The central part is either single, if only two bones are included in the joint, or divided into clearly distinct portions by sharp ridges, if more than two bones are included. Thus the upper articular surface of the arm bone (humerus) is single, for only this bone and the shoulder blade (scapula) are included in the shoulder joint. The lower articular surface of the humerus is subdivided into two parts, one for articulation with the radius and one for articulation with the ulna, both being included in the elbow joint. There is a functional reason for the subdivision, or partition, of articular cartilage when it does occur.

Within a diarthrosis joint bones articulate in pairs, each pair being distinguished by its own pair of conarticular surfaces. Conarticular surfaces constitute "mating pairs." Each mating pair consists of a "male" surface and a "female" surface, terms explained below. As has just been pointed out, there is only one such pair of bones within the shoulder joint; hence there is only one pair of conarticular surfaces. There are two such pairs within the elbow joint—the humeroradial and humero-ulnar. The radius moves on one of the two subdivisions of the lower humeral articular cartilage, the ulna moves on the other subdivision. There are, then, two pairs of conarticular surfaces within the elbow joint even though there are only three bones in it.

Ovoid and sellar classes of articular surfaces

Articular surfaces are divisible into two primary classes: ovoid and sellar. An ovoid surface is either convex in all directions or concave in all directions; in this respect it is like one or other of the two sides of a piece of eggshell, hence the name (ovum, egg). A sellar surface is convex in one direction and concave in the direction at right angles to the first; in this respect it is like the whole or part of a horse saddle (sella, saddle). There are no flat articular surfaces, although custom permits slightly curved ovoid or sellar surfaces to be called flat. Following an engineering convention, an ovoid surface is called male if it is convex, female if it is concave. In any diarthrosis having ovoid conarticular surfaces, the male surface is always of larger area than the female. For this reason the larger of two sellar conarticular surfaces is called male, the smaller is called female. The larger the difference in size between conarticular surfaces the greater is the possible amount of motion at the joint.

In all positions of a diarthrosis, except one, the conarticular surfaces fit imperfectly. This incongruence may not be great and may be lessened by mutual deformation of the opposed parts of the surfaces, a consequence of the deformability of articular cartilage. The exceptional position is called the close-packed position; in it the whole of the articulating portion of the female surface is in complete contact with the apposed part of the male surface, and the joint functionally is no longer a diarthrosis but synchondrosis. Every joint has its close-packed position brought about by the action of the main ligaments of the joint. A good example is that of the wrist when the hand is fully bent backward (dorsiflexed) on the forearm; another is that of the knee when the thigh and leg are in the military position of attention. It is not assumed constantly because it requires special muscular effort. It is also a dangerous position, for in it two bones in series are converted temporarily into a functionally single, but longer, unit, more likely to be injured by sudden, torsional stresses. Thus a sprained, or even fractured, ankle usually occurs when that joint, when close packed, is suddenly and violently bent.

No articular surface is of uniform curvature; neither is it a "surface of revolution" such as a cylinder is. That part of a male conarticular surface that comes into contact with the female in close pack is both wider and of lesser curvature than is the remainder. Inspection of two articulating bones is enough to establish their position of close pack, flexion, extension, or whatever it may be.

Intra-articular fibrocartilages. Intra-articular fibrocartilages are complete or incomplete plates of fibrocartilage that are attached to the manifest part of the fibrous layer (the investing ligament) and that stretch across the joint cavity between a pair of conarticular surfaces. When complete they are called disks; when incomplete they are called menisci. Disks are found in the temporomandibular joint of the lower jaw, sternoclavicular (breastbone and collarbone), and ulnocarpal (inner forearm bone and wrist) joints. A pair of menisci is found in each knee joint, one between each femoral condyle and its female, tibial counterpart. A small meniscus is found in the upper part of the acromioclavicular joint. These fibrocartilages are really parts of the fibrous layer of the diarthrosis in which they occur and effect a complete or partial division of the articular bursa into two parts, depending upon whether they are disks or menisci, respectively. When the division is complete, there are really two synovial joints—*e.g.*, the sternodiskal and discoclavicular.

A disk or meniscus is a chondrified ingrowth of the fibrous layer, the chondrification being slight and the fibrous element predominating, especially in the part nearest to the investing ligament. Both animal experiment and surgical experience have shown that a meniscus of the knee can be grown again if removed. The growth takes place from the fibrous layer and is wholly fibrous in structure. The function of these intra-articular plates is to assist the gliding movements of the bones at the joints that contain them.

The synovial layer. The inner layer of the articular bursal wall is called the synovial layer (stratum synoviale) because it is in contact with the synovial fluid. Unlike the fibrous layer, it is incomplete and does not extend over the articulating parts of the articular cartilages and the central parts of articular disks and menisci. One can, therefore, designate a "synovial periosteum," covering such parts of the bones as are found within the joint, and a "synovial perichondrium," covering the nonarticulating parts of the articular cartilages.

Synovial membrane cells

The layer, commonly called the synovial membrane, is itself divisible into two strata, the intima and the subintima. The intima is smooth, moist, and glistening on its free (synovial) surface. It could be described as an elastic plastic in which cells are embedded. Its elasticity allows it to stretch when one of the articulating bones either spins or swings to the opposite side and to return to its original size when the movement of the bone is reversed. It contains many elastic fibres. These are extremely fine but are easily seen when the membrane is stained by methylene blue. The cells of a synovial membrane can be divided into two classes: synovioblasts and protective cells. The synovioblasts are responsible for the generation and maintenance of the matrix. Their form depends upon their location. They are flattened and rounded at or near the internal surface of the membrane, more elongated and spindle shaped elsewhere. They appear to be quite mobile, able to make their way to the free surface of the membrane and even to enter the synovial fluid. Excepting the regions in which the synovial membrane passes from the investing ligament (fibrous capsule) to the synovial periostea, these cells are scattered and do not form a continuous surface layer as do, for example, the cells lining the inner surface of the gut or of a blood vessel. In this respect they resemble the cells of other connective tissues such as bone and cartilage. Apart from the generation and maintenance of the matrix of the membrane, their function is obscure. They seem to be the only cells capable of secreting hyaluronic acid, the characteristic component of synovial fluid, but direct evidence that they do so is still lacking.

The protective cells are scattered through the membrane. They are of two kinds, mast cells and phagocytes. The mast cells secrete heparin and play the same part in synovial membrane as they do elsewhere, for example in the skin and the gums. The phagocytes ("swallowing cells") ingest unwanted particles, even such large ones as those of injected India ink; they are, in short, scavengers here as elsewhere. The subintima is the connective tissue base on which the intima lies and may be fibrous, fatty, or areolar (loose). In it are found the blood vessels and nerves that have penetrated the fibrous layer. Both the blood vessels and the nerves form plexuses, to be described later. The areolar subintima forms folds (synovial fringes) or minute, fingerlike projections (villi) that project into the synovial fluid. The villi become more abundant in middle and old age. The fatty parts of the subintima may be quite thin; but in all joints there are places where they project into the bursal cavity as fatty pads (plicae adiposae); these are wedge shaped in section, like a meniscus, the base of the wedge being against the fibrous capsule. The fatty pads are large in the elbow, knee, and ankle joints. In the hip joint a fatty pad is found in the deepest part of the female surface (acetabulum). It is usually, but not always, connected to the male surface (head of femur) and is then called the ligamentum teres.

Functions of the fatty pads

The function of fatty pads depends upon the fact that fat is liquid in a living body and that, therefore, a mass of fat cells is easily dcformable. When a joint is moved, the synovial fluid is thrown into motion because it is adhesive to the articular cartilages, the motion of the fluid being in the direction of motion of the moving part. The fatty pads project into those parts of the synovial space in which there would be a likelihood of an eddying (vortical) motion of the fluid if those parts were filled with fluid. In short, the pads contribute to the "internal streamlining" of the joint cavity. Their deformability enables them to do this effectively. Of equal importance is the fact that the fatty pads by their very presence keep the synovial fluid between the immediately neighbouring parts of the male and female surfaces sufficiently thin, with proper elasticity as well as viscosity, to lubricate the joint.

Fatty pads are well provided with elastic fibres that bring about recovery from the deformation caused by pressure across a moving joint and prevent the pads themselves from being squeezed between two conarticular surfaces at rest. Such squeezing can happen, however, as the result of an accident and is very painful because of the large number of pain nerve fibres in these pads.

Three characteristics of the synovial fluid

The synovial fluid. The main features of synovial fluid are: (1) Chemically, it is dialyzate of blood plasma—that is, the portion of the plasma that has "filtered" through a membrane—but contains a larger amount of hyaluronic acid than other plasma dialyzates. (2) Physically, it is a markedly thixotropic fluid; that is, one which is both viscous and elastic. Its viscosity decreases with an increase of the speed of the fluid when it is in motion. Its elasticity, on the other hand, increases with increase of speed of the fluid. Its thixotropy is due to the hyaluronic acid in it. (3) Functionally, it has two parts to play: nutrition and lubrication. It has now been established that it alone, by virtue of its being a blood-plasma dialyzate, can nourish the articulating parts of the articular cartilages. Its thixotropic properties make it suitable for forming what are called elastohydrodynamic lubricant films between the moving and the fixed conarticular surfaces of any mating pair. The motion of the synovial fluid, referred to earlier in connection with the fatty pads, assists its nutritional function by distributing it over the articular surfaces, from which it slowly passes into the interior of the cartilage. The bulk of the fluid comes from the synovial blood capillaries. The source of the hyaluronic acid is not known at present.

Types of synovial joints. Recognition of the bursal nature of synovial joints makes it possible to describe them simply in terms of the bursal wall and to group together a number of types of structures. There are seven types of synovial joints: plane, hinge, pivot, sellar, ellipsoid, spheroidal, and bicondylar (two articulating surfaces). This classification is based on the anatomical form of the articular surfaces.

Plane type or arthrodial. The plane-type or arthrodial joint has mating surfaces slightly curved and may be either ovoid or sellar. Only a small amount of gliding movement is found. Examples are the joints between the metacarpal bones of the hand and those between the cuneiform bones of the foot.

Hinge type or ginglymus. The hinge-type or ginglymus joint is a modified sellar type with each mating surface ovoid on its right and left sides. This modification reduces movement to a backward–forward swing like that allowed by the hinge of a box or a door. The swing of the joint, however, differs from that of a hinge in that it is accompanied by a slight spin of the moving bone around its long axis. This brings the joint either into or out of its close-packed position, which is always that of extension.

The joints between the bones of the fingers (phalanges) and that between the ulna ("inner" bone of the forearm) and the humerus at the elbow are classical examples. When a finger is completely straightened, each of its interphalangeal joints is in close pack, as is the ulnohumeral joint when the arm and forearm are in one line.

Pivot type or trochoid. The pivot-type or trochoid joints are of two forms: in one a pivot rotates (spins) within a ring; in the other a ring moves around a pivot. In each case the ring is composed of fibrous tissue, part of which is converted into cartilage to form a female surface; the remainder may be ossified. Similarly, only part of the pivot is covered by a male articular cartilage. Pivot joints are always of the ovoid class; from a functional aspect, they are the ovoid counterparts of hinge joints.

The atlantoaxial (first and second cervical vertebrae) and the two radio-ulnar joints are examples of pivot joints. In the former, a thick, bony spike projects upward from the axis vertebra to form the pivot. The ring is formed in front by the anterior part of the (ring-shaped) atlas vertebra and completed behind by a transverse band of fibrous tissue that divides the opening of the atlas into two parts; the articulating surfaces are in front. In this joint the ring (atlas) moves around the pivot. It is the chief, though not the only, joint involved when the head is turned from side to side. In the upper radio-ulnar joint, the pivot is formed by the side of the upper end of the radius, and the ring is formed by a female surface on the ulna and a band of fibrous tissue that starts from the ulna behind and returns to it in front. This band lies in the capsule of the elbow joint and is called the radial annular ligament. In the lower radio-ulnar joint, the pivot is formed by the lower end of the ulna, and the ring by anterior and posterior bands of fibrous tissue and a female surface on the ulnar side of the radius. Thus, when the forearm is twisted (pronated) or untwisted (supinated), the limb being free, the pivot moves on the ring in the upper joint, but the ring moves on the pivot at the lower joint.

Movements of sellar joints

Sellar type. The sellar type has already been described in the section dealing with articular surfaces in general. It has two types of movement—both swings—flexion–extension and abduction–adduction. In addition to these it allows movements combining these two; that is, swings accompanied by rotation (spin) of the moving bone.

There are many examples of sellar joints. The best known is the carpometacarpal joint of the thumb, in which the free, first metacarpal moves upon the trapezium. (The carpal bones are those of the wrist, the metacarpals of the hand, and the phalanges of the fingers. The trapezium is a carpal bone.) The articular surface of the latter bone is convex from behind forward and concave from side to side. The thumb can be swung from side to side or from behind forward. But the most frequent movement is that which swings it so that it comes "face to face" with one or another of the fingers, as in

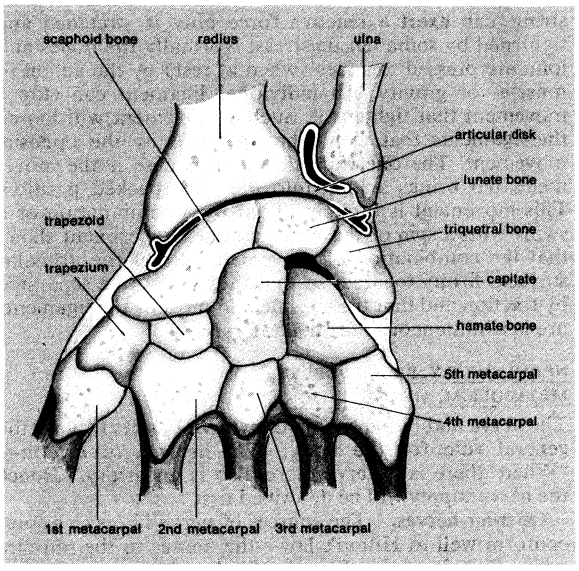

Figure 4: Coronal section through the radiocarpal, carpal, carpometacarpal, and intermetacarpal joints of the wrist.

grasping a needle or a ball. This movement is called opposition (*i.e.*, of thumb to fingers). The reverse movement is called reposition. During opposition the thumb is rotated around its long axis; it has been said that our civilization depends upon the opposition of the thumb.

Sellar joints are found wherever only two types of movement are required, and a movement of the opposition kind is the habitual one.

Ellipsoid type. The ellipsoid is also a joint having two types of movement but allowing opposition movement only to a small degree. Its surfaces are ovoid and vary in both length and curvature as they are traced from front to back or from side to side, just as the diameter and curvature of an ellipse vary in directions at right angles to each other (hence the name). The joint between the second metacarpal and the first phalanx of the second finger is a good example. The male surface is on the head (finger end) of the metacarpal, at its extremity, and extends, broadening from side to side, on to its palmar aspect. It allows the finger to flex and extend, to swing toward or away from its neighbouring finger, and to swing forward with a slight amount of rotation. Its close-packed position is full flexion. The remaining joints between metacarpals and fingers are of the same type. So also are those between the lower end of the radius and the lunate and scaphoid bones of the wrist (radiocarpal) joint. In this case, however, the close-packed position occurs when the hand is swung backward (dorsiflexed) completely. If a person falls violently on his dorsiflexed hand, fracture of the scaphoid and the lower end of the radius is likely to occur.

Spheroidal type. The spheroidal type, also known as a ball-and-socket joint (see Figure 5), is the only one with three types of movement. It is an ovoid joint the male element of which could be described as a portion of a slightly deformed sphere. It is this fact that allows one of the component bones to swing in various directions and also to spin upon the other bone. The largest spheroidal joints are those at the hip and shoulder. At the shoulder the male surface is on the humerus and faces inward toward the body.

The female surface (glenoid cavity) is at the upper front angle of the scapula and is quite shallow. This allows freedom of movement of the arm upon the body in all directions except backward (extension).

Nevertheless, the utmost amount of swing forward (flexion) or outward (abduction) is 90"; the hand can then be swung further upward by movements of the scapula on the trunk. In accordance with this freedom of movement, the capsule of the joint is long and loose in most positions, and the joint itself is extremely susceptible to dislocation if the surrounding muscles be "off guard." It is in close pack when the arm is fully abducted and outwardly rotated.

The hip joint

At the hip joint the male surface is on the femur and also faces inward; it is larger than that on the humerus. The female surface is on the side of the hipbone, It is contained within a deep, cuplike socket (acetabulum), which permits flexion and extension of about the same amount as at the shoulder but restricts abduction-adduction and rotation of the femur around its long axis. The fibrous capsule is not as loose as that at the shoulder. The hip joint is close packed in the position of fullest extension.

Bicondylar type. Condylar type is better called the bicondylar type, for in it two distinct surfaces on one bone articulate with corresponding distinct surfaces on another bone. The two male surfaces are on one and the same bone and are of the same type (ovoid or sellar). The male surfaces are called male condyles; the female surfaces are female condyles. These joints have two types of movement: one is always a swing; the other is either another swing or a spin.

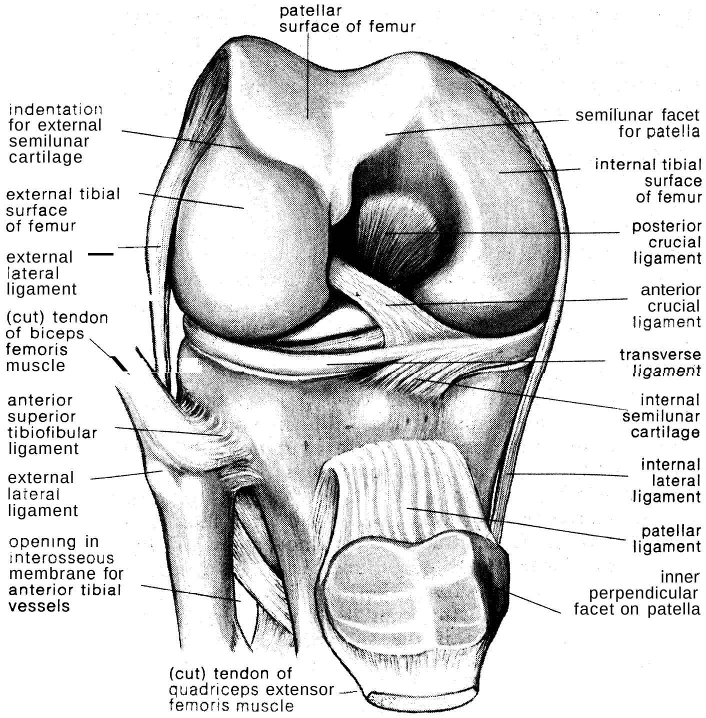
Bicondylar joints are quite common. The largest is the tibiofemoral joint in which both pairs of mating surfaces are within a single joint. At this joint, flexion and extension are the main movements; but active rotation of the leg on the femur is possible in most people when the leg and thigh are at right angles to each other.

Every vertebra of the cervical, thoracic, and lumbar series is connected to (or separated from) the one below it by a pair of synovial joints as well as by an intervertebral disk. This pair of joints constitutes a bicondylar joint, the shape of whose articular surfaces determines the amount of movement permitted between the vertebra (Figure 2). The atlanto-occipital joint between the skull and the vertebral column is also a bicondylar joint. Finally, the right and left temporomandibular joints, between the lower jaw and the skull, are really two parts of a bicondylar joint, not only by definition—if the base of the skull be considered as a single bone—but also functionally, for one mandibular condyle cannot move without the other moving also.

JOINT LIGAMENTS

Any set of collagen fibres joining one bone of an articulating pair to the other is called a ligament. Thus all the manifest part of the articular bursal wall is a ligament, called either the fibrous capsule or the investing ligament. The former name will be used in the text that follows.

In descriptive medical anatomy, the term ligament is used for special sets of collagen fibres associated with joints. There are two types of these sets: capsular and noncapsular.



patellar surface of femur
indentation for external semilunar cartilage
external tibial surface of femur
external lateral ligament
(cut) tendon of biceps femoris muscle
anterior superior tibiofibular ligament
external lateral ligament
opening in interosseous membrane for anterior tibial vessels
(cut) tendon of quadriceps extensor femoris muscle
semilunar facet for patella
internal tibial surface of femur
posterior crucial ligament
anterior crucial ligament
transverse ligament
internal semilunar cartilage
internal lateral ligament
patellar ligament
inner perpendicular facet on patella

Capsular ligaments

Capsular ligaments are simply thickenings of the fibrous capsule itself, taking the form of either elongated bands or triangles the fibres of which radiate from a small area of one articulating bone to a line upon its mating fellow. The iliofemoral ligament of the hip joint is an example of a triangular ligament. Capsular ligaments are found on the outer surface of the capsule. There is one exception to this rule: ligaments of the shoulder joint (glenohumeral ligaments) are found on the inner surface.

Noncapsular ligaments are free from the capsule and are of two kinds, internal and external.

The internal type is found in the knee, wrist, and foot. In the knee there are two, both arising from the upper surface of the tibia; each passes to one of the two femoral condyles and lies within the joint cavity surrounded by synovial membrane. They are called cruciate ligaments because they cross each other X-wise. At the wrist most of the articulations of the carpal bones share a common joint cavity, and neighbouring bones are connected sideways by short internal ligaments. The same is true of the tarsal bones that lie in front of the talus and calcaneus.

The external, noncapsular ligaments are of two kinds, proximate and remote. The proximate ligaments pass over at least two joints and are near the capsules of these joints. They are found only on the outer side of the lower limb. Examples are the outer (fibular) ligament of the knee, which passes from the femur to the upper part of the fibula over both the knee and tibiofibular joints, and the middle part of the outer ligament of the ankle joint, which passes from the lowest part of the fibula to the heel bone. These two ligaments, particularly that passing over the ankle, are especially liable to damage (sprain).

The remote ligaments are so called because they are far from, rather than close to, the joint capsule. A notable example is that of the ligaments that pass between the back parts (spines and laminae) of neighbouring vertebrae in the cervical, thoracic, and lumbar parts of the spinal column. These are the chief ligaments of the pairs of synovial joints between the vertebrae of these regions. Unlike most ligaments they contain a high proportion of elastic fibres that assist the spinal column to return to its normal shape after it has been bent forward or sideways.

Functions of the ligaments

Contrary to the opinion of earlier anatomists, ligaments are not normally responsible for holding joint surfaces together. This is because a set of collagen fibres, like a string, can exert a reactive force only if stretched and tightened by some tensile stress. Normally the bones at a joint are pressed together (when at rest) by the action of muscles or gravity. An individual ligament can stop a movement that tightens it. Such a movement will loosen the ligaments that would be tightened by the opposite movement. The one exception to this case is the movement that brings a joint into the close-packed position. This movement is brought about by a combination of a swing with a spin of the moving bone. Experiment shows that the combination of movement screws the articular surfaces firmly together so that they cannot be separated by traction and that the capsule and most of the ligaments are in simultaneous maximal tautness.

NERVE SUPPLY, BLOOD SUPPLY. METABOLISM, AND NUTRITION

The nerve and blood supply of synovial joints follows the general rule for the body: ***Ubi nervus ibi arteria***—"Where there is a nerve there also is an artery." Hence the nerve supply will be described first.

Articular nerves. The sources of nerve fibres to a joint conform well to Hilton's law—the nerves to the muscles acting on a joint give branches to that joint as well as to the skin over the area of action of these muscles. Thus the knee joint is supplied by branches from the femoral, sciatic, and obturator nerves that among them supply the various muscles moving the joint. Some of these nerves go to the fibrous capsule and ligaments; others pierce this capsule and reach the synovial membrane. Some of these nerves are sensory; others give both motor and sensory fibres to the arteries that accompany them.

Types of sensory fibres to the fibrous capsule

The sensory fibres to the fibrous capsule are of two kinds: (1) algesic, responsible for painful sensation, particularly when the capsule or other ligaments are overstretched or torn; and (2) proprioceptive, that terminate in various forms of specialized structures and convey information to all parts of the central nervous system, including the cerebellum and the cerebrum. It has been established that this information includes the posture of a resting joint and both the rate and extent of motion at a moving joint. The latter is supplemented by impulses conveyed by the nerves from the muscles acting and the skin affected by the movement.

The sensory fibres to the synovial membrane reach it by piercing the fibrous capsule at various points and form wide-meshed networks in the subsynovial layer. They are mainly algesic in function, stimulation of them giving rise to diffused rather than localized pain (unlike the corresponding fibres to the fibrous capsule). They are found wherever the synovial membrane is, being especially abundant in the fatty pads, and are also present over the peripheral (nonarticulating) parts of the articular cartilage, disks, and menisci. This fact accounts for the great, sickening pain that accompanies injury of these latter structures. The articulating part of the articular cartilage has no nerve supply.

Articular blood and lymph vessels. The arteries in the vicinity of a synovial joint give off subdivisions that join (anastomose) freely on its outer surface. From the network of vessels so formed, branches lead to the fibrous capsule and ligaments and to the synovial membrane. Blood vessels to the synovial membrane are accompanied by nerves, and, when these vessels reach the subsynovial membrane, they proliferate to form another anastomotic network from which capillaries go to all parts of the membrane. These subsynovial arteries also ramify to the fatty pads and the nonarticulating parts of the articular cartilage, disks, and menisci. None, however, go to the articulating part of an articular cartilage, which, therefore, depends for its nourishment upon the synovial fluid. The vessels to the nonarticulating part of the cartilage pass into cartilage canals in its interior. (These canals have a structure resembling that of the haversian canals of bone except that their walls are not ossified; see BONE.) In one form of connective-tissue disease (osteoarthritis), the peripheral parts of the cartilage become ossified and give rise to bony projections. The blood vessels encircling the joint are numerous.

Veins, of course, are found with the arteries. In addition, a joint has a well-developed set of lymphatic vessels the ultimate channels of which join those of the neighbouring parts of the limb or body wall.

Joint metabolism and nutrition. The metabolism and nutrition of the fibrous capsule and ligaments are similar to that of fibrous tissues elsewhere. Their blood supply is relatively small, pointing to a low rate of metabolic changes. Unlike skin, for example, they heal slowly if injured.

The metabolism of articular cartilage, however, is of interest here. It is primarily dependent upon that of its cells (chondrocytes). Carbohydrate metabolism in these cells is similar to that of cells elsewhere and is unaffected by age. The oxygen consumption of the chondrocytes, on the other hand, decreases with age once the cells have matured. All the evidence suggests that the intracellular combustion is of glucose and protein, in that order of preference, rather than of fat. Sulfur passes from the blood to the synovial fluid and from there to the chondrocytes. From these it is transferred to the matrix to help to form chondroitin sulfate and keratosulfate molecules, the main constituents of the cartilaginous material. Chondroitin sulfate could be described as a sulfonated form of hyaluronic acid, the characteristic constituent of synovial fluid. Its presence in the matrix of the cartilage but not in the synovial fluid shows that the chondrocytes are necessary for its formation. After the second decade of life, the proportion of chondroitin sulfate falls and that of keratosulfate rises, as would be expected in view of the corresponding diminution of metabolic activity of the cells.

Formation of chondroitin sulfate

Excepting the articulating parts of the articular cartilages, disks and menisci, all the tissues of synovial joints are nourished directly by the blood vessels. The excepted parts are nourished indirectly by the synovial fluid. This is distributed over the surface of the articulating cartilage by the movements of the joint. The need for keeping joints healthy by frequent exercise of all of them is thus apparent.

Joint Diseases and Injuries

Diseases of the joints, although rarely life threatening, probably cause more invalidism in Western countries than any other conditions except heart and mental disease. It has been estimated from the National Health Survey that more than 1,000,000 persons in the United States are unemployable because of them. The most sorely afflicted are the elderly, but no age is immune. The disorders may be variously short-lived or exceedingly chronic; agonizingly painful or merely nagging and uncomfortable; they may be confined to one joint or may affect many parts of the skeleton. Many different disorders are involved, and several classifications of them have been proposed by professional organizations. For the purposes of this article two principal categories are distinguished: joint diseases in which inflammation (heat, swelling, pain, redness) is the principal set of signs or symptoms; and diseases, called in this article "noninflammatory," in which inflammation may be present to some degree, as after an injury, but is not the essential feature.

INFLAMMATORY JOINT DISEASES

"Arthritis" is a generic term for inflammatory joint disease. Inflammation restricted to the lining of a joint (the synovial membrane) is referred to as "synovitis." "Arthralgias" simply are pains in the joints; as ordinarily used, the word implies that there are no other accompanying evidences of arthritis. "Rheumatism," which is not synonymous with these, does not necessarily imply an inflammatory state but refers to all manners of discomfort of the articular apparatus including the joints and also the bursas, ligaments, tendons, and tendon sheaths. Inflammation of the spine and its joints is called spondylitis. Regardless of the cause, the inflammation may cause pain, stiffness, swelling, and some redness of the skin about the joint. Effusion of fluid into the joint cavity is common, and examination of this fluid is often a valuable procedure for determining the nature of the disease. The inflammation may be of such a nature and of such severity as to destroy the joint cartilage and underlying bone and bring irreparable deformities. Adhesions between the articulating members are frequent in such cases, and the resulting fusion with loss of mobility is called ankylosis. When apposed joint surfaces are displaced from each other they are said to be "dislocated" or "luxated." Incomplete dislocation is called "subluxation."

Types and routes of infection

Infectious **arthritis.** Joints may be infected by many types of micro-organisms (bacteria, fungi, viruses) and occasionally by animal parasites. There are three routes of infection: by direct contamination, by way of the bloodstream, and by extension from adjacent bony infections (osteomyelitis). Direct contamination usually arises from penetrating wounds but may also come during surgery on joints. Blood-borne infections may enter the joints through the synovial blood vessels. Commonly, however, they first set up foci of osteomyelitis in the long bone near the end of its shaft or next to the joint. The infection then extends into the joint through natural openings or pathological breaches in the outside layer or cortex of the bone. Characteristically hematogenous (blood-borne) infectious arthritis affects one joint (monarthritis) or a very few (oligoarthritis) rather than many of them (polyarthritis), and usually large joints (knee and hip) rather than small ones.

Inflammatory reactions in the joints are like inflammation in other tissues. Joint cartilage may be damaged rapidly by formation of pus in infections with such bacteria as staphylococci, hemolytic streptococci, and pneumococci. Tuberculosis of the joint, by contrast, can result in extensive destruction of the adjacent bone and open pathways to the skin without destruction of the cartilage. Tuberculous spondylitis, Pott's disease, is the most common form of this infection. It occurs mostly in young children. Before treatment with the antibiotic streptomycin and the antituberculous drugs isoniazid and para-aminosalicylic acid was available, hunchback deformities were frequent and the mortality was about 30 percent. At one time bovine tubercle bacilli caused much of human tuberculosis of the bones and joints, but pasteurization of milk and control of dairy herds has virtually eliminated this source of infection. The most frequent American fungus infection is caused by *Coccidioides immitis,* an organism indigenous to the arid regions of the Southwestern United States. As in the case of tuberculosis, seeding from the lung to the bone usually precedes involvement of a joint. Aside from this destructive form of coccidioidomycosis, transient pains in the joints are frequent during the period of dissemination of the disease through the bloodstream. Brucellosis, like tuberculosis, has a particular affinity for the spine. *Brucella suis* is the most likely brucellar organism to cause skeletal disease.

These infections are most directly identified by finding the causative agent in the synovial fluid or in specimens of synovial tissue. At times it may be preferable to investigate the regional lymph nodes. Infections of the joints, like infections elsewhere in the body, often cause fever and other systemic indications of inflammation. Appropriate antibiotics or chemicals are used to eliminate the infection, and early drainage of the exudate is desirable if there is pus.

Among the better recognized virus infections that can cause joint discomforts are rubella (German measles) and serum hepatitis, both of which usually are of short duration and have no permanent effect. Several tropical forms of synovitis have also been reported to be viral. Destructive arthritis sometimes complicates smallpox, but it probably results from supra-imposition of a bacterial infection rather than from invasion of the joint by the pox virus proper. Parasitic infestations are unusual, but there have been documented cases of joint involvement by the Guinea worm, *Dracunculus* medinensis, a nematode that affects more than 50,000,000 persons in tropical countries. Ordinarily it penetrates only into the soft tissues of the foot, but occasionally it spreads into the knee joint.

Complicating factors in venereal diseases

Infectious arthritis complicates several venereal diseases, including gonorrhea. The gonococcal organism is highly sensitive to penicillin, and early treatment with penicillin usually effects a prompt cure and prevents the marked destruction of the joint that may otherwise ensue. The arthritis of Reiter's disease, which is occasionally confused with gonorrhea and apparently is spread by sexual contact, does not respond to antibiotics but usually improves spontaneously over the course of several months. Characteristically Reiter's disease involves inflammation of the joints, the urethra, and the conjunctiva. Syphilis appears not to infect the joints directly except in the most advanced stage of the disease and in congenital syphilis. The latter frequently causes destructive inflammation in the growing cartilaginous ends of the bones of newborn infants. Untreated it leads to deformity and restriction of growth of the involved part (Parrot's pseudoparalysis), but early treatment with penicillin results in complete recovery. Clutton's joint is another type of congenital syphilitic lesion. It is a true inflammation of the synovial membrane that occurs in youngsters between 6 and 16 years; although it causes swelling of the knees, it is a relatively benign condition. Lesions characteristic of tertiary syphilis sometimes occur in the joints of children who have congenital syphilis. Yaws, a nonvenereal infection by an organism closely related to that causing syphilis, or identical with it, leads to similar skeletal lesions. The condition has largely been eradicated but only a few years ago affected many millions of persons in tropical areas and must once have been the principal cause of infectious disease of the bones and joints.

Deformities and destructive changes in the joints in leprosy (Hansen's disease) arise from infection of the nerves by the leprosy bacillus or from infection by some other bacteria.

Infectious arthritis occurs in many animal species and is of considerable economic importance in livestock commerce. A chronic "rheumatoid-like" arthritis in swine has for many years been the first or second cause for the condemnation of pork in the United States and other countries. One body of opinion attributes it to infection by *Erysipelothrix* insidiosa (rhusiopathiae), another to Mycoplasma hyorhinis. Mycoplasma organisms are minute filterable bacteria that lack cell walls. They cause arthritis in many avian and mammalian species. Certain types of these organisms cause pneumonia, but there is no proof that they are responsible for rheumatoid or other sorts of arthritis in man. The situation with another group of filterable agents, the Bedsonia (Miyagawanella), is analogous to this except that rare instances of arthritis occur in the venereal disease lymphogranuloma venereum, which is caused by this organism. Streptobacillus *moniliformis,* an organism commonly found in rats, causes arthritis in other species as well and in man has been responsible for Haverhill fever, characterized by rash, especially on the arms and legs, and by inflammation of several joints. It usually does not last more than about two weeks, and is effectively treated with penicillin.

Rheumatoid arthritis and allied disorders. In several types of arthritis that resemble infectious joint disease no causative agent has been isolated. Principal among these is rheumatoid arthritis. This disorder may appear at any age but is most usual in the fourth and fifth decades. A type that affects children is called Still's disease. Rheumatoid arthritis typically affects the same joints on the two sides of the body. Almost any movable joint can be involved, but the fingers, wrists, and knees are particularly susceptible. The joints are especially stiff when the affected person awakes in the morning. Rheumatoid arthritis is not only a disease of the joints. Fatigue and anemia indicate that there is a more generalized systemic involvement. A slight fever may sometimes be present. Lesions also occur in sites outside the joints. Involvement of bursas, tendons, and tendon sheaths is an integral part of the disease. Approximately one of five affected persons has nodules in the subcutaneous tissue at the point of the elbow or elsewhere. Inflammatory changes also are found sometimes in small arteries and the pericardium—the membrane enclosing the heart—less often in other structures. The eyes occasionally are involved but not as frequently as in Still's disease or in ankylosing spondylitis, a spinal arthritis that causes vertebral joints to fuse together (ankylose). The natural course of rheumatoid arthritis is variable. It may be episodic or sustained. Many affected persons are benefitted over the course of several months by rest, by analgesics such as aspirin, and by therapeutic exercises. In approximately one-third of the instances of the disease, it progresses and causes serious incapacity. In the absence of proper physical therapy, the joints may become greatly deformed and ankylosed.

Signs and course of rheumatoid arthritis

The cause of rheumatoid arthritis is unknown. The two principal hypotheses at this time are that rheumatoid arthritis may be an infection whose causative agent cannot be recovered by presently available techniques; or that it may be a disorder of hypersensitivity, conceivably to an infectious agent. In approximately 85 percent of cases, the blood serum contains abnormal, large antibody-like globulins called "rheumatoid factors." Rheumatoid factors are characterized by their property of combining selectively with serum gamma globulin, the blood protein that contains antibodies. They are thus directed against a normal body constituent (the gamma globulins) and may be classified as autoantibodies. Autoantibodies are involved in causing several other disorders, but a pathogenic role for rheumatoid factors has not been proven in rheumatoid arthritis. The rheumatoid factors form the basis for useful, but not absolutely specific, diagnostic tests for rheumatoid arthritis.

Although there is no cure for rheumatoid arthritis, much can be done to make the affected person comfortable and self-sufficient. Basic to the treatment are the conservative methods already noted. Adrenal corticosteroid hormones often induce initial dramatic improvements but do not in any way cure rheumatoid arthritis. Their effectiveness generally diminishes with time, and there are definite disadvantages in their use, such as a greater susceptibility to infection and to peptic ulcers. Several chemicals that have been tried—phenylbutazone, chloroquines, and indomethacin—may be of benefit but are all somewhat poisonous. Intramuscular injections of gold compounds have proven effective in a certain proportion of persons. Surgery is often of value in correcting established deformities. Much interest in early surgical excision of the inflamed synovial tissue existed in the early 1970s. Though thousands of victims of the disease have been treated in this way, insufficient time has elapsed to permit the profession to evaluate its long-term benefits or deleterious consequences. The long continuation of the disease causes much demoralization of the afflicted and makes them prey for innumerable nostrums and frauds. There is no place for vaccines, cobra or bee venoms, or sulfur compounds in the management of rheumatoid arthritis, and antibiotics also are valueless. A mild, dry climate seems to be beneficial in occasional cases, but the improvement is generally not sufficient to justify a move that would disrupt the total pattern of the affected person's life.

There is at times a close association between rheumatoid arthritis and seemingly unrelated disorders. In about one-third of the cases of Sjögren's syndrome, characterized by greatly diminished flow of tears and of saliva with resultant dry eyes and dry mouth, there is also rheumatoid arthritis, and high levels of rheumatoid factors are usually present in the bloodstream. In Felty's syndrome, rheumatoid arthritis coexists with enlargement of the spleen and diminution in the number of circulating blood cells, particularly the white blood cells. Removal of the spleen restores the blood to normal but has no effect on the arthritis.

Diseases resembling rheumatoid arthritis

Several other types of polyarthritis resemble rheumatoid arthritis but characteristically lack the rheumatoid factors in the bloodstream. One is associated with the skin disease psoriasis. The frequency of the association is greater than chance would dictate; roughly 5 percent of patients with psoriasis also have arthritis. Psoriatic arthritis also differs from rheumatoid arthritis insofar as it has a predilection for the outer rather than the inner joints of the fingers and toes; furthermore, it results in more destruction of bone. Another type of arthritis is associated with chronic intestinal diseases—ulcerative colitis, regional enteritis, and Whipple's disease. Ankylosing spondylitis, also known as Marie-Strümpell, or Bechterew's, disease, affects some of the peripheral joints, such as the hip; but its principal location is in the spine and sacro-iliac joints. In the spine, the small synovial joints and the margins of the intervertebral disks are both involved. These structures become bridged by bone, and the spine is accordingly rigid. Ankylosing spondylitis is a disease of men, the sex ratio being approximately 8:1 over women. The age of onset is lower than that in rheumatoid arthritis. The general management of the two disorders is much the same, but phenylbutazone is more effective in ankylosing spondylitis than in rheumatoid arthritis.

"Collagen diseases." The collagen diseases are so called because in all of them abnormalities develop in the collagen-containing connective tissue. These diseases are primarily generalized or systemic, frequently accompanied by joint complaints. The latter may be trivial in comparison to the systemic problems or may be severe enough to simulate rheumatoid arthritis. One of these diseases, systemic lupus erythematosus (SLE) may affect any structure or organ in the body. It usually causes characteristic eruptions on the face and inflammation and pain in the joints; it may inflame the eyes, cause kidney disease, or affect the central nervous system. The disease is characterized by serum antibodies that react with one or another component of nucleoproteins. This gives rise to the "L.E. cell phenomenon," a useful diagnostic test. The cause of SLE is not known. Some sort of overlap with rheumatoid arthritis is suggested by the fact that one-quarter of those with SLE have positive serological tests for rheumatoid factor; and perhaps as many patients with rheumatoid arthritis have positive L.E. cell tests. In another collagen disease, generalized scleroderma, the skin becomes thickened and tight. Similar changes occur in other organs, particularly the gastrointestinal tract. Restriction of motion of the joints of the fingers is in large part accounted for by the condition of the skin, but true synovitis also is frequent.

Rheumatic fever

Rheumatic fever often is classified with the collagen diseases. It has certain similarities to rheumatoid arthritis, as the name suggests, but the differences are more impressive. In both conditions, arthritis and subcutaneous nodules occur, and inflammation of the pericardium is frequent. Nevertheless the joint manifestations of rheumatic fever typically are evanescent, while those of rheumatoid arthritis are more persistent. The reverse is true of cardiac involvement in the two disorders. There is no compelling evidence that streptococcal infection is an important causative factor in rheumatoid arthritis, but it appears well established in rheumatic fever.

Arthritis more or less resembling rheumatoid arthritis occurs in roughly one-fourth of youngsters who lack gamma globulins in the blood. In this circumstance there is a deficit in the body's mechanisms for forming antibodies. This has sometimes been cited as an argument against the hypothesis holding that rheumatoid arthritis results from hypersensitivity.

Miscellaneous arthritides. Several types of arthritis appear to be related to an altered state of hypersensitivity. Erythema nodosum is a skin disease characterized by the formation of reddened nodules on the anterior surface of the lower extremities. In the majority of cases pain may arise in various joints and sometimes swelling appears. Lymph nodes at the hilus of the lung (the site of entrance of bronchus, blood vessels, and nerves) are enlarged. The synovitis disappears in the course of several weeks or months. Although this is not always so, many cases are associated with drug hypersensitivity, with evolving infections such as tuberculosis, coccidioidomycosis, and leprosy, and with Boeck's sarcoidosis, a systemic disease in which nodules form in the lymph nodes and in other organs and structures of the body. Synovitis of this sort occurs in 10 to 15 percent of patients with sarcoidosis. Occasionally, sarcoid joint disease becomes chronic and may simulate rheumatoid arthritis.

Palindromic (recurring) rheumatism is an arthritis of unknown cause. There is no fever. Each attack lasts but a day or two and leaves no permanent effects. Nevertheless palindromic rheumatism rarely remits completely and in perhaps one-third of cases eventuates in rheumatoid arthritis. Polymyalgia rheumatica, a relatively frequent although only recently recognized condition occurring in older people, is characterized by aching and stiffness in the muscles in the region of the hips and shoulders, but the joints proper seem not to be involved. There does seem to be some relationship to one type of arterial inflammation, temporal or giant cell arteritis. Polymyalgia rheumatica is not usually accompanied by serious systemic abnormalities and is treated with small doses of corticosteroids.

NONINFLAMMATORY JOINT DISEASES

Traumatic joint diseases. Blunt injuries to joints vary in severity from mild sprains to overt fractures and dislocations. A sprain is a damage to ligaments, tendons, and muscles that follows a sudden wrench and momentary subluxation of a joint. There is some slight hemorrhage into these tissues and healing usually takes place in several days. More violent stresses may cause tears in ligaments and tendons. Because the ligaments and tendons are so strong they frequently are torn from their bony attachments rather than ripped into segments. Ligamentous, tendinous, and capsular tears are able to heal by fibrous union provided that the edges are not totally separated from each other. Internal derangements of the knee most often arise from tears in the semilunar cartilages (menisci). Usually it is the medial meniscus that is disrupted. These tears are particularly frequent in athletes and develop as the knee is twisted while the foot remains fixed on the ground. Locking of the knee is a characteristic symptom. Because the semilunar cartilages have little capacity for repair, they must be removed surgically. Bleeding into the joint, called hemarthrosis, may also result from injuries. Other things being equal, it is desirable to remove the blood that has leaked from the blood vessels.

Sprains, tears, and dislocations

Most traumatic dislocations are treated by prolonged immobilization to permit the capsular and other tears to heal over. In some instances surgical repairs are required. Fractures of bone in the vicinity of joints may or may not extend into the joint space. Whether they do or not, the normal contour of the joint must be restored or arthritic complications are likely to develop. Other sorts of complication are also seen at times. In Sudeck's atrophy the nearby but unfractured bone becomes porous and is painful. The syndrome is believed to result from neurovascular reflexes originating in the injured tissue. Treatment is therefore directed at interrupting the sympathetic nerve pathways. In Volkmann's contracture, the muscles about the injured joint (most often the elbow) become converted into a shrunken fibrous mass, and the extremity becomes deformed and useless.

Degenerative joint disease. Osteoarthritis is a ubiquitous disorder affecting all adults to a greater or lesser degree by the time they have reached middle age. It is not restricted to man but occurs in many species regardless of their position in the taxonomic scale. The name "osteoarthritis" is a misnomer insofar as its suffix implies that the condition has an inherently inflammatory nature. For this reason it frequently is called degenerative joint disease or, on the European continent, osteoarthrosis or arthrosis deformans. When the spine is involved, the corresponding term is spondylosis. Unlike rheumatoid arthritis, osteoarthritis rarely causes crippling deformities. Indeed, in the majority of instances, the milder anatomical changes are not accompanied by appreciable symptoms. There are no systemic complaints directly attributable to the joint disease. The changes are characterized by abrasive wearing away of the articular cartilage concurrent with a reshaping of adjacent ends of the bones. As a result, masses of newly proliferated bone (osteophytes) protrude from the margins of the joints. The polished ends of the bone resemble ivory.

Osteoarthritis of the hip

The clinical manifestations of osteoarthritis vary with the location and severity of the lesions. The most disabling form occurs in the hip joint, where it is known as malum coxae senilis. Osteoarthritis of the hip, like that of other joints, is classified as primary and secondary. In secondary osteoarthritis, the changes come about as a consequence of some antecedent structural or postural abnormality of the joint. In perhaps half or so of cases, however, even rigorous examination fails to disclose such an underlying abnormality; in these instances, the osteoarthritis is called primary.

Probably the most frequent cause of osteoarthritis of the hip is congenital dysplasia (dislocation or subluxation of the hip). This term refers to a poor fit of the head of the femur, the long bone of the thigh, with its socket in the pelvis, the acetabulum. There is impressive evidence that many cases arise in infancy as a consequence of swaddling infants or carrying them in headboards, procedures that keep the thighs in an extended position. Before the child is ready for walking, the hip joint has frequently not yet fully developed and the head of the femur is forced out of its normal position by this extension. There thus arises a congenital dislocation or subluxation of the hip.

Osteoarthritis of the hip occurring in relatively young persons—in their 30s or 40s—frequently follows a progressive course and requires surgical treatment. Two rather different strategies of surgery have been employed: one, an osteotomy, involves reshaping the upper end of the femur so that the load borne by the joint is distributed more efficiently; the other requires removal of the diseased tissue and replacement by an artificial joint.

Aside from the rapidly developing forms, osteoarthritis of the hips also appears frequently in aged persons. It has been estimated that 175,000 Americans 65 years and older now require assistance for even their elementary hygiene because of degenerative hip disease. Chronologic aging is an important factor in the development of other forms of degenerative joint disease as well, since the lesions increase in frequency and severity as the decades pass by.

Causes of osteoarthritis

Considerations like these have led to the view that the principal causative factors in degenerative arthritis are faulty mechanical loading and senescent deterioration of joint tissue. Single injuries, unless they leave a joint permanently deformed, rarely if ever result in osteoarthritis. Recurrent small athletic and occupational injuries, such as those arising from heavy pneumatic drill vibrations, apparently are more likely to do so. Lifting heavy weights has been implicated in some studies of spinal involvement. Compensation boards wrestle every day with the problem that injuries may aggravate or direct attention to the pathologic process and not necessarily be its cause. Obesity is often considered mechanically harmful to joints, but there is increasing evidence that it is only a minor part of the problem.

Systemic factors play a less well-defined role. Dietary factors neither cause nor cure degenerative arthritis. Endocrine influences are suggested by the fact that Heberden nodes, the osteoarthritic swellings so common in the outermost joints of the fingers, occur far more frequently in women than in men and often appear at the menopause. Complaints about joint pain are particularly frequent at this age, but it is the consensus that menopausal arthritis reflects primarily a lowered threshold to discomfort attending this emotionally stressful period of life. Therapy with natural or synthetic hormones thus has no effect on the joint disease. There is no indication for treatment with thyroid hormone. Aside from surgery of the sort noted in the hip and sometimes the knee, treatment is directed toward an adjusted program of rest and proper exercise, avoidance of injury, the use of analgesics to relieve pain, and several types of physical therapy.

Chondromalacia patellae is a common and distinctive softening of the articular cartilage of the kneecap in young persons, particularly those with athletic inclinations. It results in "catching" and discomfort in the region of the patella, or kneecap, as the knee is bent and straightened out. Pathologically the changes are indistinguishable from changes that occur early in osteoarthritis. The condition often responds poorly to conservative measures and is treated surgically, sometimes by shaving off the degenerated cartilage. The wisdom of total excision of the patella is debated by orthopedists.

Degeneration of the invertebral disk is a frequent and in some ways analogous disorder. Often this occurs acutely in young and middle-aged adults, and the pulpy centre of the disk pushes out through tears in the fibrous outer ring (so-called slipped disk). When this takes place in the lumbosacral region, the displaced centre (the nucleus pulposus) impinges on the adjacent nerve roots and causes shooting pains in the distribution of the sciatic nerve—hence the name "sciatica." Pain in the small of the back is loosely referred to as lumbago, or lumbosacral sprain. It may be associated not only with degeneration of the intervertebral disk and spondylosis but also with structural anomalies of the region. Principal among these is spondylolisthesis, in which there is an anterior displacement of one lumbosacral vertebral body on another. The episodes respond to bed rest and mechanical support from wearing an abdominal corset or brace. Muscle relaxants may be of value. Recurrences are prevented by avoidance of back strains. Muscle-strengthening exercises are frequently helpful. The protruding tissue is removed by surgery only in cases in which pain and neurological defects are severe and fail to improve after less drastic measures. Surgery is not uniformly successful.

CONGENITAL AND HEREDITARY ABNORMALITIES

Clubfoot and other deformities

Congenital abnormalities are not necessarily transmitted from generation to generation but can be acquired during fetal life or soon after delivery. The latter abnormalities usually are structural; the inherited defects may be structural or appear later in life as the consequence of a systemic metabolic defect present from conception. Mention has already been made of the most important of these: congenital dysplasia of the hip. The joint proper may be normal initially in this and in several other congenital disorders; only after other supporting tissues have altered the proper relationships does the contour of the bone and joint become distorted. In arthrogryposis multiplex congenita ("multiple congenital crooked joints"), many joints are deformed at birth, particularly the hip. The deformities are the consequence of weakness of muscles that, in turn, sometimes results from spinal cord disease. Clubfoot (talipes equinovarus) is a congenital deformity of the foot, which is twisted downward and inward because the ligaments and tendons are too short. Only infrequently are the muscles at fault as they are in arthrogryposis. Idiopathic scoliosis (lateral curvature of the spine) usually makes its appearance during early adolescence. Its ultimate cause is unknown. There is considerable plasticity of the tissues with latitude for correction of these various deformities and for preventing their progression as the child grows. For this reason, the application of splints and other mechanical supports as soon as the condition is recognized is the major part of their management. Surgery is resorted to in certain cases when other measures have proved unsuccessful.

Structural variations in the lumbosacral spine are common and often are harmless. Incompletely ossified interarticular portions of the neural arches of a vertebra constitute a congenital anomaly referred to as spondylolysis; it predisposes to forward slipping of the vertebra later in life and so to the congenital type of spondylolisthesis described above. By contrast, when the failure of bony fusion exists between the right and left halves of the neural arch, the condition is called spina bifida occulta. This is a very common incidental X-ray finding and does not favour development of condition., that cause backache.

Gout, pseudogout, and ochronotic arthropathy

Several genetically influenced metabolic diseases have important articular manifestations. Gout is the most frequent of these. It occurs in approximately three of every thousand persons in the United States and western Europe. Chalklike masses of sodium acid urate crystals are deposited in and about the joints. Acute episodes of gouty arthritis are among the most painful conditions known. There is a tendency toward involvement of the great toe, a condition known as podagra (see also METABOLISM, DISEASES OF).

Ochronotic arthropathy results from another but rarer inborn error of metabolism. It is characterized pathologically by pigmentation and degeneration of hyaline cartilage, which covers the articular surfaces of bones, and biochemically by defective breakdown of the amino acids tyrosine and phenylalanine. The normal breakdown of these products is arrested at an intermediate level, and large amounts of homogentisic acid accumulate in body fluids and the urine. The urine turns black when exposed to air, a phenomenon called alkaptonuria. After many years the cartilages also become blackened, and severe degenerative changes occur in the peripheral joints and in the spine.

In yet another metabolic disease, chondrocalcinosis, or pseudogout, crystals of calcium pyrophosphate are deposited in joint cartilages. There are several forms of the disease. Sometimes there are no symptoms. In other cases, symptoms are sufficiently severe to cause confusion with rheumatoid arthritis. Some cases run in families. Unlike the situation in gout, specific methods for treating ochronosis and chondrocalcinosis have not yet been devised.

Other inherited disorders

Joints also are affected by several relatively rare heritable defects in the metabolism of connective tissue matrices. Depending on the specific biochemical defect, these disorders may be widespread throughout the body or limited to a few structures. There also is much variation in their inheritance. In Hurler's syndrome, for example, the most important manifestations are mental retardation and heart failure, though skeletal growth also is abnormal. Most affected persons do not survive adolescence. Morquio-Brailsford disease, by contrast, is a recessively inherited form of severe dwarfism that is not associated with mental deficiency or cardiac insufficiency. X-ray films of the spine reveal a characteristic misshapen flattened appearance of the vertebral bodies. Premature and severe degenerative changes in the peripheral and spinal joints are usual. Polyepiphyseal dysplasias (abnormal development of a number of epiphyses—the ends or outlying portions of bone, in childhood separated from the main body of the bone by cartilage) are a vaguely similar, though much milder, group of conditions in which precocious osteoarthritis and spondylosis are the first abnormalities to appear. Pre-existing changes in the skeleton, resembling a milder form of Morquio-Brailsford disease, may then be discovered by X-ray examination. The hip joint is most severely affected. In some cases the inheritance is dominant, in others recessive. Abnormalities in the fibrous components of connective tissue matrices are exemplified by Marfan's syndrome. Many organs are affected in this condition, and the articular manifestations are relatively unimportant among these. The joints are, however, excessively loose, and painful complications develop in about half of these patients. Hypermobility of joints also occurs in many other circumstances.

SECONDARY JOINT DISEASES

Nutritional diseases. The principal nutritional deficiencies that affect joints are scurvy and rickets. In both conditions, the principal location of the skeletal abnormality is at some distance from the joint proper, but the latter is sometimes misshapen as well. In addition, hemorrhage into the joint space is an intrinsic part of joint defects associated with scurvy.

Hemorrhagic **joint** diseases. Hemarthrosis (bleeding into the joints) is a major complication of hemorrhagic disorders. It constitutes, aside from the life-threatening episodes of bleeding, the principal disability arising from the hemophilias.

Most persons with these clotting defects are affected, and usually within the first years of life. Bleeding into the joints is usually precipitated by relatively minor injury but may leave several residual deformities and loss of mobility of the part. Hemarthrosis sometimes is a feature of the bleeding tendency associated with acute injury from radiation but is not ordinarily present in thrombocytopenic purpura; that is, bleeding associated with a shortage of blood platelets. Recurrent hemorrhage into an isolated joint, in the absence of a systemic tendency to bleed, is a characteristic of pigmented villonodular synovitis, a disease characterized by abnormal thickening and coloration of the synovial membrane. The precise source of the bleeding here is not known, and one theory is that a hidden benign tumour or malformation of the blood vessels in the joint is at fault. This is not a primary inflammatory disease of joints, despite the name, the thickening of the synovial tissue being a response to the hemorrhagic exudation. Large joints, usually of the lower extremity, are affected. This condition occurs in adults. It usually responds well to excision of part of the synovial membrane.

Joint involvement in aseptic necrosis

Aseptic necrosis. Because joint cartilages are without blood vessels, they are more immune to failures in the blood supply than are the underlying bones. Nevertheless. several clinically important joint diseases arise in association with aseptic necrosis—tissue death not caused by infection—of bone next to the joints. The precise nature of the failure of the blood supply is not always known. Fractures are one obvious cause. In caisson disease the obstructive elements are minute gas bubbles formed in the circulating blood from excessively rapid decompression. Decompression syndromes occur principally in divers and "sandhogs" (tunnel workers). Acute cases take the form of "bends" and frequently are fatal. However, in a large proportion of workers in these occupations, even if they have not experienced bends, extensive infarcts (areas of dead tissue) of bones and secondary osteoarthritis develop after many years. Analogous changes in sickle-cell anemias presumably result from blood clotting related to the abnormality of the red blood cells. There is no entirely persuasive explanation for other types of aseptic necrosis that occur in adults. In each instance, the hip is the joint most affected. Osteochondritis dissecans is a basically similar disorder in which a piece of joint cartilage and of underlying bone breaks off and lodges in the joint cavity. Usually the person affected can remember having injured the joint. The knee is the most frequent site. The condition usually occurs during the second and third decades of life. The displaced fragment causes a creaking sound when the joint is moved and is therefore called a "joint mouse." It must be removed by surgery.

Two different patterns of aseptic necrosis with joint involvement occur in growing children. One type (so-called slipped epiphysis) is characterized by partial or complete tearing away of an epiphysis, usually as the result of injury. The epiphysis at the upper end of the thighbone is particularly susceptible. Osgood-Schlatter disease is an analogous lesion, but it affects a growth centre (anterior tibial tubercle) at a slight distance from the joint rather than in its immediate vicinity. In the second type of aseptic necrosis in children, the necrosis is not the consequence of mechanical tearing away of the part. The most frequent site is in the head of the thighbone; necrosis at this site is known as Legg-Calvè-Perthes disease. It occurs in youngsters between the ages of 3 and 13 and is much more frequent in boys than in girls. Persistent pain is the most prominent symptom. Uncorrected severe lesions lead to arrest of growth, deformity, and arthritic changes in the hip joint. Treatment is directed first toward protection of the part from injury, together with rest and immobilization. In severe cases, detached fragments from the joint are removed by surgery. Other epiphyses, including those of the spine, may be affected.

Endocrine factors. The only joint lesion clearly related to a malfunctioning of the ductless (endocrine) glands is acromegaly. This disease results from excessive secretion of growth hormone by a tumour of the anterior pituitary gland. The hormone stimulates the proliferation of several skeletal soft tissues including the joint cartilage of the peripheral joints. It is this that causes the enlargement of the fingers that is characteristic of the disease. The enlarged joints are particularly prone to undergo osteoarthritic degeneration. Other hormonally influenced joint diseases are less clearly established. Cretinism, which is related to hypothyroidism, causes dwarfism and abnormally developed bony epiphyses but apparently does not lead to joint disease. Severe diabetes mellitus, however, may result in joint disease arising from the effect of diabetes on the nervous system.

Enlarged joints in acromegaly

Neurogenic arthropathy. A Charcot joint is a severe degenerative disease that develops when the sensory mechanisms of joints are impaired. The current view is that these joints become excessively strained because the ability to receive stimuli from bodily structures and organs necessary for normal limitation of motion is lacking. As a result the supporting tissues are torn and extreme disintegration of the structure results. Neurogenic arthropathy (joint disease related to nerve lesions) is most often associated with tabes dorsalis, a late form of syphilis affecting the posterior columns of the spinal cord. Other neurological lesions, including those associated with diabetes mellitus, syringomyelia (a disease in which cavities develop in the gray substance of the spinal cord), pernicious anemia, and leprosy, also are sometimes responsible. The disease usually is localized to one joint or one group of joints, depending on the location of the nerve defect. In tabes the knee joint is the most frequent site, in diabetes the foot, in syringomyelia the upper extremity. Pain is frequently mild considering the massive distortion of the joint. Treatment is difficult and is based primarily on immobilization and restriction of weight-bearing. Surgical fusion of the joints succeeds in only a small number of persons.

Hypertrophic osteoarthropathy. In approximately 5 to 10 percent of persons who have primary tumours within the chest, the ends of the bones near the joints become enlarged and painful. New bone is formed in the periosteum (the thick membrane covering the bone except within joints) and only occasionally do abnormalities develop within the joints themselves. Just how the chest abnormality leads to hypertrophic osteoarthropathy (disease of bones and joints with abnormal growth of bone) is somewhat of a mystery, but there is reason to believe that the vagus nerve is involved, since the condition is usually relieved promptly by cutting the vagus. It is also relieved by removal of the tumour. In this disorder the tips of the fingers become club-shaped, a painless lesion that was known to Hippocrates and that occurs in many other circumstances, as well.

Shoulder–hand syndrome. The shoulder–hand syndrome, so called because pain in the shoulder is associated with pain, swelling, and stiffness of the hand, only rarely develops in the wake of external injury. Most often it follows a heart attack (myocardial infarction) or is associated with disease in the neck vertebrae; frequently there is no apparent explanation. Most often the syndrome begins with pain and stiffness of a shoulder, followed shortly by pain and swelling of the hand, with vascular (blood vessel) changes in the skin of the hand. Over the course of several months the swelling and vascular changes subside but the skin and soft tissues become tightened. These changes sometimes disappear completely, but in other cases they leave permanent contractures; *i.e.*, flexion and loss of mobility due to the tightening of the fingers. Loss of mineral occurs in the bones of the shoulder, wrist, and fingers. Blocking (interruption of functioning) of sympathetic nerves serving the area, administration of adrenal hormones (corticosteroids), and therapeutic exercises are used in the management of the condition.

Tumours of joints. Tumours of joints are uncommon. In synovial chondromatosis, a benign condition, numerous cartilaginous nodules form in the soft tissues of the joint. The lesion is usually confined to one joint, particularly the knee, and occurs in young or middle-aged adults. It may or may not cause pain or swelling and usually is cured by excision of a portion of the synovial membrane. The tumour rarely becomes malignant. The cartilaginous nodules sometimes also contain islands of bone; in this circumstance the lesion is called synovial osteochondromatosis. Like synovial chondromatosis, synovial osteochondromatosis is often a spontaneous or primary disorder of unknown cause. In many cases, however, it is a development secondary to other diseases of the synovium, such as rheumatoid arthritis and even osteoarthritis.

Synoviomas, malignant tumours of the joints, arise in the tissues around the joints—the capsule, the tendon sheaths, the bursas, the fasciae, and the intermuscular septa or divisions—and only rarely within the joint proper. Although they may occur at any age, they are most frequent in adolescents and young adults. The legs are more often involved than the arms. The tumours spread locally and also to regional lymph nodes and lungs. Synoviomas are not particularly sensitive to X-rays, and treatment with drugs has been ineffective. If distant spread has not occurred at the time the condition is identified, radical excision, usually with amputation of the part, is the recommended treatment.

SPECIAL DIAGNOSTIC PROCEDURES

Four diagnostic procedures are widely employed in the diagnosis of joint diseases and injuries: X-ray examination, serologic tests, analysis of synovial fluid, and biopsy of synovial tissue.

Four diagnostic procedures

In X-ray films the soft tissues of joints are not ordinarily visible, although the bones are. Disappearance of articular cartilage is therefore manifested by a narrowing of the "roentgenographic joint space"; *i.e.*, the gap between the apposed subchondral bone surfaces, the bone surfaces beneath the cartilage. Only infrequently is the true joint cavity made visible by the injection of air, a procedure called pneumoarthrography. In myelography a contrast medium is injected into the spinal canal to disclose a protruding intervertebral disk or other soft tissue mass. The radiopacity of bone is reduced when bone is involved in fractures or in inflammatory processes. Osteophytes (bony outgrowths) protrude from the margins of the joints in osteoarthritis and spondylosis; they are likely to involve the periosteum in inflammatory diseases. Eburnation, degeneration of bone into a hard, ivory-like substance, appears as a zone of increased density at the joint surface. Calcification is often described about joints in X-ray reports, but with few exceptions the mineral is actually part of new bone formation rather than deposits of calcium salt in other tissues.

Analysis of synovial fluid is a safe and frequently helpful diagnostic procedure. The fluid is drawn from the joint easily with a needle after local anesthesia. Its viscosity typically is reduced in inflammatory diseases, and the number of white blood cells is increased. In infectious and acute inflammations of the joints, polymorphonuclear leukocytes (white blood cells with nuclei of varying shapes) predominate; in chronic rheumatoid arthritis, lymphocytes (white blood cells formed in lymph nodes and other lymph tissue) and mononuclear cells (large white blood cells with one nucleus each). The so-called ragocyte or rheumatoid arthritis cell now is regarded as having no diagnostic specificity. Microscopic examination of the fluid with plane-polarized light is of great value in finding crystals of gout and chondrocalcinosis.

Synovial biopsy is useful occasionally in differentiating rheumatoid from gouty or infectious arthritis. Micro-organisms are sometimes seen in the tissues, but they are more readily found if the specimen is cultured. In general, infectious agents disappear from synovial fluid before they do from the synovial tissue. For this reason, it is preferable to culture the latter rather than the former.

The serologic tests for rheumatoid factors are described above.

HISTORICAL AND GENERAL CONSIDERATIONS

Joint disease in antiquity

Most of what is known about disease in prehistoric periods necessarily concerns the skeletal system because the latter, unlike the soft tissues, is preserved through fossilization. Degenerative joint disease has been recorded in fossil reptiles as far back as the Mesozoic Era, and its frequency can perhaps be gauged by the fact that vertebral ankylosis is present in 6 of 11 extant specimens of the giant sauropod dinosaur ***Dipodocus longus.*** Spondylosis has been found in several neanderthaloids and probably accounts for previously held views that primitive man had a semi-erect posture. Changes consistent with rheumatoid arthritis have been found in Egyptian mummies and of ankylosing spondylitis in Pre-Columbian Indians.

Descriptions of dislocations of joints and directions for their treatment were included in the Hippocratic writings. All forms of chronic arthritis were regarded as manifestations of gout from that era until relatively recent times. Drinking of natural mineral waters was prescribed and carefully regulated by the ancient Greeks, and the Romans built baths for these disorders throughout their empire. Although there were some earlier attempts to discriminate between gout and other arthritic conditions, the recognition of rheumatism by Guillaume de Baillou of Paris in 1591 is an historic landmark. Arthritis as a sequel to gonorrhea was described by William Musgrave of Exeter in 1703 and confirmed by John Hunter 83 years later. Musgrave also associated "white swelling" of the joints with scrofula long before the tubercle bacillus was discovered (1882). The turn of the 19th century witnessed a great clarification of these disorders as the classical theory of humoral pathology went into oblivion. Rheumatic fever emerged as a systemic disease affecting the heart as well as the joints with the publication of a book by J.-B. Bouillaud in 1836. The definitive separation of gout from other rheumatic diseases came with the identification of its relation to disordered urate metabolism by Sir Alfred Garrod in 1859. Surprisingly, rheumatoid arthritis and osteoarthritis were confused with each other by the father of cellular pathology, Rudolf Virchow (1869), and a clear delineation of the two was made only in the early years of the 20th century.

Diseases of the joints fall into two major provinces of medicine: orthopedics and rheumatology. There is some overlap between the two, but by and large they correspond to surgery and internal medicine, respectively. Accordingly, injuries to joints and surgical management of arthritic diseases are tended to by orthopedists, while other aspects of joint disease are handled by rheumatologists. There are professional and governmental agencies for these problems in most developed countries. The International League Against Rheumatism was founded in 1928. The World Health Organization has an expert committee on rheumatic diseases. In the United States, unlike certain other countries, rheumatology is not a certified specialty; but the American Rheumatism Association has some 1,800 physician members who devote their practices exclusively or primarily to these disorders. The Public Health Service conducts and supports research through its National Institute of Arthritis and Metabolic Diseases. At present there are more than a dozen medical journals in the world dealing only with arthritis and rheumatism, but they are able to publish only a fraction of the extensive relevant literature (see also JOINT).

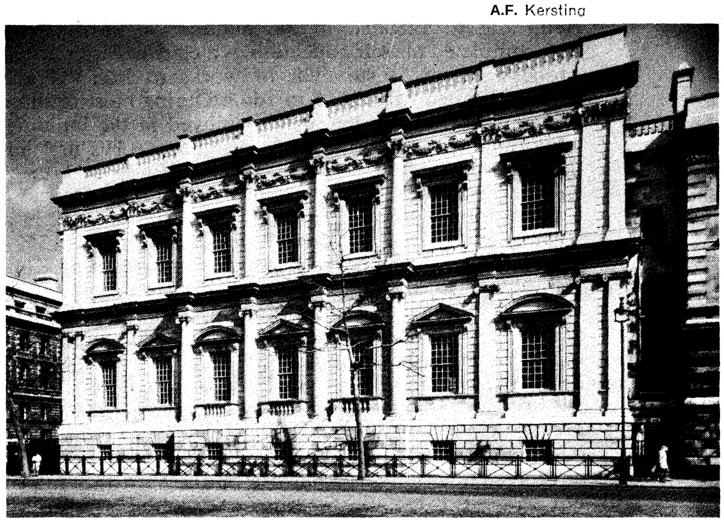
Jones, Inigo

Inigo Jones, surveyor of works to James I and Charles I of England, was the designer of court masques and architect of royal buildings during their reigns. Founder of the English classical school of architecture, he exerted a wide influence in his own time and found even greater acceptance in the 18th century. He set his mark on London by designing the first of its civic squares.



A.F. Kersting

The Banqueting House, Whitehall, London, by Inigo Jones, 1619–22.

Baptized on July 19, 1573, in the church of St. Bartholomew the Less, Smithfield, London, Jones was the son of a clothworker also called Inigo. Of the architect's early life little is recorded, but he was probably apprenticed to a joiner. By 1603 he had visited Italy long enough to acquire skill in painting and design and to attract the patronage of Christian IV of Denmark, at whose court he was employed for a time before returning to England. There, he is next heard of as a "picture maker" (easel painter). Christian IV's sister, Anne, was the queen of James I of England, a fact that may have led to Jones's employment by her in 1605 to design the scenes and costumes of a masque, the first of a long series he designed for her and later for the king. These masques had their origin in the intermezzi, scenographic and musical episodes, which had developed at the Medici Court in Florence and with which Jones was evidently familiar. The words were often supplied by Ben Jonson; the scenes, costumes, and effects nearly always by Jones. Over 450 drawings by him, representing work on 25 masques, a pastoral, and two plays ranging in date between 1605 and 1641, survive at Chatsworth House, Derbyshire.

Works for the Earl of Salisbury

From 1605 till 1610 Jones probably regarded himself as primarily under the Queen's protection, but he was patronized also by the Earl of Salisbury, for whom he produced his earliest known architectural work, a design for the New Exchange in the Strand (c. 1608; demolished in the 18th century). Though a somewhat immature design, the work was more sophisticated than anything being done in England at the time. Some designs (later superseded) for the restoration and improvement of old St. Paul's Cathedral also date from this period, and in 1610 Jones was given an appointment that confirmed the direction of his future career. He became surveyor of works to the heir to the throne, Henry, prince of Wales.

This appointment, with all its promise, was short-lived, and Jones did little or nothing for the Prince before the latter's death in 1612. In 1613, however, he was compensated by the guarantee of still higher office on the death of the King's surveyor of works, Simon Basil. To this office Jones succeeded in 1615, in the meantime having taken the opportunity offered him by Thomas Howard, 2nd earl of Arundel, to revisit Italy. Arundel and his party, including Jones, left England in April 1613 to escort Elizabeth, the daughter of James I, and her newly married husband, the elector palatine Frederick V, to their home at Heidelberg. They then proceeded to Italy, spending the winter of 1613–14 in Rome. In the course of the visit Jones had ample opportunity to study the works by modern masters as well as antique ruins. Of the masters, the one to whom he attached the greatest importance was Andrea Palladio (1508–80), the Italian architect who had gained wide influence through his Quattro *libri* dell' architettura, which Jones took with him on his tour. Returning to England in the autumn of 1614, Jones had completed his self-education as a classical architect.

Jones's career as surveyor of works to James I and Charles I lasted from 1615 to 1642. During most of those 29 years he was continuously employed in the building, rebuilding, or improvement of royal houses. His first important undertaking was the Queen's House at Greenwich, near London, based to some extent on the Poggio a Caiano, the Medici villa near Florence, but detailed in a style closer to Palladio or Vincenzo Scamozzi (1552–1616). Work there was suspended on the death of King James's queen in 1619 and only completed in 1635 for Charles's queen, Henrietta Maria. The building, considerably altered, now houses the National Maritime Museum. In 1619 the Banqueting House at Whitehall was destroyed by fire; and between that year and 1622, Jones replaced it with what has always been regarded as his greatest achievement. The Banqueting House consists of one great chamber, raised on a vaulted basement. It is conceived internally as a basilica on the Vitruvian model but without aisles, the superimposed columns being set against the walls, which support a flat, beamed ceiling. For the main panels of this ceiling allegorical paintings by Rubens were commissioned by Charles I and set in place in 1635. The exterior echoes the arrangement of the interior, with pilasters and regular columns set against rusticated walling.

Banqueting House at Whitehall

The Banqueting House has only two complete facades. The ends were never completed and this has given rise to the supposition that the building was intended to form part of a larger whole. This may have been so, and it is certain that Charles I, nearly 20 years after the Banqueting House was built, instructed Jones to prepare designs for rebuilding the whole of Whitehall Palace. These designs exist (at Worcester College, Oxford, and at Chatsworth House) and are among Jones's most interesting creations. They owe something to the Escorial Palace near Madrid, Spain, but are worked out in terms deriving partly from Palladio and Scamozzi and partly from Jones's own studies of the antique.

Apart from the Queen's House at Greenwich and the Banqueting House at Whitehall, the only one of Jones's royal buildings to survive is the Queen's Chapel at St. James's Palace (1623–27), a single-cell building with a magnificent coffered ceiling. Of Jones's many decorative works and minor additions to the royal palaces nothing remains.

Jones's work was not confined to royal palaces. He was much involved in the regulation of new buildings in London and out of this work emerged the project that he planned in 1630 for the 4th Earl of Bedford on his land at Covent Garden. This comprised a large open space bounded on the north and east by arcaded houses, on the south by the Earl of Bedford's garden wall, and on the west by a church with flanking gateways connecting to two single houses. The design probably derives partly from the piazza at Leghorn, Italy, and partly from the Place Royale (now des Vosges) at Paris. None of the original houses survive, but the church of St. Paul still stands, though much altered. Its portico is an instance, unique in Europe at its date, of the use of the primitive 'Tuscan order.

Covent Garden

With Covent Garden, Jones introduced formal town planning to London—it is the first London "square." He was probably instrumental, from 1638, in creating another square by planning the layout of the houses in Lincoln's Inn Fields, one of the houses (Lindsey House, still existing at No. 59 and 60, Lincoln's Inn Fields) being attributed to him.

The most important undertaking of Jones's later years in office was the restoration of St. Paul's Cathedral in 1634–42. This included not only the repair of the 14th-century choir but the entire recasing, in rusticated masonry, of the Romanesque nave and transepts and the building of a new west front with a portico (56 feet [17 metres] high) of ten columns. This portico, among Jones's most ambitious and subtly calculated works, tragically vanished with the rebuilding of the cathedral after the great fire of 1666. Jones's work at St. Paul's, however, considerably influenced Sir Christopher Wren and is reflected in some of his city churches as well as in his early designs for rebuilding the cathedral.

At the outbreak of the Civil War in 1642, Inigo Jones was compelled to relinquish his office as surveyor of works and left London. He was captured at the siege of Basing House in 1645. His estate was temporarily confiscated, and he was heavily fined. In the following year, however, his pardon was confirmed by the House of Lords and his estate restored. In the year of Charles I's execution, 1649, he was doing work at Wilton for the Earl of Pembroke, but the great double-cube room there is probably mostly due to his pupil John Webb, whom he had trained as his successor and who survived to re-establish something of the Jones tradition after the restoration of 1660. Jones died in London on June 21, 1652. He was buried with his parents in the Church of St. Benet, Paul's Wharf, where a monument, for which he had provided in his will, was erected, only to be destroyed in the great fire of 1666.

Of Jones's personal life little is known beyond what is told in the adulatory writings of John Webb and the slanderous satires of Ben Jonson, with whom he quarrelled. He was certainly an able administrator; he was also vain and dictatorial and wholly identified with the absolutism of his royal masters. His architecture stands out in high relief against the traditional English building work of his time and bears comparison with contemporary achievements in France and Italy, from which it is in some important respects markedly independent. His legacy to his successors was immense, eventually providing the main incentive for the "Palladian" movement that, beginning around 1715, dominated English architecture for 40 years.

BIBLIOGRAPHY. J. WEBB, ***The Most Notable Antiquity of Great Britain, Vulgarly Called Stone-Heng . . .*** (1655), based on notes by INIGO JONES, includes almost the only early biographical material available. Further biographical notes are contained in Webb's ***Vindication of Stone-Heng Restored . . .*** (1665; 2nd ed., 1725); P. SIMPSON and C.F. BELL, ***Designs by Inigo Jones in Masques and Plays at Court*** (1924, reprinted 1966), an illustrated catalog; J.A. GOTCH, ***Inigo Jones*** (1928, reprinted 1968), an adequate biographical summary but critically inadequate; and J.N. SUMMERSON, ***Inigo Jones*** (1964).

(J.Sum.)

Jonson, Ben

Eight years the junior of William Shakespeare, Ben Jonson occupies by common, though not universal, consent the second place among English dramatists of the reigns of Elizabeth I and James I. He was a man of contraries. For "twelve years a papist" (as he admitted to the Scottish poet William Drummond of Hawthornden), he was also—in fact though not in title—Protestant England's first poet laureate. His major comedies express a strong distaste for the world in which he lived and a delight in exposing its follies and vices; yet, in his masques written as diversions for the court, he could compliment King James as the ideal king and present his realms as constituting the perfect human society. A gifted lyric poet, he wrote two of his most successful plays (Epicoene and *Bartholomew* Fair) entirely in prose, an unusual mode of composition in his time. He could rebuke Shakespeare for his extravagance yet also write verses acclaiming his great rival as the equal of the dramatists of classical antiquity. Often an angry and stubborn man, no one had more disciples than he. Much the most learned dramatist of his time, he attended no university, and—though his learning permeates his writings—he was master of theatrical plot, language, and characterization. It is a measure of his reputation that his dramatic works were the first to be published in folio (the term refers to the size of page but effectively means the "collected works") and that his plays held their place on the stage until the period of the Restoration, whose dramatists he influenced. Later his plays fell into neglect, though The *Alchemist* was revived during the 18th century, and in the last 40 years or so several have come back into favour: *Volpone, The Alchemist*, and *Bartholomew Fair* especially have been staged with striking success. Jonson, indeed, belongs, securely and brilliantly, to this age as much as to his own.

Theatrical career. Jonson was born, probably on June 11, 1572, in or near London, two months after his father had died. His stepfather was a bricklayer, but by good fortune the boy was able to attend Westminster School (and later acknowledged a debt to his honoured master there, the antiquary William Camden, by dedicating two plays to him). His formal education, however, ended early, and he at first followed his stepfather's trade, then fought with some success in the Netherlands. On returning to England he became an actor and playwright, experiencing the life of a strolling player. There is reason for believing that at this time he acted the leading role of Hieronimo in Thomas Kyd's *The Spanish Tragedie;* in 1602 he was paid for making "additions" to it, and yet later he made fun of this early revenge drama. In a duel he killed a fellow actor, and, though he escaped capital punishment by pleading "benefit of clergy" (the ability to read from the Latin Bible), he could not escape branding. This, however, possibly through the help of friends, was done with a cold iron. At this time he was writing plays for Philip Henslowe, the leading impresario for the public theatre. With one exception *(The Cave is Altered)*, these early plays are known, if at all, only by their titles. He apparently wrote tragedies as well as comedies in these years, but his extant writings include only two tragedies, the brilliant *Sejanus* (1603) and the more stolid *Catiline* (1611).

Early
plays for
the public
theatre

The year 1598 marked an abrupt change in Jonson's status, when *Every Man In his Humour* was successfully presented by the Lord Chamberlain's theatrical company (a legend has it that Shakespeare himself recommended it to them), and his reputation was established. In this play Jonson tried to bring the spirit and manner of Latin comedy to the English popular stage by presenting the story of a young man with an eye for a girl, who has difficulty with a phlegmatic father, is dependent on a clever servant, and who is ultimately successful—in fact, the standard plot of the Latin dramatist Plautus. But at the same time he sought to embody in four of the main characters the four "humours" of medieval and Renaissance medicine, which were thought to determine the physical and mental makeup of human beings. These "humours" were choler, melancholy, phlegm, and blood. Following this success, the same company acted Jonson's *Every Man Out of his Humour* a year later. This was even more ambitious than its predecessor: it was the longest play ever written for the Elizabethan public theatre; it strove to provide an equivalent of the Greek comedy of Aristophanes, although most of the audience knew little of that playwright; and "induction," or "prelude," and regular between-act comment made plain the author's views on what the drama should be. (It was also a seminal play for Jonson and contained in germ most of the comic ideas that were later to be fully realized in his masterpieces.)

Plays for
the
"private"
theatres

The play, however, proved a disaster, and Jonson had to look elsewhere for a theatre to present his work. The obvious place was the "private" theatres, in which only young boys acted. The high price of admission they charged meant a select audience, and they were willing to try strong satire and formal experiment; for them Jonson wrote *Cynthia's Revels (c.* 1600) and *Poetaster* (1601). Even in these, however, there is the paradox of contempt for human behaviour hand in hand with a longing for human order. The great majority of the characters are presented for the audience's disapproval, but the goddess Cynthia finally rebukes them and indicates that men must do as she requires. This links up with Jonson's praise of the monarch's position in his masque. *Cynthia's Revels* ends when the goddess rebukes those characters who have exhibited divergent and eccentric "humours" throughout the play, demanding their reformation and their contribution to a celestial harmony. Yet it is an ending that neither Jonson nor his spokesman in the play, Crites, could properly believe in.

Unlike Shakespeare, Jonson was not a member of an acting company during his years as an important dramatist, and the fluctuations of adherence already noted continued throughout his career. Of his major plays, *Sejanus, Volpone,* and *The Alchemist* were acted by the King's Men (as the Lord Chamberlain's Company had become known on James I's accession). *Eastward Hoe,* written in collaboration with George Chapman and John Marston, and *Epicoene* were acted by the children and *Bartholomew Fair* by the Lady Elizabeth's Company. The plays of the last years—which contained much shrewd satire and authoritative writing but won little applause—were uniformly done by the King's Men, who were by that time increasingly associated with the Blackfriars Theatre, a private playhouse taken over from the children.

His masques at court. It appears that Jonson had won royal attention by his *Entertainment at Althorpe,* given before James I's queen as she journeyed down from Scotland in 1603, and in 1605 *The Masque of Blackness* was presented at court. The "masque" was a quasi-dramatic entertainment, an elaborate game of pretense in which everyone present was imagined as taking part. With its roots in medieval pageantry, especially the tournament, it slowly became recognizable during the 16th century as an independent form. The locale was a royal court or noble house. A monarch or some other emblem of human authority presided over an entertainment given for his guests and attendants; a "presenter" then entered and announced the arrival of a group of strangers who begged admission; assent being given, the strangers entered, disguised, and offered their homage; they performed their "masquing dance" in honour of the presiding figure; finally came the "revels," when the masquera danced with members of the assembled company.

This elementary pattern was much elaborated during the reign of James I, when the architect Inigo Jones provided increasingly magnificent costumes and scenic effects for masques at court. The few spoken words that the masque had demanded in Elizabethan days expanded into a "text" of a few hundred lines and a number of set songs. Thus the author became important as well as the designer: he was to provide not only the necessary words but also a special "allegorical" meaning underlying the whole entertainment. It was Jonson, in collaboration with Jones, who gave the Jacobean masque its characteristic shape and style.

Jonson's
innovations
in *The
Masque of
Blackness*

He did this primarily by introducing the suggestion of a "dramatic" action. In *The Masque of Blackness* the "presenters," Oceanus and Niger, announce the arrival of certain daughters of Niger (James's queen herself played one of them), whose beauty had been turned black by the fierceness of the sun in their own country, Ethiopia. Wishing for a lighter complexion, they have been told to travel to a land whose name ends with "-tania." They anxiously ask the name of the land they have now reached and are at first told it is "Albion." This, however, is soon corrected to "Britannia" (a tribute to James's sovereignty over both England and Scotland), and they are informed that here they will receive their hearts' desire. So there is occasion for song and dance. The degree of elaborate presentation, and also the length of time taken up by the entertainment, was far greater than a perusal of the text might suggest. The concluding "revels" could last throughout the night, and, indeed, a final song often suggests that morning is at hand. Thus, although the poet could be regarded as a mere auxiliary, it was he who provided the informing idea and dictated the fashion of the whole night's assembly. *The Masque of Blackness* was clearly a success, for during the following years Jonson was repeatedly called upon to function as poet at court. In his plays he had never been content to repeat himself, and, even if two plays share a governing idea (as in *Every Man In his Humour* and *Every Man Out of his Humour; Volpone* and *The Alchemist),* the mode of presentation is widely different. Similarly, in his masques he was fertile in inventing new motives for the arrival of the strangers. But this was not enough: he also invented the "antimasque" (sometimes "antemasque"), which preceded the masque proper and which figured grotesques or comics who, while they might dance and sing, were primarily actors (the "masquers" were played by ladies and gentlemen of the household; accomplished dancers and musicians, they could not necessarily act). A structural contrast developed between antimasque and masque. A hint of this appears as early as *Hymenaei* (1606), performed to celebrate the marriage of the Earl of Essex and Lady Frances Howard; the four "humours" appear in an attempt to disrupt the ceremony but are expelled by "reason" so that the masquers (in this case, gods favourable to marriage, with attendants) could enter for the celebration. But here the device is embryonic, and the antimasquers do not speak: that was soon to come, and from one antimasque there came to be several—though Jonson, though he must have loved the opportunity it gave him for expressing the duality of viewpoint that was so strong within him, generally managed to keep the device in its place.

Rivalry with Inigo Jones

Important though Jonson was at the court in Whitehall, it was undoubtedly Inigo Jones's contributions that caused most stir. That tension should arise between the two men was inevitable. As early as 1614 Jonson was surely making fun of Jones in *Bartholomew Fair* through his characterization of the puppet master, Lantern Leatherhead, although some scholars are doubtful of this interpretation of the role. Eventually friction led to a complete break: Jonson wrote the Twelfth Night masque for the court in 1625 but then had to wait five years before the court again asked for his services; in 1631 he wrote the poem "An Expostulation with Inigo Jones" and was ready to declare his contempt for the view that "Painting and carpentry are the soul of the masque." But the new king (Charles I) and his court preferred the display to the text. As an additional grievance, Jones was a permanent court employee, whereas Jonson was merely called in as an auxiliary. Even so, he was eventually recalled in 1631, and in noble houses away from Whitehall his services still proved welcome, even where the King himself was a guest.

His prime and later life. Troubles, meantime, had been numerous. After his tragedy *Sejanus*, he was in 1603 called before the privy council—doubtless because the fall of the Roman statesman Sejanus brought the downfall of the Earl of Essex to men's minds. His fun at the Scots' expense in *Eastward Hoe* in 1605 also led to trouble, but even so—although a "papist"—he was confidentially employed by the privy council in an attempt to make contact with a Catholic priest who might, they hoped, provide information about the attempted regicide (the Gunpowder Plot) of that year. In 1606 Jonson and his wife (whom he had married in 1594) were brought before the consistory court in London to explain their absence from church. He denied that his wife was guilty but admitted that his own opinions held him aloof from attendance. The matter was patched up through his agreement to have conference with learned men, who might persuade him if they could. Apparently it took six years for him to decide to conform. For some time before this he and his wife had lived apart, Jonson taking refuge in turn with his patrons Sir Robert Townshend and Esmé Stuart, Lord Aubigny.

During this period, nevertheless, he made a mark second only to Shakespeare's in the public theatre. *Volpone* and *The Alchemist* were among the most popular and esteemed plays of the time. Each exhibited man's folly in his pursuit of gold. Set respectively in Italy and London, they demonstrate Jonson's enthusiasm both for the typical Renaissance setting and for his own town on Europe's fringe. Both plays are eloquent and compact, sharp-tongued and controlled.

Other episodes reveal man's intransigence and vulnerability. In 1612 Sir Walter Raleigh, a prisoner in the Tower of London (but frequently visited by famous people), made Jonson his son's tutor for a visit to the Continent. The young man was difficult, and, soon after their return to England, Jonson may have mirrored their relationship in his depiction of Humphrey Wasp and Bartholomew Cokes in *Bartholomew Fair.* During this visit Jonson was present at a disputation between a Catholic and a Protestant in Paris, and he met Cardinal Duperron, assuring him that his translations from Virgil were "naught." The poet William Drummond, quoting Jonson's words on this matter in a record of the conversations he had with him in 1619, remarked that Jonson knew no French.

Conversations with Drummond

The occasion of Jonson's conversations with Drummond was a walking tour that Jonson made in 1618–19, which took him to Edinburgh and places nearby. From Drummond's report comes Jonson's view "that Shakespeare wanted art" and that "Donne was the first poet in the World, for some things" but " . . . for not keeping of accent, deserved hanging" and "for not being understood, would perish." During the visit the city of Edinburgh made him an honorary burgess and guild brother, giving a special banquet in his honour. On his return to England he received an honorary master of arts degree from Oxford University, a most signal honour in his time. He had already told Drummond that "He was Master of Arts in both the Universities by their favour not his study"; so by then he must have known of his proposed induction to the Oxford degree. No record survives of Cambridge's recognition. A letter of 1621 suggests that he narrowly escaped being knighted by James I, an honour that would have proved costly.

In 1623 his personal library was destroyed by fire (remembered in the poem "An Execration upon Vulcan"). As already noted, his services were seldom called on for the entertainment of Charles I's court, and his last plays failed to please. In 1628 he suffered what was apparently a stroke and, as a result, was confined to his room and chair, ultimately to his bed. His indignation at the failure of a play, *The Newe Inne*, in 1629 led him to write "Ode to Himself," beginning "Come, leave the loathed stage, And the more loathsome age." When he published the play in 1631, he described it as "never acted, but most negligently play'd, by some, the King's Servants. And more squeamishly beheld and censured by others, the King's subjects." In 1632 John Pory wrote to Sir Thomas Puckering that he "thought Ben Jonson had been dead."

He lived still. In 1628 he had been made city chronologer (thus theoretically responsible for the city's pageants, especially the lord mayor's show) in succession to Thomas Middleton, who had died in 1627. Middleton, a distinguished dramatist, had done the city proud: there was restiveness because Jonson did nothing to earn his salary. As so often with Jonson, the quarrel was patched up: in 1634 his salary was declared to be a pension.

Meanwhile he had other gratification, other anguish. He told Drummond that his wife "was a shrew yet honest." His admission on this occasion that he was "given to venery" suggests a reason for his long separation from her. They lived apart for five years, but several children came of the marriage, and there are poignant epitaphs from their father on the baby Mary and the seven-year-old Benjamin, who died of the plague. Thus his family responsibilities should be borne in mind when considering his generally successful career: he complained to

Drummond that poetry "had beggared him, where he might have been a rich lawyer, physician or merchant." That he always needed money may partly—but probably only partly—xplain his willingness to flatter James at court. When writing "The Prologue to the King's Majesty," which preceded *Bartholomew Fair,* he could address James as an equal, as a man who—like the playwrights and actors whose theatres were constantly under attack—had had much to put up with from the Puritans.

Patronage of James I

Certainly James was ready to help him: in 1621 Jonson had received a royal pension of 100 marks and soon afterward was given the reversion to the mastership of the revels. A further sign of honour, in 1624, was his inclusion in a list of 84 "able and famous laymen" proposed as members of the British Royal Academy. Perhaps the most interesting of all these honours is indicated in a legal document of 1623: there Jonson declared that his current residence was Gresham College. That was a town house of Sir Thomas Gresham, the famous founder of the Royal Exchange, where learning of a high order was invited. Possibly Jonson was acting as deputy to Henry Croke, who had been appointed as professor of rhetoric four years earlier. It was in this year, as already noted, that Jonson's library was destroyed; so he may have merely found a temporary refuge as a lodger in Gresham College.

His life was a life of talk as well as of writing. He engaged in "wit-combats" with Shakespeare, and, first at the Mermaid Tavern and then at the Devil Tavern, Jonson reigned supreme. It was a young man's ultimate honour to be regarded as a "son of Ben." The most prominent of his "sons" among the Caroline dramatists was Richard Brome, whose spirited comedies show how much he learned from his master: he had apparently been some sort of a "servant" to Jonson, perhaps as secretary, perhaps more menially. Others, more genteel, also flocked around him.

Jonson died on August 6, 1637. He was buried in Westminster Abbey, and on his gravestone there is an inscription "O rare Ben Jonson." It has been suggested that the first two words should be joined to make the Latin word *Orare*, the whole reading "Pray for Ben Jonson"—perhaps as a surreptitious tribute to Jonson's former Catholicism. The following year appeared *Jonsonus Virbius,* a collection of elegies written in his honour.

The first folio edition of his works had appeared in 1616; posthumously, in a second Jonson folio (1640), appeared *Timber: or, Discoveries,* a series of observations on life and letters. It was also called *Sylva* before its epigraph and *Explorata* in the title before the text. Here Jonson held forth on the nature of poetry and drama and noted his various debts to reading; here, too, he paid what was probably his final tribute to Shakespeare, in which, despite acknowledging a belief that his great contemporary was, on occasion, "full of wind"—*sufflaminandus erat*—he declared that "I loved the man, and do honour his memory, on this side idolatry, as much as any." Another prose work that also first appeared in this folio was *The English Grammar.* If it is true that for a time Jonson acted as professor of rhetoric at Gresham College, both this and the *Discoveries* may have been written with lectures in mind.

Importance in* English *drama. Jonson exerted a great influence on the playwrights who immediately followed him. In the late Jacobean and Caroline years, it was he, Shakespeare, and Beaumont and Fletcher who provided all the models. But it was he, and he alone, who gave the essential impulse to dramatic characterization in comedy of the Restoration and also in the 18th and 19th centuries. The Restoration dramatists' use of type names for their characters (Cockwood, Witwoud, Petulant, Pinchwife, Wishfort, Marwood, and the like) was a harking back to Jonson. So, too, was it in the 18th century, with such characters as Macheath, Peachum, Lumpkin, Candour, Languish. And although, as the 18th century proceeded, comic dramatists increasingly used names quite arbitrarily, the idea of the Jonsonian "type" or "humour" was always at the root of their imagining. In 19th-century comedy and melodrama type names were still employed, especially for minor characters; again the idea of the "type" was basic. In the mid-19th century, Dion Boucicault's brilliant pastiches of Restoration comedy (tempered to please the popular stage of his own day) continued the line from Jonson. In today's drama, though the type name is not so popular, the type itself remains.

Use of comic types

But Jonson did not deal exclusively in "humours." In some of the plays (notably *Every Man In his Humour)* the stock types of Latin comedy contributed as much as the humours theory did. What the theory provided for him and for his contemporaries was a convenient mode of distinguishing among human beings when such an elementary distinction was of use, as today the terms "introvert" and "extrovert" or "schizoid" and "cyclothymic" or "cerebrotonic" and "viscerotonic" may be conveniently employed. Jonson and his major contemporaries had primarily and ultimately to do with the diversity of human nature, its general surprisingness and shockingness as well as its recurrent shapes. He could also recognize the possibility of simple goodness on occasion, or at least wish for it (as in the contribution of Celia and Bonario to *Volpone),* but he found it atypical. For the rest, it was convenient to have a starting point—in the "humours," in Latin comic types, or, as in *Volpone,* in the assimilation of human beings to different members of the animal kingdom. Volpone, Mosca, Sir Epicure Mammon, Face, Subtle, Dol Common, Overdo, Ursula are not simply "humours": they are glorious type figures, so vitally rendered as to take on a being that transcends the type. Because his method was one of simplification, of typification (yet simultaneously of vitalization), his characters cannot be imagined as existing in any circumstances other than those of the play. This is not always true of Shakespeare's characters, but even in his case the exceptions are rare. The theatre encloses for the most part. In Jonson's plays it does so totally.

Jonson's influence has not been great outside the realm of comedy. His two extant tragedies, *Sejanus* and *Catiline,* belong with many other attempts in his time to bring Elizabethan and Jacobean theatre closer to that of the ancients. *Sejanus* is magnificent, but neither it nor the later tragedy was acceptable to his age. His masques belonged to and largely constituted a form that was essentially of the Jacobean and Caroline years, and attempts to revive it after the Restoration were tired things: even Jonson must sometimes have found the exercise strenuous, much as he surely wanted to celebrate the established order. In later days the atmosphere was too much filled with an awareness that real power lay elsewhere. Modern revivals of the masques have only an "archaeological" interest; modern imitations can be only a sad pastiche. As a lyric poet, however, Jonson has provided a model by no means forgotten by poets. His directness became less influential than the involuted manner of 17th-century Metaphysical poets such as John Donne, but poets and critics through the ages have honoured him.

Continental reputation

On the continent of Europe his position was for long obscure. Stefan Zweig adapted *Volpone* in 1927, and this version (in many ways a softened one) was translated into French and in that language made into a film. In general, as with so many of Shakespeare's contemporaries and successors, the European continent—even Germany, which is accustomed to speak of *unser* ("our") Shakespeare—has been slow to grapple with him. So, in some ways, has North America. Increasingly university and professional theatres have realized that his plays and those of other outstanding dramatists of his time are stage-worthy; but the theatre seems at the moment in advance of the classroom, which will surely come to confirm him as a living dramatist.

MAJOR WORKS

Every Man In his Humour (1598); *Every Man Out of his Humour* (1599); *Sejanus* (1603); *The Masque of Blackness* (1605); *Eastward Hoe* (1605); *Volpone* (1606); *Epicoene* (1609); *The Alchemist* (1610); *Bartholomew Fair* (1614); *The Metamorphos'd Gypsies* (1621); *The Newe Inne, or The light Heart* (1629); *Timber; or, Discoveries* (1640).

BIBLIOGRAPHY. For bibliographies of Jonson, see S.A. TANNENBAUM, *Ben Jonson: A Concise Bibliography* (1938; *Supplement by* S.A. and D.R. TANNENBAUM, 1947); and G.E. BENTLEY, *The Jacobean and Caroline Stage*, vol. 4, pp. 604–606 (1956). Extant contemporary manuscripts (not holograph) are listed in ALFRED HARBAGE, *Annals of English Drama*, 975–1700, rev. by SAMUEL SCHOENBAUM, pp. 311–312 (1964). STEVEN L. BATES and SIDNEY D. ORR (comps.), *A Concordance to the Poems of Ben Jonson* (1978), is keyed to Herford and Simpson's standard edition.

Editions: The major collected edition of his works is C.H. HERFORD and PERCY and EVELYN SIMPSON (eds.), *Ben Jonson*, 11 vol. (1925–52). E.A. HORSMAN (ed.), *Bartholomew Fair* (1960); and F.H. MARES (ed.), *The Alchemist* (1967), have been published in the Revels Plays. The "Yale Ben Jonson" edition includes: *Volpone*, ed. by ALVIN B. KERNAN (1962); *Bartholomew Fair*, ed. by EUGENE M. WAITH (1963); *Sejanus*, ed. by JONAS A BARISH (1965); *The Complete Masques*, ed. by STEPHEN OROEL (1969); *Every Man in His Humor*, ed. by GABRIELE BERNHARD JACKSON (1969); *Epicoene*, ed. by EDWARD PARTRIDGE (1971); and *The Alchemist*, ed. by ALVIN B. KERNAN (1974).

Biography: Biography has been best handled in Herford and Simpson's edition, vol. 1 (1925), vol. 11 (1952); and in MARCHETTE CHUTE, *Ben Jonson of Westminster* (1953). A useful brief account may be found in F.H. MARE'S edition of *The Alchemist* (cited above). G.E. BENTLEY, *Shakespeare and Jonson: Their Reputations in the Seventeenth Century Compared* (1945), is indispensable for Jonson's reputation. PERCY SIMPSON and C.F. BELL (eds.), *Designs by Inigo Jones for Masques and Plays at Court* (1924), fully indicates Jones's contribution to the performance of Jonson's masques at Whitehall.

Criticism: Critical writings of major importance include L.C. KNIGHTS, *Drama and Society in the Age of Jonson* (1937); E.B. PARTRIDGE, *The Broken Compass: A Study of the Major Comedies of Ben Jonson* (1958, reprinted 1976); and JONAS A. BARISH, *Ben Jonson and the Language of Prose Comedy* (1960). On the masques, see especially STEPHEN ORGEL, *The Jonsonian Masque* (1965); and JOHN C. MEAGHER, *Method and Meaning in Jonson's Masques* (1966). For the stage history of the plays, see R.G. NOYES, *Ben Jonson on the English Stage*, 1660–1776 (1935). *A Celebration of Ben Jonson*, ed. by WILLIAM BLISSETT, JULIAN PATRICK, and R.W. VAN FOSSEN (1973), is a collection of papers given at a conference commemorating the 400th anniversary of Jonson's birth.

(Cl.L.)

Jordan

The Hashemite Kingdom of Jordan (al-Mamlakah al-Urdunniyah al-Hāshimīyah), an Arab state of Southwest Asia, is a young nation that occupies an ancient land associated with the civilizations of antiquity. Situated on both banks of the Jordan River, it is bounded to the north by Syria, to the east by Iraq, to the southeast and south by Saudi Arabia, and to the west by Israel. The western border divides Jerusalem. Jordan has 12 miles (19 kilometres) of coastline on the Gulf of Aqaba in the southwest, where al-'Aqabah, its only port, is located. The total area is 36,833 square miles (95,396 square kilometres), and the population in the 1979 census was 3,044,000. Jordan's capital is Amman.

Since the Arab–Israeli War of June 1967, Israel has occupied the territory west of the Jordan River, known as the West Bank, including the Jordanian sector of Jerusalem. The occupied area is about 2,270 square miles, 6 percent of Jordan's territory and one-half of its agricultural land. About one-third of Jordan's de jure population lives in the West Bank.

Formation of the modern nation

As an international entity, Jordan came into being after World War I, gaining its independence from the United Kingdom as a hereditary constitutional monarchy in 1946. King Hussein ibn Talal ascended the throne in 1953; he has attempted to maintain Jordan's traditional policy of friendship with the West despite strong local and international pressures. Although Jordan has meagre natural resources, its most pressing problems are political. The intellectual and ideological divisions and frustrations that pervade the Arab world are reflected within Jordan—all the more so because the country has provided a haven for thousands of Arab refugees who fled from their homes as a result of the Arab–Israeli wars.

An economically developing country, Jordan throughout its existence has had to depend upon outside aid. This came first from the United Kingdom, later from the United States, and then—since 1967—from other Western and Arab countries, including Saudi Arabia, Kuwait, and the United Arab Emirates. Between 1954 and 1967, despite population pressures, a paucity of natural resources, and an influx of refugees, Jordan's gross natural product nearly quadrupled. To sustain this progress, Jordan adopted a seven-year plan in 1964, envisaging a self-sufficient economy by 1972. The 1967 Six-Day War with Israel, however, and the resulting influx of still more refugees, temporarily halted some of the measures included in the plan, overstrained the economy, which was already in difficulty, and increased Jordan's dependence on outside aid. Since then Jordan has carried out a three-year plan (1973–75) and a five-year plan (1976–80) and in 1981 introduced its second five-year plan. The object of these plans has been the revitalization of Jordan's economy, lessening its need for outside aid, and promoting general economic and social development. (For coverage of associated physical features, see ARABIAN DESERT; DEAD SEA; GALILEE, SEA OF; and JORDAN RIVER; for historical aspects, see JERICHO; NEAR EAST, ANCIENT; and SYRIA AND PALESTINE, HISTORY OF.)

The* landscape.** ***Relief and drainage. There are four major physiographic regions in Jordan: the Jordan desert, the East Bank uplands, the West Bank uplands, and the Jordan rift valley (a branch of the great African rift-valley system).

The desert is located in the eastern part of the country, occupying about four-fifths of the territory of the East Bank. Its northern part is composed of volcanic lava and basalt, and its southern part of outcrops of sandstone and granite. It is much eroded, primarily by wind. The East Bank uplands, an escarpment overlooking the rift valley, has an average altitude of between 2,000 and 3,000 feet (600 and 900 metres); the elevation increases to about 5,750 feet in the south. There are outcrops of sandstone, chalk, limestone, and flint extending to the extreme south, where igneous rocks solidified from the molten state predominate. In the northern uplands several valleys and perennial streams run west; around al-Karak they run west, east, and north; south of al-Karak nonperennial valley streams run east toward the Jafr Depression.

The Jordan Valley

The Jordan Valley, approximately 1,315 feet below sea level at the Dead Sea, contains the lowest point on the Earth's surface. Meandering south, the Jordan River drains the waters of the Sea of Galilee (Lake Tiberias), the Yarmūk, and the valley streams of both plateaus into the Dead Sea. The soil of its lower reaches is strongly saline, with the shores of the Dead Sea consisting of salt marshes that do not support vegetation. The Dead Sea occupies the central area of the valley. To its south, Wadi al-'Arabah, a completely desolate region, is thought to contain mineral resources.

The West Bank uplands, historically known as the Samarian and Judean mountains, are a complex anticlinal structure (*i.e.*, declining in opposite directions from a central axis) with an average height of about 3,000 feet above sea level. This plateau is cut into by some large valleys draining toward the Mediterranean; the valleys draining east are shorter and are precipitous, often consisting of deep gorges. Though the soils are generally thin and often poor, there are some rich alluvial plains among the hills and in certain basins. On these plains limestone, sandstone, and chalky rocks prevail.

Climate. The climate varies from the Mediterranean type in the west to the desert type in the east, but the land is generally arid. The proximity of the Mediterranean Sea is the major climatic influence, although this influence is modified by continental air masses and by altitude. Mean monthly temperatures for Jericho (825 feet below sea level) range between 61° and 90° F (16° and 32° C), while at Amman (2,362 feet above sea level) they range from 44° to 87° F (7" to 31° C). The prevailing wind throughout the country is westerly to southwesterly. In the north the wind is generally more humid. Rainfall occurs in the short, cool winters, decreasing from 16 inches (400 millimetres) in the north to four inches in the south. The average rainfall in the east and west uplands totals about 16 inches annually. The valley itself has a yearly average of eight inches. The desert regions receive less than two inches. Occasional snow and frost occur in the uplands but are rare in the rift valley.

Vegetation and animal life. The plant and animal life of Jordan falls into three distinct types: that associated with the Mediterranean, with the steppe (treeless plains), and with the desert. In the uplands the Mediterranean type predominates. In the drier steppe region sagebrush predominates. Grassland is prevalent there, and some trees and shrubs, such as lotus fruit and the Mt. Atlas pistachio, also occur. In the desert scant vegetation grows in depressions and on the sides and floors of the valleys.

There is a great variety of animal life, including wild boars, as well as the ibex, a species of wild goat found in the gorges and in the 'Ayn al-Azraq oasis. Hares, jackals, foxes, wildcats, hyenas, wolves, gazelles, mole rats, mongooses, and a few panthers also occur. Among the domesticated animals, horses, mules, donkeys, camels, cattle, sheep, and goats are most common. Centipedes, scorpions, and various types of lizards are also found. Birds include the golden eagle and the vulture, while wild fowl include the pigeon and the partridge.

The nomads

The landscape under human settlement. The landscape falls into two regions—the desert zone and the cultivated zone—each of which is associated with its own mode of living. The nomads (Bedouins, or Badu) generally inhabit the desert and some areas of the steppe and the uplands. The number of nomads—only about 20,000 by the early 1980s—has decreased dramatically because of successful government efforts at resettlement. The eastern Bedouins are principally camel breeders and herders, while the western Bedouins are sheep and goat herders, There are some seminomads, in whose existence the modes of life of the desert and the cultivated zones merge. These people adopt a nomadic existence, living in tents only in the winter months after they have planted their lands, upon which some have also built modest homes; they return to their homes again in the spring or at harvest time. The two largest nomadic tribes of Jordan are Banū Sakhr and al-Ḥuwayṭāt. The grazing grounds of both are entirely within Jordan, as is the case with the smaller tribe of as-Sirhān. Other, lesser tribes, include Banū Hasan, al-Banū Khalid, al-Ajarmeh, al-Adwan, Banū Attiyeh, al-Hajayah, and as-Sleet, as well as the smaller tribes of al-Hawazim, as-Sulaylat, and ash-Sherarat who are obliged to pay protection money to larger tribes. The Rwalah tribe,

which is not indigenous, passes through Jordan in its yearly wandering from Syria to Saudi Arabia.

There are some 1,000 villages on the East Bank and 800 on the West Bank. Including nomads, rural residents represent about 40 percent of the population. The average village is a cluster of houses and other buildings, including an elementary school and a mosque, with pasturage on the outskirts. A medical dispensary and a post office may be found in the larger villages, together with a general store and a small cafe, whose owners are usually part-time farmers. Bedouin influence is strongest in the East Bank villages because of the interaction between villages and tribes characteristic of this region. Kinship relationships are patriarchal, while extended-family ties govern social relationships and tribal organization. Increases in the literacy rate and the influence of the mass media, in addition to extensive migration from rural to urban areas, have had a marked influence in recent years.

Of the total population of 3,044,000, about 60 percent live in the dozen or so major cities and towns. Amman alone has a population of about 650,000, but the smaller towns have only a few thousand inhabitants. Most towns have hospitals, banks, government and private schools, mosques, churches, libraries, and entertainment facilities, and some have institutions of higher learning and newspapers. Amman and Jerusalem, and to some extent Irbid, have urban characteristics, while smaller towns are more reluctant to accept modernizing influences.

Languages and dialects

People and population. *Ethnic and religious groups.* The Jordanian Constitution states that all Jordanians are equal. The majority of the people are Arabic-speaking, In addition to the difference between the written, or classic, Arabic and the colloquial form, there are various dialects with local inflections and accents. The Qaysi–Yemeni dichotomy—a pre-Islamic split that was introduced to the area with the Arab conquests and that cut across religious and ecological lines—was at one time an important broad social division. The Arabs, whether Muslim or Christian, used to trace their ancestry from the north Arabian Qaysi (Ma'di, Nizārī, Adnani, or Ismāʿīlī) tribes or from the south Arabian Yemeni (Banū Kalb or Qahtani) tribes. Only a few tribes and towns have continued to be aware of the split, but Bethlehem considers itself Yemeni.

According to the 1979 census 93 percent of the people are Sunni Muslim, and 5 percent are Christian. Among Christians adherents of the Rum, or Greek Orthodox Church, form a majority. Other Christian groups include the Rum, or Greek, Catholics, also called the Melkites or Eastern Catholics, who recognize the supremacy of the pope; the Roman Catholic community, headed by a patriarch appointed by the pope; the Assyrian (East Syrian), or Nestorian, Church, whose members number about 1,000 and live mostly in Jerusalem and Bethlehem; and the small Syrian Orthodox, or Jacobite, Church, whose members, like the Nestorians, use Syriac in their liturgy. Most non-Arab Christians are Armenians; the majority belong to the Gregorian, or Armenian, Orthodox Church, the rest to the Armenian Catholic Church. There are several Protestant denominations representing relatively recently formed communities whose converts came almost entirely from other Christian sects.

As-Samarah, the Samaritans, are remnants of an ancient Jewish sect; they number about 200 in Jordan and reside in Nābulus, at the foot of Mt. Shekim. The Druze, an offshoot of the Ismāʿīlī Shi'ah sect, also number about 200 and reside in and around Amman. The Baha'i—who in the 19th century also split off from Shi'ah Islām and who number about 1,000—live in al-Adasiyah in the Jordan Valley. The Armenians, Nestorians, Samaritans, Druze, and Baha'i are at once religious and ethnic communities. The Shishan (Chechen) are a Cherkess (Circassian) Sunni Muslim group, numbering about 1,000, who are descended from 19th-century immigrants. With the Cherkess, also Sunni, they make up the most important non-Arab minority. Another small non-Arab group consists of some Turkmen, who inhabit the village of Rammūn near Jarash.

Demography. Within the cultivated area of Jordan, the population density is 670 per square mile. In 1979, more than half of the population in the East Bank was under the age of 15; life expectancy at birth was 58 years. The birth and death rates were 46 and 12 per 1,000 respectively, giving a natural rate of increase of 3.4 percent. Internal migration from rural to urban centres has added an additional burden to the economy. In 1961 only 60,000 Jordanians were living abroad, but by 1979 the number was estimated to be 500,000 or more.

Jordan, Area and Population

*Area figures are for settled areas only. Of the two total area figures, the first is the land area, the second the total area.
†Preliminary. $Including Palestinian refugees numbering 682,000 in the East Bank and 310,000 in the West Bank.
Source: Official government figures.

The refugees

The influx of refugees has not only altered Jordan's demographic map but also affected its political, social, and economic life. Numbering close to 700,000 in 1966, their ranks were swelled by 350,000 as a result of the 1967 war. By the 1980s refugees numbered about 680,000 in the East Bank, including many who have established Jordanian citizenship, and 310,000 in the West Bank. In 1955 there were 24 large refugee camps; since 1967 more have been added. In some of the camps the inhabitants live in huts or tents. The refugees cannot be classified as either rural, urban, or nomadic: they are displaced persons, whose situation and present status result from the interplay of regional and international forces. Most insist on their right to return to their homes, thus resisting any efforts at permanent resettlement. The condition of some of the refugees is wretched; they suffer from overcrowding and poor sanitary facilities. Some of the camps have neither electricity nor running water, which t causes extreme hardship to the inhabitants, especially in winter. Unemployment adds to the frustration and bitterness of the refugees. They are supported by the United Nations Relief and Works Agency for Palestine Refugees in the Near East, which provides dole at a subsistence level. UNRWA is also primarily responsible for their health, education, and welfare. All of the refugees have been granted full Jordanian citizenship and have refugee status only for relief purposes.

The national economy. Despite its basic problems, the Jordanian economy before 1967 showed resilience and growth. The Seven-Year Plan of 1964 looked toward economic self-sufficiency. Economic growth, which was halted by war in the second half of 1967, continued thereafter at a slower pace but was revitalized by the 1972–75 three-year plan and the 1976–80 five-year plan; real growth in the gross national product (GNP) was 7 and 10 percent, respectively, during these two periods. The GNP increased 20-fold from the mid-1950s to 1980. The West Bank's contribution to domestic income in 1965 was 38 percent of the total, but its occupation by Israel in 1967 required that the government apply its social and economic plans to the East Bank only.

Sources of revenue

By 1980 the major sources of revenue were tourism, mining and industry, trade, communications and transportation, agriculture, and construction. Income from tourism, which has grown dramatically, is mostly in foreign reserves, and tourism has become a major factor in Jordan's efforts to reduce its balance of payments deficit.

Exports, though growing. never cover the value of imports; the deficit is financed by foreign grants, loans, and other forms of capital transfers. Although Jordan's trade deficit has grown, it is offset somewhat by earnings from tourism, remittances sent by Jordanians working abroad, earnings from foreign investments made by the Jordan Central Bank, and subsidies from Arab and other governments.

In the past there has been a great outflow of skilled labour from Jordan to neighbouring countries, but the problem eased somewhat in the early 1980s. This reversal was a result both of better employment opportunities within Jordan itself and of a curb on foreign labour by the neighbouring Persian Gulf states.

Biological resources. There are only about 1,200,000 *dunums* (one *dunum* equals one-fourth of an acre) of forest, most of which are on the rocky highlands of the East Bank. Although unprotected, these forests have survived the depredations of villagers and nomads alike, as well as constant overgrazing. The Jordanian government embarked on a reforestation program in 1948. In the higher regions of the uplands, the predominant types of trees are the Aleppo oak, the Kermes oak, the Palestinian pistachio, the Aleppo pine, and the Oriental strawberry tree. Wild olives are also found there, and the Phoenicia Juniper occurs in the regions with lower rainfall.

Pastureland is so degraded that it can hardly support Jordan's livestock; it has, moreover, been reduced on the East Bank by the extension of land devoted to olive and fruit trees. Artesian wells have been dug to increase the pasturage area. Sheep and goats are by far the most important livestock, but there are some cattle, camels, horses, donkeys, and mules. Livestock decreases when droughts occur. There is fishing in the Gulf of Aqaba.

Mineral resources. Mineral resources include large deposits of phosphates, potash, and cement, as well as iron, phosphorus, manganese, and copper. In addition, newly discovered minerals include barite (the principal ore of the metallic element barium), quartzite, gypsum (used as a fertilizer), and feldspar. Marbles of various colours and limestone also are quarried.

All power in Jordan is generated by fossil fuel, mostly oil. There are several generating plants; the two major power stations, at Amman and az-Zarqāʾ, are linked by a transmission system. By the early 1980s the government had nearly completed a program to link the major cities by a country-wide grid, which later is to include rural areas.

Management of the economy. The economy is primarily based on private enterprise. To reduce its dependence on outside assistance, raise the standard of living, and reduce the imbalance between imports and exports, the government, in 1964, began the process of planning the economy. All of the government plans have given a high priority to agriculture, mining and industry, tourism, and the service industries, in addition to the strengthening and widening of the social, health, welfare, and education infrastructure. Unemployment, estimated at between 12 and 14 percent of the employable male population in 1961, had been virtually eliminated by 1980. Per capita income increased sixfold between 1963 and 1980.

Aside from a licensing system, a moderate taxation on luxury items, and the establishment of standards and health measures, both internal and international trade are virtually free of restraint. Governmental support takes the form of ensuring the basic framework of internal security, guaranteeing a stable currency, and maintaining the transport and communication routes and other facilities required for economic progress. The government also has participated with private enterprise in establishing the largest mining, industrial, and tourist firms in the country. By 1980 the government's share of the 32 largest companies was about 30 percent.

Taxation

Fiscal policy has aimed at increasing revenue by raising various tax rates and by reforming the tax system. Measures applied since 1964 include increases in customs and excise duties and an increase in income taxes, Although the government has placed great effort on reforming the income tax, both to increase revenue and to redistribute income, revenue from indirect taxes continues to exceed that from direct taxes. Tax measures have been adopted to increase the rate of savings necessary for financing investments. Exemptions on foreign investments and transfers of foreign profits and capital have been continued.

The existence of labour unions and employer organizations is recognized by law. The weakness of the trade-union movement is partly compensated for by the government, which has special procedures for settling labour disputes; if governmental efforts fail, the union or employers may resort to the judicial process.

Economic growth depends to a large extent on the return of the West Bank, where most of the sites attractive to the tourist trade are located and where a large proportion of the economically active population lives. The small size of the Jordanian market, the fluctuations in agricultural production because of irregular rainfall, lack of capital, political instability, and the presence of refugees all combine to make the continuation of outside help a necessity. Because of its basic weaknesses, the economy is highly sensitive both to domestic and to international policy.

The road system

Transportation. By 1980 the East Bank had a main, secondary, and rural road network about 4,300 miles long; of this about 3,100 miles are hard-surfaced. This roadway system, maintained by the Ministry of Public Works, links the major cities and towns and also links the kingdom with neighbouring countries. Within cities, towns, and villages, however, the local authorities are responsible for road upkeep, One of the main traffic arteries is the Amman–Jarash–ar-RamthB highway, which links Jordan with Syria to the north. The route from Amman via Maʿān to the port of al-'Aqabah is the principal route to the sea. From Maʿān the Desert Highway passes through al-Mudawwarah, linking Jordan with Saudi Arabia. The Amman–Jerusalem highway, passing through Nāʿūr, is a major tourist artery. The Hejaz Railway is government operated and extends from Darʿā in the north via Amman to Maʿān in the south. By the early 1980s part of an extension of this line, to Medina in Saudi Arabia, was being completed. Air transport developed into a major activity in the late 1960s. The Royal Jordanian Airline, Alia, operates flights linking Jordan to Arab, African, Asian, American, and European countries. Jordan's major airports, at Amman, al-'Aqabah, and Jerusalem—the latter Israeli-occupied—also receive international carriers. Queen Alia international airport near al-Jizah, south of Amman, was completed in 1982, eventually to replace the older airport at Amman.

Before 1948 Jordan's Mediterranean Sea trade was through Haifa. The Arab–Israeli conflicts severed that link, and Jordan's outlet since has been Beirut, in Lebanon. The expansion of the Jordanian economy, especially the export of phosphate, led to the development of the port of al-'Aqabah, which was handling about 6,200,000 tons of goods by 1980.

Administration and social conditions. The 1952 constitution is the most recent of a series of legislative instruments that, both before and after independence, moved toward increased executive responsibility. The constitution declares Jordan to be a constitutional hereditary monarchy with representative government; Islam is the religion of the state, and Jordan is declared to be part of the Arab *ummah* ("nation"). The king wields wide powers over the executive, legislative, and judicial branches. Jordan's central government is headed by a prime minister appointed by the king; the prime minister then chooses his cabinet. According to the constitution, the appointments of both prime minister and cabinet are subject to parliamentary approval. The cabinet coordinates the work of the different departments and establishes general policy.

Under the constitution the membership of the upper house of the bicameral legislature, composed of *al-A'yan* ("notables"), is appointed by the king for four years. Elections for *nuwwāb* ("deputies") of the lower house are to be held at least every four years. Since 1969, however, no parliamentary elections have been held; the ninth parliament, elected in 1965. was prorogued several times before being replaced in 1978 by the National Consultative Council, an appointed body with reduced power that debates government programs and activities.

Persons 18 years of age and over may vote provided they meet the legal requirements and are not members of the royal family. Voting participation has varied and has run as high as 70 percent, as it did in the 1962 elections. Political parties have been banned since 1957, however. Before that date several parties—Communist, Arab Ba'ath Socialist, National Socialist, Muslim Brotherhood, Liberation Movement, Arab Constitutional, Nahda (Renaissance), and Ummah (Community)—ran candidates. None of them, however, had a mass following. The Muslim Brotherhood was the only party exempted from the 1957 ban, but the group is kept under close surveillance.

Jordan is divided into eight administrative *muḥāfaẓāt* (governorates), which in turn are divided into districts and subdistricts, each of which is headed by an official appointed by the minister of the interior. Cities and towns have mayors and elected councils. In the West Bank the town and village municipal councils are mostly still in operation, but are under the careful scrutiny of the Israeli occupation authorities.

Three categories of courts

The judiciary. The judiciary is constitutionally independent, though judges are appointed and dismissed by royal *irddah* ("decree") following a decision of the Justices Council. There are three categories of courts. The first category consists of regular courts, including magistrates courts, courts of first instance, and courts of appeals and cassation in Amman, which hear appeals passed on from lower appeals courts. The constitution also provides for the Diwān Khāṣṣ (Special Council), which interprets the laws and passes on their constitutionality. The second category consists of Shari'ah Muslim courts and other religious courts for non-Muslims; these exercise jurisdiction over matters of personal status. The third category consists of special courts, such as land, government, property, municipal, tax, and customs courts.

The armed forces. The Jordan Army is a trained force of about 75,000. The small air force, equipped with modern jet aircraft, developed from the Arab Legion, which was originally commanded by British officers. Jordan also has a small navy. The king is commander in chief of the armed forces.

Education. There are three types of schools in Jordan—government schools, private and missionary schools, and the UNRWA schools for refugee children. Schooling consists of six years of elementary, three years of preparatory, and three years of secondary education. The Ministry of Education supervises all schools and establishes the curricula, teachers' qualifications, and state examinations; it also distributes free books to students in government schools and enforces compulsory education to the age of 14. Almost 70 percent of the students attend government schools. In addition to Khadduri Agricultural Training Institute, there are agricultural secondary schools, as well as a number of vocational, labour, and social affairs institutes, a Shari'ah (Qur'ānic) seminary, and nursing, military, and teachers' colleges. The State University of Jordan, established in Amman in 1962, had approximately 12,000 students by 1980; Yarmūk University, established in 1976, had 6,000 students. A third university, Mu'tah, opened in 1981.

Health and welfare services. Infectious diseases, except for dysentery and eye infections, have been brought under control. The number of doctors has grown rapidly, and by 1980 there was one doctor per 1,000 people. Comprehensive health facilities are operated by the government. A national health insurance program covers medical, dental, and eye care at a modest cost; service is provided free to the indigent. There are hospitals at Amman, as-Zarqā', Irbid, al-Karak, as-Salf, aṭ-Ṭafīlah, Janin, Jerusalem, and al-'Aqabah.

Traditionally, welfare services were private until the Ministry of Social Affairs was established in 1951. Besides supervising and coordinating some 400 social and charitable organizations, the ministry administers welfare programs.

Housing. The housing situation has remained critical despite the continuing house-building boom. A survey of Amman conducted in 1960 indicated that half of the city's families were living in one-room dwellings. The 1961 survey of the East Jordan Valley showed that three-quarters of the households consisted of single-room dwellings. The 1979 census estimated that 16,000 units were needed annually. The Housing Corporation and the Jordan Valley Authority build units for low-income families. Urban renewal projects in Amman and az-Zarqā' have provided new units and renovated others. The Housing Bank issues home building loans.

Wages and cost of living. Wages are higher in industry than in agriculture and in the cities than elsewhere. There are minimum wages for both skilled and unskilled labourers. The development of local services and resources, the availability of hard currencies from foreign aid, and a competitive import policy have given Jordan a degree of price stability not often encountered among developing nations.

Cultural life and institutions. Culturally, Jordan is an integral part of the Arab world and thus cannot be said to have a separate and distinct culture of its own. As in the rest of the Arab world, the highest form of artistic expression remains oral. Jordan's most famous poet was Muṣṭafā Wahbah aṭ-Ṭāl, whose style and content rank him among the major Arab poets of the 20th century. After World War II a number of important poets and prose writers emerged, though few have achieved an international reputation.

Since 1966 both private and governmental efforts have been made to foster the arts, and an art gallery has been opened. Modernity has lessened the influence of the traditional Islamic injunction against the portrayal of animate objects. Thus, in addition to the traditional decorative design, architecture, and the various handicrafts, it is possible to find sophisticated forms of painting and sculpture.

Folk and popular arts

Folk art survives in tapestry work and in the making of leather, pottery, and ceramics, as well as in the manufacturing of wool and goat-hair rugs with varicoloured stripes. Popular culture is manifested in such oral arts as songs, ballads, and storytelling. The villagers have special songs for births, circumcisions, weddings, funerals, planting, plowing, and harvesting. Several types of *debkah* (dances characterized by the pounding of feet on the floor to mark the rhythm) are danced on festive occasions, while the *sahjeh* is a well-known Bedouin dance. The Circassian minority have a sword dance, as well as several other Cossack dances. Government interest in preserving folk arts has resulted in the formation of a national troupe; it is regularly featured on state radio and television programs.

The press is relatively free, and the government only intervenes if flagrant abuse occurs. There are several literary magazines and scientific and topical periodicals. Among major newspapers the most prominent are *ar-Ra'i* and *al-Dustūr*. Most professional groups and government departments issue their own periodicals. Radio and television stations, which are government owned, feature programs from both Arab and foreign, mostly Western, countries. Most major towns have movie theatres that offer both Arab and foreign films. There is no legitimate theatre in Jordan, but amateur groups perform in institutions of learning, on radio and television, and in the various foreign cultural centres in Amman, Irbid, and Jerusalem.

Jordan River

The Jordan River (Nahr al-Urdunn), which flows southward from Syria across Israel and into Jordan, is the lowest river in the world. It rises on the southeastern slopes of Mt. Hermon in Syria (other headstreams rise in Lebanon), flows through a deep trench flanked by high plateaus, and—having crossed the Ḫula Basin and traversed the Sea of Galilee—drains into the Dead Sea at a depth of 1,315 feet (400 metres) below sea level. The Jordan is more than 223 miles (360 kilometres) in length, although, because its course is meandering, the actual distance between its source and the Dead Sea is less than 124 miles.

The river's role as a boundary

The Jordan has often served as an international boundary and, since 1948, has marked the frontier between Israel to the west and Jordan to the east from a few miles south of the Sea of Galilee until the Ytibis River flows into it from the left bank. Since 1967, however, when Israeli forces occupied the Jordanian territory on the west bank of the river south of its confluence with the Yābis, the Jordan has served as the cease-fire line as far as the Dead Sea.

The river was called the Aulon by the Greeks and ha-Yarden by the Hebrews, and it is sometimes called ash-Shari'ah (Watering Place) by the Arabs. Christians, Jews, and Muslims alike revere the Jordan; it was in its waters that Jesus was baptized by St. John the Baptist (for associated physical features, see DEAD SEA; GALILEE, SEA OF).

The natural environment. ***Physiography of the river valley.*** What is generally called the Jordan Valley is, in effect, a rift valley running north and south, forming part of the gigantic rift-valley system that extends from southern Turkey southward via the Red Sea and into East Africa. The valley itself is a long and narrow trough averaging about six miles in width but becoming narrower in some places—for example, at each end of the Sea of Galilee—and wider in others, such as the Bet She'an region, where the Ḫarod-Qishon depression gives access to the plains of Haifa to the west; the greatest width occurs in the Jericho region, where its plain is about 15 miles wide.

Throughout its course the valley lies much lower than the surrounding landscape, above all toward the south, where the Judaean plateaus rise to heights of about 3,000 feet, and those of ʿAjlūn rise to about 3,600 feet. The valley walls are steep, sheer, and bare, and they are broken only by the gorges of tributary wadis (seasonal watercourses).

Headstreams

The river course. The Jordan has three principal sources, all of which rise at the foot of Mt. Hermon. The longest of these is the Ḥāṣbānī, which rises in Lebanon, near Ḥāṣbayyā, at a height of 1,800 feet. From the east, in Syria, flows the Nahr Bāniyās; between the two is the Dan, the waters of which are particularly fresh. These three rivers join together in the Ḫula Basin, into which flow other streams, notably the 'Enot ʿEnan. The plain was formerly occupied by a lake and by marshes filled with a dense vegetation composed of papyrus, water lilies, and yellow pond lilies; in the 1950s, however, 15,000 acres (6,000 hectares) were drained to form excellent agricultural land, while 800 acres were preserved for their vegetation and animal life. At the southern end of the basin, the Jordan has cut a gorge through a basaltic barrier.

The Zor floodplain

The river then drops sharply down to the Sea of Galilee, which is itself 686 feet below sea level; this lake also serves to govern the river's rate of flow. After crossing the lake, the river valley narrows once more, and the Jordan receives its principal tributary, the Yarmūk, which marks part of the frontier between Syria and Jordan. It is then joined by two more tributaries, the Ḫarod on the right bank and the Yābis on the left. The river's plain then spreads out to a width of about 15 miles and becomes very regular; this is the Ghawr (Ghor) Plain, which is formed of marls (friable earthy deposits consisting of clay and calcium carbonate) and gypsum. Its flat and arid terraces are cut here and there by wadis or rivers (the Fāriʿah on the right bank, the Zarqā' and the Nusayrat on the left) into rocky towers, pinnacles, and badlands, a maze of ravines and sharp crests that resemble a lunar landscape and create obstacles to travel. There are three principal terraces on the plain, of which the highest is about 650 feet above the river. The Jordan has cut a valley into the plain of between about 1,300 and 10,000 feet in width and from between about 50 and 200 feet in depth. Along this stretch, the Jordan's floodplain is known as the Zor; it describes so many meanders that, although it runs for 135 miles, the actual distance it covers between the Sea of Galilee and the Dead Sea is only 65 miles. The Zor, which floods frequently, was formerly covered with thickets of reeds, tamarisk, willows, and white poplars sheltering an abundant wildlife, including boars. Since dams were built to control the river's flow, however, this land has been covered with irrigated fields. Finally, the Jordan drains into the Dead Sea through a vast, gently sloping delta.

Climate and wildlife. Although the bordering plateaus receive a relatively abundant rainfall, the depression itself is not well watered. The Ḫula Basin receives 22 inches (550 millimetres) a year, whereas only about three inches fall north of the Dead Sea. The winter is very mild, above all in the south, where the temperature in January is 52° F (11" C) in the Ḫula Basin, while at Jericho it is about 57° F (14° C). The summers, however, are torrid, with August temperatures of 81° F (27° C) in the Hula Basin and 90° F (32° C) at Jericho.

The wildlife of the Ḫula Swamp Nature Reserve includes otters, jungle cats, wild boars, and nesting populations of the common tern, the stilt (a long-legged, three-toed bird), and two types of herons. The river's fishes include some of those found in the Sea of Galilee; migrating southward, they die upon reaching the saline waters of the Dead Sea.

Volume of flow

Hydrology. The Jordan is fed by the rains falling on the neighbouring plateaus, the waters then flowing downward through rivers or wadis. The river itself is shallow. Upstream from the Sea of Galilee, the river's annual average flow is about 21,200,000,000 cubic feet (600,000,000 cubic metres); its minimum, reached in 1959 to 1960, was about 8,800,000,000 cubic feet, and its maximum, in 1968 to 1969, was more than 35,000,000,000 cubic feet. The Jordan's high-water period lasts from January to March, reaching a monthly maximum of about 3,200,000,000 cubic feet in February. Its low-water period occurs at the end of the summer and the beginning of autumn; the August flow averages about 780,000,000 cubic feet.

The waters of the Yarmūk, which average about 16,000,000,000 cubic feet, almost double the Jordan's flow; these are, however, most irregular, and the floodwaters in February are very sudden, so that the rate of flow is capable of rising from 2,000 to 60,000 cubic feet per second from one day to the next. The Zarqā' contributes an average of 1,600,000,000 cubic feet per year.

As one proceeds downstream, the rate of flow diminishes as a result of evaporation losses and the seeping away of water. As the average degree of the slopes over which the river flows is comparatively steep, the speed of the current is relatively fast, amounting to about four and a half feet per second at low water at the Allenby Bridge, a short distance north of the Dead Sea.

As the Ghawr region consists of marl, the Jordan transports a considerable load of silt, amounting to an average of more than 2 percent of its total flow and to more than 5 percent during the flood period.

The existence of thermal springs, notably in the Tiberiade region on the western side of the Sea of Galilee, as well as the frequency of gypsum, results in the Jordan's waters having a relatively high degree of salinity—averaging 0.77 percent—thus creating problems when the water is used for irrigation.

The imprint of man. *Settlements and river crossings.* Where irrigation permits, the Jordan Valley has been settled by Arab and Jewish agricultural communities. Notable settled regions are the Ḫula Valley in the north; the string of agricultural communities south of the Sea of Galilee on the West Bank, including Deganya—the oldest kibbutz (collective agricultural settlement) in Israel, founded in 1909—Afriqim, Ashdot Ya'aqov, and Ḫawwat Shemu'el; the area along the Ghawr Canal on the East Bank; and the area of the Wādī Fāriʿah on the West Bank.

Navigation is impossible because of the river's precipitous upper course, its seasonal flow, and its shallow, twisting lower course. The principal river crossings are those at the Benot Ya'aqov Bridge, on the road from Tiberias to Damascus; the Dāmiyā Bridge, on the road from as-Salf to Nābulus; the King Hussein Bridge, on the road from Irbid to ʿAfula; the Allenby Bridge, on the highway from Amman to Jerusalem; and the pipeline crossing at al-Manshiyah.

Irrigation and other projects

The river's resources. The Jordan waters are of especial importance for irrigation. For a long time the water was not used, except for several oases located in the bordering foothills—for example, at Jericho—which used the waters of springs that fed the river. The Ghawr region was formerly barren, desolate, and uninhabited except in winter by nomadic herdsmen and their livestock, who went up to the plateaus in summer. The Ghawr irrigation canal—43 miles long—was, however, completed in 1967 on the East Bank and has permitted the cultivation of oranges, bananas, early vegetables, and sugar beet in the region. In Israel, apart from the draining of the Ḫula Basin and the construction of a canal from the Sea of Galilee to Bet She'an, a water-supply grid has been constructed that permits 11,300,000,000 cubic feet of the Jordan's waters to be pumped each year to the centre and south of Israel.

Prospects for the future. Several projects have been drawn up that envisage the use of the waters of the entire basin. In addition, it has been suggested that the level of the Dead Sea could be maintained by channelling in salt water from the Mediterranean, at the same time using the flow to generate hydroelectricity. Because of Arab–Israeli tensions, however, only a partial use of the Jordan's waters has been made. Syria and Jordan envisage the construction of an irrigation and hydroelectric dam on the Yarmiik.

Joseph II, Emperor

Joseph II, Holy Roman emperor from 1765 to 1790, was one of his century's "enlightened despots." He introduced numerous reforms in a vain attempt to modernize and unify the Habsburg domains. Born in Vienna on March 13, 1741, the eldest son of Maria Theresa of Austria and Francis Stephen of Lorraine (the future emperor Francis I), Joseph was strictly and thoroughly educated.

Early years

When Maria Theresa appointed him to the Council of State, he exhibited unusual intelligence and a passionate interest in politics. Joseph's first marriage in 1760 to the Bourbon princess Isabella of Parma, whom he loved passionately, ended in tragedy when she died of smallpox three years later. In 1765 he married Maria Josepha of Bavaria, who also died of smallpox in 1767. His inability to make decisions necessarily limited his ambition. After his father died, in 1765, he became emperor, but Maria Theresa still reserved all important decisions for herself.

After her death in 1780, Joseph tried to finish her work of reform. The educational system had been consolidated throughout the monarchy. For the University of Vienna, no longer under the influence of the church, Joseph tried to find the best scholars and scientists. The judiciary and the executive had already been separated at the top; Joseph extended this process to the lower administrative levels. In 1786 the Universal Code of Civil Law was issued. Under Maria Theresa the physician Gerard van Swieten had organized a public-health service, and in Joseph's time the General Hospital in Vienna was considered one of the best equipped in Europe. The monarchy's finances were balanced. The reorganization of the army secured Joseph's position in Europe. He ordered the abolition of serfdom; by the Edict of Toleration he established religious equality before the law, and he granted freedom of the press. The emancipation of the Jews within a short time endowed cultural life with new vitality. The artistic life of Vienna rose to new heights when the Burgtheater became the German National Theater. By transferring the management of the theatres to the actors, Joseph introduced an artistically fruitful concept.

Domestic reforms

Joseph's conflict with the Roman Catholic Church, however, posed more difficult problems. He established national training colleges for priests, deprived the bishops of their authority, and limited their communications with the Pope. The power of the church was even more affected by the dissolution of more than 700 monasteries not engaged in such useful activities as teaching or hospital work. The 36,000 monks forced to leave their orders were given an annuity or money to return home; those so returning could continue as secular priests. Some measures intended to forestall a relapse into monasticism, such as the foundation of new parishes, bore good results. The Emperor's impatience in turning the monks out of the monasteries, however, caused many works of art to be destroyed. At the climax of the crisis, Pope Pius VI visited the Emperor in Vienna, but the visit changed nothing; nor did a later journey by Joseph to Rome. Joseph's passionate zeal to change everything and to force a new form of life on his subjects met with embittered resistance, chiefly in such strongly traditional countries as the Austrian Netherlands and Hungary.

Failure in foreign affairs

In foreign policy, Joseph had obtained some success even as co-regent with his mother. When a civil war occurred in Poland under King Stanistaw I1 Poniatowski, the lover of Catherine II the Great of Russia, who was completely dependent on Russia, Joseph met with Poland's third neighbour, King Frederick the Great of Prussia, to plan the partition of Poland, with each neighbour taking a part of the country and the remaining part to be given a last chance at independence. Frederick took what was later West Prussia, Austrian Galicia, and Catherine took as much border territory as she thought necessary. In a later treaty with Turkey, Joseph annexed Bukovina to his country.

To obtain a personal view of the situation in eastern and western Europe, Joseph visited France, where he was enthusiastically received by the intellectual elite, and then also visited Catherine of Russia. The banquets given in his honour in Paris could not conceal the truth from him: France was headed for catastrophe. His Russian visit gave him the impression of a state retarded in its development compared with the West, but the loyalty of its enormous population to Catherine and her nearly unlimited power seemed to make her the best ally for political manoeuvres in Europe.

After his mother's death, Joseph had involved himself fruitlessly in 1784 in an attempt to force the Dutch to lift their blockade to secure a passage to the sea for the Austrian Netherlands. The Emperor hoped for more success with his unusual plan of exchanging the Austrian Netherlands for Bavaria. The Wittelsbach dynasty had been extinguished in Bavaria, and the heir, the count palatine Charles Joseph, was in favour of moving from Munich to Brussels. But Joseph left Prussia out of his calculations. Frederick protested, and his troops marched into Bohemia. The threat of war ended without a battle being fought, for in 1785 Frederick had formed the Fürstenbund (Princes' League) against Joseph to prevent the exchange. Deeply disappointed, Joseph now saw his only hope in Catherine. Though he was in bad health, he decided to visit her again; the Austrian Netherlanders and Hungarians, enraged at his reforms, resisted the move. Both publicly and secretly Catherine proposed a complete sharing of power in the east and southeast. Joseph signed an alliance giving her a free hand for her far-reaching plans, the conquest of Constantinople and the Dardanelles, and assuring Austria of substantial territorial gains. When Catherine declared war on Turkey sooner than expected, Joseph raised an army of 250,000 men. Yet, despite careful preparations, the organization of this large army was weak. Revolutionary unrest in the Austrian Netherlands and Hungary grew in the belief that preoccupation with the war would prevent the Emperor from taking on the revolutionaries as well. Joseph spent several months with his army; but both his illness and the domestic crisis made progress dangerous, and he had to return to Vienna before a victory could be won. There the Emperor attempted to establish peace in the Austrian Netherlands by delaying negotiations, but he failed in this as he did in Hungary, where his refusal to be crowned had deprived him of a legal foundation for his reign.

In Hungary topographical surveys and the replacing of Latin by German as the official legal language drove the Hungarian gentry into opposition, and in the Austrian Netherlands immigrants who had fled from Holland opened hostilities against the occupation forces, and finally the country declared its independence.

When Joseph died in Vienna on February 20, 1790, deserted by all his friends. his efforts to achieve freedom and general welfare for his subjects seemed to have been in vain. Today, however, Joseph is generally judged differently. He is considered the benefactor of his subjects, the people's emperor, who by his many voyages and inspections devoted himself to all matters of greater or lesser importance. In his century he had predicted there would be a time when general welfare took precedence over individual prosperity. But he was born one century too soon.

Josephus, Flavius

Jewish priest and scholar, historian of the Jews, military commander against the Romans during the Jewish revolt of AD 66–70, Flavius Josephus was born Joseph ben Matthias in AD 37 or 38 of an aristocratic priestly family in Jerusalem. According to his own account, he was a precocious youth who by the age of 14 was consulted by high priests in matters of Jewish law. At age 16 he undertook a three-year sojourn in the wilderness with the hermit Bannus, a member of one of the ascetic Jewish sects that flourished in Judaea around the time of Christ. Returning to Jerusalem, he joined the Pharisees—a fact of crucial importance in understanding his later collaboration with the Romans. The Pharisees, despite the unflattering portrayal of them in the New Testament, were for the most part intensely religious Jews and adhered to a strict though nonliteral observance of the Torah. Politically, however, the Pharisees had no sympathy with the intense Jewish nationalism of such sects as the military patriotic Zealots and were willing to submit to Roman rule if only the Jews could maintain their religious independence.

IOSEPHVS
VESPASIANVS

Josephus before Vespasian, miniature portrait from a Josephus manuscript, 14th century. In the Hessische Landesbibliothek, Fulda, West Germany.

In AD 64 Josephus was sent on an embassy to Rome to secure the release of a number of Jewish priests of his acquaintance who were held prisoners in the capital. There, he was introduced to Poppaea Sabina, Emperor Nero's second wife, whose generous favour enabled him to complete his mission successfully. During his visit, Josephus was deeply impressed with Rome's culture and sophistication—and especially its military might.

Military commander in Galilee

He returned to Jerusalem on the eve of a general revolt against Roman rule. In AD 66 the Jews of Judaea, urged on by the fanatical Zealots, ousted the Roman procurator and set up a revolutionary government in Jerusalem. Along with many others of the priestly class, Josephus counselled compromise but was drawn reluctantly into the rebellion. Despite his moderate stance, he was appointed military commander of Galilee, where (if his own untrustworthy account may be believed) he was obstructed in his efforts at conciliation by the enmity of the local partisans led by John of Giscala. Though realizing the futility of armed resistance, he nevertheless set about fortifying the towns of the north against the forthcoming Roman juggernaut. The Romans, under the command of the future emperor Vespasian, arrived in Galilee in the spring of AD 67 and quickly broke the Jewish resistance in the north. Josephus managed to hold the fortress of Jotapata for 47 days, but after the fall of the city he took refuge with 40 diehards in a nearby cave. There, to Josephus' consternation, the beleaguered party voted to perish rather than surrender. Josephus, arguing the immorality of suicide, proposed that each man, in turn, should dispatch his neighbour. They were to cast lots, the first man killing the second, and so on. Curiously, Josephus contrived to draw the last lot, and, as one of the two surviving men in the cave, he prevailed upon his intended victim to surrender to the Romans.

Led in chains before Vespasian, Josephus assumed the role of a prophet and foretold that Vespasian would soon be emperor—a prediction that gained in credibility after the death of Nero in AD 68. The stratagem saved his life, and for the next two years he remained a prisoner in the Roman camp. Late in AD 69 Vespasian was proclaimed emperor, by his troops: Josephus' prophecy had come true, and the agreeable Jewish prisoner was given his freedom. From that time on, Josephus attached himself to the Roman cause. He adopted the name Flavius (Vespasian's family name), accompanied his patron to Alexandria, and there married his third wife. (His first wife had been lost at the siege of Jotapata, and his second had deserted him in Judaea.) Josephus later joined the Roman forces under the command of Vespasian's son and later successor, Titus, at the siege of Jerusalem in AD 70. He attempted to act as mediator between the Romans and the rebels, but, hated by the Jews for his apostacy and distrusted by the Romans as a Jew, he was able to accomplish little. Following the fall of Jerusalem and the destruction of the Temple, Josephus took up residence in Rome, where he devoted the remainder of his life to literary pursuits under imperial patronage.

Literary career

Josephus' first work, *Bellum Judaicum (History of the Jewish War)*, was written in seven books between AD 75 and 79, toward the end of Vespasian's reign. The original Aramaic has been lost, but the extant Greek version was prepared under Josephus' personal direction. After briefly sketching Jewish history from the mid-2nd century BC, Josephus presents a detailed account of the great revolt of AD 66–70. He stressed the invincibility of the Roman legions, and apparently one of his purposes in the works was to convince the Diasporan Jews in Mesopotamia, who may have been contemplating revolt, that resistance to Roman arms was pure folly. The work has much narrative brilliance, particularly the description of the siege of Jerusalem; its fluent Greek contrasts sharply with the clumsier idiom of Josephus' later works and attests the influence of his Greek assistants. In this work, Josephus is extremely hostile to the Jewish patriots and remarkably callous to their fate. The *Jewish War* is not only the principal source for the Jewish revolt but is especially valuable also for its description of Roman military tactics and strategy.

In Rome, Josephus had been granted citizenship and a pension. He was a favourite at the courts of Vespasian, Titus, and Domitian, and he enjoyed the income from a tax-free estate in Judaea. He had divorced his third wife, married an aristocratic heiress from Crete, and had given Roman names to his children. He had written an official history of the revolt and was loathed by the Jews as a turncoat and traitor. Yet despite all of this, Josephus had by no means abandoned his Judaism. His greatest work, *Antiquitates Judaicae (The Antiquities of the Jews)*, completed in *20* books in AD 93, traces the history of the Jews from Creation to just before the outbreak of the revolt of AD 66–70. It was an attempt to present Judaism to the Hellenistic world in a favourable light. By virtually ignoring the Prophets, by embellishing biblical narratives, and by stressing the rationality of Judaic laws and institutions, he stripped Judaism of its fanaticism and made it appealing to the cultivated and reasonable man. Historically, the coverage is patchy and shows the fatigue of the author, then in his middle 50s. But throughout, sources are preserved that otherwise would have been lost, and, for Jewish history during the Second Commonwealth, the work is invaluable.

Book XVIII of the *Antiquities* contains a celebrated reference to Christ. But the implication in the text of Christ's divinity could not have come from Josephus, and the passage undoubtedly represents the tampering (if not outright invention) of a later Christian copyist.

Appended to the *Antiquities* was a *Vita (Life)*, which is less an autobiography than an apology for his conduct in Galilee during the revolt. It was written to defend himself against the charges of his enemy Justus of Tiberias, who claimed that Josephus was responsible for the revolt. In his defense, he contradicted the account given in his more trustworthy *Jewish War*, presenting himself as a consistent partisan of Rome and thus a traitor to the rebellion from the start. Josephus appears in a much better light in a work generally known as *Contra Apionem* (*Against Apiort*, though the earlier titles *Concerning the Antiquity of the Jews* or *Against the Greeks* are more apposite). Of its two books, the first answers various anti-Semitic charges levelled at the Jews by Hellenistic writers, while the second provides an argument for the ethical superiority of Judaism over Hellenism and shows Josephus' commitment to his religion and his culture.

Since *Against Apion* mentions the death of Agrippa II, it is probable that Josephus lived into the 2nd century; but Agrippa's death date is uncertain, and it is possible that Josephus died earlier, in the reign of Domitian, sometime after AD 93.

Assessment

As a historian, Josephus shares the faults of most ancient writers: his analyses are superficial, his chronology faulty, his facts exaggerated, his speeches contrived. He is especially tendentious when his own reputation is at stake. His Greek style, when it is truly his, does not earn for him the epithet "the Greek Livy" that often is attached to his name. Yet he unites in his person the traditions of Judaism and Hellenism, provides a connecting link between the secular world of Rome and the religious heritage of the Bible, and offers many insights into the mentality of subject peoples under the Roman Empire.

Personally, Josephus was vain, callous, and self-seeking. There was not a shred of heroism in his character, and for his toadyism he well deserved the scorn heaped upon him by his countrymen. But it may be said in his defense that he remained true to his Pharisee beliefs and, being no martyr, did what he could for his people.

BIBLIOGRAPHY. The best scholarly text is that of B. NIESE in the "Teubner Series," 7 vol. (1887–95); a sound text with English translation may be found in the Loeb Classical Library edition, translated by H. ST. JOHN THACKERAY, R MARCUS and L.N. FELDMAN (1926–65). For Josephus' life and times, see H. ST. JOHN THACKERAY, *Josephus, the Man and the Historian* (1929); NORMAN BENTWICH, *Josephus* (1914, reprinted 1945); WILLIAM R. FARMER, *Maccabees, Zealots, and Josephus* (1956); R.J.H. SHUTT, *Studies in Josephus* (1961); and GEOFFREY A. WILLIAMSON, *The World of Josephus* (1964).

(Ga.P.)

Joyce, James

James Joyce's abilities as a novelist and his subtle yet frank portrayal of human nature coupled with his mastery of language and brilliant development of new literary methods have made him one of the most commanding influences on the writers of our time. Although originally banned in most countries, his novel *Ulysses*, describing the events of a single day (June 16, 1904) in Dublin, has come to be accepted as a major masterpiece, two of its characters, Leopold Bloom and his wife, Molly, being portrayed with a fullness and warmth of humanity unsurpassed in fiction. His semi-autobiographical novel *A* Portrait of the Artist as a Young Man is also remarkable for the intimacy of the reader's contact with the central figure and contains some astonishingly vivid passages. *Dubliners* is a collection of 15 short stories of Dublin life, mainly focussed upon its sordidness, but the last, "The Dead," is one of the world's great short stories. Critical opinion is divided over Joyce's last work, Finrzegans Wake, a universal dream about an Irish family, composed in a multilingual style on many levels and aiming at a multiplicity of meanings; but although seeming unintelligible at a first reading, the book is full of poetry and wit, containing passages of great beauty. Joyce's other works—some verse (Chamber Music, 1907; Pornes Penyeach, 1927; Collected Poems, 1936) and a play, Exiles (1918)—though competently written, add little to his international stature.

Gisele Freund

Joyce, photograph by Gisèle Freund, 1939.

Nearly all Joyce's works are imaginative reconstructions of his own life and early environment and, although too close an identification of the author with his fictional counterpart can mislead, a knowledge of his life history helps toward understanding his work.

John Stanislaus Joyce

Early life and work. James Augustine Joyce (he rarely used his middle name after about 1907) was born at Rathgar, Dublin, on February 2, 1882. At that time the burning question was that of Irish independence (Home Rule), and the Irish leader was Charles Stewart Parnell. John Stanislaus Joyce, James's father, was an ardent follower of Parnell, for whom he worked as election agent, an occupation for which his sociable temperament and ready tongue made him very suitable. In 1880 he had succeeded in getting two Parnellites returned as members of Parliament for Dublin and, partly as a reward, had been appointed collector of taxes for the city at the then considerable salary of £500 a year. Soon after, he married Mary Jane Murray, from Longford. With his salary, an income of £315 a year from inherited property, and what was left of his grandfather's 21st birthday present of £1,000, the young pair began married life in comfortable circumstances. James was their eldest son, and when he was six and a half (September 1888), he was sent to Clongowes Wood College, a Jesuit boarding school that has been described as "the Eton of Ireland." Such evidence as survives suggests that he was happy there. But his father was not the man to stay affluent for long; he drank, neglected his affairs, and borrowed money from his office. The dividing line came in 1890–91 with Pamell's fall following the scandal over the O'Shea divorce, and in John Joyce's mind the two events were always connected. He believed that, with his leader, he had been betrayed and suspected that the Catholic clergy were somehow responsible. The facts suggest a different interpretation: he had been absent from his office without permission while campaigning for the Parnellite candidates in Cork, and there were deficiencies in his accounts, which he eventually met by mortgaging his property. The new Irish Local Government Act had abolished his position, and he was not appointed to the equivalent one that replaced it, although he was allowed a pension. His son James shared his views and wrote, at the age of nine, a poem attacking T.M. Healy, who, with Michael Davitt, led the Irish opposition to Parnell. The poem was printed at his father's expense, but no copy is known to survive.

Education

During the years that followed, the Joyce family sank deeper and deeper into poverty. Ten children survived infancy, and they became accustomed to conditions of increasing soididness, subject to visits from debt collectors, having household goods frequently in pawn, and often moving to another house, leaving the rent and tradesmen's bills unpaid. James did not return to Clongowes after the summer vacation of 1891 but—apart from some months at a Christian Brothers' school, which he never afterward mentioned—stayed at home for the next two years and, according to his brother Stanislaus' autobiography, My Brother's Keeper (1958), tried to educate himself, asking his mother to check his work. In April 1893 both brothers were admitted, without fees, to Belvedere College, a Jesuit grammar school in Dublin. James did well there academically and was twice elected president of the Marian Society, a position virtually that of head boy. He left, however, under a cloud, as it was thought (correctly) that he had lost his Catholic faith.

He entered University College, Dublin, then staffed by Jesuit priests, although their control was limited by the Royal University Act of 1879. There he was taught neither theology nor philosophy; he studied languages, reserving his energies for extracurricular activities, reading widely—particularly in books not recommended by the Jesuits—and taking an active part in the college's Literary and Historical Society. Greatly admiring Henrik Ibsen, he learned Dano-Norwegian to read the original aad had an article, "Ibsen's New Drama"—a review of *When* We Dead Awaken—published in the London Fortnightly Review in 1899 just after his 18th birthday. This early success confirmed Joyce in his resolution to become a writer and persuaded his family. friends, and teachers that the resolution was justified. In October 1901 he published an essay, "The Day of the Rabblement," attacking the Irish Literary Theatre (later the Dublin Abbey Theatre) for catering to popular taste. Joyce had previously supported the theatre and had refused to join a students' protest against the "heresy" of William Butler Yeats's Countess Cathleen. His next publication was in the unofficial college magazine, Saint *Stephen's*, in May 1902. An essay, "James Clarence Mangan," on an Irish poet who, Joyce claimed, was unjustly neglected, it was written in an over-elaborate prose and based on a highly praised lecture he had given to the students' society.

The "epiphanies"

He was leading a dissolute life at this time but worked sufficiently hard to pass his final examinations, matriculating with "second class honours in Latin" and obtaining the degree of B.A. on October 31, 1902. Never did he relax his efforts to master the art of writing. He wrote verses and experimented with short prose passages that he called "epiphanies." The word means the manifestations, by the gods, of their divinities to mortal eyes; but Joyce used it to describe his accounts of moments when the real truth about some person or object was revealed. His experiments were useful in helping him to develop a concise style while recording accurate observation. His lifelong care in preserving his work for future use is first shown in the use he made of his "epiphanies" in his next two books.

To support himself while writing, he decided to become a doctor, but after attending a few lectures in Dublin, he borrowed what money he could and went to Paris. After a fortnight there, during which he found that fees were payable in advance and his Dublin qualifications insufficient, he returned home for a month's holiday on December 23, 1902, and became friendly with Oliver St. John Gogarty, whom he later pilloried as Mulligan in Ulysses. On returning to Paris he abandoned the idea of medical studies, wrote some book reviews, and, on the proceeds of these and of a few English lessons, with small remittances from his mother, he studied in the Sainte-Geneviève Library and compiled notes on a theory of aesthetics he was evolving from Aristotle, Aquinas, and Flaubert. The notes and the book reviews were published in Critical *Writings* of James Joyce (ed. by E. Mason and R. Ellmann, 19.59).

Recalled home in April 1903 because his mother was dying, he tried various occupations, including teaching, and lived at various addresses, including (from September 9–19, 1904) the Martello Tower at Sandycove, now Ireland's Joyce Museum. He had begun writing a lengthy naturalistic novel, Stephen *Hero*, based on the events of his own life, when in 1904 George Russell (Æ) offered $1 each for some simple short stories with an Irish background to appear in a farmers' magazine, *The* Irish Homestead. In response Joyce began writing the stories published as Dubliners (1914). Three stories, "The Sisters," "Eveline," and "After the Race," had appeared under the pseudonym Stephen Daedalus before the editor decided that Joyce's work was not suitable for his readers. Meanwhile Joyce had met, on June 10, a girl named Nora Barnacle. He met her next on June 16, the day that, mainly in celebration of their meeting, he chose as what is known as "Bloomsday" (the day of his novel Ulysses). On June 16 he fell in love with her, and eventually he persuaded her to leave Ireland with him, although he refused, on principle, to go through a ceremony of marriage.

Dubliners

Trieste—1905. Joyce and Nora left Dublin together in October 1904. Joyce obtained a position in the Berlitz School, Pola, working in his spare time at his novel and short stories. In 1905 they moved to Trieste, where James's brother Stanislaus joined them and where their children, George and Lucia, were born. In 1907, while giving English lessons to a Triestine businessman, Ettore Schmitz, he learned that Schmitz had written under the name Italo Svevo but had become discouraged. Joyce admired his work and exerted influence to obtain recognition for it. In 1906–07, for eight months, he worked at a bank in Rome, disliking almost everything he saw. Ireland seemed pleasant by contrast; he wrote to Stanislaus that he had not given credit in his stories to the Irish virtue of hospitality and began to plan a new story, "The Dead." The early stories were meant, he said, to show the paralysis from which Dublin suffered, but they are written with a vividness that arises from his success in making every word and every detail significant. His studies in European literature had interested him in both the Symbolists and the Realists; his work began to show a synthesis of these two rival movements. He decided that Stephen Hero lacked artistic control and form and rewrote it as "a work in five chapters" under a title—A Portrait of *the* Artist as a *Young* Man—intended to direct attention to its focus upon the central figure. In Trieste, too, Joyce wrote, but never tried to publish, a poetical short story, Giaconzo Joyce, describing his feelings toward one of his pupils, Amalia Popper, whose father was named Leopoldo and whose Jewish charms contributed to the character of Molly Bloom. The manuscript, found among Stanislaus' papers, was edited and published with a foreword by Richard Ellmann in 1968.

A Portrait
of the
Artist

In 1909 he visited Ireland twice to try to publish *Dubliners* and set up a chain of Irish cinemas. Neither effort succeeded and he was distressed when a former friend told him that he had shared Nora's affections in the summer of 1904. Another old friend proved this to be a lie. Joyce's reactions can still be read in a series of letters now in the Cornell University Library. Only the milder passages could be published in the "collected" Letters of *James* Joyce; the series as a whole includes some of the most astonishing examples of erotica ever written. Joyce always felt that he had been betrayed, and the theme of betrayal runs through much of his later work. So, almost equally, does that of tenderness. "The Dead" mentions a boy named Michael Furey who dies for love of the heroine, Gretta. He is based on a boy called Michael Bodkin, who had once courted Nora. On his next and final visit to Ireland in 1912, Joyce visited "the lonely churchyard on the hill where Michael Furey lay buried," and he brought its "crooked crosses" into the closing cadences of his story. But printers' objections to the themes, to the frequent mention of real places and people, and to occasional use of the word bloody prevented the publication of Dubliners till 1914, by which time A Portrait of the Artist was being serialized in The Egoist (a review financed by Harriet Shaw Weaver). Both publications were favourably reviewed.

Ziirich—1915. When Italy declared war in 1915 Stanislaus was interned, but James and his family were allowed to go to Zürich. At first, while he gave private lessons in English and worked on the early chapters of Ulysses—which he had first thought of as another short story about a "Mr. Hunter^{n}—his financial difficulties were great. He was helped first by a grant of E75 from the Royal Literary Fund; then by a large grant from Mrs. Edith Rockefeller McCormick; and finally by a series of grants from Miss Weaver, which by 1930 had amounted to more than $23,000. Her generosity resulted partly from her admiration for his work and partly from her sympathy with his difficulties, for, as well as poverty, he had to contend with eye diseases that never really left him. From February 1917 until 1930 he endured a series of 25 operations for iritis, glaucoma, and cataracts, sometimes being for short intervals totally blind. Despite this he kept up his spirits and continued working, some of his gayest passages being composed when his health was at its worst. Unable to find an English printer willing to set up A Portrait of *the* Artist for book publication, Miss Weaver published it herself, having the sheets printed in the United States, where it was also published, on December 29, 1916, by B.W. Huebsch, in advance of the English Egoist Press edition. Encouraged by the acclaim given to this, in March 1918, the American Little Review began to publish episodes from Ulysses, continuing until the work was banned in December 1920.

Ulysses

Paris—1920. After World War I Joyce returned for a few months to Trieste, then—at the invitation of Ezra Pound—in July 1920 he went to Paris. Ulysses was published there on February 2, 1922, by Sylvia Beach, proprietor of a bookshop called "Shakespeare & Co." The book, already well known because of the censorship troubles, became immediately famous. Joyce had prepared for its critical reception by having a lecture given by Valery Larbaud who pointed out the Homeric correspondences in it and that "each episode deals with a particular art or science, contains a particular symbol, represents a special organ of the human body, has its particular colour . . . proper technique, and takes place at a particular time." Joyce never published this scheme (see Table); indeed, he even deleted the chapter titles in the book as printed. It may be that this scheme was more useful to Joyce when he was writing than it is to the reader. Sometimes the technical devices become too prominent, particularly in the much-praised "Oxen of the Sun" chapter (II, 11) where the language goes through every stage in the development of English prose from Anglo-Saxon to the present day to symbolize the growth of a fetus in the womb. The execution is brilliant, but the process itself seems ill-advised. More often the effect is to add intensity and depth, as, for example, in the "Aeolus" chapter (II, 4) set in a newspaper office, with rhetoric as the "art." Joyce inserted into it hundreds of rhetorical figures and many references to winds—something "blows up" instead of happening, people "raise the wind" when they are getting money—

and the reader becomes aware of an unusual liveliness in the very texture of the prose. The famous last chapter, in which we follow the stream of consciousness of Molly Bloom as she lies in bed, gains much of its effect from being written in eight huge unpunctuated paragraphs. Nevertheless, the main strength of the book lies in its depth of character portrayal and its breadth of humour. Joyce claimed to have taken his "stream-of-consciousness" technique from a forgotten French writer, Édouard Dujardin (1861–1949), who had used the *monologue intérieure* in his novel *Les Lauriers sont coupés* (1888), but many critics have pointed out that it is at least as old as the novel, although no one before Joyce had used it so continuously.

Finnegans Wake

In Paris Joyce worked on *Finnegans Wake*, the title of which was kept secret, the novel being known simply as "Work in Progress" until published in its entirety in May 1939. In addition to his chronic eye troubles Joyce suffered great and prolonged anxiety over his daughter's mental health. What had seemed slight eccentricity grew into unmistakable and sometimes violent mental disorder that Joyce tried by every possible means to cure, but it became necessary to place her in a mental hospital near Paris. In 1931 he and Nora visited London, where they were married, his scruples having yielded to his daughter's complaints.

Meanwhile he wrote and rewrote sections of his new book; often a passage was revised more than 14 times before he was satisfied. Every word, every letter was scrutinized and pondered over. He usually began with a simple narrative. Basically the book is, in one sense, the story of a publican in Chapelizod, near Dublin, his wife, and their three children; but Mr. Humphrey Chimpden Earwicker, Mrs. Anna Livia Plurabelle, Shem, Shaun, and Isabel are every family of mankind, the archetypal family about whom all mankind is dreaming. The 18th-century Italian Giambattista Vico provides the basic theory that history is cyclic; to demonstrate this the book begins with the end of a sentence left unfinished on the last page. Ideally it should be bound in a circle. It is thousands of dreams in one. Languages merge: Anna Livia has "vlossyhair"—*włosy* being Polish for "hair"; "a bad of wind" blows; *bâd* being Turkish for "wind." Characters from literature and history appear and merge and disappear as "the intermisunderstanding minds of the anticollaborators" dream on. On another level, the protagonists are the city of Dublin and the River Liffey which flows enchantingly through the pages, "leaning with the sloothering slide of her, giddygaddy, grannyma, gossipaceous Anna Livia." And throughout the book James Joyce himself is present, joking, mocking his critics, defending his theories, remembering his father, enjoying himself.

Despite much scholarly study the book remains imperfectly understood; Joyce said he expected his readers to spend their lives on his book. It will remain a book for the minority, but it will always be loved by that minority. Since its publication it has had a great effect on many serious writers, as well as providing a new technique of word distortion and word creation for writers of advertisements.

After the fall of France in World War II (1940), Joyce took his family back to Zürich, where he died on January 13, 1941, still disappointed with the reception given to his last book. He would be pleased to know that, of the two periodicals now dealing with his work, one is entirely devoted to *Finnegans Wake*.

MAJOR WORKS

NOVELS AND STORIES: *Dubliners* (1914), 15 short stories: "The Sisters," "An Encounter," "Araby," "Eveline," "After the Race," "Two Gallants," "The Boarding House," "A Little Cloud," "Counterparts," "Clay," "A Painful Case," "Ivy Day in the Committee Room," "A Mother," "Grace," and "The Dead"; *A Portrait of the Artist as a Young Man* (1916); *Ulysses* (1922); *Finnegans Wake* (1939), sections published as parts of *Work in Progress* from 1928 to 1937.

VERSE: *Chamber Music* (1907); *Pomes Penyeach* (1927); *Collected Poems* (1936).

PLAY: *Exiles* (1918).

BIBLIOGRAPHY. The definitive biography, RICHARD ELLMANN, *James Joyce* (1959), is reliable and exhaustive. Critical studies of the works are very numerous; a list to December 1961 is given in R.H. DEMING, *A Bibliography of James Joyce Studies* (1964). The most concise account is A. WALTON LITZ, *James Joyce* (1966), which contains a well-selected bibliography with helpful comments. H. BLAMIRES, *The Rloomsday Book* (1966), is the best single guide for anyone reading *Ulysses* for the first time. FRANK BUDGEN, *James Joyce and the Making of Ulysses*, new ed. (1960), gives an intimate account of Joyce at work. For the earlier works MARVIN MAGALANER, *Time of Apprenticeship* (1959); and a collection of essays, *James Joyce's Dubliners* (1969), contain useful material; and R. SCHOLES and R.M. KAIN, *The Workshop of Daedalus* (1965), reprints Joyce's *Epiphanies* and the Pola and Trieste notebooks. No fully satisfactory account of *Finnegans Wake* has yet been written. W.Y. TINDALL, *A Reader's Guide to Finnegans Wake* (1969), is the most up-to-date comprehensive study but is not always reliable; ADALINE GLASHEEN, *A Second Census of Finnegans Wake* (1963), provides many necessary identifications. The *James Joyce Quarterly* (1963–), gives regular surveys of current critical work; *A Wake Newslitter* (1962–), now published by the English Department of Dundee University, Scotland, continues explicating *Finnegans Wake*.

(J.S.A.)

Juárez, Benito

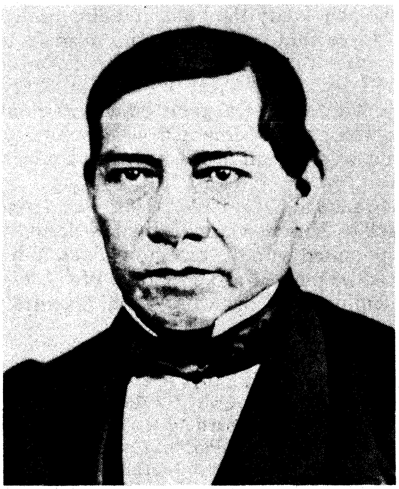
Benito Pablo Juárez, Mexico's first president of Indian descent, led his country's struggle to destroy the remnants of feudalism and to create a democratic, federal republic. To prevent foreign domination and conquest, Juárez successfully rallied the resistance of his countrymen. It may, in fact, be said that it was he who, after 50 years of nominal nationhood, brought the Mexican nation into being. To this day his countrymen revere him as their national hero.

Juárez was born in San Pablo Guelatao in the state of Oaxaca on March 21, 1806, of Indian parents, both of whom died when he was three years old. When he was 12 he left the uncle who was caring for him and joined his sister in the city of Oaxaca, where he began his formal education.

Early career

He originally studied for the priesthood, but in 1829 he entered the Oaxaca Institute of Arts and Sciences to study law and science. In 1831 he received his law degree and also won his first public office, a seat on the municipal council. Impeccably honest, he never used public office for personal gain, and his modest way of life reflected his simple tastes even after his marriage in 1843 to Margarita Maza, a Oaxaca girl 17 years younger than he. Politics soon became his life's work: he was a member of both the state and national legislatures, he became a judge in 1841, and he served as governor of his state, a post that brought him into national prominence.

During these years in politics Juárez began to formulate



Juárez.

solutions for his country's many problems. The road to economic health, he concluded, lay in substituting capitalism for the stifling economic monopoly held by the church and the landed aristocracy. He also believed that political stability could only be achieved through the adoption of a constitutional form of government based on a federal system.

But the return of the conservatives to power in the elections of 1853 doomed imminent reform. Many prominent liberals were exiled, including Jubrez. From December 1853 until June 1855 he lived in New Orleans in the United States in semipoverty, occupying himself by exchanging ideas with other Mexicans and laying plans to return home. The opportunity to put his ideas into action finally came in 1855 when the liberals took control of the national government, and Jubrez left the United States to join the new administration as minister of justice and public instruction.

The liberals carried out three major reforms, all supported by Jubrez. As minister of justice he was responsible for the law bearing his name that abolished special courts for the clergy and military, for he felt that juridical equality would help promote social equality. In June 1856 the government published the Ley Lerdo (called after the minister of finance), which, although it forced the church to sell its property, contained no threat of confiscation. By breaking up large landed estates, the government hoped that many Mexicans would be able to acquire property and thus create the middle class that it believed was essential for a strong and stable Mexico. The climax of the reform was the liberal constitution promulgated in February 1857.

In the same year, Ignacio Comonfort was elected president, and the new Congress chose Jubrez to preside over the Supreme Court and therefore, according to the constitution, also to serve as the effective vice president of Mexico. The court position was critical in determining his future career, for when the conservatives revolted and ousted Comonfort in January 1858, Juárez had a legal claim to the presidency. Lacking troops to control the area around Mexico City, however, he retired to the eastern port city of Veracruz.

At Veracruz Jubrez faced serious difficulties, for he had to create a government and hold it together through quarrels, betrayals, and defeat; to enforce and implement the constitution; to maintain armies in the field and defeat the conservative forces. But he was an extraordinarily tenacious and self-sufficient man, able to concentrate his energy and interest, and he proved himself the master of his government.

Because the clergy was supporting the conservatives against the legal government, Juárez enacted several laws to curb ecclesiastical power. He nationalized all church property, exempting only those buildings actually used for worship and instruction. To weaken clerical influence still further, he also nationalized the cemeteries and put birth registrations and marriages under the civil authority. Finally, the government separated church and state and guaranteed religious liberty to all citizens.

Presidency

By late 1860 the conservatives were faltering, and in January 1861 Jubrez was able to return to Mexico City and was constitutionally elected president. He was, however, faced with many serious problems: the opposition's forces still remained intact, the new Congress distrusted its president, and the treasury was virtually empty. As a solution to this latter problem Judrez decided in July 1861 to suspend payment on all foreign debts for two years. To safeguard their investments, England, Spain, and France decided to intervene, and by January 1862 the three countries had landed troops at Veracruz. But when Britain and Spain realized that Napoleon III intended to conquer Mexico and control it through a puppet, Archduke Maximilian of Austria, they withdrew their forces. Despite a major defeat at Puebla on May 5, 1862, reinforcements enabled the French to occupy Mexico City in June 1863, and Maximilian soon followed to take control of the government.

Forced to leave the capital again, Jubrez kept himself and his government alive by a long series of retreats that ended only at Ciudad Jubrez at the Mexican–American border. Early in 1867, as a result of continued Mexican resistance, increased United States pressure, and criticism at home, Napoleon decided to withdraw his troops. Soon afterward, Mexican forces captured Maximilian and executed him.

Jubrez then made the greatest mistake of his political career. In August 1867, shortly after his return to Mexico City, he issued a call for national elections and for a referendum on whether Congress should make five amendments to the constitution. Public opinion did not object to the President's running for re-election, but the constitutional changes aroused immediate and violent reaction in many quarters, including those sympathetic to Jubrez. Both procedure and content of his proposed changes came under fire because amendments enacted by Congress alone were unconstitutional and the changes would strengthen the executive power. Jubrez was re-elected, but the controversy had created such a crisis of confidence that the administration did not even bother to count the votes on the amendments.

Despite illness and personal loss—in October 1870 Juárez suffered a stroke and three months later his wife died—he decided to run again in 1871. After a bitter campaign he was re-elected, but many of his countrymen, refusing to accept the result as final, took up arms against him. Jubrez spent the last few months of his life trying to restore peace. On July 18, 1872, he died of a heart attack.

Assessment

Jubrez' political rise was a continual struggle to transform his liberal ideas into a permanent political reality and to overcome the prevalent social attitudes toward his Indian background. Only in the 20th century did the Mexicans come to admire and respect their Indian heritage; the prejudices of the 19th century serve to emphasize and enhance Juárez' extraordinary qualities and achievements. His domestic reforms, which freed Mexico from the most flagrant remnants of neocolonialism, and his leadership against the French earned Jubrez his place in the national pantheon.

BIBLIOGRAPHY. The best general work on Juárez is RALPH ROEDER, *Juarez and his Mexico*, 2 vol. (1947, reprinted 1968). The best biography, although uncritical, is CHARLES A. SMART, *Viva Juarez* (1963). with Juárez' important autobiographical essay, "Notes for My Children." WALTER V. SCHALES, *Mexican Politics During the Juarez Regime, 1855–1872* (1969), is a study of the domestic aspects of the Juárez government.

(W.V.S.)

Judah ha-Levi

Judah ha-Levi was a Hebrew poet and philosopher of the 11th and 12th centuries whose poetic works were the culmination of the development of Hebrew poetry within the sphere of Arabian culture. He was strongly influenced by Arabian literature, elements of which he ingeniously assimilated. His great collection of poems entitled *Dīwān* includes secular and religious poetry, both of which express passionate attachment to Zion (the land of Israel). For the poet, the Holy Land was not only a site where the Jewish people would one day gather after their deliverance from exile; immigration and settlement in Palestine would also hasten the coming of the Messiah. He celebrated Jerusalem in song as had none of his medieval predecessors. He also expounded his views on the nature of Judaism in an Arabic prose work consisting of dialogues between a learned Jew and the Khazar king who was converted to Judaism in the 8th century. It was widely circulated in Hebrew translation under the title *Sefer ha-Kuzari* ("Book of the Khazar").

Early life

Judah ha-Levi (in Hebrew, Yehuda ben Shemuel ha-Levi; Arabic surname, Abū al-Ḥasan) was born, at the latest, around 1075 in the town of Tudela in northern Spain and died in 1141 in Egypt. At the time of his birth, most of Spain, including his native town, was still under Muslim rule, but the Reconquista, the Christian sovereigns' struggle to regain the territories lost to the Muslims, was already under way. In 1085 King Alfonso VI of Castile conquered Toledo and made it his capital, and the exploits of the Cid, the celebrated national hero of Spain, also fall into the same period. Judah ha-Levi, whose poetic gifts manifested themselves unusually early, spent his childhood in the Christian part of the country. but even as a boy he felt himself drawn to Muslim Spain, then one of the principal cultural centres of Europe. He went to Andalusia in southern Spain some time before 1090, where he established contact with local Hebrew poets and intellectuals, and justly attracted considerable attention by his impressive talent. The most famous Hebrew poet of the time, Moses ibn Ezra from Granada, invited Judah ha-Levi to visit him and the two sealed a bond of lifelong friendship. His stay in Granada, enjoyed in the company of Ibn Ezra, was a period of success and happiness. He expressed his good spirits in several poems. This pleasant period ended in 1090 when Granada was stormed by the Almoravids, North African Berber disciples of a zealous Muslim movement, who now established an orthodox and intolerant regime in Andalusia. It is not known with any certainty whether Judah ha-Levi witnessed the Almoravid invasion in Granada or elsewhere, but the event greatly influenced the remainder of his life and his world view.

In his youth he also spent time in other Jewish centres of Andalusia, for example, in Lucena, a town of predominantly Jewish population in which a noted yeshiva, or academy, for Jewish theological studies was located. He composed a poetic epitaph when Isaac Alfasi, the head of the institution, died in 1103 and maintained very friendly relations with his successor, Joseph ibn Migash, for whom he even wrote letters. Judah ha-Levi also spent a certain amount of time in Seville, where he was poorly received by some wealthy Jews, on whom he revenged himself by denouncing their greed and ignorance in biting satirical verses. There are intimations in his poems that he must once have known material distress and depended on the good will of generous patrons.

Move to Christian Castile

He finally made his way, however, and became independent. Disappointed with the Almoravid regime, he turned toward Christian Castile and settled in its capital city of Toledo. There he worked untiringly as a physician, one of the professions open to Jews in Christian surroundings, a profession which in fact brought them into close contact with those surroundings.

As a resident of Toledo he celebrated prominent Castilian Jews in his verses, particularly the successful courtier Joseph ibn Ferruziel, better known by his Hispano-Arabic sobriquet Cidellus, who distinguished himself as a physician and adviser to King Alfonso VI. Judah ha-Levi for a while believed that the fortunes of his sorely tried people would flourish in Castile, but his hopes were destroyed by successive disappointments. Solomon ibn Ferruziel, a nephew of Cidellus who was also actively in the service of the Castilian state, was to return to Toledo from an important mission in Aragon. Along the way he was assassinated by Christian Spaniards on May 3, 1108. Judah ha-Levi had already composed a very elaborate poem to celebrate the reception of the Jewish statesman, which he had to set aside. He composed a long official elegy for the murdered man, ending it with a curse against the "Daughter of Edom," sinful Christianity. Additional acts of violence were committed against Jews in Castile, and still worse, it was often they who suffered in the clashes between the Almoravid realm and the Christian kingdoms in Spain. Distrusted, plundered, and slain by both sides, it was as though they were between hammer and anvil. Judah ha-Levi recognized the complete hopelessness of their situation and portrayed it in his poems.

Medieval Jews tried again and again to decipher the mysterious dates of their deliverance cited in the Book of Daniel and sought to apply them to their own time. Judah ha-Levi's works contain a reference to Daniel in a prophetic poem, in which the poet said that he had learned in a dream of the impending collapse of the Muslim empire in 1130. In the last years of his life he apparently returned in resignation to Muslim Spain and lived in Cordova, which remained an important centre of Jewish culture even in the period of decline. Judah ha-Levi had a very wide circle of acquaintances and maintained relationships with many famous contemporaries in Spain as well as abroad. He managed to gain a certain prosperity and lived in his house surrounded by a loving family and a few disciples. Yet he was thoroughly dissatisfied with his life. As old age approached he felt an increasing need to travel to Jerusalem, writing about it at length in verse and prose. The epilogue of the *Kuzari* explains his attachment to Zion and sounds like a farewell to Spain. Among his many poems celebrating the Holy Land is "Zionide" ("Ode to Zion"), his most famous work and the most widely translated Hebrew poem of the Middle Ages. He also carried on a heated controversy in verse with the opponents of his Zionist ideas.

Departure from Spain

He thought about and prepared for his journey to the Holy Land for many years. He was aided by a good friend, Halfon ha-Levi-Aldamyati, a very rich and cultivated Egyptian Jew whose trade relations extended as far as Yemen and India and who also frequently visited Spain. Judah ha-Levi left Spain in 1140. According to his carefully laid plans, he was first to embark for Egypt and then to proceed from there via the land route to Palestine. Aboard ship he composed a whole series of sea songs, which in both theme and mood represented a considerable innovation in Hebrew literature. His ship entered Alexandria Harbour on May 3, 1140, where he, along with a large Jewish party, was splendidly received. He was lodged in the magnificent home of Aaron ibn al-'ammānī, a noted Jewish physician and judge, and stayed in Egypt for several months. Many prominent Jews of the country came to admire him and to make his acquaintance, and he acquired many friends. From Alexandria he went to Cairo, or Fustat, the city where lived Samuel ben Hananiah, the Nagid, or head, of all Egyptian Jews, and there he was further acclaimed. Judah ha-Levi felt deep awe and humility in the land in which some of the biblical miracles had occurred and at the same time a kind of delight in all the beauties that revealed themselves to him. It seemed to him that his youth was restored; creative forces stirred within him and he wrote prolifically and easily. But he certainly always bore in mind his sacred destination and was often disturbed by the thought that death might yet intervene.

Death in Egypt

He did not in fact go beyond Egypt, although it is not known what detained him there. He died in July 1141 and was deeply mourned in Egypt. His death was romantically embellished in a legend that arose much later, according to which he was slain by a hostile Muslim just as he had arrived in Zion and was reciting his famous "Zionide." The legend found wide circulation and was repeated in detail by two well-known 19th-century poets, in German by Heinrich Heine in the *Romanzero* of 1851 and in Hebrew by Micah-Joseph Lebensohn in *Rabbi Yehudah ha-Levi* in 1869 (see also JEWISH PHILOSOPHY).

BIBLIOGRAPHY. J.H. SCHIRMANN'S biography of Judah ha-Levi (in Hebrew) in *Tarbiz*, 9:35–54, 219–240, 284–305, with corrections in vol. 10 and 11 (1937–40), is the only available, comprehensive study. Previous biographies are in-

complete and partly obsolete. SHELOMO D. GOITEIN discovered autographs of Judah ha-Levi and important documents concerning him in the manuscripts from the Cairo Geniza. He summarized his discoveries in "The Biography of R. Judah ha-Levi in the Light of the Cairo Geniza Documents," in *Proc. Am. Acad. Jewish Res.,* 28:41–56 (1959). For characteristics of Judah ha-Levi's personality, see J. JACOBS, "Judah Halevi: Poet and Pilgrim," in *Jewish Ideals and Other Essays* (1896); I. HEINEMANN, "Introduction," to the English translation of Judah ha-Levi's *Kuzari* (1947); S.W. BARON, "Yehudah Halevi: An Answer to an Historic Challenge," *Jewish Social Studies,* 3:243–272 (1941); J.M. MILLAS Y VALLICROSA, *Yehudd ha-Levi como poeta y apologistn* (1947); and Y.F. BAER, A *History of the Jews in Christian Spain,* vol. 1, pp. 59–77, 389–393 (1961, Eng. trans. from the 2nd Hebrew edition of 1959). The best existing edition of Judah ha-Levi's collected Hebrew poems (his *Dīwān*) has been published by H. BRODY, 4 vol. (1894–1930). The English translations by N. SALAMAN, *Selected Poems of Jehudah Halevi* (1924), with the Hebrew originals; by D. GOLDSTEIN, *Hebrew Poems from Spain,* pp. 89–120, 162–169 (1965); and the notes of FRANZ ROSENZWEIG to his German translation, 92 *Hymnen und Gedichte* (1926), are of interest. (J.Sc.)

Judaism

Judaism, the religion of the Jews, is the complex expression of a religious and ethnic community, a way of life as well as a set of basic beliefs and values, which is discerned in patterns of action, social order, and culture as well as in religious statements and concepts.

This article is divided into the following sections:

- Nature and characteristics
  - The religion of history
  - The "narrative theology" and later extrapolations
  - Basic affirmations, dispositions, and aims
- Basic beliefs and doctrines
  - God
  - Torah
  - Israel (the Jewish people)
  - Man
  - Ethics and society
  - The universe
  - Eschatology

  - Relation to Christianity
  - Relation to Islām
  - Relations with other religions
- The role of Judaism in Western culture and civilization
  - Its historic role
  - Its present role
  - Future prospects
- Present-day forms of Judaism

NATURE AND CHARACTERISTICS

God's presence in history

The religion of history. It is history that provides the clue to an understanding of Judaism, for its primal affirmations appear in early historical narratives. Many contemporary scholars agree that although the biblical (Old Testament) tales report contemporary events and activities, they do so for essentially theological reasons. Such a distinction, however, would have been unacceptable to the authors, for their understanding of events was not superadded to but was contemporaneous with their experience or report of them. For them, it was primarily within history that the divine presence was encountered. God's presence was also experienced within the natural realm, but the more immediate or intimate disclosure occurred in human actions. Although other ancient communities saw a divine presence in history, this was taken up in its most consequent fashion within the ancient Israelite. community and has remained, through many developments, the focus of its descendants' religious affirmations. It is this particular claim—to have experienced God's presence in human events—and its subsequent development that is the differentiating factor in Jewish thought. As ancient Israel believed itself through its history to be standing in a unique relationship to the divine, this basic belief affected and fashioned its life-style and mode of existence in a way markedly different from groups starting with a somewhat similar insight. The response of the people Israel to the divine presence in history was seen as crucial not only for itself but for all mankind. Further, God had—as person—in a particular encounter revealed the pattern and structure of communal and individual life to this people. Claiming sovereignty over the people because of his continuing action in history on its behalf, he had established a *berit* ("covenant") with it and had required from it obedience to his Torah (teaching). This obedience was a further means by which the divine presence was made manifest–expressed in concrete human existence. The corporate life of the chosen community was thus a summons to the rest of mankind to recognize God's presence, sovereignty, and purpose—the establishment of peace and well-being in the universe and in mankind.

History, moreover, disclosed not only God's purpose but also manifested man's inability to live in accord with it. Even the chosen community failed in its obligation and had, time and again, to be summoned back to its responsibility by divinely called spokesmen—the prophets—who warned of retribution within history and argued and reargued the case of affirmative human response. Israel's role in the divine economy and thus Israel's particular culpability were dominant themes sounded against the motif of fulfillment, the ultimate triumph of the divine purpose, and the establishment of divine sovereignty over all mankind.

The "narrative theology" and later extrapolations. When the biblical text is thus viewed, the community's basic affirmations come into relief. A paradigmatic statement is made in the narrative that begins with Genesis and concludes with Joshua. In the early chapters of Genesis the divine is described as Creator of the natural order, including mankind. In the Eden, Flood, and Tower of Babel stories, man is recognized as rebellious and disobedient. In the patriarchal stories (about Abraham, Isaac, Jacob, and Joseph) a particular family is called out of humankind to restore the thwarted relationship through personal and communal responsiveness. The subsequent history of the community thus formed is recounted so that the divinely sought restoration may be recognized and the nature of the obedient community may be observed: the Egyptian servitude, the going out from Egypt, the revelation of the "teaching," the wandering years, and finally fulfillment through entrance into the "land" (Canaan). The prophetic books (in the Hebrew Bible these include the historical narratives up to the Babylonian Exile—*i.e.*, Joshua, Judges, Samuel, and Kings) continue to deal with the rebellion–obedience tension, interpreting it within the changing historical context and adding new levels of meaning to the fulfillment–redemption motif.

Philosophical, mystical, and exegetical additions

It is from this "narrative theology," as it has been recited throughout the centuries, that new formulations of the primal affirmations have been drawn. These have been clothed in a number of vocabularies: philosophical, mystical, ethnic, political, and others. The emphases have been various, the disagreements often profound. No single exposition has exhausted the possibilities of the affirmations or of the relationship between them. Philosophers have expounded them on the highest level of abstraction, using the language of the available philosophic systems. Mystics have enveloped them in the extravagant prose of speculative systems and in simple folktales. Attempts have been made to encompass them in theoretical ethical statements and express them through practical ethical behaviour. Yet, in each instance, the proposed interpretations have had to come to terms with the biblical affirmations and with the particular mode of understanding them required by the spiritual and intellectual demands arising out of the community's experience. The biblical texts, themselves the products of a long period of transmission and embodying more than a single outlook, were subjected to extensive study and interpretation over many centuries and, when required, were translated into other languages. This activity gave rise to the Midrashim (expository and homiletic commentaries; singular Midrash), the Targumim (expository translations into Aramaic; singular Targum), and to Greek translations that also involved interpretation and explanation. Side by side with the biblical text there also existed oral tradition, concerned particularly with the legal aspect of the community's life but also containing other matters. This oral material—brought together at the end of the 2nd century CE (Common Era = AD) in an authorized collection, the Mishna—was in subsequent centuries studied and commented upon, both in Palestine and in Babylon. The results of these two processes were embodied in the Palestinian and Babylonian Talmuds (commentaries on the Mishna). The whole literature continued to provide the basis of further developments, so that any attempt to formulate a statement of the affirmations of Judaism must, however contemporary it seeks to be, give heed to the scope and variety of speculation and formulation in the past (see TALMUD AND MIDRASH).

Basic affirmations, dispositions, and aims. Judaism is not and cannot be viewed as an abstract intellectual system, although some of its affirmations may be couched in such terms. It affirms divine sovereignty disclosed in creation (nature) and in history, without necessarily insisting upon—but at the same time not rejecting—metaphysical speculation about the divine. It insists that the community has been confronted by the divine not as abstraction but as person, with whom the community and its members enter into relationship. It is—as the concept Torah (connoting "guidance" or "direction") indicates—a program of human action, rooted in this personal confrontation. Further, the response of this particular people to its encounter with God is viewed as significant for all mankind. The community is called upon to express its loyalty to God and the Covenant by exhibiting solidarity within its corporate life on every level—including every aspect of human behaviour, from the most public to the most private. Thus, even Jewish worship is communal celebration of the meetings with God in history and in nature. Yet the particular existence of the Covenant people is not thought of as contradicting but rather as enhancing human solidarity. This people, together with all men, is called upon to create political, economic, and social forms that will affirm divine sovereignty—embody it in communal existence. This task is carried out in the belief not that man will succeed solely by his own efforts in these endeavours but that these sought-after human relationships have both their source and their goal in God—who assures their actualization. Within the sphere of his existence in the community, each Jew is called upon to realize the Covenant in his personal intention and behaviour.

The Judaic and the human

In considering the basic affirmations of Judaism from this point of view it is best to allow indigenous formulations rather than systematic statements borrowed from other traditions to govern the presentation.

BASIC BELIEFS AND DOCTRINES

God. An early statement of basic beliefs and doctrines emerged in the liturgy of the synagogue some time during the last pre-Christian and first Christian centuries, although there is evidence that such formulations were not absent from the Temple cult that came to an end in the year 70 CE. A section of the Siddur (order of worship, or prayerbook) that has as its focus the recitation of a series of biblical passages (Deut. 6:4–9; Deut. 11:13–21; Num. 15:37–41) takes its name from the first of these, Shema ("Hear"): "Hear, O Israel! the Lord is our God, the Lord alone" (or ". . . the Lord our God, the Lord is one"). In the Shema—often regarded as the Jewish confession of faith, or creed—the biblical material and accompanying benedictions are arranged to provide a unified statement about God and his relationship to the world and Israel, as well as Israel's obligations toward and response to God. In this statement, God, who is the Creator of the universe and who has chosen Israel in love ("Blessed art thou, O Lord, who has chosen thy people Israel in love"), expressed by the giving of Torah, is declared to be "one"; his love is to be reciprocated by men who lovingly obey Torah and whose obedience is rewarded and rebellion punished. The goal of this obedience is God's "redemption" of Israel, a role foreshadowed by his action in bringing Israel out of Egypt.

Unity and uniqueness. At the centre of this liturgical formulation of belief is the concept of the divine unity. In its original setting, it may have served as the theological statement of the reform under Josiah, king of Judah, in the 7th century BCE (Before the Common Era = BC) when worship was centred exclusively in Jerusalem, and all other cultic centres were rejected, so that the existence of one shrine only was understood as affirming one deity. The idea, however, acquired further meaning. It was understood toward the end of the pre-christian era to proclaim—over against dualistic religious formulations in the Greco-Roman world—the unity of divine love and divine justice, as expressed in the divine names Yahweh and Elohim, respectively. A further expansion of this affirmation is found in the first two benedictions of this liturgical section, which together proclaim that the God who is the Creator of the universe and the God who is Israel's ruler and lawgiver are one and the same—as over against religious positions that insisted that the Creator God and the lawgiver God were separate and even inimical. Subsequently, this affirmation was developed in philosophical and mystical terms by both medieval and modern thinkers.

Divine love and justice

Creativity. As has been noted, this "creed," or "confession of faith," underscores in the first benediction the relation of God to the world as that of Creator to creation. "Blessed art thou, O Lord our God, King of the Universe, who forms light and creates darkness, who makes peace and creates all things." It adds the assertion that his activity is not in the past but is ongoing and continuous, for "he makes new continually, each day, the work of creation"; thus, unlike the deity of the Stoic world view, he remains actively present in nature. This "creed" is concerned as well to come to terms with the ever-present problem of evil. Paraphrasing Isa. 45:7, "I form the light and create darkness; I make peace, and create evil," it changes the last word to "all" (or "all things") rather than "evil." The change was clearly made to avoid the implication that God is the source of moral evil. Judaism, however, did not flinch from confronting the problem of pain and suffering in the world and affirming the paradox of suffering and divine sovereignty, of pain and divine providence, refusing to accept the concept of a partial God—a God that is Lord over only the harmonious and pleasant aspects of reality.

Divine Providence

Activity in the world. The second and the third benedictions deal with divine activity within the realm of history and human life. God is teacher of men through the giving of instruction (Torah); he acts in the life of mankind in historical events; he has chosen a particular people—Israel—in love to witness to his presence and his desire for a perfected society; he will, as redeemer, enable man to experience that perfection. These activities, together with creation itself, are understood to express divine compassion and kindness as well as justice (judgment), recognizing the sometimes paradoxical relation between them. Taken together, they disclose Divine Providence—God's continual activity in the world. The constant renewal of creation (nature) is itself an act of compassion overriding strict justice and affording mankind further opportunity to fulfill the divinely appointed obligation. Yet the basically moral nature of God is asserted in the second of the biblical passages that form the core of this liturgical statement (Deut. 11:13-21). Here, in the language of its agricultural setting, the community is promised reward for obedience and punishment for disobedience. The intention of the passage is clear: obedience is rewarded by the preservation of order, so that *the* community and its members find wholeness in life; while disobedience—rebellion against divine sovereignty—shatters older, so that the community is overwhelmed by adversity. The passage of time has made the original language unsatisfactory (promising rain, crops, and fat cattle), but the basic principle remains, affirming that, however difficult it is to recognize the fact, there is a divine law and judge. Support for this affirmation is drawn from the third biblical passage (Num. 15:37–41), which explains that the fringes the Israelites are commanded to wear on the corners of their garments are reminders to observe the commandments of God, who brought forth Israel from Egyptian bondage. The theme of divine redemption is elaborated in the concluding benediction to point toward a future in which the as yet fragmentary rule of God will be brought to completion: "Blessed is his name whose glorious kingdom is for ever and ever."

Otherness and nearness. Within this complex of ideas, other themes are interwoven. In the concept of the divine Creator there is a somewhat impersonal or remote quality—of a power above and apart from the world—which is underscored by such expressions as the trifold declaration of God's holiness, or divine otherness, in Isaiah 6:3: "Holy, holy, holy is the Lord of hosts. . . ." The development of surrogate divine names for biblical usage, as well as the substitution of Adonai ("my Lord") for the tetragrammaton (YHWH) in the reading of the Bible itself, suggests an acute awareness of the otheiness of God. Yet this has as its countertheme the affirmation of divine nearness. In the biblical narrative it is God himself who is the directly active participant in events, an idea that is emphasized in the liturgical narrative (Haggada) recited during the Passover meal (seder): "and the Lord brought us forth out of Egypt—not by an angel, and not by a seraph, and not by a messenger. . . ." The surrogate divine name *Shekhina*, the Present One, is derived from a Hebrew root meaning "to dwell," again calling attention to divine nearness ("presence"). The relationship between these two affirmations, otherness and nearness, is expressed in a Midrashic statement, "in every place that divine awesome majesty is mentioned in Scripture, divine abasement is spoken of, too."

The divine "thou"

Closely connected with these ideas is that of divine personhood, most particularly disclosed in the use of the pronoun "thou" in direct address to God. The community and the individual, confronted by the Creator, teacher, redeemer, addresses the divine as living person, not as theological abstraction. The basic liturgical form, the *berakha* ("blessing"), is usually couched in the second person singular: "Blessed art thou. . . ." This relationship, through which remoteness is overcome and presentness is established, illuminates creation, Torah, and redemption, for it reveals the meaning of love. From it flow the various possibilities of expressing the divine–human relationship in personal, intimate language. Sometimes, especially in mystical thought, such language becomes extravagant, foreshadowed by such vivid biblical metaphors as the husband–wife relation in Hosea; the "adoption" motif in Ezek. 16; and the firstborn-son relation (Ex. 4:22). Nonetheless, although terms of personal intimacy are used widely to express Israel's and man's relationship with God, such usage is restrained by the accompanying sense of divine otherness. This is to be seen in the liturgical "blessings," where, following the direct address to God, in which the second person singular pronoun is used, the verbs, with great regularity, are in the third person singular, thus providing the requisite tension between nearness and otherness, between the impersonal and the personal.

Modern views of God. The Judaic affirmations about God have not always been given the same emphasis nor have they been understood in the same way. This was true in the Middle Ages, among both philosophers and mystics, and in modern times down to the 1970s. In the 19th century, western European Jewish thinkers attempted to express and transform these affirmations in terms of German Idealist philosophy: more recently, philosophical Naturalism was offered as the suitable content of Judaism, while still retaining the traditional God language. The meaningfulness of the whole body of such affirmations, moreover, has been called into question by the philosophical schools of Logical Positivism and Linguistic Analysis. Most recently, the destruction of 6,000,000 Jews during the Nazi period has raised the issue of the validity of such concepts as God's presence in history, divine redemption, the covenant, and the chosen people. In every case, however, it is with the structure of ideas here noted that these challenges must deal.

The divine teaching or guidance

Torah. The concept "Giver of Torah" played a central role in the understanding of God, for it is Torah, or "teaching," that confirms the events recognized by the community as the act of God. Thus, for example, in the synagogue's reckoning of the Ten Commandments (more accurately, the Ten Utterances), a paradigmatic expression of Torah, the first is the historically oriented statement: "I am the Lord your God, who brought you out of the land of Egypt, out of the house of bondage" (Ex. 20:2). This provides the basis for the binding character of the provisions that follow, to which Israel is now to respond in obedience.

The meanings of Torah. The word Torah (plural *torot*) comes from a Hebrew root meaning "to point the way, give direction." While this sense is clearly suggested by the history recounted in the Bible, the term must be understood as involving more than guidance through the tangle of events. It implies the pattern of behaviour called for on every level of communal and individual living because of the ultimate normative guidance that has been given. Further, the source of the pattern is acknowledged to be divine, an affirmation conceptualized in the phrase *Torah min ha-shamayim,* "Torah from Heaven." When these two aspects of the term are recognized, it becomes evident that to translate Torah by the word law (as is commonly done) is, while not entirely erroneous, a grave distortion of its full meaning. Viewed from this larger perspective, Torah is the entire content of Judaism: its sacred Scriptures; its oral traditions; its theological affirmations; its historical recollections; its ethical obligations; its ritual and ceremonial observances; and its interpretations of its authoritative texts. It also has more restrictive or specific references. As the New Jewish Version of *The Torah: The Five Books of Moses* (1962) indicates, it may mean ritual prescription in a very narrow sense—"This is the ritual [*torah*] of the burnt offering," (Lev. 6:2)—or legal prescription—"These are the laws, rules, and directions [*torot*] . . ." (Lev. 26:46).

Written and oral Torah. A wider and more general usage is as the name for the Pentateuch (the five books of Moses) in the threefold division of Scriptures: Torah, Nevi'im *(Prophets),* Ketuvim (Writings). This reflects a narrowing of the concept "Torah from Heaven" to "Torah (given) to Moses at Sinai," although even the latter has been understood to include more than the five books of Moses. Nonetheless, traditionally the concept was understood to affirm not only the divine source but also the Mosaic authorship of Genesis, Exodus, Leviticus, Numbers, and Deuteronomy.

The believed Sinaitic origin of oral Torah

As indicated, while the phrase "Torah (given) to Moses at Sinai" may be understood in a restricted sense, the Pharisaic–rabbinic tradition (originated by the Pharisees and continued by the Talmudic rabbis) viewed it as referring to a wide body of teaching. According to this position, which dominated Jewish thought until the modern era and still commands the allegiance of traditionalists, the encounter between God and Israel at Sinai deposited with Israel not only a written Torah *(Torah she-bikhtav)* but also an oral Torah *(Torah she-beʿal* pe) that was transmitted from generation to generation.

Oral Torah is not merely the tradition brought together in the Mishna. It also comprises the interpretations of the written Torah, collected in the Midrashic literature, and the commentaries (Gemara) on the Mishna, collected in the Talmud. Over the centuries much of this oral tradition, eventually set down in writing, was commented upon so that a vast literature grew up embodying many levels of interpretation and reflecting the varying experiences and situations of the Jewish community.

Central to this vast structure was, of course, the Jewish community's concern to live in accordance with the divine will embodied and expressed in Torah in the widest sense. Scripture, Halakhic and Haggadic Midrash, Mishna, and Gemara were the sources from which the leaders of the communities drew in order to provide both stability and flexibility. The dispersion of the Jews outside Palestine confronted communities and individuals with novel and unexpected situations that had to be dealt with in such a way as to provide continuity while at the same time making it possible to exist with the unprecedented.

Prophecy and religious experience. Torah in the broad sense includes the whole Hebrew Bible, including the prophetic books. In biblical prophecy, God is seen as continuing to be disclosed in the nexus of historical events and as making ethical demands upon the community. According to rabbinic Judaism, this source of Torah—the charismatic person—dried up in the period of Ezra (*i.e.*, about the time of the return from the Babylonian Exile in the 5th century BCE). This opinion may have been a defensive reaction to the luxuriant growth of apocalyptic speculation about the end of the world and the kingdoms of this world, a development that was considered dangerous and unsettling in the period after the Bar Kokhba revolt (132–135 CE). Indeed, there appears to have developed an ongoing suspicion that unrestrained individual experience as the source of Torah was inimical to the welfare of the community. Such an attitude was by no means new. Deuteronomy (13:2–19) had already warned against such "misleaders." The culmination of this attitude is to be found in a Talmudic narrative in which even the bat qol, the divine "echo" that announces God's will, is ignored on a particular occasion. Related to this is the reluctance on the part of teachers in the early Christian centuries to point to wonders and miracles in their own time. Far from expressing an ossification of religious experience—the development of the Siddur and the Talmudic reports on the devotional life of the rabbis contradict such an interpretation—the attitude seems to be a response to the development of such religious enthusiasm as was exhibited, for example, in the behaviour of the Christian Church in Corinth (I Cor.) and among Gnostic sects and sectarians. Thus, even among the speculative mystics of the Middle Ages, where allegorization of Scripture abounds, the structure of the community and the obligations of the individual are not displaced by the deepening of personal religious life through mystical experience. The decisive instance of this is Joseph Karo (16th century), who was thought to be in touch with a supernal guide, but who was, at the same time, the author of an important codification of Jewish law, the Shulhan *ʿarukh.*

Anticharismatic trends in postbiblical Judaism

Admittedly, there have been occasions when Torah, even in the wide sense, has been rigidly viewed and applied. In certain historical situations, the dynamic process of rabbinic Judaism has been treated as a static structure. What is of greater significance, however, is the way in which this tendency toward inflexibility has been checked and reversed by the inherent dynamism of the rabbinic tradition.

Modern views of Torah. In modern times—since the end of the 18th century—the traditional position has been challenged both in detail and in principle. The rise of biblical criticism has raised a host of questions about the origins and development of Scripture and thus about the very concept of Torah, in the senses in which it has functioned in Judaism. Naturalistic views of God have required a reinterpretation of Torah in sociological terms as the ideals and sancta (holy things) of the Jewish people. Other and varying positions of many sorts have been and undoubtedly will be forthcoming. What is crucial, however, is the concern of all these positions to retain—with whatever modifications are required—the concept of Torah as one of the central and continuing affirmations of Judaism.

Israel (the Jewish people). *Choice and covenant.* The concluding phrase of the second benediction of the liturgical section referred to above reads: "who has chosen thy people Israel in love." Here the basis of the relationship between God and Israel set forth in the biblical narrative is clearly and succinctly stated: the choice of this people was determined by no other factor than divine love. The patriarchal narratives, beginning with the 12th chapter of Genesis, presuppose the choice, which is set forth explicitly in Deut. 7:6–8 in the New Jewish Version:

> For you are a people consecrated to the Lord your God: of all the peoples on earth the Lord your God chose you to be His treasured people. It is not because you are the most numerous of peoples that the Lord set His heart on you and chose you—indeed you are the smallest of peoples; but it was because the Lord loved you and kept the oath He made with your fathers that the Lord freed you with a mighty hand and rescued you from the house of bondage, from the power of Pharaoh king of Egypt.

Later rabbinic traditions on occasion sought to base the choice upon some special merit of Israel, and the medieval poet and theologian Judah ha-Levi suggested that the openness to divine influence originally present in Adam continued only within the people of Israel.

However understood, the background of this choice is the recurring disobedience of mankind narrated in Genesis 2–11. Abraham and his descendants are singled out not merely as the object of the divine blessing but also as its channel to all mankind. The choice, however, requires a reciprocal response from Abraham and his lineage. That response is obedience, as exemplified in the first instance by Abraham's readiness to leave his "native land" and "father's house" (Gen. 12:1). This twofold relationship was formalized in a mutually binding agreement, a covenant between the two parties. The covenant, thought by some modern biblical scholars to reflect the form of ancient suzerainty treaties, indicates (as in the Ten Utterances) the source of Israel's obligation—the acts of God in history—and the specific requirements those acts impose. The formalization of this relationship was accomplished by certain cultic acts that may, according to some contemporary scholars, have been re-enacted on a regular basis at various sacred sites in the land, eventually being centralized in Jerusalem. The content of the covenantal obligations thus formalized was Torah. Israel was bound in obedience, and Israel's failure to obey provided the occasions for the prophetic messages. The prophets, as spokesmen for God, called the community to renewed obedience, threatened and promised disaster if such was not forthcoming, and—recalling the source of the choice in divine love—sought to explain its persistence even when, strictly understood, the covenant should have been repudiated by God.

The binding agreement between God and Israel

The choice of Israel has its concrete expression in the requirements of the precepts (mitzwot, singular mitzwa) that are part of Torah. The blessing recited before the public reading of the pentateuchal portions on Sabbath, festivals, holy days, fasts, and certain weekdays refers to God as "He who chose us from among all the peoples and gave us His Torah," thus emphasizing the intimate relationship between the elective and revelatory aspects of God.

Priest and witness to the nations

Israel's role was not defined solely in terms of its own obedience to the commandments. As noted, Abraham and his descendants were seen as the means by which the estrangement of disobedient mankind from God was to be overcome. Torah was the formative principle underlying the community's fulfillment of this obligation. Israel was to be "a kingdom of priests and a holy nation" (Ex. 19:6) functioning within mankind and for its sake. This task is enunciated with particular earnestness in the writings of the prophets. In Isa. 43–44, Israel is declared to be God's witness and servant who is to bring the knowledge of God to the nations. In chapter 42 of the same book Israel is declared to be a "covenant of the people, a light to the nations, to open the blind eyes, to bring out the prisoners from the prisons, and them that sit in darkness out of the prison house" (42:6–7). This double motif of a chosen people and witness to the nations, joined to that of the righteous king, developed in the biblical and postbiblical periods into messianism in its several varieties (see below Eschatology).

The intimate relation between choice, covenant, and Torah determined the modality of Israel's existence. Religious faith, far from being restricted to or encapsulated in the cult, found its expression in the totality of communal and individual life. The obligation of the people was to be the true community, in which the relationship between its members was open, in which social distance was repudiated, and in which response to the divine will expressed in Torah was called for equally from all. One of the recurring themes of the prophetic movement was the rejection of any tendency to limit divine sovereignty to the partial area of "religion," understood as the realm of the priesthood and cult. Subsequent developments continued this theme, albeit in other forms. Pharisaic Judaism and its continuation, rabbinic Judaism, down to modern times resolutely held to the idea of the all-pervasive functioning of Torah, so that however the various Jewish communities over the centuries may have failed to fulfill the ideal, the self-image of the people was that of "holy community."

Israel and the nations. The double motif of "treasured people" and "witness" was not without its tensions as it functioned in ongoing history. Tensions are especially visible in the period following the return from the Babylonian Exile at the end of the 6th and beginning of the 5th centuries BCE. It is, however, doubtful whether the use of such terms as nationalism, particularism, or exclusivism (as opposed to universalism) are of help in understanding the situation. Emphasis has, for example, been laid upon Ezra 9:2 and 10:2, in which the re-established community is commanded to give up wives taken from "the peoples of the land." This is taken as indication of the narrow, exclusivistic, nationalistic nature of Judaism, without reference to the situation in which a harassed contingent of returned exiles sought to maintain itself in a territory surrounded by politically unfriendly if not hostile neighbours. Nor does this represent racialism, since foreigners were admitted to the Jewish community, and in the following centuries some groups engaged in extensive missionary activities, appealing to the nations to join themselves to the God of Israel, who was the one true God, the Creator of the heavens and earth.

The welding of exclusivism and universalism

A more balanced view recognizes that within the Jewish community religious universalism was affirmed at the same time and by the same people who understood the nature of Jewish existence in politically particularistic (*i.e.*, nationalistic) terms. To neglect either side is to distort the picture. In no case was the universalism disengaged from the reality of the existing community, even when it was expressed in terms of the ultimate fulfillment of the divine purpose, the restoration of the true covenantal relationship between God and all mankind. Nor was political particularism, even under circumstances of great provocation and resentment, misanthropic. The most satisfactory figure in describing the situation of the restored community, and one that continues to be useful in dealing with later episodes, is that of the human heartbeat, made up of two functions, the systole, or contraction, and the diastole, or expansion. There have been periods of contraction and of expansion in the history of Judaism. The emphasis within the abiding tension has been determined by the historical situation in which the community found itself. To generalize in one direction or the other is fatal to an understanding of the history and faith of the "holy community."

The people and the land. Closely related to the concept of Israel as the chosen, or Covenant, people is the role of the land of Israel. In the patriarchal stories, settlement in Canaan is an integral part of the fulfillment, from the divine side, of the Covenant. The goal of the Israelites escaping from Egypt is the same land, and entry into it is understood in the same fashion. The return from the Babylonian Exile, too, is seen in the same light. As there was the choice of a people, so was there the choice of a land—and for much the same reason. It was to provide the setting in which the community could come into being as it carried out the divine commandments. This choice of the land contrasts with the predominant ideas of other peoples in the ancient world, in which the deity or divinities were usually bound to a particular parcel of ground outside of which they lost their effectiveness or reality. Though some such concepts may have crept into Israelite thought during the period of the kings (from Saul to Jehoiachin), the crisis of the Babylonian Exile was met by a renewal of the affirmation that the God of Israel was, as Lord of all the earth, free from territorial restraint, although He had chosen a particular territory for this chosen people. Here again the twofold nature of Jewish thought is apparent, and both sides are to be affirmed or the view is distorted. Following the two revolts against Rome (66–73 CE and 132–135 CE), the Jews of the ever-widening dispersion continued, as they had before these disasters, to cherish the land. Once again it became the symbol of fulfillment, so that return to it was looked upon as an integral part of messianic restoration. The liturgical patterns of the community, insofar as they were concerned with natural phenomena (*e.g.*, planting, rainfall, harvest, and the annual cycle) rather than historical events, were based on geography, topography, and agricultural practices of the land, viewed as paradigmatic. Although Jews continued to live in the land, yet for most in the distant dispersion it was idealized and viewed primarily in eschatological terms—at the end of days, in the world to come. The 11th-century poet Judah ha-Levi not only longed for it in verse but also gave it a significant role in his theological interpretation of Judaism and eventually sought to return to it from his native Spain. It was not, however, until the 19th century that the land began to play a role other than the goal of pilgrimage or of occasional settlement by pietists and mystics. At the end of that century the power of the utopian concept was released in eastern Europe in a cultural renaissance that focussed, in part, on a return to the land and, in western and central Europe, in a political movement coloured by nationalist motifs in European thought. The coming together of these two gave rise to Zionism. The political movement reflected a dissatisfaction with the view of the Jews as merely a body or organization of religious believers—like the Christian churches—an interpretation that had become dominant following the political emancipation of the Jews in the period after Napoleon. The political emphasis of Zionism aroused considerable opposition from those Jews who were convinced of the necessity of a churchly definition of Judaism parallel to the Roman Catholic and Protestant communions. While this conflict erupted in bitter debate during the first half of the 20th century, the events of the Nazi period in Europe brought it to a close, except for some sporadic renewals on the part of numerically insignificant groups. For the most part, although there are few satisfactory formulations—theological or secular—there is a working consensus that acknowledges a significant role to the land and recognizes that a churchly definition of the Jewish community, while strategically acceptable in some situations, does not do justice to history and is not theologically sound if it suggests that Judaism merely consists of abstract doctrines and dogmas. Some Jews, however, argue that whatever the past has been, the future of the Jewish community is with those movements in the modern world that cut across or transcend the particularity Zionism represents.

The land as ideal and reality

Modern reinterpretations or rejections of chosenness

Modern views of the people Israel. The nature of the people Israel and of the land of Israel has been variously interpreted in the history of Jewish thought. In modern times, some interpretations have been deeply influenced by contemporary political and social discussions in the general community. Thus, for example, Zionist theoreticians were influenced by concepts of political nationalism on the one hand and by socialist ideas on the other. Further, the challenge to traditional theological concepts in the 19th century raised issues about the meaning of the choice of Israel, and Jewish thinkers borrowed from romantic nationalism such ideas as the "genius" of the people. Most recently, attempts have been made to approach the question sociologically, dismissing the theological mode as unhelpful. The concept of the chosen people is then understood to indicate a specific role deliberately undertaken by the Jewish people and similar to that espoused by other groups (*e.g.*, "Manifest Destiny" by the

American people). The establishment of the State of Israel has motivated some thinkers to call for a repudiation of the idea, in keeping with the position that normal existence for the Jews requires the dismissal of such concepts. Although only a small minority of Jewish thinkers espouse this position, the doctrine of the choice is not without its theological difficulties even for those who continue to affirm it.

Man. *The image of God.* In Gen. 1:26, 27; 5:1; and 9:6 two terms occur, "image" and "likeness," that seem to indicate clearly the biblical understanding of man's essential nature: he is created in the image and likeness of God. Yet the texts in which they are used are not entirely unambiguous; the idea they point to does not appear elsewhere in Scriptures; and the concept is skirted cautiously in the rabbinic interpretations. What the image and likeness of God or the divine image refer to in the biblical text is not made explicit, and, in the light of the psychosomatic unity of man that dominates the biblical concepts, it is not possible to escape entirely from the implication of "bodily" similarity. What the terms meant in their context at the time and whether they reflect mythological usages taken over from other Near Eastern thought is a question that is by no means answered. Evidence of the problematic nature of the concept is found in rabbinic Judaism. Akiba (2nd century CE) ignored the usages in Gen. 1 and 5 and emphasized 9:6, understanding it to mean, contrary to the usual interpretation, "after an image, God made man," that is, in the Platonic sense of a heavenly archetype. He did not wish to allow any resemblance between God and any created being. Other interpretations sought to avoid the difficulty by rendering ***elohim*** (a plural form) not as "God" but as "divine beings" (*i.e.*, angels: "God created man after the image of divine beings ***[elohim]").***

"Soul," "spirit," or "life"

The earthly-spiritual creature. In those parts of the Jewish community of antiquity that were deeply influenced by Greek philosophical ideas, a dualistic interpretation of man was offered. Here the divine likeness suggested is that of the immortal, intellectual soul as contrasted to the body. Still other thinkers, both ancient and modern, have understood that likeness to be ethical, with particular emphasis placed on freedom of the will. What is evident is that no doctrine of man can be erected on the basis of these several verses alone, but that a broader view must be taken, in which they are assimilated. A careful examination of the biblical material, particularly the words ***nefesh, neshama,*** and ***ruah,*** which are often too broadly translated as "soul" and "spirit," indicates that these must not be understood as referring to the psychical side of a psycho-physical pair. A man did not possess a ***nefesh*** but rather was a ***nefesh,*** as Gen. 2:7 says: ***"wa-yehi ha-adam le-nefesh hayya"*** (". . . and the man became a living being"). Man was, for most of the biblical writers, what has been called "a unit of vital power," not a dual creature separable into two distinct parts of unequal importance and value. While this understanding of the nature of man dominated biblical thought, in apocalyptic literature (2nd century BCE–2nd century CE) the term ***nefesh*** began to ***be*** viewed as a separable psychical entity with existence apart from body. Although this was not entirely divorced from the unitary biblical view, nonetheless a functional body–soul dualism was present in such literature. In the Alexandrian version of Hellenistic Judaism the orientation toward Greek philosophy, particularly the Platonic view of the soul imprisoned in the flesh, led to a clear-cut dualism with a negative attitude toward the body. Rabbinic thought remained closer to the biblical position, at least in its understanding of man as a psychosomatic unit, although the temporary separation of the components after death was an accepted position.

Sheol, resurrection, and immortality

The biblical view of man as an inseparable psychosomatic unit meant that death was understood to be his dissolution. Yet, although man ceased to be, this dissolution was not utter extinction. Some of the power that functioned in the unit may have continued to exist, but it was not to be understood any longer as life. The existence of the dead in ***sheol,*** the netherworld, was not living but the shadow or echo of living. For most of the biblical writers this existence was without experience, either of God or of anything else; it was unrelated to events. To call it immortality is to empty that term of any vital significance. However, this concept of ***sheol,*** along with belief in the possibility of occasional miraculous restorations of dead individuals to life, and perhaps even the idea of the revival of the people of Israel from the "death" of exile, provided a foothold for the development of belief in the resurrection of the dead body at some time in the future. The stimulus for this may have come from ancient Iranian religion, in which the dualistic cosmic struggle is eventually won by life through the resurrection of the dead. This idea began to appear in sketchy form in postexilic writings (Isa. 26:19; Dan. 12:2). In this view there is life only in the psychosomatic unit now restored. This restoration was bound up with the eschatological hope of Israel (see ***Eschatology,*** below) and was limited to the righteous. In subsequent apocalyptic literature a sharper distinction between body and soul was entertained, and the latter was conceived of as existing separately in a disembodied state after death. Although at this point the doctrine of the resurrection of the body was not put aside, nonetheless, the direction of thinking changed. The shades of *sheol* were now thought of as souls, and real personal survival—with continuity between life on earth and in *sheol*—was posited. Now Greek ideas, with their individualistic bent, began to have influence, so that the idea of resurrection that was in some way related to a final historical consummation, began to recede. True life after death was now seen as release from the bondage of the body, so that in place of, or alongside of, the afterlife of physical resurrection was set the afterlife of the immortal soul.

It was not the status of the soul, however, that concerned either the biblical or the rabbinic thinkers. What emerged from the latter's discussions of the biblical themes was an emphasis on the ethical import of man's composite makeup. Man is in a state of tension or equilibrium between the two foci of creation, the "heavenly" and the "earthly." He necessarily participates in both, and, as such, is the one responsible creature who can truly serve his Creator, for he alone, having both sides of creation in him, may choose between them. It is the ability to make an ethical choice that is the distinguishing mark of man. This ability is not derived from the "heavenly" side but resides in the double basis of man's existence. It is important to recognize this as something other than a body-soul dualism in which the soul is the source of good and the body the basis of evil. Such an attitude, however, did appear in some rabbinic material and was often affirmed in medieval philosophical and mystical speculations and by some of the later moralists. These are genuine variations and developments of the biblical-rabbinic ideas and may not be dismissed as aberrations. They represent authentic attempts to come to terms with other currents of thought and with the problems and uncertainties inherent within the earlier materials themselves.

The ethically ***bound creature.*** Mankind is then viewed, however this position is arrived at, as ethically involved. The first 11 chapters of Genesis are posited upon this responsibility, for the implicit assumption of the prepatriarchal stories is man's ability to choose between obedience and disobedience. Rabbinic Judaism, taking up the covenant-making episode between God and Noah (Gen. 9:8–17), developed it as the basis of mankind's ethical obligation. All men, not merely Israel, were engaged in a covenant relationship with God, which was spelled out in explicit precepts—variously enumerated as six, seven, or even 10 and occasionally as many as 30—that reflect general humanitarian behaviour and are intended to assure the maintenance of the natural order by the establishment of a proper human society. The Covenant with Israel was meant to bring into being a community that would advance the development of this society through its own obedience and witness.

Man's nature, viewed ethically, was explained in rabbinic Judaism not only as a tension between the "heavenly" and "earthly" components but also as a tension between two "impulses." Here again, fragmentary and allusive

The good and evil impulses

biblical materials were developed into more comprehensive statements. The biblical word *yetzer* means "plan," that which is formed in man's mind. In the two occurrences of the word in Genesis (6:5; 8:21), the plan or formation of man's mind is described as *ra,* perhaps "evil" in the moral sense or maybe no more than "disorderly," "confused," "undisciplined." The other biblical occurrences do not have this modifier. Nonetheless, the Aramaic translations (Targumim) invariably denominated it as *bisha* ("wicked") wherever it occurred. Rabbinic literature created a technical term *yetzer ha-raʿ* ("the evil impulse") to denote the source within man of his disobedience, and, subsequently, the counterterm *yetzer ha-ṭov* ("the good impulse") to indicate man's obedience. These more clearly suggest the ethical quality of man's duality, while their opposition and conflict point to man's freedom and the ethical choices he makes. Indeed, it is primarily within the realm of the ethical that Judaism posits freedom, recognizing the bound, or determined, quality of much of his existence (*e.g.*, his natural environment or physiological makeup).

It is this ethically free creature who stands within the covenant relationship and who may choose to be obedient or disobedient. Sin, then, is ultimately deliberate disobedience or rebellion against the divine sovereign. This is more easily observed in relation to Israel, for it is here that the central concern of Judaism is most evident and the subject discussed in greatest detail. It should be noted, however, that since, according to Judaic tradition, all mankind stands within a covenant relation to God and is commanded to be moral and just, essentially the same choice is made universally. In technical language, the acceptance of divine sovereignty by the people of Israel and by the individual within that community is called "receiving the yoke of the kingship." This involves intellectual commitment to a basic belief, as expressed by the Deuteronomic proclamation: "Hear, O Israel, the Lord, our God, the Lord is one!" At the same time it imposes obligations in terms of communal and individual behaviour. These two responses are understood to be inextricably bound together, so that rejection of the divine sovereign is manifest as denial of God both intellectually and practically. It amounts to "breaking the yoke of the kingship." In more specific terms, sin is sometimes summed up under three major, interrelated headings: idolatry, murder, and illicit sexual behaviour, each and all of which explicitly and implicitly involve rebellion, for they involve activities that deny—if not God's existence—his commanding relationship and the requirement of man's response. Such behaviour destroys the community and sets individual against individual, thus thwarting the ultimate purpose of God, the perfected human society.

Teshuva ("turning")

If, however, man is free to choose rebellion and to suffer its consequences, he is also able to turn back to God and to become reconciled with him. The Bible—most particularly the prophetic writings—is filled with this idea, although the term *teshuva* ("turning") came into use only in rabbinic sources. Basically it grows out of the covenant and God's unwillingness—despite man's failures—to break off his relationship. In rabbinic thought it is apparently assumed that even the direst warnings of utter disaster and rejection imply the possibility of turning back to God, motivated by remorse and the desire for restoration. Divine readiness and human openness are the two sides of the process of reconciliation. What was expressed in prophetic literature in the immediate historico-political situation was stated in the synagogal liturgy in connection with pentateuchal and prophetic lessons and the homilies developed from them. Thus, the divine invitation was constantly being offered. Man was called upon to atone for his rebellion by positive action that repudiated his failure. He was summoned to reconstitute wholeness in his individual life and community in society.

Historically viewed, Jewish existence, as it developed under rabbinic leadership, following after the two disastrous rebellions against Rome, was an attempt to reconstitute a community of faith expressed in worship and in an ordered society that would enable the individual to live a hallowed life of response to the divine will. Although this plan was not spelled out in detail, it was probably understood to be the paradigm for the eventual reconstruction of humanity.

Medieval and modern views of man. The Jewish view of man is certainly less clearly articulated than its affirmations concerning God. Nonetheless, it is evident that its central concern was ethical. The question of how man as individual and community was to behave was the focus of interest. Yet it is also clear that metaphysical concerns, however rudimentary in the beginning, were included in the developing discussion. Medieval philosophers sought an accommodation between the doctrine of the resurrection of the body and the concept of the immortality of the soul. The greatest of them, Moses Maimonides (1135–1204), propounded an extremely subtle position that equated immortality with the cleaving of the human intellect to the active intellect of the universe, thus limiting it to philosophic adepts. In the modern period, the impact of various philosophical and psychological schools has further fragmented the situation so that little or no consensus is evident, although resurrection or immortality language is still used even when its content is uncertain. But alongside this lack of agreement, the view that man is to be understood, however else, as a creature who makes free ethical choices for which he is responsible remains—although variously articulated—the basic affirmation of Judaism about man.

The imitation of God

Ethics and society. *The ethical emphasis of Judaism.* Jewish affirmations about God and man intersect in the concept of Torah as the ordering of human existence in the direction of the divine. Man, however else understood, is an ethically responsible creature responsive to the presence of God in nature and in history. Although that responsiveness is expressed on many levels, it is within the horizontal relationship of man to man that it is most explicitly called for. The pentateuchal legislation sets down, albeit within the limitations of the structures of the ancient Near East, the patterns of interpersonal relations. The prophetic messages are deeply concerned with these demands and see the disregard of them as the source of social and individual disorder. No segment of society, even the most exalted, is free of ethical obligation. Indeed, the transformation of prophetism from its earlier form as ecstaticism and soothsaying is seen in the ethical confrontation of David by Nathan ("Thou art the man") for seducing Bathsheba and arranging to have her husband killed (II Sam. 12). What is particularly striking is the affirmation that God is not only the source of ethical obligation but is himself the paradigm of it. In the so-called Code of Holiness (Lev. 19), it is imitation of divine holiness that is offered as the basis of human behaviour in the ethical sphere as well as the cultic-ceremonial. Concern for the economically vulnerable members of the community; obligations toward neighbours, hired labourers, and the physically handicapped; interfamilial relationships; and attitudes toward strangers (*i.e.*, non-Israelites) were all motivated by the basic injunction, "You shall be holy, for I, the Lord your God, am Holy." Acceptable human behaviour is, therefore, "walking in all His ways" (Deut. 11:22). The dialectic relation between God and man in the literary prophets also exhibits divine righteousness and divine compassion as patterns to be emulated in the life of the community.

This theme, *imitatio Dei* ("imitation of God"), as developed in rabbinic Judaism, is expressed succinctly in a comment on the verse from Deuteronomy quoted above. In response to the question of how it is possible to walk "in all His ways," the reply is made (*Sifre* Deut. 85a): "As He is merciful and gracious, so be you merciful and gracious. As He is righteous so be you righteous. As He is holy, strive to be holy." Indeed even more daringly, God is described as clothing the naked, nursing the sick, comforting the mourners, burying the dead, so that man may recognize his own obligations.

Interpenetration of communal and individual ethics. What stands out in the entire development of Jewish ethical formulations is the constant interpenetration of communal and individual obligations and concerns. Al-

The just man in a just society

though in the Book of Ezekiel (see especially chapter 18) emphasis is laid on individual responsibility, "the person who sins shall die," in contrast to the more widespread statement of communal involvement, "visiting the sins of the fathers upon the children" (*e.g.*, Ex. 20:5), these two aspects of ethical conduct are never entirely distinguished in Judaism. The just society requires the just man, and the just man functions within the just society. The concrete expression of ethical requirements in legal precepts took place with both ends in view, so that the process of beginning the holy community and the formation of the *ḥasid* ("pious"), the man of steadfast devotion to God, were concomitant processes. The relationship between the two is, of course, often mediated by the historical situation, so that in some periods one or the other moves to the centre of practical interest. In particular, the end of the Judaean state (70–135 CE) truncated the communal aspect of ethical obligations, often limiting discussion to apolitical responsibilities rather than to the full range of social involvements. The re-establishment of the State of Israel in the 20th century has, therefore, reopened for discussion areas that have for millennia been either ignored or relegated to the realm of abstraction. What this implies is that the full ethical responsibility of the Jew cannot be carried out solely within the realm of individual relationships but must include involvement in the life of a fully articulated community.

This double involvement is most vividly apparent in the biblical period: when both were equally present as divine command and demand. In the rabbinic period, because of the new political context, the communal aspect receded, so that discussion was mainly oriented toward the relationships between the members of the Jewish community or between individuals as such, and away from political responsibilities in the larger society. Nonetheless, the virtues that were understood to govern these relationships were, in their biblical setting, communal as well. Righteousness and compassion had been obligations of the state, governing the relationship between political units, as the first two chapters of Amos make evident. At the same time, as Micah 6:8 shows, doing justly, loving mercy, and walking humbly with God made up the pattern of the individual's obligations as well. Given the situation of the dispersion of the Jews following the revolts against Rome in the 1st and 2nd centuries CE, the individual pattern became the object of primary considerations. It is important to recognize that while theoretical ethical systems were not developed until the Middle Ages under the influence of philosophical concerns, nonetheless, even in the early period it was understood that behind the practical system of Halakha, the enumeration of legal precepts, there stood the dynamic of ethical theory. An attempt was made to reduce the hundreds of precepts to a small number expressing the ethical essence of Torah.

Protection of the weak

The key *moral* virtues. In keeping with the rabbinic understanding of Torah, study also was viewed as an ethical virtue. A passage in the traditional Prayer Book enumerates a series of virtuous acts—honouring parents, deeds of steadfast love, attendance twice daily at worship. hospitality to wayfarers, visiting the sick, dowering brides, accompanying the dead to the grave, devotion in prayer, peacemaking in the community and in family-life—and concludes by setting study of Torah as the premier virtue. Here is exhibited the complex variety of ethical behaviour called for within the Jewish tradition. To parental respect and family tranquillity are added, in other contexts, the responsibility of parents for children, the duties of husband and wife in the establishment and maintenance of a family, and ethical obligations that extend from the conjugal rights of each to the protection of the wife if the marriage is dissolved. The biblical description of God as upholding the cause of the fatherless and the widow and befriending the stranger, providing him with food and clothing (Deut. 10:18), remained a motivating factor in the structure of the community. Ethical requirements in economic life are expressed concretely in such a passage as Lev. 19:35–36: "You shall do no wrong in judgment, in measures of length or weight or quantity. You shall have just balances, just weights, a just ephah, and a just hin"; and in Amos' bitter condemnation of those who "sell the righteous for silver, and the needy for a pair of shoes" (Amos 2:6). Such injunctions, together with many other specific precepts and expressions of moral requirements, established the basis for a wide-ranging program that sought to govern, both in detail and in general, the economic life of the individual and the community. Not only are relations within the human sphere the object of ethical concern but nature also is so regarded. The animal world, in the biblical view, requires merciful consideration, so that not only man is commanded to rest on the sabbath but his domestic animals are to share the rest with him (Ex. 20:10; 23:12). Mistreatment of beasts of burden is prohibited (Deut. 22:4); and wanton destruction of animal life falls under the ban (*ibidem:* 6–7). In the rabbinic attitude toward brute creation, even inanimate nature is the object of human solicitude. Thus, for example, the food-yielding trees of a city under siege may not be destroyed, according to Deuteronomic legislation (Deut. 20:14–20). The enlargement of this and other biblical precepts resulted in the generalized rabbinic prohibition "You shall not destroy" that governs man's use of his environment.

The relation to non-Jewish communities and *cultures*. As noted above, the end of the Jewish state reduced the scope of ethical judgments in the political sphere; nonetheless, relations between the Jewish community and other societies—particularly political units: the Roman and Christian empires, the Islāmic states, and other regimes—provided opportunities for the exploration of the ethical implications of such encounters. Since most of these were victor-victim, superior-inferior, power-powerless situations, with the Jews the weaker party, prudential considerations were dominant. Despite this, Jewish authorities sought to bring to bear upon these external arrangements the ethical standards that governed the internal structures.

Isolation and assimilation

The whole problem of the relationship between the Jewish community, in whatever form it has existed and does exist, and other social units has been vastly complicated. Ideally, the relation is that of witness to the divine intent in the world. Practically, it has swung between the extremes of isolation and assimilation, in which the ideal has, on occasion, been lost sight of. Culturally, from its earliest beginnings, the people Israel has met and engaged the ideas, forms, behaviour and attitudes of its neighbours in constructive development. It borrowed as it contributed and reformulated what it received in terms of its own commitments and affirmations. On more than a few occasions, as in the period of settlement in Canaan, it rejected the religio-cultural ideas and forms of the native population. On others, it actively sought out—as in the Islāmic period in Spain (8th to 15th centuries)—ideas and cultural patterns of its neighbours, viewing them from its own perspective and embracing them when they were found to be of value. Indeed, the whole history of Israel's relationship with the world may be comprehended in the metaphor, used previously, of the heartbeat with its systole and diastole. No period of its existence discloses either total rejection of or abject surrender to other cultural and political structures but rather a tension, with the focal point always in motion at varying rates. Being more than a "confession" in the Christian sense, Judaism's adjustment to and relation with other sociopolitical units involved larger aspects of communal and individual life than merely the religious. Whether or not, under such circumstances, it is helpful to describe Judaism as a civilization, it is important to recognize that, viewed functionally, much more must be included than is usually subsumed under the common usage of "religion."

The *formulation* of Jewish ethical doctrines. The ethical concerns of Judaism have found frequent literary expression. Not only were rabbinic writings constantly directed toward the establishment of legal patterns that embody such concerns but in the medieval period the issues were dealt with in treatises on morals; in ethical wills, in which a father instructed his children about their obligations and behaviour; in sermons; and in

The Musar movement

other forms. In the 19th century the traditionalist Musar ("moral instructor") movement in eastern Europe and the philosophical discussions of the nascent Reform movement in the West focussed upon ethics. Indeed, since the political and social emancipation of the Jews, ethical and social rather than theological questions have tended to be given priority. Often the positions espoused have turned out to be, nonetheless, "judaized" versions of philosophic ethics or of political programs. In some instances, as in the case of the distinguished German-Jewish philosopher Hermann Cohen, the result has been a Jewishly compelling restatement of a secular philosophic ethics. In others, it has resulted in no more than a pastiche. More crucial, however, is the question of a unique Jewish ethics and of its authority. The re-establishment of a Jewish state renews the possibility that the full range of ethical decisions, including communal as well as individual responsibility, may be confronted. In such a situation, the ideal task of the people moves out of the realm of speculation to become actual again.

The universe. *Creation and Providence: God's world.* Although the first chapter of Genesis affirms divine creation, it does not offer an entirely unambiguous view of the origin of the universe, as the debate over the correct understanding of Gen. 1:1 in former as in modern times discloses. (Was there or was there not a pre-existing matter, void, or chaos?) Yet, basically, the interest of the author was not in the mode of creation, a later concern perhaps reflected in the various translations of the verse: "In the beginning God created," which could signify what medieval philosophers designated *creatio ex nihilo* ("creation out of nothing"); and "when God began to create," which could indicate some concept of prime matter. He was concerned rather to affirm that the totality of existence, inanimate (Gen. 1:3–19), living (20–25), and human (26–31), derived immediately from the same divine source; and, thus, that it is a universe. As divine creation, it is transparent to the presence of God, so that the Psalmist said: "The heavens declare the glory of God, and the expanse proclaims [that it is] the work of his hands" (19:1). Indeed, the repeated phrase: "And God saw how good it was" (Gen. 1:4, 10, 12, 18, 25, 31) may be understood as the ground of this affirmation, for the workmanship discloses the workman. The observed order of the universe is further understood by the biblical author to be the direct result of a covenantal relationship established between the world and God: "So long as the earth endures, seedtime and harvest, cold and heat, summer and winter, day and night, shall not cease." (Gen. 8:22). This doctrine of the providential ordering of the universe, reaffirmed in rabbinic Judaism, is not without its difficulties, as in the liturgical change made in Isa. 45:7 to avoid ascribing evil to God. Nonetheless, despite the problem of theodicy (the problem of evil in a world made and ordered by God), Judaism has not acquiesced to the mood reported in the Palestinian Targum to Gen. 4:8: "He did not create the world in mercy nor does he rule in mercy." Rather, it has affirmed a benevolent and compassionate God.

Creation and history

It is the physical world—divine creation—that provides the stage for history, which is the place of the divine-human encounter. An early Midrash, in response to the question as to why Scripture begins with the story of creation, points out that it was necessary in order to establish the identity of the Creator with the Giver of Torah, an argument basic to the liturgical structure of the Shema. This relationship is further emphasized in the *qiddush*, the prayer of sanctification recited at the beginning of the sabbath. That day is designated "a remembrance of creation" and "a recollection of the going-forth from Egypt." Thus, creation (nature) and history are understood to be inextricably bound up, for both derive from the same divine source. This being so, redemption —the reconciliation of God and man through and in history--does not ignore or exclude the natural world. Using the imagery of an extravagantly fecund world of nature, rabbinic thought expressed its view of the all-inclusive effects of the restored relationship.

Man's place in the universe. Man as creature is, of course, subject to the natural order. It is, indeed, in the world and through the world that man carries out his relationship to God. The commandments of Torah are obeyed not solely as observances between man and God but as actions between man and man, between man and the world. Although the creation story designates man as ruler over the earth and its inhabitants (Gen. 1:26–28; see also Ps. 8:5–9), nonetheless, far from being an arbitrary master, man's dominion is limited by Torah, for its regulations are concerned not only with transactions between man and man but also lay out his responsibilities to the land he cultivates, the produce of the soil, the animals he domesticates. Being bound in the network of existence he, as the moral creature, is responsible for it in all of its parts.

Man's responsibility to nature

Even the destruction of the Jewish commonwealth in the 1st and 2nd centuries CE did not alienate the Jew from these responsibilities, as the elaborate system of Mishna and Gemara gives evidence. The gradual but consistent exclusion of the Jewish community from immediate connection with large segments of the natural world, through legislation in Christendom and Islām, tended to dull the Jew's awareness of it; the recurring references to it in the religious calendar, however, and the observation of harvest festivals even by citydwellers continued to remind the community of its ties. Thus, at the end of the 19th century, the nascent Zionist movement recognized that the regeneration of the Jewish people involved, among other requirements, a responsible relation to the natural order expressed in its attitude toward and treatment of the land.

As indicated in other contexts, the particular emphasis placed on one or the other side of the frequent twofoldness of the Jewish view has depended upon the situation in which the community has found itself. If nature as the place of divine disclosure has, during long periods of Jewish existence, assumed a somewhat subordinate role, it has never been rejected or been seen to be irrelevant to the divine purpose. Indeed, in Jewish eschatology, its restoration is part of the goal of history.

Intermediary beings: angels and demons. The exact nature of the nonhuman beings mentioned in Scripture —angels or messengers—is not altogether clear and their roles seem ephemeral. In the postexilic period, perhaps under Iranian influence, and in the late biblical and post-biblical literature, these beings emerge as more complete and often as clearly identifiable individuals with their own personal names. The unfocussed biblical view gave way to an elaborate hierarchy of functionaries who acted, in some apocalyptic visions, as a veritable heavenly bureaucracy. Nevertheless, despite a consensus concerning their existence, there was little agreement as to their role or importance. In some Midrashim God takes counsel with them; in other sources the rabbis urge men not to involve them but to approach God directly. Actually, they belong to that marginal area between religion and folklore. Like their counterfigures, the demons, they have a residual existence rooted in various layers of the Jewish experience and interpretation of the universe. At some times they are highly individualized and sharply realized; at others, they flit in and out of the imagination like bats in the evening. The medieval philosophers Aristotelized or Platonized them; the early mystics Neoplatonized them; the Kabbalists continually invented new ones and fitted them into their complicated network of cosmic existence. Nonetheless, their role, even in periods of considerable emphasis, was peripheral. They were outside the great movements and meanings of Jewish thought.

Contemporary philosophical speculation about the nature of the universe has, of course, required a response from Jewish thinkers. But, given the particular temper of a period in which metaphysics has not been central to much of theological discussion, no major statement has yet developed that has taken hold of the dominant positions and attempted to view them from the Jewish creationist perspective. The attempt within Reconstructionism (see below) to provide a naturalistic framework for Judaism, while courageous, lacks the breadth and depth of the great philosophical approaches.

Eschatology. The future age of *mankind* and the world. The choice of Israel, according to the biblical writings, had occurred because of mankind's continual failure, by rebellion against its Creator, to fulfill its divine potential. The subsequent failure of Israel to become the holy community and thereby a witness to the nations gave rise to the prophetic movement that summoned the people to obedience. An integral part of prophetic summoning, side by side with threats of punishment and warnings of disaster, was the envisioning of a truly holy community, a society fully responding to the divine imperative. This kingdom of the future was conceived of as entirely natural, functioning as any normal sociopolitical unit and under the leadership of a human ruler, who would, however, carry out his tasks within the sphere of divine sovereignty, serving primarily to exhibit his own obedience and thus to stimulate the obedience of the entire people. This human monarch of the future was often, although not always, portrayed in terms of an idealized David, using such features of his life and reign as would underscore submission to God and emphasized social stability, economic satisfaction, and peace. During the period of the monarchy, the prophetic demand was directed toward each succeeding king, with the hope or even the expectation that he would be or become the new David, or the ideal ruler.

The Davidic model

The Babylonian Exile added a new measure of urgency to this expectation, although it was not expressed in any uniform fashion. The later chapters of the Book of Ezekiel provide in largely impersonal fashion the constitution for the new commonwealth but do not describe the peculiar characteristics of the ruler, while the later chapters of the Book of Isaiah focus on several figures—including Cyrus the Mede—who are seen as the divine instruments ushering in a new era. It is important to recognize that while such figures have extraordinary virtues ascribed to them, these virtues are neither superhuman nor suprahuman but such as are ultimately required of all Israel and of all men. The frustrations of the post-exilic period, when the several attempts to bring into being the holy community had no more than partial success and were thwarted by the imperial designs of the great powers—as they had been in the pre-exilic period as well—led to an emphasis upon the futuristic quality of the messianic hope. This was abetted undoubtedly by external influences, such as Iranian thought, in which the cosmic rather than the historic aspect of a future era dominated. Since ancient cosmic myths—in good measure demythologized—had been part of the Israelite intellectual inheritance, evidenced at least in literary usages throughout Scriptures, the impact of such neighbouring ideas was to reinvigorate the mythic elements. Thus, hopes for the future at the end of the Persian period and on through the Hellenistic developments after *c.* 330 BCE comprised both historical expectations focussed upon a sociopolitical community and cosmic-mythic visions that moved on a broader stage. The latter were, of course, never entirely absent from the historical expectations and situations, for a renewal of nature was viewed as integral to the functioning of true society. The obedient community required, and was to be granted, a natural world in which true human relations could exist. In its most vivid forms, apocalypses (*i.e.*, visionary disclosures of the future), the literature of the period affords a remarkable insight into the agonies and urgencies of the people. After the failures, saving events, and disappointments of the past are recounted, the present, in transparent disguise, is portrayed and the immediately hoped-for intervention of God is described in awesome detail as a means of affirming and confirming the faith of those who saw themselves as the remnant, or perhaps the promise, of the holy community.

The socio-political and cosmic-mythic aspects

The king-messiah and his reign. Put schematically, Israel's hope was for the restoration of divine sovereignty over all of creation. Concretely, that hope found a considerable variety of expressions. Of all such expressions, that which centred around the idealized king began to assume an ever more important (but never exclusive) role. Many of the writings that report the ideas and attitudes of the Jewish community in the period immediately preceding and following the rise of Christianity are either ignorant of or more probably indifferent to the personal element. God is envisioned as the protagonist of the end, actively intervening or sending his messengers (*i.e.*, angels), to perform specific acts in ending the old and inaugurating the new era. On the other hand, in some writings of the period the annointed king-messiah (Hebrew, *mashiah*, "anointed")—the title reflects the episode in I Sam. 16 in which David is thus singled out as the divinely chosen ruler—becomes more sharply defined as the central figure in the culminating events and, given the cosmic-mythic components, assumes suprahuman and in some instances, even quasidivine, aspects. It is clear, then, that the doctrine of last things in Judaism is not necessarily messianic, if that term is properly limited to an inauguration of a future era through the action of a human, suprahuman, or quasi-divine person. Nonetheless, it must be recognized that the messianic version of eschatology played a more compelling role in rabbinic Judaism than other modes. The same is true with regard to the locus of the "world (or age) to come." Given the ingredients noted above, it was possible to construct various eschatological landscapes ranging from the mundane to the celestial, from Jerusalem in the hills of Judah to a heavenly city. Indeed, confronted with an embarrassment of riches, the medieval theologians sought to combine them into an inclusive system that intricately involved as large a variety of the possibilities as could be brought together. In such patterns the messianic this-worldly emphasis was understood as a preliminary movement toward an ultimate resolution. The ideal ruler, the new David, would re-establish the kingdom in its own land (in "Zion," or Palestine) and would reign in righteousness, equity, justice, and truth, thus bringing into being the holy nation and summoning all mankind to dwell under divine sovereignty. As a component of this re-established kingdom, the righteous dead of Israel would be resurrected to enjoy life in the true community that did not exist in their days. This kingdom, however long it was destined to endure, was not permanent. It would come to an end either at a predetermined time or as victim of the unrepentant nations and cosmic foes, at which point the ultimate intervention by God would take place. All the wicked throughout history would be recalled to life, judged, and doomed; all the righteous would be transformed and transported into a new world; *i.e.*, creation would be totally restored. The particular emphases that one or the other of these ideas received, the ways in which they were interpreted—philosophically, mystically, or ethically—were determined most frequently by the situations and conditions in which the Jewish community found itself. With such a considerable body of ideas at its disposal and with the details of none of them ever receiving the kind of affirmation that statements about God, Torah, and Israel had, freedom of speculation in the realm of eschatology was little restricted. Thus, Joseph Albo (15th century) in his work on Jewish "dogmas" (*Ikkarim*) was not inhibited from denying that belief in the messiah was fundamental. The mystical movements of the Middle Ages found in eschatological hopes a crucial centre. The early Kabbala was little interested in messianism, for it interiorized the expectations in the direction of personal redemption. Following the disasters of the late 15th to 17th centuries (*e.g.*, the expulsion of the Jews from Spain and the Cossack massacre of the Jews in Poland) however, messianic speculation in all of its varieties underwent a luxuriant growth, finally running wild in the movements surrounding Shabbeiai Tzevi of Smyrna and later Jacob Frank of Offenbach. These tragedies for the Jewish communities once again resulted in a futurizing of the hopes or at least a limiting of their application (see also JEWISH MYSTICISM and MESSIAH AND MESSIANIC MOVEMENTS).

Resurrection of the dead and Last Judgment

Secularization of messianism. In the 19th century, with the political emancipation of the Jews in western Europe and the development of an optimistic evolutionism, messianism was transformed by many liberal thinkers into a version of the idea of progress whose goal was often thought of as immediately attainable through enlightened social and political action. When disillusionment with the emancipation set in, messianism was even more completely secularized in some segments of the community who saw its meaning and fulfillment in some form of socialism—again, rather close at hand. In others, it was absorbed into the emerging political nationalism—Zionism. Similar developments took place in eastern Europe, with parallel transformations. In more recent times, particularly since the events symbolized by the name Auschwitz (a Nazi death camp in Poland, where millions of Jews were exterminated), the earlier modern interpretations, particularly of messianism, but also of eschatology as a whole, have been considered inadequate. Although no compelling statement has been forthcoming, Jewish thinkers in the second half of the 20th century have been attempting once again to come to grips with eschatological concepts in all of their varieties and forms.

BASIC PRACTICES AND INSTITUTIONS

The centrality of Halakha

The hallowing of everyday existence. Systematic presentations of the affirmations of the Jewish community never served as the sole mode of expressing beliefs of the people. Side by side with speculation—Haggadic, philosophic, mystical, or ethical—there stood, not in a secondary role but as the other of the double focuses, Halakha ("practice," "rules of conduct"), the paradigmatic statement of the behaviour, individual and communal, that embodied concretely the beliefs conceptualized in speculation. Life in the holy community was understood to embrace every level of human existence, and attempts to confine it to a special religious realm met with opposition. The prophets vigorously resisted attempts to limit the sovereignty of the God of Israel to organized worship and ritual. The Pharisees, even while the Jerusalem Temple cult was still in existence, sought to reduce priestly exclusiveness by enlarging the scope of sacral rules to include, as far as possible, all of the people. Rabbinic Judaism, Pharisaism's surviving descendant, continued the process of democratization and sought, through its system of interpretation, to find in every occasion of life a means of affirming divine concern and presence. Viewed negatively by some Protestant theologians, this development has been judged to stifle spontaneity. Yet spontaneity is not necessarily lacking within a world governed by Halakha, although the danger of the stylized routine in religious and ethical life is apparent. Nonetheless, the intention of the Halakhic attitude is to remind the Jew constantly that each and every occasion of life is a locus of divine disclosure. This is most clearly seen in the *berakhot*, the "blessings," that are prescribed to accompany the performance of a broad spectrum of human actions, from the commonplace routines of daily life to the restricted gestures of the cultic-liturgical year. In these, God is addressed directly in the second person singular, his sovereignty is affirmed, and his activity as creator, Giver of Torah, or redeemer, expressed in a wide variety of eulogies, is proclaimed. There are no areas of human behaviour in which man cannot be met by God, and in terms of its intention, the Halakhic pattern is designed to make such possibilities experienced realities. Yet, again, it must be noted that the situation of the Jewish community determines in a very large way how the intention is actualized. On more than one occasion the Halakhic pattern has served as a defense against a hostile environment and has thus tended to become scrupulosity (an obsessive concern with minute details), but the dynamic of the intention itself has as often broken through to re-establish its integrity and hallow life in its wholeness.

The liturgy of daily life

The traditional pattern of individual and familial practices. Perspective on the traditional pattern of an individual's life is obtained by examining a passage from the Babylonian Talmud (tractate *Berakhot* 60b) that was subsequently reworked into a liturgical structure but which in its original form exhibits the intention discussed above. In this passage, the blessings accompanying a man's waking and returning to the routines of life are prescribed. There is a brief thanksgiving on awakening for being restored to conscious life; then the impingement of the external world is responded to in a benediction over the cock's crowing; following this, each ordinary act, opening one's eyes, stretching and sitting up, dressing, standing up, walking, tying one's shoes, fastening one's belt, covering the head, washing the hands and face, has its accompanying blessing, reminding a man that the world and the life to which he has returned exist in the presence of God. These are followed by a supplication in which the petitioner asks that his life during the day may be worthy in all of its relationships. Then, as the first order of daily business, Torah, both written (Bible) and oral (Mishna), is briefly studied, introduced by eulogies of God as Giver of Torah. Finally, there is a prayer for the establishment of the Kingdom of God, for each day contains within itself the possibility of ultimate fulfillment. As indicated, this was originally not a part of public worship (even today it is, strictly speaking, not part of the synagogue service, although it is most frequently recited there) but was personal preparation for a life to be lived in the presence of God.

The central role of women in family religion

Such individual responsibility marks much of Jewish observance, so that the synagogue—far from being the focus of observance—shares with the home and the workaday world the opportunities for the divine-human encounter. The table blessings, *kiddush* (the "sanctification" of the sabbath and festivals), the erection of the booth (*sukka*) for Sukkot (the Feast of Tabernacles), the seder (the festive Passover meal) with its symbols and narration of the Exodus, the lighting of the lamps during the eight days of Ḥanukka (the Feast of Dedication), are all the obligation of the individual and the family and have their place in the home. It is here, too, that woman's role is defined and here, as contrasted with the synagogue, that she functions centrally. Given the traditional dietary regimen of the Jewish community—the exclusion of swine, carrion eaters, shellfish, and other creatures, the separation of meat and dairy products, the ritual slaughtering of animals, the required separation and burning of a small portion of dough (*ḥalla*) when baking, the supervision of the Passover food requirements, and many other stipulations—there exists a large and meticulously governed area within the home that is indeed the sphere of woman's religion. There seems not to have been a hierarchy of values in which the home-centred, as contrasted with the synagogue-oriented, practices were given an inferior status. In modern times,

however, particularly in Western civilization where the pervasiveness of religious obligation has been replaced by ecclesiastical institutionalism, on the prevailing Christian model, this whole crucial area has lost much of its meaning as a place of divine-human meeting. Thus, for many it is only the synagogue that provides such an opportunity, and the individual act has been reduced on the scale of values. With this downgrading, woman's religion has lost its significance so that her status—when parallels are drawn to her role in the larger society—has been reduced to one of inferiority. However attenuated personal religious responsibility may have become in some environments or transformed into stylized cultural forms, the intention that informs the Halakhic structure, the hallowing of the individual's total existence, remains a potent force within the Jewish community.

The traditional pattern of synagogue practices. The other focus of observance is the synagogue. The origins of this institution are obscure and a number of hypotheses have been proposed to account for the appearance of this essentially lay-oriented form of worship. What seems certain is that during the period of the Second Temple—following the return from Babylon and continuing until the Temple destruction in 70 CE—there were, side by side with the official cult, other modes of worship more or less independent of the priesthood and nonsacrificial in form. The reports by the philosopher Philo and the historian Josephus in the 1st century, buttressed by the Qumrān document (Dead Sea Scrolls), provide some knowledge of the practices of the contemporary Essenes; rabbinic sources, including the earliest layers of the traditional order of worship, enable us to understand another, apparently Pharisaic, mode; the brief allusions to the practices of James and his Jewish Christian companions in the book of Acts suggest yet other varieties. In any case, the grouping that formed the cadre of what eventually became rabbinic Judaism observed some form of worship that, with the destruction of the Temple cult, was able to provide a new centre and even to absorb enough from the defunct priestly institution to suggest continuity and legitimacy. This was probably the basic pattern for synagogal liturgy in the millennia that followed.

Readings from the Torah and prophets

At the heart of synagogal worship is the public reading of Scriptures. This takes place at the morning service on sabbaths, holy days, and festivals, on Monday and Thursday mornings, and on sabbath afternoons. The readings from the Pentateuch are presently arranged in an annual cycle so that, beginning on the Sabbath following the autumnal festivals with Gen. 1:1, the entire five books are read through the rest of the year. The texts for festivals, holy days, and fasts reflect the particular significance of those occasions. In addition, a second portion from the prophetic writings (in the Jewish tradition these include Joshua, Judges, Samuel, and Kings, as well as the three major and 12 minor prophets, but not Daniel) is read on many of these occasions. All of this takes place within the structure of public worship and is provided with ceremonies during which the Sefer Torah ("Book of the Torah), the pentateuchal scroll, is removed from the ark (cabinet) at the front of the synagogue, and carried in procession to the reading desk; from it, the pertinent text is chanted by the reader. The text for the service is divided into subsections varying from seven on the sabbath to three at the weekday morning service, and individuals are called forward to recite the blessings eulogizing God as Giver of Torah before and after each of these. The order of worship is composed of the preparatory blessings and prayers noted above, to which are added passages recalling the Temple sacrificial cult (thus relating the present form of worship to the past); the recitation of a number of Psalms and biblical prayers; the Shema and its accompanying benedictions, introduced by a call to worship that marks the beginning of formal public worship; the prayer (tefilla) in the strict sense of petition; confession and supplication (*taḥanun*) on weekdays; the reading of Scripture; and concluding acts of worship. This general structure of the morning service varies somewhat, with additions and subtractions for the afternoon and evening services and for sabbath, holy days, and festivals.

The "Eighteen Benedictions"

The prayer (tefilla), just mentioned, is often called the shemone *ʿesre*, the "Eighteen Benedictions"—although it actually has 19—or the *ʿamida,* "standing," because it is recited in that position. It is made up of three introductory benedictions: praise of the God of the Fathers, of God the Redeemer who resurrects the dead, and of God the holy one who fills the earth with his glory, and of three concluding acts; a prayer for the acceptance of the service, a thanksgiving, and a prayer for peace—with a series of intermediate petitions for knowledge, well-being, acceptance of repentance, forgiveness of sin, and others. On the sabbath and festivals these are replaced by benedictions that mention the specific occasion but are not petitionary, it being considered inappropriate to attend to workday concerns at these times.

While the general outline of this order of service is found throughout the entire Jewish world, the details have varied, both in different periods and in geographic and cultural areas. The public service, requiring the presence of at least ten males, the minyan ("quorum"), is generally led by a synagogal official, the *ḥazzan,* or cantor, but any Jewish male with the requisite knowledge may act in this capacity since there is, quite strictly, no clerical class in the community to whom such leadership is limited (see The rabbi, below).

The synagogue room itself has a very simple basic form although, of course, it may be embellished considerably. The only requirements are a container for the Torah scroll(s), the *aron* ha-qodesh ("the holy ark")—a chest against the east wall, or a recessed closet with doors and a curtain; a prayer desk (*ʿamud*) facing the ark at which the reader stands when reciting the service; and the pulpit (*bima*)—according to some requirements in or close to the centre of the room—from which the Torah is read. In the Spanish-Portuguese tradition, only one desk (called teva) is used. The ark contains one or more scrolls, on which are written the five books of Moses. These are variously ornamented, depending upon the cultural region: European communities decking them in coverings of cloth; Oriental (North African and Near Eastern) placing them in wooden or metal containers. In addition, silver ornaments, in the form of towers or crowns, are often set on the tops of two rods on which the scroll is wound, and a breastplate and a pointer are suspended from them.

Accommodations for the worshippers vary according to the cultural milieu, from rugs and cushions in Oriental synagogues to pews and standing desks in European ones. Given this essential simplicity, the synagogue room itself may be used for other purposes than worship, *e.g.,* study and community assembly. Again, this varies with the cultural pattern.

Circumcision and naming

Ceremonies marking the individual life cycles. There are within Jewish life two cycles corresponding to the individual and the synagogal focuses, although they necessarily intermingle. The life of the individual is marked by observances that single out the notable events of personal existence. A male child is circumcised on the eighth day following birth, as a covenantal sign (Gen. 17); the rite of circumcision (berit *mila*) is accompanied by appropriate benedictions and ceremonies, including naming. Females are named in the synagogue, generally on the sabbath following birth, when the father is called to recite the benedictions over the reading of Torah. A firstborn son, if he does not belong to a priestly or a levitical family, is redeemed at one month (in accordance with Ex. 13:12–13 and Num. 18:14–16) by the payment of a stipulated sum to a *kohen* (a putative member of the priestly family). On arrival at the age of 13, a boy is called publicly to recite the Torah benedictions, thus signifying his religious coming-of-age; he is thenceforth obligated to observe the commandments as his own responsibility—he is now a Bar Mitzwa ("Son of the Commandment"). Marriage (*ḥatuna,* also *Qiddushin,* "sanctifications") involves a double ceremony, performed together in modern times but separated in ancient times by a year. First is the betrothal (erusin), which includes the reading of the marriage contract (ketubba) and the giving of the ring with a declaration, "Behold you are consecrated to me by this ring according to the law of Moses and Israel," accompanied by certain benedictions. This is followed by the marriage proper (*nissuʾin*), consisting of the reciting of the seven marriage benedictions. The ceremony is performed under a huppa, a canopy, that symbolizes the bridal bower.

The burial service is marked by simplicity. The body is prepared for the grave by the hevra' qaddisha' (the holy society), clad only in a simple shroud, and the interment takes place as soon after death as possible. In Israel no coffin is used. There are observances connected with death, many of which belong to the realm of folklore rather than Halakhic tradition. A mourning period of 30 days is observed, of which the first seven (*Shivʿa*) are the most rigorous. During the 11 months following a death, the bereaved recite a particular form of a synagogal doxology (Kaddish) during the public service as an act of memorial. The doxology itself, entirely devoid of any mention of death, is a praise of God and a prayer for the establishment of the coming Kingdom. It is also recited annually on the anniversary of the death (*yahrzeit*).

The cycle of the religious year. The ceremonials related to the life of the individual have complementary observances in the synagogal cycle. Here the calendar rather than the stages of life provides the framework. The synagogal calendar itself reflects two cycles: one beginning in the spring; one in the autumn. The former celebrates those occasions that have an agricultural as well as an historical significance: Pesah (Passover), commemorating the Exodus from Egypt and reflecting as well the beginning of the agricultural year; Shavuot (the Feast of Weeks), marking the end of the grain harvest as well as, in rabbinic tradition, the giving of the Torah at Sinai; Sukkot (the Feast of Tabernacles), an autumnal harvest observance, interpreted in historical terms to commemorate divine guidance and protection during the wilderness wanderings. This cycle is brought to a close by Shemini Atzeret (the Eighth Day of Solemn Assembly), also serving as the conclusion and new beginning of the annual cycle of Torah readings.

The other cycle is less clearly articulated. It begins in the autumn with Rosh Hashana (New Year), a solemn festival introducing a ten-day period of penitence that concludes with the fast of Yom Kippur (Day of Atonement). At midwinter, Hanukka (Feast of Dedication) is observed, commemorating victory over the Hellenistic Syrian Empire in 160 BCE. In late winter, Purim, celebrating the deliverance of the Jews of the Persian Empire, is observed. Among the several fasts in addition to Yom Kippur, Tisha be-Av (the Ninth of Av), observed in late summer in remembrance of the destruction of the Jerusalem Temple by the Romans in 70 CE, is the most important. Running through both cycles and binding them together is the Sabbath.

All of these holy days, festivals, and fasts have both their communal and individual focuses. All, or nearly all, combine both synagogue and home observances and obligations. For a more detailed discussion see JEWISH RELIGIOUS YEAR.

The Jerusalem Temple

Holy places: the land of Israel and Jerusalem. The land of Israel, as is evident from the biblical narratives, played a significant role in the life and thought of the Israelites. It was the promised home, for the sake of which Abraham left his birthplace; the haven toward which moved the tribes who escaped from Egyptian servitude; the hope of the exiles in Babylon. In the long centuries following the destruction of the Judean state by the Romans, it remained inextricably bound up with messianic and eschatological expectations. During the early period of settlement, there seem to have been many sacred localities, with one or another functioning for a time as a central shrine for all of the tribes, without displacing the others. Even the establishment of Jerusalem as the political capital by David and the building of a royal chapel there by Solomon did not bring to an end local cult centres. It was not until the reign of Josiah of Judah (640–609) that a reform centralized the cult in Jerusalem and attempted—although not entirely successfully—to end worship at local shrines. However irregular was the effectiveness of this reform, the Babylonian Exile and the subsequent return saw Jerusalem and its Temple win out over its rivals and become—in law, in fact, and in sentiment—the centre of Jewish cultic life. As noted above, this did not inhibit the rise and development of other forms of worship and even—on a few occasions—other cult centres. Nonetheless, no matter how unpopular the priesthood of the Jerusalem Temple became with some segments of the population—the Qumran community seems to have denied its legality, and the Pharisees complained bitterly about its arrogance and exactions, attempting when politically feasible to impose and enforce Pharisaic regulations upon it—reverence for the Temple itself seems to have remained a widespread sentiment. With the destruction of the Temple by the Romans in 70 CE, such reverence was transformed both by messianic expectations and eschatological hopes into fervent devotion, which, over the following centuries, became idealized and even supernaturalized. The most ardently articulated statement of the crucial role of the land of Israel and the Jerusalem Temple is found in the Sefer *ha-Kuzari* of Judah ha-Levi in which the two are seen as absolutely indispensable for the proper relation between the people Israel and God. Symbolizing the significance of the land and of the city is the practice of facing in their direction during worship. The earliest architectural evidence derived from synagogue remains in Galilee indicates that the attempt was made to arrange the building in such a way that the worshippers faced directly toward Jerusalem. This practice may have continued even in the Diaspora, but at a later date the present practice of setting the holy ark in or before the east wall was established, so that "facing Jerusalem" is now more symbolic than actual.

Use of the vernacular in worship

The sacred language: Hebrew and the vernacular tongues. The transformation of Hebrew into a sacred language is, of course, bound up with the political fate of the people. In the period following the return from the Babylonian Exile, Aramaic, a cognate of Hebrew, functioned as the international or imperial language in official life and certainly gained a foothold as a vernacular. It did not, despite claims made by some scholars, displace the everyday Hebrew of the people. The language of the Mishna, far from being a scholar's dialect, seems to reflect—in the same way as the Koine (common) Greek of the New Testament—popular speech. Displacement of Hebrew—both in its literary form in Scriptures and in its popular usage—did take place in the Diaspora, however, as evidenced by the need to translate Scriptures into Greek in some communities and into Aramaic in others. As far as the emerging order of worship is concerned, there seems also to have been an inclination on the part of some authorities to permit even the recitation of the Shema complex in the vernacular. Struggles over these issues within the communities continued for a number of centuries in various places, but the development of formal literary Hebrew—a sacred tongue, to be used side by side with the Hebrew Scriptures in worship—brought them to an end. Although the communities of the Diaspora used the vernaculars of their environment in day-to-day living and even—as in the case of the communities of the Islāmic world—for philosophical, theological, and other scholarly writings, in worship, Hebrew remained the standard until modern times when some of the reform movements in western Europe sought partially—and a very small fraction even totally—to displace it.

The rabbi: legal, judicial, and congregational roles. The rabbinate, with its peculiar nature and functions, is the result of a series of developments going back to the period that followed the disastrous second revolt against Rome (132–135 CE). The term rabbi ("my teacher") was originally an honorific title for the graduates of the academy directed by the *nasi* or patriarch, the head of the Jewish community in Palestine in that era, who was also a Roman imperial official. The curriculum of the school was Torah, written and oral, according to the Pharisaic tradition and formulation. The *nasi* appointed rabbis to the law court (the Bet Din) and as legal officers of local communities: acting with the local elders, they supervised and controlled the life of the community and its members in all of its aspects. A similar situation obtained in Babylon under the Parthian and Sāsānian empires, where the *resh galuta* or exilarch ("head of the exile") appointed rabbinical officials to legal and administrative posts. In time the patriarchate and exilarchate disappeared, but the rabbinate, nourished by independent rabbinical academies, survived. An authorized scholar, when called to become the judicial officer of a community, would at the same time become the head of the local academy and would, after adequate preparation and examination, grant authorization to his pupils, who were then eligible to be called to rabbinical posts. There was, thus, a diffusion of authority, the communities calling, rather than a superior official appointing, their rabbis. What must be kept in mind is that these rabbis were not ecclesiastical personages but communal officials, responsible for the governance of the entire range of life of what was understood to be the *kehilla qedosha,* the "holy community."

The modern rabbi

In modern times and particularly in the Western world, the total change in Jewish communal existence required a transformation of this ancient structure. The rabbinate became, for the most part, an ecclesiastical rather than a communal agency, reflecting the requirements of civic life in modern national states. The education of rabbis who now function within this new situation is carried on in seminaries whose structure and curriculum have been influenced by European and American academic institutions. The majority of their graduates serve as congregational rabbis, in roles similar to those of ministers and priests in the Christian denominations, but with some other functions deriving from the particular situation and nature of the Jewish community.

Even in the State of Israel, where certain larger areas, such as that of family law, are still reserved to the rabbinate, it nonetheless functions more as a counterpart to other ecclesiastical organizations, Christian and Muslim, than as an overarching and all-inclusive communal agency that embodies, as in the past, involvement in every aspect of community and personal life.

Chief rabbinates. The existence of the offices of chief rabbi in the State of Israel derives from the situation in the Turkish Empire when the various religious communities functioned as quasi-political entities in that multiethnic conglomerate. Israel has two chief rabbis, one for the Ashkenazic (European) and one for the Sefardic (Oriental) communities—they no longer function, however, as the heads of whole communities but only of ecclesiastical organizations. The same is true in those countries outside Israel that have the office of chief rabbi; *e.g.,* Great Britain and France. Here they function vis à vis the governments like their ecclesiastic counterparts in the Christian churches. While they have certain kinds of limited authority because of their official position, their jurisdiction extends only over those members of the total Jewish community who are ready to accept it; others form their own ecclesiastical units and act without reference to the chief rabbinate. In some situations, particularly in the

United States where there is no similar structure, the title chief or grand rabbi has been assumed occasionally by individuals as the means of asserting superior dignity or even (fruitlessly) authority.

General councils or conferences. The precise nature of the Sanhedrin (Council Court) in the last years of the Jewish commonwealth is a much disputed matter. The several councils mentioned in Talmudic literature are equally difficult to define with exactitude. There are references scattered throughout medieval literature that suggest the existence of councils and synods but their composition and authority are also uncertain. Around 1000 a synod was held in the Rhineland in which French and German communities participated under the guidance of Rabbenu Gershom, the leading rabbinic authority of the region. The late Middle Ages saw the rise in eastern Europe of the Waʿad Arba' Aratzot (Council of the Four Lands) composed of communal representatives from Great Poland, Little Poland, Russian Poland (Volhynia), and Lithuania. At the beginning of the modern era Napoleon (1806) summoned an Assembly of Notables—representatives of communities under French dominion—to deal with questions arising from the dissolution of the older status of the Jews and their naturalization as individuals into the new national states. Those decisions of the Assembly that involved questions of Jewish law were subsequently submitted to a Grand Sanhedrin called into being by Napoleon to provide some sort of Halakhic justification for the acts the French imperial government had required of the Jewish communities. During the 19th century the demand for the reform of Jewish life—principally the liturgy of the synagogue, but many other aspects as well—evoked a series of rabbinical conferences and synods that debated the questions and sought to guide the changes thought to be necessary. A similar procedure was followed on the American scene. In both instances, after an initial period in which radicals, moderates, and conservatives argued their respective cases in the same forum, polarization set in and intellectual differences were transformed into competing organizations. In the 1970s the several tendencies within the Jewish communities in North America were institutionalized in rabbinical conferences and congregational unions—Orthodox, Conservative, and Reform—whose influence was in large measure limited to their adherents. In the United States the Synagogue Council of America claims to be the "united voice" of American Jewry in common concerns. There is also a worldwide body in Reform or Liberal Judaism—the World Union for Progressive Judaism.

Modern variations. The above sketch of basic practices and institutions has attempted to describe the so-called traditional situation, although it has been indicated that even here there are variations—actually more than have been noted. In addition, reference has been made to some shifts and changes that represent a giving up of traditional practices on the basis of intellectual decisions about the nature of Judaism, its beliefs, practices, and institutions. Such changes are far too numerous to describe in detail. What is more important is to indicate their motivation. Basically, it is the view that the Halakhic system is not, as a whole and in all of its parts, divinely revealed but is rather a human process that seeks to expose in mutable forms the meaning of the divine-human encounter. Thus viewed, the practices and institutions are understood to be historically determined, reflecting the multifaceted experience of the people Israel as it has sought to live in the presence of God. Historical scholarship has, from this point of view, disclosed the origins, rise, development, and decline of these structures in the past and thus authorizes such changes in the present and future as appear to fulfill the needs of the community and its members. An examination of the specific deviations from the traditional forms makes clear that the application of this position, or attitude, has been subject to wide variation during the 19th and 20th centuries, in which it has operated. Some have seen it as a call for the disengagement from much if not all of the traditional pattern, and a recognition that only the spiritual essence is of importance or consequence for Judaism. Others have argued that an indiscriminate use of historicism (the explanation of values and forms in terms of their historical conditions) is unjustified and that the burden of proof is always upon those who would introduce changes. In the post-World War II period, the question has been whether a reconstituted Halakhic system might not be a requirement of the day.

Reinterpretations of the Halakhic system

ART AND ICONOGRAPHY

The anti-iconic principle and its modifications. Although the Second Commandment (Ex. 20:4; Deut. 5:8), "You shall not make yourself a graven image, or any likeness of anything that is in heaven above, or that is in the earth beneath, or that is in the water under the earth," has indeed been understood as absolutely prohibiting any and all artistic representation, this is not the only way in which these words may be interpreted. What is intended is a prohibition against the construction of such likenesses as were the object of worship in the cultural area in which the Israelites dwelt. Even in the Bible there are reports of artistic productivity in the construction of the tent sanctuary and its ritual vessels (Ex. 25–31) and of the Temple in Jerusalem (I Kings 6–7). The literalness and rigour with which the commandment was interpreted depended upon the larger situation of the community, so that during periods of external pressures toward religious conformity, such as the reign of Antiochus IV Epiphanes in Antioch (175–164 BCE), the anti-iconic attitude sharpened. Similarly, during the Roman occupation, the presence of the battle standards of the legions with their animal representations was looked upon as an affront, while extreme Pietists would not even handle Roman coinage because of the images stamped on it. On the other hand, the walls of a 3rd-century-CE synagogue in Doura-Europus in Syria are covered from floor to ceiling with biblical scenes with human representations, and a number of synagogues in Palestine had elaborate mosaic floors with the signs of the zodiac, representations of the seasons, and the like. Further, illuminated manuscripts from the medieval period in Europe were frequently decorated with biblical figures, some quite clearly copied from Christian prototypes. A fascinating mediating position is to be seen in a Haggada, in which the human figures have bird heads. Synagogues from a later, although pre-emancipation, period (before the 18th century) were often decorated with animal figures. In the modern period the avoidance of human figures has not been entirely accomplished, although nothing like the decorations of Doura-Europus has appeared.

The synagogue at Doura-Europus

Ceremonial objects and symbols. Nonetheless, given this general anti-iconic attitude, much of Jewish artistic endeavour has been directed toward the creation of ceremonial objects: *kiddush* goblets, candlesticks and candelabra, spice boxes for the *havdala* ceremony at the end of the sabbath, ornamented containers for the *mezuza* (a parchment on which is written Deut 6:4–9 and 11:13–21, fastened to the doorpost on the right side as one enters), the silver crowns placed on the Torah scrolls, together with the mantles and breastplates for the same, and many other objects designed to embellish the performance of the large number of ritual acts of the individual and the community. All of these vary in artistic quality, from the work of simple artisans to exquisitely produced works of master craftsmen.

Architecture. The building of synagogues, too, is an expression of artistic interest and concern, as well as of religious and social function. Nothing is known of these edifices, if indeed there were any, until the Greco-Roman period. Then the Roman basilica often provided the appropriate model. What was required was a spacious hall for assembly, and galleries for the women, and this form served that purpose very well. However synagogues were furnished before the destruction of the Second Temple, after that event some attempt seems to have been made to transfer some of the latter's appurtenances to the former, a move that was successfully resisted. When possible, the synagogue stood on a hill. Before it stood a walled entrance court with a fountain for ablutions. Before the Temple destruction, the building may have been oriented

Synagogal sites and structures

with its doors facing eastward, but afterward they faced Jerusalem; still later, when the holy ark containing the Torah scrolls was placed in a fixed position, the orientation was reversed so that the central gate would not be blocked; ultimately, the ark was placed in or against the east wall, without reference to the actual direction of Jerusalem. As the Diaspora grew larger, the new communities adapted the architectural forms of the enveloping culture. The surviving buildings of the Muslim period in Spain are often built with the horseshoe arches and decorated with the exquisite stucco arabesques that mark the era. The medieval period in Christian Europe saw a revival of a very strict anti-iconic attitude and a gradual rejection of the church edifice in favour of secular buildings as a model for the synagogue. The increasingly limited role of the Jew in that society and the enlargement of restrictions by church and state made it necessary to modify the synagogal structure. The doors no longer were in the wall facing the ark; the courtyard grew smaller; galleries were discontinued (side rooms now serving as the women's section); and a double- rather than a triple-aisled construction was largely favoured. Similar developments took place in eastern Europe with the building of fortress-synagogues and the remarkable wooden synagogues of Poland. In the early postemancipation period, Baroque style had its day, followed by Greek temples, Romanesque, Gothic, and pseudo-Byzantine churches, and pseudo-Moorish mosques. In the most recent period, the various schools of functionalism and their commercial descendants have come to the fore. The best of these have brought together fine architectural design and beautifully conceived and executed decoration. The interior arrangement, even in some traditional synagogues, has been influenced by the Protestant sermon-centred form of worship, so that some of the unique forms that marked older structures are absent. The holy ark is, however, still a centre of attention and has often been treated in interesting and striking ways.

Paintings and illustrations. As noted above, the use of paintings in the decoration of synagogues goes back to at least the 3rd century CE and is found in the late pre-emancipation and modern synagogues as well. Manuscripts, too, were illuminated with miniatures and the Renaissance period saw the appearance of beautifully decorated Scrolls of Esther and *ketubbot* (marriage contracts). Nonetheless, the appearance of Jewish artists in painting and sculpture is a modern phenomenon. Beginning in the 19th century, interest grew apace and more and more Jews are to be found, often in the avant-garde of these fields. Some, such as Marc Chagall and Jacques Lipchitz, have done specifically religious art.

Liturgical cantillation

Music. The description of the synagogue service above noted the role of the *hazzan*, or cantor. It is he who reads the service and declaims the scriptural lessons to certain set musical modes that vary with the season and occasion. Many of these call for melodic responses on the part of the congregation. The origins and varying developments of these chants are ancient, often obscure, and equally complicated. Whatever the basic materials, these were enlarged, varied, corrupted, and reworked over the centuries in the various environments in which the Jewish communities have lived. In modern times musicologists have begun to examine with great care the history of synagogal music, analyzing its basic structures and its relationship to the music of Christian liturgical traditions. In the 19th century in Western Europe much of the traditional music was either discarded or re-worked under the influence of western forms and styles. In addition the pipe-organ was introduced and was the centre of stormy controversy.

Literature. Literature has been throughout the ages the home of Jewish artistic activity. The Hebrew Bible is a work of monumental artistry, exhibiting grandeur of form and language in historical narrative, poetry, rhetoric, and aphorism. The extrascriptural writings of the period, although their originals have often vanished, still disclose literary genius of a high order in translation. The documents of the rabbinic tradition are not often looked at with an eye to their literary worth but much of the material, particularly the Haggadic portions of the Midrashim, reveals a noteworthy sensitivity to the uses of language. In the medieval period much attention was given to the production of *piyyuṭim*, liturgical poetry with which to embellish the Siddur (prayer book), itself a collection containing much imaginative, as well as pedestrian, writing. In the Islamic world, under the influence of Arabic poetry, Hebrew poetry rose to a high peak in both liturgical and secular forms. The Middle Ages in the Rhineland also saw the beginnings of the Jewish form of Middle High German that was, over the centuries, to develop into an autonomous Jewish language, Yiddish, which, in the 19th century, became a literary vehicle of very high order. The same period saw the beginnings of the recreation of Hebrew into a literary language that has become the basis of the spoken vernacular of the State of Israel and of a flourishing literature encompassing every branch of the field. Since the emancipation at the end of the 18th century, Jews in western Europe and later in the United States have turned to literature in the vernaculars of their countries, and have produced writers of note dealing with both Jewish and general themes.

RELATION WITH NON-JUDAIC RELIGIONS

Exclusivist and universalist emphases. The biblical tradition out of which Judaism emerged was predominantly exclusivist ("no other gods"). The gods of the nations were regarded as "no gods" and their worshippers as deluded, while the God of Israel was acclaimed as the sole lord of history, and the Creator of heaven and earth. The unexpected universalist implications of this exclusivism are most forcibly expressed in an oft-quoted verse from Amos (9:7):

God's rule over all the nations

> "Are you not like the Ethiopians to me, O people of Israel?" says the Lord. "Did I not bring up Israel from the land of Egypt, and the Philistines from Caphtor and the Syrians from Kir?"

Here the universal rule of the God of Israel is unmistakably proclaimed. Yet in the same book (3:1–2), after referring to the deliverance from Egypt—an act recognized as similar to that occurring in the affairs of other peoples—the prophet, speaking for God, says: "You only have I known of all the families of the earth." Thus the exclusivism has two focuses, one universal, the other particularistic. The ultimate claim of the universalistic position is found in Malachi 1:11: "For from the rising of the sun to its setting my name is great among the nations." This, however, in no way negates the special covenantal relationship between God and his people; indeed, it is this universalistic theme that underscores that special relation. To interpret Judaism's stance toward other religious systems in any other way is to fail to do justice to its inner dialectic. It is neither a bland latitudinarianism that admits any or all viewpoints and practices, nor a fanatical intolerance but rather a subtle interplay of affirmation and rejection. The latter is directed primarily against the worship of finite things or aspects—idolatry—the basic failure of the peoples who are the objects of the same divine solicitude as is Israel. If the religions of the nations are rejected because of their failure fully and truly to know God, the peoples themselves are not. Living under the covenant with Noah (see above), their fulfillment of such responsibilities provides for their acceptance, for they are not expected to live within the realm of Torah (see also *Relations with other religions* below).

Relation to Christianity. Judaism's relation to Christianity is a complicated one because of the close historical interconnections between them. From a Judaic standpoint, Christianity is or was a Jewish "heresy" and as such may be judged somewhat differently than other religions. Its claims over against Judaism as the true fulfillment of the covenant and, thus, as the true Israel have given rise throughout the centuries to polemics of varying intensity. The rise to power of the church and the embodiment of its anti-Judaic sentiments and attitudes in the political structures and processes of Christian nations made sharply negative Jewish responses inevitable. Nevertheless, during the Middle Ages Jewish thinkers attempted to avoid designating Christianity as idolatry and

Christian and Jewish polemic and counter-polemic even to argue that, in a special way, being derived from Judaism, it was fulfilling—at least on the moral plane—the divine purpose.

In modern times the relation has undergone changes necessitated by the newer situations into which the Jewish community has moved. This does not mean that the polemical-apologetic stance has come entirely to an end. The rejection of Judaism as a living religion by Christians continued and continues, argued not so much on dogmatic as on scholarly grounds. The Jewish response to this has often been countercriticism. Beyond this, however, there has been a growing inclination within the Jewish community to respond to the development of an affirmative theology of Judaism in both the Roman Catholic and Protestant churches by providing a theology of Christianity within Jewish thought. Occasional formulations in this direction have appeared, but it is far too early to know exactly what will emerge. At the same time, it must be noted, there are those who see no need for such a movement, arguing that the failure of the Christian churches in recent years to respond adequately to the tragedies of Jewish existence precludes any real engagement one with the other.

Relation to **Islām.** The emergence of Islām in Arabia in the 7th century CE brought Judaism face to face with a second religious movement that derived some of its ideas and structures from the older tradition. In this case, as in that of Christianity, the new religion claimed a special relation with Judaism. Muhammad held that the faith he proclaimed was none other than the pristine religion of Abraham, the father of Ishmael—progenitor of the Arabs—as well as of Isaac, from whom the people of Israel descended. That religion had been distorted both by Judaism and Christianity; and Muḥammad, the "seal" of the prophets, had been called by God to restore it to its purity. The confrontation between Judaism and Islām, as that with Christianity, was coloured by political and social considerations both before and after Islām moved out of Arabia to build a world empire (including the conquest and settlement of Palestine). During the subsequent period, the intellectual development of the Islamic world and the emergence of theologians and philosophers of the highest order challenged Judaism and had considerable influence on the rise of similar thinkers within that community. Given the strong monotheism and the anti-iconic attitude of Islām, many of the questions that arose between Judaism and trinitarian and iconic Christianity were not an issue between Judaism and Islam. The crucial point of dispute here was the nature of prophecy, given Muhammad's claim concerning his culminating role in the prophetic tradition. The medieval period thus saw polemics directed against that claim and, as in the case of the theological work of Moses Maimonides, *More nevukhim* ("The Guide of the Perplexed"), an exposition of the nature of prophecy that, without directly dealing with Muḥammad's claim, may be understood to undercut it. Nonetheless, Islām, too, was understood to contribute to the fulfillment of the divine purpose. From the late medieval period onward, the intellectual engagement between the two religions diminished with the general decline in the Turkish Empire that then embraced the Muslim world. In modern times it has not yet been renewed for many reasons. Once the political problems in the eastern Mediterranean between the State of Israel and the Arab world have been meliorated, the contiguity of the two communities suggests an inevitable renewal of conversations on the religions as on many other levels.

Relations with other religions. Judaism's encounters with religions other than Christianity and Islam have been in large measure limited to the past. In the Hellenistic world, it confronted and rejected the varieties of syncretistic cults that grew up. Within the Sāsānian Empire it was forced to deal with Zoroastrianism, but the outlines of its response have not yet been entirely disentangled from the literature of the period. In the modern world, particularly in the most recent period, it has come face to face with the religions of the Middle and Far East, but beyond a few tentative explorations nothing tangible has appeared. What seems certain is that, considering the growing interest in and exchange between East and West, Jewish thinkers will not be able to rest with older formulations concerning the nature of other religious systems. Without compromising its own faith or falling into an uncritical relativism, Judaism may indeed in the future seek a new way of understanding and relating to the varieties of religious systems facing it on the world scene.

Judaism confronts the religions of mankind

THE ROLE OF JUDAISM IN WESTERN CULTURE AND CIVILIZATION

Its historic role. Given the relationship between Judaism and Christianity—the dominant religious force in the development of Western culture—the role of Judaism in that development was significant. Although the church drew from other sources as well, its retention of the sacred Scriptures of the synagogue (the "Old Testament") as an integral part of its Bible—a decision sharply debated in the 2nd century CE—was crucial. Not only was the development of its ideas and doctrines deeply influenced, but it received as well an ethical dynamism that constantly overcame an inclination to withdraw into world-denying isolation. It was, however, not only Judaism's heritage but its persistence that touched Western civilization. The continuing existence of the Jews, even as a pariah people, was both a challenge and a warning; and ultimately, at the beginning of the modern era, their liberation from the shackles of discrimination, segregation, and rejection was understood by many to be the touchstone of all human liberty. Until the final ghettoization of the Jew—it is well to remember that the term "ghetto" belongs in the first instance to Jewish history—at the end of the Middle Ages and the beginning of the Renaissance, intellectual contact between Judaism and Christianity, and thus with Western culture, did not cease. Jerome translated the Hebrew Bible into Latin with the aid of Jewish scholars; Luther, into German with the aid of commentaries beholden to Jewish authors. Jewish thinkers mediated the remarkable intellectual achievements of the Islāmic world to Christian Europe and added their own contributions as well. Even heresies within the church found, on occasion, their inspiration or prototype in Judaism.

Its present role. In the modern world, while the influence of Jews has increased in almost every realm of cultural life, the impact of Judaism has diminished. The reason for this is not difficult to find. The Gentile leaders who extended emancipation to the Jews at the end of the 18th and beginning of the 19th centuries, while eager to grant political equality to the individual Jew, did so with the implicit and explicit requirement that conformity through reforms of Judaism be agreed to. With the transformation of Judaism into an ecclesiastical institution, largely on the model of German Protestant churches, its ideas and structures took on the cast of its environment in a way quite unlike what had ensued in its earlier confrontations with various philosophical systems. Indeed, for some, Judaism and 19th-century European thought were held to be not merely congruent but identical. Thus, while numerous contributors to diverse aspects of Western culture and civilization are to be found among Jews of the 20th century—scientists, politicians, statesmen, scholars, musicians, artists—their activities cannot, except in specific instances, be considered as deriving from Judaism as it has been sketched above.

Future prospects. Two events of the 20th century have, however, confronted Judaism in such ways as to suggest that its wrestling with them and their profound challenge to it may presage a new role and a new influence for Judaism: "Auschwitz" and the establishment of the State of Israel. The premeditated murder of some 6,000,000 European Jews by the Nazis for no other reason than that they were Jews, has shaken Jewish thinkers to their very core. Indeed, so traumatic was this event, that for almost two decades following it, no substantial attempt was made to plumb its meaning. At the same time, the reappearance of the State of Israel, viewed for the most part from outside the Jewish community as nothing more than a political event, has set in motion an entirely different chain of theological inquiry. These two happenings have

The two key events: Auschwitz and the establishment of Israel clearly, but in as yet unpredictable ways, begun to work and to move within the thought of contemporary Judaism. Out of this working and moving there may emerge an inescapable spiritual impact upon Western culture and civilization, which have, as yet, resolutely refused to face the realities these fateful occurrences represent. If contemporary Judaism is able to say what they mean, however haltingly, it will have renewed its potent relationship to the Western world, and, given the nature of contemporary society, established a similar bond with the Eastern world as well.

PRESENT-DAY FORMS OF JUDAISM

Orthodoxy. Statistical evidence in the field of religious beliefs and behaviour being notoriously inaccurate, to write that the majority of the Jewish religious world is Orthodox is to state a fact—if such it is—that is irrelevant, for it falls victim of the difficulties with which this article began. What may be noted is that there are many Jews who, in one way or another, think of themselves as traditionalists—whatever the content of their beliefs and the scope of their behaviour. This group is composed of many subgroups that include upper-class American scientists and intellectuals at one extreme and impoverished Oriental Kabbalists at the other, with a host of intermediate stages. Their understanding of the affirmations that this article suggests are central to traditional Judaism varies from rationalistic to mystical approaches. The breadth of their observances too, discloses a variation. Yet, despite such caveats, there is a large, fervent, and devoted section of the Jewish community that sees itself affirming--often in the most unselfconscious manner—what in its several ways it understands to be the unchanged and unchanging faith of Israel, so that for many, the foreign designation "orthodox" (used first by Reform Jews for traditionalist Jews) makes little if any sense.

Reform or Liberal. On the other hand, far more self-consciously, there stands the Reform (not "Reformed," except in a few minor and inconsequential instances) or Liberal group, although here, too, variety rather than uniformity is its badge. Although it originated in large measure in 19th-century Germany, its centre and more radical form is now in North America, with smaller groupings in western Europe, Israel, South Africa, and South America. At the moment in considerable intellectual flux, because of the impact of some forms of Existentialism, in the past it built upon a base of post-Kantian ethical philosophy and historical criticism, although theological speculation was not---on the American scene —its métier. In the matter of observance, wide variances are also to be seen—from a relatively conservative traditionalism to most radical topical Reformism.

Conservatism. The Conservative movement—primarily an American phenomenon, although the attempt has been made to connect it integrally with the moderate historical-positive wing of the German Liberal movement —is sociologically a Reform, or Liberal, development among the eastern European immigrants and their descendants in the United States. Originally less active in the field of social issues than the Reform movement, it retained a firmer hold upon the reality of the Jewish people than did most of the reformers. Theoretically, according to some of its intellectual leaders, it reaffirms traditional Judaism, but, in fact, it has included a very wide spectrum touching "Orthodoxy" on the right and Reform on the left. Like the latter, in the 1970s it was in a period of intellectual change, buffeted by the same intellectual winds and seeking new formulations.

Reconstructionism. Reconstructionism, for a long time the left wing of Conservatism, emerged as an independent entity in American Jewish life. It represents the attempt to build an intellectual base compounded of a sociological analysis of the American Jewish community, a statement about the nature of religion derived from the French anthropologists Lévi-Bruhl and Durkheim, and John Dewey's exposition of the meaning of the religious in human experience.

Hasidic groups. The various Hasidic groupings represent in large measure the self-conscious right wing of "Orthodoxy." Ḥasidism is rooted in the mystical Pietist revival in the eastern reaches of 18th-century Poland, Hungary, and western Ukraine, where it was a radical response both to the dangers of the pseudomessianic movements at the end of the 17th and the beginning of the 18th centuries and to the aridity that had enveloped rabbinism. It has now, for the most part, become a highly stylized, introverted sectarianism avoiding contact with the rest of the Jewish community, which it barely recognizes.

Regional or ethnic groups. There are, in addition to these "doctrinally" defined groupings, several that may be described as regional or ethnic. Among them are the Bene-Israel, descendants of Jewish settlers in the Bombay region of India, whose deviation in some Halakhic matters from the present Orthodox consensus has raised problems for those among them who have migrated to Israel; the Falashas, the Jewish community of Ethiopia whose development has been almost entirely outside the mainstream described in this article; and the Black Jews of the United States whose place in, and relation to, the rest of the community is unclear but not for racial reasons.

Judaism, History of

The history of Judaism in this article includes the development of the religion of the Jews in the broadest and most complete sense, from their early ancestral beginnings down to contemporary times.

The article is divided into the following sections:

- I. General observations
  - Nature and characteristics
  - Periodization
- II. Biblical Judaism (20th–4th centuries BCE)
  - The ancient Near Eastern setting
  - The pre-Mosaic period: the religion of the patriarchs
  - The Mosaic period: foundations of the Israelite religion
  - The period of the conquest and settlement of Canaan
  - The period of the united monarchy
  - The period of the divided kingdom
  - The period of classical prophecy and cult reform
  - The exilic period
  - The period of the restoration
- III. Hellenistic Judaism (4th century BCE–2nd century CE)
  - The Greek period (332–63 BCE)
  - The Roman period (63 BCE–135 CE)
- IV. Rabbinic Judaism (2nd–18th centuries)
  - The age of the tannaim (135–c. 200)
  - The age of the *amoraim:* the making of the Talmuds (3rd–6th centuries)
  - The age of the *geonim* (c. 640–1038)
  - Medieval European Judaism (950–1750)
- V. Modern Judaism (c. 1750–c. 1970)
  - The new situation
  - The Haskala, or Enlightenment
  - Religious reform movements
  - Orthodox developments
  - Developments in scholarship
  - Developments in philosophy
  - Jewish–Christian relations
  - Zionism
  - American Judaism
  - Judaism in other lands
- VI. Judaism today

I. General observations

NATURE AND CHARACTERISTICS

In nearly 4,000 years of historical development, the Jewish people and their religion have displayed both a remarkable adaptability and continuity. In their encounter with the great civilizations, from ancient Babylonia and Egypt down to Western Christendom and modern secular culture, they have assimilated foreign elements and integrated them into their own socio-religious system, thus maintaining an unbroken line of ethnic and religious tradition. Furthermore, each period of Jewish history has left behind it a specific element of a Judaic heritage that continued to influence subsequent developments, so that the total Jewish heritage at any time is a combination of all these successive elements along with whatever adjustments and accretions are made imperative by the conditions of each new age.

The fundamental teachings of Judaism have often been grouped around the concept of an ethical (or ethical–historical) monotheism. Belief in the one and only God of Israel has been adhered to by professing Jews of all ages and all shades of sectarian opinion. By its very nature monotheism ultimately postulated religious universalism, although it could be combined with a measure of particularism. In the case of ancient Israel (see below Biblical Judaism), particularism took the shape of the doctrine of election; that is, of a people chosen by God as "a kingdom of priests and a holy nation" to set an example for all mankind. Such an arrangement presupposed a covenant between God and the people, the terms of which the chosen people had to live up to or be severely punished. As the 8th-century-BCE (before the Common Era, or BC) prophet Amos expressed it: "You only have I known of all the families of the earth; therefore I will punish you for all your iniquities." Further, it was a concept that combined with the messianic idea, according to which, at the advent of the Redeemer, all nations would see the light, give up war and strife, and follow the guidance of the Torah (divine guidance, teaching, or law) emanating from Zion (a hill in Jerusalem that has a special spiritual significance). With all its variations in detail, messianism has, in one form or another, permeated Jewish thinking throughout the ages and, under various guises, has coloured the outlook of many secular-minded Jews (see also MESSIAH AND MESSIANIC MOVEMENTS).

Law became the major instrumentality by which Judaism was to bring about the reign of God on earth. In this case law meant not only what the Romans called *jus* (human law) but also fas, the divine or moral law that embraces practically all domains of life. The ideal, therefore, as expressed in the Ten Commandments, was a religio-ethical conduct that involved ritualistic observance as well as individual and social ethics, a liturgical–ethical way constantly expatiated on by the prophets and priests, rabbinic sages, and philosophers., Such conduct was to be placed in the service of God, as the transcendent and immanent Ruler of the universe, and as such the Creator and propelling force of the natural world, and also as the One giving guidance to history and thus helping man to overcome the potentially destructive and amoral forces of nature. According to Judaic belief, it is through the historical evolution of man, and particularly of the Jewish people, that the divine guidance of history constantly manifests itself and will ultimately culminate in the messianic age. Judaism, whether in its "normative" form or its sectarian deviations, never completely departed from this basic ethical–historical monotheism.

PERIODIZATION

The division of the millennia of Jewish history into periods—a procedure frequently dependent on individual preferences—has not been devoid of theological or scholarly presuppositions. The Christian world long believed that until the rise of Christianity the history of Judaism was but a "preparation for the Gospel" (preparatio *evangelica*) followed by the "manifestation of the Gospel" (demonstratio *evangelica*) as revealed by Christ and the Apostles. This formulation could be theologically reconciled with the assumption that Christianity had been preordained even before the creation of the world.

On the other hand, 19th-century biblical scholars moved the decisive division back into the period of the Babylonian Exile and restoration of the Jews to Judah (6th–5th centuries BCE). They asserted that after the first fall of Jerusalem (586 BCE) the ancient "Israelitic" religion gave way to a new form of the "Jewish" faith, or Judaism, as formulated by Ezra the Scribe and his school (5th century BCE). A German historian, Eduard Meyer, in 1896 published Die Entstehung *des* Judentums ("The Origin of Judaism"), in which he placed the origins of Judaism in the Persian period (see below Biblical *Judaism*) or the days of Ezra and Nehemiah (5th century BCE) and actually attributed to Persian imperialism an important role in shaping the new emergent Judaism.

These theories have been discarded by most scholars, however, in the light of a more comprehensive knowledge of the ancient Middle East and the abandonment of a theory of gradual evolutionary development that was dominant at the beginning of the 20th century. Most Jews share a long-accepted notion that there never was a real break in continuity and that Mosaic-prophetic-priestly Judaism was continued, with but few modifications, in the work of the Pharisaic and rabbinic sages (see below *Rabbinic Judaism*) well into the modern period. Even today the various Jewish groups, whether Orthodox, Conservative, or Reform, all claim direct spiritual descent from the Pharisees and the rabbinic sages. In actual historical development, however, many deviations have occurred from so-called normative or rabbinic Judaism; discontinuities, as well as continuity.

In any case, the history of Judaism here is viewed as falling into the following major periods of development: biblical Judaism (c. 20th–4th century BCE), Hellenistic Judaism (4th century BCE–2nd century CE), rabbinic Judaism (2nd–18th centuries CE), modern Judaism (c. 1750–1970), and the Judaism of today (1970s).

(S.W.B.)

II. Biblical Judaism (20th–4th centuries BCE)

THE ANCIENT NEAR EASTERN SETTING

The family of the Hebrew patriarchs (Abraham, Isaac, and Jacob) is depicted in the Bible as having had its chief seat in the northern Mesopotamian town of Harran —then (mid-2nd millennium BCE) belonging to the Hurrian kingdom of Mitanni. From there Abraham, the founder of the Hebrew people, is said to have migrated to Canaan (comprising roughly the region of modern Israel and Lebanon)—throughout the biblical period and later ages a vortex of west Asian, Egyptian, and east Mediterranean ethno-culture. Thence the Hebrew ancestors of the people of Israel (named after the patriarch Jacob, also called Israel) migrated to Egypt, where they lived in servitude, and a few generations later returned to occupy part of Canaan. The Hebrews were seminomadic herdsmen and occasionally farmers, ranging close to towns and living in houses as well as tents.

Early Israelite culture

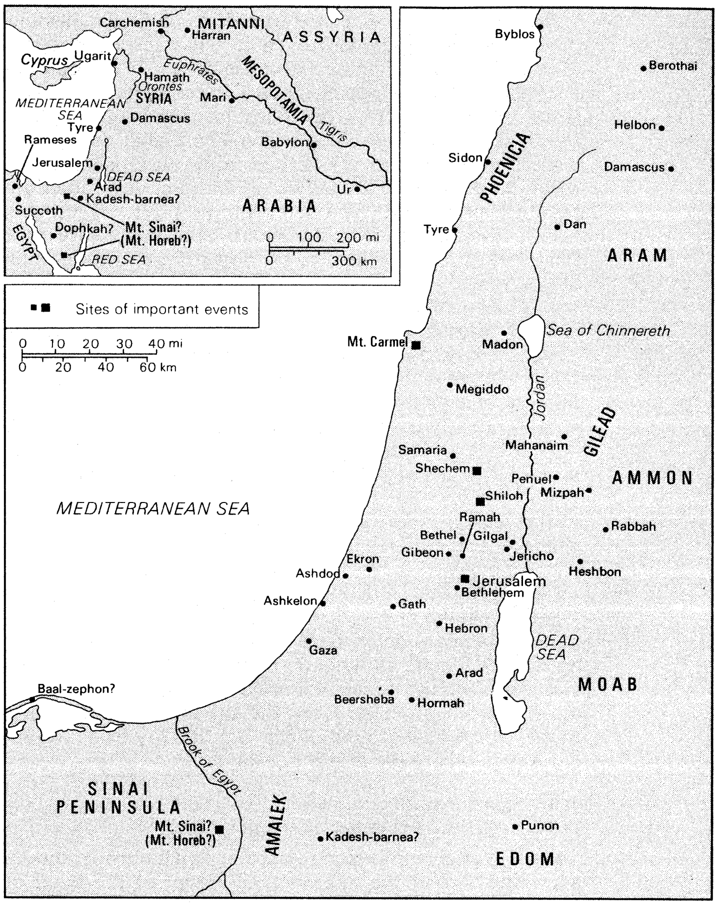
The initial level of Israelite culture resembled that of its surroundings; it was neither wholly original nor primitive. The tribal structure resembled that of West Semitic steppe dwellers known from the 18th-century-BCE tablets excavated at the north central Mesopotamian city of Mari; their family customs and law have parallels in Old Babylonian and Hurro-Semite law of the early and middle 2nd millennium. The conception of a messenger of God that underlies biblical prophecy was Amorite (West Semitic) and found in the tablets at Mari. Mesopotamian religious and cultural conceptions are reflected in biblical cosmogony, primeval history (including the Flood story in Gen. 6:9–8:22), and law collections. The Canaanite component of Israelite culture consisted of the Hebrew language and a rich literary heritage—whose Ugaritic form (which flourished in the northern Syrian city of Ugarit from the mid-15th century to the 12th century BCE) illuminates the Bible's poetry, style, mythological allusions, and religio-cultic terms. Egypt 'provides many analogues for Hebrew hymnody and wisdom literature. All the cultures among which the patriarchs lived had cosmic gods who were believed to have fashioned the world and preserved its order, including justice; all had a developed ethic expressed in law and moral admonitions; and all had religious rites and myths that were sophisticated.

Though plainer when compared with some of the learned literary creations of Mesopotamia, Canaan, and Egypt, the earliest biblical writings are so imbued with contemporary ancient Near Eastern elements that the once-held assumption that Israelite religion began on a primitive level must be rejected. Late-born amid high civilizations, the Israelite religion had from the start that admixture of high and low features characteristic of all the known religions of the area. Implanted on the land bridge between Africa and Asia, it was exposed to cross-currents of foreign thought throughout its history.

THE PRE-MOSAIC PERIOD: THE RELIGION OF THE PATRIARCHS

The God of the patriarchs

Israelite tradition identified YHWH (by scholarly convention pronounced Yahweh), the God of Israel, with the Creator of the world, who had been known to and worshipped by men from the beginning of time. Abraham (perhaps 19th or 18th–17th centuries BCE) did not discover this God, but entered into a new covenant relation with him, in which he was promised the land of Canaan and a numerous progeny. God fulfilled that promise through the actions of the 13th-century-BCE Hebrew leader Moses: he liberated the people of Israel from Egypt, imposed Covenant obligations on them at Mt. Sinai, and brought them to the promised land.



Important sites and regions of biblical Judaism.

Historical and anthropological studies present formidable objections to the continuity of YHWH worship from Adam (the biblical first man) to Moses, and the Hebrew tradition itself, moreover, does not unanimously support even the more modest claim of the continuity of YHWH worship from Abraham to Moses. Against it is a statement in chapter 6, verse 3, of Exodus that God revealed himself to the patriarchs not as YHWH but as El Shaddai —an epithet (of unknown meaning) the distribution of which in patriarchal narratives and Job and other poetical works confirms its archaic and unspecifically Israelite character. Comparable is the distribution of the epithet El Elyon (God Most High). Neither of these epithets appears in postpatriarchal narratives (excepting the Book of Ruth). Other compounds with El are unique to Genesis: El Olam (God the Everlasting One), El Bethel (God of Bethel), and El Ro'i (God of Vision). An additional peculiarity of the patriarchal stories is their use of the phrase "God of my [your, his] father." All of these epithets have been taken as evidence that patriarchal religion differed from the worship of YHWH that began with Moses. A relation to a patron god was defined by revelations starting with Abraham (who never refers to the God of his father) and continuing with a succession of "founders" of his worship. Attached to the founder and his family, as befits the patron of wanderers, this unnamed deity (if indeed he was one only) acquired various Canaanite epithets (El, Elyon, Olam, Bethel, *qone eretz* [possessor of the Land]) only after their immigration into Canaan. Whether the name of YHWH was known to the patriarchs is doubtful. It is significant that while the epithets Shaddai and El occur frequently in pre-Mosaic and Mosaic-age names, YHWH appears as an element only in the names of Yehoshua' (Joshua) and perhaps of Jochebed—persons who were closely associated with Moses.

The patriarchs are depicted as objects of God's blessing, protection, and providential care. Their response is loyalty and obedience and observance of a cult whose ordinary expression is sacrifice, vow, and prayer at an altar, stone pillar, or sacred tree. Circumcision was a distinctive mark of the cult community. The eschatology (doctrine of ultimate destiny) of their faith was God's promise of land and a great progeny. Any flagrant contradictions between patriarchal and later mores have presumably been censored; yet distinctive features of the post-Mosaic religion are absent. The God of the patriarchs shows nothing of YHWH's "jealousy"; no religious tension or contrast with their neighbours appears, and idolatry is scarcely an issue. The patriarchal covenant differed from the Mosaic Sinaitic Covenant in that it was modelled upon a royal grant to favourites and contained no obligations, the fulfillment of which was to be the condition of their happiness. Evidently not the same as the later religion of Israel, patriarchal religion prepared the way for it in its familial basis, its personal call by the deity, and its response of loyalty and obedience to him.

Little can be said of the relation of the religion of the patriarchs to the religions of Canaan. Known points of contact between the two are the divine epithets mentioned above. Like the God of the fathers, El, the head of the Ugaritic pantheon was depicted both as a judgmental and a compassionate deity. Baal (Lord), the aggressive young agricultural deity of Ugarit, is remarkably absent from Genesis. Yet the socio-economic situation of the patriarchs was so different from the urban, mercantile, and monarchical background of the Ugaritic myths as to render any comparisons highly questionable.

THE MOSAIC PERIOD: FOUNDATIONS OF THE ISRAELITE RELIGION

The Egyptian sojourn. According to Hebrew tradition, a famine caused the migration to Egypt of the band of 12 Hebrew families that later made up a tribal league in the land of Israel. The schematic character of this tradition does not impair the historicity of a migration to Egypt, an enslavement by Egyptians, and an escape from Egypt under an inspired leader by some component of the later league of Israelite tribes. To disallow these events would make their centrality as articles of faith in the later religious beliefs of Israel inexplicable.

The importance of Moses, the Exodus, and the Sinai Covenant

Tradition gives the following account of the birth of the nation. At the Exodus from Egypt (13th century BCE), YHWH showed his faithfulness and power by liberating Israel from bondage and punishing their oppressors with plagues and drowning at the sea. At Sinai, he made Israel his people and gave them the terms of his Covenant, regulating their conduct toward him and each other so as to make them a holy nation. After sustaining them miraculously during their 40-year wilderness trek, he enabled them to take the land that he had promised to their fathers, the patriarchs. Central to these events is God's apostle, Moses, who was commissioned to lead Israel out of Egypt, mediate God's Covenant to them, and bring them to Canaan.

Behind the legends and the multiform law collections, a historical figure must be posited to whom the legends and the legislative activity could be attached. And it is precisely Moses' unusual combination of roles that makes him credible as a historical figure. Like Muhammad at the birth of Islām, Moses fills oracular, legislative, executive, and military functions. The main institutions of Israel are his creation: the priesthood and the sacred shrine, the Covenant and its rules, the administrative apparatus of the tribal league. Significantly, though Moses is compared to a prophet in various texts in the Pentateuch (the first five books of the Bible), he is never designated as one—the term being evidently unsuited for so comprehensive and unique a figure.

Mosaic religion. The distinctive features of Israelite religion appear with Moses. The proper name of Israel's God, YHWH, was revealed and interpreted to Moses as meaning ehye *asher* ehye—an enigmatic phrase (literally meaning "I am/shall be what I am/shall be") of infinite suggestiveness. The Covenant, defining Israel's obligations, is ascribed to Moses' mediation. Although it is impossible to determine what rulings go back to Moses, the Decalogue, or Ten Commandments, presented in chapter 20 of Exodus and chapter 5 of Deuteronomy, and the larger and smaller Covenant codes in Ex. 20:22–23:33; 34:11–26) are held by critics to contain early covenant law. From them, the following features may be noted: (1) The rules are formulated as God's utterances —*i.e.*, expressions of his sovereign will. (2) They are directed toward, and often explicitly addressed to, the people at large; Moses merely conveys the sovereign's message to his subjects. (3) Publication being of the essence of the rules, the people as a whole are held responsible for their observance (see also COVENANT).

Moses breaking the tablets of the Law on Mt. Sinai in anger over the Israelites' worship of the golden calf. Etching by Marc Chagall (1887–).

The liberation from Egypt laid upon Israel the obligation of exclusive loyalty to YHWH. This meant eschewing all other gods—including idols venerated as such—and the elimination of all magical recourses. The worship of YHWH was aniconic (without images); even such figures as might serve in his worship were banned—apparently owing to the theurgic overtones (the implication that through them men may influence or control the god by fixing his presence in a particular place and making him accessible). Though a mythological background lies behind some cultic terminology (*e.g.*, "a pleasing odor to YHWH," "my bread"), sacrifice is rationalized as tribute or (in priestly writings) is regarded purely as a sacrament; *i.e.*, as a material means of relating to God. Hebrew festivals also have no mythological basis; they either celebrate God's bounty (*e.g.*, at the ingathering of the harvest) or his saving acts (*e.g.*, the festival of unleavened bread, which is a memorial of the Exodus).

Social values and concerns

The values of life and limb, labour, and social solidarity are protected in the rules on relations between man and man. The involuntary perpetual slavery of Hebrews is abolished, and a seven-year limit is set on bondage. The humanity of slaves is defended: one who beats his slave to death is liable to death; if he maims a slave he must set the slave free. A murderer is denied asylum and may not ransom himself from death, while for deliberate and severe bodily injuries the lex talionis ("an eye for an eye" principle) is ordained. Harm to property or theft is punished monetarily, never by death.

Moral exhortations call for solidarity with the poor and the helpless, for brotherly assistance to fellows in need. Institutions are created (*e.g.*, the sabbatical, or seventh, fallow year, in which land is not cultivated) to embody them in practice.

Since the goal of the people was the conquest of a land, their religion had warlike features. Organized as an army (called "the hosts of YHWH" in Ex. 12:41), they encamped in a protective square around their palladium—the tent housing the ark in which the stone "tablets of the Covenant" rested. When journeying, the sacred objects were carried and guarded by the Levites (a tribe serving religious functions), whose rivals, the Aaronites, had a monopoly on the priesthood. God, sometimes called "the warrior," marched with the army; in war, part of the booty was delivered to his ministers.

THE PERIOD OF THE CONQUE AND SETTLEMENT OF CANAA

The conquest of Canaan was remembered as a continuation of God's marvels at the Exodus. The Jordan River was split asunder, Jericho's walls fell at Israel's shout; the enemy was seized with divinely inspired terror; the sun stood still in order to enable Israel to exploit its victory. Such stories are not necessarily the work of a later age; they reflect rather the impact of these victories on the actors in the drama, who felt themselves successful by the grace of God.

A complex process of occupation, involving both battles of annihilation and treaty arrangements with the natives, has been simplified in the biblical account of Joshua's wars. Gradually, the unity of the invaders dissolved (most scholars believe that the invading element was only part of the Hebrew settlement in Canaan; other Hebrews, long since settled in Canaan from patriarchal times, then joined the invaders' covenant league). Individual tribes made their way with more or less success against the residue of Canaanite resistance. New enemies, Israel's neighbours to the east and west, appeared, and the period of the judges (leaders, or champions) began.

The religious situation during the time of the Book of Judges

The Book of Judges, the main witness for the period, does not speak with one voice on the religious situation. Its editorial framework describes repeated cycles of apostasy, oppression, appeal to God, and relief through a God-sent champion. The premonarchic troubles (before the kingship of Saul; see below) caused by the weakness of the disunited tribes were thus accounted for by the covenantal sin of apostasy. The individual stories, however, present a different picture. Apostasy does not figure in the exploits of the judges Ehud, Deborah, Jephthah, and Samson; YHWH has no rival, and faith in him is periodically confirmed by the saviours he sends to rescue Israel from their neighbours.

This faith is shared by all the tribes; and it is owing to their common cult that a Levite from Bethlehem could serve first at an Ephraimite and later also at a Danite sanctuary. The religious bond, preserved by the common cult, was enough to enable the tribes to act more or less in concert under the leadership of elders or an inspired champion in time of danger or religious scandal.

To be sure, both written and archaeological testimonies point to the Hebrews' adoption of Canaanite cults—the Baal worship of Gideon's family and neighbours in Ophrah in Judges, chapter 6, is an example. The many cultic figurines (usually female) found in Israelite levels of Palestinian archaeological sites also give colour to the sweeping indictments of the framework of the Book of Judges. But these phenomena belonged to the private, popular religion; the national God, YHWH, remained *one*—Baal sent no prophets to Israel—though YHWH's claim to exclusive worship was obviously not effectual. Nor did his cult conform with later orthodoxy; Micah's idol in Judges, chapter 17, and Gideon's ephod (priestly or religious garment) were considered apostasies by the editor, in accord with the dogma that other than orthodoxy there is only apostasy—heterodoxy (nonconformity) being unrecognized and simply equated with apostasy.

To the earliest sanctuaries and altars honoured as patriarchal foundations—at Shechem, Bethel, Beersheba, and Hebron in Cisjordan (west of the Jordan); at Mahanaim, Penuel, and Mizpah in Transjordan (east of the Jordan)—were now added new ones at Dan, Shiloh, Ramah, Gibeon, and Gilgal, among others. A single priestly family could not operate all these establishments, and Levites rose to the priesthood; at private sanctuaries even non-Levites might be consecrated as priests. The ark of the Covenant was housed in the Shiloh sanctuary, staffed by priests of the house of Eli, who traced their consecration back to Egypt. But the ark remained a portable palladium in wartime; Shiloh was not regarded as its final resting place. The law in Exodus, chapter 20, verses 24–26, authorizing a plurality of altar sites and the simplest forms of construction (earth and rough stone) suited the plain conditions of this period.

THE PERIOD OF THE UNITED MONARCHY

Conflicting views regarding the monarchy

The religio-political problem. The loose, decentralized tribal league could not cope with the constant pressure of external enemies—camel-riding desert marauders who pillaged harvests annually or iron-weaponed Philistines (an Aegean people settling coastal Palestine c. 12th century BCE) who controlled key points in the hill country occupied by Israelites. In the face of such threats to the Israelites, local, sporadic, God-inspired saviours had to be replaced by a continuous central leadership that could mobilize the forces of the entire league and create a standing army. Two attitudes were distilled in the crisis, one conservative and antimonarchic, the other progressive and promonarchic. The conservative appears first in Gideon's refusal, in Judges, chapter 8, verse 23, to found a dynasty: "I will not rule you," he tells the people, "my son will not rule over you; YHWH will . . .!" This theocratic view pervades one of the two contrasting accounts of the founding of the monarchy fused in chapters 8–12 of the First Book of Samuel: the popular demand for a king was viewed as a rejection of the kingship of God, which was embodied in a series of inspired saviours from Moses and Aaron, through Jerubbaal, Bedan, and Jephthah, to Samuel. The other account depicts the monarchy as a gift of God, designed to rescue his people from the Philistines (I Sam. 9:16). Both accounts represent the seer-judge Samuel as the key figure in the founding of Israel's monarchy, and it is not unlikely that the two attitudes struggled in his breast.

The triumph of the ark of the Covenant over paganism, a representation of the antagonism between Judaism and Hellenistic paganism. It was inspired by the biblical story (I Sam. 5:1-5) of the ark, which was captured in battle by the Philistines and which toppled the cult images of Dagon. Mural painting from the synagogue at Doura-Europus, Syria. 3rd century CE.

The Benjaminite Saul was made king (*c.* 1020 BCE) by divine election and by popular acclamation after his victory over the Ammonites (a Transjordanian Semitic people), but his career was clouded by conflict with Samuel, the major representative of the old order. Saul's kingship was bestowed by Samuel and had to be accommodated to the ongoing authority of that man of God. The two accounts of Saul's rejection by God (through Samuel) involve his usurpation of the prophet's authority. King David, whose forcefulness and religio-political genius established the monarchy (*c.* 1000 BCE) on an independent spiritual footing, resolved the conflict.

The Davidic monarchy. The essence of the Davidic innovation was the idea that, in addition to divine election through Samuel and public acclamation, David had God's promise of an eternal dynasty (a conditional, perhaps earlier, and an unconditional, perhaps later, form of this promise exist in Psalms, 132 and II Samuel, chapter 7, respectively). In its developed form, the promise was conceived of as a covenant with David, parallelling the Covenant with Israel and instrumental in the latter's fulfillment; *i.e.*, that God would channel his benefactions to Israel through the chosen dynasty of David. With this new status came the inviolability of the person of God's anointed (a characteristically Davidic idea) and a court rhetoric—adapted from pagan models—in which the king was styled "the [firstborn] son of God." An index of the king's sanctity was his occasional performance of priestly duties. Yet the king's mortality was never forgotten—he was never deified; prayers and hymns might be said on his behalf, but they were never addressed to him as a god.

David captured the Jebusite stronghold of Jerusalem and made it the seat of a national monarchy (Saul had never moved the seat of his government from his home town, the Benjaminite town of Gibeah, about three miles north of Jerusalem). Then, fetching the ark from an obscure retreat, David installed it in his capital, asserting his royal prerogative (and obligation) to build a shrine for the national God—at the same time joining the symbols of the dynastic and the national covenants. This move of political genius linked the God of Israel, the chosen dynasty of David, and the chosen city of Jerusalem in a henceforth indissoluble union.

The chosen dynasty and the chosen city

David planned to erect a temple to house the ark, but the tenacious tradition of the ark's portability in a tent shrine forced postponement of the project to his son Solomon's reign. As part of his extensive building operations, Solomon built the Temple on a Jebusite threshing floor, located on a hill north of the royal city, which David had purchased to mark the spot where a plague had been halted. The ground plan of the Temple—a porch with two free-standing pillars before it, a sanctuary, and an inner sanctum—followed Syrian and Phoenician sanctuary models. A bronze "sea" resting on bulls and placed in the Temple court has a Babylonian analogue. Exteriorly, the Jerusalem Temple resembled Canaanite and other Near Eastern religious structures, but there were differences; *e.g.*, no god image stood in the inner sanctum, but rather only the ancient ark and the new large cherubim (hybrid creatures with animal bodies, human or animal faces, and wings) whose wings covered it, symbolizing the presence of YHWH who was enthroned upon celestial cherubim.

Alongside a brief, ancient inaugural poem in I Kings, chapter 8, verses 12–13, an extensive (and, in its present form, later) prayer expresses the distinctively biblical view of the temple as a vehicle of God's providing for his people's needs. Since, strangely, no reference to sacrifice is made, not a trace appears of the standard pagan conception of the temple as a vehicle of man's providing for the gods.

That literature flourished under the aegis of the court is to be gathered from the quality of the preserved narrative of the reign of David, which gives every indication of having come from the hand of a contemporary eyewitness. The royally sponsored Temple must have had a library and a school attached to it (in accord with the universally attested practice of the ancient Near East), among whose products were not only royal psalms but also such liturgical pieces intended for the common man as eventually found their way into the book of Psalms.

The latest historical allusions in the Torah literature (the Pentateuch) are to the period of the united monarchy; *e.g.*, the defeat and subjugation of the peoples of Amalek, Moab, and Edom by Saul and David, in Numbers, chapter 24, verses 17–20. On the other hand, the polity reflected in the laws is tribal and decentralized, with no bureaucracy. Its economy is agricultural and pastoral, class distinctions apart from slave and free are lacking, and commerce and urban life are rudimentary. A premonarchic background is evident, with only rare explicit reflections of the later monarchy; *e.g.*, in Deuteronomy, chapter 17, verses 14–20. The groundwork of the Torah literature may thus be supposed to have crystallized under the united monarchy.

The emergence of Torah and wisdom literature

It was in this period that the traditional wisdom cultivated among the learned in neighbouring cultures came to be prized in Israel. Solomon is represented as the author of an extensive literature comparable to that of other Eastern sages. His wisdom is expressly attributed to YHWH in the account of his night oracle at Gibeon (in which he asked not for power or riches but for wisdom), thus marking the adaptation to biblical thought of this common Near Eastern genre. As set forth in Proverbs, chapter 2, verse 5, "It is YHWH who grants wisdom; knowledge and understanding are by his command." Patronage of wisdom literature is ascribed to the later Judahite king, Hezekiah, and the connection of wisdom with kings is common in extrabiblical cultures as well.

Domination of all of Palestine entailed the absorption of "the rest of the Amorites"—the pre-Israelite population that lived chiefly in the valleys and on the coast. Their impact on Israelite religion is unknown, though some scholars contend that a "royally sponsored syncretism" arose with the aim of fusing the two populations. That popular religion did not meet the standards of the biblical writers and that it incorporated pagan elements—and that such elements may have increased as a result of intercourse with the newly absorbed "Amorites"—is likely and required no royal sponsorship. On the other hand, the court itself welcomed foreigners—such as the Philistines, Cretans, Hittites, and an Ishmaelite, among others—and made use of their service. Their effect on the court religion may be surmised from what is recorded concerning Solomon's many diplomatic marriages: foreign princesses whom Solomon married brought along with them the apparatus of their native cults, and the King had shrines to their gods built and maintained on the Mount of Olives. Such private cults, while indeed royally sponsored, did not make the religon of the people syncretistic.

Such compromise with the pagan world, entailed by the widening horizons of the monarchy, violated the sanctity of the holy land of YHWH and turned the king into an idolator in the eyes of zealots. Religious opposition, combined with grievances against the organization of forced labour for state projects, led to the secession of the northern tribes (headed by the Joseph tribes) after Solomon's death.

THE PERIOD OF THE DIVIDED KINGDOM

Religion in the northern kingdom (Israel)

Jeroboam I (10th century BCE), the first king of the north (now called Israel, in contradistinction to Judah, the southern Davidic kingdom), appreciated the inextricable link of Jerusalem and its sanctuary with the Davidic claim to divine election to kingship over all Israel (the whole people, north and south). He therefore founded rival sanctuaries at Dan and at Bethel—ancient cult sites—and manned them with non-Levite priests whose symbol of YHWH's presence was a golden calf—a pedestal of divine images in ancient iconography and the equivalent of the cherubim of Jerusalem's Temple. He also moved the autumn ingathering festival one month ahead so as to foreclose celebration of this most popular of all festivals in common with Judah.

For the evaluation of Jeroboam's innovations and the subsequent official religion of the north down to the mid-8th century, one must rely almost exclusively on the book of Kings (later divided into two books). This work has severe limitations as a source for religious history. The material of this book, in good part contemporary, is subjugated to a dogmatic historiography that regards the whole enterprise of the north as one long apostasy ending in a deserved disaster. The culmination of Kings' history with the exile of Judah shows its provenience to have been Judahite. Yet the evaluation of Judah's official religion is subject to an equally dogmatic standard, namely, the royal adherence to the Deuteronomic rule of a single cult site. The author considered the Solomonic Temple to be the cult site chosen by God, according to Deuteronomy, chapter 12, the existence of which rendered all other sites illegitimate. Every king of Judah is judged according to whether or not he did away with all extra-Jerusalemite places of worship. (The date of this criterion may be inferred from the indifference toward it of all persons [*e.g.*, the 9th-century-BCE prophets Elijah and Elisha and the Jerusalemite priest Jehoiada] prior to the late-8th-century-BCE Judahite king Hezekiah.) Another serious limitation is the restriction of Kings' purview: excepting the Elijah–Elisha stories, it notices only the royally sponsored cult; notices of the popular religion are very few. From the mid-8th century the writings of the classical prophets, starting with Amos, set in. These take in the people as a whole, in contrast to Kings; on the other hand their interest in theodicy (justification of God) and their polemical tendency to exaggerate and generalize what they deem evil must be taken into consideration before approving their statements as sober history.

Religion in the southern kingdom (Judah)

For a half-century after the north's secession (c. 922 BCE), the religious situation in Jerusalem was unchanged. The distaff side of the royal household perpetuated, and even augmented, the pagan cults. King Asa (reigned *c.* 908–867 BCE) is credited with a general purge, including the destruction of an image made for the goddess Asherah by the queen mother, granddaughter of an Aramaean princess. He also purged the *qedeshim* ("consecrated men"—conventionally rendered as "sodomites," or "male sacred prostitutes").

Foreign cults entered the north with the marriage of the 9th-century-BCE king Ahab to the Tyrian princess Jezebel. Jezebel brought with her a large entourage of sacred personnel to staff the temple of Baal and Asherah that Ahab built for her in Samaria, the capital of the northern kingdom of Israel. In all else, Ahab's orthodoxy was irreproachable, though others of his court may have joined the worship of the foreign princess. That fierce opposition to the non-YHWH cults sprang up must he supposed in order to account for Jezebel's persecution of the prophets of YHWH, conduct untypical of a polytheist except in self-defense. Elijah's assertion that the whole country apostatized is a hyperbole based on the view that whoever did not actively fight Jezebel was implicated in her polluted cult. Such must have been the view of the prophets, whose fallen were the first martyrs to die for the glory of God. The quality of their opposition may be gauged by Elijah's summary execution of the foreign Baal cultists after they failed the test at Mt. Carmel, where they vied against him in a contest over whose god was truly God. A three-year drought (attested also in Phoenician sources), declared by Elijah to be punishment for the sin, must have done much to kindle the prophets' zeal.

To judge from the Elisha stories, the Baal worship in the capital city, Samaria, was not felt in the countryside. There the religious tone was set by the popular prophets and the prophetic companies ("the sons of the prophets") who attached themselves to them. In popular consciousness these men were wonder-workers—healing the sick and reviving the dead, foretelling the future, and helping to find lost objects. To the biblical narrator they witness the working of God in Israel. Elijah's rage at the Israelite king Ahaziah's recourse to the pagan god Baalzebub, Elisha's cure of the Syrian military leader Naaman's leprosy, and anonymous prophets' directives and predictions in matters of peace and war all serve to glorify God.

The issue of "true" and "false" prophecy

Indeed, the equation of Israel's prosperity with God's interest generated the issue of "true" and "false" prophecy that made its first appearance at this time. That prophecy of success could turn out to be a snare is exemplified in a story of conflict between Micaiah, the lone 9th-century-BCE prophet of doom, and 400 unanimous prophets of victory who lured Ahab to his death. The poignancy of the issue is highlighted by Micaiah's acknowledgment that the 400 were also prophets of YHWH—but inspired by him deliberately with a "lying spirit."

THE PERIOD OF CLASSICAL PROPHECY AND CULT REFORM

The emergence of the literary prophets. By the mid-8th century a hundred years of chronic warfare between Israel and Aram had finally ended—the Aramaeans having suffered heavy blows from the Assyrians. King Jeroboam II (8th century BCE) was able to undertake to restore the imperial sway of the north over its neighbour, and a prophecy of Jonah that he would extend Israel's borders from the Dead Sea to the entrance to Hamath (Syria) was borne out. The well-to-do expressed their relief in lavish attentions to the institutions of worship and their private mansions. But the strain of the prolonged warfare showed in the polarization of society between the wealthy few who had profited from the war and the masses whom it had ravaged and impoverished. Dismay at the dissolution of Israelite society animated a new breed of prophets who now appeared—the literary or classical prophets, first of whom was Amos, an 8th-century-BCE Judahite who went north to Bethel.

Prophetic denouncements of social injustices

That apostasy would set God against the community was an old conception of early prophecy; that violation of the socio-moral injunctions of the Covenant would have the same result was first proclaimed by Amos. Amos almost ignored idolatry, denouncing instead the corruption and callousness of the oligarchy and rulers. The religious exercises of such villains he proclaimed were loathsome to God; on their account Israel would be oppressed from the entrance to Hamath to the Dead Sea and exiled from its land.

The westward push of the Neo-Assyrian Empire in the mid-8th century BCE soon brought Aram and Israel to their knees. In 733–732 Assyria took Gilead and Galilee from Israel and captured Aramaean Damascus; in 721 Samaria, the Israelite capital, fell. The northern kingdom sought to survive through alliances with Assyria and Egypt; its kings came and went in rapid succession. The troubled society's malaise was interpreted by Hosea, a prophet of the northern kingdom (Israel), as a forgetting of God. As a result, in his view, all authority had evaporated: the king was scoffed at, priests became hypocrites, and pleasure seeking became the order of the day. The monarchy was godless; it put its trust in arms, fortifications, and alliances with the great powers. Salvation, however, lay in none of these, but in repentance and reliance upon God.

Prophecy in the southern kingdom. Judah was subjected to such intense pressure to join an Israelite–Aramaean coalition against Assyria that its 8th-century-BCE king Ahaz chose to submit himself to Assyria in return for relief. Ahaz introduced a new Aramaean-style altar in the Jerusalem Temple and adopted other foreign customs that are counted against him in the book of Kings. It was at this time that Isaiah prophesied in Jerusalem. At first (under Uzziah, Ahaz' prosperous grandfather), his message focussed on the corruption of Judah's society and religion, stressing the new prophetic themes of indifference to God (which went hand in hand with a thriving cult) and the fateful importance of social morality. Under Ahaz, the political crisis evoked Isaiah's appeals for trust in God, with the warning that the "hired razor from across the Euphrates" would shave Judah clean as well. Isaiah interpreted the inexorable advance of Assyria as God's chastisement; Assyria was "the rod of God's wrath." But since Assyria ignored its mere instrumentality and exceeded in an insolent manner its proper function, God, when he finished his purgative work, would break Assyria on Judah's mountains. Then the nations of the world, who had been subjugated by Assyria, would recognize the God of Israel as the lord of history. A renewed Israel would prosper under the reign of an ideal Davidic king, all men would flock to Zion (the hill symbolizing Jerusalem) to learn the ways of YHWH and submit to his adjudication, and universal peace would prevail (see also MESSIAH AND MESSIANIC MOVEMENTS).

The prophecy of Micah (8th century BCE), also a Judahite, was contemporary with that of Isaiah, and touched on similar themes (*e.g.*, the vision of universal peace is found in both their books). Unlike Isaiah however, who believed in the inviolability of Jerusalem, Micah shocked his audience with the announcement that the wickedness of its rulers would cause Zion to become a plowed field, Jerusalem a heap of ruins, and the Temple mount a wooded height. Moreover, from the precedence of social morality over the cult, Micah drew the extreme conclusion that the cult had no ultimate value and that God's requirement of men can be summed up as "to do justice, and to love kindness, and to walk humbly with your God."

The reform of King Hezekiah

Reforms in the southern kingdom. According to Jeremiah (about 100 years later), Micah's prophetic threat to Jerusalem had caused King Hezekiah (reigned c. 715–c. 686 BCE) to placate God—possibly an allusion to the cult reform instituted by the King in order to cleanse Judah from various pagan practices. A heightened concern over assimilatory trends resulted in his also outlawing certain practices considered legitimate up to his time. Thus, in addition to removing the bronze serpent that had been ascribed to Moses (and that had become a fetish), the reform did away with the local altars and stone pillars, the venerable (patriarchal) antiquity of which did not save them from the taint of imitation of Canaanite practice. Hezekiah's reform, part of a restorational policy that had political, as well as religious, implications, appears as the most significant effect of the fall of the northern kingdom on official religion. The outlook of the reformers is suggested by the catalog in II Kings, chapter 17, of religious offenses that had caused the fall, the affinity to which the objects of Hezekiah's purge is manifest. Hezekiah's reform is the first historical evidence for Deuteronomy's doctrine of cult centralization. Similarities between Deuteronomy and the Book of Hosea lend colour to the supposition that the reform movement in Judah, which culminated a century later under King Josiah, was sparked by attitudes inherited from the north.

Hezekiah was the leading figure in a western coalition of states that coordinated a rebellion against the Assyrian king Sennacherib with the Babylonian rebel Merodach-Baladan, shortly after the Assyrian's accession in 705 BCE. When Sennacherib appeared in the west in 701 the rebellion collapsed; Egypt sent a force to aid the rebels, but it was defeated. Hezekiah saw his kingdom overwhelmed and offered tribute to Sennacherib; the Assyrian, however, pressed for the surrender of Jerusalem. In despair, Hezekiah turned to the prophet Isaiah for an oracle. Though the prophet condemned the King's reliance upon Egyptian help, he stood firm in his faith that Jerusalem's destiny precluded its fall into heathen hands. The King held fast, and Sennacherib, for reasons still obscure, suddenly retired from Judah and returned home. This unlooked-for deliverance of the city may have been regarded as a vindication of the prophet's faith and was doubtless an inspiration to the rebels against Babylonia a century later. For the present, while Jerusalem was intact, the country had been devastated and its kingdom turned into a vassal state of Assyria.

Foreign influences and the Deuteronomic reform

During Manasseh's peaceful reign of 55 years in the 7th century BCE, Judah was a submissive ally of Assyria. Manasseh's forces served in the building and military operations of the Assyrian kings Esarhaddon and Ashurbanipal. Judah benefitted from the upsurge of commerce that resulted from the political unification of the whole Near East. The prophet Zephaniah attests to heavy foreign influence on the mores of Jerusalem—merchants who adopted foreign dress, cynics who lost faith in the efficacy of YHWH to do anything, people who worshipped the pagan host of heaven on their roofs. Manasseh's court was the centre of such influences. The royal sanctuary became the home of a congeries of foreign gods—the sun, astral deities, and Asherah (the female fertility deity) all had their cults there alongside YHWH. The countryside also was provided with pagan altars and priests, alongside the local YHWH altars that were revived. Presumably, at least some of the blood that Manasseh is said to have spilled freely in Jerusalem must have belonged to YHWH's devotees. No prophecy is dated to his long reign.

With Ashurbanipal's death in 627, Assyria's power faded quickly; the young Judahite king Josiah (reigned c. 640–609 BCE) had already set in motion a vigorous movement of independence and restoration, a cardinal aspect of which was religious. First came the purge of foreign cults in Jerusalem, under the aegis of the high priest Hilkiah; then the countryside was cleansed. In the course of renovating the Temple, a scroll of Moses' Torah (by scholarly consensus an edition of Deuteronomy) was found. Anxious to abide by its injunctions, Josiah had the local YHWH altars polluted to render them unusable and collected their priests in Jerusalem. The celebration of the Passover that year was concentrated in the Temple, as it had not been "since the days of the judges who judged Israel," according to II Kings 23:22, or since the days of Samuel, according to II Chron. 35:18; both references reflect the unhistorical theory of the Deuteronomic (Josianic) reformers that the Shiloh sanctuary was the precursor of the Jerusalem Temple as the sole legitimate site of worship in Israel (as demanded by Deuteronomy, chapter 12). To seal the reform, the King convoked a representative assembly and had them enter into a covenant with God over the newfound Torah. For the first time, the power of the state was enlisted on behalf of the ancient covenant and in obedience to a covenant document. It was a major step toward the fixation of a sacred canon.

Josiah envisaged the restoration of Davidic authority over the entire domain of ancient Israel, and the retreat of Assyria facilitated his program—until he became fatally embroiled in the struggle of the powers over the dying empire. His death in 609 was doubtless a setback for his religious policy as well as his political aspirations. To be sure, the royally sponsored syncretism of Manasseh's time was not revived, but there is evidence of recrudescence of unofficial local altars. Whether references in Jeremiah and Ezekiel to child sacrifice to YHWH reflect post-Josianic practices is uncertain. There is stronger indication of private recourse to pagan cults in the worsening political situation.

That Assyria's fall should have been followed by the yoke of a harsh new heathen power dismayed the devotees of YHWH who had not been prepared for it by prophecy. Their mood finds expression in the oracles of the prophet Habakkuk in the last years of the 7th century BCE. Confessing perplexity at God's toleration of the success of the wicked in subjugating the righteous, the prophet affirms his faith in the coming salvation of YHWH, tarry though it might. And in the meantime, "the righteous must live in his faith."

Prophecies of Jeremiah and Ezekiel

But the situation in fact grew worse as Judah was caught in the Babylonian–Egyptian rivalry. Some attributed the deterioration to the burden of Manasseh's sin that still rested on the people. For the prophet Jeremiah (active c. 626–c. 580 BCE), the Josianic era was only an interlude in Israel's career of guilt that went back to its origins. His pre-reform prophecies denounced Israel as a faithless wife and warned of imminent retribution at the hands of a nameless northerner. After Nebuchadrezzar's decisive defeat of Egypt at Carchemish (605 BCE), Jeremiah identified the scourge as Babylon. King Jehoiakim's attempt to be free of Babylonia ended with the exile of his successor, Jehoiachin, along with Judah's elite (597); yet the court of the new king, Zedekiah, persisted in plotting new revolts, relying—against all experience—on Egyptian support. Jeremiah now proclaimed a scandalous doctrine of the duty of all nations, Judah included, to submit to the divinely appointed world ruler, the Babylonian monarch Nebuchadrezzar. In submission lay the only hope of avoiding destruction; a term of 70 years had been set to humiliate all men beneath Babylon. Imprisoned for demoralizing the populace, Jeremiah persisted in what was viewed as his traitorous message; the leaders, on their part, persisted in their policy, confident of Egypt and the saving power of Jerusalem's Temple, to the bitter end.

Jeremiah also had a message of comfort for his hearers. He foresaw the restoration of the entire people—north and south—in the land, under a new David. And since events had shown that man was incapable of achieving a lasting reconciliation with God on his own, he envisioned the penitent of the future being met halfway by God, who would remake their nature so that to do his will would come naturally to them. God's new covenant with Israel would be written on their hearts, so that they should no longer need to teach each other obedience, for young and old would know YHWH.

Among the exiles in Babylonia, the prophet Ezekiel, Jeremiah's contemporary, was haunted by the burden of Israel's sin. He saw the defiled Temple of Manasseh's time as present before his eyes, and described God as abandoning it and Jerusalem to their fates. Though Jeremiah offered hope through submission, Ezekiel prophesied an inexorable, total destruction as the condition of reconciliation with God. The majesty of God was too grossly offended for any lesser satisfaction. The glory of God demanded Israel's ruin, but the same cause required its restoration also. For Israel's fall disgraced YHWH among the nations; to save his reputation he must therefore restore Israel to its land and make it prosper as never before. The dried bones of Israel must revive, that they and all the nations should know that he was YHWH (Ezek. 37). Ezekiel, too, foresaw the remaking of human nature, but as a necessity of God's glorification; the concatenation of Israel's sin, exile, and consequent defamation of God's name must never be repeated. In 586 BCE the doom prophecies of Jeremiah and Ezekiel came true. Rebellious Jerusalem was reduced by Nebuchadrezzar, the Temple was burnt, and much of Judah's population dispersed or deported to Babylonia.

THE EXILIC PERIOD

Postexilic religious forms

The survival of the religious community of exiles in Babylonia demonstrates how rooted and widespread the religion of YHWH was. Abandonment of the national religion as an outcome of the disaster is recorded of a minority only. There were some cries of despair, but the persistence of prophecy among the exiles shows that their religious vitality had not flagged. The Babylonian Jewish community, in which the cream of Judah lived, had no sanctuary or altar (in contrast to the Jewish garrison of Elephantine in Egypt); what developed in their place can be surmised from new postexilic religious forms: fixed prayer: public fasts and confessions; and assembly for the study of the Torah, which may have developed from visits to the prophets for oracular edification. The absence of a local or territorial focus must also have spurred the formation of a literary–ideational centre of communal life—the sacred canon of Covenant documents that came to be the core of the present Pentateuch. Observance of the sabbath—a peculiarly public feature of communal life—achieved a significance among the exiles virtually equivalent to all the rest of the Covenant rules together. Notwithstanding its political impotence, the spirit of the exiles was so high that foreigners were attracted to their ranks, hopeful of sharing their future glory.

Assurance of that future glory was given not only in the consolations promised by Jeremiah and Ezekiel (the fulfillment of whose prophecies of doom lent credit to their consolations); the great comforter of the exile was the writer or writers of what is known as Deutero-Isaiah (Isa. 40–66), who perceived in the rise and progress (from *c.* 550) of the Persian king Cyrus II the Great the instrument of God's salvation. Going beyond the national hopes of Ezekiel, animated by the universal spirit of the pre-exilic Isaiah, Deutero-Isaiah saw in the miraculous restoration of Israel a means of converting the whole world to faith in Israel's God. Israel would thus serve as "a light for the nations, that YHWH's salvation may reach to the end of the earth." In his conception of the vicarious suffering of God's servant—through which atonement is made for the ignorant heathen—Deutero-Isaiah found a handle by which to grasp the enigma of faithful Israel's lowly state among the Gentiles. The idea was destined to play a decisive role in the self-understanding of the Jewish martyrs of the Syrian king Antiochus IV Epiphanes' persecution in the 2nd century BCE (in, for example, Daniel) and later again in the Christian appreciation of the death of Jesus.

THE PERIOD OF THE RESTORATION

After conquering Babylon, Cyrus so far justified the hopes put in him that he allowed those Jews who wished to do so to return and rebuild their Temple. Though, in time, some 40,000 made their way back, they were soon disillusioned by the failure of the glories of the restoration to materialize and by the controversy with the Samaritans, and left off building the Temple. (The Samaritans were a judaized mixture of native north Israelites and Gentile deportees settled by the Assyrians in the erstwhile northern kingdom.) A new religious inspiration came under the governorship of Zerubbabel, a member of the Davidic line, who became the centre of messianic expectations during the anarchy attendant upon the accession to the Persian throne of Darius I (522). The prophets Haggai and Zechariah perceived the disturbances as heralds of an imminent overthrow of the heathen Persian Empire and a worldwide manifestation of God and glorification of Zerubbabel. Against that day they urged the people quickly to complete the building of the Temple. The labour was resumed and completed in 516; but the prophecies remained unfulfilled. Zerubbabel disappears from the biblical narrative, and the spirit of the community flagged again.

Role of repentance and the Torah

The one religious constant in the vicissitudes of the restored community was the mood of repentance and the desire to win back God's favour by adherence to his Covenant rules. The anxiety that underlay this mood produced a hostility to strangers, which encouraged a lasting conflict with the Samaritans, who asked permission to take part in rebuilding the Temple of the God they too worshipped. The Jews, however, rejected them on ill-specified grounds—apparently ethno-religious; *i.e.*, they felt the Samaritans to be alien to their historical community of faith, especially to its messianic hopes. Nonetheless, intermarriage occurred and precipitated a new crisis when, in 458, the priest Ezra arrived from Babylon, intent on enforcing the regimen of the Torah. By construing ancient and obsolete laws excluding Canaanites and others so as to make them apply to their own times and neighbours, the leaders of the Jews brought about the divorce and expulsion of several dozen non-Jewish wives and their children. Tension between the xenophobic (fear of strangers) and xenophilic (love of strangers) in postexilic Judaism was finally resolved some two centuries later with the development of a formality of religious conversion, whereby Gentiles who so wished could be taken into the Jewish community by a single, simple procedure.

The decisive constitutional event of the new community was the covenant subscribed to by its leaders in 444, making the Torah the law of the land: a charter granted by the Persian king Artaxerxes I to Ezra—scholar and priest of the Babylonian Exile—empowered him to enforce the Torah as the imperial law for the Jews of the province Avar-nahra (Beyond the River), in which the district of Judah (now reduced to a small area) was located. The charter required the publication of the Torah and the publication, in turn, entailed its final editing—now plausibly ascribed to Ezra and his circle. Survival in the Torah of patent inconsistencies and disaccords with the postexilic situation indicate that its materials were by then sacrosanct, to be compiled but no longer created. But these survivals made necessary the immediate invention of a harmonizing and creative method of text interpretation to adjust the Torah to the needs of the times. The Levites were trained in the art of interpreting the text to the people; the first product of the creative exegesis later known as Midrash is to be found in the covenant document of Nehemiah, chapter 9—every item of which shows development, not reproduction, of a ruling of the Torah. Thus, with the publication of the Torah as the law of the Jews the basis of the vast edifice of the Oral Law characteristic of Judaism was laid.

Origins of the Oral Law

Concern over observance of the Torah was fed by the gap between messianic expectations and the gray reality of the restoration. The gap signified God's continued displeasure, and the only way to regain his favour was to do his will. Thus it is that Malachi, the last of the prophets, concludes with an admonition to be mindful of the Torah of Moses. God's displeasure, how-ever, had always been signalized by a break in communication with him. As time passed and messianic hopes remained unfulfilled, the sense of a permanent suspension of normal relations with God took hold, and prophecy died out. God, it was believed, would some day be reconciled with his people, and a glorious revival of prophecy would then occur. For the present, however, religious vitality expressed itself in dedication to the development of institutions that would make the Torah effective in life. The course of this development is hidden from view by the dearth of sources from the Persian period. But the community that emerged into the light of history in Hellenistic times is one made over radically by this momentous, quiet process.

(Mo.Gr.)

III. Hellenistic Judaism (4th century BCE–2nd century CE)

THE GREEK PERIOD (332–63 BCE)

Hellenism and Judaism. Actual contact between Greeks and Semites goes back to Minoan and Mycenaean times and is reflected in certain terms in Homer and in other early Greek authors. It is not until the end of the 4th century, however, that Jews are first mentioned by Greek writers, who praise the Jews as brave. self-disciplined, and philosophical.

After being conquered by Alexander the Great (332 BCE), Palestine became part of the Hellenistic kingdom of Ptolemaic Egypt, the policy of which was to permit the Jews considerable cultural and religious freedom.

Hellenizing under Seleucid rule

When in 198 BCE Palestine was conquered by King Antiochus III (247–187 BCE), of the Syrian Seleucid dynasty, the Jews were treated even more liberally, being granted a charter to govern themselves by their own constitution, namely, the Torah. Greek influence, however, was already becoming manifest. Some of the 29 Greek cities of Palestine attained a high level of culture. The mid-3rd century-BCE Zenon papyri—containing the correspondence of a business manager of a high Ptolemaic official—present the picture of a wealthy Jew, Tobiah, who through commercial contact with the Ptolemies acquired a veneer of Hellenism, to judge at least from the pagan and religious expressions in his Greek letters. His son and especially his grandsons became ardent Hellenists. It has been argued that the Hellenic influence was so strong among the Jews of Judaea by the beginning of the 2nd century that if the process had continued without the forcible intervention of the Seleucids in Jewish affairs (see below) Judaean Judaism would have become even more syncretistic than that of Philo, the Hellenistic Jewish philosopher of Alexandria (*c.* 15 BCE–c. 40 CE). The apocryphal writer Jesus ben Sirach so bitterly denounced the Hellenizers in Jerusalem (c. 180 BCE) that he was forced by the authorities to temper his words.

The Maccabean revolt

In the early part of the 2nd century BCE, 'Hellenizing Jews came into control of the high priesthood itself. Jason as high priest (175–172 BCE) established Jerusalem as a Greek city, Antioch-at-Jerusalem, with Greek educational institutions. His ouster by an even more extreme Hellenizing faction, which established Menelaus (died 162 BCE) as high priest, occasioned a civil war, with the wealthy aristocrats supporting Menelaus and the masses Jason. The Syrian king Antiochus IV Epiphanes, who had initially bestowed exemptions and privileges upon the Jews, intervened upon the request of Menelaus' party. Antiochus' promulgation of decrees against the practice of Judaism and the offensive and cruel measures to enforce them led to the revolt of an old priest, Mattathias, and his five sons—the so-called Maccabees or Hasmoneans. It has been conjectured that one of the Dead Sea Scrolls, the War of *the* Sons of *Light* Against the Sons of Darkness, mirrors the fierceness of this struggle. In any case, the figure of the martyr, as known in Judaism and Christianity—the person who bears witness to the faith through his suffering and death—dates from this event.

The tactics employed both in the countryside and in Jerusalem by the Hasmoneans in their counterattack against Hellenizing Jews, whose children they forcibly circumcised, indicate the inroads that Hellenism had already made. On the whole, however, the chief strength of the Hellenizers lay among the wealthy urban population, while the Maccabees derived their strength from the peasants and urban masses. Yet, there is evidence that the ruthlessness exhibited by the Hasmoneans toward the Greek cities of Palestine had political rather than cultural origins, and that, in fact, they were fighting for personal power no less than for the Torah. In any case, some of those who fought on the side of the Maccabees were idol-worshipping Jews. The Maccabees soon found a modus vivendi with Hellenism: Jonathan (160–142), according to the Jewish historian Josephus (c. 38–c. 100 CE), negotiated a treaty of friendship with Sparta; Aristobulus (104–103 BCE) actually called himself Philhellene (a lover of Hellenism); Alexander Jannaeus (103–76) hired Greek mercenaries and inscribed his coins with Greek as well as with Hebrew. The Greek influence reached its height under King Herod I of Judaea (37–4 BCE), who built a Greek theatre, amphitheatre, and hippodrome in or near Jerusalem.

Social, political, and religious divisions. During the Hellenistic period the priests were both the wealthiest class and the strongest political group among the Jews of Jerusalem. The wealthiest of all were the Oniad family, who held the hereditary office of high priest until they were replaced by the Hasmoneans; the Temple that they supervised was, in effect, a bank, where the Temple wealth was kept and where private individuals also deposited their money. Hence, from a social and economic point of view, Josephus is justified in calling the government of Judaea a theocracy (rule by those having religious authority). Opposition to the priests' oppression arose among an urban middle class group known as scribes (soferim), who were interpreters and instructors of the Torah on the basis of an oral tradition probably going back to the time of the return from the Babylonian Exile (538 BCE and after). A special group of the scribes known as Hasidim (Greek, Hasideans), or "Pietists," became the forerunners of the Pharisees (middle-class liberal Jews who reinterpreted the Torah and the prophetic writings to meet the needs of their times) and joined the Hasmoneans in the struggle against the Hellenists, though on religious rather than on political grounds.

Josephus held that the Pharisees and the other Jewish parties were philosophical schools, and some modern scholars have argued that the groupings were primarily along economic and social lines; but the chief distinctions among them were religious and go back well before the Maccabean revolt. The equation of Pharisaic with "normative" Judaism can no longer be supported, at any rate not before the destruction of the Temple in 70 CE. The fact that in 70 CE, according to the Palestinian Talmud (see below Rabbinic Judaism), there were 24 types of "heretics" in Palestine indicates that there was, in fact, much divergence among Jews; and this picture is confirmed by Josephus, who notes numerous instances of religious leaders who claimed to be prophets and who obtained considerable followings.

The Pharisees and the Sadducees

Some other modern scholars have sought to interpret the Pharisees' opposition to the Sadducees—wealthy, conservative Jews who accepted the Torah alone as authoritative—as based on an urban–rural dichotomy; but a very large share of Pharisaic concern was with agricultural matters. To associate the rabbis with urbanization seems a distortion. The chief support for the Pharisees came from the lower classes, whether in the country or in the city.

The chief doctrine of the Pharisees (literally "Separatists") was that the Oral Law had been revealed to Moses at the same time as the Written Law. In their exegesis and interpretation of this oral tradition, particularly under the rabbi Hillel at the end of the 1st century BCE, the Pharisees were liberal, and their regard for the public won them considerable support. That the Maccabean ruler John Hyrcanus I broke with them and that Josephus set their number at merely "more than 6,000" at the time of King Herod indicates that they were less numerous and influential than Josephus would have his readers believe. The Pharisees stressed the importance of performing all the commandments, including those that appeared to be of only minor significance; those who were particularly strict in their observance of the Levitical rules were known as *ḥaverim* (“companions”). They believed in the providential guidance of the universe, in angels, in reward and punishment in the world to come, and in resurrection of the dead, in all of which beliefs they were opposed by the Sadducees. In finding a modus vivendi with Hellenism, at least in form and in terminology, however, the Pharisees did not differ greatly from the Sadducees. Indeed, the supreme council of the Great Synagogue (or Great Assembly) of the Pharisees was modelled in its organization on Hellenistic religious and social associations. Because they did not take an active role in fostering the rebellion against Rome in 66–70 CE, they were able, through their leader Johanan ben Zakkai, to obtain Roman permission to establish an academy at Jabneh (Jamnia), where, in effect, they replaced the cult of the Temple with study and prayer.

The Sadducees and their subsidiary group, the Boethusians (Boethosaeans), who were identified with the great landowners and priestly families, were more deeply influenced by Hellenization. The rise of the Pharisees may thus be seen, in a sense, as a reaction against the more profound Hellenization favoured by the Sadducees, who were allied with the philhellenic Hasmoneans. From the time of John Hyrcanus (135–104 BCE) the Sadducees generally held a higher position in comparison with the Pharisees and were in favour with the Jewish rulers. Religiously more conservative than the Pharisees, they rejected the idea of a revealed oral interpretation of the Torah, though, to be sure, they had their own tradition, the *sefer gezerot* ("book of decrees" or "decisions"). They similarly rejected the inspiration of the prophetic books of the Bible, as well as the Pharisaic beliefs in angels, rewards, and punishments in the world to come, providential governance of human events, and resurrection of the dead. For them Judaism centred on the Temple; but about ten years before the destruction of the Temple in 70 CE, the Sadducees in effect disappeared from Jewish life when the Pharisees excluded them from entering the Temple.

The "people of the land" and converts

Not constituting any particular party were the unlearned rural masses known as *ʿamme ha-'aretz* ("people of the land"), who were to be found among both the Pharisees and Sadducees and even among the Samaritans, descendants of the northern Israelites who had their own Torah and their own sanctuary. The *ʿamme ha-'aretz* did not give the prescribed tithes, did not observe the laws of purity, and were neglectful of the laws of prayer; and so great was the antagonism between them and the learned Pharisees that to their daughters was applied the biblical verse, "Cursed be he who lies with any kind of beast." The antipathy was reciprocated, for in the same passage in the Babylonian Talmud (*Pesaḥim*) are added the words, "Greater is the hatred wherewith the *ʿamme ha-ʾaretz* hate the scholar than the hatred wherewith the heathens hate Israel." That there was, however, social mobility is clear from the Talmudic dictum, "Heed the sons of the *'am ha-'aretz,* for they will be the living source of the Torah." That there is little evidence that the early church was particularly successful in converting *ʿamme ha-'aretz* suggests that their position was not unbearable.

Proselytes (converts) to Judaism, though not constituting a class, became increasingly numerous both in Palestine and especially in the Diaspora (the Jews living beyond Palestine). Scholarly estimates of the Jewish population of this era range from 700,000 to 5,000,000 in Palestine ana from 2,000,000 to 5,000,000 in the Diaspora, with the prevailing opinion being that about one-tenth of the population of the Mediterranean world at the beginning of the Christian Era was Jewish. Such numbers represent a considerable increase from previous eras and must have included large numbers of proselytes. Already in 139 BCE the Jews of Rome were compelled by the praetor (civil administrator) to go back to their own homes, charged with attempting to contaminate Roman morals with their religion, presumably an allusion to attempts at proselytism. The first large-scale conversions were by John Hyrcanus and Aristobulus, who, in 130 and 103 BCE, respectively, forced the people of Idumaea in southern Palestine and of Ituraea in northern Palestine to become Jews. The eagerness of the Pharisees to win converts is seen in a statement in Matthew that the Pharisees would "traverse sea and land to make a single proselyte." To be sure, some of the proselytes, according to Josephus, did return to their pagan ways, but the majority apparently remained true to their new religion. In addition, there were many "sympathizers" with Judaism who observed one or more Jewish practices without being fully converted.

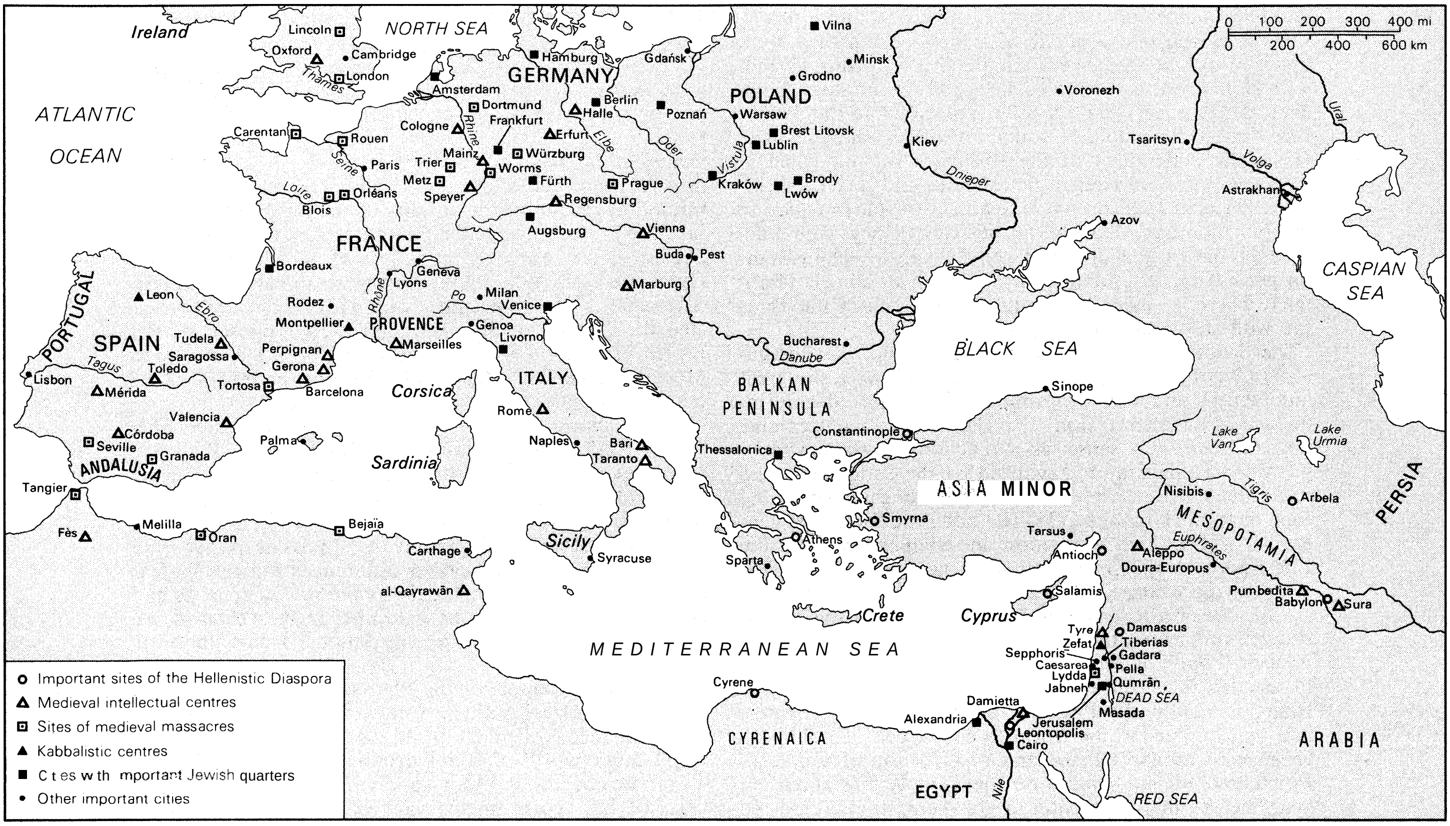
Outside the pale of Judaism in most, though not all, respects were the Samaritans, who, like the Sadducees, refused to recognize the validity of the Oral Law; and, in fact, the break between the Sadducees and the Samaritans did not occur until the conquest of Shechem by John Hyrcanus (128 BCE). Like the later so-called Qumrān covenanters (the monastic group with whom are associated the Dead Sea Scrolls), they were opposed to the Jewish priesthood and the cult of the Temple, regarded Moses as a messianic figure, and forbade the revelation of esoteric doctrines to outsiders.

Scholars have recently revised an older conception of a "normative" Pharisaic Judaism dominant in Palestine and a deviant Judaism dominant in the Diaspora. On the one hand, the picture of "normative" Judaism is broader than at first believed, and it is clear that there were many differences of emphasis within the Pharisaic party; and, on the other hand, supposed differences between Alexandrian and Palestinian Judaism were not as great as had been formerly thought. In Palestine, no less than in the Diaspora, there were then deviations from Pharisaic standards.

Hellenistic influences on Pharisaic Judaism

Despite the attempts of the Pharisaic leaders to restrain the wave of Greek influence, they themselves showed at least a surface Hellenization. In the first place, as many as 2,500–3,000 words of Greek origin are to be found in the Talmudic corpus, and they supply important terms in the fields of law, government, science, religion, technology, and everyday life, especially in the popular sermons preached by the rabbis. When preaching, the Talmudic rabbis often gave the Greek translation of biblical verses for the benefit of those who understood Greek only. The prevalence of Greek in ossuary (burial) inscriptions and the discovery of Greek papyri in the Dead Sea caves confirm the widespread use of the language, though few Jews, it seems, really mastered Greek. Again, there was a surface Hellenization in the frequent adoption of Greek names, even by the rabbis; and there is evidence (Talmud, *Soṭa*) of a school at the beginning of the 2nd century that had 500 students of "Greek wisdom." Even after 117 CE, when it was prohibited by the rabbis to teach one's son Greek, Rabbi Judah the Prince, the editor of the Mishna (authoritative compilation of the Oral Law) at the end of the 2nd century, remarked, "Why talk Syriac in Palestine? Talk either Hebrew or Greek." Even the synagogues of the period have the form of Hellenistic–Roman basilicas, have frequent inscriptions in Greek, and often have pagan motifs. Many of the anecdotes told about the rabbis have Socratic and Cynic (Greek philosophical) parallels. There is evidence of discussions of rabbis with Athenians, Alexandrians, and Roman philosophers, and even with the emperor Antoninus; but in all of these discussions there is evidence of only one rabbi, Elisha ben Abuyah, who became a Gnostic heretic—a person accepting certain esoteric religious dualistic views. The rabbis never mention the Greek philosophers Plato or Aristotle or the Hellenistic Jewish philosopher Philo, and they never use any Greek philosophical terms; the only Greek author whom they name is Homer. Again, the parallels between Hellenistic rhetoric and rabbinic hermeneutics are in the realm of terminology rather than of substance, and those between Roman and Talmudic law are inconclusive. Part of the explanation of this may be that, although there were 29 Greek cities in Palestine, none was in Judaea, the real stronghold of the Jews.

Religious rites and customs in Palestine: Temple and synagogues. The most important religious institution of the Jews until its destruction in 70 was the Temple in Jerusalem—the Second Temple, erected 538–516 BCE. Though services were interrupted for three years by Antiochus Epiphanes (167–165 BCE) and though the Roman general Pompey desecrated the Temple (63 BCE), Herod lavished great expense in rebuilding it. The high priest-



Important historical sites of Hellenistic and medieval Judaism.

hood itself became degraded by the extreme Hellenism of such high priests as Jason and Menelaus; and the institution declined when Herod began the custom of appointing the high priests for political and financial considerations. That not only the multitude of Jews but the priesthood itself suffered from sharp divisions is clear from the bitter class warfare that ultimately erupted in 59 CE between the high priests on the one hand and the ordinary priests and the leaders of the populace of Jerusalem on the other.

Though the Temple remained central in Jewish worship, synagogues may already have emerged during the Babylonian Exile in the 6th century BCE. In any case, in the following century, Ezra stood upon a pulpit of wood and read from the Torah to the people (Nehemiah). According to the interpretation of some scholars, a synagogue existed even within the precincts of the Temple; and certainly by the time of Jesus, to judge from the references to Galilean synagogues in the New Testament, synagogues were common in Palestine. Hence, when the Temple was destroyed in 70, the spiritual vacuum was hardly as great as it had been after the destruction of the First Temple (586 BCE).

The Sanhedrin

The chief legislative, judicial, and educational body of the Palestinian Jews during the period of the Second Temple was the Great Sanhedrin (council court), consisting of 71 members, among whom the Sadducees were an important party. The members shared the government with the king during the early years of the Hasmonean dynasty, but beginning with Herod's reign their authority was restricted to religious matters. In addition, there was another Sanhedrin, set up by the high priest, which served as a court of political council, as well as a kind of grand jury.

Religious and cultural life in the Diaspora. During the Hellenistic–Roman period the chief centres of Jewish population outside Palestine were in Syria, Asia Minor, Babylonia, and Egypt, each of which is estimated to have had at least 1,000,000 Jews. The large Jewish community of Antioch—which, according to Josephus, had been given all the rights of citizenship by the Seleucid founder-king, Seleucus Nicator (died 280 BCE)—attracted a particularly large number of converts to Judaism. It was in Antioch that the apocryphal book of Tobit was probably composed in the 2nd century BCE to encourage wayward Diaspora Jews to return to their Judaism. As for the Jews of Asia Minor, whose large numbers were mentioned by Cicero (1st century BCE), their not joining in the Jewish revolts against the Roman emperors Nero, Trajan, and Hadrian would indicate that they had sunk deep roots into their environment. In Babylonia, in the early part of the 1st century CE, two Jewish brothers, Asinaeus and Anilaeus, were able to establish an independent minor state; their followers were so meticulous in observing the sabbath that they assumed that it would not be possible to violate the sabbath even in order to save themselves from a Parthian attack. In the early part of the 1st century CE, according to Josephus, the royal house and many of their entourage in the district of Adiabene in northern Mesopotamia were converted to Judaism; some of the Adiabenian Jews distinguished themselves in the revolt against Rome in 66 (see below).

The Egyptian Diaspora

The largest and most important Jewish settlement in the Diaspora was in Egypt. There is evidence (papyri) of a Jewish military colony at Elephantine (Yeb), Upper Egypt, as early as the 6th century BCE. These papyri reveal the existence of a Jewish temple—which most certainly would be considered heterodox—and some syncretism (mixture) with pagan cults. Alexandria, the most populous and most influential Hellenistic Jewish community in the Diaspora, had its origin when Alexander the Great assigned a quarter of the city to the Jews. Until about the 3rd century BCE the papyri of the Egyptian Jewish community were written in Aramaic; after that, with the exception of the Nash papyrus in Hebrew, all papyri until 400 CE were in Greek. Similarly, of the 116 Jewish inscriptions from Egypt, all but five are written in Greek. The process of Hellenistic acculturation is, thus, obvious.

The most important work of the early Hellenistic period, dating, according to tradition, from the 3rd century BCE, is the Septuagint, a translation of the Pentateuch into Greek. (The translation of the whole Hebrew Bible was completed during the next two centuries.) The fact that, in the *Letter* of *Aristeas* (see below) and the works of Philo and Josephus, this translation was itself regarded as divinely inspired led to the neglect of the Hebrew original. The translation shows some knowledge of Palestinian exegesis and the tradition of Halakha (the Oral Law); but the rabbis themselves, noting that the translation diverged from the Hebrew text, apparently had ambivalent feelings about it, as is evidenced in their alternate praise and condemnation of it. The fact that such a concept as Torah was translated as *nomos* ("law") and *tzedaqa* as *dikaiosynē* ("justice") opened the way to antilegalism in early Christianity and to Platonic interpretations; and the introduction of such Greek mythological terms as "Titans" and "Sirens" helped to pave the way for the syncretism of Judaism and paganism.

The establishment of a temple at Leontopolis in Egypt (c. 145 BCE) by a deposed high priest, Onias IV, indicates that the temple was clearly heterodox; but this temple never really offered a challenge to the one in Jerusalem and was merely the temple of the military colony of Leontopolis. It is significant that the Palestinian rabbis ruled that a sacrifice intended for the temple of Onias might be offered in Jerusalem. That the temple of Onias made little impact upon Egyptian Jewry can be seen from the silence about it on the part of Philo, who often mentions the Temple in Jerusalem. The temple of Onias, however, continued until it was closed by the Roman emperor Vespasian in 73 CE.

The chief religious institutions of the Egyptian Diaspora were synagogues. As early as the 3rd century BCE there were inscriptions mentioning two *proseuchai*, Jewish prayerhouses. In Alexandria there were numerous synagogues throughout the city, of which the largest was so famous that it is said in the Talmud (see below Rabbinic Judaism) that he who has not seen it has never seen the glory of Israel.

Egyptian Jewish literature. In Egypt the Jews produced a considerable literature (most of it now lost), intended to inculcate in Greek-speaking Jews a pride in their past and to counteract an inferiority complex that some of them felt about Jewish cultural achievements. In the field of history, Demetrius, near the end of the 3rd century BCE, wrote a work *On* the Kings in Judaea—perhaps intended to refute an anti-Semitic Egyptian priest and author—showing considerable concern for chronology. In the 2nd century BCE a Jew who used the name of Hecataeus wrote On the Jews (or On Abraham). Another, Eupolemus (c. 150 BCE), like Demetrius, wrote On *the* Kings in Judaca; an indication of its apologetic nature may be seen from the fragment asserting that Moses taught the alphabet not only to the Jews but also to the Phoenicians and to the Greeks. Artapanus (c. 100 BCE), in his book On the *Jews*, went even further in romanticizing Moses by identifying him with the Greek Musaeus and the Egyptian Hermes-Thoth (god of Egyptian writing and culture) and by asserting that Moses was the real originator of Egyptian civilization and that he even taught the Egyptians the worship of the deity Apis (the sacred bull) and the ibis (sacred bird). In his history, Cleodemus (or Malchus), in an obvious attempt to win for the Jews the regard of the Greeks, asserted that two sons of Abraham had joined Heracles in his expedition in Africa and that the Greek hero had married the daughter of one of them. On the other hand, Jason of Cyrene (c. 100 BCE) wrote a history, of which II Maccabees is a summary, glorifying the Temple and violently attacking the Jewish Hellenizers; but his manner of writing history is typically Hellenistic, with emphasis on pathos. *III* Maccabees (1st century BCE) is a work of propaganda intended to counteract those Jews who sought to win citizenship in Alexandria. The Letter of *Aristeas*, though ascribed to a pagan courtier, Ptolemy II Philadelphus, was probably composed by an Alexandrian Jew about 100 BCE to defend Judaism and its practices against detractors.

Egyptian Jews also composed poems and plays, now extant only in fragments, to glorify their history. Philo the Elder (c. 100 BCE) wrote an epic On *Jerusalem* in Homeric hexameters. Theodotus (c. 100 BCE) wrote an epic On *Shechem*, quite clearly apologetic, to judge from the fragment connecting the name of Shechem with Sikimios, the son of the Greek god Hermes. At about the same time, a Jewish poet wrote a didactic poem, ascribing it to the pagan Phocylides, though closely following the Bible in some details; the author disguised his Jewish origin by omitting any attack against idolatry from his moralizing. A collection known as *The* Sibylline Oracles, containing Jewish and Christian prophecies in pagan disguise, includes some material composed by a 2nd-century-BCE Alexandrian Jew who intended to glorify the pious Jews and perhaps to win converts; it is possible that the Oracles were known to the Roman poet Virgil when he wrote his fourth Eclogue.

A Jewish dramatist of the period, Ezekiel (*c.* 100 BCE), composed tragedies in Greek. Fragments of one of them, The Exodus, show how deeply he was influenced by the Greek dramatist Euripides. Whether such plays were actually presented on the stage or not, they edified Jews and showed the pagans that the Jews had as much material for drama as they did.

Alexandrian Jewish philosophical achievements

The greatest achievement of Alexandrian Judaism was in the realm of wisdom literature and philosophy. In a work entitled An Interpretation of the Law of Moses, Aristobulus in the 2nd century BCE anticipated Philo in attempting to harmonize Greek philosophy and the Torah, in using the method of allegory to explain anthropomorphisms in the Bible, and in asserting that the Greek philosophers were indebted to Moses. The Wisdom of Solomon, dating from the 1st century BCE, shows an acquaintance with the Platonic doctrine of the pre-existence of the soul and with a method of argument known as sorites that was favoured by the Stoics (Greek philosophers). During the same period the author of IV Maccabees showed an intimate knowledge of Greek philosophy, particularly of Stoicism.

By far the greatest figure in Alexandrian Jewish literature is Philo, who has come to be recognized as a major philosopher. His synthesis of Greek philosophy, particularly that of Plato, and of the Torah, and his formulation of the Logos (Word, or Divine Reason) as an intermediary between God and the world, helped lay the groundwork for Neoplatonism (a philosophy dealing with levels of being), Gnosticism (a dualistic religious movement teaching that matter is evil and that spirit is good), and the philosophical framework of the early Church Fathers. Philo was a devotee of Judaism neither as a mystic cult nor as a collateral branch of Pharisaic Judaism; he was a Diaspora Jew with a profound knowledge of Greek literature who, though almost totally ignorant of Hebrew, tried to find a modus vivendi between Judaism and secular culture.

Mention may be made of the Jewish community of Rome. Numbering perhaps 50,000, it was, to judge from the inscriptions in the Jewish catacombs, predominantly Greek-speaking and almost totally ignorant of Hebrew. References in Roman writers, particularly Tacitus and the satirists, have led scholars to conclude that the community—which was influential, to judge from the pagan jibes—observed the sabbath and the dietary laws and was active in seeking converts.

Modifications of Jewish traditions by Diaspora Jews

The Hellenization of the Diaspora Jews is, however, to be seen not merely in their literature but even more in the papyri and art objects that have recently been studied at great length. As early as 290 BCE, Hecataeus of Abdera, a Greek non-Jew living in Egypt, had remarked that under the Persians and Macedonians the Jews had greatly modified the traditions of their fathers. The fact that—to judge from other papyri—at least three-fourths of the Egyptian Jews had personal names of Greek, rather than Hebrew, origin is significant. That the only schools of which mention is made are sabbath schools intended for adults and that, on the contrary, Jews were extremely eager to gain admittance for their children to Greek *gymnasia*—where quite obviously they would have to make compromises with their Judaism—indicates their scale of values. Again, there are a number of violations from the norms of Halakha (which precluded the charging of interest for a loan), most notably in the fact that of 11 known extant loan documents only two are without interest. There are often striking similarities between the documents of sale, marriage, and divorce of the Jews and of the Greeks in Egypt, though some of this, as with the documents of the Elephantine Jewish community, may be due to a common origin in the cuneiform law of ancient Mesopotamia. The charms and apotropaic (designed to avert evil) amulets are often syncretistic, and the Jews can hardly have been unaware of the religious significance of symbols that were still very much filled with meaning in pagan cults. The fact that the Jewish community of Alexandria was preoccupied in the 1st century BCE and the 1st century CE with obtaining rights as citizens—which certainly involved compromises with Judaism, including participation in pagan festivals and sacrifices—shows how far they were ready to deviate. Philo mentions Jews who scoffed at the Bible, which they insisted on interpreting literally, and of others who failed to adhere to the biblical laws that they regarded as mere allegory; he writes too of Jews who observed nothing of Judaism except the holiday of Yom Kippur. But despite such deviations, the pagan writers constantly accuse the Diaspora Jews of being "haters of mankind" and of being absurdly superstitious; and Christian writers later similarly attack the Jews for refusing to give up the Torah. At least they were loyal Jews in their contributions of the Temple tax and in pilgrimages to Jerusalem on the three festivals. Actual apostasy and intermarriage were apparently not common, but the virulent anti-Semitism and the pogroms perpetrated by the Egyptian non-Jews must have served as a deterrent.

Apocalyptic and wisdom literature

Palestinian Literature. During this period literature was composed in Palestine in Hebrew, Aramaic, and Greek, with the exact language still a subject of dispute among scholars in many cases and with the works often apparently composed by more than one author over a considerable period of time. Most of the works composed in Hebrew, many of them existing only in Greek—Ecclesiasticus, I Maccabees, Judith, *Testaments of the Twelve Patriarchs,* Baruch, *Psalms of Solomon*, Prayer of Manasseh—and many of the Dead Sea Scrolls are generally conscious imitations of biblical books, often reflecting the dramatic events of the Maccabean struggle and often with an apocalyptic tinge (involving the dramatic intervention of God in history). The literature in Aramaic consists of the following: (1) biblical or Bible-like legends or midrashic (interpretive) additions—Testament *of Job, Martyrdom of Isaiah, Paralipomena of Jeremiah, Life of Adam and Eve,* the Dead Sea *Genesis Apocryphon*, Tobit, Susanna, Bel and the Dragon; and (2) apocalypses—Enoch (perhaps originally written in Hebrew), *Assumption of Moses,* the Syriac Baruch, II (IV) Esdras, and *Apocalypse of Abraham*. In Greek the chief works by Palestinians are histories of the Jewish War against Rome and of the Jewish kings by Justus of Tiberias (both are lost) and the history of the Jewish War, originally in Aramaic, and the *Jewish Antiquities* by Josephus (both written in Rome).

Of the wisdom literature composed in Hebrew, the book of the Wisdom of Jesus the Son of Sirach, or Ecclesiasticus *(c.* 180 BCE), modelled on the book of Proverbs, identified Wisdom with the observance of the Torah. The *Testaments of the Twelve Patriarchs*, probably written in the latter half of the 2nd century BCE, patterned on Jacob's blessings to his sons, are now thought to belong to eschatological literature related to the Dead Sea Scrolls. The identification of Wisdom and Torah is stressed in the Mishnaic tract *Pirqe Avut* ("Sayings of the Fathers"), which, though edited 200 CE, contains the aphorisms of rabbis dating back to 300 BCE.

Books such as the *Testament of Job,* the Dead Sea Scroll *Genesis Apocryphon,* the *Book of Jubilees* (now known to have been composed in Hebrew, as seen by its appearance among the Dead Sea Scrolls), and *Biblical Antiquities,* falsely attributed to Philo (originally written in Hebrew, then translated into Greek, but now extant only in Latin), as well as the first half of Josephus' *Jewish Antiquities*, often show affinities with rabbinic Midrashim (interpretive works) in their legendary accretions of biblical details. Sometimes, as in *Jubilees* and in the Pseudo-Philo work, these accretions are intended to answer the questions of heretics, but often, particularly in the case of Josephus, they are apologetic in presenting biblical heroes in a guise that would appeal to a Hellenized audience.

Apocalyptic trends, given considerable impetus by the victory of the Maccabees over the Syrian Greeks, were not—as was formerly thought—restricted to Pharisaic circles. They were (as is clear from the Dead Sea Scrolls) found in other groups as well, and are of particular importance for their influence on both Jewish mysticism and early Christianity. These books, which have a close connection with the biblical Book of Daniel, stress the impossibility of a rational solution to the problem of theodicy—how to reconcile the righteousness of God with observable evil. They also stress the imminence of the day of salvation, which is to be preceded by terrible hardships, and presumably reflected the current historical setting. In the book of *Enoch* there is stress on the terrible punishment inflicted upon sinners in the Last Judgment, the imminent coming of the Messiah and of his kingdom, and the role of angels.

The sole Palestinian Jewish author writing in Greek whose works are preserved is Josephus. His account of the war against the Romans in his *Life* and, to a lesser degree, in the *Jewish War* are largely a defense of his own questionable behaviour as the commander of the Jewish forces in Galilee. But these works and more especially *Against Apion* and the *Jewish Antiquities* are largely defenses of Judaism against anti-Semitic attacks. Josephus' *Jewish War* is often quite deliberately parallel to Thucydides' *History of the Peloponnesian War;* and his *Jewish Antiquities* is quite deliberately parallel to Dionysius of Halicarnassus' *Roman Antiquities,* dating from earlier in the same century.

THE ROMAN PERIOD (63 BCE–135 CE)

New parties and sects. Under Roman rule a number of new groups, largely political, emerged in Palestine. Their common aim was to seek an independent Jewish state. All were zealous for, and strict in their observance of, the Torah.

The Herodians and the Zealots

The Herodians were a political group that after the death of Herod—whom they apparently regarded as the Messiah—sought the re-establishment of the rule of Herod's descendants over an independent Palestine as a prerequisite for Jewish preservation. Unlike the Zealots, however (see below), they did not refuse to pay taxes to the Romans.

The Zealots' party, founded c. 6–9 CE, refused to pay tribute to the Romans and advocated overthrowing them on the ground that they should acknowledge God alone as their master. A priestly, eschatologically oriented resistance movement, the Zealots were particularly dedicated to keeping the Temple and its cult pure and used guerrilla tactics toward that end. The Sicarii (Assassins), so-called because of the dagger (*sica*) they carried, arose c. 54, according to Josephus, as a group of bandits who kidnapped or murdered those who had found a modus vivendi with the Romans. It was they who made a stand at the fortress of Masada near the Dead Sea, committing suicide rather than be captured by the Romans (73).

The Essenes, New Covenanters, and Dead Sea groups

A number of other parties—various types of Essenes, Damascus Covenanters, and the Qumrān Dead Sea groups—were distinguished by their pursuit of an ascetic monastic life, disdain for material goods and sensual gratification, sharing of material possessions, concern for eschatology, strong apocalyptic views in anticipation of the coming of the Messiah, practice of ablutions to attain greater sexual and ritual purity, prayer, contemplation, and study. The Essenes were like the Therapeutae, a Jewish religious group that had flourished in Egypt two centuries earlier, but the latter actively sought "wisdom" whereas the former were anti-intellectual. Only some of the Essenes were celibate. The Essenes have been termed Gnosticizing Pharisees because of their belief, shared with the Gnostics, that the world of matter was evil; some have seen in them the influence of a quasi-monasticism.

The Damascus sect (New Covenanters) were a group of Pharisees who went beyond the letter of the Pharisaic Halakha. Like the Essenes and the Dead Sea sect, they had a monastic type of organization and opposed the way in which sacrifices were offered in the Temple.

The continuing recent discoveries of scrolls in caves of the Dead Sea area have focussed attention on the groups that lived there. On the basis of paleography, carbon-14 testing, and the coins discovered there, most scholars accept a 1st-century date for them. A theoretical relationship of the communities with John the Baptist and the nascent Christian groups remains in dispute, however. The sectaries have been identified variously as Zealots, an unnamed anti-Roman group, and especially Essenes; but a major difference between the Qumriin groups and the Essenes is that the former were militarily activist (the discovery of hymns and a calendar at Masada—a stronghold of the Sicarii—that had previously been found at Qumrān, may indicate a connection between the groups), while the latter were, for the most part, pacifist. That the groups had secret, presumably apocalyptic, teachings is clear from the fact that among the scrolls are some in cryptographic script and reversed writing; and yet, despite their extreme piety and legalistic conservatism, they apparently were not unaware of Hellenism, to judge from the presence of Greek books at Qumriin.

It has long been debated whether the Gnostic systems of the 1st and 2nd centuries go back to the collapse of the apocalyptic strains in Judaism—which expected a final transforming catastrophic event—when the Temple was destroyed in 70. It is doubtful that there is any direct Jewish source for this Gnosticism, though some characteristic Gnostic doctrines are found in certain groups of particularly apocalyptic 1st-century Jews—the dichotomy of body and soul and a disdain for the material world, a notion of esoteric knowledge, and an intense interest in angels and in problems of creation.

Primitive Christianity a part of the 1st-century Jewish religious spectrum

Origin of Christianity: the early Christians and the Jewish community. Though it attracted little attention among pagans and Jews at the beginning, the rise of Christianity was by far the most important "sectarian" development of the Roman period. With the revision, largely due to the discoveries at Qumrān, of the view that Pharisaic Judaism was to be considered normative, primitive Christianity, with its apocalyptic and eschatological interests, has come to be viewed by many scholars as no longer "sectarian" or peripheral to Jewish development but, at least initially, as part of a broad spectrum of attitudes within Judaism. Jesus himself, despite his criticisms of Pharisaic legalism, may now be classified as a Pharisee with strong apocalyptic inclinations; he proclaimed that he had no intention of abrogating the Torah, but of fulfilling it. It is possible to envision a direct line between Jewish currents, both in Palestine and the Diaspora in the Hellenistic Age, and Christianity, particularly in the traditions of martyrdom, proselytism, monasticism, mysticism, liturgy, and religious philosophy, especially the doctrine of the Logos (Word) as an intermediary between God and the world and the synthesis of faith and reason. The Septuagint, in particular, played an important role both theoretically, in the transformation of Greek philosophy into the theology of the Church Fathers, and practically, in converting Jews and Jewish "sympathizers" to Christianity. The connection of nascent Christianity with the Qumrān groups may be seen in their dualism and apocalypticism; but there are differences, notably in the conception of the Incarnation, in the relationship of the Son and the Father, and in Jesus' vicarious suffering for sinners as against the direct suffering of the Qumrān Teacher of Righteousness. Again, the Qumran group constituted an esoteric movement, militant, with enforced community of goods, concerned with strict observance of the Torah, especially with its calendar, whereas Christianity was pacifist, was open to all, and represented a New Covenant, with stress away from the Torah ritual and with voluntary community of possessions. In general, moreover, Christianity was more positively disposed toward Hellenism than was Pharisaism, particularly under the leadership of Paul, a thoroughly Hellenized Jew.

When Paul proclaimed his antinomianism (against Torah observance as a means of salvation) many Jewish followers of Jesus became Jewish Christians and continued to observe the Torah. Their two main groupings were the Ebionites—probably to be identified with those called minim, or "sectaries," in the Talmud—who accepted Jesus as the Messiah but denied his divinity, and the Nazarenes, who regarded Jesus as both Messiah and God, but regarded the Torah as binding upon Jews alone.

The break between Judaism and Christianity

The percentage of Jews converted to any form of Christianity was extremely small, as can be seen from the frequent criticisms of Jews for their stubbornness by Christian writers. In the Diaspora, despite the strong influence of Hellenism, there were relatively few Jewish converts, though the Christian movement had some success in winning Alexandrian Jews.

There were four major stages in the final break between Christianity and Judaism: (1) the flight of the Jewish Christians from Jerusalem to Fella across the Jordan in 70 and their refusal to continue the struggle against the Romans; (2) the institution by the patriarch Gamaliel II of a prayer in the Eighteen Benedictions against such heretics (c. 100), and (3 and 4) the failure of the Christians to join the messianic leaders Lukuas-Andreas and Bar Kokhba in the revolts against Trajan (115–117) and Hadrian (132–135), respectively.

Judaism under Roman rule. When Pompey entered the Temple in 63 BCE as an arbiter both in the civil war between Hyrcanus and Aristobulus and in the struggle of the Pharisees against both Jewish rulers, Judaea in effect became a puppet state of the Romans. During the civil war between Pompey and Julius Caesar, the Idumaean Antipater had ingratiated himself with Caesar by aiding him and was rewarded by being made governor of Judaea; the Jews were rewarded through the promulgation of a number of decrees favourable to them, which were reaffirmed by Augustus and later emperors. His son Herod, king of Judaea, an admirer of Greek culture, supported a cult worshipping the Emperor and built temples to Augustus in non-Jewish cities. Since he was by origin an Idumaean, he was regarded by many Jews as a foreigner. (The Idumaeans, or Edomites, were forcibly converted to Judaism by John Hyrcanus; see above.) On several occasions during and after his reign, Pharisaic delegations sought to convince the Romans to end the quasi-independent Jewish government. After the death of Herod's son and successor Archelaus in 6 CE, his realms were ruled by Roman procurators, the most famous or infamous of whom, Pontius Pilate (26–36), attempted to introduce busts of the Roman emperor into Jerusalem and discovered the intense religious zeal of the Jews in opposing this measure. When Caligula ordered the governor of Syria, Petronius, to install a statue of himself in the Temple, a large number of Jews proclaimed they would suffer death rather than to permit such a desecration. Petronius in response succeeded in getting the Emperor to delay. The procurators of Judaea, being of equestrian (knightly) rank and often of Oriental Greek stock, were more anti-Semitic than the governors of Syria, who were of the higher senatorial order. The last procurators in particular were indifferent to Jewish religious sensibilities; and various patriotic groups, to whom nationalism was an integral part of their religion, succeeded in polarizing the Jewish population and bringing on an extremely bloody war with Rome in 66–70. The climax of the war was the destruction of the Temple in 70, though, according to Josephus, the Roman general (and later emperor) Titus sought to spare it. The war was not ended, however, until 73, when the Sicarii at Masada committed suicide rather than submit to the Romans.

Jewish wars against the Romans

The papyri indicate that the war against Trajan (115–117), involving the Jews of Egypt, Cyrenaica, Cyprus, and Mesopotamia (though only to a minor degree those of Palestine), was a widespread revolt under a Cyrenian king-messiah, Lukuas-Andreas, aimed at freeing Palestine from Roman rule. The same spirit of freedom impelled another messiah, Bar Kokhba, who had the support of the greatest rabbi of the time, Akiba, in his spontaneous uprising (132–135). The result was Hadriax's decrees prohibiting circumcision and public instruction in the Torah, though these were soon revoked by Antoninus Pius. Having suffered such tremendous losses on the field of battle, Judaism turned its dynamism to the continued development of the Talmud (see below ***Rabbinic** Judaism*). (*L.H.F.*)

IV. Rabbinic Judaism (2nd–18th centuries)

THE AGE OF THE TANNAIM (135–C. 200)

The role of the rabbis. With the defeat of Bar Kokhba and the ensuing collapse of active Jewish resistance to Roman rule (135–136), politically moderate and quietist rabbinic elements remained the only cohesive group within Jewish society. With Jerusalem off limits to the Jews, rabbinic ideology and practice, which were not dependent on Temple, priesthood, or political independence for their vitality, provided a viable program for autonomous community life and thus filled the vacuum created by the suppression of all other Jewish leadership. The Romans, confident that the will for insurrection had been shattered, soon relaxed the Hadrianic prohibitions of Jewish ordination, public assembly, and regulation of the calendar and permitted rabbis who had fled the country to return and re-establish an academy in the town of Usha in Galilee.

The rabbinic way

The strength of the rabbinate lay in its ability to represent simultaneously the interests of the Jews and the Romans, whose religious and political needs, respectively, now chanced to coincide. The rabbis were regarded favourably by the Romans, as a politically submissive class, which, with its wide influence over the Jewish masses, could translate the Pax Romana (the peace imposed by Roman rule) into Jewish religious precepts. To the Jews, on the other hand, the rabbinic ideology gave the appearance of continuity to Jewish self-rule and freedom from alien interference. The rabbinic program fashioned by Johanan ben Zakkai's circle (see above *Hellenistic Judaism*) had replaced sacrifice and pilgrimage to the Temple with study of Scripture, prayer, and works of piety, thus eliminating the need for a central sanctuary (in Jerusalem) and making of Judaism a religious association capable of fulfillment anywhere. Judaism was now, for all intents and purposes, a Diaspora religion even on its home soil. Any sense of real break with the past was mitigated by continued adherence to purity laws (dietary and bodily) and by assiduous study of Scripture, including those legal sections that historical developments had now made obsolete. The reward held out for scrupulous study and fulfillment was the promise of messianic deliverance; *i.e.*, divine restoration of all those institutions that had become central in Jewish notions of national independence—the Davidic monarchy, Temple service, the ingathering of Diaspora Jewry—and, above all, the assurance of personal reward to the righteous through resurrection and participation in the national rebirth.

The Mishna

Apart from the right to teach Scripture publicly, the most pressing need felt by the surviving rabbis was for the reorganization of a recognized body that would reactivate the functions of the former Sanhedrin and pass on disputed questions of law and dogma. A high court was, accordingly, organized under the leadership of Simeon ben Gamaliel (reigned *c.* 135–c. 175), the son of the previous patriarch (the Roman term for the head of the Palestinian Jewish community) of the house of Hillel, in association with rabbis representing other schools and interests. In the ensuing struggle for power, the patriarch managed to concentrate all communal authority in his office. The dominating role of the patriarchate reached its zenith in the days of his son and successor, Judah the Prince, whose reign (*c.* 175–c. 220) marked the climax of this period of rabbinic activity, otherwise known as the "age of the *tannaim*" (teachers). Armed with wealth, Roman backing, and dynastic legitimacy (which the patriarch now traced to the house of David), Judah sought to standardize Jewish practice through a corpus of legal norms that would reflect recognized views of the rabbinate on every aspect of life. The Mishna (collection of rabbinic law) that soon emerged became the primary source of reference in all rabbinic schools and constituted the core around which the Talmud (commentary on Mishna, literally "teaching") was later compiled. It thus remains the best single introduction to the complex of rabbinic values and practices as they evolved in Roman Palestine.

The making of the Mishna. Although the promulgation of an official corpus represented a break with rabbinic precedent, Judah's Mishna did have antecedents. During the 1st and 2nd centuries CE, rabbinic schools had compiled for their own reference collections in which the results of their exegesis and application of Scripture to problematic situations (Midrash, "investigation" or "interpretation"; plural Midrashim) had been recorded in terse legal form. By 200 CE several such compilations were circulating in Jewish schools and were being utilized by judges. While adhering to the structural form of these earlier collections, Judah compiled a new one in which universally accepted views were recorded alongside those still in dispute, thereby largely reducing the margin for individual discretion in the interpretation of the law. Although his action aroused opposition, and some rabbis continued to invoke their own collections, the authority of his office and the obvious advantages of a unified system of law soon outweighed centrifugal tendencies, and his Mishna attained quasi-canonical status, becoming known as "The Mishna" or "Our Mishna." For all its clarity and comprehensiveness, its phraseology was often obscure or too terse to satisfy all needs, and a companion known as the Tosefta ("Additions") was compiled shortly thereafter in which omitted traditions and explanatory notes were recorded. Since, however, neither compilation elucidated the processes by which their decisions had been elicited, various authorities set about collecting the midrashic discussions of their schools and recording them in the order of the verses of Scripture. During the 3rd and 4th centuries the tannaitic Midrashim on the Pentateuch were compiled and introduced as school texts.

Fundamentally legal in character, this literature was designed to regulate every aspect of life—the six divisions of the Mishna on agriculture, festivals, family life, civil law, sacrificial and dietary laws, and purity encompass virtually every area of Jewish experience—and, accordingly, also recorded the principal Pharisaic and rabbinic definitions and goals of the religious life. One tract of the Mishna, Avot ("Sayings of the Fathers"), treated the meaning and posture of a life according to Torah, while other passages made reference to the mystical studies into which only the most advanced and religiously worthy were initiated; *e.g.*, the activities of the *Merkava*, or divine "Chariot," and the doctrines of creation (see JEWISH MYSTICISM). The rabbinic program of a life dedicated to study and fulfillment of the will of God was thus a graded structure in which the canons of morality and piety were attainable on various levels, from the popular and practical to the esoteric and metaphysical. Innumerable sermons and homilies preserved in the midrashic collections, liturgical compositions for daily and festival services, and mystical tracts circulated among initiates all testify to the deep spirituality that informed rabbinic Judaism.

THE AGE OF THE AMORAIM: THE MAKING OF THE TALMUDS (3RD–6TH CENTURIES)

Palestine (c. 220–c. 400). The promulgation of the Mishna initiated the period of the *amoraim* (lecturers or interpreters), those teachers who made the Mishna the basic text of legal exegesis. The curriculum now centred on the elucidation of the text of the standard compilation, harmonization of its decisions with extra-Mishnaic traditions recorded in other collections, and the application of its principles to new situations. The records of these amoraic studies have been preserved in the form of two running commentaries on the Mishna known as the Palestinian (or Jerusalem) Talmud ("Teaching") and the Babylonian Talmud, reflecting the study and legislation of the academies of the two principal centres of Jewish concentration in the Roman and Persian empires of that time. (Talmud is also the comprehensive term for the whole collections, Palestinian and Babylonian, containing Mishna, commentaries, and other matter.)

The principal agencies mediating the rabbinic way of

The rabbinic educational system

life and literature to the masses were the schools, ranging from the primary school to the advanced "house of study" and more formal academy (yeshiva), the synagogue, and the Jewish courts, which not only adjudicated litigations but also decided on ritual problems. Primary schools had long been available in the villages and cities of Palestine, and tannaitic law made education of male children a religious duty. Introduced at the age of five or six to Scripture, the student advanced at the age of ten to Mishna and finally in mid-adolescence to Talmud or the processes of legal reasoning. Regular reading of Scripture in the synagogue on Mondays, Thursdays, the sabbaths, and festivals, coupled with concurrent translations into the Aramaic vernacular and frequent sermons, provided for lifelong instruction in the literature and the values elicited from it. The amoraic emphasis on the moral and spiritual aims of Scripture and its ritual is reflected in their midrashic collections, which are predominantly homiletical (sermonic) rather than legal in content.

An amoraic sermon conceded that of every thousand beginners in primary school only one would be expected to continue as far as Talmud. In the 4th century, however, there were enough advanced students to warrant academies in Lydda, Caesarea, Sepphoris, and Tiberias (in Palestine), where leading scholars trained disciples for communal service as teachers and judges. In Caesarea, the principal port and seat of the Roman administration of Palestine, where pagans, Christians, and Samaritans maintained renowned cultural institutions, the Jews, too, established an academy that was singularly free of patriarchal control. The outstanding rabbinic scholar there, Abbahu (c. 279–320), wielded great influence with the Roman authorities and, because he combined learning with personal wealth and political power, attracted some of the most gifted students of the day to the city. In c. 350 the studies and decisions of the authorities in Caesarea were compiled as a tract on the civil law of the Mishna. Half a century later, the academy of Tiberias issued a similar collection on other tracts of the Mishna, and this compilation, in conjunction with the Caesarean material, constituted the Palestinian Talmud.

The role of the patriarchs

Despite increasing tensions between some rabbinic circles and the patriarch, his office was the agency providing a basic unity to the Jews of the Roman Empire. Officially recognized as a Roman prefect, a government official, the patriarch at the same time delegated apostles to Jewish communities to inform them of the Jewish calendar and of other decisions of general concern and to collect an annual tax of a half shekel paid by male Jews for his treasury. As titular head of the Jewish community of the mother country and as a vestigial heir of the Davidic monarchy, the patriarch was a reminder of a glorious past and of a hope for a brighter future. How enduring these hopes were may be seen from the efforts to gain permission to rebuild the Temple in Jerusalem. Although the emperor Julian (reigned 361–363) actually authorized the reconstruction, the project came to naught as a consequence of a disastrous fire on the sacred site and the subsequent death of the Emperor.

The adoption of Christianity as the religion of the empire had no direct effect on the religious freedom of the Jews; *i.e.*, on their freedom to worship and observe their life rules. The ever-mounting hostility between the two religions, however, resulted in severe curtailment of Jewish disciplinary rights over their coreligionists, interference in the collection of patriarchal taxes, restriction of the right to build synagogues, and, finally, upon the death of the patriarch Gamaliel VI in c. 425, the abolition of the patriarchate and the diversion of the Jewish tax to the imperial treasury. Though Mediterranean Jewry was now fragmented into disjointed communities and synagogues, the principles of the regulation of the Jewish calendar had been committed to writing c. 359 by the patriarch Hillel II, and this, coupled with the widespread presence of rabbis, ensured continuity of Jewish adherence. Even the emperor Justinian's (reigned 527–565) restrictions on synagogal worship and preaching apparently had no devastating effect. A new genre of liturgical poetry, combining ecstatic prayer with didactic motifs, developed in this period of political decline and won acceptance in synagogues in Asia Minor as well as beyond the Euphrates.

Babylonia (200–650). In the increasingly unfriendly climate of Christendom, Jews drew consolation in the knowledge that in nearby Babylonia (then under Persian rule) a vast population of Jews continued to live under a network of effective and autonomous Jewish institutions and officialdom. Steadily worsening conditions in Palestine had drawn many Jews to Persian domains, where economic opportunities and the Jewish communal structure enabled them to gain a better livelihood while living in accordance with their ancestral traditions. To regulate internal Jewish affairs and ensure the steady flow of taxes, the Parthian, or Arsacid, rulers (247 BCE–224 CE) had appointed c. 100 CE an exilarch, or "head of the [Jews in] exile"—who claimed more direct Davidic descent than the Palestinian patriarch—to rule over the Jews as a quasi-prince. In c. 220 two Babylonian disciples of Judah the Prince, Abba Arika and Samuel bar Abba, began to propagate the Mishna and related tannaitic literature as the yardsticks of normative practice. As heads of the academies at Sura and Nehardea, respectively, Abba and Samuel cultivated a native Babylonian rabbinate, which increasingly provided the manpower for local Jewish courts and other communal services. While the usual tensions between temporal and religious arms frequently erupted in Babylonia, too, the symbiosis of exilarchate and rabbinate endured uninterruptedly until the middle of the 11th century.

The model for Diaspora Judaism

Paradoxically, Babylonian rabbinism derived its ideological strength from its fundamentally unoriginal character. As a transplant of Palestinian Judaism it claimed historic legitimacy to the Sāsānid rulers (224–651), who protected Jewish practices against interference from fanatical Magian priests, and to native Jewish officials, who argued for the validity of indigenous Babylonian deviations from Palestinian norms. But ultimately the historic importance of this transplantation lay in Babylonia's serving as the proving ground for the adaptability of Palestinian Judaism to a Diaspora situation. Legal and theological adaptations generated by needs of the new locale and times inevitably effected changes in the religious tradition. The laws of agriculture, purity, and sacrifices all of necessity fell into disuse. The values embodied in these laws, however, and the core of the legal–theological system—ranging from doctrinal faith in the revelation and election of Israel, to the requirement that the individual live by the canons of Jewish civil and family law, and the establishment of a network of communal institutions modelled on those of the mother country—remained intact, thereby ensuring a basic continuity and uniformity to rabbinically oriented communities everywhere. The real contribution of the Babylonian rabbinate to Jewish religion lay, accordingly, in its demonstration of how Palestinian Judaism was to be implemented on Gentile soil. Since historic circumstances made Babylonia the mediator of this tradition to all Jewish communities in the High Middle Ages (9th–12th centuries), the Babylonian version of Jewish religion became synonymous with normative Judaism and the measure of Judaic authenticity everywhere.

"The law of the [Gentile] government is binding," the principle formulated by Samuel, head of the academy at Nehardea (died 254), summarizes the essential novelty in rabbinic reorientation to life on foreign soil. Whereas Palestinian rabbis had perforce to comply with imperial decrees of taxation de facto—and this was all that Samuel had in mind—Babylonian teachers now rationalized the legitimacy of governmental authority in this respect de jure and thus enjoined upon the Jews political quietism and submissiveness as part of their religious theory. In all other areas of civil law, the Jews were instructed by their rabbis to bring their litigations to Jewish courts and thus to conduct their businesses as well as their family lives by rabbinic law.

While the rabbis could obviously more effectively impose their discipline in matters of public law than in private religious practice, the density of the Jewish population in many areas of Parthia (northeastern Iran) and Babylonia facilitated the application of moral and disciplinary pressures. The most effective vehicle for the dissemination of their teachings was the academies, of which those of Sura and Pumbedita remained pre-eminent, where judges and communal teachers were trained. Frequent public lectures in the synagogues of the academies on sabbaths and festivals were capped by public *kalla* (study-course) assemblies for alumni of the schools during the two months, Adar (February–March) and Elul (August–September), when the lull in agricultural work freed many to attend semi-annual refresher instruction. These meetings were followed by regular popular lectures during the festival seasons that soon followed. Thus, while rabbis constituted a distinct class within the community, their efforts were oriented toward making as much of the community as possible members of an elite of learning and religious scrupulosity. The harmonious relations that obtained with but few interruptions over the centuries between the Sāsānian rulers and their Jewish subjects gave the Jewish population the air of a quasi-state, which the Jewish leadership frequently extolled as superior to the Jewish community of Palestine.

Redaction of the Babylonian Talmud, c. 500–650

The dissemination of the Palestinian Talmud probably stimulated the Babylonians to follow suit by collecting and arranging in similar fashion the records of study and decisions of their own academies and courts. The Babylonian Talmud, which apparently underwent several stages of redaction (c. 500–650) on the basis of the proto-Talmuds—the early collections of commentaries on the Mishna—used in the academies, accordingly became the standard of reference for judicial precedent and theological doctrine for all of Babylonian Jewry and all those communities under its influence. As had been the case with the Mishna, the redaction of the Babylonian Talmud was later designated by authorities as marking the end of a period in Jewish history, and the scholars who put the finishing stylistic touches, known as *savoraʾim* ("explicators"), were classified as a transitional stage between the *amoraim* and *geonim* (see below).

The enduring vigour of Jewish faith throughout these centuries is graphically demonstrated by the missionary activity of Jews throughout the ancient Near East, especially in the Arabian Peninsula. Proud Jewish tribes living in close proximity to each other in the vicinity of Yathrib (later Medina, Muhammad's home city), engaged in agriculture and commerce and also in proclaiming the superiority of their monotheistic ethos and eschatology (doctrine of last things). In Yemen (southwestern Arabia) the last of the Himyarite rulers (reigned from c. 2nd century CE), Dhu Nuwas, proclaimed himself a Jew and finally suffered defeat (c. 525) as a consequence of Christian influence on the Abyssinian armies. Jewish missionaries, however, continued to compete with Christian missionaries and thus helped lay the groundwork for the birth of an indigenous Arabic monotheism—Islām—that was to alter the course of world history.

THE AGE OF THE GEONIM (c. 640–1038)

Triumph of the Babylonian rabbinate. The lightning conquests in the Middle East, North Africa, and the Iberian Peninsula by the armies of Islam (7th–8th centuries) provided the environmental framework for the basically uniform (*i.e.*, Babylonian) character of medieval Judaism. As a "people of the Book" (*i.e.*, of the Bible), the Jews were permitted by the Muslims to live under the same autonomous structure that had developed under Arsacid and Sāsānian rule. The heads of the two principal academies were now formally recognized by the exilarch, and through him by the Muslim caliphate (religio-political rulers), as the official arbiters of all questions of religious law and as the religious heads of all Jewish communities that came under Muslim sway. Known as *geonim* (plural of *gaon*, "excellency"), and conducting high courts manned by scholars assigned graded ranks, these presidents drew their financial support from Jewish communities assigned to them by the exilarch. Religious questions and contributions were solicited from all Jewish communities, and these along with formal gaonic replies (*responsa*) were regularly publicized at the semi-annual *kalla* convocations. Under the strong leadership of Yehudai, *gaon* of Sura (presided 760–763), the Babylonian rabbinate exerted vigorous efforts to replace Palestinian usage wherever it was still in vogue, including the study of Palestinian amoraic legal literature, by Babylonian practice and texts, thus making the Babylonia Talmud the unrivalled standard of Jewish norms everywhere. The success of this campaign is evidenced by the fact that the term Talmud, when unqualified, has ever since meant the Babylonian Talmud. Indeed, even in Palestine the Babylonian corpus displaced its older rival and caused the study of Palestinian Talmudic literature to be confined to circles of legal specialists.

Antirabbinic reactions. The firm, and on occasion oppressive, tactics of exilarchs and *geonim* generated antirabbinic reactions, especially in outlying areas where enforcement was difficult, in the form of sectarian and messianic revolts. Inspired in part by ancient Palestinian sectarian doctrines and in part by Muslim usage, the sects were by and large quickly and forcefully suppressed. In the 9th century, however, a moderate group under the leadership of Anan ben David, a disaffected member of the exilarchic family, successfully organized a dissident movement that soon developed into a formidable challenger of Rabbinite (a term first used for the Talmudic adherents by the dissidents) supremacy. Known as Karaites (Scripturalists), the new sect advocated a threefold program of (1) rejection of rabbinic law as a human fabrication and therefore an unwarranted, unauthoritative addition to Scripture, (2) a return to Palestine to hasten the messianic redemption, and (3) a re-examination of Scripture to retrieve authentic law and doctrine. Under the leadership of Daniel al-Qumisi (c. 850?), a Karaite settlement prospered in the Holy Land, from which it spread as far as northwestern Africa and Christian Spain. A barrage of Karaite treatises arguing new views of scriptural exegesis stimulated renewed study of the Bible and Hebrew language in Rabbinite circles as well. The most momentous consequence of these new studies was the invention of several systems of vocalization for the text of the Hebrew Bible (Christian Old Testament) in Babylonia and Tiberias in the 9th and 10th centuries. The annotation of the Masoretic (traditional, or authorized) text of the Bible with vocalic, musical, and grammatical accents in the Tiberian schools of the 10th-century scholars Ben Naftali and Ben Asher fixed the Masoretic text permanently and through it the morphology (basic form and structure) of the Hebrew language for Karaites as well as Rabbinites.

The Karaite movement

In the face of sectarian challenges, the *geonim* intensified their efforts against any deviation from Rabbinite norms and began to issue handbooks of Jewish law that set forth in concise and unequivocal terms the standards for correct practice. A number of these codes, notably the *Halakhot gedolot* ("Great Laws"), *Siddur Rav Amram Gaon* (on liturgical practice), and *She'eltot* ("Disquisitions") by Aha of Shabha (c. 680–c. 752), attained authoritative status in local schools and further helped give a unitary stamp to medieval Judaism.

Secular culture and philosophy

The *geonim*, however, were powerless to halt several social developments in the 9th century that progressively undermined their hold even over Rabbinite communities. A renascence of Greek philosophy and sciences in Arabic translation, coupled with the progressive urbanization of the upper classes of all religio-ethnic groups in the centres of political, commercial, and cultural activity, generated a new intelligentsia that cut across religio-ethnic lines. Widespread skepticism in basic doctrines of faith such as creation, revelation, and retribution was most poignantly represented by latitudinarianism (the tendency to be flexible and tolerant about deviations from orthodox beliefs and doctrines) and by antinomian (anti-Mosaic-law) Gnostic groups that negated divine providence and omniscience. Hiwi al-Balkhi, a 9th-century skeptical Jewish pamphleteer, scandalized the faithful by an open attack on the morality of Scripture and by an expurgated edition of the Bible for schools that omitted "offensive" materials (*e.g.*, alleged stories of God acting dishonestly). A mystifying Hebrew tract entitled *Sefer yetzira* ("Book of Creation") posited in terse and enigmatic epigrams a novel theory of creation that betrayed unmistakable Neoplatonic influence. Karaites joined philosophically oriented intellectuals in heaping scorn on popular Rabbinite customs that smacked of superstition and, above all, on Talmudic homilies that referred to God in anthropomorphic terms.

Gaonic difficulties were compounded by the rise in North Africa and Spain of populous and wealthy Jewish communities that, thanks to the development of their own local schools and native talent, ignored the Babylonian academies or favoured one over the other with religious queries and, in consequence, with financial contributions. To the delight of dissidents and the chagrin of the faithful, competition between the Babylonian academies turned to internecine hostility. Occasional revolts against exilarchic taxation and administration in outlying areas of Persia had to be quelled with armed force. The Palestinian Rabbinites had revived their own academies, and their presidents now not only appealed for support in other Diaspora lands but challenged the authority of the Babylonians to serve as final arbiters on such matters of public import as the regulation of the calendar. By 900 the Rabbinite community of Babylonia was in a state of chaos and dissolution.

The gaonate of Sa'adia ben Joseph. In a bold effort to restore discipline and respect for the gaonate, an able exilarch, David ben Zakkai (916/917–940), bypassed the families from whom the *geonim* had traditionally been selected and in 928 appointed Sa'adia ben Joseph al-Fayyumi to head the academy of Sura. Of Egyptian birth, Sa'adia had gained wide acclaim for his scholarly retorts to Karaites, heretics, and Palestinian Rabbinites. Politically, Sa'adia's brief presidency was a fiasco and aggravated the chaos by a communal civil war. His gaonate, however, gave an official stamp to his many works, which responded to the ideological challenges to Rabbinism by restating traditional Judaism in intellectually cogent terms. Sa'adia thus became the pioneer of a Judeo-Arabic culture that was to come to full flower in Andalusian Spain a century later (see below *Sefardic developments*). His translation of the Bible into Arabic and his Arabic commentaries on Scripture made the rabbinic understanding of the Bible accessible to masses of Jews. His poetic compositions for liturgical use provided the stimulus for the revival of Hebrew poetry. Above all, his rationalist commentary on the puzzling "Book of Creation" and his brilliant philosophic treatise on Jewish faith, *Beliefs and Opinions,* synthesized Torah (the divine law in the Five Books of Moses and the rabbinic understanding of this revelation) and "Greek wisdom" in accordance with the dominant Muslim philosophical school of Kalām and thus made Judaism philosophically respectable and the study of philosophy a religiously acceptable pursuit.

Gaonates of Sherira and Hai

Far from tightening the gaonic hold over the Jewish communities of the Arabic world, Sa'adia's works actually provided the wherewithal for ever-greater intellectual and religious self-sufficiency. While economic, political, and military upheavals progressively weakened all institutional fabrics in the Middle East, concurrent prosperity and consolidation in the West stimulated the maturation of indigenous leadership in Egypt, al-Qayrawān (Kairouan; in present-day Tunisia), and Muslim Spain. To be sure, able *geonim* such as Sherira and his son Hai exercised enormous influence over the Judeo-Arabic world through hundreds of legal *responsa* issued in the course of their successive terms (968–1038) at Pumbedita. Circumstances beyond anyone's control, however, were bringing the curtain down on the effectiveness of exilarchate and gaonate. But by 1038, the year of Hai's death, the consequences of four centuries of gaonic activity had become indelible: the Babylonian Talmud had become the agent of basic Jewish uniformity; the synthesis of philosophy and tradition had become the hallmark of the Jewish intelligentsia; and the Hebrew classics of the past had become the texts of study in Jewish schools everywhere:

MEDIEVAL EUROPEAN JUDAISM (950–1750)

The two major branches. Despite the fundamental uniformity of medieval Jewish culture, the cultural–political divisions within the Mediterranean basin, in which Arabic-Muslim and Latin-Christian civilizations coexisted as discrete and self-contained societies, shaped the character of the Jewish subculture of the area. Two major branches of rabbinic civilization developed in Europe, the Ashkenazic, or Franco-German, and the Sefardic, or Andalusian-Spanish. Distinguished most conspicuously by their varying pronunciation of Hebrew, the numerous differences between them in religious orientation and practice derived, in the first instance, from the geographical fountainheads of their culture—the Ashkenazim (plural of Ashkenazi) tracing their cultural filiation to Italy and Palestine and the Sefardim (plural of Sefardi) to Babylonia—and from the influences of their respective immediate milieus. While the Jews of Christian Europe wrote for internal use almost exclusively in Hebrew, those of Muslim areas regularly employed Arabic for prose works and Hebrew for poetic composition. Whereas the literature of Jews in Latin areas was overwhelmingly religious in content, that of the other branch was well endowed with secular poetry and scientific works inspired by the cultural tastes of the Arabic literati. Most significantly, the two forms of European Judaism differed in their approaches to the identical rabbinic base that both had inherited from the East and in their radically different attitudes to Gentile culture and politics.

The Golden Age of Jewish Arabic and Hebrew culture

Sefardic developments. In Muslim Spain, Jews frequently served the government in official capacities and, therefore, not only took an active interest in political affairs but also engaged in considerable social and intellectual intercourse with influential circles of the Muslim population. Since the support of letters and scholarship was part of state policy in Muslim Spain, and since Muslim savants traced the source of Muslim power to the vitality of the Arabic language, scripture, and poetry, Jews looked at Arabic culture with undisguised admiration and unabashedly attempted to adapt themselves to its canons of scholarship and good taste. The hallmark of the cultured Jew accordingly became a polished command of Arabic style and the ability to display the beauty of his own heritage through a philological mastery of the text of the Hebrew Bible and through the composition of new Hebrew verse, now set to an alien Arabic metre. Since Arabic philosophers and scientists promulgated syntheses of Greek philosophy with the revelation to Muhammad, rationalist study of the Jewish classics and defense of rabbinic faith in philosophic terms became dominant motifs in the Andalusian Jewish schools (in southern Spain).

The atmosphere generated a fever of literary creativity in classical Jewish disciplines as well as in the sciences cultivated by the Arabs that has gained for the period the title of "the Golden Age of Hebrew literature" (c. 1000–1148). What distinguished the Jewish culture of this age was not only the supreme literary merit of its Hebrew poetry, the new spirit of relatively free and rationalist examination of hallowed texts and doctrines, and the extension of Jewish cultural perspectives to totally new horizons—mathematics, astronomy, medicine, philosophy, political theory, aesthetics, belles-lettres—but also the frequent overlapping of the Sefardic religious leadership with the new Jewish courtier class. The unprecedented heights which the latter attained—Hisdai ibn Shaprut as counsellor to the caliphs of Córdoba, the Ibn Nagrelas as viziers of Granada, the Ibn Ezras, Ibn Megashs, and Ibn Albalias as high officials in Granada and Seville—and the distinctions of these men and of their protégés in Jewish and worldly letters restored the ancient integration of culture and practical life and generated a neoclassicism ("classicism" here meaning biblicism) that expressed the identification of the Jewish elite with the biblical age of Jewish power and artistic creativity. The effort to recapture the vitality and beauty of biblical poetry stimulated comparative philological and fresh exegetical research that yielded new insights

Influence of Greco-Arabic philosophy

into the morphology of the Hebrew language and into the historical soil of biblical prophecy. Judah ibn Ḥayyuj and Jonah ibn Janah (c. 1000) produced manuals on biblical grammar that applied the results of Arabic philology to their own tongue and that have, accordingly, provided the principles of Hebrew grammatical study down to modern times. The anticipations of modern higher biblical criticism by Judah ibn Bala'am and Moses ibn Gikatilla (flourished 11th century) were popularized in Hebrew a few generations later by Abraham ibn Ezra. In the revival of Hebrew poetry, liturgical as well as secular, that translated the new preoccupation with language and beauty into art, Andalusian Jewry saw its greatest achievements. Solomon ibn Gabirol, Moses ibn Ezra, and Judah ha-Levi were but the acknowledged supreme geniuses of a form of expression that became a passion with thousands the length and breadth of Spain. But by far the most enduring consequence of the new temper was their redefinition of religious faith in the light of Greco-Arabic philosophical theories. Solomon ibn Gabirol's exposition of faith in Neoplatonic terms, Abraham ibn Daud's defense of Rabbinism by Aristotelian categories, Judah ha-Levi's attack on philosophy as religiously bankrupt, and Moses Maimonides' epoch-making synthesis of Judaism and medieval Aristotelianism fixed philosophic inquiry as an enduring subject on the agenda of rabbinic concerns. A new class of philosophers that emerged in the 13th century and sponsored the translation of Arabic literature into Hebrew and of Hebrew and Arabic literature into Latin brought Jews and their thought into the mainstream of Western philosophy and gained for them the position of middlemen of culture between East and West.

The salient trends of Sefardic Judaism did not imply relegation of the rabbinic class to a second place. Rather they shaped a fresh approach to rabbinic texts that paralleled in many respects those adopted in biblical exegesis. Strict adherence to consistency, systematization, and philological exactitude yielded new codes that often diverged from gaonic judgments. A digest of Talmudic law by Isaac Alfasi placed the Sefardic rabbinate on a self-reliant footing and epitomized its ideal of getting at the essentials of Talmudic law by sidestepping contingent discussions. In this area, too, it was Moses Maimonides who through his code of Jewish law, *Mishne Torah*, brought the Sefardic principles of comprehensiveness, lucidity, and logical arrangement to their apex. Written in Mishnaic Hebrew, the work remains to this day the only comprehensive treatment of all of Jewish law, including those fields that are not applicable in the Diaspora (agriculture, purity, sacrifices, Temple procedure).

With Maimonides, however, the pure Sefardic tradition came to an end, for the Almohad (Berber Muslim reformers) invasion of Spain in 1147–48 wiped out the Jewish communities of Andalusia and drove thousands either to northern Spain and Provence or, as in the case of Maimonides' family, to North Africa and Egypt. Sefardic Jewry suddenly encountered a discrete, mature, Jewish culture that for centuries had been developing independently and along quite different lines.

Ashkenazic developments. The spokesmen of Ashkenazic Jewry, into whose communities the Sefardim had been thrust by political events, regarded their own heritage and the Christian world in which they lived from a perspective shaped exclusively by rabbinic categories. From the world of the Talmud and Midrash they drew their school texts and the values that determined their judgments. Sensing no intellectual challenge in Christian faith, which they regarded with thinly concealed contempt, they constituted for the most part a merchant class that lived in urban centres under the protection of ecclesiastical and temporal rulers but under their own complex of laws and institutions. Except for mercantile relations, Christian society was closed to them, thanks largely to age-old ecclesiastical prohibitions forbidding all social intercourse with them. With the Arab conquest and the rise of the Carolingians (the 8th–10th-century dynasty that ruled France and Germany), the 12-decade interlude of suppression by the Visigoths (589–711) came to an end, and the Roman precedent of toleration and autonomy again became the rule. Merchants and rabbis moved from Italy to France and the Rhineland and infused new energies into the Jewish communities there. A native religious leadership began to emerge at the very time that Andalusian Jewry was entering its Golden Age. The bloody upheavals of the First Crusade (1096–99) in the communities of the Rhineland, although unleashing a tide of hatred, periodic violence, and progressive restrictions on Jewish activities, struck Jewish communities that had attained sufficient resilience to re-establish their communal institutions shortly afterward and continue the cultivation of their deeply ingrained traditions.

Ashkenazic cultural and religious patterns

By 1150 Ashkenazic Jewry had generated a culture pattern of its own with an indigenous literature that ranged from the popular homily to the esoteric tract on the nature of the divine glory. Study of the Bible and Talmud was oriented toward a mystical pietism in which prayer and contemplation of the secrets embedded in the liturgy were to lead to religious experience. Significantly, the fathers of the Ashkenazic tradition were remembered as liturgical poets and initiates into divine mysteries, and the early codes of the Franco-German schools were heavily weighted with discussions of liturgical usage. After the Second Crusade (1147–49), the German Jewish mystics (also called Hasidim, or pietists) placed heavy emphasis on the merits of asceticism, martyrdom and lifelong disciplines of penitence, thus adapting to Jewish idiom the features of saintliness celebrated in the universe of discourse of which they were a part. For the masses of Jews the cultural fare consisted principally of biblical tales and instruction, as interpreted by rabbinic Midrash, the lives of scholars and saints, and liturgical poetry reaffirming the election of Israel and faith in messianic redemption. The chief vehicle of popular instruction consisted of anthologies from the Rabbinic writings and commentaries on Scripture, of which the most popular was that of Rabbi Solomon ben Issac of Troyes, known as Rashi, the acronym formed from the initials of his name in Hebrew. For the more advanced student, Rashi composed a succinct commentary on the Talmud that, unmatched for compact thoroughness and lucidity, achieved an authority approaching that of the text itself.

As living sources of law and values, the Bible and Talmud had an impact that was apparent in communal decision and in the bearing of the leadership at home, in the marketplace, and in the synagogue. Taking their cue from Talmudic precedent and from Christian ecclesiastical procedures of their own times, the Ashkenazic rabbis occasionally gathered in regional synods to enact legislation on problems of a general nature for which there was no adequate precedent in the literature. Among the most enduring of these measures were the prohibition of bigamy and arbitrary divorce and severe economic penalties for abandonment of wives. Of far more immediate concern to the average Jew were the circumvention of Talmudic prohibitions against usury, relaxation of prohibitions regarding traffic with Gentiles in wines, and adoption of severe disciplinary measures, such as excommunication, against informers or those appealing, in cases involving Jews, to the Gentile authorities.

The rise and spread of Kabbala

A new religious trend began in Provence (a province of southeastern France) in the 13th century with the introduction into the Talmudic academies of a novel form of mystical study known as Kabbala (literally, "tradition"), which soon spread to northern Spain. Expressing Gnostic-type doctrines in rabbinic guise, the devotees of Kabbala devised an esoteric vocabulary that reinterpreted the Bible and rabbinic law as allegories of the various modes in which God is manifested in a spiritual universe, access to which was reserved for initiates. The most renowned literary product of this new circle was the *Zohar* ("The Book of Splendour"), a vast mystical commentary on the Pentateuch by Moses de León (c. 1275), which with later additions became the Bible of Jewish mystics everywhere. Although some of the theological notions of the Kabbalists deviated from basic postulates of Jewish monotheism, the insistence of the mystics on unflagging ritual orthodoxy and on a nominal acceptance of the biblical text as

Jews, longing for a return to the Holy Land, point to a visionary Jerusalem, which is depicted in the Gothic style of Christian church architecture. The Jews are shown with the pointed hats they were required to wear to distinguish them from Christians, and are represented with birds' heads, since they felt it was sacrilegious to depict the human form in sacred objects. Illustration from the Birds' Head Haggada, an illuminated manuscript from southern Germany, c. 1300.

divine revelation helped them avert the suspicions aroused by Jewish Aristotelians and Averroists (followers of the 12th-century Arabic Aristotelian philosopher Averroes) and, in time, even won for them the status of a rabbinic elite. Indeed, some of the mystics lent their support to the antiphilosophic campaign that began in Montpelier, in southern France, *c.* 1200 and condemned the study of philosophy as generating skepticism, latitudinarianism, and disrespect for traditional literature. (For a fuller discussion of Kabbala see JEWISH MYSTICISM.)

Conflicts, disasters, and new movements. Basically, the conflict between "fundamentalist" and philosopher in Provence and northern Spain represented a clash between two mature Jewish subcultures of diverse geographic origins, the Sefardic and Ashkenazic, each of which had in the course of centuries developed different esoteric doctrines to transcend the legalistic formalism and confining dogmas of normative Judaism. Both forms of speculation sought salvation for exceptional individuals through knowledge and thus provided an immediate substitute for messianic deliverance from exile and servitude. Each group charged the other with distortion of tradition, and each issued apologias (defenses or justifications) and excommunications characteristic of medieval doctrinal controversy. While the rifts within communities attained bitter proportions, the common threat posed by ecclesiastical attacks on the Talmud in public disputations and by the expulsion of the Jews from France in 1306 prevented open rupture or resolution of the conflict. Ever since that time, two strands of orthodoxy representing the two forms of medieval metaphysical speculation have lived side by side in an uneasy truce.

Most rabbinic circles of the 14th and 15th centuries displayed a progressive dogmatism and insistence on uniformity of practice. The great legal code of Jacob ben Asher of Toledo, ***Arba'a ṭurim*** (*c.* 1335; "Four Rows"), which sought to level differences in usage between Ashkenazim and Sefardim, bespoke the dominant trend of the rabbinate. The increasing hardening of ideological lines, however, did not eliminate independent thinking. Levi Gersonides gave Jewish Aristotelianism a new and comprehensive formulation, while Isaac Albalag propounded an Averroist (rationalistic) interpretation of the Bible predicated on a theory of double truth (of reason and revelation). In Muslim areas, the Maimonidean regimen of philosophic contemplation was extended by Maimonides' son Abraham to a quest for pietist ecstasy that betrayed many features of Siifism (Islāmic mysticism).

Adversity and response: mysticism, messianism, rationalism

Anti-Jewish riots and massacres of 1391 and a wave of apostasy in the wake of the disputation of Tortosa (1411–14)—which ended with a papal bull forbidding Talmud study, compelling attendance at Christian sermons, and other onerous measures—struck catastrophic blows in the Spanish communities and fed the anti-intellectualism of the rabbinate. Hasdai Crescas, while conceding the philosophic untenability of traditional belief in freedom of the will, launched a scathing attack on Aristotelian approaches to religion, and his disciple Joseph Albo issued a compendium on dogma that reaffirmed the traditional postulates of divine creation, revelation, and retribution as axioms of Judaism. But these reassertions of traditional faith could not overcome the ideological and social flagmentation that had split the Spanish communities into congealed strata that were often in open conflict with each other. Widespread marranism (ostensible conversion to Christianity) polarized the community and left deposits of bitterness that extended to those returning to the fold. The expulsions from Spain (1492) and Portugal (1497 and 1506) dealt the final blow and drove the escaping leadership into intensified pursuits of mystical escape from, and rationalization of, the endless calamities that befell their flocks. In Italy and the Ottoman Empire (Asia Minor, northeastern Africa, and southeastern Europe), the two principal centres of refuge for the exiles of the Iberian Peninsula, legalistic Kabbalism, which insisted on strict observance of the law as precondition of mystical practice and study, became the dominant spirit of a rabbinic leadership that in the face of terribly adverse circumstances continued to produce works of encyclopaedic proportions and staggering erudition in every field of Jewish learning.

Inspired by the Jewish tradition that the messianic era —when the messiah would come to bring in the rule of God—would be preceded by horrendous catastrophes, a group of single-minded rabbis established a community in Ẓefat (Safed), Palestine, where in anticipation of the new dawn all of life was to be conducted on principles of saintliness and mystical contemplation. Under the leadership of one Jacob Berab, the ancient practice of ordination was reinstituted in 1538 to form the nucleus of a revived Sanhedrin so as to administer ritual procedures requiring ordained authorities. While the effort failed because of rabbinic opposition, it reflected a widespread temper and further fanned messianic hopes sparked shortly before by the campaigns of tragic consequences by David Reubeni and Solomon Molkho in Italy, which ended in their being burned at the stake by the Christian authorities. In Ẓefat itself Kabbalism soon entered a new phase under the inspiration of Isaac Luria and Ḥayyim Vital, who confided to their disciples that the calamities of Israel were but a mirror of the captivity into which many sparks of the Godhead itself had fallen. Liturgical innovations and a novel mystical theology were formulated to redeem the imprisoned elements of divinity and thus restore creation to the harmony intended for it (see also JEWISH MYSTICISM).

That the Almighty himself was not quite omnipotent, at least with respect to the fate of his chosen people, was cautiously hinted in a Hebrew work of history (1550) by Solomon ibn Verga, who saw the Jewish problem as a socio-political one to which theological answers were futile. Such guarded rationalism was entertained by a number of courageous thinkers in 16th-century Italy, where, despite the policy of ghettoization (the segregation of the Jewish community in a restricted quarter) begun by Venice in 1516 and soon extended to all major Italian cities, the spirit of the Renaissance and the passion for historical criticism had captivated many Jews. Catholic scholars and prelates occasionally employed rabbis to instruct them in the Hebrew language and in the secrets of the Kabbala, which some Christians believed actually verified the postulates of their own faith. Contacts with Christian scholars in turn introduced Jews like Azariah dei Rossi, whose *Meor ʿenayim* ("Enlightenment of the Eyes") inaugurated critical textual study of rabbinical texts, to new bodies of literature that had been lost to the Jewish community, such as the works of Philo and Josephus (see above Hellenistic Judaism).

The Shabbetaian debacle

Such phenomena, however, were decidedly in the minority and contrary to the dominant trend. Dogmatic Kabbalism spread progressively and finally came to social expression in 1666 with the widespread acceptance of the views of the pseudo-messiah Shabbetai Tzevi (Sabbatai Zevi). Most of European and Ottoman Jewry was swept into a hysterical pitch in the belief that the end was now finally at hand. When the pseudo-messiah converted to Islām after being apprehended by the Ottoman government, mass despondency took the form of crypto-Shabbetaianism in which the apostasy of the messiah was explained as a form of voluntary crucifixion for the sake of the Jews. A witch-hunt on the part of traditionalists to uncover the cells of heresy unsettled Jewish communities everywhere by an emphasis on greater rigidity than before.

The century that followed (to *c.* 1750) was the darkest in the history of rabbinic Judaism. Scholarship reached an ebb of quality and popular religion a mechanical state such as Jews had never before experienced. The massacres and impoverishment of Polish Jewry after 1648 brought a pall over the growing eastern European centres of Jewish life. Antinomian eruptions on the part of extreme Shabbetaians under the leadership of the self-proclaimed messiah and later Catholic convert Jacob Frank (1726–91) alarmed Gentile authorities almost as much as they did Jews. But the fossilization referred to above was only apparent. Beneath the surface many were restlessly searching for new avenues of faith, and the 18th century saw fresh responses that set the history of the Jews and of Judaism on new directions and spelled the beginnings of a new era. (G.D.C.)

V. Modern Judaism

THE NEW SITUATION

The various criteria used to mark off dividing points in the history of the Jews and Judaism (see above General *observations*) are especially notable when it comes to setting a starting date for the modern period. Historians of thought put it in the late 17th century with the appearance of men, such as the philosopher Benedict de Spinoza, who ceased, in part or in toto, to believe in the inherited faith without at the same time ceasing to be Jews (*i.e.*, to consider themselves and be considered as Jews). Some Israeli scholars set it at about 1700 with the first stirrings of that new and continuing emigration from the Diaspora to the Holy Land that culminated in the mid-20th century in the creation of the State of Israel. Political and social historians set it in the mid- and late-18th-century processes that led to the American and French revolutions and to the results that flowed from these two epochal events, among them the emancipation of Jews from discriminatory and segregative laws and customs, the attainment of legal status as citizens, and the freedom of individual Jews to pursue careers appropriate to their talents. These varying approaches appear to have one thing in common —the view that these postmedieval forms of Jewish experience assume the end of the doctrine of the Exile, whereby Jews saw themselves as a people waiting out centuries of woe in alien lands until the moment of divine redemption. Jewish modernity for most scholars, then, is marked by the end of a passive waiting on the Messiah and the beginning of an active pursuit of personal or national fulfillment on this earth and preferably in one's lifetime.

Although the 18th century Haskala (Enlightenment) among the Ashkenazim of central and eastern Europe is often taken as the starting point of Jewish modernity, the process of Westernization had begun a good deal earlier among the Sefardim in western Europe and Italy. The Marranos who went to such communities as Amsterdam and Venice in the 17th century to declare themselves as Jews carried with them the Western education that they had acquired while living as Christians in the Iberian Peninsula, and the habits of criticism that had kept them from assimilating into the majority during their Marrano years and that some, such as Spinoza, a son of Marranos, used in analyzing all of the biblical tradition, including especially their own religion. In Italy there was an older Jewish community that had never been sealed off culturally from the influence of its environment; some of its figures were influenced by, and participated in, the main currents of the Renaissance (see above Rabbinic Judaism).

Increased contact with Western languages, manners, and modes of living came to the Ashkenazim only in the 18th century when new economic opportunities created such possibilities and needs. Jewish bankers and factors in various German principalities, army provisioners in most of the European countries, capitalists who were permitted to live in such places as Berlin because they opened new factories or were otherwise helpful to the expansion of the economy—all were in increasing contact with Gentile society, and most of them began to look upon the goal of their lives as the winning of full acceptance. Around this wealthy element there arose a number of intellectuals who agitated for the end of ghetto ways as the necessary preamble to the emancipation of the Jews.

THE HASKALA, OR ENLIGHTENMENT

The role of Moses Mendelssohn

In central Europe. By far the most outstanding figure of the 18th-century Jewish Enlightenment was the philosopher Moses Mendelssohn, who, while remaining a devoted adherent of Orthodox Judaism, turned away from the traditional Jewish preoccupation with the Talmud and its literature to the intellectual world of the European Enlightenment, of which he became the foremost Jewish representative. Mendelssohn did not attempt a philosophical defense of Judaism until pressed to do so by Christians who questioned how he could remain faithful to what they saw as an unenlightened religion. In his response, *Jerusalem*, published in 1783, Mendelssohn defended the validity of Judaism as the inherited faith of the Jews by defining it as revealed divine legislation and declared himself at the same time to be a believer in the universal religion of reason, of which Judaism was but one historical manifestation. Aware that he was accepted by Gentile society as an "exceptional Jew" who had embraced Western culture, Mendelssohn's message to his own community was to become Westerners, to seek out the culture of the Enlightenment. To that end he joined with a poet, Naphtali Herz (Hartwig) Wessely, in translating the Torah into German, combining Hebrew characters with modern German phonetics in an effort to displace Yiddish, and wrote a modern biblical commentary in Hebrew, the Be'ur ("Commentary"). Within a generation, Mendelssohn's Bible was to be found in almost every literate Jewish home in central Europe and had served to introduce its readers to German culture. Through his personal example and his life's work Mendelssohn made it possible for his fellow Jews to join the Western world without sacrificing their Judaism; he had convinced them that their intellectual processes were those of universal reason, with which Judaism accorded.

Mendelssohn's work was carried on by a group of Jewish intellectuals who had gathered around him in his lifetime, forming the nucleus of the Berlin Haskala, which was most active in the 20 years following their mentor's death. In the pages of their Hebrew-language periodical, ha-nze'assef ("The Collector"), they preached the virtues of secular culture and used Hebrew as a vehicle by which to introduce that culture. To achieve their goal of an enlightened Judaism, the leaders of the Berlin Haskala publicized the need for secular education. In response to the Holy Roman emperor Joseph of Austria's Edict of Toleration of 1781, Naphtali Wessely welcomed the efforts and issued an urgent call for the

Educational reform

reform of Jewish education as a prelude to full emancipation. Purely secular subjects — mathematics, German, and world history and literature — were to take precedence over the traditional Jewish studies. The study of the Bible, since it was generally acknowledged to be a fundamental part of Western culture, was to be emphasized at the expense of the more traditional learning in the Talmud. Following this model, modern Jewish schools were established by Jewish intellectuals and businessmen in several German cities, among them Frankfurt and Hamburg. As its educational activities began to bear fruit in the wide dissemination of secular culture, the Berlin Haskala abandoned the use of Hebrew for German and gradually disintegrated. Unlike Mendelssohn himself, the immediate descendants of his circle and his own children were unable to strike a balance between Jewish and secular culture; their Western education undermined their religious faith and they perceived their identity as Europeans rather than as Jews.

One of Mendelssohn's disciples, David Friedlander, offered to convert to Christianity without accepting Christian dogma or Christian rites; he felt that both Judaism and Christianity shared the same religious truth but that there was no relation at all between Judaism's ceremonial law and that truth. The offer was refused unless Friedlander would acknowledge the superiority of Christianity and make an unconditional commitment to it, which he was not prepared to do. Unlike Friedlander, many others who began by following Mendelssohn chose to leave the Jewish faith as the only way to win full acceptance in the European community of which they felt themselves a part.

The modern Hebrew Renaissance

In eastern Europe. The Haskala, thus, was quickly played out in central Europe; as an idea its further career was to continue in eastern Europe, particularly in the Russian Empire, where it flourished in the middle third of the 19th century until, as a result of the pogroms of 1881, Jews lost faith in the goodwill of Russians to accept "enlightened" Jews. It was a tenet of the Russian Haskala that the tsar was a benevolent leader who would bestow emancipation upon his Jewish subjects as soon as they proved themselves worthy of it; and that it was the task of the Jews, then, to transform themselves into model citizens, enlightened, unsuperstitious, devoted to secular learning and productive occupations. Following the example of the Berlin Haskala, a Russian Hebrew-language writer, Isaac Baer Levinsohn, published a pamphlet, Te'uda *be-Yisrael* ("Testimony in Israel") citing the benefits of secular education. At the same time, such writers as Joseph Perl and Isaac Erter, though Orthodox Jews themselves, in virulent satire attacked the superstitious folk customs of the masses and opened the way to the anti-clericalism which was to become characteristic of the Russian Haskala. In the 1840s and 1850s the emphasis shifted from satire and attack on the cultural parochialism of the Pale of Settlement (the regions to which the Jews were restricted) to romanticization of life outside the Pale, including periods of the Jewish past. Thus, Hebrew poets and novelists, such as Michal Levensohn and Abraham Mapu, arose on Russian soil to contribute their talents to the creation of a modern Hebrew literature. With the climate of government reforms in the 1860s, the Russian Haskala entered a "positivist" phase, calling for practical social and economic reforms. Hebrew-language journals were established and the Hebrew essay and didactic poetry, calling for religious and cultural reforms, came into their own, particularly at the hands of such stylists as the poet Y.L. Gordon and the essayist Moses Leib Lilienblum. Abandoning the original Hebrew and German orientation of the Russian Haskala, a number of Jewish intellectuals, the most prominent of whom were Yoachim Tarnopol, Osip Rabinovich, and Lev Levanda, became Russifiers, founding Russian-language Jewish weeklies devoted to "patriotism, emancipation, modernism." Like their contemporary fellow Jews in western Europe, they declared themselves to be Russians by nationality and Jews by religious belief alone. In 1863 a group of wealthy Jews in St. Petersburg and Odessa created the Society for the Promotion of Culture among the Jews of Russia for the purpose of educating Jewry into "readiness for citizenship." The goal of all segments of the Russian Haskala in the 1860s and 1870s was to turn Jews into good Russians and to make their Jewishness a matter of personal idiosyncrasy alone. The period of reaction that set in with the pogroms (massacres) of 1881 was to prove how deluded the hopes of the Haskala had been.

RELIGIOUS REFORM MOVEMENTS

German Reform Judaism

One element of Westernization that the Haskala had championed was the reform of religion. It began in western Europe during the Napoleonic period (1800–15) when certain aspects of Jewish belief and observance were seen as incompatible with the new position of the Jew in Western society. Napoleon convoked a Sanhedrin (Jewish legislative council) in 1807 to create a new, modern definition of Judaism in its renunciation of Jewish nationhood and national aspirations, its protestations that rabbinic authority was purely spiritual, and its recognition of the priority of civil over religious authorities even in the matters of intermarriage. In areas other than France, the rationale for reform, at least in its early years, was more aesthetic than doctrinal. The external aspects of worship—*i.e.*, the form of the service — appeared unacceptable to the newly Westernized members of the Jewish bourgeoisie in both Germany and the United States, whose standards of cultural acceptability had been shaped by the surrounding society, and who desired above all to resemble their Gentile peers. Thus, the short-lived Reform temple established in Seesen, by the pioneer German reformer Israel Jacobson, in 1810 enshrined order and dignity of a Protestant type in the service and introduced an organ, sermon, and prayers in German, in place of Hebrew, to create an uplifting spiritual experience. The more radical temple in Hamburg (established 1818) adopted all of Jacobson's reforms and published its own much-abridged prayer book, which deleted almost all the references to the long-awaited restoration of Zion. Reformers in Charleston, South Carolina, introduced similar changes in the synagogue ritual in 1824, for they sought a non-national Judaism similar in form to Protestantism and adapted to the surrounding culture. It was apparent to the reformers that in Western society Judaism would have to divest itself of its alien customs and conform to the cultural and intellectual standards of the new "age of reason."

German Reform in the 1840s became institutionalized, a matter of organized, formal belief and practice, and, at a series of synods held at Brunswick (1844), Frankfurt (1845), and Breslau (1846), it created the first theological rationalization for changes introduced in the previous generation. Judaism, it was declared, had always been a developmental religion that conformed to the demands of the times, and, since the Jews were not now a nation, they were no longer bound by their entire religious–political code of law, but only by the dictates of moral law. Thus, those rituals which stood in the way of full Jewish participation in German social and political life were no longer considered valid expressions of Jewish religious truth. The use of Hebrew in religious services was limited; practices such as the dietary laws and circumcision and all national messianic hopes were discarded upon the altar of the "spirit of the times." Messianism in Reform Judaism was transmuted into active concern for social welfare in the present, and the Jewish role in history became Diaspora-centred, a mission to the Gentiles.

Reform Judaism in the United States

Although Reform was initiated in Europe, it did not enjoy a successful career there, for many central European governments that regulated the existence of religious communities would not recognize more than one form of Judaism in any one locale. Reform did not achieve its greatest success until it was imported into the United States along with the massive German-Jewish immigration of the 1840s and coalesced with earlier American trends toward reform. By 1880 almost all of the 200 synagogues in the United States had become Reform, amalgamating in the Union of American Hebrew Congregations (formed 1873). In 1885 the Reform philosophy was given its most comprehensive formulation in the so-called Pittsburgh Platform, drawn up by a conference of Reform rabbis. This manifesto declared that Judaism was an evolutionary faith, and no longer a national faith, and that it was now to be de-orientalized. While the preservation of historical identity was considered to be beneficial, the maintenance of continuity of tradition was not; the Talmud was to be considered merely as religious literature, and not as legislation. The rationalist principles of the Pittsburgh Platform remained the official philosophy of the American Reform movement until a later generation, seeking to meet different emotional and intellectual needs, reintroduced the concept of Jewish peoplehood into the Columbus Platform of 1937, which also re-emphasized Hebrew and traditional liturgy and practices. Classical (19th-century) Reform was very much a late child of the Enlightenment, and by mid-20th century its Enlightenment philosophy appeared antiquated to many Jewish thinkers.

Conservative Judaism

If Reform was a child of Enlightenment rationalism, Conservative Judaism was a child of historical romanticism. It began in 1845 when Zacharias Frankel and a group of followers seceded from a second Reform synod at Frankfurt over the issue of the limitation of the use of Hebrew to a small core of prayers. For Frankel, Hebrew represented the spirit of Judaism and the Jewish people, and Judaism itself was not merely a theology of ethics but the historical expression of the Jewish experience; this definition he called "positive-historical Judaism." Although Conservative Judaism conceived of Judaism as a developmental religion, it charted its course through close study of the tradition and the will of the people, and thus came to largely traditional conclusions about religious observance.

ORTHODOX DEVELOPMENTS

In western and central Europe. The bulk of the official Jewish establishment in western and central Europe, though affected by the efforts at religious reform, remained Orthodox (a term first used by Reform leaders to designate their traditionalist opponents). Under the leadership of Samson Raphael Hirsch, a more modern and militant form of Neo-Orthodoxy arose, based in Frankfurt am Main, which asserted its right to break with any Jewish community that contained Reform elements and to form an independent community. The thinking of this group was profoundly influential, for it indicated the possibility of living a ritually and religiously full life while being totally integrated into Western society. It accomplished this by positing a theoretical division between religion and culture; the Jews were to remain Orthodox in religion (although deferring their messianic aspirations to the unforeseeable future) while becoming Western in manners and culture. This form of Orthodoxy, which became the intellectual model for Western Orthodoxy, continued into the early 1970s in the United States in a variety of religious and academic institutions (such as the Yeshiva University and the bulk of English-speaking Orthodox synagogues), coexisting in substantial tension with a number of Orthodox groups, most notably the Lubavitcher and Satmar Hasidim (for Hasidism, see below), and some Talmudic academies that saw the Western world itself as the enemy and chose to recreate the ghetto.

In eastern Europe. By the mid-18th century Orthodoxy in eastern Europe, having been convulsed by frantic messianism and stifled by the sterility of purely legalistic scholarship, was ripe for revival. The experience of Shabbetaianism (the first messianic movement to excite virtually all of world Jewry) had revealed in the mid-17th century the pervasiveness of Jewish exhaustion with the Exile and fervent longing for messianic redemption, while the nihilistic sect of Frankists (the followers of Jacob Frank, see above Rabbinic Judaism) in the 18th century had transmuted that messianism into a this-worldly hysteria. Talmudic piety and study, sunk in excessive pilpul (acute logical distinctions that often became mere hairsplitting), was refreshed by the new critical methods of Elijah ben Solomon, the gaon of Vilna. Although essentially a legal rigorist, he was open to Western scientific learning insofar as it helped him to elucidate Talmudic texts. Orthodox religious expression also was raised to a new level with the development of Ḥasidism (Pietism) by Israel Baal Shem Tov in the mid-18th century. Although Ḥasidism contained elements of social protest, being at least in part a movement of the poor against the wealthy communal leadership and of the unlearned against the learned—though many of its leaders, among them Rabbi Baer, the *maggid* ("preacher") of Mezhirich and Rabbi Levi Isaac of Berdichev, were well-versed in Talmudic learning—it was essentially a non-messianic outcry in the name of religious emotion, emphasizing prayer and personal religious devotion here and now. Contemporary scholarship is investigating the linkage between Ḥasidism and eastern European Christian pietistic movements. The major innovation that Ḥasidism introduced into Jewish religious life was the charismatic leader, the rebbe who served as teacher, confessor, wonder-worker, God's vicar on earth, and occasionally as atoning sacrifice. Although the earliest *rebbes* were democratically chosen, the position of leadership passed to their descendants on the presumption that they had inherited their fathers' charisma and thus created spiritual dynasties. Ḥasidism spread throughout eastern Europe and enjoyed its greatest success in Poland.

Ḥasidism

Ḥasidism was notably unsuccessful, however, in Lithuania, where the traditional rabbinic class, under the leadership of Elijah, the Vilna gaon, was able to stave off its influence by issuing a ban of excommunication (*ḥerem*, "anathema") against the new movement. The tactic (a complete boycott and cutting off of communication) was widely embraced by non-Hasidic rabbis, who earned for themselves among the Hasidim the title of Mitnaggedim (Opponents), but it proved largely ineffective in areas where the rabbis had lost the respect of the masses, and it called forth a round of counter-excommunications by the Hasidic rebbes. With the passage of time, Hasidim and Mitnaggedim abandoned their conflict and came to see each other as allies against the threat to all Orthodox Jewish religion of Haskala and secularization. The impact of Ḥasidism on eastern European Jewry cannot be overemphasized; even in Lithuania, where it did not take firm hold, it stimulated the growth of a home-grown pietism in the Musar (ethicist) movement of the mid-19th century, and it renewed the Talmudic energies of its opponents.

DEVELOPMENTS IN SCHOLARSHIP

The Science of Judaism

As Jews moved into Western society in central Europe, there arose a group of young Jewish intellectuals who devoted themselves to Jewish scholarship of a far different type from traditional Talmudic learning or medieval philosophy. In 1819 Leopold Zunz and Moses Moser founded the Society for Jewish Culture and Learning for the study of Jewish history and literature. Although the original group quickly dissolved, Zunz became the unofficial leader of a generation of scholars dedicated to the Wissenschaft des Judentums (Science of Judaism). Under its carefully objective and scholarly facade, the Wissenschaft movement embraced a variety of nonacademic motives and goals. All of its members sought to prove that the Jewish past was intellectually respectable and worthy of study, and hence that the Jews deserved an equal place within European societies. Jewish scholarship was enlisted as a weapon in the battles for change. Thus, Isaac M. Jost wrote a general history of the Jews to promote Reform; Zunz's Gottesdienstliche Vortrage *der Juden, historisch* entwickelt (1832; "The Worship Sermons of the Jews, Historically Developed") served to legitimize the modern innovation of the sermon in the vernacular; and Abraham Geiger, the outstanding leader of German Reform in the 1840s and 1850s, interpreted the Pharisees as the forerunners of the reformers of his own day. In their work these intellectuals presented archetypes of what modern Jews should become. To support their claims of academic respectability, the Wissenschaft figures highlighted those aspects of the Jewish past that were closely integrated with general fields of study. In particular, Moritz Steinschneider, who owes his fame to towering achievements in bibliography, was concerned above all with the contribution of Jews to science, medicine, and mathematics. Nineteenth-century Jewish scholarship set out to praise Judaism as one of the cofounders of the Western tradition, and thus to argue that whenever the Jews were not excluded from European society they have produced great culture, and that they would repeat such accomplishments under conditions of social and political equality.

The Wissenschaft movement stimulated the critical study of the Jewish past, and great works of synthesis, written from a variety of perspectives, began to appear: Heinrich Graetz's multivolumed *Geschichte der Juden von den ältesten Zeiten bis auf die Gegenwart* (1853–75; *History of the Jews)*, written from a romantic-national point of view; Isaac Halevy's *Dorot ha-rishoizinz* (1897–*1932;* "The First Generations") and Ze'ev Jawitz's *Toldot Yisrael* (1894; "History of Israel"), from an orthodox standpoint; and Simon Dubnow's *Weltgeschichte* des *jüdischen Volkes* (1925–29; "World History of the Jewish People"), reflecting his belief in secular, nationalistic communal autonomy. Since the 1920s this tradition of great synthesis has been carried on in the United States by Salo W. Baron, who by the early 1970s had produced 14 volumes of his *Social and Religious History of the Jews* (1952), and in Israel by Benzion Dinur, the most prominent of the Zionist historians, who was still at work on his *Yisrael ba-gola* (2nd ed. 1958; "Israel in the Exile"). Many other first-rank scholars in Europe, Israel, and the United States have made notable contributions to the study of Jewish history, rabbinics, and mysticism. This great emphasis on historical research and knowledge from a wide variety of perspectives tended to propose veneration for the Jewish past as a substitute for waning religious faith.

DEVELOPMENTS IN PHILOSOPHY

Krochmal's philosophy of history

Modern Jewish philosophers have been faced with the special problem of attempting to define the reason for Jewish continuity now that the Halakha ("oral law") is no longer seen by the majority of Jewry as divinely ordained. While Moses Mendelssohn first presented the problem in *Jerusalem* with his declaration that pure reason can be taught by all religions, his own solution—that the uniqueness of Judaism was its status as revealed divine legislation—proved unsatisfactory to succeeding generations. Jewish philosophers in the period following Mendelssohn, then, had to find new rationales for Jewish uniqueness. Nachman Krochmal, whose *More nevukhe ha-zman* ("Guide for the Perplexed of Our Time") was published posthumously in 1851, posited Judaism as the bearer of the historical process. In his cyclical theory of history the Jews were the sole nation to arise anew after each period of decline, for they alone enjoyed a direct link to the Absolute Spirit. The Jews thus constituted a constant source of creativity, ever evolving to higher levels of self-realization, and their spiritual creativity became their raison d'être. For most central European Jewish philosophers of Krochmal's generation and the one following, Judaism became the bearer of the moral process. Following contemporary trends in philosophy, Solomon Formstecher, Samuel Hirsch, and Samuel Holdheim identified Judaism with what they posited to be the absolute good, ethical and moral reason. This tendency in Jewish philosophy reached its fruition in Hermann Cohen, who defined Judaism as the one true philosophy, which was, for him, Neo-Kantianism. In Cohen's work Judaism became the incarnation of ultimate moral teaching raised to the level of religious piety. However, in his last works, Cohen's personal piety, his sense of the reality of a personal God of forgiveness, contended with his philosophy of rationalism, as he attempted to find place for the God of Abraham, whom he had never really left. in the reasonable world he could not abandon. In the 20th century, Jewish philosophy has been renewed by the original contributions of Franz Rosenzweig and Martin Buber. A Neo-Orthodox existentialist, who emphasized the existing individual's relation to God, Rosenzweig conceived of Judaism as true revelation and valued its traditions as well as its ethical teachings. Yet he saw no reason to preach Judaism's superiority to Christianity; the two religions were merely different, but complementary, means of reaching the same truth. For Buber as well, Judaism was one very intense form of personal encounter with God, which is the height of religious experience. In the United States. Jewish religious philosophy has, as in Europe, proceeded into "modernity" by attempting to define a version of Judaism in terms of the dominant philosophy of the day. Perhaps the most noteworthy of American Jewish philosophers is Mordecai Menahem Kaplan, whose philosophy—reconstructionism—draws heavily upon John Dewey's Pragmatism. For Kaplan, Judaism is religious nationalism, an evolving religious civilization with a humanistic core. Like all modern religious philosophy, modern Jewish philosophy deals with the defense not merely of Judaism but of all religion. Jewish existence in particular is defended as the source of personal authenticity and creativity, the Jewish way of experiencing universal moral content.

JEWISH–CHRISTIAN RELATIONS

Christianity and Russian anti-Semitism

Christianity and the Nazi persecution

Jewish–Christian relations in the 19th century, strained at best, often erupted into open conflict. Established Christianity, and Roman Catholicism in particular, staunch upholders of the old order, identified the Jews as the major beneficiaries of the French Revolution and as the bearers of a liberal, secular, anticlerical, and often revolutionary threat. Clerical anti-Semitism was thus in France allied with the anti-Semitism of the traditional right, and these movements contended with those who affirmed the results of the French Revolution in the great convulsion of the "Dreyfus affair" in the last years of the 19th century. In Russia the conflict of the Jews and the Orthodox Church released the most open and virulent manifestation of religious anti-Semitism. To the church, the Jews were the enemy seeking to undermine Russian Orthodoxy and the tsar, the very foundations of Russian tradition. The church and the tsarist authorities went so far as to condone, and even encourage, the violent pogroms that were perpetrated against the Jews in 1881–82 and again in 1905. Russian Orthodoxy was active as well in spreading the so-called blood libel, a superstitious belief in Jewish ritual murder which had re-emerged even in the 19th century, in Damascus in 1840 (in which instance the French Consul in Syria initiated the accusation) and in Hungary in the Tiszaeszlar affair in 1882. In both cases torture was used to obtain false confessions but the accused were ultimately cleared. The most infamous recurrence of the blood libel in modern times, however, was the Beilis case of 1911–13, in which the tsarist government, with church complicity, sought unsuccessfully to convict a Jewish bookkeeper in Odessa of ritual murder. From Russian Orthodox circles, too, arose the "Protocols of the Elders of Zion," a fraudulent documentation of an alleged international Jewish conspiracy to conquer the world by subverting the social order through Liberalism, Freemasonry, and other modern movements; the concoction appeared around the turn of the century and enjoyed a phenomenal success in anti-Semitic propaganda. In spite of the fact that much of modern anti-Semitism was not Christian but racial, pagan, and often left-wing, Jews have attributed even secular anti-Semitism to older Christian teachings, which they assert persisted as a case of time lag. In the 20th century Jews and Christians have moved toward mutual understanding. In the early decades of the century, some liberal Christian voices were raised against anti-Semitism; in the United States the National Conference of Christians and Jews was founded (1928) as a response to anti-Semitism propagated in Henry Ford's *Dearborn Independent.* Elements of the Church spoke out during the 1930s against the Nazi persecution of the Jews, but the majority of Christian religious figures in Europe remained silent, even during the Holocaust (near extermination of European Jews). In response to the Holocaust, however, the World Council of Churches denounced anti-Semitism in 1946, and in 1965 the Roman Catholic Church's Schema on the Jews and other non-Christian religions, adopted by the Second Vatican Council, revised its traditional attitude toward the Jews as the killers of Christ. A growing sense of ecumenism (of fellowship and common concerns) has been shared by Jews and Christians alike. Although there remain many difficulties related to the question of the place that Zionism and the State of Israel hold within Judaism, the older forms of official church anti-Semitism have radically lessened.

ZIONISM

The most striking of the new phenomena in Jewish life is Zionism, which, insofar as it has focussed on the return to Zion (the poetic term for the Holy Land), is a re-echo of older religious themes. Insofar as it has stressed the national concentration of the Jews in a secular state, however, it is yet another example of the secularization of Jewish life and of Jewish messianism. In its secular aspects Zionism attempted to complete the emancipation of the Jews by transforming them into a nation like all other nations. Although it drew upon the general currents of 19th-century European nationalism, its major impetus came from the revival of a virulent form of racist anti-Semitism in the last decades of the 19th century, as noted above. Zionism reacted to anti-Semitic contentions that the Jews were aliens in European society and could never hope to be integrated into it in any numbers, and transformed this charge into a basic premise of a program of national regeneration and resettlement. Zionism has come to occupy roughly the same place in Jewish life as the "social gospel"—according to which the Kingdom of God is to be achieved in economic and social life—for Christians; the involvement in Israel as the new centre of Jewish energies, creativity, and renewal serves as the secular religion of many Diaspora Jews.

AMERICAN JUDAISM

The story of Judaism in the United States is the story of several fresh beginnings. In the colonial period the style of the tiny American Jewish community was shaped by the earliest Sefardic immigrants; the community was officially Orthodox but, unlike European Jewish communities, was voluntaristic, and by the early 19th century there was a significant drift of the younger generation from Judaism. By the mid-19th century a new wave of central European immigrants revived the declining American Jewish community and remade it to serve its own needs. Primarily petty shopkeepers and traders, the new immigrants migrated westward, founding new Jewish centres which were almost entirely controlled by laymen. The exigencies of life on the frontier within an open society created a predisposition for religious reform, and it is significant that the greatest American Reform Jewish leader of the 19th century, Isaac Mayer Wise, was based in Cincinnati, Ohio. Wise sought to unite all of American Jewry in the new nontraditional institutions that he founded, Hebrew Union College (1875), the Union of American Hebrew Congregations (1873), and the Central Conference of American Rabbis (1889); but his ever more radical reforming spirit ultimately drove the traditionalist elements within the American Jewish community into opposition. The head of the traditionalist circles had been Isaac Leeser, a native of Germany, who had attempted to create an indigenous American community on the lines of a modernized traditionalism. Conservative forces, after his death, became disorganized, but in reaction to Reform they defined themselves by their attachment to the sabbath, the dietary laws, and especially to Hebrew as the language of prayer. Under the leadership of Sabato Morais, an Orthodox Jew of Italian birth, Conservative circles in 1886 founded a rabbinic seminary of their own, the Jewish Theological Seminary of America.

The central and eastern European immigrant styles of Judaism

The eastern European immigrants who moved in large numbers to the American shores in the years from 1881 to 1914 were profoundly different in culture and manners from the older elements of the American Jewish community, and it is they and their descendants who made American Judaism as it is today. The bridge between the existing Jewish community led by German Jews of Reform persuasion and the new immigrant masses was the traditionalist element among the older settlers. Cyrus Adler, traditionalist himself, cooperated with a German Reform circle of Jacob Schiff in reorganizing the Jewish Theological Seminary (1902) and other institutions for the purpose of Americanizing the eastern European immigrants. Enough eastern European rabbis and scholars had immigrated, however, to create their own synagogues, which reproduced the customs of the old world. Whereas in 1880 almost all of the 200 Jewish congregations in the United States were Reform, by 1890 there were 533 synagogues, and most of the new ones founded by immigrant groups were Orthodox. The Union of Orthodox Jewish Congregations, which was established in 1898 by elements associated with the Jewish Theological Seminary, was soon taken over by Yiddish-speaking recent immigrants for whom the seminary was much too liberal. In 1902 immigrant rabbis also formed their own body, the Union of Orthodox Rabbis of the United States and Canada (the Agudath ha-Rabbanim), which fostered the creation of yeshivas (rabbinic academies) of the old type. In 1915 two small yeshivas, Etz Chaim and Rabbi Isaac Elhanan Theological Seminary, added Yeshiva College of secular studies in 1928, and became Yeshiva University in 1945. The eastern European Orthodox elements concentrated primarily on Jewish education and it was they who introduced the movement for Jewish day schools, analogous to Christian parochial schools. Gradually an American version of Orthodoxy developed on the Neo-Orthodox model of Samson Raphael Hirsch, which combined institutional separatism and cooperation with other Jewish groups in umbrella organizations.

American Orthodoxy

The immigrants and their children had three desires; to upgrade themselves socially by joining older congregations or forming their own in an Americanized image; to affirm an unideological commitment to Jewish life; and to maintain their ties to the overseas Jewish communities of their origin. With their strong sense of Jewish peoplehood, they introduced Zionism into American Jewish life, and accepted the basic ideas of Mordecai Kaplan's Reconstructionism, which was committed to Zionism. A small group of anti-Zionists remained a significant force in the 1930s and 1940s, but their central organization, the American Council for Judaism, represented the descendants of earlier German-Jewish immigrants. The later immigrants took over all the earlier institutions of the Jewish community and imbued them with their own spirit.

The religious continuum

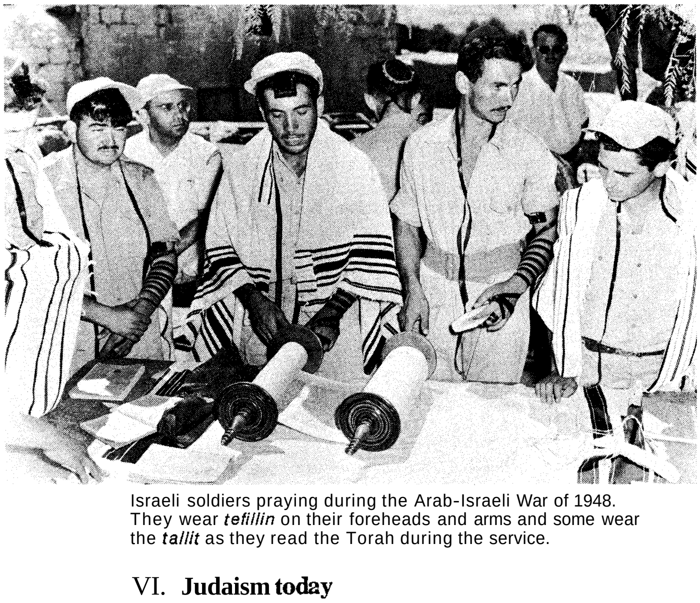
American Jewish religious life is a continuum—from the most traditional Orthodoxy to the most radical Reconstructionism. In theory, all of the Orthodox groups agree on the revealed nature of all of Jewish law; for the Reform groups, the moral doctrine of Judaism is divine and its ritual law is man made; the Conservatives see Judaism as the working out in both areas of a divine revelation that is incarnate in a slowly changing human history; and the Reconstructionists (who include both Conservative and Reform Jews) view Judaism as the evolving civilization created by the Jewish people in the light of its highest conscience. What really marks the various bodies in the mind of the Jewish community is their difference in ritual practices, but the ritual variations shade from one group into the other. The role of the rabbi is substantially the same in all three groups; he is no longer a Talmudic scholar but a preacher, pastor, and administrator, a cross between a parish priest and the leader of an ethnic group. Although there was some cooperation among the three major Jewish denominations—Orthodoxy, Reform, and Conservatism—the real effort of organized Jewish religion in America in the early 1970s revolved around the individual synagogue and the denomination to which it belonged. As religious identification became increasingly respectable in American life, the Jews followed the American norm, affiliating in greater numbers with synagogues, though often for ethnic or social, rather than religious reasons.

JUDAISM IN OTHER LANDS

Modernity came first to the Jewish people in Europe and it was, therefore, within the European context that representatives of important non-Ashkenazi communities such as the proto-Zionist Sefardi Judah ben Solomon Hai Alkalai of Sarajevo, the Luzzatto family in Italy, and Elijah ben Abraham Benamozegh in France, participated in variations of Jewish modernity. In England and France, more than in Germany or Russia, Wissenschaft des Judentums (see above Developments *in* scholarship), with its enlightenment ideology, was the central focus of Jewish experience; there the "republic of scholarship" became the synagogue of the Jewish intelligentsia. In neither country did Reform Judaism gain a major foothold, for the Orthodox establishment, which remained the official synagogue, liberalized its synagogue practice while retaining its essentially conservative outlook. In Anglo-Jewish life in the last decades of the 19th century the two most pronounced modernist tendencies were Solomon Schechter's moderate romantic traditionalism and the "renewed Karaism" of Claude Joseph Goldsmid Montefiore, whose version of religious reform was "back to the Bible."

Outside of Europe, in such places as South America and Canada, Jewish modernity appeared late, for European Jewry arrived in those places even later than in the United States, attaining a significant number only in the 20th century. These communities have been dependent on immigrant scholars and intellectuals for serious Jewish thought. Jews in the Arab lands, in North Africa and the Middle East, living within traditional societies, entered modernity even later than those on the peripheries of Europe. Many of them received their first introduction to the Western world in widespread schools set up by the Alliance Israélite Universelle (a Jewish defense organization centred in Paris), which combined Jewish education with the language and values of French civilization. Yet most of these communities remained traditionalist almost to the moment when they were expelled or felt compelled to relocate, since 1948, when the state of Israel was created. The ferment of modernity in all its forms is now being felt in their ranks. In Israel, which has received a large segment of Sefardic Jewry, the attention of these communities has turned to attaining equality with the more advanced Ashkenazim rather than developing some forms of modern Jewish thought.

Wide World Photos



Israeli soldiers praying during the Arab-Israeli War of 1948. They wear *tefillin* on their foreheads and arms and some wear the *tallit* as they read the Torah during the service.

VI. **Judaism today**

As a result of the Holocaust, Judaism has become a non-European religion; its three major centres, which together include more than three-fourths of world Jewry, are Israel, the Soviet Union, and the United States. Although Jews constitute only a small fraction of the population of the United States, Judaism occupies a role far surpassing its numerical importance and is regarded with Roman Catholicism and Protestantism as one of the major American faiths. Similarly, in the international realm of Western religion, Judaism has been welcomed as a partner able to deal with other major religions as an equal on such issues as anti-Semitism, human rights, and world peace.

The rights and needs of the world Jewish community, including Israel, have triggered deep conflicts with which Judaism has been involved with the Arab and Communist worlds. Friction between Israel and the Arab states has created tension with Islām, while the political stand of Israel and the treatment of the Jewish minority within the Soviet Union have led to open clashes with the Communist leadership. Some of the diatribes and charges that have issued from the Arabs and Communists in this struggle have at times re-evoked older forms of anti-Semitism. In the long-range view, the problems of Judaism and Islām seem more soluble than those of Judaism and such secular ideologies as Communism, for the major religions of the world are increasingly seeking accommodation with each other, as all are confronted by hostile secularist ideologies which have retained their conversionary élan.

Secularization and Jewish identity

Within its own community Jewry is faced with the increasing secularization of Jewish identity in its three major centres, each in its own way. In the United States the open society and the melting pot ideologies of past generations have fostered among many Jews a sense of Jewish identity increasingly devoid of concrete religious, national, or historical content; in the Soviet Union government policy since the 1930s has banned the teaching of Judaism and Jewish culture to the young and has severely discouraged any manifestation of Jewish identity as a sign of the disloyalty of "rootless cosmopolitans" to the Russian state; and in Israel a secular nationalism has taken root, raising questions as to the role that Judaism plays in the identity of the average Israeli. Nonetheless, underneath the external secularization there are signs of a persisting deep Jewish religious fervour, in which the sense of history, community, and personal authenticity figure as the intertwined strands of Jewish religious life, especially as it has been affected by the State of Israel. Some of the rituals of the Jewish tradition, especially the rites of passage at the crucial stages of individual existence, are almost universally observed, except in the Soviet Union; in the United States, for example, more than 80 percent of Jewish children receive some formal religious training. Among Jewish youth there is, in some circles, a recurring quest for tradition. In the United States, Jewish communes have been established that seek new forms of Jewish expression; in Israel, groups such as Mevaqshe Derekh (Seekers of the Way) have tried to bridge secular Israeli culture and Jewish tradition and to maintain traditional Jewish ethical standards of behaviour even in wartime; in the Soviet Union thousands of young people gather on several occasions of the year to dance and sing and express solidarity in the squares in front of the synagogues in Leningrad and Moscow. Still, signs of major weaknesses persist. The rate of intermarriage among Jews in the Diaspora increased, while regular synagogue attendance, at the very highest 20 percent in the United States, remained far below church attendance. Despite their lack of traditional piety, there is a general sense among Jews that they remain Jews not because of the force of anti-Semitism but because of the attractiveness of their own tradition and their sense of a common history and destiny.

In the largest Jewish community, that of the United States, of the close to 6,000,000 Jews, three-fifths are members of synagogues. In the Soviet Union, which contains the second largest community (about 3,000,000), despite decades of assimilation and cultural deprivation, an estimated 100,000 Jews persisted in pursuing Jewish studies and 1,000,000 Jews still listed Yiddish as their mother tongue. Amid growing anti-Semitism and a Soviet-Arab entente, a movement emerged in the early 1970s affirming Jewish identity and pressing, at great personal risk, for emigration to Israel. In Israel, where there is a Jewish population of about 2,500,000, 40 percent of the children attend schools of Orthodox religious orientation, though politically the strength of the (Orthodox) religious parties is not high, and non-Orthodox government schools also stress Jewish subjects. The 800,000 Jews of Central and South America express their sense of Jewish identity in secular and ethnic rather than religious terms, and have increasingly turned from Yiddish to Spanish. In western Europe the picture is mixed. Only Great Britain and France retain large Jewish communities, approximately 500,000 each. In England the community suffers from a declining birth rate, while the French community has been revivified by the recent influx of North African Jews in the 1950s and 1960s.

The enduring existence of the Jews and Judaism

If in 1945, the world Jewish community, decimated and horrified by the Holocaust, felt in danger of disappearing, there appeared to be no such despair in the early 1970s when there was an expectation that Jewish communal feeling would remain strong, especially, for many or most Jews, in the light of the existence of Israel. Judaism enjoyed a heightened dignity in the eyes of the world as well, not only as a result of the creation of the State of Israel, but also because of its close relations with other world religions. Although the recurring phenomenon of the alienation of young Jews from their tradition was a troubling prospect, it is no more so than in recent past generations. Along with other major religions, Judaism's most disturbing problem yet to be solved was how to deal with secular ideologies and with the growth of secularism within its own ranks. Thus, looking forward to the last decades of the 20th century, it appeared that Judaism would have to contend with as many problems as other major religions, but that it faced them with no less confidence than these, and with more confidence than it had felt earlier in the century. (Ar.H.)

BIBLIOGRAPHY

General observations: SALO W. BARON, *A Social and Religious History of the Jews,* 2nd ed., *15* vol. (1952–73), a comprehensive presentation of the intertwined social and religious history with copious bibliographical information critically evaluated; LOUIS FINKELSTEIN (ed.), *The Jews: Their. History, Culture and Religion,* 4th ed., *3* vol. (1970–71), critical essays by outstanding authorities on the major aspects of Jewish history and culture; JULIUS GUTTMANN, *Die Philosophic des Judentums (1933;* Eng. trans., *Philosophies of Judaism,* 1964), the best single volume on the history of Jewish thought from ancient times to the present, especially valuable for medieval Jewish philosophy; LEO W. SCHWARZ (ed.), *Great Ages and Ideas of the Jewish People* (1956), interpretive and highly readable essays by six historians on Jewish history, with emphasis on intellectual history, intended primarily for the layman; GERSHOM G. SCHOLEM, *Major Trends in Jewish Mysticism,* 3rd rev. ed. (1954), the classic treatment of mystical doctrines and schools in Judaism; MAX L. MARGOLIS and ALEXANDER MARX, *A History of the Jewish People (1927,* reprinted 1958), an excellent, readable, introductory survey.

Hellenistic Judaism: (Bibliographies): GERHARD DELLING (ed.), *Bibliographie zur jüdisch-hellenistischen und intertestamentarischen Literatur 1900–1965* (1969), extremely comprehensive bibliography on religion and literature of Diaspora Judaism, arranged according to topics, with separate bibliographies on every major Hellenistic Jewish author and on each book of the Apocrypha and Pseudepigrapha; RALPH MARCUS, "A Selected Bibliography *(1920–1945)* of the Jews in the Hellenistic-Roman Period," *Proceedings of the American Academy for Jewish Research,* 16:97–181 (1946–47), covers both Palestine and the Diaspora, helpful for noting works that are useful introductions and works that are indispensable to the specialist; LOUIS H. FELDMAN, *Scholarship on Philo and Josephus, 1937–1962* (1963), critical bibliography, arranged topically, with comments on both Diaspora and Palestinian Judaism generally. *(Papyrological and archaeological sourcebooks):* VICTOR A. TCHERIKOVER, ALEXANDER FUKS, and MENAHEM STERN (eds.), *Corpus Papyrorum Judaicarum, 3* vol. (1957–64), contains text, translation, bibliography, and commentary on all papyri and inscriptions pertaining to Jews from *323* BCE to *641* CE—thoroughly reliable; ERWIN R. GOODENOUGH, *Jewish Symbols in the Greco-Roman Period, 13* vol. (1953–68), a magnificent, exhaustive collection of the archaeological findings, with highly insightful, if controversial, commentary. *(Standard scholarly treatments of Hellenistic Judaism):* SALO W. BARON, *A Social and Religious History of the Jews,* 2nd ed. rev., vol. 1 and 2 *(1952).* VICTOR A. TCHERIKOVER, *Hellenistic Civilization and the Jews (1959;* orig. pub. in Hebrew, 1930), extremely meticulous and generally balanced (though with an anti-theological bias), particularly in dealing with the political and social factors in both Palestinian and Diaspora Jewry; ROBERT H. PFEIFFER, *History of New Testament Times, with an Introduction to the Apocrypha* (1949), a sane and useful, if unoriginal, survey of the political, religious, and literary history of Palestinian and especially Diaspora Judaism, from 200 BCE to 200 CE; MOSES HADAS, *Hellenistic Culture: Fusion and Diffusion* (1959), highly suggestive, though often extravagant, treatment of the interaction of Hellenism and other cultures, especially Judaism. *(Introductory popular treatments of Hellenistic Judaism):* RALPH MARCUS, "The Hellenistic Age," in LEO W. SCHWARZ (ed.), *Great Ages and Ideas of the Jewish People,* pp. 93–*139* (1956), extremely judicious and readable account by an eminent authority; for a readable guide to the literature, together with representative samples, see his "Hellenistic Jewish Literature," in LOUIS FINKELSTEIN (ed.), *The Jews: Their History, Culture and Religion,* 3rd. ed., vol. *2,* pp. *1077–1115 (1960). (Works on Palestinian Judaism):* GEORGE FOOT MOORE, *Judaism in the First Centuries of the Christian Era, 3* vol. *(1927–30,* reprinted 1966–67), a classic treatment based primarily on the Talmudic corpus, though the view of a Pharisaic "normative" Judaism has since been strongly challenged; SOLOMON ZEITLIN, *The Rise and Fall of the Judaean State: A Political, Social and Religious History of the Second Commonwealth, 2* vol. (1962–67), stimulating and often highly original survey of the period from *332* BCE to *66* CE, though the scholarly dogmatism is occasionally jarring; SAUL LIEBERMAN, *Greek in Jewish Palestine,* 2nd ed. *(1965)* and *Hellenism in Jewish Palestine,* 2nd ed. (1962), highly significant, ingenious, and learned illustrations of the influence of Greek culture on the language and exegetical format of the Palestinian rabbis. *(Works on Diaspora Judaism):* HARRY A. WOLFSON, *Philo: Foundations of Religious Philosophy in Judaism, Christianity, and Islam,* rev. ed., *2* vol. (1962), a great and seminal, though controversial, work that makes Alexandrian Judaism a collateral branch of Palestinian Pharisaic Judaism; LOUIS H. FELDMAN, "The Orthodoxy of the Jews in Hellenistic Egypt," *Jewish Social Studies,* 22:215–*237* (1960), a survey using literature, papyri, and art objects to examine the synthesis of Greek culture and Judaism in the upper and lower classes, respectively, of Hellenistic Egypt.

Rabbinic Judaism: (Palestinian Judaism): GEORGE FOOT MOORE, *Judaism in the First Centuries of the Christian Era, 3* vol. *(1927–30);* SOLOMON SCHECHTER, *Aspects of Rabbinic Theology* (1961), a concise, authoritative, and engaging treatment of classical (*i.e.,* rabbinic) Judaism. *(Babylonian Judaism):* JACOB NEUSNER, *A History of the Jews in Babylonia, 5* vol. *(1965–70;* vol. *1,* rev. 1969), the most comprehensive treatment of Babylonian Jewry during the Tannaitic and Amoraic periods. *(Judeo-Arabic culture):* S.D. GOITEIN, *Jews and Arabs: Their Contacts Through the Ages (1955* and 1964), a popular work by the ranking authority on all aspects of Jewish-Arabic symbiosis, particularly valuable for the medieval period; ABRAHAM IBN DAUD, *Sefer ha-Qabbalah (The Book of Tradition),* ed. and trans. by GERSON D. COHEN (1967), the classic medieval Hebrew chronicle with analytic essays on Spanish Jewry's "golden age." *(Jews of medieval*

Europe): ISRAEL ABRAHAMS, *Jewish Life in the Middle Ages*, new ed. rev. by CECIL ROTH (1932), delightful and erudite studies of social life and institutions in medieval Europe; MORITZ GUEDEMANN, *Geschichte des Erziehungswesens und der Cultur der Juden*, 3 vol. (1880–88), a social and intellectual history of medieval Ashkenazic Jewry (France, Germany, Italy); CECIL ROTH, *The Jews in the Renaissance* (1959), lucid and informative, but with little critical analysis, valuable on Jewish contact with Christian men of letters; SOLOMON SCHECHTER, "Safed in the Sixteenth Century," *Studies in Judaism*, 2nd Series, pp. 202–285 (1908), a scholarly *tour de force* on the great community of Jewish jurists and mystics; GERSHOM SCHOLEM, *Shabbethai Zevi*, 2 vol. (1957), a penetrating and comprehensive study (in Hebrew) of the great false Messiah as well as of his religious antecedents and legacy.

Contemporary Judaism: The most convenient summary for the study of modern Jewish history is HOWARD MORLEY SACHAR, *The Course of Modern Jewish History* (1958). Modern Jewish thought and movements are covered in a useful manual by JOSEPH BLAU, *Modern Varieties of Judaism* (1966). NATHAN ROTENSTREICH, *Jewish Philosophy in Modern Times* (1968); and the last (modern) section of JULIUS GUTTMAN, *Philosophies of Judaism* (1964), are more advanced. The very best book on Jewish religion in the modern age is unfortunately still untranslated: MAX WIENER, *Jüdische Religion im Zeitalter der Emanzipation* (1933). For Zionism, see the only attempt at a comprehensive reader in English, ARTHUR HERTZBERG (ed.), *The Zionist Idea* (1959). There are two excellent expositions of Judaism from a Reform–Liberal point of view: LEON ROTH, *Judaism: A Portrait* (1960); and LEO BAECK, *The Essence of Judaism* (1961). Conservative Judaism is well described in a book about its early history, MOSHE DAVIS, *The Emergence of Conservative Judaism* (1963); and by JACOB AGUS, *Dialogue and Tradition* (1969), the essays of a distinguished Conservative thinker. Reconstructionism is best understood in the words of its founder, MORDECAI M. KAPLAN, *Judaism As a Civilization*, 2nd ed. (1957). The standard modern single volume about Orthodox Judaism is ISIDORE EPSTEIN, *Judaism* (1935). Neo-Ḥasidism was best described by its greatest name, MARTIN BUBER, *The Origin and Meaning of Hasidism* (1960).

(S.W.B./L.H.F./G.D.C./Ar.H./Mo.Gr.)

Juglandales

This is a small but important order of flowering plants consisting of two families, Rhoipteleaceae, with one genus and one species, and Juglandaceae, the walnut family, with eight genera and about 57 species. The walnuts are common large forest trees, primarily of temperate areas but also of subtropical regions, mostly of eastern North America, Central America, western South America and eastern Asia. Walnuts, hickories, and pecans have been appreciated for many years for their edible oily nuts and their valuable wood, and they are now cultivated in large numbers in most temperate regions of the world.

Some of the trees, at least in the early days before extensive cutting for lumber, grew to be 150 feet or even 175 feet high (46–53 metres). The black walnut, *Juglans nigra*, has been reported to reach six feet (two metres) in diameter. The smallest member of the order is the Texas walnut, *J. microcarpa*, a shrubby tree of Texas and New Mexico only 20 to 30 feet (six to nine metres) high.

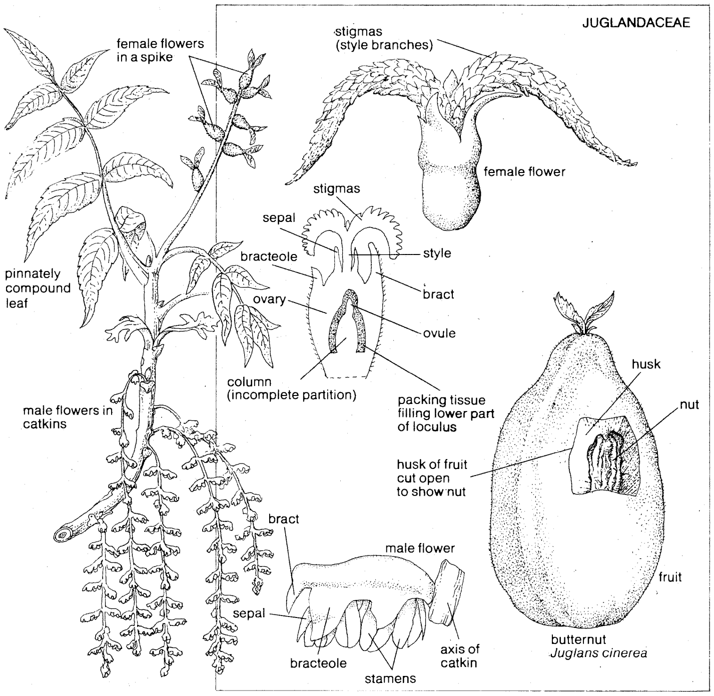
GENERAL FEATURES

Distribution and abundance. The trees are common throughout the deciduous forests of eastern United States and in parts of eastern Asia. In Mexico and Central America they are only locally common in certain canyons in the mountains or in fog belts on the slopes of the mountains. One species, *Oreomunnea (Engelkardia) pterocarpa*, occurs in only one valley in Costa Rica. The black walnut, *Juglans nigra*, yields such valuable timber that most of the native trees in the eastern United States have been cut down; hickories (*Carya* species), too, have been greatly reduced in numbers. The fall webworm attacks the hickory and walnut leaves in many regions, and insect damage also seems to be reducing the numbers of the butternut (*Juglans cinerea*) in the northeast. In the United States and in Europe many walnut and hickory trees have become naturalized in the regions where they have been planted.

Uses of the black walnut

Economic importance. The most important and best known member of the order is undoubtedly *Juglans regia*, the Persian walnut, also known as the English walnut and Circassian walnut. This was originally native to China, the Himalayan mountains, and from Iran to Greece. The wood and nuts have been used and prized for over 2,000 years; the Persian walnut is probably the most important of all nuts. Orchards and individual trees have been planted in warm temperate areas in many countries. The pecan, *Carya illinoensis*, native of the southeastern United States and northern Mexico, though not as valuable for its wood, is important, next to the Persian walnut, for its valuable nuts; more and more orchards are being planted not only in the southern United States but also in other countries. The black walnut, *Juglans nigra*, native in the eastern United States, is well known for its valuable wood used in fine furniture and in cabinetwork, interior panelling, and gun stocks. The tree has become so scarce as a native tree that lumbermen have been known to try to buy yard trees from private homes. Even single trees can be extremely valuable because the wood can be extended considerably if used as thin veneers. Black walnut meats are very tasty and are used in candy and cakes, but the hard-shelled nuts are difficult to crack. Important primarily locally for their nuts are the American butternut, *Juglans cinerea;* Japanese butternut, *J. ailantifolia;* shagbark hickory, *Carya ovata;* and the big shellbark hickory, *C. laciniosa*. The wood of the hickories is extremely valuable because of its toughness, hardness, strength, and resistance to shock and is used for tool handles, wagon axles, and agricultural implements. The fresh husks of the butternut have been used as a dye (khaki); the fruits of *Platycarya* have been used in China as a black dye for cotton cloth. The meats of the Persian walnut have been used for a drying oil. Several members of the temperate genera have been planted for dooryard trees or park trees. The Japanese butternut, a rapidly growing tree, is very hardy and is increasingly being planted in the United States; the nuts of the heartnut variety are easily cracked. The woods of the Asiatic members other than walnuts and hickories have local uses but none of these trees has edible nuts. Leaves of various species have been thrown into the water for use as fish poisons by primitive people. A toxic substance, juglone, is given off by the leaves and roots of the black walnut and under certain conditions injures vegetable crops growing near the trees,

From (left) *American Journal of Botany*, vol. 25 (1938) and (female flower, butternut) *American Journal of Botany*, vol. 27 (1940)



Vegetative, floral, and fruiting structures of the walnut order.

Natural history. The trees are adapted to wind pollination; thus the stamens or staminate (male) flowers are very numerous and the stigmas (female flower structures) are enlarged to catch the pollen. Adaptations for seed dissemination have developed in two different directions. All members of the order have one-seeded fruits and the seed remains inside the fruit for dissemination. Some genera have developed small fruits with wings for wind dispersal; others have developed large fruits, or nuts, for animal, primarily squirrel, dissemination. The seeds are typically viable for only one winter season in the northern regions and must not dry out; squirrels plant them underground, where it is moist. The nuts have an adherent husk for protection, but it is not known whether its principal function is to prevent drying out or injury in falling from the trees.

Many interesting natural hybrids are known among the hickories and the walnuts, but most of these are not used commercially. Some of the species of Carya (hickories) are diploids—*i.e.*, they have the normal two sets of chromosomes per cell; some are tetraploids, with four sets of chromosomes in the nucleus of each cell.

Ecology. Many of the trees in the walnut order grow in the forests of the temperate regions; others grow in the mountains of the tropics; a few are subtropical or even grow near the seashore in the tropics, but none of them is strictly alpine. Most of the members have deciduous leaves, even in the tropics, but a few are evergreen. All appear to require moisture in the soil. A few grow in swamps, some in rich bottomlands; others prefer dry hillsides, but only where rainfall is sufficient; a few grow in arid regions, but then only along streams in canyons or in the fog belts in the mountains. Members of the order rarely occur as solid forests but are mixed with other trees, especially oaks. An oak–hickory forest covers much of the deciduous forest of eastern United States and part of eastern Mexico. *Engelhardia* is occasionally dominant in eastern Asia.

Scattered occurrence of trees

Distinguishing features. All members of the order are trees. The alternate or, rarely, opposite leaves are pinnately compound (*i.e.*, each leaf is composed of several leaflets arranged along both sides of a central axis). The lower surfaces of the leaflets, and often the buds, flowers, and young fruits, are dotted with yellow or sometimes pale several-celled resinous scales. The inconspicuous flowers lack petals, and at least some occur in catkins or elongate slender spikes. Catkins are long and scaly, and usually drooping, spikes of unisexual flowers; that is, the male or staminate flowers occur in one catkin, the female or pistillate flowers in another. The ovary is two-celled or incompletely two-celled (that is, with one or two ovarian cavities or locules), but there is only one ovule. The one-seeded fruits are either winged nutlets or nuts, which are enclosed in husks. The seeds are oily and lack endosperm, a starchy nutrient tissue for the developing embryo.

EVOLUTION

Fossil record. There is no fossil record for the rare Chinese and Indochinese family, Rhoipteleaceae, but the walnut family, Juglandaceae, is abundantly represented in the fossil record in the form of leaves, nuts, and pollen grains. Members of this family appear first in the Upper Cretaceous Period (about 75,000,000 years ago), along with the earliest flowering plants, and by then had already evolved into essentially modern genera. This indicates a long previous history, which is also true of many other flowering plants. As early as the Eocene Epoch (about 50,000,000 years ago) the walnut family had spread over much of the Northern Hemisphere, with a much wider distribution than in modern times, and continued to spread through the rest of the Tertiary Period. Trees, therefore, occurred in regions where modern members are no longer native, such as Europe, North Africa, Alaska, Greenland, and the northwestern United States. Thus, in north central Oregon, in the Clarno Formation of the Eocene, of about 50,000,000 years ago, 75 recently discovered petrified fruits strongly resemble the living Arizona walnut, *Juglans major*. The species is, however, much more primitive than any modern one and apparently is intermediate between modern species. Furthermore, some of the genera now restricted to eastern Asia, such as Pterocarya, Platycarya, and Engelhardia, once were to be found over much of the United States as well as Europe.

Restriction of distribution during recent geologic time

The range has since become much restricted, due to a general cooling of the climate in the north and to mountain building, resulting in present-day drier conditions. Furthermore, glacial activities in the Pleistocene Epoch of the last 2,000,000 years completely wiped out the trees in Europe, where they could not survive south of the glaciers because of the extensive east-to-west oriented European mountains that blocked their southward range extensions as the glaciers advanced. In eastern United States and in China the mountains run largely from north to south, and during periods of approaching glaciation the trees were able to move south by means of seed dispersal along the valleys, encountering no physical barriers, and move back north after the glaciers had retreated.

Phylogeny. Juglandales is one order of a group formerly known as the Amentiferae. All members of this group are woody plants, with inconspicuous wind-pollinated flowers that lack petals and are arranged in elongated clusters known as catkins (aments) or spikes, such as are found in the willows, bayberries, birches, oaks, and beeches. The catkins superficially resemble the cones of the gymnosperms (pines, spruces, firs, etc.). Some botanists believe that all of these orders are related, are very primitive, and have evolved directly from ancient gymnosperms, perhaps even the seed ferns. This belief is due partly to the resemblance of catkins to cones, and especially to the separation on the same tree of the male catkins from the female ones; partly to wind pollination and lack of petals as in the gymnosperms; and partly to the early appearance of the plants in the fossil record. While most botanists no longer believe that the Amentiferae group gave rise to more advanced flowering plants, some still believe that they are primitive and possibly had a different origin and line of evolution from the rest of the flowering plants. One European botanist, for example, has found features about the ovule of Engelhardia, a primitive genus of the family Juglandaceae, to be different from other angiosperms and highly reminiscent of certain fossil seed ferns.

Evolutionary status of walnut order and its relatives

Most present-day botanists, however, now believe that the families of the Amentiferae are not primitive but advanced, having had ancestors with conspicuous, insect-pollinated flowers that had petals and bisexual flowers (with male stamens and female pistil together in the same flower). Thus, the presence of an abortive female pistil in a few male flowers in various species of the Juglandaceae family indicates that the ancestral flowers were bisexual. In addition, the compound pistil with inferior ovary (*i.e.*, located below the attachment point of the other flower parts) in several families of the Amentiferae group suggests an advanced rather than a primitive nature. The ancestral bisexual flowers have been reduced, the sexes separated, the petals lost, and the flowers crowded into catkins with specialization for wind pollination. Furthermore, the catkin and the cone are technically not equivalent; each flower of a catkin (for example, a staminate flower) is equivalent to a complete cone (for example, a staminate cone) in the gymnosperms. Thus, theoretically, a catkin could be considered equivalent to a large number of massed cones. There is also a difference of opinion among present-day botanists as to the nature and evolution of the primitive flower itself and as to the type of plant, and its reproductive structure, from which the angiosperms arose. Since truly primitive angiosperms have not yet been located in the decidedlv incomplete fossil record, the presence of early fossils of the Amentiferae group does not necessarily prove them to be the most primitive of flowering plants.

The Juglandales order itself, in turn, has stood apart from the other orders of the Amentiferae group because of its compound leaves, and the Juglandaceae family itself lacks the stipules (small, leafiike appendages at the base of leaf stalks) present in the other orders.

It has often been suggested that the Juglandaceae family has been derived from the Sapindales order, which includes the sumacs. These are woody plants with pinnately compound leaves also lacking stipules, some of them having resinous dots on the leaflets as do the members of the Juglandaceae family. They also have panicles of flowers but, unlike the walnut family, petals are present. A few members even have reduced crowded flowers arranged in spikes. The wood anatomy and pollen structure, however, indicate that not only is the Juglandaceae family unrelated to the Sapindales order, but it is even more primitive than the latter in several features. Thus, the walnut family was probably derived from some other more primitive group. It now seems likely, though not proved, that the family was derived with the bayberries, oaks, and birches through the Hamamelidales, the witch hazel order, from the Magnoliales, the magnolia order. It is generally agreed that this last order is the most primitive living group of flowering plants, having, as it does, extremely primitive gymnosperm-like wood structure as well as other primitive features.

Relatives of the walnut family

There have been differences of opinion about which families are related to the walnut family. The families Julianiaceae, Picrodendraceae, and Rhoipteleaceae have been considered to be close to the Juglandaceae family because of their compound leaves and general flower and inflorescence (*i.e.*, the flower cluster) structure. Studies on wood anatomy and pollen grain structure have shown that the first two are much more likely to be related to the Sapindales order. The stipules, flowers, and flattened winged fruits of the Rhoipteleaceae family strongly suggest the elms in the order Urticales, though the latter have simple leaves. Again, wood anatomy indicates that the Rhoipteleaceae family is more closely related to the walnut family, especially to the more primitive genera of that family, *Engelhardia* and *Alfaroa*. The flower and inflorescence structure of the genus *Rhoiptelea* fit exactly the proposed hypothetical ancestor of the Juglandaceae family. In the Amentiferae group the bayberry family, Myricaceae, considered by many to constitute a distinct order, has been placed by some in the order Juglandales. This family has catkins, and one-seeded nutlets that are often winged. Once more the bayberries have simple leaves and stipules, but they could still be close to the Juglandales order. The compound leaves of the Juglandaceae (walnut) family, however, separate it from the oaks and birches and even from witch hazels and magnolias.

CLASSIFICATION

Distinguishing taxonomic features. The two families of the order are quite distinct in position of the ovary (superior or inferior) and internal structure of the ovary (two-celled or one-celled; that is, two-loculed or one-loculed), and in having bisexual (perfect) flowers in long slender spikes or unisexual (imperfect) flowers in true catkins. Within the Juglandaceae family itself the subfamilies, tribes, and genera are separated on the basis of the modification of the primary and secondary bracts (scales) in the fruiting condition into wings or into husks for the nutlets or nuts. In addition, the presence or absence of sepals (the outer whorl of flower structures, similar to flower petals but usually smaller and coloured green), type and position of inflorescences, variation in position of the carpels (ovule-bearing leaves of the pistil), type of stigma, wood anatomy, and pollen structure are of value.

Annotated classification.

ORDER JUGLANDALES

Trees; leaves mostly deciduous, alternate or rarely opposite or whorled, equally or unequally pinnately compound; leaflets as few as 3 but usually 5 to 31, serrate (toothed) or entire (smooth margined), dotted beneath with yellow or pale several-celled resinous scales; inflorescences consisting of elongate spikes or catkins, the pistillate (female) spikes sometimes few-flowered and short; bracts (leaflike appendages) associated with the flowers usually as conspicuous as or more conspicuous than the floral parts; individual flowers bisexual or unisexual, inconspicuous, wind-pollinated, lacking petals, with 4 sepals or these lacking; filaments of stamens very short; pistil with 2 carpels, and 2 styles or style branches; ovary completely or incompletely 2-celled but with only one ovule in the middle of the fertile locule; fruit 1-seeded, a small winged nutlet or a large nut, the seed lacking endosperm. Two families, 9 genera, and about 58 species distributed in temperate and subtropical regions of eastern and southwestern United States, Mexico, West Indies, western South America to Argentina, Japan and Philippines to New Guinea and Java, Manchuria and China to Malay Peninsula to Himalayan mountains of India, and Iran (Persia) and from the Caucasus mountains to Greece. They are absent from Australia, New Zealand, Africa, most of Europe, and western Asia.

Family Rhoipteleaceae

Leaves alternate, with stipules, unequally pinnately compound; leaflets serrate; inflorescence consisting of a terminal panicle of identical elongate slender spikes resembling catkins; flowers 3 to a primary bract along the axis of the spike, the central flower bisexual, with 4 sepals, 6 stamens and a pistil, the lateral 2 flowers pistillate (female only) but sterile; ovary 2-celled, superior, the single ovule attached to the partition in the fertile locule, ovule anatropous (curved), unlobed, with 2 integuments, and without packing tissue below it; fruit a small flattened nutlet, 2-winged due to outgrowths of the ovary wall; bracts and sepals free from the ovary and stamens; staminate (male only) flowers none. One genus and 1 species, *Rhoiptelea chiliantha,* found in southwestern China and North Vietnam; unknown outside the Orient.

Family Juglandaceae (walnut family)

Leaves without stipules, alternate, opposite or whorled, unequally or equally pinnately compound; leaflets serrate or entire; buds naked or scaly; inflorescences of 2 types: many-flowered, usually drooping staminate catkins, or many-flowered, several-flowered, or few-flowered, drooping or erect pistillate spikes; plants monoecious (*i.e.*, flowers of both sexes occur on one plant) or rarely dioecious (*i.e.*, there are separate plants of each sex); flowers 1 to a primary bract, unisexual, with the primary and usually also the two secondary bracts fused with the staminate receptacle and in most cases also with at least the base of the ovary, thus appearing to be part of the floral envelope; staminate flowers with or without 4 sepals and 3 to 100 stamens; pistillate flowers with 4 sepals or these rarely absent; ovary inferior, 1-celled (1-loculed), but 2- to 4- (sometimes to 8-) celled near the base because of the presence of 1 or 2 (or 3, rarely) incomplete partitions in the lower half of the ovary; packing tissue at first filling the lower part of the locule; ovule orthotropous (straight), erect at the top of the primary incomplete partition with 1 integument; fruit a small winged nutlet or a nut, the latter enclosed in an adherent dehiscent (splitting) or indehiscent husk, the nut enclosed in the husk resembling a drupe (stoney-seeded fruit such as a cherry or peach), and this whole fruit sometimes called a tryma; wings and husks of the fruits developed from the bracts of the flower; in 1 genus, *Alfaroa,* the nut lacks both true husk and wings; seed with a straight embryo, 2- or 4- or rarely 8-lobed at the base; cotyledons ("seed leaves") 4-lobed, at germination remaining underground in the fruit (cotyledons hypogeous) or appearing aboveground as 4-lobed leaves (cotyledons epigeous). Three subfamilies, 3 tribes, 8 genera, and 57 species. Distribution as given for the order.

Subfamily Juglandoideae

Fruiting catkin or spike not conelike, either many-fruited and drooping or few-flowered and erect; fruiting primary bract remaining attached to nut or nutlet and falling off the tree with it; catkins or spikes many to few-flowered, at least the staminate catkins drooping; pistillate catkin or spike completely pistillate; secondary bracts present in the staminate flowers.

Tribe Juglandeae. Three genera: *Juglans* (walnut, butternut) 20 species, *Pterocarya* (wing-nut) 5 species, and *Cyclocarya,* 1 species.

Tribe Engelhardieae. Three genera *Engelhardia,* 5 species, *Oreomunnea* (in many books combined with *Engelhardia),* 2 species, and *Alfaroa,* 5 species.

Tribe Caryeae. One genus, *Carya* (hickory, pecan), 18 species.

Subfamily Platycaryoideae

Fruiting catkin condensed, many-flowered, conelike, erect, the unmodified unlobed primary bracts rigid, woody; fruiting primary bract separating from the nutlet, the bract persisting on the tree, the very small flattened slightly two-winged nutlet falling off the tree; all catkins elongate, erect, clustered, the cluster terminal; pistillate catkin central in the terminal cluster, many-flowered, tipped by a staminate catkin; secondary bracts absent in the staminate flowers; carpels lateral; pith solid; leaves alternate, with terminal leaflets. One genus and one species, *Platycarya strobilacea,* of Japan and eastern Asian mainland.

Critical appraisal. The classification used here for dividing the Juglandaceae (walnut family) into subfamilies and tribes is a recent one of recognized authority. Most of the former classifications divided the family merely on the basis of the appearance of the fruits; for example, one group of genera has small, winged fruits, the other has larger fruits, most of which have husks. Yet various studies in wood anatomy, pollen structure, inflorescence type and position, floral structure, and nature of primary and secondary bracts show that the traditional classification schemes bring together unrelated members.

Tremendous advances have been made within the past 50 years, primarily in the family Juglandaceae, in the knowledge of inflorescences, flower structure, wood anatomy, pollen-grain structure, seedling type and its anatomy, number of genera and species, number of fossils, relationship within the family, and relationship to other families and orders. Much still remains to be done, however. Active studies are still being made. Opinions differ as to what genera and how many species should be recognized. Relationships among the genera are still open to question. Knowledge of fruit and seedling structure is still incomplete. Better knowledge of the relationships of the order to other orders is still needed as is indicated in the lack of a satisfactory explanation for the compound leaf. Intensive studies are now going on in an attempt to obtain a better natural classification of the flowering plants as a whole. The location of the Juglandales order in this classification is still in doubt.

Bot.,* 28:872–878 (1941), a technical study of the wood structure of the genus *Rhoiptelea* with a comparison to that of the Juglandaceae family and Urticales order.

(Wa.E.M.)

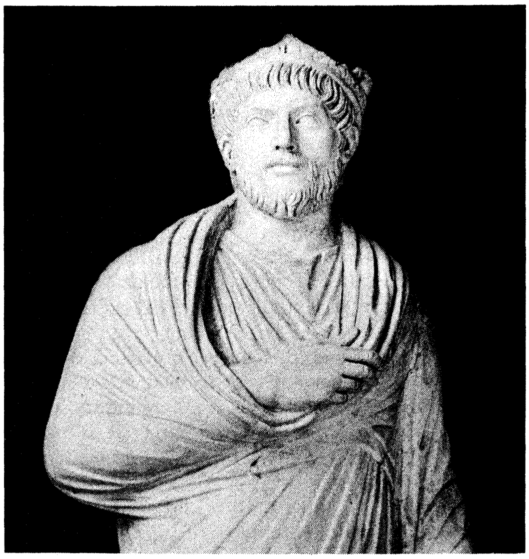
Julian the Apostate

Flavius Claudius Julianus, born *c.* AD 331/332, famous in history as the Apostate, was the last Roman emperor to attempt to replace Christianity by a revived polytheism of the Greco-Roman pantheon. Julian was a younger son of Julius Constantius, the half-brother of Constantine I (the Great), and his second wife, Basilina. When he was five, his father's nephew, also called Constantius, became emperor in the East as Constantius II and in 340, by the death of his brother Constantine II, sole emperor. The army, determined to have none but Constantine I's sons as his successors, murdered the latter's half-brothers and other possible aspirants. Constantine I's third son, Constantius II had Julian's father killed in or just after 337, and an elder brother of Julian was killed in 341. Basilina had died soon after the birth of Julian, who was thus early left an orphan. With his surviving half-brother, Gallus, seven years his senior, he was brought up in obscurity, first by Eusebius, bishop of Nicomedia, in Bithynia and later at the remote estate of Macellum in Cappadocia. By the patronage of Eusebia, wife of Constantius II, Julian, when 19, was allowed to continue his education, first at Como and later in Greece. His physical appearance is described thus by his contemporary and comrade-in-arms, Ammianus Marcellinus:

> He was of medium stature, his hair was soft, as if it had been combed, his beard rough and pointed. His eyes were fine and flashing, an indication of the nimbleness of his mind. He had handsome eyebrows, a straight nose, rather a large mouth with a drooping lower lip. His neck was thick and slightly bent, his shoulders broad and big. From top to toe he was well-knit, and so was strong and a good runner.

His statue in the Louvre generally confirms this description, showing him as a stocky, rather diffident-looking philosopher.

Giraudon



Julian the Apostate, detail of a marble statue. In the Louvre, Paris.

Julian's freedom as a student had a powerful influence on him and ensured that for the first time in a century the future emperor would be a man of culture. He studied at Pergamum, at Ephesus, and later at Athens. He was attracted by Neoplatonism and adopted the cult of the Unconquered Sun.

That his literary talent was considerable is demonstrated in his surviving works, most of which illustrate his deep love of Hellenic culture.

Julian had been baptized and raised as a Christian; but, although he outwardly conformed until he was supreme, Christianity in its official guise meant to him the religion of those who had murdered his father, his brother, and many of his relations and, as such, was hardly likely to commend itself to him. He found far more solace in his philosophic speculations. This reaction has sometimes been defended as natural but eccentric. Natural it certainly was; but it is a misinterpretation of the age to imagine that Julian was alone in preferring Hellenism to Christianity. Society, and particularly the educated society in which Julian was at home, was in fact still largely if not predominantly pagan. Even bishops were proud of their Greek culture; no one was proud of the exotic degeneracy and extravagance of the court of Constantius. It is not surprising that Julian's austerity, chastity, and enthusiasm for the heritage of Greece found a sympathetic response among many of his cousin's subjects.

Military successes in Gaul

Rise to supremacy. In 351 Constantius II, perturbed by the death of his brother Constans and subsequent disorders in the West, appointed Gallus as his caesar; that is, as his coadjutor and eventual successor. Gallus was a failure, and was executed near Pola in Italy (now Pula, Yugoslavia) in 354. Constantius, again in need of a caesar of his own house, after much hesitation summoned Julian from Greece, whence the latter arrived "still wearing his student's gown." In November 355, at the age of 23, he was duly proclaimed and invested as caesar, an honour which he accepted with justifiable foreboding. The Emperor gave Julian his sister Helena as wife. She died after five years of marriage—the fate of their issue, if any, is unknown. Julian was at once dispatched to Gaul, where he proved a resolute and successful commander. He defeated and expelled the Alemanni and the Franks, feats that aroused the jealousy of Constantius, who kept Julian short of funds and under secret surveillance. In 360, while Julian was wintering at Paris, his preferred headquarters, the Emperor sent a demand for a number of his best troops, ostensibly for service in the East but in reality to weaken Julian. Julian's army thereupon hailed him as Augustus. This naturally infuriated Constantius, who refused any accommodation. Julian, realizing that war between himself and Constantius was now inevitable, decided to move first. But, before the clash could come, Constantius died near Tarsus (November 361), having on his deathbed accepted the inevitable by bequeathing the empire to Julian.

Policies as emperor. Julian, now sole Augustus, greatly simplified the life of the palace and reduced its expenses. He issued proclamations in which he declared his intention to rule as a philosopher, on the model of Marcus Aurelius. All Christian bishops exiled by Constantius were allowed to return to their sees (although the purpose of this may have been to promote dissension among the Christians), and an edict of 361 proclaimed freedom of worship for all religions.

But this initial toleration of Christianity was coupled with a determination to revive paganism and raise it to the level of an official religion with an established hierarchy. Julian apparently saw himself as the head of a pagan church. He performed animal sacrifices and was a staunch defender of pagan orthodoxy, issuing doctrinal instructions to his clergy. Not surprisingly, this incipient fanaticism soon led from apparent toleration to outright suppression and persecution of Christians. Pagans were openly preferred for high official appointments, and Christians were expelled from the army and prohibited from teaching. The latter action led Ammianus, who admired Julian's virtues and was himself an adherent of the traditional religion, to censure the emperor:

> That was inhumane, and better committed to oblivion, that he forbade teachers of rhetoric and literature to practice their profession if they were followers of the Christian religion.

Julian wrote an attack on Christianity that is known today only by fragmentary citation. "The trickery of the Galileans"—his usual term—has nothing divine in it, he argues; it appeals to rustics only, it is made up of fables and irrational falsehoods. Here perhaps may be detected the sunset snobbery of the Athens of his day. Though professing to be a Neoplatonist and a sun worshipper, Julian himself was an addict of superstition rather than religion, according to Ammianus.

His project to rebuild the Jewish Temple in Jerusalem was designed rather to insult the Christians than to please the Jews, who, for long accustomed to the worship of the synagogue, would have found the revival of animal sacrifice acutely embarrassing. The plan was dropped when it was reported (as it was on both an earlier and a later occasion) that "balls of fire" had issued from the old foundations and scared away the workmen. Christian cities were penalized, and churches were burned in Damascus and Beirut. Bishops, including the great Athanasius, were banished. One was horribly tortured. Bacchus was installed in the Christian basilicas of Emesa (modern Homs, Syria) and Epiphameia (modern Ḥamāh, Syria). At Antioch, where Julian was preparing for a campaign against the Persians, his closing of the great basilica and the removal of the relics of the martyr Babylas from the sacred grove of Daphne annoyed the Christians. His priggish austerity did not endear him to the pagans, either, and both were equally incensed by his pamphlet entitled *Misopogon* ("Beard Hater"), in which he assailed the Antiochenes for the ridicule that they poured on him for his personal conduct, his religion, and his claim to be a philosopher on the strength of his beard.

The campaign against Persia.

The invasion of Persian territory was always a lure in antiquity and one to which Julian was not immune. Motivated by a desire for military glory and a decision to reassert Rome's pre-eminence in the East, he assembled, despite counsels of prudence from Rome and the Levant, the largest Roman army (65,000-strong and backed by a river fleet) ever to head a campaign against Persia. The Persians, aided by the desert, famine, treachery, and incompetence of the Romans, once again proved themselves superior. During a disastrous retreat from the walls of Ctesiphon, below modern Baghdad, Julian was wounded by a spear thrown "no one knew hence," which pierced his liver. He died the next night (June 363) at the age of 31, having been emperor for 20 months.

Julian's religious policy had no lasting effect. It had shown, however, that paganism, as a religion, was doomed. It is perhaps sad, in retrospect, that the odium of proving it should rest on Julian, who with a little less venom and more tact might have been remembered for his many virtues rather than for his two fatal blunders.

BIBLIOGRAPHY

Ancient: By far the most important source is the history of AMMIANUS MARCELLINUS. Ammianus was a contemporary and fellow-soldier of Julian in his Persian campaign. He was an orthodox pagan, but is outspokenly critical of Julian's anti-Christian policy. He devotes far more space to Julian than to any other character in the extant portion of his history. See books xv, 8 to xxv, 4, in the 3 vol. ed. trans. by J.C. ROLFE (1950–56), which are virtually a biography of Julian. See also Julian's own works, *Juliani imperatoris epistulae . . .*, ed. by J. BIDEZ and F. CUMONT (1922). For English readers the best edition is that of W.C. WRIGHT, 3 vol., "Loeb series" (1953–54), with a very helpful introduction. Of secondary ancient sources the most valuable and balanced is the BREVIARIUM OF EUTROPIUS. The *Decline of Rome* of ZOZIMUS, finished after 425, is the work of an avowed enemy of the Christian Church. ST. GREGORY NAZIANZEN is naturally hostile to Julian.

Modern: Many monographs have been devoted to this controversial prince. Among them may be cited G.H. RENDALL, *The Emperor Julian, Paganism and Christianity* (1879); G. NEGRI, *L'imperatore Giuliano l'Apostata*, 2nd ed. (1902; Eng. trans., *Julian the Apostate*, 1905); P. ALLARD, *Julien l'Apostat*, 3 vol., 3rd ed. (1906–10); A. ROSTAGNI, *Giuliano l'Apostata* (1919); and J. BIDEZ, *La Vie de l'empereur Julien* (1930). H. MATTINGLY's article on Julian in the OXFORD CLASSICAL DICTIONARY is to be commended.

(S.H.P.)

Julius II, Pope

The greatest art patron of the papal line and one of the most powerful rulers of his age, Julius II (Giuliano della Rovere) re-established the authority of the papacy in its ancient territory after the Borgia wars earlier in the century. As a politician and patron of the arts, he strove for a synthesis of church and state, of spirit and culture, with a grandeur unequalled by succeeding popes.

Career as cardinal and exile

He was born on December 5, 1443, in Albisola, Italy, the son of the impoverished Rafaello della Rovere, Pope Sixtus IV's only brother. In 1468 he became a Franciscan, and in 1471 Sixtus IV made him a cardinal. In this office Giuliano displayed all of the attributes of cupidity and corruption of an unscrupulous Renaissance prince. The Pope lavished on him six bishoprics in France and three in Italy along with an abundance of wealthy abbeys and benefices. The Cardinal, who lacked any interest in spiritual pursuits, became an outstanding patron of the arts. He is shown with his protégés in Melozzo da Forlì's superb fresco of Sixtus IV in the Vatican Museum.

Leonard von Matt—EB Inc.

Julius II, contemporary medallion. In the coin collection of the Vatican Library.

After the death of Sixtus IV, for whom Giuliano commissioned a bronze sepulchre by Antonio Pollaiuolo, now in the Vatican Grotto of St. Peter's, the Cardinal's candidate, the weak Innocent VIII, was elected through bribery. When Rodrigo Borgia, elected pope as Alexander VI in 1492, plotted Giuliano's assassination, Giuliano fled in 1494 to the court of Charles VIII of France. He accompanied the French king on his expedition against Naples in the hope that Charles would also depose Alexander VI. After accompanying Charles on his forced return to France, Giuliano took part in Louis XII's invasion of Italy in 1502. Alexander VI twice attempted to seize him.

Following the death of the Borgia pope in 1503, he returned to Rome, having been ten years in exile, and, after Pius III's brief pontificate, was, with the liberal help of simony, elected Pope Julius II in October 1503. Immediately after his election he decreed that all future simoniacal papal elections would be invalid and subject to penalty.

Political activities

Julius II viewed as the main task of his pontificate the restoration of the Papal States, which had been reduced to ruin by the Borgias. Large portions of it had been appropriated by Venice after Alexander VI's death. As a first step as pope, Julius subjugated Perugia and Bologna in the autumn of 1508. Then, in March 1509, he joined the League of Cambrai, an anti-Venetian alliance formed in December 1508 between Louis XII, who then ruled Milan, Emperor Maximilian I, and Ferdinand II of Spain, who had been king of Naples since 1503. The league troops defeated Venice in May 1509 near Cremona, and the Papal States were restored.

Having become an exponent of Italian national consciousness, Julius II proposed to drive the French from Italy, but his second war, which lasted from September 1510 to May 1511, was unsuccessful. Several cardinals defected to Louis XII and called a schismatic council, to which Julius responded by summoning the fifth Lateran Council. After concluding an alliance with Venice and Ferdinand II of Spain and Naples in October 1511, he opened the council in May 1512 at the Lateran palace. Louis XII had defeated the troops of the alliance at Ravenna in April 1512, but the situation changed when Swiss troops were sent to the Pope's aid. The territories in northern Italy occupied by the French revolted, the French left the country, and the Papal States were augmented by the acquisition of Parma and Piacenza. Toward the end of his life, he viewed with concern the replacement of French by Spanish efforts to attain supremacy in Italy. Julius II was Italy's saviour.

Patron of the arts

The enduring impact of the life of Julius II stemmed from his gift for inspiring great artistic creations. His name is closely linked with those of great artists such as Bramante, Raphael, and Michelangelo. With his wealth of visionary ideas, he contributed to their creativity. Following an overall plan, he added many fine buildings to Rome and laid the groundwork in the Vatican Museum for the world's greatest collection of antiquities. Among the innumerable Italian churches that benefited from his encouragement of the arts was Santa Maria del Popolo in Rome, for which he commissioned Andrea Sansovino to create sepulchres for a number of cardinals and Pinturicchio to paint the frescoes in the apse. Donato Bramante became the architect of Julius' fortifications in Latium, of the two galleries that form the Belvedere Court, and of other Vatican buildings. Around 1503 the Pope conceived the idea of building a new basilica of St. Peter, the first model of which Bramante created. Its foundation stone was laid on April 18, 1506.

The Pope's friendship with Michelangelo, begun in 1506, was enduring despite recurrent strains imposed on their relations by the two overly similar personalities. Their relationship was so close that the Pope became, in fact, Michelangelo's intellectual collaborator. Of Julius' tomb only the Moses in the church of San Pietro in Vincoli, in Rome, was completed; the Pope is, however, not interred there, but in St. Peter's, along with the remains of Sixtus IV. The famous bronze statue of the Pope for the church of San Petronio in Bologna, completed in 1508, was destroyed in 1511. In 1509 Michelangelo was prevailed upon by Julius to begin his paintings on the ceiling of the Sistine Chapel, which were unveiled in October 1512. The paintings, which represent a climax in Western art, were, in form and conception, a product of the artistic symbiosis of Michelangelo and the Pope.

In 1509 Raphael, introduced to Julius, began his masterpieces for the Pope, the frescoes in three rooms of the Vatican. Spiritual references to the person and the pontificate of Julius II are evident in one of the rooms (the Stanza della Segnatura), where earthly and celestial wisdom are juxtaposed in the "School of Athens" and the "Disputa," while the beauty of creativity is represented in the "Parnassus." The theme of another room (the Stanza d'Eliodoro), which could be called a transcendental "political" biography of the Pope, is still more personal. "The Expulsion of Heliodorus from the Temple" symbolizes the expulsion of the French and the subjugation of all the church's enemies, with Julius II depicted witnessing the scene from his portable throne. Closely related to this is the "Liberation of St. Peter," in which light and darkness serve to symbolize the historic events of the pontificate. The third great fresco in this room, the "Mass of Bolsena," shows the Pope kneeling, rather than enthroned, in commemoration of his veneration of the *corporale* (communion cloth) of Bolsena in the cathedral of Orvieto. In addition to these fresco portraits, there is one by Raphael in the Uffizi gallery in Florence, one of the masterpieces of portraiture, which shows the Pope not as the victorious Moses springing to his feet, as Michelangelo portrayed him, but as a resigned, pensive old man at the end of an adventurous, embattled life. Michelangelo's chalk drawing of the Pope in the Uffizi gallery approaches it in quality.

As cardinal, Julius II fathered three illegitimate daughters, Felice, Clarissa, and Giulia, none of whom achieved any particular distinction. He made four members of the della Rovere family cardinals, only one of whom achieved any importance. From the marriage of the Pope's only brother, Giovanni, to the daughter and heiress of Duke Federigo of Montefeltro descended the dukes of Urbino. Julius II died in Rome on February 21, 1513.

The Pope added wisely to the church's treasures. Although he had little of the priest in him, he was concerned toward the end only with the church's grandeur. He wished for greatness for the papacy rather than for the pope, and he wished for peace in Italy. The Swiss historian Jacob Burckhardt called him the "saviour of the papacy," because Alexander VI had greatly endangered its existence for the sake of his family interests.

Assessment

Julius had an extraordinarily violent temper, often lost his self-control, and could be rude and often even vulgar in manner. Yet, apart from the avarice and corruption inherent in his office and time as much as in himself, he was incapable of baseness and vindictiveness and despised informers and flatterers; no one was able to influence his decisions. Everywhere he saw and sought out greatness. He lacked the smooth manners of the servile. His faults arose from his relentless candour and uncontrollable temper. He was called *terrible,* an epithet suggesting that he was regarded as sublime, even superhuman.

BIBLIOGRAPHY. LUDWIG VON PASTOR, *Geschichte der Päpste*, vol. 2 (1889; Eng. trans., *The History of the Popes,* vol. 6, 1898), is the standard work of papal history; E.P. RODOCANOCHI, *Histoire de Rome: Le Pontificat de Jules II, 1503–1513* (1928), the main French work on Julius; and G.B. PICOTTI, *La politica italiana sotto il pontificato di Giulio II* (1949), a study of Italian politics at the time of Julius. Two recent biographies are C. FUSERO, *Giulio II* (1965); and L. BINDI SENESI, *Giulio II* (1967).

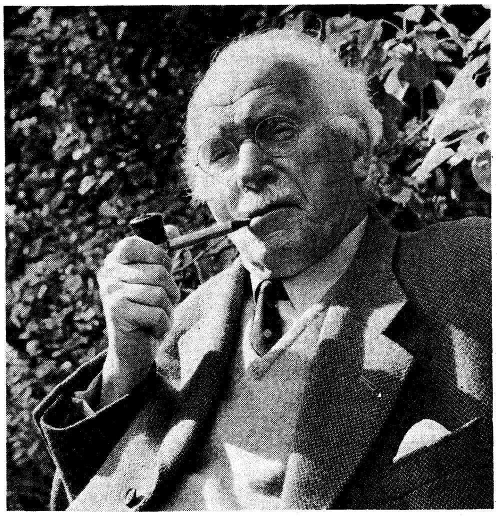
Jung, Carl

Carl Gustav Jung achieved international recognition through his psychological and psychiatric studies and therapeutic work. A contemporary and one-time colleague of Sigmund Freud, he was a highly original thinker and promoted what he termed analytic psychology rather than Freud's psychoanalysis. He advanced the concepts of the extroverted and introverted personality and of archetypes and the collective unconscious. His work has been influential in psychiatry and in the study of religion and related fields. The greater number of his books are long, technical, and intended for analysts and scholars. Later in his life he produced some shorter and more accessible works, including *Modern Man in Search of a Soul* (1933), an appraisal of modern religious dilemmas; *Aufsatze zur Zeitgeschichte* (1946; *Essays on Contemporary Events,* 1947), a study of the problems of World War II; *Antwort auf Hiob* (1952; *Answer to Job,* 1954), an essay attacking conventional views of God; and *Erinnerungen, Träume, Gedanken* (1962; *Memories, Dreams, Reflections,* 1963), an autobiographical essay published posthumously.

Leni Iseley–Nancy Palmer Agency



Jung.

Jung was born July 26, 1875, in Kesswil, Switzerland, the son of a philologist and pastor. His childhood was lonely, though enriched by a vivid imagination; and from an early age he observed the behaviour of his parents and teachers, which he tried to resolve. Especially concerned with his father's failing belief in religion, he tried to communicate to him his own experience of God. Though the elder Jung was in many ways a kind and tolerant man, neither he nor his son succeeded in understanding each other. Jung seemed destined to become a minister, for there were a number of clergymen on both sides of his family. In his teens he discovered philosophy and read widely, and this, together with the disappointments of his boyhood, led him to forsake the strong family tradition and to study medicine and become a psychiatrist. He was a student at the universities of Basel (1895–1900) and Zurich (M.D., 1902).

After beginning work at the University Psychiatric Clinic in Zurich, he was fortunate in joining the staff of the Bergholzli Asylum in Zurich at a time (1902) when it was under the direction of Eugen Bleuler, whose psychological interests had initiated what are now considered classical researches into mental illness. At Bergholzli, Jung began, with outstanding success, to apply association tests initiated by earlier researchers. He studied, especially, patients' peculiar and illogical responses to stimulus words and found that they were caused by emotionally charged clusters of associations withheld from consciousness because of their disagreeable, immoral (to them), and frequent sexual content. He used the now famous term complex to describe such conditions.

Early association with Freud

These researches, which established him as a psychiatrist of international repute, led him to understand Freud's investigations; his findings confirmed many of Freud's ideas, and, for a period of five years (between 1907 and 1912), he was Freud's close collaborator. He held important positions in the psychoanalytic movement and was widely thought of as the most likely successor to the inventor of psychoanalysis. But this was not to be the outcome of their relationship. Partly for temperamental reasons and partly because of differences of viewpoint, the collaboration ended. At this stage Jung differed with Freud largely over the latter's insistence on the sexual bases of neurosis. The formal break came in 1912, with the publication of Jung's *Wandlungen und Symbole der Libido (Psychology of the Unconscious,* 1916), which ran counter to many of Freud's ideas. Though Jung had been elected president of the International Psychoanalytic Society in 1911, he resigned from the society and was the cofounder (with A. Maeder) of a new school in Zurich.

His first achievement was to differentiate two classes of people according to attitude types: extroverted (outward-looking) and introverted (inward-looking). Later he differentiated four functions of the mind—thinking, feeling, sensation, and intuition—one or more of which predominate in any given person. The results of this study were embodied in *Psychologische Typen* (1921; *Psychological Types,* 1923). Jung's wide scholarship was well manifested here, as it also had been in *The Psychology of the Unconscious.*

As a boy Jung had remarkably striking dreams and powerful fantasies that had developed with unusual intensity. After his break with Freud, he deliberately allowed this aspect of himself to function again and gave the irrational side of his nature free expression. At the same time, he studied it scientifically by keeping detailed notes of his strange experiences. He later developed the theory that these experiences came from an area of the mind that he called the collective unconscious, which he held was shared by everyone. This much contested conception was combined with a theory of archetypes that Jung believed were of fundamental importance for the study of the psychology of religion. In Jung's terms, archetypes are instinctive patterns, having a universal character, expressed in behaviour and images.

Character of his psychotherapy

The rest of his life was given over to the development of his ideas, especially those on the relation between psychology and religion. In his view, obscure and often neglected texts of writers in the past shed unexpected light not only on Jung's own dreams and fantasies but also those of his patients; he thought it necessary for the successful prosecution of their art that psychotherapists become familiar with writings of the old masters.

Besides the development of new psychotherapeutic methods that derived from his own experience and the theories developed from them, Jung gave fresh importance to the so-called Hermetic tradition. He conceived that the Christian religion was part of a historic process necessary for the development of consciousness, but he thought that the heretical movements, starting with Gnosticism and ending in alchemy, were manifestations of unconscious archetypal elements not adequately expressed in the varying forms of Christianity. He was particularly impressed with his finding that alchemical-like symbols could be found frequently in modern dreams and fantasies, and he thought that alchemists had constructed a kind of textbook of the collective unconscious. He drove this home in four large volumes of his *Collected Works.*

His historical studies aided him in pioneering the psychotherapy of the middle-aged and elderly, especially those who felt their lives had lost meaning. He helped them to appreciate the place of their lives in the sequence of history. Most of these patients had lost their religious belief; Jung found that if they could discover their own myth as expressed in dream and imagination they would become more complete personalities. He called this process individuation.

In later years he became professor of psychology at the Federal Polytechnical University in Zurich (1933–41) and professor of medical psychology at the University of Basel (1943). His personal experience, his continued psychotherapeutic practice, and his wide knowledge of history placed him in a unique position to comment on current events. As early as 1918 he had begun to think that Germany held a special position in Europe; the Nazi revolution was, therefore, highly significant for him, and he delivered a number of hotly contested views that led to his being wrongly branded as a Nazi sympathizer.

To the end of his life he retained his love of simple things: the Swiss countryside in which he had been brought up, the peasant lore, and life in the open air. He and his wife Emma had built a beautiful home by the lake of Zurich, where she acted as a hostess to their many distinguished visitors; helped him in his work, and made original contributions of her own. Jung lived to the age of 85, dying on June 6, 1961, at Kusnacht, Zürich.

MAJOR WORKS

Jung wrote and published continually during an active life and revised and reissued many papers; his writings occasionally appeared first in English and then in German. The selection below does not take revision and reissue into account and is based upon publication in English, whether in translation or not. Further, certain books represent the gathering together of papers first published separately, and this is indicated, the dates, but not always the titles, of papers in German being cited.

Studies in Word Association, trans. by M.D. Eder (1918; in *Collected Works,* vol. 2; *Diagnostische Assoziationsstudien,* 2 vol., 1906–10); *The Psychology of Dementia Praecox* (1909; *Collected Works,* vol. 3; *Über die Psychologie der Dementia Praecox,* 1907); *The Psychology of the Unconscious,* trans. by Beatrice M. Hinkle (1916; rev. as *Symbols of Transformation* in *Collected Works,* vol. 5; *Wandlungen und Symbole der Libido,* 1911–12); *The Theory of Psychoanalysis* (1915; *Collected Works,* vol. 4; *Versuch einer Darstellung der psychoanalytischen Theorie,* 1913); *Collected Papers on Analytical Psychology,* ed. by Constance Long (1916); *Psychological Types,* trans. by *H.G.* Baynes (1923; *Collected Works,* vol. 6; *Psychologische Typen,* 1921); *Two Essays on Analytical Psychology,* trans. by C.F. and H.G. Baynes (1928), comprising "The Unconscious in the Normal and Pathological Mind" (German 1926) and "The Relation of the Ego to the Unconscious" (German 1928; rev. in *Collected Works,* vol. 7); with Richard Wilhelm, *The Secret of the Golden Flower,* trans. by C.F. Baynes (1931, in part as *Das Geheimnis der goldenen Blüte,* 1929), containing the following by Jung—"Commentary" (in *Collected Works,* vol. 13), "Examples of European Mandalas," and "In Memory of Richard Wilhelm" (German 1930); with Jung and Pauli, "On the Nature of the Psyche," trans. by R.F.C. Hull ("Theoretische Überlegungen zum Wesen des Psychischen" in *Votz den Wurzen des Rewusstseins,* 1954), in *The Structure and Dynamics of the Psyche, Collected Works,* vol. 8); *Psychology and Religion* (1938; somewhat expanded as *Psychologie und Religion,* 1940; in *Collected Works,* vol. 11); *The Integration of the Personality,* trans. by Stanley M. Deil (1939); *Psychology and Alchemy,* trans. by R.F.C. Hull (1949; *Psychologie und Alchemie,* 1944; in *Collected Works,* vol. 12); with Károly Kerényi, *Essays on a Science of Mythology,* trans. by R.F.C. Hull (1949; *Einführung in das Wesen in der Mythologie,* 1941); *Aion: Researches into the Phenomenology of the Self,* trans. by R.F.C. Hull (1959; *Collected Works,* vol. 9; *Aion: Untersuchungen zur Sytnbolgeschichte,* 1951); *Mysterium Conjunctionis,* trans. by R.F.C. Hull (German 1955–56; *Collected Works,* vol. 14); *The Undiscovered Self* (1958; *Collected Works,* vol. 10; *Gegenwart und Zukunft,* 1957); *Flying Saucers: A Modern Myth of Things Seen in the Sky* (1959; *Collected Works,* vol. 10; *Ein moderner Mythus: Von Dingen, die am Himmel gesehen werden,* 1958).

BIBLIOGRAPHY. The authoritative English collection of all Jung's published writings is HERBERT READ, MICHAEL FORDHAM, and GERHARD ADLER (eds.), *The Collected Works of C.G. Jung,* trans. by R.F.C. HULL, 2nd ed. (1966–). Examples of Jung's own collections of essays addressed to the general public are: *Modern Man in Search of a Soul* (1933, reprinted 1961), which covers a wide range of topics from dream analysis and literature to the psychology of religion; *Aufsatze zur Zeitgeschichte* (1946; Eng. trans., *Essays on Contemporary Events,* 1947; contained in *Collected Works,* vol. 10), which gives an account of his theory of the psychology of mass movement; *Antwort auf Hiob* (1952, rev. ed. 1961; Eng. trans., *Answer to Job,* contained in *Collected Works,* vol. 11), the best example of his thinking on religious history; and *Memories, Dreams, Reflections* (1962), fascinating semi-autobiographical reading, partly written by Jung himself and partly recorded by his secretary. FRIEDA FORDHAM, *An Introduction to Jung's Psychology,* 3rd ed. (1966), is the most clear and widely read introduction to Jung's theorizing and analytic practice. A fairly good critical assessment is provided by AVIS M. DRY in *The Psychology of Jung* (1961).

(M.S.M.F./F.Fo.)

Jungles and Rain Forests

The word jungle comes from the Hindi *jaṅgal,* originally from the Sanskrit *jaṅgala,* meaning desert. Later it came to mean scrub or scattered bush, and jungly became a word in India for something poor or savage. In modern usage, jungle has come to mean tropical forest and connotes luxuriant, tangled, impenetrable vegetation in a hot, steamy environment, teeming with wildlife. The rain forest exhibits a wide variety of forms but very seldom approaches its popular image; in fact, it is darkly shaded, with little ground cover, and is fairly easy to travel in. Where light can penetrate to the ground, however, as along tracks and riverbanks, a dense and tangled mass of vegetation appears, and because most people see the forest from a track or from a boat it is easy to believe in the impenetrable jungle. Tangled and dense bush often invades as a secondary growth after a rain forest has been cleared, and the word jungle is sometimes used in a more technical sense for such regrowth.

Rain forests, as the name suggests, occur in regions of high rainfall, commonly over 1,800 millimetres (70 inches) per year. It is overall wetness that forests require, however, and no single figure really expresses the most desirable conditions. This is because the effectiveness of precipitation depends on losses from runoff and evapotranspiration (the amount of water that is lost by direct evaporation and by transpiration through plants) that in turn depends on topography, soil, and temperature. Rain forests, therefore, span a wide range of environments, with widely varying geology, water regime, soils, landscapes, and potential use.

Commonly, most rain-forest areas are places of relatively low human-population density. Thus, such areas are possible sites of agricultural expansion thereby providing food for ever-expanding populations elsewhere or of settlement areas for the release of future population pressures.

This article treats the types and characteristics of rain forests, their topography and hydrology, weathering and soils, geological history, and plants and animals. For further information on processes of weathering and soil formation, see WEATHERING; SOILS. For relevant data on an allied environment, see SWAMPS, MARSHES, AND BOGS. For a discussion of the geological origins of swamps and rain forests, see CARBONIFEROUS PERIOD, LOWER; CARBONIFEROUS PERIOD, UPPER.

VARIETIES AND CHARACTERISTICS OF RAIN FORESTS

Some authorities divide the tropical rain forest into "equatorial" and "tropical" or "tropical" and "subtropical" forest, the former in each case being the more permanently wet. In this article, "equatorial" and "subtropical" are used for these divisions, and "tropical" is a general term for both. The term selva is synonymous with tropical rain forest. The world distribution of jungles and rain forests is shown in Figure 1.

Equatorial rain forests. Equatorial rain forests grow in areas of little varying climate with rain throughout the year, no frost, high average temperatures, and no very marked seasonal variations, though occasional dry periods of a month or two can occur. Average daily temperatures in equatorial-rain-forest regions usually range between a daytime maximum of about 30° C (86" F) and a nighttime minimum of about 20° C (68" F), with a monthly and yearly average of about 27° C (81" F). Wide variations from these temperatures are exceptional, and the average annual range is usually only one or two degrees. The average daily range, normally between five and eight degrees, is greater than the annual range, so it may truly be said that night is the winter of the tropics. Any seasons that can be recognized are dependent on variations in the amount of rainfall rather than in the amount of temperature.

Rainfall in equatorial forests

Annual rainfall generally amounts to between 1,500 and 3,500 millimetres (60 and 140 inches), generally well distributed throughout the year (see Figure 2). There may be a drier period, and some places have two periods of maximum rainfall that roughly coincide with the two periods of vertical noonday sun. Some equatorial rain originates from thermal convection, but most of the annual precipitation comes from organized, migrating atmospheric disturbances. The relative humidity in an equatorial rain forest is high at all times.

There is a large water surplus and thus a large runoff; soils are permanently moist, leaching is intense, and erosion is potentially severe. Chemical reactions affecting soil and vegetation take place rapidly because of the high temperatures and abundant rainfall. Plant growth is continuous, though individual species have their own seasons of leaf shedding. The light intensity on the forest floor is usually less than 1 percent of that just above the forest canopy. The ground is littered with fallen leaves and wood, and there are few low-growing plants except for the seedlings of the trees themselves.

The main areas of equatorial forest are the Amazon lowlands, the Congo lowlands (together with a coastal zone extending from Nigeria to Guinea), parts of Indonesia (especially Sumatra), and several Pacific islands.

Rain forest can sometimes extend into areas where rainfall appears to be inadequate if it is augmented by groundwater—forests often extend along valleys surrounded by other vegetation types—or if generally high humidity effectively reduces water losses, as in parts of southern Nigeria.

Equatorial forest grades into subtropical rain forest on windward coasts, into monsoon forests in parts of Southeast Asia and Australia, and into montane forest with increasing altitude.

Subtropical rain forests. Subtropical rain forest is located on the windward coasts, roughly from 10" N and 10° S to the tropics, but occasionally it extends farther. It differs from the equatorial rain forest by having a season of reduced rainfall or even drought, although the wet season is dominant. With distance from the Equator, there is greater variation in length of day and greater seasonal variation in temperature; as a result, this type of rain forest is slightly more open and lower and has a smaller number of species and fewer lianas.

Such forest is found in Central America and in the Caribbean—especially on the windward side of islands; in the Western Ghāts of India and coastal areas of Burma, where there is a short dry season; and in Vietnam, the Philippines, parts of the Brazilian coast, and Madagascar. In the Everglades of Florida there are small patches of such jungle, known as hammocks, which contain mahogany, strangler fig, and epiphytes (air plants).

Monsoon forests. Monsoon forest, also known as tropical deciduous forest, occurs in regions with a large total rainfall but a marked dry season. Monsoon climates are characterized by seasonal pressure and wind reversal resulting in heavy rainfall during the high-sun period of onshore winds and little or no rain during the low-sun period of offshore winds. Average temperatures are high, often over 25° C (77" F), but the annual range is greater than in areas of equatorial rain forest. This forest is lower than equatorial forest, trees have more spreading branches, and there is more light penetration. Because of the dry season, a high proportion of the trees are deciduous, and there is a general period of leaf shedding. Teak is a common species, lianas and epiphytes are locally abundant, and thickets of bamboo are common. Undergrowth is likely to be denser in monsoon forest than in equatorial rain forest because of the greater openness and light penetration, and there is more "jungle" formed after clearing than in tropical rain forest.

This sort of forest is found in monsoon Asia, Burma (behind the coastal tropical forest already mentioned), Thailand, Cambodia, Indonesia (especially Java and the Celebes), northeast Australia, and in parts of West Africa and South America bordering the tropical rain forest.

Mangrove forests. Mangrove forest grows along many tropical coasts, especially on low-lying muddy shores. Trees are commonly between two and ten metres (seven and 33 feet) high, but some reach 30 metres (100 feet). The tangle of stilt roots, air roots, and general debris unites to trap mud and thus build up the land along a low

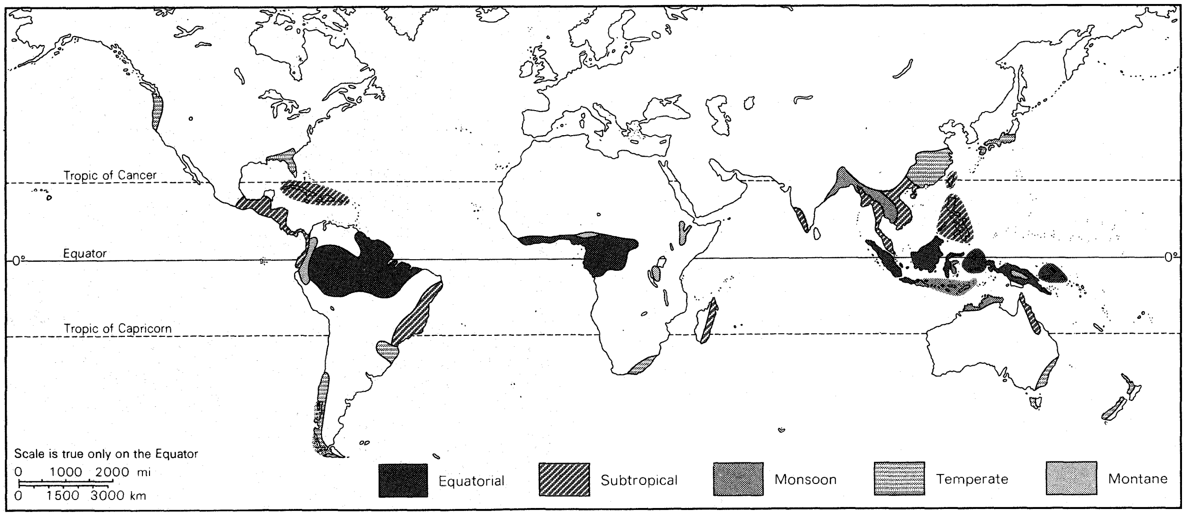


Figure 1: **Types** and locations of the world's major jungles and rain forests.

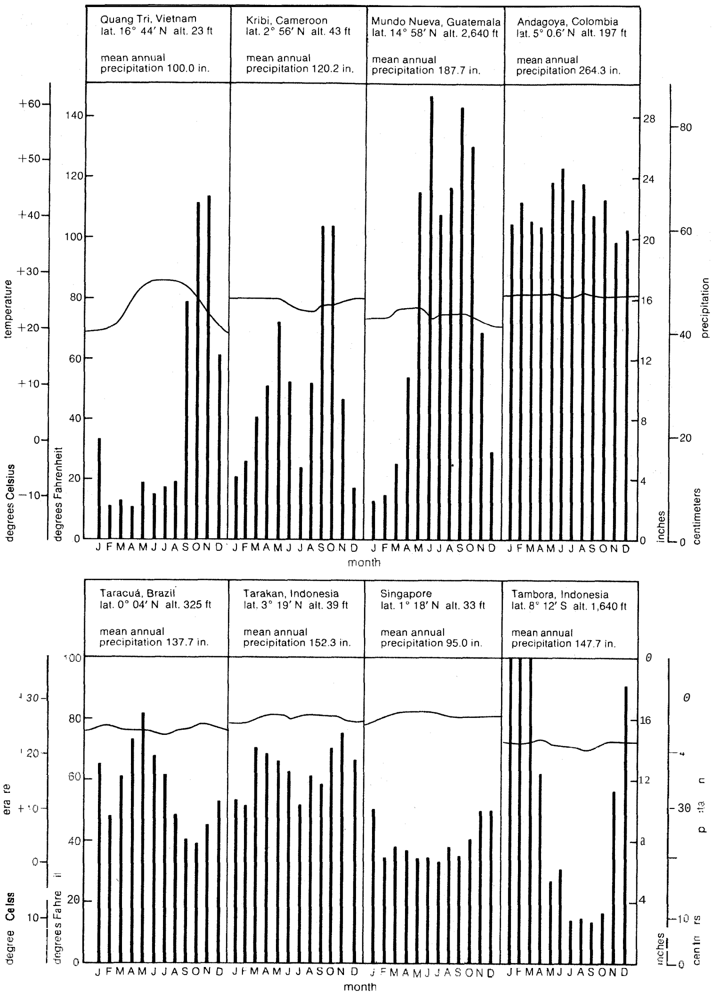

Figure 2: Representative temperatures and rainfall regimes in tropical areas.

coast. Mangrove can tolerate a wide range of salinity and often lines tropical estuaries and deltas, sometimes extending for tens of kilometres inland. Several species may grow in belts parallel to the coast. Mangrove has little use except as fuel, but it may be cleared for the planting of swamp rice.

Temperate rain forests. Temperate rain forest, also known as temperate evergreen forest and laurel forest, has fewer tree species than other types of rain forest, is lower and less dense, and commonly has species with leathery leaves. It is found in regions with an equable climate, abundant and well-distributed rainfall, and small or moderate temperature range. For these reasons it occurs in two main areas; namely, on west coasts between latitudes 35° and 55" and on east coasts between latitudes 25° and 40".

Areas of temperate rain forest

In the first group, the western coasts, are southern Chile, the west coast of New Zealand, Tasmania, and the Pacific coast of the United States. In the second group are the southeastern U.S., southeast China, southeast Brazil and neighbouring areas of Paraguay and Uruguay, the southeast part of South Africa, southeast Australia, and southern Japan.

In these temperate regions, a wider range of soils is present than in the tropics, and climatic controls of the environment are more variable. Evapotranspiration is low and decomposition is slow, so there is relatively deep humus accumulation. Despite its high productivity, temperate rain forest has low recuperative powers and can be permanently destroyed.

Montane forests. Montane forest occurs in the high altitude regions within or bordering the tropical rain forest and includes the Ruwenzori mass of Central Africa, the New Guinea highlands, the Amhara Plateau of Ethiopia, and the Monts Gotel (Gotel Mountains) of Cameroon. With its lower temperatures, this forest has many affinities with the temperate rain forest; but, although altitude brings lower average temperatures, other features, such as length of day, cloudiness, and seasonal variation, are unlike the temperate regions, and the two forest types are therefore dissimilar. Tropical forest gives way to submontane forest at an average altitude of 1,000

Rain forest in New Guinea.

metres (3,300 feet) and to true montane forest, or "mossy forest," at about 1,500 metres (4,900 feet).

TOPOGRAPHY AND HYDROLOGY

Rock type and landscape. Rain forest is found on a wide variety of rock types and in a wide range of topographic situations, but a few major varieties of landscape may be distinguished.

High plateau and gentle uplands are found in large areas of Africa and in the highlands of the Guianas, Brazil, and other parts of South America. Broad, shallow valleys are separated by broad, gently convex or flat interstream areas, on which erosion is very slight. Weathering to a depth of 100 metres (330 feet) is quite common, and detailed investigations usually show that the lower limit of weathering is irregular with respect to depth; rapid lateral changes in the depth of weathering occur. Occasional hills of fresh rock rise quite abruptly from a surrounding plain, to a height of tens or hundreds of metres. Such hills are called inselbergs, and some authorities regard them as typical of the humid tropical environment.

In areas where erosion has followed a period of widespread laterite formation (see below *Lateritic soils),* flat-topped hills capped by lateritic ironstone are common in the landscape. Lateritic ironstone requires seasonal drying out for its formation, however, and so is more frequent in savanna regions and around the edges of the tropical forest than in the pure equatorial forest.

A completely different kind of landscape is present in some rain forest of highland areas and even in areas of quite low hills, where V-shaped valleys with sharply angular interstream areas produce a landscape consisting entirely of slopes that are often steep and straight. This landscape is dominant in the New Guinea highlands, in the island arcs (*q.v.*) and mountain belts of Indonesia and Central America, and around the edges of high plateaus. Similar topography may also be found in mountainous areas of temperate forest, as in New Zealand.

Volcanoes in various stages of dissection by erosion are found in several parts of the humid tropics, including Central America and Indonesia. These often produce fertile soils. Limestone areas in tropical forest often give rise to a distinctive kind of landscape with "haystack hills," which rise abruptly from the surrounding plains. Broad alluvial plains, such as the lowlands of the Amazon, the Congo, and the Fly in New Guinea, make up large areas of rain forest. There is much variation in alluvial landforms, and these lowlands are by no means uniform with regard to sediments, landforms, or soils.

Precipitation, evapotranspiration, and runoff. In rain-forest areas there is an excess of precipitation over evapotranspiration for most, if not all, of the year (Figure 3).

Effects of plant cover

Only a small proportion of the raindrops fall directly to the ground except at canopy openings. Most are intercepted by the leaves in the canopy and either re-form as waterdrops that fall from the drip tips of the leaves or trickle down the tree trunks. Tropical forest trees generally have broad leaves with drip tips to help shed the water, but, even so, the rain forests probably intercept more rain than any other cover. Estimates of precipitation reaching the ground under various types of cover are: dense forest, 70–80 percent; dense, high grass, 80 percent, cereals and other crops, 80–85 percent; and bare soil, 100 percent.

These data ard based on an assumed average of four millimetres held (intercepted) per shower. This means that rains of less than four millimetres (0.2 inch) do not contribute much to the supply of soil moisture or runoff. The amount retained depends on the total rainfall per day; with heavier showers a greater proportion gets through.

The approximate quantity of rainfall retained by vegetation in a typical site in Indonesia was estimated to be:

Average rainfall	2,400 millimetres (95 inches)
Number of rainy days	160
Rainfall per rainy day	15 millimetres (0.6 inch)
Retained by vegetation (160 X 4)	640 millimetres (25 inches)
Amount reaching soil	1,760 millimetres (69 inches)

Similar results were obtained in Brazil, where it was estimated that about two-thirds of the total rainfall reaches the ground, one-third as raindrops and waterdrops and one-third by streaming down tree trunks.

Evaporation rates can be determined from various kinds of apparatus, but results are very difficult to correlate with evaporation from a ground surface. Available data indicate an annual evaporation of 542 millimetres (21 inches) at Djakarta; 1.139 millimetres (45 inches) at Surabaja; 2,300 millimetres (91 inches) from a pond in Madras, India; and 1,930 millimetres (76 inches) from a reservoir in Bombay.

Evaporation from soil is very hard to determine, but, in Indonesia where temperature is fairly uniform throughout the year, it was found empirically that evaporation (in millimetres for periods of a month) could be expressed by the formula $E = 60 + 0.125P$, in which E is evaporation and P is precipitation. This means that with less rainfall there will be less evaporation, and with no rain at all there will still be 60 millimetres (2 inches) of evaporation per month.

Transpiration usually accounts for a major share of the water lost by an area, and different species of plants exhibit a wide range in their rates of transpiration under similar conditions. Some types of vegetation, including many trees, may utilize moisture equivalent to nearly all of the rain falling even during the wettest months, whereas grasses or mixed forest may transpire only a fraction of the available moisture. This may account for a rise in the water table after land clearance. The average annual transpiration of plants in Java (in millimetres) has been estimated to be:

Mature forest— (trees 740) (undergrowth 130)	870 (34 inches)
Bamboo forest	1,500 (60 inches)
Jungle below 1,000 metres	1,200 (45 inches)
Jungle at 1,000 metres	1,200–500 (45–20 inches)
Jungle at 2.500 metres	600–500 (25–20 inches)

From *A.N.* Strahler, *Introduction* to *Physical Geography* (1965); John Wiley & Sons, Inc.

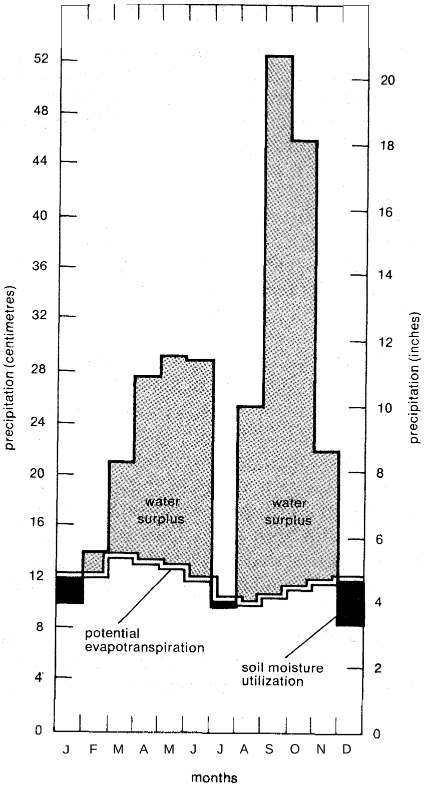

Figure 3: Water budget at Kribi, Cameroon, illustrative of an equatorial climate with two rainfall maxima.

The annual evapotranspiration in the forest zone of the Congo Basin is estimated to be 1,650 ± 100 millimetres (65 ± 4 inches).

Forest soils tend to be permanently moist and spongy, but their structure allows a great deal of infiltration. Nevertheless, tropical storms are so intense that runoff is common during rains, especially on steeper slopes. There are very great differences between the hydrological regimes in areas of different topography, especially between the plateau landscapes and the ridge and valley landscapes.

Sediment transport by streams

In ridge and valley areas large runoff produces high rates of erosion, and rivers carry a large sediment load. In flatter areas, minor streams are frequently blocked by fallen trees and associated plant growth to form swamps and lakes. This reduces the ability of the streams to transport debris and leads to sedimentation in temporary pools. Major streams, however, are open and often fast flowing, their sediment load depending on their catchments (drainage areas).

In the Amazon Basin there are "black water" streams, draining swamp-forest peats that carry black, acid water stained with organic matter but little sediment. This black water contrasts markedly with the muddy water of other streams and has the incidental advantage to explorers of being free from insects. In New Guinea, the Fly River has a comparatively small sediment load, although it is nevertheless murky and opaque; but its tributary, the Strickland, coming from a more mountainous interior, carries much greater quantities of sediment in its turbulent waters. The difference in the two streams is sufficient to give rise to different alluvial landforms and different vegetation patterns along the respective rivers.

Flooding is important in lowland rain forest. It is often of considerable range, such as the eight-metre (26-foot) variation of the Fly River, which is a great obstacle to development or permanent settlement of such areas. Such floods cover the ground and trees over many square miles. Over-bank floods spread out over the land, depositing new sediments, building levees, and adding new layers of silt to the soils of the lowland forest.

Change occurs in the water table after forest clearance. In Nigeria a rise of 60 metres (about 200 feet) has been noted in 50 years. Larger streams continued to flow in the dry season longer than they formerly did, new springs appeared, and one valley was drowned by a new lake.

Climatic changes also alter hydrologic regimes, but not always in easily predictable ways. In main valleys, the reduction in flow due to greater desiccation might be more than offset by increased flow from runoff and from accentuation of groundwater ridges.

WEATHERING AND SOILS

Tropical weathering. In hot, wet areas chemical weathering is most intense, and, in the intertropical zone, weathering of rock produces clay-rich weathering mantles up to 100 metres (330 feet) deep or even more. The distinction between soil and weathering mantle is hard to draw.

The weathered rock that is still in place retains features of the unweathered hard rock and is separated from an overlying loose mantle of more or less transported material by stone lines of varied composition and controversial origin. All of the rain forests have abundant rainfall, so on well-drained sites there is a washing out, or leaching, of dissolved chemicals. In all of the rain forests, bases such as calcium and magnesium tend to be leached out, but in the tropics there is also removal of silica, which leads to the formation of different soils under tropical and temperate rain forest.

On well-drained sites in the tropics the leaching of bases and silica leads to an accumulation of aluminum and iron oxides and hydroxides and the formation of the clay mineral kaolinite, which is relatively poor in silica (see further CLAY MINERALS). Many upland soils in the tropics consist of little more than kaolinite and iron hydroxides, which give the soil a red or yellow colour. There are two main divisions among the tropical red soils: tropical red loams and lateritic soils.

Tropical red loams

Tropical red loams (known also by other names, such as krasnozem and tropical red earth) are deep, friable, and easily tilled soils. They are very porous and freely drained at all depths, and there is little change in colour or texture of the soil material in the vertical soil profile. Clay is common, but it is so combined with the iron oxides that it behaves more like a loam and retains a porous, freely drained structure even when wet. It does not break into larger blocks, such as commonly happens in clay-rich soils of temperate regions. Soil profiles of this kind are not affected by water tables within the soil profile. In the tropical rain forest these soils are much more common than the lateritic soils.

Lateritic soils. In contrast to the uniformity of the tropical red-earth profiles, lateritic soils have profiles with well-marked horizons (layers). The uppermost horizon is quite variable but is commonly a red loam, lighter in texture than the underlying horizons and sometimes containing ironstone gravel. Beneath this is a layer rich in iron. So long as it is kept moist under a forest cover this material will remain soft, but if it is dried out it will irreversibly harden and may even be used for brickmaking. It was to such material that the term laterite was first applied, but the word has been used very loosely since then. There was in the early 1970s a tendency among soil scientists to return to this early usage, and the whole sequence of associated horizons may be referred to as a laterite. or lateritic, profile. In some profiles the laterite horizon is hard, even within the intact soil profile. Beneath this layer there may be a mottled zone and beneath that a bleached-white, kaolin-rich zone, known as the pallid zone. These zones may be many metres thick.

The formation and potential hardening of the iron-rich zone of lateritic soils are their most distinctive and important features. Hardening can come about in several ways: forest clearing by man, drying out of the soil due to climatic change, and drying of the soil due to valley downcutting and drainage change.

The iron-enriched layer occurs closer to the ground surface with increasing distance from the Equator, and north of 14" north only fossil crusts are found. In the Ivory Coast, for instance, there is a latitudinal sequence: in the south, under rain forest with over 1.5 metres (five feet) of rain, are soils that do not form crusts so long as the forest cover is intact; whereas to the north, under subtropical forest and with rainfall less than 1.5 metres, the soils are less deep, and ironstone crusts exist on dry sites.

With increasing distance from the Equator and longer dry seasons, less silica is removed, and the soils of the humid tropics give way to the ferruginous (iron-rich) soils of the savanna areas. In extremely wet and hot areas, on the other hand, even more silica is leached away, leading to the formation of aluminum-rich bauxite rather than laterite. In the humid tropics the influence of parent rock is less than in temperate areas, and lateritic soils can form on practically any parent rock.

Nevertheless, there is considerable variation. In South America, dark lateritic soils occur in humid areas or on rocks rich in calcium and magnesium, red lateritic soils on acid rocks (rich in soda and potash), and brown lateritic soils on volcanic ash or basalt. Volcanic soils are generally more fertile than others, and in regions of active volcanoes, such as parts of Indonesia, occasional eruptions produce layers of ash that act like a rich topsoil in restoring fertility. Terra rossa soils (clay-rich, red, granular soils) are common on limestone, including that of coral islands, which often have rain-forest cover.

On base-poor rocks, such as sandstones, podzols (leached soils with distinct sandy topsoils) may form. Tropical podzols are widespread in the catchment areas of the Rio Negro in Amazon, in Guyana, Malaya, Borneo, and Thailand. These are not under normal forest but under "heath forest," the padang of Southeast Asia.

On tropical mountains there is a general tendency for tropical red loam or lateritic soils to be produced on lower slopes and podzols to be formed higher up, but there are many complications due to parent material, erosion, aspect, drainage, and other factors.

Thus far, discussion has centred on the soils of leached sites, the well-drained areas on higher ground. A well-marked division is found in many tropical areas, however, with red, leached soils on the uplands and black clays, gray soils, and fresh alluvium in the lowlands. Furthermore, swamp forest with very acid soil consisting largely of peat is found in Java, Sumatra, Borneo, Celebes, Malaya, and Guyana, although it is apparently absent in Africa. This peat occurs in large areas, is often over six metres (20 feet) thick, and is composed almost entirely of the remains of trees and other woody plants of the swamp forest.

The common idea that all of the tropical soils are laterites is a gross oversimplification, and detailed investigations in New Guinea and elsewhere reveal a wide range of soil types.

Agricultural possibilities in the rain forest

Despite the luxuriant plant growth, tropical forest soils are not particularly fertile. Under intense weathering, leaf litter quickly decomposes and thus provides the nutrients essential for the trees, which absorb some of the released ions before they are leached from the soil profile. Most plant nutrients are thus recycled by the trees, and there is very little reserve of nutrients in the soil. The humus layer is normally only a few centimetres thick, and decomposition of vegetation is rapid.

Removal of tropical rain forest to allow cropping swiftly eliminates leaf litter, and the water-retaining, spongy soil structure is destroyed. The mineral cycle is broken and the soil productivity declines; laterite dries out because of increased evaporation and so accelerates the development of undesirable physical features. Clearing of lateritic soils also accelerates erosion of the meagre upper horizon, exposing the ironstone layer at the surface and facilitating the hardening process. Ironstone crusts have been known to form in as little as 30 years in West Africa from such causes.

Cleared forest is therefore of use for only a short time before it is exhausted, so primitive inhabitants of tropical forest practice shifting cultivation. If only small patches of forest are cleared, regeneration is possible, but on any large scale the changes of soil become progressively worse and irreversible, and the forest gives way to other vegetation types. In some areas there is tangled secondary regrowth, or jungle, while in others, especially in areas of climatic stress, savanna expands at the expense of forest; in New Guinea, for example, large areas of kunai grass appear to be of anthropogenic origin, replacing original forest.

Erosion in rain forests. Authorities are divided on the type and rate of erosion that occur under tropical forests. This state of affairs results partly because generalizations have been drawn from studies in restricted areas and partly because a paucity of factual data has led to a too-theoretical consideration of tropical erosional processes.

Theory of dominance of chemical weathering

One school of thought, derived largely from studies in South America and Africa, may be summarized as follows: in temperate forest it has been observed that erosion under forest is much slower than under grassland. Forest canopies intercept a considerable proportion of the rainfall, breaking the force of raindrop impact and increasing immediate loss by evaporation, and raindrops that reach the ground strike an absorbent layer of leaf litter. Some water reaches the ground quietly by trickling down the stems of trees.

Similarly, the dense, luxuriant vegetation of tropical forest should be adequate to protect the ground from mechanical erosion, enabling the buildup of thick mantles of weathering products. The thorough weathering of fine-textured rocks would leave few tools (large, hard particles) for stream erosion and would tend to produce mass movement such as landslides and soil creep. The essence of this argument is that humid tropical landscapes are dependent on the predominance of chemical weathering and mass action over fluvial erosion.

Peculiarities of river behaviour in tropical rain forests, in this view, result from the dominance of chemical weathering over mechanical weathering. Decay of the rocks involves removal of material in solution and leaves a residue consisting of fine particles, with no rock fragments and mineral particles to make river gravel and coarse sand. Running water is thus deprived of the tools of erosion. Streams fail to erode laterally or even vertically, and both small streams and large rivers flow alike in sluggish, swampy reaches separated by falls and rapids.

Quite different data and ideas have been produced by investigators in areas of steep ridges and valleys in New Guinea, Malaya, and elsewhere. This school of thought may be summarized as follows: In primary tropical forest, canopy openings due to tree fall are common, the shrub layer is sparse, and leaf litter is thin (averaging only one to three centimetres) because of the rapid decay rate. Despite the high porosity of the soils, runoff occurs because the rainfall intensity is greater than the rate of infiltration can cope with. These factors, it is held, lead to much greater runoff under tropical than under temperate forest cover.

Importance of waterdrop erosion

Much evidence exists to support this view. The effect of raindrop and waterdrop erosion is revealed by many small earth pillars (columns) on bare soil patches. In tropical rain forest many waterdrops will have a free fall of more than eight metres (26 feet) and will be close to terminal velocity when they strike the ground; these drops will be just as effective as raindrops with unimpeded fall. Waterdrop erosion is thus more important in tropical than in temperate rain forest because of the higher upper story, the greater rainfall, and the less abundant leaf litter.

Runoff floats away leaf litter, which helps the rapid decay to keep the forest floor free of debris. Although leaf litter may attain a depth of 250 millimetres (ten inches) on ridge crests, on hillslopes it is usually less than three millimetres, and often the ground has only a scattering of recently fallen leaves. A muddy suspension is carried from areas affected by erosion, and transported material is deposited at root barriers to form steps. Scoured surfaces and accumulations of lag gravel (deposits of particles too large to be moved under existing hydrological conditions) indicate that unconcentrated sheetwash is able to transport detached soil particles. Rainwater streaming down tree trunks has sufficient energy to effect erosion at the tree base, and lateral surface roots are often undermined on the downslope side. On very steep slopes, trees usually fall down before reaching maturity.

Rain-forest soils are always nearly saturated, and there is an immediate response to heavy rainfalls in streamflow. Streams rise rapidly and, armed with a coarse bed load, cut deep into bedrock. Despite the rapidity of weathering, streams carry unweathered gravels together with the detritus from landslides. In New Guinea and Malaya much gravel and rock in stream beds provide abundant erosive tools, and, in fact, only in stream beds are rock outcrops frequently found.

Sheetwash is the main form of erosion on slopes. Mass movements such as landslides and avalanches are restricted to steeper slopes; even there landslides may be rare as the soil is too thin. But in some areas, like parts of Hawaii, landslides may dominate the erosive processes and produce landforms with sharp ridges and gullies.

In the rugged country of the New Guinea rain forests, the straight slopes are mantled with shallow, loamy soils that contain a high proportion of unstable minerals from the parent rock, and there are no changes in depth of weathering up- or downslope or accumulation of soil or litter at the base of the slope. Weathering is therefore balanced by erosion, and the material eroded is transported from the area by rivers as fast as it is supplied. Such rivers carry abundant sediment and are well equipped by rocks to erode, and many valleys have a rock-cut niche at the base of the V-shaped valley.

GEOLOGICAL HISTORY OF RAIN FORESTS

Rain forests have occasionally been much more widespread in the world than they are at present. By the end of the Carboniferous Period (280,000,000 years ago), forests of tree ferns, giant horsetails, and club mosses covered vast areas, and their remains formed coal seams. Conifers made their appearance before the end of Carboniferous times, probably in tropical climatic conditions, and became dominant throughout Triassic and Jurassic times (225,000,000 to 136,000,000 years ago). During Cretaceous times (136,000,000 to 65,000,000 years ago) the angiosperms gained ground, and by Eocene times (54,000,000 to 38,000,000 years ago) trees similar to modern types were dominant in many areas.

Through the Tertiary Period (from 65,000,000 to 2,500,000 years ago) climates were generally warmer than now and forests more widespread. In early mid-Tertiary times midlatitude vegetation of North America, Europe, and Asia was like that of the humid subtropics, rather like the forest of northern New Zealand today. Indeed, the New Zealand forest may be a true descendant of the ancient and once almost universal midlatitude forests. In middle Pliocene time (about 5,000,000 years ago) deciduous trees from high latitudes invaded the middle latitudes, and conifers also spread; and in Pleistocene times (from 2,500,000 to 10,000 years ago) there was a complete transformation, culminating in the advance of the ice sheets.

In the last 1,000,000 years or so, the world's climate has been dominated by a number of ice ages. When ice caps grew at the poles, there was a general shift of climatic and vegetation belts. In the view of some authorities, however much the boundaries may vary in relation to the Equator, the actual equatorial belt tends to remain in place. In this view, the day length, insolation (incident solar radiation), and tropical convectional storm patterns remained constant, and the only variables were the total rainfall and the average temperature. It is possible that the temperature varied slightly through time but to a lesser degree than in other latitudinal zones. Some authorities have postulated pluvial (moist) periods, corresponding to glacial periods of the poles, in which rainfall was higher than at present; but in equatorial forest regions even large changes in total rainfall would make little difference because these areas already have abundant water. The forest belt may in the past have extended toward the desert by about two degrees of latitude.

Pleistocene aridity in present rain-forest areas

Other authorities have postulated drier periods, even arid periods, corresponding with the glacial periods outside the equatorial zone. Low effective-solar-radiation levels of the glacial periods should have resulted in greatly reduced evaporation from the tropical oceans, which in turn would lead to greatly reduced equatorial rainfall. Some studies in Africa, South America, and Australia, supported by radioactive-carbon dating, suggest that glacial maxima were, in fact, matched by widespread development of deserts in the tropics. During the cold–dry maxima the great rivers of central Africa almost dried up, and the now vegetated "fossil" dunes can be traced from the Sahara and from the Kalahari into the Congo. It is said that there is scarcely a jungle tree in the Congo Basin that does not have its roots in desert sand.

If there were simultaneous glaciation in both hemispheres, rain-forest belts would merely widen or narrow at the expense of adjacent deserts, but some authorities believe glaciation was asymmetrical, and the forest belt may actually have intermittently shifted north and south.

At the present time there is no doubt that the rain forests are shrinking, but this is due to the continued expansion of man's clearing and not to natural causes. In earlier times the tropical rain forests were occupied only by small numbers of primitive hunters and collectors who did not attempt to alter the forest environment. The slightly more advanced shifting cultivators clear patches of forests but do not maintain soil fertility, a wasteful and dangerous method of land use often leading to irreparable damage to the soil. More advanced communities destroy the forest at even greater rates. All too often, forests are regarded as mere "undeveloped areas" awaiting either utilization of the wood or clearance for occupation. It seems incredible that these vast, apparently interminable rain forests are in danger of significant destruction, but they must be considered a diminishing resource.

(C.D.O.)

LIFE IN THE RAIN FOREST

The tropical rain forest is the most complex ecological system (ecosystem) on earth, and its plant and animal life is richer and more diverse than that of any other type of forest. A five-acre (two-hectare) sample often has more than 100 different species of trees 30 centimetres (12 inches) or more in diameter (in the Malay Peninsula more than 200 species have been recorded), compared with about 25 tree species in the richest temperate broad-leaved forests (North America). Similar data for animals are difficult to obtain, but comparisons have been made of the number of bird species: more than 600 in a 300-mile-square area of rain forest in Panama, as against about 100 in a similar area of temperate forest of the eastern United States. The number of bird species, however, is small compared with the number of insects.

The environmental setting. *Climate.* One obvious reason for the enormous variety of plant and animal life in the rain forest is the climate, which is hot and moist throughout the year. The soil never dries out, and the humidity of the air is always high. This constantly warm and moist environment allows plants and animals to grow and reproduce all year long, though they may not in fact do so. In the rain forest the struggle for survival is, thus, less against a hostile physical environment, as in climates with a cold winter or summer drought, than against the competition of other organisms. This has led, among both plants and animals, to the evolution of a great variety of species filling many different niches, or ecological roles, some of which are highly specialized.

The constancy of physical conditions

Another and less obvious reason for the great diversity of species in the rain forest is probably its age. In the tropics the climate has changed little since the Cretaceous period, and therefore evolution has proceeded uninterrupted for some 60,000,000 years.

Forest structure and microclimates. The trees and other plants that grow together in a primary, or undisturbed, tropical rain forest may seem a chaotic mass of vegetation, but the forest, in fact, has an irregular pattern of structure not easily discernible at ground level. Tree crowns are arranged in several stories, or strata (Figure 4), called A, B, C, D, and E from above downward. These layers are generally poorly defined, so that only an arbitrary boundary can be drawn between one stratum and the next. Most of the trees in the lower strata are immature individuals of species that may later reach a higher stratum. The A stratum, of trees 30 to 50 metres (100 to 165 feet) high, is never continuous; their crowns rarely touch and may be widely separated. For this reason, the roof of the forest, as seen from the air, has a very uneven surface, the crowns of the largest trees standing out like gigantic, dark-green cauliflowers. The B-stratum trees, whose crowns are smaller and more closely spaced, likewise do not generally form a continuous layer. The trees of the A and B strata are often called the emergents; together they form the forest canopy.

From *Ecology*, vol. 19 (1933); reproduced by permission of the Duke University Press

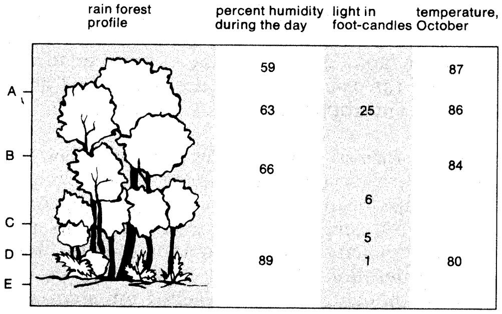

Figure 4: Stratification of a tropical rain forest (see text).

The C and D strata comprise the densest layers of the forest, where little space is unoccupied by trunks, branches, twigs, or foliage. In contrast, the lowest, or E, stratum is often thinly stocked, and much of the ground surface itself is bare except for a thin covering of dead leaves and litter. Contrary to popular belief, the undergrowth of the rain forest is seldom impenetrable: it is usually possible to walk about and to see another person at least a distance of 50 metres (about 165 feet). Only where sunlight

The scant undergrowth of jungle

reaches the ground in sufficient intensity, in clearings and on the edges of roads and rivers, does the undergrowth become the dense jungle commonly described. Similarly, the undergrowth of young secondary forests, which spring up in clearings left by timber operations or by agriculture. is much denser and more tangled than that of undisturbed primary forest.

The leaves and branches act as a filter to light and heat radiation and as a barrier to air movements, resulting in wide differences in temperature and humidity of the air in the lower stories, compared with the relatively open canopy. In the undergrowth there is very little air movement, and, apart from occasional flecks of sunlight, most of the light has passed through or been reflected from leaf surfaces. Within the forest, conditions are quite different from those in a clearing or in the open, and there is a range of "local climates" (micsoclimates).

At midday in sunny weather the temperature in the A and B strata might be 32° C (90" F), while in the undergrowth it could be 26° C (79" F). During cloudy or rainy weather the difference would be smaller, but the upper strata are always warmer than the undergrowth during the day. At night the position is reversed, and, especially on clear nights, the air around the treetops is cooler than that near the ground. Although at night the air in all strata is nearly saturated with moisture, during the day there are considerable differences in humidity between the upper strata, where relative humidity often falls to 60 percent in the afternoon of a sunny day, and the undergrowth, where the humidity rarely drops below 80 to 90 percent. The undergrowth of the tropical rain forest is in fact one of the most constant biological environments on earth, and it is not surprising that, as in caves, another unusually constant environment, some strange forms of animal life are found—some of which, such as the Ricinulei (a small group of arachnids) and the wormlike *Peripatus*, can be regarded as "living fossils."

The three tropical sectors compared

The biological component. The rain forests of tropical America, Africa, and Southeast Asia to Oceania (northern Australia and the western Pacific islands) are similar in many features, but each has a distinctive plant and animal life, with almost no species common to all three and not many common to any two of the tropical land sectors. Whole groups of organisms are confined to a single sector. For example, the Dipterocarpaceae, the most important family of trees in Indo-Malayan rain forests, is absent in the Americas and in Africa is represented by only a few small trees of the savannas. The pineapple family (Bromeliaceae), so common as air plants (epiphytes) in the American tropics, have only one species in the Old World tropics. Much the same is true of the animals: tropical America alone has monkeys with prehensile tails, sloths, toucans, and leaf-cutting ants, but it has no apes, hornbills, or very large mammals, such as elephants and rhinoceroses, all of which are confined to tropical Africa and Asia. Often a group in one sector replaces one of another; thus, the flower-visiting sunbirds of the Old World occupy a niche similar to that of the hummingbirds of tropical America.

Plants. The tropical rain forest is overwhelmingly dominated by trees and woody-stemmed vines (lianes, or lianas). Woody plants are the chief producers of the food on which all the animals depend and of the shelter in which they live. Most of the nonwoody plants are epiphytes living on the trunks and branches of the trees, but a few, including grasses, grow on the ground.

Rain-forest trees range from giants 60 metres (almost 200 feet) high down to treelets of not more than one metre (just over three feet). The great majority belong to the large group of flowering plants known as dicotyledons, but palms and other monocotyledons occur in the lower stories and in open areas. Conifers are found only in certain parts of the rain forests of Borneo, New Guinea, and neighbouring areas. Although belonging to a very large number of different families, rain-forest trees are remarkably uniform in appearance, the majority having thick, leathery leaves, like those of temperate laurels in size and shape. Most are evergreen, but some are deciduous, remaining leafless for a few days or weeks. Because the behaviour of the different plants is not closely synchronized, the forest as a whole always appears in full leaf. The young leaves of the trees are often bright red and hang limply, as if wilted.

Shallowness of root systems

Flangelike buttresses, extending up the trunk for three to four metres (ten to 13 feet) and outward for about the same distance, are characteristic of many of the larger trees, and stiltlike aerial roots are not uncommon among the smaller trees. Root systems in general are shallow—even those of the largest trees seldom penetrate deeper than a metre—and most of the fine nutritive roots are concentrated in the humus-rich layer within a few centimetres of the soil surface.

Large, brilliantly coloured flowers are not common in the rain forest; those of many trees are inconspicuous and white or greenish. The production of flowers on the main trunk, rather than on the twigs or branches, is characteristic of many small- to medium-sized trees; this feature may be related to pollination by bats or other animals that cannot easily reach flowers hidden within a mass of twigs and leaves.

Lianas are plentiful, especially where clearings are formed by the death of old trees. These woody vines reach the tops of all but the tallest trees, linking them together and competing with them for space and light. In the eastern tropics, climbing palms (rattans) are common and grow to a length of 100 metres (30 feet) or more. Strangling plants, which include many members of the fig genus (Ficus) and, in the American tropics, species of *Clusia*, also compete with the trees. These plants start life as epiphytes on tree branches to which their seeds are carried by birds; later they send aerial roots to the ground and enclose the host trunk in a network of stout, woody roots that may kill it, leaving the strangler as an independent tree.

Epiphytes are commonest on branches 30 metres (about 100 feet) or more above ground in positions fully exposed to the sun. Common rain-forest epiphytes include orchids, bromeliads, and specialized ferns as well as lichens, mosses, and liverworts that grow on the surface of leaves in the humid, shaded undergrowth. Most epiphytes do not harm the host tree but simply depend on it for physical support. They obtain mineral nutrients from rainwater and from the organic debris that collects among their roots, often brought there by ants. Many epiphytes have special adaptations, such as bracket- or pitcher-shaped leaves that collect water and humus. The most remarkable of such adaptations are the "tanks" of bromeliads, formed by closely overlapping leaf bases. These may hold several litres, or quarts, of water and provide a home for many kinds of aquatic organisms, including mosquito and other insect larvae, tadpoles, and even crabs.

Many rain-forest plants are not green and so cannot make their own food; they live either on decaying matter as saprophytes or on other living plants as parasites. Although most of these nongreen plants are fungi, a few are specialized flowering plants. One of the most spectacular of all rain-forest plants is the Malaysian monster flower (*Rafflesia*), which is a parasite of certain woody vines; its flowers may be a metre (over three feet) in diameter.

Animals. The variety of animals even in a small area of tropical rain forest is so vast that a large proportion of species of all of the groups, except the vertebrates, are still unnamed and unclassified, a formidable obstacle to research in rain-forest ecology. All groups of vertebrates except fishes are represented and almost all groups of terrestrial invertebrates. Even groups that are normally aquatic, such as planarians (flatworms) and polychaete worms, are able to live in the continually moist undergrowth of the rain forest. Land leeches that attach themselves to passing animals (including man) ale one of the most troublesome pests of the rain forests of the Philippines and other parts of the eastern tropics.

Wide representation of animal groups

Rain-forest mammals range from such large creatures as the elephant (of Africa and Asia) and forest rhinoceros (of Malaysia) down to tiny mice and shrews. In tropical America the range of size is less, because there are no mammals larger than jaguars and tapirs. A tendency to gigantism is shown among rain-forest invertebrates, which include the giant snail of Africa, "bird-eating" spiders, and the goliath beetle. The splendid ***Ornithoptera*** butterflies of Malaysian forests, the blue ***Morpho*** butterflies of tropical American forests, and the huge Atlas moth of Asian forests are among the largest Lepidoptera.

Although the animals of the tropical rain forest are abundant and many striking and colourful in appearance, often few can be seen except for some butterflies and bees, an occasional hummingbird, ground squirrel, or armadillo, and the omnipresent ants. One reason for this is that a large proportion of the animals, including most of the birds, live in the trees and rarely come down to ground level. Others are extremely well camouflaged; *e.g.*, the leaf butterflies, which are virtually invisible when they rest on dead leaves; green tree snakes, which hide among the foliage; and the numerous shy, brownish birds and mammals, which are well concealed until they move.

Another reason for the apparent scarcity of animal life is that many of the rain-forest animals are nocturnal, including such mammals as lemurs and tarsiers, such birds as nightjars and owls, most toads and frogs, and most moths, as well as a host of other insects of many different families. All of these animals become active only after dark, when the temperature is lower and the dangers from water loss and predators less than in the day. Many nocturnal animals are highly adapted to their way of life; the large saucer eyes of tarsiers, bushbabies, and owls and the luminous organs of fireflies and lightning bugs are a few examples of the ways in which nocturnal animals are adapted to their way of life.

Often more evident than the animals themselves are their habitations. Birds' nests are seldom easy to find, but the beautifully constructed nests of wasps, bees, ants, and termites are everywhere to be seen. Termites, which are among the most abundant of all of the forms of life in the rain forest, play a vital part in removing deadwood and plant debris. During the day they remain within their nests (termitaria), and in covered passages of cemented wood and soil particles. Termitaria are found both on trees and rising from the ground as fantastic, spired or conical structures sometimes a metre or more in height. Both types of nests often have highly developed rain-shedding devices: in the tree nests, chevron-like arrangements of ridges direct the water away, and in some free-standing termitaria superposed "hats," somewhat like the roof of an African grass hut, drain water away.

Animal stratification

The animals of the tropical rain forest, like the plants, are stratified, but, because of the difficulty of exploring the forest above ground level, zoologists usually divide the forest merely into canopy and undergrowth, or into top, middle, and lower layers, rather than into the five strata mentioned earlier.

In the canopy not only is there more open space but, because of the higher light intensity and greater photosynthetic activity of the foliage, more young leaves, fruits, and flowers are available as food. In the undergrowth there is less variety of plant food, though leaves and wood that continually fall from above provide a plentiful source of food for some animals and plants.

For the larger animals the canopy provides opportunities for flying, gliding, and leaping, as well as for climbing and running along branches; both sight and hearing are important senses in seeking food and escaping predators. The life of an undergrowth animal is quite different. Running, fluttering, hopping, and climbing are the chief modes of locomotion, and, because the animals tend to be camouflaged, communication between them is more by sound than by sight. Many undergrowth birds—for example, the cotingas and bellbirds—have dull, concealing colours but surprisingly loud, clear calls.

The American naturalist William Beebe was one of the first to study the stratification of animals in a tropical forest. In Guyana he recognized five height "zones," each mainly inhabited by different mammals and birds. More recent studies in Malaya, where the forest animals are similarly stratified, have shown that the animals of each level tend to differ in both their mode of locomotion and their feeding habits. For example, the mammals living on the ground include large species, such as the elephant and rhinoceros, with no climbing ability, and smaller species that climb only to a limited extent. This group includes herbivores, which browse on leaves and eat fallen fruits (elephant, deer), mixed feeders (Malayan bear), and carnivores (tiger, leopard). The inhabitants of the middle levels and canopy have little contact with the ground; they climb, leap, or swing from branch to branch (gibbons, monkeys) or glide for long distances (flying squirrels, flying lemur). Mostly they are fruit and insect eaters, though some are carnivorous (clouded leopard, marten). The birds of different strata show similar differences in their movements and feeding habits.

The animals of the rain forest show many striking structural adaptations to their mode of life, those of the treetops, in particular, having evolved special characteristics not found in those living nearer the ground; ***e.g.***, the winglike skin flaps of the flying squirrels and lemurs, the prehensile tails of the New World monkeys, the peculiar limbs of sloths (which allow them to hang from branches upside down), the stiff tails of woodpeckers (used as an aid to climbing), and the beaks of parrots (well-adapted to cracking nuts and to assist in climbing).

Adaptations to the requirements of climbing in different strata are particularly well shown among rain-forest primates. The only forest primates that live mainly on the ground are the chimpanzees and gorillas of Africa; they have limbs adapted to walking and climbing but not to venturing high in the trees. The tarsiers, galagos, and lemurs, found mostly in the small trees of the B and ***C*** strata, have short legs and arms; they climb well, run, and make short jumps. The primates of the treetops include the orangutan and the athletic gibbons of Malaysia and monkeys of many kinds. The orangutan and the gibbons have very long arms with which they swing from branch to branch, while the monkeys are better adapted to running along branches and leaping from tree to tree. In feeding habits the different groups of primates are also well adapted to the strata in which they mainly live.

Specialized tree-bound animals

Among the animals that rarely come down to earth are certain frogs and toads, which must obtain water for their tadpole stage. Some lay their eggs in water held in holes in trees or by epiphytic bromeliads; in others the tadpole stage is abbreviated, and the developing eggs are carried attached to a moist membrane on the mother's back. One Central American species lays its eggs in packets fixed to branches of trees overhanging streams, so that the tadpoles fall into the water when they hatch.

Rotholes and bromeliad "tanks" also provide treetop habitats for mosquitoes and other insects with aquatic larvae. Mosquitoes that breed in the treetops are of much practical importance because some are carriers of malaria, yellow fever, and other diseases of man and animals. Malaria-carrying ***Anopheles*** mosquitoes breeding in forested regions of tropical America sometimes come down to ground level and become a source of infection for people living in the area. Similarly, ***Aedes*** mosquitoes, which carry yellow fever, normally bite monkeys living in the treetops in the forests of Africa and the Amazon, but when trees are felled these mosquitoes may bite lumbermen and initiate epidemics among susceptible human populations.

There are many rain-forest inhabitants normally found below the soil surface to a depth of a metre or more (three or four feet). This underground community includes burrowing vertebrates, such as armadillos, which also spend much time above ground, and others, such as caecilians (wormlike amphibians), worm snakes, and many more, which are wholly subterranean. Much more important than these, however, is the host of small soil invertebrates (worms, mites, insects, etc.) that, together with fungi and micro-organisms, play a large part in decomposing dead vegetation and freeing the elements contained therein for recirculation in the forest ecosystem.

The year-round warm and moist conditions in the rain forest are of great significance for animals as well as for plants. In general, rain-forest animals are unrestricted in their activities by seasonal changes of climate. The environment demands no prolonged rest periods—neither hibernation nor estivation—and resting stages of insects are either absent or very short, with little relation to the time of year.

A very important aspect of the environment for animals is that food is always available. Foods such as leaves, flowers, and fruit may vary in abundance but are never quite unobtainable as in a temperate-zone winter. Many forest birds depend exclusively on fruits, and bats as well as hummingbirds and sunbirds have evolved flower-visiting habits.

Some animals actually reproduce at all times of year. Some African forest birds, such as fruit pigeons and flycatchers, breed at all of the seasons, and some tropical butterflies, such as the swallowtails, have a succession of broods throughout the year rather than the one or two as in temperate Europe and America. Although breeding is always possible, the majority of animals have fairly definite breeding periods; these periods, however, are not synchronized for different species, so there is no time at which some birds, mammals, and insects are not reproducing. The breeding season of many rain-forest birds and mammals seems to be related to variations in abundance of their chief foods.

Reproduction tends to take place more frequently or over a larger part of the year than in temperate animals, and there is a tendency for fewer young to be born in each brood. This is especially true of tropical birds, which lay fewer eggs at a time than do temperate birds.

Complex association forming a stable ecosystem

Relationships between organisms. The very large and diverse populations of organisms in a tropical rain forest interact with each other and with their environment to form an extremely complex but very stable ecosystem. As in any other natural community, the basic relationships between the constituent organisms are the food and energy links. Radiation from the sun provides energy for the photosynthesis of trees and other chlorophyll-containing plants. These are eaten by herbivorous animals, the most important of which in the rain forest are probably the insects. These primary consumers are the food of secondary consumers, such as insectivorous birds, which are in turn eaten by others, so that there are food chains with up to four or five "links" (trophic levels). The food chains end with such predators as jaguars, eagles, and owls, all of which are relatively scarce and, because of their size and large food requirements, rather unselective in their diet. Most rain-forest plants and animals have parasites, which may in turn be attacked by parasites (hyperparasites), establishing another kind of food chain.

An important difference between a tropical forest and other ecosystems is that the food chains (or food webs because they are interconnected) are so many and so complex. A further characteristic of the rain forest is that within the main ecosystem with its food webs, there are small subsidiary systems, which are partially isolated. One subsidiary system is that of the bromeliad tanks in tropical American rain forests. In these the chief sources of food are plant debris falling into the tanks or brought there by ants and production of food by populations of certain green algae. The consumers are worms, insect larvae, tadpoles, etc., some of which remain in the tanks, whereas others, such as frogs and mosquitoes, leave them when mature to find food elsewhere in the forest.

Another subsystem consists of the large number of organisms dependent in one way or another on ants. Many kinds of insects live in ants' nests in various relationships with their hosts, the nature of which is often not clear. Some large predators, such as anteaters, feed largely on ants and termites, while ant birds (a characteristic group of thrushes and other species) follow the migratory army ants of tropical America and the similar driver ants of Africa as they advance through the forest, eating not the ants themselves but the insects and small vertebrates disturbed by them.

There are also many kinds of ant–plant relationships, the most remarkable perhaps being that between green plants and the tropical American leaf-cutting ants. These ants bite out small semicircular pieces from leaves and carry them in procession into the recesses of their mound-like nests. Special fungi, which grow on the leaf bits, produce knoblike outgrowths on which the ants feed.

Another kind of ant–plant relationship found in all of the tropical rain forests is that between certain types of ants and certain species of plants in which they nest, known as myrmecophytes ("ant plants").

Stratification of pollinators and seed dispersers

Among rain-forest trees, in contrast to temperate trees, pollination by wind is uncommon, and insects, birds, or bats are generally the pollinators. Specialized coadaptations between flower and pollinator have often evolved, the most extraordinary being perhaps the fantastically elaborate pollination mechanisms in some tropical orchids. Several unusual features common among rain-forest trees, such as flowers borne on the main trunk or hanging from the branches on long cordlike stalks, seem to be adaptations to bird or bat pollination.

Animals of many kinds play a part in dispersing the seeds of many rain-forest trees and vines, though some, especially species colonizing gaps and clearings, have wind-borne fruits. Trees of the A and B strata often have very heavy fruits that crash through the foliage beneath and are subsequently distributed by rodents and other small animals. Other trees have edible nuts or berries, which are dispersed by parrots, monkeys, and other treetop inhabitants.

Many forest plants have evolved protective features that may make them distasteful or toxic. It is significant that the seeds of the Fabaceae (Leguminosae), a family to which many rain-forest trees and vines belong, often have bitter seeds avoided by insect larvae. Similarly, the leaves of the Rubiaceae, the largest family of tropical plants, often contain poisonous or bitter compounds; it can hardly be a coincidence that few caterpillars are known to feed on them.

Biological productivity. The luxuriance of the tropical rain forest and the speed with which clearings are invaded by secondary growth suggest that the rates of photosynthesis, growth, and other physiological processes in tropical plants must be high compared with those in temperate climates. To test such impressions, estimates of biomass (total quantity of organic material per unit of land area) and of the amount of new material added yearly (biological productivity) are required.

A few estimates for some primary rain forests indicate that from 300 to 400 metric tons (330 to 440 tons) of plant material occupy a hectare (2.5 acres), which is greater than the biomass of most temperate forests but less than that of the redwood forests of California. It is probable that the biomass of the forests of the Malay Peninsula, however, reaches as much as 500 tons per hectare.

In every case, over 80 percent of the biomass consists of woody stems and branches, leaves forming only a small proportion of the total. The organic material available as food for herbivorous insects and other leaf feeders is thus a small fraction of the whole. If the biomass can be regarded as the forest's capital, the annual increment of organic material is its income, and this latter depends on several factors, of which the most important is the amount of available energy. More radiation falls on the tropical zone than on any other part of the earth. In the humid tropics the radiation actually reaching the earth's surface is about double the amount received at 60° north, the latitude of Leningrad, and the northern tip of Newfoundland. It might, therefore, be expected that the tropical rain forest would produce more organic matter per unit of land surface than any other kind of vegetation, but this does not in fact seem to be so.

Surprisingly low organic productivity

A reliable estimate of organic production in the tropical rain forest of the Ivory Coast (West Africa) gave the figure of nine metric tons per hectare per year, not much higher than the productivity of a beech wood in Denmark. For several reasons this forest was perhaps untypical, but estimates for other tropical areas do not suggest much higher figures.

If it is indeed true that tropical forests are not much more productive than those in temperate climates, the explanation may lie mainly in the high respiration rates of tropical plants. The total amount of organic material produced by a tropical tree in a year may be prodigious (about two or three times that produced by a temperate tree), but much of it is unavailable for plant growth because it is lost in respiration. It seems that, generally, tropical plants lose through respiration a larger proportion of the carbohydrate material they build up during the day than do temperate plants.

The tall trees of the forest, whose crowns are more or less fully exposed to the Sun, photosynthesize more actively than those in the shaded undergrowth. In Cambodia the A stratum contributes more than half the productivity of the forest, though its foliage forms only about a fifth of the total leaf area.

The rate of growth in girth and height, like the productivity, of primary rain-forest trees does not seem to be unusually high. The evidence suggests that primary rain-forest trees do not, in general, grow as rapidly as the fastest growing temperate trees, such as poplars, eucalyptus, and some pines. Very high growth rates, however, are found in trees of young secondary rain forests, such as the *Cecropia* of tropical America and the African musanga (parasol tree). The latter can reach a height of over 20 metres (65 feet) in 20 years. Such trees do not, in fact, grow as fast as such temperate plants as the sunflower under comparable conditions. Temperate plants, however, grow fast only during a short summer season, whereas the growth rates of trees such as the *musanga* are maintained through the year.

Rapid turnover of nutrients

At tropical temperatures, decomposition is normally much faster than under temperate conditions. As a result, plant and animal remains do not accumulate as litter or as humus incorporated in the soil. Studies in the Thailand rain forest showed that more than 80 percent of the carbon present is in the form of living wood and leaves and less than 20 percent as dead material on and in the soil. By contrast, in a northern coniferous forest more than half the carbon may be present as organic matter in the soil or as litter on its surface.

Elements released from the dead organic material by decomposition are almost immediately reabsorbed by tree roots, often with help from fungi living in close association with them. The very small amounts of nutrients washed down into the soil by the rain or carried away by streams are replaced by additional nutrients set free by the weathering of soil minerals. There is thus an almost closed cycle of mineral nutrients, and a rain-forest soil is able to support a luxuriant vegetation and abundant animal life in a permanent equilibrium with its environment. Because the loss of nutrients is so small, the concentration of mineral elements in the water of rivers, such as the Amazon, that drain large rain-forest areas is scarcely higher than in rainwater.

In the undisturbed rain forest the greater part of the mineral resources is locked up in the biomass itself, but there is a drastic change if the forest is felled. When clearings are made by the slash-and-burn system—the commonest method of growing food crops in rain-forest areas—good harvests are seldom obtained after the first year. When the vegetation is burned, the minerals contained in it are suddenly released in soluble form, and a large proportion is washed away in surface erosion or carried down into the soil and drained away later to the rivers. The fertility of the soil can be restored only by a fallow period of 10 or more years, during which secondary forest covers the old field. Thus, new forest clearings have to be made almost every year.

Jupiter

Jupiter, symbol ♃ in astronomy, is the most massive of the planets and the fifth in distance from the Sun. When ancient astronomers named the planet Jupiter for the ruler of the gods in the Greco-Roman pantheon, they had no idea of the planet's true dimensions, but the name is appropriate, for Jupiter is larger than all of the other planets combined. It has a narrow system of rings and 16 known satellites, one larger than the planet Mercury and three larger than our Moon. Jupiter also has an internal heat source; *i.e.*, it emits more energy than it receives from the Sun. This giant also has the strongest magnetic field of any planet, with a magnetosphere so large that it would exceed the apparent diameter of our Moon if it could be seen from Earth. Jupiter's system is the source of intense bursts of radio noise, at some frequencies occasionally radiating more energy than the Sun.

Knowledge about the Jovian system grew dramatically during the 1970s. The new information came in part from Earth-based observations, but especially from two sets of spacecraft—Pioneers 10 and 11 in 1974–75 and Voyagers

Table 1: Basic Data

Orbital characteristics		
Semimajor axis	5.20 a.u. (483.4 X 10^6 miles)	
Sidereal period	11.86 years	
Eccentricity	0.049	
Inclination	1°19′	
Physical elements		
Mean apparent diameter	47 seconds of arc	
Equatorial radius	71,400 km	= 11.2 (Earth = 1)*
Polar radius	66,770 km	= 10.4 (Earth = 1)
Ellipticity $\left(\frac{R_e - R_p}{R_e}\right)$	0.065	= 18 (Earth = 1)
Mass	18.99 X 10^{29}	= 317.8 X Earth's mass
		$= \frac{1}{1047.39}$ X Sun's mass
Mean density	1.33 g/cm^3	= 0.24 X Earth's density
Surface gravity	2,288 cm/s^2	= 2.65 X Earth's gravity
Escape velocity	59.5 km/sec	= 5.45 X Earth's escape velocity
Rotation periods		
System I (±10" from equator)	9h50m30s	
System II (higher latitudes)	9h55m40s	
System III (magnetic field)	9h55m29s	
Inclination of equator to orbit	3°04'	
Miscellaneous data		
Dimensions of Great Red Spot	26,000 km X 14,000 km	
Mean apparent visual magnitude	−2.55	
Magnetic field strength at equator	4.3 gauss	= 13.8 X Earth's surface field

*Radius of Earth = 6,378 km or 3,963 mi

1 and 2 in 1979 (see Figure 1). The Pioneer spacecraft served as scouts for the Voyagers, showing that the radiation environment of Jupiter was tolerable and mapping out the main characteristics of the planet and its environment. The more sophisticated instrumentation on the later spacecraft then filled in the details, providing so much new information that it was still being analyzed in the early 1980s.

Basic physical and orbital data

Table 1 shows physical and orbital data for Jupiter. Of special interest are the low mean density of 1.33 grams per cubic centimetre (g/cm^3)—in contrast with Earth's 5.5 grams per cubic centimetre—coupled with the large dimensions and mass, and the short rotational period. The low density and large mass suggest that Jupiter's composition and structure are quite unlike those of Earth and other inner planets (the planets between Jupiter and the Sun), a supposition supported by detailed investigations of its atmosphere and interior.

Three rotational periods have been established. The two periods labelled Systems I and II (Table 1) are mean values and refer to the speed of rotation at the equator and at higher latitudes, respectively, as exhibited by features observed in the planet's visible cloud layers. Jupiter has no solid surface; the transition from the atmosphere to the core occurs gradually at great depths. This variation in rotation period at different latitudes does not imply, therefore, that the solid body of the planet rotates with either of these mean velocities. In contrast, the apparent constancy of the period deduced from observations at radio wavelengths, System III, during 20 years of observation, suggests that it is associated with the planet's magnetic field, formed deep in Jupiter's liquid or semisolid interior.

THE OUTER LAYERS

The clouds and the Great Red Spot. Even a modest telescope can show much detail on Jupiter. The region of the planet's atmosphere that is seen from Earth contains several different types of clouds that are separated both vertically and horizontally. Changes in these cloud systems can occur in a few hours, but an underlying pattern of latitudinal currents has maintained its stability for decades. (It has become traditional to describe the appearance of the planet in terms of a standard nomenclature for alternating dark belts and bright zones. The currents, however, seem to have greater persistence than this pattern.)

Various cloud forms

The close-up views of Jupiter from the Voyager spacecraft revealed a variety of cloud forms, with a predominance of elliptical features reminiscent of cyclonic and anticyclonic storm systems on Earth. All of these systems are in motion, appearing and disappearing on time scales dependent upon their sizes and locations. Also observed to vary are the pastel shades of various colours present in the cloud layers—from the tawny yellow that seems to characterize the main layer, through browns and grays, to the well-known salmon-coloured Great Red Spot, Jupiter's largest, most prominent, and longest-lived feature (see Figure 2). The vertical and horizontal segregation of the cloud systems is evidently accompanied by chemical differences as well.

Jovian meteorology can be compared with the global circulation of the Earth's atmosphere. On Earth huge spiral cloud systems often stretch over many degrees of latitude and are associated with motion around high- and low-pressure regions. These cloud systems are much less zonally confined than the cloud systems on Jupiter and move in latitude as well as longitude. Local weather on Earth is often closely tied to the local environment, which in turn is determined by the varied nature of the planet's surface.

Jupiter has no solid surface, hence no relief features, and the planet's large-scale circulation is dominated by latitudinal currents. The lack of physical boundaries on Jupiter's surface makes the persistence of these currents and their associated cloud patterns all the more remarkable. The Great Red Spot, for example, moves in longitude with respect to all three of the rotation systems, yet it does not move in latitude. The three white ovals found at a latitude just south of the Great Red Spot exhibit similar behaviour; white ovals of this size are found nowhere else on the planet. The dark brown clouds, evidently holes in the tawny cloud layer, are found almost exclusively at latitudes near +18°. The blue-gray or purple areas, from which the strongest thermal emission is detected, only occur in the equatorial region of the planet.

The nature of the Great Red Spot. The true nature of Jupiter's unique Great Red Spot was still unknown by the early 1980s, despite extensive observations by the instruments on the Voyager spacecraft. On a planet whose cloud patterns have lifetimes often counted in days, the Great Red Spot has survived as long as detailed observations of Jupiter have been made—at least 100, and perhaps 300, years. There is some evidence that the spot may be slowly shrinking, but a longer series of observations is needed to confirm this suggestion. Its present dimensions are about 26,000 by 14,000 kilometres (16,150 by 8,700 miles), making it large enough to accommodate, side by side, two planets the size of Earth. These huge dimensions are probably responsible for the feature's longevity and possibly for its distinct colour.

The rotation period of the Great Red Spot with respect to the rotation of Jupiter itself shows a variability that has not been successfully correlated with other Jovian phenomena. Earth-based observations in 1966 and 1967 revealed the counterclockwise circulation of the material within the spot itself to have a period of 12 days. This period was confirmed by the Voyager observations, which recorded a large number of interactions between the Great Red Spot and much smaller disturbances moving in the current at the same latitude (Figure 2). The Voyager pictures showed the interior of the spot to be remarkably tranquil, with no clear evidence for the expected upwelling (or divergence) of material from lower depths.

The Great Red Spot, therefore, appears to be a huge anticyclone. a vortex, or eddy, whose lateral dimensions are greater than the Earth's diameter. This lateral size is presumably accompanied by a huge vertical extent that allows the feature to extend well below and well above the main cloud layers. The extension above the main clouds can be observed directly, and it also is manifested by lower temperatures and by less gas absorption above the Great Red Spot than at neighbouring regions on the planet.

The tawny clouds

Cloud composition. The clouds that are recorded in pictures of Jupiter are formed at different altitudes in the planet's atmosphere. Except for the top of the Great Red Spot, the white clouds are the highest, with cloud-top temperatures of about 140 kelvin (140 K; −133" C). The white clouds apparently consist of frozen ammonia crystals and are thus analogous to the water-ice cirrus clouds in the Earth's atmosphere. At lower levels occur the tawny clouds that are widely distributed over the planet. They appear to form at a temperature of about 220 K (−53° C), which suggests that they probably consist of condensed ammonium hydrosulfide (NH_4SH) and that their colour may be caused by other ammonia-sulfur compounds such as ammonium monosulfide, $(NH_4)_2S$, or ammonium polysulfides, $(NH_4)_2S_x$ (x may equal 2,3, . . .).

The reasons for invoking sulfur compounds as likely colouring agents (chromophores) lie in the relatively high cosmic abundance of sulfur and the absence of any evidence of hydrogen sulfide (H_2S) in Jupiter's atmosphere. Jupiter is primarily composed of hydrogen and helium. Under equilibrium conditions—allowing all of the elements to react with one another at an average Jovian pressure and temperature—a predominance of methane (CH_4), ammonia (NH_3), water (H_2O), and hydrogen sulfide over other compounds involving these abundant elements would be expected. This outcome is true for carbon, nitrogen, and oxygen, but no form of sulfur has been directly detected on Jupiter. This can be understood if the presence of sulfur compounds—formed in part because of the ease with which hydrogen sulfide can be broken down by solar ultraviolet light—in the lower clouds is postulated. In this hypothesis the sulfur made available by photodissociation is free to combine with the more abundant ammonia to form tawny chromophores.

Sulfur compounds have also been proposed to explain the dark brown colouration of the clouds detected at still lower levels, where the measured temperature is 260 K (−13" C). These clouds are seen through what are apparently holes in the otherwise ubiquitous tawny clouds. They appear bright in pictures of Jupiter that are made from the thermal radiation detected at a wavelength of five micrometres.

The colour of the Great Red Spot has been attributed to the presence of complex organic molecules, red phosphorus, or yet another sulfur compound. All of these ideas find support in laboratory experiments, but there are counter arguments in each case. Dark regions occur near the heads of white plume clouds near the planet's equator, where temperatures as high as 300 K (27° C) have occasionally been measured. Despite their blue-gray appearance, these dark features have a reddish tint. They may be clear gas exhibiting a blue colour (from Rayleigh scattering) overlain with a thin haze of reddish material. That these regions occur only at the equator, the elliptical dark brown clouds only near +18°, and the most prominent red colour on the planet only in the Great Red Spot implies a localization of cloud chemistry that is particularly puzzling in such a dynamically active atmosphere.

Localized cloud chemistry

At still lower depths in the atmosphere, astronomers expect to find water-ice clouds and water droplet clouds, both consisting of dilute solutions of ammonium hydroxide (NH_4OH). These cloud layers are expected to be reached by a probe to be sent into the Jovian atmosphere by the Galileo Project planned for the late 1980s.

The atmosphere. The proportions of constituents. Until a probe has entered Jupiter's atmosphere, studies of the planet's spectrum must be relied upon to provide information about the composition, temperature, and pressure of the atmosphere. In this technique light or thermal radiation from the planet is spread out in wavelengths (colours, in visible light, as in a rainbow) by the dispersing element in a spectrograph. The resulting spectrum indicates that there are discrete intervals at which energy has been absorbed by the constituents of the planet's atmosphere. By measuring the exact wavelengths at which this absorption takes place and comparing the results with spectra of gases obtained in the laboratory, the gases in Jupiter's atmosphere can be identified.

The presence of methane and ammonia in Jupiter's atmosphere was deduced more than 50 years ago, while hydrogen was detected for the first time in 1960. (Although 500 times more abundant than methane, hydrogen has much weaker absorption lines because it is a molecule of two identical atoms that interacts only very weakly with electromagnetic waves.) Subsequent studies led to a growing list of new constituents, including the discovery of hydrogen cyanide (HCN) in 1981. Table 2 includes a list of Jupiter's atmospheric constituents and their abundances as determined by early 1982.

If the condition of chemical equilibrium held rigorously in Jupiter's atmosphere, molecules such as carbon monoxide (CO), hydrogen cyanide, acetylene (C_2H_2), and ethane (C_2H_6) would not occur in the abundances shown in Table 2. Sources of energy other than the molecular kinetic energy corresponding to local temperatures are evidently available. Solar ultraviolet radiation is responsible for the breakdown of methane and subsequent reactions of its fragments into acetylene and ethane. In the convective region of the atmosphere, lightning discharges contribute to these processes and may be responsible for the production of hydrogen cyanide. Still deeper, at temperatures around 1200 K, carbon monoxide is made by a reaction between methane and water vapour. Vertical mixing must be sufficiently strong to bring this gas up to a region where it can be detected from outside the atmosphere.

Differences between Jupiter and the Sun

Table 2 includes a comparison of elemental abundances in Jupiter's atmosphere with the composition of the Sun. If the planet had formed by simple condensation from the primordial solar nebula (see below), the abundances of the elements should be the same in both Jupiter and the Sun. Instead, there is a real spread in the values for different elements. On the other hand, except for methane and helium, the abundances of the gases from which the elemental abundances are derived depend on dynamical phenomena in Jupiter's atmosphere—principally condensation and vertical mixing. Thus the apparent enrichment in carbon may be an indication of a real difference in composition between Jupiter and the Sun.

Another difference is indicated by the presence of deuterium (D) on Jupiter. This heavy isotope of hydrogen has disappeared from the Sun as a result of nuclear reactions in the solar interior. Because no such reactions occur on Jupiter, the ratio of deuterium to hydrogen there should be identical to the ratio of those isotopes in the cloud of interstellar gas and dust that collapsed to form the solar system 4,600,000,000 years ago. Since deuterium may have been made primarily in the "big bang" that has been postulated to have begun the expansion of the universe, an accurate measurement of deuterium/hydrogen on Jupiter would allow the calibration of expansion models.

Temperature and pressure. The best profiles for the relation between changes in temperature and pressure in the Jovian atmosphere have resulted from the Pioneer and Voyager measurements. Both passed behind the planet as viewed from Earth, and the attenuation of the signal as it passed through Jupiter's atmosphere before being completely extinguished provided a measure of the change in atmospheric density, which is a function of temperature and pressure. A self-consistent analysis of the data is in agreement with independent studies based on analyses of the thermal radiation escaping from the planet.

Table 2: Atmospheric Abundances

gas	mixing ratio*	element ratio	Jupiter/Sun
H_2	1		
He	0.12	He/H	1
CH_4	2×10^{-3}	C/H	2
NH,	2×10^{-4}	N/H	1
C_2H_6	4×10^{-5}		
H_2O	10^{-6}	O/H	10^{-2}
C_2H_2	8×10^{-7}		
PH_3	4×10^{-7}	P/H	1
CH_3D	3.8×10^{-7}	D/H	†
CO	3×10^{-9}		
HCN	2×10^{-9}		
GeH_4	6×10^{-10}	Ge/H	10^{-1}
C_3H_8	(detected)		

*The mixing ratio is the number of molecules of a given atmospheric constituent in a unit volume divided by the number of hydrogen molecules in that same volume.

†Deuterium is not present on the Sun because of nuclear burning. The value of D/H on Jupiter is 3.5×10^{-5} ($\pm 1.5 \times 10^{-5}$), which is approximately 2.3 times the present interstellar value.

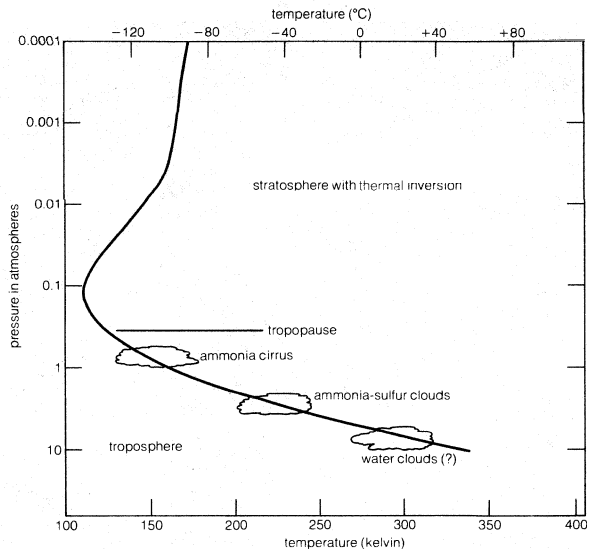

Figure 3: The structure of the atmosphere of Jupiter as deduced from Voyager measurements.

One of the profiles resulting from these studies is shown in Figure 3. From the figure it is possible to locate the positions of the principal cloud decks. It is interesting to notice that temperatures higher than the freezing point of water occur at pressures just a few times greater than the sea-level pressure on Earth. This is mainly a consequence of Jupiter's inernal energy source, although some warming would occur just by the trapping of infrared radiation by the atmosphere in the so-called greenhouse effect.

Temperature inversion

The increase in temperature above the tropopause is known as an inversion because temperature normally decreases with height. The inversion is caused by the absorption of solar energy at these altitudes by gases and aerosol particles.

Other likely atmospheric constituents. The list of atmospheric abundances in Table 2 is certainly not complete. For example, although the noble gas neon has about the same cosmic abundance as nitrogen, it, like helium, is very difficult to detect by spectroscopic observations. Neon had not been observed in the Jovian atmosphere by the early 1980s, even though it should be as abundant as ammonia.

Complex organic molecules in Jovian atmosphere

The formation of complex organic molecules in Jupiter's atmosphere is of great interest in the study of the origin of life. The initial chemical processes leading to the formation of living organisms may have occurred on Earth at a time when the composition of the terrestrial atmosphere was very similar to the present Jovian atmosphere, allowing for an appropriate depletion of hydrogen and helium. The active Jovian cloud system is a source of electrical discharges, while solar ultraviolet radiation, precipitation of charged particles, and the internal energy of the planet are also available to drive chemical reactions in the Jovian atmosphere. Thus, Jupiter may well represent an enormous natural laboratory in which the initial steps toward the origin of life are being pursued again and again. A determination of the degree of complexity reached under such conditions constitutes one of the most fascinating problems confronting any program of space exploration.

Radio emission. Jupiter was the first planet found (in 1955) to be a source of radiation at radio wavelengths. The radiation was recorded at a frequency of 22 megahertz (*i.e.*, a wavelength of 13.6 metres, or 1.36 decametres) in the form of noise bursts with peak intensities sometimes great enough to make Jupiter the brightest source at this wavelength, except for the Sun during its most active phase. The bursts of radio noise from three distinct areas constituted the first evidence for a Jovian magnetic field. Subsequent observations at shorter (decimetre) wavelengths revealed that Jupiter is also a source of steady radio emission. It has become customary to refer to these two types of emission in terms of their

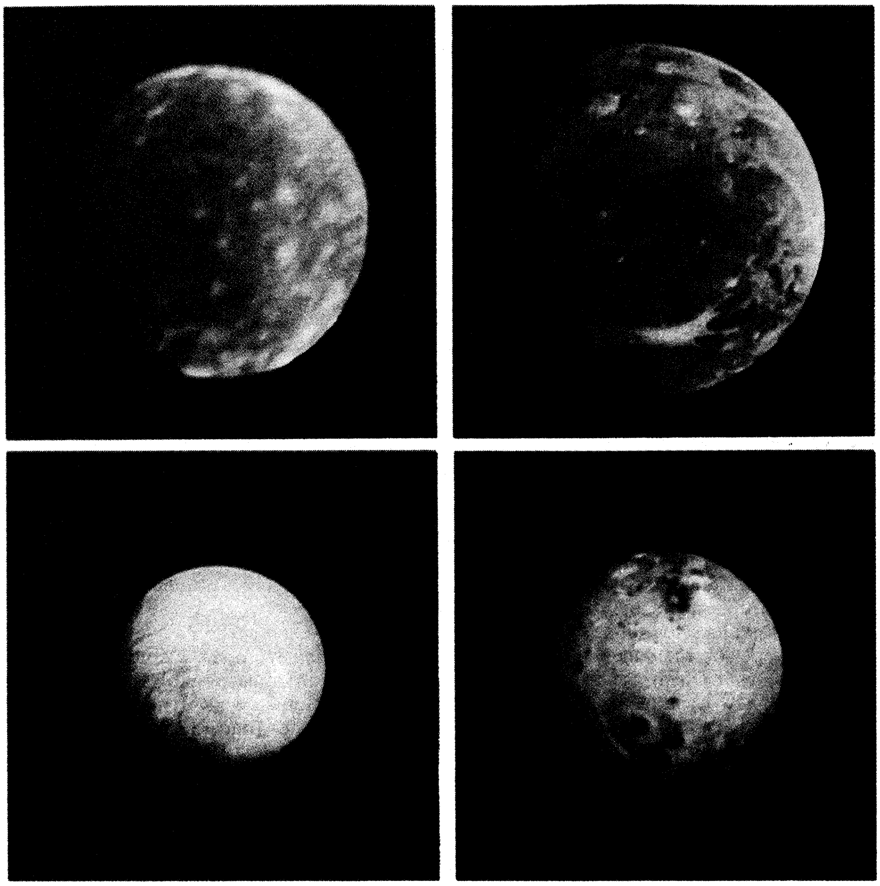

Figure *4:* The four Galilean satellites of Jupiter.
(Top) Callisto and Ganyrnede. (Bottom) Europa and Io. Photographs taken by Voyager 1 between March 1 and 3, 1979.

characteristic wavelengths: decametre radiation (the erratic bursts) and decimetre radiation (the continuous source).

The nonthermal component of the decimetric radiation is interpreted as synchrotron emission; that is, radiation emitted by very high-speed electrons moving in a magnetic field within a toroidal, or doughnut-shaped, region surrounding Jupiter—a phenomenon closely analogous to that of the terrestrial Van Allen belts. The maximum emission occurs at a distance of two planetary radii from the centre of the planet and has been detected at 178–5,000 megahertz. The position of the plane of the polarization (vibrations of the radio emission preferentially being in a plane) and intensity of the radio emission vary with the same period. Both effects are explained if the axis of the planet's magnetic field is inclined by about 10" to the rotational axis. The period of these variations is the period designated as System III (see Table 1).

The radio emission at decametre (10-metre) wavelengths has been studied from Earth in the accessible range of 3.5 to 39.5 megahertz (3.5×10^6 to 39.5×10^6 cycles per second). Freed from the low-frequency cutoff established by the Earth's ionosphere, the radio-wave experiment on the Voyager spacecraft was able to detect emissions from Jupiter down to 60 kilohertz (60×10^3 cycles per second), corresponding to a wavelength of five kilometres. The strength of the radio signal and the frequency of noise storms show a marked time dependence that led to the early detection of three "sources," or emitting regions. The System III coordinate system was initially defined through the periodicity of these sources.

Effect of Io on noise storms

The noise storms are greatly affected by the position of the satellite Io in its orbit. For one source, events are much more likely to occur when Io is 90° from superior geocentric conjunction (*i.e.*, 90° from the position in which Earth, Jupiter, and Io are in a straight line) than otherwise. The noise sources appear to be regions that lie in the line of sight toward the optical disk of the planet (unlike the nonthermal decimetric radiation).

The most promising explanation of the effect of the orbital motion of Io on noise storms relates the emission to a small region of space linked to Io by magnetic field lines (a flux tube) that move with Io. Electrons moving in spirals around the magnetic field lines could produce the observed radiation. Interaction between these electrons and the Jovian ionosphere can be expected and were, in fact, observed by the Voyager spacecraft.

The Jovian magnetosphere. The nonthermal radio emissions described above are the natural result of trapped charged particles interacting with Jupiter's magnetic field and ionosphere. Interpretation of these observations led to a remarkably accurate definition of the basic characteristics of the planet's magnetosphere that was supported by the direct exploration of fields and particles in the vicinity of Jupiter by the Pioneer and Voyager spacecraft. The basic magnetic field of the planet is dipolar in nature, generated by a hydromagnetic dynamo that is driven by convection within the electrically conducting outer layers of Jupiter's interior. The magnetic moment is 19,000 times greater than that of Earth, leading to a field strength at the equator of 4.3 gauss, compared with 0.3 gauss at the Earth's surface. The axis of the magnetic dipole is offset by 0.1 R_J (where R_J is Jupiter's equatorial radius of 71,400 kilometres) from Jupiter's rotational axis, to which it is indeed inclined by 10°. The orientation of the Jovian magnetic field is exactly opposite to the present orientation of the Earth's field, such that a terrestrial compass taken to Jupiter would point south (relative to the planet's vector of angular momentum).

Magnetic links with Io

The magnetic field dominates the region around Jupiter to a distance of about 10 R_J to a point between the orbits of its satellites Europa and Ganymede (see below Satellites and rings). Within this region the most striking activity is generated by the satellite Io, whose influence on the decametric radiation has been discussed above. An electrical current of approximately 5×10^6 amperes flows in the magnetic flux tube linking Jupiter and Io. This satellite is also the source of a torus (doughnut-shaped) cloud of ions that surrounds its orbit.

THE INTERIOR

The atmosphere of Jupiter comprises only a very small fraction of the planet, much as the skin of a fruit compares with its contents. Nothing can be directly observed below this thin outer layer, so that indirect conclusions are drawn from the evidence in order to determine the composition of the interior of Jupiter.

The quantities derived directly from observation with which the astronomer can work are the atmospheric temperature and pressure, mass, radius, shape, rate of rotation, heat balance, and perturbations of satellite orbits and spacecraft trajectories. From these follow the ellipticity and the departure from an ellipsoid of the planet, quantities that may also be predicted using theoretical descriptions, or models, for the internal distribution of material. Such models can then be tested by their agreement with the observations.

Jupiter's central temperature and pressure

The basic difficulty in constructing a model that will adequately describe the internal conditions for Jupiter is the absence of extensive laboratory data on the properties of hydrogen and helium at pressures and temperatures appropriate to the conditions near the centre of this giant planet. The central temperature is estimated to be close to 25,000 K, to agree with an internal source of heat that allows Jupiter to radiate about twice as much energy as it receives from the Sun. The central pressure is in the range of 50,000,000–100,000,000 atmospheres (where one atmosphere is the sea-level pressure on Earth). The required extrapolation is not quite as dramatic as it may seem, since at such tremendous pressures hydrogen assumes a metallic state, the properties of which can be calculated with some confidence. The difficulty lies, first, in establishing the transition point at which the metallic state occurs and, second, in defining the properties of hydrogen between this transition point and the region where laboratory measurements are available. A third difficulty is posed by the solubility of helium in hydrogen at these pressures and temperatures, resulting in a multicomponent system.

Predominance of hydrogen and helium

Despite these problems, there has been a steady improvement in the precision of the models. Perhaps the most significant early conclusion from these studies was the realization that Jupiter cannot be composed entirely of hydrogen; if it were, it would have to be considerably larger than it is to account for its mass. On the other hand, hydrogen must predominate, constituting at least 78 percent of the planet by mass, no matter in what form—gas, liquid, or solid—it may occur. If it is assumed that the bulk of the rest of the planet is helium, the proportion of hydrogen to helium is on the order of 14:1, in close agreement with the atmospheric value and present ideas for the composition of the Sun (see Table 2). Current models agree on a transition from molecular to metallic hydrogen at approximately 0.75 R_J. It should be stressed that this is not a transition between a liquid and a solid, but rather between two liquids with different electrical properties. In the metallic state the electrons are no longer bound, thus giving the hydrogen the conductivity of a metal. No solid surface exists in any of these models, although most contain a rock and ice core with a radius of 0.03–0.10 R_J (0.33–1.1 Earth radii).

The source of internal heat has not been resolved. The favoured explanation in the early 1980s invoked the gradual release of primordial heat left over from the planet's formation. In other words, the conversion of gravitational energy to thermal energy that initially led to a very hot Jupiter is still progressing with a very gradual contraction of the planet (see below Theories of origin).

SATELLITES AND RING

The first objects in the solar system discovered by means of a telescope were the four brightest satellites of Jupiter. Galileo, who first observed them in 1610, proposed that the satellites be named the Medicean stars, in honour of his patron, Cosimo II de' Medici; but they soon came to be known as the Galilean satellites in honour of their discoverer. Galileo regarded their existence as a fundamental argument in favour of the Copernican model of the solar system in which the planets orbit the Sun.

In order of increasing distance from the planet, these satellites are called Io, Europa, Ganymede, and Callisto, for legendary figures closely associated with Jupiter (Zeus) in Greek mythology. The names were assigned by the German astronomer Simon Marius, Galileo's contemporary and rival. There proved to be a certain further aptness in the choice of Io's name: 10—"the wanderer" (Greek *iōn*, "going")— has an indirect influence on the ionosphere of Jupiter. The fifth satellite was also discovered by visual observation at a telescope, while the other 11 known satellites were found photographically (JVI–JXIII) or in pictures obtained by the Voyager spacecraft (JXIV–JXVI). Roman numerals are assigned to the satellites in order of their discovery.

Satellite groups. Jovian satellite data are summarized in Table 3. The orbits of the inner eight satellites have low inclinations and low eccentricities; *i.e.*, all of them are nearly circular. The orbits of the outer eight, in contrast, have much higher inclinations and eccentricities. The two innermost satellites (XIV and XVI) seem to be intimately associated with Jupiter's ring and may in fact be two of the sources of the fine particles within the ring itself. There are almost certainly additional members of all of these groups.

The Galilean satellites. Although approximate diameters and spectrophotometric characteristics of the four largest satellites of Jupiter had been determined from ground-based observations, it was the Voyager missions of 1979 that indelibly established these four bodies as worlds in their own right (see Figure 4). Before Voyager,

Table 3: Satellites of Jupiter

roman numeral	name	discoverer	year of discovery	mean distance from Jupiter (km)	sidereal period (days)	orbital inclination (degrees)	orbital eccentricity	radius (km)	mass (kg)	mean density (g/cm^3)

it was known that Callisto and Ganymede were both as large or larger than the planet Mercury; that they and Europa had surfaces covered with water ice; that Io was surrounded by a torus of atoms and ions that included sodium, potassium, and sulfur; and that the inner two satellites have mean densities much larger than those of the outer two. This density gradient resembles that found in the solar system itself and seems to result from the same cause (see below *Theories of origin*). The implication is that Io and Europa have a rocky composition similar to that of our Moon, whereas approximately **60** percent of Ganymede and Callisto must be a much less dense substance, with water ice as the most likely candidate.

Callisto. The surface of this satellite is so dominated by impact craters that there are no smooth plains such as the dark maria on the Moon. In other words, there seem to be no areas on Callisto where subsequent internal activity has obliterated any of the record of early bombardment. This record was formed by impacting debris (comet nuclei and asteroidal material) primarily during the first **500,000,000** years after the formation of the solar system in much the same way that the craters on Earth's Moon were produced.

Ganymede. Unlike Callisto, this equally icy satellite reveals distinct patches of dark and light terrain. This contrast is reminiscent of what can be seen on the Moon, but the association of chronology with albedo (reflected brightness) is exactly reversed. The dark regions on Ganymede are the oldest areas, showing the heaviest concentration of craters. The light regions are younger, revealing a complex pattern of parallel and intersecting ridges and grooves in addition to unusually bright impact craters typically surrounded by systems of rays. Like Callisto, Ganymede also exhibits relatively low topographic relief, indicating the action of viscous flow of the icy surface.

Smoothness of Europa

Europa. The surface of Europa is totally different from that of Ganymede and Callisto, despite the fact that the infrared spectrum of this object indicates that it, too, is covered with ice. There are few impact craters on Europa—the number per unit area is about comparable to that on the continental regions of Earth. This indicates that the surface that can be seen is relatively recent. Some scientists think the surface is young enough to suggest that significant resurfacing is still taking place on the satellite. This resurfacing evidently consisted of the outflow of water from the interior to form an instant frozen ocean. Its frozen surface is crisscrossed by a pattern of dark stripes and curved ridges. The relief is extremely low, with ridge heights perhaps a few hundred metres at most. Europa thus has the smoothest surface of any of the solid bodies examined in the solar system thus far.

Io's volcanoes

Io. Seen through a telescope, Io looks reddish-orange, while the other satellites are neutral in tint. Io's infrared spectrum shows no evidence of the absorptions of water ice. Scientists expected Io's surface to look different from those of Jupiter's other moons, but the Voyager pictures revealed a landscape even more unusual than anticipated. Volcanic calderas, instead of impact craters, dot the surface of Io, and **10** volcanoes were observed in eruption when the two Voyager spacecraft flew by in **1979.** This unprecedented level of activity makes Io the most tectonically active object in the solar system. The surface of the satellite is continually and completely replaced in spans of time considered short when compared with the age of the solar system. Various forms (allotropes) of sulfur appear to be responsible for the black, orange, and red areas on the satellite's surface, while solid sulfur dioxide is probably the main constituent of the white areas. Sulfur dioxide was detected as a gas near one of the active volcanic plumes by Voyager's infrared spectrometer and was identified as a solid in ultraviolet and infrared spectra obtained from Earth-orbital and ground-based observations. These identifications provide sources for the sulfur and oxygen ions observed in the Jovian magnetosphere.

The energy for this volcanic activity requires a special explanation, since radioactive heating is inadequate for a body as small as Io. The favoured explanation is based on the observation that orbital resonances with the other Galilean satellites perturb Io into a more eccentric orbit than it would assume if only Jupiter controlled its motion. The resulting tides developed by the contest between the other satellites and Jupiter may release enough energy to account for the observed volcanism.

Surface of Amalthea

Other satellites. The only other Jovian satellite that was close enough to the trajectories of the Voyager spacecraft in **1979** to allow surface features to be seen was Amalthea. So small that its gravitational field is not strong enough to deform it into a sphere, it has an irregular, oblong shape (see Table 3). Like Io, its surface exhibits a reddish colour that may result from a coating of sulfur compounds released by Io's volcanoes.

The ring. One of the tasks of the Pioneer II mission of **1974** was to monitor the charged particles around Jupiter. As the spacecraft sped toward its closest approach of **1.6** R_J, a sudden decrease in the density of charged particles was detected at a distance of **1.7–1.8** R_J. This led to the suggestion that a moon or a ring of material might be orbiting the planet at this distance. The existence of a ring was verified by the first Voyager spacecraft when it crossed the planet's equatorial plane, and the second spacecraft recorded additional pictures, including a series taken in the shadow of the planet looking back at the ring material. The ring is comprised of large numbers of micron-sized particles that produce strong forward scattering of incident sunlight. Submicron dust is also present, as indicated by a faint halo of material surrounding the ring plane. The halo particles are charged and move out of the equatorial plane in response to the rocking motion of the magnetic equatorial plane as the planet rotates.

Source of Jupiter's ring

The presence of such small particles requires a source. Indeed, the finest material extends all the way in to the planet itself. It seems likely that the source of this material is large boulders, or small moonlets, within the ring. Visible examples of what are presumably among the largest of such objects are satellites JXIV and JXVI. The ring particles are generated by impacts of micrometeoroids, cometary debris, and possibly volcanically produced material from Io. It seems plausible that the inner edge of Jupiter's ring is defined by the orbit of one of these moonlets, even as the outer edge appears to be defined by satellite JXIV.

THEORIES OF THE ORIGIN OF THE JOVIAN SYSTEM

The origin of Jupiter and its satellites is part of the problem of the origin of the entire solar system. Current thinking favours the gradual development of the Sun and planets from a huge cloud of gas and dust containing gravitational instabilities. Details of the later evolutionary picture vary, however, especially on the role of magnetic fields and on the relative importance of condensation and accretion.

Early history of Jupiter. Given the planet's large proportion of hydrogen and its huge mass, it has been traditional to assume that Jupiter formed by condensation from the primordial solar nebula. This hypothesis implies that the elements should all be present on Jupiter in the same proportions that they occur in the Sun. The most recent evidence (Table 2) suggests that this may not be true.

Accretion of dust and ices

Current models for Jupiter's origin suggest that a core formed first as a result of the accretion of grains of dust and ices into accumulating planetesimals. The heavier elements in the core would have been present in solar proportions, but as the core grew and began to attract more volatile material, a nonsolar composition could have resulted. In particular, models have been proposed with a core containing high proportions of water ice and an envelope of hydrogen and helium. Although these light gases, relative to the heavier elements in the core, do not reach their solar abundance, the ratio of hydrogen to helium is solar in all of these models, as appears to be the case on Jupiter itself.

Early history of the satellites. The inner eight satellites of Jupiter are commonly thought to have originated in much the same way as the planet itself. Just as the primordial solar nebula is believed to have broken up into accreting planetesimals with a central condensation that became the Sun, the accumulation of material into a proto-planetary cloud at Jupiter's orbit ultimately led to the formation of the planet and its inner satellites. The analogy goes further. The high temperature of the forming planet apparently prevented volatile substances from condensing at the distances of the innermost satellites. Hence Ganymede and Callisto represent the volatile-rich outer bodies in this system.

The origin of the outer eight satellites, with their orbits of high eccentricities and inclinations, is thought to be quite different. They are members of the population of irregular satellites in the solar system and have most likely been captured by Jupiter.

BIBLIOGRAPHY. A discussion of telescopic observations of Jupiter consisting of descriptions of motions, colours, and transformations observed in the Jovian cloud layers may be found in B.M. PEEK, ***The Planet Jupiter*** (1958). An extensive compilation of papers on all aspects of the Jovian system through 1975 is presented in T. GEHRELS (ed.), ***Jupiter*** (1976). The Pioneer missions are described in R.O. FIMMEL, W. SWINDELL, and E. BURGESS, ***Pioneer Odyssey: Encounter with a Giant*** (1974). An early summary of information about the satellites appeais in J.A. BURNS (ed.), ***Planetary Satellites*** (1977). A later account is given in D. MORRISON (ed.), ***Satellites of Jupiter*** (1981), which includes a discussion of the Voyager results pertaining to the satellites. Summary articles of other Voyager discoveries may be found in the following journals: ***Science***, 204:945–957, 960–1008 (June 1, 1979), and 206:925–996 (November 23, 1979); ***Nature***, 280:725–806 (August 30, 1979); ***J. Geophys. Res.***, 86 (September 30, 1981), the entire issue being devoted to "Voyager Missions to Jupiter." The Voyager spacecraft and their experiments are described in ***Space Science Reviews***, vol. 21, no. 2 and 3 (1977). An overview of this mission is given in D. MORRISON and J. SAMZ, ***Voyage to Jupiter*** (1980); and many of the results and their interpretation are presented in articles in J.K. BEATTY, B. O'LEARY, and A. CHAIKIN (eds.), ***The New Solar System*** (1981). (T.C.O.)

Jura Mountains

A major physical feature of the European continent, the Jura Mountains are smaller and somewhat younger companions of the Alps, stretching in an arc from the Rhône River gorge near the Isère River in France north and east to the Rhine Valley upstream from Basel. Consisting of plateaus with an average elevation of more than 2,800 feet (850 metres) and mountains up to about 5,650 feet, the Jura is about 225 miles long and up to 40 miles wide. It lies mostly in Switzerland, but a good part of the western sector lies in France.

Geologically, the Jura is a part of the Alpine foreland. Thus it is geologically related to the Swabian and Franconian Jura (Swabian and Franconian Alps), which form a separate region north and east of the Rhine.

Relation to the Alps

The Jura Mountains were named for their pronounced forested character, *jura* meaning "forest" (from the Gaulish *jor, juria;* ultimately related to Slavic *gora*, "mountain"). The Jurassic System of rocks was named for the mountains' fossil-bearing limestone formations, which date to the Jurassic Period of geologic time, about 190,000,000 to 136,000,000 years ago.

History. The Jura Mountains were inhabited by Celtic tribes, the Rauraci and Sequani, when they became known to the Romans, and, after the Roman conquests, they belonged to the Roman province of Germania Superior (50 BC). The area was shown as mountain country on maps of the 2nd century AD. The region was Christianized by St. Columban in the early 7th century, and it supported a series of monasteries.

Scientific study of the mountains began in the 18th century with the work of Alexander von Humboldt, who named the Jurassic System for the Jura's rocks. Definitive geological studies, however, did not begin until the end of the 19th century and the beginning of the 20th. The best analysis was given by the Swiss geologist Albert Heim.

The physical environment. The highest peaks of the Jura Mountains are in the south, in the Geneva area, and include Crêt de la Neige, 5,636 feet, and Le Reculet, 5,633 feet, both in France, and Mont Tendre and La Dôle, both more than 5,500 feet, in Switzerland.

Stratigraphically, the mountains include formations from the Mid-Triassic Period (preceding the Jurassic and up to 225,000,000 years old) in the plateaus to the Miocene and early Pliocene (from 7,000,000 to less than 26,000,000 years old). During the Jurassic Period the Jura landscape was a more or less flat, shallow maritime trough in which up to 3,000 feet of sedimentary rocks accumulated. The rocks are principally fossil-rich limestones interlayered with chalks, clays, and marls, with iron-ore concretions in places.

The formation of the Jura Mountains began in the Early Tertiary (about 65,000,000 to 50,000,000 years ago) as a part of the same Earth movements that formed the Alps. The main thrust from the southeast occurred in the Pliocene. Thus the mountain building process took place in at least two separate thrust phases: the first one formed the outer, French chain of ridges; and the second thrust formed the adjacent, higher inner ranges.

Classification by structure and form

On the basis of their structure and form, the Jura Mountains are classified as either the folded Jura, including the chain Jura and the plateau Jura, or the Jura tableland. The greater part of the range consists of the folded Jura, with its chain Jura constituting the inner side of the Rhône-Rhine arc and being characteristically folded into parallel anticlines (longitudinal upraised ridges) and synclines (longitudinal valley troughs). Cutting through the longitudinal ridges are transverse valleys (cluses). The area of less pronounced folds in the western outer zone of the arc is known as the plateau Jura. There the folds have been worn down by erosion, and their original direction is shown only by surface ribs along the sides of isolated hills. In the north the structure of the mountains has been complicated by faulting that produced upthrust blocks, or horsts, forming the tableland of the Swiss Jura. To the northeast, these same strata form the overmantle of the Black Forest (Schwarzwald) highlands and the terraced landscape of the Swabian and Franconian Jura. But it is the folded Jura that forms the characteristic landscape type. The folds are seldom simple and symmetrical. Rather, they are overturned, or at least compressed, by pronounced thrusting toward the northwest; nevertheless, they are clearly wavelike in form. Often, older rocks lie over younger ones, as in the nappe of the Alps.

The prevalence of limestone, alternating with softer layers of marl, results in great permeability; the fissured surfaces of the limestone beds permit the surface waters to percolate underground, producing a karst topography (*i.e.*, creating sinks and sinkholes and dissolving out caverns and underground drainage channels). As a result, there is a lack of running water, particularly in the central part (plateau Jura). Traditionally, each farmstead collected its own cistern water; today, supply networks bring water up from the gorges of the rivers. Lake Joux has an underground outlet reappearing as a river, the Orbe, about two miles farther down. Similar underground stream sources are numerous. The largest rivers are the Doubs, the Ain, and the Birs.

Landscape and population. Lack of water affects both vegetation and settlement. Annual precipitation increases to the south and west, reaching more than 80 inches (2,030 millimetres) on Le Mont Risouz and Mont Tendre; but the Delsberg Valley and the north-facing corridor of the Ergolz River (Liestal) receive less than 40 inches. The climate is of the maritime-continental transitional type: rawer on the Jura heights, milder in the protected valleys and on the south-facing slopes. Pools of cold air form in the high valleys in winter. The average summer temperature at Geneva is 66" F (19° C), while the winter equivalent is 34° F (1° C). At La Brévine, for example, more extreme conditions prevail: the corresponding figures are 55° F (13° C) and 25° F (−4° C). Maximum and minimum readings at the stations vary from highs of, respectively, 95° F (35° C) and 84° F (29° C) to lows of 1° F (−17° C) and −44° F (−42° C).

Climate, vegetation, uses, and settlement

Natural vegetation is of the forest type throughout the region. From lower to higher elevations there occur oak groves and beech forests (most handsomely manifested at 2,000–4,000 feet) interspersed at higher elevations with fir. In the southern Jura, the firs are replaced by sycamore maple. The crests above the tree line (about 5,300 feet) are covered with Alpine grasses. Only over deposits of marl and clay are there also isolated moors. Wildlife is practically extinct.

Pastures on the high plateaus are more characteristic of the Jura than are the cultivated fields in the basins and valleys. The dairy economy is based on cattle raising, and a number of types of cheese are produced. In the west the Jura reaches the vineyard zone of the Saône Valley, and grapes also are grown on the south face of the Jura. The Jura farmer, in addition, raises fruits and ample quantities of potatoes and vegetables but little grain. The most important mineral resource has been granular iron ore.

Villages are found in abundance, especially in the valleys, while larger cities are almost entirely on the margins—Chambéry, Geneva, Neuchâtel, Biel (Bienne), Solothurn, Aarau, Baden, Bourg-en-Bresse, Lons-le-Saunier, Besançon, Montbkliard-Porrentruy, and, on the Rhine, Basel and Schaffhausen.

Industries of the Jura area

Centres of the Swiss watchmaking industry in the Jura are La Chaux-de-Fonds, Le Locle, Saint-Imier, Geneva, Biel, Grenchen, and Schaffhausen. Other light industries include gem cutting and polishing, the manufacture of eye glasses, briar tobacco pipes, music boxes, phonographs, camera equipment, paper, and typewriters; and the processing of tobacco and chocolate. The Jura population has always been noted for its industrial activities.

The strong sense of nationality possessed by the inhabitants of the Jura was manifested by the controversy in Switzerland that ended with the creation in 1978 of Jura canton, Switzerland's 26th, which separated about 70,000 French-speaking residents of Bern canton from its predominantly German-speaking majority.

In the second half of the 20th century the beauty of the Jura has been the destination of many tourists, both in the summer and, increasingly, also in winter for skiing. A consequence has been the development of the transportation network. Now, every scene of natural beauty and every Jura valley is accessible over excellent roads, while for through traffic the mountains form an obstacle. The cluses (gaps in the transverse ranges), since the earliest settlement, have been transportation routes. The few railroad lines follow them, as did the oldest Roman roads.

The principal express rail lines (Basel–Geneva, Basel–Olten, Paris–Lausanne–Milan via Simplon Pass) cut through the chains in tunnels. New tunnels were made for the Swiss national road network, and cuts were made for roadway pass crossings (for example, Faucille, Belchen, and Bozberg). The construction of the tunnels and cuts has made communications easier and also has laid bare new sections of the mountains for study of their structure. (W.T.K.)

BIBLIOGRAPHY. The most comprehensive recent bibliography is the *Bibliographie* jurassienne, 1928–1972 (1973), published by the SOCIETE JURASSIENNE D'EMULATION; an annual survey of new publications covering the Swiss portions of the region may be obtained from the Bibliographie des montagnes neuchdteloises, issued by the city library of La Chaux-de-Fonds. (Ed.)

Jurassic Period

The Jurassic Period occupies an intermediate position in the Mesozoic Era between the Triassic Period and the Cretaceous Period. Its name refers to the chalk sequence in the rock strata of the Swiss–French Jura Mountains. Around 1800 William Smith recognized that a group of strata was characterized by a particular set of fossils, thus making it possible to establish a connection, or relation, between Swiss-Jura limestones and English oolitic limestones. In France, Alexandre Brongniart introduced the term terrain jurassique ("Jurassic ground"), which also included the underlying Lias rocks. In southern Germany, L. von Buch distinguished Lower, Middle, and Upper Jurassic, which were later designated Black Jurassic (Lias), Brown Jurassic (Dogger), and White Jurassic (Malm) by F.A. Quenstedt and A. Oppel. On the basis of the predominant fossils, Quenstedt named six component layers within each of these three divisions (Table 2).

Classification of stages

Alcide d'Orbigny classified the period into stages, which in general were named after geographic locations in western Europe or were names introduced by previous geologists. With some later additions, the succession is summarized in Table 1. Oppel named the uppermost' (Portlandian) Stage in the Alpine–Mediterranean area "Tithon" because of its differing facies. That name has been extended to include other Late Jurassic units outside Great Britain. Sergey Nikolayevich Nikitin (1881) called the Jurassic of the Volga Basin the Volgian, which has been retained as a stage name for the youngest Jurassic rocks. Characteristic and fascinating landscapes in Jurassic rocks may be seen in the Jura Mountains, the Swabian–Franconian Jura, the Krakow district, southern England, and the western United States.

In areas of continuous succession the Jurassic is underlain by Rhaetic rocks (the youngest Triassic) and overlain by the Lower Cretaceous. The Berriasian in the Mediterranean area and the Ryazanian in the Soviet Union have been considered lowermost Cretaceous, though their ammonite faunas are close to Jurassic types. According to radiometric dating, the Jurassic Period began about 190,000,000 years ago and ended 136,000,000 years ago.

There is a peculiar balance between ancient and modern traits in the Jurassic record. The submergence of considerable portions of the continents beneath the seas and the dominance of the now-extinct ammonites and dinosaurs provide the unfamiliar, ancient elements of the picture. Geosynclinal seas of the Jurassic were to be the birthplaces of many of the present-day mountain ranges, however, and the development of Jurassic birds and mammals began the process of the modern forms of life.

Of economic importance among the Jurassic deposits are chromite (in basic igneous rocks in the Balkans); oolitic and sideritic iron ores of marine origin in central and western Europe; alluvial deposits of uranium ores and gold in the U.S.; coal in Siberia, China, Korea, Australia, Iran, Hungary, and elsewhere; salt in underground salt domes in Arkansas, Louisiana, and northern Germany; building stone (limestone, sandstone), brick-making and cement-making materials in Europe; and oil-producing rock strata along the Gulf Coast and in the western interior of North America, in the Emba district of the Soviet Union, and in northern Germany. In northwestern Germany, asphalt is obtained from Upper Jurassic limestone strata. Near Oldenburg, also in northwestern Germany, there is an important celestite (strontium sulfate) deposit. Fuller's earth is still mined near Bath, England. The production of lithographic stones in the Franconian Jura was of substantial economic importance in the 19th century, and the stone is still prized by lithographers.

This article treats the rocks, life-forms, and environments of the Jurassic Period. For similar information on previous and subsequent time intervals, see TRIASSIC PERIOD; CRETACEOUS PERIOD. For the relationships of these three periods, see MESOZOIC ERA; and see FOSSIL RECORD for additional details on all life-forms.

JURASSIC ROCKS

General distribution

Rock strata of the Jurassic System occur on all continents (Table 2). Jurassic beds that are covered by younger sediments have been discovered in recent decades by borings in southeastern England, Denmark, northern Germany, Poland, Louisiana, and elsewhere.

The picture of the Jurassic world still is very problematical, but it particularly derives from the study of the sedimentary rocks (*q.v.*). The restriction of the marine Jurassic sediments to the border regions of the present continents indicates that these land areas must have existed as shields by the Jurassic Period. Only in North America and Asia did the Jurassic oceans extend far into the interior. The absence of any Jurassic sediments on the east coasts of North America and South America, on the coast of West Africa, and, in part, on the coast of Europe suggests that in Jurassic times the Atlantic Ocean did not yet exist in its full form. The Jurassic sequence of eastern Africa and western Madagascar is interpreted as resulting from deposits laid down in an ocean strait that was beginning to divide Gondwanaland, the supercontinent that extended from South America through Africa to India, during the Jurassic Period. Continental drift (*q.v.*)

must be considered in the genesis of the Atlantic and Indian oceans and in reconstruction of the paleogeography (*q.v.*) of the Jurassic (see Map). Except for their peripheral areas, the old shields remained free of the Jurassic sediments (Scandinavia and the Canadian Shield). In inland depressions, fresh water and wind laid down Jurassic deposits of thick terrestrial (lacustrian, fluviatile, eolian) sediments, as in Siberia and Australia (Walloon Lake) and before and after the marine flooding in the western interior of North America.

The sedimentary strata deposited in shallow Jurassic seas were generally from several hundred to a thousand metres thick. Around the Pacific Ocean, thicker layers associated with igneous rocks indicate belts of particularly marked subsidence (geosynclines); in Jurassic and later times those belts rose to form the folded mountains of today. The greatest thicknesses of Jurassic rocks occur in southern Alaska (5,000 metres), California and Oregon (5,000 to 8,000 metres [16,000 to 26,000 feet]), California Coast Ranges (16,000 metres [53,000 feet]), Daghestan, Caucasus (12,000 metres [40,000 feet]), Verkhoyansk Mountains (3,000 to 7,000 metres [10,000 to 23,000 feet]), and Ouda Basin, Amur (7,800 metres [25,600 feet]).

The geosyncline called Tethys provided similar sites for thick accumulations in southern Europe and southern Asia. At its eastern and western ends the Tethys Sea was linked, at least temporarily, with the circum-Pacific geosynclines; at the western end the link probably consisted of a Middle Atlantic Seaway between southern Europe and Central America.

Sediment types

Conditions that have recurred constantly during the earth's history permitted the deposition of sandstones, conglomerates, shales, limestones and dolomites, and evaporites (*qq.v.*) during Jurassic time. In various locations on the periphery of the Arctic Ocean and in the interior of the Soviet Union, lime-poor, clayey, and marly rocks and marginally distributed silt, sand, and conglomerates were deposited.

The sediments of the central and northwestern European shelf region (European Archipelago) contain a large proportion of carbonates that grade to sand in nearshore facies and to clay and evaporites in offshore facies. Rhythmic sedimentation (cyclothems) often appears.

The secondary clay minerals (*q.v.*) of quite a few of these rocks contain kaolin, indicating that copious amounts of material from the bordering land were deposited in the sea.

Parts of the Alpine geosynclines contain marly or pure-bedded limestones, siliceous limestones, and radiolarites of Jurassic age. A relatively small thickness indicates rapid subsidence. Because of distance from land and the solubility of lime at depth, the sedimentation rate was low. Among the secondary clay minerals, kaolin is lacking. Scarcity of terrigenous sediment material resulted in scarcity of nutrients, a scant bottom fauna, and consequently an oxygen-rich ocean floor with red colours in the rock. Breccias resulted from the action of density currents (*q.v.*) on undersea slopes.

Thick clays and marls and marly limestones were deposited in many geosynclinal areas and were intruded by basic magma. Metamorphosis of the thick sequence of layers into phyllites occurred. Such lustrous, slaty rocks are represented by the Biindner (Graubünden) schists of the Swiss Alps.

Other Jurassic sedimentary rock types include bedded limestones and reef limestones on sinking ridges within the geosynclines; thin limestones formed on stable ridges and submarine plateaus under conditions of sweeping bottom currents; breccias of great thickness at the foot of large submarine ridges (*e.g.*, Nappe de la Brèche, Swiss Alps); flysch sediments that indicate rapid deposition in orogenic. or mountain-building, areas such as the California Coast Ranges and the Caucasus; and terrestrial limestones, clays, sands, sandstones, and coal seams in inland depressions of Jurassic continents.

The output of magmatic rock was substantial in Jurassic times. The rocks of the inner geosynclinal region were metamorphosed by orogenesis. Granites were converted to orthogneisses; clayey–limy sediments to phyllite (*e.g.*, central Alps, Sumatra, and Java) and into paragneiss (Cordilleras); and the sandstones to quartzite. The dating of metamorphic rocks is still uncertain in many cases because of the scarcity of fossils.

JURASSIC LIFE

Invertebrates

Protista. In the Lower Jurassic of the Tethys Geosyncline, the coccolithophorids (flagellates, up to millions per cubic centimetre) appeared; they were major producers of calcareous material in the calcium economy of the warm seas.

Associated limestone-forming organisms in the Upper Jurassic were the *Calpionella* (Tintinnida, 1). Among other microfossils are the problematic single-celled hystrichosphaerids, which in Jurassic times had a second burst of development. Dinoflagellates are known since the Middle Jurassic. Among the Foraminiferida, the lime-shell types were most important. In the Tethys appeared complex, large Foraminifera (Lituolidae) and the first planktonic Globigerinidae. The Radiolaria formed siliceous radiolarite deposits in the absence of clastic or carbonate materials.

Sponges. The siliceous sponges, colonizing somewhat deeper waters than the calcareous sponges, reached their greatest prevalence in Jurassic times. In the Alpine sequences rock beds consist almost entirely of the spicules of sponges; starting in the Lower Jurassic, the latticed Hexactinellida and the Lithistida formed local undersea meadows. On the northern edge of the central European Tethys (Swiss Jura, southern Germany, Poland)—while

heavy lime sedimentation was proceeding—those sponges and the calcareous algae (stromatolites) built up a great reef complex. Because of greater resistance to erosion, such reefs often appear in the present-day landscape as groups of crags. During or following the sedimentation, the silica concentrated by the sponge skeletons formed as chert nodules (see SILICEOUS ROCKS).

Coelenterates. In the Tithonian *Plattenkalke* (plate-like limestones) of the Franconian Jurassic magnificent impressions of large jellyfish (Scyphozoa) are found. In some locations hydrozoans made up a large part of the Upper Jurassic coral reefs of the Tethys, but the rich world of Jurassic corals belongs to the order of the Scleractinia; these anthozoans were dominant from the Triassic Period to the present. The conditions required for the life of these modern corals must have been the same in Jurassic time as today (see CORAL ISLANDS, CORAL REEFS, AND ATOLLS).

Worms. Concentrations of calcareous tubes of the marine worm *Serpula* constitute the Upper Jurassic Serpulite Formation of northwest Germany.

Bryozoa. The Cyclostomata, today characteristically are to be found in cold seas, were by far the predominant forms in the warm Jurassic seas. Cryptostomata lived in cavities excavated in the shells of dead mollusks. The modern Cheilostomata first became important in the Cretaceous.

Brachiopods. Brachiopods were most abundant and diverse in the Paleozoic. Stragglers from the Paleozoic Helicopegmata are known in the form of ***Spiriferina*** as late as the lowest Middle Jurassic beds. The little *Cadomella* (Upper Pliensbachian–Lower Toarcian), in spite of a helicopegmatic arm support converging toward the Spiriferida, appears to be the last representative of the Strophomenacea.

The great bulk of the Jurassic Brachiopoda consists,

however, of the modern groups Rhynchonellacea and Terebratulacea, which experienced a new evolutionary burst. The majority lived firmly attached by means of byssuses (silky filaments) to the bottoms of the epicontinental shallow seas and to the reefs. The form taken by *Pygope* in the Tithonian strata of the Mediterranean Tethys is particularly remarkable. The hole that extends through both its valves probably permitted a complete separation of the outflowing water from the nutrient-bringing inflowing water—possibly an adaptation to nutrient-poor deep water.

Bivalves. The Jurassic pelecypod fauna consisted of approximately 40 families. (Today there are 54 families.) Of those, 19 originated in the Paleozoic with all but 3 of the 19 still surviving today. Ten families began in the Triassic and about 12 in the Jurassic itself; none of these have become extinct. The Ostreidae, although originating in the Triassic, played an important role in the Jurassic, especially the *Liostrea*, *Gryphaea*, and *Lopha*. Thus the Jurassic was a time of especially marked development and modernization of the bivalves. The flourishing Trigoniidae were characteristic, as were *Inoceramus* (Jurassic–Cretaceous) and *Buchia* (Upper Jurassic–Lower Cretaceous). The curious spondylids *Lithiotis* and *Cochlearites* were limited to shallow-water facies of the Tethys.

The sediments which were richest in pelecypods were those of the epicontinental shallow seas and the geosynclinal ridge areas. It is thought to be probable that many Pectinidae already possessed a limited swimming ability, and the life-style of *Posidonia* (Silurian–Jurassic) is assumed to have been some type of constant swimming motions. Pelecypod groups characteristic of brackish and fresh water also have been studied for various correlation purposes.

Gastropods. Like the bivalves, the prosobranch gastropods, dominant since the Paleozoic, developed greatly

Depositional regions and tectonics during the Jurassic Period.

during the Jurassic. Among the primitive Archaeogastropoda, *Pleurotomaria, Discohelix* (Triassic?–Jurassic), and *Trochus* (the latter beginning with the Lias, or Early Triassic) are important. *Patella, Helcion,* and *Scurria* have a secondarily acquired dish-shape, an adaptation to their sessile, or anchored, existence. Among the Mesogastropoda (especially numerous throughout the Mesozoic), the Nerineacea, a group of extraordinary high-spired forms, originated in the Jurassic. Freshwater Pulrnonata genera found in the lacustrine Upper Jurassic (Purbeck Facies) are *Limnaea, Planorbis, Physa,* and *Auricula.* These Pulmonata, which had taken the path from sea to land beginning with the Carboniferous, had turned about and returned to water. Prosobranchiate-gilled snails of the Purbeck Facies comprise *Valvata, Bithynia,* and representatives of the Hydrobiidae, all beginning with the Jurassic.

Occurrence and evolution of ammonites

Cephalopods. The Ammonites, an order derived from the Nautiloidea in the Ordovician Period (*q.v.*), for unknown reasons almost became extinct toward the end of the Triassic. Only the genera *Phylloceras* and *Lytoceras* managed to survive and to initiate a new evolutionary surge.

The shell forms showed great diversity. The ammonite shell may be distinguished from the nautilus by a two-flap lid member (aptychus) and by the complexity of the sutures along which the septa (dividing walls) are attached to the inner walls of the shell tubes. These sutures exhibit lobes (rearwardly directed) and saddles (forward inflections); in adult shells both are folded, branched, and often serrated like moss. The suture is the prime distinguishing characteristic in establishing the family relationships of the ammonites.

The Phyllocerata and Lytocerata remained quite constant during the Jurassic and Cretaceous periodsr Most of the other Jurassic ammonites descended from a line that presumably arose from the Lytocerata toward the end of the Triassic and appeared at the beginning of the Jurassic in the form of the genus *Psiloceras* with an almost unsculptured shell. Numerous Jurassic superfamilies developed from *Psiloceras.* The greatest complexity of the suture is attained in the Stephanocerataceae in the Bajocian Age. Many regressions appear in the Perisphinctaceae of the Upper Jurassic. Nevertheless, the primary suture is always quinquelobate. Atavisms in the form of unrolled or rod-shaped shells, like those of the earliest Paleozoic ammonites, occur from the Bajocian to the Callovian and later in the Tithonian (Protancyloceras, from which the aberrant Cretaceous ammonites developed).

The Nautiloidea, like the ammonites, survived the crisis of the Triassic–Jurassic boundary in the form of only one genus, *Cenoceras,* which also experienced a new surge of development.

Coleoidea (cephalopods with internal skeletons). Of the pre-Jurassic Belemnoidea, *Atractites* (originating in the Triassic) still existed in the Lower Jurassic, particularly in the geosynclines. The Belemnoidea first attain some measure of importance in the Jurassic, beginning with small forms in the European Hettangian. Their pikelike calcite rostrums, including the distal part of the chambered cone, certainly have fewer distinctive characteristics than do shells of the ammonites. Early Jurassic Belemnoidea had rostrums with short distal furrows. In the Bajocian, *Megateuthis,* the largest belemnite form, grew to a length of perhaps two metres. A peculiarity of an older Jurassic group (Upper Pliensbachian to Toarcian) was the development of a hollow epirostrum of unknown function.

Crustacea. Minute, bivalved Ostracoda serve as important guide fossils, which in many cases allow a finer biostratigraphic classification than the ammonites. The Isopoda (wood lice) are known beginning with the Jurassic. The decapods developed more markedly than previously into swimming and benthonic (bottom-dwelling) forms. The earliest true lobster was found in the Upper Jurassic of Germany. Within the Anomura, *Gastrodorus* abandoned a protecting external skeleton on the rear portion of the body, suggesting the origin of the hermit crabs. In the form of primitive Dromiacea, the Brachyura (crabs) arose in the Jurassic. Close relatives of the Jurassic Anomura and Dromiacea still inhabit deep-sea waters today.

Echinoderms. The dominant order of the crinoids, Articulata, showed a tendency toward smaller and more motile calyx-forming calcareous platelets. The Isocrinida produced in *Seirocrinus subangularis* the largest crinoid forms ever to exist; in the Toarcian Age they led a pseudoplanktonic life attached to driftwood. Extraordinary preservations occurred in fine sediments of oxygen-poor basins where the remains were not disturbed by animal burrowing.

The Middle Jurassic *Paracomatula helvetica,* exhibiting atrophy of the stalk, was the probable ancestor of the modern nonstalked comatulid sea lilies, which first appeared in the Upper Jurassic. *Apiocrinus, Millericrinus,* and *Eugeniacrinites,* with jointed calyxes and strong stalks provided with rootlets, were adapted to the conditions of life found in moving waters over hard bottoms and in the reefs.

The genetic development of the echinoids during the Jurassic is centred in the emergence of asymmetrical sea urchin forms from the older symmetrical species. The anus moved from the centre of the upperside toward the rear on the underside; the mouth, on the underside, moved forward; and large club-shaped spines disappeared. Those transformations permitted residence in mud: the large spine would have been a hindrance, and a top-positioned anus would have interfered with the intake of clean water.

Vertebrate life

Fishes and amphibians. Among the Chondrichthyes (see SELACHII), are found hybodontids (seven-foot-long, rather primitive sharks) and less frequently Holocephali (ancestors of the ratfish or chimaera). Of the Osteichthyes (bony fish), crossopterygian and chondrost fishes (*q.v.*) were few, but holosts ("ganoid fishes") were quite numerous.

The first teleosts with fully ossified vertebrae appeared in the Jurassic. These small herringlike fish were the primitive members of the group that came to dominate the fish world in later times. According to some taxonomists, they are representatives of separate lines of development, which led polyphyletically from the holosts to the teleosts (see FISH).

Among the amphibians, the Labyrinthodonts and allied groups, which died out in the Late Triassic, were replaced by the first certainly identified Anura (frog and toad group). From the Bajocian strata of southern France a vertebra has been identified as the oldest find of a salamander (Urodeles). Very little fossil material bridges the gap between abundant Late Paleozoic and Triassic amphibian and the present-day orders.

Reptiles. On land the dominant forms were the archosaurians, successors to the Triassic Pseudosuchia. The best known of the reptiles are the dinosaurs (Saurischia and Ornithischia, differing in pelvis structure). The Saurischia included vegetarians and carnivores and the largest land animals in the history of life on the planet. The vegetarian sauropods were 20 to 30 metres (65 to 100 feet) long. Some carnivorous species attained ten metres (33 feet) (see REPTILIA). The Ornithischia included no carnivores.

The vegetarian therapsids, still numerous in the Triassic, had died out after several development lines split off from them, lines that led to the primitive mammals of Jurassic times.

The seas of the Jurassic were inhabited by Ichthyosauria and Plesiosauria, whose ancestors had secondarily adapted themselves to life in the water. This adaptation was further perfected in the Jurassic. Also, tortoises took to the water for the first time. The crocodiles (Archosauria) are known in the Jurassic from the Pliensbachian onward as armoured forms with land-type limbs, inhabiting shores and nearshore waters. In the Upper Jurassic the Metriorhynchidae developed modifications of limbs and tail adapted to marine life independent of the land; but the group died out in the Lower Cretaceous, before the adaptation process was complete.

Buds. The conquest of the air was accomplished in the Jurassic (presumably it had begun in the Triassic) by descendants of the Pseudosuchia. The flying, or gliding, saurians (with flight membrane on the elongated fourth finger) are known from remains of long-tailed forms, Rhamphorhynchoidea, from the earliest Jurassic onward; later in the period the short-tailed Pterodactyloidea appeared. Parallel with the flying saurians, and from similar roots, the birds emerged; the three oldest specimens known (*Archaeopteryx*) date from the Kimmeridgian of the Franconian Alps in southern Germany and might be regarded as feathered, flying saurians (with feathers as modifications of scales).

Lines of development

Plants. The terrestrial plant world, whose history is recorded in continental and marginal marine sediments, exhibits a smooth line of development from the Triassic through the Jurassic and the Lower Cretaceous. The plants are represented primarily by the pteropsid sporebearing and seed-bearing fern groups and the gymnosperms; the occurrence of angiosperms (*q.v.*) is still dubious. The Matoniaceae and the Dipteridaceae appear among the sporebearing ferns for the first time; a few still survive. A particularly large variety of the Osmundaceae (ferns) occurs. The lycopsids (club mosses) are limited to herbaceous growths. The Jurassic stand of bushes and trees consists of the gymnosperms, most numerous of which are the conifers; others include the gingkoes, cycads, Nilssoniae, and Caytonialae. Bennettitaceae also appears; it already possessed flower characteristics resembling those of the angiosperms.

GUIDE AND INDEX FOSSILS AND CORRELATIONS

Guide fossils, which are characterized by narrow vertical (time) and wide horizontal (space) distribution, plentifulness, and easy recognizability, are made use of for the definition of biostratigraphic zones (see STRATIGRAPHIC BOUNDARIES). Albert Oppel's first comprehensive zone scheme (1856–58) made use of the ammonites principally, because they underwent particularly rapid phylogenetic change. It has since become possible to structure the entire Jurassic into ammonite zones that furnish the time scale now accepted as standard.

In spite of the supposedly continuous phylogenetic development of all Jurassic ammonites from *Psiloceras* as the initial form, it is not possible to base the zonal division upon a continuous chain of ammonite species. A phylogenetic species series can never be followed for more than a finite length of time because of abrupt changes of characteristics, sudden reduction in numbers, and competition by other lines. The Jurassic zonal succession is therefore supported only by fragments of various species chains and by isolated species.

Because many guide ammonites are confined to certain areas, correlation of the ammonite zones of different regions has been achieved by matching ammonite fauna. Nevertheless, many uncertainties still exist and more studies need to be made.

Other fossils can be used as indices in regions where ammonites are lacking. Preferred fossils for such "para-indices" include brachiopods, pelecypods, snails (*Discohelix* in the Lias); and among the microfossils (important because of their great numbers) ostracods, foraminiferids, and, in the Upper Jurassic, the *Calpionella* (Ciliata). Their genera, on the average. show a longer life than those of the ammonites; yet even among them are found rapidly changing species chains and typical, short-lived associations.

Stratigraphic correlation and system boundaries

The chronological correlation of worldwide Jurassic profiles remains an uncompleted task. The most important means of global comparison is the biostratigraphic method, which involves the use of index fossils or fauna. For the dating of terrestrial Jurassic sediments, dovetailing them with marine sediments, as is possible in East Asia, is important.

The Jurassic Period as a whole corresponds to the rise of the Neoammonoidea. Its exact beginning is marked by the base of the Hettangian-type stratum, or the first ammonite zone of the Hettangian. Correlation is incomplete for the latest Jurassic stage, which zoogeographically consists of the Tithonic (Tethys), the Volaian (Boreal). and the Portland (northwest Europe). Correlation of those latest stage areas, as well as of the Jurassic–Cretaceous boundary, has not yet been done with consistency because of the gaps in the profiles of the epicontinental regression areas and because of the smooth development of the ammonites. Jost Wiedmann (1968) argues for adding the Beriassian (Lower Cretaceous) to the Jurassic. The establishment of an accepted boundary, however, can only be accomplished by explicit agreement, that also has not been reached for the still nonuniform boundaries between Lower, Middle, and Upper Jurassic.

In many areas during the Jurassic, sedimentation occurred only temporarily, during occasional marine invasion or subsidence of continental interior basins. Even in profiles that were formed under continuous ocean cover, interruptions in the series of sediments are often found. Such gaps are recognized by layers of shell fragments, seeming spurts of organic evolution, the absence of certain biozones, and the condensation of the index fauna of several zones into one horizon. Cases of extreme condensation over long periods in the ridge areas of the Tethys have been reported by Jobst Wendt from the Sicilian Jurassic.

OROGENIC ACTIVITY AND VOLCANISM

The varying distribution of land and sea primarily is caused by epeirogeny, or the relatively mild deformation and vertical movement of the earth's crust. A cyclically advancing invasion of the sea from the geosynclines onto the continental margins began at the outset of the Jurassic and, after a setback in the Bajocian, reached its peak in the Callovian–Oxfordian. Such invasions seem to be related to a general rise of the sea level, the cause of which is unknown, however. Toward the end of the Jurassic and after a second trend toward marine invasion, an extensive retreat into the geosynclinal regions occurred. This macrocycle of invasion and regression played an important part in the demarcation of the limits of the Jurassic System, especially in Europe.

In addition to epeirogenic movements, orogenic faulting and folding movements take place. It is evident from the Jurassic sediments of the Alpine geosynclines that subsidence was associated with a distension process, producing tension cracks through which basic magma (ophiolites) ascended. The compression (Alpine-type orogenesis with folding and overthrusts) was a subsequent process, which in the Alpine geosynclines was post-Jurassic, continuing into post-Cretaceous time.

Jurassic mountain building

In the North American Cordilleran geosynclines, however, compression took place after Lower Jurassic magma extrusion and at the threshold of the Middle Jurassic. This was the Nevadan orogeny, of rather uncertain date. In the California Coast Ranges, a strong geosynclinal subsidence produced 10,000 metres of Tithonic-type deposition (Franciscan formation) with associated radiolarites and basic magmas. Folding occurred later at the threshold of the Cretaceous. Similarly, in the South American Andean geosynclines, great quantities of lavas and volcanic tuffs were extruded, which are interbedded with marine and other sediments. The orogenesis here, however, was post-Jurassic. Immense igneous intrusions took place in the Caucasus (peripheral depression of the Tethys) and in the Amur and Verkhoyansk geosynclines of eastern U.S.S.R.

In Alpine-type orogenesis, subcrustal anatexis (melting and mixing) usually produces plutonic granites. In certain Asiatic mountains such plutonic rocks of Jurassic age are exposed. But among the vast Jurassic–Cretaceous, plutonic granodiorites of the Cordilleras and the Sierra Nevada only the granites of the Klamath Mountains in Oregon–California are positively known to be of Jurassic age.

Faulting and folding also occurred on pre-existing rocks outside the active geosynclines in Jurassic times. There are a number of examples: in the region of older orogenies in China; in the Yenshan Phase of Mongolia, Korea, and Japan; and in eastern Australia, in the region of the Paleozoic Tasman Geosyncline. Some geosynclinal and epicontinental sedimentation areas (*e.g.*, the Saxonian tectonics in northwest Germany) also experienced faulting and folding. Such tectonic action may be associated with igneous activity: the basalt flows of the Drachensberge in the region of the east African peripheral faults; similar flows in Queensland, New South Wales, Tasmania, and east Antarctica; tuff-filled explosion pipes of the Stormberge (Africa); volcanic rocks in Lebanon, China, eastern Siberia, and New England; and lavas and granitic intrusions in northern Nigeria.

CLIMATE

Plant growth over the entire earth and widespread coal formation during Jurassic time give evidence of a moist, warm climate that was warmer and more uniform than that of modern historic times. Seasons existed, however, as evidenced by annual growth rings of trees in the Northern and Southern hemispheres. The distribution of corals on both sides of the Tethys indicated that the Equator lay as much as 20° farther north than at present. The supplanting of mainly argillaceous rocks of the Lower Jurassic by Middle and Upper Jurassic limestones indicates increasing temperature in Europe, as also does the advance of reef corals as far as northern Scotland in the Oxfordian. A cooling trend is indicated toward the end of the Jurassic.

Oxygen-isotope determinations from belemnite shells indicate more uniform ocean temperatures than in modern times. The poles, whose Jurassic location is still problematical, seem not to have been covered with ice caps (see CLIMATIC CHANGE).

BIBLIOGRAPHY. W.J. ARKELL, *Jurassic Geology of the World* (1956), is a comprehensive textbook, treating biostratigraphic classification and correlation that presents an image of the earth surface in the Jurassic Period and includes a complete bibliography; H. HOLDER, *Jura*, in F. LOTZE (ed.), *Handbuch der stratigr. Geologie*, vol. 4 (1964), supplements Arkell's book, but focusses on the middle European and Alpine Jurassic.

Jury

The jury is an historic Anglo-American legal institution in which a group of laymen participate in a major way in deciding cases brought to trial. Its exact characteristics and powers depend on the laws and practices of the countries, provinces, or states in which it is found, and there is considerable variation. But its basic characteristics make it a remarkable political institution. It recruits laymen at random from the widest population for the trial of a particular case and allows them to deliberate in secrecy, to reach a decision by other than majority vote, and to make it public without giving reasons. Throughout its history it has been both overpraised as a charter of liberty and overcriticized as reliance on incompetent amateurs in the administration of justice.

History **and** use. The jury's origin is lost in the past. It may have been indigenous to England or have been brought there by the Norman invaders in 1066. Originally, the jurors were neighbourhood witnesses who passed judgment based on what they themselves knew. But the breakdown of medieval society and the growth of the towns changed this; the jury was called upon to determine the facts of the case, based upon the evidence presented in court. The availability of the jury in the king's courts may have been a key factor in centralizing the nation's courts under the king and in creating the common law. By the 15th century, nonrational modes of trial such as ordeal, in which the defendant was subjected to various tortures that, if successfully endured, proved his innocence, were replaced by the jury trial, which became the established form of trial for both criminal and civil cases at common law.

Early development in England

Two forces moved the jury abroad. One was the expansion of the British Empire, which brought the jury to Asia, Africa, and the American continent. The other was the French Revolution and its aftermath, which brought it, as a symbol of popular government, to the European continent: first to France itself, then, through Napoleon, to the Rhineland, later to Belgium, most of the remaining German states, Austria-Hungary, Russia, Italy, Switzerland, Holland, and Luxembourg, although the last two abolished it immediately after Napoleon's defeat. In each of these countries, use of the jury was from the outset limited to trials of major crimes and of political crimes against the state.

Beginning in the mid-19th century, the jury was emasculated in a variety of ways: in 1850, Prussia, for example, removed treason from its jurisdiction; in 1851, the duchy of Nassau removed all political crimes; in 1923, Czechoslovakia removed treason and, one year later, libel; in 1919, Hungary suspended jury trial entirely and never restored it. Germany abandoned the jury in 1924. Both the Soviet bloc and the fascist states abolished it outright; France never restored the jury abolished during the German occupation in the 1940s, and Japan did away with its short-lived jury courts in 1943. After World War II, Austria reintroduced the jury in a weakened form.

United States as major user of jury system

Thus, there are three important points about the history and development of the jury as a legal institution: first, the effort to introduce it outside the Anglo-American legal orbit has failed; further, in England itself, its use has limited by statute to a small category of cases; and thus, the United States has emerged today as the home of the jury system for both criminal and civil cases. Some 120,000 jury trials are conducted there annually, more than 90 percent of all jury trials in the world.

Use of the jury in the United States depends on two factors: the degree to which it is available as a matter of right, and the degree to which the parties themselves choose to use it. The laws as to its availability have varied from state to state, but in 1968 in *Duncan* v. *Louisiana,* the United States Supreme Court declared that a jury trial is a constitutional right in all criminal cases in which the penalty may exceed six months. In civil cases its constitutional status is less clear, but in general jury trial is available. The practice of allowing the parties to waive a jury trial also varies widely from region to region, and as a result, the number of jury trials per year also varies widely. The annual number of criminal jury trials per 100,000 population ranges between 3 for Connecticut to 144 for Georgia.

Jury procedures. *Selection.* Historically, there were some minimum requirements of property and competence for jury service. More recently, the idea of genuine random selection from the population, to achieve a cross section of the community, has been gaining ground. Since 1969, it has been the principle of selection in the federal courts. Most jurisdictions exempt some groups from jury service: policemen, lawyers, doctors, and so on. Some jurisdictions exempt women entirely. All jurisdictions excuse jurors if the service imposes undue hardship.

The voir dire

The commitment of important decisions to a random group of laymen has been moderated, particularly in the United States, by an elaborate screening, voir dire, conducted by trial counsel at the inception of a trial. The law permits counsel to challenge prospective jurors either for cause (if there is specific likelihood of bias) or, for a limited number, "peremptorily"—that is, without having to give a reason. American trial tradition attaches a great deal of significance to the strategies of juror selection, and in celebrated cases, the lawyers' voir dire examination has extended for several weeks.

Size and unanimity. Traditionally, the jury had 12 members and was required to reach its decisions with unanimity, a striking arrangement in Anglo-American countries that make all other decisions by majority vote. Over the years some modifications have been made. Some jurisdictions prescribe or allow in minor cases a jury of six. Oregon allows 10:2 verdicts—that is, a majority of 10—in all criminal cases, except capital ones; and in 1968 Great Britain followed the Oregon example. A few Southern states in the United States allow majority verdicts in misdemeanour trials. In civil cases, many states now allow 10:2 verdicts. When the required number (12 or 10) of jurors cannot agree on a verdict (termed a hung jury in the United States), the judge declares a mistrial, which means the case, unless it is withdrawn, must be tried anew. It is somewhat remarkable that "hung" juries occur with relative infrequency even when unanimity is required. In Europe juries operate under a different principle. Unless at least two-thirds of all the jurors vote guilty, the defendant must be acquitted. The U.S. Army court-martial jury also operates under this principle.

Sentencing. Although in civil cases the jury decides both issues of liability and amount of damages, in criminal cases it has been restricted generally to the issues of guilt, with punishment left to the judge. In some Southern U.S. states, however, the jury also decides the sentence within a range that the law provides. And in all jurisdictions that have retained the death penalty, if the jury finds the defendant guilty of the capital crime, it decides, or at least expresses an opinion, as to whether the death penalty is to be imposed. In most jurisdictions decisions on guilt and sentence are rendered simultaneously, but California has introduced the so-called second trial in capital cases, which occurs after a guilty verdict. At such a "second trial" pleas and evidence are presented for and against the imposition of the death penalty in the specific case, and only then is the jury asked to determine the sentence.

Control. Trial by jury is, of course, trial by jury under the supervision of a judge. The formula for sharing power between judge and jury is complex. First, the judge decides what the jury may or may not hear under the rules of evidence. Second, if the judge finds that the evidence presented leaves no factual issue to be resolved, he may withdraw the issue from the jury and direct the jury to acquit a defendant or, in a civil trial, find for either plaintiff or defendant; he cannot, however, direct a guilty verdict in a criminal trial. Third, in some jurisdictions the judge may, and often will, summarize the evidence or even discuss its weight. Fourth, the judge instructs the jury as to the law it should apply in reaching the verdict. Finally, if the judge finds the jury's verdict to be manifestly against the weight of the evidence, he may with one exception set it aside and order a new trial. The only exception is in a criminal case in which the jury renders an acquittal; under Anglo-American law (though not under European continental law) the jury's acquittal is always final.

The jury normally renders a general verdict, that is, a yes or no answer to liability or guilt, and does not give reasons for its decision. At times, however, courts employ "special verdicts" or "special interrogatories" in which the jurors are asked to decide a series of specific factual issues that bear on the overall verdict.

The controversy over the jury. The jury has been enmeshed in a perennial debate as to its merits, a debate that has recruited some of the great names in law and political philosophy, from Montesquieu, William Blackstone, and Thomas Jefferson to present-day theorists and practitioners, and has centred on three issues. First, there is the debate about collateral aspects: there are favourable contentions that the jury provides an important civic experience, that it makes tolerable the stringency of certain decisions, that it acts as a sort of lightning rod for animosity that otherwise might centre on the more permanent judge, and that the jury is a guarantor of integrity since it is said to be more difficult to bribe 12 men than one. Against this it has been urged that jury duty disenchants the citizen, that it imposes an unfair burden, that the jury is expensive, and that it makes it difficult to do away with the often interminable delays that exist in civil litigation.

The jury's competence

Second, there is the issue of the jury's competence. It is argued that the judge, by training, discipline, experience, and superior intelligence, is better able to understand law and facts than laymen drawn from a broad range of levels of intelligence, without experience in matters of this sort and without durable official responsibility. But it is also argued that 12 heads are better than one, that the jury as a group has wisdom and strength beyond that of its individual members, that it makes up in common sense and experience what it lacks in training, and that its very inexperience is an asset because it secures a fresh perception of each trial, avoiding the stereotypes that may infect the judicial eye.

Finally, there is the question of the jury's interpretation of the law. The critics complain that the jury will not follow the law, either because it does not understand it or because it does not like it, and hence will administer justice unevenly and that the jury produces a government by men and not by rule of law, against which Anglo-American political tradition is so steadfastly set. The jury's champions offer this very flexibility as its most endearing characteristic. They see the jury as a remarkable device for ensuring that the rigidity of the general rule can be shaped to justice in a particular case, with government by the spirit of the law and not by its letter.

Performance. In a recent survey of some 7,000 jury trials, the presiding judges were requested to reveal how they would have decided without a jury; the results of the survey provided some major insights into the actual performance of the contemporary American jury. In both civil and criminal trials, judge and jury agreed in 78 percent of all verdicts. In civil cases the disagreement in the remaining cases was symmetrically split; in 19 percent of the criminal cases, however, the judge would have convicted, whereas the jury acquitted. The letter of the law confines the jury to "finding the facts," but the deviations from the judge are mostly due to the jury's subtle, and not always conscious, injecting its sense of justice into a case that might go either way. This sense of justice may be concerned with the person of the accused, with the threat of too harsh a punishment, or with the content of the criminal law rules. Thus, close study of the jury has revealed it as a highly sensitive institution, subtle and discerning, moved by factors far beyond gross sympathy for the defendant. On the whole, the system tolerates and even appreciates these deviations of the jury from the judge, even if in rare cases they reflect what the national community experiences as intolerable local prejudice.

Lay judges. The jury, though a distinctive institution, must be seen in the larger context of other forms of lay participation in the judicial process, a feature of most legal systems since the days of Athens and Rome. Today, the eastern European bloc, West Germany, Austria, and some Scandinavian countries have mixed tribunals in which lay judges sit side by side with learned judges, in varying proportions, on both criminal and civil cases in trial and appeals courts. The largest of these mixed tribunals is the so-called jury in West Germany and France, with three learned and six lay judges forming one tribunal. At the other extreme are single lay judges, such as the English magistrates and the now almost defunct justice of the peace in the United States.

There is a difference in the performance of juries deliberating alone and lay judges deliberating jointly with judges on mixed tribunals. Only juries reach verdicts that are often significantly different from what the learned judges would have done. Lay judges in mixed tribunals --even when they outnumber the learned judges--exert little influence on the guilt–innocence issue, somewhat more on the punishment. But perhaps the very presence of lay judges ensures that the learned judges never stray too far from what the community would allow.

Justinian I

The spectacular and enduring legal and architectural monuments of the great Byzantine emperor Justinian's reign and the vivid personalities of the Emperor and his contemporaries have caused his age to be recognized as a highly significant period in world history. This recognition has indeed sometimes even led to an unjust appraisal of Justinian's work, particularly his ambitious foreign policy, causing his achievements to be seen out of per spective and in isolation rather than as part of a long and continuous imperial development.

Alinari—Giraudon

Justinian I, detail of a mosaic, 6th century. In the Basilica of San Vitale, Ravenna, Italy.

Early career. Justinian I (Flavius Petrus Sabbatius Justinianus, called the Great), Byzantine emperor from 527 to 565, was a Latin-speaking Illyrian, born in 483 of peasant stock in Tauresium (a village probably south of Niš in present-day Yugoslavia). The names Petrus Sabbatius are known only from a consular diptych of 521 and were dropped after his accession to the throne. Justinianus was a Roman name that he took from his uncle, the emperor Justin I, to whom he owed his advancement. Nothing is known of his early life except that he went, while still a young man, to Constantinople, where his uncle held high military command. He received an excellent education, though it was said that he always spoke Greek with a bad accent. When Justin became emperor in 518, Justinian was a powerful influence in guiding the policy of his elderly and childless uncle, whose favourite nephew he was. He was legally adopted by Justin and held important offices. In 525 he received the title of caesar and, on April 4, 527, was made coemperor with the rank of augustus. At the same time his wife, the former actress Theodora, who exercised considerable influence over him, was crowned augusta. On Justin I's death on August 1, 527, Justinian succeeded him as sole emperor.

Influence in government and accession to the throne

Foreign policy and wars. Two important facets of Justinian's foreign policy were his continuation of the age-long struggle with Persia and his attempt to regain the Roman provinces in the West, lost to barbarian invaders.

Eastern wars. When Justinian came to the throne, his troops were fighting on the Euphrates against the armies of the Persian king Kavadh (Qobād) I. After campaigns in which the Byzantine generals, among whom Belisarius was the most distinguished, obtained considerable successes, a truce was made on the death of Kavadh in September 531. His successor, Khosrow I, finally came to terms and the Treaty of Eternal Peace was ratified in 532. The treaty was on the whole favourable to the Byzantines, who lost no territory and whose suzerainty over the key district of Lazica (Colchis, in Asia Minor) was recognized by Persia. Justinian, however, had to pay the Persians a subsidy of 11,000 pounds of gold, and in return Khosrow gave up any claim to a subvention for the defense of the Caucasus.

War broke out again in 540, when Justinian was fully occupied in Italy. Justinian had somewhat neglected the army in the East, and in 540 Khosrow moved into Mesopotamia, northern Syria, and Byzantine Armenia and systematically looted the key cities, including Antioch. In 541 he invaded Lazica in the north. Belisarius, now reappointed commander in chief in the East (*magister militum per Orientem*), launched counteroffensives in 541 and 542 before his recall to Italy. The war dragged on under other generals and was to some extent hindered by the spreading of bubonic plague. A five years' truce was made in 545 and renewed in 551 but still did not extend to Lazica, which the Persians obstinately refused to restore, and a fierce struggle continued intermittently in this mountainous region. When the truce was again renewed in 557, however, Lazica was included. Finally, a 50 years' truce was negotiated, probably at the end of 561; Byzantium agreed to pay an annual tribute of 30,000 solidi (gold coins), and the Persians renounced all claim to the small Christian kingdom of Lazica, an important bulwark against northern invaders. They did, however, keep their hold over Suania, a small Lazican dependency. Justinian had thus maintained his eastern provinces virtually intact in spite of the vigorous offensives of the Persian King, so his policy on this front can hardly be described as a failure.

Regaining of lost provinces

Western wars. In the West, Justinian's policy followed inevitably from his conception of imperial responsibility; he considered it his duty to regain provinces lost to the empire "through indolence," and he could not ignore the trials of Catholics living under the rule of Arians (Christian heretics) in Italy and in North Africa. In both these regions he had reason to believe that his help was desired and that political circumstances were favourable to his intervention. In the Vandal kingdom of North Africa, an Arian domain, Catholics had been subject to frequent persecution. There was also a disputed succession to the throne after the aged Vandal king Hilderich, who had been in alliance with Constantinople and had ceased persecution of the Catholics, was deposed in favour of Gelimer in 530. At the same time, the Vandals were threatened by the Moorish tribes of Mauretania and south Numidia. In the face of considerable opposition from his generals and ministers, Justinian launched his attack on North Africa to aid Hilderich in June 533. The fleet of about 500 vessels set out with 92 warships. Procopius, Belisarius' legal advisor (assessor), reports that there were about 15,000 regular troops in the transport ships, along with 1,000 barbarian allies, as well as the bodyguard (buccellarii) of Belisarius, who was in command of the expedition. An unopposed landing was made in August, and by the following March (534) Belisarius had mastered the kingdom and received the submission of the Vandal ruler Gelimer. Northern Africa was reorganized as part of the empire and now included Sardinia, Corsica, the Balearic Islands, and Septem (Ceuta). Justinian placed the conquered territory under a praetorian prefect of Africa with seven provincial governors. There was also a commander in chief (magister *militum* per Africam) with five duces, or military leaders (four African and one of Sardinia). Both the prefecture and the magisterium *militum* per Africam were centred in Carthage. Justinian, with his usual care for detail, issued precise orders regulating the duties and salaries of these officials. The native inhabitants and the Catholic Church were able to regain land extorted from them by the Vandals. Heretics and Jews were penalized. The reconquest was celebrated by a triumph in Constantinople granted to Belisarius, and the treasure (part of the Vandal loot) was displayed together with the Vandal prisoners, who were subsequently enrolled into imperial regiments active on the eastern frontier.

After Belisarius' departure from North Africa in 534 there was some discontent, particularly among Roman soldiers who had married the dispossessed Vandal women and also among the Arians. Mutiny in the army, Moorish attacks, and revolts—particularly during 543–548—were, however, suppressed, and good government was restored along the North African coast. In 547 Septem was attacked by the Visigoths from Spain. This was followed by a disputed succession and a revolt by the Catholics of Córdoba in Spain. In 552 Justinian sent an expedition to support Athanagild, the claimant to the throne, and to strengthen the conquered part of southeast Spain, which for purposes of administration was attached to North Africa.

In Italy, the mother province of the Roman Empire in which the elder capital city (Rome) was situated, Justinian found a situation similar to that in North Africa and particularly favourable to his ambitions. Under his immediate predecessors, Italy had been ruled by a barbarian, the Ostrogoth Theodoric, who, though virtually independent, was the nominal representative of the Byzantine emperor. He was an Arian and, though at first a tolerant and wise ruler, toward the end of his reign had begun to persecute the Catholics. He had no male heir, and on his death there was not only antagonism between Arian Goths and Catholic Italians but a rift within the ranks of the Ostrogoths, some of whom were violently anti-Byzantine. Theodoric's daughter, Amalasuntha, appealed to Justinian for help, but she was killed in 535 by the Gothic nationalist party after the death of her young son Athalaric in 534.

Re-establishment of imperial administration in Italy

Thinking that this was now his opportunity to support his fellow Catholics and to reassert direct control over the province, Justinian dispatched an army to Italy via Dalmatia and sent Belisarius with a fleet to attack Sicily, while an embassy set off to gain the support of the powerful Franks now settled in Gaul. After the defeat of the Ostrogothic king Witigis and the capture of Ravenna in 540, imperial administration was re-established in Italy under the praetorian prefect Athanasius. Rigorous financial exactions and the rapacity of the soldiers made the new regime unpopular. Many of the Ostrogoths had never submitted, and after the two short and unfortunate reigns of Hildebad and Eraric, they proclaimed Totila (Baduila) as their king in the autumn of 541. Totila proved a vigorous and able leader: in 542 he took the offensive in southern Italy and in 543 captured Naples. In 544 Belisarius was sent against him with inadequate forces. As contributing factors to the successes of Totila, Belisarius encountered discontent among the Italians at the financial scrutiny of Justinian's auditors, as well as demoralization among the troops stationed there, because of arrears of pay. City after city was captured by the Ostrogoths until only Ravenna, Otranto, and Ancona remained in Byzantine hands. Belisarius could make no headway without adequate reinforcements. which his wife Antonina's personal appeal to Justinian failed to obtain, and in 549 he was recalled to Constantinople. Meanwhile, Totila took over the administration of the country, though at the expense of alienating the great landowners. He hoped to come to terms with Justinian, but in 552 a powerful army was sent against him under the eunuch commander Narses. Totila was defeated by superior numbers and strategy and was mortally wounded at the battle of Busta Gallorum. Narses entered Rome and soon afterward defeated Ostrogothic resistance at Mount Lactarius, south of Vesuvius. Pockets of resistance, reinforced by Franks and Alemanni who had invaded Italy in 553, lingered on until 562, when the Byzantines were in control of the whole of the country.

Justinian hoped to restore the social and economic well-being of Italy by a series of measures embodied in the Pragmatic Sanction of 554. These dealt with such problems as the restoration of confiscated property, the return of slaves and *coloni* (serfs) to owners and landlords, and the collection of taxes. The country was so ravaged by war, however, that any return to normal life proved impossible during Justinian's lifetime, and only three years after his death part of the country was lost to the Lombard invaders.

On the northern frontier in the Balkans, the Roman provinces faced continual attacks from barbarian raiders. Thrace, Dacia, and Dalmatia were harried by Bulgars and Slavs (known as Sclaveni). In 550–551 the invaders even wintered in Byzantine territory, despite the efforts of the army to dislodge them. In 559 the Bulgars and Slavs were joined by the Kotrigur Huns, who got as far south as Thermopylae and eastward through Thrace to the long wall protecting Constantinople. The veteran Belisarius saved the situation by mustering the civilian population. In 561 the Avars joined the raiders but were bought off with a subsidy. These attacks from beyond the Danube did immense damage, and although fortifications and defense works were built and strengthened in the Balkans and in Greece, the newcomers were neither effectively repulsed nor assimilated by the Byzantines. The Slavs, and later the Bulgars, eventually succeeded in settling within the Roman provinces. Failure to keep them out is one of the criticisms sometimes made against Justinian. The Slavs in the Balkans and in other parts of the empire, however, did provide a source of manpower, which was particularly welcome in view of the ravages of the 6th-century bubonic plague.

The Code of Justinian

Internal policy. Legislation. Justinian's best known work was as a codifier and legislator. He greatly stimulated legal studies, and in 528 he set up a commission to produce a new code of imperial enactments or constitutions. This was published in 529, and in 530 a second commission sat to codify the Roman jurists; the work of this commission, known as the Digest, appeared in 533. At the same time a handbook for the use of law students, the Institutes, was prepared and published in 533. A second edition of the Codex Justinianus containing Justinian's own laws up to the date of issue was published in 534. His subsequent legislative work to 565 is known as the Novels (Novellae constitutiones). Much of this legal activity was supervised and inspired by Tribonian, a gifted advocate, who had by 529 become quaestor of the sacred palace, the most important judicial minister. He probably played a major part in framing these laws.

Administration. Justinian was genuinely concerned with promoting the well-being of his subjects by rooting out corruption and providing easily accessible justice. This involved adequate control over provincial governors and some administrative reorganization. At the same time it was essential to provide revenue for Justinian's various campaigns, particularly in the West. Justinian knew how to pick his servants. He had two outstanding ministers. One was John of Cappadocia from Asia Minor—outspoken, blunt, efficient, incorruptible, treating rich and poor alike, a clerk who rose to the office of praetorian prefect in 531; he was a man with many enemies, including the empress Theodora, who achieved his dismissal in 541. The other was Peter Barsymes, a Syrian clerk in the financial department of the praetorian prefecture, who became praetorian prefect of the East in 543 and was evidently a careful administrator, even though his name is blackened by Procopius.

Administrative reforms

The first important reform was the prohibition of the *suffragia*, or sale of provincial governorships, in 535, for it was clear that desire to recoup oneself for this heavy initial outlay to buy the offices accounted for much extortion suffered by the provincials. Instructions were drawn up for provincial governors, and the position of the *defensores* civitatis, the officials whose duty it was to protect the cities, was strengthened and their jurisdiction widened so that provincials did not need to have the expense of going to the governor's court. At the same time there was a reorganization of the provincial system. Changes were made in the dioceses of Asiana, Pontica, and Oriens and in Egypt, involving the abolition of the vicariates (administrative officials) and the regrouping of the provinces, thus effecting some economy. In some cases (*e.g.*, Egypt and Cappadocia, where only purely internal civil disorders might arise), civil and military authority was combined and the governor given the higher rank of *spectabilis* (notable) with final jurisdiction in cases of less than 500, later 750, solidi. But where it might be necessary for the duces to defend a strategic point against an enemy, the civil and military powers remained distinct, as in Syria.

Financial reforms

These rather piecemeal changes sometimes resulted in situations in which, despite Justinian's efforts, the provincial governor was unwilling or not sufficiently strong to enforce good government; and with the disappearance of the larger unit of the vicariate, there was nothing left but an expensive appeal to Constantinople. In order to meet these difficulties, there was a partial renewal of a different kind of vicariate after John of Cappadocia's fall. Under both John and his successor, Peter Barsymes, finance was of primary concern, since wars and subsidies to foreign powers and barbarian rulers were expensive. Regained provinces, especially in Italy, were often so devastated that they could not pay their way, and income from these provinces was, therefore, very irregular. The money was found, however, largely through the financial ability of Justinian's two ministers. Taxes were efficiently collected, accounts audited, misappropriations tracked down, public expenses pruned, and city spectacles and municipal services cut down—thus alienating both rich and poor alike in the provinces and in the capital. One important source of revenue came from trade and industry that had long been vigorously promoted in the Roman Empire, particularly with India, Southeast Asia, and China. Spices, perfumes, and raw silk were among the most important imports, silk coming either by way of Ceylon and Persia or by caravan through Central Asia. Persian hostility could cause prices to rise or even stop supplies. A feature of this period was the introduction of the silkworm from Sogdiana (Samarkand and Bukhara), so that the Byzantine market eventually achieved an independent supply. The sale of raw material was a government monopoly and Peter Barsymes, Justinian's finance minister, extended this to silk fabrics, thus creating another lucrative state monopoly.

Government attempts to root out abuses and its attacks on vested interest, whether of rich or poor, were unpopular. In 532 public discontent was voiced most dramatically in Constantinople by the Nika revolt (Nika, "Conquer" or "Win," was the cry of rival factions at the races in the hippodrome). The city parties known as the Greens and the Blues united and attacked and set fire to the city prefect's office and public buildings, as well as to part of the imperial palace and the Church of the Holy Wisdom adjoining it. Then they gathered in the hippodrome, calling for the dismissal of the city prefect and of Justinian's two ministers, John the Cappadocian and the advocate Tribonian. Justinian agreed, but the mob was by now out of control and perhaps exploited by interested parties. The next day the late emperor Anastasius' nephew Hypatius was proclaimed emperor and was supported by certain senators. The crowd and the usurper assembled in the hippodrome. At this point two factors saved Justinian. Theodora persuaded him to stand his ground, and the generals in the city, Belisarius and Mundus, mustered what troops they could and resolutely turned on the mob in the hippodrome. They gained the upper hand, helped by Narses, though only at the cost of a wholesale massacre of the rebellious citizens. Hypatius was executed. The uprising had nearly cost Justinian his throne.

Buildings. Justinian's costly building program was motivated by his sense of imperial responsibility. It is described in detail in Procopius' book, On Buildings (De aedificiis), and ranged from assisting civic authorities in special need, such as rebuilding cities devastated by earthquakes (*i.e.*, Antioch in 528), to the provision for aqueducts and bridges, or the strengthening of the massive fortifications on the extensive frontiers, the remains of which can still be seen. Monasteries, orphanages, and hostels were provided, as well as superb churches, such as Hagia Sophia in Constantinople, the daring construction of which was owed to the genius of the mathematicians and engineers Isidore of Miletus and Anthemius of Tralles, and which still stands as a breathtaking monument to Byzantine genius.

Ecclesiastical policy. To treat Justinian's ecclesiastical policy separately is in a sense misleading, since it obscures the extent to which church and state were indissolubly linked as essential aspects of a single Christian empire, the terrestrial counterpart of the heavenly polity. It

Support of orthodoxy

was therefore the duty of Justinian, as it was for later Byzantine emperors, to promote the good government of the church and to uphold orthodox teaching. This explains why so many of his laws deal in detail with religious problems, being either directed against pagans or heretics or concerned with matters of ecclesiastical and monastic discipline. Pagans, heretics, and Samaritans, for instance, were forbidden to teach any subject whatsoever, and though fully appreciative of the classical heritage, Justinian expelled pagan teachers from the once famous Academy at Athens, an action directed against paganism rather than Greek philosophy. In 542–543 Justinian took the initiative in condemning the teaching of Origen, the great theologian of Alexandria in the 3rd century, which was spreading in monastic circles in Palestine. His edict, which had the support of the episcopate and the Pope, also anathematized Origen himself.

Justinian's main doctrinal problem was the conflict between the orthodox view accepted at the Council of Chalcedon (451), that the divine and human natures coexist in Christ, and the Monophysite teaching that emphasized his divine nature. Monophysitism was strongly held in Syria and Egypt and was closely allied to growing national feelings and resentment of Byzantine rule. Justinian, whose wife, Theodora, was a strong champion of the Monophysites, did not wish to lose the eastern provinces, but, on the other hand, any concessions to them would almost certainly alienate Rome and the West. Soon after his accession he had tried to win over the Monophysite leaders, treating them with such consideration that Pope Agapetus protested. He had made a further attempt at compromise when in 544 he issued an edict condemning parts of the writings of Theodore of Mopsuestia, Theodoret of Cyrrhus, and Ibas of Edessa on the ground that these were tainted with Nestorianism (a heretical view holding that there are two separate Persons in the Incarnate Christ, the divine and the human), thus hoping to placate the Monophysites, who charged the Chalcedonians with Nestorian sympathies. This edict roused an outcry in the West but had some support from the eastern bishops. Pope Vigilius, summoned to Constantinople, knew that if he supported imperial policy he would be repudiated by the West. The second Council of Constantinople (553) finally reaffirmed the Chalcedonian position and condemned the so-called Three Chapters (this originally referred to Justinian's three heads of condemnation but was later used of the suspect writings). Justinian achieved nothing by the episode of the Three Chapters: he did not conciliate the Monophysites, he enraged Antioch by the attack on its teachers, and he aroused Rome particularly by his handling of Pope Vigilius and his attempt to determine doctrinal matters. The decrees of the council were not accepted by Vigilius' successors, and a schism thus occurred between Rome and Constantinople lasting until 610.

Toward the end of his reign, Justinian to some extent withdrew from public affairs and was occupied with theological problems. He even lapsed into heresy when, at the end of 564, he issued an edict stating that the human body of Christ was incorruptible and only seemed to suffer (the doctrine called Aphthartodocetism). This roused immediate protest and many ecclesiastics refused to subscribe to it, but the matter was dropped with the Emperor's death, at which time the throne passed to his nephew Justin II on November 14, 565. To describe Justinian's interest and activity in church affairs as caesaropapism (state in control of the church) is misleading. Justinian, like succeeding Byzantine emperors, regarded himself as the vicegerent of Christ, and the Eastern Roman Empire knew no such clear-cut distinction between church and state as developed in Latin Christendom.

Character and significance

Assessment. Two mosaic pictures of Justinian exist at Ravenna, one in San Vitale, the other in Sant' Apollinare Nuovo. In appearance he was somewhat above middle height, with fresh colour in his cheeks; he had an extraordinary power of doing without food and rest and was called "the emperor who never sleeps." Justinian was a man of large views and great ambitions, of wonderful activity of mind, tireless energy, and an unusual grasp of detail. In attempting to restore the Old Roman Empire, Justinian's work has all too often been regarded in isolation. His aims—though by reason of historical circumstances on a more grandiose scale than most rulers—were those of nearly every Byzantine emperor, even though such plans were generally doomed to failure. It should not be forgotten that Justinian renewed Byzantine rule and Hellenic influence in parts of Italy for several centuries and that, for over a half century, sound government was given to North Africa, from which came salvation for Constantinople in the person of Heraclius in 610. Justinian's legal work and the magnificent Great Church (as Hagia Sophia was called) have won him unending fame, and the literature, poetry, and philosophical achievements of his contemporaries witnessed to the outstanding quality of 6th-century civilization in the Eastern Roman Empire.

Juvenal

Juvenal (Decimus Junius Juvenalis) was the last and most powerful of the Roman satiric poets. Since he seldom speaks directly of himself in his poems and gives no important facts about his life and character, conjecture —based on the topical and personal allusions in his Satires, three poems about him by the epigrammatist Martial, a few references by later writers, and an inscription (now lost)—must take the place of documentation.

Life. The one contemporary who ever mentions Juvenal is Martial, who claims to be his friend, calls him eloquent, and describes him as living the life of a poor dependent cadging from rich men. There are a few biographies of him, apparently composed long after his death; these may contain some nuggets of fact, but they are brief, ill-proportioned, and sometimes incredible.

From these sparse sources it can be inferred that Juvenal was born in the town of Aquinum southeast of Rome, perhaps between AD 55 and 60; that his family was well-to-do; and that he became an officer in the army as a first step to a career in the administrative service of the emperor Domitian (AD 81–96), but failed to obtain promotion and grew embittered. He wrote a satire declaring that court favourites had undue influence in the promotion of officers, and for this he was banished—possibly to the remote frontier town of Syene, now Aswān, in Egypt—and his property was confiscated. In 96, after Domitian's assassination, he returned to Rome; but, without money or a career, he was reduced to living as a "client" on the grudging charity of the rich. After some years his situation improved, for autobiographical remarks in Satire 11 show him, now elderly, living in modest comfort in Rome and possessing a farm at Tibur (now Tivoli) with servants and livestock. Although still pessimistic, the later Satires show a marked change of tone, and some touches of human kindness, as though he had found some consolation at last. Though no details of his death exist, he probably died in or after 127.

The Satires. Juvenal's 16 satiric poems deal mainly with life in Rome under the much-dreaded emperor Domitian and his more humane successors Nerva (96–98), Trajan (98–117), and Hadrian (117–138). They were published at intervals in five separate books. Book One, containing Satires 1–5, views in retrospect the horrors of Domitian's tyrannical reign and was issued between 100 and 110. (The historian Tacitus, a contemporary of Juvenal, was also embittered by the suspicion and fear of that epoch.) Book Two, the single, enormous Satire 6, contains topical references to the year 115. The third Book, with Satires 7, 8, and 9, opens with praise of an emperor—surely Hadrian, who endowed a literary institute to assist deserving authors—whose generosity makes him the sole hope of literature. There is no datable allusion in Book Four, which comprises Satires 10–12. Book Five, made up of Satires 13, 14, 15, and 16, has two clear references to the year 127.

Themes of the Satires

The Satires attack two main themes: the corruption of society in the city of Rome and the follies and brutalities of mankind. In the first Satire, Juvenal declares that vice, crime, and the misuse of wealth have reached such a peak that it is impossible *not* to write satire, but that since it is dangerous to attack powerful men in their lifetime, he will take his examples from the dead. He does not maintain this principle, for sometimes he mentions living contemporaries; but it provides a useful insurance policy against retaliation, and it implies that Rome has been evil for many generations. Male homosexuals are derided in two poems: passives in Satire 2, actives and passives together in Satire 9. In the third Satire a friend of Juvenal explains why, abandoning the humiliating life of a dependent, he is determined to live in a quiet country town and leave crowded and uncomfortable Rome, which has been ruined by Greeks and other foreign immigrants; while in the fifth Juvenal mocks another such dependent by describing the calculated insults he must endure on the rare occasions when his patron invites him to dinner. The fourth relates how Domitian summoned his cringing Cabinet to consider an absurdly petty problem: how to cook a turbot too large for any ordinary pan.

Satire 6, over 600 lines long, is a ruthless denunciation of the folly, arrogance, cruelty, and sexual depravity of Roman women. The seventh Satire depicts the poverty and wretchedness of the Roman intellectuals who cannot find decent rewards for their labours. In the eighth, Juvenal attacks the cult of hereditary nobility. One of his grandest poems is the tenth, which examines the ambitions of mankind—wealth, power, glory, long life, and personal beauty—and shows that they all lead to disappointment or danger: what mankind should pray for is "a sound mind in a sound body, and a brave heart." In Satire 11, Juvenal invites an old friend to dine quietly but comfortably and discourses on the foolishly extravagant banquets of the rich. The 12th is a quiet little poem distinguishing between true and mercenary friendship. In the 13th Juvenal offers sarcastic consolation to a man who has been defrauded of some money by a friend, telling him that such misdeeds are commonplace; while in the 14th he denounces parents who teach their children avarice. Satire 15 tells of a riot in Egypt during which a man was torn to pieces and eaten: a proof that men are crueller than animals. In the 16th Juvenal announces that he will survey the privileges of professional soldiers, an important theme; but the poem breaks off at line 60 in the middle of a sentence: the rest was lost in ancient times.

Style

Technically, Juvenal's poetry is very fine. The structure of the individual Satires is—with a few exceptions—clear and forceful. They are full of skillfully expressive effects in which the sound and rhythm mimic and enhance the sense; and they abound in trenchant phrases and memorable epigrams, many known to people who have never heard of Juvenal: "bread and circuses"; "slow rises worth, by poverty oppressed"; "who will guard the guards themselves?"; "the itch for writing"; "the greatest reverence is due to a child." Vivid, often cruelly frank, remarks appear on almost every page: after describing a rich woman's efforts to preserve her complexion with ointments, tonics, donkey's milk, and poultices, Juvenal asks, "Is that a face, or an ulcer?" He describes striking and disgusting scenes with a clarity that makes them unforgettable: we see the statues of the emperor's discarded favourite melted down to make kitchenware and chamber pots; the husband closing his disgusted eyes while his drunken wife vomits on the marble floor; the emperor Claudius (poisoned by his consort) "going to heaven" with his head trembling and his lips drooling long trains of saliva; the impotent bridegroom whimpering while a paid substitute consoles his wife. Juvenal is not a poet to be relished by soft hearts or optimists, but he has power.

Influence. His work was forgotten for a time after his death. Later it began to be read and quoted, first by the Christian propagandist Tertullian—who lived and wrote about AD 200 and was as full of passionate indignation as Juvenal—then by other Christian authors and also by pagan students of literature. A commentary on the Satires (which survives) was compiled at some time between 350 and 420, and two editions of the text were produced, based on one master copy: apparently the only copy that had been preserved till then. Thenceforward Juvenal has never ceased to be studied and admired: he has been imitated by many satirists; for instance, by Giovanni Boccaccio, Nicolas Boileau, and Lord Byron.

BIBLIOGRAPHY

Bibliographies: G. HIGHET, *Juvenal the Satirist* (1954), pp. 339–346 lists and describes 81 books and articles dealing with many aspects of Juvenal's life and art. A more recent, specialized bibliography appears in sect. 6 of M. COFFEY'S new introduction to the reissue of J.D. DUFF'S edition of Juvenal's satires (1970).

Editions: The best text of the satires is that edited by U. KNOCHE with a critical apparatus in Latin (1950); W.V. CLAUSEN'S edition (1959), is also recommended. The best English-language edition with explanatory annotations is by J.D. DUFF (1898, reissued 1970). It is expurgated, omitting satires 2 and 9 and parts of 6, as well as occasional sentences elsewhere.

Translations: The first good English verse translation was published by JOHN DRYDEN and a group of friends, *The Satires of Decimus Junius Juvenalis* (1693), and is still highly readable. Less vivacious but equally vigorous is that by WILLIAM GIFFORD, *Satires, with the Satires of Persius* (1802, reissued with revisions by J. WARRINGTON, 1954). G.G. RAMSAY'S prose version, *Juvenal and Persius* (Loeb series, 1918; rev. ed., 1961), misses much of the poetic values, but is reliable as a guide to the meaning. The best modern English verse rendering is by ROLFE HUMPHRIES, *Satires* (1958), bright, slangy, rather slapdash. SAMUEL JOHNSON adapted satire 3 in his "London" (1738) and satire 10 in "The Vanity of Human Wishes" (1749). There are translations into French, German, Italian, and Spanish.

Biography and criticism: G. Highet's book (cited above) reconstructs the poet's career, analyzes each of the satires individually, estimates their value as poetry, and surveys his influence in later literature. Various aspects of Juvenal's work have recently been examined by W.S. ANDERSON, "Juvenal and Quintilian," *Yale Classical Studies,* 17:1–93 (1961); M. COFFEY, in his new introduction (cited above); H.A. MASON, "Is Juvenal a Classic?" pp. 93–176 in J.P. SULLIVAN (ed.), *Roman Literature: Satire* (1963); E.J. KENNEY, "Juvenal: Satirist or Rhetorician?" and D. WIESEN, "Juvenal's Moral Character," both in *Latomus,* vol. 22 (1963).

(G.Hi.)

Kabuki Theatre

For nearly 400 years Kabuki theatre has been a popular entertainment in Japan. It is a rich blending of realism and formalism, of music, dance, mime, and spectacular staging and costuming. In modern Japanese, the word is written with three characters; ***ka*** signifying "song"; *bu,* "dance"; and *ki,* "skill."

To many Westerners, Kabuki is the most perfect and complete theatrical expression. Its highly lyrical plays are regarded, with notable exceptions, less as literature than as vehicles for its actors to demonstrate their enormous range of skills in visual and vocal performance. These actors have carried the traditions of Kabuki from one generation to the next with only slight alterations. Many of them trace their ancestry and performing styles to the earliest Kabuki actors and add a "generation number" after their names to indicate their place in the long line of actors bearing the same name.

Traditionally, a constant interplay between the actors and the spectators took place in the Kabuki theatre. The actors frequently interrupted the play to address the crowd, and the latter responded with appropriate praise or clapped their hands according to a prescribed formula. They also could call out the names of their favourite star

actors during the performance. Since Kabuki programs ran from morning to evening and many spectators often attended for only a single play or scene, there was a rather constant coming and going in the theatre. At mealtimes food was served to the viewers. The programs incorporated themes and customs that reflected the four seasons or inserted material derived from contemporary events. Unlike most Western theatres, in which since the late 17th century a proscenium arch has separated actors and audience, the Kabuki performers constantly intruded on the audience. When two *hanamichi*, elevated passageways from the main stage to the back of the auditorium, were used, the audience was fenced in by three stages.

The Kabuki form dates from the late 16th century, when a former priestess, Okuni, achieved popularity with parodies of Buddhist prayers. She gathered a company of women, introduced bolder dancing, and began a tradition whose long history was both notorious for the sensuality of its performers and illustrious for its art. Kabuki owes much to the tastes of the Tokugawa period (1603–1867), during which the ukiyo-e school of artists used as subjects for their wood-block prints the everyday scenes and the brilliant costumes of the common people. Always able to assimilate new forms and ideas with ease, Kabuki came rapidly to reflect this interest in the commonplace as well as the sensational. As a result its thematic material is often pedestrian, but the Kabuki has invariably infected it with great aesthetic appeal.

Relations with other Japanese theatre

Kabuki is regarded as an eclectic theatre incorporating earlier traditions of Japanese drama. Bugaku, the dance ceremony of the imperial court, and the Nō theatre (*q.v.*), both of great antiquity, were long the exclusive domain of the nobility and the warrior-aristocrats known as samurai; Kabuki became the theatre of the townspeople and the farmers. Bugaku and Nō have a fragile elegance and an extreme subtlety of movement. In contrast, Kabuki is somewhat coarse and unrestrained, and its beauty is gaudy and extravagant. It appeals to the senses rather than to the intellect.

The strongest ties of Kabuki are to the Nō, its predecessor, and to *jōruri*, the puppet theatre that developed during the 17th century. Kabuki derived many of its materials from the Nb and constantly parodied this theatre. When Kabuki was banned in 1652, it re-established itself by adapting and parodying the Kybgen, the plays that provided comic interludes during the Nb performances.

Kabuki programs

Kabuki plays and playwrights. Within each of these categories, the subject matter creates such distinctions as that between the historical play (*jidaimono*) and the domestic play (sewamono). A Kabuki program generally presents them in this order, separated by one or two dance plays featuring ghosts, courtesans, and other exotic creatures. It ends with a lively dance finale (*ōgiri shosagoto*) with a large cast.

The historical plays often depicted events that were more or less contemporary but were moved back in time to satisfy censors. One of the Kabuki masterpieces, the cycle *Chūshingura* ("Treasury of Royal Retainers"; 1748), a collaboration of three leading playwrights, was based on an actual event in 1702 but was shifted to an earlier period. In this process, the *jidaimono* became an interesting mixture of fact and fiction.

The early domestic plays developed out of this custom of dramatizing recent, sensational events. They were presented as an added attraction to the jidaimono and were somewhat related to it in theme. The sewarnono became a distinct genre around the middle of the 19th century in the plays of Kawatake Mokuami, which brought about a renewed focus on the lives of everyday people and a revival of realism on the Kabuki stage. Among the sensational topics of the sewamono, which flourished in the 17th century, the love-suicide (*shinju*) theme figures prominently because of its appeal to the townspeople. The dialogue and events of these plays are more realistic than those of the historical genre. Playwrights tried at times to link the historical and domestic plays in a program by maintaining that the principal characters of the former appeared again under new names in the latter.

Although the basic purposes of Kabuki are to entertain and to allow the actors to demonstrate their skills, there is a didactic element, an ideal represented by the notion of kanzen-chdaku ("reward the virtuous and punish the wicked"). Thus the plays often present conflicts involving such religious ideas as the transitory nature of the world (from Buddhism), and the importance of duty (from Confucianism), as well as more general moral sentiments. Tragedy occurs when morality conflicts with human passions. At the same time, erotic, grotesque, and sadistic elements are often introduced to please public taste, but such scenes rarely fail to achieve a high aesthetic stature.

Structurally, the plays often comprise two or more themes in a very complex plot, but they lack the strong unifying element for which Western drama strives. Kabuki plays include a variety of intermingled episodes, which develop toward a final dramatic climax.

Written texts

The early written texts of Kabuki themselves were more scenarios than fully developed scripts. Like the scenarios of the commedia dell'arte in the West, they were essentially notes on plot that gave the performer both license and obligation to improvise upon them. Over time many of these texts were expanded and revised, as were the productions based on them, especially as single authorship gave way to collaboration. In this system, subordinate writers filled in the outline provided by the chief playwright after consultation with the theatre manager and principal actors.

Despite the collaborative nature of much Kabuki drama, several individual playwrights stand out for their writing and innovation. Chikamatsu Monzaemon (1653–1724), the earliest writer of note, has been called the Shakespeare of Japan. For the puppet theatre and the Kabuki, he wrote over 100 full-length plays, of which about 50 authenticated ones survive. Some of his famed works featured the double suicide of lovers, drawn from actual cases. Namiki Gohei (1747–1808) first clearly separated the *jidaimono* and sewamono genres. The dance dramas of Sakurada Jisuke I (1734–1806) are still popular. The complete definition of the sewamono was the work of Kawatake Mokuami (1816–93).

The most important work on playwriting is Kezairoku ("Valuable Hints on Playwriting"), written in 1801 by Namiki Shbzb II (?–1807). There are no Tokugawa writings dealing with the theoretical aspects of Kabuki. Popular introductions, dictionaries, and other miscellaneous works on Kabuki were written by novelists.

Theatre and stage design. Kabuki is commonly known as the *shibai*, a term that may mean "play" or "theatre." In the early, outdoor Kabuki, shibai referred to the grass-covered viewing area around the stage or to the broad, open space directly in front of the stage. Later, it came to be identified with the theatre structure itself. Originally, most spectators sat on carpets or mats spread on the ground; when it rained, the performance was cancelled. The more affluent occupied an elevated, roofed structure (*sajiki*), a social distinction by elevation that was retained when Kabuki went indoors.

Stage components

The stage was borrowed entirely from the Nb, but gradually acquired its own features. The entire theatre was placed under a single roof during the Genroku period (1688–1703). About 1716 the hanarnichi ("flower path"), originally a temporary path for sending flowers and gifts to the actors, became a permanent fixture for the entrance and exit of the performers. This passageway, which permitted the actors to enter the main stage from the rear of the auditorium, was first located at the centre but was later shifted to stage right. (The terms right and left as used here and in the remainder of the article refer to the actor's right and left when facing the audience.) When necessary to the production, a narrower ramp was placed on stage left. With the main stage, the three virtually encircle the audience. The *hanamichi* can serve a multitude of functions. It can represent a road, a river, or the banks of a river. On occasion, the actors may start down the left *hanamichi*, follow the passageway in the back of the auditorium, walk onto the right *hanamichi*, and finally appear on the main stage. During this time, the main stage can be prepared for the next scene.

Another special feature is the revolving stage (*mawari*butai). In 1758, the Osaka playwright Namiki Shōzō I used this device to show two simultaneous events. In 1847 two concentric stages (*janome-mawashi*) revolving around a common centre were introduced. This invention could simulate such events as two boats passing each other. Other stage devices include the rising platform (seridashi) and the trap door (*suppon*). These mechanisms were installed when the area under the stage was enlarged, and the actors could appear from below. The actors could emerge from the *suppon*, located on the hanantichi, when they played spirits, ghosts, and magicians or when they appeared in a dream sequence. In Sanmort Gosan *no* Kiri ("The Story of Ishikawa Goemon"), Goemon, the notorious thief, stands in a large temple gate that emerges from below the stage, and in *Sendaihagi* ("The Dispute in the Household of Lord Sendai"), a mansion rises through the stage floor to a point above the main stage, and the action occurs under the floor of this huge structure.

The curtains behind the apron are the draw curtain (*joshikimaku* or hikimaku) and the scene curtain (*dōgumaku.*) The brilliantly coloured draw curtain, used mainly for changing scenes, is often opened to musical accompaniment. It can serve a ceremonial function as well, as in the grand opening scene of *Chūshingura*.

Properties and lighting

Large stage properties (*ōdōgu*) include a special platform (yatai or *nijubutai*), which is 16.7 inches (42.4 centimetres) high if used for a domestic play and 25 inches (64 centimetres) or 33.4 inches (84.8 centimetres) high for an historical play. For plays adapted from the puppet theatre, a chanter's platform (choboyuka) for the musicians and chanters is placed at an angle at the left corner of the stage. In the dance plays, which feature a style of Kabuki music known as *nagauta*, singers sit directly in front of the audience on a two-tiered, carpeted platform (*hinadan*) and such dance music as kiyomoto and *tokiwazu* is performed on another platform to the right.

The role of the large property man (dddgugata) appeared early in the development of Kabuki and became hereditary. The dddgugata even supervised the construction of theatre. Hasegawa Kambei XI (1781–1841) was especially known for his many important inventions for the Kabuki stage.

The small stage properties (koddgu) are those held by the actors. A row of cherry blossoms strung from the ceiling is an *ōdōgu*, whereas the cherry branch, which can be broken, is a koddgu. Among the many other small properties is the long, stiff wire (*sashigane*), that has a butterfly or bird on the end and is manipulated by the stage assistant (kdken).

The modern Kabuki stage is illuminated by electric lights, but no dimming of lights or change in colour is allowed. Following the ancient traditions of performance, the light or darkness is indicated by the behaviour of the actors and by the symbolic opening and closing of windows. A face light (tsura-akari), a candleholder attached to a long stick, may be wielded by the *kōken* to achieve certain traditional moods. When, for example, the leading actor appears on the harzamichi or performs a *mie*, striking an attitude, the *kōken* brings the light near his face to suggest the effect of a closeup. Before the electric lamp, candles were used for lighting. In the Kyōto–Osaka area there was decorative lighting from the ceiling of the main stage, a custom still used occasionally.

Costumes, wigs, and makeup

Kabuki costumes, whether the realistic fashions of the sewamono or the stylized garments of the *jidaimono*, are based on historically authentic Japanese dress. Many standard costumes exist for various character types as well as historical periods. Improvements in costumes and their manipulation followed advances in weaving and dyeing, and the Kabuki stage and popular fashions have long had a strong influence upon one another.

An unusual feature of Kabuki is the practice of making costume changes in full view of the audience, often as a symbolic or metaphorical expression of the play's action or the characters' experiences. The two methods for such change are, first, the bukkaeri, in which the threads holding the outer garment are pulled out at the shoulders, the upper garment then falling to reveal a new and striking inner one, and, second, the hikinuki, in which both the upper and lower portions of the costume are removed with the aid of the *kōken*, who must not disturb the tempo or rhythm of the dance in progress. The former technique is often used to show sudden changes in character, as when a scoundrel reveals his true colours, or to signify responses to events, such as the angry and humiliated reaction of a Buddhist monk to his seduction by a beautiful woman. The latter technique is used in Musume *Dōjōji* ("Dōjōji Dance"), in which the basic pattern of the successive costumes remains the same while the background colour changes.

Costumes, wigs, and makeup form an integral unity for the actor, reflecting the rather clearly defined "types" that exist in Kabuki for both plays and characters. Hair styles are distinguished by sex, age, class, and occupation, and like the costumes they are realistic or stylized. The fantastic characters of the "rough plays" (aragoro) popular in the Edō (modem Tokyo) area wore highly stylized "wheel wigs" (kurumabin) of the heroes or "great hundred-day wigs" (daibyaku) of the brigands. The female impersonator (onnagata) wears wigs that are functional as well as decorative. Of these, the gattari can collapse to one side, the sabaki has forelocks that remain in place while the rest falls into disarray, and the *sō-sabaki* becomes totally dishevelled as during a murder or suicide. Ghosts and other fantastic and supernatural characters require special wigs. Persons caring for the wigs are distinguished from both wigmakers and hair stylists, and the male and female wigs have separate hair setters.

The stylized makeup for the jidaimono comprises white and red types, indicative, respectively, of the good and bad characters. The romantic rascals (iroaku) wear white. A special type, kumadori, consists of bold designs in either red or blue. The warm red represents anger, strength, or justice; the cool blue, wickedness, death, ghosts, or fiends. Comic qualities may be indicated by the red kurnadori, and animal figures may have their special kumadori.

Conventions of staging

Staging of Kabuki. Despite the ease with which it can assimilate new forms, Kabuki is a very formal theatre. It retains numerous conventions adapted from earlier forms of theatre that were performed in shrines and temples. The opening call of a Kabuki production, "*Tōzai-tōzai*" ("East–west, east–west"), was originally addressed to the audience seated in the left and right sides of the viewing area, and the tradition remains, although the seating arrangement has altered.

In Japan the left is regarded as sacred, the right as profane, a factor that is the basis of many conventions. The principal curtain is opened from right to left. Although stage right (shimote, the westerly direction) is the entrance, stage left (*kamite*, the easterly direction) is the position of honour. Characters of high rank, guests, and messengers cross to the *kamite* and climb the double-tiered platform (*nijū-butai*). The master of the house must retire to the shimote from the katnite before paying respects to his guests. Men begin moving on their left foot, women on their right. In climbing stairs, men are on the left, women the right. These traditions can be used to dramatic purpose: in *Chūshingura* a young lord, in a state of great anxiety, starts to climb a platform with his right foot before realizing and correcting his error.

The idea of the picturesque (*emen*) plays an important part in Kabuki. In each scene there must be a harmonious balance in the actors' positions and the colours of costumes and stage. Each major scene in the jidaimono culminates in a mie, the striking of an attitude by one or more actors. The *sewamono*, though it tries to preserve such a balance at the ending of a scene, is generally less formal, and the curtain closes on a more realistic picture.

In Western theatre the drama is ordinarily portrayed "as if" it were really happening, but Kabuki does not engage in this pretense. Its actors always address the audience directly, an indication of its storytelling quality. Other nonactors perform functions that would destroy the belief of a Western audience. The *kōken* may assist in costume changes and bring on or remove stage properties. Other stage assistants are the kurogo, men dressed completely in black to symbolize their invisibility, and those in traditional ceremonial attire who frequently appear in the ritualistic plays known as *shosagoto*.

Speech, acting, and dance

The dialogue of Kabuki may be extremely stylized in its rhythm and tempo and it may be almost colloquial. A blend of the two styles in a given play creates a distinctive dramatic effect. Both the jidiamorzo and the *sewamono* are mixtures of formalistic and realistic elements, but the speech patterns of the former tend toward stylization, of the latter toward the everyday. In certain kinds of play the actor can introduce himself in his role by delivering a long speech to demonstrate his skill in elocution. In the *warizerifu*, two actors may deliver lines that are seemingly unrelated to each other but that produce a cumulative dramatic effect when the audience combines them as a single story. In the watarizerifu, a number of actors may speak their lines in succession, with a finale in unison. The various male and female roles also have distinctive manners of delivery.

Geographical differences in Kabuki include the preference in the Kyōto–Osaka area for the kind of play called wagoto. In this, romantic and sentimental elements are combined with the comedic for a more realistic production. In Edō, the most stylized forms of play and of acting traditionally have been preferred. There the *mie,* the dramatic moment when the stage becomes frozen into a picture, and the *roppō*, a spectacularly exaggerated exit, were developed as part of the *aragoto* style. The aragoto and wagoto represent opposing extremes in Kabuki acting.

Kabuki dance is probably the best known feature of this theatre. Rarely is an opportunity missed to insert dancing, whether the restrained, flowing movement of the women or the exaggerated posturings of the men. The acting in Kabuki can be so stylized that it becames virtually indistinguishable from dancing. Most dances are gay and colourful, and usually they are identified with an object—flowers, a fan, a towel, a musical instrument—carried by the dancer. They may be, for example, dances of priestesses, townspeople, or lovers, or they may be slow and delicate or wildly acrobatic. The best known of Kabuki dances in the West is probably the *Musume Dōjōji* dance.

Production of Kabuki. Kabuki was performed under government supervision during the Tokugawa period. Kyōto, Osaka, and Ed6 established their own theatres, which have since become hereditary. Besides the major theatres, which were given special status, large numbers of lesser theatres were scattered throughout Japan. Temporary licenses were issued to even smaller theatres, which often performed in temples, shrines, and market places. The major theatres were under the direct charge of the town magistrate, whereas the smaller ones were administered by the magistrate responsible for religious affairs. The actors and playwrights were hired on an annual basis, and no theatre enjoyed a monopoly on talent. Thus the three largest cities each had their own performers who circulated among the major theatres. The Kyōto–Osaka area and Ed6 developed their distinctive traditions in acting, playwriting, and theatre management. The actors performing in lesser theatres were forbidden to work on a major stage, and the same rule kept outsiders from joining a major theatre.

Although in the beginning the theatres were centrally located, they were moved out into the suburbs by the government officials. The first theatres in the three largest cities were along the river banks: the dry bed of the Kamo River in Kyōto, where Okuni is alleged to have performed in 1586, is regarded as the birthplace of Kabuki. Traditionally, the government regarded Kabuki as being akin to the city's pleasure quarter (the *akubasho*, the "wicked place"). In Ed6 the original downtown theatre district was moved in 1842 to a notorious location, which continues to be the centre of theatrical activity.

In the Tokugawa period, Kabuki performances were required by law to begin at six o'clock in the morning and to end at five in the afternoon. Ticket prices were determined by the location of the viewing area; those in the sajiki were equivalent to the annual wage of a low-salaried worker. The opening day, however, was free. In this first performance of the new year, a courtesan play (*keis*eimono) was given in the Kyōto–Osaka area. Scenes of the pleasure quarter with its beautiful courtesans were a prominent feature of the jidaimono at this season. In Edō, however, a well-known local vendetta was the main theme for the new-year performance, and this custom has continued for over two centuries.

Position of actors

During the Tokugawa period, the Kabuki actors were not regarded as ordinary citizens. They were subject to moral and social stigmas sometimes assigned to performers in the West, and their living quarters were restricted by the government. Nonetheless, the top stars earned high wages and lived extravagantly. The Kabuki actors exerted enormous influence on popular fashions, painting, and writings.

Kabuki actors are extremely conscious of their status within the acting hierarchy. They often begin training as early as five, and at advanced ages Kabuki actors may portray young men or women. When actors assume the names of predecessors who belonged to distinguished acting families, they go through the ***shiimei,*** an elaborate on-stage ceremony to proclaim their new position. Such names are given to a direct descendant or to a pupil. The successor is expected to perpetuate the style of the acting family to which he belongs. The innovations of famous actors become part of an established tradition in the next generation. The function of the director has been assumed by the chief actor ***(zagashira),*** who has absolute authority.

The ***Yakusha Hydbanki*** ("Actors' Annual") was published yearly for 230 years (1656–1886). Its treatment of Genroku period is outstanding, and it remains a unique chronicle for understanding the history of this theatre. The ***Yakiishabanaslzi*** ("The Stories about Actors"; 1776) is regarded as a kind of bible by Kabuki actors; it contains accounts by actors and playwrights from the Kyōto–Osaka area who were active during the Genroku period. The autobiographies of Nakamura Nakazb I (1736–90) and Nakamura Nakazb III (1809–86) describe the life of Kabuki actors in the Tokugawa period. Since the Meiji period, many actors have written accounts of their lives.

Kabuki in the 20th century. In the Taishō period (1912–26), plays were written by non-Kabuki playwrights, including novelists and journalists, and were called ***Shin-Kabuki*** ("new Kabuki play"). The representative dramatist of the period was Okamoto Kidō (1872–1939). Today both old and new Kabuki plays are given on the same program.

At present, regular performances are held at the Kabuki Theatre (Kabuki-za)—with a capacity of 1,600—and the National Theatre, both in Tokyo. Other theatres have occasional performances. Troupes of Kabuki actors also perform outside of Tokyo. There are several such companies, but their memberships often overlap. A typical program at the Kabuki Theatre consists of a ***jidaimono,*** a ***shosagoto,*** and a ***sewamono,*** in that order; two performances are held daily. At the National Theatre, a complete *jidaimono* and a ***sewamono*** or a ***Shin-Kabuki*** is given daily. At the Kabuki Theatre, the length of an average program is about five hours; at the National Theatre it is about four. The Kabuki Theatre upholds the actors' traditional position by adopting a conservative approach, planning its program around the major stars. The National Theatre stresses the importance of the play itself, trying to maintain the historical tradition and to preserve Kabuki as a classical form. The prestige of the leading acting families is as strong as ever, and lineage is regarded as more important than talent.

Kabuki
and motion
pictures

The influence of Kabuki is evident in the theories of cinematic montage propounded by the Russian film director Sergey Eisenstein. Kabuki also influenced such later film directors as the Italians Federico Fellini and Pier Paolo Pasolini. In Japan, themes from Kabuki have been adapted for motion pictures and Western-style plays.

It is difficult to predict the future of Kabuki theatre. Many critics complain that its traditions, unlike those of the Nō theatre, have been watered down since the Meiji period through excessive assimilation of new materials. Kabuki travelled abroad before World War II but much more afterward, and the form has become internationally recognized. This contact with foreign cultures and theatrical traditions could erode its distinctive qualities. To remain a significant part of contemporary world theatre, Kabuki must preserve its traditions and at the same time keep itself open to growth and adaptation as it has in the centuries of the past.

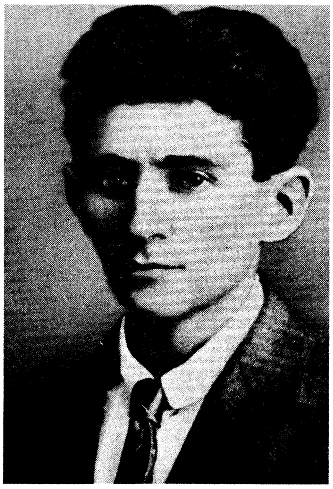
BIBLIOGRAPHY. FAUBION BOWERS, ***Japanese Theatre*** (1952), a popular, authoritative history that emphasizes Kabuki, includes three translations of Kabuki plays; EARLE ERNST, ***The Kabuki Theatre*** (1956), an outline of the Kabuki form considered as an expression of Japanese life and culture, includes a short glossary of Japanese theatre terms and a selected bibliography of works in Western languages; ADOLPHE C. SCOTT, ***The Kabuki Theatre of Japan*** (1955), in which the author brings to his study of Kabuki a relevant knowledge of the classical drama of China, includes a glossary of Japanese terms used and a list of Japanese eras with which the history of Kabuki theatre is involved.

(M.Gu.)

Kafka, Franz

Franz Kafka was a creator of visionary fiction and the most influential master of modern German prose whose work has become a symbol of 20th-century anxiety and of the sense of alienation pervasive in Western society. Judged by external standards, his life was sheltered, uneventful, and secure. The conflicts and upheavals he suffered, which he expressed in terms that revealed the despair of an age, were almost entirely internal events.

Archiv fur Kunst und Geschichte



Kafka.

Early influences. Franz Kafka, the son of Julie (*née* Lowy) and Hermann Kafka, a merchant, was born into a Jewish middle class family on July 3, 1883, in Prague. After two brothers nearest to him in age died in infancy, he became the oldest child, remaining forever conscious of his role as older brother; Ottla, the youngest of his three sisters, became the family member closest to him. Kafka identified with his maternal ancestors not because of their social superiority but in view of their spirituality, intellectual distinction, piety, rabbinical learning, eccentricity, melancholy disposition, and their delicate physical and mental constitution. He was not, however, particularly close to his mother, ***a*** simple woman devoted to her children. Subservient to her overwhelming, ill-tempered husband and his exacting business, she shared with her spouse a lack of comprehension of their son's unprofitable and possibly unhealthy dedication to the literary "recording of [his] . . . dreamlike inner life."

Kafka's
father
figure

The figure of Kafka's father overshadowed his work as well as his existence; the figure is, in fact, one of his most impressive creations. For, in his imagination, this robust, tenacious, coarse, and domineering shopkeeper and patriarch, who liked to complain and to brag about the hardships of his childhood and who worshipped nothing but material success and social advancement, belonged to a race of giants and was an awesome, admirable, but repulsive tyrant. In Kafka's most important attempt at autobiography, the "Letter to His Father" (written 1919), a letter that never reached the addressee, Kafka attributed his failure to live—to cut loose from parental ties and establish himself in marriage and fatherhood—as well as his escape into literature, to the prohibitive father figure, which instilled in him the sense of his own impotence. He felt his will had been broken by his father. Yet there is something solid and consoling in this dramatization of a classical Oedipal conflict, an experience typical of Kafka's generation and, particularly, of his literary contemporaries among the Expressionists. The conflict with the father is reflected directly in Kafka's story ***The Judgment.*** It is projected on a grander scale in Kafka's novels, which portray, in lucid, deceptively simple prose, a protagonist, K., in desperate struggle with a mysterious and overwhelming power that may persecute its victim, as in ***The Trial,*** or be sought after and begged in vain for approval, as in ***The Castle.*** Yet the roots of Kafka's anxiety and despair go deeper than his relationship to his father and family, with whom he chose to live in close and cramped proximity for the major part of his adult life. The source of Kafka's despair lies in a sense of ultimate isolation from a true community and communion with all human beings—the friends he cherished, the women he loved, the job he detested, the society he lived in—and with God or, as he put it, with true indestructible Being.

This is not to say that Kafka failed to live up to the expectations of others. He was considered a good, obedient, sensible child. He did well in German elementary school and in the Altstadter Staatsgymnasium, an exacting high school designed for the academic elite. He was respected and liked by his teachers. Inwardly, however, he rebelled against the authoritarian institution and the dehumanized humanistic curriculum, with its emphasis on rote learning and classical languages. Nonetheless, he owed to it some of his intellectual discipline, meticulous sense of verbal structure, and abiding love of German literature. Moreover, his very protest against conventional authority allied him, in turn, with the insular intellectual and literary vanguard of Prague.

The socialist and atheist

Intellectual life in Prague. Kafka's opposition to established society became apparent when, as an adolescent, he declared himself a Socialist as well as an atheist. He continued in his later life to reject capitalism as "a state of the world and of the mind" (as in his image of Amerika). But it should also be pointed out that he was inclined to reject the entire sensory world as a sinful aberration from true Being. Throughout his adult life he expressed qualified sympathies for the Socialists; attended meetings of the Czech Anarchists (before World War I); and, in his later years, showed marked interest and sympathy for a socialized Zionism. Yet even then he remained a politically unengaged and inactive spectator.

In this respect he was rather unlike many of the German Jewish intellectuals and literati of Prague (*e.g.*, Max Brod, E.E. Kisch, Franz Werfel) with whom he soon became associated. By external standards they were as isolated as he, not only from the Czech population but also, as Jews, from the privileged German minority. Indeed, by virtue of their modern sophistication, they were isolated from their own Jewish heritage. Even if his fellow students felt a glass wall separating Kafka from them, he nonetheless sought their friendship actively; later on, he was sought after and wooed by a small group of devoted friends, including Max Brod, the most intimate and solicitous of his friends, who was to survive as promoter, saviour, and interpreter of Kafka's writings and as his most influential biographer.

They became acquainted in 1902, when Kafka, resigned to the necessity of preparing for an indifferent nonliterary profession, was studying law at the University of Prague. He received his doctorate in 1906, and, after a respite of one year—spent in a perfunctory legal apprenticeship—he took up regular employment with an insurance company. The long hours and exacting requirements of the Assicurazioni Generali, however, did not permit Kafka to devote himself to writing. In 1908 he found in Prague a "single shift" job (8 AM to 2 PM, including Saturday) in the semi-nationalized Workers' Accident Insurance Institute for the Kingdom of Bohemia. There he remained until 1917, when tuberculosis forced him to take intermittent sick leaves and, finally, to retire (with a pension) in 1922, about two years before he died. In his job he was considered tireless and ambitious; he soon became the right hand of his boss, whose efficiency he admired, and was esteemed and liked by colleagues, subordinates, and superiors. Kafka himself, however, found his futile office job and the exhausting double life into which it forced him (for his nights were frequently consumed in writing) to be excruciating torture. The question whether "to earn one's living or to live one's life" proved to be insoluble.

This is not to suggest that Kafka's existence should be stylized into a mere symbol of despair. The tall, well-dressed, retiring young man who, as a student, was received into socially distinguished circles, took interest in a variety of subjects, including Alfred Weber's analysis of capitalist society and Franz Brentano's philosophy of ethics. Though Kafka's social life became increasingly restricted, he continued to frequent intellectual salons, where he met leading philosophers, mathematicians, physicists, and other men of learning; thus he became acquainted, in some measure, with science, the classics of German Idealistic philosophy, psychoanalysis, and theosophy. Unlike other German poets of Prague, such as Rainer Maria Rilke or Franz Werfel, he actively sought contact with the Czech people and frequently visited the assemblies of their political parties. He travelled to Switzerland, Paris, Berlin, Hungary, and, in 1912, to Weimar, home of Goethe, and to a centre for methods of natural cure. Consistent with his concern for a life-style in keeping with nature were his vegetarianism, his love of the countryside, his enjoyment of long hikes, and his skill and endurance in swimming and rowing.

Personal charm and complex personality

Kafka's friends have attested to the charm and fascination of his conversation. His sensitive, undoctrinaire intelligence was subservient to a precise sensibility and a uniqueiy original imagination. It was natural for him to express himself in startling metaphors or in statements that combined a complex thought refined to the point of paradox with a quietly simple and entirely unassuming manner. His contemporaries speak of his scrupulous conscientiousness, veracity, self-control, and quiet courage; of a grace even in shyness, a sense of tact and readiness to help; of his childlike integrity and ethical rigour. His subtle irony and sense of humour were rooted in the awareness of the incongruity of human affairs vis-à-vis the—unquestionable and unattainable—absolute. Brod, in particular, has been at pains to stress the positive aspects of Kafka's personality: "His spiritual bent was not in the direction of the morbidly interesting, the bizarre or grotesque." Characteristically, he took no interest in the literary Decadents or the authors of horror stories but instead sought out "the curative, health-giving, sound, firmly established, simple things."

Yet such statements apply only to one aspect of Kafka's complex and ambivalent personality. With good reason, he referred to himself as to a battlefield. Some of his contradictory tendencies and conflicting inclinations became explicit in his erotic and sexual relationships. It is odd that a man who could speak of sexual intercourse as punishment for the happiness of being together with his beloved should have relished on occasion (and quite in keeping with the customs of the time) the easy girls or the professional prostitutes of Prague. Apparently, his sexual life was sporadic, occasionally intense, and frequently interrupted by periods of indifference. In his writings sex is most frequently associated with dirt and guilt and is treated—with ascetic disgust—as an abomination. Yet Kafka also experienced the sweetness of erotic intimacy in two fleeting vacation affairs and with the women he loved: his two fiancées, Felice Bauer and Julie Wohryzek; his married mistress, Milena Jesenská Pollak (1920), a Czech woman of extraordinary vitality, élan, and intelligence; and Dora Dymant (1923–24), a young girl who lived with him in Berlin during the last year of his life. Kafka's most desperate conflict was not in relation to sex, however, but rather in relation to marriage, which he wanted yet feared in the years of his tormented courtship of Felice Bauer (1912–17) and again in his brief engagement to Julie Wohryzek (1919–20). To marry and found a family, he felt, was the greatest achievement possible to man, though he also felt himself incapable of assuming the powers and privileges his father enjoyed, and he found family life incompatible with solitary nights spent in writing, the one and only activity he was meant for. Moreover, he also felt that marriage represented the "world," which was essentially evil, though, to be sure, man should meet the world to give it its due and to suffer his way through it.

Outbreak of tuberculosis. Kafka himself thought that the outbreak of his tuberculosis in 1917 was a psychosomatic event initiated by a conspiracy between head and body for the purpose of putting an end to his insoluble and unbearable internal struggles. From this time on, he spent half of his remaining life in sanatoriums and health resorts. His disease released him from his office job and his marriage dilemma. It did not inhibit his creative development as a writer, the intensity of his vital experience, or the range of his interests. Indeed, it could be argued that his illness enabled him to pursue his most essential concerns and to promote his self-realization through a study and rediscovery of Judaism and a confrontation not merely with religious authors but ultimately with questions of faith.

Literary influences

Kafka had always been a passionate reader and was fond of reading his favorite prose authors aloud to an audience. In his early phase these included Friedrich Nietzsche, Thomas Mann, Hugo von Hofmannsthal—the latter a distinct influence on Kafka's early works. Apart from his perennial concern with Goethe, Kafka's diaries suggest his sense of affinity to a variety of literary figures; *e.g.*, to Heinrich von Kleist, Franz Grillparzer, Flaubert, Dostoevsky, Strindberg, and Knut Hamsun; his appreciation of the Bible; of Friedrich Hebbel, J.P. Hebel, Adalbert Stifter; of Dickens and Tolstoy; of some Chinese poetry; as well as of contemporaries, among whom he admired Werfel excessively. Characteristic of Kafka as a reader is his marked preference for autobiographical documents, diaries, correspondence, and memoirs. His interest in the Jewish heritage was first activated through close contact with a group of Yiddish players in 1911–12. Evidence of his increased concern with religion and with biblical, linguistic, literary, historical, and contemporary aspects of Judaism may be found in his study of the Danish philosopher Søren Kierkegaard in 1917–18; in the beginning of his intensive study of Hebrew in 1918 and, presumably, of the Jewish mystical practices and beliefs known as Hasidism; and in his reading of Yiddish authors and his sympathetic attitude toward the Zionism of Brod and Dora Dymant.

In the final year of his life, Kafka still sought to escape from his paternal family and the native city that had shaped his life and work. He settled down in Berlin, where his stay was cut short by a decisive deterioration of his health during the winter of 1924. After a brief final stay in Prague, where Dora Dymant joined him, he was moved to a clinic in Vienna, then to a sanatorium nearby at Kierling, where he was cared for by Dora Dymant and his friend and physician Robert Klopstock. There he died, after painful suffering, on June 3, 1924. His body was buried in the family tomb in the ancient Jewish cemetery of Prague.

Publications and posthumous fame. Sought out by leading publishers of the literary vanguard, Kafka reluctantly published a mere fraction of his writings during his lifetime. These publications include two sections (1909) from ***Description of a Struggle*** (1936), written in Kafka's early, somewhat florid style; ***Meditation*** (1913), a collection of short prose pieces; and works representative of Kafka's maturity as an artist, notably "The Stoker" (1913; the first chapter of ***Amerika***); ***The Judgment*** (1913), a long story written in 1912, which, in Kafka's opinion, represented a breakthrough and his coming into his own; two further long stories entitled ***Metamorphosis*** (1915) and ***In the Penal Colony*** (1919); and a collection of short prose, ***The Country Doctor*** (1919). ***A Hunger Artist*** (1924), four stories exhibiting the concision and lucidity characteristic of Kafka's late style, had been prepared by the author; the book did not appear until after his death.

Characteristically, Kafka wrote under the impact of creative spells that were both inspired and frustrated by his love affairs. His breakthrough in 1912, the year he produced ***The Judgment***, ***The Metamorphosis***, and the major portion of his first extant novel, ***Amerika***, took place when he first met Felice Bauer; and the failure of this relationship is reflected in ***The Trial*** (written in 1914). Similarly, the relationship to Milena appears to have influenced the composition of ***The Castle*** (probably written mainly in 1922), while the last stories are to be associated with Kafka's life with Dora Dymant and with his attempt to come to terms with his sickness (as in "The Burrow," 1923).

Publication of ***The Trial*** and ***The Castle***

The works published by Kafka himself include less than half of his shorter narrative prose, and, apart from the famous parable "Before the Law," scarcely any of the essential parables and aphorisms that are among his most perfect creations. These publications gave no inkling of his major, if fragmentary, novels, ***The Trial*** and ***The Castle***, nor of the fragments, notes, diaries, and extensive correspondence (including the letter to his father, the letters to Felice Bauer, to Milena, and the still unpublished letters to his sister Ottla).

At the time of his death, Kafka was appreciated only by a small literary coterie. His name and work would not have survived if Max Brod had honoured Kafka's testament—two notes requiring his friend to destroy all unpublished manuscripts and to refrain from republishing the works that had already appeared in print. Brod took the opposite course, and thus the name and work of Kafka gained worldwide posthumous fame. This development took place first during the Hitler regime, in France and the English-speaking countries—at the very time when Kafka's three sisters were deported and killed in concentration camps. After 1945 Kafka was rediscovered in Germany and Austria and began to greatly influence German literature. In the 1960s, this influence extended even to the intellectual, literary, and political life of Communist Czechoslovakia.

MAJOR WORKS

NOVELS (all published posthumously): ***Der Prozess*** (1925; ***The Trial***, 1937); ***Das Schloss*** (1926; ***The Castle***, 1930; definitive ed., 1969); ***Amerika*** (1927; Eng. trans., 1938)—all translated by Willa and Edwin Muir.

STORIES: *Betrachtung* (1913; ***Meditation*** in ***In the Penal Settlement: Tales and Short Prose Works***, 1949); ***Das Urteil*** (1916; ***The Sentence***, 1928; also trans. as ***The Judgment***, 1945); ***Die Verwandlung*** (1915; ***Metamorphosis*** in ***Metamorphosis and Other Stories***, 1961); ***In der Strafkolonie*** (1919; ***In the Penal Colony*** in ***Metamorphosis and Other Stories***, 1961); *Ein Landarzt* (1919; ***The Country Doctor***, 1940); *Beim **Bau der Chinesischen Mauer*** (published posthumously, 1931; ***The Great Wall of China*** in ***Description of a Struggle and The Great Wall of China***, 1960).

BIBLIOGRAPHY. Useful bibliographies include HARRY JARV, ***Die Kafka-Literatur*** (1961), most comprehensive; and ANGEL FLORES (ed.), ***The Kafka Problem***, pp. 447–477 (1963), with a list of works available in English. A major collection of Kafka manuscripts is kept in the Bodleian Library, Oxford, England.

Editions: The first collection of Kafka's works was the *Gesammelte* ***Schriften***, ed. by MAX BROD, 6 vol. (1935–37). The most comprehensive edition (though neither critical nor complete) is the ***Gesammelte Werke***, ed. by Brod, 8 vol. (1952–), which includes two volumes of letters, ***Briefe*** 1902–1924 (1958) and ***Briefe an Felice*** (1967).

Biography: The most important biographies are the intimate, congenial, basic (if biased) account of MAX BROD, ***Franz Kafka*** (1937; Eng. trans., 2nd ed., 1960); and the more factual and detailed study of Kafka's youth by KLAUS WAGENBACH, ***Franz Kafka: Eine Biographie seiner*** *Jugend, 1883–1912* (1958). See also Wagenbach's summary presentation of Kafka's entire career, ***Franz Kafka in Selbstzeugnissen und Bilddokumenten*** (1964), and his edition of an annotated collection of photos and documents, ***Franz Kafka, 1883–1924*** (1968), available in English.

Critical studies: HEINZ POLITZER, ***Franz Kafka, Parable and Paradox*** (1962), aesthetic and psychological analyses of texts; WILHELM EMRICH, ***Franz Kafka*** (1958; Eng. trans., 1968), philosophical; WALTER H. SOKEL, ***Franz Kafka. Tragik und Ironie*** (1964), a psychoanalytical reading, and his brief ***Franz Kafka*** (1966); RONALD D. GRAY (ed.), ***Kafka: A Collection of Critical Essays*** (1962), which includes important studies by F. Beissner, Albert Camus, Erich Heller, Martin Buber, and Edmund Wilson; ANGEL FLORES (ed.), ***The Kafka Problem*** (1963), representative selections from the literature on Kafka; HERBERT TAUBER, ***Franz Kafka: Eine*** *Deutung* ***seiner Werke*** (1941; Eng. trans., ***Franz Kafka: An Interpretation of His Works***, 1948), an early attempt at thorough interpretation; and GUNTHER ANDERS, ***Kafka*** (1951; Eng. trans., 1960), influential and challenging.

For a discussion of divergent (aesthetic, psychoanalytical, Marxist, existentialist, and theological) interpretations of Kafka, see PETER HELLER, "Kafka: The Futility of Striving," in ***Dialectics and Nihilism***, pp. 227–306 (1966).

(Pe.H)

Kalahari (Desert)

A basin-shaped, largely sand-covered region in southern Africa, the Kalahari (called the Kalahari Basin by geographers) is bounded by the Orange River to the south; the headwaters of the Zambezi to the north; the plateaus of the Transvaal, and Rhodesia to the east; and the highlands of South West Africa to the west. Its area is more than 100,000 square miles (260,000 square kilometres); the part colloquially known as the desert is in central and western Botswana, north of the Molopo River, and south of the Chobe and Okavango swamps.

THE LANDSCAPE

Frequently termed a desert, the Kalahari is more aptly described as a thirstland. With the exception of the Boteti River and related drainages, there is no permanent surface water in this sandy but well-vegetated region.

The Kalahari is a featureless, gently undulating, sand-covered plain lying 3,000 to 3,600 feet above sea level, rising to a height of some 4,000 feet on its southeastern and northwestern margins. Its lowest point of about 2,600 feet is at the confluence of the Nossob and Molopo rivers.

Relief features. The only projections above the relatively uniform surface of the Kalahari are occasional residuals of older rocks that form hills in the southeast, in the southwest near Tshabong, and in the northwest. At the southwestern extremity of the Okavango Swamps, south and southwest of Lake Ngami. a rib of ancient rock forms a low swell with a northeasterly strike. Hills some 500 feet high, also south and southwest of Lake Ngami, form the most prominent topographical features of the Kalahari.

Formation of dunes

Barchan dunes (crescent-shaped dunes, with the convex side facing the wind) on the Ntwetwe Pan in the western Makgadikgadi (formerly Makarikari) region are the only naturally formed sand dunes in the area. Following destruction of vegetation by man and stock, however, bare sand dunes have been formed in the southwestern Kalahari. Transport of sand by wind erosion occurs only where the vegetation has been destroyed. The minor amount of wind erosion is offset by local sheetflood erosion, which decreases differences in relief. A remarkably flat surface has consequently developed, but minor relief is evident in the form of low, fixed sand dunes, sandy hollows, pans, and fossil river valleys.

Near the lower parts of the Molopo and Nossob rivers, fixed dunes occur as west-northwest trending sand ridges. In the northeastern Kalahari low linear dunes extend southwestward from Rhodesia in the area north of the Makgadikgadi. All are fixed by vegetation.

South of the Boteti River, fossil river valleys form striking topographical features. These ancient drainage lines have undergone repeated cycles of aggradation and rejuvenation during past climatic regimes. Pronounced valleys are characteristic of the middle portions of their courses, but they become less clearly defined when traced both headward and into the Kalahari. where they normally degenerate into strings of shallow, grass-covered pans and flats, upon which the bush is encroaching.

Pans south of the Boteti River may be several miles long and may lie more than 50 feet below the plain. They invariably have a well-defined sand ridge along their southern and southwestern margins. Three main types of pan can be defined: grassed pans, with a dark-coloured, sandy, clay floor; ungrassed pans, on which there is a sparsely developed, halophilic (*i.e.*, thriving in a saline environment), scrubby vegetation; and saline pans, where the pan floor consists of whitish, saline, and highly alkaline clay, which does not support any plant growth higher than reddish-coloured algae. Some pans have well-defined characteristics, but all gradations may occur.

North of the Boteti River, fossil river valleys can seldom be traced. Pans of the type found in the area to the south are absent, though a different type of pan—a shallow basin-like drainage depression, with relatively high water-holding characteristics—is frequently encountered.

The Makgadikgadi depression

A major feature in the northeastern Kalahari is the Makgadikgadi depression, erroneously identified as a "salt pan" on most maps. This feature is an ancient interior drainage basin consisting of two extensive bare pan areas floored by alkaline sandy clays, with a combined floor area of over 3,000 square miles. The basin is fed mainly by waters from five ephemeral rivers flowing into the Sua, or eastern pan area, from the east and northeast. On occasion floodwaters from the Boteti River enter the southwestern part of the western, Ntwetwe, pan.

Drainage and soils. The only permanent drainage system is the Boteti River, which is fed by a seasonal overflow from the inland deltaic Okavango Swamps. High rainfall areas in Angola drain into the Okavango Swamps and eventually into the Boteti River, which runs from the southeastern margin of the swamps to flow east. It then turns south through the north-central Kalahari, flowing into Lake Xau (formerly Dow), after which it drains northeast into the Makgadikgadi area. Elsewhere, apart from seasonal accumulations in pans and valleys, water has to be obtained from wells and boreholes.

South of the Boteti River there is little or no runoff, except along certain stretches of the ancient valley systems, and within limited areas that are mainly found around pans. No rivers or streams, permanent or otherwise, are to be found. Rainfall is eventually lost by evaporation and—in the sand veld areas away from the ancient valleys and the pans—by evapotranspiration.

Two distinct ancient drainage systems can be traced in the fossil valleys, along most of which no flow now occurs. An ancient drainage divide, known as the Bakalahari-Schweile, crosses the southern part of the Kalahari. To the south of this divide, ancient valleys occur as former tributaries of the Molopo River, which originally was a tributary of the Orange River. (At present the Molopo is only ephemeral in its upper bed. In the extreme southwestern Kalahari, the dry Nossob River joins the Molopo. The Nossob flows only if exceptionally heavy rain falls in its headwater regions in South West Africa.)

North of the Bakalahari-Schwelle, the former drainage of the region was directed toward the Makgadikgadi. Northerly draining fossil river valleys can be traced from their ancient headwaters in the southeast. From the west, another ancient drainage system, the Okwa, can be traced eastward for more than 250 miles through the central Kalahari, running from the South West African border to join the northerly drainage system flowing into the Makgadikgadi. Tributaries of the Okwa are fossilized, but after exceptional rains in South West Africa the main river may flow into the Kalahari, for as much as 70 miles.

North of the Boteti River, runoff drains into shallow local depressions, or—occasionally—into an ancient valley system draining toward the Okavango.

Types of sands

Sands of the characteristic Kalahari type mantle over 90 percent of the region. They are of both eolian (wind) and fluviatile (river) origin. South of the Boteti River they are typically reddish brown in colour, with grayish-white sands prominent in low-lying areas. Grayish-white sands are generally more typical in the north, where fluviatile sands predominate. The wide distribution of these sands is broken only where pans, drainage lines, or large outcrop areas occur. In pan areas, along the fossil valley systems, along the Boteti River, and in the Makgadikgadi region, silicified sands, calcareous sandstones and grits, surface limestones, lake limestones, diatomaceous sandy limestones, marls, conglomerates, pan tufas, gravels, gritty sands, and the full lithological range of silcretes and calcretes are to be found.

Climate. The climate is of the low latitude, hot steppe type. Precipitation is local and erratic, with wide variations in any one locality. The mean annual rainfall is 16 to 18 inches in the east, 12 to 14 inches in the west, and less than 8 inches in the southwest. North of the Boteti River, the mean rises, reaching nearly 26 inches in the extreme north.

The climate is characterized by marked differences in seasonal temperatures and by large diurnal temperature ranges. Shade temperatures may be as high as 117" F in the summer—from October until March. In winter, freezing nights are common, with temperatures as low as 8° F. Such extremes are not normal in the northern Kalahari, where the humidity is relatively higher.

Vegetation and wildlife. The Kalahari possesses a well-developed cover of trees, low scrub, and tussocky grasses. The vegetation is xerophytic (adapted to dry conditions). Most trees and shrubs shed their leaves in season.

Tall savanna woodlands, which include a number of timber trees, occur in the north. Shrubby vegetation, with areas of scattered palm trees and baobabs, as well as open grassy flats, fringe the Makgadikgadi depression.

South of the Boteti River the vegetation predominantly consists of thorny woodland, with trees that seldom exceed about 25 feet in height. Parkland country with scattered tree growth occurs in certain parts. Proceeding to the south of the Kalahari, there is a progressive decrease in the number of tree species until only four kinds of trees are found. Around pans, in the ancient fossil valleys, and in patches in the sand veld plain, relatively dense, thorny, species of scrub acacia sometimes form thickets. Certain woodland and scrub areas subjected to repeated burning have degenerated into pure grassland.

Close to the ground — apart from a variety of grasses and low-growing shrubs — seasonal annuals, tuberous and bulbous plants, creepers, and vines are found.

Animal life is varied and is richer in the north than in the south. Even in the more arid southern areas, however, the variety of animal life is great. Many species exist for long periods of the year despite the absence of surface water. South of the Boteti River the principal animals found are springbok, wildebeest (gnu), hartebeest — all occasionally in vast herds; gemsbok (oryx); eland; and many smaller nongregarious species, such as duiker and steenbok. Kudu occur in denser bush areas.

Northward from the Boteti River and Makgadikgadi region, giraffe, zebra, and elephant are also found. In wetter areas the density and variety of animal life increases, and buffalo, roan and sable antelope, tsessebe (a species of South African antelope), impala, and other species are to be seen. Predators, such as lions, are ubiquitous. There are also some leopards, cheetahs, and lynxes.

Other animals common to the area include the hyena, Cape hunting dog, foxes and jackals, varieties of wild cat, warthog and bushpig, baboons, badgers, scaly anteaters, ant bears, and hares, as well as numerous rodents including porcupines, ground squirrels, springhares, gerbils, mice, and dormice. A wide variety of snakes and other reptiles occur, and there is also a wealth of bird life. (C.B.)

THE INHABITANTS

The Kalahari is inhabited by approximately 79,000 Bantu-speaking Africans, 500 Europeans, and 17,000 Bushmen.

The Bantu. The Bantu — represented by the Tswana, the Kgalagadi, and the Herero — appear to be relative newcomers to the Kalahari. In the late 18th century the Tswana spread westward from the Limpopo basin into the northern and eastern Kalahari; the Kgalagadi moved north and westward into the southern and western Kalahari; and the Herero refugees from the German colonial wars fled eastward into the western and northern Kalahari at the beginning of the 20th century.

Cattle-raising among the Bantu

Bantu in the Kalahari live in villages housing between 20 and 1,000 people. The villages are composed of mud-walled, single-roomed, thatched huts, situated near wells or boreholes. Cattle, the basis of the economy, are kept on the outskirts of villages, or at distances of up to 50 miles away. Grazing lands are state-owned, and their use is determined by local tribal government or by village councils. Wells and boreholes are owned by villages, by syndicates of cattle owners, by the state, or by private individuals. As the only regular supplies of water, away from the Okavango Swamps, are provided by bores and wells, these sources constitute the key factor controlling access to grazing in dry seasons. Cattle selectively feed upon a small range of the available vegetation and, in the absence of fences or pasture-improvement measures, soon degrade the indigenous pasture in a growing circle about the water point. Drought, disease, internal parasites, and wild animals also threaten the cattle, nearly all of which can be marketed only after an overland trek of up to 400 miles to the railhead slaughter house. Despite these drawbacks, herds continue to increase and to provide herdsmen with a living. Cattle are valued as wealth and as a measure of social status.

Goats furnish most of the meat and milk for home consumption, and nearly all households cultivate crops of maize, sorghum, and pumpkins. Due to drought, more crops fail than are successful. Wild food plants and the meat of game animals are important components of diet in the smaller and more remote villages. All villages have trading stores or are visited by hawkers who sell maize meal and other foodstuffs, clothing, ammunition, patent medicines, and other commodities.

All but the smallest villages have state-run primary schools, which are attended by the great majority of children, although few proceed to secondary education. The literacy rate is about 30 percent. State-run health clinics and hospitals in the larger villages supplement the services of herbalists and diviners.

Riding horses and donkeys are the usual means of local travel. Trucks belonging to traders or to the mine labour recruiting agency are used for longer journeys.

Europeans. Europeans first penetrated the Kalahari as travellers in the mid-19th century. The principal European settlement is in the Ghanzi District, where some 200 whites are engaged in cattle ranching. Since 1960 determined efforts at pasture management, better utilization of groundwater supplies, and scientific stock breeding have increased productivity. Similar methods are also being adopted by Bantu pastoralists.

The remainder of whites in the Kalahari are expatriates employed by the state or by traders.

Bushmen. Bushmen are short in stature. The average height of the men is five feet two inches; the women are some two inches shorter. Skin colour at birth is coppery-yellow, darkening to light brown with exposure to the sun. The facial profile is almost flat.

Life style of the Bushmen

Most Bushmen are now clients of Bantu pastoralists, hunting game and working at cattle posts in return for support. Some 4,000 Bushmen work on the ranches of Ghanzi, which are owned by either whites or Africans; the Bushmen are employed there as ranch labourers, or else are dependents of such labourers.

An estimated 6,000 Bushmen still follow their traditional pattern of hunting and gathering. Of these, the Kung (!Kung), ! xong, and G/wi tribes (the "!" and "/" represent clicks) have been intensively studied in recent years. While each group is distinct, the G/wi of the Central Kalahari Game Reserve may be considered as illustrative of the Bushman hunter-gatherer ecology.

They travel together in bands, each consisting of 5 to 16 families united by bonds of kinship and friendship. Each band has a recognized territory of 300 to 400 square miles, selected for its resources of food plants (which contribute the main part of the diet), wet-season waterholes (for drinking water during the six to eight weeks when sufficient rainwater gathers in pools), trees (for shade, shelter, firewood, and wood for making artifacts), and areas of grazing to attract and sustain herds of game animals. Subsistence is based on 34 species of edible plants, of which eight are staples in their various seasons. This diet is supplemented by the meat of antelope and other herbivorous mammals, by tortoises and other reptiles, and by the flesh and eggs of all but raptorial and scavenging birds. Plant-gathering is mostly done by the women ranging within five miles of the camp, while men hunt over a much larger area of the territory. The main hunting weapon is a light bow shooting flimsy, unfletched, poisoned arrows. The range is only 25 yards, and great skill is needed to stalk the quarry within this distance. Antelope leather provides clothing material. Women wear fore and hind skirts, as well as cloaks, which also serve as blankets and carrying-bags. Men wear breechclouts and cloaks. Sandals are sometimes worn as protection from the hot sand.

From November to some time between late June and early August, when there is sufficient food, the band lives as one community, moving camp every three or four weeks as the local supply of food plants becomes exhausted. Blighting frosts deplete the available food plants in winter (which lasts from May to September), and the band then splits into its constituent households, each retreating to a separate part of the territory. Early-fruiting plants increase the food supply just before the approach of the wet season, allowing the band to reunite at a joint campsite.

During dry seasons, shelters are little more than open windbreaks made of branches and grass. In the wet season, domed structures of branches are thatched and made rainproof. (G.Si.)

TRAVEL AND TRANSPORT

The Kalahari thirstland constituted a barrier to early travellers. Many avoided the central Kalahari, since some early attempts to cross it ended in disaster.

The advent of the internal-combustion engine opened up previously inaccessible areas. The earliest crossing by this method was made in 1925, when the central Kalahari was traversed from east to west by truck. Because of its sparse population, the Kalahari is served by infrequent roads and tracks, the majority of which are passable only by trucks or four-wheel drive vehicles.

Maintained roads connect administrative centres, major habitations, and marginal farming areas in the south, southwest, and northwest. Constructed roads now link eastern Botswana with the Okavango Swamps and with mining developments south of the Makgadikgadi.

Kālidāsa

Traditions concerning his life

Kālidāsa (fl. c. 5th century AD) was an Indian poet and dramatist, the outstanding master of the Sanskrit language and probably the greatest writer of any Indian epoch. As with most classical Indian authors, little is known about his person or his historical relationships. His poems suggest but nowhere declare that he was a Brahmin (priest), liberal yet committed to the orthodox Hindu world view. His name, literally "servant of Kālī," presumes that he was a Saivite (follower of the god Śiva, whose consort was Kālī), though occasionally he eulogizes other gods, notably Viṣṇu (Vishnu). A Sinhalese tradition says that he died in Ceylon during the reign of Kumāradāsa (ascended the throne AD 517). A more persistent legend makes Kālidāsa one of the "nine gems" at the court of the fabulous King Vikramiiditya of Ujjain. Unfortunately, there are several known Vikramādityas ("sun of valour"—a common royal appellation); likewise, the nine distinguished courtiers could not have been contemporaries. It is certain only that the poet lived sometime between the reign of Agnimitra, the second Śuṅga king (c. 170 BC), the hero of one of his dramas, and the Aihoḷe inscription of AD 634, which lauds Kālidāsa. He is apparently imitated, though not named, in the Mandasor inscription of AD 473.

No single hypothesis accounts for all the discordant information and conjecture surrounding this date. An opinion accepted by many—but not all—scholars is that Kālidāsa should be associated with Candra Gupta II (reigned AD c. 380–*c.* 415).

The most convincing but most conjectural rationale for relating Kālidāsa to the brilliant Gupta dynasty is simply the character of his work, which appears as both the perfect reflection and the most thorough statement of the cultural values of that serene and sophisticated aristocracy.

Works and significance

Tradition has associated many works with the poet; criticism identifies six as genuine and one more as likely ("Ṛtusaṃhāra," the "Garland of the Seasons," perhaps a youthful work). Attempts to suggest a poetic and intellectual development across them run afoul of the impersonality that is characteristic of classical Sanskrit literature. His works are judged by the Indian tradition as realizations of literary qualities inherent in the Sanskrit language and its supporting culture. Kālidāsa has become the archetype for Sanskrit literary composition.

In drama, his *Abhijñānaśakuntala*, "Śakuntalā Recognized," is the most famous and is usually judged the best Indian literary effort of any period. Taken from an epic legend, it tells of the seduction of the nymph Śakuntalā by King Duṣyanta, his rejection of the girl and his child, and their subsequent reunion in heaven. The epic myth is important because of the child, for he is Bharata, eponymous ancestor of the Indian nation (Bhāratavarṣa, "sub-continent of Bharata"). Kālidāsa remakes the story into a love idyll whose characters represent a pristine aristocratic ideal: the girl, sentimental, selfless, alive to little but the delicacies of nature, and the King, first servant of the *dharma* (religious and social law and duties), protector of the social order, resolute hero, yet tender and suffering agonies over his lost love. The plot and characters are made believable by a change Kālidāsa has wrought in the story: Duṣyanta is not responsible for the lovers' separation; he acts only under a delusion caused by a sage's curse. As in all of Kālidāsa's works, the beauty of nature is depicted with a precise elegance of metaphor that would be difficult to match in any of the world's literatures.

The second drama, *Vikramorvaśī*, "Urvaśī Won by Valour" (possibly a pun on *vikramdditya)*, tells a legend as old as the Veda (earliest Hindu scripture), though very differently. Its theme is the love of a mortal for a divine maiden; it is well-known for the "mad scene" (Act IV) in which the king, grief-stricken, wanders through a lovely forest apostrophizing various flowers and trees as though they were his love. The scene was intended in part to be sung or danced.

The third drama, *Mālavikāgnimitra*, "Mālavikā and Agnimitra," is of a different stamp—a harem intrigue, comical and playful, but not less accomplished for lacking any high purpose. The play (unique in this respect) contains datable references, the historicity of which have been much discussed.

Kālidāsa's efforts in *kdvya* (strophic poetry) are of uniform quality and show two different subtypes, epic and lyric. Examples of the epic are the two long poems *Raghuvaṃśa*, "Dynasty of Raghu," and *Kumārasambhava*, "Birth of the War God." The first recounts the legends of the hero Riima's forebears and descendants; the second tells the picaresque story of Śiva's seduction by his consort Pārvatī, the conflagration of Kāma (the god of desire), and the birth of Kumāra (Skanda), Siva's son. These stories are mere pretext for the poet to enchain stanzas, each metrically and grammatically complete, redounding with complex and reposeful imagery. Kālidāsa's mastery of Sanskrit as a poetic medium is nowhere more marked.

A lyric poem, the "Meghadfita," "Cloud Messenger," contains, interspersed in a message from a lover to his absent beloved, a series of unexcelled and knowledgeable vignettes, describing the mountains, rivers, and forests of north India.

Modern and Western interest in Kālidāsa begins with Sir William Jones's translation of the story of Śakuntalā (1789)--one of the earliest Indic works into a Western language—which, through a German retranslation, awakened the enthusiasm of Johann Wolfgang von Goethe.

The society reflected in Kālidāsa's work is that of a courtly aristocracy sure of its dignity and power. Kālidāsa has perhaps done more than any other writer to wed the older, Brahminic religious tradition, particularly its ritual concern with Sanskrit, to the needs of a new and brilliant secular Hinduism. The fusion, which epitomizes the renaissance of the Gupta period, did not, however, survive its fragile social base; with the disorders following the collapse of the Gupta Empire, Kālidāsa became a memory of perfection that neither Sanskrit nor the Indian aristocracy would know again.

MAJOR WORKS

PLAYS: *Abhijñānaśakuntala*, major critical edition by S.K. Belvalkar (1965; Eng. trans. by M.B. Emeneau, 1962); ***Vikramorvaśī***, ed. by H.D. Velankar (1961; Eng. trans. by E.B. Cowell, 1851); *Mālavikāgnimitra*, ed. by F. Bollensen (1879; Eng. trans. by E. Gerow, 1972).

POEMS: *Raghuvaṃśa*, ed. by S.P. Pandit (1869–74; French trans. by L. Renou, 1928); ***Kumdrasambhava***, ed. by Ganapati Sastri (1913–14; Eng. trans. by R.T.H. Griffith, 2nd ed., 1878); "Meghadfita," ed. by E. Hultzsch (1911; Eng. trans. by F. and E. Edgerton, 1964); "Ṛtusaṃhāra," ed. by A. Scharpé (1958; Eng. trans. by G.R. Mathiers, 1929).

All the works of Kālidāsa (including the "Ṛtusaṃhāra") have been edited by A. Scharpé and were published in four volumes of ***Rijksuniversiteit te Gent: Werken uitgegeven door de Faculteit van de Wijsbegeerteen Letteren*** (vol. 117, 120, 122, and 134). For the "Ṛtusaṃhāra," this constitutes the only modern critical edition. All the works are available in excellent but not critical (by Western standards), editions, published by the Nirnayasagara Press, Bombay.

(Ed.G.)

Kandinsky, Wassily

Among the vanguard artists who changed the history of art in the early years of the 20th century, the Russian painter and aesthetic theorist Wassily Kandinsky occupies a special niche of his own, for he is often referred to as the creator of the first pure abstraction—the first picture that broke completely with the Western tradition of depicting recognizable objects. His absolute priority in this respect, like most historical firsts, is open to argument. But, in his paintings and his writing just before and just after World War I, he was certainly one of the most undeviating and most eloquent of European abstractionists.

Kandinsky.

Kandinsky was born in Moscow on December 4, 1866 (November 22 on the old Russian calendar). His mother was a Muscovite, one of his great-grandmothers a Mongolian princess, and his father a native of Kyakhta, a Siberian town near the Chinese border; the boy thus grew up with a cultural heritage that was partly European and partly, although not very specifically, Asian. His family was genteel, well-to-do, and fond of travel; while still a child he became familiar with Venice, Rome, Florence, the Caucasus, and the Crimean peninsula. At Odessa, where his parents settled in 1871, he completed his secondary schooling and became an amateur performer on the piano and the cello. He also became, along with several of his relatives, an amateur painter; and he later recalled, as a sort of first impulse toward abstraction, an adolescent conviction that each colour had a mysterious life of its own. In 1886 he began to study law and economics at the University of Moscow, but he continued to have unusual feelings about colour as he contemplated the city's vivid architecture and its collections of icons; in the latter, he once said, could be found the roots of his own art. In 1889 the university sent him on an ethnographic mission to the ***oblast*** (provincial subdivision) of Vologda, in the forested north, and he returned with a lasting interest in the often garish, nonrealistic styles of Russian folk painting. During that same year he discovered the Rembrandts in the Hermitage at St. Petersburg (Leningrad), and he furthered his visual education with a trip to Paris. He pursued his academic career and in 1893 was granted the degree equivalent of a doctorate.

Early understanding of colour

By this time, according to his reminiscences, he had lost much of his early enthusiasm for the social sciences. He felt, however, that art was "a luxury forbidden to a Russian." Eventually, after a period of teaching at the university, he accepted a post as the director of the photographic section of a Moscow printing establishment. In 1895 he had what proved to be a prophetic experience: looking at one of Claude Monet's haystack pictures, he was momentarily unable to recognize the depicted object because of the Impressionist handling of flecked light and colour. He remembered,

> I had the feeling that here the subject of the picture was in a sense the painting itself, and I wondered if one couldn't go much further along the same route. After that I looked at Russian icons with different eyes; I had eyes, that is, for what was abstract. . . .

The next year, when he was approaching his 30th birthday, he was forced to choose among his possible futures, for he was offered a professorship in jurisprudence at the University of Dorpat (later called Tartu), in Estonia, which was then undergoing Russification. In what he called a "now or never" mood, he turned down the offer and took the train for Germany with the intention of becoming a painter.

Munich period. He already had the air of authority that would contribute to his success as a teacher in later years. He was tall, large-framed, impeccably dressed, and equipped with pince-nez glasses; he had a habit of holding his head high and seeming to look down at the universe. He resembled, according to acquaintances, a mixture of diplomat, scientist, and Mongol prince. But for the moment he was simply an overage art student. and he enrolled as such in a private school at Munich run by the minor painter Anton Azbé. Two years of study under Azbé were followed by a year of work alone and then by enrollment at the Munich Academy in the class of Franz von Stuck, who had a considerable reputation as a painter of bacchanalia and lurid, heavily emphatic allegories. Among the students at the Azbé school was Alexey von Jawlensky, who was heading toward a personal kind of Expressionism after studying with the Russian Realist Ilya Repin in Moscow; among those at the Munich Academy was the Swiss-born Paul Klee, who was developing his own inimitable kind of semi-abstract fantasy.

Academic training in art

Kandinsky emerged from the academy with a diploma in 1900 and, during the next few years, achieved moderate success as a competent professional artist in touch with modern trends. Starting from a base in 19th-century Realism, he was influenced by Impressionism, by the whiplash lines and decorative effects of Art Nouveau (called Jugendstil in Germany), by the dot technique of Neo-Impressionism or Pointillism, and by the strong, unrealistic colour of central European Expressionism and French Fauvism. Often he revealed that he had not forgotten the icons of Moscow and the folk art of Vologda; sometimes he indulged in patterns of violent hues that would have delighted his Asian ancestors. He exhibited with the vanguard groups and in the big nonacademic shows that had sprung up all over Europe—with the Munich Phalanx group (of which he became president in 1902), with the Berlin Sezession group, in the Paris Salon d'Automne and Salon des Indépendants, and with the Dresden group that called itself Die Brucke (the Bridge). In 1903 in Moscow he had his first one-man show, followed the next year by two others in Poland. Between 1903 and 1908 he travelled extensively, from Holland to as far south as Tunisia and from Paris back to Russia, stopping off for stays of several months each in Kairouan (Tunisia), Rapallo (Italy), Dresden, the Parisian suburb of Sèvres, and Berlin.

In 1909 Kandinsky and the German painter Gabriele Münter, who had been his mistress since 1902, acquired a house in the small town of Murnau, in southern Bavaria. Working part of the time in Murnau and part of the time in Munich, he began the process that led to the emergence of his first strikingly personal style and finally to the historic breakthrough into purely abstract painting. Gradually, the many influences he had undergone coalesced around a question that had evidently been on his mind since at least 1895, when he had felt that Monet's picture of a haystack was communicating something that had nothing to do with haystacks. His impulse to eliminate the haystack altogether was not, it should be noted, due merely or even primarily to strictly aesthetic considerations. No one could have been less of an aesthete, less of an "art for art's sake" addict, than Kandinsky. Nor was he the sort of born painter who could enjoy the physical properties of oil and pigment without caring what they meant. In his book *Über* das Geistige in der *Kunst* (Concerning the Spiritual *in Art*). which he completed in 1910 and published late the next year, he emphasizes what he presents as a modern need for an art that springs not from "the exterior" but from an "interior necessity." In his *Rückblicke* (*Reminiscences*), published in 1913, he remarks: "I saw clearly in front of me the danger of an ornamental kind of painting. . . ." In summary, he wanted a kind of painting in which colours, lines, and shapes, freed from the distracting business of depicting recognizable objects, might evolve into a visual "language" capable—as was, for him, the abstract "language" of music—of expressing general ideas and evoking deep emotions.

Development of a theory of purely abstract painting

The project was not, of course, entirely new. Analogies between painting and music had long been common; many thinkers had attempted to codify the supposed expressiveness of colours, lines, and shapes; and more than one fairly ancient sketch might compete for the honour of being called the first abstract picture. Moreover, in these years just before World War I, Kandinsky was by no means alone in his attack on figurative art. By 1909 the Cubists were turning out intellectualized and fragmented visions of reality that completely baffled the ordinary viewer. Between 1910 and 1914 the list of pioneer abstract artists included the Russians Mikhail Larionov, Natalya Goncharova, and Kazimir Malevich; the Swiss Augusto Giacometti (uncle of the sculptor Alberto Giacometti); the Frenchmen Robert Delaunay and Fernand Léger; the Czech František Kupka; and the Dutchman Piet Mondrian. A strict examination of works and dates can show, therefore, that Kandinsky does not quite deserve to be called, as he often is, the "founder" of nonfigurative painting; at least he cannot be called the only founder. But, when this historical point is conceded, he remains a pioneer of the first importance. He had no consequential precedent for his theorizing in *Über das* Geistige in der *Kunst* and no fellow researcher before 1910 whose program was as coherent as his. Moreover, in the beginning he was alone in possessing the peculiar but probably required combination of rationalism with an emotionalism that verged on mysticism. He was a trained lawyer and social scientist and at the same time capable, according to his own testimony, of seeing colours as he listened to Wagner's opera Lohengrin. His orderly, rather academic mind was not immune to the fascination of the large, loose notions of the pre-1914 Theosophists. He had, according to his friend Klee, "his heart in his head."

Place as a pioneer of nonfigurative painting

Stylistic evolution toward a nonrepresentational art

Kandinsky's widely accepted claim to historical priority rests mainly on an untitled work dated 1910 and commonly referred to as "First Abstract Watercolour." On the basis of research done in the 1950s, however, this work can be dated somewhat later and can be regarded as a study for the 1913 "Composition VII"; and in any event it must be considered merely an incident—among many for which the evidence has not been preserved—on Kandinsky's route. In "Blue Mountain" (1908) the evolution toward nonrepresentation is already clearly under way; the forms are schematic, the colours non-naturalistic, and the general effect that of a dream landscape. In "Landscape with Steeple" (1909; Musée National d'Art Moderne, Paris) similar tendencies are evident, together with the beginning of what might be called an explosion in the composition. By 1910, "Improvisation XIV" is already, as its somewhat musical title suggests, practically abstract; with the 1911 "Encircled," there has definitely developed a kind of painting that, though not just decoration, has no discernible point of departure in the depiction of recognizable objects. After that come such major works as "With the Black Arch," "Black Lines," and "Autumn"; in such pictures, done between 1912 and 1914 in a slashing, splashing, dramatic style that anticipates the New York Abstract Expressionism of the 1950s, most art historians see the peak of the artist's achievement.

Kandinsky's theorizing and his mysticism kept pace with the evolution of his style. In 1913, in his ***Riickblicke,*** he remarks:

> Thus the domain of Art was separating itself, for me, more and more from the domain of Nature, to the point where I could experience each of them as a domain by itself. I fully realized this for the first time this year.

He adds:

> To paint is to detonate a shock of different worlds. . . . In terms of technique, each work comes into existence as the Cosmos did, by means of catastrophes that, beginning with the chaotic cries of the instruments, finish in the symphony we call the music of the spheres.

Not surprisingly, he is said to have often reached a point in his conversations beyond which his friends could not follow his thinking. But he is also said to have possessed an unexpectedly quick, deadpan sense of humour, and this report is supported by some of his occasional verse, written in a vein that recalls both a Russian fairy tale and a Dada joke. Kandinsky also wrote, in 1909, three theatrical pieces, entitled ***Der Gelber Klang*** ("The Yellow Sound"), *Der Grüner Klang* ("The Green Sound"), and *Schwartz und Weiss* ("Black and White"), and in 1911 followed them with a fourth, ***Violet.***

Formation of Der Blaue Reiter

He was an active animator of the avant-garde movement in Munich, helping to found in 1909 the Neue Kiinstlervereinigung (New Artists' Association). Following a disagreement within this group, he and the German painter Franz Marc founded in 1911 an informally organized rival group, which took the name Der Blaue Reiter (The Blue Rider), from the title of one of Kandinsky's 1903 pictures, and which stated its aims in terms that clearly reflected Kandinsky's rather Oriental philosophical stance:

> To give expression to inner impulses in every form that provokes an intimate reaction in the beholder, such is the goal which the Blaue Reiter will aspire to achieve. We seek today, behind the veil of external appearances, the hidden things that seem to us more important than the discoveries of the Impressionists.

Among the important members, in addition to Kandinsky and Marc, were Klee and the gifted young German artist August Macke. The Blaue Reiter disappeared with the outbreak of World War I, but during its short life it had a significant role in the development of modern art. In the exhibitions it staged at Munich in 1911 and 1912, it gave central Europeans an opportunity to see the work of such artists as Delaunay, Henri Rousseau, Larionov, Goncharova, Georges Braque, André Derain, and—as a painter—the composer Arnold Schoenberg. The Blaue Reiter "almanac"—a volume of essays and reproductions—featured material on modern music and on modern, primitive, popular, medieval, and Oriental visual art.

Russian interlude. When World War I was declared in 1914, Kandinsky broke off his relationship with Gabriele Münter and returned to Russia by way of Switzerland, Italy, and the Balkans. An early marriage to a cousin had been dissolved in 1910 after a long period of separation, and in 1917 he married a Moscow girl, Nina Andreevskaya, whom he had met the previous year. Although he was past 50 and his bride was many years younger, the marriage turned out to be extremely successful, and he settled down in Moscow with the intention of reintegrating himself into Russian life. His intention was encouraged by the new Soviet government, which at first showed itself anxious to win the favour and services of avant-garde artists. In 1918 he became a professor at the Moscow Academy of Fine Arts and a member of the arts section of the People's Commissariat for Public Instruction. His autobiographical ***Riickblicke*** was translated into Russian and published by the Moscow municipal authorities. In 1919 he created the Institute of Artistic Culture, became director of the Moscow Museum for Pictorial Culture, and helped to organize 22 museums across the Soviet Union. In 1920 he was made a professor at the University of Moscow and was honoured with a one-man show organized by the state. In 1921 he founded the Russian Academy of Artistic Sciences. But by then the Soviet government was veering from avant-garde art to Social Realism, and so, at the end of the year, he and his wife left Moscow for Berlin.

Influence of Constructivism

In spite of the war, the Revolution, and official duties, he had found time to paint during this Russian interlude and even to begin a quite drastic transformation of his art. Whereas, in his Munich work as late as 1914 one can still find occasional allusions to landscape, the canvases and watercolours of his Moscow years show a determination to be completely abstract. They also show, possibly because of the influence of such Russian revolutionaries as the severely geometrical Malevich and the Constructivists Naum Gabo and Antoine Pevsner, a growing tendency to abandon the earlier spontaneous, lyrical, organic style in favour of a more deliberate, rational, and constructional approach. The change is evident in such pictures as "White Line" and "Blue Segment."

Bauhaus period. By this time Kandinsky had an international reputation as a painter. He had always, however, been interested in teaching, first as a lecturer in law and economics just after getting his university degree, then as the master of a painting school he had organized in Munich, and more recently as a professor at the University of Moscow. He seems not to have hesitated, therefore, when early in 1922 he was offered a teaching post at Weimar in the already famous Bauhaus school of architecture and applied art. At first his duties were a little remote from his personal activity, for the Bauhaus was not concerned with the formation of "painters" in the traditional sense of the word. He lectured on the elements of form, gave a course in colour, and directed the mural workshop. Not until 1925, when the school moved from Weimar to Dessau, did he have a class in "free," nonapplied painting. In spite of the somewhat routine nature of his work, however, he appeared to have found life at the Bauhaus rewarding and very pleasant. Among the professors were his old friend Klee, the American-born Cubist Lyonel Feininger, the German abstractionist Josef Albers, the Hungarian Constructivist László Moholy-Nagy, the Hungarian architect and furniture designer Marcel Breuer, and the German architect Walter Gropius, who was the school's director until 1928. The climate was one of research and craftsmanship combined with a certain amount of aesthetic puritanism; it was classical, to use the term rather loosely, by comparison with the warm romanticism of his pre-1914 days in Munich.

Kandinsky responded to this climate by continuing to evolve in the general direction of geometrical abstraction, but with a dynamism and a taste for detail-crowded pictorial space that recall his earlier sweeping-gesture technique. Although circles and triangles became his dominant forms, they were combined with arrows, spikes, and warped grids in a way that defied the Bauhaus notion of bare Euclidean purity. The colours sometimes suggested Russian folk art and sometimes something vaguely Aztec. Typical works are the transitional "In the Black Circle," "One Center," "Yellow-Red-Blue," "Three Sounds," "On the Points," and "Affirmed Pink." Although this period of the artist's career has always had its fervent admirers, a probable majority of art historians has tended to have reservations concerning the frequent lack of ease and spontaneity—the look, despite the energy displayed, of something contrived to illustrate a theory.

Treatises on theory

That Kandinsky was keenly interested in theory during these years is evident from his publication in 1926 of his second important treatise, ***Punkt und Linie zu Fläche*** (Point and Line to Plane). In his first treatise, ***Concerning the Spiritual in Art,*** he had emphasized in particular the supposed expressiveness of colours, comparing yellow, for example, to the aggressive, allegedly earthly sound of a trumpet and comparing blue to the allegedly heavenly sound of the pipe organ. Now, in the same spirit, he analyzed the supposed effects of the abstract elements of drawing, interpreting a horizontal line, for example, as cold and a vertical line as hot. He continued to have a partly mystical belief in the possibility of an abstract visual language; in 1931 he wrote:

> The impact of an acute angle of a triangle on a circle produces an effect no less powerful than the finger of God touching the finger of Adam in Michelangelo; and if fingers are not just anatomical or physiological, but something more, a triangle or circle is something more than geometry.

Paris period. Although he had been a German citizen since 1928, he emigrated to Paris when, in 1933, the Gestapo forced the Bauhaus to close. The last, and one of the finest, of his German pictures is the sober "Development in Brown"; its title probably alludes to the Nazi brown-shirted storm troopers, who regarded his abstract art as "degenerate." He lived for the remaining 11 years of his life in an apartment in the Parisian suburb of Neuilly-sur-Seine, becoming a naturalized French citizen in 1939.

"Concrete" style of late paintings

During this final period his painting, which he began to prefer to call "concrete" rather than "abstract," became to some extent a synthesis of the organic manner of the Munich period and the geometrical manner of the Bauhaus period. The visual language he had been aiming at since at least 1910 turned into collections of signs that look like almost-decipherable messages written in pictographs and hieroglyphs; many of the signs resemble aquatic larvae, and now and then there is a figurative hand or a lunar human face. Typical works are "Violet Dominant," "Dominant Curve," "Fifteen," "Moderation," and "Tempered Elan." The production of such works was accompanied by the writing of essays in which the artist stressed the alleged failure of modern scientific positivism and the need to perceive what he termed "the symbolic character of physical substances."

Kandinsky died at Neuilly-sur-Seine on December 13, 1944. His influence on 20th-century art, often filtered through the work of more accessible painters, was profound.

MAJOR WORKS

"The Sluice" (1901; Neue Pinakothek, Munich); "The Blue Rider" (1903; Ernst Biihrle Collection, Ziirich); "Beach Baskets in Holland" (1904; Neue Pinakothek); "The Night" (1907; Neue Pinakothek); "Street in Murnau with Women" (1908; Musée National d'Art Moderne, Paris); "Blue Mountain" (1908; Solomon R. Guggenheim Museum, New York); "First Abstract Watercolour" (1910; Nina Kandinsky Collection, Neuilly-sur-Seine, France); "Encircled" (1911; Nina Kandinsky Collection); "All Saints Picture 11" (1911; Neue Pinakothek); "With the Black Arch" (1912; Nina Kandinsky Collection); "Black Lines" (1913; Solomon R. Guggenheim Museum); "Improvisation No. 30" (1913; Art Institute of Chicago); "Composition VII" (1913; State Tretyakov Gallery, Moscow); "Picture with Three Spots" (1914; Solomon R. Guggenheim Museum); "Autumn" (1914; Solomon R. Guggenheim Museum); "White Line" (1920; Nina Kandinsky Collection); "Blue Segment" (1921; Solomon R. Guggenheim Museum); "In the Black Circle" (1923; Fondation Maeght, Saint-Paul, France); "One Center" (1924; Solomon R. Guggenheim Museum); "Yellow-Red-Blue" (1925; Nina Kandinsky Collection); "Several Circles" (1926; Solomon R. Guggenheim Museum); "Three Sounds" (1926; Solomon R. Guggenheim Museum); "On the Points" (1928; Nina Kandinsky Collection); "Scarcely (Kaum)" (1930; Boymans-von-Beuningen Museum, Rotterdam); "Affirmed Pink" (1932; Solomon R. Guggenheim Museum); "Development in Brown" (1933; Musée National d'Art Moderne, Paris); "Violet Dominant" (1934; Fondation Maeght, Saint-Paul, France); "Succession" (1935; Phillips Collection, Washington); "Dominant Curve" (1936; Solomon R. Guggenheim Museum); "Tensions Relaxed" (1937; W. Gidwitz Collection, Chicago); "Sweet Trifles" (1937; Nina Kandinsky Collection); "Fifteen" (1938; Nina Kandinsky Collection); "Composition X" (1939; Nina Kandinsky Collection); "Moderation" (1940; Solomon R. Guggenheim Museum); "Various Actions" (1941; Solomon R. Guggenheim Museum); "Division-Unity" (1943; Nina Kandinsky Collection); "Circle and Square" (1943; Nina Kandinsky Collection); "Seven" (1943; Max Bill Collection, Zurich); "White Balancing Act" (1944; Professor W. Loffler Collection, Zurich); "Tempered Élan" (1944; Nina Kandinsky Collection).

BIBLIOGRAPHY. MAX BILL *et al.*, *Wassily Kandinsky* (1951), is a collection of essays by Bill and other critics, with a useful chronology by NINA KANDINSKY. WILL GROHMANN, *Wassily Kandinsky: Life and Work* (1959), is a sympathetic biography by a friend of the artist. PAUL OVERY, *Kandinsky: The Language of the Eye* (1969), offers the best analysis of the painter's not always clear intentions.

(R.McMu.)

K'ang-hsi

K'ang-hsi (Pin-yin romanization, Kang-xi; given name, Hsiian-yeh; temple name, Sheng-tsu; posthumous name, Jen Huang-ti) was the fourth Ch'ing emperor but only the second to reign in China. Usually counted among the ablest monarchs ever to govern the vast Chinese empire, K'ang-hsi reigned for 61 years, laying the foundation for a long period of dynastic stability and prosperity that became commonly known as the K'ang-hsi–Ch'ien-lung age.

By courtesy of the Metropolitan Museum of Art, New York, Rogers Fund, 1942

K'ang-hsi, painting on silk by an unknown Chinese artist, 19th century. In the Metropolitan Museum of Art, New York.

Early life. The third son of Emperor Shun-chih, K'ang-hsi was born on May 4, 1654, in the Forbidden City of Peking, to Empress Hsiao-k'ang, daughter of Tulai, a famous Manchu general from the prestigious T'ung clan. (The Manchus were a people of Tungusic stock living in Manchuria who conquered China and established the Ch'ing dynasty in 1644.) Upon Shun-chih's sudden death from smallpox at age 23, in February 1661, K'ang-hsi was immediately raised to the Imperial throne over his five brothers, who had been born to mothers lower in birth than his; and the era's name was changed starting the next Chinese New Year, from Shun-chih (Manchu: Ijishūn Dasan), or Obedient Rule, to K'ang-hsi (Elhe Taifin), or Peaceful Harmony.

Elevation to the Imperial throne

Because the new emperor was not yet quite seven years old, his government was first administered by Sonin, Suksaha, Ebilun, and Oboi—four conservative Manchu courtiers from the preceding reign. One of the first political acts of the four Imperial advisers was to replace the so-called Thirteen Offices (Shih san ya men) with a Nei-wu-fu (Dorgi yamun), or Office of Household. The Thirteen Offices, all organized solely by Chinese eunuchs, had been the abomination of the Manchus ever since they were introduced by the late emperor, to handle affairs of the Imperial household, patterned after an elaborate model that had existed under the preceding dynasty—the Chinese Ming. Now the private sector of the Emperor's life would be run by his personal Manchu bond servants who staffed the newly created Office of Household. Thus, the Manchu Ch'ing successfully prevented court eunuchs from meddling with politics, in sharp contrast to many other dynasties, the Ming in particular, that had recurrently let eunuchs gain access to actual power, often with most disastrous results.

In 1667, advised by Sonin and other ministers, K'ang-hsi began attending to affairs of state at the age of 13, as his father had before him. He ruled only in name, however; the real power was still firmly in the hands of the four advisers. Sonin soon died, and Oboi became a virtual dictator, putting Suksaha to death for an alleged crime and cowing Ebilun into submission. Finally, in 1669, Oboi and Ebilun were eliminated by K'ang-hsi, who must have enlisted the help of his grandmother, the Grand Empress Dowager, and of Hsiung Tz'u-li, his Chinese tutor. The actual arrest of Oboi was made in the audience room by young wrestlers, who jumped upon the powerful minister from their hiding place behind the throne. With this coup the 15-year-old Emperor proved to the public that he was their real master.

Potential rivals in South China

Acquisition of actual power. Once in power, K'ang-hsi was confronted by the grave problem of what to do with three vassal kings in South China. The three kings—Wu San-kuei of Yunnan, Shang K'o-hsi of Kwangtung, and Keng Chi-mao (after his death succeeded by his son Keng Ching-chung) of Fukien—were among the Chinese warlords who, with their powerful firearms, had been welcomed into the Manchu camp even before the Manchu conquest of China in 1644. When Shun-chih had entered Peking in that year, the rest of China was still in the hands of the remaining Ming forces or of roving bands of robbers. Having made a major contribution toward subduing them, the three warlords had been created kings and had stayed in South China with their private armies. It was inevitable that the three vassal kings, with their virtual immunity, should become a menace to the Peking government.

A chance to improve the situation came in 1673, when Shang K'o-hsi offered to give up the command of his army and retire to Manchuria, his birthplace. The offer was so promptly accepted by K'ang-hsi that the other two kings were forced to make the same offer, if only for courtesy's sake. Now the chief issue at the Imperial council in Peking became whether or not to challenge the formidable military strength of Wu San-kuei, the very person responsible for the 1644 Manchu take-over of the capital. The young Emperor again showed his resoluteness by deciding in favour of trying to deprive Wu of his army, arguing that the three kings were sure to eventually rebel against Peking and that it would be better to forestall them by taking advantage of this opportunity. A shocked Wu immediately went to war against the Manchus, starting the so-called Revolt of the Three Feudatories. Initial reverses suffered by the Imperial forces prompted King Burni of the Chakhar Mongols—the supreme royal tribe until the Manchu conquest of Inner Mongolia in 1635—to revolt also against the Ch'ing and sent ripples of political unease among other East Asian countries. K'ang-hsi's youthful energy and genius in military strategy finally triumphed over the senility of Wu San-kuei, who never even attempted to march on Peking but died soon after styling himself emperor. The Ch'ing army entered the city of Kunming, in Yunnan, in 1681; the war was over, and the dynasty was saved.

After eliminating the three kings, K'ang-hsi turned his attention to the Cheng regime on Taiwan. Originally from Fukien, the Cheng family had been for generations a sea power that monopolized trade across the vast expanse of the China seas; Gen. Cheng Ch'eng-kung (the Koxinga), who refused to submit to the Manchus, had moved his headquarters to Taiwan, which he took from the Dutch in 1662, and his descendants had continued resistance to the Ch'ing from there. Lack of naval power prevented the Ch'ing from mounting an effective attack on Taiwan. Their only strategy, adopted in 1661, though to little avail, was the forced relocation of the inhabitants of coastal areas deeper into the continent, so that the Cheng might be isolated. In 1683 an internal strife in the Cheng family gave K'ang-hsi a chance to order his troops across the Taiwan Straits. The Cheng surrendered, and Taiwan was incorporated into the province of Fukien.

Enemies in the north

With China securely under his power, K'ang-hsi next turned to face his enemies in the North. The Russians in Siberia, who had reached the Amur Valley in the mid-17th century, had been expelled from their fortresses of Albazin and Nerchinsk by the Ch'ing army before K'ang-hsi's reign. But the Russians restored the two fortresses and were busily building many more in that region, and K'ang-hsi prepared to deal them a blow. In 1685 Ch'ing forces attacked Albazin and captured it in a few days. As soon as they withdrew, however, the Russians manned the fortress again. Infuriated, K'ang-hsi ordered another expedition to Albazin the following year and began a protracted siege. Concurrent diplomatic negotiations between K'ang-hsi and Tsar Peter the Great of Russia led to the signing of the Treaty of Nerchinsk (1689). Drafted under the pressure of a superior number of Ch'ing troops sent into Nerchinsk by K'ang-hsi, the treaty drew the Sino-Russian borderline along the Gorbitsa, an outer tributary of the Amur, and the Stanovoy Range, thereby leaving the Amur Valley and Manchuria, homeland of the dynasty, in the hands of the Ch'ing.

Next K'ang-hsi brought Outer Mongolia under his power. Dga'-ldan Boshogtu Khan of the Dzungar Oyrats, a nomadic people who lived to the west of Outer Mongolia and to the north of the T'ien Shan, was an ambitious ruler who had conquered east Turkistan and then invaded the territories of the Outer Mongolian Khalkhas. The Khalkha Mongols fled in great numbers to Inner Mongolia, seeking protection under the Ch'ing. In 1691 K'ang-hsi met with representatives of the Khalkha tribes at Doloon Nuur (later called To-lun Hsein) in Inner Mongolia, where he received their formal pledge of allegiance. In 1696 he embarked on a daring and extremely dangerous venture—a military expedition to Outer Mongolia across the scorched desert of Gobi. In personal command of the middle corps, K'ang-hsi managed to overcome hunger and thirst in the hostile terrain and annihilated the Dzungars at Juun Modu, east of the present-day Ulaanbaatar. Dga'-ldan committed suicide the following year at his hideout in the Altai Mountains. With the return of the Khalkhas to their homeland, Outer Mongolia became an integral part of the Ch'ing empire.

Two decades of peace between the Ch'ing and the Dzungars ensued, until the latter invaded Tibet and took Lhasa in 1717. Mindful of the spiritual sway of Tibet's Dalai Lama over the Mongols, K'ang-hsi sent his army into Tibet and expelled the Dzungars from Lhasa in 1720, thus incorporating the country into his empire. Hoping to check the Dzungar power, K'ang-hsi sent, in 1712, an embassy to the Torguts, or Volga Kalmyks, who had migrated to southern Russia in the earlier half of the 17th century. When the Manchu envoys, who travelled the length of Siberia back and forth by its myriad waterways, returned to Peking three years later, one of them, Tulishen, wrote a detailed account of the journey under the title of *I yü lu* (Record of *Strange Regions*).

Personal attention to detail

Administration of the empire. K'ang-hsi was an accomplished military leader who was endowed with exceptional physical strength and with skill in archery; he poured his inexhaustible energy into his daily administrative duties. Under the traditional Imperial system of China, nothing in the empire was too small to come under the personal scrutiny of the Emperor. K'ang-hsi read all the reports and memorandums presented to him, meticulously correcting even the smallest scribal errors, and he often boasted that he routinely took care of all the documents, even in wartime, when 300–400 arrived daily.

The Huang Ho was one of the subjects that commanded K'ang-hsi's attention. Long neglected, the river repeatedly flooded the land near where it joined the Huai Ho, causing great damage to northern Kiangsu. In 1677

K'ang-hsi appointed Chin Fu superintendent of riparian works; in 1683 Chin finished embanking and dredging to stabilize the flow of the river. At the same time, the Grand Canal, the important arterial waterway that connected the Huang Ho with the lower Yangtze River, was repaired to allow the smooth flow of large quantities of rice needed in the north from the rich granaries of the south. To inspect the results of the works and to acquaint himself with cultural and economic leaders of the wealthy south, K'ang-hsi travelled to the lower reaches of the Yangtze six times between 1684 and 1707, financing each journey with his own private funds. In his private life, K'ang-hsi was frugal in court expenditures, waited upon only by a small number of court ladies and eunuchs. He never raised taxes, even in wartime; in fact, taxes were reduced or exempted many times during his reign; in three years starting in 1711, all provinces received a tax relief that totalled more than 30,000,000 taels. In 1711 K'ang-hsi declared that from then on the number of tax-paying adults should be perpetually fixed at the present level for head-tax purposes, permanently exempting the balance of future population growth from taxation.

After the conquest of Taiwan, K'ang-hsi lifted restrictions on coastal trade and opened four ports, including Canton, to foreign ships. Foreigners brought silver to China to purchase such Chinese products as tea, silk, and chinawares. Such activities and internal peace stimulated a tremendous industrial growth, particularly in the lower reaches of the Yangtze.

Fondness for learning

K'ang-hsi was very fond of learning. His avidity for study steadily increased with his age, to a degree that even when ill from overwork he did not stop reading books. In 1677 he opened a small study hall called the Nan shu-fang in the Forbidden City, where he engaged himself in lively discussions on philosophical and historical topics with the leading scholars of his time. His inclination toward the scholar Chu Hsi's philosophy and arduous emulation of its Confucianist ideals were a most effective means for the Manchu Ch'ing to gain confidence of the Chinese majority.

Besides the traditional civil service examinations for recruiting Chinese officials educated in Confucian disciplines, K'ang-hsi opened in 1678 a special channel through which persons with exceptional talents in learning and writing were admitted into his service on recommendation. The 50 men who thus won appointments at the Hanlin Academy, the famous scholar Chu I-tsun among them, worked on compilation of the *Ming-shih*, an official history of the Ming dynasty. Other great books commissioned by K'ang-hsi included the dictionary of Chinese characters, *K'ang-hsi tzu-tien*, listing about 42,000 characters (1716); the rhyming dictionary of Chinese compounds, *P'ei wen yün-fu* (1711); and the subject-matter encyclopaedia, *Yuan-chien lei-han* (1710). Another great encyclopaedia, the *Ku-chin t'u-shu chi-ch'eng*, which was to consist of 10,000 chapters, was also started in K'ang-hsi's reign.

In the field of popular education, K'ang-hsi issued, in 1669, an Imperial precept consisting of 16 articles, a revision and expansion from the six articles issued by Shun-chih, in which he detailed practicalities of village life. The precept, expanded further by his son and successor, Yung-cheng, offered moral guidelines to the Chinese peasantry for almost two and a half centuries.

Always eager to absorb new knowledge and technologies from Europe, K'ang-hsi employed many Jesuit missionaries. He learned geometry from Ferdinand Verbiest, who became deputy director of the Imperial Observatory and compiled the official calendar of the empire. Verbiest was also responsible for the production of cannons that proved effective against the three rebellious kings and the Dzungars. Jean-François Gerbillon and Joachim Bouvet taught K'ang-hsi mathematics. K'ang-hsi ordered Pierre Jartoux, Jean-Baptiste Régis, and others to compile an accurate atlas of the empire; after long and laborious trigonometric surveys that covered every corner of the empire, starting in 1708, the atlas *Huang yü ch'üan lan t'u* was completed in 1717. The famous *Nouvel Atlas de la Chine, de la Tartarie chinoise et du Thibet* of Jean-Baptiste Bourguignon d'Anville is a French version of this original. European painting also fascinated K'ang-hsi. Gio Ghirardini, an Italian layman brought by Bouvet, and Giuseppe Castiglione were the Emperor's favourite court artists, who influenced Chinese painting with their European-style perspective drawing and other activities.

The Rites Controversy

Those cultural contributions by the Jesuits endeared Catholicism to K'ang-hsi, who gave official permission for its propagation in 1692 and later gave French missionaries a residence within the Imperial City and built a church for them in Peking in gratitude for curing him of malaria. His sympathy attracted to China more missionaries from such orders as the Dominicans, the Franciscans, and the Augustinians. In contrast to the Jesuits, who were lenient with such traditional Chinese rites as ancestor worship and state cult of Confucius and Heaven, those newcomers condemned the traditions as superstitions incompatible with Christian faith. The Rites Controversy raged on until 1704, when Pope Clement XI issued a decree forbidding Chinese Catholics to take part in such rites. Angered by this interference in what he considered his exclusive domain, K'ang-hsi ordered the Portuguese to arrest Carlo Tommaso Maillard de Tournon, an apostolic legate to China carrying the papal decree; and in 1706 he expelled missionaries who would not adhere to the Jesuit line. In 1720 Carlo Ambrogio Mezzabarba, another legate, was ordered back home by the Emperor.

K'ang-hsi had three empresses—one a granddaughter of Sonin of the Hesheri clan, another a daughter of Ebilun of the Niohuru clan, and the third a granddaughter of Tulai of the T'ung clan—in addition to many concubines; they bore him 35 sons in all. He nominated the second son, Yin-jeng, crown prince in 1675, at the age of little more than a year and a half; this was against the Manchu tradition of giving all sons equal rights of succession, and it resulted in vicious fights among K'ang-hsi's sons. The hapless Yin-jeng was deposed in 1708, restored in 1709, and again deposed in 1712, this time permanently. Terribly hurt by the experience, K'ang-hsi and his successors never again tried to nominate a crown prince.

At the Chinese New Year of 1722, K'ang-hsi celebrated his long and prosperous reign by inviting many elders to a great banquet at the court. That winter he fell ill while staying at the Imperial villa of Ch'ang ch'un yüan, in the northwestern outskirts of Peking, and he died on December 20. The next year he was buried at Ma lan yü, to the northeast of Peking, in a mausoleum called the Ching ling. His throne was taken over by his fourth son, Yin-chen (Yung-cheng).

K'ang Yu-wei

K'ang Yu-wei (in Pin-yin romanization Kang Yu-wei), an original thinker, influential writer, and the leader of the Chinese Reform Movement, which reached its zenith in 1898, was a key figure in the intellectual development of modern China.

Born on March 19, 1858, he came from a scholarly gentry family in the district of Nan-hai in Kwangtung Province. His teacher imbued him with the Confucian ideal of service to society, and his study of Buddhism impressed him with its spirit of compassion. He rebelled against convention, Neo-Confucian authoritarianism, and the demands of the civil service examination system. After reading about the outside world, he came to admire Western civilization. In the 1880s he began to conceive some of his basic ideas: ideas of historical progress, social equality, a world government, and the nature of the universe.

Efforts at reform

K'ang's first venture in social reform was in 1883, when he tried to abolish in his village the custom of foot-binding imposed on women. The decay of the Ch'ing Empire (1644–1911) prompted K'ang and other concerned Chinese to urge fundamental institutional reforms. After his plans for the salvation of China—submitted in 1888 to the Ch'ing court—were ignored, K'ang set out to convert the educated class to his views and to arouse the people from their lethargy. In 1890 he opened a school in Canton to teach new learning. Assisted by his students, among whom was Liang Ch'i-ch'ao, who collaborated in his reform movement, he wrote *The Forged Classics* (1891), which reveals that the Confucian classics held sacrosanct as bases of the state cult had been tampered with in the Han period (206 BC–AD 220). This book was followed by *Confucius as a Reformer* (1897), which expounded K'ang's belief that Confucius was concerned with contemporary problems and stood for change and that the progress of mankind was inevitable. His interpretation of Confucian teachings and researches on ancient texts later inspired modern scholarship in the reappraisal of China's past, although critics have charged that he invoked Confucius to further his reform aims and was undermining the established way of life.

When China was defeated by Japan in 1895, K'ang mobilized hundreds of provincial graduates then in Peking to protest against the humiliating peace terms and to petition for far-reaching reforms to strengthen the empire. To arouse the people to the dangers confronting China, he and his associates published newspapers and founded the Society for the Study of National Strengthening, the archetype of political parties in modern China. The society was suppressed in 1896.

In 1898, when foreign powers threatened to partition China, K'ang and his followers suggested an alliance with Britain and Japan to check Russia's advance and insisted that only institutional reforms could save China. He urged the clearing of channels for the expression of public opinion, the convocation of assemblies, and even the acceptance of popular sovereignty and the separation of state powers, and he organized the Society to Preserve the Nation to marshal support. Finally, he prevailed upon the emperor Kuang-hsii to launch the reform program. Among the many measures that were promulgated were the streamlining of the government, strengthening of the armed forces, new standards in the civil service examination system, the development of commerce and industry, the promotion of local self-government, and the opening of Peking University and modern schools.

Years of exile

The reform measures were annulled, however, when the dowager empress Tz'u-hsi (1835–1908) reasserted control. The Emperor was placed in confinement, six of the reform leaders, including K'ang's brother, were executed, and scores were arrested. K'ang and Liang Ch'i-ch'ao escaped to Japan. Unable to persuade the Japanese and British governments to intervene for the Emperor, K'ang founded the China Reform Association (popularly known as the Save the Emperor Association and in 1907 renamed the Constitutional Party) in Victoria, British Columbia, to carry on his plans.

After the failure of the revolts instigated by the reformers in 1900 in Anhwei and Hupeh provinces to restore the Emperor, K'ang resumed his writing in exile. His most significant work completed at this time was *The Great Commonwealth*, in which he envisaged a utopian world attainable through successive stages of human development, a world where the barriers of race, religion, state, class, sex, and family would be removed and where there would be an egalitarian, communal society under a universal government.

K'ang emerged from his retreat in 1903. To help the overseas Chinese and to unite them in a common effort, he and his colleagues founded an international business firm and established schools and newspapers. These activities, conducted in the United States, Mexico, Japan, and Southeast Asia, brought them into sharp competition with the Chinese revolutionists.

During his exile, K'ang travelled extensively, circling the globe four times. His stay in Europe and his study of Western history moved him to shun the violence and destructiveness of revolution as means of political change, and he proposed as an alternative course the promotion of science, technology, and industry to rebuild China.

Return to China

After his return in 1914 to a weak and troubled China, he was soon involved in the campaign to thwart the monarchical scheme of the Chinese statesman Yüan Shih k'ai (1859–1916). In 1917, in line with his idea of a constitutional monarchy to bridge the transition to a truly democratic republic, he participated in the abortive restoration of the Ch'ing ruler. In the years that followed, animated by the fear of a divided country, he opposed the South China government of the revolutionary leader Sun Uat-sen (1866–1925). He called for the preservation of the best of China's heritage and the establishment of a reformed Confucian Church to provide the people with spiritual guidance. Partisan writers have criticized him for holding to these views. In his later years, he renewed his philosophic reflections, completing his last book, *The Heavens*, in which he blends astronomy with his own metaphysical musing, a year before his death at Tsingtao on March 31, 1927.

Besides prolific writings on the Chinese classics, politics, and economics, K'ang also left travel accounts and an anthology of his poems; he was also a famous calligrapher.

JUNG-PANG LO, *K'ang Yu-wei: A Biography and a Symposium* (1967), the only book-length biography of K'ang Yu-wei available in a Western language—contains a translation of the *Chronological Autobiography* of K'ang, which narrates the events of his life to the end of 1898, and a discussion of his career and thought from 1898 to 1927; LAURENCE G. THOMPSON (ed. and trans.), *Ta T'ung Shu: (The) One-World Philosophy of K'ang yu-wei* (1958), a translation of K'ang's work (completed in 1902) in which he sets forth his vision of an attainable utopian world —includes a brief biographical introduction; KUNG-CHUAN HSIAO, "In and Out of Utopia: K'ang Yu-wei's Social Thought," *Chung Chi Journal*, 7:1–18 (1967), 7:101–149 (1968), and 8:1–52 (1968), the best analyses of K'ang's ideas and their impact on modern China published in a Western language.

(J.-p.L.)

Kansas

Location and general character

Lying amid the westward-rising landscapes of the Great Plains of the North American continent, Kansas in 1861 became the 34th state of the United States. In that year the capital was located in Topeka by popular vote, outpolling nearby Lawrence by some 2,700 ballots. The state's 82,264 square miles (213,063 square kilometres) are bounded by Nebraska on the north, Missouri on the east, Oklahoma on the south, and Colorado on the west. The state's name was derived from that of the Kansa, or Kaw, Indians.

Whatever the Kansas slogan, "Midway U.S.A.," lacks in inspiration, it makes up for in aptness. The geographical centre of the 48 coterminous states of the nation is marked by a limestone shaft and a flag located in a pasture near Lebanon, Kansas, close to the Nebraska border. Some 40 miles (65 kilometres) to the south is the magnetic, or geodetic, centre of the terrestrial mass of North America.

The more than 2,300,000 Kansans recorded in the 1980 census live in what was once looked upon as the agricultural heartland of the nation, After 1952, however, industry contributed more to the economy than the vast wheat fields and cattle ranches of the plains. Wichita, the state's largest city, is known locally as the "Air Capital of the World" because it produces more small aircraft than any other city. (For information on related topics, see the articles UNITED STATES OF AMERICA; UNITED STATES, HISTORY OF THE; NORTH AMERICA; and GREAT PLAINS.)

THE HISTORY OF KANSAS

Indians, explorers, and settlers. Archaeological exploration has uncovered evidence of Indian cultures that existed in Kansas for many centuries before the Europeans settled on the land. From about 1200 to 1500 there had been a thriving agricultural society in the area of the Republican and Blue rivers.

The first known European explorers were Spaniards under Francisco Vázquez de Coronado, who in 1541 rode northward from Mexico seeking the gold of the legendary Seven Cities of Cibola. Juan de Padilla, a priest with the expedition, founded the first mission in the territory, possibly north of present-day Wichita. The territory was claimed for France in 1682 by Robert Cavelier, sieur de La Salle. During the 18th century French fur traders had a flourishing exchange with the Indians in what is now the northeastern part of the state.

The region passed to the United States as a part of the Louisiana Purchase in 1803. The explorer Zebulon Montgomery Pike passed through Kansas in 1806 and described it as the "Great American Desert"—a false image that still persists, to the dismay of the state's boosters. Kansas was thoroughly explored during the following decades, but westward-bound settlers and miners passed through it without staying.

From 1830 to 1854 Kansas was in an area designated as Indian Territory, actually an area in which to relocate Indian tribes who occupied lands wanted by whites. The Kansas–Nebraska Act of 1854, however, created two territories and opened both to settlement. It also provided that residents could determine whether their future states would be free or slave. The rush began, and Kansas became a major breeding ground for the U.S. Civil War as North and South each attempted to send the most settlers into the new territory. Most early settlement was near the eastern border, and free staters were harassed constantly by "Border Ruffians" from Missouri. One notable incident was the sacking of Lawrence by Southern guerrillas in 1856. The abolitionist John Brown, with his sons and a few other men, retaliated by dragging five of their proslavery neighbours from their homes and killing them. Proslavery forces attempting to avenge this massacre were captured by Brown, who became a hero to the Northern sympathizers. Hundreds of such incidents won the territory the name "Bleeding Kansas."

Statehood. Kansas entered the Union as a free state in 1861. Before and after the Civil War, sporadic fighting occurred between the settlers and the Indians. In 1867 a peace treaty was signed in which the Indians agreed to sell their land; in return, the United States agreed to build homes for them in what is now Oklahoma and to provide money, food, and clothing. The U.S. Congress did not honour the treaty, and when the Indians returned they found their land occupied by white settlers. Further sporadic battles continued until the last Indian raid, in 1878.

Early settlers in wooded eastern Kansas lived in log cabins, but in the west they had only dugouts or houses made of buffalo-grass sod. The unpredictable weather, the recurring Indian raids, the droughts and dust storms, and the grasshopper invasions discouraged many early settlers. One of the heroes of this era was William Mathewson, known as the original Buffalo Bill, who hunted buffalo for the settlers all of one winter without pay, providing meat by the wagonloads. The coming of the railroads in the late 1860s and the 1870s made first one village and then another into boisterous cow towns. Texas cattlemen drove herds northward to Caldwell, Wichita, Dodge City, Ellsworth, Newton, and Abilene to reach the railhead. Although this development brought prosperity to Kansas and created a persistent image, the cow-town era lasted less than a decade.

The most important event in Kansas' agricultural history may have been the arrival of the Mennonites in 1874, who brought with them trunks full of hand-selected grains of Turkey Red wheat. This excellent strain provided the basis of the abundant crops that became an important part of the Kansas economy. Many of the Mennonites' descendants remain as prosperous farmers.

Expansion of agriculture

By about 1890 most of the land was occupied, and Kansans settled into a peaceful life dominated by agriculture. World War I produced a great demand for food, and more and more virgin prairie was plowed and put into production, which led to temporary prosperity but contributed directly to the terrible dust storms that devastated the state in the 1930s. World War II contributed to Kansas' growing eminence in aircraft and brought many people from Oklahoma and Arkansas to work in Wichita's aircraft plants.

THE NATURAL AND HUMAN LANDSCAPE

The natural environment. ***Surface features.*** Kansas has been erroneously characterized as a featureless plain, but its topography, while rarely spectacular, is varied. The land rises slowly but steadily from 700 feet (200 metres) above sea level in the southeast to 4,039 feet near the Colorado border. The far western section consists of high plains with few natural trees and appears to be flat and endless. Actually these seemingly flat plains are creased with shallow gullies, called draws, the product of millennia of erosion. In this part of Kansas are some of the state's most spectacular geological formations. Castle Rock, south of Quinter, consists of chalk spires rising high above the level plains. Monument Rocks, a few miles to the west, resemble sphinxes. Near Jetmore is Horse Thief Canyon, a miniature of the Grand Canyon.

Millions of years ago, much of Kansas was the floor of an inland sea. The land was built up by the deposit of soil and vegetable matter from streams feeding the sea. This residual soil is some of the most fertile in the world, and in it prehistoric fossils of great importance have been found.

Under irrigation, southwestern Kansas in recent years has produced truck crops and sugar beets. Northeastern Kansas, once covered by the glacier that crept over most of the northern United States, is hilly and timbered, with many creeks and springs. The southeast, lying near the foothills of the Ozark Mountains, is rough and covered in parts with scrub oak. In south central Kansas, near Medicine Lodge, are the Gypsum Hills, which resemble the mesas of the Southwest and are named for the gypsum found in them. In east central Kansas, the Flint Hills stretch from north to south; gentle, rolling, largely treeless, and covered with bluestem grass, they provide one of the world's best natural grazing regions. The principal rivers are the Kansas and the Arkansas. Tributaries of the Kansas are the Blue, the Republican, the Solomon, the Saline, and the Smoky Hill, all in northern Kansas. The Arkansas flows into the state from Colorado and winds through southwestern and south central Kansas, continuing through Oklahoma and Arkansas to the Mississippi. Tributaries of the Arkansas are the Cimarron, the Verdigris, Neosho (Grand), and the Marais des Cygnes.

Climate. The climate of Kansas is temperate but continental, with great extremes between summer and winter temperatures but few long periods of extreme hot or cold. The annual average temperature is 55° F (13° C). The growing season ranges from mid-April to mid-September. Normal annual rainfall ranges from less than 20 inches

(500 millimetres) in the west to more than 40 inches in the southeast.

Vegetation and animal life. Buffalo grass is native in the west and central areas of the state, bluestem around the Flint Hills, and bluegrass in the east. Wild flowers of many kinds are to be found in all parts of the state, and sunflowers grow in profusion (Kansas is popularly known as the Sunflower State). The cottonwood grows throughout Kansas, while in the northeast there are many oak, walnut, and maple trees, as well as cedar and elm. Western Kansas abounds in quail, prairie chicken, and pheasant. Deer, once almost extinct, were protected by law for many years and have multiplied to the degree that hunting is again allowed in season. The buffalo that once proliferated across the plains are to be found only in parks and zoos.

Rural and urban life

Human imprints. ***Patterns of settlement.*** Most western Kansas farms or ranches are large, covering not less than one section (a square mile, or 640 acres [260 hectares]) of land, though a farmer's holdings may not always be contiguous. Eastern Kansas began with small farms, some of no more than 40 acres; but these have grown in size. A Kansas law forbids other than family corporations for farming purposes. Most of the small towns are modern and well-kept, with paved streets and full utilities. Many of the small cities, especially in the west, present unexpected cultural and commercial resources, perhaps because they often lie far apart and draw from large trade territories. In the east the cities are older, closer together, and generally less progressive, though most of them are attractive, with broad, well-shaded residential streets and adequate downtown shopping facilities.

Wichita, the largest city, is characterized by the state's largest buildings, biggest industries, and most venturesome businesses. In Topeka, where state government once was the largest industry, more people now are employed in services. Kansas City, Kansas, merges with its larger neighbour, Kansas City, Missouri, and contains a significant part of the industrial complex of that region. Leavenworth, the state's oldest city, is built around institutions, including an army post at Ft. Leavenworth, a federal prison, a state penitentiary, and a veterans' hospital. Lawrence, home of the state's largest university, depends heavily on the school for its economy, though the city has been working aggressively and successfully for industry since the 1960s. Most of the other cities depend primarily on farm trade and agriculturally related business.

Regional spirit. Kansas suffered during most of its history from two kinds of regionalism: one that pits rural against city dwellers; the other, the east against the west. The two are related in some ways, for none of the state's principal cities is in the western half of the state. More thinly populated than the east, western Kansas has always feared and fought eastern domination, while the east often has ignored the west. Wichita, one of Kansas' three metropolitan areas, contains approximately one-seventh of the state's population. The Kansas City–Topeka area of northeastern Kansas, containing two metropolitan areas, is less populous but still is the centre of much industry. Rivalry has existed between these two urban areas, but it is diminishing gradually as the cities gain more representation in the state legislature. People from the rural areas, mostly farmers, ranchers, and owners of small businesses, as well as residents from the smaller towns, have tended to distrust the cities, often bringing about an impasse in the state legislature.

THE PEOPLE OF KANSAS

Migrations past and present

Ethnic groups. Kansas' early settlers were principally antislavery New Englanders of Anglo-Saxon stock. After the Civil War and with the building of the railroads, many central Europeans were attracted by the promise of jobs laying track and of free land when the jobs were finished. Small communities populated by citizens of predominantly Russian, Bohemian, German, or Scandinavian ancestry still dot the state. The original languages have largely disappeared, though here and there church services are still conducted in German or Swedish, and a few communities hold festivals each year at which the old folkways, foods, and languages are featured. During World War II there was an influx of servicemen and aircraft workers, many of whom remained. The state is largely Protestant, though there are some small Roman Catholic communities. Virtually every sect is represented in the state, including such rare ones as the Amish, Dunkard Brethren, Mennonite, and Eastern Orthodox.

Contemporary demography. Because of insufficient employment opportunities, Kansas loses a considerable number of its young people to other states, but this loss is almost balanced by in-migration. The birth rate, however, produces a slight natural increase in population in most years. The most conspicuous demographic trend is from the farms to the cities. In 1980 about 67 percent of the population was living in urban areas and 33 percent in rural areas. As further technological advances in farming are made and individual landholdings increase in size, this trend undoubtedly will continue.

THE STATE'S ECONOMY

Components. Both agriculture and manufacturing contribute significantly to Kansas' economy—the former contributing many of the raw materials for the latter. The production of the some 77,000 farms and ranches places Kansas first among the U.S. states in wheat, first in sorghum grains, and fourth in wild hay; in beef, it ranks fifth; in hogs, eighth. Some 4,300 manufacturing and processing plants produce everything from airplanes to zinc castings. Wichita is the world's largest producer of camping gear; it also manufactures heating and air-conditioning equipment, snowmobiles, and a variety of other products. In addition to ranking first in the world in production of small private aircraft, Wichita also is an important manufacturing centre for military aircraft. Other plants in the state turn out baby foods, pet foods, prefabricated houses, mobile homes, greeting cards, tires, paint, and dishwashers. Grain milling, though not as important as it once was, still is a major industry, and the meatpacking and processing industry is growing. Garvey Elevator, near Wichita, is the world's largest single-unit grain elevator.

Kansas has large mineral resources, a good labour force, a healthy retail trade, ample electrical power, plenty of water, and a central location. Kansas is among the 20 top mineral-producing states. It is rich in oil and gas, helium, portland cement, stone, clay and clay products, sand, salt, gravel, zinc, bituminous coal, and lead. There is an almost unlimited supply of chalk. Many plants produce gasoline, oil, grease, and paving materials from the oil pumped from Kansas wells.

Despite large oil production, Kansas has imposed only a small severance tax (laid at the time of severance, or extraction from the ground) on oil or gas for the purposes of conservation and pollution prevention. It has a tax rate on manufacturing plants that compares favourably with that of other states. Most Kansas cities issue revenue bonds to encourage new industry. The state has a right-to-work law that forbids compulsory unionism.

Two long-established army posts have contributed significantly to the state's economy. Ft. Leavenworth, with its renowned Command and General Staff College, dates from 1827. The fort was a major outpost in the early Indian wars and during the Civil War and has offered the most sophisticated training to field-grade officers for many years. Ft. Riley, near Junction City, was established in 1853 and was also an Indian outpost. In the 20th century it has been an important infantry training centre. During World War II air force bases were established in Topeka and Wichita.

Transportation. Kansas has an excellent system of railroads for east–west transport but, except in the east, has less adequate north–south lines. The same may be said of its highways, with the best ones generally carrying east–west traffic. An exception is the state's single toll road, the Kansas Turnpike, which runs southwesterly from Kansas City to the Oklahoma line south of Wichita. Although Kansas has more than 200 airports and is served by eight airlines, the only major airport with transcontinental service is in Wichita.

ADMINISTRATION AND SOCIAL CONDITIONS

Government and politics. Kansans elect a governor, lieutenant governor, attorney general, and secretary of state, while other state officers are appointed. Its legislature comprises 125 representatives and 40 senators, the former elected for two-year terms, the latter for four-year terms. The legislature holds a session in odd-numbered years and meets for a briefer period in even-numbered years. Each of the 105 counties elects three commissioners, a county attorney, a treasurer, and several other officers. Judges of the 29 judicial districts are elected, but the seven justices of the Supreme Court are appointed by the governor, subject to senate approval, from a panel presented by a Supreme Court nominating commission. The justices must subject themselves to the approval of the voters, but none has ever received a vote of "no confidence." If that were to happen, the justice would be replaced by appointment.

Innovations in government and law

The first legislative council in the United States was inaugurated in Kansas in the 1930s. It was an interim body designed to work between legislative sessions at analyzing and drafting laws. Several other states later adopted legislative councils. The 1969 legislature provided for prefiling of bills between sessions, a change that persuaded the legislature that the council was no longer necessary. It was replaced in the 1971 session by the Legislative Coordinating Council, made up of the leadership of both houses.

In 1933 Kansas enacted a "cash basis law," which requires that no state money be expended until it has been raised and appropriated by the legislature. Bonds have been issued only for capital improvements, such as college dormitories and highways, in which case they are retired by user fees.

Kansas once was known as the most Republican state in the nation, but it now has a sizable Democratic minority, a growing independent vote, and small Conservative and Prohibition parties. The first legislature, in 1861, gave women the right to vote in school elections. In 1887, women's suffrage was extended to city and bond elections, and in that year the world's first woman mayor was elected in Argonia. The state constitution of 1861 granted women equal rights to own property and to have control of children. Universal suffrage was granted in Kansas in 1912.

The Farmers' Alliance and the Populist Party both had their origin in Kansas, and for a few years in the 1890s they played an important part in the politics of the Midwest. Kansas pioneered the direct primary, and a Kansas senator introduced the resolution in the U.S. Congress that put direct election of U.S. senators into the federal Constitution.

Kansas was the first state to adopt the constitutional prohibition of alcoholic beverages. The prohibitory amendment was added to the state constitution in 1880 and was not repealed until 1948. Liquor is sold only in package stores operated by licensed individuals under strict state control. An attempt to amend the constitution to permit sale of liquor by the drink failed by a narrow margin in 1970. Drinkers have little difficulty slaking their thirst, however, in a multitude of "private clubs" that operate under state license.

The social milieu. ***Education.*** A landmark civil rights case of the 20th century, ***Brown*** v. ***Board of Education,*** originated in Topeka in 1951, when the clergyman father of a nine-year-old black girl led her to the door of an all-white school. She was denied enrollment, and the decision that was handed down by the U.S. Supreme Court in 1954—basically stating that segregated, even "separate but equal," education is inherently unequal and must be eliminated with all due speed—became the basis for most of the civil rights decisions that have been applied to schools since that time.

In the mid-1960s Kansas abolished its office of state superintendent of public instruction and substituted the Department of Education headed by a commissioner and an elected state board of education. More than 400,000 pupils attend public schools in the some 300 school districts throughout the state. A number of two-year junior colleges are operated by the communities in which they are located.

Universities and colleges

Kansas has six state universities with a total enrollment of approximately 64,000. Fort Hays State University, Kansas State University of Pittsburg, and Emporia Kansas State University offer liberal arts degrees but specialize in training teachers. The University of Kansas is located in Lawrence, Kansas State University in Manhattan, and Wichita State University in Wichita. Kansas State, recognized as having one of the country's leading agricultural colleges, was the first land-grant college in the United States. The state's medical school is part of the University of Kansas College of Health Sciences and Hospital, with its campus at Kansas City. In 1971 the School of Medicine established a second campus at Wichita to expand its clinical teaching facilities. There are two law schools, one at the University of Kansas, the other at Washburn University of Topeka, a municipal school. In addition, there are 17 private four-year colleges in Kansas, all church-affiliated and all offering liberal arts degrees. They have a total enrollment of about 11,000 students.

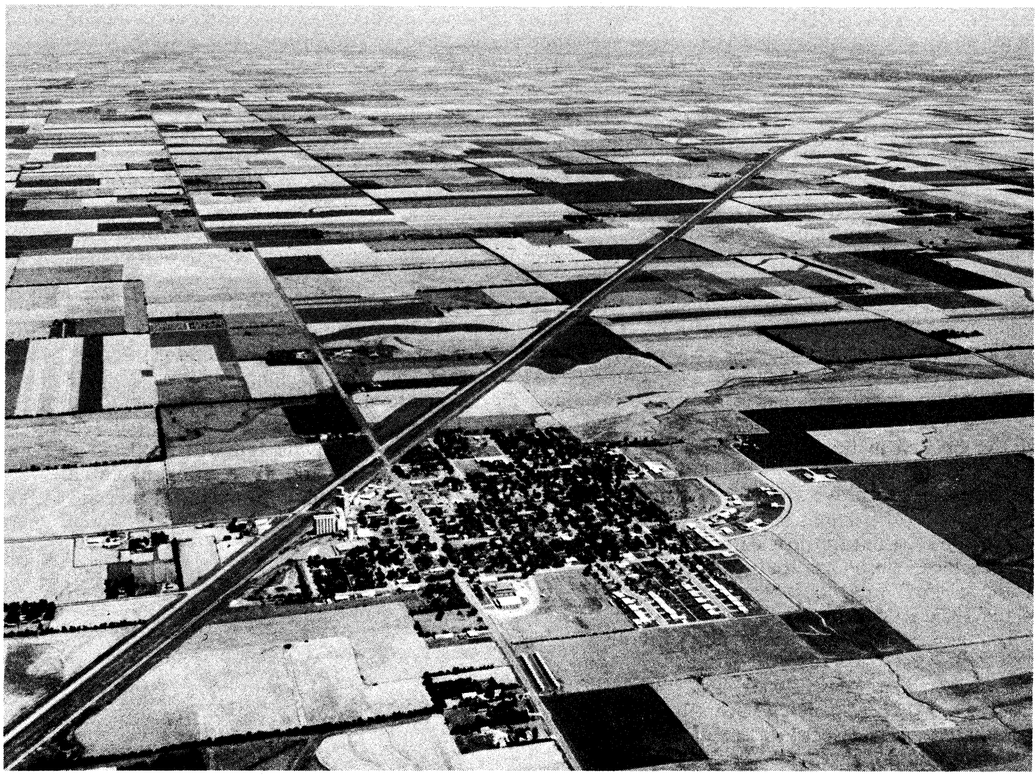
Health and welfare. The State Board of Health, consisting of appointive members, supervises the activities of one of Kansas' largest administrative departments, including doctors, dentists, sanitary engineers, hospital administrators, and veterinarians. Kansas operates three mental hospitals; they have been rated among the best in the nation and work in close conjunction with the renowned Menninger Foundation of Topeka. The health education division supplies information films on preventable diseases to more than 500,000 Kansans each year and distributes an equal number of pamphlets on subjects related to health. The board of health also has divisions of geriatrics and chronic diseases, hospital facilities, and services in public health nursing, nutrition, maternal and child health, mental hygiene, sanitation, and tuberculosis control.

Since 1862 Kansas has had some form of public assistance for the needy. The state welfare department, which is overseen by an appointed board, offers both financial assistance and special education to those requiring it. Special divisions care for crippled children, dependent children, the aged, and the blind. Vocational and rehabilitational services also are provided for the handicapped. There are schools for the mentally retarded at Parsons and at Winfield, and a children's home has operated at Atchison since 1855. There is a Kansas treatment centre for mentally disturbed children at Topeka and a reform school for girls at Beloit.

Standards of living. Kansas businesses and industries employ a civilian work force of more than 1,200,000 people. A state minimum wage was established in 1977. In 1970 Kansas had a per capita personal income just below the national average, but by 1980 it was well above the national average. The cost-of-living index for urban consumers was about equal to the national average in the late 1970s.



Flat farmland near Inman

' Grant Heilman

The state has a fair-housing law and a civil rights commission that hears grievances and attempts to mediate them.

CULTURAL LIFE AND INSTITUTIONS

The arts. The citizens of Kansas resent the suggestion that they live in a cultural desert, but the assertion is at least partially true. Most of the larger cities have amateur theatre groups, while Topeka and Wichita support symphony orchestras. The numerous colleges and universities in the state provide a concentration of art and music in many small communities that otherwise would have no comparable activities. In the sparsely populated areas of western Kansas, however, a large number of the small communities have few cultural institutions except a public library. Wichita, however, has two art galleries and a cultural and civic centre with two theatres, an exhibition hall, and a convention hall. Civic music series are sponsored in most of the larger cities of Kansas, but most professional road companies appear in theatrical productions only in Wichita. The extreme eastern areas of Kansas mainly rely upon Kansas City, Missouri, for cultural attractions. In the mid-1960s the Kansas Cultural Arts Commission was formed; funded by the state, it seeks to encourage the development of the arts, often providing seed money for communities or organizations that have the desire to develop cultural events. The University of Kansas has an outstanding museum of natural history and an art museum.

Traditional commemorations

Folk culture. In addition to an art gallery, the small community of Lindsborg has a biennial folk festival, the Svensk Hyllnings Fest, which honours the Swedish pioneers who settled the town. It features Swedish costumes, traditional food, folk dances, and displays of the arts and crafts of local artisans. Wilson has a Czech festival each year. Examples of bizarre sculpture are found in Lucas, where a self-taught artist, working in wet concrete, sculpted his own idea of the Garden of Eden and other biblical stories.

Communications media. Kansas has approximately 250 weekly and 50 daily newspapers. Among the latter, the largest are the *Wichita Eagle* and the *Wichita Beacon,* the *Topeka Daily Capital,* the *Hutchinson News,* and the *Salina Journal,* but there are many influential smaller dailies, including the *Emporia Gazette.* The state has radio stations in almost every town and television stations in all the major cities, including public television stations in Wichita and Topeka.

PROSPECTS

Kansas is adjusting to a decreasing demand for one of its major agricultural crops, wheat. It is making serious efforts to attract new industry and is developing its recreational and cultural facilities, hoping to make itself more appealing to the people additional industry would bring to the state. It is a state of pleasant towns and good living conditions, but it still has major problems. Kansas needs to streamline its governmental structure at every level to reduce duplication and cut unnecessary demands upon the taxpayers. Its tax structure, a patchwork that has grown to meet the demand for revenue over more than 100 years, needs a thorough overhaul, while service industries must be developed to employ farm labourers displaced by changing technologies and employment patterns. Legislative sessions have addressed themselves to these problems, and it seems probable that at least limited solutions can be reached.

BIBLIOGRAPHY. Sources of general information about the state are *The Kansas Directory* (biennial), containing a brief history, statistics, and information about state government, officials, and points of interest; and THE UNIVERSITY OF KANSAS, *Kansas Statistical Abstract* (annual). LOUISE BARRY, *The Beginning of the West: Annals of the Kansas Gateway to the American West, 1540–1854* (1972), is an excellent account of the earliest history to its opening for settlement. WILLIAM E. UNRAU, *The Kansa Indians: A History of the Wind People, 1673–1873* (1971), is a good account of the tribe from which Kansas got its name. One of the best histories of the turbulent days from the opening of the Kansas Territory to the U.S. Civil War is ERIC CORDER, *Prelude to Civil War: Kansas–Missouri, 1854–61* (1970). The colourful history of the trail that brought thousands of people to and through Kansas is outlined, with suggestions for additional reading, in JACK D. RITTENHOUSE, *The Santa Fe Trail: A Historical Bibliography* (1971). The story of the cattle trails and legendary cow towns is well recounted in ROBERT R. DYKSTRA, *The Cattle Towns* (1968). One of the most difficult periods in modern Kansas history, the drought and dust-bowl days, is admirably covered in FRANCIS W. SCHRUBEN, *Kansas in Turmoil, 1930–1936* (1969). One of the most readable brief histories of the state

from its earliest days to recent times is BLISS ISELY and WALTER M. RICHARDS, *The Kansas Story* (1961). Another that contains both history, good illustrations, and information about the geography and geology of the state is MOSE J. WHITSON and BARNEY SLAWSON, *Kansas: Its Geography, History and Government* (1968). A good account of the present condition and habits of Indians in Kansas is RUTH LANDES, *Prairie Potawatomi: Tradition and Ritual in the Twentieth Century* (1970). WILLIAM F. ZORNOW, *Kansas: A History of the Jayhawk State* (1957), is among the best of the modern overviews of the entire development of Kansas from earliest times to the recent era. For an interesting picture of the legends, early customs, hardships, and adventures of the pioneers, SAMUEL J. SACKETT and WILLIAM E. KOCH, *Kansas Folklore* (1961), is recommended.

(C.G.P.)

Kansu

The province of Kansu (Gan-su in Pin-yin romanization), administratively a part of the Northwest region, reaches into the geographic centre of the People's Republic of China. It is bordered by the Mongolian People's Republic to the north; by the Chinese provinces of Tsinghai and Szechwan to the south; by the Ningsia Hui Autonomous Region, the province of Shensi, and the Inner Mongolian Autonomous Region to the east; and by the Sinkiang Uighur Autonomous Region to the west. A vital strategic pivot, linking China proper with the vast territory in the extreme west, the narrow corridor of Kansu has served for several centuries as a passageway between the Upper Huang Ho (Yellow River) area and Chinese Turkistan.

Territorial changes

Kansu covers 238,100 square miles (616,600 square kilometres) of land, almost 5 percent of the total territory in China. The area within its jurisdiction has undergone several changes during the past two decades. In 1954 Kansu annexed the province of Ningsia. In 1956 the A-la-shan and Edzen Gol (in Chinese, O-chi-na Ho) region in northwestern Kansu was detached and incorporated into the Inner Mongolian Autonomous Region. In 1958, however, the affixed Ningsia Province was separated from Kansu to become the Ningsia Hui Autonomous Region, and in 1970 the A-la-shan and Edzen Gol region of the Inner Mongolian Autonomous Region was returned to Kansu again, leaving the territory of Kansu almost unchanged when compared with its 1950 area.

In 1970 the population of Kansu was estimated at about 13,000,000.

The capital of Kansu is Lan-chou, on the south bank of the Huang Ho; its population was 750,000 in 1960 and was expected to double in the 1970s. Endowed with rich mineral resources, traditionally backward Kansu is building itself into a vital industrial base to support the exploitation of the province of Tsinghai to the south and the autonomous region of Sinkiang to the far west. For associated physical features, see GOBI (DESERT); HUANG HO (RIVER).

History. Kansu became a part of Chinese territory during the Ch'in dynasty (221–206 BC), when Chinese power began to extend up to the Kansu Corridor and into the region of modern Ningsia and Tsinghai. In ancient times, all traffic between China proper and the far west was funnelled through the Kansu Corridor. Along the ancient Silk Road that began at Ch'ang-an (Sian) and continued through the corridor, camel caravans carried the tea, silk, and porcelain of China to bazaars in the Near East and even to the markets of Byzantium and Rome. In the train of these caravans such travellers as the Buddhist missionary Kumārajīva and the Venetian merchant Marco Polo entered China.

The name of Kansu first came into existence in the Yüan dynasty (1279–1368), when, under Mongol rule, it comprised the two districts of Kan-chou and Su-chou. In the Ch'ing dynasty (1644–1911), Kansu covered the later provinces of Kansu, Ningsia, a part of Tsinghai, and a part of Sinkiang. The area was under the administration of a governor general of Shensi-Kansu, who was stationed at Lan-chou and had authority over both provinces. One of the most prominent governors general was Tso Tsung-t'ang (1812–85), who, after 1878, brought a half century of peace to Kansu. A hero in the suppression of the Taiping Rebellion, Tso also helped the Ch'ing court to put down the Muslim Rebellion in Kansu, which lasted for 16 years (1862–78) and affected the lives of more than 10,000,000 people.

Before Tso assumed the governorship, Kansu was an area without law and order. The Muslims in Kansu were in open rebellion, committing murder, arson, and numerous other crimes. After having effectively destroyed their strongholds, Tso extended Chinese educational and civil-service systems into the conquered districts for the benefit of Muslims and non-Muslims alike. As a result, the violence subsided and peace prevailed.

Kansu remained a province of China during the period of the Chinese Republic (1911–49). The territory, however, shrank substantially when Sinkiang, Tsinghai, and Ningsia became independent provinces. The discovery of the Yii-men oil field in 1937 opened brighter economic prospects for the area. Communist influence in Kansu began in 1935 after the Chinese Red Army withdrew from southeast China to Shensi, and a Communist-controlled Shensi-Kansu-Ningsia border government was established in the late 1930s. Kansu continued to be a province after the establishment of the People's Republic in Peking in 1949.

THE LANDSCAPE

Relief. Plateaus are the dominant physical features of Kansu. Along the southern border, the lofty Nan Shan and Ch'i-lien Shan-mo ranges separate Kansu from Tsinghai. These ranges have an average height of 12,900 feet. Near Lan-chou in central Kansu, the Huang Ho Valley opens out, and excellent agricultural land is available. North of the Wushaling (Dark Sand Peak), 120 miles northwest of Lan-chou, there is a stretch of interior drainage where the land is relatively flat and glacier-fed streams, including the Hei Ho (Black River), disappear into the desert; this is the area previously referred to as the Kansu Corridor. The higher mountains nearby are covered with forests and their lower slopes are green with grass, but the floor of the corridor itself is monotonously flat and barren yellow earth. Geologically, Tertiary formations (from 2,500,000 to 65,000,000 years old) appear in a number of basins in Kansu, with strata generally composed of red clays, conglomerates, red sandstones, and gypsum.

The earthquake zone

The topographical features of Kansu are relatively uncomplicated in the west and northwest, in contrast to the southeast, where the land has suffered local dislocations from earthquakes. In the northwest there are very few mountains but rather a hilly terrain that merges into the Gobi Desert to the east. The average altitude is about 3,000 feet. The eastern part of Kansu is the principal centre of earthquakes in China. From the 6th century AD to the present, major earthquakes have taken place on an average of once every 65 years, while minor quakes occurred at least once every ten years. One of the greatest disasters of modern times occurred in 1920, when a violent earthquake, centred in eastern Kansu, caused great landslides. The death toll was estimated at 246,000; many cities and towns totally vanished.

Climate. The climate in Kansu undergoes sharp fluctuations of temperature in summer (June to August) and winter (December to February), with uneven and unpredictable precipitation throughout the year. In the west, the average January temperature in Chiu-ch'üan, for instance, is 18° F (—8" C), and in Tun-huang, 200 miles west of Chiu-ch'iian, is 19" F (—7" C). The temperature in July in Chiu-ch'iian is 70° F (21° C), and in Tun-huang it is 81° F (27° C). Annual temperature variations for most parts of Kansu are more than 54° F (12° C).

Rainfall is meagre throughout most of Kansu. As one goes further inland, the precipitation becomes increasingly less frequent. In the western part of the province annual rainfall ranges from two inches at Tun-huang to three inches at Chiu-ch'iian. Irrigation depends mainly on melting snow from the Ch'i-lien Shan-mo.

The southeastern part, something of an exception to the general pattern, receives a relatively abundant rainfall. In P'ing-liang, 170 miles east of Lan-chou, rainfall reaches 20 inches. Summer is usually the period of maximum precipitation, when 50 to 70 percent of the annual rainfall occurs. Near Lan-chou, because of the high rate of evaporation, the farmers spread layers of pebbles over the cultivated surface to check evaporation and to keep the soil moist.

Vegetation. Wheat is the chief crop throughout the province; barley, millet, beans, and sweet potatoes are also important food crops. Kaoliang (Chinese sorghum), buckwheat, corn (maize), oats, and rice are grown to a lesser extent. Cotton, wool, and tobacco are produced as cash crops. Kansu is famous for its water-pipe tobacco, which is raised near Lan-chou and farther west, around Chang-yeh. Although vegetation is rather limited in the mountain area, primeval forests still exist in the high mountains of Liu-p'an Shan and Ho-lan Shan in the eastern part of Kansu. On the floor of the Kansu Corridor, willows and poplars grow along the roads and ditches. Lan-chou and its vicinity are known for fruit growing: pears, peaches, apricots, dates, apples, palms, and watermelons are all cultivated there.

Animal life. Wild animals include marmots (burrowing rodents), deer, and foxes. Domestic livestock is comprised of cattle, goats, and sheep (including the Ho-si sheep that produces fine wool). About 40,000 bactrian (two-humped) camels are reared in the Kansu Corridor.

PEOPLE AND POPULATION

In 1946 the population of Kansu was estimated at about 6,500,000 and that of Ningsia at about 700,000. The 1953 census reported a total of 12,900,000 for the two areas—an increase of about 5,700,000 people, largely due to immigration of the Chinese population from the coastal areas. Average density was 48 people per square mile. In 1970, as mentioned, the population was estimated at about 13,000,000.

Population distribution

The population is concentrated in the Lan-chou Basin, in the fertile valley plains of the south and central sections where irrigation is possible, and in the dry terrace land of the Liu-p'an Shan. Population density around Lan-chou is as high as 200 per square mile. In western Kansu, population is intensively concentrated in a number of small, isolated oases scattered along the base of the high snow-capped ranges.

Ethnic groups. The Chinese, numbering more than 10,000,000, comprise the main racial group in Kansu. Other ethnic groups are the Monguors (Mongols), the Turks (Salars and Sarigh-Uighurs), and the Tibetans. There are more than 300,000 Mongols to the west of Lan-chou, and there are 400,000 Tibetans scattered over an area enclosed by the rivers P'ingfan, Ta-t'ung Ho, and Huang Ho.

Religious groups. The Chinese majority tends to follow the same traditional religious practices, such as Buddhism, generally observed elsewhere in China. The most important minority group in Kansu is formed by the Muslims (Hui-hui), living mostly in the north and west, who number about 1,500,000. In Asia, in general, Muslims are referred to as Dungans (Tungans), but in Kansu they are called Hui-hui or Hui. Some are of Arab, Turkish, or Mongol origin, whereas a few are converted Chinese. The Muslims include believers in both the Sunnī and Shi'ah traditions; the Sunnis follow the more traditional Islāmic interpretation, but the Shi'ahs do not recognize hereditary religious leadership. Tibetans and Mongols follow Tibetan Buddhism. Almost every Tibetan family has at least one son in a Buddhist monastery.

Linguistic groups. Most of the ethnic groups, including the Tibetan minority, speak Chinese as a second language. The Monguors, however, whose language differs completely from either Western or Eastern Mongolian, rarely speak a second language. Chinese Muslims use both Chinese and Arabic scripts, although Arabic is usually used only for religious purposes.

Patterns of rural and urban settlement. The Chinese and the Muslims are essentially agriculturists, although some engage in trade and industry. The Mongols are pastoralists or are seminomadic. In 1957 the agricultural population represented about 80 percent of the total, industrial population (including those engaged in handicrafts) about 3 percent, and those engaged in trade about 3 percent.

Important urban areas are centred on Lan-chou, which had a population of 750,000 in 1960. The largest city in eastern Kansu is P'ing-liang, which had a population of more than 100,000 in 1957. A major centre in western Kansu is Chiu-ch'iian, which had a population of 50,000 in 1957.

ADMINISTRATION AND SOCIAL CONDITIONS

Administration. The provincial government has its headquarters in Lan-chou. Two municipalities are under the direct supervision of the provincial government—Lan-chou itself and Chia-yii-kuan, at the western terminus of the Great Wall (which runs from northwest to southeast through the province). Intermediate administrative divisions include eight special districts (*chuan-chu'ü*)—Ting-hsi, P'ing-liang, Ch'ing-yang, T'ien-shui, Wu-tu, Wu-wei, Chang-yeh, and Chiu-ch'iian—and two autonomous wards or districts (*chou*)—the Lin-hsia Hui Autonomous District, inhabited by Muslims, and the South Kansu Tibetan Autonomous District, inhabited by Tibetans. After the transfer of part of Pa-yen-Nao-erh League (*meng*) from Inner Mongolia certain additional districts were added, but their composition is not yet fully known.

On the third level of administration before the 1970 administrative changes the province was grouped into 66 counties (hsien), six autonomous counties (*tzu-chih* hsien), two banners (ch'i), and three municipalities (*shih*) of T'ien-shui, Yii-men, and Lin-hsia.

The Muslim villages

Village life. Village life among the Chinese inhabitants is generally similar to that elsewhere in North China. There usually are from 20 to 30 families in a village. In Muslim villages, however, the religious–communal life-style is distinctly different. There is a small public building that serves as a mosque, where children gather regularly to receive religious instruction and to learn the alphabet and phonetics. Muslim villages are, by comparison, more organized and possess more community spirit than is usual in the Chinese villages. Hitherto the two peoples have been mutually segregated.

Tibetan villages, in many apsects, are similar to Chinese villages. Those Tibetans who are sedentary, however, have no clearly defined clan organization, and their family ties are much looser than among the Chinese.

Village dwellings are the conventional types of mud huts. Some people live in caves—which may be elaborate, with fine furnishings, or simply scooped out of the porous yellow earth cliffs. Brick structures predominate in cities and towns.

The eating habits of the people are slightly different from those of the Chinese in other parts of the nation. Coarse food and wheat flour, rather than rice, are consumed.

Education. The educational standard is comparatively lower than elsewhere in North China. In 1946 there were about 200 secondary schools, 800 primary schools, and 6,500 junior primary schools, with a total enrollment of almost 500,000 students. Since 1950 educational facilities have been greatly expanded. In 1950 there were more than ten universities and colleges, mostly located in Lan-chou, including Lan-chou University, the Northwest Normal College, and the Northwest Institute for Minorities Special colleges providing training for railway work, the petroleum industry, animal husbandry, and veterinary medicine are also established in Lan-chou.

Health and sanitation. By Western standards. the area is backward in health and sanitation. The most common diseases are the fecal-borne intestinal diseases spread through the use of human waste as fertilizer. The shortage of water supplies and the lack of modern doctors, nurses, and pharmacists constitute a serious problem.

Welfare. Welfare work in this area is more concerned with the victims of natural disasters than with the poor in general. Frequent earthquakes and severe droughts require the government to assume responsibility for relief. In the Muslim community, a part of the public welfare is organized by the Muslims themselves; Muslim officials collect obligatory charity for this purpose.

Since 1949 the Communist government has made general progress in Kansu with its welfare program for workers and peasants. New residential areas, for instance, have been built in Chiu-ch'iian for families of workers in the Yii-men oil fields. Medical clinics have been established in remote areas, where most people previously relied on local herb doctors.

The economy. Traditionally, Kansu has been an area of poverty. The region is frequently subject to earthquakes, droughts, and famines. On the average, calamities destroyed 20 percent or more of the crop each year during the period from 1904 to 1929.

Agricultural resources

Resources. Although it is predominately an agricultural area, and despite the fact that the per capita landholding is much larger than the national mean, output of food grain is insufficient to feed the population. The extent of cultivation in different areas depends upon the elevation, the steepness of the slope of the land, and the dryness of the climate. High elevation has a greater precipitation and is therefore more favourable for farming. Terracing is prevalent and is practiced on about 18 percent of all of the cultivated land. Much of the hill land is cultivated by the use of a modified form of contour plowing. Because the slopes of the fields are so steep, however, and the fields so extensive, erosion is a serious problem, and some of the land has been abandoned. Agriculture in this area depends on the improvement of irrigation.

Kansu is rich in minerals of great value. The oil field of Yii-men, which is located in the northwest part of Kansu, has a reserve of 729,000,000 barrels. A new oil reserve found in Ya-er-hsia (Duckling Gorge) near Yü-men is estimated at 670,000,000 tons. Coal reserves are estimated at 2,400,000,000 tons. A large deposit of iron ore has been discovered in the Nan Shan area in western Kansu and is tentatively estimated to amount to at least 100,000,000 tons.

Resource exploitation. Since 1950 strenuous efforts have been made to develop Kansu into an industrial base for northwest China. During the First Five-Year Plan (1953–57) the government emphasized efforts to build Lan-chou into a centre for heavy industry. Lan-chou won fame for its petroleum production and now has dozens of large modern industrial enterprises. The Lan-chou Petroleum Machinery Plant and the Lan-chou Petroleum and Chemical Machinery Plant were both constructed with Soviet aid and are the two key enterprises manufacturing modern petroleum drilling and refining equipment for China's fast-growing petroleum industry. The Lan-chou Refining Plant, one of the largest in China, handles more than 16,790,000 barrels of petroleum a year. The Lan-chou Locomotive Plant, the largest in the northwest, is the regional centre for locomotive repairs and also manufactures internal-combustion-engine locomotives for operation in desert areas.

Since 1960, efforts have also been made to build Lan-chou into a base for nuclear industry. A gaseous diffusion plant, a major installation of the nuclear industry, was constructed and put into operation in 1963 near the city. It is capable of separating the fissionable uranium-235 from uranium-238 and is one of the major nuclear plants in China.

From 1950 to 1960, extensive geological surveys for minerals and oil were conducted in Kansu. The oil field in Yii-men was then greatly expanded, with the output of petroleum reaching 12,400,000 barrels by 1967. Yii-men has its own refinery with an annual capacity of 6,570,000 barrels and is linked by pipeline with the Lan-chou refinery.

The chief coal mine is located at A-kan-chen, almost 20 miles south of Lan-chou. It produces 1,000,000 tons of coal a year. Total coal production for the province was estimated in 1966 at 7,000,000 tons. A large iron and steel complex is under construction at Chiu-ch'iian with a designed capacity of 2,600,000 tons of pig iron and 1,800,000 tons of steel.

Hydro-electric projects

An ambitious project is under way to harness the waters of the Huang Ho by establishing two huge hydroelectric power stations on its upper course. One of them, the Liu-chia Hsia (Liu-chia Gorge) hydroelectric station above Lan-chou, now under construction, will produce 1,000,000 kilowatts of electricity. It will not only supply ampler and cheaper electric power to the new industrial enterprises around Lan-chou but will also free the city of Lan-chou from the menance of floods caused by the Huang Ho and bring large tracts of land under irrigation.

In agriculture, attempts have been made to increase agricultural output by transforming the vast areas of wasteland along the Kansu Corridor into cotton fields. Of more than 1,600,000 acres of wasteland in this area, more than one-third is suitable for cotton.

Transportation and communication. The major barrier to development in this area has been the absence of transportation facilities. Before 1952, only the Lunghai Railway connected Kansu with the coastal area; in that year a 215-mile extension between Lan-chou and T'ien-shui to the southeast was completed. In addition, a new railway extends westward from Lan-chou via Yii-men to Urumchi, the capital of Sinkiang, spanning a distance of about 1,730 miles. The 600-mile-long Lan-chou-to-Pao-t'ou railway, linking Kansu with the Inner Mongolian Autonomous Region, was completed in 1958. Survey work for a new railway between Lan-chou and Tsinghai began in 1955. The line, completed in 1959, runs for 930 miles, connecting Lan-chou with the rich mineral area of the Tsaidam Basin in northwest Tsinghai.

The highway system has also been greatly expanded. Highways radiate from Lan-chou toward Tsinghai, Sinkiang, Inner Mongolia, Shensi, and Szechwan. Domestic aviation services connect Lan-chou with Sian, Peking, Urumchi, Hsi-ning in Tsinghai, and Chungking in Szechwan. Telephone and telegram services are in operation throughout the province.

Navigation on the Huang Ho is limited to the section between Lan-chou and Chung-wei because of considerable silting and the river's seasonal flow.

Cultural life. Kansu represents a colourful mixture of races, customs, and cultures. The land abounds with mosques, lamaseries (monasteries of lamas), and Chinese temples.

Religious festivals

The cultural milieu. Communal life in Chinese villages is marked by religious observances, particularly rituals connected with ancestor worship; seasonal celebrations, such as the New Year, the Dragon Boat Festival, and the Moon Festival; and customs relating to birth, marriage, funerals, and burials. All of these activities are similar to those of the Chinese throughout the nation. Village theatricals provide another type of communal activity.

Most of the Monguors and Tibetans have abandoned their nomadic way of life and have settled down. They live in brick and mud houses resembling their former tents (yurts). Tibetans insist on simultaneous group actions within the village. Every year, when the first day of spring planting is determined by the horoscope, for instance, all the villagers go to the fields in their best clothing. The fields are then plowed simultaneously, and the seeds are sown at the same time in each field. During the course of the growing season, all the villagers periodically parade through the fields carrying their holy books on their heads.

Cultural traditions. The Muslims are faithful followers of their religion and strictly observe the fast of Ramaḍān, during which they eat nothing between sunrise and sunset. Before darkness falls, pious, bearded men say their prayers in public, and one or two of the elders may preach on points of theology, quoting the Qur'ān in oddly mutilated Arabic. At nightfall a communal feast is eaten; the community fires blaze all night, and people call and shout to one another.

Chinese Muslims also observe the practice of making a pilgrimage to Mecca. The *ḥājīs*, those who have completed the pilgrimage, are highly respected in the community. The number of pilgrimages has, however, decreased considerably since 1949.

The western part of Kansu has long been a region renowned for ancient and classic artistic works. Numerous stone caves in Tun-huang have many kinds of religious paintings on their walls, dating from the T'ang dynasty (AD 618–907). In Wu-wei, in western Kansu, large numbers of writings on bamboo slips have been found on the sites of the old frontier garrisons of the Han Empire (206 BC–AD 220). In 1964, a coherent bamboo text comprising a large part of one of the classic works on ritual (the *I Li*) came to light in western Kansu. In Tun-huang, within a Buddhist cave-temple, a library was discovered that had been immured there in the year 1035. It consisted of voluminous rolls of texts, including many valuable paintings and Buddhist classics.

The mass media are government controlled. The most influential newspaper is the provincial party organ, the *Lan-chou Jih-pao* ("Lanchow Daily"). Radio services are provided by the Kansu People's Radio station in Lan-chou.

BIBLIOGRAPHY. A Regional Handbook on Northwest China (1956) provides basic materials on Kansu during the pre-Communist era and some information on the early years of the Communist rule. CHANG KUEI-SHENG, "Geographical Bases for Industrial Development in Northwestern China," *Econ. Geogr.*, 39:341–350 (1963), gives data for the new discoveries of mineral resources in this area. LIU EN-LAN, "The Ho-Si Corridor," *ibid.*, 28:51–56 (1952), describes the author's personal impressions of this vital gateway. Two historical accounts of the Muslim Rebellion in Kansu are CHU WEN-DJANG, *The Moslem Rebellion in Northwest China, 1862–1878* (1966); and W.L. BALES, *Tso Tsung-t'ang: Soldier and Statesman of Old China* (1957). GEORGE B. CRESSEY, *Land of the 500 Million* (1955); and T.R. TREGEAR, *An Economic Geography of China* (1970), are general references on the geographic aspects. The official grand plan for the transformation of Kansu into a new industrial base is included in T.H. TENG, "Report on the Multi-Purpose Plan for Permanently Controlling the Yellow River and Exploiting Its Water Resources," *People's China*, supplement (September 1, 1955).

(C.y.C.)

Kant, Immanuel

Immanuel Kant was the foremost thinker of the Enlightenment and one of the great philosophers of all time, in whom were subsumed new trends that had begun with the Rationalism (stressing reason) of René Descartes and the Empiricism (stressing experience) of Francis Bacon. He inaugurated a new era in the development of philosophical thought. His comprehensive and systematic work in theory of knowledge, ethics, and aesthetics greatly influenced all subsequent philosophy, especially the various German schools of Kantianism and Idealism (*qq.v.*).

Kant, pencil portrait by Hans Veit Schnoor von Carolsfeld (1764–1841). In the Kupferstichkabinett, Dresden, East Germany.

Pietist rearing and schooling

Background and early life. Kant was born on April 22, 1724, at Konigsberg in East Prussia (since 1946 a part of the Soviet Union) and lived in that remote province for his entire life. His father, a saddler, was a descendant of a Scottish immigrant; his mother, an uneducated German woman, was remarkable for her character and natural intelligence. Both parents were devoted followers of the Pietist branch of the Lutheran Church, which taught that religion belongs to the inner life expressed in simplicity and obedience to the moral law. The influence of their pastor made it possible for Kant—the fourth of 11 children, but the eldest surviving child—to obtain an education.

At the age of eight Kant entered the Pietist school that his pastor directed. This was a Latin school, and it was presumably during the eight-and-a-half years he was there that Kant acquired his life-long love for the Latin classics, especially for the naturalistic poet Lucretius. In 1740 he enrolled in the University of Konigsberg as a theological student. But, although he attended courses in theology and even preached on a few occasions, he was principally attracted to mathematics and physics. Aided by a young professor who had studied Christian Wolff, a systematizer of Rationalist philosophy, and who was also an enthusiast for the science of Sir Isaac Newton, Kant began reading the work of the English physicist and, in 1744, started his first book, dealing with a problem concerning kinetic forces. Though by that time he had decided to pursue an academic career, the death of his father in 1746 and his failure to obtain the post of undertutor in one of the schools attached to the university compelled him to withdraw and seek a means of supporting himself.

Tutor and Privatdozent. He found employment as a family tutor and, during the nine years that he gave to it, worked for three different families. With them he was introduced to the influential society of the city, acquired social grace, and made his farthest travels from his native city—some 60 miles away to the town of Arnsdorf. In 1755, aided by the kindness of a friend, he was able to complete his degree at the university and take up the position of *Privatdozent*, or lecturer.

The three early dissertations

Three dissertations that he presented on obtaining this post indicate the interest and direction of his thought at this time. In one, *De Igne* (On Fire), he argued that bodies operate on one another through the medium of a uniformly diffused elastic and subtle matter that is the underlying substance of both heat and light. His first teaching was in mathematics and physics, and he was never to lose his interest in scientific developments. That it was more than an amateur interest is shown by his publication within the next few years of several scientific works dealing with the different races of men, the nature of winds, the causes of earthquakes, and the general theory of the heavens.

At this period Newtonian physics was important for Kant as much for its philosophical implications as for its scientific content. A second dissertation, the *Monodologia physica* (1756), contrasted the Newtonian methods of thinking with those employed in the philosophy then prevailing in German universities. This was the philosophy of Gottfried Wilhelm Leibniz, a universal scholar, as systematized and popularized by Wolff and by Alexander Gottlieb Baumgarten, author of a widely used text, the *Metaphysica* (1739). Leibniz' works as they are now known were not fully available to these writers; and the Leibnizian philosophy that they presented was extravagantly Rationalistic, abstract, and cut-and-dried. Yet it remained a powerful force, and the main efforts of independent thinkers in Germany at the time were devoted to examining its ideas.

In a third dissertation, *Principiorum Primorum Cognitionis Metaphysicae Nova Dilucidato* (1755), on the first principles of metaphysics, Kant analyzed especially the principle of sufficient reason, which, in Wolff's formulation, asserts that for everything there is a sufficient reason why it should be rather than not be. Although critical, Kant was cautious and still a long way from challenging the assumptions of Leibnizian metaphysics.

During his 15 years as a *Privatdozent,* Kant's fame as a teacher and writer steadily increased. Soon he was lecturing on many subjects besides physics and mathematics—including logic, metaphysics, and moral philosophy. He even lectured on fireworks and fortifications and every summer for 30 years gave a popular course on physical geography. He enjoyed great success as a lecturer; his style, which differed markedly from that of his books, was humorous and vivid, enlivened by many examples from his reading in English and French literature, and in travel and geography, science and philosophy.

Although he twice failed to obtain a professorship at Konigsberg, he refused to accept offers that would have taken him elsewhere—including the professorship of poetry at Berlin that would have brought greater prestige. He preferred the peace and quiet of his native city in which to develop and mature his own philosophy.

Critic of Leibnizian Rationalism. During the 1760s he became increasingly critical of Leibnizianism. According to one of his students, Kant was then attacking Leibniz, Wolff, and Baumgarten, was a declared follower of Newton, and expressed great admiration for the moral philosophy of the Romanticist Jean-Jacques Rousseau.

The attack on Leibniz

His principal work of this period was *Untersuchung iiber die Deutlichkeit der Grundsätze der natiirlichen Theologie und der Moral* (1764; "An Inquiry into the Distinctness of the Fundamental Principles of Natural Theology and Morals"). In this work he attacked the claim of Leibnizian philosophy that philosophy should model itself on mathematics and aim at constructing a chain of demonstrated truths based on self-evident premises. Kant argued that mathematics proceeds from definitions that are arbitrary, by means of operations that are clearly and sharply defined, upon concepts that can be exhibited in concrete form. In contrast with this method, he argued that philosophy must begin with concepts that are already given, "though confusedly or insufficiently determined," so that philosophers cannot begin with definitions without thereby shutting themselves up within a circle of words. Philosophy cannot, like mathematics, proceed synthetically; it must analyze and clarify. The importance of the moral order, which he had learned from Rousseau, reinforced the conviction received from his study of Newton that a synthetic philosophy is empty and false.

Besides attacking the methods of the Leibnizians, he also began criticizing their leading ideas. In an essay *Versuch, den Begriff der negativen Grössen in die Weltweisheit einzuführen* (1763), he argued that physical opposition as encountered in things cannot be reduced to logical contradiction, in which the same predicate is both affirmed and denied, and, hence, that it is pointless to reduce causality to the logical relation of antecedent and consequent. In an essay of the same year, *Der einzig mogliche Beweisgrund zu einer Demonstration des Daseyns Gottes,* he sharply criticized the Leibnizian concept of Being by charging that the so-called ontological argument, which would prove the existence of God by logic alone, is fallacious because it confuses existential with attributive statements: existence, he declared, is not a predicate of attribution. Moreover, with regard to the nature of space, Kant sided with Newton in his confrontation with Leibniz. Leibniz' view that space is "an order of co-existences" and that spatial differences can be stated in conceptual terms, he concluded to be untenable.

Investigation of the world of spirits

Some indication of a possible alternative of Kant's own to the Leibnizian position can be gathered from his curious *Traume eines Geistersehers erläutert durch Träume der Metaphysik* (1766). This work is an examination of the whole notion of a world of spirits, in the context of an inquiry into the spiritualist claims of Emanuel Swedenborg, a scientist and biblical scholar. Kant's position at first seems to have been completely skeptical, and the influence of the Scottish Skeptic David Hume is more apparent here than in any previous work; it was Hume, he later claimed, who first awoke him from his dogmatic slumbers. Yet Kant was not so much arguing that the notion of a world of spirits is illusory as insisting that men have no insight into the nature of such a world, a conclusion that has devastating implications for metaphysics as the Leibnizians conceived it. Metaphysicians can dream as well as spiritualists, but this is not to say that their dreams are necessarily empty; there are already hints that moral experience can give content to the ideal of an "intelligible world." Rousseau thus acted upon Kant here as a counterinfluence to Hume.

Early years of the professorship at Konigsberg. Finally, in 1770, after serving for 15 years as a *Privatdozent,* Kant was appointed to the chair of logic and metaphysics, a position in which he remained active until a few years before his death. In this period—usually called his critical period, because in it he wrote his great *Critiques*—he published an astounding series of original works on a wide variety of topics, in which he elaborated and expounded his philosophy.

"Inaugural Dissertation" of 1770

The *Inaugural Dissertation* of 1770 that he delivered on assuming his new position already contained many of the important elements of his mature philosophy. As indicated in its title, *De Mundi Sensibilis atque Intelligibilis Forma et Principiis: Dissertatio,* the implicit dualism of the *Traume* is made explicit; and it is made so on the basis of a wholly un-Leibnizian interpretation of the distinction between sense and understanding. Sense is not, as Leibniz had supposed, a confused form of thinking but a source of knowledge in its own right, although the objects so known are still only "appearances"—the term that Leibniz also used. They are appearances because all sensing is conditioned by the presence, in sensibility, of the forms of time and space, which are not objective characteristics or frameworks of things but "pure intuitions." But though all knowledge of things sensible is thus of phenomena, it does not follow that nothing is known of things as they are in themselves. Certainly, man has no intuition, or direct insight, into an intelligible world; but the presence in him of certain "pure intellectual concepts, such as those of possibility, existence, necessity, substance, cause, enables him to have some descriptive knowledge of it. By means of these concepts he can arrive at an exemplar that provides him with "the common measure of all other things as far as real." This exemplar gives man an idea of perfection for both the theoretical and practical orders: in the first, it is that of the Supreme Being, God; in the latter, that of moral perfection.

After the *Dissertation,* Kant published virtually nothing for 11 years. Yet, in submitting the *Dissertation* to a friend at the time of its publication, he wrote:

> About a year since I attained that concept which I do not fear ever to be obliged to alter, though I may have to widen it, and by which all sorts of metaphysical questions can be tested in accordance with entirely safe and easy criteria, and a sure decision reached as to whether they are soluble or insoluble.

Period of the three "Critiques." In 1781 the *Critik der reinen Vernunft (Critique of Pure Reason)* was published, followed for the next nine years by great and original works that in a short time brought a revolution in philosophical thought and established the new direction in which it was to go in the years to come.

The Critique of Pure Reason. The *Critique of Pure Reason* was the result of some 10 years of thinking and meditation. Yet, even so, Kant published the first edition only reluctantly after many postponements; for although convinced of the truth of its doctrine, he was uncertain and doubtful about its exposition. His misgivings proved well-founded, and Kant complained that interpreters and critics of the work were badly misunderstanding it. To correct these wrong interpretations of his thought he wrote the *Prolegomena zu einer jeden künftigen Metaphysik die als Wissenschaft wird auftreten können* (1783) and brought out a second and revised edition of the first "critique" in 1787. Controversy still continues regarding the merits of the two editions: readers with a preference for an Idealistic interpretation usually prefer the first edition, whereas those with a Realistic view adhere to the second. But with regard to difficulty and ease of reading and understanding, it is generally agreed that there is little to choose between them. Anyone on first opening either book finds it overwhelmingly difficult and impenetrably obscure.

The cause for this difficulty can be traced in part to the works that Kant took as his models for philosophical writing. He was the first great modern philosopher to spend all of his time and efforts as a university professor of the subject. Regulations required that in all lecturing a certain set of books be used, with the result that all of Kant's teaching in philosophy had been based on such handbooks as those of Wolff and Baumgarten, which abounded in technical jargon, artificial and schematic divisions, and great claims to completeness. Following their example, Kant accordingly provided a highly artificial, rigid, and by no means immediately illuminating scaffolding for all three of his *Critiques.*

The *Critique* of *Pure Reason,* after an introduction, is divided into two parts, of very different lengths: A "Transcendental Doctrine of Elements," running to almost 400 pages in a typical edition, followed by a "Transcendental Doctrine of Method," which reaches scarcely 80 pages. The ". . . Elements" deals with the sources of human knowledge, whereas the ". . . Method" draws up a methodology for the use of "pure reason" and its a priori ideas. Both are "transcendental," in that they are presumed to analyze the roots of all knowledge and the conditions of all possible experience. The "Elements" is divided, in turn, into a "Transcendental Aesthetic," a "Transcendental Analytic," and a "Transcendental Dialectic."

The simplest way of describing the contents of the *Critique* is to say that it is a treatise about metaphysics: it seeks to show the impossibility of one sort of metaphysics and to lay the foundations for another. The Leibnizian metaphysics, the object of his attack, is criticized for assuming that the human mind can arrive, by pure thought, at truths about entities, which, by their very nature, can never be objects of experience, such as God, human freedom, and immortality. Kant maintained, however, that the mind has no such power and that the vaunted metaphysics is thus a sham.

The synthetic a priori in mathematics and physics

As Kant saw it, the problem of metaphysics, as indeed of any science, is to explain how, on the one hand, its principles can be necessary and universal (such being a condition for any knowledge that is scientific) and yet, on the other hand, involve also a knowledge of the real and so provide the investigator with the possibility of more knowledge than is analytically contained in what he already knows; *i.e.*, than is implicit in the meaning alone. To meet these two conditions, Kant maintained, knowledge must rest on judgments that are a priori, for it is only as they are separate from the contingencies of experience that they could be necessary and yet also synthetic; *i.e.*, so that the predicate term contains something more than is analytically contained in the subject. Thus, for example, the proposition that all bodies are extended is not synthetic but analytic because the notion of extension is contained in the very notion of body; whereas the proposition that all bodies are heavy is synthetic because weight supposes, in addition to the notion of body, that of bodies in relation to one another. Hence, the basic problem, as Kant formulated it, is to determine "How [*i.e.*, under what conditions] are synthetic a priori judgments possible?"

This problem arises, according to Kant, in three fields, viz., in mathematics, physics, and metaphysics; and the three main divisions of the first part of the *Critique* deal respectively with these. In the "Transcendental Aesthetic," Kant argued that mathematics necessarily deals with space and time and then claimed that these are both a priori forms of human sensibility that condition whatever is apprehended through the senses. In the "Transcendental Analytic," the most crucial as well as the most difficult part of the book, he maintained that physics is a priori and synthetic because in its ordering of experience it uses concepts of a special sort. These concepts—"categories," he called them—are not so much read out of experience as read into it and, hence, are a priori, or pure, as opposed to empirical. But they differ from empirical concepts in something more than their origin: their whole role in knowledge is different; for, whereas empirical concepts serve to correlate particular experiences and so to bring out in a detailed way how experience is ordered, the categories have the function of prescribing the general form that this detailed order must take. They belong, as it were, to the very framework of knowledge. But although they are indispensable for objective knowledge, the sole knowledge that they can give is of objects of possible experience; they yield valid and real knowledge only when they are ordering what is given through sense in space and time.

The synthetic a priori in metaphysics

In the "Transcendental Dialectic" Kant turned to consideration of a priori synthetic judgments in metaphysics. Here, he claimed, the situation is just the reverse from what it was in mathematics and physics. Metaphysics cuts itself off from sense experience in attempting to go beyond it and, for this very reason, fails to attain a single true a priori synthetic judgment. To justify this claim, Kant analyzed the use that metaphysics makes of the concept of the unconditioned. Reason, according to Kant, seeks for the unconditioned or absolute in three distinct spheres: (1) in philosophical psychology it seeks for an absolute subject of knowledge; (2) in the sphere of cosmology, it seeks for an absolute beginning of things in time, for an absolute limit to them in space, and for an absolute limit to their divisibility; and (3) in the sphere of theology, it seeks for an absolute condition for all things. In each case, Kant claimed to show that the attempt is doomed to failure by leading to an antinomy in which equally good reasons can be given for both the affirmative and the negative position. The metaphysical "sciences" of rational psychology, rational cosmology, and natural theology, familiar to Kant from the text of Baumgarten, on which he had to comment in his lectures, thus turn out to be without foundation.

With this work, Kant proudly asserted that he had accomplished a Copernican revolution in philosophy. Just as the founder of modern astronomy, Nicolaus Copernicus, had explained the apparent movements of the stars by ascribing them partly to the movement of the observers, so Kant had accounted for the application of the mind's a priori principles to objects by showing that the objects conform to the mind: in knowing, it is not the mind that conforms to things but things that conform to the mind.

The Critique of *Practical Reason.* Because of his insistence on the need for an empirical component in knowledge and his antipathy to speculative metaphysics, Kant is sometimes presented as a Positivist before his time; and his attack upon metaphysics was held by many in his own day to bring both religion and morality down with it. Such, however, was certainly far from Kant's intention. Not only did he propose to put metaphysics "on the sure path of science," he was prepared also to say that he "inevitably" believed in the existence of God and in a future life. It is also true that his original conception of his critical philosophy anticipated the preparation of a critique of moral philosophy. The *Critik der practischen Vernunft* (1788; *Critique of Practical Reason),* the result of this intention, is the standard source book for his ethical doctrines. The earlier *Grundlegung zur Metaphysik der Sitten (1785)* is a shorter and, despite its title, more readily comprehensible treatment of the same general topic. Both differ from *Die Metaphysik der Sitten* (1797) in that they deal with pure ethics and try to elucidate basic principles; whereas the later work is concerned with applying what they establish in the concrete, a process that involved the consideration of virtues and vices and the foundations of law and politics.

Similarity between his ethics and epistemology

There are many points of similarity between Kant's ethics and his epistemology, or theory of knowledge. He used the same scaffolding for both—a "Doctrine of Elements," including an "Analytic" and a "Dialectic," followed by a "Methodology"; but the second *Critique* is far shorter and much less complicated. Just as the distinction between sense and intelligence was fundamental for the former, so is that between the inclinations and moral reason for the latter. And just as the nature of the human cognitive situation was elucidated in the first ***Critique*** by reference to the hypothetical notion of an intuitive understanding, so is that of the human moral situation clarified by reference to the notion of a "holy will." For a will of this kind there would be no distinction between reason and inclination; a being possessed of a holy will would always act as it ought. It would not, however, have the concepts of duty and moral obligation, which enter only when reason and desire find themselves opposed. In the case of human beings, the opposition is continuous, for man is at the same time both flesh and spirit; it is here that the influence of Kant's religious background is most prominent. Hence, the moral life is a continuing struggle in which morality appears to the potential delinquent in the form of a law that demands to be obeyed for its own sake—a law, however, the commands of which are not issued by some alien authority but represent the voice of reason, which the moral subject can recognize as his own.

In the "Dialectic," Kant took up again the ideas of God, freedom, and immortality. Dismissed in the first ***Critique*** as objects that men can never know because they transcend human sense experience, he now argued that they are essential postulates for the moral life. Though not reachable in metaphysics, they are absolutely essential for moral philosophy.

Kant is often described as an ethical Rationalist, and the description is not wholly inappropriate. He never espoused, however, the radical Rationalism of some of his contemporaries nor of more recent philosophers for whom reason is held to have direct insight into a world of values or the power to intuit the rightness of this or that moral principle. Thus, practical, like theoretical, reason was for him formal rather than material—a framework of formative principles rather than a content of actual rules. This is why he put such stress on his first formulation of the categorical imperative: "Act only on that maxim through which you can at the same time will that it should become a universal law." Lacking any insight into the moral realm. men can only ask themselves whether what they are proposing to do has the formal character of law—the character, namely, of being the same for all persons similarly circumstanced.

Critiques of aesthetics and natural teleology

The "Critique of Judgment." The ***Critik der Urtheilskraft*** (1790)—one of the most original and instructive of all of Kant's writings—was not foreseen in his original conception of the critical philosophy. Thus it is perhaps best regarded as a series of appendixes to the other two ***Critiques.*** The work falls into two main parts, called respectively "Critique of Aesthetic Judgment" and "Critique of Teleological Judgment." In the first of these, after an introduction in which he discussed "logical purposiveness," he analyzed the notion of "aesthetic purposiveness" in judgments that ascribe beauty to something. Such a judgment, according to him, unlike a mere expression of taste, lays claim to general validity; yet it cannot be said to be cognitive because it rests on feeling, not on argument. The explanation lies in the fact that, when a person contemplates an object and finds it beautiful, there is a certain harmony between his imagination and his understanding, of which he is aware from the immediate delight that he takes in the object. Imagination grasps the object and yet is not restricted to any definite concept; whereas a person imputes the delight that he feels to others because it springs from the free play of his cognitive faculties, which are the same in all men.

In the second part, Kant turned to consider teleology in nature as it is posed by the existence in organic bodies of things of which the parts are reciprocally means and ends to each other. In dealing with these bodies, one cannot be content with merely mechanical principles. Yet if mechanism is abandoned and the notion of a purpose or end of nature is taken literally, this seems to imply that the things to which it applies must be the work of some supernatural designer; but this would mean a passing from the sensible to the suprasensible, a step proved in the first ***Critique*** to be impossible. Kant answered this objection by admitting that teleological language cannot be avoided in taking account of natural phenomena; but it must be understood as meaning only that organisms must be thought of "as if" they were the product of design, and that is by no means the same as saying that they are deliberately produced.

Last years. The critical philosophy was soon being taught in every important German-speaking university, and young men flocked to Konigsberg as a shrine of philosophy. In some cases, the Prussian government even undertook the expense of their support. Kant came to be consulted as an oracle on all kinds of questions, including such subjects as the lawfulness of vaccination. Such homage did not interrupt Kant's regular habits. Scarcely five feet tall, with a deformed chest, and suffering from weak health, he maintained throughout his life a severe regimen. It was arranged with such regularity that people set their clocks according to his daily walk along the street named for him, "The Philosopher's Walk." Until old age prevented him, he is said to have missed this regular appearance only on the occasion when Rousseau's ***Bmile*** so engrossed him that for several days he stayed at home.

Works on religion and the ban on them

With the publication of the third ***Critique,*** Kant's main philosophical work was done. From 1790 his health began to decline seriously. He still had many literary projects but found it impossible to write more than a few hours a day. The writings that he then completed consist partly of an elaboration of subjects not previously treated in any detail, partly of replies to criticisms and to the clarification of misunderstandings. With the publication in 1793 of his work ***Die Religion innerhalb der Grenzen der blossen Vernunft,*** Kant became involved in a dispute with Prussian authorities on the right to express religious opinions. The book was found to be altogether too Rationalistic for orthodox taste; he was charged with misusing his philosophy to the "distortion and depreciation of many leading and fundamental doctrines of sacred Scripture and Christianity" and was required by the government not to lecture or write anything further on religious subjects. Kant agreed but privately interpreted the ban as a personal promise to the King, from which he felt himself to be released on the latter's death in 1797. At any rate, he returned to the forbidden subject in his last major essay, ***Der Streit der Fakultaten*** (1798; "The Conflict of the Faculties").

The large work at which he laboured until his death—the fragments of which fill the two final volumes of the great Berlin edition of his works—was evidently intended to be a major contribution to his critical philosophy. What remains, however, is not so much an unfinished work as a series of notes for a work that was never written. Its original title was ***Ubergang von den metaphysische Anfangsgriinde der Naturwissenschaft zur Physik*** ("Transition from the Metaphysical Foundations of Natural Science to Physics"), and it may have been his intention to carry further the argument advanced in the ***Metaphysische Anfangsgrunde der Naturwissenschaft*** (1786) by showing that it is possible to construct a priori not merely the general outline of a science of nature but a good many of its details as well. But judging from the extant fragments, however numerous they are, it remains conjectural whether its completion would have constituted a major addition to his philosophy and its reputation.

After a gradual decline that was painful to his friends as well as to himself, Kant died in Konigsberg, February 12, 1804. His last words were "Es ist gut" ("It is good"). His tomb in the cathedral was inscribed with the words (in German) "The starry heavens above me and the moral law within me," the two things that he declared in the conclusion of the second ***Critique*** "fill the mind with ever new and increasing admiration and awe, the oftener and the more steadily we reflect on."

MAJOR WORKS

PRE-CRITICAL WRITINGS: ***Gedanken von der wahren Schätzung der lebendigen Krafte und Beurtheilung der Beweise derer sich Herr von Leibniz und anderer Mechaniker in dieser Streitsache bedient haben (1746); Allgemeine Naturgeschichte und Theorie des Himmels (1755; Kant's Cosmog-***

ony . . . , 1900 and 1968; *Universal Natural History and Theories of the Heavens,* 1969); *Principiorum Primorum Cognitionis Metaphysicae Nova Dilucidatio* (1755; Eng. trans. by F.E. England in *Kant's Conception of God,* 1929); *Metaphysicae cum geometria iunctae usus in philosophia naturali, cuius specimen I. continet Monadologiam physicam* (1756); *Versuch einiger Betrachtungen über den Optimismus* (1759); *Die falsche Spitzfindigkeit der vier syllogistischen Figurerewiesen* (1762; trans. in *Kant's Introduction to Logic and His Essay on the Mistaken Subtilty of the Four Figures,* 1963); *Der einzig mögliche Beweisgrund zu einer Demonstration des Daseyns Gottes* (1763; *Enquiry into the Proofs for the Existence of God,* 1836); *Versuch, den Begriff der negativen Grössen in die Weltweisheit einzuführen* (1763; *An Attempt to Introduce the Conception of Negative Quantities into Philosophy,* 1911); *Untersuchung über die Deutlichkeit der Grundsätze der natürlichen Theologie und der Moral* (1764); *Beobachtungen über das Gefühl des Schönen und Erhabenen* (1764, 1766, 1771; *Observations on the Feeling of the Beautiful and Sublime,* 1960); *Träume eines Geistersehers erläutert durch Träume der Metaphysik* (1766; *Dreams of a Spirit-Seer, Illustrated by Dreams of Metaphysics,* 1900; *Dreams of a Spirit Seer, and Other Related Writings,* 1969); *De Mundi Sensibilis atque Intelligibilis Forma et Principiis: Dissertatio* (1770; *Kant's Inaugural Dissertation and Early Writings on Space,* 1929); *Von den Verschiedenen Racen der Menschen* (1775).

CRITICAL AND POST-CRITICAL WRITINGS: *Critik der reinen Vernunft* (1781; rev. ed., *Kritik der reinen Vernunft,* 1787; *Critique of Pure Reason,* 1929, 1950); *Prolegomena zur einer jeden künftigen Metaphysik die als Wissenschaft wird auftreten können* (1783; *Prolegomena to Any Future Metaphysics,* 1951); *Grundlegung zur Metaphysik der Sitten* (1785; *The Fundamental Principles of the Metaphysic of Ethics,* 1938; *The Moral Law; or, Kant's Groundwork of the Metaphysic of Morals,* 1948; *Foundations of the Metaphysics of Morals,* 1969); *Metaphysische Anfangsgründe der Naturwissenschaft* (1786; *Metaphysical Foundations of Natural Science,* 1970); *Critik der practischen Vernunft* (1788; *Critique of Practical Reason,* 1949); *Critik der Urtheilskraft* (1790, 2nd ed. 1793; *Kant's Kritik of Judgment,* 1892, reprinted as *Kant's Critique . . . ,* 1914; new version, *Critique . . . ,* vol. 1, *Kant's Critique of Aesthetic Judgment* and vol. 2, *Critique of Teleological Judgment,* 1911–28, republished 1952); *Über eine Entdeckung, nach der alle neu Critik der reinen Vernunft durch eine ältere entbehrlich gemacht werden soll* (1790; 2nd ed., 1791); *Die Religion innerhalb der Grenzen der blossen Vernunft* (1793; 2nd ed., 4 pt., 1794; *Religion Within the Boundary of Pure Reason,* 1838; *Religion Within the Limits of Reason Alone,* 2nd ed., 1960); *Zum ewigen Frieden* (1795; 2nd ed., 1796; *Perpetual Peace,* 1796, many later editions; 1915 ed. reprinted 1972); *Die Metaphysik der Sitten* (1797; 2nd ed., 1798–1803; *The Metaphysic of Morals,* 2 vol., 1799 and 1965; *The Metaphysic of Ethics,* 1836), comprising *Metaphysische Anfangsgründe der Rechtslehre* (*The Philosophy of Law,* 1887) and *Metaphysische Anfangsgründe der Tugenlehre* (*The Doctrine of Virtue,* 1964); *Der Streit der Facultäten* (1798); *Von der Macht des Gemüths durch den blossen Vorsatz seiner krankhaften Gefühle Meister zu seyn* (1798; *Kant on the Art of Preventing Diseases,* 1806); *Anthropologie in pragmatischer Hinsicht abgefasst* (1798; improved ed., 1800; *The Classification of Mental Disorders,* 1964); *Immanuel Kants Physische Geographie,* 3 vol. in 6 pt., 1801–04); *I. Kants Logik: Ein Handbuch zu Vorlesungen* (1800; *Logic,* 1819); *Immanuel Kant über Pädagogik* (1803; *Kant on Education,* 1899; *The Educational Theory of Immanuel Kant,* 1904; *Education,* 1960); *Welches sind die wirklichen Fortschritte, die Metaphysik seit Leibnizens und Wolf's Zeiten in Deutschland gemacht hat?* (1804).

BIBLIOGRAPHY

Biography: The main sources for Kant's life are three memoirs published in 1804: LUDWIG ERNEST VON BOROWSKI, *Darstellung des Lebens und Charakters Immanuel Kants;* REINHOLD B. JACHMANN, *Immanuel Kant geschildert in Briefen an einen Freund;* and CHRISTOPH WASIANSKI, *Immanuel Kant in seinen letzten Lebensjahren* (the basis of THOMAS DE QUINCEY'S "The Last Days of Kant" included in his *Works*). See also J.H.W. STUCKENBERG, *The Life of Immanuel Kant* (1882); FRIEDRICH PAULSEN, *Immanuel Kant: Sein Leben und seine Lehre,* 2nd–3rd ed. (1899; Eng. trans., *Immanuel Kant: His Life and Doctrine,* 1902); ERNST CASSIRER, *Kants Leben und Lehre* (1921); and KARL VORLANDER, *Immanuel Kants Leben* (1921) and *Immanuel Kant: Der Mann und das Werk,* 2 vol. (1924).

Editions: The standard edition of Kant's works is that of the Berlin Academy, 1st ed., 9 vol. (1902–23; vol. 10–14, 1900-02, 1911), 4th ed., much augmented, in progress in the 1970s, which contains Kant's correspondence and literary remains as well as his published writings. There are also modern collected editions by ERNST CASSIRER, 11 vol. (1912–22) and by KARL VORLANDER, 10 vol. (1920–29). The most convenient edition of the *Critique of Pure Reason* is that by RAYMOND SCHMIDT (1926).

Aids to study: RUDOLF EISLER, *Kant-lexicon* (1930); HEINRICH RATKE, *Systematisches Handlexikon zu Kants Kritik der reinen Vernunft* (1929, reprinted 1965).

Kantianism

As a philosophical designation, Kantianism can signify either the system of thought contained in the writings of the epoch-making 18th-century philosopher Immanuel Kant or those later philosophies that arose from the study of Kant's writings and drew their inspiration from his principles. Only the latter is the concern of this article.

NATURE AND TYPES OF KANTIANISM

The Kantian movement comprises a loose assemblage of rather diverse philosophies that share Kant's concern with exploring the nature, and especially the limits, of human knowledge in the hope of raising philosophy to the level of a science in some sense similar to mathematics and physics. Participating in the critical spirit and method of Kant, these philosophies are thus opposed to dogmatism, to expansive speculative naturalism (such as that of Baruch Spinoza, the Jewish Rationalist), and, usually, to irrationalism. The various submovements of Kantianism are characterized by their sharing of certain "family resemblances"; *i.e.*, by the preoccupation of each with its own selection of concerns from among the many developments of Kant's philosophy: a concern, for example, with the nature of empirical knowledge; with the way in which the mind imposes its own categorial structure upon experience, and, in particular, with the nature of the structure that renders man's knowledge and moral action possible, a structure considered to be a priori (logically independent of experience); with the status of the *Ding-an-sich* ("thing-in-itself"), that more ultimate reality that presumably lurks behind man's apprehension of an object; or with the relationship between knowledge and morality. **A** brief exposition of Kant's philosophical system may be found in KANT, IMMANUEL.

A system such as the critical philosophy of Kant freely lends itself to reconstructions of its synthesis according to whatever preferences the private philosophical inclinations of the reader may impose or suggest. Kant's system was a syncretism, or union, of British Empiricism (as in John Locke, George Berkeley, and David Hume) that stressed the role of experience in the rise of knowledge; of the scientific methodology of Isaac Newton; and of the metaphysical apriorism (or Rationalism) of Christian Wolff, who systematized the philosophy of Gottfried Leibniz, with its emphasis on mind. Thus it constituted a synthesis of elements very different in origin and nature, which tempted the student to read his own presuppositions into it.

Varieties of Kantianism

The critical philosophy has been subjected to a variety of approaches and methods of interpretation. These can be reduced to three fundamental types: those that conceive of the critical philosophy as an epistemology or a pure theory of (scientific) knowledge and methodology; those that conceive of it as a critical theory of metaphysics or the nature of Being (ultimate reality); and those that conceive of it as a theory of normative or valuational reflection parallel to that of ethics (in the field of action). Each of these types—known, respectively, as epistemological, metaphysical, and axiological Kantianism—can, in turn, be subdivided into several secondary approaches. Historically, epistemological Kantianism included such different attitudes as empirical Kantianism, rooted either in physiological or psychological inquiries; the logistic Kantianism of the Marburg school, which stressed essences and the use of logic; and the realistic Kantianism of the Austrian Alois Riehl. Metaphysical Kantianism developed from the transcendental Idealism of German Romanticism to Realism, a course followed by many speculative thinkers; who—like nearly all contemporary Kantians—saw in the critical philosophy the foundations of an essentially inductive metaphysics, in accordance with the results of the modern sciences. Finally, axiological Kantianism—concerned with value theory—branched, first, into an axiological approach (properly so-called), which interpreted the methods of all three of Kant's *Critiques* (*i.e., Critique of Pure Reason, Critique of Practical Reason,* and *Critique of Judgment)* as normative disciplines of thought; and, second, into an eclectic or relativistic Kantianism, which regarded the critical philosophy as a system of thought dependent upon social, cultural, and historical conditions.

The chief representatives of these submovements are identified in the historical sections below.

It is essential to distinguish clearly between two periods within the Kantian movement: first, the period from 1790 to 1831 (the death of Hegel); and, second, the period from 1860 to the present—separated by a time when an antiphilosophical Positivism, a type of thought that supplanted metaphysics with science, was predominant. The first period began with the thorough study and emendation of Kant's chief theoretical work, *Kritik der reinen Vernunft* (2nd ed., 1787; the *Critique of Pure Reason,* 1929); but it soon became intermingled with the romantic tendencies in German Idealism. The second period, called specifically Neo-Kantianism, was, first of all, a conscious reappraisal, in whole or in part, of the theoretical *Critique*, but also, as a total system, a reaction against Positivism. Earlier Neo-Kantianism reduced philosophy to the theory of knowledge and scientific methodology; systematic Neo-Kantianism, arising at the beginning of the 20th century, expressed itself in attempts at building metaphysical structures.

EARLY KANTIANISM: 17961835

Kant himself

According to Immanuel Kant (1724–1804), his major work, the *Critique of Pure Reason*, comprised a treatise on methodology, a preliminary investigation prerequisite to the study of science, which placed the Newtonian method (induction, inference, and generalization) over against that of Descartes and Wolff (deduction from intuitions asserted to be self-evident). The result was a critique of metaphysics, the value of which lay not in science but in a realm of being accessible only to the pure intellect. In exploring this "noumenal" realm, as he called it, Kant placed his *Critique* in a positive role. Recalling the revolution that occurred in astronomy when Nicolaus Copernicus discerned, in the apparent motions of the planets, reflections of the earth's own motion, Kant inaugurated a Copernican revolution in philosophy, which claimed that the subject doing the knowing constitutes, to a considerable extent, the object; *i.e.*, that knowledge is in part constituted by a priori or transcendental factors (contributed by the mind itself), which the mind imposes upon the data of experience. Far from being a description of an external reality, knowledge is, to Kant, the product of the knowing subject. When the data are those of sense experience, the transcendental (mental) apparatus constitutes man's experience or his science, or makes it to be such. These transcendental elements are of three different orders: at the lowest level are the forms of space and time (technically called intuitions); above these are the categories and principles of man's intelligence (among them substance, causality, and necessity); and at the uppermost level of abstraction the ideas of reason—the transcendental "I," the world as a whole, and God. It is by virtue of the encounter between the forms of man's sensory intuition (space and time) and his perceptions that phenomena are formed. The forms arise from the subject himself; the perceptions, however—or the data of experience—have reference, ultimately, to things-in-themselves, which nevertheless remain unknowable, inasmuch as, in order to be known at all, it is necessary for things to appear clothed, as it were, in the forms of man's intuition and, thenceforth, to present themselves as phenomena and not as noumena. The thing-in-itself, accordingly, indicates the limit and not the object of knowledge.

Early criticism

These theses of Kant provoked criticism among the followers of Christian Wolff, the Leibnizian Rationalist, and doubts among the disciples of Kant, which, as they further developed into systems, marked the first period of Kantianism. Inasmuch as these disciples took the *Critique of Pure Reason* to be a *preface* to the study of the pure reason or of the transcendental system and not the system itself, they saw in this interpretation an explanation for the ambiguities to which the *Critique* (as they felt) was subject. Their doubts revolved around two points: first, Kant had erroneously distinguished three kinds of a priori knowledge, coordinate with the three aforementioned levels or faculties of the mind; and second, Kant had accepted the thing-in-itself as constitutive of knowledge. Regarding the first point, they claimed that Kant had accepted the three faculties and their respective transcendental characteristics without investigation, in which case this structure should be viewed, in accordance with the preliminary character of the *Critique,* as a triple manifestation of a single fundamental faculty. For this reason the distinction between the levels of intuition and understanding (or between the receptivity and spontaneity of the mind) had to be rejected—for the three transcendentals—space and time, the categories, and the ideas of reason—were not existents but were only functions of thought. Finally, these disciples argued that the existence of a single transcendental subject, the Ego, would render the thing-in-itself superfluous and even pernicious for the scientific treatment of epistemology.

This function of human thought (the transcendental subject), which serves as the absolute source of the a priori, was variously designated by different early Kantian thinkers: for the German Realist Karl L. Reinhold, it constituted the faculty of representation; for the Lithuanian Idealist Salomon Maimon, it was a mental capacity for constructing objects; for the Idealist Jakob S. Beck, a protégé of Kant's, it was the act of synthesis; for the empirical critic of Kantianism G.E. Schulze, it was experience in the sense intended by Hume—a volley of discrete sense impressions; for the theory of knowledge of the outstanding ethical Idealist Johann G. Fichte, it was the original positing of the Ego and the non-Ego—which meant, in turn, in the case of the aesthetic Idealist F.W.J. von Schelling, "the absolute self," and in the case of G.W.F. Hegel "the *Geist* or absolute Spirit," and finally, in the case of the pessimistic Romanticist Arthur Schopenhauer, "the absolute Will." In each case (excepting Schulze) the interpretation of the thing-in-itself in a realistic metaphysical sense was rejected in favour of various degrees of transcendental Idealism. Removed from the main current of Kantianism was the empirically oriented thinker Jakob Friedrich Fries (the one figure in this group who was not an Idealist in the true sense), who interpreted the a priori in terms of psychological faculties and elements.

Having earlier renounced these apostates on a large scale, Kant, at the end of his life, prepared a new exposition of the transcendental philosophy (the second part of his *Opus Postumum),* which showed that he was ready tacitly to accede to the criticisms of his adversaries.

NEO-KANTIANISM: SINCE 1860

General features of Neo-Kantianism

Nineteenth-century Neo-Kantianism. The rejection of all of philosophy by Positivism had the anomalous effect of, itself, evoking an awakening of Kantianism, for many thinkers wished to give to Positivism itself a philosophical foundation that, while respecting the phenomenological attitude, would yet be hostile to the metaphysics of Positivism, which was usually a tacit, but inconsequent, Materialism. It was justifiably held that Kant could provide such a foundation because of his opposition to metaphysics and his limitation of scientific knowledge to the sphere of phenomena. The complexity of the critical philosophy was such that the theoretical criticism could be approached in diverse ways and that, through the facts themselves, diverse interpretations of the *Critique of Pure Reason* could be obtained. In the order of their origin (though not of their worth or importance), there thus arose currents of Kantianism that were empiricist, logicist, realist, metaphysical, axiological, and psychological—of which the most important have survived into the 20th century.

The return to Kant was determined by the historical fresco of the incomparable historian of philosophy Kuno Fischer entitled *Kants Leben und die Grundlagen seiner Lehre* (1860; "Kant's Life and the Foundations of his Teaching"), which replaced the earlier work of the semi-Kantian Ernst Reinhold, son of the more notable Jena scholar (published 1828–30), and especially that of the outstanding historian of philosophy Johann Eduard Erdmann (published 1834–53). In 1865 the order: "Zuriick nach Kant!" ("Back to Kant!") reverberated through the celebrated work of the young epistemologist Otto Liebmann, *Kant und die Epigonen* ("Kant and his Followers"), which was destined to extricate their spirits from the Positivistic morass and, at the same time, to divert the Germans from romantic Idealism.

Schools of Neo-Kantianism

Epistemological Neo-Kantianism. The empiricist, logistic, and realistic schools can be classed as epistemological.

Empiricist Neo-Kantianism was represented by the erudite pioneering physicist and physiologist Hermann L.F. von Helmholtz and, in part, by F.A. Lange, author of a famous study of Materialism. Helmholtz found support in Kant for his claim, first, that, although perception can *represent* an external thing, it usually does so in a way far removed from an actual description of its properties; second, that space and time comprise an empirical framework created for thought by the perceiving subject; and, third, that causality is an a priori law allowing the philosopher to infer a reality that is absolutely unknowable. Smilarly, Lange reduced science to the phenomenal level and repudiated the thing-in-itself.

Logistic Neo-Kantianism, as represented in the most well-known and flourishing school of Kantianism, that at Marburg, originated with Hermann Cohen, successor of Lange at Marburg, who, in a book on Kant (1871), argued that the transcendental subject is not to be regarded as a psychic being but as a logical function of thought that constructs both the form *and* the content of knowledge. Nothing is *gegeben* ("given"), he urged; all is *aufgegeben* ("propounded," like a riddle) to thought—as when, in the infinitesimal calculus, the analyst generates motion by imagining thin slices of space and time and adding up their areas. Hence experience is a perfect construction of man's logical spirit. The example of Cohen inspired many other authors, among them Cohen's colleague at Marburg Paul Natorp, who, in his work on the logical foundations of the exact sciences, integrated even psychology into the Marburgian transcendentalism; and Ernst Cassirer, best known for stressing the symbolizing capacities of man, who, in his memorable work *Das Erkenntnisproblem in der Philosophie und Wissenschaft der neueren Zeit* (1906–20; *The Problem of Knowledge: Philosophy, Science, and History since Hegel,* 1966), transposed this same logisticism into a form that illumines the history of modern philosophy.

Realistic Neo-Kantianism, the third manifestation of epistemological Neo-Kantianism, was represented in the Realism of the scientific monist Alois Riehl and of his disciple Richard Honigswald. In a work on the significance of the critical philosophy for the positive sciences (published 1876–87), Riehl held, in direct opposition to the Marburgian logisticism, that the thing-in-itself participates positively in the constitution of knowledge inasmuch as all perception includes a reference to things outside the subject.

Metaphysical Neo-Kantianism. Ten years after the appearance of the aforementioned ground-breaking book *Kant und die Epigonen,* its author, Otto Liebmann, introduced the new metaphysical approach in his book on the analysis of reality (1876), which came near to the Kantianism of Marburg. The Romanticist Johannes Volkelt, in turn, took up the theme of a critical metaphysics and expressed his persisting aspirations toward the Absolute in the claim that, beyond the certainties of man's own subjective consciousness, there exists a new kind of certainty in a transsubjective realm. Subjectivity is, thus, inevitably transcended, just as the sciences are surmounted when they presuppose a metaphysics. The influential spiritual moralist Friedrich Paulsen defended the claim that Kant had always behaved as a metaphysician, even in the *Critique of Pure Reason,* in spite of the epistemological restrictions that he imposed upon himself—a claim that made an impact that was felt throughout the following century.

Axiological Neo-Kantianism. Inasmuch as the two principal representatives of the axiological interpretation both taught at Heidelberg, this branch is also known as the Southwest German or Baden school. Its initiator was Wilhelm Windelband, esteemed for his "problems" approach to the history of philosophy. The scholar who systematized this position was his successor Heinrich Rickert, who had come from the tradition of Kuno Fischer. Drawing a parallel between the constraints that logic exerts upon thought and those that the sense of ought exerts upon ethical action, these thinkers argued that, while man's *action* must answer to an absolute value (the Good), his *thought* must answer to a regulative value (the True), which imposes upon him the duty of conforming to it. The *Critique of Pure Reason,* they held, elaborates this rule—which is not an entity but an imperative, or absolute, charge to act. Rickert regarded the critical endeavour as having been too narrow, since it was suited merely to physics. Actually, he charged, it should be the foundation for all of the sciences of the spirit. The distinctive characteristic of this school thus consisted in reintegrating German Idealism (as in Fichte and Hegel) into a rather personal Kantianism. Consequently, it succeeded in annexing more than one area of semi-Kantian thought: *e.g.,* "the philosophy of the spiritual sciences" of Wilhelm Dilthey, who held that intellectual life cannot be explained by means of naturalistic causality but only through historical understanding (*Verstehen*); "the life-philosophy" of the social philosopher Georg Simmel, who deviated from an earlier naturalistic relativism to the espousal of objective values; "the philosophy of value" of the experimental psychologist Hugo Munsterberg, author of one of the earliest systems of values; the "semi-Hegelianism" of Richard Kroner, a philosopher of culture and religion; and the general works of Bruno Bauch, Liebmann's successor at Jena. All of these philosophers were more or less related to axiological Neo-Kantianism.

Psychological Neo-Kantianism. An initial attempt to interpret Kantian transcendentalism in psychological terms was made by the Friesian Empiricist Jürgen Bona Meyer in his *Kants Psychologie* (1870). Later, a more important contribution in this field was made by the Göttingen philosopher of ethics and law Leonard Nelson and published in the *Abhandlungen der Fries'schen Schule* (1904 ff; "Acts of the Friesian School"). Even this title suggests an intimate agreement with the Kantianism of Fries's new critique of reason (1807); and Nelson, indeed, is regarded as the founder of the Neo-Friesian school. At a time when other Kantian schools were concerned with the transcendental analysis of objective or outer knowledge, Nelson held that, in the analysis of the subjective or inner self, the transcendental equipment of the mind—the a priori—is directly revealed. It thus fell to psychology to lay bare this equipment, which belongs in itself to the metaphysical order. It was upon this basis that the Marburg theologian Rudolf Otto, in his book *Das Heilige* (1917; *The Idea of the Holy,* 1958), ventured a type of religious phenomenology that has proved very successful.

Kantian philology

A discipline known as the Kant *Philologie,* concerned with the history, development, and works of Kant, has pre-empted a considerable portion of philosophical historiography since 1860. These studies began with the immense commentary on the *Critique of Pure Reason* produced in 1881–92 by Hans Vaihinger, known for his philosophy of the "As If" (which stresses man's reliance on pragmatic fictions), and with the founding of the new journal *Katttstudien* (1896) and the Kant-Gesellschaft ("Kantian Society," 1904)—both of which are still extant. The most conspicuous result of this philological movement, however, was undeniably the monumental edition, in 23 volumes, of all of Kant's available works prepared (1900 ff) by the Academy of Sciences at Berlin under the editorship of the champion of humanistic studies, Wilhelm Dilthey. These volumes include: Sect. 1, Works; Sect. 2, Correspondence; Sect. 3, The "Nachlass." Since the transfer of this task to the University of Münster, Sect. 4, Kant's Lectures, has been undertaken. Those on logic and metaphysics (vols. 24–25) have already been splendidly edited by Gerhard Lehmann.

Contemporary Neo-Kantianism. The recent development of Neo-Kantianism, except for innumerable historical studies, is very one-sided: no longer considered as exclusively epistemological, it merely prolongs the metaphysical school. Moreover, a large portion of the present Kant research is covered by the so-called *Problems of Kantianism* (see below). Important studies have been made on the development of Kant's philosophical thought, on Kant as a metaphysician, on his ontology and teachings on science, and on his transcendental deduction.

NON-GERMAN KANTIANISM

The Kantian awakening, in no wise limited to Germany, extended throughout Western philosophy. Its principal initiators were as follows: France was the first to open to its influence, beginning with the eclectic thinker Victor Cousin, who had studied German authors and made several trips to Germany. The relativistic personalist Charles Renouvier then defended a rather personal critical philosophy, which exerted an enduring influence through its impact upon the extreme Idealist Octave Hamelin of the Sorbonne; upon the metaphysician and cofounder of French neospiritualism Jules Lachelier; and upon his pupil, the philosopher of science Émile Boutroux.

English Kantianism

The English-speaking countries, on the other hand, have not seemed disposed to assimilate the critical philosophy as they did Hegelian Idealism. Except for the Scottish religious absolutist Edward Caird (*The Critical Philosophy of Immanuel Kant,* 1889), who was chiefly an Hegelian, there was in Britain at the close of the 19th century only another Scot, the critical Realist Robert Adamson, who was a Kantian. After him, however, can be cited the commentary, published in 1918, of Norman Kemp Smith, producer of the standard English translation of Kant's first *Critique,* and more recently, the remarkable exposition by the Oxford Kantian Herbert J. Paton, *Kant's Metaphysic of Experience* (2 volumes, 1936). Finally, Kantian methods can be discerned today in the later work of the prominent Oxford "ordinary language" philosopher, Peter F. Strawson, entitled *Individuals: An Essay in Descriptive Metaphysics* (1959). Kantianism became known in the United States toward 1840 primarily through the New England transcendentalist and poet Ralph Waldo Emerson—who was not, however, a Kantian himself. The physicist and logician Charles Sanders Peirce owes his Pragmatism largely to Kant's role as a counterweight against Hegelianism. The former southern California philosopher William H. Werkmeister represents a type of Neo-Kantianism inspired by the Marburg school (*The Basis and Structure of Knowledge,* 1948).

Italian scholars, on the other hand, have been vigorously engaged in Kantian studies since the initiative was taken by Alfonso Testa. The chief Neo-Kantian in Italy, however, was the Realist Carlo Cantoni, who took an anti-Positivist stance. Later, in the period from 1900 to 1918, Kantianism was represented by the extreme Realism of the theist Francesco Orestano. A school of Kantian philology has formed at Turin around the erudite Christian Idealist Augusto Guzzo and his journal *Filosofia.* More independent in spirit is the work of the critical ontologist Pantaleo Carabellese, Giovanni Gentile's successor at Rome.

ASSESSMENT OF KANTIANISM

At the present time there does not exist, either in Germany or elsewhere, a purely Kantian philosopher; but all acknowledge the obligation to come to grips with him. Within the four great currents of contemporary thought, however—*i.e.,* in Phenomenology, in the traditionalistic metaphysics, in Existentialism, and in the Positivistic Empiricism of the Vienna Circle and of Analytical philosophy—the predominant attitude toward Kant is negative.

Problems of Kantianism. As far as epistemology is concerned, the critical philosophy constitutes a theory of science that agrees with current trends; for science must have a base that is empirical though also real. On the other hand, the transcendental or a priori is implicated; and severe complications ensue whenever the question is posed whether a type of apprehension can be acquired apart from experience that conveys, however, some new and genuine knowledge — whether, in short, synthetic a priori judgments can be made. Significantly, the founder of Phenomenology, Edmund Husserl, came back to the fold of Kantian transcendentalism after previously opposing it bitterly. As against the Kantian position, Empiricism entirely rejects the possibility (and even the meaning) of the synthetic a priori and, robbed thereby of everything traditionally regarded as the subject matter of philosophy, directs its philosophical inquiries principally to the study of language. The foremost recent analyst of language, however, the pioneering philosopher Ludwig Wittgenstein, imposed upon philosophy the obligation to limit reason (or the transcendental element in knowledge) — a semi-Kantian position, which he nonetheless later renounced. As for Existentialism, one of recent Germany's foremost philosophers, Martin Heidegger, has presented in his ***Kant und das Problem der Metaphysik*** (1929; Eng. trans., ***Kant and the Problem of Metaphysics***, 1962) a highly personalized interpretation. A student of Cohen at Marburg, the metaphysician Nicolai Hartmann, became the harbinger of the Realistic approach, elaborating in his analysis of the metaphysics of knowledge (1921) an ontological relation that he discerned to obtain between two forms of being: between thought and reality. Accordingly, the principles of thought correspond, in his view, to those of reality — a position at odds with Kant (even when he is interpreted as a Realist). Moreover, Hartmann treated the problems of mathematics — so urgent in current philosophy — in a manner again completely opposed to Kant; in particular, he questioned the validity of Kant's a priori intuition (or positing) of the spatio-temporal framework in terms of which man thinks about the world, challenging Kant at this point not merely to accommodate the non-Euclidean geometries (with curved space) that afforded a Realist alternative to the a priori but above all to reflect the distinctly logistic position regarding the foundations of mathematics to which he adhered. Discussion of the status of the thing-in-itself in man's knowledge of the real remained on the philosophical agenda both during and after Hartmann's time, but invoked the same indecision as it always had. At a time when Hartmann was accepting the thing-in-itself almost naïvely, Empiricism (in all its forms) rejected it categorically and attempted to construe the real in terms merely of what Kant had called phenomena. In the realm of ethics, Phenomenologists and Existentialists were dissatisfied with the purely formal character of Kant's ethics—*i.e.*, with its lack of specificity — and substituted a "material" ethic, of concrete duties, which was no less absolute than that of Kant. For their part, Empiricists were only interested in the analysis of expressions of moral judgment, which they reduced to imperative statements that are emotive and aimed at winning adherents.

Objections to Kantianism. It must be acknowledged that Kant has furnished many of the most significant themes that are found in the currents of contemporary philosophy, even in the forms that they still assume today. Yet, as compared with the state of affairs that existed from 1860 to 1918, Kantianism has suffered an impressive decline — though a slight recovery seems to have occurred during the third quarter of the 20th century.

Scientism, formalism, subjectivism

What were the reasons for this decline? In general, since World War I the reduction of philosophy to the philosophy of science has no longer been accepted, though contemporary Positivistic Empiricism has offered hardly any objection to it. The philosophy of science comprises, in fact, only ***one*** problem area, not the entire assemblage of philosophical problems. From this a second objection arises: Kantianism in general is too formalistic to satisfy man's actual inquisitiveness, which inclines more and more toward concrete concerns. Kantianism restricts itself to examining the a priori forms of thought and cares little for its diverse contents. Were this objection pertinent only to the exact sciences, it would not be serious — for these sciences attend to their own applications; but the objection becomes very grave for the field of ethics. For this reason, the objection against Kant's formalism has been raised most passionately against his ethical treatise, the ***Critique*** of ***Practical Reason—as*** by Hartmann, by the Phenomenologist Max Scheler, and by others. This transcendental formalism immediately encounters the further objection of subjectivism — in spite of efforts (from the side of logic) to evade it—*i.e.*, it is blamed for obstructing man's apprehension of the real universality of his Ego, of the thinking subject, and for inexorably impelling the scholar to the view that man's knowledge is merely the product of subjective construction. This subjectivistic transcendentalism, by its intrinsic logic, denies man access to the external world. Not only does it debar him from the world of things-in-themselves but it also prevents him from granting objective reality to phenomena as such, inasmuch as the transcendental source is here viewed as playing a constructive role with respect to experience and the phenomenon.

These three major objections, which stand out in the midst of many criticisms of minor details, recur constantly in the Kantian literature of the past quarter of a century. The result of these objections, as far as the evaluation of the critical philosophy is concerned, is that it is repudiated in its entirety — without, however, being thereby considered barred by limitation. Kant thus remains, in spite of everything, an inexhaustible source of problems and ideas, comparable in this respect to Plato and Aristotle, with whom he forms the great triad of Western philosophical thought.

BIBLIOGRAPHY. Though the literature on Kant himself comprises innumerable titles, that on Kantianism is relatively scanty. The only work that contains the complete history of Kantianism is ***Friedrich Ueberwegs Grundriss der Geschichte der Philosophie,*** 13th ed. (1953), volumes 3:606–620 and 4:1–128 for the first period and pp. 410–483 for the second. For the first period, there is an abundant literature. Of particular interest for the present purposes are: J.E. ERDMANN, ***Versuch einer wissenschaftlichen Darstellung der Geschichte der neueren Philosophie,*** 2nd ed., vol. 3–5 (1931); ERNST CASSIRER, ***Das Erkenntnisproblem in der Philosophie und Wissenschaft der neueren Zeit***, 2nd ed., vol. 3 (1923); G. LEHMANN, "Kant im Spatidealismus und die Anfänge der neukantischen Bewegung," in ***Zeitschrift für philosophische Forschung,*** 17:438–456 (1963); and two works by H.J. DE VLEESCHAUWER, ***La Deduction transcendentale dans I'oeuvre de Knnt,*** vol. 3 (1937), and ***L'Evolution de la pensée kantienne*** (1939; Eng. trans., ***The Development of Kantian Thought,*** 1962). For the second period, MARIANO CAMPO has begun the history in his ***Schizzo storico della esegesi e critica Kantiana,*** vol. 1 (1959); and summaries have been written by L.W. BECK in the ***Encyclopedia of Philosophy,*** 5:468–473 (1967); and by HERMANN NOACK in his ***Die Philosophie Westeuropas,*** pp. 143–196 (1962). See also the ***Enciclopedia Filosofica,*** new ed., vol. 3, col. 1225, and vol. 4, col. 953 (1969); the article by ERNST CASSIRER on the same subject in the ***Encyclopaedia Britannica,*** 14th ed., pp. 215–216 (1929); W. RITZEL, ***Studien zum Wandel der Kantauflassung*** (1952); HENRI DUSSORT, ***L'École de Marbourg*** (1963); and HEINRICH RICKERT, ***Die Heidelberger Tradition und Kants Kritizismus*** (1934). Some recent works on Kant are reviewed by H.J. DE VLEESCHAUWER in the ***Review of Metaphysics,*** vol. *2* (1957).

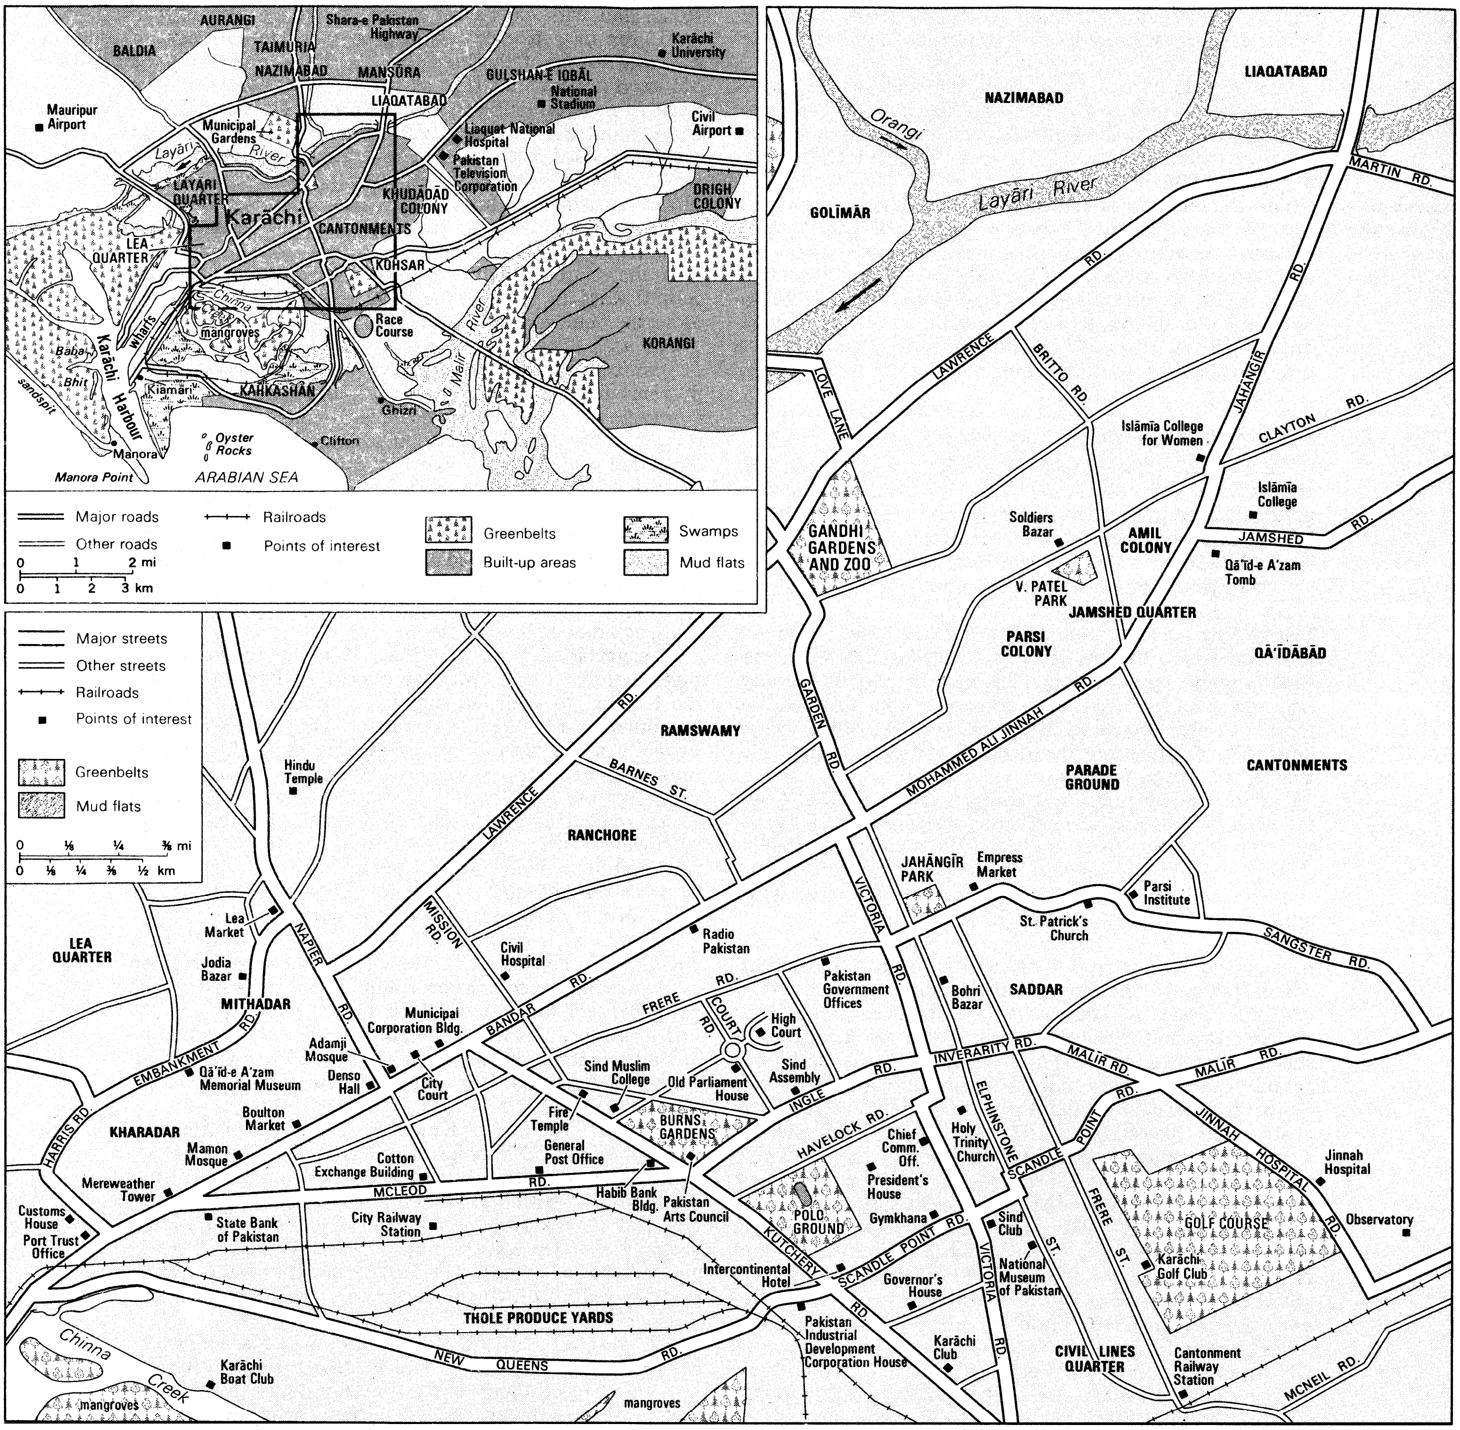
(H.J.deV.)

Karāchi

Karfichi, the principal seaport and the largest city in Pakistan, is located on the coast of the Arabian Sea immediately northwest of the Indus River Delta. It is the capital of the province of Sind as well as the headquarters of the district and division of Karfichi. It is also a major commercial and industrial centre. The city proper covers an area of 228 square miles (591 square kilometres), while the metropolitan area of Greater Karachi spreads out over an area of 560 square miles. The population is about 3,400,000 (metropolitan area).

The city has been variously called Caranjee, Crochey, Krotchey, Currachee, and Kurrachee. All its names are believed to be derived from the Sindhi name of the original settlement that initially stood on the spot — Kalachi-Jo-goth (meaning the village of Kalachi — the headman of the tribe).

The impetus to Karāchi's development originally came from its role as the port serving the Indus River Valley and the Punjab region of British India. The development



The city of KarHchi and (inset) its metropolitan area.

of air travel subsequently increased Karāchi's importance. It is also the port serving the landlocked country of Afghanistan. It is a crowded, bustling, optimistic city whose continued development and preeminence seem assured. (For an associated physical feature, see INDUS RIVER.)

HISTORY

Origins of the port

Karāchi was a small fishing village when a group of traders moved there in the early 18th century from the decaying port of Kharak Bandar nearby. It expanded rapidly, and was already of significance when it was captured in 1839 by the British, who annexed it in 1842, together with the province of Sind. It then became an army headquarters for the British, and also began to develop from a fishing village into the principal port for the Indus River region.

In 1843 a river-steamer service was introduced between Karachi and Multān, about 500 miles up the Indus. Port facilities were improved from 1854 onward. In 1861 a railway was built from Karāchi to Kotri, 90 miles upstream on the right bank of the Indus, opposite Hyderābād. In 1864 direct telegraph communications were established with London and with the interior. With the opening of the Suez Canal in 1869, the importance of Karachi grew, and it became a full-fledged seaport. By 1873 it possessed an efficient and well-managed harbour.

Karachi was connected directly with the hinterland when the railway line was extended from Kotri in 1878 to join the Delhi–Punjab railway system at Multān. In 1886, the Karachi Port Trust was established as the port authority, and between 1888 and 1910 the East Wharf—186,000 feet in length—was constructed. When the Punjab emerged as the granary of India in the 1890s, KarHchi became the region's principal outlet. By 1914, it had become the largest grain exporting port of the British Empire.

After World War I, manufacturing and service industries were installed. By 1924 an aerodrome had been built, and Karachi subsequently became the main airport of entry to India. The city became the provincial capital of Sind in 1936.

Growth after 1947

With the creation of Pakistan in 1947, Karachi not only became the capital and premier port of the new country but a nerve centre for industry, business, and administration. Although Rāwalpindi became the interim capital in 1959, some governmental agencies, including the Public Service Commission, as well as "skeleton" staffs of various ministries, remained in Karachi, which continued to play a role as a multifunctional city serving the entire country.

THE CONTEMPORARY CITY

The setting. *The city site.* Karachi Harbour, on the shores of which the city is situated, is a safe and beautiful natural harbour. It is protected from storms by Kiamāri Island, Manora Island, and Oyster Rocks, which together block the greater part of the harbour entrance in the west.

A low-lying coastal strip runs along the shore of the harbour. Inland, the ground rises gently to the north and east to form a large plain, from 5 to 120 feet above sea level, on which the city is built. The Malir River, a seasonal stream, passes through the eastern part of the city, and the Layāri River, also seasonal, runs through the most densely populated northern section. Some ridges and isolated hills occur in the north and east; Mango Pīr, the highest, is 585 feet high.

The 560 square miles that comprised the Federal Capital Area of Pakistan in 1948 are considered, for all practical purposes, to form the Karāchi metropolitan area. Almost half of the area is occupied by the city and its suburbs, and the surrounding 332 square miles consist of agricultural land and government wasteland.

Climate. Karachi has pleasant weather for the greater part of the year. May and June are the hottest months, when the mean maximum temperature is about 93° F (34" C). Spells of enervating weather occasionally prevail in May and October, during which the temperature shoots up to 105" F (41" C). The coolest months are January and February, during which the mean minimum temperature remains about 56° F (13° C). A biting north wind occasionally blows in these months and the temperature may drop to 40° F (4° C). The relative humidity varies from 58 percent in October, the driest month, to 82 percent in August, the wettest month. The average rainfall is eight inches; most of the rain falls during a total of nine or ten days in June, July, and August.

The city faces some pollution problems. High humidity does not permit evaporation of stagnant water in some places, while fumes from factories and automobiles contribute to air pollution, in spite of land and sea breezes.

Vegetation and animal life. The natural vegetation is scanty. Seaweed rises in tangles, and mangroves grow along some of the shores. Coarse grass, cactus, and castor plants occur on the plains and hills, and date and coconut palms grow in the river valleys.

The common wild animals are wolves, chinkaras (a type of gazelle), hog deers, jackals, wild cats, and hares. Domestic animals include sheep, goats, horses, and cows. Local birds include geese, ducks, snipe (game birds related to the woodcock), cranes, flamingos, and ibis (wading birds related to the heron). There are various types of snakes, particularly cobras, kraits, vipers, and python.

Layout and traditional regions. The most striking aspect of Karachi's layout is the west-to-east parallel alignment of the four arterial roads—Lawrence Road, Bandar Road, Frere Road, and McLeod Road. Beginning at Mereweather Tower in the vicinity of the port, these roads run through the centre of the city. Several roads, such as Napier Road, Kutchery Road, and Garden Road, cut across these arteries from north to south.

The old town

The old town lies near the port, to the north of Bandar Road, and with extensions stretching along the material roads for over a mile; unplanned, it is reminiscent of medieval towns of the Near East or Europe. East of the old town are such districts as the Drigh Cantonment, the Civil Lines (residential areas for senior civil service officers), and the Saddar Bazar. This area is planned on a checkerboard pattern, and shows European characteristics. Beyond this stretch several radial roads, along which recent growth has taken the form of neighbourhood units; each unit is laid out with straight, broad roads connected by smaller streets.

On the map, Karachi resembles a huge spider, with central Karachi forming the body, and the developments along the outer roads forming extended legs.

Land use. The land-use pattern of the city is complex. In the central area, the preponderance of residential property tends to form a matrix within which all other functions are set. There is, however, a marked concentration of commercial buildings at the western ends of Bandar Road and McLeod Road. Wholesale businesses are located in the old town, retail businesses along Bandar Road and in Saddar Bazar, the government offices on Frere Road, near Saddar. The outer areas are dominated by dormitory suburbs and planned industrial areas, interspersed with a scattering of cantonments (military quarters), agricultural tracts, salt works, airports, railway stations, and marshalling yards.

Transportation. *Roads.* The Karachi to Peshāwar highway links the city with the interior of Pakistan, while the Karachi to Zāhedān highway connects it with Iran and other Middle Eastern countries. There are 400 miles of roads in the central area of the city and a far greater road mileage (approximately 1,600 miles) in the outer area. Express roads radiate from the city centre, while feeder roads connect the express roads with local streets.

Railways. Karachi is the terminus of Pakistan's railway system, which mainly serves to transport goods between Karachi and the interior; about a dozen freight trains arrive daily, and about the same number leave. There are also a number of passenger trains, as well as a circular railway that skirts the city on the north and the east, catering to commuter traffic and the transport of goods between the port and the industrial areas.

Air transport. Karachi Airport is a major international traffic centre servicing flights between Europe, the Far East, and Australia; it is equipped with a runway for jet aircraft, and other facilities.

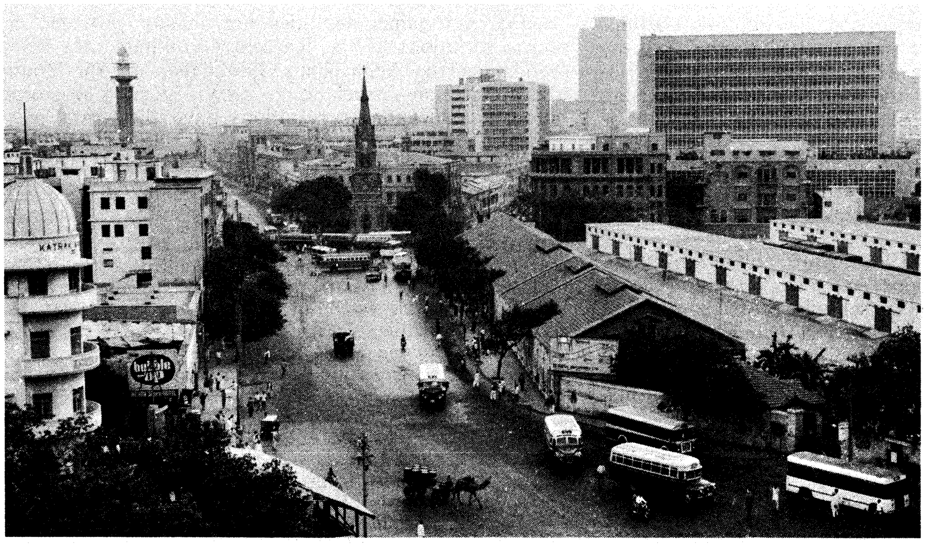
The port. The port of Karāchi is one of the busiest east of Suez. About 1,700 ships visit it annually. There are 19 general cargo berths—15 at the East Wharf and 4 at the West Wharf—with berth lengths ranging from 400 to 600 feet and depths from 30 to 34 feet. Three additional berths are under construction at West Wharf. There is also a separate wharf with 20 berths for shallow-draft craft, as well as oil-tanker berths, dry-dock facilities, and a shipyard.

Demography. In 1961 the population of Karachi numbered about 1,900,000, of which almost 1,100,000 were males and more than 800,000 were females. More than half of the inhabitants were migrants who came to the city after 1947 from India, from other cities in Pakistan, or from other countries.

The migrant population

The average population density in the city proper is 300 persons to the acre, although densities reach from 500 to 700 persons to the acre in some wards. In outlying areas the density is between 50 and 100 persons to the acre.

No ethnic group predominates in the city. Cultural and social activities essentially revolve around religion. Of the total population in 1961, 97 percent were Muslims, almost 2 percent were Christians, and 1 percent Hindus; there are also small Parsi, Buddhist, and Jain minorities. Most of the Muslims derive from Indo-Pakistani stock, except for "Makranis" and "Shiddies," who are also descended from Negro elements, and who originated during the era of the slave trade in the days before British rule, when Karachi was an important slave-trading centre. Some of the members of the Christian minority are of Indo-Pakistani origin, while others are descended from Portuguese or other European groups.



Mereweather Tower on McLeod Road in downtown Karlchi.
Frederic Ohringer — Nancy *Palmer* Agency

Housing. In the mid-1960s only 55 percent of the population possessed their own houses; the remainder lived in rented property. On the average, a family of four or five persons occupied 1.4 rooms. The city proper has old and decayed buildings, occupied by members of the middle and lower income groups. Further from the city centre are new bungalows occupied by richer persons; the outer zone is occupied by workers.

Building types. Karachi has a variety of types of building. The central area contains apartment bungalows, barracks, and multistoried buildings; the outer areas are characterized by bungalows, blocks of flats, and quarters (streets of small houses). Buildings of the British period were constructed with stone in western styles of architecture; other stone buildings in the central city show a blending of Eastern and Western styles, and have towels, domes, pillars, arches, hanging balconies, and rectangular courtyards. Buildings in the outer areas are built of cement blocks, and with few exceptions they show no uniformity in design. Some follow contemporary American design, while others incorporate features of traditional Muslim architecture.

Manufacturing

The economy. In the mid-1960s Karachi had more than 3,000 factories employing almost 113,000 workers, without including about 70 establishments employing 40,000 workers in Lāndhi and other suburbs. Textiles and footwear were the principal items manufactured, followed by such items as metal products, food and beverages, paper and printing, wood and furniture, machinery, chemicals and petroleum, leather and rubber, and electrical goods. Karāchi is also an important centre for handicrafts and cottage industries that produce handloomed cloth, lace, carpets, articles make of brass and bell metal (an alloy of copper and tin), pottery, leather goods, and gold and silver embroidery.

Karāchi handles the entire seaborne trade of Pakistan and, as mentioned, of landlocked Afghanistan. Between 1970 and 1971 total imports accounted for 6,279,000 tons of goods, and exports for 3,157,000 tons.

There are 29 large banks that have branches throughout Pakistan; these include the State Bank of Pakistan, the Habib Bank Ltd., the National Bank of Pakistan, the United Bank Ltd., the Industrial Development Bank of Pakistan, and the Agricultural Development Bank of Pakistan. The city is also the centre of about two dozen insurance companies, which play an important role in the economic development of the country by investing large sums in power development, housing programs, joint-stock companies, government loan securities, and savings certificates.

Karachi has a stock exchange that handles an overwhelming proportion of transactions in government securities and in the shares of most of the important industrial and financial institutions.

The twin bases of the city's prosperity are manufacturing and trade; together they employ 44 percent of the total labour force. Services and professions employ about 42 percent of the labour force, transport 9 percent, and agriculture 1 percent.

Political and governmental institutions. *Administration.* The city is administered by five institutions, the heads of which are appointed by the government. The Karachi Municipal Corporation, constituted in 1852, performs a large number of civic functions affecting more than three-fourths of the population of Greater Karachi. The Korangi-Lāndhi and Drigh-Malir municipal committees were established in 1966 and 1970, respectively, to provide civic facilities to the suburban areas developed after 1947. The Karāchi Cantonment Board, established in 1852, is the administrative body for the areas where the military are quartered. The Karachi Port Trust was constituted in 1886 to administer the affairs of the port, and is entrusted with the development and maintenance of the harbour.

Sources of water supply

Public utilities. The three main sources of the city's water supply are Lake Hāleji, 55 miles away, which is fed by the Indus River; wells that have been sunk in the dry bed of the Malir River, 18 miles away; and Lake Kalri, 60 miles away, which is also fed by the Indus waters. The city uses about 100,000,000 gallons of water a day, with Lake Kalri supplying about 70 percent of the total. Although the city's water mains have a total length of about 280 miles, some of the outer areas, such as Lāndhi, Malir, New Karachi, and Mauripur, still experience an acute water shortage.

The Karachi Electric Supply Corporation is responsible for electricity services. It has four power stations, all located in the city, with a total generating capacity of about 393,000 kilowatts; these stations use natural gas, diesel oil, or both. A nuclear power station has been built at Paradise Point, but in 1972 had not yet begun to function.

Karāchi Municipal Corporation maintains a fleet of vehicles for refuse collection, night soil removal, dog catching, and antimalarial and antifly operations. Sweepers are employed to clean the streets. Sewage is disposed of by two underground drainage systems, and there are two sewage treatment plants, one serving the city proper and the other the outlying areas.

Health and safety. In ***1964*** Karachi proper had 21 general hospitals, as well as five hospitals specializing in tuberculosis, skin diseases, leprosy, and epidemic diseases. There are also child-welfare centres and dispensaries, in addition to three more general hospitals in the suburbs.

The city has about two hospital beds for every 1,000 people.

There are several well-equipped fire-fighting stations; separate fire brigade units are attached to the Railway Department, which is a part of Pakistan's railway administration. In addition, the Port Trust and Pakistan International Airlines (PIA) have services that can be used in emergencies.

The police are administered by the Sind provincial administration; the inspector general of police is assisted by a force of more than 1,100. The city is divided into 40 police districts.

Education. In the early 1960s, Karachi had more than 900 schools, of which about 700 were primary schools and about 200 were secondary schools. More than half of all these are privately run, the rest being run by the government. Among schools established by different religious communities are Karachi Grammar School, St. Joseph's Convent School, and St. Patricks High School, all of which are Christian; a school for the Parsi community; and Sind Madrassa, a Muslim school.

The University of Karāchi

The University of Karachi, the primary institution of higher education, was established in 1951. It has 22 graduate departments in arts and sciences, as well as a graduate school of business administration. Courses in a variety of subjects, including commerce and law, are provided by about 75 colleges affiliated to the university. In addition, there is a medical college, as well as two engineering colleges, a polytechnic institute, a college of home economics, and two teacher-training colleges.

Cultural life. *Cultural institutions.* Pakistan Arts Council is the primary cultural institution in the city; it organizes various cultural functions including art exhibitions, and offers training in music. The Ghanshyam Art Centre and the Bulbul Academy promote Pakistani dancing and other cultural activities.

Karachi does not have well-established theatre, but amateur dramas and variety shows are frequently staged in Katrak Hall. Motion pictures are more popular, and there are more than 50 cinemas.

Karachi has a small museum containing relics of the early Indus Valley civilization and examples of the Greco-Buddhist art of Gandhāra (a region of ancient India in what is now northwestern Pakistan); it also possesses some ethnological collections representing life in different regions of Pakistan.

The library of the University of Karachi is the city's largest, but there are also ten public libraries containing books of a popular nature. Material of a more scholarly nature is to be found in the British Council Library, the American Information Centre Library, and the Liaqat Memorial Library. The departmental libraries of the State Bank of Pakistan, the Pakistan Institute of Development Economics, and the National Archives contain collections of books on economics and on national matters.

The media. Most of the national news agencies have their head offices in Karachi, and some of the larger newspapers are published in the city. Among the latter are *Dawn* and *The Morning News* (both published in English), and *Jang* and *Āghāz* (both in Urdu). There are also three Gujarati and two Sindhi newspapers, as well as several evening papers, biweeklies, periodicals, and journals published in various languages.

Television services were established in 1966, and programs are broadcast for four hours each evening. The Karāchi Radio Station, established in 1948, is equipped with medium and shortwave transmitters; programs include news, music, features, talks, and discussions. External broadcasts are received from the United Kingdom, South and East Africa, Afghanistan, and Middle Eastern and Southeast Asian countries.

Recreation. There is a general shortage of open spaces and parks in Karachi. Of the 19 existing parks, Gandhi Gardens and Burns Gardens are the most famous. There are a number of fine swimming and fishing beaches, such as Paradise Point, Hawks Bay, Sandspit, Manora, and Clifton.

The Karachi Zoo

The Karāchi Zoo is located in the Gandhi Gardens, and contains a varied collection of animals, birds, and reptiles. A 270-acre botanical garden is to be established along University Road.

Sports and games facilities are mostly provided by such associations as the Karachi Gymkhana, the Parsi Gymkhana, the Agha Khan Gymkhana, and the Young Men's Christian Association (YMCA). Various organizations and educational institutions have their own playgrounds. The largest sports area is the National Stadium, which contains playgrounds for cricket, hockey, football (soccer), and tennis. There are also boating, yachting, and flying clubs.

(Z.A.K.)

Karakoram Range

A mountain system of Central Asia, the Karakoram Range (Turkish: "Black Rock Mountains") extends some 300 miles from the easternmost part of Afghanistan to the southeast. The borders of the Soviet Union, China, Pakistan, Afghanistan, and India all converge within the system.

Physiography. The Karakorams consist of a group of parallel ranges with several spurs. Only the central part is a monolithic range. The width of the system is about 150 miles; the length is increased from 300 to 500 miles, if the easternmost extension—the Ch'iang-ch'en-mo Shan (called Chāng Chenmo in Jammu and Kashmir) and Pantong ranges of the Tibetan Highlands—is included. The Karakoram Range is one of the highest mountain systems in the world; its average height is around 20,000 feet, and four peaks exceed 26,000 feet, the highest being K2 (Godwin Austen, Chogori, Dapsang) at 28,250 feet (8,611 metres). K2, the second highest peak in the world, was first climbed by an Italian expedition in 1954; the remaining high peaks were climbed in 1956–58.

Glaciation

The topography is characterized by craggy peaks and steep slopes. The southern slope is long and very steep, the northern slope steep and short. Cliffs and taluses (great accumulations of large, fallen rocks) occupy a vast area. In the intermontane valleys, rocky inclines occur widely. Transverse valleys usually have the appearance of narrow, deep, steep ravines. Because of their great height, the Karakorams are characterized by heavy glaciation, the total glaciated area amounting to 6,900 square miles (17,800 square kilometres). Glaciers occur on both slopes, but glaciation is more developed on the southern, more humid slope. The snow line on the southern slope of the Karakorams begins at an altitude of 15,400 feet; glaciers begin at 9,440 feet. On the northern slope the figures are 19,400 feet and 11,580 feet, respectively. Often, glaciers combine to form complex glacial systems occupying not only valleys but also the watersheds. Seasonal thawing of the glaciers give rise to serious floods on the southern slopes. Traces of ancient glaciation are evident at altitudes of 8,500 to 9,500 feet.

The Karakorams serve as a watershed for the basins of the Indus and Tarim rivers. The formation of river channels, for the most part, occurs in the high-altitude zone, the melted waters of seasonal and perpetual snows and glaciers being principal feeders of the rivers. Groundwaters accumulate in the rocky taluses and contribute to a more even flow throughout the year. During winter, huge layers of ice are formed.

Geology. Structurally, the Karakorams originated from folding in the Cenozoic Era (up to 65,000,000 years ago). Granites, gneisses, crystallized slates, and phyllites dominate the geological composition. To the south and north, the crystal centre of the Karakorams is edged by a region of limestones and micaceous slates of the Paleozoic and partly of the Mesozoic eras (from 190,000,000 to 570,000,000 years old). To the south the sedimentary rock is sometimes cut by intrusions of granite. Certain areas expose slate at the surface, which yields more rapidly to weathering.

At the end of the Mesozoic Era (65,000,000 years ago), the region of Karakorams was characterized by great structural changes, and the Karakorams emerged as the result of intensive, geologically recent upheavals. Today there is considerable seismic activity in the region, individual earthquakes exceeding nine points on the ten-point Richter scale. Hot springs are found in several areas.

There is also evidence of stannic-tungsten on the northern slopes of the Karakorams and of alluvial gold on the southern slopes.

Climate. The climate of the Karakoram Range is for the most part semi-arid and sharply continental. The southern slopes are exposed to the humidifying influence of the monsoons coming in from the Indian Ocean, but the northern slopes are extremely dry. In the lower and central part of the slopes, rain and snow is precipitated in small quantities; average annual precipitation does not exceed four inches. At altitudes of more than 16,000 feet precipitation always takes a solid form, but, even lower down, in June, snow is not infrequent. At altitudes of around 18,700 feet, the average temperature during the warmest month is lower than 32" F (0° C), and, at altitudes between 12,800 and 18,700 feet, the temperature is lower than 50" F (10" C). Rarified air, intensive solar radiation, strong winds, and great ranges of temperature are characteristic climatic features of the region.

High-altitude vegetation patterns

Vegetation and animal life. The high-altitude vegetation of the northern and southern slopes of the Karakorams is varied. On the northern slope, at altitudes of 7,900 to 9,200 feet on the rocky desert soil, a complex of plant combinations of such species as flowering plants of the genus *Kalidium,* and horsetail (genus *Equisetum)* has developed. Vast expanses, completely devoid of vegetation, are not infrequent. Only at the source of the Yarkand River (Tarim Basin) and its tributaries, up to altitudes of 10,000 feet are there individual thickets of brushwood (mainly barberry) and poplars. In the central part of the northern slope, at altitudes of 8,500–10,200 feet, a desert-steppe landscape is developed, with sparse thickets of coarse grasses and wintergreen. At altitudes of 10,500–11,500 feet, a mountain steppe predominates, and, in places that are most humid and well sheltered from winds, there are prairie steppes. Still higher up are found high-altitude expanses of wintergreen, wormwood, and meadows of desert-like plants. Sparse combinations of wintergreen and prickly herbs of the genus *Acanthus* are located on the coarse soils near the arable-land zone. On the moister southern slopes, more extensive and varied vegetation is found. Valleys up to 10,000–11,500 feet support forests of pine, Himalayan cedar, and, near streams, willows and poplars. Higher up, high-altitude steppes rather like typical alpine meadows predominate.

Notable animals of the region include the snow leopard, wild yak, and Tibetan antelope; in the southern foothills wild asses are also found. There are a great number of pikas and marmots. Among birds, the Pallas sand grouse, Tibetan capercaillie, partridge, ibis white dove, and red brambling are characteristic.

Human settlement. Being centred in an area of very high ranges covered with immense glaciers, the Karakorams are extremely inaccessible. Mountain passes are situated at altitudes of about 16,000 feet and are open only five or six months of the year. Sections along the banks of rivers and lakes are utilized as pasture, and in places, on the southern slopes, agriculture is developed, with two harvests in years when water is plentiful. Apricot orchards are extensive.

Exceptionally severe natural conditions in the Karakorams make life hard for man. An area of almost 80,000 square miles supports a population of only a few tens of thousands of people, mainly Tibetans, who live in villages at altitudes of up to 14,800 feet. Most of the Tibetans are farmers who grow barley, oats, and millet and who breed cattle. Individual groups of Tibetans lead a nomadic or seminomadic way of life and are occupied with the breeding of yaks, *dso* (a hybrid of the yak and common cow), sheep, and goats; they also do some hunting. Other peoples include the Baltis and Ladkhis, who, like the Tibetans, are Tibetan Buddhist. Also there are the Burishki people, who speak a language that occupies a singular place in linguistic classification. The Burishki are Muslims and are settled on farms,

Kara-Kum Desert

Kara-Kum (Peski Karakumy in Russian, in the transliteration system of the Akademiya Nauk; Russianized Turkmen *karakumy,* "black sands"; *i.e.,* with vegetation) is the name given to a great sandy desert comprising about 60 percent of the area of the Turkmen Soviet Socialist Republic (*q.v.*) of the U.S.S.R. Another, smaller desert in the Soviet republic of Kazakhstan near the Aral Sea is called the Priaralskiye Karakumy.

The Turkmen Kara-Kum. The Turkmen Kara-Kum is approximately 100,000 square miles (300,000 square kilometres) in area. It is bordered on the north by the Sary-Kamysh Depression (Sarykamyshskaya Kotlovina), on the northeast and east by the Amu Darya (River) Valley, and on the southeast by the Karabil (Vozvyshennost) Highlands and Badkhyz semidesert. In the south and southwest the desert runs along the foot of the Kopet-Dag Mountains (Khrebet), and in the west and northwest it borders the course of the ancient valley of the Uzboy River. It is divided into three parts: the elevated northern Zaunguzskiye Karakumy; the central, low-lying Central Kara-Kum (Tsentralny Nizmennye Karakumy); and the southeastern Kara-Kum, through which runs a chain of salt-marshes. Across the border of the Zaunguzskiye and Central Kara-Kum passes the Unguz chain of saline, isolated, wind-eroded hollows.

The relief of the Turkmen Kara-Kum is quite sharp and clear-cut and reflects its origin and historical development. The surface of the Zaunguzskiye Karakumy has been eroded by violent winds. The plain of the Central Kara-Kum runs from the Amu Darya to the Caspian Sea along the same incline as the river. The height of wind-accumulated, half-overgrown, sand ridges ranges from five to 100 feet, depending on age and wind velocity. Somewhat less than 10 percent of the area consists of crescent-shaped dunes (*barkhany*), some of them 250 feet or more in height. There are numerous hollows of clay deposits, called *takyr,* and saline land formed by the evaporation of subsoil waters.

Climate of the Kara-Kum

The climate of the Turkmen Kara-Kum is continental, with long, hot summers and unpredictable but warm winters. The average temperature in July in the north and along the shore of the Caspian Sea ranges from 79° to 82° F (26" to 28° C), and in the central part of the Central Kara-Kum from 86° to 90° F (30" to 34° C). In January, average temperatures are 25" F (−4° C) in the north and 39° F (+4° C) in the south, but temperatures may fluctuate from as low as −4° F (−20" C) to +97° F (+36° C) within a 24-hour period. The average annual rainfall varies from 2.75 inches (70 millimetres) in the north to six inches (150 millimetres) in the south. Precipitation occurs mainly in autumn and early spring, more than half of it between November and April. There is little snow. The prevailing northeasterly and northwesterly winds are mild.

The vegetation is quite varied, consisting mainly of grass, small shrubs, bushes, and trees. The humid early spring permits the widespread growth of ephemeral plants—the main animal fodder—while in the barchan dune areas the typical vegetation consists of cereals, the wormwood shrub, and trees of the species *Ammodendron conollyi*. The most common bushes are species of *Astragalus*, *Calligonum*, and the salt-tree (*Salsola* richteri). In regions of deep underground water, the white haloxylon is the most typical plant, but in regions where water is nearer to the surface, the black haloxylon occurs. The vegetation of the Turkmen Kara-Kum can be used as hay in winter by camels, sheep, and goats.

Animals are not numerous, but they are of many kinds. The insects include ants, termites, ticks, beetles, darkling beetles, dung beetles, and spiders. Various species of lizards, snakes: and turtles also occur. The most common birds are skylarks, haloxylon (sacksal) jays, wagtails, and desert sparrows. Among the rodents are sand eels, gophers, and jerboas. The tolai hare, the hedgehog, barchan cat, and corsac fox and also the dzheran (a gazelle) usually live near takyr soils.

The population is composed of Turkmen, among whom some tribal distinctions have been preserved. Formerly nomadic, they settled into agricultural pursuits or fishing on the shores of the Caspian. Collective and state farms have developed permanent settlements, with gas and electricity. Cattle-raising brigades care for the socialized livestock. The development of oil, gas, and other industries has brought new settlements, populated by diverse nationalities. From 1939 to 1970 the population doubled.

Irrigation and economic development

Irrigation has made the desert suitable for the raising of livestock on a large scale, especially astrakhan sheep. The Karakum Canal (Karakumsky Kanal) has brought water to Southeastern Kara-Kum, the southern border of the Central Kara-Kum, and along the foot of the Kopet-Dag Mountains, where fine-fibred cotton is now grown in the oasis areas. The proposed extension of the canal to the shore of the Caspian Sea will permit the cultivation of the subtropical arid regions.

Intensive economic development after World War II brought an industrial revolution to the Kara-Kum. Factories, gas lines, railroads, and highways have changed the face of the region. Hydroelectric stations are under construction at Takhiyatas and Tyuyamuyun.

The Priaralskiye Kara-Kum. 'The Priaralskiye Kara-Kum in Kazakhstan is northeast of the Aral Sea and south of the Turgay Lowlands (Turgayskaya Dolina). Its altitude ranges from 174 to 410 feet above sea level. Its white and yellow sand contains only quartz and a little magnetite. Winding regions of half-exposed sand alternate with broad, flat-bottomed depressions and areas of grass. Here and there shallow reserves of fresh underground water occur, enabling the sands to be used as year-round pasture for sheep, goats, cows, horses, and Bactrian camels. (B.A.F.)

Kara Sea

A marginal sea of the Arctic Ocean, the Kara Sea (Karskoye More in Russian; spelled Karskoje More in the transliteration system of the Akademiya Nauk) is located between the coast of the West Siberian Plain and the Novaya Zemlya islands on the west, Franz Joseph Land on the northwest, and the Severnaya Zemlya islands on the east. In the north it is connected with the Arctic Basin, in the west with the Barents Sea, and in the east with the Laptev Sea. It has an area of about 340,000 square miles (880,000 square kilometres). The average depth is 417 feet (127 metres), the maximum depth 2,034 feet (620 metres), and the volume of water 27,000 cubic miles (113,000 cubic kilometres). The greatest extent of the sea from southwest to northeast is about 900 miles; the greatest width in the northern part is about 500 miles. Several deep inlets cut into the low, gently sloping bank of the mainland. The largest rivers flowing into the sea are the Yenisey, Ob, Pyasina, and Kara, from which the sea derives its name. The rivers have a total volume of about 310 cubic miles a year, 80 percent of which is in the summer.

Numerous islands dot the sea, totalling about 4,000 square miles in area. They are concentrated primarily in the northern part and include the Minina Islands, the Nordenshelda Islands (more than 70 islands), and others. The islands are diverse in origin and landscape. Some are mountainous, and the mountains on the islands of Vaygach and Novaya Zemlya seem to be a continuation of the Urals. In the mountains of Severnity Island, Novaya Zemlya, Franz Josef Land, and Severnaya Zemlya lie iceberg-calving glaciers. Their shores are steep and broken by fjords. Other islands—Ushakova and Shmidta, for example—are completely covered by icy domes. There are many low-lying, sandy islands.

Physical characteristics. The Kara Sea lies on the Siberian Shelf; thus, about 40 percent of it is less than 160 feet deep, and only 2 percent is more than 1,600 feet deep. The shelf is cut in the north by two wide, deep-sea troughs—the Svyatory Anny along the eastern shore of Franz Joseph Land, with a depth of 2,034 feet, and the parallel Voronina Trough, some 180 miles to the east, with a depth of 1,475 feet. Along the eastern shores of Novaya Zemlya stretches the Novozemelskaya Trough, 650–1,300 feet deep.

Geologically, the Kara Sea is one of the youngest. It formed as a result of deglaciation during the last Ice Age, traces of glacial ice being found under a thin layer of sediment—brown, gray, and blue silts in troughs and deepwater hollows and sandy silts on underwater heights and shallows. Rocky soils are found in the northeast part of the sea. There are also sandbars and sandy mainland shores.

Salinity

Salinity varies greatly: near the mouths of the Ob and the Yenisey it is 10–12 parts of salt per 1,000 parts of water; at Cape Zhelaniya it rises to 30; and at Franz Joseph Land it reaches 33. In the southwestern areas, salinity of the surface waters fluctuates from 20 to 25 parts per thousand, rising toward the southern straits to 30–31. The upper layer of water is very fresh as a result of river inflows and summer thawing. This freshwater layer could reach a thickness of 63 inches (160 centimetres)—the greatest of the whole globe.

Currents move in two slow counterclockwise rotations in the southwestern and northeastern parts of the sea. The tides are primarily twice a day. Tidal influence is from the Barents Sea and the Arctic Basin, the high–low tide range reaching as much as 2.5 feet.

Climate. The climate is severely Arctic. The polar night (period during which the sun does not rise above the horizon) lasts three to four months of the year. Air temperatures below 32" F (0° C) prevail in the north nine to ten months a year and in the south seven to eight months. The average temperature in January is from −18" to −4° F (−28" to −20" C), and the minimum is −51° F (−46" C). In July, averages are from 30° to 43° F (−1° to 6° C), with a maximum of 61° F (16" C). In the winter there are frequent gales, and snowstorms and, in the summer, snow, snow squalls, and fogs. For most of the year the sea is covered with ice. In unfavourable years, summer ice occupies almost the entire sea; in other years, considerable expanses of open water are found.

The water masses of the Kara Sea are extremely cold

Water temperatures

and stratified. Water masses with a temperature below 29.3" F (−1.5" C) predominate, and only in the troughs penetrating from the Arctic Basin are found warm Atlantic waters, at depths of 500–650 feet and at temperatures up to 36.5" F (2.5" C). In the winter the water temperature averages 29.1" F (−1.6" C); in the summer it reaches 43" F (6° C) in the southwestern part of the sea and 36" F (2" C) in the north.

Economic activity. Fish having commercial significance include cod, salmon, and sturgeon. Mammals include the seal, sea hare, white whale, walrus, and polar bear.

The Kara Sea is on the Soviet Northern Sea route. The main port is Dikson. Seagoing vessels also call at the towns of Igarka and Dudinka on the Yenisey. Timber, building materials, furs, and foodstuffs are the most important cargoes. Since the 1960s the importance of the Kara Sea route has increased in connection with the discovery in the Ob–Yenisey region of large deposits of oil and natural gas. (Y.G.N./A.O.S.)

Kármán, Theodore von

One of the great research engineers of the 20th century, Theodore von KBrmBn pioneered the use of mathematics and the basic sciences in aeronautics and astronautics, as well as in other fields of technology in which, until then, progress had been achieved mainly empirically. He made a lasting impact on the world as a scientist, teacher, research organizer, and promoter of international scientific cooperation.

By courtesy of the California Institute of Technology. Pasadena

von Kármán.

The third of five children, he was born to Maurice and Helene von KBrmBn in Budapest, Hungary, on May 11, 1881. Probably the best known of his ancestors is Judah Low ben Bezalel, the "Exalted" Rabbi of Prague, a friend of the astronomer Tycho Brahe, and himself a famous 16th-century scholar, who was credited with creating an automaton called the Golem of Prague. Von Kármán's father, a professor at the University of Budapest and Commissioner of the Ministry of Education, reformed the secondary school system of the country and founded the Minta (Model) Gymnasium, which his son attended, as did the atomic physicists George de Hevesy and Leo Szilard. Von KBrmBn showed a natural mathematical facility at an early age and was well on his way to becoming a child prodigy when his father, fearing that he would become a mathematical freak, guided him toward engineering.

On completing his undergraduate studies in 1902 at the Royal Polytechnic University in Budapest, he decided to pursue his engineering career in the academic world, which would enable him to fulfill his wide scientific interests and to practice the art of teaching, which his father had inspired in him. In later years, he was delighted when engineers to whom he had imparted his scientific attitude and methodological approach acknowledged him as their teacher.

Between 1903 and 1906 he served on the faculty of the Polytechnic University and as consultant to the principal Hungarian engine manufacturer. The research he conducted on the strength of materials prepared the way for important later contributions to the design of aircraft structures. He was awarded a two-year fellowship to the University of Gottingen, Germany, to obtain a doctor's degree, but before completing it he went to the University of Paris. There, after an all-night party, a friend suggested that, instead of going to sleep, they watch the French aviation pioneer Henri Farman fly his machine. Farman successfully completed a two-kilometre (1¼-mile) course, unknowingly providing the inspiration for the young man who was to become a founder of the aeronautical and astronautical sciences.

Shortly thereafter, Ludwig Prandtl, a pioneer of modern fluid mechanics, invited von Kármán to return to Göttingen as his assistant on dirigible research and to complete his degree. The environment at the University was admirably suited to develop von Kármán's talents. He responded, in particular, to the school of the eminent mathematician Felix Klein, which stressed the fullest use of mathematics and of the basic sciences in engineering to increase technological efficiency. In 1911, he made an analysis of the alternating double row of vortices behind a bluff body (one having a broad, flattened front) in a fluid stream, now famous as Kármán's Vortex Street. The use of his analysis to explain the collapse, during high winds, of the Tacoma Narrows Bridge in the state of Washington, in 1940, is one of the most striking examples of its value.

Kármán's Vortex Street

In 1912, after a short stay at the College of Mining Engineering in Hungary, he became director of the Aeronautical Institute at Aachen (Aix-la-Chapelle), Germany, at the age of 31, remaining until 1930. In World War I he was called into military service and while at the Military Aircraft Factory at Fischamend in Austria led the development of the first helicopter tethered to the ground that was able to maintain hovering flight. After the war, as his international reputation grew, so did that of the institute. Students came from many countries, attracted by the intellectual and social atmosphere he had created. To help re-establish contacts and friendships broken by the war, he was instrumental in calling an international congress on aerodynamics and hydrodynamics at Innsbruck, Austria, in 1922. This meeting resulted in the formation of the International Applied Mechanics Congress Committee, which continues to organize quadrennial congresses, and gave birth, in 1946, to the International Union of Theoretical and Applied Mechanics, with von Kármán as honorary president.

Von KBrmBn never married. His mother and his sister, Josephine, lived with him from 1923 onward in The Netherlands near Aachen and later in Pasadena, California. His sister was his manager and hostess until her death in 1951 in America. Brother and sister were devoted to each other, and her death plunged von KBrmBn into deep depression for several months, during which he was unable to work.

He began travelling widely in the 1920s as a lecturer and consultant to industry. After his first visit to the United States in 1926, he was invited in 1930 to assume the direction of the Guggenheim Aeronautical Laboratory at the California Institute of Technology (GALCIT) and of the Guggenheim Airship Institute at Akron, Ohio. His love for Aachen caused him to hesitate, but the darkening shadow of German Nazism decided him to accept. He never regretted his decision. When Pres. John F. Kennedy presented to him the first National Medal of Science in 1963, he "pledged his brain as long as it lasted" to the country of which he had become a citizen in 1936.

Shortly after his arrival at the California Institute of Technology, his laboratory became again a mecca of the world of the aeronautical sciences. Two years later he became a founder of the U.S. Institute of Aeronautical Sciences, consultant to various U.S. industries and to the government. His personal scientific work continued unabated with important contributions to fluid mechanics, turbulence theory, supersonic flight, mathematics in engineering, aircraft structures, and wind erosion of soil.

His openmindedness was well demonstrated by his involvement in the development of astronautics. In 1936, in spite of the general disbelief in academic circles in the possibilities of rocket propulsion and its applications, he supported the interest of a group of his students in the subject. Within two years the U.S. Army Air Corps sponsored a project at his laboratory on the use of rockets to provide superperformance for conventional aircraft—especially to reduce their distance of takeoff from the ground and from naval aircraft carriers. In 1940, von Kármán, together with Frank J. Malina, showed for the first time since the invention of the black powder rocket in China around the 10th century that it was possible to design a stable, long-duration, solid-propellant rocket engine. Shortly thereafter, the prototype of the famed jet-assisted takeoff (JATO) rocket was constructed. This became the prototype for rocket engines used in present day long-range missiles, such as the Polaris, Minuteman, and Poseidon of the United States armed forces. In 1941, von Kármán participated in the founding of the Aerojet General Corporation, the first American manufacturer of liquid- and solid-propellant rocket engines. In 1944 he became the cofounder of the present NASA Jet Propulsion Laboratory at the California Institute of Technology when it undertook America's first governmental long-range missile and space exploration research program for the U.S. Ordnance Department.

Invention of the rocket engine

When he took leave from the Institute in 1944 to establish in Washington, D.C., the Air Corps Scientific Advisory Group for Gen. Henry H. Arnold, commander of the U.S. Army air forces in World War II, von Kármán could look back on his participation in a number of major contributions to achievements in rocket technology: America's first assisted take-off of aircraft with solid and liquid propellant rockets, flight of an aircraft with rocket propulsion alone, and development of spontaneously igniting liquid propellants of the kind that were to be used in the Apollo Command and Lunar Excursion modules some 25 years later.

His dedication to international scientific cooperation led him in 1947 to propose to the United Nations the establishment of an international research centre for fluid and soil mechanics in the Middle East, which, though unfulfilled, contributed to the development by UNESCO of the Arid Zone Research Project in 1950. He conceived the idea of cooperation among aeronautical engineers of the member nations of the North Atlantic Treaty Organization (NATO) and, in 1951, obtained approval to launch the Advisory Group for Aeronautical Research and Development (AGARD), of which he was chairman until his death. In 1956 his efforts brought into being the International Council of the Aeronautical Sciences (ICAS) and, in 1960, the International Academy of Astronautics. One of the outstanding activities of the academy under his presidency was its sponsorship, in 1962, in Paris, of the First International Symposium on the Basic Environmental Problems of Man in Space, at which for the first time scientists from the United States and the Soviet Union, as well as other countries, exchanged information in this field. Between 1960 and 1963 he led NATO-sponsored studies on the interaction of science and technology.

During his lifetime, laboratories were named after von Kármán at the California Institute of Technology, the Arnold Engineering Development Center of the U.S. Air Force at Tullahoma, Tennessee, and the NATO institute for fluid dynamics at Sint-Genesius-Rode, Belgium. A crater on the Moon has carried his name since 1970.

An appreciation of von Kármán's personality must also take account of his nonscientific talents. He was much interested in poetry and literature and could always supply a story appropriate to any occasion. When the atmosphere became charged with tension in a scientific meeting, he was able to restore balance by drawing on his collection of anecdotes. He had a fantastic capacity for work and left behind him wherever he went a trail of bits of paper covered with calculations. He was an optimist and believed in the future, despite the difficulties in the world at the time of his departure, as he put it, for "the other side of space": he died in Aachen, West Germany, on May 6, 1963.

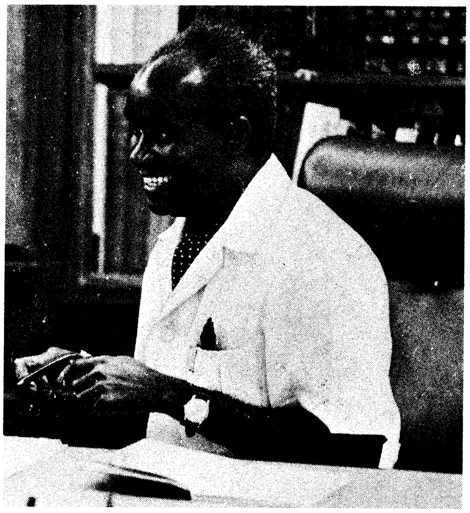
Kaunda, Kenneth

Kenneth David Kaunda, president of Zambia (formerly Northern Rhodesia) and the leading figure in Zambia's independence movement, was born in 1924 in Chinsali, a small town in the north of the country. His father, who was from Nyasaland (now Malawi), eventually became a schoolteacher; his mother, also a teacher, was the first African woman to teach in colonial Zambia. Both taught among the Bemba tribe in northern Zambia, where young Kaunda received his early education, completing secondary school in the early 1940s. Like the majority of Africans in colonial Zambia who achieved some measure of modern middle class status, he also began to teach, first in colonial Zambia, in the middle 1940s in Tanganyika (now Tanzania), and returning to Zambia in 1949.

Camera Press—Publix



Kaunda.

In that year he became interpreter and adviser on African affairs to Sir Stewart Gore-Browne, a liberal white settler and a member of the Northern Rhodesian Legislative Council. Kaunda acquired knowledge of the colonial machinery as well as political skills, both of which served him well when later that same year he joined the African National Congress (ANC), the first major anticolonial organization in Northern Rhodesia. The ANC had its origin in the Federation of African Welfare Societies, a group that had sought to extend African political influence; the group organized into a federation of welfare societies in 1946 and two years later transformed itself into an explicit political agency, the ANC. In the early 1950s Kenneth Kaunda became the ANC's secretary general, functioning as its chief organizing officer, a role that brought him into close contact with the movement's rank and file. Thus, when the leadership of the ANC clashed over strategy in 1958–59, Kaunda carried a major part of the ANC operating structure into a new organization, the Zambia African National Congress.

Role in the African National Congress

Kaunda became president of the new organization and skillfully used it to forge a militant policy against the British plan for a federation of the three central African colonies——Southern Rhodesia, Northern Rhodesia, and Nyasaland. African leaders opposed and feared any such federation because it would tend to place ultimate power in the hands of a white minority of settlers. Kaunda employed the Zambia congress as an instrument for executing what he called "positive nonviolent action," a form of civil disobedience against the federation policy. His campaign had two major results: first, the British government modified the federation policy and eventually agreed to discard it; second, the imprisonment of Kaunda and other militant leaders elevated them to the status of national heroes in the eyes of the masses. Thus, from 1960 on, the nationwide support of Zambia's independence movement was secured, as was too the dominant status of Kenneth Kaunda in that movement.

Struggle for independence

Kaunda was released from prison by the colonial government on January 8, 1960. At the end of that month he was elected president of the United National Independence Party (UNIP), which had been formed in October 1959 by Mainza Chona, a militant who was disenchanted with the older African National Congress. The party enjoyed a spectacular growth, claiming 300,000 members by June 1960. This strength, however, did not prevent severe harassment by the government and especially by the local chiefs who owed their status to their colonial rulers. Yet the government also was quick to recognize the legitimacy of the UNIP leaders among the Zambian populace. Thus in December 1960 it invited Kaunda and several other UNIP leaders to participate in discussions on the status of the three colonies at the Federal Review Conference in London. Early in the following year the British government announced that formal decolonization of Zambia would commence.

The procedures through which Zambia moved toward independence were complicated, however, by the presence of the European settler community of some 77,000 and also an Asian community of 11,000. Both groups sought to delay decolonization, hoping to strengthen their positions. The British government proved indecisive in its handling of this conflict. The leadership of Africans by Kaunda and the UNIP was, however, largely able to allay the deeply felt grievances among Zambians, although there was an outbreak of widespread anti-white rioting in urban areas in 1961. The first major elections leading to final decolonization were held in October 1962. The constitutional proposals upon which the election was based provided the European settlers with a disproportionate share of the votes. Yet the two major African parties—the UNIP and ANC—gained a majority of the votes. The UNIP was the winner, gaining 15 of the 37 seats in the new Legislative Council.

The UNIP success was attributed overwhelmingly to the leadership of Kaunda. He had been astute both in allaying European fears that an African regime would unfairly disregard their interests and at quelling anarchistic militancy among wide sections of the country's African population. It was this same skill that enabled Kaunda to negotiate further constitutional advances, and in 1964 Zambia was granted independence. Like other African leaders, Kenneth Kaunda faced many complex post-independence problems, especially the issue of tribalism. He succeeded in continuing to negotiate on this issue, saving Zambia the trauma of tribal civil war. Nonetheless political violence began to occur, and this, together with pressures on his borders, led him in 1973 to impose single-party rule on his country. In 1976, with a declining economy at home and civil war in Angola, just to the east, he assumed emergency powers.

BIBLIOGRAPHY. For further information on Kaunda, see RICHARD S. HALL, ***The High Price of Principles: Kaunda and the White South*** (1969), a reliable description of Kaunda's political relations with the white-ruled regimes in southern Africa; DAVID C. MULFORD, ***Zambia: The Politics of Independence, 1957–1964*** (1967), the best account of Zambian politics in the years of decolonization; and ***The Northern Rhodesia General Election, 1962*** (1964), the only published work on the Zambian election; ROBERT I. ROTBERG, ***The Rise of Nationalism in Central Africa: The Making of Malawi and Zambia, 1873–1964*** (1965), a study of the emergence of modern anti-colonial nationalism in the British territories of Nyasaland and Northern Rhodesia, noted for its attention to the role of African voluntary organizations, called Native Welfare Associations, in this development; and RONALD SEGAL, ***Political Africa: A Who's Who of Personalities and Parties*** (1961), a valuable compendium of biographical data, party histories, and concise descriptions of key political events.

(M.Ki.)

Kazakh Soviet Socialist Republic

Stretching across the rolling tablelands of the heart of the Eurasian landmass, the Kazakh Soviet Socialist Republic (or Kazakhstan) has been since December 5, 1936, one of the 15 constituent republics of the Soviet Union. It is bounded by the People's Republic of China on the east; by the Kirgiz and Uzbek S.S.R.'s on the south; by the Caspian Sea and a small portion of the Turkmen S.S.R. on the west; and by the Russian S.F.S.R. on the north. It covers 1,049,200 square miles (2,717,300 square kilometres), an area larger than that of Algeria. It stretches about 1,200 miles (1,900 kilometres) from east to west and 800 miles (1,300 kilometres) from north to south. By the mid-1970s, it was the home of 14,170,000 persons. The capital is at Alma-Ata.

The ancient nomadic way of life in this part of the world has been changed greatly during the Soviet period. Industry, particularly the extractive industries, now plays the major role in the economy of Kazakhstan, the republic functioning as an important supplier of raw materials for the entire Soviet Union. Agriculture, however, continues to be of significance. The transformation was accompanied by an influx of settlers—the Kazakhs themselves now form only slightly more than a third of the population. Urbanization, too, is increasing, but many traditional customs have been preserved, side by side with such incursions of modernity as the Soviet cosmodrome, or space-launching centre, Baykonyr, near Leninsk.

For related information, see RUSSIA AND THE SOVIET UNION, HISTORY OF; INNER ASIA. HISTORY OF; TURKISTAN, HISTORY OF; CENTRAL ASIAN PEOPLES, ARTS OF; ALTAIC LANGUAGES; RUSSIAN STEPPE; BALKHASH, LAKE; CASPIAN SEA; and ARAL SEA.

THE LANDSCAPE

Topography. Although it exhibits a variety of relief forms, Kazakhstan is essentially a tableland. Lowlands account for more than a third of the total area, hilly plains and plateaus for nearly half, and mountainous regions make up barely 20 percent. The highest point is Khan-Tengri Peak, on the border between Kazakhstan and Kirgiziya. The lowest point in the whole Soviet Union is found in the Karagiye salt depression of the east Caspian region.

The Caspian Depression

The western and southwestern portions of the republic are dominated by the Caspian Depression (Prikaspiyskaya Nizmennost), south of which lies the Ustyurt Plateau and, on the Mangyshlak Peninsula, the Karatau and Aktau mountains. Farther east, the Ural Plateau and its extension, the Mugodzhar Hills, separate the Caspian Depression from the extensive Turan Plain, while the Aral Sea lies to the south. The rivers that lose themselves in this region have deposited vast amounts of sand, forming the Greater and Lesser Barsuki deserts in the north, the Aral region of the Kara-Kum Desert in the centre, and the sandy Kyzylkum desert in the south. Most of the deserts retain some vegetative cover, fed by subterranean groundwater.

Central Kazakhstan is an undulating upland, having depressions filled by salt lakes, the water of which has largely evaporated. In the north, the mountains reach about 5,000 feet (1,500 metres), and there are similar high areas in the west (the Ulutau Mountains) and in the east (the Chingiz-Tau Range).

In the east and southeast, high mountain massifs are furrowed by valleys. The Altai mountain complex to the east sends three ridges—the Listvyaga, Kholzun, and Tigirek—into the republic, and, farther south, the Tarbagatay Range is a similar offshoot of the Narym-Kolbin complex.

Another range, the Dzhungarian Alatau, penetrates the republic to the south of the depression containing Lake Balkhash. The Tien Shan rises along the southern frontier with the Kirgiz S.S.R., and, to their northwest, the much lower Chu-Ili Mountains and the Karatau Range are penetrated by the Muyunkum Desert.

Drainage patterns. The republic has more than 7,000 streams and rivers, most of them part of the inland drainage systems of the Caspian and Aral seas and lakes Balkhash and Tengiz. The major exceptions are the Irtysh, Ishim, and Tobol, which flow across Kazakh territory and ultimately drain to the Arctic. Many of the other rivers cease to flow in summer or wander through salty lagoons. In addition to the Irtysh in the northeast, the major rivers include the Ural in the west and the Syrdarya in the south.

The Irtysh River

Every year the Irtysh discharges some 988,000,000,000 cubic feet (28,000,000,000 cubic metres) of water into the vast West Siberian catchment area, and the Irtysh-Karaganda Canal will ultimately divert 8 percent of this mass of water into central Kazakhstan. The only major tributary of the Irtysh is the Bukhtarma. The Ural winds its way along a wide, flood-prone valley dotted with lakes; the Syrdarya, rising in the Tien Shan, is vital to Kazakh agriculture, several dams having been built to prevent floods and aid irrigation. Its major tributary, the Arys, irrigates more than 500,000 acres (200,000 hectares).

The rivers of the east and southeast are swollen by melting snow and by glaciers, of which there are more than 1,500, covering more than 800 square miles. Kazakhstan also contains about 48,000 small lakes, most of which have variable water levels, and some of which dry up periodically. The Caspian Sea is the largest inland body of water in the world, and Kazakhstan has 1,450 miles of its coastline. The other large bodies of water are the Aral Sea and Lake Balkhash, followed by Zaysan, Alakol, Tengiz, and Seletytengiz.

Climate and plant and animal life. The climate is sharply continental, especially in the plains and valleys, with hot summers alternating with equally extreme winters. Temperatures fluctuate remarkably: the average January temperature in northern and central regions ranges from 3" to –2° F (–16" to –19° C), and in the south from 23° to 29° F (–5" to –1.4° C), while the average July temperatures range from 68" F (20" C) in the north to 84" F (29" C) in the south. Absolute temperatures have been recorded at –49" F (–45" C) and 113" F (45" C), with desert-sand temperatures occasionally reaching 158" F (70" C). Precipitation ranges from eight to 12 inches (200 to 300 millimetres) in the north and centre to 16 to 20 inches (400 to 500 millimetres) in the southern mountain valleys, although it rises to twice the latter figures in the high ranges and falls to one-fifth in the deserts.

Strong, dry winds are common in the northwest and in the centre of the country, and mountain valleys (*e.g.*, the Dzungarian Gate) are often hit by hurricane-like winds.

The rich, black chernozem soils of the north account for about 7 percent of the total area; farther south they are replaced by fertile chestnut-brown soils and steppe areas (about 26 percent), and these give way to infertile alkaline soils (35 percent) consisting of sands and saline clays; there are also saline solonchak soils. Wind-blown loess soils are found in the Dzhambul and Chimkent regions. Kazakhstan has 74,000,000 acres (30,000,000 hectares) of arable land, with cultivation most highly developed on the chestnut-brown soils of the northern steppes. Other cultivated areas fringe the mountains on the south and east, and, where irrigation and reclamation are feasible, extend along river valleys into the deserts.

Plant life

Steppes and deserts dominate the landscape, the vegetation of the latter including wormwood and tamarisk. Wormwood is also found in the drier steppes, along with feather grass. The wooded area is very small (about 3 percent of Kazakh territory).

The fauna of Kazakhstan includes 155 mammal species, including antelope, elk, and, in the mountains, wolf, bear, and snow leopard. Ermine and sable have commercial importance. The rivers and lakes contain many fish species, including carp, perch, pike, and white salmon, and sprats and trout have become acclimatized. The fishing industry also makes use of the sturgeon, herring, and roach of the Caspian.

The human imprint. Kazakhstan's varied historical heritage has given rise to distinct regional patterns of settlement. Large villages, centres of collective and state farms (kolkhozy and sovkhozy, respectively) characterize the northern steppes, forming green oases separated by wheat fields, often situated along a stream or on a lake shore. The more arid steppes, semideserts, and deserts also contain large villages, housing the state farms of sheep breeders, while *chabany*, or herdsmen, live in temporary settlements made up of yurts, tents made of felt. The foothills are fringed by a string of village settlements, clustering along highways and surrounded, in the north, by fields of wheat and sugar beets and, in the south, by orchards, vineyards, and fields of melons.

Urban settlements are of two types: older communities such as Alma-Ata, Semipalatinsk, Petropavlovsk, and Uralsk, which have one- and two-storied houses and whole districts of modem multistoried buildings; and entirely new, planned towns such as Karaganda, Ust-Kamenogorsk, and Rudny, with wide, straight thoroughfares, tail buildings, and fringing industrial areas.

THE PEOPLE

The Kazakh S.S.R. in 1975 was made up of 19 regions, including 82 cities and 183 semi-urban settlements, with a total population estimated at 14,170,000.

The Kazakh people—Muslims, who speak a Turkic language but are Mongol in physical type—were never the exclusive inhabitants of Kazakhstan, and at the 1970 census they made up only about 33 percent of the total population; Russians constituted 42 percent, Ukrainians just over 7, and Germans (deported from the Soviet west to Central Asia in 1941) nearly 7. The remainder consisted of small percentages of Tatars, Uzbeks, Belorussians, Uighurs, Dungans, Koreans, and others. At the census of 1970, slightly more than half of the total population (but only about 26% of Kazakhs) lived in urban areas.

Immigration

Around 400,000 Russians arrived in Kazakhstan before 1897. Some Uighur and Dungan settlers (both Muslim) also appeared there in the last third of the 19th century (after Russia conquered Kazakhstan) and settled in the south and in the Alma-Ata and Taldy-Kurgan regions, to the east. Some Uzbeks and Kirgiz also inhabited the Chimkent and Dzhambul regions in the south. The main immigration, however, took place in the first third of the 20th century. More than a million had come to the area by 1916 and remained. Large numbers of Russians, Ukrainians, Belorussians, Mordvins, Germane, Bulgarians, Poles, Jews, and Tatars, most of them non-Muslim, moved in, first from the tsarist and then from the Soviet west. Koreans were transported by Joseph Stalin's orders from the Soviet Far East to Central Asia. Immigration by additional settlers occurred mainly between 1954 and 1956, as a result both of industrialization and of the Virgin and Idle Lands program.

The population is very unevenly distributed, with highest densities in the developed agricultural regions of the north and southeast. Since World War II, as a consequence of rapid industrialization, there has been a great movement to the urban areas. This process occasioned an urban housing problem, which was attacked by the development of a building industry, using industrialized methods, and an intensive regional planning program (see below Housing, *health*, and recreation).

A notable feature of the urbanization process has been the fact that it involved an influx of people from other republics rather than a movement (of young people, for example) from the countryside. Major factors in this respect have been the virtual monopolizing of urban and industrial employment by Russians and other outsiders and, to some extent, the modernization of agriculture, which demands skilled, well-educated manpower. During the mid-1950s, there was even an exodus from the towns to the Virgin Lands areas.

Like its neighbouring Central Asian republics, Kazakhstan has one of the highest rates of natural increase in the Soviet Union. This approximates 16.7 per 1,000 persons, with a very high birth rate (23.2 per 1,000) offset by a low mortality rate (6.5 per 1,000). In their republic, Kazakhs alone increased by 52 percent between 1959 and 1970.

THE ECONOMY

During the Soviet period, the economy of Kazakhstan has become characterized by industry and mechanized agriculture, and the republic acts as a major supplier of raw materials for other parts of the Soviet Union.

Resources. The development of the economy has been determined largely by the availability of natural resources. More than 90 different minerals have been discovered in the republic. Copper, in central Kazakhstan and the Aktyubinsk ***oblast;*** lead, zinc, and silver in the Rudny Altai, the Dzhungarian Alatau, and the spurs of the Karatau; tungsten and tin in the Kolbin Ridge and the southern Altai; chromite, nickel, and cobalt in the Mugodzhar Hills; titanium, manganese, and antimony in the central regions; vanadium in the south; and gold in the north and east are the most important.

Mineral wealth

Iron ore is worked in the Karaganda and Kustanay ***oblasti,*** and an extensive iron-ore basin has been prospected in the east; phosphorite deposits lie beneath the Karatau Mountains, and borates and other salts are worked in the deposits at Inderborsky. The leading coalfields lie in the Karaganda, Turgay, Ekibastuz, and Maykuben basins, while the Mangyshlak Peninsula and the Caspian Depression are promising regions for oil and gas. The republic also contains other reserves, ranging from asbestos to molybdenum, while its building materials include marble and limestone.

Fuel and electrical power resources are estimated at about 114,500,000,000,000 tons of conventional fuels and a yearly potential of 177,300,000,000,000 kilowatt-hours of electricity generated by waterpower.

Industry. Industry is now the leading branch of the Kazakh economy, though it engages less than one-tenth of the indigenous Kazakhs, most industrial manpower being supplied by Russians and other Slavs. Cast iron, steel, rolled metal, cement, and mineral fertilizer are manufactured, as well as consumer goods. There are steelworks in Temirtau and Karaganda. Kazakhstan's nonferrous industry, concentrated in the east, holds first place in the Soviet Union for lead production and second for copper.

Fuel production is on the increase; the main coalfields are still located in the Karaganda Basin, although production at Ekibastuz is expanding. The discovery of petroleum deposits in the Mangyshlak Peninsula stimulated oil production from the late 1960s onward.

The building industry is vital, and prefabricated construction has become as important as traditional methods. Manufacturing was stimulated during World War II, and Kazakhstan's plants now range from the automatic press factory at Chimkent to the X-ray equipment centre at Aktyubinsk.

Meat-packing plants are widespread; creameries are found chiefly in the north and east, and sugar refineries in the Alma-Ata, Dzhambul, and Taldy-Kurgan ***oblasti.*** Grain milling, brewing, and wine making are also important, as are fruit- and vegetable-canning plants. Newer industries include a synthetic-fibre plant at Karaganda and pharmaceutical manufacturing at Chimkent.

Agriculture. Kazakhstan has 460,000,000 acres (190,000,000 hectares) of land suitable for agriculture, and about three-quarters of this is used for pasture. About 20 percent is arable land, and the rest is made up of hayfields and relatively small portions of fallow land and land under orchards and vineyards. Agriculture still occupies almost half the population, and the republic in 1975 had about 1,800 state and about 410 collective farms, most of the former in the central and northern regions, and the latter in the south and east. Grain-growing state farms represent more than a third of these farms, and another third are occupied in sheep raising. By the mid-1970s, the republic contained some 7,945,600 head of cattle and additional large numbers of sheep, goats, pigs, and poultry. In 1974, 1,127,000 tons of meat, 4,633,000 tons of milk, more than 2,630,000,000 eggs, and some 116,000 tons of wool were produced.

Arable farming, not introduced till the 1880s, is now very important, with grain crops (20,350,000 tons in 1974) alone accounting for almost two-thirds of Kazakhstan's gross agricultural output. The republic is also a leading Soviet producer of fodder and industrial crops, potatoes, vegetables, and melons. The principal grain-producing areas are the rolling plains of the north, which produce up to a third of all wheat grown in the Soviet Union. In the south, fruits, vegetables, melons, sugar beets, rice, and grapes predominate.

Granary regions

Transportation. The great distances, scattered industrial centres, and developing extractive industries of Kazakhstan mean that transportation plays a critical role. By the early 1970s, the total amount of freight hauled approached 159,000,000,000 ton-miles (232,000,000,000 ton-kilometres) annually. Forty percent of this total was intra-republic traffic, though much more freight is shipped out of Kazakhstan than is brought in. Coal, iron ore, and grain, as well as metal, machinery, and livestock products, are exported, and timber, oil products, machinery, and other equipment are imported.

The railways take almost 85 percent of the total freight turnover, and the track length, at about 8,749 miles (14,080 kilometres), approximates to a density of 11.9 miles per 1,000 square miles (7.4 kilometres per 1,000 square kilometres), with the densest network in the north. Kazakhstan is crossed by long sections of the Trans-Siberian, South Siberian, and Turkistan–Siberian trunk lines, among others. while the Orenburg–Tashkent line serves the west and south. Electrification of the railroads is proceeding.

The total length of the republic's highways is about 69,200 miles, almost half hard-surfaced, and freight hauled on the roads approached 14,929,000,000 ton-miles (21,765,000,000 ton-kilometres) annually by the mid-1970s. The road network includes the 500-mile "Eastern Ring," reaching many areas of the Rudny Altai.

River transport accounts for less than 1 percent of the freight turnover. The Irtysh is the most important waterway, using tugboats and barges.

The bulk of passenger traffic is by air, and air transport provides a vital link between Kazakhstan and the rest of the Soviet Union. There is also an air network connecting regional centres and minor settlements, including individual collective and state farms.

Kazakhstan also possesses an extensive network of pipelines, including the Guryev–Orsk and the Uzen–Zhetybay–Shevchenko oil pipelines. Important sections of Soviet trunk oil pipelines also cross the republic.

ADMINISTRATION AND SOCIAL CONDITIONS

Constitution and government. According to the constitution of the Kazakh Soviet Socialist Republic, adopted on March 24, 1937, all power in the republic belongs to working people, with a socialist system, based on state ownership of the means of production, forming its economic foundation. The highest legislative body, which possesses no real power in the Soviet political system, is the Supreme Soviet of the Kazakh S.S.R., selected (no opposing candidates compete with a single list) every four years and meeting for a short period semi-annually. Its members select a Presidium, composed of a chairman, three deputy chairmen, a secretary, and 15 members, to function between the widely spaced sessions of the Supreme Soviet.

The socialist state

Local government operates through ***oblast,*** district, city, village, and ***aul*** (Kazakh village) soviets, selected for two-year terms.

The republican Supreme Soviet also generates the Council of Ministers, which coordinates and supervises the work of republican ministries and agencies. The chairman of the Supreme Soviet of the Kazakh S.S.R. serves also as a vice chairman of the union-wide Supreme Soviet, which meets in Moscow, and the chairman of the republican Council of Ministers also serves in the Council of Ministers of the Soviet Union.

Political life in the republic is largely determined by the Communist Party authorities in Moscow, acting via the more than 610,000-member Communist Party of Kazakhstan, a republican branch (there is no Kazakh Communist Party as such) of the CPSU (Communist Party of the Soviet Union). Substantially less than half of that membership in 1972 was Kazakh. The Komsomol (Young Communist League) of Kazakhstan has more than 1,600,000 members, including many Slavs and other non-Kazakhs.

The trade unions, with a membership approaching 5,500,000, do not, as in the West, have the right to strike, to picket, or otherwise energetically to protect labour's interests in relations with management.

Education. All forms of education are provided tuition-free, the institutions being supported mainly by turnover and business taxes affecting most employees and enterprises in the republic. A high percentage of literacy —96.9 in 1959 and 99.7 in 1970—is claimed for everyone in Kazakhstan between nine and 49 years of age. Only 2.5 percent of Kazakhs over 60 (391,450 persons), however, had completed any formal schooling beyond grade school.

Multilingual instruction

By the mid-1970s almost 3,400,000 children attended the republic's 10,000 schools of all types annually, while children of preschool age attended about 5,550 kindergartens and nurseries. Languages of instruction are mainly Russian and Kazakh but include minority tongues. In sparsely populated areas, there are boarding-type secondary schools for pupils whose homes are far away. Evening secondary schools for young workers and farmers are widely attended. Vocational education is also available at numerous specialized secondary and technical schools.

Kazakhstan has 148 students in higher education per 10,000 population. Major educational establishments are the Kazakh S.M. Kirov State University, the Abay Teachers College, and polytechnical, agricultural, veterinary, and other institutions in Alma-Ata; and the medical and teachers' institutes in Karaganda. Other regional centres have at least one institution of higher learning. Many Kazakhs study in other Soviet cities. Kazakhs are poorly represented in graduate schools; in 1970, when they constituted 4.35 percent of the total Soviet population, they constituted only 1.7 percent of the total number of graduate students.

In 1970 half the 630,000 high school and college graduates in the Kazakh S.S.R. were women, though among Kazakhs themselves women holding college degrees represented but 2 percent, compared with 4.4 percent of men. At the same time, Russian men and women in the republic holding college degrees were near parity, with 4.4 percent of males and 4 percent of females over the age of nine recorded as having graduated from college.

Scientific research is under the auspices of the Academy of Sciences of the Kazakh S.S.R., founded in 1945. The work of Kazakh scholars on the history of the Kazakh language and literature, on the history and ethnography of the Kazakh people, and in industrial and agricultural research has been widely acclaimed.

Housing, health, and recreation. Urbanization and population growth have been accompanied by a housing boom. Living conditions in heavily industrialized regions such as Karaganda, however, have been said by visitors to be largely substandard, with considerable attendant ethnic friction resulting from overcrowding and competition for adequate living space. As industry has developed, anti-pollution measures have been introduced.

Health standards are high. By 1973 the republic had 35,200 physicians and about 122,500 qualified nurses and other auxiliary personnel. Medical establishments are represented by 1,900 outpatient clinics and hospitals with 169,600 beds, sustained by a wide network of auxiliary centres. Five medical institutions of higher learning had 18,500 students in 1970, training physicians of all specialties. In addition, the republic has 25 medical secondary schools with a student body of about 23,000.

Special attention is given to the care of mothers and children, with about 1,100 infant and maternal care centres in 1973 and more than 16,000 beds in hospitals for expectant mothers.

Sanatoriums of different types are scattered through the republic, the best known being those for treatment of respiratory diseases with koumiss (fermented mare's milk), which are often situated in settings of woods and lakes. Hospitals for rheumatics have been built around mineral springs, and mud cures are also available.

Cultural life and institutions. Cultural traditions are deeply rooted in the distinctive ways of life found in Kazakhstan. This heritage is evident in clothes, food, and interior decoration. The national costume style is best preserved in women's clothes: long, wide dress with a stand-up collar and bloomers gathered at the ankle, supplemented by a kerchief or cotton headdress with a face slit, bracelets, and earrings. Young girls wear both European and such national clothes as wide, white gowns, brightly coloured velvet waistcoats, and beads. Elderly men usually wear wide, white shirts, wide trousers, and woollen or cotton robes. Kazakh homes are decorated with carpets and *q̣oshma*s, felt rugs in gay colours. Kazakh ornamentation (stucco work and wall facing) is widely used in building.

Kazakh literature

Kazakh folklore has roots deep in the past. Abay Ibragim Kunanbayev, a late 19th-century humanist, poet, man of letters, and translator, gave a strong start to the development of modern Kazakh written literature and literary language. Most important to the development of Kazakh as a national written language in the first decades of the 20th century was the work of Aqmet (Ahmed) Baytursin-uli, reformist politician, author, intellectual leader, and editor of the influential Kazakh newspaper Qazaq, published intermittently between 1913 and 1918 in Orenburg and Troitsk. The *aqïn* (bard) Jambil Jabayev gained major recognition from the Soviet authorities as a folk poet.

One of the first Soviet Kazakh playwrights, the academician Mukhtar Auezov, also wrote a long novel, Abay, the first part of which won a Stalin Prize in 1949; on completion, it was awarded the Lenin Prize for literature in 1959. Abay, translated into English and many other languages, is an encyclopaedic but nevertheless somewhat psychological representation of Kazakh steppe life in the late 19th century; its main characters are based upon real historical counterparts. This tradition is actively continued by Kazakh writers and poets as well as through the observance of such traditional Kazakh rites as the recital of folk lyrics and epic poems, the performances of popular comedians, and the competitions between *aqïn*s, any of which events may turn into grand theatrical performances. There is also a large number of modern theatres of all types, including Uighur and Korean musical show houses, as well. as opera, ballet, and a puppet theatre. The Kazakh film studio, founded in 1944, has released many feature films and a great number of documentaries, popular science films. and newsreels.

There are many art schools, and Alma-Ata has a national picture gallery; museums and libraries are numerous, Amateur art, drama, musical groups, and dance ensembles abound.

By 1973, 385 newspapers (146 in the Kazakh language) and 168 magazines (29 in Kazakh) were being published in the Kazakh S.S.R. In the republic, annual book publishing in Kazakh per person rose from 2.4 copies around 1959 to 2.5 copies about 1970, a very small increase in comparison to Kazakh population growth (more than 50 percent) during the same period. Kazakhstan also has a multilingual radio centre, in Alma-Ata, and local broadcasting stations in the regional centres. Many collective farms, state farms, and large plants have their own relay systems. Television relay systems enable the viewers to watch programs from Moscow and Alma-Ata and, in the south, from Uzbekistan and Kirgiziya.

Every year many thousands of families find accommodation at rest homes, tourist and skiing camps, and the Young Pioneer summer camps. Many people also take part in physical culture and sports, including horseback riding, and the network of sports facilities includes a world-famous skating rink at Medeo, near Alma-Ata.

PROSPECTS

The Kazakh industrial profile shows a major emphasis on ferrous and nonferrous metallurgy, the coal, oil, and chemical industries, power generation, and manufacturing. Mid-1970s production under the Ninth Five-Year Plan (1971–75), following the introduction of many new plants, was originally expected to reach 100,000,000 tons of coal, 33,000,000 tons of oil, 5,500,000 tons of pig iron, and about 8,000,000 tons of cement annually; the revised plan for 1975 indicated that only in coal production were original goals likely to be met. About half the total capital investment went into the light and food industries, and accelerated housing construction also reflected a greater emphasis on social welfare generally. In agriculture, the plan anticipated an increase in the average total yearly production of grain (to 26,400,000 tons), and particular attention was also given to sugar beets, vegetables, and melons and to horticulture and viticulture in southern *oblasti*, with emphasis on new irrigation systems.

Cattle and, especially, sheep breeding were to be aided by expansion of pastures, again relying heavily on irrigation. Kazakhstan planned to produce about 1,100.000 tons of meat, 120,000 tons of wool, and 4,400,000 tons of milk annually by 1975, and, except for wool, met these goals by 1974. The most intensive economic development was to take place in the northern, western, and southern *oblasti*. Population increase and a planned rise in the labour force was expected to produce a string of new settlements.

With the rising higher and secondary educational level of Kazakhs, in addition to the increase in the urban segment of the Kazakh population, new and higher expectations became general among this dynamic nationality. The anticipated growth in the Kazakh S.S.K. population resulting from further Slavic immigration appears likely to increase tension over securing employment in white-collar or skilled, desirable (higher paying) jobs as more and more educated and trained Kazakhs from their rapidly growing population insistently enter the industrial and management employment market.

Kean, Edmund

An actor whose megalomania was the source of his histrionic genius as well as the source of his human tragedy, Edmund Kean ranks with David Garrick and Sir Henry Irving as one of the three great English tragic actors of all times.

Though no official record of his birth exists, it has been well established that he was born in London, probably on March 17, 1789, the bastard son of Ann Carey, who described herself as an itinerant actress and street hawker, and Edmund Kean, a mentally unbalanced youth who committed suicide at the age of 22. The story of Kean's upbringing is overladen with legend, much of it the product of his own later fantasies, but during his formative years he was in the charge of Charlotte Tidswell, mistress of his father's eldest brother Moses. Miss Tidswell, then a small-part member of the Drury Lane Theatre Company, had been born to a higher station in life and had accepted her position at Drury Lane as the cast-off mistress of Charles Howard, the 11th duke of Norfolk. Extremely ambitious for her adopted child, she gave him both an early stage training and the rudiments of a general education. Her efforts to provide a disciplined home background were defeated, however, by his willfulness and vagrancy, and for much of his childhood he lived as a waif and stray. At times he was with his mother, who exploited his precocious talents for singing, dancing, reciting, and acrobatics. For a while he was adopted by a wealthy middle class couple, from whom he fled when he discovered that they considered him their social inferior. This behaviour was typical of the boy Kean, who displayed in miniature the character of the man he was later to become. He was as sensitive to slight as he was obsessively anxious for applause, and as self-destructive as he was determined to fulfill his destiny.

Kean, pencil drawing by Samuel Cousins, 1814. In the National Portrait Gallery, London.
By courtesy of the National Portrait Gallery, London

At the age of 15 he was his own master and set out to conquer the stage, the only world he knew. Joining one Samuel Jerrold's company at Sheerness, Kent, for 15 shillings a week he engaged to "play the whole round of tragedy, comedy, opera, farce, interlude and pantomime." The ensuing ten-year struggle was especially hard for him to endure, not only because of the privations of a strolling player's existence but also because it prolonged the agony of his frustrated ambition.

In 1808 Kean married Mary Chambers, a fellow member of his theatrical company, a woman of lower middle class background who had little understanding of his ferocious ego. She bore him two sons, whom he called Howard and Charles, presumably in recognition of Miss Tidswell's relationship with the Duke of Norfolk and his own latent fantasy that he was its offspring. The elder son, his favourite, died a few days after he had at last received the offer of a London engagement.

Style of acting

Kean's long apprenticeship left scars, particularly an addiction to alcohol, which he had come to rely on as a substitute for recognition. But the experience of adversity may well have been essential to his artistic achievement. By the standards of the time, he was unsuited to the great tragic roles. The style then in vogue was artificial, declamatory, and statuesque, and its leading exponent, John Philip Kemble, was an actor of classic good looks, imposing figure, and vocal eloquence. Though Kean had handsome features, notably unusually expressive eyes, he was small, with a voice forceful and commanding rather than melodious. He could never have hoped to compete with Kemble on Kemble's terms, so he had to school himself to become an innovator as well as a virtuoso. On January 26, 1814, when, as Shylock, he made his Drury Lane debut, the measure of his triumph was not to outshine Kemble but to outmode him.

Kean reintroduced a so-called naturalistic style of acting; by rejecting static poses in favour of agility of movement, and beautiful recitation in favour of unleashed passion, he gave the illusion of *being*, rather than *playing*, a character. There was nothing improvised about his performances, however. Technically they were carefully planned, and it was said of his portrayal of Othello that, with its unvarying tones and semitones, rests and breaks, forte and piano, crescendo and diminuendo, it might have been read from a musical score. He permitted himself melodramatic tricks now long regarded as unnatural; his range, moreover, was limited. The poet Samuel Taylor Coleridge said that Kean revealed Shakespeare by "flashes of lightning," but he failed in parts which left no opportunity for the thunder to roll as well as for the lightning to flash. As a grim archvillain in Philip Massinger's *New Way to Pay Old Debts,* Kean was so convincing as a rapacious extortioner that he was reputed to have sent the poet Lord Byron into convulsions; as Romeo he was almost laughably unpersuasive. Nevertheless, he had a profound and lasting influence on the art of acting. In magnetic power and domination of the stage he has, possibly, never been equalled.

Reputation and character

Though Kean remained a passionately admired actor, as a public figure he became increasingly unpopular. Haunted by his fear of losing his position as head of the British stage, he was betrayed into displays of jealousy against potential rivals. At the same time, his fame and fortune (he earned, on the average, $10,000 a year) were insufficient to satisfy his ambitions. Rebelling against his low social status as an actor, he surrounded himself with tavern riffraff and founded quasi-political secret societies dedicated to the "damnation of all lords and gentlemen." The climax came in 1825, when he was successfully sued for adultery with the wife of a city alderman. This provided the pretext for a virulent press campaign, in which he was subjected to hostile demonstrations in England and during his second, and last, tour of the United States. Though he courageously withstood this persecution and eventually quelled it, Kean never recovered from the blow it dealt to his pride. The last eight years of his life were a story of slow suicide by drink and other excesses.

At Covent Garden on March 25, 1833, playing Othello to his son Charles's Iago, he collapsed during the performance—his last. On May 15, he died at his house at Richmond, Surrey, leaving his son only his name. The name proved to be a valuable asset, however, for Charles John Kean (1811–68), who established a reputation as the pioneer of representational realism and who in this sense is considered the forerunner of Sir Henry Irving.

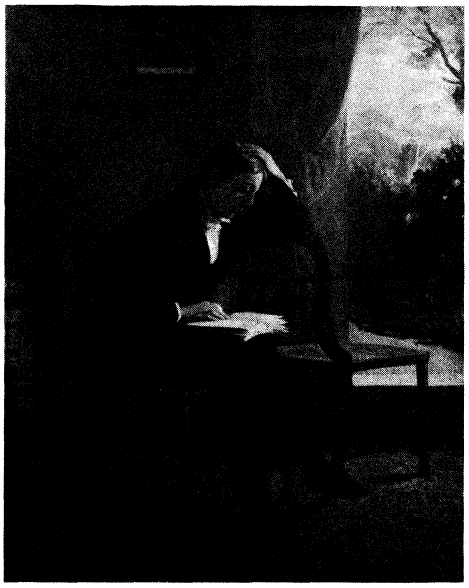
BIBLIOGRAPHY. Early accounts of Kean's life, though inaccurate, are of interest for his contemporary reputation. See especially "BARRY CORNWALL" (B.W. PROCTER), Life of *Edmund Kean* (1835). H.N. HILLEBRAND, *Edmund Kean* (1933), provides the first scholarly examination of the evidence on Kean's parentage, birth, and upbringing. For a fuller documentation, see G.W. PLAYFAIR, *Kean,* 2nd ed. (1950); and the *Letters* of *Mr. and Mrs. Charles Kean Relating to Their American Tours,* ed. by W.G.B. CARSON (1945).

(G.W.P.)

Keats, John

One of the most immediately attractive of English poets and one of the greatest of the 19th century, John Keats devoted his short life to the perfection of a poetry marked by vivid imagery, great sensuous appeal, and an attempt to express a philosophy through classical legend.

Youth. John Keats was born in London on October 31, 1795. His maternal grandfather, John Jennings, was a prosperous man who leased a livery stable and inn and employed Thomas Keats, a west-country man of uncertain origin, who married Jennings' daughter Frances. In 1802, Keats's father took over management of the business; in April 1804 he died in a riding accident. His widow remarried almost immediately. The death of Keats's grandfather, with litigation over his will and the breakup of his mother's second marriage, resulted in the Keats children living with their widowed grandmother at Edmonton, Middlesex. The mother apparently did not return to them for some years.



Keats, oil painting by Joseph Severn. 1821. In the National Portrait Gallery, London.

Keats and his two surviving brothers attended a school at Enfield, two miles away. This liberal and humane establishment became his real home, and he formed a lasting friendship with the headmaster's son, Charles Cowden Clarke. At school, Keats was noted as being "a creature of passion," a fighter, and "not literary," but in 1809, possibly prompted by the return of his mother, he began to read voraciously and won several academic prizes. In March 1810 his mother died of tuberculosis, after Keats had spent his holidays nursing her. Keats's grandmother appointed two guardians and trustees to administer her estate for the benefit of her grandchildren. Shortly afterward Keats left school and was apprenticed to the family doctor, though he still paid frequent visits to Charles Cowden Clarke. He showed no dislike of his chosen career, but he quarrelled with the doctor. His association with Clarke led him, about this time, to compose his first poem, an "Imitation of Spenser." Other poems followed, all derived from popular models, many composed under the influence of a small circle of poetical amateurs.

Schooling

On October 1, 1815, Keats became a student at Guy's Hospital in the Borough of Southwark, London. In four weeks he was promoted to dresser, the equivalent of a junior house surgeon, but poetry had now become a passion with him, and he even threatened suicide if he did not succeed in it. His reading of serious contemporary poets, such as Leigh Hunt and William Wordsworth, led him away from his old circle to find a style of his own. In May 1816 his sonnet "O Solitude" was printed in Hunt's *Examiner.* In July 1816 Keats was examined and made a licentiate of the Society of Apothecaries.

Associations with Hunt. After a summer holiday at Margate with his brother Tom, poetry became his dominant interest, and, although he attended surgical lectures with a view to obtaining membership of the Royal College of Surgeons, he did not complete the course. He now lodged in Dean Street, just south of London Bridge, and, after an evening spent with Clarke, reading a translation of Homer by George Chapman, he returned there to write his first mature sonnet, "On First Looking Into Chapman's Homer." In October 1816, Clarke introduced Keats to Leigh Hunt, who had already printed one of his poems. He was instantly received into Hunt's circle, where he met the historical painter Benjamin Robert Haydon, the young poet John Hamilton Reynolds, and, a little later, Shelley. His literary pursuits could no longer be combined with further medical studies, and Keats himself increasingly felt doubts about his fitness for surgery. In November he moved to lodge with his brothers, and, as he was now 21, he informed his surviving guardian that he intended to abandon medicine for poetry. By this change of plans Keats forfeited his guardian's sympathy, but suppositions that the latter subsequently mishandled or even misappropriated Keat's legacy from his grandmother have no foundation.

First sonnet

On December 1, 1816, Leigh Hunt's article "Young Poets" appeared in *The Examiner,* praising Keats, together with Reynolds and Shelley, and quoting the whole of Keats's sonnet on Chapman's Homer. According to a fellow medical student, "This sealed his fate." He prepared a book of poems for publication, including his latest, "Sleep and Poetry," which reflected his intention to be a poet and nothing else. He bad little money and no employment, but his attractive personality made him welcome everywhere. Strikingly handsome, with reddish-gold hair and classical features, Keats had an alert expression and upright bearing that made him look more than his actual height, which was only five feet. His animation, burning thought, and deeply ingrained sense of humour are best seen in the remarkable letters that he began to write at this time, which still provide the chief authority for his life and his poetic development. His volume of *Poems,* dedicated to Leigh Hunt, was published in March 1817 but was practically unnoticed by the public. Nevertheless, another publisher engaged him to write his first long poem, *Endymion,* planned, according to one account, in friendly competition with Shelley. The poem is based on a subject that had already entered his poems, the Greek legend of the love of the moon goddess, Cynthia, for a mortal, Endymion.

First major work. Keats left London in April 1817 to begin the poem in the isolation of the countryside. The first of four 1,000-line books, into which the poem was divided, was written at Carisbrooke (Isle of Wight), Margate, Canterbury, and Hastings. He returned to write Book II in Hampstead, and there he became intimate with two neighbours, the antiquary and critic Charles Wentworth Dilke and the literary dilettante Charles Brown. Book III was written in September at Oxford, where he stayed with another new friend, Benjamin Bailey, a theological student with whom he had religious and philosophic discussions. Book IV was written partly in London and partly at Box Hill, near Dorking, and was completed in the last days of November. While writing it, Keats formulated many ideas on philosophy and art, mostly expressed in letters to Bailey. An illness mentioned in these letters may have been venereal.

In the winter of 1817–18, while leading an intensely active social life, Keats met William Wordsworth. who was visiting London. Though hardly wavering in his admiration for Wordsworth's poetry, he was disappointed by the egotism of the older poet. He also became disillusioned by Hunt and felt himself in danger of being attacked by critics whom Hunt had offended. During the early months of 1818, Keats prepared *Endymion* for the press, wrote much minor poetry, and attended the lectures by the critic William Hazlitt on the English poets. He began to plan another poem, though it was not written for another year, on a Greek legend, the supplanting of the Titan Hyperion by the sun god Apollo.

Adversity. Personal and family difficulties now began to cloud his life. His money was exhausted; one brother, Tom, was suffering from the family disease, tuberculosis, while the other, George, was planning to marry and emigrate to America. In March 1818, Keats relieved George as companion to Tom, who was wintering for his health at Teignmouth, Devonshire. There he wrote the narrative poem "Isabella; or, The Pot of Basil," based on a story from the *Decameron* of Boccaccio and suggested by Hazlitt. Tom's worsening health and his own tendency toward introspection led Keats to expand, in prose and verse, the profound series of letters he was already writing to J.H. Reynolds.

In these, he rejected the doctrine of his letters to Bailey —"O for a Life of Sensations rather than of Thoughts!" —and insisted on the need for thought, especially as a preparation for his own epic *Hyperion.* Returning to London with Tom early in May, shortly after the publication of *Endymion,* Keats accepted an invitation from Charles Brown to accompany him on a walking tour among the mountains of Westmorland, Cumberland, and Scotland. His intention was to enlarge his vision for the new poem, and he was financed by £500 from his brother George, who left for America with his bride at the end of June. Keats and Brown, who had accompanied George to Liverpool, then proceeded on the tour, passing through the Lake District and the Western Highlands, with a brief visit to Ireland. Contracting a feverish cold on a strenuous detour to the Scottish islands of Mull and Iona, Keats was obliged to leave Brown at Inverness and return by sea to London. There, in mid-August, he found Tom dangerously ill; he devoted himself to nursing his brother through his last illness.

Illness

In September, three reviews of *Endymion* had appeared, in *Blackwood's Edinburgh Magazine,* the *Quarterly Review,* and the *British Critic.* All attacked him for his association with Leigh Hunt; but, whereas the *Quarterly* attempted some serious though grudging and biassed appraisal, the review in *Blackwood's* was irresponsible and flippant, and that in the *Critic* was mere vulgar abuse. Treating Keats throughout as an ignorant apothecary's apprentice and quoting derisively from *Poems* as well as *Endymion, Blackwood's* article advised, "It is a better and a wiser thing to be a starved apothecary than a starved poet; so back to the shop, Mr. John."

Mature work. Keats met these reviews with a calm assertion of his talents, "I think I shall be among the English Poets after my death," and proceeded to write the first two books of *Hyperion* during his brother's last months. In the same period, he was attracted by three women, Jane Cox, a cousin of J.H. Reynolds; Isabella Jones, an enigmatic lady he had met at Hastings in 1817; end his final love, Frances (Fanny) Brawne, who lived with her widowed mother in Hampstead. The exact date of his meeting with Fanny Brawne is controversial; but from Tom's death, when he came to lodge with Brown in Hampstead, he began to see her frequently. Her recollection of Christmas 1818 as a particularly happy time may indicate some understanding, though not an engagement, between them at that date, but Keats continued to see Isabella Jones, who suggested to him the subject of a new narrative poem, "The Eve of St. Agnes." Written in the second half of January 1819 on a visit with Brown to Dilke's relatives in Sussex and Hampshire, the poem was full of rich, vivid, and dramatic detail, coloured certainly by Tom's death and possibly by his unresolved relationship with Fanny Brawne. The unfinished "Eve of St. Mark" followed on his return in February, but during the next several weeks he became increasingly disturbed and despondent and abandoned *Hyperion* halfway through Book III.

Early in April, Fanny and her mother came to live next door, and Keats entered into a phase of intense creative activity. In April and May, he wrote the sonnet "On a Dream," the lyric "La Belle Dame sans Merci," and his most distinctive poetical achievements, the great odes "To Psyche," "On Melancholy," "To a Nightingale," and "On a Grecian Urn," together with the less important "On Indolence." The odes are not united formally but share a common theme, examined in various aspects, of the transitoriness of youth, beauty, and life.

Odes

A long-awaited letter from George announced financial difficulties in America, and Keats determined to raise money by a popular narrative poem "Lamia," and a play, *Otho the Great,* the latter constructed in collaboration with Brown. For this purpose, he left London to spend the summer at Shanklin (Isle of Wight) and Winchester, where he completed both works, though the absence from Fanny Brawne caused friction between them. He also began to remodel *Hyperion* as a more personal vision, *The Fall of Hyperion: A Dream,* and late in September he wrote the serene "To Autumn." In October he returned to London, planning to earn money by journalism and to live away from Fanny, near Dilke, who had moved to Westminster. A visit to Hampstead broke his resolve; he took up lodgings again with Brown and became officially engaged to Fanny. Tuberculosis, caught while nursing Tom, threatened, and worry over an indefinitely long engagement and over George's financial troubles marred their happiness. His hopes for the play failed, and he worked without much conviction on a topical satirical poem, "The Cap and Bells."

Last years. In January 1820, George appeared in London, obtained his portion of Tom's estate, and left, taking most of John's share too, as a repayment of the £500 he had lent his brother in the summer of 1818. Though Fanny and many of Keats's friends thought George at fault, the settlement seems to have been financially correct. On February 3 Keats had a lung hemorrhage, that, as he himself realized, heralded his impending death. He struggled on through spring and summer, torn by unreasoning jealousy over Fanny and despair over his work. In fact, his volume ***Lamia, Isabella, The Eve of St. Agnes, and Other Poems,*** which appeared at the beginning of July 1820, was well received. After further hemorrhages, his doctor advised Keats to go to Italy as a last hope. Financed by his publishers and accompanied by a young artist, Joseph Severn, Keats sailed on September 17. On his 25th birthday he landed at Naples and journeyed to Rome. After a few weeks' respite, massive hemorrhages showed there was no hope. Keats wanted to commit suicide but was prevented by Severn. By February 1821 he grew calmer, and on February 23 he died in Severn's arms. At his request (though with additional phrases invented by his friends), the words "Here lies one whose name was writ in water" were engraved on his tombstone. Shelley's memorial poem ***Adonais,*** Byron's gibes, and Leigh Hunt's reminiscences created the false legend that Keats's death was in some way caused by the critics' lack of understanding of his work.

Assessment

Keats's poetry, at its best, conveys a direct, almost pictorial impression of the object or situation he describes. This follows from his own doctrine of the chameleon nature of the poet, who takes on the character of every experience without allowing his own identity to interfere with the communication of sensations. His letters reveal an astonishingly mature outlook on life and art; they display, with few lapses, a personality all the more lovable because its balance was achieved by victory over an inward violence of temperament. His impact on 19th-century poetry was considerable and continues to be so.

MAJOR WORKS

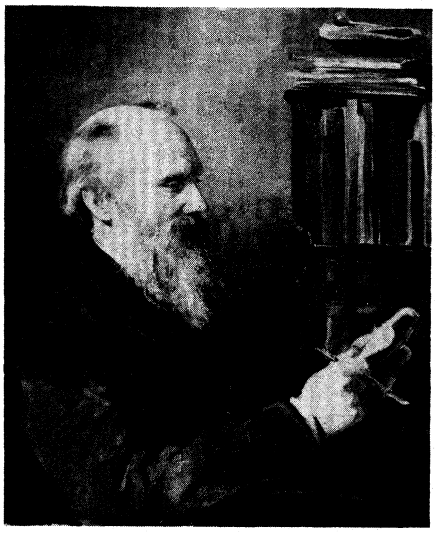
Poems (1817); ***Endymion: A Poetic Romance*** (1818); ***Lamia, Isabella, The Eve of St. Agnes, and Other Poems*** (1820). Some individual poems in the above volumes were first published in periodicals, for example, the sonnets "O Solitude" and "On First Looking into Chapman's Homer" both appeared in ***The Examiner*** in 1816; "Ode to a Nightingale" and "Ode on a Grecian Urn" in ***Annals of the Fine Arts*** in 1819; and "La Belle Dame sans Merci" in ***The Indicator*** in 1820. Other poems of Keats were not collected or published until after his death.

BIBLIOGRAPHY. The three major critical biographies are WALTER JACKSON BATE, ***John Keats*** (1963); ROBERT GITTINGS, ***John Keats*** (1968); and AILEEN WARD, ***John Keats: The Making of a Poet*** (1963). There is no entirely satisfactory edition of the texts of Keats's poems. For general use, the Oxford Standard Authors edition, ***Poetical Works*** (1939; definitive ed., 1958), ed, by H.W. GARROD, is adequate. The ***Letters of John Keats, 1814–1821*** (1957), are edited complete in two volumes by HYDER E. ROLLINS. The most comprehensive selection is ROBERT GITTINGS (ed.), ***Letters of John Keats*** (1970). Special studies are C.L. FINNEY, ***The Evolution of Keats's Poetry,*** 2 vol. (1936, reprinted 1963), a detailed account of the origins of poems; and M.R. RIDLEY, ***Keats' Craftsmanship*** (1933, reprinted 1963), an examination of Keats's working methods. Valuable articles are D.G. JAMES, "Purgatory Blind," in ***Romantic Comedy*** (1948, reprinted 1963); F.R. LEAVIS, "Keats," in ***Revaluation*** (1936, reprinted 1964); and LIONEL TRILLING, "The Poet As Hero: Keats in His Letters," in ***The Opposing Self*** (1955).

(R.Gi.)

Kelvin, William Thomson, Lord

William Thomson, who became Lord Kelvin in 1892 in recognition of his work in engineering and physics, was foremost among the small group of British scientists who helped to lay the foundations of modern physics. His contributions to science included a major role in the development of the law of conservation of energy; the absolute temperature scale (in degrees Kelvin); the dynamical theory of heat; the mathematical analysis of magnetism and electricity, including the basic ideas for the electromagnetic theory of light; the geophysical determination of the age of the Earth; and fundamental work in hydrodynamics. His inventions for use on submarine cables and his theoretical work on submarine telegraphy aided Britain in capturing a pre-eminent place in world communication during the 19th century. He had, in general, a profound influence on the scientific thought of his day.



Kelvin, oil painting by Elizabeth King, 1886–87. In the National Portrait Gallery, London.

Influences on his career

Thomson was born on June 26, 1824, in Belfast, the fourth child in a family of seven. His mother died when he was six years old. William Thomson's father, who was a textbook writer, taught mathematics first in Belfast and later at the University of Glasgow; he taught young Thomson the most recent mathematics, much of which had not yet become a part of the British university curriculum. An unusually close relationship between a dominant father and a submissive son served to develop the son's extraordinary mind.

His family having moved to Glasgow in 1832, Thomson entered the University there at the age of ten. At the age of 15 he won a University gold medal for "An Essay on the Figure of the Earth," which exhibited a high order of mathematical ability and opened a field for his later research. While at Glasgow, Thomson read the book by the French mathematician and physicist Joseph Fourier, ***Analytical Theory of Heat,*** which applied abstract mathematical techniques to the study of the flow of heat through any object. Although the book was well-known in France, very few British scientists had studied or appreciated the wide generality of Fourier's approach. Thomson's first two published articles, at age 16 and 17, were a defense of Fourier's work. Thomson first promoted the idea that Fourier's mathematics could be applied to many energy questions in physics—whether fluids in motion or electricity flowing through a submarine cable.

Thomson entered the University of Cambridge in 1841 and took his B.A. in 1845 with high honours. In 1845 he was given a copy of George Green's publication ***An Essay on the Application of Mathematical Analysis to the Theories of Electricity and Magnetism.*** That essay, with Fourier's book, were the components from which Thomson created his pioneering synthesis. After finishing at Cambridge, Thomson went to Paris, where he worked in the laboratory of the physicist and chemist Victor Regnault to gain practical experimental knowledge to supplement his theoretical education.

The chair of natural philosophy at Glasgow fell vacant in 1846. Thomson's father then mounted a carefully planned and energetic campaign to have his son named to the position, and at the age of 22 William was, in fact, unanimously elected to it. Despite blandishments from Cambridge, Thomson remained at Glasgow for the rest of his career.

In 1847–49 Thomson and the British mathematician and physicist George Gabriel Stokes collaborated in a series of articles on hydrodynamic principles, which Thomson applied to electrical and atomic theory. In 1848 Thomson described his absolute temperature scale, now given in degrees Kelvin, based on the theory of heat of Sadi Carnot, the French physicist. Although at first Thomson rejected ideas that heat could be converted into mechanical energy, in 1851 he proposed a statement that effectively synthesized the ideas of Carnot and James Prescott Joule. Embodied in his paper, "On the Dynamical Theory of Heat,"—a major mathematical treatise—his statement is one version of the second law of thermodynamics. In the 1850s he collaborated with Joule in experiments on the thermal effects of gases and liquids.

The trans-atlantic cable

Although mild by nature, Thomson became involved in the controversial questions dealing with the projected cable under the Atlantic through an inquiry from G.G. Stokes, a lifelong correspondent on scientific matters, who asked him in 1854 for a theoretical explanation of the apparent delay in an electric current passing through a very long cable. In his reply Thomson referred to his early paper "On the Uniform Motion of Heat in Homogeneous Solid Bodies, and its Connexion with the Mathematical Theory of Electricity" (1842).

The publication of Thomson's reply to Stokes prompted a rebuttal by a man helping to plan the cable, E.O.W. Whitehouse. Whitehouse claimed that practical experience refuted Thomson's theoretical findings. Despite their disagreement, Thomson participated, as chief consultant, in the hazardous early cable-laying expeditions. The advice of Whitehouse, who was the company's chief electrician, prevailed with the directors of the Atlantic Telegraph Company.

In 1858 Thomson patented his telegraph receiver for use on the cable. The device, the mirror galvanometer, along with his later modification called the siphon recorder, was the instrument used on most of the worldwide network of submarine cables. Eventually, the Atlantic Telegraph Company directors fired Whitehouse and adopted Thomson's suggestions for the design of the cable and for his mirror galvanometer. In 1866 Thomson was knighted by Queen Victoria for his work on the cable. He became rich and well-known through his cable patents and consulting.

Thomson had broad interests in science, including electricity, magnetism, thermodynamics, and hydrodynamics. He was interested in many geophysical questions concerning tides, the shape of the Earth, atmospheric electricity, thermal studies of the ground, rotation of the Earth on its axis, and geomagnetism. Believing that all science is related, he was easily drawn into the controversy over Darwin's theory of evolution.

Investigations of the age of the Earth

Thomson challenged the views on geological and biological change of the early uniformitarians, including Darwin, who claimed that the Earth and its life had evolved over an incalculable number of years, during which the forces of nature always operated as at present. On the basis of thermodynamic theory and Fourier's studies, Thomson estimated in 1862 that more than 1,000,000 years ago the Sun's heat and the temperature of the Earth must have been considerably greater than at present. These conditions had produced violent storms and floods and an entirely different type of vegetation. His published views of 1868 particularly angered Darwin's supporters. Thomas Henry Huxley used the occasion of the Anniversary Address of the President of the Geological Society of London in 1869 to reply to Thomson. Although Thomson's speculations as to the age of the Earth and the Sun were inaccurate, he did succeed in pressing his contention that biological and geological theory had to conform to the well-established theories of physics.

Thomson's intellectual dynamism and his physical vigour enabled him to pursue, with extraordinary success, the two careers of engineer and scientist. He travelled extensively in Europe and the United States chiefly for pleasure, although in 1884 he delivered a series of lectures at Johns Hopkins University. With the wealth resulting from his cable projects, he bought a sailing yacht, the "Lalla Rookh," of 126 tons. From his interest in the sea came a number of patents: a compass used by the British admiralty; a calculating machine for measuring tides in a harbour and for calculating tide tables for any hour, past or future; and sounding equipment. He manufactured these items himself. The textbook, Treatise on Natural Philosophy (1867), he co-authored with P.G. Tait helped to shape the thinking of future physicists.

Lord Kelvin was said to be entitled to more letters after his name than any other man in Britain. He received honorary degrees from major universities throughout the world and was lauded by engineering societies and scientific organizations. He published more than 600 papers and was granted dozens of patents. He was elected a Fellow of the Royal Society in 1851 and served as its president from 1890 to 1895. Lord Kelvin died on December 17, 1907, at Netherhall, near Largs, Scotland, and was buried in Westminster Abbey.

BIBLIOGRAPHY. S.P. THOMPSON, ***The Life of William Thomson, Baron Kelvin of Largs,*** 2 vol. (1910), written by one who knew and admired Thomson, has a complete bibliography of his published works, a complete list of his patents, and a list of his honours and awards. HAROLD I. SHARLIN, ***Kelvin: A Biography of William Thomson*** (in prep.), provides a new interpretation of the sources of originality of an extraordinary scientist-engineer that blends the scientist's life with his work. ANDREW GRAY, ***Lord Kelvin: An Account of His Scientific Life and Work*** (1908), is an admiring but not thorough account. ELIZABETH THOMSON KING, ***Lord Kelvin's Early Home*** (1909), are reminiscences of his early family life by Thomson's oldest sister.

(H.I.S.)

Kennedy Family

The Kennedys of Massachusetts are unique in United States politics. With the exception of the Adamses and the Roosevelts, no family has played a more prominent role in the nation's public life. As much through legend as through deeds, the Kennedys provided a recognizable theme in the confusing events in the 1960s. By the decade's end, all but one of the Kennedy men were dead, leaving behind an extraordinary record of accomplishment, drama, and tragedy.

Joseph P. Kennedy. Joseph P. Kennedy (1888–1969), was the son of a Bay State politician and grandson of an Irish immigrant. In 1912 young Kennedy graduated from Harvard. Two years later he married Rose Fitzgerald, the daughter of John F. ("Honey Fitz") Fitzgerald, mayor of Boston. Rose bore her husband nine children and taught them love, compassion, and serenity. From their father they acquired a fierce competitive drive and a yearning for distinction.

Acquisition of the Kennedy fortune

A freckled, vigorous man whose horn-rimmed spectacles gave him a slightly owlish look, Joseph Kennedy was a bank president at age 25 and a millionaire at 30. He became a shipbuilder, a motion-picture tycoon, and a heavy contributor to the Democratic Party. In five years (1929–34) as manager of the stock division of Hayden,

Stone and Company, an investment-banking firm, he mastered the art of stock-exchange manipulation. Striking out on his own, he became a brilliant plunger in the bull market of the 1920s. He retired early in 1929, having acquired enough capital to establish a million-dollar trust fund for each of his children. Then as chairman of the Securities and Exchange Commission (1934–35) under Pres. Franklin D. Roosevelt, Kennedy outlawed the very speculative practices that had made him rich.

He became chairman of the United States Maritime Commission and, in 1937, the first Irish-American to serve as the U.S. ambassador to Great Britain. In November 1940 he resigned; he was convinced that Britain was doomed to Nazi conquest and believed America's only hope lay in isolationism.

By then, Ambassador Kennedy's family was complete—four sons: Joseph P., Jr. (born 1915), John F. (born 1917), Robert F. (born 1925), Edward M. (born 1932); and five daughters: Rosemary (born 1918), Kathleen (born 1920), Eunice (born 1921), Patricia (born 1924), and Jean (born 1928). Prodded by their parents, the children were competitive and cohesive. They vied with one another in sailboat races, touch football games, tennis matches, and rough and tumble fights. No quarter was asked or given. The important thing was winning. Often they would emerge bruised and bleeding. The girls were given no preferential treatment. If they ran home sobbing, their mother would comfort them, but if their father saw their tears, he sent them back into the fray.

The ambassador was not trying to breed professional athletes. He had made enough money for them all. He expected his sons to prepare for public life and his daughters to be ready for marriage to distinguished men who would become "naturalized" Kennedys. The children were encouraged to read ***The New York Times*** at an early age. Small talk was not allowed at the dinner table. Instead, the family discussed national issues, sometimes with consequences not seen till years later. Joseph, Jr., for example, became an isolationist; John an ardent advocate of United States participation in world affairs; and Robert, perhaps because of the age gap, became shy—an affliction he battled throughout his life.

The family experienced its first misfortune when Rosemary was found to be mentally defective. Then tragedy befell Kathleen; in 1944 she married an Englishman, William Cavendish, marquess of Hartington. That same year Hartington was killed during the Allied invasion of Normandy. Four years later she herself died in a European plane crash.

Passing of the family's political standard

John F. Kennedy. Joseph Kennedy had expected his eldest son to be the first Kennedy to run for public office, but young Joe was killed too, in 1944, during the war. Thus, the family's political standard passed to the next oldest son, John, who had planned to pursue an academic or journalistic career. John's first book, ***Why England Slept,*** based on his senior thesis at Harvard, had become a best seller in 1940, the year he was graduated cum laude. Now, keeping the flame of his father's pride burning became a matter of duty. As he explained prophetically in the 1950s, when he had become a senator:

> Just as I went into politics because Joe died, if anything happened to me tomorrow, my brother Bobby would run for my seat in the Senate. And if Bobby died, Teddy would take over for him.

John Kennedy himself barely escaped death in battle. Commanding a navy motor torpedo (PT) boat, he was gravely injured when a Japanese destroyer sunk it in the Solomon Islands. Marooned far behind enemy lines, he led his men back to safety. He was awarded the Navy and U.S. Marine Corps medal for heroism and returned to active command at his own request. But his back, which had bothered him since his teens, never really healed. Despite operations in 1944, 1954, and 1955, he was in pain for much of the rest of his life. None of the Kennedys, however, including him, ever thought that John might choose a career less strenuous than politics. He was expected to run for office and to win.

Congressman. He did win; indeed, he never lost an election. His first opportunity came in 1946, when he ran for Congress. Though still weak from his wartime injuries, he campaigned aggressively, bypassing the Democratic organization in the Massachusetts 11th congressional district and depending, instead, upon his family, college friends, and fellow navy officers. In the Democratic primary he received nearly double the vote of his nearest opponent; in the November election he overwhelmed the Republican candidate. He was only 29.

John Kennedy served three terms in the House of Representatives (1947–53) as a bread-and-butter liberal. He advocated better working conditions, more public housing, higher wages, lower prices, cheaper rents, and more Social Security for the aged. In foreign policy he was an early supporter of Cold War policies. He backed the Truman Doctrine and the Marshall Plan but was sharply critical of the Truman administration's record in Asia. He accused the State Department of trying to force Chiang Kai-shek into a coalition with Mao Tse-tung. "What our young men had saved," he told the House on January 25, 1949, "our diplomats and our President have frittered away."

Senator. His congressional district in Boston was a safe seat. Had he remained there, eventually he could have become a power in the House, perhaps even its speaker. As a Kennedy, however, he was expected to raise his sights. In 1952 he ran for the U.S. Senate against the popular incumbent, Henry Cabot Lodge, Jr. John's mother and sisters held "Kennedy teas" across the state. Thousands of volunteers flocked to help, and 27-year-old Robert managed his brother's campaign. That fall the Republican presidential candidate, General Dwight D. Eisenhower, carried Massachusetts by 208,000 votes; but Kennedy defeated Lodge by 70,000 votes. Less than a year later, on September 12, 1953, John enhanced his electoral appeal by marrying Jacqueline Lee Bouvier.

John's election to the Senate

Senator Kennedy ordered that the door to his office be kept always open, and he quickly won a reputation for responsiveness to requests from constituents, except on certain occasions when the national interest was at stake. In 1954 he was the only New England senator to approve an extension of President Eisenhower's reciprocal-trade powers; and he vigorously backed the opening of the St. Lawrence Seaway, despite the fact that over a period of 20 years no Massachusetts senator or congressman had ever voted for it.

He was not as sensitive as liberal Democrats wished, however, to the demagogic excesses of Sen. Joseph R. McCarthy of Wisconsin, who in the early 1950s conducted witch-hunting campaigns against government workers accused of being Communists. His father, Joseph Kennedy, liked McCarthy; he contributed to his campaign and even entertained him in the family's compound at Hyannis Port on Cape Cod. John disapproved of McCarthy, but as he once observed, "Half my people in Massachusetts look on McCarthy as a hero." Yet on the Senate vote over condemnation of McCarthy's conduct (1954), Kennedy expected to vote against him. He prepared a speech explaining why, but he was absent on the day of the vote. Later, at a National Press Club Gridiron dinner, costumed reporters sang, "Where were you, John, where were you, John, when the Senate censured Joe?" Actually, John had been in a hospital, in critical condition after back surgery. For six months afterward he lay strapped to a board in his father's house in Palm Beach, Florida. It was during this period that he wrote *Profiles in Courage* (1956), his account of eight great American political leaders who had defied popular opinion in matters of conscience. In 1957 the book was awarded a Pulitzer Prize.

Back in the Senate, Kennedy led a fight against a proposal to abolish the electoral college, crusaded for labour reform, and became increasingly committed to civil rights legislation. As a member of the Senate Committee on Foreign Relations in the late 1950s, he advocated extensive foreign aid to the emerging nations in Africa and Asia, and he stunned Washington by calling upon France to grant Algerian independence.

Movement to the political left

During these years his political outlook was moving leftward. Possibly because of their father's dynamic personality, the sons of Joseph Kennedy matured slowly. Gradually John's stature among Democrats across the nation grew, until he had inherited the legions that had once been pledged to Gov. Adlai E. Stevenson of Illinois, the two-time presidential candidate who by appealing to idealism had transformed the Democratic Party and made Kennedy's rise possible. "A whole new generation," Edward Kennedy later said of Stevenson, "was drawn to take an interest in public affairs when he came on the scene. They were led by him, taught by him, and inspired by him." According to the historian Arthur M. Schlesinger, Jr., John Kennedy was emerging as "the heir and executor of the Stevenson revolution."

Presidential candidate. John had nearly become Stevenson's vice presidential running mate in 1956. The handsome, young New Englander's near victory and his speech of concession on television brought him into 40,000,000 American homes. Overnight he had become one of the most famous political figures in the country. Already his campaign for the 1960 nomination had begun. One newspaperman called him "young man in a hurry." Kennedy felt that he had to redouble his efforts because of the widespread conviction that no Roman Catholic candidate could be elected president. He made his 1958 race for re-election a test of his popularity in Massachusetts. "Senator Kennedy is on the move," James Reston wrote in *The New York Times*. "He is swinging for the fences now." His margin of victory was 874,608 votes—the largest ever in Massachusetts politics and the greatest of any senatorial candidate that year.

A steady stream of speeches and periodical articles followed. Photographs of him and his wife appeared on magazine covers. To transport him and his staff around the country, his father bought a 40-passenger Convair aircraft. His brothers Robert ("Bobby" or "Bob") and Edward ("Teddy" or "Ted") pitched in. After graduating from Harvard University (1948) and from the University of Virginia Law School (1951), Bob had embarked on a brilliant career as a Justice Department attorney and counsellor for congressional committee. John called young Ted "the best natural politician in the family." After a shaky start at Harvard—he was suspended after a friend had taken an examination for him—Ted had been graduated with honours (1956) and from Virginia Law School (1959). Both were astute campaigners.

In January 1960 John F. Kennedy formally announced his presidential candidacy. His chief rivals were Senators Hubert H. Humphrey of Minnesota and Lyndon B. Johnson of Texas. Kennedy knocked Humphrey out of the campaign and dealt the religious taboo against Catholics a blow by winning the primary in Protestant West Virginia. He tackled the Catholic issue again, by avowing his belief in the separation of church and state in a televised speech before a group of Protestant ministers in Houston. Nominated on the first ballot, he balanced the Democratic ticket by choosing Johnson as his running mate. In his acceptance speech Kennedy declared, "We stand on the edge of a New Frontier." Thereafter the phrase New Frontier was to become attached to his programs.

Presidential nomination

Another phrase, the Kennedy style, encapsulated the candidate's emerging identity. It was glamorous and elitist, an amalgam of his father's wealth, John Kennedy's charisma, Jacqueline Kennedy's glamour and sophistication, the charm of their children and relatives, and the erudition of the Harvard advisers who surrounded him.

President. Kennedy won the general election, narrowly defeating the Republican candidate, Vice Pres. Richard M. Nixon, by a margin of 118,550 out of the total of 68,335,642 votes cast. Nixon had defended the Eisenhower record; Kennedy, whose slogan had been "Let's get this country moving again," had deplored unemployment, the sluggish economy, what he called a missile gap, and the Communist government in Havana. A major factor in the campaign was a unique series of four televised debates between the two men; an estimated 85,000,000–120,000,000 Americans watched one or more debates. Kennedy, who had been the lesser known candidate, was impressive for his poise, firmness, and grasp of issues.

Concern with foreign affairs

John Fitzgerald Kennedy was the youngest man and the first Catholic ever elected to the presidency. His administration lasted 1,037 days. From the onset he was concerned with foreign affairs. In his memorable inaugural address he called upon Americans "to bear the burden of a long twilight struggle . . . against the common enemies of man: tyranny, poverty, disease, and war itself." He declared:

> In the long history of the world, only a few generations have been granted the role of defending freedom in its hour of maximum danger. I do not shrink from this responsibility—I welcome it. . . . The energy, the faith, the devotion which we bring to this endeavor will light our country and all who serve it—and the glow from that fire can truly light the world. And so, my fellow Americans: ask not what your country can do for you—ask what you can do for your country.

The administration's first brush with foreign affairs was a disaster. In the last year of the Eisenhower presidency, the Central Intelligence Agency had equipped and trained a brigade of anti-Communist Cuban exiles for an invasion of their homeland. The Joint Chiefs of Staff unanimously advised the new president that this force, once ashore, would spark a general uprising against Fidel Castro. But the operation was a fiasco; every man on the beachhead was either killed or captured. Kennedy assumed "sole responsibility" for the setback. Privately he told his father that he would never again accept a Joint Chiefs recommendation without first challenging it.

The Soviet premier, Nikita Khrushchev, thought he had taken the young president's measure when the two leaders met in Vienna in June 1961. Khrushchev ordered a wall built between East and West Berlin and threatened to sign a separate peace treaty with East Germany. The President activated National Guard and reserve units, and Khrushchev backed down on his separate peace threat. In

October 1962 a buildup of Soviet missiles was discovered in Cuba. Kennedy demanded that the missiles be dismantled; he ordered a "quarantine" of Cuba—in effect, a blockade. For 13 days nuclear war seemed near; then the Soviet premier announced that the offensive weapons would be withdrawn. Ten months later Kennedy scored his greatest foreign triumph when Khrushchev and Prime Minister Harold Macmillan of Great Britain joined him in signing a Nuclear Test-Ban Treaty.

Relations with Congress

Because of his slender victory in 1960, Kennedy approached Congress warily, and with good reason; Congress was largely indifferent to his legislative program. It approved his Alliance for Progress (Alianza) in Latin America and his Peace Corps, which won the enthusiastic endorsement of thousands of college students. But his two most cherished projects, massive income tax cuts and a sweeping civil rights measure, were not passed until after his death.

Nevertheless, he was an immensely popular president, at home and abroad. At times he seemed to be everywhere at once, encouraging better physical fitness, improving the morale of government workers, bringing brilliant advisers to the White House, beautifying Washington, D.C. His wife joined him as an advocate for U.S. culture. Their two young children, Caroline Bouvier and John F., Jr., were familiar throughout the country.

Joseph Kennedy had been invalided in Hyannis Port by a stroke, but the other Kennedys were in and out of Washington, D.C. Robert Kennedy, as John's attorney general, was the second most powerful man in the country. He advised the President on all matters of foreign and domestic policy, national security, and political affairs. A strong civil rights supporter, he was widely admired by the country's blacks and Mexican-Americans and by poor people everywhere.

In 1962 Edward Kennedy was elected to the President's former Senate seat in Massachusetts. Eunice's husband, R. Sargent Shriver, Jr., became director of the Peace Corps. Jean's husband, Stephen Smith, was preparing to manage the Democratic Party's 1964 presidential campaign. Patricia had married Peter Lawford, an English-born actor, and Lawford served the family as an unofficial envoy to the entertainment world. Almost all Americans knew who Rose, Jackie, Bobby, and Teddy were, and most could identify Bobby's wife as Ethel and Teddy's wife as Joan.

Assassination. President Kennedy believed that his Republican opponent in 1964 would be Sen. Barry Goldwater of Arizona. He was convinced that he could bury Goldwater under an avalanche of votes, thus receiving a mandate for major legislative reforms. One obstacle to his plan was a feud in Vice President Johnson's home state of Texas between Gov. John B. Connally, Jr., and Sen. Ralph Yarborough, both Democrats. To present a show of unity, the President decided to tour the state with both men. On Friday, November 22, 1963, he and Mrs. Kennedy were in a motorcade riding slowly through downtown Dallas in an open limousine. At 12:30 PM CST a sniper opened fire.

The death of John F. Kennedy

Two rifle bullets struck the President, at the base of his neck and in the head. He was dead upon arrival at Parkland Memorial Hospital. Governor Connally, though gravely wounded, recovered. Vice President Johnson took the oath as president at 2:38 PM CST. Lee Harvey Oswald, a 24-year-old Dallas citizen, was accused of the slaying. Two days later Oswald was shot to death by Jack Ruby, a local nightclub owner, in the basement of the Dallas police station. A presidential commission appointed to investigate the assassination and headed by the chief justice of the United States, Earl Warren, later found that neither the sniper nor his killer "was part of any conspiracy, domestic or foreign, to assassinate President Kennedy," but that Oswald had acted alone.

John Kennedy was dead, but the Kennedy mystique was still very much alive. Jacqueline Kennedy and her two children moved from the White House to a Georgetown home. Continuing crowds of the worshipful and curious made peace there impossible, however, and in the summer of 1964 she moved to New York City. Pursuit continued until October 20, 1968, when she married Aristotle Onassis, a wealthy Greek shipping magnate. The Associated Press said that the marriage "broke the spell of almost complete adulation of a woman who had become virtually a legend in her own time." She found a haven on her second husband's island home of Skorpios in the Ionian Sea.

Robert F. Kennedy. Robert Kennedy continued to serve as attorney general until he resigned in September 1964. The months after his brother's death were a desperate time for him. He was stooped by grief and spent long periods staring out windows or walking in the Virginia woods. He had presided over the Department of Justice for 44 months. He had emerged as a statesman of the law, improving the lot of many. Learning on May 20, 1961, that a hostile mob threatened the civil rights leader Martin Luther King, Jr., and 1,200 of his supporters in Montgomery, Alabama, Attorney General Kennedy sent 400 federal marshals to protect them. In subsequent racial crises he used long telephone sessions to work out the strategies of peace officers in the South. He also led a tough and imaginative drive against organized crime. One of his proudest achievements was assembling the evidence that convicted the head of the Teamster Union, James R. Hoffa. On Robert Kennedy's departure from the Department of Justice ***The*** New ***York Times,*** which had criticized his appointment three years earlier, said editorially, "He named excellent men to most key posts, put new vigor into protecting civil rights through administrative action, played a pivotal role in shaping the most comprehensive civil rights law in this country. . . . Mr. Kennedy has done much to elevate the standard."

In November 1964 he was easily elected U.S. senator from New York. Within two years Robert had established himself as a major political figure in his own right. He became the chief spokesman for liberal Democrats and a critic of President Johnson's Vietnam policy. On March 16, 1968, he announced his candidacy for the presidency. By June 4 he had won five out of six presidential primaries, including one that day in California. Shortly after midnight on June 5 he spoke to his followers in Los Angeles' Ambassador Hotel. As he left through a kitchen hallway he was fatally wounded by an Arab immigrant, Sirhan Bishara Sirhan. Robert Kennedy was buried near his brother at Arlington National Cemetery.

Edward M. **Kennedy.** Edward Kennedy remained in the Senate. He was unable to campaign actively for reelection in 1964—his back had been broken in an airplane crash—but was swept back into office by a landslide vote. Early in 1969 he was elected majority whip in the Senate and had become front-runner for the 1972 Democratic presidential nomination until July 18, 1969. On that night he drove his car off an unmarked bridge on Chappaquiddick Island, near Martha's Vineyard, Massachusetts. His companion, 28-year-old Mary Jo Kopechne, was drowned, and Edward was found guilty of leaving the scene of the accident. Kennedy was reelected to the Senate in 1970 but announced that he would not seek the presidency in 1972.

During the 1970s Kennedy continued to be a prominent spokesman for the policies that had come to be associated with the family name, and he became an advocate for many liberal causes, including a system of national health insurance. Supporting the nomination of Jimmy Carter for the presidency, Kennedy in 1976 won reelection to a third full term in the Senate. From 1979 to 1981 he was chairman of the Senate Judiciary Committee. In 1980 Kennedy entered the race against Carter for the Democratic presidential nomination. He won only 10 primaries and withdrew from the race during the convention.

The death of Joseph P. Kennedy

On November 18, 1969, Joseph P. Kennedy died at Hyannis Port, age 81. Edward Kennedy read the eulogy, which had been written in 1967 by his brother Robert:

> He has called on the best that was in us. There was no such thing as half-trying. Whether it was running a race or catching a football, competing in school—we were to try. And we were to try harder than anyone else. We might not be the best, and none of us were, but we were to make the effort to be the best. "After you have done the best you can," he used to say, "the hell with it."

Kentucky

The Commonwealth of Kentucky is a south central state of the United States. Long the home of various Indian tribes, Kentucky was settled by Daniel Boone and other frontiersmen in 1769. By 1792, when it was admitted as the 15th state of the Union—the first west of the Appalachian Mountains—Kentucky had drawn nearly 75,000 settlers.

Location and size

Rivers define Kentucky's boundaries except on the south, where it shares a border with Tennessee along a nearly straight line of about 425 miles (685 kilometres), and on its mountainous southeastern border with Virginia. The Tug and Big Sandy rivers separate it from West Virginia on the east and northeast. From the point where the Big Sandy empties into the Ohio River, the pyramid-shaped northern boundary cuts a jagged line across the country, following the Ohio and meeting the states of Ohio, Indiana, and Illinois to the north. Where the Ohio flows into the Mississippi, the short western edge of the state is separated by the Mississippi from Missouri. The 40,395 square miles (104,623 square kilometres) encompassed by these boundaries are occupied by more than 3,660,000 people, about one-half of whom are rural residents. The capital, Frankfort, lies between the two major cities, Louisville, which lies on the Ohio River, and Lexington.

Kentucky brings to mind images of coal mines, of the bourbon whiskey that was developed there, of white-suited colonels and their ladies sipping mint juleps on summertime verandas, of mountaineers and moonshiners, of horse breeding and the Kentucky Derby. In actuality, Kentucky has a curious mixture of poverty and wealth, ugliness and beauty. From the 1950s through the 1970s, at least 940 lives were lost in Kentucky's coal mines, and strip-mining has continued to leave countless hillsides to erode after denuding them of their forest cover. Yet the seemingly endless landscape of white-railed horse pens and paddocks, characteristic of the rolling Bluegrass region around Lexington, symbolizes an unhurried and genteel way of life that looks more to Kentucky's ties with the pre-Civil War South than to its position in the industrial frenzy of the nation. Kentucky has always existed in the middle: as a state looking back and ahead, as a crossroads for westward expansion, and as a split personality during the Civil War. It was the birthplace both of Abraham Lincoln, 16th president of the United States, and of Jefferson Davis, president of the Confederate States during that strife. (For information on related topics, see the articles UNITED STATES; UNITED STATES, HISTORY OF THE; APPALACHIAN MOUNTAINS; and NORTH AMERICA.)

THE HISTORY OF KENTUCKY

Exploration and settlement. Before the arrival of Europeans, the Kentucky region was a hunting ground and battlefield for such Indian tribes as the Shawnee from the north and the Cherokee from the south. Even earlier agricultural and hunting peoples left burial mounds and other traces. French and Spanish explorers must have seen Kentucky from the rivers of the Mississippi basin, and traders entered the region from the eastern colonies during the early 18th century. During the 1750s and 1760s Indian resistance and rough terrain hindered successful exploration of the region. In 1769, however, Daniel Boone penetrated to the central plateau region, or Bluegrass country.

Indian raids and immigration

Settlement was rapid during the 1770s, though the prophecies of an angry Cherokee chieftain, Dragging-Canoe—that Boone and other whites would find Kentucky "a dark and bloody land"—were in large part fulfilled. British officers spurred the Indians during the Revolution, notably in raids on Boonesboro in 1777 and 1778 and at a bloody ambush at Blue Licks in 1782, and settlers encountered numerous other sieges, scalpings, and skirmishes. Following the war immigrants poured down the rivers and travelled the Wilderness Road from Cumberland Gap. The settlers founded towns and before long began to call for separation of the judicial district of Kentucky from Virginia. Statehood conventions at Danville in the 1780s were somewhat ruffled by the "Spanish Conspiracy" of James Wilkinson and others to ally the region with Spain, but they led ultimately to admission into the Union on June 1, 1792, and to the organization of state government, which took place in a Lexington tavern.

Statehood and crises. Events leading to a second state constitution in 1800 revealed an internal division that has continued to characterize Kentucky. Farmers, who floated their grain, hides, and other products on flatboats down the Mississippi to Spanish-held New Orleans, allied themselves with other antislavery forces to oppose slaveholders and businessmen. The federal Alien and Sedition Acts of 1798, passed in an attempt to control criticism of the government, were vigorously opposed. One of the leading spokesmen for the opposition was the young politician Henry Clay, who was to stamp his personality on the state and national scenes as the "great compromiser."

Kentucky took a lead in the War of 1812, much of which was fought in the adjacent Northwest Territory against combined British and Indian forces. Following the war a land boom, with attendant speculation and inflation, and the chartering of 40 independent banks that flooded the state with paper money led to financial disaster during the national economic panic of 1819. Fierce controversy over relief to debtors split Clay's Whigs and Andrew Jackson's Democrats. Signs of progress from 1820 to 1850, however, included the building of a canal at Louisville, the chartering of railroads, and increased manufacturing. The slavery question was uppermost, however, until the Civil War. The few large slaveholders were located mainly in the plantation agriculture of the Bluegrass and Pennyrile sections, but by 1833, when the legislature forbade importation of slaves for resale, the state was already one-quarter black. Until the Civil War, proslavery forces maintained an iron control of government and prevented any constitutional change that endangered their property.

Civil War and its aftermath. During the war Kentucky was a state divided. Officially, it had sought to avoid war by continuing Clay's tradition of compromise. Some 90,000 soldiers fought for the Union armies and about 40,000 for the Confederacy, though after the war popular sentiment became strongly pro-South. Following the defeat of the Confederate general Braxton Bragg at Perryville, in 1862, the only action in the state consisted of widespread guerrilla warfare.

The opening of new rail lines into the eastern coal country and the introduction of a tobacco economy stirred the state in the last decades of the 19th century. The Ku Klux Klan evoked fears and hatred, but the freed blacks were given the vote and settled as tenant farmers or urban workers. As elsewhere, however, blacks were not to become first-class citizens. Lexington and the Ohio

River cities—Louisville, Owensboro, Paducah, and Covington—grew rapidly, and the state was intensely involved in the populist agrarian politics of the period. Warfare between tobacco growers and tobacco trusts brought on an era of barn burning and similar attempts to keep tobacco prices up.

Continued diversification marked the 20th century, though the Great Depression and strikes by the United Mine Workers of America brought serious problems and open strife in many sectors. The state followed the national trends toward the loss of rural population to industrial centres, both inside and outside the state. In 1966 the devastations of strip-mining were partially ameliorated by a law requiring restoration and reforestation of the landscape.

THE LANDSCAPE

Climate. Kentucky enjoys a temperate climate, plentiful rainfall, and distinctive soils, which combine to create variety in vegetation, animal life, and landscape. The state's mean annual temperature is between 55° and 60° F (13° and 16° C). The growing season lasts from 176 to 197 days a year. Mean annual rainfall for the entire state is about 45 inches (1,143 millimetres), evenly distributed throughout the year. The greatest differences occur between the southern areas, which average as much as 48 inches annually, and the northeast, which may receive only 40 inches. Prevailing winds are from the south and southwest, although winter's chill frequently arrives on north and northwest winds.

Vegetation and animal life. Kentucky was part of the great hardwood forest region covering the nation from the Allegheny Mountains to the western prairies. Three-fourths of the state was once covered with magnificent stands of yellow poplar, oak, chestnut, sycamore, and walnut. By the close of the 19th century, however, all but a fraction of these virgin forests had been felled. Trees, shrubs, and plants of many kinds still flourish in all parts of the state, ranging from the native hardwoods and pines on the eastern slopes to the picturesque bald cypresses in the western river marshes, and the maples, beeches, and magnolia found throughout the state, Rhododendron, laurel, dogwood, redbud, and trillium are prominent among the dozens of flowering plants in the Kentucky mountains.

Birds and animals of Kentucky include those native to the Deep South as well as those of southern Canada. Of the numerous hoofed animals that once roamed Kentucky—bison, elk, moose, and deer—only deer remain. Wolves, beavers, and panthers have likewise disappeared. Among the many small animals found in the state are rabbits, squirrels, foxes, raccoons, opossums, woodchucks, and—in the numerous caves—bats and rodents. The northwestern corner of Kentucky, where the Green River flows into the Ohio, is the site of one of the world's great migratory bird routes. More than 200 species of birds frequent this area, while close to 300 species have been found in the state as a whole. The marshes of the southwestern Kentucky–Tennessee border provide breeding places for such waterfowl as the American egret, great blue heron, and double-crested cormorant. A few wild turkeys remain as a reminder of pioneer days. The swift mountain streams, wide rivers, and man-made lakes of Kentucky provide habitats for more than 100 species of fish. The muskellunge, the largest member of the pike family, and commonly considered a Great Lakes fish, is found especially in the Barren and Green rivers.

Bird life

Soils. The landscape of Kentucky is as diverse as the life it supports, extending from the wrinkled outcroppings of early Paleozoic rocks to the 2,300-mile shoreline of Kentucky Lake. Rich alluvial deposits lie along the rivers, while the rest of the state's soil derives from the long and gradual breakdown and decay of underlying rock.

Physiographic regions. Kentucky has six major physiographic regions: Mountain, Knobs, Bluegrass, Pennyrile, Western Coal Field, and Purchase.

Mountain region. More than 10,000 square miles of the easternmost part of Kentucky lie in the Mountain region, a sloping plateau of the Cumberland and Pine mountain ranges. It is a scenic land of narrow valleys, steep pinnacles, and transverse ridges. The state reaches its highest point at Big Black Mountain, 4,150 feet (1,265 metres) in altitude. An area of deep gorges, natural rock arches, and small valley farms, eastern Kentucky is drained by three major rivers and their tributaries: the Big Sandy, Cumberland, and Kentucky rivers. Natural passages through these mazes of mountains are sometimes provided by winding gaps, such as historic Cumberland Gap, or water gaps, which include the picturesque Breaks of Sandy.

Physical diversity

The great eastern coalfields of Kentucky lie in the mountains and, though the region has been a major coal-producing area throughout the 20th century, there are more than 13,000,000,000 tons of coal still buried in the eastern hills. Mining has created the state's paradox of wealth and poverty, and the dilemma of whether to exploit natural resources or preserve the ecology.

The Knobs. A long, narrow region shaped like an irregular horseshoe with both ends touching the Ohio River, the Knobs embraces the Bluegrass country on its inner side, the Mountain area on the east, and the Pennyrile on the west. Its landscape is one of cone-shaped or rounded hills and ancient escarpments. The weathered shale soil is not rich and is easily eroded, making it better adapted to forest growth than to cultivation. Canebrakes grew along some of the lower ground before European settlement and attracted large herds of buffalo and deer. A major portion of the Daniel Boone National Forest lies in the eastern Knobs.

The Bluegrass. There is a folk saying that when east Kentuckians die they want to go to Lexington, the capital of the Bluegrass. The Bluegrass lies at Kentucky's geographic and legendary heart. Its 8,000 square miles are encircled by the Knobs and the Ohio River. The region was named for the long-stemmed grass that flourishes there; it shows a bluish tint when rippled by the wind that blows across the uplands. The underlying limestones are rich in phosphates and have created pasturage for some of the world's most famous horse farms.

The Pennyrile, or Pennyroyal. The 7,800 square miles of the Pennyrile touch every other region except the Bluegrass. On the east it joins the Mountains; to the north its irregular boundaries are the Knobs, the Ohio River, and the Western Coal Field; in the west it joins the Purchase; and on the south it is bounded by Tennessee. Its unusual name derives from the local pronunciation of pennyroyal, a plant of the mint family that is abundant in the area.

The Pennyrile encompasses wooded rocky hillsides, small stock farms, cliffs, and an area once known as the Barrens—a condition caused by the Indians' continuous burning off of forest cover to make grasslands for the buffalo. Above all, it is a region of caves. Abundant waters, both surface and underground, and the limestones deposited during the Mississippian Period of geologic history (more than 300,000,000 years ago), have combined to create the area known as the Land of Ten Thousand Sinks and such famous subterranean passages as Mammoth Cave. The vast underworld cavern includes three rivers, two lakes, and a sea, and it covers more than 150 miles on five distinct levels. Its temperature remains constant at 54° F (12° C) throughout the year. Many other caves underlie the Pennyrile.

Cave region

Western Coal Field. Surrounded by the Pennyrile and the Ohio River and crossed by the Green River, the Western Coal Field's 4,680 square miles comprise less than half the area of the eastern coal beds and only a little more than half of that of the Bluegrass. The region has coal deposits throughout its extent, however, and it is fertile on some of its rolling uplands and river bottom lands. Hence it is both a mining and farming area.

The Purchase. Bounded by the Tennessee, Mississippi, and Ohio rivers, the Purchase, also called Jackson Purchase, encompasses only 2,569 square miles in the southwestern corner of the state. It was purchased in 1818 from the Chickasaw Indians, and Andrew Jackson, the seventh president of the United States, was one of the signers of the treaty. The Purchase is the lowest topographic area of Kentucky, but it is not uniformly flat. Wide floodplains are broken by low hills that may have been sandbars in ancient oceans. Bluffs, swamps, and lagoons form part of the terrain, and soft rocks of the region erode rapidly, altering the landscape. The area is one of the most fertile sections of Kentucky and is widely known both for crops and for its fine stands of poplar, hickory, and oak.

THE PEOPLE OF KENTUCKY

Patterns of settlement. Early settlers of Kentucky, who were predominantly English and Scots-Irish, came from North Carolina, Virginia, Maryland, and Pennsylvania. The migrations of Daniel Boone reflected those of many of his fellow countrymen. He moved from Pennsylvania, where he was born, down the Great Valley of Virginia into North Carolina, where he lived until he led new settlers through Cumberland Gap to Kentucky. Despite the horrors of backwoods warfare during and following the Revolution, the migration into the Bluegrass country continued. In addition to the Cumberland Gap route, the Mississippi brought early French emigres from New Orleans, particularly to the Louisville area, while dunng the mid-19th century the Ohio River carried many German settlers and other migrants, via Pittsburgh, from New England and the Middle Atlantic states. There was also a large black population in Kentucky, though the proportion decreased after 1833. Just prior to the Civil War, the Underground Railroad flourished in Kentucky to help transport escaped slaves to free soil, and there was considerable black emigration during and after the war. By 1980 only 7.1 percent of Kentucky's population was black.

Demography. From the beginning, Kentucky has been a strongly rural state of small towns and crossroads. Only Louisville and Lexington had a population greater than 100,000 by the early 1980s. Part of the urban population lives in small cities such as Lexington, Covington, Paducah, and Frankfort. Since World War II many of the younger people have left rural counties for cities both within and outside the state, creating severe economic, educational, and cultural problems.

Traditions. Distinctive traditions of life have attracted Kentucky historians and sociologists. There is no such thing, it is claimed, as a halfway Kentuckian. Politics occupies a central position in the lives of most residents, with political speeches and barbecues having a special Kentucky flavour. The pace of living for most Kentuckians remains more leisurely than in many other areas of the country, even in the urban areas. Strong family ties and personal relations dominate major aspects of individual and community life. The popular image of the Bluegrass Kentuckian includes leisurely colonels and fast horses, cold mint juleps and a hot game-meat stew called burgoo, while the mountaineer Kentuckian might be idealized as a dulcimer-strumming weaver of old English rhymes and homespun wisdom. Each is rooted, to some degree, in fact and, though Kentuckians are losing many of their distinctive traits, part of the colour and flavour of individualism remains.

THE STATE'S ECONOMY

Principal crops

Agriculture. In the first half of the 19th century, Kentucky was a leading producer of the nation's hemp, corn (maize), hogs, oats, rye, tobacco, wheat, and beef. Demands of Kentucky hemp growers brought adoption of the protective-tariff system in the United States. When sailing vessels were replaced by steamships, however, the need for hemp rope declined. Farm products have remained basic to the state's economy; after years of declining, the amount of farm acreage increased slightly during the late 1970s. Tobacco, corn, hay, and soybeans are major crops, Lexington is the heart of the light burley tobacco country, while the extreme western and southwestern parts of the state, known as the Black Patch, produce dark tobacco. Louisville, once the nation's largest tobacco market, has extensive cigarette factories. Corn and hay are essential to livestock production. Though cattle, sheep, and hogs are important, the state ranks first nationally in the breeding of Thoroughbred horses, both as saddle horses and as racehorses. About one-half of the thoroughbred saddle horses in the nation are bred in Kentucky. Production of bluegrass and orchard-grass seed is also important.

Mining, forestry, and manufacturing. Kentucky ranks second only to West Virginia in coal production. The high death toll in underground mines and the ecological disasters of strip-mining have brought national attention to the state's coal industry and its problems. Petroleum, natural gas, asphalt, and iron ores are also among Kentucky's resources. Despite rapid depletion of the forests, lumbering and allied furniture and woodworking industries remain important. Manufactured products include whiskey, which has been produced in Louisville since 1783, textiles, foods, paints and varnishes, machinery, and iron and steel products.

Mine labour and strife

Labour. A strong labour union tradition exists in the Ohio River towns, and the United Mine Workers of America is influential in the coal region. Early struggles between the UMWA and coal operators in eastern Kentucky gave rise to tragic violence. The name of Bloody Harlan commemorates that county's labour wars during the 1920s and 1930s, highlighting working and living conditions that became popularly identified with those of the state as a whole. Numerous ballads recount the history of conflict and death surrounding work in the coal mines.

Transportation. The first road engineers in Kentucky were the buffalo, whose traces to and from salt licks provided roadbeds for the earliest settlers. But, when Daniel Boone and his party hacked a passage through Cumberland Gap in 1775, Kentucky's transportation system was born. The Ohio and Mississippi rivers, bordering Kentucky for more than 700 miles, and the various tributaries of the Ohio provided Kentucky with one of the most extensive systems of navigable waterways in the nation. The waterways supported a colourful era of flatboats, rafts, and steamboats in the 19th century. Along the trails and toll roads, livestock drovers, stagecoach drivers, and hardy horsemen found travel difficult, and rough terrain hampered road building in mountainous areas. Railroads were slow to develop in Kentucky, but in 1859 the first train began to run between Louisville and Nashville, Tennessee.

Highway construction has diminished the isolation of the eastern area. The Mountain Parkway in the east, the Kentucky Turnpike from Louisville south, and the Western Kentucky Parkway are among the scenic highways making each area of the state accessible. Several cities had airline service by the early 1980s.

ADMINISTRATION AND SOCIAL CONDITIONS

Governmental branches

State and local government. The state government is comprised of the executive, legislative, and judicial branches. The governor is elected for four years and may not seek a second term. The General Assembly includes a Senate of 38 members, half to be chosen every two years for four-year terms, and a House of Representatives of 100 members, who are elected for two-year terms. All tax bills must originate in the House, which has sole power of impeachment. There are several levels in the state judiciary, from the Court of Appeals to local police courts. All judges are elected by popular vote. In 1955 the state constitution was amended to lower the voting age to 18 years. The major units of local government are the county and the municipality. All county officers are elected to four-year terms. Municipalities are divided into six classes according to population. In 1970 Area Development Districts were created by the state to provide more local participation in community-planning decisions. Each of the 15 multicounty districts is governed by a board of directors, which consists of county judges, a mayor from each county, and citizens.

Federal installations. During World War I four military training camps were established in Kentucky. The most famous, Fort Knox, home of the gold bullion depository of the United States since 1936, contains billions of dollars in gold bricks. During World War II Bowman Field and Camps Breckinridge and Campbell were national training sites for the air force.

Education. A long struggle was required to establish and support a public school system in Kentucky. In 1838 the legislature passed a law establishing the first public school system, but efforts at implementation found only scattered support, and during the Civil War the movement received a setback. A state school fund, distributed on a per-pupil basis, provided the sole support of public schools until 1908, when the legislature established each county as a unit of taxation to provide educational funds. Gradually, improvements were made: school laws were codified in 1934, the Council of Higher Education was formed, and in 1954 a base salary for teachers was set in public schools. Increases in appropriations to the program were made possible by a state sales tax. The one-room, one-teacher schools that long characterized many of Kentucky's educational districts have disappeared, and the consolidation of schools has changed the way of life in many remote areas. School attendance of children aged seven to 16 is required. Kentucky adjusted to school-desegregation requirements with varying degrees of speed and success, and Louisville was the first major Southern city to integrate its schools.

Transylvania University (chartered in 1780 as a college), the oldest institution of higher learning west of the Allegheny Mountains, was moved to Lexington in 1788. It had the first library, football team, medical school, and law school in the West. Its enrollment of less than 1,000 students during the early 1980s contrasted sharply with that of the University of Kentucky (1865), also in Lexington, with almost 40,000 students. The University of Louisville, founded by the city council in 1798, is the oldest public college in the state. Other state and community colleges are located in various sections of Kentucky, as are a number of vocational schools. There are numerous private colleges at both the two- and four-year level. Among the most distinctive is Berea College, founded in 1853 to serve youths with small financial resources. Many leaders from the mountain communities were educated there.

Health and welfare. A state board of health was first established in 1878, and the state Department for Human Resources now includes numerous divisions and bureaus that handle such areas as preventive medicine, medical inspection and licensing, medical care for the needy, chronic disease control, sanitation in water supply and sewage, public assistance, and child welfare programs. Despite federal aid granted for the construction of hospitals and other health centres, much improvement in the state's public medical facilities is needed.

CULTURAL LIFE

The horses. One of the more colourful aspects of the social and cultural life of Kentucky is that of the Kentucky Thoroughbred. Lexington is the centre of the world of horse breeding, and its boosters point out that, though they may race the horses at New York or California tracks, they breed, rear, and train them in the rolling Kentucky countryside. There are more than 300 horse-breeding farms around the city; many are open to visitors. At Louisville's Churchill Downs, one of the most colourful traditions of the sports world takes place, as it has since 1875, on the first Saturday of each May, when the Kentucky Derby is run.

The arts. Louisville is the centre of much of the cultural life of the state. It has an outstanding symphony orchestra, known for its performances and recordings of contemporary music; a ballet group; the J.B. Speed Art Museum; an active little theatre; and the Kentucky Opera Association. Kentucky continues to make a special contribution to the national culture with its folk arts, especially in the rural areas. Haunting ballads from Elizabethan days and mournful songs relating recent tragedies or desertions combine to create a distinctive musical life among mountain people. Crafts handed down through generations still produce handsome homespun cloth, hand-carved furniture, patchwork quilts, and sturdy pottery. Surrounded by a mechanized, standardized world, Kentucky folksongs and handicrafts preserve a link with earlier days. Among the nationally recognized writers identified with Kentucky are Robert Penn Warren and Irvin S. Cobb.

Folk arts

Park system. An extensive system of state parks, from Kenlake in the west to Jenny Wiley in the east, provides ample recreation for Kentuckians and tourists. In addition to providing attractive lodge and camping accommodations and a variety of sports facilities, the parks capitalize on local features of landscape or history. Restoration projects, exhibits, and outdoor pageants recreate specific episodes of pioneer days, the Civil War, and the life of Lincoln and other famous residents. Unique natural wonders, such as Mammoth Cave, are preserved and often made a focal point for the parks.

Communications. ***The Courier Journal*** of Louisville achieved distinction under one of the South's most noted editors, Henry Watterson. It is nationally recognized as an outstanding newspaper, and its voice and influence reach throughout most of Kentucky. WAVE-TV, Kentucky's first television station, and WAVE radio are located in Louisville; WHAS-TV and radio are operated by ***The Courier Journal*** and ***The Louisville Times.*** Other television and radio stations are located throughout the state.

Prospects. In Kentucky the past is reflected in many areas of life. The result is a people, a society, an economy, and a culture that are at once fascinating and baffling. The potential mineral wealth remaining in the state is enormous, yet the problems of severe poverty persist and multiply. The needs of all public agencies continue to grow and providing adequate health services, education, law enforcement, and welfare for the whole population is a continuing challenge.

The scenic wonders of the state are varied and spectacular, and the abundant natural resources can support a wide range of agricultural and industrial pursuits. Such natural assets, however, will require strong conservation efforts and careful planning in the future if they are to be preserved.

(W.D.)

Kenya

An independent republic within the Commonwealth of Nations, Kenya is situated in East Africa astride the Equator. It is bordered on the north by Ethiopia and The Sudan, on the west by Uganda, on the south by Tanzania, and on the east by the Indian Ocean and Somalia. It has a total area of 224,960 square miles (582,646 square kilometres) and, in 1980, had a population of almost 16,400,000. The pronunciation of the national name as Kēn-ya is associated with British colonialism and Kĕn-ya is preferred by African nationals. Nairobi is the national capital and the country's largest city.

Since attaining independence in 1963, Kenya has been marked by its national slogan of "*Harambee,*" or

"Pulling together." It has tried to strengthen its traditional agricultural base and to augment it with other economic activities, particularly industry and tourism. Renowned for its abundant wildlife, Kenya has set aside vast preserves as protected domains for endangered species. Kenya's post-colonial development has centred around communal efforts and self-help projects that include large farming units, schools, and even independent churches. The nation's peoples are independent and proud of their cultural heritages, yet at the same time they are aware of the need to forge a strong national identity of which cooperation is a basic ingredient.

The beauty and variety of the landscape, which includes snowcapped mountains, lakes, grassy plains, and gently rolling hills, as well as the pleasant and sunny climate, exert a compelling attraction that has often found a reflection on the cinema screen or in the pages of literature. (*Green Hills of Africa,* a tale by the American writer Ernest Hemingway; *Out of Africa,* an autobiographical memoir by the Danish writer Isak Dinesen; and *Born Free,* a filmed story about raising a lion cub by Joy Adamson, an Englishwoman, are examples.) In addition, Kenya's diverse tribal life styles--exemplified by the colourful cattle-raising Masai people who, although small in numbers, are internationally famous for their Spartan ways—have also contributed to an only partly mythical image of life in Kenya. As a result, the country attracts more tourists than any other African country (see the city article NAIROBI; for associated physical features, see EAST AFRICAN LAKES; EAST AFRICAN MOUNTAINS; for history, see EAST AFRICA, HISTORY OF).

THE LANDSCAPE

Five geographic regions

Relief. The country is divided into five contrasting geographic regions. They are the Lake Victoria Basin, the central Rift Valley and its associated highlands, the eastern plateau, the semiarid and arid areas of the north and south, and the coastal region.

The Lake Victoria Basin. The southwestern corner of Kenya borders on Lake Victoria, which is shared by Kenya, Uganda, and Tanzania. The basin region extends eastward from the lake to the Mau Escarpment and is composed of a level plateau between 3,000 and 4,000 feet above sea level. The rolling grassland is cut almost in half by an eastward extension of the lake known as the Kavirondo (Winam) Gulf that penetrates inland for 50 miles. The region is very fertile and is intensively cultivated with cotton, sugarcane, and subsistence crops.

The central Rift and the highlands. The part of the Rift Valley that runs through Kenya from north to south splits the highland region into two sections—the Mau Escarpment to the west and the Aberdare Range to the east. The valley is from 30 to 80 miles wide, and its floor rises from 1,500 feet in the north around Lake Rudolph to over 7,000 feet at Lake Naivasha but then drops to 2,000 feet at the Tanzanian border in the south. It is occupied by a chain of shallow lakes that are separated by inactive or extinct volcanoes. Lake Naivasha is the largest; the others include Lakes Magadi, Nakuru, Hanrington, and Baringo. Between Lake Baringo and the southern tip of Lake Rudolph the Suguta Swamp lies in an area where the valley flattens and loses its distinctive formation.

The Mau Escarpment rises over 9,000 feet and stretches for more than 200 miles northward from the Tanzanian border to the Cherangany Hills. Important plateau areas of the western highlands include Trans-Nzoia, Uasin Gishu, Nandi, and Kericho, all between 6,000 and 7,500 feet above sea level. Mt. Elgon rises to 14,178 feet (4,321 metres) on the Uganda border. The Aberdare Range, which forms the eastern border of the Rift Valley, rises to nearly 10,000 feet. The eastern highlands extend from the Ngong Hills near Nairobi northward to the Laikipia Plateau. Snow-capped Mt. Kenya, the nation's highest mountain, rises to 17,058 feet (5,199 metres) and is linked to the highlands by the Nyeri saddle. The relief of both highlands is complicated and includes plains, deep valleys, and mountains. The soils are fertile; the area formerly attracted European settlement.

The eastern plateau. Sandwiched between the eastern highlands and the coastal strip, the vast Nyika plain slopes gently toward the sea. Its surface is covered with thorn scrub and is dotted with striking elevated formations, including the Taita, Kasigau, Mach, and Kitui Hills. The entire region suffers from periodic drought and is considered the country's traditional famine region. The human population is concentrated in the isolated hilly areas, where the climate is somewhat less severe.

The semiarid and arid regions. To the north and northeast, the Nyika plain merges with an area of increasing aridity that covers most of northern Kenya. A similar area is located in the southern part of the Rift Valley around Lake Magadi. There are scattered trees and grasses, but the meagre and unreliable rainfall usually supports only dwarf shrubs and bush. Areas of real desert are limited to the region east of Lake Rudolf.

The coast. The coastal belt runs for about 250 miles along the Indian Ocean. Here the shore is indented by bays, inlets, and river mouths and is dotted with islands, including Mombasa and Lamu islands. The coastal plain is limited on the west by a series of low hills. In the south the plain consists of a narrow strip two to ten miles wide; to the north the plain broadens, forming the 100-mile-wide Tana Lowlands that extend along the Somali border.

The river system

Drainage. Kenya is drained by a network of small rivers and streams that are generally shallow and exhibit seasonal changes in flow. Its two most important rivers, the Tana and the Galana, rise in the eastern highlands and flow roughly southeast into the Indian Ocean. Neither is navigable above its lower reaches, but the Tana River is being developed as a source of irrigation and hydroelectric power. The western highlands generally drain into Lake Victoria through the Nazoia, Yala, Mara, and Nyando rivers. The headwaters of the Ewaso Ng'iro are divided from those of the Tana by the Nyeri saddle; the river drains the southern portion of the eastern highlands into Lake Natron. Smaller rivers in the north and east are no more than intermittent streams or marshes.

Soils. The most fertile soils, consisting of dark brown loams, occur in the highlands. Loams, sandy loams, and clays are found in the plateau lands of west Kenya, the Rift Highlands, and parts of the coast. The most widespread soils are the sandy loams of the semiarid regions between the coast and the Rift Highlands. To the north are vast areas covered by the red desert soils, mainly sandy loams. The arid north and northwest are characterized by areas of shallow stony soils with frequent rock outcrops and desert soils.

The tendency to impeded drainage in parts of the country has given rise to a number of important soil types. Clay loams and brown loams occur in parts of west Kenya and the areas east of the rift. Also in this group are the red to strong brown friable clays of the Eldoret Plateau, Laikipia, and parts of Lake Victoria Basin.

In the lowlying parts of the Lake Victoria Basin, Eldoret Plateau, Athi-Kapiti plains, and the coast are a range of black cotton soils. In addition, alluvium and recent lacustrine depressions cover parts of the Rift Valley and the lower parts of some large rivers.

Climate. Seasonal climate rhythms are controlled by the large-scale pressure systems of the western Indian Ocean and adjacent landmasses. From December to March, northeast winds predominate north of the Equator, and south to east winds south of it. During the same months the dominant air mass is comparatively dry, although rain may occur locally. The rainy season extends from late March to May, with air flow from the east in both hemispheres. From June to August the southeast winds gradually prevail in the south; north of the Equator, however, they blow from the southwest. During this season of little rainfall, weather is stable, especially in the highlands, where it tends to be dull and cold. October marks the beginning of the transition period, which ends with the return of northeast winds in December, north of the Equator.

Local variations in temperature and rainfall occur ac-

cording to changes in altitude and physiography. In the Lake Victoria Basin, annual maximum mean temperatures range from 72° to 93" F (22" to 34° C), and the mean minimum from 50° to 64° F (10° to 18° C); precipitation varies between 40 and 70 inches annually. The higher areas of the Rift Valley experience mean temperatures of 60° to 80° F (16" to 27" C) and rainfall of from 20 to 60 inches. The highlands often experience frost and mist; mean temperatures vary from 55° to 60° F (13" to 16° C); and about 45 inches of rainfalls yearly from March to September in the west, and from 35 to 60 inches in the east, occurring from March to May and from October to December. Annual maximum mean temperatures over the eastern plateau range from 72" F (22" C) to less than 64° F (18" C) and the minimum mean temperatures from 50" F (10" C) to less than 43° F (6° C). Over the arid regions maximum mean temperatures are well above 79" F (26" C) and the minimum mean well over 57° F (14" C). The eastern plateau receives only 20 to 30 inches (500 to 750 millimetres) of precipitation annually, while the arid regions receive less than 20 inches. The coast has a mean annual temperature of more than 80" F (27" C) and rainfall of between 40 and 60 inches (1,000–1,500 millimetres).

Vegetation and animal life. In the highlands the characteristic landscape consists of patches of evergreen forest separated by wide expanses of short grass. Above the forest, a zone of bamboo extends to about 10,000 feet, beyond which the mountain moorland includes tree heaths, tree groundsel (a foundation timber of the *Senecio* genus) and giant lobelia (a widely distributed herbaceous plant). East and west of the highlands, the vegetation gives way to low trees that are scattered through grass five to eight feet high. On the northern and southern margins of the highlands, flat-topped trees are scattered through an even cover of shorter grass. Semidesert conditions below 3,000 feet give rise to thornbush, interspersed with acacias and thick-trunked baobabs. In the still drier areas of the north, desert scrub occurs, exposing the bare ground. In the coastal belt, dense high bush alternates with limited areas of forest and extensive open glades. Coconut palms are characteristic at the high-tide line, and stands of mangrove occur in the tidal estuaries and lagoons.

Large mammals

Kenya is noted for its big game, which ranges especially over the dry thornbush country in numbers that vary greatly in accordance with migrational movements. Large carnivores include the lion, leopard, cheetah, and wild dog. The commonest animals are herbivorous, however. They include the elephant, buffalo, and rhinoceros, which are found in open country as well as in the mountain forests, and huge herds of zebras, antelope, and gazelles, which range over the open plains. The wildebeest, hartebeest, impala, Thomson's gazelle, Grant's gazelle, oryx, eland, and giraffe are some of the other numerous herbivores. The hippopotamus and crocodile are common in most of the large rivers, swamps, and lakes. Hyenas and jackals play a useful role as scavengers. Baboons frequent the open country, while Sykes' and colobus monkeys live in the forests.

The many species of snakes include the mamba, cobra, puff adder, and python. Among Kenya's birds are ostriches, storks, several kinds of eagles and vultures, guinea fowl, weavers, and hornbills. By the lake shores flamingos, pelicans, herons, ibis, and ducks abound. There are also many species of migrant birds from Europe. The main mountain streams are well stocked with trout. The ngege (a nest-building freshwater fish of the genus *Tilapia*) is the principal fish in Lake Victoria, and Kenya's sea fisheries include big game fishing.

The landscape under human settlement. ***Rural*** *settlement.* More than 90 percent of the population lives in dispersed rural settlements. In the greater part of the country, land is held by traditional communal ownership. Virtually no community settlements, such as villages or towns, have developed except along the coast. Those that do exist in the interior have resulted primarily from the introduction during the colonial period of mission stations, administrative centres, and markets. Even where land reforms have resulted in the enclosure of individual land, new settlements have not been formed. Village life, where it exists, tends to centre around the activities of foreign missions.

Urban settlement. Pre-European urbanization was confined to Arab trading ports and towns established in the narrow coastal strip; a number of these, which often have a long history, still exist. More recent urban centres developed during the period of European colonization. As the railway penetrated into the interior, towns grew up along the route, as well as along the feeder roads that linked the rail line to the rest of the country.

The small town with a population of 3,000 to 10,000 is the dominant form of urban settlement. Such towns are, however, overshadowed by the capital city of Nairobi (*q.v.*), with its population of about 500,000, and by the Indian Ocean port of Mombasa; together the two cities account for approximately 69 percent of the total urban population. Apart from these, the only cities with populations of between 30,000 and 50,000 are Nakuru and Kisumu. Although most of the towns were founded for administrative reasons, their roles as centres of economic growth have taken on importance, and as more people move to the cities they play a dynamic role in the changing balance between rural and urban populations. Most of these towns are located in the highland region where European settlement was mostly concentrated. Since independence, however, the tempo of urbanization has been increasing on the coast and in the Lake Victoria Basin.

THE PEOPLE

Ethnic composition. Almost the entire population is composed of Africans. Other groups—including Asians, Europeans, and Arabs—amount to only 2 percent of the country's total inhabitants. The 10,700,000 Africans are divided into 70 different tribal groups that are distinguished from each other by language and culture. The overwhelming proportion of these peoples are agriculturalists; except for city dwellers, the rest are either herdsmen, hunters, or fishermen. Although each group tends to populate its traditional territory, different groups often coexist in a complex ecological relationship that is most developed in the southwest.

Language and tribal groups

The African peoples can best be distinguished according to the three major Kenyan language groups: Bantu, Nilotic, and Cushitic. The Bantu generally inhabit central and western Kenya; the Nilotic speakers are found in the west and northwest; and the Cushitic peoples occupy the northeast. The 11 largest tribal groups compose 92 percent of the African population; these are the Bantu-speaking Kikuyu, Kamba, Meru, Gusii, Luhya, and Mijikenda (Nyika); the Nilotic-speaking Luo, Masai, Kalenjin, and Turkana; and the Cushitic-speaking Somali. Of these 11 groups, the Kikuyu and Luo are the most numerous, and both tend to hold a great deal of political power.

Most of the Kenya tribes are well represented in the rapidly growing urban centres. The accelerating rate of urbanization and the tendency of the various ethnic groups to retain their identity against this process are well-known problems. Although urbanization tends to minimize tribal differences, the majority of the ethnic groups still retain strong links with rural origins. The dangers of tribal rivalries and consequent conflicts are problems to which political leaders have constantly drawn attention.

The Indian population of about 140,000 is found in the urban centres throughout the country. The Indians are traders; in the cities they are also engaged in large businesses. The Indian communities are cohesive, with their social activities usually restricted to their own groups. They retain their own languages—Hindustani, Punjabi, Gujarati, and Konkani—and adhere to the Islāmic or Hindu religions.

The white, or European, community numbers about 41,000. Most Europeans are from the United Kingdom, but there are also small numbers of continental Europeans as well as some Americans. The white population is variously employed, mostly as farmers, businessmen, civil servants, and missionaries. Because of the colonial legacy, their education, and their comfortable economic status, the white community enjoys an elite status. The Europeans tend to preserve their Western culture, and almost all speak English.

Arabs have continued to occupy the coastal strip since medieval times; they were—and often still are—engaged in trade between Africa and Asia. They number about 28,000, still speak Arabic, and adhere to Islām. The community is divided between "Old" or "True" Arabs—respectively, those who are descended from the early traders and those whose ancestors migrated to Kenya after the Portuguese arrived in the 16th century.

Prevalence of Swahili

About 75 different languages are spoken in Kenya. The lingua franca is Swahili, a multipurpose language that evolved on the coast and is spoken in several dialects throughout the country. Essentially a Bantu language, it contains an enormous Arabic vocabulary, as well as some Portuguese, Hindi, and English loanwords; it has evolved a standard written form. It is the language of trade, newspapers, and courts and is taught as a second language in the school system. In December 1971 Swahili became Kenya's only official language; previously English also had that status.

There is no state religion. Koman Catholicism, Anglicanism, and their reformist offshoots represent the main Christian religions. **Islām** is well established along the coast and in urban areas.

Demography. The regional distribution of population exhibits marked inequalities. The northern half of the country is only sparsely inhabited; most of the population is concentrated in the Lake Victoria Basin, the Rift Highlands, and the coastal belt. On the eastern plateau isolated settlements occupy the more elevated areas, leaving extensive stretches of relatively empty country between them. The average population density was about 47 persons per square mile at the 1969 census, while a maximum of 1,400 persons per square mile is reached in Western Province and a minimum of less than 10 per square mile occurs in the arid areas of the north.

The population is young; almost 74 percent are under 30 years of age. The total population of almost 12,000,000 is rapidly expanding, generated by a birth rate of 50 per 1,000 and a death rate of 17 per 1,000. There are more males than females.

THE ECONOMY

Resources **and** resource exploitation. ***Agriculture.*** Agriculture is the mainstay of Kenya's economy, contributing over one-third of the gross domestic product, about 60 percent of the nation's exports, and one-third of all wage employment. About four-fifths of the country is unsuitable for cultivation, however, and farming is restricted to the highlands, the western plateaus, and parts of the coast. Irrigation projects have opened some additional lands to cultivation along the Tana River and at Ahero in western Kenya. The main cash crops are coffee, tea, sisal, wattle (bark of the wattle tree, used for manufacturing tannin), and sugar, which are grown on both plantations and small farms. Grains, pyrethrum (chrysanthemums whose leaves are used in the manufacture of insecticides), cotton, tropical fruit, coconuts, and cashew nuts are also grown for market. Staple crops include maize (corn), pulses (leguminous plants, such as peas, beans, and lentils), millet, bananas, sweet potatoes, and potatoes. Stock raising is also important, including cattle for dairying and for meat. Most of the country's livestock is kept in the dry regions by subsistence pastoralists, or herdsmen, who seldom market their animals. Commercial stock raising is practiced on small farms as well as on large ranches. Hides, skins, and wool are produced both for domestic consumption and for export.

The farm-cooperative program

Agricultural development since independence has been marked by two basic programs: the Africanization of land ownership, and the encouragement of farm cooperatives. About 1,000,000 acres previously owned by Europeans had been transferred to about 30,000 African farmers by the early 1970s, and further transfers of ownership from a willing European seller to a willing African buyer are encouraged. The approximately 900 agricultural cooperatives, whose members are mainly small African farmers, are responsible for marketing, production, and maintaining quality standards. These cooperatives are most popular among the growers of pyrethrum, coffee, and sugar, as well as among dairy farmers.

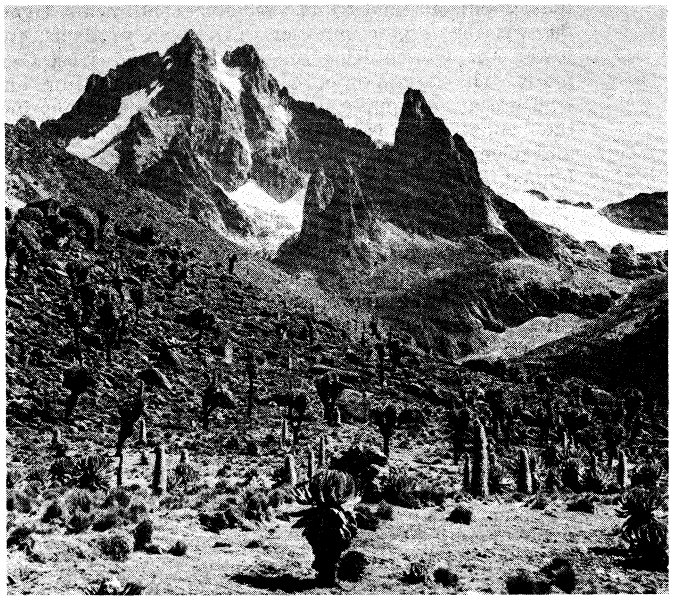
Mining and quarrying. The mining industry, though relatively small, has a potential for expansion. Geological surveys have revealed small deposits of minerals including copper, gold, silver, iron ore, lead, zinc, nickel, barite (barium sulfate), cyanite (an aluminum silicate), and wollastonite (calcium silicate). Development is restricted by the necessity of large capital outlays, the remoteness of some of the deposits, and the limited internal market. There are promising possibilities for the recovery of niobium (a metallic element used in alloy steels) and europium (a rare-earth metallic element with light-pink salts used in the production of colour television) at Mrima Hill in the coastal region. Similar possibilities exist for lead and zinc near Mombasa, as well as the limestone deposits on the coast, near Nairobi, and at Homa Bay. Sodium carbonate (soda ash) is now being worked.

Forestry. The total area of forest reserve of about 4,330,000 acres represents approximately 3 percent of the total area of the country. Most of this reserve is natural forest bush bamboo and grass, and the remainder consists of planted softwoods. The forests help to conserve soil and water and are also used used as sources of fuel and timber. Resources are estimated to amount to 17,600,000 cubic feet of timber.

Fisheries. Fish form an important supplement to the diet of subsistence farmers, but fishing contributes less than 1 percent to the nation's total income. The considerable fishing potential of Lake Rudolf, regarded as one of the largest—and virtually untapped—freshwater fisheries in Africa, has a potential annual production estimated at from 20,000 to 100,000 tons. So far, however, three-quarters of the freshwater fish landed in Kenya come from Lake Victoria. There are also plans to expand the inshore exploitation of crustaceans and to develop deep-sea fishing. The development of Lake Rudolf, located in far northern Kenya, will further necessitate the provision of adequate transportation and processing facilities.

Tourism. The nation's wildlife and natural beauty form the basis of an expanding tourist industry. Because much of the country is unsuited to agriculture, vast areas have been developed as game reserves. In the early 1970s tourism accounted for more than 2 percent of the national income, and there were well over 400,000 annual visitors to the national parks. The most popular tourist centres are Nairobi National Park, which is conveniently located close to the capital city, and Tsavo National Park, the largest game reserve. Other important attractions include Mt. Kenya, Aberdare, Lake Nakuru, and Meru National parks. There are also rapidly growing sporting and holiday facilities along the coast, both north and south of Mombasa. Malindi is an important coastal resort that attracts a growing number of overseas as well as local visitors.

Authenticated News



Peaks of Mt. Kenya, the highest mountain in Kenya. Although near the Equator, it has a permanent covering of ice and snow.

Fuel and power. Natural-fuel resources are limited to timber, from which charcoal is also made. Prospecting for natural gas and petroleum had not met with any success by the early 1970s. Crude oil imported from the Persian Gulf is refined at Mombasa.

In the early 1970s, Kenya produced about 513,000,000 kilowatt-hours of electricity yearly by thermal (oil-fuelled) or hydroelectric generation. As this did not meet domestic demand, 218,000,000 kilowatt-hours had to be imported from Uganda and Tanzania. The East African Power and Lighting Company distributed electricity to consumers, and the Kenya Power Company purchases as well as generates electric power. The Seven Forks hydroelectric scheme, administered by the Tana River Development Company, was established to increase domestic output. The first stage of the Tana River development—which began to operate in 1968 at Kindaruma—will have an initial capacity of 40,000 kilowatts. It is planned that the completed scheme will produce 300,000 kilowatts.

Industrial development

Manufacturing. Manufacturing industries were introduced into Kenya after World War II, and by the early 1970s about 1,000 such enterprises had been established, mainly in Nairobi and Mombasa. In the late 1960s the construction and food-processing industries grew the fastest. The production of textiles declined, but the manufacture of footwear rose. Products include meat preparations and frozen fish, chemicals and petroleum, pyrethrum, beer, and tobacco.

Financial services and foreign trade. *Financial services.* The Central Bank of Kenya, established in 1967, regulates the issue of notes and coins; assists in the development of a sound monetary, credit, and banking system; and serves as banker and financial adviser to the government. In addition the Commercial Bank of Kenya grants short-term or seasonal loans. The nation is also served by six international banks. The raising of funds and investment is promoted by the Nairobi Stock Exchange, which also floats public loans. An exchange control regulates the flow of private capital out of the country.

The unit of currency is the Kenyan shilling (KShs.), which is divided into 100 cents. Twenty Kenyan shillings equal one Kenyan pound (K£); (KShs. 7.14 equal $1 U.S.; KShs. 17.14 equal £1 sterling on April 1, 1971).

Foreign trade. In 1971, exports were valued at about K£111,000,000, and imports at about K£198,000,000. Coffee, tea, and sisal constituted about half of the exports; all of them were subject to fluctuating agricultural prices. Other important exports included petroleum products, chemicals, and fruits, vegetables, and meats. Uganda was the largest importer of Kenyan products, followed the United Kingdom, Tanzania and West Germany. The largest imports were crude petroleum and transportation equipment. Other products brought into the country included paper, synthetic fibres, medicines, and scientific instruments. Major import sources were the United Kingdom, West Germany, Uganda, Japan, and the United States.

A unified customs and excise service—a department of the East African Community—is in operation in Kenya, Uganda, and Tanzania. Nondiscriminatory customs dues are fixed at levels appropriate to the commodity; capital equipment is usually admitted free. Uganda and Tanzania are Kenya's major trading partners in Africa.

Attempts to secure foreign investment

Management of the economy. Economic policy recognizes that domestic resources available for development are limited and therefore encourages the investment of foreign capital. The investment of private capital in projects that will increase both production and employment is welcomed. The government also seeks to save foreign exchange and to ensure that development projects are given an equitable geographic distribution.

The central government, local authorities, and the East African Community all participate in various economic activities. Between 1960 and 1970, central government expenditure more than doubled, and in the late 1960s, government investment contributed about 27 percent annually to the gross domestic product.

Taxation. Income tax is levied upon incomes that are earned in or are derived from East Africa, providing the government with one-quarter of its revenue. Subject to certain conditions, personal allowances may be deducted according to marital status and age. Deductions are allowed for capital expenditure. A graduated personal tax is levied upon every adult living in Kenya in order to help pay for local public services. Companies are subject to a corporation tax or to an undistributed income tax.

Employment and trade unions. In the 1960s there were 625,000 employees and self-employed persons out of a total labour force of 3,200,000. The normal working week consists of 45–48 hours, depending upon the trade or profession. The Kenyanization Bureau is responsible for increasing the employment of Kenyans in all sectors of the economy. In 1965 the government enacted the National Social Security Fund and National Social Security Fund Act, which provide insurance coverage for employees in return for wage deductions.

Workers' and employers' unions

The national constitution guarantees the right of workers and employers to form trade unions for purposes of collective bargaining on wages and terms of employment. The Central Organisation of Trade Unions (COTU) was established in 1965, amalgamating the smaller unions then in existence. In the early 1970s there were 47 registered trade unions affiliated to the Central Organisation of Trade Unions. The Kenya Federation of Employers is composed of 16 employers' unions. Provision is made for settlement of a trade dispute through voluntary bargaining by the parties concerned, or by referring the dispute to arbitration.

Transportation. *The railways.* Almost 1,300 miles of railways are operated in Kenya by the East African Railways Administration. The main line runs northwestward from Mombasa through Nairobi, Nakuru, and Eldoret to the Uganda border at Tororo. In addition, there are branch lines from Nakuru to the Lake Victoria port of Kisumu; from Voi to Kahe in Tanzania; and from Konza to the soda deposits at Lake Magadi. Other lines running to agricultural regions include those from Gilgil to Thomsons Falls, from Rongai to Solai, from Leseru to Kitale, and from Kisumu to Butere.

Harbours. Mombasa, the principal port of Kenya, handles all the import and export traffic of Kenya, Uganda, and the northern Tanzanian mainland. At Mombasa, which is situated on an island, harbour activities are carried on at Kilindini—which extends to Kipevu—as well as at the old Mombasa Harbour on the eastern side of the island. The Mombasa-Kilindini Harbour has 13 deepwater berths, together with a jetty for the oil tankers that supply the refinery. In 1971 about 3,900,000 tons of cargo, including oil, were landed annually at Mombasa, and about 1,700,000 tons loaded. The ports of Lamu and Malindi provide additional but limited facilities; they mainly serve the coastal trade and fisheries.

Inland waterways. The services operated on Lake Victoria provide important links between Kenya and Uganda and Tanzania. From Kisumu, lake steamers serve the main ports, including Mwanza and Port Bell. In addition, lighter services serve the lesser ports. There is a marine base with work shops and a dry dock at Kisumu.

Road building

Roads. Kenya has an extensive road network covering the more populous parts of the country. There are plans to extend the system to the more arid regions. A highway from Nairobi to Addis Ababa in Ethiopia is under construction. A large proportion of development funds have been devoted to improvements in road communications. Between 1960 and 1971 paved road mileage almost trebled, increasing from 700 to 1,900 miles. Since the mid-1960s total receipts from the road transport industry consequently increased by 61 percent, exceeding the receipts from railway transport. Registration of new vehicles has increased by about 10 percent a year; with a sharp rise in the registration of trucks and 'motorcycles. Priority is placed by the government on the development of feeder roads as part of the rural-development program.

Aviation. Nairobi Airport, one of the main international airports of East Africa, serves 20 international airlines. Its runways are being extended to accommodate the largest jets. The airport is situated more than eight miles from the centre of Nairobi in the Athi-Kapiti plains.

Domestic routes link Nairobi, Mombasa, Malindi, Kisumu, and Kitale; there are connections to international air routes through Nairobi, as well as through Dar es Salaam in Tanzania and Entebbe in Uganda. In addition, several private airlines provide charter service to smaller centres in East Africa.

ADMINISTRATION AND SOCIAL CONDITIONS

Government structure. *The constitutional framework.* Kenya is a republic and a member of the Commonwealth of Nations. The constitution consists of a British Order in Council, made at the time of independence in 1963, which has since been radically amended by the Kenya parliament. It provides for a parliament consisting of the president and the National Assembly. The president is the head of state and commander in chief of the armed forces. The unicameral assembly consists of 158 elected members and 12 members who are elected by the National Assembly sitting as an electoral college. Elections are by universal adult suffrage, and are held at least every five years. The speaker and the attorney general are ex officio members of the National Assembly. The president appoints the vice president from among the ministers, who are all elected members of the assembly. The Cabinet consists of 23 ministers, including the president, vice president, and attorney general. There are 29 assistant ministers appointed by the president from among the members of the National Assembly.

Local government. Kenya is divided into seven provinces: Central, Rift Valley, Nyanza, Western, North-Eastern, Eastern, and Coast. The administrative district of Nairobi forms a separate unit. Local government consists of appointed provincial commissioners and elected county councils and township or municipality authorities. The commissioners are responsible for education, transport, and health in their provinces, while the councils are concerned with services. An appointed district commissioner serves as an ex officio member of the county council. Local advisory committees composed of the councillors of a specific area advise the councils on local matters. Mayors and county chairmen are appointed from names submitted by the elected councillors.

The Kenya African National Union

The political process. Although the constitution provides for a multiparty system, Kenya is at the moment a one-party state. The ruling part is the Kenya African National Union (KANU), which is headed by the president. Party officials include the president, provincial vice presidents, and district chairmen. Participation in the party's activities is through membership. The election of party candidates for the National Assembly is by secret ballot.

De facto political developments. The former opposition party, the Kenya People's Union, is banned, and no other party was registered by the early 1970s. Political representation tends to reflect the geographical distribution of ethnic groups. There is, however, a strong national identity among members of KANU.

Justice. The judiciary is independent and is headed by the chief justice and 11 puisne (associate) judges of the High Court, which has full civil and criminal jurisdiction. There are also resident magistrates' courts and district magistrate courts. Judges are appointed by the president. All legal practitioners are advocates of the High Court and may appear in all courts. The final court of appeal is the Court of Appeal for East Africa in Nairobi. Although there is only one judiciary, Islāmic customary law is accepted in the courts.

The armed forces. The army totals about 6,500 men and is headed by a major general; it is divided into four battalions and a paratroop company. In addition, there is a 2,000-man paramilitary organization, the General Service Unit, which is organized on a territorial basis and which assists in the maintenance of law and order. The Kenya Air Force and the Kenya Navy each consist of a small nucleus capable of further expansion. The air force possesses a number of training and transport planes. The small navy operates patrol boats.

The police. Kenya has the largest and best equipped police force in East Africa. Its 12,000 members are headed by a commissioner of police who is appointed by the president; he is assisted by a number of senior assistant and provincial commissioners. Responsibility for the police, immigration, and prison administration lies with the vice president, in his, capacity as minister of home affairs.

Social conditions. ***Education.*** A single national educational system consists of three educational levels. At the first level, there are seven years of primary education; followed by a further six years of secondary education; the third level is represented by university education, which requires from three to five years of study in order to sit for degree examinations. When primary schooling is completed, entrance to the secondary level is contingent upon passing an examination.

Secondary education has expanded markedly since independence, and greater emphasis has been placed upon technical education. As accommodations available in government-supported secondary schools are limited, self-help secondary schools, which now outnumber government secondary schools, have accounted for much of the expansion. The self-help schools receive liberal government assistance, both in the provision of teachers and learning materials.

The University of Nairobi, which, until 1970, was part of the University of East Africa, is now Kenya's independent national university. University education is oriented toward the promotion of Kenya's social and economic development.

Housing. Because of a rapidly expanding population, the provision of housing is a critical national problem. In the rural areas it is a question of improving the quality of the existing housing, but in the cities and towns the influx of population has created a demand for more housing units. Investment in housing, both public and private, is increasing. Government housing programs for the construction of rental flats and private units in the cities are the responsibility of the National Housing Corporation, an agency of the Ministry of Housing. Inproved rural housing is promoted by government housing loans. To safeguard the public against excessive rental charges, the government has established a Rent Restriction Department; rent tribunals meet periodically in Nairobi, Kisumu, and other towns.

Rural housing

Rural housing consists of circular or rectangular buildings of mud and thatch. Tin roofing, cement, bricks, and tiles are commonly used as building materials. Groups of buildings, or compounds (enclosures with dwellings), are separated from the surrounding fields by fences, hedges, stone walls, or courtyards. Housing in the towns is of various types, and sanitation facilities are provided in varying degrees. The town dwellings occupied by recent African migrants are similar to those in the rural areas, and are not well suited to crowded urban conditions. Other buildings include shop-houses, apartment buildings, and bungalows. Most homes are rented, but since the mid-1960s the government has promoted private ownership.

Health and welfare services. Health services are provided by the central government, local authorities, voluntary agencies, and private practitioners. There are almost 1,800 medical practitioners, as well as dentists, pharmacists, and a large number of registered and enrolled nurses and midwives. Government hospital facilities slightly exceed those available at private or mission hospitals.

Emphasis is changing from curative to preventive medicine, and the government plans a rapid expansion in paramedical personnel. Maternal and child health care and family-planning services are provided. The government participates in a wide range of community and social welfare services to promote the organization of self-help activities, such as the development of family- and child-welfare services, the care and rehabilitation of the disabled, providing assistance to the handicapped, and the promotion of adult education.

Cultural life. Kenya, a country of diverse and rich cultural traditions, seeks to cultivate and develop those traditions to ensure that its valuable cultural assets are not irretrievably lost and that social cohesion is not undermined in the process of change to newer ways.

The national museum

A National Archive Service has been established, and it is saving an increasing number of documents. A national library service board has also been established to equip, maintain, and develop libraries in Kenya, including a branch library service. Kenya has a national museum of world repute; it contains collections of wildlife, archaeological remains, and objects of Kenya's material culture. The museum cooperates closely with the University Cultural Division of the Institute for Development Studies. The division promotes and conducts research in history, archaeology, social anthropology, musicology, literature, traditional arts and crafts, and systems of belief.

Performing arts and literature. The Kenya National Theatre is incorporated in the Kenya Cultural Centre. A theatre school was founded in 1968 to provide professional training in theatrical techniques, which include the writing of plays by Kenyan authors and the performance of traditional music and dance. Music and dance play an integral role in social and religious life. Rhythm, all-important, is largely provided by the drum, supplemented by wind and stringed instruments. Swahili literature, both oral and written, is traditional in form and content. Contemporary novelists, including James Ngugi and Mugo Gatheru, deal with the social frictions between traditional and modern society. Visual arts are largely confined to the mass production of wood sculpture for the tourist trade. Elimo Njau and Ronal Rankin are popular Kenyan painters.

The media. The national press consists of daily and weekly newspapers published either in Swahili or English. It is independent and uncensored, but it is expected to support government developmental policies. Radio services are provided by the government-owned Voice of Kenya, which broadcasts from Nairobi in Swahili, English, and several African vernaculars, as well as in Hindustani and Gujarati. There are transmitters at Mombasa and Kisumu. News broadcasts and public affairs themes are popular; other programs cover religion, sports, music, and drama. Television, also government-sponsored, is available in Nairobi and in the Rift Valley, West, and Coast provinces. Programs are broadcast simultaneously in Swahili and English; many are imported from the United States and the United Kingdom. In the towns, movie theatres show full-length feature films that largely come from the United States, the United Kingdom, and India. Educational and documentary films are popular and are shown in rural areas also by mobile units.

Prospects. The continuation and extension of development programs aiming at Kenya's social and economic advancement may be expected to provide the focus of national effort in the future. Economic progress, which in Kenya is dependent upon the participation of the individual through community activities, is also dependent to some extent upon foreign investment. National income is also, to some extent, subject to fluctuations in commodity prices and to the threat of drought. Health, sanitation, and housing improvements are being made, but gains in these domains are challenged by the increasing birthrate, although family-planning programs are also being introduced. Progress is dependent upon the preservation of an atmosphere of sustained national unity.

BIBLIOGRAPHY. F.F. OJANY, *The Physique of Kenya* (1966), is a short but comprehensive paper on the Kenya landscape; S.H. OMINDE, *Land and Population Movements in Kenya* (1968), a comprehensive geographical account of the country and its population in the context of planning; KENYA COLONY AND PROTECTORATE, *Survey of Kenya: Kenya Atlas*, 3rd ed. (1971), contains texts and photographs. Development aspects of Kenya are discussed in S.H. OMINDE, "Kenya," in *Developing Countries of the World* (1968); and R.B. OGENDO, *Some Aspects of the Geography of Electricity in Kenya* (1965). Useful information on population trends and problems is contained in *United Nations Mission to Kenya on Housing* (1965); *Family Planning in Kenya: Report of the Mission of Popzrlation Council of the United States of America* (1967); and in *East Africun Royal Commission Report 1953–1955*, Cmd 9475. Important sources of population data include the following volumes from the Kenya Population Census 1962: *Population Census Advanced Report:* vol. 1 and 2 (1964); vol. 3: *African Population* (1966); and vol. 4, *Non-African Population* (1966). The most recent population data is published in the *Kenya Population Census* (1969, 1970). Current industrial policy and conditions are treated in a summary from *A Guide to Industrial Investment* (1968), published by the MINISTRY OF COMMERCE AND INDUSTRY. W.T.W. MORGAN (ed.), *East Africa: Its Peoples and Resources* (1969), is a useful collection of 20 essays on East Africa including Kenya.

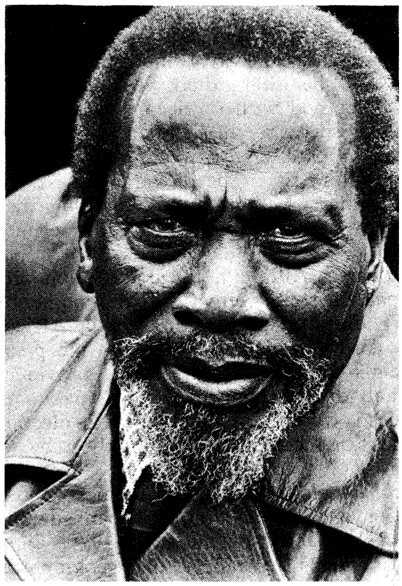
(S.H.O.)

Kenyatta, Jomo

The career of Jomo Kenyatta, an African statesman and nationalist leader, spans the entire period of colonial rule in British East Africa. A heavy-set, powerful man with considerable personal magnetism and a gift for oratory, he became, in 1963, the first prime minister of independent Kenya.

Early life

He was born as Kamau, son of Ngengi (c. 1894), at Ichaweri, southwest of Mount Kenya in the East African highlands. His father was a leader of a small agricultural settlement; his grandfather was a *murogi*, or diviner, whose knowledge of medicine and magic set him apart from other people. Like all Kikuyu boys, Kamau learned hunting skills, close observation, memory discipline, social obligations and responsibilities, family and clan history. From his grandfather he learned herbal remedies and gained a respect for the spiritual knowledge and powers of the diviner.



Kenyatta.
John Moss—Black Star

At about the age of ten Kamau became seriously ill with jigger infections in his feet and one leg, and he underwent successful surgery at a newly established Church of Scotland mission. This was his initial contact with Europeans. Fascinated with what he had seen during his recuperation, Kamau ran away from home to become a resident pupil at the mission. He studied the Bible, English, mathematics, and carpentry and paid his fees by working as a houseboy and cook for a European settler. In August 1914 he was baptized with the name Johnstone Kamau. He was one of the earliest individualists and outcasts among the Kikuyu to run away from the confines of his own culture. And, like many others, Kamau soon left the mission life for the bright lights of Nairobi.

There, he secured a job as a clerk in the Public Works Department. During World War I Kamau enjoyed his relative affluence, impressing people with flashy clothes and a general savoir-faire. He added the name Kenyatta, the Kikuyu term for a fancy belt, which he affected. After serving briefly as an interpreter in the High Court, Kenyatta transferred to a post with the Nairobi Town Council. About this time he married and began to raise a family. According to his younger brother, he was "not interested in politics."

The first African political protest movement in Kenya against a white-settler-dominated government began in 1921—the East Africa Association (EAA), led by an educated young Kikuyu named Harry Thuku. Kenyatta joined the following year. In March 1922 Thuku was arrested; he was later deported and overt protest was silenced. Kenyatta, however, continued to work privately for the EAA as propaganda secretary. As a government employee, he was supposed to avoid politics, but he managed to remain inconspicuous. In 1925 the EAA disbanded as a result of government pressures, and its members re-formed as the Kikuyu Central Association (KCA). Three years later Kenyatta became its general secretary, though he had to give up his municipal job as a consequence.

Entrance into full-time politics

In May 1928 Kenyatta launched a monthly Kikuyu-language newspaper *Mwigithania* ("He Who Brings Together"), aimed at gaining support from all sections of the Kikuyu. The paper was mild in tone, preaching self-improvement, and was tolerated by the government. But soon a new challenge appeared. A British commission recommended a closer union of the three East African territories (Kenya, Uganda, Tanganyika). Settler leaders supported the proposal, expecting that internal self-government might follow. To the KCA such a prospect looked disastrous; in February 1929 Kenyatta went to London to testify against the scheme.

In London the secretary of state for colonies refused to meet Kenyatta, but several groups critical of British colonialism aided him; the League Against Imperialism arranged a brief trip to Moscow for him, from August to October 1929. The following July Kenyatta attended the International Negro Workers' Conference at Hamburg. His hosts urged the unity of the black proletariat as a worldwide exploited class, but Kenyatta's interests remained rivetted on the sufferings of his own people. On March 26, 1930, he wrote an eloquent letter in ***The Times*** of London setting out five issues championed by the KCA: (1) security of land tenure and the return of lands alienated to Europeans, (2) increased educational facilities, (3) repeal of hut taxes on women, which forced some to earn money by prostitution, (4) African representation in the Legislative Council, (5) noninterference with traditional customs.

He concluded by calling the lack of these measures "a short-sighted tightening up of the safety valve of free speech, which must inevitably result in a dangerous explosion—the one thing all sane men wish to avoid."

Again in 1931 Kenyatta's testimony on the issue of closer union was refused despite the help of liberals in the House of Commons. In the end, however, the government abandoned its plan for union for the time being. Kenyatta did manage to testify on behalf of Kikuyu land claims in 1932 at hearings of the Carter Land Commission. The commission decided to offer compensation for some alienated territories but maintained the "white-highlands" policy, which restricted the Kikuyu to overcrowded reserves. Kenyatta again visited the Soviet Union and eastern Europe, and on his return he supported himself from 1933 to 1936 as a phonetics informant at University College, London. He studied anthropology in 1936 at the London School of Economics. His thesis was revised and published in 1938 as ***Facing Mount Kenya,*** a study of the traditional life of the Kikuyu characterized by both insight and a tinge of romanticism. It defended a way of life that was already deeply eroded, and it ignored the extensive adaptations Kikuyu had made to European culture. The book signalled another name change, to Jomo (Burning Spear) Kenyatta.

During the 1930s, Kenyatta briefly joined the Communist Party, met other black nationalists and writers, and actively organized protests against the Italian invasion of Ethiopia. The onset of World War II temporarily cut him off from the KCA, which was banned by the Kenya authorities as potentially subversive. Kenyatta maintained himself in England by lecturing for the Workers Educational Association and working as a farm labourer. But he continued to produce political pamphlets publicizing the Kikuyu cause.

Return to Kenya

Kenyatta helped organize the fifth Pan-African Congress, which met in Manchester on October 15–18, 1945, with W.E.B. Du Bois of the United States in the chair; Kwame Nkrumah, the future leader of Ghana, was also present. Resolutions were passed and plans discussed for mass nationalist movements to demand independence from colonial rule. Kenyatta returned to Kenya in September 1946 to take up leadership of the newly formed Kenya African Union, of which he was elected president in June 1947. From the Kenya African Teachers College, which he directed as an alternative to government educational institutions, Kenyatta organized a mass nationalist party. But he had to produce tangible results in return for the allegiance of his followers, and the colonial government in Kenya was still dominated by unyielding settler interests. The "dangerous explosion" he had predicted in 1930 erupted in Kenya as the Mau Mau rebellion of 1952.

On October 21, 1952, Kenyatta was arrested at his home at Gatundu. Police seized documents and arrested 98 other African leaders. Despite government efforts to portray Kenyatta's trial as a criminal case, it received worldwide publicity as a political proceeding. In April 1953 Kenyatta was sentenced to a seven-year imprisonment for "managing the Mau Mau terrorist organization." He denied the charge then and ever afterward, maintaining that the Kenya African Union's political activities were not directly associated with Mau Mau violence.

The British government responded to African demands by gradually steering the country toward African majority rule. In 1960 the principle of one man, one vote was conceded. Kenya nationalist leaders such as Tom Mboya and Oginga Odinga organized the Kenya African National Union (KANU) and elected Kenyatta (still in detention despite having completed his sentence) president in absentia; they refused to cooperate with the British while Kenyatta was detained. In a press conference Kenyatta promised that "Europeans would find a place in the future Kenya provided they took their place as ordinary citizens."

Kenyatta was released in August 1961, and, at the London Conference early in 1962, he negotiated the constitutional terms leading to Kenya's independence. KANU won the pre-independence election in May 1963, forming a provisional government; Kenya celebrated its independence on December 12, 1963, with Kenyatta as prime minister.

A year later Kenya became a one-party republic with a strong central government under Kenyatta as president. Kenyatta, who had spent his youthful years herding his father's goats on the ridges of Kikuyuland, quite unaware of the greater world outside, presided over the complex problems of postindependence development and instructed his United Nations delegates on the subtleties of a "nonaligned" foreign policy. Always—in spite of his imprisonment by the British authorities—the most pro-British of African leaders, Kenyatta made Kenya the stablest black African country and one that attracted foreign investment on a broad scale. Under his leadership the economy prospered: agriculture, industry, and tourism all expanded. He died at Mombasa on August 22, 1978.

BIBLIOGRAPHY. GEORGE DELF, ***Jomo Kenyatta: Towards Truth About "The Light of Kenya"*** (1961), written while Kenyatta was still detained, defends Kenyatta from charges of leading Mau Mau. A later biography, by JEREMY MURRAY-BROWN, is ***Kenyatta*** (1972). ANTHONY HOWARTH, ***Kenyatta: A Photographic Biography*** (1967), assembles information on Kenyatta's early life from a variety of published sources and includes excellent pictures. Two works by KENYATTA are ***Facing Mount Kenya*** (1938), a study of traditional Kikuyu life from a sympathetic and even romantic viewpoint but containing much insight; and ***Kenya: Land of Conflict,*** with an introduction by GEORGE PADMORE (1944), a pamphlet that signals Kenyatta's shift toward more aggressive demands on behalf of Kenya Africans. CARL ROSBERG and JOHN NOTTINGHAM, ***The Myth of "Mau Mau"*** (1966), is a survey of the rise of nationalist politics in Kenya.

(Jo.R.)

Kepler, Johannes

The Renaissance astronomer and astrologer Johannes Kepler is best known for his discovery of the three principles of planetary motion, by which he clarified the spatial organization of the solar system. Moreover, he founded modern optics by presenting the earliest correct explanation of how human beings see. He was the first to set forth accurately what happens to light after it enters a telescope, and he designed a particular form of that instrument. His ideas provided a transition from the ancient geometrical description of the heavens to modern dynamical astronomy, into which he introduced the concept of physical force.

Early life. On December 27, 1571, in the German town of Weil der Stadt, then a "free city" within the Holy Roman Empire, Johannes was born prematurely, the offspring of an unhappy marriage. His father was a ne'er-do-well mercenary soldier, his mother the quarrelsome daughter of an innkeeper. Small in stature, Johannes never enjoyed robust health, but his superior intelligence was recognized even when he was a young child. Coming from a poor family, he would have received no education had not the dukes of Wiirttemberg adopted the enlightened policy of providing generous scholarships for the bright sons of their impoverished subjects.

With such help Kepler in 1587 was able to attend the University of Tiibingen, where he had the good fortune to study astronomy under Michael Mästlin, a professor who may have been unique in his day, for he was convinced that the astronomical system propounded by Nicolaus Copernicus was basically true: the Earth is a planet that rotates daily around its own axis and revolves annually around the Sun. Kepler's youthful acceptance of Copernican astronomy profoundly affected the subsequent course of his life.

Kepler, engraving by an unknown artist, c. 1730, after a contemporary painting.
Archiv fur Kunst und Geschichte

Major achievements. After obtaining the B.A. in 1588 and the M.A. in 1591, Kepler planned to become a Lutheran minister. But in 1594, during his last year of training in theology at Tubingen, the teacher of mathematics in the Lutheran high school of Graz, in Austria, having died, Kepler was strongly recommended by the Tiibingen faculty to fill the vacancy. Kepler did not finish the theology course at Tiibingen but went to Graz the same year. On a summer day in 1595, while he was teaching a class, a spectacular idea flashed through his mind. Ancient Greek geometry had proved that there were five regular solids, or "Platonic bodies": tetrahedron (pyramid), cube, octahedron (formed by eight equilateral triangles), dodecahedron (12 pentagons), and icosahedron (20 equilateral triangles). The ancients knew that these five solids could be enclosed in a sphere, and that there can be no additional regular solids. Sustained by a vision of mathematical harmonies in the skies, a vision he derived from the philosophy of Plato and the mathematics of the Pythagoreans, Kepler tried to relate planetary orbits with geometrical figures.

The notion of cosmic harmony

According to Copernican astronomy there were six planets, whose orbits were regulated by the turning of invisible spheres. But why were there only six planets and not nine or 100? Was the cosmos so constructed that one of the five regular solids intervened between each pair of the unseen spheres that carried the six Copernican planets? This nest of alternating planets and regular solids constituted the main theme in Kepler's *Prodromus Dissertationurn Mathematicarum Continens Mysterium Cosmographicum* ("Cosmographic Mystery"), which he published in 1596 under the auspices of the Tübingen faculty. The Platonic and Pythagorean components in Kepler's conception of celestial harmony, however mystical in origin, helped to lead him to the three principles of planetary motion now known by his name.

Kepler sent copies of his first major work to a number of scientists, including Tycho Brahe, who was soon to become the imperial mathematician of the Holy Roman Empire. Although Brahe did not agree with the underlying Copernican foundation of Kepler's *Mysterium Cosmographicum,* he was so impressed by the author's knowledge of astronomy and skill in mathematics that in 1600 he invited him to join his research staff in the observatory at Benatek (now Benátky nad Jazerou), outside Prague. When Brahe died the next year, Kepler was promptly appointed his successor as imperial mathematician. His first publication at Prague, *De Fundamentis Astrologiae Certioribus* (1601; "The More Reliable Bases of Astrology"), rejected the superstitious view that the stars guide the lives of human beings. Nonetheless, his deep feeling for the harmony of the universe included a belief in the harmony between the universe and the individual, and his skill in astrological prediction was much in demand.

While Kepler was watching a rare conjunction of Mars, Jupiter, and Saturn in October 1604, a supernova appeared that remained visible for 17 months. This event was evidence that the realm of the fixed stars, considered since ancient times as pure and changeless, could indeed experience change. He published the results of his observations in 1606 as *De Stella Nova in Pede Serpentarii* ("The New Star in the Foot of the Serpent Bearer").

Contributions to optics

Kepler now had access to Brahe's incomparable collection of astronomical observations, the results of decades of unremitting and painstaking toil by the greatest naked-eye observer of the heavens and the leader of a highly qualified team of astronomers. As a member of the team, Kepler had been assigned to investigate the planet Mars. But before he could use the raw observations, Kepler felt that he had to solve the problem of atmospheric refraction: how is a ray of light, coming from a distant heavenly body located in the less dense regions of outer space, deflected when it enters the denser atmosphere surrounding the Earth?

Kepler incorporated his results in a book that he modestly entitled *Ad Vitellionem Paralipomena, Quibus Astronomiae Pars Optica Tradirur* (1604; "Supplement to Witelo, Expounding the Optical Part of Astronomy"); Witelo (Latin Vitellio) had written the most important medieval treatise on optics. But Kepler did much more than add to Witelo's work. He made an analysis of the process of vision that provided the foundation for all of the advances in the understanding of the structure and function of the human eye. Kepler wrote that every point on a luminous body in the field of vision emits rays of light in all directions, but that only those rays can enter the eye that impinge on the pupil, which functions as a diaphragm. He stated that the rays emanating from a single luminous point form a cone, the circular base of which is in the pupil. All of the rays are then refracted within the normal eye to meet again at a single point on the retina, identified by Kepler as the sensitive receptor of the eye. If the eye is not normal, the second short interior cone comes to a point not on the retina but in front of it or behind it, causing blurred vision. For over three centuries eyeglasses had helped older persons to see better. But nobody before Kepler was able to explain how these little pieces of curved glass had worked.

After the invention of the telescope had been reported to Galileo, who promptly proceeded to make his astounding discoveries, Kepler applied the same ideas concerning optics to the explanation of how the telescope works. Although Galileo's findings were received in general with skepticism and ridicule, Kepler acknowledged the Italian's accomplishments in his *Dissertatio cum Nuncio Sidereo Nuper ad Mortales Misso a Galilaeo Galilaeo* in 1610.

Kepler's three principles of planetary motion

Galileo did not return the compliment. He chose to ignore the epoch-making results Kepler had published the preceding year. In his *Astronomia Nova* ("New Astronomy") of 1609, Kepler had demonstrated that the orbit of the planet Mars is an ellipse. Although it had been believed since antiquity that the planets, being heavenly bodies, were perfect and therefore could move only in perfect circles or combinations of circles, Copernicus had correctly classified the Earth as one of the planets; and it was fully accepted that the Earth was far removed from perfection. Kepler extended Copernicus' reasoning to the other planets and was the first to declare that the other planets resemble the Earth in being material bodies. That a material body, being imperfect, need not travel in a perfectly circular orbit was a conclusion made by Kepler after he tried unsuccessfully to fit the orbit of Mars to Brahe's observations in every possible combination of circles his ingenuity could devise. Because none of them worked, he tried noncircular paths until he found the true solution: Mars revolves in an elliptical orbit with the Sun occupying one of its two focuses.

The pre-Keplerian dogma that permitted only circular paths entailed the concept of uniform motion—*i.e.*, the moving body or point must traverse equal arcs in equal intervals of time. Such a conception of uniform motion as measured along an arc was, of course, incompatible with an elliptical orbit. But Kepler found an alternative form of uniformity. This new uniformity equated equal areas with equal times. With the Sun remaining stationary in one focus of the ellipse, the planet, while revolving along the periphery of its elliptical orbit, would sweep out, in equal intervals of time, equal areas of the ellipse, not equal arcs along the periphery of the ellipse.

In 1619, ten years after Kepler published these first two principles of planetary motion (the elliptical orbit and equality of areas), he published the *Harmonices Mundi* (*Harmonies of the World),* in which he expounded his third principle, which related a planet's mean distance from the Sun to the time it takes to complete its elliptical orbit around the Sun. The cube of the distance proved to be in a constant ratio to the square of the time required for all the planets to complete such an orbit. The enunciation of this rule (sometimes called the 3/2 ratio) completed Kepler's contribution to the understanding of planetary motion and helped to prepare the way for Sir Isaac Newton's idea of universal gravitation, affecting all of the material bodies in the physical universe.

Later life. Meanwhile, Kepler's patron, the Holy Roman Emperor, had been compelled by his brother to abdicate, and Kepler himself had found it desirable to leave Prague, then the capital of the empire. Although he was reappointed imperial mathematician by the new emperor, Kepler moved to Linz, in Austria. His first wife had died in Prague; Kepler remarried in 1613. Once, when buying supplies for his new home, Kepler became unhappy about the rough-and-ready methods used by the merchants to estimate the liquid contents of a wine barrel. Because the curved containers they used were of various shapes, Kepler sought a mathematical method for determining their volumes. Following the model established by Archimedes, the most talented mathematician of antiquity, Kepler, in his volumetric researches, investigated the properties of nearly 100 solids of revolution—made by rotating a twodimensional surface on one of its axes—that had not been considered by Archimedes. Starting with an ordinary wine barrel, Kepler enormously extended the range of Archimedes' results. He did so by refusing to confine himself, as Archimedes had done, to cases in which a surface is generated by a conic section—a curve formed by the intersection of a plane and a cone—rotating about its principal axis. Kepler's additional solids are generated by rotation about lines in the plane of the conic section other than its principal axis.

While he was in Linz, Kepler published his *Epitome Astronomiae Copernicanae* (1618–21; *Epitome of Copernican Astronomy*). He modelled this title after the highly successful introduction to astronomy published by his former Tiibingen professor in a number of editions. But, whereas Mastlin had deemed it prudent pedagogical practice to keep Copernicanism out of an elementary textbook, which he therefore entitled simply "Epitome of Astronomy," Kepler emphasized his open espousal of the new cosmology by inserting the provocative label "Copernican."

Witchcraft trial of his mother

In Linz in 1620, Kepler heard that his mother had been indicted on the charge of being a witch. Such a defendant was often subjected to torture and, if convicted, was usually burned at the stake. If his mother had suffered this fate, Kepler's own status as imperial mathematician of the Holy Roman Empire and mathematician of Upper Austria might have been irreparably impaired. He rushed to her defense, therefore, not only out of filial devotion but also out of prudent self-interest. Only his skillful intervention saved her from torture and a fiery death.

Kepler had planned to publish his *Tabulae Rudolphinae* (*Rudolphine Tables),* named in honour of his first imperial patron, Rudolph II, in Linz. But this work, the final outcome of long years of unceasing reflection and tireless calculation, could not be printed there because of a rebellion by the peasants, who were infuriated by a combination of being forced to return to Catholicism and to pay heavy taxes. Kepler had to find another home and a new patron.

Albrecht von Wallenstein, duke of Friedland and Żagań, a successful soldier of fortune who had put his private army at the disposal of the empire in the Thirty Years' War, accepted the responsibility of satisfying Kepler's financial needs. The astronomer moved to Żagań in Silesia, where he was able to establish his own printing press. The *Rudolphine Tables* were printed at Ulne, Germany, in 1627, before Kepler went to Żagań in 1628. But Wallenstein turned out to be someone on whom Kepler could not rely.

Leaving his family behind in Żagań, Kepler went west to collect the interest due on two promissory notes he held in exchange for money he had deposited in Austria. On his way he stopped at Regensburg, where the Imperial Diet was in session. He fell acutely ill and died on November 15, 1630. The tremendous upheavals suffered by Germany in the Thirty Years' War later obliterated his grave.

J. Phys.,* 34:610–613 (1966); and "Kepler and Witchcraft Trials," *Historian,* 28:447–450 (1966).

(Ed.R.)

Kerala

Kerala, one of the smallest states in the Republic of India, was formed in 1956. It has an area of 15,007 square miles (38,869 square kilometres) and a population of more than 21,000,000 (1971). With only about one percent of the area of India, Kerala has to support almost four percent of its population.

The state stretches for about 360 miles along the Malabar Coast on the western side of the Indian peninsula; its width varies from 20 to 75 miles. It is bordered by Mysore state to the north, Tamil Nadu (Madras) state to the east, and the Arabian Sea to the west. The capital is Trivandrum. Isolated from the Deccan Plateau by the mountainous belt of the Western Ghāts, but with a long coastline that opens it to foreign influences, Kerala has evolved a unique culture. It is a highly politicized region, but it has a long tradition of religious amity. It is an educationally advanced state with its own language, Malayalam, and has the highest rate of literacy among India's states. Women in Kerala enjoy a high social status, thanks perhaps to its historic matrilineal system. But the hills of Kerala are inhabited by some of India's least advanced tribes. (For a related physical feature see ARABIAN SEA.)

History. The first known mention of Kerala occurs on one of the rock inscriptions left by Aśoka, emperor of India during the third century BC. It was then an independent kingdom known as Keralaputra, which was ruled by the powerful Cēra dynasty until the fifth century AD. In ancient times it traded with Egypt, Babylonia, Greece, Rome, and China. This was the period when Aryans migrated into Kerala and introduced Hinduism, Buddhism, and Jainism into this Dravidian kingdom. It is believed that St. Thomas the Apostle founded the Syrian Church—and Jewish immigrants established a colony—at Muziris (Cranganore) in the first century AD.

The Malabar era

The history of Kerala from the sixth to eighth centuries AD is obscure. It was probably during this period that Arab traders introduced Islām. From AD 825—the year in which the Kollam era, regarded as still in progress, began—Kerala rose to prominence under the Kulasekhara dynasty. The ninth and tenth centuries formed a golden age marked by a remarkable development in philosophy, literature, education, and the fine arts. This period marks the origin of Malayalam as a separate language.

During the 11th century a hundred years' war with the Cōḻas led to the disintegration of the Cēra kingdom into innumerable petty principalities. By the beginning of the 14th century, however, the ruler Ravi Varma Kulasekhara established a short-lived supremacy over the whole of southern India. His empire fell to pieces, however, soon after his untimely death in 1314, after which Kerala became a conglomeration of warring chieftaincies, among which the most important were Calicut in the north and Travancore in the south.

The year 1498—when Vasco da Gama landed at Calicut—marked the beginning of the era of foreign intervention. In the 16th century the Portuguese superseded the Arab traders and dominated the commerce of Malabar. Their attempt to establish sovereignty, however, was thwarted by the *zamorin* of Calicut. The Dutch ousted the Portuguese in the 17th century but met with a crushing defeat at the hands of King Martanda Varma of Travancore in 1741. The destructive invasions of Kerala between 1766 and 1790 by Hyder Ali and Tippu Sultan, both of Mysore, paved the way for the establishment of British power. Both Cochin and Travancore were obliged to accept British suzerainty in 1791 and 1795, respectively; the *zamorin*'s territories were annexed by the British and constituted into the Malabar district of the Madras presidency under their direct rule. Unsuccessful revolts against British rule were led by Pazhassi Raja of Malabar from 1800 to 1805 and by Velu Thampi of Travancore in 1809, both of whom were martyred as a result. Two years after India's independence was achieved in 1947, the two states were united as the Travancore-Cochin state. In 1956 the present Kerala was constituted on a linguistic basis, thus also including other Malayalam-speaking areas in the Malabar region.

The landscape. Kerala is a region of great natural beauty. From the majestic heights of the Western Ghāts the country undulates westward, presenting a vista of silent valleys clothed in the richest green. Among the many rivers that glide across the plains to merge their waters with the Arabian Sea, the more important are the Periyār, the Pamba, and the Bharatapuḻha. Along the coast, sand dunes shelter a linked chain of lagoons and backwaters the still waters of which are studded with sea gulls and country canoes plying at a snail's pace. The silence of their clear skies is broken only by the coos of koels, a type of cuckoo, and the frequent flutter of cranes perched on the embankments.

Climate. The climate is equable and varies little from season to season. The temperature normally ranges from 80° to 90" F (27" to 32° C) in the plains but drops to about 70° F (21" C) in the highlands. The state gets its due share of both the southwest and northeast monsoons, and the rainfall is heavy, averaging about 118 inches annually.

Land reclamation

Vegetation and animal life. The alluvial lowlands are covered with coconut groves and rice fields. A unique feature of agriculture in the Kuttanad area of Travancore is the annual reclamation of land from deep lakes and backwaters for rice cultivation. The midland region between the coast and the plateau is rich in a variety of crops such as rice, tapioca, and millet, and in palm, mango, jackfruit, and cashew trees. The highlands are rocky in the higher reaches, but at lower levels there are extensive plantations of pepper, rubber, coffee, tea, and cardamom. Primeval forests cover the mountainous belt and are inhabited by a variety of wildlife including elephants, tigers, panthers, bison, and cobras. The game sanctuary at Thekkady is a centre of tourist attraction.

Population. *Ethnic composition.* The racial distribution of the state's population is representative of the subcontinent's history. Several of the hill tribes exhibit Negroid features, while others appear to be related to the Veddas, the forest nomads of Sri Lanka (Ceylon). These racial types occur only in southern India and are probably remnants of the region's earliest peoples. The bulk of Kerala's inhabitants, however, are of the Dravidian stock. The Nairs and Ezhavas, who form the leading Hindu communities, belong to the Dravidian group of the early Cēra kingdom, while the Nambudiri Brahmins are descendants of the later Aryan migrants from the north. The Malayālis—Malayalam-speaking people—are a product of race admixture between the predominant Dravidian and the smaller Aryan groups.

Demography. Kerala is the most densely populated state in India. The average density of population in 1961 was 1,126 persons per square mile---over three times the Indian average. About 50 percent of the talukas (subdistricts), however, had a density of 1,000 to 3,000, and 18 percent were above 3,000. According to the 1971 census, the average density increased by 26 percent during the decade. The proportion of urban population in 1971 was 16 percent, but this low figure is deceptive as the villages in Kerala are semi-urban and form a continuous chain. The major industrial complexes are at Alwaye, Quilon, Alleppey, Calicut, and Cannanore. Other demographic features reflect the status of a burgeoning population. A high birthrate—which, thanks to the family-planning campaign, shows signs of declining—a high female sex ratio of 1,019 females to 1,000 males (as against the national ratio of 932), and a declining death rate have contributed to a decennial growth rate of more than 25 percent between 1961 and 1971. Despite the highest average marriage age of females in India, Kerala has a high fertility rate, which is concentrated in the age group of 20 to 39.

Religious harmony

Religions. Kerala has a unique record in India of harmonious coexistence of diverse religions. The majority of the Malayālis belong to the Hindu community, which has absorbed Buddhists and Jains into its fold. There is no conflict between the Dravidian *naga* (serpent-god) worship and that of Kālī (the mother goddess) on the one hand and the Hindu pantheon on the other, nor between the rival sects of Saivism (worship of the god Śiva) and Vaiṣṇavism (worship of the god Viṣṇu). The concept of unity in diversity is exemplified in the various Kerala temples by giving all these deities their allotted places. The Jewish community remains a small, exclusive sect. The Christians, forming about a fourth of the population, belong broadly to the Orthodox Syrian, Roman Catholic, and Protestant churches, but the denominations among them are no less numerous than the subcastes among Hindus. The Muslim minority have lived in habitual amity with the Hindus.

Administration and political life. The administration conforms to the uniform pattern adopted by states in the Indian federation, with a governor at the head, a single-chamber legislature, a cabinet executive presided over by a chief minister, and an independent judiciary. The legislative assembly has a membership of 134. The structure of the judiciary is hierarchical, with a high court at the apex from which appeals to the Supreme Court of India may be made. For provincial administration the state is divided into 10 districts subdivided for revenue purposes into 56 talukas and about 1,650 villages. Local self-governing institutions consist of three city corporations, 28 municipalities, and 952 *pañcāyat*s (ancient institutions revived as the lowest administrative units).

Kerala's modern political experience has been one of unstable government, with popular ministries rising and falling in quick succession. Between 1948 and 1970 as many as 12 ministries held office at Trivandrum and four midterm elections were conducted, one of which proved abortive. There were also three interludes of presidential rule, extending in all to about four years. In 1957 Kerala returned the local Communist Party to power. Though this government was overthrown two years later, the Communists again rose to power after the 1967 elections. The subsequent proliferation of political parties, however, added a new dimension to Kerala politics and made coalition governments inevitable.

Social conditions. *Customs.* The Aryan-Dravidian ethnic synthesis created a caste-ridden society characterized by peculiar social customs, manners, and institutions. The matrilineal joint family has only recently given way to innumerable nuclear families (each composed of father, mother, and children) with paternal inheritance. Women in Kerala enjoy an honoured place in society and are to be found in all walks of life. Both polygamy and polyandry were widely prevalent but today are illegal except for Muslim polygamy. The marriage ceremony of the Nairs, consisting merely of the presentation of cloth, is simple, but it is an accepted and respected bond of union.

A high level of education

Education and welfare. In education, Kerala is the most advanced state in India. The level of literacy, about 66 percent among males and about 54 percent among females, is substantially higher than the national average. Elementary education is free and compulsory between the ages of 6 and 11. There are over 11,000 primary, basic, and secondary schools, about 50 polytechnical and industrial training institutes, more than 100 arts and science colleges, about 30 professional colleges, and 3 universities. The state maintains a relatively high standard of health service, with one hospital bed for every 1,000 persons. There is a comprehensive health insurance plan for factory workers and free medical treatment in many hospitals and dispensaries.

Economic conditions. The economy is largely circumscribed by geographic and geologic constraints. The amount of arable land is far below the needs of the crowded population. The state is devoid of major deposits of minerals and fossil fuels, except for such minerals as ilmenite (the principal ore of titanium), rutile (titanium dioxide, used for coating welding rods), and monazite (a mineral composed of cerium and thorium phosphates), which are found in the beach sands. It has, however, enormous hydroelectric potential in its rapid rivers. Total installed hydroelectric capacity, which in the early 1950s was about 30 megawatts, had risen to almost 550 megawatts by the early 1970s. The educational system, a developed banking system, and excellent transport facilities provide conditions favouring further economic development.

Agriculture is the state's main economic activity. Cash crops, which account for 40 percent of the total land under cultivation, earn a sizable amount of foreign exchange but have also resulted in a shortage of food for local consumption. Though livestock is of poor quality, commercial poultry farming is the best developed in India, and eggs are exported. The forests yield industrial raw materials such as bamboo (used in the rayon industry), wood pulp, charcoal, gums, and resins, as well as ivory and rare timbers such as teak and rosewood. Kerala also accounts for 20 percent of the fish production in India; fishing trawlers have been bought, and the industry has been mechanized with Norwegian assistance.

The majority of the population is unaffected by industrialization. The traditional low-wage cottage industries, such as the processing of coconut fibre and cashews or weaving, employ about 60 percent of industrial workers. Most of those employed by larger industrial enterprises are engaged in food processing. The state participates in most major industrial concerns; products include fertilizers, chemicals, electrical equipment, titanium, aluminum cables, plywood, ceramics, and synthetic fabrics. More than one-fourth of the working force is employed in providing services. Unemployment, however, is acute, and the problem is accentuated by a high level of education among the jobless. The per capita income of Kerala in 1967 was only about 300 rupees a year, compared with the national average of about 320 rupees.

Transport and communications. In proportion to its area the state has the most developed road system and traffic flow in India; it is connected with the states of Tamil Nadu, Mysore, and Mahiiriishtra by the national highway and by a west coast road. The railway stretches for 551 miles from the northern border near Mangalore down to Trivandrum, connecting the principal towns. There are three major ports—Cochin, Alleppey, and Calicut—which handle both coastal and foreign traffic, and nine minor ports. More than 1,100 miles of inland waterways constitute the main arteries of commerce and carry the bulk of freight from and to the ports. Trivandrum has an international airport and Cochin a domestic one.

Cultural life. Kerala's cultural heritage contains elements of ancient Hindu culture that have been enriched by centuries of contact with both East and West. Literature and learning, in both Tamil and Sanskrit, flourished from the 2nd century AD onward. The Malayalam language, though an offshoot of Tamil, has absorbed the best in Sanskrit and has a prolific literature. Notable names in Malayalam poetry are Thunchath Ezhuthachan and Kunchan Nambiar, among classical poets, and Vallathol and Kumaran Asan in the present century.

Dance and drama

In recent times dramatic productions in the Kerala style that combines poetry, music, and dance have entered folk tradition. The themes are usually stories from the great Indian epics. The Kalamandalam, a recently established cultural institution, seeks to revive and promote traditional arts. There are a number of folk dances. A display of various visual arts takes place during Ōṇam, the national festival of Kerala. Ōṇam is also the occasion for an exciting snake-boat race at Aranmulai, in which hundreds of participants in each boat row rhythmically to the accompaniment of music and dancing.

In the fine arts, Swati Thirunal, the 19th-century royal composer, made signal contributions to classical Karnatak music of South India, while the artist Ravi Varma was renowned for his oil paintings. The splendid murals that adorn the walls of palaces, temples, and churches reveal a tradition and style that is distinct from classical Indian painting. Wood carving has attained a high level of excellence. The "Malabar gable"—a triangular projection at the top extremities of tiled or thatched roofs—is the characteristic feature of the Kerala style of architecture, which is noted for its beauty and utilitarian simplicity.

Kertanagara

Kertanagara, the last king of Tumapel (or Singhasiiri) in Java, is still venerated by Indonesians as one of their greatest rulers. The information on this 13th-century historical figure is sketchy and is primarily based on the two Javanese chronicles—the *Pararaton* ("Book of Kings") and *Nāgarakertāgama* (the epic of Majapahit), which give contradictory pictures of the King.

Pararaton says only that the King was a drunkard and fond of good food. He dismissed his able chief minister Raganatha (Kebo Arema) and appointed Aragani, who could serve him delicious food every day. Aragani is also known as Kebo Tengali, though some scholars say these were two separate men. He drank palm wine and held orgies, which eventually led to his death—he was killed by his enemies during one of his wild parties.

Nāgarakertāgama describes Kertanagara as a great and wise king. He was the son of respectable families—King Vishnuvardhana of Janggala and a princess of Kaḍiri—so that by birth he was a reuniter of the two moieties of the realm. Even his name Kertanagara, meaning Order

Stone sculpture thought to be Kertanagara in the form of *hari-hara ardhanari,* c. early 14th century. Acquired by the Museum fur Volker Kunde, Berlin, in 1865.

Consecration as king

in the Realm, might refer to reunion, which was the achievement of a great king according to the Javanese dualistic cosmology. Probably for this reason, he was consecrated a king in 1254 before his father's death. For the ceremony people from Janggala and Kadiri went to Kutaraja, the capital city of Tumapel, which was then renamed Singhasāri. From that time Tumapel was also called Singhasāri. Kertanagara was too young to rule the country; therefore, his father was still the de facto ruler. Kertanagara came to power only in 1268.

Nāgarakertāgama further describes Kertanagara as a zealous follower of Tantric Buddhism, which dealt with magic and demons and encouraged drinking and orgies of a ritual sort having nothing to do with pleasure-seeking. He believed that he was living in the Kali *yuga,* in Hindu cosmology the last of the four periods of world history, which was full of confusion, fear, and disaster, and that he, as a ruler, should save the world. According to at least one 20th-century scholar, however, "he knew the practical difficulties of protecting the world in Kali *yuga,* therefore he zealously upheld his religious duties and vows, in order to strengthen the Buddhist faith and to follow the example of former rulers with a view to securing the welfare of the world."

Many scholars tend to accept the *Nāgarakertāgama* because it fits in the historical context and is in accordance with the historical evidence.

Kertanagara's reign (1268–92) coincided with the expansion of Kublai Khan's realm in Southeast Asia. Kertanagara thought that he could stop an invasion only by aligning himself with or conquering neighbouring states and by strengthening himself with religious rites. He believed that Kublai Khan had already acquired a type of secret knowledge, which he himself could also gain. His chief minister Raganatha disagreed with Kertanagara's policy and, as a result, was removed from the post; Aragani, who was an ardent supporter of the policy, therefore came to power.

Kertanagara married a princess of Champa (southern Vietnam), a country that was dangerously exposed to Kublai Khan. Kertanagara sent envoys to Malayu (Sumatra) in 1275, and his statue as Amoghapāśa (Dhyāni Buddha Avalokiteśvara) was erected in the area (Jambi) in 1286, an indication that his influence had reached Sumatra. He also conquered Java and took Bali in 1284. A statue of a meditative Buddha, known as Jaka Dolog, discovered in Surabaja (eastern Java), was also erected by Kertanagara. According to its inscription, the statue was erected for the benefit of the King, the royal family, and the unity of the kingdom. Because the statue was erected on the hermitage of Bharada, the great wizard who had been asked to divide east Java into two kingdoms during the reign of Airlangga (1019–49), it must also have been aimed at neutralizing the evil effects of Bharada's division of his land.

Both the Jaka Dolog and the Amoghapāśa statues indicate that Kertanagara was very religious, as suggested by the chronicle *Nāgarakertāgama.* This does not mean, however, that he was unskilled in politics and government; in fact, he often used religion as an aid in gaining political ends.

Insult to Kublai Khan

When an envoy of Kublai Khan, Meng Ch'i (or Meng K'i), arrived in Java in 1289 to ask for tribute, Kertanagara refused to pay. This infuriated the Khan, who sent armed forces to punish Kertanagara. Before the troops arrived, however, Kertanagara was killed by the ruler of his vassal state, Jayakatwang of Kadiri, in the course of a Tantric ritual drinking bout.

Nāgarakertāgama indicates that toward the end of his life, Kertanagara became more involved in religious practices. It can be argued that he was too involved in his religion to provide for security of his throne and his country. Thus, although he thought of himself as being strong enough to resist Kublai Khan and hence refused to pay him any homage, he was not able to defend himself against an internal rival. Nonetheless, he was worshipped as a great king by many later Javanese leaders.

Keyboard Instruments

The large and important group of keyboard instruments includes all musical instruments on which different notes may be sounded by pressing a series of push buttons or parallel levers. This group has assumed its great importance because the keyboard enables a performer to sound as many notes as he has fingers, either at once or in close succession. This unique capability enables him to play a reasonable approximation of any work in the entire literature of Western music, whether it involves complex harmonies or the interplay of independent contrapuntal parts. Moreover, the capabilities of keyboard instruments have influenced the composition of music for other media, because virtually every major composer from William Byrd (c. 1543–1623) to Béla Bartók (1881–1945) and beyond has been at least an accomplished keyboard performer, if not a renowned virtuoso.

In its broadest sense, the term keyboard instruments may be applied to any instrument with a keyboard and thus may refer to organs, accordions, percussion instruments such as the celesta and the carillon, and many electronic instruments—for example, the Moog synthesizer and the Ondes Martenot. In this article the term is applied in a narrower sense and is restricted to instruments in which sound is produced from strings, whether by plucking, striking, or rubbing. For other instruments operated by a keyboard, see ELECTRONIC MUSIC AND INSTRUMENTS; ORGAN; and articles on instrument families, such as PERCUSSION INSTRUMENTS.

DEVELOPMENT OF THE KEYBOARD

Evolution from early forms. Long before the appearance of the first stringed keyboard instruments in the 14th century, the keyboard was developed and applied to the organ. A keyboard of the kind familiar today—a series of parallel levers balanced or pivoted so that they can be pushed down by the fingers—first appeared on the hydraulis, an organ used by the Romans at least as early as the 1st century AD. This type of keyboard seems to have disappeared after the fall of Rome, and the organs of the early Middle Ages generally had sliders that were pulled out to sound different notes; some may have had keys that turned like the key for a lock. Keys of the last type were certainly used on the organistrum, a large medieval hurdy-gurdy operated by two players: one turned a crank rotating a wheel that rubbed against one or more strings to make them sound, while the other produced different notes by turning the key-shaped levers that stopped the strings at various points (much as guitar strings are stopped against the fingerboard).

Key arrangements and colours

Some small portable organs had push buttons instead of keys as late as the 1440s, but a keyboard very similar to the modern type existed in the 14th century, although the arrangement of naturals and sharps (corresponding to the white and black keys on the modern piano) was only gradually standardized. The arrangement of the keys depended in part on the music played and partly on the current state of musical theory. Thus, early keyboards are reported with only a single raised key in each octave (B♭), and at least one organ exists that has both B and B♭ as "natural" keys, with C♯, D♯, F♯, and G♯ as raised keys. The colours of the keys—white for naturals and black for sharps—became standardized much later, c. 1800, depending on fashion or on the relative cost of ivory and ebony. Flemish instruments had bone naturals and black sharps by 1580; English instruments generally had either brown boxwood naturals and black sharps or ebony naturals and ivory sharps until c. 1720; French and German instruments had ebony naturals and ivory sharps until the 1790s.

Special key arrangements. *The* short octave. Even after the present arrangement of five raised keys and seven natural keys per octave had become standard in the 15th century, two special exceptions existed. The first of these—the "short octave"--concerned only the lowest octave at the bass end of the keyboard. In the short octave, not all keys actually sounded notes of the expected pitch; their respective strings were tuned to lower notes. In the earlier form (Figure 1A), the keyboard apparently started on E, but the string for this key note was tuned to the C below. The apparent F♯ was tuned to D and the G♯ to E, so that the notes of the entire octave from C to c were encompassed within an apparent key span of only E to c. With this arrangement C♯, E♭, F♯, and G♯ were not available in the bass octave, but these notes were rarely required in the bass when this form of short octave first appeared (c. 1540). When the missing F♯ and G♯ became necessary in later music, short-octave keyboards were made with these keys divided into two parts, the fronts sounding D and E and the back parts sounding F♯ and G♯. Later still, a second short octave was developed (Figure 1B) in which the keyboard apparently began on low B. This key actually sounded the G below, and the apparent C♯ and E♭ were tuned to A and B (or B♭). Eventually, as musical styles changed, the two retuned sharps were divided in this arrangement as well, providing C♯ (or sometimes B♭) and E♭ at the back of these keys while retaining A and B at the front.

Divided sharps. The second type of exceptional keyboard arrangement was originally required by the so-called meantone tuning system generally used in the 16th–18th centuries. Meantone tuning provided significantly purer tuning for a relatively small number of tonalities than does the system of equal temperament now in use (in which all tonalities are somewhat out of tune; see TUNING AND TEMPERAMENT, MUSICAL), but only at the expense of making it virtually impossible to use any of the remaining tonalities. This characteristic arose because in meantone tuning each of the raised keys could be used in only one way: for example, if the key between D and E was tuned to E♭, it could not be used as D♯ without retuning. One solution was to build keyboards with the raised keys divided, the front half of the key sounding the appropriate sharp while the back half sounded the equivalent flat. The keys most commonly divided were A♭/G♯, E♭/D♯, and B♭/A♯. Instruments with up to three divided keys in each octave were commonly made in the 16th and 17th centuries, especially in Italy. Since the 1590s still more complicated keyboards have been built, permitting even more refined tunings; some in the 19th century had more than 50 keys per octave. Instruments have also been made with the octave divided into 24 rather than 12 equal parts to permit playing music utilizing quarter-tone intervals.

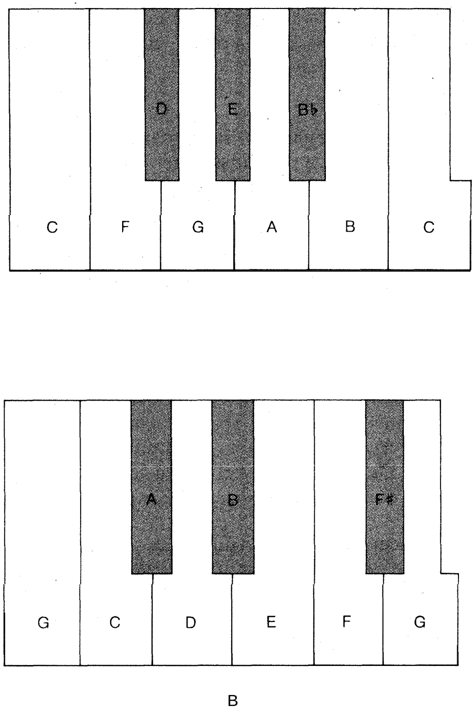

Figure 1: Special key arrangements.

Impact of tuning systems

Keyboard size and range. Although some early organs had very wide keys that could be played only with the fists, stringed keyboard instruments seem always to have had natural keys no more than an inch wide, yielding an octave span of seven inches. The octave span on the modern piano is about 6½ inches, much the same as on Flemish and Italian harpsichords of the 16th-18th centuries, whereas that of English keyboards was generally 6⅜ inches. On most French and German instruments of the 18th century, the octave span was even narrower (6¼ inches), permitting the playing of tenths—such as C to the second E above—by a hand of average size.

The range of the keyboard gradually expanded from a single octave for some early organs to 2% or 3 octaves in the 15th century and 4 or 4% octaves in the 16th century. By the early 18th century, except in Italy and Spain, a range of five octaves was standard: from the F below low C to the F above high C (F_1–f‴). This range began to be expanded only at the very end of the century, usually upward toward c'''' (C above high C) but occasionally downward to C_1 (C below low C). A few pianos with a range of six octaves (from C, to c'''') were built before 1800, and Beethoven's Hammerclavier Sonata, Opus 106 (completed, 1818), requires 6% octaves from C_1 to f''''. A seven-octave range was reached before

1830, and the modern piano keyboard consisting of 88 keys provides the only slightly greater range seven octaves and a third, from A, to c′′′′′.

THE CLAVICHORD

Some kind of stringed keyboard instrument is known to have existed by 1385, when an instrument called the *eschiquier* was described as "resembling the organ but sounding by means of strings." There exists no description of the eschiquier, however, and it is not known whether it was a variety of clavichord, in which the strings are struck by blades of metal that must remain in contact with them as long as they are to sound; a harpsichord, in which the strings are plucked; or a type of keyboard-equipped dulcimer, in which—as in the piano—the strings are struck by small hammers that immediately rebound from them. All three types of instruments were described and illustrated in the first half of the 15th century by Henri Arnaut of Zwolle, personal physician of Philip the Good, Duke of Burgundy, and later physician and astrologer to King Charles VII and King Louis XI of France.

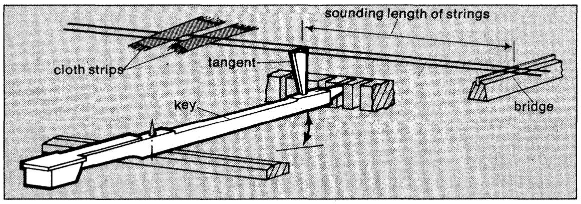
Relation to the monochord

Despite the uncertainty regarding the eschiquier, it seems probable that the clavichord was the earliest stringed instrument having keys that could be pushed down by the fingers. Its principle of operation resembles that of the medieval organistrum, and it is apparently closely related to the monochord, an instrument consisting of a shallow closed box over which one or two strings were stretched. The monochord was in continuous use by theorists from ancient Greece onward as a tool for explaining and measuring musical intervals. Monochords were also used as performing instruments at least as early as the 13th century, and the kinship of the clavichord to the monochord was so close that, as late as the 16th century, clavichords were often called monocordia.

Shape and layout

Principle of operation. The clavichord is rectangular in shape, and its strings run from left to right across the keys, which are placed along one of the longer sides of the rectangle. The soundboard of the instrument is at the right-hand end of the case, and the vibrations of the strings are communicated to it by a bridge on which the strings rest. The soundboard amplifies the sound of the strings by permitting them to set a large mass of air into vibration rather than the very small mass of air that can actually be in contact with the string itself. (This is the same principle that makes a tuning fork sound louder when its stem is held in contact with a tabletop.)

The clavichord's principle of operation is extremely simple. A brass blade rather like the end of a screwdriver is driven into the top surface of each key near the back of the key (Figure 2); a smaller piece of wood, whalebone, or horn is driven into the back end of the key. (This piece fits into a fixed slot behind the key and prevents the key from moving from side to side as it moves up and down.) When the front end of the key is pushed down by the finger, the back end rises, and the brass blade, called a tangent, strikes the strings (which in most clavichords are arranged in pairs), causing them to vibrate. To the left of the tangent a strip of cloth is woven between the strings. When the key is struck, only the portion of the strings to the right of the tangent—*i.e.*, between the tangent and the bridge—sounds; the cloth prevents the string section to the left of the tangent from sounding. As soon as the key is released, the tangent falls away from the strings, which are then entirely silenced by the cloth. Because the sounding portion of each string is the segment between tangent and bridge, the tangent serves not only to set the strings in vibration but also to determine their sounding length. Thus, a series of tangents striking a given pair of strings at different points will produce a series of different notes, and all the earliest clavichords were designed to take advantage of this fact. Arnaut of Zwolle's clavichord used only nine or ten pairs of strings to produce all the 37 notes of its three-octave keyboard, and the clavichord represented in an Italian intarsia (picture in wood inlay) of about 1480 (Palazzo Ducale, Urbino) used only 17 pairs of strings to produce 47 notes in a four-octave range.



From N. Bessaraboff, Ancient European *Musical* Instruments (1941); Harvard University Press

Figure 2: Clavichord action (see text).

Making a single pair of strings serve several keys had two important disadvantages. Because each pair of strings can sound only one note at a time, it is impossible to play any two notes sounded from the same strings simultaneously, making it impossible to play certain chords. Furthermore, an unpleasant clanking sound is likely to result if the performer attempts legato playing of successive notes sounded from the same strings, making it necessary to play in a semi-detached fashion.

As early as the time of Arnaut of Zwelle, the first of these disadvantages was minimized by allowing no more than four keys to sound from the same pair of strings and by carefully choosing the points at which such groups of four keys were placed, so that only dissonant chords would be unplayable. The second problem could be solved only when a maximum of two keys were served by the same strings, so that each natural key shared its strings only with the sharp or flat next to it. G, for example, was paired with G♯, and in the normal music of the period the two notes were never needed at the same time or in immediate succession. Of course, if one wanted to use the G♯ key as an A♭, the problem would reassert itself; but, as long as meantone tuning was in use, the G♯ could not serve as A♭ in any case.

Fretted and unfretted clavichords

Eventually, however, it was felt necessary to be able to play in all tonalities without restrictions either of style of playing or in the use of dissonant chords, and clavichords began to be built with one pair of strings for each key. Such clavichords are called "unfretted," in contrast to those having several keys for each pair of strings, which are called "fretted." Although the unfretted clavichord was apparently known before 1700, fretted clavichords were being made well into the 1780s; they had fewer strings to go out of tune, and the smaller number of strings permitted all the keys to be shorter and more equal in length, giving the instrument a superior touch. In addition, the smaller number of strings imposed a smaller downward force on the soundboard, resulting in a brighter, clearer tone.

Tone quality. The greatest disadvantage of the clavichord is its extremely soft tone. Because it arises directly from the way in which the sound of the instrument is produced, this disadvantage cannot readily be overcome. It is impossible to impart very much energy to a string by striking it at one end (it is for this reason that a guitarist makes less sound when he strikes the strings against the fingerboard with his left hand than when he plucks them with his right, even though the pitches produced are the same). In compensation, the clavichordist alone of all keyboard-instrument players has control over a note once it has been struck. As long as a note is sounding, he has contact with the string through the tangent and key, and by changing his pressure on the key he can vary the pitch of the note, produce a controlled vibrato, or even create the illusion of prolonging or swelling the tone. Although the maximum loudness of which a clavichord is capable is not great, its softest pianissimo is very soft indeed, and the clavichordist has complete control over an enormous number of gradations in loudness between these two extremes. As a result of this touch sensitivity, the clavichord was highly valued as a teaching and practice instrument. In addition, its relative cheapness made it the normal domestic keyboard instrument in Germany and Scandinavia.

The soft tone of the clavichord made it impossible to use the instrument for any kind of ensemble music, except for providing a very discreet accompaniment for a single singer. Although much of the solo keyboard music of the 16th–18th centuries can be played on the clavichord, it cannot be stated that any of it before the latter part of the 18th century was especially composed with the clavichord in mind. At that time, however, the clavichord experienced a great revival in Germany, and music composed with its singing tone and unique capabilities of dynamic shading and vibrato was written for it by such masters as Carl Philip Emanuel Bach (1714–1788).

Clavichords in the 19th century

Clavichords continued to be made in Germany and Scandinavia well into the 19th century, long after the piano was both well known and popular. Indeed, many instrument makers built both clavichords and pianos (and harpsichords as well). The continued demand for the older instruments may have been a consequence—among other things—of musicians' recognition of the three instruments' differing capabilities.

The clavichord owes its modest modern revival largely to the efforts of Arnold Dolmetsch in England, who began building clavichords and performing on them in public in the 1890s. Both his style of playing the clavichord and the design of his instruments have remained a strong influence today. Only German makers, however, are presently producing clavichords in any great numbers.

THE HARPSICHORD

Principle of operation. ***Plucking mechanism.*** The sound of the wing-shaped harpsichord and its smaller rectangular, triangular, or polygonal relatives, the spinet and virginal, is produced by plucking their strings. The mechanism that accomplishes this is called a jack (Figure 3). It rests on the key and consists of a narrow slip of wood with two slots cut into it. The larger slot holds a pivoted tongue from which protrudes the quill, plastic, or leather plectrum that does the actual plucking; the smaller slot holds a piece of cloth that rests on the string and silences it when the key is not depressed. When the harpsichordist pushes down on a key, the back end rises, lifting the jack and forcing the plectrum past the string, plucking it. When he releases the key, the jack falls, and when the plectrum reaches the string on the way down, it forces the pivoted tongue backward so that the plectrum can get past the string again without plucking it. Once the plectrum has passed the string, a light spring made of bristle, plastic, or metal pushes the tongue forward again. Finally, when the key is completely at rest, the cloth damper touches the string, silencing it. A wooden bar covered with felt on its underside is placed over the jacks. The purpose of the wooden bar is to prevent the jacks from flying out of the instrument and to limit the depth to which the keys can be depressed.

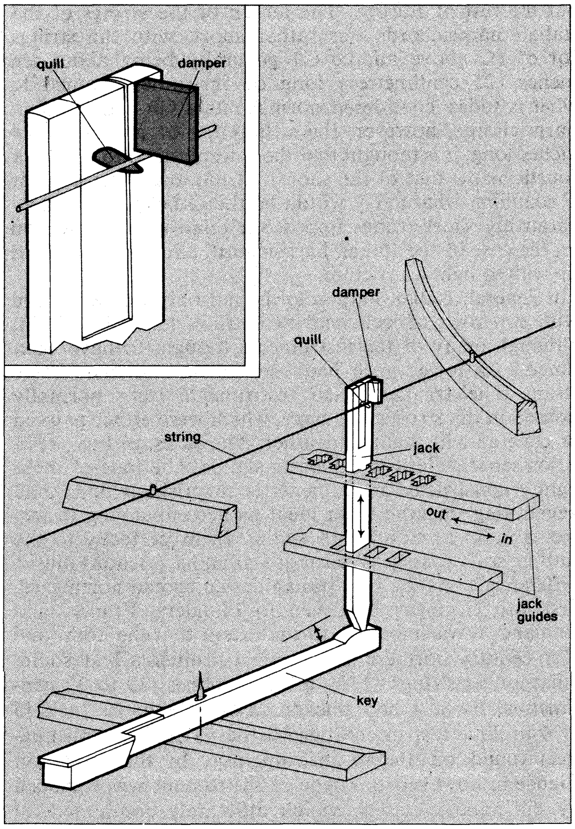

Figure 3: Harpsichord action (see text).

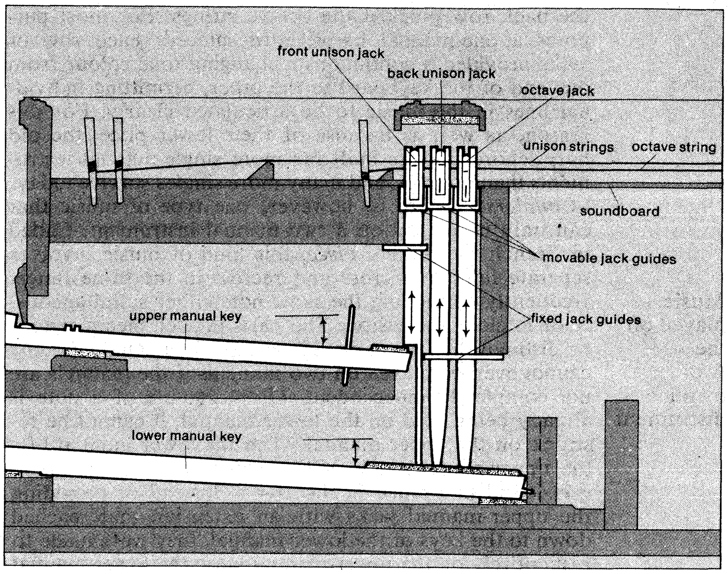

Figure 4: Flemish two-manual harpsichord action (see text).

Variations in loudness and timbre

Although minor variations in loudness and timbre, or tone colour, can be obtained by differences in the firmness with which the harpsichordist depresses the kevs. no great differences in loudness and no sustained crescendos are obtainable by the action of the fingers alone. For this reason, most harpsichords made since about 1550 have had at least two strings and two jacks for each key. Each can be engaged or disengaged at will by a slight shift of the uppermost of two slotted guides through which the jacks pass. Moving the guide in one direction brings the entire row of jacks close enough to the strings for the quills to pluck them; moving the guide in the opposite direction takes the jacks far enough from the strings so that the quills cannot reach them. Two rows of jacks can provide three different levels of loudness or three differing tone colours, depending on whether the performer uses each row separately or both together.

Two-manual instruments. Even given two rows of jacks, it would not ordinarily be possible to produce the rapid changes in loudness required for pieces in echo style, for example, or to play loudly with one hand while providing a soft accompaniment with the other. To accomplish this, it is necesssary to have two keyboards or "manuals," one of which operates a single row of jacks while the other operates two or more. It then becomes possible to play loudly on one keyboard and softly on the other, [illegible]r simultaneously or in rapid alternation. Two [illegible]l [illegible]si[illegible]d of th[illegible] kind were [illegible]ted at some point before 1620 in Flanders and gradually became known throughout the rest of Europe during the 17th century. These instruments had three sets of strings, two unison strings at normal pitch (called 8' pitch because the low C at this pitch is produced by an organ pipe eight feet long) and a third set of shorter strings tuned an octave higher, or at 4' pitch; this shorter set passed over its own bridge and was fastened to pins driven through the soundboard into a rail fixed to its underside. There were three rows of jacks (Figure 4). The front row plucked one set of unison strings and was made in such a way that it would be moved by the keys of both the upper and the lower keyboards. Both the middle and back rows operated from the lower manual only; the second row plucked the second set of unison strings, and the back row plucked the octave strings. For most purposes a one-manual harpsichord sufficed: each row of jacks provided a continuously changing tone colour from one end of the keyboard to the other, permitting individual lines in the music to be articulated clearly. For this reason, as well as because of their lower price, the old harpsichord makers built far more single-manual instruments than doubles, and many more singles survive today.

Music played on the two-manual instrument

Couplers. There is, however, one type of music that can only be played on a two-manual instrument. Called in French the ***pilce croisée***, this kind of music involves separate lines that cross and recross in the same range, frequently employing the same note either simultaneously or in close succession. The parts in such pieces cannot be distinguished when played on a single manual and they cannot even be played on two manuals if the manuals are not completely independent. (For example, if a note is already being held on the lower manual, it cannot be restruck on the upper manual when the lower manual lifts the upper-manual jacks.) The solution to this problem was found in France in the 1640s. Instead of providing the upper-manual jacks with an extension that reached down to the keys of the lower manual, they were made to rest entirely on the upper-manual keys; the lower-manual keys were then fitted with small upright pieces-of wood called coupler dogs, which reached upward toward the underside of the upper-manual keys. The upper manual was constructed to slide forward and back by about ¼ inch. When it was pushed into the instrument, the coupler dogs were positioned below the back ends of upper-manual keys. As a result, when any lower-manual key was pushed down and its back end rose, the coupler dog would push up on the underside of the corresponding upper-manual key, lifting its jack as well. When one wished to uncouple the two keyboards in order to play ***pilces croisées***, one could do so by pulling the upper manual outward. The coupler dogs then passed slightly beyond the ends of the upper-manual keys, so that they were not lifted when the lower-manual keys were depressed.

Two-manual harpsichords of this kind permit one to exploit the difference in the tone colours produced by the two rows, or "registers," of unison jacks. This difference depends on the distance along the string at which it is plucked. The closer the plucking point is to the end of a string, the brighter and more nasal the sound; the farther away from the end that a string is plucked, the fuller and rounder the tone becomes, until one approaches the centre; plucking near the centre of a string produces a sweet, flutey, but somewhat hollow sound. In order to emphasize the difference in tone colours produced by the two rows of unison jacks French harpsichord builders put the row of octave jacks between them, thereby increasing the difference between the two unison plucking points and the difference in tone of the two unison registers.

Special effects. A set of jacks plucking very close to the end of the string yields a very brassy, nasal sound. This type of register, called a lute stop, was first used in Germany in the 16th century and later spread to Flanders and to England, where it was added to the normal three registers on two-manual instruments. It did not have its own set of strings but, rather, plucked those of one of the existing unison registers. In England the lute stop plucked the same set of strings as the set of jacks operated by both keyboards; but, because the lute-stop jacks rested only on the upper-manual keys, they could also be used to provide a completely independent register on the upper manual. It was thus possible to play *pièces croisées* by taking off the unison register controlled by both manuals, using the lute stop for the upper manual and leaving the lower manual with its own unison register. Many harpsichords of all countries were also equipped with a buff stop (sometimes also called a lute stop), a device that presses pieces of soft leather against one of the sets of unison strings, producing a muted, pizzicato tone.

In Germany in the 18th century, harpsichords were made with still more strings and jacks for each key. Some had three unison strings in addition to an octave string; some had two unisons, an octave, and a suboctave (or 16') register; and some even had a 2' register, with very short strings tuned two octaves above the unisons. Harpsichords with three keyboards were apparently built throughout the 17th and 18th centuries, although only one authentic three-manual harpsichord is known today.

Resources of the 18th-century harpsichord

It should be emphasized, however, that the harpsichord of the 16th–18th centuries normally had only one or two keyboards and only two or three sets of strings and jacks per note. In the 16th and early 17th centuries, one-manual instruments usually had only two registers (either two unisons or a unison and an octave) with or without a buff stop; in the second half of the 17th century a second unison register became common, increasing the number of jacks and strings to three per note. Two-manual instruments, likewise, had no more than three sets of strings (two unisons and an octave) and three sets of jacks throughout the 17th century. In the 18th century, a fourth row of jacks was sometimes added. In England and Flanders, this row was the close-plucking lute stop; in France, if a fourth row was added, it was placed behind the other three and equipped with plectra of soft buff leather that provided a gentle, flutey tone, which was highly prized in the rather decadent period of the harpsichord's decline. Until the last half of the 18th century, it was possible to change registers only by moving knobs at the side of the instrument or above the keyboards, which could be done only when one hand or the other was not playing. This fact and the surviving written evidence suggests that the harpsichordists of earlier times changed registers relatively infrequently, preventing monotony of sound by relying on variations of touch and the changes of texture and pitch level written into the music.

History. The harpsichord was described by Arnaut of Zwolle in the mid-15th century and was apparently known throughout Europe by the end of the century, although no 15th-century examples have survived. The harpsichords depicted in sculptures, paintings, and miniatures of the period all appear to be shorter and to have thicker cases than the earliest surviving 16th-century examples, all of which are Italian and are constructed of very thin cypress.

Italy. The thin-cased style of harpsichord construction appears to have been developed in Italy about 1500, and it rapidly influenced the design of harpsichords throughout the rest of Europe. The length of the strings of the Italian harpsichords was rather short, with the strings for c'' (C above middle C) generally being about ten inches (25 centimetres) long on instruments tuned to what is today considered normal pitch. On some Italian harpsichords, however, the strings for c'' are about 14 inches long; it is thought that these were tuned to a pitch a fourth below that of the shorter-strung ones, the key for C sounding what today would be the G below. The comparatively short strings imposed a relatively low tension on the case of the Italian harpsichord, allowing it to hold up with so light a structure.

In general, Italian harpischords had only one keyboard with two rows of jacks and two strings tuned in unison, although many of the instruments thought to have been tuned to a lower pitch had one unison and one octave string. The fragile Italian instruments were normally housed in thick softwood cases, which were either painted or covered with stamped leather. The cases, in turn, rested on separate legs or elaborate stands. The tone of these lightly constructed instruments is surprisingly loud and penetrating, making them ideal as accompanying instruments in an orchestra and suiting them perfectly to the rattling scale passages typical of Italian harpsichord music.

Flanders. As the new Italian design spread northward, first into Germany and then to Flanders, France, and England, it was modified to the extent that the 16th- and 17th-century northern European instruments had somewhat longer strings (11% to 12% inches [29 to 32 centimetres] for c'') and thicker cases (3⁄16 to ¼ inch [5 to 6 millimetres] in contrast to the ⅛ inch [3 millimetres] found on Italian instruments). In the 1560s in Flanders, however, this type of instrument was replaced by still another design, which ultimately dominated all northern European harpsichord making. These instruments had long strings (about 14 inches for c'' at normal pitch) and thick cases with substantial internal bracing to withstand the greater tension imposed by the greater string length. Because the longer strings made it unfeasible to double the string length for each octave below middle C, harpsichords of the newer Flemish design have less gracefully curved bentsides and wider tails than either Italian harpsichords or the intermediate instruments built elsewhere north of the Alps.

Harpsichord building of the Ruckers family

The name most often associated with Flemish harpsichord building is that of the Ruckers family, which for four generations (a period spanning the century from about 1580 to 1680) dominated Flemish harpsichord making and whose instruments were exported to all parts of Europe—one was even shipped as far as Peru. At first sight, Ruckers harpsichords appear to be rather crude compared to their Italian counterparts, and their thick softwood cases give the impression of being clumsily cobbled together on the inside. Nonetheless, the tone of unaltered or properly restored examples is extraordinarily good, and it is easy to see why Ruckers instruments were so highly prized that a lively business in making forgeries of rhem flourished in the 18th century.

In addition to a wide variety of virginals (discussed below), the Ruckers family made several different harpsichord models. The most popular was apparently six feet long, having a four-octave keyboard from *C* to c''', with a short octave in the bass; one unison and one octave register; and, occasionally, a buff stop on the unison. They were typically painted in imitation of marble on the outside and decorated on the inside with block-printed paper on which a Latin motto was painted. The soundboard was usually decorated with paintings of flowers, leaves, and birds. (This decoration should be contrasted with that of the Italian harpsichords, which was generally lavished on the outer case, leaving the instrument unadorned except for finely profiled top and bottom moldings.) Flemish harpsichords were set directly on any of various types of fairly massive stands, examples of which may be seen in the numerous Dutch paintings of musical groups of the period. Similar harpsichords were made in smaller sizes tuned a fifth or an octave above normal pitch (the key c' sounding either g' or c''). By the mid-17th century, some single-manual instruments had a range of 4½ octaves from F_1 or G_1 in the bass to c'''.

The Ruckers family appear to have been the first to make two-manual harpsichords. These were of two types: in one (which may have been the earlier type and was not built after *c.* 1650), both keyboards were served by a single set of unison and octave strings and were not meant to be played at the same time. Instead, the keyboards were so arranged that c''' on the upper keyboard was placed over f''' on the lower keyboard, which meant that playing a piece on the lower keyboard automatically transposed it to a pitch a fourth below that of the upper keyboard. Whether this arrangement was used to facilitate routine transpositions or whether it was intended to provide in a single instrument the same resources as those available from both an Italian instrument with a 10-inch c'' and one with a 14-inch c'' is still a subject for controversy. The second type of two-manual harpsichord built by the Ruckers family was basically the type one finds today, with keyboards aligned over one another and intended to provide contrasts in loudness. Because the only set of upper-manual jacks was also played directly from the lower manual, it was not possible to play *pièces croisées.*

France. During the 17th century, instruments of the Ruckers type gradually influenced those being built throughout northern Europe; and by the early 18th century France, England, and Germany all had developed their own national variations on the thick-cased Ruckers design, replacing the thinner cased and shorter strung instruments of their earlier native schools. The sound of a typical 18th-century French harpsichord is delicate and sweet compared to the rather more astringent sound of a Ruckers. Those examples by the Blanchet family and their heir Pascal Taskin (1723–1793) are noted for their extraordinarily high level of craftsmanship and the lightness and evenness of their touch. Eighteenth-century French harpsichords were almost always painted and rest on elaborate carved and gilded cabriole (curved-leg) stands. As with Flemish harpsichords, the French soundboards are decorated with painted flowers and birds, and the maker's mark appears in the form of a cast ornament in the sound hole. In the 1760s, Taskin added a fourth row of jacks with soft plectra of buff leather as a special solo stop and also devised a highly ingenious system of knee levers that permitted the harpsichordist to play crescendos and decrescendos and to change registers without taking his hands from the keyboard. By the time of these inventions, however, the great Baroque composers of harpsichold music, such as François Couperin, J.S. Bach, Jean-Philippe Rameau, and Domenico Scarlatti, were dead, and these devices have no relevance to the historically accurate performance of virtually any of the harpsichord music one is likely to hear today.

Blanchet and Taskin harpsichords

England. In England the making of harpsichords in the 18th century was dominated by two London families, the Kirkmans and the Shudis. Both families made instruments for several generations and eventually moved on from harpsichord building to piano building. Their harpsichords are very similar, and the two-manual instruments all have a close-plucking lute stop in addition to the usual two unisons and octave. They are invariably veneered in walnut or mahogany and rest on simple stands, usually with straight or tapered legs. The tone of a Kirkman or Shudi harpsichord is both more robust and more brilliant than that of a French or Flemish instrument, making it a superb instrument for filling in the harmonies in the orchestral music as well as for the performance of the solo harpsichord literature.

Germany. Two German schools appear to have existed in the 18th century. One in the southern part of the country has left very few surviving instruments, which is unfortunate because these are the kind probably played by J.S. Bach. As far as is known, the southern German instruments were fairly plain, veneered ones, having only three registers and a rather darker tone than either French or Flemish instruments. The second German school was centred in the city of Hamburg and is best represented by the work of the Hass family. The Hass instruments are among the most elaborate ever made, both in decoration and complexity. They are the only 18th-century harpsichords with 16' and 2' registers, and some have lute stops as well. Their tone does not, unfortunately, live up to the quality of their craftsmanship or the ingenuity of their design, seeming overly brilliant and too thick in all of the surviving examples that have been restored to playing condition.

Hass family instruments

Decline of the harpsichord. Although many of the finest surviving harpsichords date from after 1750, few composers of the first rank were writing for the instrument by that time. Furthermore, the emergence of a newer, lighter style of music and an increased interest in crescendo and decrescendo effects led to the addition of various new devices foreign to the essential nature of the instrument. These include the knee- and foot-operated contrivances for the rapid changing of registers or for producing crescendos and decrescendos. Such devices represent the harpsichord builders' response to the same musical needs that eventually caused the harpsichord's replacement by the piano; but they were created before the real rise in the piano's popularity and must not be thought of as attempts to stave off the competition of the newer instrument.

As with the clavichord, builders continued to make harpsichords side by side with pianos. In England, Shudi's son-in-law, John Broadwood (see below), continued to make harpsichords until after 1800 (although in decreasing quantity), producing at the same time an ever-increasing number of pianos. There is even a small but interesting group of compositions by English, German, and French composers calling for both instruments.

Modern revival. The harpsichord had all but vanished except as a curiosity or in very rare historical concerts when the modern revival began in the 1890s with the building of new harpsichords by the piano firms of Erard and Pleyel in Paris. Almost immediately, the full brunt of 19th-century piano technology was applied to the manufacture of the revived instruments, and they became increasingly massively strung and framed as time passed. Pedals for changing registers were included from the beginning, and Pleyel first added the 16' stop in 1911. The Pleyel's sound, as preserved in the recordings of the Polish virtuoso Wanda Landowska and her numerous pupils, typified the harpsichord for most music-lovers until the 1950s, and it is for a heavy, metal-framed instrument of this type, with pedals for changing registers and a 16' stop, that most of the 20th-century harpsichord music has been composed.

Pleyel instruments

In 1905 modern harpsichord building was begun in Germany, initially taking the new Pleyel and Érard instruments as inspiration. Subsequent German building has produced a highly characteristic instrument somewhat reminiscent of the harpsichords of the 18th-century Hamburg school in sound. Taking as their model an improperly restored instrument falsely said to have belonged to Bach, these instruments generally have the unhistorical stop arrangement of one 8' and the 4' on the upper manual, with the second 8' and a 16' on the lower manual.

Arnold Dolmetsch, who began the modern revival of the clavichord, also built harpsichords, working in Paris and Boston as well as in England. He deserves to be considered the "godfather" of not only the present British school of harpsichord making but also of the flourishing U.S. school, most of whose members are, however, building a very different and far more historically based instrument than any that Dolmetsch made after about 1910.

Harpsichords specifically intended for electronic amplification have been built since the 1960s. Although some were meant for the performance of Baroque concertos with modern orchestras and in large halls, such instruments have had their greatest success among the other amplified instruments used by rock groups.

The virginal, spinet, and clavicytherium. The virginal, spinet, and clavicytherium are all varieties of harpsichord that differ from it primarily in size, shape, and musical resources. Virginals and spinets usually have only a single set of strings and a single row of jacks. The clavicytherium is basically a harpsichord set upright so that its soundboard is vertical. Instruments of this form were made from the 15th through the 18th centuries. Generally, their mechanism must be fairly complicated because the jacks must move horizontally rather than vertically and cannot therefore return to their rest position solely by the action of gravity. As a consequence of this complexity of its mechanism, the touch of the clavicytherium tends to be heavy, although the instrument takes up less space, and it is claimed that the vertical soundboard projects the sound outward far more effectively than the horizontal soundboard of the conventional harpsichord.

The virginal and spinet are small varieties of harpsichord, but the precise usage of the terms differs. Some writers reserve the term virginal for rectangular instruments and call all small triangular or polygonal instruments spinets. Others apply the term virginal to all plucked-stringed keyboard instruments whose strings run more or less from left to right across the keys (a usage followed in this article), reserving the term spinet for instruments in which the strings run obliquely away from the player. The terminological question is complicated by the fact that the word virginal in 16th- and 17th-century England referred to all plucked stringed keyboard instruments, including harpsichords and spinets as well as those today termed virginals. The term *épinette* ("spinet") had a similarly broad usage in France.

Italian builders of the 16th and 17th centuries made virginals and spinets employing a thin-cased construction similar to that of their harpsichords, and, like Italian harpsichords, these smaller instruments were kept in stout outer cases. The typical Italian virginal was either rectangular or polygonal in shape, with its keyboard projecting from the front of the case, and many of the surviving examples are sumptuously decorated with inlay or intarsia. Most Italian spinets are constructed as an irregular quadrilateral, but in the 17th century a new form was developed that more closely resembles a small harpsichord in having a bentside at the player's right and a long straight back slanting away from him. The new form was copied throughout Europe and became the standard domestic keyboard instrument in England in the late 17th century.

In Flanders, early virginals were polygonal and resembled Italian ones except that their keyboards were inset rather than projecting. In the 1560s, at the same time as the thick-cased harpsichord is believed to have emerged, thick-cased rectangular virginals made their appearance. By the end of the 16th century, two distinct types existed. They can readily be distinguished by the position of their keyboards: off-centre either to the left or to the right in one of the long sides of the rectangular case. Virginals with the keyboard at the right were far more common. They produce a characteristic flutey tone because the placement of the keyboard causes the strings to be plucked near their centre for most of the instrument's range. In virginals with the keyboard at the left, the strings are plucked off-centre except in the extreme treble, and the tone changes gradually from reedy in the bass, through full in the middle register, to flutey in the treble, much as on a harpsichord. Flemish builders produced virginals of both types in several sizes, the smaller ones being tuned to higher than normal pitches. They also made "double" virginals, consisting of a large virginal at normal pitch and a smaller one tuned an octave higher, which could be stored in a recess next to the keyboard of the larger instrument. The two virginals could be coupled together by placing the smaller instrument on top of the larger one.

Types of Flemish virginals

The virginals made in England were of the left-keyboard type. Those made elsewhere in Europe (some having the keyboard centred) were also built with strings plucking off-centre.

THE PIANO

Principle of operation. Although the basic principles of the piano's mechanism are simple, the refinements required in developing the powerful yet sensitive modern piano make it also the most complex of all instruments except the organ. The strings of the piano are struck by a felt-covered hammer that must rebound from the strings instantaneously or it will dampen their vibrations in the very act of initiating them. The hammer must thus be thrown toward the strings and allowed to fly freely. For the pianist to retain maximum control of loudness and softness, the distance of the hammer's free flight must be as small as possible; but, if the distance is too small, the hammer will bounce back and forth between the strings and the part of the mechanism that pushed it, producing a stuttering sound whenever the keys are struck firmly. As a consequence, all truly simple piano mechanisms — those in which, say, a rigid rod at the back of the key simply pushes the hammer upward until the key is stopped by a rail and the hammer flies free — must be adjusted to provide a large distance for free flight and can therefore give the pianist only limited dynamic range and control.

History. *Invention.* Piano mechanisms as unsophisticated as that described above continued to be devised and built throughout the 18th century. Nevertheless, the first successful piano — made in Italy by Bartolomeo Cristofori — solved the problems inherent in such simple mechanisms, as well as nearly every other problem facing piano builders until well into the 19th century. Cristofori reportedly started experiments on a "harpsichord with hammers" in 1698. By 1700 one of these instruments, together with six of his harpsichords and spinets, was included in an inventory of instruments belonging to the Medici family in Florence. In 1711 the instrument was described in detail in the Venetian *Giornale* de' *letterati d'Italia* by Scipione Maffei, who called Cristofori's invention *gravicembalo col piano e forte* ("harpsichord with soft and loud") — whence the present names pianoforte and piano.

Cristofori's pianos

In the three surviving examples of Cristofori's pianos, which date from the 1720s, the mechanism, or "action," differs somewhat from that described and pictured by Maffei; however, rather than merely representing an earlier phase of Cristofori's work, Maffei's diagram may be in error. In the surviving instruments a pivoted piece of wood is set into the key (Figure 5). The pivoted piece (which in a modern piano would be called a jack and should not be confused with the jack in a harpsichord) lifts an intermediate lever when the key is depressed. The lever, in turn, pushes upward on the hammer shaft near the hammer's point of attachment to a rail fixed above the keys. When the key is pressed completely down, the jack tilts and disengages itself from the intermediate lever, which then falls back, permitting the hammer to fall most of the way back to its rest position, even while the key is still depressed. This feature, called an escapement, is the heart of Cristofori's invention; it makes possible a short free flight for the hammer, after which the hammer falls so far away from the string that it cannot rebound against it, even when the keys are struck firmly. Cristofori provided a check (a pad rising from the back of the key) to catch and hold the falling hammer. At the end of the key he included a separate slip of wood, resembling a harpsichord jack, to carry the dampers that silence the string when the key is at rest.

From R.E.M. Harding, *The* Piano-Forte (1933); published by Cambridge University Press

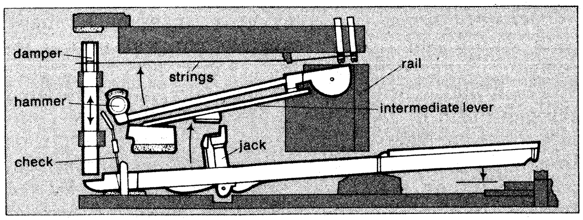

Figure 5: Cristofori's piano action (see text).

Utilizing an intermediate lever to act on the hammer near one end of its shaft provides an enormous velocity advantage, and the hammer flies upward toward the string much faster than the front end of the key descends under the pianist's fingers, adding to the crispness and sensitivity of Cristofori's action. The sound of his instruments is strongly reminiscent of the harpsichord, owing to the thinness of the strings and to the hardness of the hammers. The dynamic range is surprisingly wide, but it should be emphasized that the instrument's loudest sounds are softer than those of a firmly quilled Italian harpsichord and do not begin to approach the loudness of a modern piano.

Gottfried Silbermann's instruments

German and Austrian pianos. After Cristofori's death, piano making in Italy appears to have languished, but word of his invention became known in Germany through a translation of Maffei's account published in 1725. Before 1720 there had been independent attempts in France as well as in Germany to devise hammer mechanisms, although none was comparable to Cristofori's in sophistication or practicality. In the 1730s Gottfried Silbermann, of Freiberg in eastern Germany, a builder of organs, harpsichords, and clavichords, began constructing pianos patterned on Cristofori's. The surviving ones, probably from the 1740s, appear to have been directly copied from an instrument imported into Germany rather than derived from Maffei's description, but the ones he made earlier (and of which Bach is said to have disapproved in 1736) may have owed their failure to an attempt to follow Maffei's diagram exactly. By 1747 Silbermann had sold several of his pianos to King Frederick the Great of Prussia, and one of these is reported to have met with Bach's approval in 1747.

Subsequent German piano building did not follow the path charted by Silbermann. Instead, various German builders attempted to devise actions that were simpler than Cristofori's, generally adapting them to the clavichord-shaped instruments now called "square" pianos. In the most characteristic German actions, the hammers point toward, rather than away from, the player, and, instead of being hinged to a rail passing over all the keys, they are attached individually to their respective keys. As the front of the key is depressed, the back rises, carrying the hammer with it. A projecting point at the rear of the hammer shank catches on a fixed rail above the back of the keys, so that the hammers are flipped upward as the keys are stopped by a second rail set just above them. This action had no escapement, and (on the evidence of a letter of 1777 from Mozart to his father) many German instruments of the 1770s still lacked this highly important feature.

A pupil of Silbermann, Johann Andreas Stein of Augsburg in southern Germany, is generally credited with devising the first German action to include an escapement. As a replacement for the fixed rail that caught the projecting points at the rear of the hammer shanks, Stein provided an individually hinged and sprung piece for each key (Figure 6). As the back of the key reaches its highest point, this piece (the escapement) tilts backward on its hinge and releases the point at the back of the hammer shank. The hammer is then free to fall back to rest position even when the key is still depressed. This is often called the "Viennese" action because it was used by all the important 18th- and early-19th-century piano makers in Vienna, including Stein's daughter and son-in-law, Nannette and Johann Andreas Streicher; Anton Walter, Mozart's favourite piano builder; and Conrad Graf, maker of Beethoven's last piano. It was used in German-speaking countries until the mid-19th century, when it was replaced by mechanisms derived from a Cristofori-based action developed in England.

From R.E.M. Harding, The Piano-Forte (1933); published by Cambridge University Press

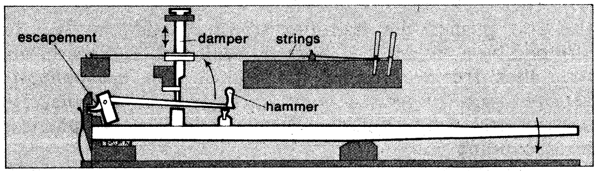

Figure 6: The German action (see text).

Although the tone of a piano by Stein or Walter is not loud, it is very sweet, with a singing treble and a clear tenor and bass that blend superbly with the sound of stringed instruments. The touch is extremely light and shallow: the force required to depress a key is only one-fourth that required on a modern piano, and the key need only be depressed half as far. In their sensitivity to the finest differences in touch and their singing tone, the Viennese pianos suggest the tone of a clavichord, although producing a louder sound.

Special effects

Austrian and German pianos of the late 18th and early 19th centuries often feature a great array of pedals. Only one of Cristofori's surviving pianos has any special effects: a lever on the underside of the instrument permits the player to shift the action sideways so that the hammers strike only one of the two strings provided for each note. By the time Silbermann built his pianos for Frederick the Great, a second special effect had been introduced —a mechanism to lift the dampers from the strings so that they could vibrate freely whether or not the keys were depressed. (These two effects, the sideways sliding of the action—to produce a softer sound and different tone colour—and the lifting of the dampers—to produce a louder, more sustained sound and another variation in tone colour—are the only ones found on all modern grand pianos.) Silbermann's pianos had hand levers for raising the treble and bass dampers separately and an additional hand lever for muting the strings. Stein's pianos normally had two knee levers for raising the treble and bass dampers and a third knee lever that interposed a strip of cloth between the hammers and the strings to produce a velvety pianissimo. Later instruments might have five or more pedals that, for example, pressed a roll of parchment against the bass strings to produce a buzzing sound or rang small bells and banged on the underside of the soundboard in imitation of the cymbals and drums of the then-fashionable "Turkish" music.

The English action. In the late 1750s a number of German piano builders emigrated to England, and one, Johann Christoph Zumpe, invented an extremely simple action for the square pianos he began building in the mid-1760s. Zumpe's action goes back to the Cristofori–Silbermann system in which the hammers point away from the player and are hinged to a rail over the keys. A metal rod tipped with a padded button is driven into the back of the key (Figure 7). When the key is depressed, the rod pushes the hammer upward; and the key is stopped by a padded rail over its back end, and the hammer flies freely. Despite the lack of an escapement, Zumpe's square pianos were an enormous commercial success and were copied in France, the Low Countries, and Scandinavia.

From R.E.M. Harding, *The Piano-Forte* (1933); published by Cambridge University Press

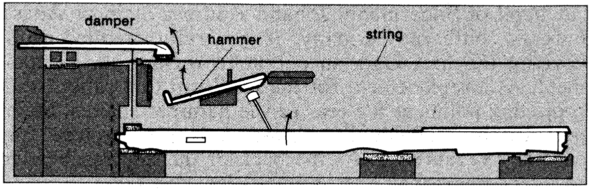

Figure 7: Zumpe's square-piano action (see text).

Zumpe had worked for the harpsichord builder Burkat Shudi when he first came to England, and around 1770 three other workmen in Shudi's shop, John Broadwood, Robert Stodart, and Americus Backers, devised for grand pianos an adaptation of Zumpe's action that included an escapement. This important development made London a major centre of piano building and created a characteristic English piano of fuller and louder sound than the Viennese piano but with a heavier, deeper touch and a consequent inability to play repeated notes as rapidly. In the English grand-piano action (Figure 8), the fixed rod of Zumpe's square-piano action was replaced by a pivoted jack, similar to that in Cristofori's action. The upper end of the jack fits into a notch at the base of the hammer shank, slipping out of the notch as the back of the key reaches its highest point; the hammer then flies free, strikes the string, and falls back to be caught by a hammer check even when the front of the key is still held down by the pianist. The tone of a typical 18th-century English grand piano is surprisingly reminiscent of the tone of an English harpsichord, suggesting that the English piano makers were, like Cristofori, seeking to make an expressive harpsichord, unlike the German builders who, in effect, appear to have been trying to build a louder clavichord.

From R.E.M. Harding. The *Piano-Forte* (1933) published by Cambridge University Press

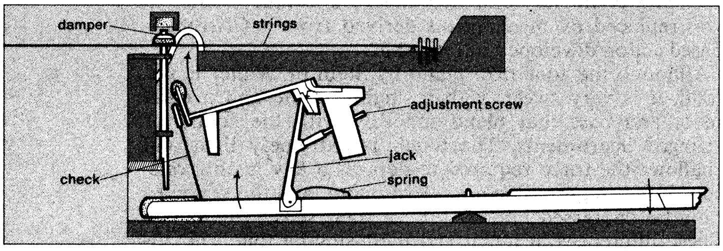

Figure 8: The English action (see text).

Unlike their Austrian and German counterparts, English pianos had two or, at most, three pedals. One of the two ordinary pedals shifted the keyboard sideways so that the hammers struck two or only one of the three strings provided for each note. The second pedal raised all the dampers. It was sometimes replaced by two pedals--one for the treble dampers, the other for the bass dampers—or, occasionally, by a single damper pedal divided into two parts that could be depressed separately or together with one foot, as on the piano presented by Broadwood to Beethoven in 1817.

Although the pianos of the late 18th and early 19th centuries were perfected instruments ideally suited to the music of their period, the increasing popularity of public concerts in large halls and concertos with large orchestras stimulated attempts by piano builders to produce an instrument of greater brilliance and loudness. Their efforts gradually created today's vastly different piano. In recent years, the special merits of the earlier instruments (sometimes called "fortepianos" to distinguish them from modern pianos) have come to be appreciated, and several builders have begun to make replicas of them.

Other early forms. As previously mentioned, many 18th-century pianos were "squares," built in a form resembling the clavichord. More compact and less expensive than wing-shaped grands, the square piano continued through much of the 19th century to be the most common form of piano in the home. But as square pianos became larger and larger, these advantages diminished, and the square piano was eventually replaced by the upright. In the 18th and early 19th centuries, upright pianos (*i.e.*, pianos with vertical strings and soundboard) took three different forms. In the "pyramid piano" the strings slanted upward from left to right, and the case above the keyboard took the form of a tall isosceles triangle. Or a grand piano was essentially set on end with its pointed tail in the air, producing the asymmetrical "giraffe piano." Placing shelves in the upper part of the case to the right of the strings yielded the tall rectangular "cabinet piano." Because the lower end of the strings, which ran nearly vertically, was about at the level of the keyboard, all such instruments were very tall. Although there were attempts to construct lower instruments by, in effect, positioning a square piano on its side, the American builder John Isaac Hawkins made the first truly successful low uprights in 1800 by placing the lower end of the strings near floor level. Robert Wornum in England built similar small uprights in 1811, and in 1842 he devised for them his "tape check" action, the direct forerunner of the modern upright action.

Pyramid, giraffe, and cabinet pianos

Development of the modern piano. In the early 19th century, piano makers were principally concerned with two problems whose solutions led to the modem piano. These were the relatively small volume of sound that could be produced from the thin strings then in use and the difficulty of producing a structure that could withstand the tension even of such light strings once the range of the instrument exceeded 5½ octaves.

Bracing and frame. Like 18th-century harpsichords, the pianos of the 18th and early 19th centuries were constructed entirely of wood, with the case (supported by a structure of internal wooden braces) sustaining the entire stress exerted by the strings. The only metal bracing in such instruments appears in the form of flat pieces bridging the gap through which the hammers rise to strike the strings. These braces eventually proved insufficient when the walls of the case itself and the pinblock (the long piece of wood into which all the tuning pins were driven) were incapable of withstanding the increasing tensions placed upon them. For this reason, ever-increasing quantities of metal bracing came into use, first in the form of individual bars running parallel to the strings from the side of the case to the pinblock but finally in the form of a single massive casting that took the entire tension of the strings upon itself. The one-piece cast-iron frame was first applied to square pianos by Alpheus Babcock of Boston in 1825, and in 1843 another Bostonian, Jonas Chickering, patented a one-piece frame for grands. With the adoption of such frames, the tension exerted by each string (about 24 pounds for an English piano of 1800) rose to an average of approximately 170 pounds in modern instruments, the frame bearing a total tension of 18 tons.

Babcock and Chickering pianos

Overstringing. The strings in early pianos, like those in harpsichords or clavichords, ran parallel to one another, causing the grand pianos of the 18th and early 19th centuries to retain much of the graceful shape of the harpsichord. In the 1830s it was realized that the bass strings could be made longer and their layout improved if they were made to fan out over the treble strings. This idea was first applied to square pianos, but in 1855 Steinway & Sons built a grand piano with a complete cast-iron frame embodying this "overstrung" plan, in which the strings of the treble and the middle registers fan out over most of the soundboard and the bass strings cross over them, forming a separate fan at a higher level. Because the bass strings fan out, the tail of the modern grand piano is far wider than that of the earlier "straight-strung" instruments.

Modifications in the action. The gradual strengthening of the piano's structure to permit the use of heavier strings eventually gave rise to hitherto unforeseen problems. The thicker strings could yield the louder sound of which they were capable only if they were struck by heavier hammers; because of the great velocity advantage provided by the early piano actions, any increase in the weight of the hammer required a manyfold increase in the force required to depress the keys. This difficulty was present to a minor extent even in the 18th-century English grand-piano action, and the touch on these instruments was both deeper and heavier than on Viennese pianos. Moreover, the deeper touch meant that it took longer for a key to return to rest position so that a note could be restruck. Consequently, English pianos were not capable of the rapid repetition of Viennese instruments. This problem became quite severe as the hammers grew heavier and as musicians wished increasingly to use tremolo effects in imitation of orchestral music.

The double-escapement action of Érard

What was necessary was an action that would permit a note to be restruck before the key returned to rest position. The first successful action of this type was devised by the Frenchman Sébastien Érard, who as a young man had built a harpsichord with a particularly elaborate system of pedals and knee levers and in 1810 devised the system of pedals still in use on the harp. Brard's first "repetition" or "double-escapement" action was patented in 1808, and an improved version that is the basis of the modern action was patented in 1821.

A further consequence of the use of thicker strings was that, if the sound of the instrument were not to become unduly harsh, the hammers had to be softer than those used on 18th-century instruments—light slips of wood covered with a few layers of thin leather. Felt-covered hammers were patented by the Parisian builder Jean-Henri Pape, who also contributed a number of other ingenious and important improvements, but the use of felt instead of leather did not become universal until after 1855.

With the adoption of the one-piece cast-iron frame, overstringing, and felt hammers, the piano achieved its modern form in all but a few details. One was the invention in 1862 by Claude Montal of Paris of a pedal that kept the dampers off the strings only for notes already held down. Individual notes could thus be sustained without the overall blurring caused by raising all the dampers by the ordinary damper pedal. This device is not generally found on European pianos, but it is included in American instruments as the middle pedal with the damper ("loud") pedal at the right and the action-shifting (una corda, or "soft") pedal at the left.

Types of modern piano. Since the abandonment of the square piano, only upright and grand pianos are manufactured. The grands range in length from a minimum of about 5 feet (150 centimetres) for a "baby" grand to a maximum of about 9 feet (270 centimetres) for a "concert" grand, although both shorter and longer instruments have been constructed. Among upright pianos, the models over 4 feet (120 centimetres) tall—which frequently had an excellent tone because of their relatively long bass strings—have largely been superseded by the lower models, the "console" (about 40 inches [100 centimetres] high) and the "spinet" (about 36 inches [90 centimetres high]), which look less bulky in the smaller rooms of present-day homes. Because the spinet's case rises such a small distance above the keyboard, it usually has "drop" action, most of which lies below the level of the keys.

Console and spinet models

Modern piano actions. In 1636 Marin Mersenne, the author of the treatise ***Harmonie universelle,*** quoted a remark that the harpsichord of his time contained 1,500 different parts. The modern piano contains 12,000, most of which are found in the action. The modern grand-piano action (Figure 9) is a simplified version of Brard's double-escapement action of 1821, and, although different manufacturers' actions differ in detail, they all work in much the same way. When the key is depressed, its back end rises, lifting the wippen. The wippen raises a pivoted L-shaped jack that pushes the hammer upward by means of a small roller attached to the underside of the hammer shank. The hammer flies free when the back of the L-shaped jack touches the adjustable regulating button. At the same time, the upper end of the repetition lever—through which the upright arm of the jack passes—rises until it is stopped by the drop screw. When the hammer rebounds from the string, the roller falls back until it is stopped by the intermediate lever, enabling the tip of the jack to return to position beneath the roller, even if the key is still partially depressed. The jack is then ready to raise the hammer again should the player restrike the key before it returns to rest position. In the meantime, the hammer is prevented from bouncing back up toward the strings by the padded hammer check, and the damper is raised above the strings by a separate lever lifted by the extreme end of the key.

From E.Q. Norton. Tuning and Care of the Pianoforte

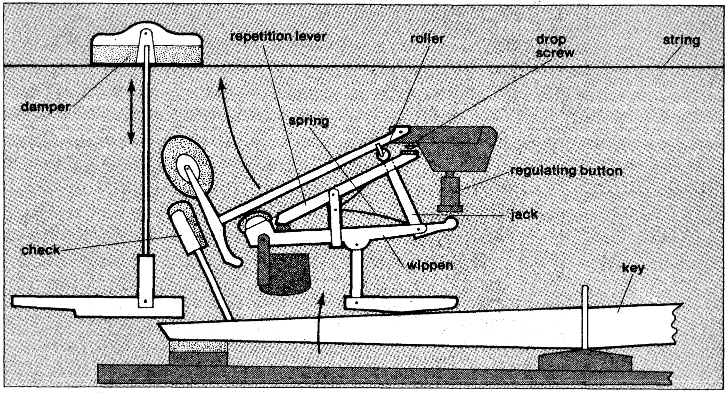

Figure 9: Modern grand-piano action (see text).

Action of the modern upright piano

In the modern upright-piano action (Figure 10), depressing the key also lifts a wippen, which in turn carries an L-shaped jack like that in the grand action. The tip of the jack engages a notch in the hammer butt, thrusting it forward until the regulating button causes the jack to pivot and escape from the notch. Rapid repetition is ensured by the bridle, a strip of cloth that tightens as the hammer moves toward the strings and helps to bring the hammer back to rest position. The dampers are moved away from the strings by a small metal pin, or "spoon," at the back of the wippen.

Player pianos. The history of automatically playing keyboard instruments dates at least to the 16th century. The inventory of musical instruments owned by King Henry VIII at his death in 1547 included "an instrument that goethe with a whele without playing upon," and three spinets equipped with a pinned barrel like that of a music box or barrel organ survive from the workshop of the Augsburg builder Samuel Bidermann (1540–1622). The most common type of player piano operates by means of a roll of punched paper that controls a pneumatic system for depressing the keys. Its heyday was the 1930s, and it was largely rendered obsolete by the increasing popularity of the phonograph and the radio.

Electronic pianos. Since the 1920s there have been experiments with instruments using electric or electromagnetic pickups, amplifiers, and loudspeakers instead of the conventional piano soundboard. Many such pianos do not use strings at all for the generation of sound, employing instead either electronic circuits or tuned pieces of metal. Small, inexpensive instruments of this type are sometimes used for practice, the student listening to himself through earphones. Although some electronic pianos approach the sound of a conventional instrument, their principal advantage seems to lie in producing effects that the conventional piano cannot, by means of electronic prolongation and alteration of their tone.

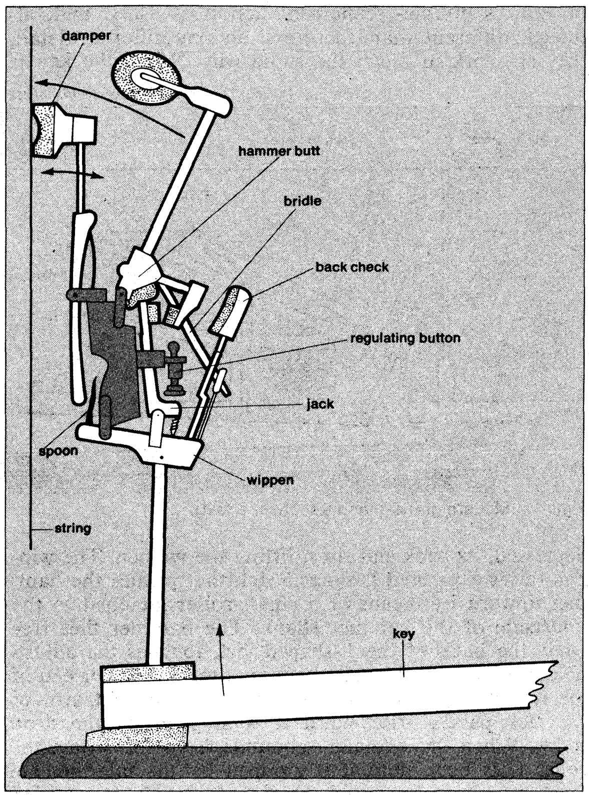

Figure 10: Modern upright-piano action (see text).

OTHER STRINGED KEYBOARD INSTRUMENTS

Stringed keyboard instruments have as their principal defects an inability, first, to sustain a tone indefinitely and, secondly, to alter the tone's loudness once a key has been depressed. There have been various attempts to build stringed instruments sounded by other means than plucking or striking—including vibrating the strings by blowing a current of air past them, as in the ***piano éolien*** of 1837. The most successful of these other instruments in one way or another adopted the principle of the hurdy-gurdy: ***i.e.***, vibrating the strings by friction.

Heyden's *Geigenwerck*

An instrument of this kind appears in several diagrams in the notebooks of Leonardo da Vinci (1452–1519). Some apparently highly successful ones (none of which, unfortunately, have survived) were made by the Nürnberg builder Hans Heyden, who described them at length in pamphlets published in 1605 and 1610. These instruments had a series of rosined wheels that rubbed the strings when they were drawn against them by the action of the keys. According to Heyden, the instrument, which he called a ***Geigenwerck***, was capable of recreating the sound of an ensemble of viols and produced sounds of different loudness depending on the force with which the keys were depressed. The sole surviving instrument of this type, made in Spain in 1625, is far less sophisticated than Heyden's and gives only a faint inkling of what his must have sounded like.

In 1772 a device called a celestina was patented by Adam Walker of London; it employed a continuous horsehair ribbon (kept in motion by a treadle) to rub the strings of a harpsichord. Thomas Jefferson, who ordered a harpsichord equipped with a celestina in 1786, commented that it was suitable for use in slow movements and as an accompaniment to the voice. Similar devices, some using rosined rollers, were applied to pianos by various ingenious inventors throughout the 19th century.

BIBLIOGRAPHY

Development of the keyboard, the clavichord, and the harpsichord: FRANK HUBBARD, ***Three Centuries of Harpsichord Making*** (1965), the only book on the subject to clarify the history of the instrument and the techniques of earlier harpsichord makers; RAYMOND RUSSELL, ***The Harpsichord and Clavichord*** (1959), a general history, less technical than Hubbard's, illustrated with excellent photographs; DONALD H. BOALCH, ***Makers of the Harpsichord and Clavichord, 1440–1840*** (1956), known data on all makers whose names have survived as well as the locations of their extant instruments; EDWIN M. RIPIN (ed.), ***Keyboard Instruments*** (1971), a collection of 10 articles on specialized topics, including Italian, Flemish, and English harpsichords, 15th-century instruments, and the ***Geigenwerck;*** HANNS NEUPERT, ***Das Klavichord*** (1956; Eng. trans., 1965) and ***Das Cembalo,*** 3rd ed. (1956; Eng. trans., ***Harpsichord Manual,*** 1960), elementary treatises with emphasis on modern instruments—much of the historical information has now been superseded; FRANZ J. HIRT, ***Masterwerk des Klavierbaus*** (1955; Eng. trans., ***Stringed Keyboard Instruments,*** 1968), a splendid picture book with interesting but somewhat unreliable supporting text; EMANUEL WINTERNITZ, ***Keyboard Instruments in the Metropolitan Museum of Art*** (1961), a useful, small, and inexpensive picture book with a fair text; WOLFGANG J. ZUCKERMANN, ***The Modern Harpsichord*** (1969), the standard work on modern harpsichords and their makers, although unreliable for historical information and technical aspects of instrument design and building; WILLI APEL, "Early History of the Organ," ***Speculum,*** 23:191–216 (1948), an excellent account, especially useful for the details it gives on the evolution of the keyboard; EDWIN M. RIPIN, "The Early Clavichord," ***Musical Quarterly,*** 53:518–538 (1967); "A Reassessment of the Fretted Clavichord," ***Galpin Society Journal,*** 23:40–48 (1970); "The Two-Manual Harpsichord in Flanders Before 1650," ***ibid.,*** 21:33–39 (1968); and "Expressive Devices Applied to the Eighteenth-Century Harpsichord," ***The Organ Yearbook,*** 1:65–80 (1970), a series of articles presenting new information or interpretations not available in book form; RAYMOND RUSSELL, "The Harpsichord Since 1800," ***Proceedings of the Royal Musical Association,*** 82:61–74 (1955–56), an account of the early period in the modern revival of the harpsichord that fills some of the gaps in Zuckermann's work.

The Piano: R.E.M. HARDING, ***The Piano-Forte: Its History Traced to the Great Exhibition of 1851*** (1933), the standard work in the field—the diagrams are excellent, but the text yields its information only reluctantly; ALFRED J. HIPKINS, ***A Description and History of the Pianoforte and of the Older Keyboard Stringed Instruments*** (1896), a classic that has never been superseded as a brief account of the subject, includes discussion of all stringed keyboard instruments; ARTHUR LOESSER, ***Men, Women and Pianos*** (1954), a lively account of all keyboard instruments, their music, and their place in society—the author's bias in favour of the modern piano makes the book unreliable for details on instruments before 1840; WILLIAM L. SUMNER, ***The Pianoforte*** (1966), an acceptable elementary history; DANIEL SPILLANE, ***History of the American Pianoforte*** (1890, reprinted 1969), still the standard work on American piano building; WILLIAM B. WHITE, ***Piano Tuning and Allied Arts,*** 5th ed. rev. (1946), the standard technician's manual in America; A.W.J.G. ORD-HUME, ***Player Piano*** (1970), an excellent history as well as a technical manual; THEODORE E. STEINWAY, ***People and Pianos*** (1953), contains interesting details and human-interest material; HUGH GOUGH, "The Classical Grand Pianoforte, 1770–1830," ***Proceedings of the Royal Musical Association,*** 77:41–50 (1950–51), a good discussion of the musical and technical aspects of the instruments, especially valuable for its comparison of English and German pianos.

(E.M.R.)

Keynes, J.M.

John Maynard Keynes, critic and architect of economic policies, political journalist, and successful financier, first made his mark as an iconoclastic economist with ***The Economic Consequences of the Peace,*** a compelling indictment of the Versailles Peace Treaty. His enduring fame, however, rests on his ***General Theory of Employment, Interest and Money,*** which showed that recovery from a recession can best be achieved by a government-sponsored policy of full employment.

Early life and education. Keynes was born in Cambridge, England, on June 5, 1883, into a moderately prosperous family of the professional elite. His father was an esteemed economic scholar and later academic administrator in Cambridge University. His mother, the daughter of a minister endowed with advanced opinions, was one of the first female graduates of the same university.

An obviously gifted youngster, Keynes travelled the customary educational route provided for the upper and upper middle class child. From his preparatory school, he

Keynes at Eton

went to Eton, the most prestigious public (*i.e.*, private) boy's school in the land. In sharp contrast to the bitter school memories of such gifted Englishmen as the writers George Orwell and Cyril Connolly, Keynes appears to have enjoyed every moment of his Eton experience. He was somewhat delicate of constitution and no athlete, but he excelled both as a mathematician and as a scholar of the classics. His essays on such varied themes as Bernard of Cluny, the character of the Stuart monarchs, and the differences between East and West won numerous prizes. As his greatest feat, he secured the respect and admiration of his irreverent contemporaries by a general affability and a pronounced talent for the management of student societies. His classmates honoured him by election to Pop, the student society that traditionally participates in the government of Eton affairs.

At Cambridge, which Keynes entered in 1902, he fared even better. At King's College, one of the oldest and richest of Cambridge endowments, he "quickly established," as one biographer put it, "the ascendancy that he had achieved over his contemporaries at Eton." He blossomed as a polemical speaker, becoming president of the University Union Society, the undergraduate counterpart of the House of Commons. Gradually, as he came under the influence of Alfred Marshall, the leading Cambridge economist, his mathematical interests diminished, and his attachment to politics and economics increased.

The Bloomsbury group

Cambridge introduced Keynes to an important circle of writers and artists. The early history of Bloomsbury, that exclusive circle of the cultural elect, which counted among its members E.M. Forster, the philosopher G.E. Moore, Virginia Woolf, the painter Duncan Grant, and the art critic Clive Bell, centres upon Cambridge and the remarkable figure of Lytton Strachey. Strachey, who had entered Cambridge two years before Keynes, inducted the younger man into the exclusive private club known simply as "the Society." Its members and associates were the leading spirits of Bloomsbury. Throughout his life, Keynes was to cherish the affection and respond to the influence of this tribe of free souls. The group was more than extraordinary in its achievements: it was also utterly fearless in its opinions and courageous in its conduct. No practice, from homosexuality (Keynes was later reported to have vied at one time with Lytton Strachey for the affections of Duncan Grant) to conscientious objection, was the occasion for reprobation in this circle, provided only that it could logically be justified as promoting one or both of the major group values—friendship and beauty.

Early career. After graduating from Cambridge, Keynes became a civil servant and moved to the India Office in Whitehall. His experience there formed the basis of his first major work, which is still the definitive examination of pre-World War I Indian finance and currency. He then returned to Cambridge, where he taught economics with great success until 1915. The onset of World War I brought him back to government employment, this time in the Treasury, an agency even more powerful than its American counterpart. Here he was daily concerned with the economic management of the war. His special responsibility covered relations with allies and the conservation of England's scant supply of foreign currencies.

His scintillating performance marked Keynes for a great public career. But the Versailles Peace Conference was to transform his prospects. Accompanying his prime minister, Lloyd George, to France as an economic adviser, Keynes soon became so distressed at the political chicaneries of the proceedings and the unrealistic character of the reparations policies to be imposed upon a defeated Germany that his health deteriorated, and he resigned his post, oppressed, to quote from a letter to his father, at the impending "devastation of Europe."

Always an activist, Keynes translated personal distress into public protest. In two summer months he composed the indictment of the Versailles settlement that by Christmas 1919 reached the bookstores as *The Economic Consequences of the Peace*. The permanent importance of this great polemical essay lies in its cogent economic analysis of the excessive weight of reparations upon the German economy and the corresponding lack of probability that they ever would be paid. What guaranteed the book general success were the blistering sketches of Woodrow Wilson, Clemenceau, and Keynes's old chief Lloyd George. Wisely, Keynes began the book with these portraits in acid.

***The** Economic Consequences of the Peace*

To Keynes's former superiors and colleagues in the Treasury, the performance was even worse than a scandalous betrayal of a privileged position: it was a raving success into the bargain. As a consequence, in some Whitehall circles Keynes remained to the end of his life a man not quite to be trusted, an iconoclast perfectly willing to rock any boat into which he had imprudently been invited.

In Cambridge, to which Keynes now returned, his reputation was rather different. He was quite simply esteemed as the most brilliant student of Alfred Marshall and A.C. Pigou, the two Cambridge economists who between them had produced the authoritative explanation of how competitive markets functioned, business firms operated, and consumers spent their incomes. Although the tone of Keynes's major writings in the 1920s was occasionally skeptical, he did not directly challenge that conventional wisdom of the period that held laissez-faire, only slightly tempered by public policy, the best of all possible social arrangements.

Two of Keynes's opinions did foreshadow the theoretical revolution over which he presided in the 1930s. In 1925 he opposed England's return to the gold standard at the prewar dollar–pound ratio of $4.86; and long before the Great Depression, Keynes was worried about the persistent unemployment of British coal miners, shipyard workers, and textile operatives. Reconciled by this time to Lloyd George (who was never to return to office), he supported the Liberal Party's program of public works to take the unemployed off welfare and place them in useful jobs. But respectable economists still relied upon the expected automatic adjustments of the free market, and the Treasury was attached to the still more doctrinaire view that public works were necessarily useless because any increase in the government deficit would surely reflect itself as an equal decline in private investment. Since Keynes could not yet offer a theoretical refutation of his colleagues' opinions, his agitation for public works had little political effect.

Marriage and prosperity

His private life was more satisfactory. In 1925 he married the talented and charming ballerina Lydia Lopokova. Despite the doubts expressed by Cambridge conservatives of his wisdom in courting a "chorus girl," the marriage was happy. Indeed, in the judgment of Mrs. Alfred Marshall, the economist's widow, it was "the best thing Maynard ever did." His friendships with the Bloomsbury circle prospered, and he easily financed a comfortable London apartment from the proceeds of highly successful stock speculations. Always a late riser, Keynes conducted the management of his investments in civilized fashion while he breakfasted in bed. As a journalist he extended his reputation, writing in the leftist New *Statesman* (whose Board of Directors he later joined) as well as the major newspapers, *The Times* (of London) and the *Manchester Guardian* (now the *Guardian).*

Keynes and the Depression. What altered Keynes's public reputation a second time and swept him to permanent fame was his response to the economic tragedies of the 1930s. With a few noteworthy exceptions politicians and economists were universally bewildered by events and shorn of confidence in traditional policies. Conventional economic wisdom still held, against mounting evidence to the contrary, that time and nature would restore prosperity if government did not try to manipulate the economy. After all, the unemployed could always get jobs if they only were willing to work for lower wages. Businessmen could always restore their sales by the parallel strategy of slashing their prices. In the process a few of the weaker brethren would indubitably be wiped out. Nevertheless, if all groups accepted the discipline of competitive adjustment, soon recovery, prosperity, and higher wages would return.

The General Theory of Employment, Interest and Money

Unhappily, the remedy worked nowhere. In the United States Franklin Roosevelt's 1932 landslide presidential victory over Herbert Hoover attested to the political bankruptcy of laissez-faire. New explanations and new policies were urgently needed. These Keynes supplied. His enduring triumph was his composition in the early 1930s of the most influential treatise composed by an economist thus far in this century, comparable to the *Wealth of Nations* as an intellectual event and to Malthus' *Essay on Population* as a guide to public policy. *The General Theory of Employment, Interest and Money,* which appeared in England at the very end of 1935, is a highly technical, even abstruse exposition of new ideas that had been partly foreshadowed in his *Treatise on Money* (1930). The central message is readily translated into two powerful propositions. The first declared the existing theory of unemployment nonsense. In a depression, according to Keynes, there was no wage so low that it could eliminate unemployment. Accordingly, it was wicked to blame the unemployed for their plight. The second proposition proposed an alternative explanation about the origins of unemployment and depression. This centred upon aggregate demand—*i.e.*, the total spending of consumers, business investors, and public agencies. When aggregate demand was low, sales and jobs suffered. When it was high, all was well.

From these generalities there flowed a powerful and comprehensive view of economic behaviour. Because consumers were limited in their spending by the size of their incomes, they were not the source of business cycle fluctuations. The dynamic actors were business investors and governments. In depressions the thing to do was either to enlarge private investment or to create public substitutes for private investment deficiencies. In mild economic contractions, monetary policy in the shape of easier credit and lower interest rates just might stimulate business investment and restore the aggregate demand caused by full employment. Severer contractions required as therapy the sterner remedy of deliberate public deficits either in the shape of public works or subsidies to afflicted groups.

Impact of Keynes

In an extremely short space of time, Keynes converted most of his professional colleagues. During World War II and after, one Western democracy after another affirmed its new commitment to maintain high employment. In the United States the Employment Act of 1946 formally imposed upon presidents and congresses the duty of maintaining prosperity. In the United States the 1964 tax cut, initiated by President John F. Kennedy and enacted in his successor's administration, quite openly enlarged an existing national deficit so as to promote faster expansion and high employment. This was truly the triumph of the Keynesian idea and vision.

Keynes's late career. The *General Theory* was Keynes's last major written work. In 1937 he suffered a severe heart attack. Two years later, though not completely recovered, he returned to teaching at Cambridge, wrote three influential articles on war finance entitled *How to Pay for the War,* and served once more in the Treasury as an all-purpose adviser. As the war drew to a victorious conclusion, Keynes turned his thoughts to the design of international financial institutions calculated to limit the spread of depression. At the Bretton Woods Conference in 1944 he played a prominent part. But the institutions that resulted from the conference, the International Monetary Fund and the World Bank—two agencies that survive into the 1970s—bear much stronger marks of the orthodox theories of the United States Treasury of that time than of Keynes's thinking.

His last major public service was his brilliant negotiation in the autumn and early winter of 1945 of a multibillion-dollar loan granted by the United States to England. By this time the British establishment was more than ready to welcome home its errant son. He was now both a member of the Court of the Bank of England (as its governing board is termed) and, as Lord Keynes of Tilton, a peer of the realm. In the old Bloomsbury tradition of disrespect for the conventional, he wryly commented, "I am not sure which of us is being made an honest woman—the Old Lady [as the Bank of England is popularly known] or me." The worry was groundless. Keynes's old enemies had by now capitulated to one of their country's supreme intellects.

On April 21, 1946, overstrained by wartime exertion, Keynes died in Firle, Sussex. Intimate alike of artist, scholar, and politician, cultural entrepreneur, gifted teacher, loyal friend, and original thinker, this child of the philosophical tradition of Locke, Hume, and Mill late in his life expressed as a single regret that he had not drunk more champagne. Bloomsbury has always preferred effervescence to pomposity.

BIBLIOGRAPHY. R.F. HARROD, *The Life of John Maynard Keynes* (1951), is an authoritative biography written by one of Keynes's students and colleagues. R. LEKACHMAN, *The Age of Keynes* (1965), contains a short biography, a summary of Keynesian economics, and an account of its use in the U.S. An exceptionally clear exposition of Keynes's major work may be found in D.D. DILLARD, *The Economics of John Maynard Keynes* (1948). Keynes's opinions of public issues and of other economists are best examined in his graceful essays contained in the following collections: *Essays in Biography* (1933); and *Essays in Persuasion* (1931).

(R.L.)

Khoisan Cultures of Africa

The term Khoisan is derived from the Hottentot roots *khoi* ("man," in the generic sense) and *sa* ("Bushman"). It is therefore an apt portmanteau word to designate the indigenous southern African peoples known as Hottentots and Bushmen. The nature of the relationship between the two Khoisan groups has given rise to much discussion. They closely resemble each other in physical appearance and are markedly different from any of the other southern African populations. The prevailing view is that they are of the same genetic stock and differ only in their cultures, the Hottentots being pastoral while the Bushmen were formerly all hunter-gatherers. The Central Bushman languages, Naro (Nharo), G/wi, and G//ana (/ and // represent click sounds in the Hottentot language), have such close lexical and structural resemblance to Hottentot languages that all have been classified as belonging to the same language family.

Physical appearance of the Khoisan peoples

Bushmen and Hottentots are lightly built with thin limbs and wiry muscles. They are shorter in stature than most southern African peoples; Bushman males average about five feet two inches (1.57 metres), women being an inch or so shorter, and Hottentots are perhaps two inches taller than Bushmen. Their skin colour at birth is coppery yellow, darkening to yellowish brown with exposure to the sun. They have a rather flat, protuberant forehead (a feature more marked in Bushmen), narrow, deep-set eyes, and prominent cheekbones. The nose is rather flat, with arched nostrils, and the lips are turned slightly outward. The chin is small and slightly pointed. Their small, often lobeless ears sit close to the head beneath black, tightly kinked "peppercorn" hair. Their dark-brown eyes are narrowed by the fullness of the upper lids and the pronounced epicanthic folds, a feature that has led some erroneously to link them with Mongoloid peoples.

Facial hair is sparse, and few men develop beards before middle age. There is little body hair, even in the armpits and genital region. The skin loses its elasticity early, supposedly because of the thinness of the layer of subcutaneous fat, and heavy wrinkles often form on the face, neck, and abdomen, giving the individual a misleadingly aged appearance.

Steatopygia (protuberant buttocks) and "Hottentot apron" (elongated labia minora) are common among Khoisan women. Steatopygia is caused partly by a characteristic outward curvature of the spine about the lumbar–sacral region, which pushes the buttocks outward; the prominence of the buttocks is increased by the racial tendency to accumulate fat on the hips and buttocks rather than about the abdomen. The penis of Bushman males and of many Hottentot males extends outward almost horizontally in a semi-erect position even when not tumescent.

The now-extinct Bushmen south of the Molopo River were smaller and lighter coloured than are the present-day Bushmen of Botswana, South West Africa, and Angola. The latter are thought to have acquired Negroid characteristics from interbreeding with Bantu-speaking peoples.

THE KHOIKHOIN, OR HOTTENTOTS

Origin of the name Hottentot

The origin of the name Hottentot is uncertain. The most plausible theory is that it was invented in 1647 by the survivors of a Dutch shipwreck who camped in the vicinity of present-day Cape Town for a year before being rescued. They established friendly relations with the local inhabitants but were quite unable to learn their language. The supposition is that the Dutchmen took the refrain autentou from a ¾-time dance of the people and used it in friendly, joking reference to them. In the form hottentot it was later adopted by the Europeans and subsequently by the Hottentots themselves. The original Hottentot self-designation had been Khoikhoin ("people people," or "proper people").

Knowledge of traditional Hottentot culture is fragmentary and imprecise. The only records come from travellers and missionaries who were untrained observers and therefore strongly influenced by their own values and preconceptions. By the time capable and interested observers came to the southern African scene, war and disease had taken their toll, and only vestiges of the traditional cultures remained.

Subsistence and economics. The Khoikhoin were pastoral, grazing their fat-tailed sheep and long-horned cattle over much of the drier, western half of the subcontinent. The native sward and the meagre supplies of water were unsuited to sustained stock raising, and the Khoikhoin had periodically to trek their flocks and herds in search of new pasture and water. No crops were cultivated. The diet of milk and meat was supplemented by game and wild plants.

Their settlement pattern appears to have varied with the conditions of the locale, but a typical community may have consisted of 200 or 300 people, together owning upward of 1,000 head of stock. The temporary settlement was enclosed by a circular fence of thornbush, within which were the kraals (corrals) for lambs and calves. No special enclosures were made for adult beasts, which were driven into the main enclosure at night among the huts of their owners. These huts were hemispherical structures made by planting a ring of wands in the ground and bending the tops over, tying them together to form a dome that was covered with woven grass matting. Weatherproof and cool, the huts could be assembled or taken down in a few hours, loaded onto oxen, and carried to the next settlement site. The oxen were used as mounts as well as pack animals.

The hut was the property and domain of the wife; she had complete authority over it, to the extent of being able to exclude her husband if she wished. It appears that the Khoikhoiti woman's status was equal or nearly so to that of the man; women could own stock and were economically important in their role as gatherers of plant food. The men were herders and hunters and, among some tribes, metalworkers. The principal weapons were arrows and spears tipped with bone or iron. An extensive trading network seems to have existed through which scattered settlements exchanged aromatic, medicinal, and narcotic herbs; pottery; and metalware such as iron and copper beads, arrowheads, and knife and spear blades. Some Khoikhoin, particularly in northeastern Botswana, had developed rather advanced mining techniques; the old shafts indicate a high order of geological insight.

Religion of the Hottentots. The Khoikhoi deity Tsuni-g // oab is celebrated in myths as the first of that people from which all others take their origin. A great chief and a powerful magician, he worked many wonders, including the creation of men and women. He died several times and was resurrected, eventually becoming a purely spiritual being. As such he was omniscient and omnipresent and the giver of life and of rain. Supplication was made to him in an elaborate ritual to persuade him to send the rain that was essential for survival of man and stock.

Death and rebirth

Another deity, Heitsi-eibib, was the hero of a cycle of myth. He could change his form and had died and been reborn many times. He was worshipped at his many graves scattered about Hottentot country; the passerby would add a stone to the heap marking the grave and pray to Heitsi-eibib for prosperity and success.

G // aunab was a god with varying attributes who, with appropriate phonemic changes of his name to fit a particular language, appeared in the theologies of a number of Khoisan peoples. In the myths of the Hottentots he is the adversary of Tsuni-g // oab and the bringer of death, disease, and other misfortunes. In some accounts he appears as the personification of the malevolent spirits of the dead. Among those peoples exposed to Christianity, he has been equated with the devil.

The Khoikhoin are also said to have worshipped the moon, although not much is known about this. Certainly the moon figures in their very rich mythology.

The practice of magic does not seem to have been very extensive. Curing and divination were the main activities of magicians, although they occasionally misused their powers for evil purposes. When they did, their influence could be negated by the application of cold water, either to the sorcerer or to his victim—an illustration of the high value placed on water by the Hottentots.

Political organization. Hottentot communities were linked by language and kinship into a loose confederation of clans that formed a nation. Several nations existed in the 17th century. Each had its own territory, its own name, and apparently its own dialect. (The dialectal differences must have been minor, as there was great similarity in the Hottentot languages across their total range of nearly 2,000 miles [3,000 kilometres] from the eastern Cape Province to the highlands of South West Africa.) The clans comprising a nation were ranked in order of seniority, the chief of the nation being drawn from the senior clan. Marriage within the clan was strictly forbidden; the need to find spouses in other clans helped to keep the nation together. The nation as a whole had exclusive rights to grazing and hunting land, water holes, and mineral rights. In the larger nations there seems to have been some apportionment of land among the clans.

Hottentot confederation of clans

Leadership, despite its clan basis, was not strong; it was persuasive rather than autocratic. Many instances are recorded of individual clans hiving off from the main body, attracting a following from other clans, and setting up as an independent nation with a new rank order of constituent clans. It has been suggested that this anarchistic tendency was reinforced by social and environmental pressures. Among a people lacking a strong and coercive political system and totally dependent on a scarce resource such as water, the use of that resource can be effectively controlled only if harmony prevails in the community. Harmony is threatened if the community reaches an unwieldy size and imposes too heavy a demand on the limited supply of water. The only solution then is for the community to divide. The "daughter" component must put sufficient distance between itself and the "parent" community to avoid predation by the latter. The effect is to limit the size of communities and to encourage their wide dispersal over habitable country.

Hottentot nations did not develop great strength or solidarity. As nomadic pastoralists they were forced to give ground before the incursions of more cohesively organized peoples: the Bantu who moved down the southeastern coastal areas (probably about the 10th century AD) and European settlers who began moving inland from Table Bay in the 17th century. By the 19th century some of the Hottentot nations felt themselves desperately pressed. Strong leaders were able to unite fragments of clans and nations under them, and large groups moved across the Orange River out of Cape Colony into South West Africa, thus retracing the route that may have been taken by forebears, who are thought to have migrated into southern Africa from the central African lakes. In South West Africa some of the Hottentots had troubles with the Herero group of the Bantu, who were roving farther and farther south. Caught between the Europeans and the Bantu, the Hottentots fought for nearly 100 years, giving up the struggle only after the suppression of an uprising at Bondelswart in 1922.

Little now remains of a distinctively Khoikhoi culture, despite the efforts of missionaries and governments to soften the impact of alien cultures. The Nama and Garikwe communities retain their identities as Hottentots, and the former have kept their language and some of their customs. Many other communities live on reserves, where they make a living from their livestock, supplemented by jobs as unskilled or semiskilled labourers, but theirs is more the culture of poverty than that of the traditional Khoikhoin people.

THE BUSHMEN

The term Bushman is an anglicization of the 17th-century Dutch *bosjesmans* ("bush dwellers"; *i.e.*, people without fixed abode). The historical evidence concerning Bushmen is incomplete and often unreliable. As hunters and gatherers they were unobtrusive in their occupation of the land. Few early explorers took much interest in them, and fewer had the time and means to study the small, widely dispersed communities that shifted their encampments every few weeks. The Bushmen occupied most of the country south of the Zambezi River that was not in the hands of the Hottentots or Bantu. Skeletal and cultural remains, particularly rock paintings and engravings, indicate that the yellow hunters once ranged over the whole subcontinent.

Distribution of modern Bushmen

Present-day Bushmen. The Bushman population in the 1970s numbered between 45,000 and 50,000. Some 25,000 or 30,000 lived in the Republic of Botswana, 17,000 of them in the western Kalahari districts. South West Africa had about 15,000, and it is estimated that another 4,000 lived in southeastern Angola. A small number of them moved among Zambia, Rhodesia, and Botswana. Two groups lived in the Republic of South Africa, one in the Kalahari Gemsbok National Park in Cape Province and the other, a very small community, near Lake Chrissie in the eastern Transvaal.

It is often stated that the surviving Bushmen migrated to their present inhospitable desert habitats in recent times after being driven out of other territories. But there is ample evidence that they occupied their present locations in the mid-19th century, when other Bushmen were still living in parts of southern Africa where they are now extinct. Secondly, there is no evidence that the latter groups migrated into the desert areas; rather, it is clear that they remained where they were until they were overwhelmed by war and disease or absorbed by interbreeding with Europeans and Bantu. Thirdly, the distribution of dialects among the present-day population is consistent with their having been in their present locations over a very long period.

The majority of today's Bushmen have been dispossessed of their territories by European and Bantu cattle raisers. The intrusion of cattlemen has reduced the supply of game animals and esculent plants that constituted the greater part of their diet. Most Bushmen have therefore turned to livestock raising for their living, either by hiring themselves as labourers to ranchers or by entering into master–client relationships with Bantu owners of cattle posts. A few of them still follow the traditional hunter-gatherer style of life.

Ranch labourers. On the marginal cattle ranches in the arid regions of southern Africa, Bushmen compete with the Bantu for available jobs. Because of their relative lack of strength, sophistication, and marketable skills and their common ignorance of languages other than their own, they can get only the lowest paid jobs. Any man who finds employment soon attracts a number of dependent kin and friends who come and live with him on the ranch. Most ranchers recognize the plight of the Bushmen and increase the labourer's issue of rations (the usual supplement to wages) to accommodate the train of dependents. Some ranchers give an annual bonus of small livestock, intended to be kept and allowed to multiply on the ranch; more often than not, however, the Bushmen slaughter the bonus for Christmas or some other special occasion.

Ranch Bushmen, although retaining their languages and some aspects of social organization such as the kinship structure, have lost much of the rationale of their old culture. In the traditional life-style, women had great economic importance as the gatherers of food plants, which constituted the main part of the diet. On the ranches, however, a labourer's wife may be something of a liability when he is competing with other men for a job. Deserted wives and children are numerous; they turn to already overburdened kinsmen for help or to prostitution and petty crime.

Hunting-gathering Bushmen. Independent Bushmen are confined mainly to the western part of Botswana. In the northwest are the K!ung (! represents a click sound), who inhabit an area with some permanent water holes and numerous esculent plants, including extensive groves of mugongo trees (*Ricinodendron* rautanenii), which bear pleasant-tasting and nutritious nuts. The !xõ live in the west central part of Botswana, a region without natural supplies of permanent water but rich in game and esculent plants. In the central Kalahari region of Botswana are the G/wi, /aba, and G//ana groups. This region does not have the seasonal abundance of game that is seen farther west and is also waterless except during the wet season. Other hunter-gatherer Bushmen are found elsewhere in Botswana, South West Africa, and Angola, but they are not independent and autonomous, and their way of life is therefore less representative of the traditional Bushman cultures.

Cultural variety of Bushmen

Bushmen are not culturally homogeneous, although the cultures of some of the groups resemble one another. The K!ung, !xõ, and G/wi, though all hunter-gatherers, live in rather different habitats containing different resources, and the three groups show marked differences in their technologies and their patterns of exploiting resources. Organizationally, these groups also exhibit marked contrasts. The lexical and structural differences among their languages are so great that they have been classed in three different language families. Generalizations about the Bushmen can therefore be made only at the level of a "southern African hunter-gatherer culture" and limited to such superficial common features as the use of bows and poisoned arrows in hunting; a low population density and small communities; generally diffuse and ephemeral leadership; egalitarian communities, the government of which is by consensus; an absence of the lineage principle in most if not all, kinship systems; and a lack of formal legal and judicial systems. Both the breaking up and coalescence of communities are common. Violence and warfare, although frequently reported in the literature of now-extinct Bushmen, are not characteristic of the present-day hunting-gathering Bushman peoples; on the contrary, their ethics stress cooperation.

A detailed description of one of the Bushman peoples follows.

The G/wi people of the Kalahari. The G/wi inhabit the western half of the Central Kalahari Game Reserve and the eastern fringe of the Ghanzi ranches. About 800 G/wi live on the ranches as labourers and their dependents. Another 500 or so move into the ranching area in time of drought. Sporadic trading visits are made at other times to exchange the desert produce of game-hide leather for tobacco, iron rods, and fencing wire—used in the manufacture of tools and weapons. The remaining 2,000–2,500 G/wi are permanent desert dwellers who have only sporadic contact with Bantu and Europeans and have retained their traditional hunter-gatherer culture.

Environment of the G/wi

The habitat. The G/wi country lies in the centre of the Kalahari Basin, a depression in the vast inland plateau of southern Africa. The basin is covered by a mantle of fine-grained sand, up to **400** feet (120 metres) deep, poor in plant nutrients and of a texture that renders it susceptible to wind erosion, leaching, and scorching. Rainfall is confined to ten or 12 weeks after midsummer. The country responds with startling rapidity to the first good rains, and within four days the landscape is transformed by a luxuriant growth of grasses and herbs and by the flush of foliage on shrubs and trees. Rain is the key to all life in the Kalahari. The extreme seasonal variations in rainfall, humidity, and temperature lead to corresponding seasonal contrasts in the amounts of plant and animal food available to hunter-gatherers. There are a few localities in which resources are sufficient to meet the year-round needs of the hunters and gatherers, and these are the areas that the G/wi communities occupy as their territories.

The G/wi world view. In G/wi theology the universe was created by N!adima. He is the owner of all that is and may dispose of it as he wishes. His actions are, however, bound by the natural systems he is believed to have ordained; he cannot suspend or reverse their operation. N!adima is remote from his creatures. They cannot communicate with him or influence his will to their own advantage or favour. G/wi therefore have no religious rites such as prayer, worship, or sacrifice and no priests. They stoically accept N!adima's occasional caprice; *e.g.*, when "he grows tired of a man's face" and sends a marauding lion or some other misfortune to kill him.

G // amama is a less powerful being than N!adima. He sporadically attempts to do harm to man and is often successful, but he can be frustrated by a number of means that N!adima created and man has been able to discover. Several herbal medicines have the power to counter G // amama's influence; certain communal dances also serve to exorcize the evil he is believed to send in the form of invisible, magical slivers of wood.

The logic of the G/wi world view is that N!adima, having created man, intends him to survive and thus permits him to make use of what is available in the environment to that end, subject to the restriction that N!adima will be angered by wastefulness or greed on the part of those using his property. Man, at least G/wi man, must devise for himself the best means of survival that he can, including the regulation of interpersonal behaviour. Social usages and customs are therefore seen as man-made and not sacrosanct. The stability of behaviour and the predictability of others' actions require agreement by all concerned. Such agreement can be won only by persuasion and ensured by the fulfillment of obligation. It is therefore imperative that individuals and the community remain on good terms with everybody in the circle of social contact.

Social and political organization. The communities, or bands, usually have between **40** and 60 members, the extremes being 25 and 85. They are open communities, in the sense that there are no particular qualifications for membership, but members tend to stay with a group over long periods. Eventually, some catastrophe such as severe drought or epidemic disease (*e.g.,* the smallpox outbreak of 1950) may lead some bands to merge, in order to ensure their members' survival.

G/wi kinship and social structure

The G/wi kinship system is partially classificatory (*i.e.,* it subsumes several different biological relationships under a smaller number of categories). There is also a high degree of equivalence among those classified by the same kinship term. These features allow the kinship system to be applied to persons other than actual kin, including the whole membership of the band. The kinship system can thus be used as the organizing principle of society and, by further extension, to govern relationships between people in different bands.

The kinship system permits not only extension but also truncation: groups can be enlarged by inclusion of new members and also easily split when necessary by substituting other members for those who have left. This is of great advantage to the G/wi. Not only are their bands subject to periodic disasters, but they also grow; in some cases they outgrow their territorial resources and need to be able to split up. The bands normally respond to the decreased density of food resources in winter and summer by reducing their population density. This is achieved by fragmenting into constituent households, each of which goes off into a separate part of the territory and remains there until the approach of the wet season, when food supplies increase again. The organization of the band must therefore compromise between making the community cohesive enough to hold the members together and keeping it loose enough to allow them to separate when necessity dictates.

The kinship system also provides sets of rules for appropriate behaviour. All kin of any individual are either his avoidance or his joking relatives. Behaviour between avoidance relatives is reserved and polite. The avoidance category includes those who are in a relationship involving submission to or exercise of authority—firstly, the parent–child relationship and, by extension, relationships between all those who are classificatorily equated with parents and children. Siblings of opposite sex are in the avoidance category and, by extension, all those whose classificatory relationship prohibits intermarriage. All other kin are joking relatives, among whom behaviour is much less restrained: possessions are freely shared; ribald, bawdy joking is in order; and pointed but friendly criticism of behaviour is permitted in public without offense.

The regular retreat into isolation requires that each household be capable of independent existence for three or four months of the year. This precludes the development of any centralized authoritarian political system either within the band or among bands. Leadership is diffuse and ephemeral, arising in response to specific situations. The function of a leader is to make proposals for action that are acceptable to the members, and he has little power to force agreement. Because of its lack of firm leadership and its equalitarianism, the band would have only tenuous solidarity were it not for the emphasis placed upon harmonious relationships and the fact that social relationships are structured so as virtually to exclude competition.

Means of subsistence

The G/wi economy. About **30** plant species provide the basis of G/wi subsistence. None is available the year round, the number available at one time varying from 29 in autumn to only four in early summer—of which only two are sufficiently plentiful to make a significant contribution to the diet. The work required in gathering food for a household therefore varies greatly with the season; the more species there are to be taken, the easier and shorter is the search and the greater the number of people able to subsist on the resources of a given area. It is for this reason that the band separates in winter, when the frosts blight the plants and sharply reduce the amount of plant food available. Dispersed in individual households, each exploiting a particular area, the relative load on the food resources is reduced, as is also the amount of work required to gather enough to eat. Just before the onset of the wet season the variety and amount of food plants increase; the band can again reform and resume its normal life as one community, shifting its encampment every five or six weeks to a new supply of plant food.

The work of gathering is done mainly by the women and girls. They range over a radius of up to five miles, picking fruits and berries and digging the roots and tubers that comprise about **80** percent of the G/wi diet. A three-foot stick sharpened at one end serves as digging tool and carver. An antelope-hide cloak, worn over the shoulders and fastened around the neck, does duty as a blanket at night. The lower points of the cloak are tied about the waist, forming a bag.

Hunting and trapping is the work of men. They use a light bow and flimsy, unfeathered arrows tipped with poison prepared from the pupae of the beetle *Diamphidia simplex.* Arrowheads were formerly of bone, but most are now made of fence wire hammered by stone into precise shape; the poison is applied just behind the cusps of the arrowhead. Careful stalking is necessary if the hunter is to get close enough to the antelope and small desert mammals to place his arrow effectively and inject a dose of poison. The poison requires between six and 96 hours to take effect, depending on the animal, during which time the animal must be tracked and followed; when killed, its meat has to be carried many miles back to the encampment.

The beetle grubs for making poison can be gathered only in summer, and, since by the middle of winter supplies are usually exhausted, recourse must be had to traps. These are snares, loaded by attaching the free end of the line to a bent-over sapling. The noose is held in place by a trigger, which, when stepped upon, releases the sapling and causes the noose to tighten around the leg of the antelope and hold it until the trapper returns, which he does about four times a day. The monthly intake of meat per person varies from about four pounds (two kilograms) in October, the end of winter, to 15 pounds (seven kilograms) in January, when fresh arrow poison is available and the antelope population is increased by the arrival of migrating herds.

The G/wi have drinking water only for about eight weeks of the year. They meet their fluid requirements at other times from the juices of plants and by drinking the blood and rumen liquor (squeezed-out cud) of antelope; they also drink the amniotic fluid of pregnant does.

Technology

Tools are light and multipurpose. The desert does not provide many raw materials, and migrations between campsites impose a need for easy portability. Iron rods obtained from the ranches are beaten out on stone anvils to make the heads and blades of spears, knives, adzes, and axes. Pestles and mortars are adzed out of wood. Bowls and other receptacles are also carved from wood. Tin cans and enamelware are imported and used as cooking pots, replacing the fragile pottery that was formerly obtained from the Boteti (Botletle) River area and has now become rare. Antelope hides, pegged out to dry in the sun, are scraped clean of fat and other waste and then tanned, using a mixture of plant juices, bone marrow, urine, and rotted brains. The leather of the steenbok and duiker is worked into a fine kid having the softness of cloth and is one of the main commodities of exchange with the bands nearer civilization. Other antelope hides are made into cloaks and skirts or sewn to make bags or sandals.

Shelters vary with the season. The dry-season structure is a roofless windbreak of shrubs, branches, and grass. The wet-season hut is of a beehive shape, made from a frame of branches thatched with clumps of grass. When a band migrates, the huts or shelters are abandoned and new ones set up within several hours after arrival at a new campsite.

BIBLIOGRAPHY. The classic reference work is I. SCHAPERA, *The Khoisan Peoples of South Africa* (1951), a review and synthesis of the literature up to 1928 with a full bibliography. J.A. ENGELBRECHT, *The Korana* (1936), is an account of the history and customs of a now virtually extinct Hottentot people. ELIZABETH MARSHALL THOMAS, *The Harmless People* (1959), is a popular account that conveys better than any other book in English the quality of K!ung Bushman life. A series of papers based upon sustained anthropological fieldwork among Bushmen by LORNA MARSHALL were published in various numbers of *Africa:* vol. 29, no. 4 (1959); vol. 30, no. 4 (1960); vol. 31, no. 3 (1961); and vol. 32, no. 3 (1962). GEORGE B. SILBERBAUER, *Report to the Government of Bechuanaland on the Bushman Survey* (1965), describes a six-year survey of the Bushmen of Botswana. RICHARD B. LEE, "What Hunters Do for a Living, or How to Make Out on Scarce Resources," in R.B. LEE and I. DEVORE (eds.), *Man the Hunter* (1968); and "!Kung Bushman Subsistence: An Input-Output Analysis," in D. DAMAS (ed.), *Contributions to Anthropology: Ecological Essays* (1969), analyze the ways in which one group of Bushmen adapt to their environment.

Khomyakov, Aleksey Stepanovich

Khomyakov was the founder of the 19th-century Slavophile movement, which extolled the superiority of the Slav or Russian way of life, as well as-a poet and influential lay theologian of the Russian Orthodox Church. His importance lies in that—at the time of the triumphant march of Western civilization—he recognized the West's serious defects and suggested radical changes.

Novosti—Sovfoto

Khomyakov, engraving by Ivan Pozhalostin, 1879.

Early life and literary career

Born on May 13 (May 1, old style), 1804, in Moscow, Khomyakov came from a family that had for many generations served the Russian tsars. His father, Stepan, lacking practical ability, brought the family's financial'affairs to the brink of ruin; his mother, Maria Kireyevskaya, however, saved the situation because of her combined business sense and intelligence. Deeply devoted to the Orthodox Church, she brought up her two sons and her daughters in the spirit of traditional Russian piety and enabled them to receive an excellent education. Aleksey had among his private tutors a French refugee priest, a Greek scholar, and some well-known Russian professors. He acquired a mastery of French, German, English, Greek, and Latin; he also learned Sanskrit and compiled a Russian–Sanskrit dictionary. Though he did not enroll as a student, Aleksey passed his final examinations in mathematics at Moscow University. A visit to France for 18 months completed his education.

During the Russo-Turkish War (1828–29) he served with distinction and spent the remainder of his life in Moscow involved to a great extent in intellectual pursuits, though frequently visiting his family estates of Bugucharovo and Lipitsy. He was reputed to be happily married and had several children.

Among his many accomplishments, Khomyakov was known as a gifted writer and a brilliant controversialist; he dealt with a wide range of subjects, composed poetry, wrote philosophical and political essays and treatises on economics, sociology, and theology. A successful landlord, he won prizes in England for the construction of agricultural machinery. Being a remarkable marksman he made important improvements in the design of guns. He was also a self-taught doctor and treated many of the peasants on his estates.

A rigid censorship in tsarist Russia permitted only some of his articles to appear in print during his lifetime. His major theological and historical works were thus published posthumously by his friends and associates. Even today his writings are proscribed in the U.S.S.R.

Khomyakov belonged to what has been called the Golden Age of Russian literature. At that time (first half of the 19th century) an intellectual elite of exceptional ability created a striking contrast to the proponents of the reactionary rule of Nicholas I (1825–55). The best Russian thinkers were preoccupied with the problem of the political and social orientation of their people. Russia had been brought out of its previous isolation by Peter the Great's reforms (1682–1725), and contacts with the West had stimulated the upper classes, but under Nicholas I they felt frustrated and dissatisfied. Two main groups appeared: the Westernizers and the Slavophiles. The Westernizers saw in the political institutions of the West and in liberal and socialist ideas a pattern for imitation. The Slavophiles, led by Khomyakov, insisted that Russia should follow its own path of development based on the pre-Petrine (prior to Peter the Great) culture inspired by the Eastern Orthodox Church.

Slavophile views

Though Khomyakov felt at home in the Western world, he also knew and loved Russia's past, a sentiment rare among his upper class contemporaries. His aim was to combine the best elements of both traditions, but the social system he advocated was opposed to the individualism of the West. He did not believe that secularized and selfish man, denying the existence of a divine creator, could establish a satisfactory political and social order. Criticizing both capitalism and socialism, he regarded them as coming from the same Western outlook. He believed that the root of man's problems lay in what he viewed as the defects of Western interpretations of Christianity, and he blamed Roman Catholicism and Protestantism equally for their failure to solve the problem of the relationship between authority and freedom. "Rome kept unity at the expense of freedom. Protestants had freedom but lost unity." He was convinced that the Orthodox Church possessed a more balanced presentation of Christian teaching than any of the Western churches.

In Khomyakov's system the key term was ***sobornost*** (togetherness-symphony). This word, in the Slavonic version of the Nicene Creed, corresponds to "catholic." It does not, however, mean "universal" but denotes a perfect organic fellowship of redeemed people united by faith and love. Khomyakov believed that a person could best achieve spiritual and intellectual maturity in an organic community that respected the liberty of its members and that true progress would depend not on competition (as in the West) but on cooperation. He thus claimed that the task of the church was to teach mankind how to live in unity and freedom. In Khomyakov's estimation, the Christian West, after its separation from the East, had not been able to fulfill this role.

In another aspect of his Slavophile thought, Khomyakov idealized the Russian peasants, exalted their humility and sense of brotherhood, and regarded them as better fitted to realize a Christian social order than the more aggressive Western nations.

Khomyakov's vast erudition, his literary gifts, his integrity, and strength of convictions should have procured for him a distinguished political and academic career. But he lived under the oppressive rule of Nicholas I and had no opportunity of using his talents for the public good. He remained until his death a mere retired cavalry captain. He died on October 5 (September 23, O.S.), 1860, at the age of 56, from cholera, which he caught from the peasants whom he treated.

BIBLIOGRAPHY. Khomyakov's works were published in Moscow in 1862. Enlarged editions in 8 volumes appeared in 1882 and 1900. Only a few of his writings, such as ***The Orthodox Doctrine of the Church*** (1864), ***L'Église Latine et le Protestantisme . . .*** (1872), and ***The Church Is One*** (1948, 1968), have been translated.

Khosrow I of Persia

Khosrow I of Persia, also called Chosroes in classical sources, ruled the **Sāsānian** Empire from 531 to 579. He is known in Persian sources as **Anūshīrvan**, or Of the Immortal Soul, since he is remembered as a great reformer and possessed of a noble character. He was also given the surname the Just. Because of his fame the Arabs later called all rulers of the **Sāsānian** Empire by his name, in the Arabic form **Kisrā.**

Khosrow I, crystal medallion, 6th century. In the Bibliothèque Nationale. Paris.
J.E. Bulloz

Little is known of the early life of Khosrow beyond legends. One story says that when Khosrow's father, King Kavadh, took refuge with the Hephthalites, eastern neighbours of Iran, on the way (near the town of Nishapur) he married a peasant's daughter, who gave birth to Khosrow. At his father's death Khosrow did not at first succeed him, but in a struggle for the throne he was successful and put to death his brothers. At the end of his father's reign, great social disorders had occurred because of a religious revolution of a sect called the Mazdakites. Khosrow first restored order and then launched reforms to transform the declining **Sāsānian** Empire.

Reforms

The reform of taxation was the most important of his actions, and it was probably copied from the Roman system inaugurated by Diocletian. Previously in the **Sāsānian** Empire taxes had been levied on the yield of land; Khosrow established a fixed sum rather than a yearly variation. Other taxes were introduced that brought stability to the income of the state and were also fairer to those who paid the taxes. Khosrow's program of taxes lasted into Isltimic times.

Khosrow also reorganized the **Sāsānian** bureaucracy, and the system of ministries, or divans, under a prime minister is said to have been initiated by him. He was fortunate during most of his reign in having a capable prime minister called Bozorgmehr, who became famous in story and legend for his wisdom and abilities. Khosrow also reorganized the army and appointed four chief commanders to guard the four frontiers of Iran. On the frontier against the Byzantines and their Arab allies in the Syrian Desert, against the peoples of the steppes of south Russia at the town of Derbent between the Caucasus Mountains and the Caspian Sea, and to the east of the sea in the present Turkmen steppes, Khosrow built defensive walls. The army, however, did not remain on the defensive, for Khosrow's reign is noted for his wars against the Byzantines. In 540 the great city of Antioch was conquered and held for a short time by Khosrow. He brought great numbers of prisoners from Antioch and settled them in a new town near his capital of Ctesiphon, built after the model of old Antioch. In the east, Khosrow, in alliance with the Turks, a new power in Central Asia, crushed the Hephthalites, and he established a hegemony over many of their principalities. The **Sāsānian** frontier in the east reached the Oxus River during his reign.

He also fought extensively in Armenia and Lazica in the Caucasus. Furthermore, under his reign a **Sāsānian** army conquered Yemen. Khosrow relied on a professional army more than his predecessors, who had summoned feudal levies when they set out to war.

Under Khosrow the process of decentralization of the power of the monarch was reversed, and the lower aristocracy, or knights, called dihqdns, grew in importance at the expense of the great feudal lords, who had been more powerful under Khosrow's predecessors. It is difficult to know how many changes really can be attributed to Khosrow's reign and how many are arbitrarily assigned to him because of his place in history. Whether the religiously sanctioned division of society into priests, warriors, bureaucracy, and common folk was codified under his reign, as claimed by some sources, is difficult to determine.

Patron of culture

Khosrow was also a great patron of culture, and in 529, when the ancient academy of Athens was closed, a number of Greek philosophers migrated to the **Sāsānian** Empire, where they were well received by the **ruler.** The later famous medical school of **Gondēshāpūr** was probably started in Khosrow's reign, and the famous physician Burzoe is supposed to have been sent to India by Khosrow to gather Sanskrit books of learning to be translated into the Middle Persian language. The game of chess reportedly was also brought by him from India. Astronomy and astrology flourished at the court of Khosrow, and one star table (called the *zīj-i* Shahriydr), which was the basis of many later **Islāmic** tables, is said to have originated during the reign of Khosrow. Several works of Middle Persian, such as the Book of Deeds of Ardashir (*Kārnā*mak), are attributed to this period. Likewise, some scholars claim that the codification of the Avesta, the sacred book of the Zoroastrian religion, as well as the creation of a special Avestan alphabet to record the text, took place at the order of Khosrow. Further, it is supposed that the stories and legends of ancient Iran were gathered into a *Khwatāy-nāmak* ("Book of Kings") in the time of Khosrow and thus provided the source for Ferdowsi's immortal epic much later. Some of the names found in Ferdowsi's *Shāh-nāmeh* appear among the royal family of Khosrow, which indicates at the least an interest on the part of the monarch in ancient legends.

Perhaps more than fact, the stories told about Khosrow have made his name famous in history. Almost any **pre-Islāmic** structure in Iran the origin of which is unknown will be attributed to Khosrow by the simple folk. Undoubtedly he built many bridges, roads, and palaces, but much more is assigned to him in legend. The famous palace with the huge arch, called **Ṭāq** Kisrā, in Ctesiphon, near modern Baghdad, is said to date from Khosrow I, but this is uncertain. Several collections of wise sayings of this monarch, as well as stories about him, have been preserved in Arabic or New Persian versions. In them his reputation for justice as well as wisdom is constantly cited. The splendour of the court and the glory of his reign provided models for the later **ʿAbbāsid** court in Baghdad, and many of the institutions established by Khosrow were maintained in **Islāmic** times, when Khosrow was hailed as the model **pre-Islāmic** ruler to be emulated by Muslim princes.

BIBLIOGRAPHY. The principal study on Khosrow is in ARTHUR E. **CHRISTENSEN,** *L'Iran sous les* Sassanides, 2nd **ed.** rev. (1944).

(R.N.F.)

Khosrow II of Persia

Khosrow **II Parvīz** (the Victorious) was a late **Sāsānian** king of Persia (Iran). His glorious court and the bitter contrast of his failure and death so impressed themselves on the poetic tradition of that country that it is impossible to be certain about his personal history or the social conditions during his reign. Under him the **Sāsānian** Empire achieved its greatest expansion, while its art and culture flourished as never before.

Expansion of the empire. Son of Hormizd IV, Khosrow was proclaimed king in AD 590 in turbulent times. Hormizd's general, **Bahrām** Chiibin, after defeat by the Byzantine army at Lazica, had been openly insulted by the King. During a subsequent palace revolt led by **Bostām** and **Bindōē** (brothers-in-law of **Hormizd**), which culminated in the King's assassination, **Bahrām Chūbīn** renounced the allegiance of his army to the monarchy and forced the new **king** Khosrow to flee to **Mesopotamia.** Khosrow's pursuers were held off by the military tactics of his uncle **Bindōē,** until eventually the Byzantine emperor Maurice provided Khosrow with forces to defeat his adversary. **Bahrām** Chiibin was subsequently assassinated.

Khosrow II, coin, 590–628 AD. In the collection of the American Numismatic Society.
By courtesy of the American Numismatic Society

Insecure and unpopular, Khosrow now eliminated those connected with his father's murder, including **Bindōē,** on whose support he had relied. Although he retained a bodyguard of Byzantine legionaries, he resented the Byzantine presence in Armenia, which he had been forced to cede.

Invasion of the Byzantine Empire

Using the murder of Maurice (602) and his replacement as emperor by Phocas as a pretext and encouraged by the fact that Narces, who had commanded the Byzantine force that established Khosrow on the throne, refused to recognize Phocas, Khosrow's armies invaded Armenia and Mesopotamia. The Byzantine forces in Mesopotamia were weak, and the towns of Dara, **Amida,** and **Edessa** soon fell (604). Crossing the Euphrates, Khosrow took Hierapolis and Beroea (Aleppo). Internal dissensions made the eastern Byzantine provinces an easy prey, and Armenia and central Asia Minor were overrun by the Persians—though apparently not permanently occupied or administered. Nor was the Persian advance checked when Heraclius became emperor in 610 and sued for peace.

A second invasion of Mesopotamia, by Khosrow's ablest general, **Shahrbarāz,** took place in 613. Damascus was taken in that year, and in 614 Jerusalem fell. The Holy Sepulchre was destroyed and the true cross carried to Ctesivhon. Although Khosrow himself was generally tolerant of **Christianity, Shahrbarāz** permitted **thousands** of Christian prisoners to be tortured by his Jewish aides. In 616 **Alexandria** was captured, and **in** 617 Chalcedon (opposite Byzantium), which had long been under siege by another of Khosrow's generals, **Shāhīn,** finally fell to the Persians.

This tide of conquest was turned by Heraclius in a series of brilliant campaigns between 622 and 627. Since he retained command of the sea, Heraclius was able to sail to Issus and rout the Persian army near the Armenian border. In alliance with the **Khazar kingdom** north of the Caucasus, he invaded Armenia again in 623, gaining victory over the King's army near Canzaca (Takht-e **Sulaimān,** Shiz). The town and fire temple were destroyed, together with the temple at Lake **Urmia,** traditionally associated with Zoroaster. The campaigns of 624 and 625 **ranged** across northern Syria and Mesopotamia and culminated in a reversal for **Shahrbarāz'** forces on the river Saras.

Khosrow rallied his forces in 626 and, in alliance with the Avars, a people who were also in conflict with **Byzantium** at this time, sent one army to besiege **Constantinople** and another to oppose Heraclius. Constantinople held, and **Shāhīn** was defeated; the Persian second force was outmanoeuvred in 628 by Heraclius' brave dash to Dastagird, the royal residence 70 miles north of **Ctesiphon.** An important but indecisive battle was fought near Nineveh, but, as the Byzantine army reapproached **Dastagird,** Khosrow fled. His letters calling **Shahrbarāz** to his aid had been intercepted, and, although his resources were by now drastically reduced, he refused peace terms.

Khosrow's execution

Khosrow's prestige was shattered, and he was now sick. The execution of Shahrbariiz and the desecration of Shāhīn's corpse were followed by revolution in the royal household. Khosrow was condemned to death and executed (628), and his youngest son and heir, Mardānshāh, was murdered before his eyes. His eldest son, Qobād, II Shērōē, signed the peace.

Cultural and economic influence. Khosrow was a serious patron of the arts; silver working and carpet weaving reached their peak during his reign. Sources tell of the enormous "Spring of Khosrow," a carpet designed like a garden. A splendid silver dish in the Bibliothbque Nationale is thought to depict him in the traditional Sāsānian royal hunt. Most authorities attribute to Khosrow II the grottos at Taq-e Bostan (Kermanshah), taking them as evidence of a renaissance of rock sculpture in his reign. The reliefs depict the king in hunting scenes and standing motionless listening to a group of harpists—a reminder of the famous musicians Biirbad and Sarkash, who were kept at Khosrow's court. His architectural work is chiefly known from the ruins of the enormous palace Imirat-e Khosrow near Qasr-e Shirin (near Khānaqīn) and at nearby Hawsk-Kuri. A provincial palace exists at Qaṣr al-Mushattii in Transjordan.

Booty and taxes brought Khosrow enormous wealth, including thousands of elephants, camels, horses, and women. The 9th-century Arab historian aṭ-Ṭabarī describes his golden throne supported by legs of rubies, as well as such curios as a piece of malleable gold and an asbestos napkin. But despite widespread trade connections and the amassing of individual fortunes, there is no evidence that the economy flourished. High taxation and the uncertainties of war did nothing for the merchant class. By creating a military aristocracy, Khosrow II had weakened the authority of the king, while his administrative reforms and bureaucratic centralization removed the power of regional dynasties and their feudal armies, which might have resisted the invasion of the Arabs 12 years after Khosrow's death. Already in 611 the Arabs had inflicted a defeat on the Sāsānian army at Dhu-Qar. The destruction by Khosrow II of the Christian Arab states of the Lakhmids and Ghassānids in Syria and western Iraq was a further factor exposing Iran to Arab attack.

The love of Khosrow for his Armenian Christian wife Shirin was celebrated by the poets, especially by the 12th-century poet Neẓāmī in *Khosrow-va-Shirin.*

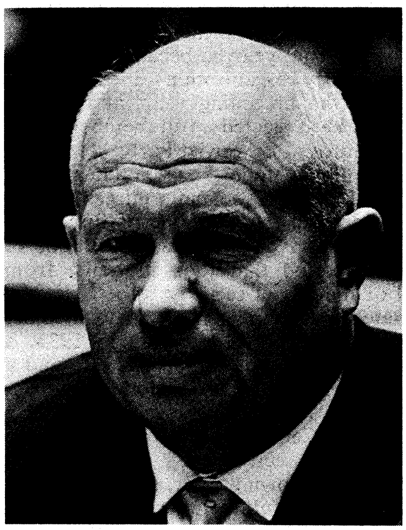
BIBLIOGRAPHY. The fullest account in English is in SIR PERCY SYKES, *A History of Persia,* 3rd ed., vol. 1 (1969). The two basic works dealing with the Arabic literary sources are T. NOELDEKE, *Geschichte der Perser und Araber zur Zeit der Sasaniden: Aus der Chronik des Tabari . . .* (1879); and A.E. CHRISTENSEN, *L'Iran sous les Sassanides* (1936), particularly good on the use of Byzantine sources. The national poet FERDOWSI in the *Shah-Nameh,* vol. 8-9 (Eng. trans. 1908), deals in detail with the war with Bahrām Chūbīn, treasures, and buildings. For literary references to Khosrow Parvīz, see E.G. BROWNE, *A Literary History of Persia,* vol. 1 (1928–29). An authoritative recent discussion of social conditions will be found in R.N. FRYE, *The Heritage of Persia* (1963).

(W.Cu)

Khrushchev, Nikita Sergeyevich

For the Soviet Union and indked for the entire world Communist movement, Nikita Khrushchev was the great catalyzer of political and social change. In his seven years of power as first secretary and premier, he broke both the fact and the tradition of the Stalin dictatorship and established a basis for liberalizing tendencies within Soviet Communism. Khrushchev was a thoroughgoing political pragmatist who had learned his Marxism by rote, but he never hesitated to adapt his beliefs to the political urgencies of the moment. His experience with international realities confirmed him in his doctrine of peaceful coexistence with the non-Communist world—in itself a drastic break with established Soviet Communist teaching. He publicly recognized the limitations as well as the power of nuclear weapons, and his decision to negotiate with the United States for some form of nuclear-testing control was of vast importance. At the same time, Khrushchev's rough empathy with the Soviet people resulted in concessions to a consumer economy and in a general relaxation of security controls, which had equally far-reaching effects. Despite his repression of the Hungarian uprising in 1956, his acceptance of "different roads to Socialism" led to growing independence among European Communist parties, but his Russian nationalism and his suspicion of Mao Tse-tung's Communism helped create an unexpectedly deep fissure between China and the Soviet Union that changed the balance of world politics. By the time he was removed from office in 1964, he had set up certain guidelines for and limitations to Soviet policy making that his successors were hard put to alter.

Werner Wolf—Black Star



Khrushchev, 1960.

Early life. Khrushchev was born on April 17, 1894, at Kalinovka in the Russian province of Kursk, close to the Ukrainian border. Unlike Stalin, Lenin, and most other Soviet leaders, who had generally middle class backgrounds, Khrushchev's father was a miner; his grandfather had been a serf who served in the tsarist army. After a village education, Khrushchev went with his family to Yuzovka (later named Stalino, now Donetsk), a mining and industrial centre in the Donets Basin, where he began work as a pipe fitter at the age of 15. Because of his factory employment, he was not conscripted in the tsarist army during World War I. Even before the Russian Revolution of 1917, he had become active in workers' organizations, and in 1918, during the struggle between Reds, Whites, and Ukrainian nationalists for possession of the Ukraine, he became a member of the Russian Communist Party (Bolsheviks).

Membership in the Communist Party

In January 1919 he joined the Red Army and served as a junior. political commissar, ultimately in the campaigns against the Whites and invading Polish armies in 1920. After he was demobilized in 1921, he returned to work in Yuzovka. His first wife, Galina, died during a famine that year, leaving him with two children.

At Yuzovka in 1922, Khrushchev secured admission to one of the new Soviet worker's schools, where he received a secondary education along with additional party instruction. He quickly became a student political leader and was appointed secretary of the Communist Party Committee at the school. At Yuzovka, also, he married his second wife, Nina Petrovna, a schoolteacher, in 1924. She bore him three children.

Political career under Stalin. In 1925 Khrushchev went into full-time party work, as party secretary of the Petrovsko-Mariinsk district of Yuzovka. He distinguished himself by his hard work as well as his down-to-earth knowledge of mine and factory conditions. His work soon came to the notice of Stalin's close associate, Lazar M. Kaganovich, secretary general of the Ukrainian Party

Central Committee. He accompanied Kaganovich as a nonvoting delegate to the 14th Party Congress in Moscow in December 1925, where Stalin celebrated his final victory over Trotsky.

For the next four years—in Yuzovka, then in Kharkov and Kiev—Khrushchev was active as a party organizer. In 1929 he received permission to go to Moscow to study metallurgy at the Stalin Industrial Academy. There, too, he made a name for himself through intense political activity and was appointed secretary of the academy's Party Committee. In 1931 he went back to full-time party work in Moscow. By 1933 he had become second secretary of the Moscow Regional Committee, again directly under Kaganovich.

During the early 1930s Khrushchev consolidated his hold on the Moscow party cadres that would ultimately secure his ascendancy. He personally supervised the completion of the Moscow subway, which became a showplace of the Soviet Union and for which he received the Order of Lenin in 1935. That year he became first secretary of the Moscow party organization—in effect, the mayor of Moscow. In the preceding year, at the 17th Party Congress, he had been elected a full member of the 70-man Central Committee of the Soviet Party.

Membership in the Central Committee

Khrushchev was a zealous supporter of Stalin in those years and participated in the sweeping purges of the Communist Party leadership. He was one of three provincial secretaries who survived the mass executions of the *Yezhovshchina*, a period that took its name from Yeshov, then head of the Soviet security forces. He was promoted appropriately, becoming an alternate member of the federal legislature's ruling Presidium in 1935, a member of the Constitutional Committee in 1936, and a member of the Foreign Affairs Commission of the Supreme Soviet in 1937. In 1938 Khrushchev was made a candidate member of the Central Committee's Politburo and sent to Kiev as first secretary of the Ukrainian party organization. The following year, on the eve of World War II, he was made a full member of the Politburo.

In 1940, after Soviet forces had occupied eastern Poland, Khrushchev presided over the "integration" of the former Polish areas into the Soviet Union. Throughout the Ukraine his principal objective was to liquidate both Polish and Ukrainian separatist movements, as well as to restore the Communist Party organization, which had been shattered in the purge. This work was disrupted by the German invasion of the Soviet Union in June 1941.

Khrushchev's first wartime task was to evacuate as much of the Ukraine's industry as possible to the east. Thereafter, he was attached to the Soviet Army and received the rank of lieutenant general; his principal task was to stimulate the resistance of the civilian population and maintain liaison with Stalin and other members of the Politburo in Moscow. He was political adviser to Marshal Andrey I. Yeryomenko during the defense of Stalingrad (now Volgograd), and he later participated in the huge tank battles at Kursk in 1943 as political adviser to Lieut. Gen. Nikolay F. Vatutin.

After the liberation of the Ukraine in 1944, Khrushchev worked to restore the civil administration and to bring that devastated country back to a subsistence level. A famine in 1946 was probably the worst in the Ukraine's [illegible] Khrushchev fought to restore g[illegible] p[illegible] and to distribute f[illegible] supplies, [illegible] St[illegible] on greater production from the Ukraine for use in other areas. During this period Khrushchev made firsthand acquaintance with the problems of Soviet agricultural scarcity and planning, with which he was to grapple throughout his political life.

Temporary demotion

Largely because of his failure to achieve prompt collectivization of Ukrainian agriculture, Khrushchev was demoted in 1947 and replaced by his former boss Kaganovich; but he was later restored to favour. In 1949 Stalin called him back to Moscow, where he took over his old job as head of the Moscow City Party and concurrently was appointed secretary of the All-Union Central Committee. In Moscow, over the next four years, Khrushchev continued to consolidate his power.

The period 1949–53 was far from pleasant for Khrushchev and other members of the Soviet leadership, who found themselves pawns in Stalin's paranoiac palace politics. "All of us around Stalin," Khrushchev said later, "were temporary people." Khrushchev moved more and more into agriculture, where he began his schemes for the *agrogorod* ("farming town") and larger state farms at the expense of the conventional collectives. On this and other issues he clashed with Georgy Malenkov, Stalin's heir apparent. After Stalin died, in March 1953, Khrushchev cooperated with Malenkov and other members of the Politburo in the arrest and execution of the deputy prime minister and state security chief, Lavrenty Beria.

Leadership of the Soviet Union. Later Khrushchev engaged in a power struggle with Malenkov and gained the decisive margin because of his control of the party machinery. In September 1953 he replaced Malenkov as first secretary and in 1955 was able to remove Malenkov from the premiership and replace him with his handpicked nominee, Marshal Nikolay A. Bulganin. Through this period Khrushchev adopted a conservative party position, attacking Malenkov for not developing heavy industry and for neglecting party organization.

Personal diplomacy

In May 1955, however, when Khrushchev made his first trip outside the Soviet Union—to Yugoslavia with Bulganin—he began to show greater flexibility; he apologized to Tito for Stalin's denunciation of Yugoslav Communism in 1948. Later, in trips with Bulganin to Geneva, Afghanistan, and India, he began to exhibit a brash, extroverted personal diplomacy that was to become his trademark. Although his attacks on world capitalism were virulent and primitive, his outgoing personality and peasant humour were in sharp contrast to the picture of reserved hostility toward non-Socialist countries that earlier Soviet public figures had cultivated.

Destalinization. On February 24–25, 1956, during the 20th Party Congress in Moscow, Khrushchev delivered his memorable secret speech about the excesses of Stalin's one-man rule, attacking the late Soviet ruler's "intolerance, his brutality, his abuse of power." It shook the Communist world to its foundations. The spectacle of the First Secretary of the Communist Party exposing the wrongful executions of the Great Purge of the 1930s and the excesses of Soviet police repression, after years of fearful silence, had far-reaching effects that Khrushchev himself could barely have foreseen. The resulting "thaw" in the U.S.S.R. saw the release of thousands of political prisoners and the "rehabilitation" of many thousands more who had perished. Although some argue that Khrushchev had been forced into his denunciations by party pressures, he will go down in history as the man who ultimately destroyed not only the "cult of personality" but also the idea, fostered since the Revolution, of Soviet Communism as an infallible monolithic authority.

Rebellions in eastern Europe. The destalinization movement had repercussions in the Communist countries of eastern Europe. Poland revolted against its Stalinist government in October 1956. Hungary followed shortly afterward. Faced with open revolution, Khrushchev flew to Warsaw on October 19 with other Soviet leaders and first tried to face down, then temporized with the new Polish national Communist leadership. He ultimately acquiesced in the Polish leader Władysław Gomułka's national Communist solution, which allowed the Poles a great deal of freedom. Khrushchev's behaviour in dealing with the Hungarian Revolution was quite different; his shared decision to crush the Hungarian Revolution by force, after much hesitation, came largely because of the Hungarian premier Imre Nagy's decision to withdraw from the Warsaw Pact. With this sanguinary exception, however, Khrushchev allowed a considerable amount of freedom to the European Communist parties. Indeed, his slogan of "many roads to Socialism" produced a strong revival in various Communist parties, whose leaders found themselves permitted by Moscow to adopt more nationalist positions.

Opposition at home. The stresses in eastern Europe helped crystallize opposition to Khrushchev within the Soviet Party. In June 1957, he was almost overthrown from his position of primacy by a coalition led by Malenkov, representing the managerial class, and by Vyacheslav M. Molotov and Kaganovich, leading the conservative pro-Stalinist bloc. Although a vote in the Presidium actually went against him, Khrushchev managed to reverse this by appealing to the full membership of the party Central Committee. In the end he secured the permanent disgrace of Malenkov, Molotov, and others, who were labelled members of the antiparty group. In October he dismissed Marshal Georgy Zhukov from his post as minister of defense, and in March 1958 he assumed the premiership of the Soviet Union himself, as sign and seal of his victory.

Assumption of the premiership

Relations with the United States and China. Confirmed in power, Khrushchev widely asserted his doctrine of peaceful coexistence, which he had first enunciated in a public speech at the 20th Party Congress. In opposition to old Communist writ, he stated that "war is not fatalistically inevitable." At the 21st Party Congress in 1959 he said: "We offer the capitalist countries peaceful competition." His visit to the United States in 1959, where he toured cities and farms with the ebullience of a politician running for office, was a decided success, and the "spirit of Camp David," in Maryland, where he conferred with Pres. Dwight D. Eisenhower, brought Soviet–American relations to a new high. A long-planned summit conference with Eisenhower in Paris in 1960 broke up, however, with Khrushchev's announcement that a U.S. plane (a U-2 reconnaissance aircraft) had been shot down over the Soviet Union and its pilot captured. In 1961 his Vienna conference with the new U.S. president, John F. Kennedy, led to no agreement on the pressing German question; the Berlin Wall was built shortly thereafter.

Soviet success in lofting the world's first space satellite in 1957 had been followed by increased missile buildups. In 1962 Khrushchev attempted to emplace Soviet medium-range missiles in Cuba. During a famous confrontation in October 1962, when the U.S. and the U.S.S.R. apparently stood on the brink of war, Khrushchev agreed to remove the missiles on the promise that the United States would make no further attempts at overthrowing Cuba's Communist government. The U.S.S.R. and Khrushchev in particular were bitterly attacked by the Chinese Communists for this settlement, and relationships between the two great Communist countries, already strained, grew worse. The Sino-Soviet split, which began in 1959 with Khrushchev's second trip to Peking, reached the stage of public denunciations at international party meetings in 1960. China's ideological insistence on all-out "war against the imperalists" and Mao Tse-tung's annoyance with Khrushchev's coexistence policies were exacerbated by Soviet refusal to assist the Chinese nuclear weapon buildup and to rectify the Russo-Chinese border. The Soviet Nuclear Test-Ban Treaty with the United States in 1963, although generally welcomed throughout the world, served only to intensify Chinese denunciations of Soviet "revisionism."

Internal pressures. During Khrushchev's entire time in office, he had to rudder constantly between opposed tendencies. There were continuing popular pressures toward a consumer-oriented society and agitation by intellectuals for greater freedom of expression; these were offset by the growing fear of the Soviet bureaucracy that destalinization reforms would get out of hand. Khrushchev himself was uneasy with intellectuals, and he sanctioned the repression of Boris Pasternak's ***Doctor Zhivago*** (1957) within the Soviet Union, culminating in the Soviet government's refusal to allow Pasternak to accept the Nobel Prize in 1958. On the other hand, Khrushchev permitted the 1962 publication of Aleksandr Solzhenitsyn's ***One Day in the Life of Ivan Denisovich,*** with its sweeping denunciation of Stalinist repression. Meanwhile, for the first time, Soviet tourists were permitted to go overseas, and Khrushchev often seemed amenable to widening exchanges with both Socialist and capitalist countries.

Khrushchev's desire to reduce conventional armaments in favour of nuclear missiles—partly a result of budgetary problems—was bitterly resisted by the Soviet military. In addition, his freewheeling, often high-handed methods of leadership and his attempted decentralization of the party structure antagonized many in the very cadres that had supported his rise to power. But the central crisis of Khrushchev's administration was agriculture. Perennially an optimist, he based many plans on the bumper crops in 1956 and 1958, which fuelled his repeated promises to overtake the United States in agricultural as well as in industrial production. ("If we catch up with the United States in per capita production of meat, butter and milk, we will have hit the pillar of capitalism with the most powerful torpedo yet seen.") He opened up more than 70,000,000 acres of virgin land in Siberia and sent thousands of young labourers from Russian cities to till them; but his plan was unsuccessful, and the Soviet Union soon again had to import wheat from Canada and the United States to keep up its own precarious balance of grain imports and exports.

Khrushchev's central crisis

Fall from power. The failures in agriculture and the China quarrel, added to his arbitrary administrative methods, were the major factors in Khrushchev's downfall. A Soviet critic wrote, "Khrushchev suffered from an incurable organizing itch, an inability to leave well enough alone." By October 1964 opponents were strong enough to bring him down. On October 14 the Central Committee accepted Khrushchev's request to retire from his position as the party's first secretary and chairman of the Council of Ministers of the U.S.S.R. because of "advanced age and poor health."

Last years. The succession passed without any violence. For almost seven years thereafter, Khrushchev lived quietly in Moscow and at his country dacha outside the city, as a special pensioner of the Soviet government. He was mentioned in the Soviet press only occasionally and in a derogatory manner; he appeared in public only to vote in Soviet elections. The one break in this ordered obscurity came in 1970 with the unprecedented publication of his memoirs in the United States and Europe, although not in the Soviet Union. He denied granting permission to print them, but most foreign observers felt them to be basically genuine in both style and content.

Publication of memoirs

On September 11, 1971, Khrushchev died of a heart attack. His wife, one son, and three daughters survived him. Almost 48 hours elapsed before his death was announced to the Soviet public. He was denied a state funeral and the concomitant interment in the Kremlin wall, although he was allowed a quiet burial at Novodevichye Monastery Cemetery in Moscow.

Appraisal. The cautious handling of his death announcement reflected his increasing popularity in his last years, both in the U.S.S.R. and the outside world, as many contrasted his consistent, if occasionally stormy, peaceful-coexistence diplomacy with the more restricted and conservative policy of his successors. At the time of his death it was widely felt that the basic changes in Soviet life made under his regime would be hard to uproot and might indeed result in ultimate changes in the pattern of Soviet society and world power relationships. Whatever the view of his personal eccentricities, his boisterousness, his vulgarity, and his bewildering shifts of position, he was accounted a man of stature. As his son Sergey pronounced in a short eulogy at the cemetery, "There were those who loved him, there were those who hated him, but there were few who would pass him by without looking in his direction."

BIBLIOGRAPHY. EDWARD CRANKSHAW, ***Khrushchev: A Career*** (1966), is the best all-around biography; while MARK FRANKLAND, ***Khrushchev*** (1966); and LAZAR PISTRAK, ***The Grand Tactician*** (1961), are also useful. EDWARD CRANKSHAW, ***Khrushchev Remembers*** (1970), is the controversial memoir, generally accepted as genuine, with invaluable notes by Crankshaw. MYRON RUSH, ***The Rise of Khrushchev*** (1958), concentrates on the political phenomena of Khrushchev's assumption of power; as do WOLFGANG LEONHARD, ***Nikita Sergueievitch Khrushchev: Ascencion et Chute d'un homme d'État sovietique*** (1965); HOWARD R. SWEARER, ***The Politics of Succession in the U.S.S.R.*** (1964); BORIS NICOLAEVSKY, ***Power and the Soviet Elite*** (1965); and BERTRAM WOLFE, ***Khrushchev and Stalin's Ghost*** (1957), an excellent treatment of the secret speech and the destalinization movement. ZBIGNIEW BRZEZINSKI, ***The Soviet Bloc: Unity and Conflict*** (1960); and

FRANK GIBNEY, *The Khrushchev Pattern* (1960), are concerned with the impact of Khrushchev's policy outside the Soviet Union and the Moscow–Peking Axis. PRISCILLA JOHNSON and LEOPOLD LABEDZ (eds.), *Khrushchev and the Arts* (1965), is especially interesting for its insight into Khrushchev's relations with the Soviet intelligentsia. For a more general background on Khrushchev and his milieu, see LEONARD B. SHAPIRO, *The Communist Party of the Soviet Union* (1963); and MILOVAN DJILAS, *Conversations with Stalin* (Eng. trans. 1962).

(F.B.G.)

Kiangsi

Kiangsi (Jiang-xi in Pin-yin romanization) is one of the 21 provinces of the People's Republic of China. Occupying a south central location, it is bounded by the provinces of Hupeh and Anhwei on the north, Chekiang and Fukien on the east, Kwangtung on the south, and Hunan on the west. On the map its shape resembles an inverted pear. Situated on the south bank of the Yangtze River (Ch'ang Chiang), the port of Chiu-chiang, 430 miles upstream from Shanghai and 135 miles downstream from Hankow (Han-k'ow), is the province's principal outlet on that great river.

The area of the province is 63,600 square miles (164,700 square kilometres), and its population in 1953 was almost 17,000,000; an estimate from the early 1970s was 25,000,000. The provincial capital is Nan-ch'ang.

The name Kiangsi means West of the (Yangtze) River, although the entire province lies south of it; this seeming paradox is caused by changes made in administrative divisions throughout China's history.

Kiangsi's strategic location

Lying in the midst of a longitudinal depression between China's western highlands and the coastal ranges of Fukien Province, Kiangsi constitutes a corridor linking the province of Kwangtung, in the south, with the province of Anhwei and the Grand Canal, in the north. Throughout China's long history, Kiangsi has played a pivotal role in national affairs because of its position astride the main route of armies, commerce, and population migrations. The beautiful basin of the Kan Chiang (Kan River), together with the valleys of its many tributaries, was one of the nation's most affluent regions before trade patterns were changed by the opening of treaty ports to the Western powers in the mid-19th century.

In the first half of the 20th century, Kiangsi became a focal point for revolution and war; for the entire period from 1911 to 1949, it experienced more than its share of deprivation and suffering. With the establishment of the people's republic in 1949, however, the province entered an era of stability and progress, and many new economic and social developments were pioneered there. These include the establishment of new models for land utilization, for a labour university, and for local initiative in developing and financing rural industries.

History. From 770 to 453 BC, during the Chou dynasty, Kiangsi was a part of the Kingdom of Ch'u. During the period of the Warring States (481–221 BC), the territory east of the P'o-yang Hu (Poyang Lake) was annexed by the Kingdom of Wu. When a unified empire was established under the Han dynasty (206 BC–AD 220), Kiangsi became the western portion of the large province of Yang-chou and grew rapidly in population and culture.

From 221 to 589, large numbers of families from North China, fleeing the Tatar invaders, settled in Kiangsi. Initially, there were clashes between the northern newcomers and the original inhabitants. In time mutual accommodation prevailed, and the province benefitted immensely from the introduction of northern arts, culture, and administrative skills. It was during this period that the Kan Chiang Valley became the main highway of the empire.

Under the T'ang dynasty (618–907) the growth of commerce and population in Kiangsi was even greater than in earlier times. This was caused firstly by the opening of the Grand Canal, linking Lo-yang with the Lower Yangtze, and secondly by a new influx of people from North China. Equally noteworthy was the spread of Buddhism in this period.

Period of Confucianist domination

In the Sung dynasty (960–1279) Kiangsi became a microcosm of the Confucianist state, governed by scholar-officials. The Pai Lu Tung (White Deer Grotto) Academy, near Ku-ling, where Ch'u Hsi, an influential thinker of the 12th century, taught, became a renowned centre of Confucian learning. From 1069 to 1076, Wang An-shih, a native of Lin-ch'uan, southeast of Nan-ch'ang, was prime minister; Wang introduced reforms to curb the rich and help the poor, only to be overthrown by the conservative champions of the traditional order. In the late Sung period, and throughout the era of the Mongol conquest, Kiangsi's cultural and political vigour declined. Such was the obscurantism of the government that it sanctioned a Taoist "papacy" at Lung-hu Shan, near Kuei-ch'i, which lasted into the mid-20th century.

In the early years of the Ming dynasty (1368–1644) Kiangsi produced a number of great statesmen, but after a time the government's despotic tax program alienated the people. From the early 16th century onward, peasant brigands living in the hills fought the government. The widespread unrest was ended after the Ch'ing dynasty (1644–1911) reunified the country. During this period of prolonged peace Kiangsi again became one of the richest regions of China, but its days of prosperity ended in the mid-19th century, when the Yangtze Valley was devastated by the great Taiping Rebellion against the ruling Ch'ing dynasty and when treaties with the Western powers diverted trade to coastal regions.

After the 1911 revolution the province fell victim to warlord rule, until Chiang Kai-shek brought it under Nationalist control in 1926. Chiang's break with the Communists, however, made Kiangsi a bone of contention between the two sides. An uprising was staged in Nan-ch'ang by the Communists in 1927, followed by the establishment of peasant bases in the southern counties (from the Chiang-kang Shan area eastward) under the Communist leaders Mao Tse-tung and Chu Teh. Such was the growth of their strength that, in 1931, Jui-chin, in southeastern Kiangsi, was declared the capital of the Chinese Soviet Republic. In the continuing struggle the Communist guerrillas withstood Chiang's "annihilation campaigns," but his use of an economic blockade forced the Communists to flee Kiangsi on their Long March (1934–35) to northwestern China. Chiang then briefly regained control of southern Kiangsi, but from 1938 to 1945 Kiangsi was under Japanese occupation. The Communists carried on guerrilla activities inside Kiangsi throughout the period.

After the Japanese withdrawal Communist guerrillas dominated the countryside, while the Nationalist government took precarious control of the cities. In 1949 Communist forces crossed the Yangtze from the north and took possession of the province.

Physical geography. Topographically, Kiangsi corresponds to the drainage basin of the Kan Chiang, which runs northeastward in descending elevation from the southern tip of the province to P'o-yang Hu (Poyang Lake) and the Yangtze in the north. This basin is surrounded by hills and mountains that rim the province from all sides. Among the more important ranges are: the Hwai-yü Shan (Chinese *shan*, "mountain range"), to the northeast; the Wu-i Shan, to the east; the Chiu-lien Shan and Ta-yu Ling, to the south; the Chu-kuang Shan, Wan-yang Shan (including Ching-kang Shan), Yun-hsiao Shan, Wu-kung Shan, and Chiu-ling Shan, to the west; and the Mu-fou Shan and Lu Shan, to the northwest. A remarkable feature of these mountains is that they rise in disconnected masses and thus contain corridors for interprovincial communication, especially along the Hunan border. The mountains to the south, too, present no formidable barrier. The Mei-ling Kuan (Plum Range Pass) is a broad and well-paved gap, at an elevation of 1,000 feet, leading to Kwangtung Province.

Other mountains are found in the centre and north of the province. East of the Middle Kan Valley is the Yu Shan. Made up of short and moderate hills separated by a complicated network of streams, the country traversed by this range consists of a succession of small valleys with bottomlands from five to 12 miles wide. The Lu Shan, in the north, rises sharply to 5,000 feet from the alluvial lowlands west of the P'o-yang Hu.

The rivers

The principal river of Kiangsi is the Kan, which traverses the entire province from south to north. Its headwaters are two streams (the Kung Shui and the Chang Shui) that converge to form one river at Kan-chou. Along its course this great river receives such tributaries as Sui Chiang, Ho Shui, Yüan Shui, and Chin Chiang from the west and such smaller tributaries as the Fu-chuan Shui and Wu Chiang from the east.

Besides the major system of the Kan Chiang, other rivers of Kiangsi form distinct basins of their own in the northeastern and northwestern parts of the province. These include the Hsin Chiang, which rises near Yii-shan in the northeast and runs westward through Shang-jao and Yii-kan to P'o-yang Hu; the Ch'ang Chiang and the Lo-an Chiang and its headwater, the Wu Chiang, also in the extreme northeast of the province; and the Hsiu Shui, which, rising in the Mu-fou Shan in the northwest, drains southeastward into P'o-yang Hu via Wu-ning and Yung-hsiu.

Ultimately, all Kiangsi's rivers drain into P'o-yang Hu, which is connected with the Yangtze by a wide neck at Hu-k'ou, a short distance east of the Yangtze port of Chiu-chiang. In summer, when the Yangtze rises, P'o-yang Hu gains in size and depth: its area then covers about 1,800 square miles (90 miles long by 20 miles wide), and its depth averages 65 feet. In winter, when the Yangtze waters recede, it shrinks in size, leaving shallow channels of water in many places. If the high-water stage occurs simultaneously on the Yangtze, the Kan, and other rivers, floods inevitably result. Fortunately, such flooding is an infrequent happening. The lake also serves as a useful reservoir.

Situated in the subtropical belt, Kiangsi has a hot and humid summer lasting more than four months, except in spots of high elevation, such as Lu-shan. Daytime high temperatures in Nan-ch'ang in July and August average 95° F (35° C). In winter the variations in temperature between north and south are greater. January temperatures in the extreme north at times fall to 25° F (—4° C), while those in counties south of Chi-an average 40° F (4° C). Most of the province, nevertheless, has a growing season of ten to 11 months, thus making it possible to raise two crops of rice. Rainfall is plentiful. During May and June, farmers, as a rule, can count on continuous rains to fill the rice fields with needed water. Average annual rainfall is 47 inches in the north and 60 inches in the south. In the Wu-i Shan region, on the Fukien border (where Wu-i, or "Bohea," tea is grown), the annual rainfall is as high as 78 inches.

The soil in the plains of northern Kiangsi is alluvial and permits intensive cultivation. The hilly lands in other parts of the province have red and yellow soils. Here few natural forests have been preserved; commercial trees planted are tea, tung, camphor, bamboo, and pine. On farms with clayey red soils, where rains have washed away the mineral contents, as well as the humus, the soil requires working over and the addition of green manure or chemical fertilizers in order to become productive.

Population. The 1953 census gave the population of Kiangsi as 16,770,000. The average population density at that time was 264 per square mile (102 per square kilometre); there were, however, 530 persons per square mile in the P'o-yang Hu plains and the lowlands of the river valleys but only 120 per square mile in the mountainous regions in the south.

An official estimate placed the population of Kiangsi in the early 1970s at approximately 25,000,000.

Composition of the population

As already noted, Kiangsi received successive waves of migration from North China through the ages. Its population is virtually all Han (or Chinese); the Miao, Yao, and Muslim peoples total only 10,000. The Hakkas, descendants of a unique group of migrants from North China, have maintained their separate identity, with their own dialect and social customs.

The language usually spoken is Mandarin, with a marked Lower Yangtze accent, although it has an admixture of the Fukien dialect in regions south of Kuei-ch'i and is heavily tinged with the Cantonese accent in the Ta-yü region, south of Kan-chou.

Through the centuries all three of China's major religions—Confucianism, Taoism, and Buddhism—had large followings in Kiangsi and left indelible marks on its cultural heritage. Under the people's republic, however, Buddhist monks and Taoist priests have lost their landed property to the state and have abandoned their profession to take up other employment, but, despite the regime's ideological campaigns, the influence of Confucianism still endures.

Approximately 14 percent of Kiangsi's population is urban, while 86 percent of the people live in rural areas. The leading city is Nan-ch'ang, with a population of 600,000. Situated on the right bank of the Kan Chiang, a short distance before it enters P'o-yang Hu, Nan-ch'ang is the focal point for rail and river transport, an industrial centre, and a trading centre for agricultural products. Chiu-chiang, on the south bank of the Yangtze 87 miles north of Nan-ch'ang, is the principal port through which the province's products are exported. Six miles south of Chiu-chiang is the beautiful resort of Ku-ling (Ox Ridge), perched 3,500 feet atop the Lu Shan.

From Nan-ch'ang southward up the Kan, Chi-an and Kan-chou are the leading cities, each with a population of more than 100,000. Chi-an, rich in literary lore and the centre of a tea industry, is the commercial metropolis of the Middle Kan Valley, just as Kan-chou is the centre of culture and trade in the Upper Kan Valley. Smaller cities along the river include Feng ch'eng (an industrial centre), Ch'ing-chiang (a trade centre for herbs), T'ai-ho (famous for its scribing paper), and Ta-yü, on the headwaters of the Kan (a centre for tungsten mining). Cities with populations ranging from 30,000 to 70,000 dot the hinterland on both sides of the river. The leading city in the extreme northeast is Ching-te-chen, the porcelain capital of China, with a population of 250,000.

The vast stretch of country east and southeast of Nan-ch'ang contains many cities of historical and commercial importance. Nan-feng, on the Shu Shui (or Hsii Chiang), is noted for its tangerines, and I-huang is known for its hemp, while Lin-ch'uan (Fu-chou), on the lower course of the Fu Ho, is a distributing centre for watermelons. The major cities on the Hsin Chiang are, from east to west, Yii-shan, Shang-jao, Ho-k'ou, Kuei-ch'i, Ying-t'an, and Yii-kan.

In the west and northwest of the province, Hsiu-shui and Wu-ning, on the Hsiu Shui, are important centres of the tea trade, while Jui-ch'ang is a centre of the iron industry. Wan-tsai, on the upper Chin Chiang, is noted for its ramie cloth. On the Chekiang–Kiangsi railroad from Nan-ch'ang westward, Hsin-yü is a new industrial centre; I-ch'un is noted for its ramie cloth and wrapping paper; while Ping-hsiang, which is situated on the Hunan border, is an important centre for heavy industry because of its coal mines.

Administration. As in other provinces, Kiangsi's administrative divisions are arranged in a hierarchy of levels. Immediately below the province there are two municipalities (shih), Nan-ch'ang and Ching-te-chen; two administrative bureaus, Lu Shan and Ching-kang-shan; and six areas (*t'i-ch'ü*), Ching-kang-shan, Chiu-chiang, Fu-chou, I-ch'un, Kan-chou, and Shang-jao. At the next lower level there are five additional municipalities (also called shih) and 80 counties (hsien). The lowest political units are the communes and towns.

People's congresses and councils

People's congresses at all levels are the organs of governmental authority; the deputies at the lowest level are chosen by direct vote of the people, but those at the other levels are elected by the people's congresses at the next highest level. The executive functions of government are performed by the people's councils–elected at each level by their respective people's congresses. The chairman of the Provincial Revolutionary Committee (called the Provincial People's Council before the Great Proletarian Cultural Revolution of 1966 to 1969) is the governor of the province. The Communist Party, with its own congresses and committees at every level, exercises controlling power over this system of government. Candidates are nominated under the supervision of the party, and no more than one list of candidates is voted upon. Many positions are held by party members; further, party cadres are attached to all levels of government.

Kiangsi was one of the most politically progressive of China's provinces during the Cultural Revolution. The Kiangsi Provincial Revolutionary Committee—a new power structure based on the "triple alliance" of the representatives of the revolutionary cadres, the army, and the revolutionary masses—was set up in Nan-ch'ang in 1968. Revolutionary committees were then established for all special districts, municipalities, and counties throughout the province. In subsequent years the consolidation of this power structure continued. Campaigns were launched to develop mass criticism and to study ideology as propounded by Mao-tse Tung. There is evidence that one of the concrete results of these campaigns was the closer cooperation of the government, the army, and the people for national preparedness.

Social conditions. Before 1949 the greatest scourge was the prevalence of malaria. This debilitating disease, carried by the anopheles mosquitoes, which bred in the marshes along the rivers and lakes, annually took a heavy toll of lives. Since 1949 the draining of swamps and of pools of stagnant water and measures taken for epidemic prevention have reduced this disease to a minimum. Another menace to health peculiar to the P'o-yang Hu region was liver fluke (a kind of flatworm). Many thousands of lives were previously lost every year as such worms, incubated in aquatic snails, entered the human body to develop into flukes sucking on the liver. This disease, too, is rapidly becoming a danger of the past, following mass control of the fluke embryo in the lake and surrounding waters.

Curative medicine

In curative medicine, improvements made by the early 1970s were impressive. Clinics providing free medical care were available in every commune and on every state farm, while modern hospitals were found in all cities and counties. A significant trend since the Cultural Revolution has been the rediscovery and promotion of indigenous treatments and drugs. Literally hundreds of indigenous prescriptions for many types of disease have been reported in curing not only common ailments and chronic diseases but also such diseases as jaundice, hepatitis, and gastritis. A great variety of indigenous herbs have been brought into use for the treatment of fractures and wounds, tumours, and other forms of sickness. The regime makes much of the fact that the popularization of indigenous treatments and drugs makes low-cost medical care generally available.

A minimum of social welfare is available. The welfare fund of the commune guarantees care for the sick, disabled, and aged and is also available when drought or flood occurs. For industrial workers there are measures for accident prevention, as well as insurance programs that provide for hospital treatment, sick leave, disability compensation, maternity leave, and old-age and death benefits. In Nan-ch'ang and other industrial towns the government has been improving the housing situation and expanding recreational facilities.

In education, children from three to seven attend nursery schools and kindergartens. Those from seven to 13 attend primary schools, which are run by production brigades in the rural areas and by street committees in the cities. The curriculum of the middle schools—comprising, as a rule, three years of junior and three years of senior grades—stresses proletarian ideology, physical training, and the sciences rather than social studies or humanities. All students in the middle schools are required to work and study at the same time. In the early 1970s there was a conspicuous trend to shift the operating costs of the middle schools from the state to the communes or the factories, while emphasis on the "proletarian revolution in education" brought about radical changes in educational policy. Often a pacesetter of innovations on the national scene, Kiangsi's educational program was striving to serve proletarian politics and to combine learning with productive labour. One of the models of such proletarian education was the Part-Time Tea-Growing and Part-Time Study Middle School in Wu-yüan County, Shang-jao Special District, where leadership was exercised by tea-growing peasants and instruction given by barefoot teachers who participated in the tea production.

Centres of higher learning include the Botanical Garden and Arboretum, in Lu Shan, and the Kiangsi Branch of the Chinese Academy of Sciences, the Kiangsi Library, the Kiangsi Provincial Museum, the Kiangsi Agricultural Institute, and the Kiangsi Medical College, all located in Nan-ch'ang. Perhaps the most significant development in higher education has been the Kiangsi Labour University, founded in 1958. It has its main campus in Nan-ch'ang but operates a network of more than 50 branch campuses, plus 14 affiliated technical schools, throughout the province. Aiming at the development of productive work through the dissemination of advanced education, the branch campuses are pioneering a multiplicity of development projects, including the building of roads in mountain areas, the founding of new villages, land reclamation, the building of factories, and the promotion of afforestation.

Economy. Kiangsi is one of China's richest agricultural provinces. Measures taken to increase agricultural production since 1949 include reclamation of unused land, treatment of red soil to make it more fertile, construction of large numbers of irrigation projects and hydroelectric power stations, and the increased use of chemical fertilizers and mechanization. As a result, arable land now occupies well over 35 percent of the total area of the province.

Principal crops

Food crops produced in Kiangsi include rice, wheat, and sweet potato; of these, rice is by far the most important. The P'o-yang Hu plain, the Lower Kan Chiang Valley, and the Shu Shui Valley are the principal areas of rice production; two crops a year are raised in all parts of the province. Kiangsi also produces a great variety of commercial crops. Tea is grown on hillsides in many regions; Chi-an, Wu-ning, and Hsiu-shui are the major centres of production. Ramie (China grass), used for making a fine, silky grass linen for summer wear, is produced at Wan-tsai, I-ch'un, Lin-ch'uan, and I-huang. Cotton is grown on the plains northeast of P'o-yang Hu (at P'eng-tse and Hu-You), while the Yü-shan and Kuang-feng regions, on the Chekiang border, produce tobacco. Sugarcane is raised in many parts of the province—at Po-yang, Lo-p'ing, and Tung-hsiang, in the northeast, as well as in Kan-chou, in the south. Other important commercial crops include soybeans and peanuts.

Kiangsi is a great provider of fruit. Especially notable are oranges, tangerines, watermelons, pears, persimmons, pomelos, apples, loquats (the fruit of a small tree of the apple family), and kumquats (a small citrus fruit). The hills of the province also supply the nation's apothecaries with such important herbs as the three-foliaged orange, the plantago major, and the gall nut. The lower valleys of the Wu Chiang and Hsin Chiang, east of P'o-yang Hu, are producers of the indigo plant.

Lush forests occupy 10 percent of the total area of Kiangsi. The region from Chi-an southward contains pine, fir, cedar, oak, and banyan. The timber produced here—used for building material and for furniture—is sent down the Kan and other rivers to Chiu-chiang for export to all parts of China. No less important are the camphor tree and the giant bamboo. The timber industry also yields valuable by-products, especially tung oil, resin, turpentine, lampblack (for making Chinese ink sticks), and tea oil.

Livestock raised in Kiangsi includes water buffalo, pigs, chickens, and ducks. Hog bristles and sausage casings are exported in significant volume. Fishing is a major industry in such cities as Hu-You, Chiu-chiang, Hsing-tzu, and Po-yang on P'o-yang Hu. The catches here consist of carp, eel, sturgeon, shad, loach, bream, stickleback, bleak, beltfish, barbel, perch, pike, bass, trout, and about 20 other kinds of fish. In addition, fisheries are found along the numerous rivers and in the almost countless village ponds. It is estimated that a total of more than 67,000 tons is produced every year.

Industry

Although for centuries Kiangsi was known for handicrafts, modern industry had only a limited base when the present regime took power in 1949. By 1970, however, the province had made immense progress in the establishment of both heavy and light industries. Coal and tungsten are the most important minerals mined. The P'ing-hsiang area in the west, with mines at An-yiian and Kao-k'eng, is the coal capital of south central China. The coke produced there supplies the older blast furnaces in neighbouring Hupeh Province and no doubt will supply the new steelworks being built closer by. Another coal-mining centre of rising importance is Feng-ch'eng, 38 miles south of Nan-ch'ang. The region surrounding Ta-yii, on the Kwangtung border, is the centre of tungsten mining, although extensive new deposits have recently been discovered in the Chien-nan region at the extreme southern tip of the province. It is estimated that Kiangsi contains more than 80 percent of China's total known deposits of tungsten. The ore mined there contains 60 percent tungsten; the remaining 40 percent permits the production of sizable amounts of tin, bismuth, and molybdenum. Iron is mined at An-fu, Ching-kang-shan, Sui-chang, and Chiu-chiang, while manganese is mined at Lo-p'ing. The discovery of a salt field in 1970 ended the long accepted belief that salt did not exist in Kiangsi.

The modern factories constructed since 1949 are designed either to aid agriculture or to manufacture goods using local raw materials. Nan-ch'ang is the largest industrial centre; it has plants for farm machinery, electric motors, chemicals, fertilizers, textiles, paper, dyes, pitch, jute, sanitary supplies, and ramie weaving. Chiu-chiang is principally a centre for textile mills and textile machinery. In Kan-chou are located plants for manufacturing paper, sugar, matches, cigarettes, and cotton cloth, as well as tractors, electric supplies, and chemicals. The majority of Kiangsi's industries operate on power from thermoelectric stations, although hydroelectric power has been developed, such as at the Shang-yu Chiang station, southwest of Kan-chou. Food processing is carried on in many localities throughout the province. Camphor is processed in Chi-an and tea in Chi-an, Shang-jao, and Ching-te-chen.

The development of industry, however, has not affected certain handicrafts for which Kiangsi has been famous throughout history. The ramie cloth produced in Wan-tsai, I-ch'un, I-huang, and Lin-ch'uan continues to be the nation's preferred choice for summer wear. Other important local products are the typical Kiangsi varieties of paper—lien-shih paper for printing (made of bamboo), piao-hsin paper for wrapping (also of bamboo), and mao-pien paper for scribing (made of rice and mulberry straw). Hsii-wan, on the Shu Shui, is a major centre of the engraving and printing industry.

The porcelain industry

No account of Kiangsi's economy is complete without reference to the porcelain industry—the industry par *excellence* of the province. In the Ching-te reign (1004–07) of the Sung dynasty the town of Fou-liang, on the Ch'ang Chiang, was by Imperial decree made a centre for fine porcelain. From that time on, Fou-liang was known as Ching-te-chen, after the Imperial patron; for ten centuries it has supplied the Chinese people with porcelain ware of all descriptions—ranging from items of daily use to artistic works of rare beauty made for the enjoyment of emperors and collectors.

The beautiful translucence and hardness of the porcelains from Ching-te-chen are attributable to two ingredients—kaolin and peituntze. Kaolin (or china clay) is a decomposition of granite, and peituntze (or white briquette) is a hard, feldspathic stone; both are fusible at high temperatures. These materials, found in the Ch'ang Chiang Valley and along the east shore of P'o-yang Hu, are pulverized to a fine powder and mixed to form the clay.

Today Ching-te-chen has a population of about 250,000, most of which is employed in one way or another in the making of porcelain. The bulk of the output is for domestic trade, although selected items are shipped abroad to foreign markets. The government is making an effort to revive and preserve the secret formulas of the Ming and Ch'ing potters. But there, as elsewhere in China, the inevitable tendency seems to be away from handicrafts and toward machinery.

Transportation. Kiangsi has an abundance of waterways. Most of the rivers flow diagonally, from east and west toward the centre, emptying into the Kan Chiang and P'o-yang Hu; many are navigable. The Kan Chiang itself is navigable by steamers from the lake upstream to Chi-an and by smaller steam launches from Chi-an to Kan-chou, although along the latter stretch, navigation is often made difficult by a series of 18 rapids. On many shallow streams, as well as on the headwaters of the Kan Chiang, navigation is by junk. Thus, the products of all the 80 counties of the province enjoy adequate transportation; Nan-ch'ang and Chiu-chiang are the main centres for transshipment and distribution. Goods for export are carried by large steamships on the Yangtze, but the labyrinth of towns on P'o-yang Hu forms a commercial empire in itself, knit together by regional navigation lines.

There are three railroads in Kiangsi. One line, built on the eve of World War I, runs north–south, linking Chiu-chiang with Nan-ch'ang. Another, the Chekiang–Kiangsi railroad, completed in 1937, runs east–west, from Yü-shan, on the Chekiang border, westward to P'ing-hsiang, on the Hunan border. This line forms part of a national trunk line that is being extended westward through Hunan into Kweichow to connect with the rail network of the southwest. The third line, built under the people's republic to provide strategic transport from the Yangtze Valley to the Fukien coast, runs from Ying-t'an southeastward to Amoy, opposite Taiwan.

Besides these existing railroads, new lines are either projected or under construction. These include a north–south line from Ch'i-men, in Anhwei, to Ying-t'an, with a branch line connecting Ching-te-chen with Chiu-chiang; another north–south line from Chin-hsien to Yii-tu, taking in the cities on the Shu Shui and the Mei Chiang and branching out from Yii-tu to Chang-t'ing, in Fukien; and still another north–south line from Hsin-yu—via T'ai-ho, Kan-chou, and Ta-yii—into Nan-hsiung, in Kwangtung, over the Mei-ling Kuan (Plum Range Pass), with a branch line from T'ai-ho westward to Ch'a-ling (east of Hengyang), in Hunan.

The highways

Kiangsi's highways were well developed in the Nationalist period. Many new roads have since been added, thanks to the mobilization of labour in the communes. There are five focal centres for the highway system—Nan-ch'ang, Lin-ch'uan, Shang-jao, Chi-an, and Kan-chou. Serving hinterlands of varying sizes, each of these centres represents at once the hub of regional roads and the terminus of interprovincial highways.

Although Nan-ch'ang is not a major centre of China's air transport, it is linked with Shanghai, Hangchow, Peking, Wu-han, and Canton by regular flights. Until the early 1970s, connections were made at Canton or Peking. Within the province, air travel is restricted mostly to government personnel on important assignments.

Cultural life and traditions. For nearly 2,000 years the people of Kiangsi lived under the pervading influence of Confucian culture. With village life rooted in intensive agriculture and government in the hands of the landlord-scholar-officials, the dynamics of society were regulated by Confucian ethics, which upheld learning and merit as the criteria of leadership and stressed family relationships and harmony with nature as the bases for group endeavour and group behaviour. Such a culture gave the province many famous sons that still fire one's imagination. Besides T'ao Yüan-ming (a great Chin poet of the reclusive life), Chu Hsi (the Sung dynasty Neo-Confucian philosopher), and Wang Yang-ming (the Ming philosopher), all of whom either taught or lived there, Kiangsi produced a full quota of statesmen during both the Sung and the Ming dynasties.

Yet, despite the predominance of Confucian learning and culture, peasant rebellions were a strong tradition in the province. Partly due to the temperament of the people and partly due to geographical environment, the poor and oppressed had a history of revolt against social and political injustice.

The present-day history of Kiangsi is the history of the interaction of these dual traditions. There is no denying the fact that the Confucian tradition has been torn asunder by the triumph of the revolution. With the reorientation of production and distribution since 1949, the people of Kiangsi are undergoing unprecedented changes in their life and cultural values. Proletarian ideology has replaced Confucian ideology; the peasant, the worker, the soldier, and the revolutionary intellectual are the heroes of the new society.

Yet, the peaceable character of the current scene in Kiangsi indicates that the basic elements of Confucian culture have not been totally lost. Many of the functions of the traditional family have been taken over by the state; for example, the government now sanctions marriages through civil registration, and the commune-operated kindergarten cares for the children. The party worker now oversees the moral code and discipline. In place of the old family loyalty, there is now substituted a new loyalty to the state. The government imposes hard work on the people but provides state-supported services to ensure a measure of social well-being. Yet, underlying the new equilibrium in the relationship between the government and people is the same emphasis on the leadership of the educated elite and on group endeavour and group behaviour. Reports on conditions in the communes, factories, and schools in Kiangsi give ample evidence that the dual forces of tradition and revolution are not overwhelming each other but imperceptibly reaching an accommodation.

Current developments are covered in issues in ***China Reconstructs, Peking Review, Union Research Service Reports,*** and ***Far Eastern Economic Review.***

(P.-c.K.)

Kiangsu

A province on the east coast of China, Kiangsu (Jiang-su in Pin-yin romanization) is bounded by the Yellow Sea, the province of Chekiang to the south, Anhwei to the west, and Shantung to the north. It occupies an area of 39,500 square miles (102,300 square kilometres), or 1.1 percent of the total area of China. The population in the early 1970s was 47,000,000, 6.5 percent of the national total. The provincial capital is Nanking, which was the southern capital of China during the Ming dynasty (1368–1644 AD) and the capital under the Nationalist Government (1928–49). Kiangsu became a separate province in 1667 (the sixth year of the reign of Emperor K'ang Hsi). The name is derived from the prefixes of Chiang-ning and Su-chou, the names of the two most important *fu* (prefectures) within the province at that time.

The province consists almost entirely of alluvial plains divided by the estuary of the Yangtze River into two sections, Chiang-nan (south of the river) and Sii-pei (northern Kiangsu). Chiang-nan forms a part of the Yangtze Delta and is fertile and well watered, famed for its silk and handicraft, and very densely populated and industrialized. The famous cities of Soochow, Nanking, Wu-hsi, and Shanghai (the chief metropolis of China and the fifth largest city of the world in the early 1970s) are all located in this region. Shanghai is situated at the mouth of the Yangtze River, on the Huang-pu Shui-tao (Huang-pu Channel). Administratively, the Shanghai Municipality is not a part of Kiangsu Province but is controlled directly by the State Council of the People's Republic of China in Peking. Northern Kiangsu is relatively poor in comparison with Chiang-nan. It is watered by the Hung-tse Hu (the "great marsh lake"), by the new North Kiangsu Irrigation Trunk Canal, which drains the lake, by the Huai Ho, which flows to the sea, and by the Grand Canal, which runs through the province from north to south, connecting it with the Yangtze, the T'ai Hu, and Hangchow Bay. During several periods in Chinese history, northern Kiangsu has also been drained by the Huang Ho (Yellow River), which has now been diverted back to its former course north of the Shantung Peninsula. The northernmost section of Kiangsu, from Siichow to the sea, formed by the alluvium of Huang Ho, it is actually a part of the great North China Plain in its physical geography, as well as in its agriculture and general way of living. The poorest section of Kiangsu, it is densely populated.

Historical background

Before the Christian Era, the province, except for the northernmost part, was a part of the ancient state of Wu. The term *sheng* (province) was adopted for the first time during the Ming dynasty (1368–1644), when the province was first placed under the direct jurisdiction of the Imperial capital of Nanking. When the capital was moved to Peking, it was placed under the jurisdiction of the Southern Capital. During the earlier part of the Ch'ing dynasty (1644–1911), it was part of Chiang-nan Province but was later made a separate province of Kiangsu (1667). It has remained thus ever since. The Yangtze Delta was invaded by British forces in the Opium War (1839–1842). It was occupied by Japan during the Sino-Japanese War (1937–1945) and suffered immense damage, from which it has since recovered.

Physical geography. ***Relief and drainage.*** The most important physical characteristic of the province is its wide alluvial plain, stretching from north to south, at a low elevation above sea level. Most of the soils are thus alluvial, both calcareous and noncalcareous, and including some saline soils. There is an intricate network of rivers and canals, lakes and ponds, all protected from floods by dikes built by the farmers. Most of the province is less than 150 feet above sea level. Hills of moderate elevation are found only in the southwestern corner of the province and in the extreme north along the Shantung border. These uplands constitute no more than 5 percent of the total area. Nearly 10 percent of the total area is occupied by shallow lakes and reedy marshes. The silt of the great rivers encroaches constantly on the sea, leaving seaports of former ages high and dry. In coastal areas below the high-water level, cultivation is carried on in polders (areas protected from the sea, mainly by dikes). Extensive canalization and a vast development of polders have been systematically carried out, first under the Nationalist Government, and, since 1949, by the People's Republic. This section of the surface of the earth has been completely altered by human hands.

The Kiangsu lowlands are floodplains formed by the alluvial deposits of the mighty Yangtze, the Huai Ho, the Huang Ho, and their tributaries. Using the Yangtze and Huai Ho channels as convenient landmarks, the area of these plains may be divided into three sections. The Chiang-nan plain south of the Yangtze forms the principal part of the Yangtze Delta, characterized by flatness and lying only 10 to 16 feet above sea level. It is crisscrossed by streams and canals and dotted with ponds and lakes, forming an elaborate network of flowing water, meticulously maintained by farmers. This area actually possesses the highest stream density in China: within it, no place is more than 100 yards from the T'ai Hu drainage system. The canals were all dug by farmers of the area. Isolated hillocks dot the edge of the T'ai Hu area, which adds to its enchanting beauty. The lakes were parts of former shallow bays and inlets of the sea, obstructed and enclosed by the steady advance of Yangtze Delta. After being cut off from the sea, the water gradually decreased in salinity and formed freshwater lakes. T'ai Hu is connected with the Yangtze and its estuary by many distributaries. The Chiang-nan Canal (the name for the section of the Grand Canal south of the Yangtze), which runs through the full length of the T'ai Hu plain from northwest to southeast, cuts across all the distribu-

The three sections of the plains

taries connecting the T'ai Hu basin with the Yangtze, thus forming a vital link of the T'ai Hu system.

Between the Yangtze and the ancient channel of the Huai Ho is what Chinese geographers call the Yangtze-Huai Ho plain, built by the alluvium of the two rivers. The centre of this plain is only 6.5 to 13 feet above sea level, while its periphery stands at about 17 to 33 feet. It is considered to be a section of the Yangtze Delta, as it has the same topographical elements, including alluvial deposits and drainage. Formerly, the Huai flowed into the sea, but when its channel was gradually usurped by the Huang Ho, beginning over a thousand years ago, it was unable to reach the sea and emptied itself into the Hung-tse Hu, which flows into the Kao-pao Hu, the Grand Canal, and the Yangtze. As a sluggish tributary of the latter, the Huai causes widespread floods during the high-water season.

North of the old channel of Huai Ho is the Süchow-Huai Ho plain, built of the alluvium of the Huai Ho and the Huang Ho and standing about 30 to 150 feet above sea level. In the northern part of the plain are low hills with heights of about 650 feet. Yun-t'ai Shan, near the Yellow Sea, is the highest point in the province, at 2,034 feet (620 metres).

The Yangtze enters the province to the southwest of Nanking on the Kiangsu–Anhwei border, flowing east for a distance of about 300 miles to its junction with the Huang-'pu Chiang (Whangpoo River) before reaching the East China Sea. The waters from upstream meet tide-waters at Nanking, where at some points the river is barely one-half mile wide. The river becomes broader at Chen-chiang, widening to over 11 miles at Nan-t'ung, and more than 56 miles at its mouth. It carries about 10,600,000,000 cubic feet of silt to the sea annually, depositing it to form the delta. Tides and currents carry some of the sediment to form sandbars in the estuary and along the coast. The delta itself grows at an average rate of about 82 feet a year.

Yangtze Valley and North China climates

Climate. Within the province, two subtypes of climate may be distinguished: the Yangtze Valley climate, in central and southern Kiangsu, and the North China climate, to the north of the old Huai Ho. The former is humid subtropical, while the latter is cool, temperate continental, with greater extremes of temperature. Nanking in the south has a mean temperature of 36" F (2.2" C) in January and 82.4" F (28" C) in July. For northern Kiangsu, the mean January temperature is below 32° F (0° C), but summer is as hot as in the south. Annual precipitation generally increases from north to south, ranging from 23.6 to 47.2 inches, that of Nanking being 42 inches. Seasons are distinct in both north and south. Between spring and summer, the south receives prolonged rains of cyclonic origin, typical of the Yangtze Valley and extremely useful for rice growing. The coast is often visited by destructive typhoons between late summer and early autumn.

Vegetation and animal life. Northern Kiangsu is vegetated with temperate broadleaf deciduous trees, typical of the North China Plain, while in southern Kiangsu are found subtropical mixed broadleaf deciduous and broadleaf evergreen trees, typical of the Yangtze Valley. As the whole of the province has been cleared for cultivation since ancient times, no primary forest remains today. In terms of natural flora, it is a markedly depleted territory, because of the dense population and intensive cultivation. There is a warmth-loving and moisture-loving fauna characteristic of the monsoon climate of East Asia. The fauna has considerable economic significance, fish, ducks, crabs, and shrimps being important sources of food. Fish raising is highly developed—the numerous ponds, reservoirs, lakes, canals, and streams are stocked with hundreds of millions of fry that are shipped to other provinces and are also exported to other countries.

There are also numerous agricultural pests, such as rodents and insects, which harm cultivated plants and trees. Great strides have been made in the control of the more common pests, but the insects that damage trees have not yet been adequately studied or brought under complete control.

Population. The registered population of Kiangsu, excluding Shanghai, in 1957 had grown to 45,200,000. The growth rate for the 4.5-year span since the census of 1953 was 3 percent per annum, close to the national average. The population estimate for the early 1970s was 47 million, indicating an average growth rate of less than 0.5 percent per annum, which is less than one fifth that of the preceding period. This may be partially explained by the movement of Kiangsu population into Shanghai, which grew from 6,900,000 in 1957 to 10,000,000 in 1959, adding 3,100,000, or 45 percent, in two years during the Great Leap Forward—the period of intensive pressure toward economic development—in 1958 and 1959. Authorities have made a persistent effort to stop the drifting of population into Shanghai from the surrounding areas and to send migrant peasants back to the provinces.

Population densities

The population distribution patterns of Kiangsu Province and Shanghai Municipality (*q.v.*) should be studied together, as they are inseparable geographically and economically. Their total population in the early 1970s was 57,800,000, giving an average of approximately 1,400 persons per square mile. By comparison, The Netherlands—one of the most densely populated regions of Europe—had a population density of about 900 persons per square mile in the early 1970s. Population density is higher in the north, a fact explained by its earlier development, which dates from ancient times, and its importance as a communication link between North China and the Lower Yangtze Valley. Even the hilly district in southwestern Kiangsu has very high population densities in comparison with Europe and the United States. In the valleys, the figure is above 1,000 per square mile.

These figures indicate the fertility of the region and its capacity to support a large population, even in a state of relative economic underdevelopment.

The population of Kiangsu is entirely Chinese (Han), with the exception of a few Hui (Chinese Muslims). The inhabitants of Chiang-nan speak the Wu (Shanghai) dialect, while those of northern Kiangsu and the Nanking area speak the eastern Mandarin (*hsia-chiang-kuan-*hua).

Rural people make up 71 percent of the population of the Kiangsu-Shanghai area. For Kiangsu alone, the figure was about 85 percent in 1957. Social and economic conditions during the eight-year period from 1950 through 1957 were relatively stable. This was followed by a 12-year period of cataclysmic change and mass movements from 1958 through 1969, including the Great Leap Forward (1958–1959), the reorganization of the Chinese countryside into people's communes (1958), a nationwide agricultural crisis of 1959 to 1961, and, lastly, the Great Proletarian Cultural Revolution, from 1966 to 1969. The effect of these social upheavals upon the distribution of population, birth and death rates, and the urban–rural ratio has never been adequately studied by Chinese or Western scholars. Despite this lack and the statistical gap after 1957, an analysis of the population patterns and trends from 1953 through 1957 should be useful as an indication of what a densely populated province in China is like under normal conditions.

Administration and social conditions. Since 1949, under the People's Republic of China, Kiangsu Province has formed one of the 29 primary administrative divisions of the Republic. The province itself is subdivided into 15 secondary administrative units consisting of municipalities under the direct jurisdiction of the province (shih) and areas (*t'i-ch'ü*).

Organization and functions of communes

These secondary administrative units are subdivided into 68 hsien-level or tertiary units consisting of four municipalities (shih) and 64 counties (hsien). In 1958, the latter subdivisions were replaced by people's communes, administered by elected commune committees, which function as instruments of the Chinese Communist Party (CCP). The commune is divided into production brigades, which own the land and the means of production. The brigade branch committee is the grass-roots control body of the CCP apparatus, providing political and economic guidance to the rural inhabitants. The brigade is again subdivided into productive teams, which form the lowest level administrative unit, averaging 20 to 40 households.

Local government at all levels is theoretically run by elected assemblies, but actually it has usually been run by local CCP cadres. This was changed by the Great Proletarian Cultural Revolution, unleashed in the winter of 1965–66, when many local administrations were disrupted and replaced by revolutionary committees, constituted by the People's Liberation Army, revolutionary mass organizations, and "state organs of the dictatorship of the proletariat."

Numerous communes have successfully established labour-intensive rural industries. The profits from these enterprises have helped to pay for rural primary and secondary education; for social welfare, the care and support of the aged, veterans, orphans, and widows; for rural recreation; and for universal medicare.

The Third Provincial Party Congress met in 1970 and elected a committee of 56 and a standing committee of nine, headed by a first secretary, who is also chairman of the Provincial Revolutionary Committee and commander of the Nanking Military District.

Rural Life and agriculture. The villages are distributed very close to each other on the Yangtze Delta and are generally just 300 to 600 yards apart. They are located mostly on the banks of rivers and canals. Villages with several scores of households are the most common. Communication between villages is usually very easy, thanks to canals and barges, rural roads, and the ubiquitous bicycle, again somewhat like the Low Countries of Europe. The houses are usually well built of brick baked in local kilns. Dwelling conditions are fair to good by Chinese standards.

Dispersed rural settlement is the rule along the coast and the rivers of northern Kiangsu. Dwellings are found singly along the river banks, and in groups of two, three, or four among the rice fields, quite close to each other.

Reorganization of the agricultural force

In the newly reclaimed areas along the coast, the population is sparse, and the peasant dwellings are usually located at the centre of rectangular fields laid out in an orderly fashion. After the Communists came to power, they sought to transform Chinese peasant farming into large-scale, socialized agriculture, first through "mutual aid teams" in the village, then through agricultural producers' co-ops and state farms, and finally by means of communes. Before the Communist period, Kiangsu peasants, like their counterparts in the rest of China, were underemployed for most of the year but extremely busy a small part of the year at planting and harvesting time. A great number of poor peasants who could not make a living in the village drifted into the cities to look for work. They became coolies in the big cities, pulling rickshas, pedalling pedicabs, carrying cargo on their backs, or else joining the army of the unemployed, of which there were more than 670,000 after World War II in Shanghai alone. The new government has sought to eliminate this through organized mass employment in rural reconstruction, such as the building of thousands of small reservoirs and water conservancy works, road construction, and the planting of tens of millions of trees each spring to reforest the country. The construction work is done generally with very little machinery, using human muscle alone.

The whole province is cultivated, the principal food crops being rice and wheat. Secondary food crops include barley, maize, and sweet potatoes. The Yangtze Delta is a major cotton region, and silkworms are raised in the T'ai Hu plain. Tea is grown in the southwestern uplands around I-hsing, which produces the famous I-hsing china tea sets. Cattle, pig, and poultry raising provide an important source of food and income, even under the commune system, in which a small private plot is allowed to each household. Fishing and pisciculture are other sources of food. Fishing is carried out along the coast and in the rivers and lakes.

Urban life and culture. Town and city dwellers constituted about 29 percent of the total population of the Kiangsu–Shanghai area in 1957. Shanghai is the largest municipality in China and one of the ten largest in the world; it is almost a modern conurbation (*i.e.*, an aggregation of urban districts). Besides Shanghai, there is another very large city (demographically) in the region—Nanking, with 1,700,000. This is the largest city of Kiangsu proper and is its administrative and cultural centre. There are three other cities in the region with over 500,000 inhabitants, namely Siichow (710,000 as of 1957), in northern Kiangsu; Soochow (651,000); and Wu-hsi (616,000), in Chiang-nan. There are altogether over 60 cities and towns with a population of over 10,000. Most of them are chief towns of the counties *(hsien)*.

There are two categories of cities from the standpoint of historical development—the ancient cities and the modern cities. The former date from ancient or medieval times and include Nanking, Soochow, Yang-chou, Chen-chiang, and Siichow. Several of them are well-known in East Asian history, are rich in cultural heritage, and have a long tradition that has found artistic expression in Chinese traditional architecture, painting, sculpture, flower gardens, stone bridges, and world-renowned handicraft industries, such as silk embroidery and carving of various materials. These cities often possess historical monuments, famous temples, and local shrines and *p'ai-lou* (arches) honouring their illustrious citizens. Many cities have a rich folklore. Nanking, especially, abounds in national monuments and famous historical relics. The most renowned are the simple Ming tombs (of Ming emperors) and the magnificent Sun Yat-sen Mausoleum, both in the eastern part of the huge city, at the foot of Tzuchin Shan (Purple and Gold Hill). The gastronomic specialty of this ancient capital is the renowned Nanking salted duck, which is sold in gourmet food stores throughout the region. The duck is raised in ponds and lakes nearby. Other renowned products from the Nanking area include the hand-woven silk (*tzu-ching*), particularly the cloud brocades, which use every conceivable shade of colour to portray the clouds of sky at sunset.

The modern cities sprang up in the 19th century after the Opium War and the Treaty of Nanking (1842), which opened China to international trade. Such cities as Shanghai, Wu-hsi, Nan-t'ung and Lien-yiin-chiang-shih fall into this category. Most of them are seaports, river ports, or railway junctions.

Industry. Nanking is the most important modern industrial centre of Kiangsu proper. The Nanking Motor Works was reorganized from a military workshop for repairing motor vehicles under the Nationalists (before 1949) and expanded to produce spare parts. In 1952 it was further enlarged to build 2.5-ton trucks and then four-cylinder 50-horsepower and six-cylinder 70-horsepower engines. In 1964 it employed 3,500 workers. A chemical-fertilizer plant at P'u-k'ou, opposite Nanking on the left bank of the Yangtze, is the biggest of its kind in China. The Nanking industrial area also produces steel, machine tools, electrical supplies, cameras, textiles, cement, and sundry building materials. Other manufacturing industries include machinery, food processing, and oil refining.

Wu-hsi on the Shanghai-Nanking railway is a rising industrial centre with good inland waterway connections to all parts of the province. Modern manufactures include cotton textiles, silk reeling, and food processing. Good deposits of iron and coal are reported to have been found at I-hsing across the T'ai Hu. They are used in a local ironworks and steelworks, which, early in the present decade, employed more than 2,000 workers, making iron, manganese iron, and steel; output was 60,000 tons a year, and an output of 200,000 tons of iron and 200,000 tons of steel a year was projected to meet local needs for such material.

The policy of industrial dispersion

It appears that an upsurge of local industrial development has taken place in Kiangsu since 1966. Eight major branches of small industries have been built or expanded throughout the province, including chemical-fertilizer plants, ironworks and steelworks, agricultural-machinery plants, and coal mines. During the period 1966–1970, 35 new coal mines, 68 small hydroelectric plants, and 250 new factories were built in 13 local administrative units alone. The emphasis is upon industries for supporting agriculture. Each of the province's 64 counties now has agricultural-machinery plants that can effect major repairs. Many of them also make rice transplanters, harvesters, threshers, pumps for irrigation and drainage, and mechanized or semi-mechanized farm machinery. Besides county industrial enterprises, there have developed far more commune-run small plants. Nine-tenths of the counties have a local chemical industry. There are 80 small fertilizer plants in the province and 20 factories manufacturing insecticides. Two-thirds of the counties have nitrate-fertilizer plants; half of them have phosphate plants. The dispersion of industry into the countryside is part of China's preparation against nuclear war, which was given impetus by border clashes between the Soviet Union and China in 1969.

BIBLIOGRAPHY. The most comprehensive contemporary regional economic monograph is SUN CHING-CHIH (ed.), ***Economic Geography of the East China Region (Shanghai, Kiangsu, Anhwei, Chekiang)*** (Eng. trans. 1961). ***Nagel's Encyclopedia-Guide to China*** (1968) includes reports on the observations of young French Sinologists during a visit to China. H.Y. HU, "A Geographical Sketch of Kiangsu Province," ***Geogrl. Rev.***, 37:609–617 (1947), is dated, but shows intimate knowledge of the province. See also V.T. ZAYCHIKOV (ed.), ***The Physical Geography of China***, 2 vol. (1969; orig. pub. in Russian, 1964). A. HERRMANN, ***An Historical Atlas of China***, new ed. (1966), is indispensable, but contains some mistakes.

Kierkegaard, Søren

Søren Aabye Kierkegaard, an eminent 19th-century religious philosopher whose mode of thought inspired many 20th-century thinkers, particularly the Existentialists, and earned him the credit of being the father of Existentialism (*q.v.*), is famous for his critique of systematic rational philosophy, particularly Hegelianism, on the grounds that actual life cannot be contained within an abstract conceptual system. With this stance, he intended to clear the ground for an adequate consideration of faith and, accordingly, of religion—specifically Christianity.

Kierkegaard. drawing by his cousin Christian Kierkegaard, c. 1840. In a private collection.

Early life. Kierkegaard was born in Copenhagen on May 5, 1813. His father, Michael Pedersen Kierkegaard, who had a great influence on his character, had begun his own career as a poor tenant-farmers' helper in the desolate moorlands of western Jutland. One day, desperate with rage at divine indifference to his sufferings and privations, the boy stood on a hill and solemnly cursed God. Soon after, he was sent to Copenhagen, to an uncle who was a dealer in woolen articles, and from that moment he prospered, ending his life as a rich man—the owner of five houses in the capital that all miraculously escaped destruction during the British bombardment of Copenhagen in 1807. Moreover, having placed his entire fortune in gilt-edged securities, he was among the few who escaped ruin in the state bankruptcy of 1813, the year Søren was born. Thus, at his death in 1838, the old man left Kierkegaard and his brother a considerable fortune that enabled Kierkegaard to spend his life writing, unhampered by financial considerations.

Heritage of melancholy

Kierkegaard's psychological heritage was, however, far more important than his financial legacy in its consequences for his development as a man and a writer. His father combined a strict adherence to orthodox Lutheranism with a fondness for the logic of formal argument; and yet the austere religious and intellectual training he devised for the most brilliant of his sons was enlivened by a captivating imagination. Kierkegaard never shook off the influence of his father's overpowering personality nor of the suppressed melancholy that lay so disquietingly below the surface of his father's piety. In his diary he tells the story of a man who one day looked at his son and said, "Poor child, you are living in silent despair." At an early age, Kierkegaard became aware of the heavy burden of guilt that weighed his father down and later learned, in circumstances the traumatic effect of which he designated as "The Great Earthquake," that the reasons for it lay in the boyhood curse his father had hurled at God. Appalled by the knowledge of his father's sin, he threw himself into a life of dissipation yet remained haunted by the elder Kierkegaard's conviction that God's curse lay on the family, a conviction that the death of Kierkegaard's mother and five of his six brothers and sisters seemed to confirm.

He went to the University of Copenhagen to study theology but neglected this in favour of philosophy and fell under the influence of a professor of philosophy, Poul Martin Møller, who was also a writer of some importance. The later characteristics of Kierkegaard as a writer were anticipated in the works of Møller, whose declared aversion to systematic philosophy also made a deep impression on him. Moreover, the other professor of philosophy at the University at that time, Frederik Christian Sibbern (1785–1872), held a viewpoint similar to Møller's and also attempted to explain and illustrate his thoughts by writing fiction.

Relationship with Regine Olsen

The death of his father in 1838 had a sobering effect on Kierkegaard. He resumed his theological studies and two years later took his master's degree. There was, however, another reason for his renewal of purpose; he had fallen in love with a young girl, Regine Olsen, and determined to propose to her. He seems to have exerted a great fascination on everybody, concealing his melancholy under a cover of gaiety and wit, and Regine's acceptance came as no surprise to him. Yet only two days later he began to think he had made a mistake, though he still felt himself deeply in love. It appears that he became increasingly aware of the gulf between the young, innocent, inexperienced girl and himself, weighed down as he was by a feeling of guilt and by his unusual consciousness of the complexities of the human mind, which he would never be able to communicate to Regine. As he wrote in his diary: "I was a thousand years too old for her."

Accordingly, he decided to break the engagement. But Regine was in love with him, and the more he tried to persuade her to let him go, the more she clung to him. In the end he had to break off their relationship himself, but, in order to preserve her reputation, he staged an elaborate show of caddishness so as to make it appear that it was she who had rejected him. This point established, he fled to Berlin, where he lived for half a year. The little romance, novelettish though it may seem in bare outline, had a profound effect on Kierkegaard and furnished him with material for reflection and comment in several of his books.

First philosophical works. He returned from Berlin with an enormous manuscript in his trunk, ***Either/Or: A Fragment of Life***, published in 1843 under a pseudonym. Nearly all Kierkegaard's books were published pseudonymously, with fictitious names suited to the particular work, a peculiarity intended to persuade the reader that the ideas he proposed were not to be taken as the pronouncements of an authority but presented various modes of life for the reader's judgment and, especially, choice. This is, in fact, the meaning of the title *Either/Or*, which offers the alternatives of an aesthetic or an ethical (or ethico-religious) view of life. Kierkegaard's belief in the necessity—for each individual—of making a fully conscious, responsible choice among the alternatives that life offers has become fundamental in all Existential writing and thought.

His unhappy experience with Regine obviously plays a great role in *Either/Or*. Indeed, the final part of the first volume, which bears the provocative title "Diary of the Seducer," recalls his own love story in many details recorded in his diary, and the book can be seen as a secret communication to Regine, intended to explain and justify his attitude to her. Such secret communications run through all his works, and he returns again and again to the question of his responsibility for what he did. It could be argued, in fact, that it was the engagement to Regine and what followed that made Kierkegaard a writer, a writer of the type that his teachers Møller and Sibbern had been before him, a poet–philosopher. *Either/Or* was Kierkegaard's first work in this genre, and it is a work of high artistic value; in addition, it provides an important illustration of the current literary trend when Romanticism was developing some of its later preoccupations—social realism and individual psychology—and was becoming more pessimistic and morbid in its outlook. These elements also occur in the subsequent books, which appeared in rapid succession.

"The teleological suspension of the ethical"

Among them should be mentioned ***Fear and Trembling*** and ***Repetition,*** both of which also were published in **1843.** Both deal with faith and with the idea of sacrifice. The starting point of ***Fear and Trembling*** is the story of Abraham and Isaac. Once more Kierkegaard examines the implications of his break with Regine, a sacrifice, like that of Abraham, performed in obedience to a higher duty, and, like Abraham's readiness to slay his son, an act that contravenes the laws of ethics. The problem is whether situations can be imagined in which ethics can be suspended by a higher authority—*i.e.*, by God, when God himself must be considered the essence of everything ethical. This problem—which Kierkegaard calls "the teleological suspension of the ethical"—led him to the conclusion that faith is essentially paradoxical. ***Repetition*** is associated with ***Fear and Trembling*** since it provides a psychological demonstration of these ideas.

In **1844** ***Philosophical Fragments*** and ***The Concept of Dread*** appeared. They stand in the same relation to each other as do the two previous books, in the sense that the first is a philosophical statement, the second a psychological demonstration. ***Philosophical Fragments*** is an attempt to present Christianity as it should be if it is to have any meaning. It aims particularly at presenting Christianity as a form of existence that presupposes free will, without which everything becomes meaningless. This was an attack on the prevailing Hegelian philosophy, which employed grandiose historical perspectives in which the individual was sucked up as tracelessly as a grain of dust. In fact, by this time Kierkegaard was preparing for a showdown with Hegelian philosophy, but, before he did so, he felt the need to extend his ideas concerning the philosophy of freedom into the sphere of psychology. The result was ***The Concept of Dread.*** Extraordinarily penetrating, it is perhaps the first work of depth psychology in existence.

Here Kierkegaard makes a clear distinction between what he calls ***Angst*** "dread"—a feeling that has no definite object—and the fear and terror that derive from an objective threat (*e.g.*, a wild animal, a gunman). How intimately Kierkegaard's ideas were intertwined with his life can be seen from an extract from his diary:

> But if I had explained things to her [Regine], I would have had to initiate her into terrible things, my relationship with my father, his melancholy, the eternal night that broods over me, my despair, lusts, and excesses, which perhaps in God's eyes were not so heinous; for it was dread which caused me to go astray.

In the last part of the sentence we have the starting point and key to ***The Concept of Dread.*** Kierkegaard perceived that freedom cannot be proved philosophically because any proof would imply a logical necessity, which is the opposite of freedom. The discussion of freedom does not belong to the sphere of logic but to that of psychology, which cannot discuss freedom itself but can describe the state of mind that makes freedom possible. This state of mind is dread. Through experiencing dread, one leaps from innocence to sin, and, if the challenge of Christianity is accepted, from guilt to faith. Dread is thus sin's prelude, not its sequel, as one would think at first.

The three levels of ***Stages on Life's Way***

In **1845** Kierkegaard had a new book ready, ***Stages*** on ***Life's Way,*** a voluminous work and perhaps his most mature artistic achievement. In a way, it reiterates the idea of *Either/Or*, as the two titles indicate, but there is a vital difference—now the religious stage, or sphere, is distinguished not merely from the aesthetic but also from the ethical. This development was, in fact, a logical consequence of the ideas embodied in all the former works, which aimed at exposing the inadequacy of human ethics as a way of life. Accordingly, while in ***Either/Or*** there were only two spheres, the aesthetic and the ethical, in ***Stages on Life's Way*** there are three. In the third and last section of the book, "Guilty?"/"Not Guilty?," Kierkegaard once more dissects the story of his broken engagement but now from a new angle. On the aesthetic plane, a love tragedy signifies that two lovers cannot be united because an extraneous power prevents them; the story of Romeo and Juliet provides a classic example. On the ethical plane, the obstacle consists in their belonging to different spheres of existence, one interpreting love aesthetically, the other ethically. This obstacle can only be overcome by one elevating the other to his own sphere of existence, a thing that very rarely happens. On the religious plane, however, the obstacle lies in the fact that one of the two is constitutionally different, for he conceives his destiny to be one of suffering, and only the acceptance of suffering will enable him to achieve detachment from the here and now and so prepare him for eternity. The aesthetic hero has his opposition outside himself; the religious finds it within. The aesthetic hero becomes great by conquering; the religious hero by suffering. But suffering in the service of "the idea" is precisely the realization of the idea in the religious sphere of existence. This was the argument that Kierkegaard had not himself conceived when he wrote ***Either/Or*** and for whose sake he had to write the book over again.

It is an argument that evinces an increasingly sombre outlook on life and on humanity as a whole. A number of unpleasant experiences had contributed to his changed mood. The girl he loved had married and thus crushed a romantic illusion about their remaining in a sort of divine marriage, raised above the terrestrial level, only waiting for God to make the impossible possible. This, in fact, was the idea underlying both ***Fear and Trembling*** and ***Repetition.*** Now it had all come to nothing, and the disillusionment emerges clearly in the first part of ***Stages on Life's Way,*** called "In Vino Veritas" or "The Banquet," which is modelled on Plato's ***Symposium*** and deals with the same subjects—he, eros, sex, woman—and reflects a biting sarcasm and scathing contempt for women in general.

Attack on Hegelianism. Kierkegaard also had other disappointments. He quarrelled with literary critics who did not see the purport of his writings or, even worse, did see it and still tried to make him a laughing stock. From these skirmishes, he emerged victorious but deeply hurt and filled with an enormous disgust for mankind. This bitterness manifests itself in most of what he wrote afterward. But his next book was an exception. It bears the impressive title "***Concluding Unscientific Postscript to the Philosophical Fragments. A Mimic-Pathetic-Dialectic Composition, an Existential Contribution.*** By Johannes Climacus. Published by S. Kierkegaard." **(1846).**

It is typical of Kierkegaard's irony that his most philosophically important work figures as a postscript to a book only about a fifth its size. And by calling his book "an existential contribution," Kierkegaard gives the reader a strong hint of his own philosophical position; his aim is to settle accounts with the predominant philosophy of his time, the Hegelian philosophy, which had swept Europe. Kierkegaard attacked Hegel's attempt to systematize the whole of existence, declaring that a system of existence cannot be constructed, since existence is incomplete and constantly developing. He further drew attention to the logical error that arose from Hegel's attempt to introduce mobility into logic and so revealed the confusion arising from the mixing of categories. Hegel thought he had created the objective theory of knowledge; Kierkegaard put forward the thesis that subjectivity is truth or, to quote his own definition, "the objective uncertainty maintained in the most passionate spirit of dedication is truth, the highest truth for one existing."

Kierkegaard's view of subjectivity of truth

These tenets, which have become the foundation stones of modern Existentialism, have not only punctured "the system," as Hegel called his own philosophy, but have made all philosophical systems precarious. The system builder will never understand that it is not possible to understand existence intellectually. Hegel equated existence and thought and thus left no room for faith. Accordingly, Christianity appeared as a mere paragraph in the system, an example of the general, and that, according to Kierkegaard, was the scandal. Kierkegaard did not feel himself called upon to persuade people to become Christians, but he certainly did feel an obligation to let his contemporaries understand what Christianity really is. And more than that, he had a feeling that God had designated him for a special task. But what that task was was uncertain. He discussed it with himself in his diaries, particularly after he had finished his last two books. Quite naturally, after five years of enormous concentration and after having completed a production unequalled in the literature of philosophy, he felt the need for a pause for breath, and at times he even thought of giving up writing altogether.

Showdown with the church. But Kierkegaard's retirement was not to be. He could not abstain from writing, and now the "mission" was beginning to crystallize. God had appointed him, he thought, to reveal to his contemporaries the true nature of Christianity and to expose the scandal of the established Church of Denmark, the clergy of which had betrayed their religion by making themselves comfortable in secular society, in short, had become civil servants instead of followers of Christ.

The attack against Christendom

It is clear that Kierkegaard was moving in the direction of even greater austerity in his religious thinking, and in the works that he now produced, particularly *Edifying Discourses in Divers Spirits* (1847), *Works of Love* (1847), *Christian Discourses* (1848), *The Sickness unto Death* (1849), and *Training in Christianity* (1850), he depicted a Christianity sterner and more uncompromising than in any of his other writings. The last book was also a disguised attack on the heads of the Danish Church, particularly Bishop Jacob Pier Mynster, as the highly cultivated, secularized prelate who knew how to combine the hedonism of Goethe with the sufferings of Christ.

Kierkegaard nevertheless retained a great respect for Mynster, who had been his father's spiritual adviser and friend, and therefore hesitated to publish a frontal attack. But when Mynster died in January 1854, and was succeeded by Hans Lassen Martensen (1808–84), a theologian, professor of philosophy, and court preacher whom Kierkegaard did not respect in any way and who was one of the most stubborn Hegelians in Denmark, Kierkegaard did not see any reason why he should not declare war openly on the established church and its clergy. Now he felt convinced that God had authorized him to attack ruthlessly, and he began at once with a great number of small books and pamphlets and even a periodical called *The Moment,* to the ten numbers of which he was the sole contributor.

The strain of this intensely conducted campaign made grave inroads on his health. After nearly two years of it he collapsed and was brought to a hospital, where he died a month later, on November 11, 1855. By that time he had exhausted his fortune. The tenth number of *The Moment,* which he had sent to the printer before he fell ill, had cost the remainder of his inheritance. The few things of value he possessed he left to Regine, the woman he had loved and who by that time lived in the Danish West Indies, married to the governor.

Influence on modern Existentialism. The virulent attack on the state church that was the culmination of Kierkegaard's *oeuvre* was a difficult heritage to administer. It did not change the establishment, but it did cause many individual clergymen to revise their attitude toward it and even to disaffiliate.

It was not until later that the philosophical and artistic value of Kierkegaard's work was fully appreciated. The merit for this belongs to the Danish literary critic Georg Brandes (1842–1927), who in 1877 published the first book ever written about Kierkegaard and gave a brilliant analysis of his thought and life. Brandes was a declared atheist and hater of Christianity, and it was part of his strategy to play Kierkegaard off against the church. It is, in fact, characteristic of Kierkegaard's thought that it appeals as much to people who do not subscribe to its Christian tenets as to persons specifically committed to religion. Thus, of the three editors of the first edition of Kierkegaard's works, one was a convinced Christian, the other two, atheists, and one of these was also a declared enemy of the Christian Church.

Fame in Germany

In Germany interest in Kierkegaard was widespread, and everything of his was translated before World War I. It was not, however, until the years between the two great wars that the knowledge of his work became widespread, partly advanced by Freudian psychoanalysis, which very largely deals with the same phenomena as he does; *e.g.,* "sickness unto death." The theology of the Swiss Protestant theologian Karl Barth also contributed to escalate Existentialist thinking, as did the philosophical thought of Karl Jaspers and Martin Heidegger and the Jewish religious thinker Martin Buber as well.

The crucial understanding of Kierkegaard's writing came in the post-World War II years, which seem to have created a more penetrating realization of such states as *Angst* and suffering. Now the interest in Kierkegaard became universal, reaching both America and Japan, as well as England and France. About a century after his lonely death, Kierkegaard's time had finally come.

MAJOR WORKS

Enten-Eller: Et Livs Fragment (1843; Eng. trans., *Either/Or: A Fragment of Life,* 2 vol., 1944); *Frygt og Baeven. Dialektisk Lyrik af Johannes de silentio* (1843; *Fear and Trembling,* 1939); *Gjentagelsen. Et Forsøg i den experimenterende Psychologi af Constantin Constantius* (1843; *Repetition,* 1942, 1944); *Opbyggelige Taler,* a series of texts published intermittently (1843–44; *Edifying Discourses,* 4 vol., 1943–46); *Philosophiske Smuler, eller en Smule Philosophi. Af Johannes Climacus* (1844; *Philosophical Fragments, or a Fragment of Philosophy,* 1936, rev. 1962); *Begrebet Angest. En simpel psychologisk-paapegende Overveielse i Retning af det dogmatiske Problem om Arvesynden, af Vigilius Hafniensis* (1844; *The Concept of Dread,* 1944); *Stadier paa Livets vei. Studier af forskjellige . . . udgivne af Hilarius Bogbinder* (1845; *Stages on Life's Way,* 1940); *Afsluttende uvidenskabelig Efterskrift til de Philosophiske Smuler: Mimisk-pathetisk-dialektisk Sammenskrift, existentielt Indlæg, af Johannes Climacus* (1846; *Concluding Unscientific Postscript,* 1941, 1968); *Kjerlighedens Gjerninger* (1847; *Works of Love,* 1946 and 1962); *Christelige Taler* (1848); *Sygdommen til Døden. En christelig psychologisk Udvikling til Opbyggelse og Opvækkelse, af Anti-Climacus* (1849; *The Sickness unto Death,* 1941); *Indøvelse i Christendom. Af Anti-Climacus* (1850; *Training in Christianity,* 1941); *Til Selvprovelse* (1851; *For Self-Examination,* 1941); *Dette skal siges: Saa vaere det da sagt* (1854); *Hvad Christus dømmer om officiel Christendom* (1855); *Øieblikket,* 10 pt. (1855; *Attack upon "Christendom,"* 1944 and 1956).

BIBLIOGRAPHY. JENS HIMMELSTRUP (ed.), *Søren Kierkegaard: International Bibliografi* (1962). All Kierkegaard manuscripts are held in the Royal Library in Copenhagen. The Kierkegaard-selskab (society), also in Copenhagen, publishes a yearbook.

CROXALL, *Kierkegaard Studies, with Special Reference to (a) the Bible, (b) Our Own Age* (1948 and 1956); LEV SHESTOV, *Kierkegaard and the Existential Philosophy* (1970; orig. pub. in Russian, 1939), the first work to underline the Existentialist point of view; HERMANN DIEM, *Die Existenzdialektik* (1950), an important contribution to Existentialist thought; EDUARD GEISMAR, *Lectures on the Religious Thought of Søren Kierkegaard,* 2nd ed. (1938), a clear account of Kierkegaard's thought by one of his leading students; THEODOR HAECKER, *Sören Kierkegaard* (1913; Eng. trans., 1937), a study of a leading German Kierkegaard ideologist; JOHANNES HOHLENBERG, *Søren Kierkegaard* (1949; Eng. trans., 1954), a sober, reliable account; WALTER LOWRIE, *Kierkegaard* (1938), a study by a man who translated most of Kierkegaard's works and whose books bear evidence of an intimate familiarity with the texts; PETER P. ROHDE, *Søren Kierkegaard, et geni i en købstad* (1962; Eng. trans., *Søren Kierkegaard: An Introduction to His Life and Philosophy,* 1963), for the common reader; CHRISTOPH SCHREMPF, *Søren Kierkegaard: Eine Biographie, 2* vol. (1927–28), a fine, scholarly work, now slightly outdated; ADI SHMUELI, *Kierkegaard and Consciousness* (1971), a penetrating account of Kierkegaard's thought from a new angle.

(P.P.R.)

Kiev

The capital of the Ukrainian Soviet Socialist Republic, a port on the Dnepr River, and a large railroad junction, Kiev is one of the largest and most important cities of the Soviet Union. It was the home of some 2,013,000 people in 1976, thus ranking as the third largest Soviet city and first among cities of the Ukraine. Kiev has an ancient and proud history. As the centre of Kievan Rus, the first Russian state, 1,000 years ago, it acquired the title "Mother of Russian Cities." It suffered severe damage during World War II, but by the mid-1950s it was fully restored and by the 1970s had become a thriving, modern capital, with a well-developed economic and cultural life.

The city stands on the Dnepr River just below its confluence with the Desna and 591 miles (952 kilometres) from its mouth in the Black Sea. The original location was on the high and steep right bank, which rises above the river in an imposing line of bluffs, culminating in Batyyeva Hill, 330 feet (100 metres) above mean river level. This precipitous and wooded bank, topped by the golden domes and spires of churches and bell towers and by modern high-rise apartment buildings, makes the city an attractive and impressive sight from across the Dnepr. Since World War II, Kiev has extended on to the wide, low, and flat floodplain on the left bank.

Climate

Kiev has a moderately continental climate. The average January temperature is 21.6" F (—5.8" C), and winter days with temperatures above freezing are not uncommon; in cold spells with a northerly or northeasterly airstream, temperatures may drop sharply, and an absolute minimum of —27.4" F (—33" C) has been recorded. Snow cover lies usually from mid-November to the end of March; on average, the frost-free period lasts 180 days but in some years surpasses 200 days. Summers are warm, with a July average of 67.1" F (19.5" C) and a recorded maximum of 102.2" F (39" C). The mean annual rainfall is 24.5 inches (622 millimetres), with maximum precipitation in June and July. (For information on related subjects, see RUSSIA AND THE SOVIET UNION, HISTORY OF: *Kiev;* and UKRAINIAN SOVIET SOCIALIST REPUBLIC.)

HISTORY

Origins and foundation. Kiev has a long, rich, and often stormy history. Its beginnings are lost in antiquity. Archaeological findings of stone and bone implements, the remains of primitive dwellings built of wood and skins, and large accumulations of mammoths' bones indicate that the first settlements in the vicinity date from the Late Paleolithic Period (some 15,000 to 40,000 years ago). As early as 3000 BC in the Neolithic Period and subsequently at the time of the Cucuteni-Tripolye culture at the end of the Neolithic, tribes engaged in agriculture and animal husbandry lived on the site of modern Kiev. Excavations continue to uncover many artifacts from settlements dating from the Copper, Bronze, and Iron ages. The tribes of the area traded with the nomadic peoples of the steppe to the south, Scythians, Sarmatians, and later Khazars, and also with the ancient Greek colonies that were located on the Black Sea coast.

According to the 12th-century chronicle *Povest vremennykh let* ("Tales of Bygone Years," also known as *The Russian Primary Chronicle),* Kiev was founded by three brothers, Kiy, Shchek, and Khoriv, leaders of the Polyane tribe of the East Slavs. Each established his own settlement on a hill, and these became the town of Kiev, named for the eldest brother, Kiy; a small stream nearby was named for their sister Lybed. Although the chronicle account is legendary, there are contemporary references to Kiev in the writings of Byzantine, German, and Arab historians and geographers. Archaeological evidence suggests that Kiev was founded in the 6th or 7th century AD.

The first Russian capital. Less legendary is the chronicle account of the Varangians, who seized Kiev in the mid-9th century. As in Novgorod to the north, a Russo-Varangian ruling elite developed. Kiev, with its good defensive site on the high river bluff and as the centre of a rich agricultural area and a group of early Russian towns, began to gain importance. In about 882 Oleg (Ukrainian Oleh), the ruler of Novgorod, captured Kiev and made it his capital, centre of the first Russian state, Kievan (or Kiev) Rus. The town flourished, chiefly through trade along the Dnepr, going south to Byzantium and north over portages to the rivers flowing to the Baltic, the so-called "road from the Varangians to the Greeks," or "water road." Trade also went to the Caspian Sea and Central Asia.

Christianization

In 988 the introduction of Orthodox Christianity to Kiev enhanced its significance as the spiritual centre of Rus. By the 12th century, according to the chronicles, the city's wealth and religious importance was attested to by its more than 400 churches. The Cathedral of St. Sophia, parts of the monastery known as the Pecherskaya Lavra, and the ruins of the Golden Gate remain today as witnesses to Kiev at the height of its splendour. The town was famed for its art, the mosaics and frescoes of its churches, its craftsmanship in silver, and the quality of many of its manufactures. One of Europe's major cities, Kiev established diplomatic relations with Byzantium, England, France, Sweden, and other countries. Travellers wrote of its population as numbering tens of thousands.

Throughout the period of Kievan Rus, however, the city was engaged in a succession of wars against the nomadic warrior peoples who inhabited the steppes to the south, in turn the Khazars, Pechenegs, and Polovtsy (Kipchaks). These conflicts weakened the city, but even greater harm was done by the endless, complex internecine struggles of the Russian princedoms into which Rus was divided. In 1169 Prince Andrew Bogolyubsky of Rostov-Suzdal captured and sacked Kiev. Thus by the late 12th century the power of the city had declined, and in the following century it was unable to resist the rising and formidable power of the Mongols. In 1238 a Mongol army under Batu, grandson of Genghis Khan, invaded Rus and, having sacked the towns of central Russia, in 1240 besieged and stormed Kiev. Much of the city was destroyed and most of its population killed. The Italian traveller Giovanni da Pian del Carpini six years later reported only 200 houses surviving in Kiev.

Kiev under Lithuania and Poland. In the 14th century, what was left of Kiev and its surrounding area came under the control of the powerful and expanding Grand Duchy of Lithuania, which captured it in 1362. For a long time thereafter Kiev had little function save as a fortress and minor market on the vaguely defined frontier be-

Kreshchatik, the central thoroughfare [illegible]f Ki[illegible], with apa[illegible] h[illegible] in the [illegible] and the Palace of Culture for O[illegible] ct in [illegible]entre background.

tween Lithuania and the steppe Tatars, based in the Crimea. It frequently came under attack from the Tatars; in 1482 the Crimean khan, Mengli Giray, took and sacked the town. Almost the only survival of Kiev's former greatness was its role as the seat of an Orthodox metropolitan. A step forward came in 1516, when the grand duke Sigismund I granted Kiev a charter of autonomy, thereby much stimulating trade.

In 1569 the Union of Lublin between Lithuania and Poland gave Kiev and the Ukrainian lands to Poland. Kiev became one of the centres of Orthodox opposition to the expansion of Polish Roman Catholic influence, spearheaded by vigorous proselytization by the Jesuits. In the 17th century a religious Ukrainian brotherhood was established in Kiev, as in other Ukrainian towns, to further this opposition and encourage Ukrainian nationalism. Peter Mogila (Ukrainian Mohyla), major theologian and metropolitan of Kiev from 1633 to 1646, founded in the town the Collegium (later the Academy of Kiev), which became a major focus of the struggle with Roman Catholicism.

The Cossack state

The 17th century also saw increasing unrest among the Zaporozhian Cossacks of the Dnepr downstream of Kiev and an ever-growing struggle between them and the Polish crown. This culminated in the revolt of Bohdan Khmelnytsky, who, assisted by the Crimean Tatars, entered Kiev with his insurgent Cossacks in 1648. Under heavy pressure from the Polish forces, in 1654 Khmelnytsky and the Cossacks offered their allegiance to Moscow (the Pereyaslav Agreement); this was followed by a prolonged and confused period of strife and destruction, leading in 1667 to the Treaty of Andrusovo, by which Kiev and the Dnepr left bank part of the Ukraine became an autonomous Cossack state under the suzerainty and protection of Moscow. Thereafter further struggle ensued against the Turks, with the Cossacks constantly changing sides and engaging in internecine disputes. In 1686 Kiev was finally yielded to Russia by Poland and stood as the sole Russian outpost on the right bank of the Dnepr.

Kiev under the tsars. The Second Partition of Poland in 1793, under Catherine the Great, brought the right bank Ukraine into Russia, and Kiev, assisted by the abolition in 1754 of the tariff barriers between Russia and the Ukrainian lands, began to grow in commercial importance. Catherine's reign saw the abolition of the old administrative system and of the post of Cossack hetman and the division of the Ukraine into new administrative provinces, for one of which Kiev became the centre. Subsequently it became centre of a governor generalship, covering three provinces.

In the first half of the 19th century, Kiev developed as a major focus of Ukrainian nationalism, although severe persecution from the tsarist government forced the movement to shift the brunt of its activities to Lvov in the Austrian Ukraine. In Kiev as in other Russian cities there was clandestine revolutionary activity (beginning with the Dekabrists in the early 19th century) that culminated in a series of strikes and demonstrations leading up to the revolution of 1905. An important role in this revolutionary movement was taken by students of the University of Kiev (now Kiev T.G. Shevchenko State University), which had been established in 1834.

In the 19th century the expanding economic importance of the Ukraine, and especially the growing export of grain, brought further commercial development to Kiev. Modern factory industry appeared; to the Arsenal, set up as early as the 18th century, were added timber working and the building of river craft. The town had significant industries processing agricultural products of the Ukraine —leather, tobacco, distilling, brewing, and textiles. In the late 1860s Kiev was connected by rail to both Moscow and the Black Sea port of Odessa, further enhancing its role as a centre of industry, commerce, and administration. By the outbreak of World War I, the city had a population of some 350,000.

Kiev in the revolutionary period. With the outbreak of the Revolution in 1917, a revolutionary soviet, the Central Rada (rada, "council"), was elected by the city workers, consisting primarily of Menshevik and Social Revolutionary members, with strong support from Ukrainian nationalist groups. In January 1918, the Rada proclaimed an independent Ukrainian state with Kiev as its capital. Minor uprisings by Bolshevik workers, who were mostly concentrated in the Arsenal works, were suppressed, but Red Army troops came to their aid and on February 8, 1918, entered Kiev.

By the Treaty of Brest-Litovsk (March 3) between the Bolshevik government and the Germans, however, the new Soviet government recognized the independence of the Ukraine, which was promptly occupied by German troops. A puppet Ukrainian government was set up in

Kiev by the Germans, but it collapsed with the German surrender to the Allies in November 1918 and the subsequent withdrawal of German troops. Once more an independent Ukraine was declared in Kiev, under the leadership of Semen Petlyura, but its brief and stormy history was a series of struggles between Ukrainian nationalist, White, and Red forces. In November 1919 Kiev was briefly taken by the White armies under Gen. A.I. Denikin before being finally occupied by the Red Army. Peace was still denied the city, with the outbreak of the Russo-Polish War. In May 1920 the Poles captured Kiev but were driven out in a counterattack.

Petlyura government

Kiev in the Soviet period. Kiev's role as the centre for Ukrainian nationalists caused the Soviet government to transfer the capital of the new Ukrainian Soviet Socialist Republic to Kharkov, and it was not until 1934 that Kiev once more resumed its capital status. Meanwhile the restoration of the city's shattered economy was undertaken. During the first Five-Year Plans, between 1928 and 1940, new machine tool, electrical, and chemical industries were established. By 1939 the population of Kiev had reached 846,724. The German invasion in 1941 once again brought severe suffering and destruction to the city. After a fierce 80-day battle for the town, German forces entered it on September 21, 1941. Many of the inhabitants were deported for forced labour and to concentration camps, including almost all the large prewar Jewish segment of the population. In 1943 the advancing Soviet troops forced the Dnepr and, after bitter fighting, liberated Kiev on November 6. The city itself had suffered great destruction, including more than 40 percent of its buildings and some 800 of its industrial enterprises.

For its role in the war Kiev was later honoured by the Soviet government with the Order of Lenin, the title of Hero-City, and the Gold Star medal. In the first postwar Five-Year Plan, rapid reconstruction was undertaken. Since then Kiev has continued to grow and to strengthen its industrial base. Its population passed the million mark in the later 1950s, reaching 1,109,840 in the census of 1959 (within the present city limits) and 1,631,908 in the census of 1970.

THE CONTEMPORARY CITY

The layout of the city. The city limits enclose an area of 300 square miles (707 square kilometres) on both banks of the Dnepr. It is divided into 10 administrative wards: Darnitsky, Dneprovsky, Leninsky, Moskovsky, Pechersky, Podolsky, Radyansky, Shevchenkovsky, Zaliznichny, and Zhovtnevy.

The Upper Town

The focus of Kiev is the area of the ancient Upper Town, crowning the high bluff of the Dnepr. Although very largely of postwar construction, this central area retains its old street pattern, and here are most of the surviving historical and architectural monuments. First among these is the Cathedral of St. Sophia, now a museum. Founded in the 11th century, it remains, despite certain Baroque modifications in the 18th century, one of the finest and most beautiful examples of early Russo-Byzantine ecclesiastical architecture. It has a nave and four aisles, and it is crowned by five domes. The interior is magnificently decorated with frescoes and mosaics; it contains the tomb of Yaroslav, during whose reign the cathedral was built.

Close by is the Baroque Church of St. Andrew (Andreyevskaya), designed by Bartolomeo Rastrelli and built in the mid-18th century; its site on the crest of the steep slope to the river makes it a striking landmark. Other relics of the past in the central area include the ruins of the Golden Gate, also built in the 11th century in the reign of Yaroslav; the Zaborovsky Gate, built in 1746–48; and the five-domed Desyatinnaya church, built in 1828–42 on the site of a church founded by St. Vladimir in the 10th century.

Within and immediately adjacent to the area of the former Old Town are many of the city's museums, theatres, and public buildings as well as the principal shops, including the central department store and the covered market. The axis of the centre is the street known as Kreshchatik, which runs along the bottom of a small valley the sides of which have in part been landscaped with terrace gardens interspersed with tall, modern office and apartment buildings. The greenery of the gardens, the trees lining the street, the squares which it intersects—all combine with the variegated colours of brick, red and gray granites, and decorative ceramic tiles to give Kreshchatik an attractive and colourful aspect, much admired by Kiev's inhabitants. Among important buildings on the street is that of the City Council, where the 800 elected deputies hold their meetings.

Intersecting Kreshchatik at right angles is the wide, poplar-lined Boulevard of Taras Shevchenko, on which stands the university with its eye-catching red-washed walls. Here too is the Cathedral of St. Vladimir (still in use as a church), built in 1850–96 in Byzantine style and containing impressive paintings by Viktor Vasnetsov and other Russian artists. Notable among the many statues in central Kiev are those that commemorate the Cossack leader Bohdan Khmelnytsky and the Ukrainian poet Taras Shevchenko.

North of the old centre is the former trading and Jewish quarter, Podol, with a rectangular pattern of streets and the old merchants' trading exchange, the House of Contracts, built in 1817. Here too is the river port. South of the centre is the Pechersky district, along the top of the river bank. This district contains many of the principal buildings of the Ukrainian republican government, including the glass-domed palace of the Supreme Soviet of the Ukrainian S.S.R., built in 1936–39, and the 10-story block that houses the Council of Ministers. Nearby is the attractive Mariinsky Palace, built in 1752–55 for the tsaritsa Elizabeth and reconstructed in 1870; it is now used for receptions by the Ukrainian government.

Pechersky district

At the southern end of this district is the Pecherskaya Lavra (Monastery of the Caves), one of the most famous and important monasteries in Russian history, founded in the early 11th century. It was at the *lavra* that the monk Nestor wrote the earliest surviving Russian chronicle. Although the Cathedral of the Assumption (inside the walls of the monastery) was blown up by the Germans in 1941, Trinity Church, of the same period, survives. Also within the walls are the 17th-century Church of All Saints and an impressive 18th-century bell tower, rising up 315 feet. A major feature of the monastery is the system of catacombs beneath it in which are the mummified bodies of early monks and saints, including that of Nestor. Although a museum, open to the public, the Pecherskaya Lavra is still in use as a monastery.

South from the *lavra* is yet another monastery, the Vydubetsky, dating from the 11th century; it too suffered severe damage in World War II.

All along the steep river bank, fronting the Upper Town and Pechersky district, an attractively landscaped park has been laid out overlooking the Dnepr. With the views it affords, the park forms one of the most striking features of the city. It contains an open-air theatre, sports stadium, and restaurant, and a funicular railway climbs the 300-foot slope. Within the park are also many memorials; dominating the northern end is the statue of Prince Vladimir, bringer of Christianity to Russia, which marks the place where in 988 the people of Kiev were baptized en masse. The southern end, called the Park of Glory, has an 85-foot granite obelisk rising above the grave of the Unknown Soldier and a memorial garden. Also located in the park are the grave of Gen. Nikolay Vatutin, commander of the Soviet forces that liberated Kiev in 1943, and a rotunda marking the supposed grave of the early Varangian chief Askold.

Around these central districts of Kiev stretch extensive suburbs of factories and residential neighbourhoods. The low priority given to housing during the Stalin period means that the greater part of these suburbs has been built since 1956. The neighbourhood units, known as micro-regions, consist of groupings of apartment buildings housing 2,500 to 5,000 people, together with basic services, local shops, a health centre, cinema, and primary school. Since the late 1960s the apartment buildings have usually been of 12 to 20 stories and of prefabricated construction. Most apartments have only two or

Suburbs

three rooms, and population densities are therefore high, in the new residential developments as much as in the older central areas. The growing ownership of private cars was beginning by the late 1970s to pose problems in the provision of garage space in these new districts. A feature of development since World War II has been the rapid spread of the city on the low left bank of the Dnepr, previously almost devoid of settlement. The left bank is linked to the main part of Kiev by a railway bridge and by the imposing Ye.O. Paton road bridge, which is 4,920 feet (1,500 metres) long and named after its designer.

Between the neighbourhood units are substantial areas of park and green space. These include the very large botanical gardens of the Ukrainian Academy of Sciences, the smaller university botanical gardens (established in the mid-19th century), and in the southwestern suburbs the extensive permanent exhibition of the Ukrainian economy. On the city outskirts are several areas of forest, which are much used for recreation. In the south is the Goloseyevsky Forest Park, dominated by deciduous trees, and to the north are nearly 10,000 acres (4,000 hectares) of the Pushche-Voditsa Forest Park, mainly covered by coniferous species.

Soviet cities on the whole tend to a certain monotony of appearance. A number of factors combine to make Kiev an exception to this rule and one of the most attractive urban places in the Soviet Union—the site, with its sharply contrasted relief and wide views across the Dnepr, the abundance of greenery in and around the city, and the many buildings of historic interest and beauty.

Economic life. Kiev, as capital of the Ukraine, has major administrative functions, with considerable employment in the offices of ministries responsible for the republic's economy. The city is also an important industrial centre, possessing a wide range of manufactures. In the early 1970s some 350,000 persons were engaged in industry, about two-fifths of the total number employed. Factories are found in all quarters of the city, with major concentrations to the west of the city centre and on the Dnepr left bank.

Engineering industries, based on metal from the iron and steel plants of the Dnepr bend region and the Donbass coalfield, take pride of place and include the production of complex machinery and precision tools and instruments. The Bolshevik plant makes equipment for chemical works, such as conveyor lines for vulcanized rubber, linoleum, and fertilizer factories; the Gorky works produce metal-cutting machines. Other engineering products are aircraft, hydraulic elevators, electrical instruments, armatures, river- and seagoing craft, motorcycles, and cinematograph apparatus.

Chemical industry

Another important sector is the chemical industry, making resin products, fertilizers, plastics and chemical fibres, the last at the Darnitsa viscose rayon plant on the left bank. Timber working and the making of bricks and reinforced concrete items are also well developed. Consumer goods manufactured include cameras, thermos flasks, knitwear, footwear, a range of foodstuffs, and, in a plant built in the 1970s, watches. Kiev is a large publishing centre, with 14 printing houses.

Power for the many enterprises is supplied by natural gas, piped from Dashava in the western Ukraine, and by electricity from the Kiev hydroelectric station on the Dnepr. This station, completed in 1968, is at Vyshgorod, just upstream of the city; its 20 turbines have a total capacity of 370,000 kilowatts. The reservoir created by the station's dam is 60 miles (97 kilometres) long. Twenty-five miles southeast of Kiev is the still more powerful Tripolye thermal electric station, with a capacity of 1,800,000 kilowatts.

Transportation for the industries and for the city as a whole is provided by a good communications network. Trunk railways and all-weather roads link Kiev to Moscow, to Kharkov and the Donets Basin (Donbass), to the southern Ukraine and the port of Odessa, and to the western Ukraine and Poland. The navigability of the Dnepr has been improved by a series of barrages and reservoirs. Borispol airport operates direct flights to most major Soviet cities and to many Ukrainian towns, as well as some international connections to Romania and Bulgaria. Within Kiev itself there is efficient bus, streetcar, and trolleybus service, moving more than 2,000,000 persons daily. Construction of an underground railway began in 1960. Transportation accounts for a tenth of the total number of persons employed in Kiev.

Social and cultural life. Kiev's ancient tradition as a cultural centre is still vigorously alive. The Kiev State University, with some 20,000 students, heads an array of 20 institutions of higher education, notable among which are the Polytechnic (founded in 1898), the Agricultural Academy, and the medical, art, and architectural institutes.

There are about 300 general secondary schools, 80 evening schools for adults, and a number of specialist technical schools. A range of research establishments is headed by the Academy of Sciences of the Ukrainian S.S.R., established in 1919, which also maintains the largest of the city's many libraries. Kiev is particularly noted in the Soviet Union for medical and cybernetic research. The emphasis on applied research is illustrated by the academy's Ye.O. Paton Institute of Electrical Welding.

There are a number of theatres, notably the Shevchenko Theatre of Opera and Ballet. Plays are presented at the Lesya Ukrainka and Ivan Franko theatres, which specialize in Russian and Ukrainian drama, respectively; drama is also frequently staged in the 4,000-seat auditorium of the Palace of Culture and in the Palace of Sport, which can seat 12,000 people. In addition there are youth, open-air, and musical comedy theatres. Kiev has a circus and more than 130 cinemas; films are made in a studio in the city. Concerts are regularly given at the Tchaikovsky Conservatory. The most important of the city's many museums are the Kiev State Historical Museum, the Kiev State Museum of Russian Art, and the Kiev State Museum of Ukrainian Art.

Sports

Kiev has good facilities for sports; the largest of its 15 stadiums, the Central Stadium, can accommodate 100,000 people. Aquatic sports take place on the reservoir of the Kiev dam at Vyshgorod and also on Trukhanov Island in the Dnepr opposite the city centre, where there is a fine beach and water sports centre. The city is well provided with health facilities, including general and specialized hospitals and local polyclinics, the latter serving residential neighbourhoods. Since the majority of women are employed, a number of nursery schools and crèches care for children below school age. Around the outskirts of Kiev are a number of health resorts, sanatoriums, and children's holiday camps. (R.A.F.)

King, Martin Luther, Jr.

The Rev. Martin Luther King, Jr., was an eloquent black Baptist minister who, from the middle 1950s until his assassination in April 1968, led the first mass civil rights movement in United States history. He achieved worldwide recognition when he was awarded the Nobel Prize for Peace in 1964 for his application of the principle of nonviolent resistance—patterned after India's Mahatma Gandhi—in the struggle for racial equality in America.

Early years. Born in Atlanta, Georgia, on January 15, 1929, King came from a family steeped in the tradition of the Southern Negro ministry: both his father and maternal grandfather were Baptist preachers. At the age of 15 he entered Morehouse College, Atlanta, under a special program for gifted students, receiving his B.A. in 1948. As an undergraduate his earlier interests in medicine and law were eclipsed by a decision in his senior year to enter the ministry, as his father had urged. Spending the next three years at Crozer Theological Seminary in Chester,

Martin Luther King, Jr.
Julian Wasser—Pix

Pennsylvania (bachelor of divinity, 1951), King first became acquainted with Gandhi's philosophy of nonviolence as well as with the thought of contemporary Protestant theologians. He found himself increasingly dissatisfied with the Social Gospel of Walter Rauschenbusch and yet unable to accept the pessimism of Reinhold Niebuhr's Neo-orthodoxy, which was an attempt to return to the basic theological principles of the 16th century. He was elected president of the student body and graduated with the highest academic average in his class. From Crozer he went to Boston University (Ph.D., 1955), where, in seeking a firm foundation for his own theological and ethical inclinations, he began to focus his attention on conceptions of the relationship of man to God. In his doctoral dissertation, "A Comparison of the Conceptions of God in the Thinking of Paul Tillich and Henry Nelson Wieman," his conclusions were fairly Niebuhrian. King himself conceived of God as an active, personal entity; man's salvation was to be found neither in the quest for social progress (Rauschenbusch) nor in the unaided power of reason (Wieman); faith in God's guidance was the essential thing.

Religious ideas

The Montgomery bus boycott

While in Boston, King met Coretta Scott, a native Alabamian who was studying at the New England Conservatory of Music. They were married in 1953 and had four children. King had been pastor of the Dexter Avenue Baptist Church in Montgomery, Alabama, slightly more than a year when the city's small group of civil rights advocates decided to contest racial segregation on the public buses. On December 1, 1955, Mrs. Rosa Parks had refused to surrender her bus seat to a white passenger and had been arrested for violating the city's segregation law. Black activists formed the Montgomery Improvement Association to boycott the transit system and chose King as their leader. He had the advantage of being a young, well-trained man who was too new in town to have made enemies; he was generally respected, and his family connections and professional standing would enable him to find another pastorate should the boycott fail.

In his first speech to the group as its president, King declared:

> We have no alternative but to protest. For many years we have shown an amazing patience. We have sometimes given our white brothers the feeling that we liked the way we were being treated. But we come here tonight to be saved from that patience that makes us patient with anything less than freedom and justice.

These words introduced to the nation a fresh voice, a skillful rhetoric, an inspiring personality, and in time a dynamic new doctrine of civil struggle. Although King's home was dynamited and his family's safety threatened, he refused to yield his faith in ultimate victory; one year and a few weeks later, the blacks of Montgomery achieved their goal of desegregation of the city's buses.

Rise **to national prominence.** Recognizing the need for a mass movement to capitalize on the successful Montgomery action, King set about organizing the Southern Christian Leadership Conference (SCLC), which gave him a base of operation throughout the South, as well as a national platform from which to speak. King lectured in all parts of the country, discussed problems of blacks with civil rights and religious leaders at home and abroad, visited Ghana and India, and conferred with heads of state. In February 1959 he and his party were warmly received by India's Prime Minister Jawaharlal Nehru; as the result of a brief discussion with followers of Gandhi about the Gandhian concepts of *Satyāgraha* ("soul-force"), King became more convinced than ever that nonviolent resistance was the most potent weapon available to oppressed people in their struggle for freedom.

The Southern Christian Leadership Conference

In 1960 he moved to his native city of Atlanta, where he became copastor with his father of the Ebenezer Baptist Church. At this post he devoted most of his time to the SCLC and the civil rights movement, declaring that the "psychological moment has come when a concentrated drive against injustice can bring great, tangible gains." His thesis was soon tested as he agreed to support the sit-in demonstrations undertaken by local college students. In late October he was arrested with 33 young people protesting segregation at the lunch counter in an Atlanta department store. Charges were dropped, but King was sentenced to Reidsville State Prison Farm on the pretext that he had violated his probation on a minor traffic offense committed several months earlier. The case assumed national proportions, with widespread concern over his safety, outrage at Georgia's flouting of legal forms, and failure of Pres. Dwight Eisenhower to intervene. He was released only upon the intercession of Democratic presidential candidate John F. Kennedy—an action so widely publicized in the black community throughout the nation that it was felt to have contributed substantially to Kennedy's slender election victory eight days later.

In the years from 1960 to 1965 King's influence reached its zenith. The tactics of active nonviolence (sit-ins, protest marches) aroused the devoted allegiance of many blacks and liberal whites in all parts of the country, as well as support from the administrations of Presidents Kennedy and Lyndon B. Johnson. There were also notable failures, as at Albany, Georgia (1961–62), when King and his colleagues failed to achieve their desegregation goals for public parks and other facilities.

In Birmingham, Alabama, in the spring of 1963, King's campaign to end segregation at lunch counters and in hiring practices drew nationwide attention when police turned dogs and firehoses on the demonstrators. King was jailed along with large numbers of his supporters, including hundreds of schoolchildren. His supporters did not, however, include all the black clergy of Birmingham, and he was strongly opposed by some of the white clergy who had issued a statement urging the blacks not to support the demonstrations. From the Birmingham jail King wrote a letter of great eloquence in which he spelled out his philosophy of nonviolence:

The letter from Birmingham jail

> You may well ask: "Why direct action? Why sit-ins, marches and so forth? Isn't negotiation a better path?" You are quite right in calling for negotiation. Indeed, this is the very purpose of direct action. Nonviolent direct action seeks to create such a crisis and foster such a tension that a community which has constantly refused to negotiate is forced to confront the issue. It seeks so to dramatize the issue that it can no longer be ignored. . . . We know through painful experience that freedom is never voluntarily given by the oppressor; it must be demanded by the oppressed.

Near the end of the Birmingham campaign, in an effort to draw together the multiple forces for peaceful change and to dramatize to the nation and to the world the importance of solving the U.S. racial problem, King joined other civil rights leaders in organizing the historic March on Washington. On August 28, 1963, an interracial assembly of more than 200,000 gathered peaceably in the shadow of the Lincoln Memorial to demand equal justice for all citizens under the law. Here the crowds were uplifted by the emotional strength and prophetic quality of King's famous "I have a dream" speech, based on biblical phraseology. In emphasizing his faith that all men, someday, would be brothers, the vision of the philosopher, the faith of the Christian, and the rhetoric of the Southern Baptist preacher all conjoined powerfully to inspire his followers throughout the world.

The rising tide of civil rights agitation produced, as King had hoped, a strong effect on national opinion and resulted in the passage of the Civil Rights Act of 1964, authorizing the federal government to enforce desegregation of public accommodations and outlawing discrimination in publicly owned facilities, as well as in employment. That eventful year was climaxed by the award to King of the Nobel Prize for Peace at Oslo in December. He interpreted his role and his times thus:

> I accept the Nobel Prize for Peace at a moment when twenty-two million Negroes of the United States of America are engaged in a creative battle to end the long night of racial injustice.... Yet when the years have rolled past...men and women will know and children will be taught that we have a finer land, a better people, a more noble civilization—because these humble children of God were willing to suffer for righteousness' sake.

Challenges of the final years. The first signs of opposition to King's tactics from within the civil rights movement surfaced during the March 1965 demonstrations at Selma, Alabama, which were aimed at dramatizing the need for a federal voting rights law. King organized an initial march from Selma to the state capitol building in Montgomery but did not lead it himself; the marchers were turned back by state troopers with nightsticks and tear gas. He determined to lead a second march, despite an injunction by a federal court and efforts from Washington to persuade him to cancel it. Heading a procession of 1,500 marchers, black and white, he set out across Pettus Bridge outside Selma until the group came to a barricade of state troopers. But instead of forcing a confrontation, he led his followers in kneeling in prayer and then unexpectedly turned back. This decision cost King the support of many young radicals who were already faulting him for being too cautious and mocking him with the title "de Lawd." The suspicion of an "arrangement" with federal and local authorities—vigorously but not entirely convincingly denied—clung to the Selma affair. The country was nevertheless aroused, resulting in the passage of the Voting Rights Act of 1965.

King and "black power"

Throughout the nation, impatience with the lack of greater substantive progress encouraged the growth of black militancy. Especially in the slums of the large Northern cities, King's religious philosophy of nonviolence was increasingly questioned. The rioting in the Watts district of Los Angeles (August 1965) demonstrated the depth of the urban race problem. In an effort to meet the challenge of the ghetto, King and his forces initiated a drive against racial discrimination in Chicago at the beginning of 1966. The chief target was segregation in housing. After a spring and summer of rallies, marches, and demonstrations, a Summit Agreement was signed between the city and a coalition of blacks, liberals, and labour organizations, calling for various measures to strengthen the enforcement of existing laws and regulations with respect to housing. But this agreement had little effect; the impression remained that King's Chicago campaign was nullified partly because of the opposition of the powerful mayor, Richard J. Daley, and partly because of the unexpected complexities of Northern racism. His presence in Chicago, however, left a long-term legacy of hope among black people, for he inspired the creation of institutions (such as a West Side tenants' movement and Operation Breadbasket, the economic arm of the SCLC) through which social ills could continue to be attacked even after he was gone.

In Illinois and Mississippi alike, King was being challenged and even publicly derided by young black power enthusiasts. But he found compassion for his dissatisfied brethren when he considered the great disillusionment attendant upon his "radiant promises of progress," as compared with his inability to deliver on those promises. In the face of mounting criticism, King responded by broadening his approach to include concerns other than racism that were equally detrimental to his people's progress. On April 4, 1967, at Riverside Church and again on the 15th at a mammoth peace rally in New York City, he committed himself irrevocably to opposition of the war in Vietnam. Once before, in early January 1966, he had condemned the war, but official outrage from Washington and strenuous opposition within the black community itself had caused him to relent. He then sought to widen his base by forming a coalition of the poor of all races that would address itself to such problems as poverty and unemployment. It was a species of populism, seeking to enroll janitors, hospital workers, seasonal labourers, and the destitute of Appalachia, along with student militants and pacifist intellectuals. "For years I laboured with the idea of reforming the existing institutions of society," he confessed, "a little change here, a little change there. Now I feel quite differently. I think you've got to have a reconstruction of the entire society, a revolution of values." His endeavours along these lines, however, did not engender much support in any segment of the population.

His plans for a Poor People's March to Washington were interrupted in the spring of 1968 by a trip to Memphis, Tennessee, in support of a strike by city sanitation workers. On April 4 he was killed by a sniper's bullet while standing on the balcony of the motel where he and his associates were staying. On March 10, 1969, the white assassin, James Earl Ray, pleaded guilty to the murder and was sentenced to 99 years in prison.

Assessment. The contribution of Martin Luther King to the black freedom movement was that of a leader who was able to turn protests into a crusade, to translate local conflicts into moral issues of nationwide concern. Successful in awakening the black masses and galvanizing them into action, he won his greatest victories by appealing to the consciences of white Americans and thus bringing political leverage to bear on Washington. The strategy that broke the segregation laws of the South, however, was not adequate to solve more complex racial problems elsewhere. King was only 39 when he died—a leader in midpassage who regarded himself as a "drum major" for justice, peace, and righteousness. Although he never wavered in his insistence that nonviolence must remain the essential tactic of the movement or in his faith that all Americans would some day attain racial and economic justice, he did not take for granted the immediate future either of his own leadership or of the causes for which he fought. "Well, I don't know what will happen now," he said characteristically—and prophetically—in his last address in Memphis, "but it really doesn't matter with me now. Because I've been to the mountaintop. ... I may not get to the promised land with you, but I want you to know tonight that we as a people will."

BIBLIOGRAPHY. King wrote a number of books. The most important for an understanding of his career are: ***Strrde Toward Freedom: The Montgomery Story*** (1958); ***Why We Can't Wait*** (1964); and ***Where Do We Go from Here: Chaos or Community?*** (1967). Useful books about King are: LAWRENCE **REDDICK**, ***Crusader Without Violence*** **(1959)**, for his early years; KENNETH L. SMITH and IRA G. ZEPP, JR., ***Search*** for ***the Beloved Community: The Thinking of Martin Luther King, Jr.*** **(1974)**, for his years at Crozer Theological Seminary and at Boston University; DAVID L. LEWIS, ***King: A Biography,*** 2nd ed. **(1978)**, a complete study; C. ERIC LINCOLN (ed.), ***Martin Luther King, Jr.*** **(1970)**, a work that contains varied views of the personality and politics of Dr. King; and WILLIAM ROBERT MILLER, ***Martin Luther King, Jr.: His Life, Martyrdom, and Meaning for the World*** **(1968)**, a sympathetic and competent treatment.

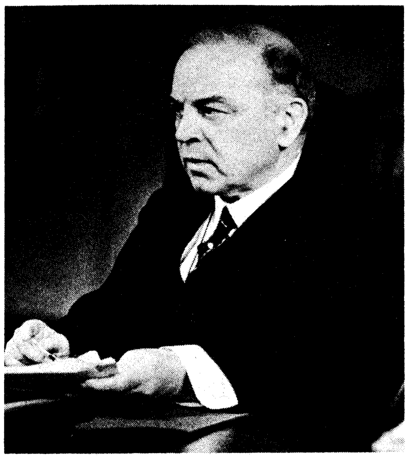
Additional works by and about Dr. King may be found in WILLIAM H. FISHER, ***Free at Last: A Bibliography of Martin Luther King, Jr.*** (1977).

(D.L.Le.)

King, W.L. Mackenzie

One of the leading Canadian statesmen of the first half of the 20th century, William Lyon Mackenzie King held the office of prime minister three times during a record-breaking 21 years. He made the Liberal Party, which he led for 30 years, a truly national party that did much to preserve the unity of the English and the French populations. He championed the independence of Canada in international affairs and led his countrymen through World War II and the difficult postwar adjustment.

Mackenzie King, as he is usually called, was born in Berlin (now Kitchener), Ontario, on Dec. 17, 1874, the son of John King and Isabel Grace Mackenzie, daughter of William Lyon Mackenzie, a leader of the Rebellion of 1837, aimed at establishing self-government in Upper



Mackenzie King.
National Film Board of Canada

Canada. Isabel, born while Mackenzie was in exile after the Rebellion, taught her son from childhood that it was his destiny to vindicate his grandfather. King had an outstanding academic career at Toronto, Chicago, and Harvard universities, broadened by travel in England and Germany. In Chicago (where he stayed at Jane Addams' Hull House) and in London, he engaged in social settlement work that profoundly influenced his later life. He was among the first Canadian politicians to show an active interest in the workers in industry.

In 1900 King declined an academic post at Harvard to take a civil service post as deputy minister of labour in the newly formed government department at Ottawa. In his new position he edited the *Labour Gazette* and showed a remarkable capacity for conciliating industrial disputes. His work brought him favourably to the attention of the Liberal prime minister Sir Wilfrid Laurier. Although King was by nature impetuous, his Presbyterian upbringing and diffident manner gave him an appearance of modesty and a veneer of prudence that became almost second nature. At decisive moments, however, he would overcome his caution and take great risks to further the destiny in which he increasingly believed. Such a risk was his resignation in 1908 from the civil service to stand as the Liberal candidate for Parliament for his native county, North Waterloo, a Conservative stronghold. Elected in 1908, he joined the Laurier government in 1909 as the first full time minister of labour in Canada. King lost his seat when the government was defeated in 1911. For the next three years he occupied himself with party publicity and organization while seeking vainly an opportunity to return to Parliament. In 1914, in need of money, he accepted a post with the Rockefeller Foundation to investigate industrial relations in the United States, resulting in 1918 in the publication of *Industry and Humanity.* When he accepted the Rockefeller post, King had insisted on residing in Canada, and, in the 1917 election, he unsuccessfully contested North York as a Laurier Liberal. After Laurier's death in 1919, King became leader of the Liberal Party. His loyalty to Laurier in 1917 was probably the decisive factor in the leadership contest, though his advocacy of social reform without socialism appealed to many of the younger party members. Leadership of the Liberal Party in 1919 was no assurance of political success. During World War I the party had split over conscription mainly along English–French lines, and several leading Liberals had joined the Conservatives in a Union Government. Moreover, the western base of the party had been sapped by the rise of an agrarian party, the Progressives.

Liberal leader

After the defeat of the Union Government in the election of 1921, King became prime minister on December 29, although his party was just short of a majority in Parliament. The future of King and his party was far from secure. In the election of 1925, he made an appeal for a majority but emerged with fewer seats in Parliament than the Conservatives. Despite this apparent Liberal defeat, the Conservatives also lacked a majority. Instead of resigning, King met with Parliament, where, with the support of Progressive and Independent members, his government won a vote of confidence. The government carried on in 1926 for six months, but, with the emergence of a scandal in the customs department, support in Parliament declined. King decided to end the uncertainty and advised the governor general to dissolve Parliament. When his advice was not taken, he resigned. The Conservative leader, Arthur Meighen, formed a government that was defeated in Parliament two days later. Meighen was given the dissolution that King had been refused. The 1926 election was fought on the constitutional issue. Because of alliances between Liberals and Progressives in many constituencies, King found himself for the first time with a decisive majority in Parliament. He became prime minister again on September 25. Late in 1926, at the Imperial Conference in London, King's was probably the determining voice in securing the declaration of equality of status of the self-governing nations of the empire, thereafter styled the Commonwealth (see **BRITISH EMPIRE** AND COMMONWEALTH).

King's government lost the election of 1930, and he led the opposition through the worst years of the Great Depression and won an overwhelming victory in the election of 1935. From then until his retirement in 1948, King was prime minister and the dominant personality in Canadian public life. It was his leadership of the country through six years of war and three years of postwar reconstruction that gave King a commanding place in Canadian history. During those years, he led a country, long divided over external policy, unitedly into war in 1939; surmounted two political crises over conscription, one nearly fatal to his government; and won the postwar election. The government he led organized a tremendous military, industrial, and financial contribution to the war and at the same time prepared for a smooth and rapid advance in economic development and social welfare afterward. When King retired, his successor, Louis St. Laurent, took over a strong government, a united and effective political party, and a rapidly growing and self-confident country.

Wartime leadership

This remarkable record was achieved by a lonely bachelor, lacking in popular appeal, political eloquence, or the trappings of strong leadership. His success was a compound of acute intuitions of the public mood and a superb capacity for the management of men. He died on July 22,1950, a year and a half after leaving office.

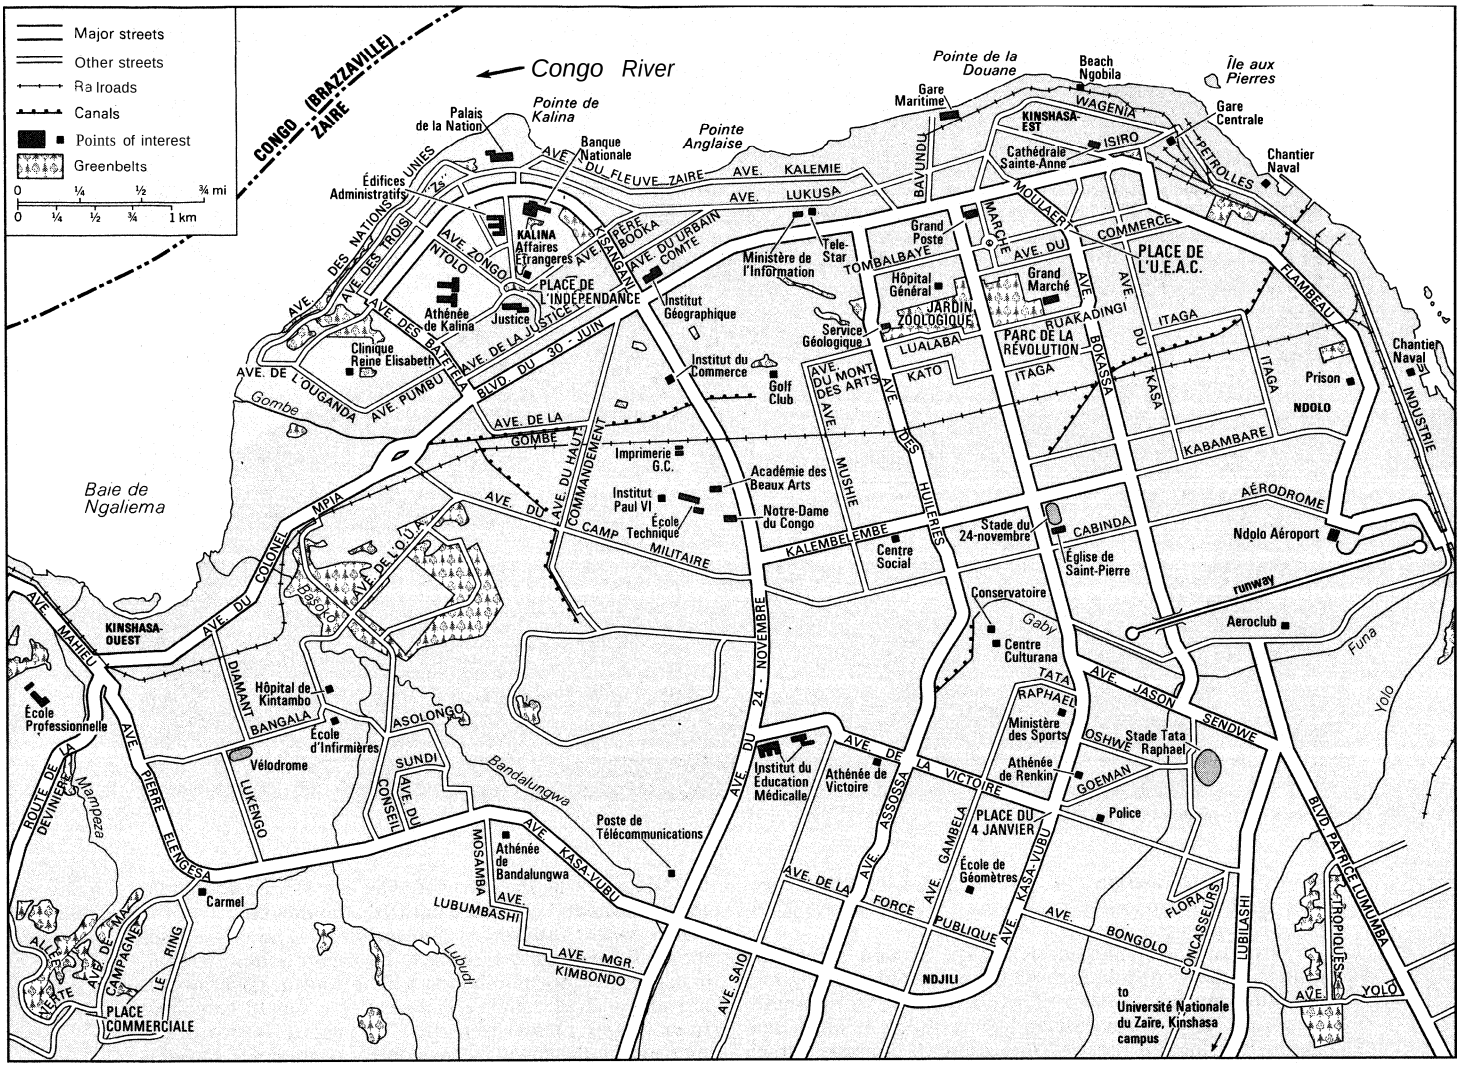
Kinshasa

Kinshasa, the capital of the Republic of Zaire, lies about 320 miles from the Atlantic Ocean on the south bank of the Congo River. It is the *ville neutre* (equivalent to a federal district) of Kinshasa, administered outside the rest of the republic, the outlying regions of which have more in common with their neighbours than with their capital. It is the largest city of sub-Saharan Africa, and it is the administrative, industrial, and commercial hub of the second largest black-African state.

Because of its strategic position and relatively longstanding contacts with Europe, it has far outstripped Zaire's hinterland. As in many other of the republic's main towns, the erstwhile European district is spacious and well planned, with many amenities common to all modem cities, such as electrical and sanitary facilities, a public water system, running water, ice plants, a good food supply, hotels, cafés, cinemas, and social and sports clubs. Well-built houses, cinemas, and restaurants (all the result of sound building projects) also characterize the former African district, which, unlike the satellite towns



The city of Kinshasa,

and some newer parts of Kinshasa, has not been developed by uncontrolled private enterprise.

Few Europeans are to be found in a population that has rapidly expanded from approximately 400,000 at independence in 1960 to almost 1,300,000 in 1970. The city, originally named Léopoldville for the Belgian king Leopold II and, since 1966, Kinshasa, covers an area of approximately 760 square miles (1,968 square kilometres).

History. Like all the shores of Malebo Pool (formerly known as Stanley Pool)—a shallow lake 22 miles long and 14 miles wide formed by a widening of the Congo River (*q.v.*)—the area on which the city stands was inhabited in very ancient times. It was later occupied by the members of the Humbu group who crossed the Congo River to found and colonize the villages of Kinshasa and Kintambo, from which the present city evolved. Sir Henry Morton Stanley, the explorer, who first went to Kintambo in 1877, established such cordial relations with its ruler that on his return in 1881 he was able (despite French efforts to forestall him) to acquire a site there and to found a depot, which he named Léopoldville after his patron. Though Stanley succeeded in opening river traffic as far north as Stanleyville (Kisangani since 1966) by having steamers portaged around the cataracts of the lower river to Stanley Pool, Léopoldville had little or no importance as an international trade centre until the railway line from downstream Matadi was completed in 1898. A pipeline from Matadi to carry crude oil to the upriver steamers at Léopoldville was laid in 1914, and an air service was inaugurated between Léopoldville and Stanleyville in 1920. Both developments so reinforced the city's growing importance that the administrative headquarters of the then Belgian Congo were transferred there from Boma in 1923. Its increasing importance attracted immigrant African labourers, a migration the Belgian administration strove to encourage by providing houses and other social amenities. Léopoldville in 1960 became the capital of the new republic.

The founding of **Léopold-ville**

The modern city. Standing on a plain 1,066 feet above sea level, Kinshasa is partly encircled by higher ground. It stretches about seven miles southward from a 12-mile semicircular stretch of Malebo Pool's southwestern shore. Its climate is that of a typical tropical rain forest. Rain falls throughout the year, with a mean annual total of slightly more than 60 inches. The hottest month is April, with mean daily maximum and minimum temperatures of 89" F (32" C) and 71° F (22° C), respectively. The corresponding figures for July, the coldest month, are 81° F (27" C) and 64° F (18" C). The countryside is heavily farmed rain forest; chief crops are cassava, surgarcane, oil palms, plantain, maize (corn), and beans.

In the extreme west an industrial zone (before 1966 called Old Town or Léo-Ouest) flourishes near the site of Stanley's first depot. To its east lies the riverside residential and administrative suburb of Kalina, which houses most of the European population and the new Congolese elite. The commercial district (known before 1966 as Léo-Est), of which the Boulevard du 30-Juin forms the focal point, occupies the city's eastern sector, which developed from the village of Kinshasa. Its northern waterfront is lined with three miles of quays, behind which large warehouses are stacked like packing cases. Ndolo, on its eastern periphery, comprises a complex of port facilities and industrial plants. The lower working class areas, in what used to be known as the African district, extend southward from the east and west of Kinshasa. Of

The city's **commer-cial** centre

Palais de la Nation in Kinshasa.
Afrique Photo

Kinshasa's two satellite cities, Ndjili contains about 20 percent of the metropolitan population, and upstream Kimpoko is being developed as an outer port.

Transportation. Though Kinshasa is well served by roads, its dense population and concentrated working sector cause much congestion. The railway line from Matadi enters the city in the east and then bisects it north and south; it brings in most of the country's imports, which are mostly thence conveyed by river upstream. At one stage or another almost all inland traffic destined for the Atlantic port of Matadi must be transported by water to Kinshasa, where total river traffic stands at more than 1,500,000 tons annually. An airport at Ndolo provides local and international services.

Demography. The population of Kinshasa, though slow to grow at first (from 5,000 people in 1889 to 23,000 in 1923), increased rapidly after 1940 to almost 1,300,000 in 1970. After the country's political crises of 1960–64, the proportion of European inhabitants drastically declined. Of the black inhabitants, the majority are first-generation immigrants from Zaire at large and from other Central and West African states.

Building types. Notable examples of architecture are found mainly in Kalina and the commercial sector. Chapels, cathedrals, and churches of an obsolete European style stand half hidden by a profusion of ornamental trees, while tall, modern buildings such as banks and public corporation and commercial offices stand out prominently. Multi-story buildings characterize the commercial sector; in the residential areas bungalows and long multi-unit dwellings are common.

Economic life. Its large population has made Kinshasa the most important consumer centre of the republic and has thus ensured its emergence as a major industrial centre. The main industries include food processing (confectionery, beer, and soft drinks), textiles, woodworking, paper, and the manufacture of packing cases, tobacco, and chemicals (perfumes, pharmaceutical products, plastics, and insecticides). Construction and various service industries also contribute to the city's economy.

Kinshasa serves as the headquarters of major public corporations and of industrial and commercial companies. It contains the head offices of the six main banks in Zaire, showing the extent to which Kinshasa dominates the financial and commercial life of the republic.

Government institutions and utilities. The city houses the central government offices. Its urban administration, under a governor nominated by the central government, provides such essential services as water supply (obtained from the river) and sanitation. A special service is the spraying of the town by helicopter to eradicate mosquitoes. Electricity is provided by a company named COLECTRIC. In 1969 there were three major clinics and more than 30 health establishments headed by doctors.

Education. Facilities for primary and secondary education are available. Institutions of higher education include an advanced teacher-training college, a national school of administration and law, a school of telecommunications, and an academy of fine arts, as well as institutes of social training, political studies, medical training, and commerce. Université Nationale du Zaïre, Kinshasa campus (formerly Université Lovanium de Kinshasa), the nation's largest, with a student community of 3,000 and a faculty of about 400 in 1969, lies within the Kinshasa metropolitan district. Apart from its numerous faculties, the university has an archaeological museum and an experimental nuclear reactor. There are also ethnographical and geological museums.

Université
Nationale
du Zaïre

Cultural life. There are four principal daily papers and three weekly newspapers published in French.

The radio station at Kinshasa, one of the most powerful in all Africa, provides a 24-hour service. One state-run station and one commercial station, called Tele-Star, offer television.

Recreational facilities include parks, zoological gardens, a racetrack, two stadiums—one of which can seat 70,000 spectators—and a large number of clubs and hotels.

Kinship

Kinship—the system of human relationships derived from marriage and descent—plays an important part in all societies. It is a major factor regulating behaviour between individuals and affecting the formation of social, political, and territorial groups. In modern industrial society the domestic family is the most obvious example of an institution based on kinship. In tribal societies kinship is of even more significance, having far-reaching effects on the social and economic life of the community.

CULTURAL AND SCIENTIFIC ASPECTS

Modern research has revealed the nature of the biological continuity between an individual and his genetic parents. But kinship, as a set of social relations, does not depend on knowledge of genetics or physiology. Indeed, some societies with elaborate kinship systems have held beliefs about the development of the human fetus that in no way approximate to the actualities of conception and gestation. Genetic mechanisms are uniform for all mankind, but human groups differ widely in the significance they attach to kinship.

All cultures recognize that the human fetus is born from the womb of its mother, on whom it depends for survival. There is thus a physically based and culturally defined relationship between mother and child. Likewise, all cultures distinguish between male and female individuals and institutionalize, in varying forms, a second relationship: that between a man and a woman who copulate in some acceptable way. This relationship is described in English as "marriage." There are vast differences between cultures in the customary entailments of these two relationships—mother and child, man and woman—and in how they generate other separately identified relationships such as, in English, father, sibling, mother-in-law, or cousin. The study of kinship began with the recognition, from at least classical times, that the names for kin relations in one language cannot always be translated accurately, on a one-to-one basis, into the kin terms of another language. It was stimulated by the discovery by an American ethnologist in 1858 that two Indian languages, Iroquois and Ojibwa, though apparently unrelated, nevertheless possessed common patterns of kin terms so that one-to-one translation was possible. Yet there is more to the study of kinship than the investigation of patterns of names for kin relations. For such study embraces the investigation of (1) the ways in which individuals enter into and leave kin relationships; (2) how they use them in private and public life; (3) how kin relations are made to define social groups and categories; (4) what connection kinship has with other sets of relations between individuals and groups based on political, residential, religious, and other non-kin criteria; (5) how copulation and birth are associated with kin relationship; (6) how ideas about the development of the human embryo, the acquisition of personal characteristics, the fate of the soul after death, and other matters may be linked in any culture with the pattern of kin relations; and (7) what explanations can be given for the genesis, development, maintenance, and decay of these various beliefs and practices.

Kinship and affinity

In some analyses a contrast is made between kinship and affinity—that is, between relations built up from links between parents and children (the so-called consanguineal, or blood, relations) and relations based on one or more marriage links (relations of affinity). In this sense, a man's brother-in-law and his mother-in-law, for instance, are classified as his affines and not as his kin, though not all of the cultures that make the contrast draw the dividing line in the same place. Unfortunately there is no convenient overall term for "kinship and affinity." In this article, unless otherwise indicated, kin and kinship are used in a broad sense to include affines and affinity. A "relative" is a kinsman or affine.

In most industrialized societies the family home, typically inhabited at night and for part of the day by a married couple and their young children, is the site where all members find food and shelter and develop multistranded bonds of affection between and hostility toward one another, where the couple copulate and conceive, and where the children begin to acquire the values, symbols, and skills of their culture. But in industrialized society, education takes place outside the home, and adults work and earn their living elsewhere, bringing back to the home for use and consumption goods produced by strangers. Although links with kinfolk outside the home remain important on festival occasions, at moments of crisis, and particularly in old age, kinship is not the basis of economic, political, or religious activity. At the other extreme of technical development, among peoples who subsist by hunting and by collecting wild plants, kin relationships are dominant within the small local group, but the restricted scale of social relations generally (except in aboriginal Australia) limits the possibility of maintaining an elaborate wide-range kinship system. Most highly developed kinship systems are found in middle-range nonindustrial tribal societies based on agriculture or pastoralism.

Elementary families and genealogies. Relations of motherhood, marriage, and fatherhood are formed in the domestic family and then persist even after the persons linked by them have ceased living under the same roof, and may continue to persist in symbolic form even after some of the persons are dead. Though there are parallels between human and nonhuman primate "domestic" organization, kinship as a symbolic construct seems unique to man. The nuclear family—man, wife, and unmarried children living as a domestic unit—gives rise to one of the basic kinship constructs, the elementary family, consisting of man, wife, and all of their children, wherever they may be living and whether alive or dead. Every person belongs to a so-called family of orientation—*i.e.*, the elementary family containing his mother and father and his full brothers and sisters; he may also belong to one or more "families of procreation" or "reorientation" containing one of his spouses and their children. Elementary families thus overlap and provide a basis for recognizing relations with distant kinsmen traced through several intermediate links. As a man's father has two parents and his mother also has two parents, most cultures recognize a connection between a man and his four grandparents, though not all use four different names for these relations. Similarly, relations with cousins (parents' siblings' children) are recognized, and there is great variation in the ways in which different kinds of cousins are grouped or distinguished.

Families of orientation and procreation

The process of tracing out paths to distant kin via overlapping elementary families can be applied in three contexts. First, the logical product of several culturally distinguished kin relations can be formed to generate still another relation. The product of the relations "father," "brother," and "wife," for example, is "aunt" (that is, any woman who is the wife of one's father's brother is one's aunt). Second, the tracing can be done through individuals, as, for example: "my father Thomas Brown had a brother, now dead, called William, whose widow, now remarried, is known as Mrs. E. Smith, but who is in fact my aunt." Third, tracing may be a way of marking the category of kin from non-kin. In the above example, for instance, one can trace a path to the aunt's second husband James Smith, but one cannot regard him as a kinsman, although he is one's father's brother's widow's second husband.

A written or oral statement of the names of individuals and of their kin relations to one another is a genealogy. In literate societies records of births and marriages can be used to construct large genealogical charts, but these may have little social significance. In nonliterate societies, genealogical knowledge is transmitted orally, and the form and content of a genealogy is more likely to be of social significance and consequence. In some cultures people have little interest in ancestry and may even forget the names of their grandparents. In other cultures, genealogies tracing ascent through one line, though rarely through more than one, may be remembered for 15 or 20 generations. Even if ancestors are forgotten, individuals may be able to trace paths to distant relatives laterally through affinal links. It is often the case that ancestors who do not serve as symbols for defining an individual's place in society are forgotten, and the custom of teknonymy (*i.e.*, the practice in which a parent is identified by reference to the name of his or her child) may have the effect of ensuring that the names of members of higher generations are systematically forgotten. The occasionally encountered prohibition against uttering the name of a dead person clearly has such an effect. In industrial societies, in which extrafamilial kinship is relatively unimportant, women tend to know more than men about kin links, and relatives linked through women tend to be remembered longest.

The process of filiation

Genealogical knowledge provides a basis for identification and connection with relatives. Patrifiliation is the process of identifying with one's father so that one becomes a member of the social groups he belongs to or used to belong to. Matrifiliation is identification with one's mother. The set of all persons connected to an individual by several ascending filial steps (steps between parent and child) constitute his lineal ancestors; those linked to him by several ascending, followed by several descending, cognatic steps (links between blood relatives) form his cognatic or consanguineal kin.

Both patrifiliation and matrifiliation occur in almost all societies, though many emphasize one more than the other; systems in which they are treated equally are called equilateral or bilateral. In some cultures there is no dogma of emphasis or equality, and individuals make their own choice as to which side of their family they will associate with.

Kin terms. All cultures have sets of names for various relations between kin. The number of basic terms in a set varies, averaging about 25, though in some cultures an indefinitely large number of compound terms may be constructed, as in English — "great-great- . . . great-grandfather." Such nomenclatures or sets of relationship terms may be analyzed in several ways. One procedure is to generate a standard genealogical grid consisting of consanguineal and affinal kin types, such as father's brother's wife and mother's sister's son, and to map the terms in a set on to this grid. The various kin types designated by any one term constitute a kin class. Lewis Henry Morgan, the American ethnologist who in the 19th century laid the foundation for the scientific study of kinship terminologies, grouped sets into two categories, descriptive and classificatory. In classificatory sets, lineal and collateral kin and kin belonging to several generations are typically included in a single class and are referred to by the same kin term. All cognatic kin are either lineal or collateral. Two persons are lineal kin to each other if one is an ancestor of the other. All other cognatic kin are collateral. In descriptive sets, close and lineal kin are typically distinguished by separate terms, which are not used for collaterals. In English, for example, "father" designates a single relative, but "uncle" refers to certain others, all collaterals. "Brother" may denote one of several close relatives but designates only a single kin type. Collateral relatives such as parents' siblings' children are all called "cousin." Later writers categorized sets of terms not by characteristics of the sets as a whole but by the way in which certain kin types were sorted into classes. Sets were categorized according to the classes for cousins and according to those for parents' siblings, but commentators have returned to looking at sets as wholes.

Most methods of analysis involve mapping terms on to a standard genealogical grid. Some writers argue that the notion of a grid is not present in all cultures and that these methods do not reveal how kin terms are perceived by the people who utter them. Even if people can trace out kin connections step by step, they may have other ways of deciding what term to apply to a kinsman.

THE DOMESTIC FAMILY

Evidence from other primates. In most societies the majority of people live in domestic family units consisting of one or a few closely related men, wife or wives, and young children. The widespread occurrence of this form of domestic organization suggests that it developed early in human evolution. Despite the fact that man differs in many ways from other primates, some of the mechanisms underlying human domestic arrangements are basically similar to those of apes and monkeys. In all primate species there are bonds between adult females and immature members, and among chimpanzees, recognition and cooperation between a mother and her young sometimes lasts well beyond the period needed for the young to attain biological self-sufficiency. Bonds between adult males and young are also found, but are less prominent. With nonhuman primates as with man, adequate socialization in infancy seems to be a precondition of adequate maternal behaviour in adult life and of the development of paternal bonds. On the other hand, exclusive bonds between a single adult male and a single adult female are found only in gibbons. Some writers on evolution have held that the human hunting band, seen as an aggregation of domestic families, developed from a chimpanzee-like troop in response to increasing separation of function between male and female. Others suggest that isolated hominid (manlike) breeding units, each with one male and several female adults (as found with hamadryas monkeys), learned to associate in order to hunt large animals. Alternatively, it may have been that baboon-like societies with closed membership and a male dominance hierarchy adapted to cooperative hunting by relaxing the hierarchy and forming male–female pair bonds. Whatever evolutionary path was followed, it seems reasonable to assume that early man lived in aggregations of families, with women caring for the young and collecting plant food and with men hunting animals and providing protection against animal predators and human enemies. It is still possible to investigate the material and technical achievements of pre-Neolithic man, but his forms of social organization remain uncertain, and the extent to which he made use of the symbolic notion of kinship quite unknown.

Sexual and filial bonds of primates

Family and household. In anthropological usage the domestic family is any group of kinsmen and spouses that constitutes a household, has a common hearth or kitchen, a common purse or food supply, and, usually, a common roof. There are nonfamily households based on other principles and some which have a family core with the addition of unrelated friends, lodgers, slaves, and servants.

The nuclear family

A very common type of domestic family consists of one adult man, his wife, their unmarried children, and no one else. Some writers have maintained that this nuclear family is universal, but in no society are all households of this type, if only because there are widows, orphans, unmarried mothers, and others who need a home. And on reaching maturity a child may remain at home and be joined by an incoming spouse. When they have children, there will be three generations in the family, and if the process continues there may be four before the original parents die of old age. Family composition is thus determined largely by whether a newly married couple set up a new household or become members of an already existing household occupied by close kin of either the bride or groom.

Extended and expanded families

The terms extended and expanded are used to refer to various types of nonnuclear family. A "stem" family, for example, is an extended family generated by the rule that only one child shall remain at home after marriage. Found in parts of rural Europe and Japan, it is compatible with reliance on a family farm that is adequate to sustain a married couple, plus their aged parents and young children, but not large enough to be subdivided. The child who remains at home is usually the eldest or youngest son. In Japan a young man was sometimes brought into the household if there were no sons; he eventually married the daughter of the couple and took over leadership of family and farm. With a stem-family system, provision has to be made for those forced to leave their natal household. Daughters are provided with dowries at marriage, and sons are either given chattels or money or have to find a place outside the system by pioneering new land or taking nonagricultural employment.

If the economy is less diversified or the agricultural pattern more flexible, other kinds of extended family that allow more or all sons or daughters to remain at home are possible. In studies of industrial societies, the term extended family usually refers to a domestic family plus close relatives living elsewhere, but in nonindustrial societies this grouping is called an expanded family. In nonindustrial societies, an extended family is a single domestic unit. Some extended-family households among the Pandits of Kashmir, for example, consist of an old married couple, all their married sons, their unmarried sons and daughters, their sons' wives, and their sons' children. In this system, women leave their natal household at marriage to join their husbands' households, usually coming under the domestic control of the husband's mother. When the senior couple die, the household may continue intact, forming a fraternal extended family in which the senior men are brothers. A generation later the senior men would be first cousins, but these units often break up before this happens, owing to quarrels over the distribution of resources, the rearing of children, and other domestic issues. Though the domestic unit may split, the group may persist as a land-holding unit or even, as in India in modern times, as a corporation owning industrial property.

Though birth and marriage account for most family recruitment, some societies, particularly in Eurasia, allow for the acquisition of family members by means of the adoption of both children and adults. In ancient Rome a householder without an heir would adopt a boy or unmarried man from another family as his son. The Japanese custom mentioned above was similar, though in this case the "adopted" son and heir, unlike a son by birth, had to marry the man's appointed daughter. In many modern systems of adoption infants are adopted because the mother cannot care for them or because the adopting parents desire children, rather than for reasons of inheritance. The transfer takes place in infancy and the identity of the infant's natural mother may be kept secret. The adopted child thus derives all its social position from the adopting parents. Adoption is distinct from fostering, in which a boy or girl lives with and is cared for by a family but does not abandon its links with its own parents, deriving its social position from them alone.

SEXUAL ACTIVITY AND MARRIAGE

Finding a spouse. Getting married may be a long process. When men and women choose for themselves whom they marry, there is usually some institutionalized way in which those eligible sort themselves into compatible pairs. These customs range from computerized dating to, for example, "carrying leg," as was found among the Kuma of New Guinea, among whom groups of girls summoned young men of their choice to sit in the evening with them in a hut with legs intertwined while they talked, gossipped, and made jokes. Courting activities are often organized by peer groups of youths and girls, though successful courting leads to the formation of individual pairs and the breakup of the group. In some societies a couple may be expected to set up house together; if the trial goes well, the marriage is recognized or ratified. In other systems, as in much of India, bride and groom may not have seen one another before the day they are irrevocably married; their kin have made all arrangements for them. In many societies girls are promised in marriage while still infants, and sometimes a woman may promise a daughter as yet unborn.

Wedding practices

Social recognition of a marriage may depend on the performance of a public wedding ceremony. In peasant societies particularly, weddings are major festivities and may entail greater expense than any contributions that have to be made to endow the couple or to pay for the bride. In contrast, there may be no recognized ceremony or ritual. In some Australian Aboriginal societies, for example, a couple started to live together without marking the event, though their marriage might have been the legitimate consequence of a bestowal made many years previously. In general, ceremonies mark the change of status from unmarried to married, as well as the formation of a particular marriage link; hence first marriages may be celebrated differently from subsequent ones. Living in the same household or copulation may precede or follow the wedding by many years. In the West Indies it is common for couples who have lived together for many years and acquired children to hold an expensive wedding and go through a legal marriage ceremony.

Monogamy and polygamy. In many societies marriage is monogamous: a man may have only one wife at a time and a woman only one husband. This exclusiveness may be permanent, as in those Indian cultures that have prohibited divorce and the remarriage of widows. Polygamous systems, on the other hand, allow either polygyny, the marriage of a man to several women at the same time, or, less commonly, polyandry, the marriage of a woman to several men, often a set of brothers (adelphic polyandry). Both polyandry and polygyny may occur in the same society, and in some Himalayan societies a man who shares one wife with his brothers might also be married exclusively to a second wife of his own.

Some cultures enjoin equality of status for cowives, while others allow for ranking, with one wife perhaps designated as mother of the man's heir. Among the Ngoni of south central Africa, for example, an important man might have several bevies of wives, each containing half a dozen or so women arranged in an order of seniority. Some pairs of cowives in the same bevy, usually sisters, were specially linked, the children of the junior woman being treated as if they had been born to her linked senior.

Concubinage

A distinction more radical than ranking is drawn in some cultures between wives and concubines. Thus, among the Jews in biblical times a man could take a female captive as his concubine or could buy the services of a free girl. Despite her own lower status, the children of such a woman had status equal to the children of a wife. Similarly in China, the sons of concubines enjoyed equal status. In general, the relation of a man to a wife provides the basis for a link between his group and her natal group, whereas with a concubine there may be no significant relation with her natal group, whether or not her children enjoy equal status.

But whatever social customs or practices are used to bring potential spouses together, and however many spouses an individual may take, there are in all societies certain restrictions on the choice of sexual and of marriage partner. These are known as incest and exogamy rules.

Incest and exogamy. In all cultures copulation is the diacritical activity in the marriage relation. In most cultures it is also regarded as an essential or contributory concomitant of the growth of the fetus, and hence underlies the mother–child relation.

Other basic human activities—sleeping, eating, talking, touching, working—may be culturally oriented, but copulation is particularly subject to cultural control. The nearest approach to a universal rule found in all known human cultures is the incest taboo—the prohibition of sexual intercourse between a man and his mother, sister, daughter, or other specified kin. As with the domestic family, this widespread occurrence of incest prohibitions suggests that they developed early in human evolution. And it seems likely that the two developments were interdependent.

Origins of the incest taboo

Evidence for sexual avoidance among wild nonhuman primates is hard to collect, but avoidance between mother and son is reported for Japanese macaque monkeys. Incest prohibitions may have been adopted by early man in response to evolutionary pressures. If, as now, girls reached sexual maturity before they could fend for themselves, avoidance of intercourse between siblings and between father and daughter may have kept births within the family in line with its economic productivity. Inbreeding, some writers argue, is genetically disadvantageous to slow-maturing animals bearing single offspring, so that a human group that, for whatever reason, adopted incest prohibitions would be favoured, even though the genetic selection processes at work remained unnoticed. Unregulated sexual competition within the family would threaten its stability, though some marriage systems allow a woman to share her husband with a daughter by an earlier marriage or a man to share his wife with a son by a different mother. Some writers have argued that socialization cannot be effective unless erotic impulses are frustrated within the family and are directed outside it, while others stress the political and social advantages to the family that follow from the alliances made with other groups as growing children seek sexual satisfaction elsewhere.

The inculcation of incest prohibitions is a part of the socialization process and once established tends to perpetuate itself. Some cultures treat incest as a terrible sin; others regard it lightheartedly. The three basic modes of incest—with mother, sister, or daughter—are not classed together in all cultures, and there may be no indigenous concept corresponding to "incest" as used in English. There is certainly no innate aversion to intercourse with sister or daughter, though some evidence from kibbutzim and elsewhere suggests that common rearing may diminish sexual attraction. Incestuous intercourse occurs in most societies, and very small isolated groups that see their survival threatened may abandon incest prohibitions. Sexual intercourse between siblings or between father and daughter has been permitted or required on ritual occasions or for small elites, as, for example, between the pharaoh and his sister-wife in ancient Egypt.

Exogamic rules

Incest prohibitions are associated with exogamic rules (injunctions against marriage between kin), but they are not necessarily coincident. Copulation may be tolerated where marriage is forbidden. In a few types of relation classified as "marriage," copulation is impossible, as, for example, when the "husband" is dead or is a woman; but in the great majority of marriages copulation is possible and legitimate, and may be a duty as much as a right. Incest prohibitions usually apply to only a portion of those kin whom an individual is prohibited from marrying. Incest rules everywhere extend beyond the basic triad of mother, sister, and daughter, but these extensions vary from one culture to another and cannot be explained by the universalist evolutionary arguments mentioned above. Exogamic rules are often extended further still.

In most cultures marriage is possible only with the cooperation of kinsfolk and may require state approval. Incest rules aim at prevention, whereas exogamic rules direct marriage choice away from kinsfolk; hence the domain and content of the two sets of rules differ. The Tallensi of Ghana, for example, considered copulation with a son's wife as terrible as copulation with a man's own mother. The son's wife was addressed by the same kin term as the man's mother, and if the son died the man could not marry her. A man could also not marry various distant cousins who belonged to his clan and whom he addressed as "sister," yet sexual intercourse with them was not considered incestuous or disgraceful.

Rules of incest and exogamy force men and women to look outside the domestic family for sexual satisfaction and marriage partners. The French cultural anthropologist Claude Lévi-Strauss and others have argued that for this reason the adoption of the concept of incest marks the beginning of human culture. Yet it is exogamy rather than incest that leads men to form enduring links with other groups based on the publicly recognized relation of marriage, rather than on copulation, a private activity.

Marriages between kin. The study of marriages between kin has been a major concern of anthropologists for many decades and is still controversial. In some kinship systems marriage with any relative is prohibited, but in others marriage with a specified relative is required or preferred. Sometimes such marriages are observed to be frequent without being explicitly preferred. The preferred marriage partner is often a "cross-cousin" (mother's brother's daughter or father's sister's daughter) or a parallel cousin on the father's side (father's brother's daughter). Lévi-Strauss and others have explained preferential marriage patterns in terms of the principle of reciprocity, a basic element in many forms of exchange in social life. Marriage is viewed as a form of exchange involving the circulation of women. In a system of restricted exchange, two groups interchange women as wives, while in generalized exchange, group A gives its women as wives to group B, which gives its women as wives to group C. Some societies may thus be broken down into "wife-giving" and "wife-receiving" groups.

Secondary marriages to kin

Secondary kin marriages arise out of interpersonal rights and obligations. In some systems, when a woman's husband dies, she remains married to the dead man but is cared for by his younger brother or other relative; any children she bears by her pro-husband are treated as if they had been fathered by the dead man. In some parts of Central Africa the marriage relation persisted after the husband's death in the custom whereby the "widow" was required to copulate with one of his close kinsmen to cleanse herself of the "pollution" or defilement caused by his death; she was then considered to be divorced and was free to marry again. The term levirate, often used loosely for widow inheritance, is best reserved for the custom, mentioned in the Christian Bible, whereby a younger brother of a married man who died childless is required to copulate with the widow so that the dead man may gain an heir posthumously. This arrangement differs from widow inheritance, whereby a widow becomes the true wife of her dead husband's kinsman, any children she then bears counting as the children of the new husband. Among the Nuer of the southern Sudan a widow who did not wish to live with one of her dead husband's kin usually became a concubine and accepted lovers, any children she bore counting as offspring of the dead husband. The Nuer carried the principle of the levirate a stage further: if a man died unmarried, one of his brothers or brothers' sons was expected to take a woman, not as his own wife but as wife of the ghost. The pro-husband lived with and looked after the woman, but their children were regarded as children of the dead man. These ghost marriages were almost as numerous as ordinary marriages between "live" men and women. Less frequently, a barren Nuer woman owning cattle took a wife or wives as if she had been a man. Someone was called in to beget children and provide masculine assistance around the home, but the children born by the wives called the barren woman "father" and traced connections through her to her kin as if she had been a man.

A man's first marriage may influence his range of choice in subsequent polygynous marriages. Several cultures prohibit a man from marrying two women who are sisters, either simultaneously or serially, whereas in other cultures, this is a preferred arrangement. Sororal polygyny consists in marrying two or more sisters, whereas the term sororate is best reserved for the arrangement whereby the kinsfolk of a married woman who dies or who is barren have to provide another wife to supplement or substitute for the first.

Marriage, alliance, and property. Exogamic and endogamic rules provide a framework within which marriage links are formed. These links may sustain, or may be derived from, distinctive patterns of kin connections between individuals and between groups.

In so-called dynastic marriage, typical of medieval Europe, political advantage was sought through the transfer of dowry and other property and through alliances between rulers created or strengthened by affinity. Similar "political" marriages occur in some nonindustrial societies. In the Trobriand Islands in the South Pacific, a chief married a woman from each of his villages, usually a sister or close relative of the village headman. Among the Lele of Central Africa, about one woman in ten was a "village wife." Rights to receive cooked food from a village wife and to sleep with her in her house were shared by several men in the village; and any villager, but not an outsider, had the right to copulate with her in the forest. A chief who visited a village and collected tribute had to provide a daughter or granddaughter to become a village wife, thereby augmenting the weak political link between himself and the village with a tie of affinity. Elsewhere in Central Africa, relations between villages were expressed in the idiom of kinship. In the Luapula Valley (Zambia) village headmen were said to be brother, sister's son, or son-in-law to one another. Whoever became headman took over unchanged the quasi-kin relations of his predecessor. These relations derived from true kin connections said to have prevailed at the time the various villages were founded and symbolized the contemporary pattern of intervillage alliance.

Marriage is typically accompanied by a prestation (payment) or transfer of property or the performance of services. Transfers may begin with bestowal or betrothal and may continue for years after the wedding. Part of the transfer is horizontal, between the parents or other kinsmen of the groom and the kin of the bride, and although goods may pass in both directions, one side often gains more than the other. Another part of the transfer may be vertical, from one or both groups of kin to the new couple, enabling them to establish a properly endowed household. The payment, prominent in many African systems of marriage, made by the groom or his kin to the kin of the bride is known as "bridewealth," whereas "dowry" usually refers to the contribution made by the bride's kin to the newly married couple or to the bride herself as her personal endowment. When bridewealth is large, a man with many sons is at a disadvantage, whereas if dowries are large, many daughters are a serious burden. Among the Lovedu of the Transvaal, who paid substantial bridewealth, the cattle received at a woman's marriage were used to secure a wife for one of her brothers, establishing an enduring relation between the man and his cattle-linked sister. Some kinds of exchange marriage are favoured as a way of avoiding large transfer payments, as for example among Palestinian Arabs, where a man and his sister might marry a woman and her brother.

Dowry and bride-wealth

Prestations may be fixed by custom, be variable but not a matter for bargaining, or may be subject to bargaining. The various items may relate to specified aspects of the marriage, with specific payments for the virginity of the bride or for the children she has already borne. Prestations may be made to specified relatives, as, for example, to the bride's mother for the pains she felt in childbirth. One set of payments may establish the groom's rights over his bride and his right to claim damages from anyone else who copulates with her, whereas others establish rights attaching to the groom's kin group all the children the bride bears, possibly including those conceived in adultery. Sometimes labour service is performed by the groom or his group for the benefit of the bride's group and may be perceived as compensation for the loss of the bride's labour. In several societies a newly married man has to live with his wife's kin group and work for the group for a few years before he is allowed to take her back to his own group to live.

Adultery and wife lending. Marriage and concubinage, relations that may be combined with mother–child links to generate other kin relations, must be distinguished from other kinds of association for sexual purposes, such as prostitution and various more permanent arrangements whereby a married woman takes a recognized lover. If the marriage bond is perceived as giving exclusive sexual rights to either spouse, then copulation with another person must be viewed as a violation of the marriage (adultery). Many cultures distinguish acts of adultery according to the relation between the adulterer and the woman's husband. Thus, among the Tallensi of Ghana, adultery with the wife of a brother was regarded as incestuous and with the wife of a distant clansfellow as reprehensible but not incestuous, whereas adultery with the wife of a member of an unrelated clan led merely to an attempt by members of the cuckold's clan to seduce a woman married to a member of the adulterer's clan so as to make things even.

Eskimo wife exchange

Sometimes a woman is required, by virtue of her marriage tie to one man, to copulate with another. Among the Eskimos of north Alaska, for example, two men who were trading partners or who belonged to the same whaling crew might exchange wives for a few days. This exchange created a relation of mutual assistance between the children of the two married couples. A more widespread custom is for the younger unmarried brothers of a married man to be allowed to copulate with his wife, any children she may bear being treated as his own.

Divorce. The frequency and ease of divorce varies greatly. It may be nonexistent, as in the Republic of Ireland, or it may be so commonplace that the majority of marriages end in divorce. Among the Bemba of Zambia, for example, it was recognized that in a long succession of divorces and marriages a man might marry the same woman twice; a special verb denoted marrying in this way. In industrial societies the welfare of the children of a divorced couple is often specially provided for, while in nonindustrial societies the important consideration is usually which kin group the children are to join. If children normally join their mother's group, divorce tends to be relatively easy and frequent, whereas if the woman and her children are all fully incorporated into the husband's group, divorce is likely to be difficult. Prestations made at the time of marriage may have to be returned before a divorce can be settled, but large prestations do not necessarily prevent divorce. Divorce is often easier when there are no children, and barrenness may be an adequate ground for divorce. In some societies the children of a divorced woman have at best a weak link to their father, whereas in others this is not so. Among the Ngoni of Zambia and Malawi, for example, a man divorcing his wife could demand back the prestation made at the beginning of the marriage whereby he gained his marriage rights, while at the same time he could offer to the woman's father or brother a larger prestation to secure the affiliation of the children to his kin group.

Legitimacy. Marriage is sometimes defined as a union between a man and a woman such that children borne by the woman are recognized as the legitimate offspring of both parents. This definition fails to discriminate between wives and concubines in those societies in which the children of wives and of concubines enjoy equal status, and it fails to cover those societies in which children regarded as having been conceived in adultery are treated as the offspring of the adulterer rather than the husband. Some cultures, particularly those emphasizing connections with the mother's group rather than the father's, do not draw a clear contrast between the two kinds of status usually described as "legitimate" and "illegitimate," whether this refers to the child's status in society, to the woman's status as mother, or to the kind of membership the child has in a specified kin group. Legitimacy or illegitimacy usually derives from circumstances prevailing at the time of birth, but change later may be possible. In Britain, for example, a child born to an unmarried woman may subsequently be legitimized by her marriage to its physical father.

KINSHIP AND THE COMMUNITY

Kinship and residence. The domestic family is a residential unit, the spatial distribution of which may be determined to a large extent by kin relations, "Virilocal" residence occurs when a newly married couple live near the groom's kin, "uxorilocal" when they live near the bride's kin, and "neolocal" when they choose where to live without reference to where their various kinsfolk live. The older terms patrilocal and matrilocal are still sometimes used for virilocal and uxorilocal respectively but more properly refer to residence near the kin of the father, or of the mother, of either bride or groom; "avunculocal" refers to residence near a mother's brother. The two sets of prefixes may be combined, "matriuxorilocal" referring to residence near the bride's mother, and so on.

The universal prohibition against marriage with a parent or sibling usually entails a move at marriage out of the natal family for at least one of the couple. Regular moves may occur before as well as at marriage. Among the Haida of British Columbia, for example, a young man would leave his parents' house to join the household of one of his mother's brothers. When he married, his wife joined him there.

Rules of residence regulate access to fixed resources such as houses and land. Kinsmen in many societies live together so that they can cooperate readily for hunting and gardening, for defense and attack. Regular patterns of postnuptial residence generate a local community composed of kin and of inmarrying spouses and children. About four out of five married men among the Tiv of Nigeria, for example, lived patrivirilocally, and most of the adult men in any small community were closely related to one another through their father's kin. Among the Yao of Malawi, on the other hand, most married men lived matriuxorilocally, and the core of the local community was made up of married women related to each other as sisters and daughters, plus a resident brother living matrivirilocally with responsibilities toward his sisters. Whatever the form of the larger society within which it is enclosed, the local community is thus typically composed of several domestic families, nuclear or extended, whose members are related to one another by kinship in various ways.

Customary behaviour between kin. Within the family there are tensions of many kinds, and outside the family many peoples have the maxim, "We marry our enemies." Different groups have adopted different ways of attempting to regulate the conflicting interests embedded in the various kinds of kin relations. Particularly widespread are customs formalizing the relation between a man and his wife's mother. In Aboriginal Australia, for example, a man could not touch or talk to his wife's mother. In Polynesia close contact between a man and his sister was usually forbidden. Other traditional specifications of proper behaviour between kin either enjoin respect, as, for example, between a man and his mother's brother, or allow familiarity, as, for example, between a man and his granddaughter. In certain relations, typically between brothers-in-law, joking is encouraged or expected. Similar forms of enjoined respect, avoidance, or joking are customary between groups, particularly between groups based on kinship. The distribution of customary respect and familiarity, avoidance, joking, and the like over the different kinds of kin relations varies from one system to another, but in general each individual finds himself with some relatives he must respect, others who must defer to him, and yet others with whom he can behave with familiarity. Lévi-Strauss argues that the four relations of brother, sister, father, and son form the "true atom" of kinship, constituting a balanced quadruplet, but this analysis has been challenged by others who look for balance in a wider set of relations.

Procreation and paternity. The contrast between the material basis of genetic connection and the cultural or symbolic basis of kinship becomes obvious when attention is turned to kin groups larger than the domestic family. Relations with outsiders are recognized or denied not on grounds of genetic similarity or diversity but because of indigenous principles of social organization. In analysis, three kinds of fatherhood are distinguished. The genetic father is the one who actually supplies the spermatozoon that fertilizes the ovum. The "pater" or social father, usually the mother's husband and also the genetic father, is the person through whom the child acquires, at least in part, its position in society. The "genitor" is a person believed to have contributed essentially to the growth of the fetus in the mother's womb. There may be more than one genitor, particularly among those peoples who believe that continued copulation is necessary to sustain fetal growth. Thus the Iban of Sarawak believed that if a woman copulated with several men during her pregnancy, one would contribute an arm, another a leg, and so on. Similar beliefs have been reported from Melanesia. The genitor of an exceptional individual may not be a man at all, as seen, for example, in the medieval belief that Christ's conception in Mary's womb was achieved by the Holy Ghost through her ear. The alleged ignorance of the fact of physiological paternity among certain groups, particularly the Trobrianders of Papua and the Aboriginal inhabitants of Australia, has created much controversy. Some commentators have argued that the assertion that copulation does not cause conception is an expression of religious dogma rather than of ignorance. Others argue that there was true ignorance even when it was believed that copulation was merely a necessary precondition for the intervention of a spirit genitor or that copulation contributed to fetal growth but did not initiate it. The Murinbata of northern Australia believed that the spirit genitor was directed to the mother by an individual known as the "firestick father"; he was often the mother's husband but was sometimes another man or even a woman. In other cultures, on the other hand, it is asserted that the womb is merely a receptacle for semen and that the mother contributes nothing to the substance of the fetus, a view advanced by Apollo in Aeschylus' play ***Eumenides*** (lines 657–661). In many parts of Asia it was believed that bones were derived from semen whereas the soft parts of the body came from the blood and milk of the mother. The Orokaiva of Papua believe that no genitor contributes to a female fetus but that mother and father both contribute blood to a male fetus.

Concepts of fatherhood

The genitor may have specific rights and duties. Thus, in leviratic marriage among the Nuer, when the pater dies his brother is obligated to become the genitor and foster-father of his children and his widow's pro-husband. Among the Lozi of Zambia, the genitor of a child born in adultery has the right to claim it as his own and to become its pater. In other societies, although the woman's husband is pater of all her children, an adulterer's position as genitor may also be recognized in certain contexts.

Motherhood is simpler. Even if the genetic mother is believed to contribute nothing to the fetus, it is she alone who is recognized as the genetrix (female counterpart of the genitor). Attempts to conceal the true identity of a genetrix do not imply ignorance of physiological maternity in indigenous belief. The genetrix may also be the mater (the social mother), but not necessarily so. In the case of the Ngoni linked cowives mentioned above, for example, the children born by the junior took the senior of the pair as their mater.

Relations with a genitor or genetrix receive some cultural recognition, particularly in the common requirement that genitor and pater must coincide for an individual to obtain full status in society, but the major symbolic constructs of kinship are built up from the links with pater and mater. In discussions of kinship the relations "father" and "mother" refer to pater and mater unless otherwise indicated. An individual may apply a kin term inaccurately translated as "father" to several people, but in most societies he will recognize a stronger connection with one of these; this is his pater.

Quasi-kin relations. Many cultures recognize relations analogous to those of kinship. Quasi-kin relations, also known as fictive or ritual kin, define a connection between individuals or groups that has some of the same content as relations of authentic kinship. The most widespread example of a quasi-kin relationship is usually known as ritual coparenthood ***(compadrazgo*** in Latin America) and is derived from the Christian relation of spiritual kinship formed at baptism with a godparent. The sponsor has responsibilities to his or her godchild analogous to those of a secular pater or mater. The bond of spiritual kinship, combined with authentic kinship, led in medieval Christendom to a prohibition against marriage between the person baptized and a child of his or her godparent. Ritual coparenthood is the basis for enduring alliances between peasant families or between peasants and protectors of higher social status.

Ritual coparenthood

Another form of quasi-kin relation is blood brotherhood, found in Africa and elsewhere. Two men, usually not linked by authentic kinship, establish a formal bond of trust and cooperation. Among the Azande of the Sudan the bond was validated by a ritual act in which each swallowed blood of the other. Among the Chagga of Tanzania, pairs of independent chiefs establish treaties of alliance between their chiefdoms by becoming blood brothers. In Japan the custom known as ***oyako-kankei*** or ***oyabun-kobun*** enabled a man to establish a life-long link to a wealthier patron on whom he could depend for economic assistance. Later, the same relations came to be established between foremen and labourers in building firms and other industrial enterprises, particularly those employing ex-peasants. Not all quasi-kin relations may be combined with those of authentic kinship, but all use the language of kinship to designate a relation involving some of the same moral rights and duties.

Nepotism. In societies in which the boundaries of kinship are clear, one moral code may apply to dealings between kinsfolk and another to dealings with non-kin. Although most cultures recognize that there may be hostility and antagonism between kinsmen, particularly between affines and between cowives, kinsmen are in general expected to stand together against the wider community. Yet in all societies a man may from time to time have to balance his duties to his kin against his obligations to non-kinsmen. This conflict of loyalty is particularly noticeable in industrial societies in which the individual bears many social responsibilities. Nepotism, a term derived from the undue preferment given to the "nephews" (that is, illegitimate sons) of popes, is the practice of favouring one's kin in contexts in which criteria other than kinship are supposed to apply. Some cultures institutionalize procedures for avoiding situations likely to generate a conflict. Thus, many universities do not allow close kin to serve in the same department, and in Norway close kin cannot serve together in the cabinet.

THE WEB OF KINSHIP

Descent systems. By virtue of his acknowledged social parentage, a person may succeed to an office, inherit property, and become a member of a descent group. Often many persons (all sons except the eldest, for example) may be excluded from succession; some persons (daughters, for example) may not inherit; but in general everyone can claim membership in some group or set of kin. The English anthropologist W.H.R. Rivers and later writers have stressed distinctions between succession, inheritance, and descent, but in any society all three are closely related and often run in the same direction.

Everyone has two parents, four grandparents, eight great-grandparents, and so on; the number of a person's ancestors is incalculable, and all the descendants of each of these ancestors are potentially kin to him. If no limitation was placed on the recognition of kinship, everyone would be kin to everyone else. Indeed, in Europe at one time it was fashionable to show how thousands of eminent people could trace descent from Charlemagne. But in most societies some limitation is put on the recognition of kinship, so that a person regards at least some of his associates as not his kin.

In urban Europe of the 20th century, for instance, it is rare to find a man who will associate with his wife's brother's wife's mother, even if they might recognize some link of descent or affinity and even though specific kinship terms may exist for such categories. On the other hand, in Australian aboriginal society, where numbers were small, everyone with whom a person came into contact was regarded as a kinsman; social intercourse was impossible until the kinship connection between them had been ascertained. In China, despite the much larger number of persons who were in social contact with one another, there was a large-range kinship system, and kinship through males was recognized widely.

It is characteristic that kinship may be recognized further in one direction than in another, so that, for example, links through men may be remembered while those through women may be forgotten. Or the reverse may hold. People tend to remember or forget the names of their relatives in conformity with the directions and extent to which they recognize kinship.

Patriliny and matriliny

Unilineal systems. One method of limiting the recognition of kinship is to emphasize the relationships through one parent. Such unilineal kinship systems, as they are called, are of two main types: agnatic or patrilineal systems, in which the relationships through the father are emphasized; and matrilineal systems, in which maternal relationships are stressed. Under patriliny, a man (or woman) is linked to his patrikin—*i.e.*, his sons and daughters, his sons' children, his sons' sons' children, and so on; but he is in certain respects cut off from his daughters' children, his sons' daughters' children, and so on, for these are linked to their own agnatic kin. The people who are linked to him are thereby linked to each other and may form a group persisting through the generations, possessing its own internal organization and specific interests. An enduring group of this kind is called a patrilineal lineage or patrilineage.

Each male member of a patrilineage is the potential founder of a branch or segment of the original lineage. In some societies, each lineage is thus a segmented group, dividing in turn into major segments, each of which is divided into lesser segments, and so on. Groups of this kind may be kept in being by the common interests of their members in rights to land and in the control of marriages of members of the group, by obligations of mutual assistance, or by adherence to an ancestor cult. In some stateless societies, lineages wage war and maintain law and order.

An emphasis on matrilineal descent gives rise to groups of matrikin, consisting of a woman, her sons and daughters, her daughters' children, her daughters' daughters' children, and so on. Matrilineages are usually not so highly segmented as patrilineages. Whereas at least the smaller segments of a patrilineal system are formed around a core of men living in close proximity, two modes of residence are found with matrilineages. The local group may be organized around the women of a matrilineage, consisting of them, their husbands, and their children; or it may be based on the men of the matrilineage, consisting of them, their wives, and their children. In the first instance, the group of local women may require the counsel and leadership of a man of their matrilineage, who must live locally with his family; conversely, some of the women of the matrilineage may be married to men who are acting as local leaders for their own sisters; the kinship basis of the local group is then complicated, and it may split into several units of kin. Similarly, in the second instance, competition among brothers for the allegiance and support of their sisters' sons may split a matrilineal group of organized coresident men. In both instances, the larger matrilineal segments tend to disappear as effective social units. The same arguments do not apply to patrilineages, for a local group of males does not usually need a female leader, while quarrels between brothers merely emphasize the lines of internal segmentation.

In systems of double descent, patrilineal and matrilineal principles are found in the same society, each in its specific context. Thus, among the Yako of Nigeria, a man lives with his male patrikin, after an initial period of living with his wife's relatives, and cultivates land controlled by his patrilineage. He also belongs to a matrilineage, whose members are dispersed but who provide priests for certain cults. He inherits movable property from his matrikin and is most closely connected with their marriages. Unilineal descent, either patrilineal or matrilineal, can generate organized groups persisting through the generations. In double unilineal systems, there are two series of enduring groups, and each person belongs to one or more groups in each series.

Cognatic systems. Unilineal systems differ radically from cognatic systems (those in which everyone has obligations and duties of much the same kind toward both his paternal and maternal kin). In patrilineal descent, an individual is allied to his father's brothers' children but not to his mother's sisters' children; in matrilineal descent, the reverse holds. In a double unilineal system, he is allied to both these kinds of parallel cousins but usually in different contexts. In no kind of unilineal system does he share group membership with his cross-cousins—*i.e.*, his father's sisters' children and his mother's brothers' children. In a cognatic system, however, he is in some sense allied to all his cousins, with a possible division between, on the one hand, paternal or patrilateral cousins (*i.e.*, father's brothers' children and father's sisters' children) and, on the other, the maternal or matrilateral cousins (his mother's siblings' children). The kinship system of most European countries and the United States is cognatic.

Whereas unilineal systems give rise to groups with fixed membership, cognatic systems do not. An individual has his own cousins, but some of their cousins are strangers to him; his set of cognates overlaps but does not coincide with theirs. One of the best known cognatic systems is that of the Germanic peoples, among some of whom compensation paid after homicide was provided by all persons who were fourth cousins or closer cognatic relatives of the slayer and was distributed among similar relatives of the dead person.

Variant systems. A variant of unilineal systems is one in which an individual may choose whether he will belong to his father's group or to his mother's, but he cannot simultaneously belong to both, at least not in the same degree.

Some societies do not apparently display the formal regularities of either unilineal or cognatic kinship. Persons are free to choose whether they ally themselves with their father's relatives or with their mother's or with those of a spouse, and they may shift from one to the other. Omnidirectional kinship systems, as these are sometimes called, generate impermanent groupings of kinfolk, each grouping containing kin of various kinds. The emphasis is on person-to-person links of diverse types through which new members gain a foothold in the unit, rather than on the rights and duties associated with a specified kinship link. Every person has a large number of kinship links that he may or may not utilize; not all people utilize the same kind of link, and every cluster of kinsfolk can recruit its members from a large number of other units.

Control of resources and inheritance. The mother–child relation entails the division of members of the family into different generations; in this sense, families are stratified rather than homogeneous units. Although a son may be older than his father's youngest wife, generation and age usually run parallel. Thus stratified, the family is the centre for the transmission of economic, political, religious, and other attributes from one generation to the next.

Inheritance often occurs only after the death of the person controlling resources, but in some societies, as in rural Ireland and Norway, when the main asset is a peasant farm, it is customary to take over control long before death; the transfer then includes provision for the care and maintenance of the senior person. In literate societies, an individual is usually able to dispose of at least part of his property to nonrelatives by writing a will or testament, but he may be legally prevented from cutting off his wife and children without a penny. If he dies without making a will, his estate is distributed according to formal rules of inheritance. In nonliterate societies, there is little or no provision for testamentation, and all property is subject to rules of inheritance. In many societies, there are constraints on the disposal of property from one living person to another, so as to protect the rights of potential heirs.

Partible and impartible inheritance

Inheritance may be impartible—*i.e.*, in which all a man's or woman's possessions pass to a single heir—or partible, in which possessions can pass to a plurality of heirs, each of whom gets a part. Different kinds of property may be subject to different rules. Among the LoWiili of Ghana, for example, a man's cattle passed at death to certain kinsmen of his mother's brothers, while his house passed to his eldest son. With partible inheritance, heirs may be treated alike or some may be favoured. In some Islamic societies a man's possessions are divided equally among his sons, whereas in others his daughters are entitled to half shares. In Norway, a widow receives her half of the matrimonial estate and inherits a quarter of the other half, the remaining three-quarters of this half being divided equally among the children. All systems have substitution rules so that if, for instance, a man dies childless, some other specified relative becomes his heir. The range of eligible substitutes may be defined, and if there are no available relatives within the range, the property may pass to non-kin—a chief or king, for example.

In patrilineal systems of inheritance a man's property usually passes to his son or sons. In medieval England three versions existed in different parts of the country; gavelkind in Kent, in which all sons inherited equally, and either primogeniture (eldest son as sole heir) or ultimogeniture (youngest son inheriting alone) in central England. Some agnatic systems give priority to a dead man's surviving brother as heir, so that the transmission of property from one generation to the next is delayed until the last member of the senior generation dies. These lateral, rather than vertical, systems are often found together with a rule whereby a man's heirs, sooner or later, are his sister's children rather than his own children. A woman without brothers may, in some agnatic systems, inherit as if she were a man. A married woman is, in many societies, so closely identified with her husband or her husband's group of kin that anything she owns may be treated as if it had been her husband's, but in other societies she may, despite her marriage, remain anchored in her own group and transmit her property to her brother's children. Typical of Africa is a system whereby property owned by men is transmitted to men (either sons or brothers or sisters' sons) while women's property passes to sisters or daughters. More commonly in Europe and Asia, property is inherited across sex lines, by daughters as well as sons.

Consequences of inheritance rules

Various rules of inheritance produce various social consequences. With impartible inheritance, each generation sees a division into those who benefit from inheritance and those who do not, so that economic differentiation is perpetuated, even among close kin. A partible system that rigidly excludes one sex from inheriting may promote the perpetuation of differentiation between large groups of kinsmen but minimizes differences within each group. A diverging system (with no sexual discrimination) gives each individual two sources of inherited wealth, via his two parents, and tends towards equality of distribution. Movable inherited property, whether money, cattle, jewelry, or other chattels, can be distributed spatially, but houses and land can be used only by heirs who live nearby. Hence, if these fixed assets cannot be sold, their inheritance affects family and local organization.

Succession. In kinship studies succession refers to the transmission of office from one incumbent to another, rather than to inheritance, the transmission of control over resources. The same rules of filial or fraternal unigeniture (primogeniture, ultimogeniture, etc.) may apply as with impartible inheritance, but other considerations may also apply, particularly when the office concerns interests wider than those of a domestic unit. Thus, while succession in some monarchies is by filiation, a man being succeeded by his son, in others an office may circulate among several more distant male kin, as in medieval Ireland. Either all certain categories of male kin may be eligible, or succession may be restricted to, say, those whose fathers have held office; choice of successor may be made according to a rule of seniority or by election or armed struggle.

Universal succession, a term taken from jurisprudence, refers to the transfer to someone else of all a man's liabilities, rights, and positions in society. Positional succession refers to the custom whereby every person has a successor. Among the Bemba and other matrilineal peoples of Central Africa, for example, a woman who died was often succeeded by one of her daughters' daughters, who adopted the personal name of the dead woman and referred to her kinsfolk by the terms she used. The guardian spirit of the dead woman was believed to transfer itself to her successor.

Ancestor worship and totemism. In many cultures it is held that after death men and women continue to interact with the living, particularly with members of the kin groups to which they belonged or to which they were linked. If there are unilineal descent groups, shrines to ancestors may serve as markers for the arrangement of lineage segments, as among the Tallensi; in China, ancestral tablets indicated the distinction between one segment and another. Sacrifices and other prestations are made to ancestors. The powers attributed to ancestors vary from one culture to another, but the cult generally provides symbolic legitimacy for the existing social order.

Totemism (*q.v.*), the identification of an individual or human group with a natural species or other feature of nature, is often associated with kinship. In Australia, where totemism was most fully developed, kin groups and categories were associated with totems and with totemic sites at which events of cosmological significance were believed to occur. Some groups believed that the growth of the fetus was caused by the arrival of a "spirit-child" linked to a totemic object which became the "conception totem" of the infant.

Kinship and social evolution. The 19th century saw many attempts to describe the prehistory of social institutions, including kinship. One theorist postulated a progression from promiscuity through gynecocracy (political and social supremacy of women) to father right; another began with promiscuous hordes practicing female infanticide and developing polyandry and matriliny, shifting then to patriliny and finally to monogamy; another emphasized the roots of Indo-European kinship in the patriarchal extended family and claimed that ties of consanguinity gave way to those of territoriality. The American anthropologist Lewis H. Morgan, who used a better analyzed body of ethnographic data than his predecessors, distinguished three main stages of social evolution: savagery, barbarism, and civilization, each with its own distinctive types of social institutions and kin nomenclature.

Although all these schemes came to be discredited, interest in social evolution began to revive in the 1950s. It seems clear that some social forms, such as the nuclear family, are found in societies at all levels of technical development, whereas others, such as highly developed systems of unilineal descent groups, are found neither among hunting and collecting peoples nor in industrialized societies. The types of kin nomenclature associated with unilineal descent groups also are concentrated in middle-range societies. Changes in kinship are not necessarily cumulative, and some writers argue in favour of systematic shifts from one form of filiation or descent or marriage to another, with no irreversible evolutionary changes occurring. Matrilineal institutions, regarded as primitive in most 19th-century schemes, are adaptive to many different social environments, though they are not found with the highest forms of nonindustrial agriculture. They are less frequent among people living by hunting, gathering, and fishing than among agricultural societies and are rare among pastoral peoples. Although industrial development seems to be incompatible with large matrilineal groups, the matrifocal household, with no permanent husband, is common under conditions of industrial poverty. The persistence of nepotism in all areas of modern life suggests that interpersonal kin ties continue to be significant even after kin groups larger than the nuclear family have disappeared. Social mobility does not greatly diminish contacts with extrafamilial kin, and contacts may be maintained by mail or telephone when kin are separated. Differences in religious affiliation are more disruptive of kin ties.

BIBLIOGRAPHY. R. FOX, ***Kinship and Marriage*** (1967), is a good introduction; P. BOHANNAN and J. MIDDLETON (eds.), ***Kinship and Social Organization*** (1968), and ***Marriage, Family, and Residence*** (1968), reprint many relevant articles. W.H. GOODENOUGH (ed.), ***Explorations in Cultural Anthropology*** (1964); and S.A. TYLER (ed.), ***Cognitive Anthropology*** (1969), are also useful. Three collections by single authors bearing on many aspects of kinship are M. FORTES, ***Time and Social Structure and Other Essays*** (1970); J.R. GOODY, ***Comparative Studies in Kinship*** (1969); and E.R. LEACH, ***Rethinking Anthropology*** (1961). The best known collections of descriptions of specified kinship systems include: A.R. RADCLIFFE-BROWN and D. FORDE (eds.), ***African Systems of Kinship and Marriage*** (1950); J.R. GOODY (ed.), ***The Developmental Cycle in Domestic Groups*** (1958); M. FORTES (ed.), ***Marriage in Tribal Societies*** (1962); G.P. MURDOCK (ed.), ***Social Structure in Southeast Asia*** (1960); J.M. MOGEY (ed.), ***Family and Marriage*** (1963); and R.M. GLASSE and M.J. MEGGITT (eds.), ***Pigs, Pearlshells, and Women*** (1969). There are several articles on kinship in J.A. PITT-RIVERS (ed.), ***Mediterranean Countrymen*** (1963); and among innumerable monographic studies L.R. HIATT, ***Kinship and Conflict*** (1965); T.N. MADAN, ***Family and Kinship*** (1965); and D.M. SCHNEIDER, ***American Kinship*** (1968), stand out. The easiest lead into the complex arguments about Trobriand kinship is via H.A. POWELL, "Genealogy, Residence and Kinship in Kiriwina," ***Man***, 4:177–202 (1969). Sophisticated discussion of kinship in general is found in M. FORTES, ***Kinship and the Social Order*** (1970); I.R. BUCHLER and H.A. SELBY, ***Kinship and Social Organization*** (1968); and R.M. MARSH, ***Comparative Sociology***, pt 2, ch. 3 (1967).

Among the special topics in the field of kinship, evidence from primates is assessed in V. REYNOLDS, "Kinship and the Family in Monkeys, Apes and Man," ***Man***, 3:209–223 (1968). Inheritance is dealt with in R.F. GRAY and P.H. GULLIVER (eds.), ***The Family Estate in Africa*** (1964); J.R. GOODY, ***Death, Properly and the Ancestors*** (1962), and "Sideways or Downwards? Lateral and Vertical Succession, Inheritance and Descent in Africa and Eurasia," ***Man***, vol. 5 (1970); and G.C. HOMANS, ***Sentiments and Activities*** (1962). Adoption is treated in J.R. GOODY, "Adoption in Cross-Cultural Perspective," ***Comparative Studies in Society and History***, 11:55–78 (1969). A recent contribution to the debate about incest is A.P. WOLF, "Childhood Association and Sexual Attraction," *Am. Anthrop.*, 72:503–515 (1970); while divorce and genealogies are discussed by J.A. BARNES in A.L. EPSTEIN (ed.), ***The Craft of Social Anthropology*** (1967); a good discussion of pedigrees is in E.L. PETERS, "The Proliferation of Segments in the Lineage of the Bedouin in Cyrenaica," ***Journal of the Royal Anthropological Institute***, 90:29–53 (1960). M.F. ASHLEY-MONTAGU, ***Coming Into Being Among the Australian Aborigines*** (1937), deals with procreative beliefs; as does E.R. LEACH, "Virgin Birth," ***Proceedings of the Royal Anthropological Institute 1966*** (1967). The kindred is examined in N. YALMAN, "The Structure of the Sinhalese Kindred," ***Am. Anthrop.***, 64:548–575 (1962). The classic exposition of the notion of descent is discussed by Firth and Schneider in the new edition of W.H.R. RIVERS, ***Kinship and Social Organization*** (1968); while other views on the same topic are found in D.M. SCHNEIDER and K. GOUGH (eds.), ***Matrilineal Kinship*** (1961); H.W. SCHEFFLER, "Ancestor Worship in Anthropology," *Curr. Anthrop.*, 7:541–551 (1966); and R.M. KEESING, "Shrines, Ancestors, and Cognatic Descent," ***Am. Anthrop.***, 72:991–1019 (1970). The significance of kin terminology is examined in R.M. KEESING, "On Quibblings over Squabblings of Siblings," *SWest.* J. *Anthrop.*, 25:207–227 (1969), and in many articles in the collections mentioned above. Marriage rules are discussed in CLAUDE LEVI-STRAUSS, *Les structures élémentaires de la parenté* (1967; Eng. tran., ***The Elementary Structures of Kinship***, 1969), and "The Future of Kinship Studies," ***Proceedings of the Royal Anthropological Institute 1965*** (1966); R. NEEDHAM, ***Structure and Sentiment*** (1962); and by HOMANS and SCHNEIDER in G.C. HOMANS, ***Sentiments and Activities*** (1962). Ancestor worship is dealt with in M. FORTES, "Some Reflections on Ancestor Worship in Africa," in M. FORTES *et al.*, ***African Systems of Thought*** (1965); and J.D. MCKNIGHT, "Extra-Descent Group Ancestor Cults in African Societies," ***Africa***, 37:1–20 (1967). Fictive kinship is examined in E.A. HAMMEL, ***Alternative Social Structures and Ritual Relations in the Balkans*** (1968). A good general account of the history of kinship studies is S. TAX, "From Lafitau to Radcliffe-Brown," in F. EGGAN, ***Social Anthropology of North American Tribes***, 2nd ed. (1955); additional information is contained in F. EGGAN, "Lewis H. Morgan in Kinship Perspective," in G.E. DOLE and R.L. CARNEIRO (eds.), ***Essays in the Science of Culture*** (1960).

(Jo.A.B.)

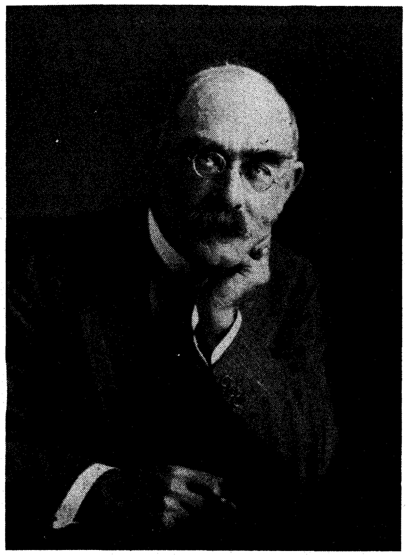
Kipling, Rudyard

Rudyard Kipling, English novelist, short story writer, and poet, is best remembered for his celebration of British imperialism and his tales and poems of British soldiers in India and Burma as well as his children's stories. He was extraordinarily popular in the late 19th and early 20th century, but following World War I his reputation as a serious writer suffered through his being widely viewed as a jingoistic imperialist. Latterly, however, he has again enjoyed high regard.

Joseph Rudyard Kipling was born in Bombay, India, on December 30, 1865. His father, John Lockwood Kipling, an artist and scholar who had considerable influence on his son's work, became curator of the Lahore museum and is described presiding over this "wonder house" in the first chapter of *Kim*, Rudyard's most famous novel. His mother was Alice Macdonald, two of whose sisters married the highly successful 19th-century painters Sir Edward Burne-Jones and Sir Edward Poynter, while a third married Alfred Baldwin and became the mother of Stanley Baldwin, later prime minister. These connections were of lifelong importance to Kipling.

Childhood

Much of his childhood was unhappy. Kipling was taken to England by his parents at the age of six and was left for five years at a foster home at Southsea, the horrors of



Kipling.
Elliott and Fry

which he described in the story "Baa Baa, Black Sheep" (1888). He then went on to the United Services College at Westward Ho, north Devon, a new, inexpensive, and inferior boarding school. It haunted Kipling for the rest of his life—but always as the glorious place celebrated in *Stalky & Co.* (1899) and related stories: an unruly paradise in which the highest goals of English education are met amid a tumult of teasing, bullying, and beating. The Stalky saga is one of Kipling's great imaginative achievements. Readers repelled by a strain of brutality—even of cruelty—in his writings should remember the sensitive and shortsighted boy who was brought to terms with the ethos of this deplorable establishment through the demands of self-preservation.

Kipling returned to India in 1882 and worked for seven years as a journalist. His parents, although not officially important, belonged to the best Anglo-Indian society, and Rudyard thus had opportunities for exploring the whole range of that life. All the while he had remained keenly observant of the thronging spectacle of native India, which had engaged the interest and affection of his earliest childhood. He was quickly filling the journals he worked for with prose sketches and light verse. He published *Departmental Ditties* in 1886, *Plain Tales From the Hills* in 1888, and between 1887 and 1889 brought out six paper-covered volumes of short stories. When he returned to England in 1889, his reputation had preceded him, and within a year he was acclaimed as one of the most brilliant prose writers of his time. His fame was redoubled upon the publication of *Barrack-Room Ballads* in 1892. Not since the English poet Lord Byron had such a reputation been achieved so rapidly. When the poet laureate Alfred Lord Tennyson died in 1892, it may be said that Kipling took his place in popular estimation.

In 1892 Kipling married Caroline Balestier, the sister of Wolcott Balestier, an American publisher and writer with whom he had collaborated in *The Naulahka* (1892), a facile and unsuccessful romance. The young couple moved to the United States and settled on Mrs. Kipling's property in Vermont, but their manners and attitudes were considered objectionable by their neighbours. Unable or unwilling to adjust to life in America, the Kiplings eventually returned to England. Ever after Kipling remained very aware that Americans were "foreigners," and he extended to them, as to the French, no more than a semi-exemption from his proposition that only "lesser breeds" are born beyond the English Channel.

Novels

During his years in America, however, he published *The Light that Failed* (1890), the story of a painter going blind and spurned by the woman he loved; *Captains Courageous* (1897), which, in spite of its sense of adventure, is often considered a poor novel because of the excessive descriptive writing; *Kim* (1901), which, although essentially a children's book, must be considered a classic; and The *Jungle Books* (1894 and 1895), stylistically superb and further proof that Kipling was best at telling a story but inconsistent in producing balanced, cohesive novels.

In 1902 Kipling bought a house at Burwash, Sussex, which remained his home until his death. Sussex was the background of much of his later writing—especially in *Puck* of *Pook's Hill* (1906) and *Rewards and Fairies* (1910), two volumes that, although devoted to simple dramatic presentations of English history, embodied some of his deepest intuitions. In 1907 he received the Nobel Prize for Literature. In South Africa, where he spent much time, he was given a house by Cecil Rhodes, the diamond magnate and South African statesman. This association fostered Kipling's imperialist persuasions, which were to grow stronger with the years. These convictions are not to be dismissed in a word; they were bound up with a genuine sense of a civilizing mission that required every Englishman, or, more broadly, every white man, to bring European culture to the heathen natives of the uncivilized world. Kipling's ideas were not in accord with much that was liberal in the thought of the age, and as he became older he was an increasingly isolated figure. When he died (in London, January 18, 1936), two days before King George V, he must have seemed to many a far less representative Englishman than his sovereign.

Kipling is said to have twice declined the Order of Merit, one of the highest distinctions that can be conferred upon a British subject, and also to have intimated, in 1895, that he would decline the poet laureateship, should it be offered to him.

Assessment

As a poet Kipling will scarcely rank high, although his rehabilitation has been attempted by so distinguished a critic as T.S. Eliot. His verse is indeed vigorous, and in dealing with the lives of soldiers and sailors in particular it breaks new ground. But balladry, music-hall song, and popular hymnology provide its unassuming basis; and even at its most serious—as in "Recessional" (1897) and similar pieces in which Kipling addressed himself to his fellow countrymen in times of crisis—the effect is rhetorical rather than imaginative. But it is otherwise with Kipling's prose. In the whole sweep of his adult storytelling, he displays a steadily developing art. While his later stories cannot exactly be called better than the earlier ones, they are as good—and they bring a subtler if less dazzling technical proficiency to the exploration of deeper though sometimes more perplexing themes. There is much in Kipling's later art to curtail its popular appeal. It is compressed and elliptical in manner and sombre in many of its themes. But that his reputation among informed critics should have declined steadily during his lifetime can scarcely be accounted for except in terms of political prejudice.

MAJOR WORKS

SHORT STORIES: *Plain Tales from the Hills* (1888), 40 stories, enlarged in later editions; *Soldiers Three* (1888); *Wee Willie Winkie* (1888), including "Baa Baa, Black Sheep"; later revised editions include also "Under the Deodars," "The Phantom Rickshaw," and "The Man Who Would Be King"; *Life's Handicap* (1891), including "The Man Who Was," "Without Benefit of Clergy," and "The Mark of the Beast"; later revised editions include also "The City of Dreadful Night" and "The Courting of Dinah Shadd"; *Many Inventions* (1893), including "My Lord the Elephant," "His Private Honour," and "Love o' Women"; later revised editions include also "The Finest Story in the World"; *The Jungle Book* (1894), *The Second Jungle Book* (1895), stories linked by poems for children; *The Day's Work* (1898), including "The Bridge-Builders," "The Ship that Found Herself," "The Tomb of His Ancestors," ".007," "William the Conqueror," "The Maltese Cat," and "The Brushwood Boy"; *Stalky & Co.* (1899), nine school stories, with prefatory poem; *The Complete Stalky & Co.* (1929), adds five stories and a concluding poem; *Just So Stories* (1902), animal fables linked by poems for young children; *Traffics and Discoveries* (1904), stories linked by poems, including "The Bones of Discipline," "Their Lawful Occasions," "They," and "Mrs. Bathurst"; *Puck of Pook's Hill* (1906), and *Rewards and Fairies* (1910), the two volumes combined in *All the Puck Stories* (1935), stories, with accompanying poems, on episodes in English history for children; *Actions and Reactions* (1909), stories linked by poems, including "An Habitation Enforced," "The Puzzler," and "Little Foxes"; *A Diversity of Creatures* (1917), stories linked by poems, including "The Village That Voted the Earth Was Flat" and "My Son's Wife"; *Debits and Credits* (1926), stories linked by poems, including "The United Idolaters," "The Janeites," "In the Interests of the Brethren," and "A Madonna of the Trenches"; *Limits and Renewals* (1932), stories linked by poems, including "The Woman in His Life," "The Church That Was at Antioch," "Beauty Spots," "Aunt Ellen," and "Uncovenanted Mercies."

NOVELS: *The Light That Failed* (1890), version with happy ending serialized in 12 chapters, version with unhappy ending as a book in 14 chapters, revised in 15 chapters 1891, later further revised; *Kim* (1901), for children.

VERSE: *Departmental Ditties and Other Verses* (1886, later enlarged); *Departmental Ditties, Barrack-Room Ballads, and Other Verses* (1890); enlarged edition of *Barrack-Room Ballads and Other Verses* (1892); *The Seven Seas* (1896); *Recessional and Other Poems* (1899); *Songs from Books* (1912, enlarged 1913), collects and revises prefatory and interspersed poems from prose volumes; *The Years Between* (1919).

OTHER WORKS: *From Sea to Sea*, 2 vol. (1899), sketches and travel pieces; *Letters of Travel* (1920), letters and sketches, 1892–1913; *Somethzng of Myself, for My Friends Known and Unknown* (posthumously 1936, dated 1937), unfinished.

BIBLIOGRAPHY. The standard bibliographical work is F.V. LIVINGSTONE, *Bibliography of the Works of Rudyard Kipling* (1927), together with its supplement (1938). The only substantial biography, CHARLES E. CARRINGTON, *Rudyard Kipling: His Life and Work* (1955), is judicious and sympathetic and benefits from a thorough knowledge of Kipling's background in three continents. Three of the best short critical discussions of Kipling's work are those of BONAMY DOBREE in *The Lamp and the Lute* (1929); EDMUND WILSON in *The Wound and the Bow* (1941); and T.S. ELIOT in *A Choice of Kipling's Verse* (1941). Among longer studies two are outstanding: J.M.S. TOMPKINS, *The Art of Rudyard Kipling* (1959); and BONAMY DOBREE, *Rudyard Kipling: Realist and Fabulist* (1967). The first of these, which deals mainly with the prose fiction, is at once enthusiastic and discriminating; the second is a penetrating examination of the philosophical basis of Kipling's work. In *Kipling's Mind and Art* (1964), ANDREW RUTHERFORD has brought together an excellent selection of essays by various hands. R. LANCELYN GREEN (ed.), *Kipling: The Critical Heritage* (1971), affords a valuable conspectus of the development of Kipling's reputation.

(J.I.M.S.)

Kirgiz Soviet Socialist Republic

Located in the heart of the Asian landmass, the Kirgiz (or Kirghiz) Soviet Socialist Republic (Kirgiz S.S.R., Kirgiziya, or Kirgizistan) has an area of 76,600 square miles (198,500 square kilometres) and was inhabited by an estimated 3,294,000 people in January 1975. Almost 44 percent of the population (1970) is composed of Kirgiz, a Turkic people, former nomads whose known history dates back at least to 200 B.C. Kirgiziya became an autonomous *oblast* under the Russian Soviet Federated Socialist Republic in 1924 and an autonomous soviet socialist republic in 1926. It was made a constituent republic only in 1936, with its capital at Frunze (until 1925 named Pishpek).

By the 1970s Kirgiziya had become transformed into a rapidly industrializing state, with the former nomads settled under a collectivized agricultural system. Though urbanization is accelerating, many of the old ways of life, nevertheless, survive.

To the north and northwest, Kirgiziya is bounded by the Kazakh S.S.R. On the southwest lies the Uzbek S.S.R., and on the south, beyond the Turkistan and Zaalay ranges, the Tadzhik S.S.R. On the southeast, the Kokshaal-Tau Range, part of the Tien Shan, forms the border with China. Most of Kirgiziya's borders run along mountain crests, and the few lowland areas—the Chu and Fergana valleys---occur near the places where the borders dip down to meet the plains and deserts that lie to the west and north. A deep hollow in the northeast holds Lake Issyk-Kul, one of the finest natural features in all of Central Asia.

For related information, see TIEN SHAN (MOUNTAINS); ISSYK-KUL, LAKE; INNER ASIA, HISTORY OF; RUSSIA AND THE SOVIET UNION, HISTORY OF; TURKISTAN, HISTORY OF; ALTAIC LANGUAGES; and CENTRAL ASIAN PEOPLES, ARTS OF.

THE LAND

Topography. Kirgiziya is above all a mountainous country. At its eastern extremity, on the Chinese border, rise Victory Peak (Pik Pobedy), the second highest in the entire Soviet Union, and Pik Khan-Tengri, the fourth highest. This region is the core of the massive Tien Shan system, which thrusts on eastward into China; from it, mountainous belts spread westward over most of Kirgiziya. On the republic's southern border appear the Kokshaal-Tau, Alay, and Zaalay ranges, the last named influenced geologically by the vast structural knot of the Pamirs lying to the south in the adjoining Tadzhik Soviet Socialist Republic.

Mountain peaks

In the southwest lies the Fergana Valley. A similar huge hollow lies in the northeast, comparatively close to Khan-Tengri; bounded by the westward-thrusting arms of the Kungey-Alatau and Terskey-Alatau ranges, it contains Lake Issyk-Kul, the clear and deep waters of which are backed by snow-clad peaks. The rugged mountain and basin structure of much of the country, and the high alpine plateau of the central and eastern regions, are separated from the Fergana Valley on the west by the Fergana Range. running southeast to northwest, which merges into the Chatkal Range. The last named is linked to the Issyk-Kul region by a final enclosing range, the Kirgiz.

Apart from the Fergana Valley, the only important lowland areas are the Chu and Talas valleys near the northern border of the republic, the former containing the capital, Frunze. These lowland areas, occupying 15 percent of the total area, are of immense significance for settlement.

Drainage. The crests of the ranges are mantled in perpetual ice and snow. The total area thus clad exceeds 2,500 square miles and includes the 37-mile-long southern branch of the Inylchek glacier, one of the world's greatest. Numerous short rivers, with many rapids, pour from the mountains into the inner basins. The Naryn River, running down into the Fergana Valley and continuing northwestward as a tributary of the Syrdarya, is of major significance, as is the Chu, running parallel to, or forming part of, the northern boundary with Kazakhstan.

Climate. Important influences on the climate are the remoteness of Kirgiziya from the oceans and the sharp change of elevation from neighbouring plains. The republic is surrounded by the Central Asian plains and deserts to the north, west, and southeast, making the contrast with the climate and landscape of its mountainous interior all the more striking. The lower parts of its fringing ranges lie in belts of high temperature and experience the hot, moisture-consuming winds from the deserts beyond. Conditions in the transitional zone above this hot desert region but below the cold high deserts vary greatly according to relief patterns: westward- and northward-facing slopes generally receive more moisture, which increases with altitude. Summer in the valleys is hot and dry, and the mean temperature in July is 82" F (28" C), while the average January temperature is —0.5" F (—18" C). Absolute temperatures have an even wider range, from a high of 109" F (43" C) to a low of —65" F (—54" C). Annual precipitation varies from 7.1 inches (180 millimetres) in the eastern Tien Shan to 30–40 inches (750–1,000 millimetres) in the Kirgiz and Fergana mountains. In the most populous valleys, it ranges from four to 20 inches.

Precipitation

Vegetation and animal life. Except at the highest altitudes, the elevated landscapes of Kirgiziya are characterized by flower-strewn alpine and subalpine pastures. Woodlands are found along the lower valleys and on the slopes of the north-facing ranges; occupying 3 to 4 percent of the total area of the country, they are coniferous and include the striking Tien Shan white spruce. Animal life in the forests is a varied mixture of European and Asian species that includes brown bear, wild pig, lynx, gray wolf, and ermine. The wooded ravines and the valleys of the mountainous steppe regions are the abode of the *arkhar—a* mountain sheep—mountain goats, deer, and snow leopards. Birds are plentiful in the mountains;

rock partridges are found on cliffs and around water sources, and jackdaws and the snow, black, and bearded varieties of vulture live in the alpine areas. By comparison, animal life in the desert regions is scanty: rodents—yellow gophers and jerboas—hares, and a large-eared hedgehog are typical; birds include the desert bullfinch and red starling, and among reptiles are the steppe turtle and some snakes.

The human imprint. Since the beginning of the Soviet period, the pattern of settlement has changed considerably, with large immigration and industrialization. Cities have grown remarkably, with 38 percent of the population clustered in 18 large cities and 47 other urban communities by the mid-1970s, compared with only 12 percent urbanization in the mid-1920s. The densest settlement is in the Chu and Fergana valleys. The capital, Frunze, a town of some 30,000 people in the 1920s, in 1970 registered a population of 430,618. Only 53,059 (12.3 percent) of these people were Kirgiz, however. More than 66 percent (284,676) of the city's residents were Russian, and Ukrainians made up 6.2 percent (26,901). Tatars, Uighurs, Uzbeks, and Jews made up smaller minorities of the Frunze populace.

Patterns of urbanization

Around the edges of the Fergana Valley are five towns ranging in population from 16,000 to 120,000. Clockwise from the north they are Tash-Kumyr, Kok-Yangak, Osh, Kyzyl-Kiya (all coal-mining towns except Osh, a silk-processing centre), and Sulyukta. Another city of similar size is Przhevalsk, at the eastern end of Lake Issyk-Kul.

The modern buildings and planned layout of the new cities contrast with rural life, which differs according to ethnic background. Russian and Ukrainian villages are scattered in the north, together with communities of Dungans, or Hui (Chinese Muslims). There are old-fashioned Uzbek settlements, known as *qishlaq*s, in the south. The Kirgiz kyshtaks, villages built during the Soviet period to speed the transition from a nomadic to a settled existence, are scattered everywhere, as are collective and state farms.

The development of a modern transportation network is breaking down much of the old isolation. Frunze was formerly linked with the Fergana region only by a railway that made a long detour over the lowlands to the west, through Kazakhstan and Uzbekistan, but since 1965 traffic has flowed along the direct Frunze–Osh highway that cuts through the mountains and halves the distance. Alpine terrain still presents a great impediment to the construction of railways, but a network of highways is gradually replacing the winding paths along which people travelled for centuries by horse or camel or on foot.

THE PEOPLE

Ethnic backgrounds. Kirgiziya's population is made up mainly of Kirgiz, Russians, Uzbeks, Ukrainians, and Germans (the last deported to Central Asia from the Soviet west in 1941). The 1,284,773 Kirgiz in 1970 constituted less than half of the 2,932,805 total, Russians more than 29 percent, Uzbeks 11.3 percent, Ukrainians 4.1 percent, and Germans 3.1 percent. Many smaller groups made up the remainder.

The early Kirgiz

The first Kirgiz tribes settled in the Tien Shan region in ancient times and had a long history as one of the great nomadic groups of Central Asia. During the Soviet period, the almost complete abandonment of nomadic life under compulsion, and the replacement of individual farming by state collectivization in agriculture, have caused great changes in Kirgiz society.

Demographic trends. The Kirgiz death rate has diminished to little more than one-sixth that of the early 20th century, while the birth rate has doubled, giving an average annual natural increase of 2.4 percent. Between 1959 and 1970 Kirgiz in their republic grew by 53.5 percent, an average of nearly 4.9 percent each year, including natural and other forms of increase.

In 1970, 85.5 percent of the Kirgiz remained rural dwellers, engaged almost wholly in agriculture; the growing urbanization and economic development in industry have largely bypassed them. At the same time, 66 percent of all Russians in Kirgiziya lived in urban areas, as did 51 percent of Ukrainians, 37.5 percent of Germans, and 36 percent of Uzbeks. These groups, along with Tatars, Uighurs, Jews, and smaller but also considerably urbanized minorities, occupied a disproportionate share of urban-industrial employment in Kirgiziya.

The population density averaged 38 per square mile at the census of 1970, but the interior mountainous regions are virtually uninhabited, whereas Frunze alone accounts for almost 15 percent of the population.

The Kirgiz in Kirgiziya rose from 40.5 percent in 1959 to 43.8 percent in 1970, but demographers doubt that this high rate of increase will be maintained. In the identical period, though the percentage of Russians in the republic's population declined slightly, from 30.2 to 29.2, the absolute numbers of Russians grew from 623,562 to 855,935, a gain of more than 37 percent. Kirgiziya differs from most other union republics in that fairly large numbers of Russian and other Slavic and Soviet western immigrants have entered the farming population and not merely added to the population of the urban areas.

THE ECONOMY

Kirgiziya was formerly wholly agricultural, and stock raising was prevalent. By the 1970s the republic was a source of nonferrous metals, notably antimony and mercury ores, and a producer of machinery, instruments, hydroelectric power, and the products of light and food industries. The mineral wealth of the mountains—lead, zinc, and other metals—is being discovered, Kirgiziyan coal reserves are estimated at about 3,000,000,000 tons, and deposits of petroleum and natural gas have been found in the Fergana region. Extensive irrigation makes possible the expansion of agriculture and represents part of a large capital investment in the republic. During the years of the pre-World War II five-year plans, this investment produced plants for the extraction of antimony and for the processing of agricultural products, and the first metal-manufacturing plants and modernized blast furnaces were introduced. Large sugar factories were built, and emphasis was given to the primary processing of cotton and other fibre crops. During World War II, manufacturing expanded, and in ensuing decades the industries producing machines, building materials, and electric power were developed.

Industry. In addition to ore extraction, coal mining continues to be of basic importance. About 4,400,000 tons were produced annually by the mid-1970s, and new sources in the north and east were being exploited, in addition to the traditional southern reserves. The new deposits include major reserves in the Karakichi region of the inner Tien Shan, where coal layers up to 250 feet (75 metres) thick outcrop onto the surface. Petroleum and natural gas deposits have been exploited in the south, and annual extraction rates in the mid-1970s reached 260,000 tons of oil. Plans call for coal, oil, and natural gas to serve as the base for a chemical industry.

Food-processing and light industries, utilizing local agricultural raw materials, are also of importance in the republic. They include the production of meat, canned meat, fruits and vegetables; woollen, cotton, and silk fabrics; and leather goods. Cotton spinning and cleaning and enterprises producing worsted cloth, knitted garments, and leather and sheepskin coats are particularly significant.

Energy resources

The considerable energy resources of the republic are essential for industrial development. More than half the electric energy, some 4,400,000,000 kilowatt-hours annually, comes from waterpower. Completion of, and greater utilization of the power produced at, the Toktogul station, using the waters of the Naryn River, is one of the pressing industrial tasks.

Agriculture. Industrialization has stimulated the mechanization of Kirgiz agriculture, and many types of machines necessary to cope with the rugged terrain are now manufactured in the republic. Irrigation has been most important in increasing agricultural output; in the Fergana region, for example, where the republic's cotton is produced, the network of canals and reservoirs has been completely restructured.

The leading branches of agriculture are pasture-based stock raising and the cultivation of cotton, sugar beets, tobacco, and opium poppies. Some 80 percent of the total agricultural land is taken up by pastures and by fields used to grow hay. Under the collectivized, state-owned system, the always important stock raising of the Kirgiz is being linked with the cultivation of cereals and industrial crops, silage, and seed grasses. This process is encouraged on every kolkhoz (collective farm) and sovkhoz (state farm) but is most fully developed in the valleys on the republic's borders.

Livestock

Sheep and goats totalled almost 10,000,000 head by the mid-1970s, and milk and beef cattle—especially in the Chu Valley and the Issyk-Kul region—approached 1,000,000 head. Around Lake Issyk-Kul and in other mountain regions, the breeding of fine racehorses was being developed, as was the raising of swine, bees, and rabbits.

Horses are also important in the mountain kolkhozy; not only are they used as draft animals, but also their meat is eaten, and fermented mare's milk. known as koumiss, is the favourite nourishing beverage of the Kirgiz, also used as part of the treatment at mountain health resorts.

By the mid-1970s the total area under crops had reached 3,183,000 acres (1,288,000 hectares), of which about 44 percent was devoted to food grains, 6 percent to cotton, and 4 percent to sugar beets, while the remaining acreage was used for potatoes, vegetables, and fodder (not including hay).

The total cotton harvest approached 232,000 tons annually in the mid-1970s, and yield per acre was high. The annual production of sugar beets, mostly in the Chu Valley, was around 2,050,000 tons, providing work for a half dozen sugar factories and giving that area the Russian nickname *sakharnaya* ("sugar valley"). In the Naukat Valley in the south and also in the Talas Valley of the north, tobacco is cultivated. Horticulture and viticulture are developed in the Chu Valley and the Fergana area, with the mulberry trees of the latter supporting the raising of silkworms.

Hunting and fishing. The sparsely populated interior valleys contain almost inaccessible regions suitable for valuable fur-bearing species of animals. Kirgiz are enthusiastic hunters; indeed, five of the months in the Kirgiz calendar are named after game animals. Although modern firearms and traps have been introduced, there is still a preference for using the trained golden eagles to search out rabbits, foxes, and even wolves.

Lake Issyk-Kul, in spite of a paucity of plankton, is rich in fish. The catch—about 8,000 tons annually—is brought to the shoreline communities almost year round, the exception being in winter, when the fish descend to great depths. Artificial stocking of the lake has included the introduction of trout from Lake Sevan in Armenia, and fish-breeding farms are also used.

Transportation. Before 1924 the only railways in Kirgiziya were two narrow-gauge lines leading from the borders to the coal deposits of Kok-Yangak and Sulyukta. The construction of a line from Frunze across the Chu Valley and over the border to Lugovaya in Kazakhstan joined the north of the republic to the Turkistan–Siberian main railway line and, through it, to the south of the republic and the entire Soviet railway network. In 1948 a link extended the line up-valley from Frunze—it reached heights of 5,000 feet along the remote Boam Canyon—to Rybachye at the western tip of Lake Issyk-Kul. New southern lines reached the coal mines at Tash-Kumyr and Kyzyl-Kiya.

The road system

Highways are nevertheless being developed as the basic answer to the topographic problems confronting land transportation. One main route climbs from Frunze to Rybachye (with extensions along the north and south shores of Issyk-Kul), then swings south across difficult central terrain to Naryn, and then through the high Torugart Pass across the frontier with China and down to the city of Kashgar, in the Sinkiang Uighur Autonomous Region. The other major artery, the "route beyond the clouds," from Frunze to Osh, crosses the Kirgiz Alatau crest through a 10,500-foot (3,200-metre) tunnel. An important southern link is provided by the road joining Osh, via the Alay Pass, to the Pamir region of Tadzhikistan. An offshoot runs eastward through Irkeshtam to Kashgar. The total main and secondary road network in the country approached 12,800 miles (20,600 kilometres) by the mid-1970s, and about 2,523,000 ton-miles (3,684,000 ton-kilometres) of freight moved along the roads each year.

Cargo-carrying and passenger vessels ply Lake Issyk-Kul, whose waters, although surrounded by peaks clad with snow, remain unfrozen in winter. Very strong local winds, raising waves and waterspouts, are an ever-present hazard, and travellers, not unexpectedly, generally prefer to use the modern lakeside highways.

ADMINISTRATION AND SOCIAL CONDITIONS

The constitutional and political framework. The republican constitution dates from March 23, 1937. All significant state functions are subordinated to the central government in Moscow, the capital of both the Russian S.F.S.R. and the Soviet Union. Though sovereignty is claimed for the Kirgiz S.S.R. by Soviet authorities, in fact it exercises no independent control over cultural, economic, social, political, military, or foreign affairs affecting it.

The highest governmental body in the republic is the Supreme Soviet, selected from a single slate of nominees for a four-year term. The Supreme Soviet, which exercises only ceremonial functions, generates an executive and administrative Council of Ministers. Local soviets are selected every two years. The chief legal officer of the Kirgiz S.S.R., the procurator, is appointed by the central government in Moscow.

The Communist Party

The sole authorized political organization and centre of power in Kirgiziya is the Communist Party, a branch of the Communist Party of the Soviet Union (CPSU). Kirgiz constitute a disproportionately small part of the membership throughout the Soviet Union as well as within their own republic. In 1970 they made up 0.6 percent of the entire Soviet Union population but in 1972 only 0.3 percent of CPSU members. More important is the fact that, inside the Kirgiz S.S.R., there were 38,881 Kirgiz party members out of a total membership of 103,028, just 37.7 percent, compared with the 38,847 (also 37.7 percent) Russian members, whose share of the republic's population in 1970 was less than 30 percent. Ukrainians supplied 8.7 percent of Kirgiziya's party members from their 4.1 percent of its population; the Uzbeks, by contrast, provided only 6.1 percent, although they constituted more than 11 percent of the republic's population. These figures reveal both the Kirgiz disadvantage and a general disparity between the proportion of membership in this privileged organization allowed to the indigenous Central Asians as compared to the various immigrant groups.

The Komsomol (Young Communist League), closely tied to the CPSU, counts more than 350,000 youths enrolled in Kirgiziya, a large proportion of them from the ranks of outsiders rather than Kirgiz or other Central Asians.

Labour unions, which enroll about 981,000 members in the republic, exert little influence upon protecting the interests of workers in relations with management. In effect, they serve the government by leading campaigns for higher labour productivity and by supervising granting of vacations to working people as well as access to resorts, sanatoriums, and other facilities.

Education and other services. Between 1959 and 1970 the number of Kirgiz with college degrees rose from 21 to 56 per 1,000 persons in the republic over nine years of age. The ratio of men to women in this category was about three to one in 1970, an improvement from more than four to one in 1959. At the time of the Soviet census of 1970, however, 98.3 percent of Kirgiz over 60 years of age, 91.8 percent between the ages of 55 and 59, and 79.5 percent between 50 and 54 had had no secondary education.

By the mid-1970s, ordinary public schools enrolled more than 820,000 pupils of all nationalities; technical schools and similar institutions with specialized curricula admitted some 42,000. Nine institutions of higher learning enrolled almost 49,000 students from a mixture of ethnic groups. The Kirgiz State University and other principal institutions are located in Frunze, but Przhevalsk, Dzhalal-Abad, and Osh also have institutions of higher education.

Education is provided without direct tuition charge, the institutions being supported by turnover taxes, touching most working people, and levies upon factories and other firms.

Academy of Sciences

The Academy of Sciences, established as a branch of the central body in Moscow in 1954, has three departments and about a dozen research institutes, and there are 50 other scientific and other research establishments.

With the concentration of a growing immigrant population from outside the republic in the cities, housing development has had to undergo great expansion, as have hospitals, maternity and child welfare centres, and other public health bodies. By the 1970s the republic had a ratio of 2.3 doctors per 1,000 population. Medical services are tax-supported.

The mass communications media. Newspapers and magazines are published in both Russian and Kirgiz. Radiobroadcasting also is carried out in both languages, and most of the larger cities and all the districts have studios. There are republican television centres and studios in Frunze and regional studios in nearly all regional capitals. A network of relay lines connects the stations, enabling them to receive programs from Moscow, as well as those of the European Intervision and Eurovision networks.

Cultural life. Kirgiz cultural life has been greatly influenced by the rich oral literary tradition (including epic cycles and lyric poetry) of the region; by the development of a modern literary language and the change from the Arabic alphabet to Roman and finally to Cyrillic (with diacritical markings added) beginning in 1940; by imposition of Marxist-Stalinist-Leninist ideology in all fields of thought and the arts; and by persistent official attacks upon Islām (to which the Kirgiz were converted long ago) and the practice of religion.

A leading figure in drama and the novel today is the Kirgiz writer Chingiz Aytmatov, whose work, especially *Tales of the Mountains and Steppes*, which was widely circulated in English translation, won him a Lenin Prize in 1963. Although Aytmatov writes in both Kirgiz and Russian, the easy accessibility of his prose makes both originals and translations of the stories and longer writings extremely popular. His play, *The Ascent of Mt. Fuji*, written with the Kazakh playwright Kaltay Muhamedjanov, with its discussion of moral compromises made under Stalin, was a sensation when it first appeared on stage in Moscow in 1973 and has since been performed in English in Washington, D.C., and elsewhere. Kirgiz poets strive to accommodate their tradition to the new ideology and its literary guidelines known as Socialist Realism. Folk legacies are handed on by the bards, who recite the long Kirgiz verse epic *Manas*, expressing the fiercely independent outlook of the earlier Kirgiz.

In music, older traditions are represented in ensembles of the three-stringed *komuz*, plucked like a lute, and there is a Kirgiz Philharmonia. There are vigorous folk dance groups, and theatres perform Kirgiz and Russian plays as well as plays translated from other languages.

The Kirgiz motion-picture studio, which was established in 1942, produces feature films as well as newsreels, documentaries, and popular scientific films.

THE OUTLOOK

Under the Ninth Five-Year Plan, for 1971–75, industrial products were planned to increase by almost 50 percent, with manufacturing and light, hydroelectric, and mining industries particularly scheduled for expansion. Completion of the Toktogul hydroelectric station (first power generated in 1975) was to be followed by construction of the large Kurpsay project. Agriculture was also to be strengthened. An expansion of services and consumer goods should result in a rise in living standards.

Lively developments in literature, education, and publishing suggest the maturing of a sizable new Kirgiz intelligentsia. Gains, though slight, in Communist Party membership within Kirgiziya, together with the dramatic Kirgiz population growth, also presage further advancement for the Kirgiz people. For Kirgiz leaders, the primary problem will soon cease to be the modernization of their people and will become the taking on of greater responsibility for their own affairs. This promises to raise serious challenges when the highly trained Kirgiz younger generation cannot find suitable employment in the cities, where most jobs for skilled and educated persons are still filled by non-Kirgiz.

BIBLIOGRAPHY. For modern Kirgiziya, extensive reference lists appear in RICHARD A. PIERCE, *Soviet Central Asia: A Bibliography* (1966), as well as in the following publications, which also cover recent developments in the Kirgiz S.S.R. in detail: EDWARD ALLWORTH (ed.), *Central Asia: A Century of Russian Rule* (1967) and *The Nationality Question in Soviet Central Asia* (1973); and ZEV KATZ *et al.* (eds.), *Handbook of Major Soviet Nationalities (1975).*

(S.N.R./E.Al.)

Kirin

A province of the central (Northeast Manchuria) region in northeastern China, Kirin (Ji-lin in Pin-yin romanization) borders the Primorsky Kray (Maritime Province) of the Soviet Union to its east, North Korea to its southeast, the Chinese province of Liaoning to its south, Heilungkiang to its north, and the Inner Mongolian Autonomous Region to its west. It has an area of 72,200 square miles (187,000 square kilometres) or 2 percent of the national total, and a population registered in 1957 as 12,550,000 or 1.9 percent of the national total. The estimated 1970 population is 20,000,000. The capital (since 1954) of the province is Ch'ang-ch'un. Kirin was created a province in 1907, near the end of the Manchu dynasty, and was occupied by the Japanese Army in 1931, becoming a part of the puppet state of Manchukuo (1932–45). Just before Japan's surrender to the Allies on August 15, 1945, Soviet forces entered the region, dismantled key industrial installations, and removed them to the Soviet Union. Following the withdrawal of Soviet troops, Chinese Nationalists moved in, but by 1948 they had been driven out by Chinese Communist forces.

The landscape. *Relief and drainage.* The province may be divided into three parts: the eastern mountains, the western plains, and a transitional zone of rolling hills between them. Elevation decreases from the highlands in the southeast toward the Manchurian Plain in the northwestern part of the province. The mountains of eastern Kirin take the form of parallel ranges with the Cathaysian or Sinian trend, and are separated by broad valleys. The most famous of the ranges is the Ch'ang-pai Shan ("permanent white mountain") close to the Korean border. Its snow-covered summit is 9,000 feet (2,744 metres) above sea level—the highest peak in northeastern China. The summit is formed by a volcanic crater occupied by a lake called the T'ien Ch'ih ("celestial pond"). The range is the source of three important rivers: the Sungari, the Yalu, and the Tumen.

Mountains

The Yalu and Tumen rivers flow in opposite directions along the Sino-Korean border. The Yalu runs southwest along the border to the Korea Bay; the Tumen down the Ch'ang-pai Shan northeastward to the Sea of Japan. The two rivers are of great strategic importance, guarding the land approaches to northeastern China from the Korean peninsula.

The Sungari River (Sung-hua Chiang) is the major stream of Kirin. It flows for almost 500 miles within the province, draining an area of over 30,000 square miles. Its upper course runs northwest in a series of rapids through heavily forested mountains before it enters the Sungari Reservoir, a man-made lake some 105 miles long and 210 square miles in area, having a storage capacity of 12,300,000,000 tons of water. It irrigates more than 167,000 acres of farmland, and generates 567,000 kilowatts of electricity. Emerging from the reservoir, the Sungari flows past the city of Kirin, situated at the head of navigation of Sungari River and at the geographical centre of the province. At Fu-yii it enters the Manchurian Plain and is shortly afterward joined by its chief tributary, the Nen Chiang, which is in fact larger than the Sungari. It then turns sharply east to run along the provincial boundary for a short distance before it leaves Kirin Province.

The middle section of the Manchurian Plain forms the northwestern part of the province, and constitutes three-eighths of its area. It has a rolling topography, with an average elevation of about 650 feet above sea level.

Temperature and precipitation

Climate. Kirin Province forms a transitional climatic zone between northern and southern Manchuria. The winter is cold and long, and rivers are frozen for about five months; the ice on the Sungari is thick enough to support mule carts. Ch'ang-ch'un, midway between northern and southern Manchuria at 708 feet above sea level, has mean temperatures of 1.6" F (—16.9" C) for January and 74.5" F (23.6" *C)* for July. It has a mean annual precipitation (rain and snow) of 24.5 inches, 83 percent of it during the five warm months from May to September. Precipitation increases southeastward to more than 40 inches in the Ch'ang-pai Shan area, but decreases westward; the Manchurian Plain has only 16 inches.

Soils. There are two main types of soil in the province: podzols in the eastern mountainous region and black earth in the western plains. The podzols occur in several forms and are of both high and low fertility. Central and western Kirin are the areas of the black earths of the Manchurian Plain. Of high fertility and adequate thickness (20–50 inches) and containing a high percentage of organic matter (10 percent and more), they form good arable land. The young alluvial soils along the Sungari and its tributaries also provide excellent land for cultivation. In western Kirin are saline soils, alkali soils, and high-alkali soils of low agricultural value.

Tree types

Vegetation and animal life. The natural vegetation is prairie grass in the western plains and mixed conifer and broadleaf deciduous forest in the eastern mountainous area. The vegetation in the eastern mountains includes tree species such as the Japanese red pine, Manchurian ash, fish-scale pine, larch, birch, oak, willow, elm, and the Manchurian walnut. In the deep mountain interior, virgin forest has been preserved. Tree types are distributed in distinct belts depending mainly on altitude: between 800 feet and 1,600 feet elevation is the deciduous broadleaf belt, mainly mountain willow and thumb; between 1,600 feet and 3,000 feet is found mixed coniferous and broadleaf forest; between 3,000 feet and 5,900 feet occurs coniferous forest; and from 5,900 feet to 6,900 feet is found mountain birch.

Many valuable wild animals and medicinal plants are found in the forested mountain areas. The Manchurian hare, valued for its fur, and some species of rodents such as the rat hamster and the eastern field vole are believed to be peculiar to the Manchurian forest. Among the birds, finches, the buteo hawk, the needle-footed owl, the black and white barrier, and certain species of flycatcher are typical. Among semiaquatic animals, the lungless newts are notable. Certain species of snakes, such as the Schrenk racer, found in the inhabited areas of the Northeast and Korea, live in a semidomesticated state and are used to eliminate harmful rodents in orchards and gardens. The European wild boar, the common hedgehog, the Asian red deer, the harvest mouse, and the field mouse are among the more common Eurasian species. Valuable pelts include fox, chipmunk, the light-coloured polecat, the Manchurian hare, and the sable. The sable population, however, has become very small.

The people. Population growth. The annual rate of growth of population for the period 1957–67 was 3.1 percent, and it was estimated in 1970 that the population of the province had reached 20,000,000, compared with the 11,290,000 of 1953. The rapid population increase is accounted for partly by a mass immigration of farmers and partly by natural increase during two decades of peace and order. There has been some birth control, and the death rate has been rapidly declining in China because of relatively easy improvements in public hygiene and medicine, and, above all, a general improvement in nutrition among the peasants.

Density. The average population density (1967–68) was 236 per square mile—higher than the national average of about 194 per square mile. The Kirin figure is thus slightly higher than that of France and Austria, both of which had densities of nearly 231 per square mile in 1966. A study by the Institute of Geography of the Chinese Academy of Sciences reported that in 1957 the density varied greatly in different sections of the province; some densely populated counties (hsien) in northeast Kirin reached 414 per square mile, and sparsely populated counties of the forested area in the southeast had as few as 26 persons per square mile. More than 30 percent of the population is urban.

Urbanization. Kirin Province is the most urbanized in China: in 1957 the urban population accounted for nearly 30 percent of the total, a rapid advance from the 22 percent of 1949. At the end of 1957, the largest city, Ch'ang-ch'un, had 975,000 inhabitants; and Kirin, second largest, 568,000. Three cities (Ssu-p'ing, Liao-yiian, and T'ung-hua) had 100,000–250,000 inhabitants; four had 50,000–100,000; 25 had 20,000–50,000; and 31 more had between 10,000 and 20,000 persons.

Ethnic groups. The population registration in 1957 revealed that 90 percent of the inhabitants were Chinese, 6.3 percent Korean, and 2.9 percent Manchus. Chinese predominate throughout the province, except in the Yen-pien Korean Autonomous District. In the Yen-pien District, which is contiguous to North Korea, Koreans, who introduced the cultivation of rice to Kirin, form 59 percent of the population. They came originally from Korea. Most of the Manchus live in the central part of the province: in Kirin, in Yung-chi Special District (*chuan-ch'ii*), and T'ung-hua Special District. A few Muslims (Hui) are distributed in the cities and towns of the province, and some Mongolians are to be found in the Pai-ch'eng area in northwestern Kirin.

Administration and social conditions. Kirin province is one of the 29 primary administrative divisions of the People's Republic of China. The province is divided into eight subprovince level areas consisting of five special districts (chuan-ch'ii), one autonomous district (*tzu-chih-chou*), and two municipalities (shih) under the direct control of the province. The two municipalities are Ch'ang-ch'un Shih, the largest city and the provincial capital, and Chi-lin Shih (Kirin), the second largest city and former capital of the province. The subprovincial administrative areas are further subdivided into 36 counties (hsien), seven municipalities (shih), and two autonomous counties (tzu-chih-hsien). The latter are Ch'ang-pai Korean Autonomous Hsien, in the southeast, and South Gorlos (Ch'ien-kuo-erh-lo-ssu) Mongol Autonomous Hsien, in the northwest.

The role of the production teams

The traditional subcounty territorial unit is the hsiang (rural district or civil township). The hsiang was retained in the 1954 Constitution of the Chinese People's Republic, but during the mid-1950s became obsolete with the organization of "higher co-ops," and was finally relegated to administrative limbo with the establishment of people's communes in 1958. Each commune is administered by an elected commune committee, but actually the real power lies in the commune party committee of the Chinese Communist Party. The commune is subdivided into production brigades, the branch committee of which is the grass-roots control body of the party apparatus. The production brigade owns the land as well as the means of production, and it is subdivided into production teams that form the lowest level administrative unit. These are often agglomerated rural villages, or *chieh-tao* (residential street grouping) within a town. The production team is the basic economic accounting unit of rural China. During the Great Proletarian Cultural Revolution

(1966–69), many local administrations, both party and government, were disrupted by Red Guards and replaced with revolutionary committees constituted by representatives of the People's Liberation Army, the "revolutionary mass organizations" and "state organs of the dictatorship of the proletariat." The People's Liberation Army assumed an increasingly important role in local administration after 1969. Rural education, social welfare, the care and support of the aged, orphans and widows, rural recreation, medical care, and rural economic development and modernization are in part financed from profits of labour-intensive rural industry organized under the commune system.

Economic organization. ***Manufacturing.*** The two largest cities, Ch'ang-ch'un and Kirin, serve as major administrative, cultural, educational, commercial, and manufacturing centres.

The oldest city, Kirin, has a history of merely 300 years; Ch'ang-ch'un was founded only in 1825; and most of the towns have a history of not more than 60 years. Rapid urban-industrial development has occurred only during the last three or four decades.

Ch'ang-ch'un has long been a food-processing centre for the rich agricultural region of the Sungari Valley, where wheat, rice, maize, soybeans, kaoliang, and millets are grown and livestock raised. Lumbering is also important. Under the People's Republic, the industrial base has been greatly expanded. The huge Ch'ang-ch'un No. 1 Motor Vehicle Plant was designed and equipped with the technical assistance of the Soviet Union to produce 30,000 "Liberation" trucks (six cylinders, 90 horsepower, four tons) a year. Because of the Sino–Soviet rift, the Soviets withdrew their assistance in mid-1960, but the 23,000 Chinese workers, by the end of 1960, were producing up to 100 trucks a day. A railway carriage factory was also designed by Soviet experts, but when the Soviets withdrew support the plant was left unfinished. The designed capacity was 50 cars a day, but the daily output in late 1960 was only five a day. Ch'ang-ch'un has the second largest film studio in China and produced 26 films and 12 documentaries in 1960.

Vehicle production

Transportation. The province is served by 1,676 miles (1957) of railroads, about 10 percent of China's railways. It has 236 miles of railroad per 100 square miles of area, the densest in China. Of the 47 municipalities and counties in the province, 38 have direct access to a rail line.

The Sungari is the main artery of the inland navigation network. Large steamers can sail up to the town of San-ch'a-ho, smaller steamers to Feng-man, and wooden vessels to Liang-chiang-k'ou. Its tributary the Hui-fa Ho and the Tumen River are both navigable by wooden vessels. The Yalu is navigable by steamers up to Yii-shu-lin-tzu, and by wooden vessels above that point.

Kirin Province is served by over 6,000 miles of motor roads. The highway network has four regional centres—at Ch'ang-ch'un, Kirin, Yen-chi, and T'ung-hua.

Cultural life. In 1959 to 1960 there were 35 institutions of higher learning in the province, with a total student enrollment of 32,000. Kirin University, Kirin Polytechnic University, and Kirin Normal University were located in Ch'ang-ch'un. Higher education institutions closed during the Cultural Revolution (1966 to 1969), but in 1970 the North-East People's University was one of those which had reopened.

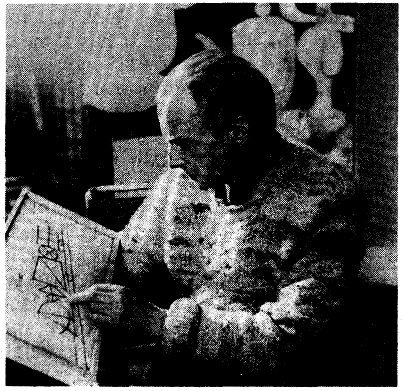
BIBLIOGRAPHY. The best regional economic monograph is SUN CHING-CHIH (ed.), ***Economic Geography of Northeast China*** (Eng. trans. 1962). Two of the best atlases on China are the C.I.A. publications: ***Communist China Map Folio*** (1967) and ***Communist China Administrative Atlas*** (1969). The best physical geography of China in a Western language is V.T. ZAYCHIKOV (ed.), ***The Physical Geography of China*** (Eng. trans. 1965).

(F.Hu.)

Klee, Paul

One of the most acute creators of forms in modern painting, Paul Klee has had a considerable influence on the art of the 20th century. This genius of modern art stands apart from all groups. If Expressionism can be considered as the "direct visualization of individual emotion," Klee perhaps can be said to belong to this movement. He was able to create a new language of colour, form, and space and to develop a private symbolism that communicates deeply. Klee was also an accomplished musician, and much of his system of visual form is built up like musical form. To Klee, "art was a symbol of creation, an example much as the earth exemplifies the cosmos." He proceeded to create his own reality, which does not represent the familiar reality but penetrates to a reality that is not known until one sees his paintings. The present state of things, he felt, is only a momentary and accidental arrangement, and he attempted to communicate a world as it might once have been or is in the process of becoming. If a work of art is able to be more than a pleasing decoration, if it is able to give insight and perhaps change lives, then it may be understood why Klee is one of the most admired artists of one of the most creative periods in the history of art.

Aufnahme Fotopress



Klee, 1939.

Early **life** and education. Klee was born on December 18, 1879, at Miinchenbuchsee, near Bern, capital of the Swiss Confederation. He was Swiss on the side of his mother, née Ida Maria Frick, whose family was from Basel; she had studied music at the Stuttgart conservatory. His father, Hans Klee, was a German, born in Thuringia in 1849, who had given up a singing career and contented himself with teaching music.

Klee's involvement with the musical and visual arts began early in his life. At the age of four, he sought refuge near his mother when the devils he was scrawling on scraps of paper seemed to him to come to life. In his Uncle Ernst's cafe he would daydream over the sinuous patterns in the marble tabletops, which suggested to him fantastic designs. The boy's imagination was also stimulated by the stories he heard from his grandmother Frick. At seven, he began to play the violin.

Childhood interest in art and music

As a student, Klee was considered attentive, but he early displayed an original turn of mind opposed to the established order. He described his boyhood education as "mountains immeasurably high but with no foot." As a youth he was particularly fond of Greek and drawing (12 notebooks filled with drawings are preserved in the Klee-Stiftung in Bern), but most of all he liked to play the violin. His musical talents were so developed that he was used as a substitute by the Bern symphony orchestra. The teen-age Klee also wrote precociously sophisticated poetry and short stories.

Upon graduating from secondary school in 1898, Klee decided to devote himself exclusively to painting. Choosing Munich over Paris as a place to study art, he attended an art preparatory school in the Bavarian capital until he entered the Munich Academy in 1900 and studied under Franz von Stuck, an academic painter known for his allegorical pictures. Stuck demanded of his pupils a strict knowledge of anatomy and preferred to make them concentrate most of their time on drawing rather than on painting. Repelled by his teacher's conformity, Klee left the academy in 1901. His enthusiasm for avant-garde German publications, such as the magazine ***Jugend*** and the satirical newspaper Simplicissimus, further influenced his departure from artistic and intellectual conventionalism.

During his art-student years he assiduously attended concerts, being especially attracted to the music of the German Romantic composer Richard Wagner and the works of the Austrian composers Richard Strauss and Mozart. It was at a musical evening in the winter of 1899–1900 that he first met Lily Stumpf, the daughter of a prominent Munich doctor; he married her in 1906.

in June of 1901 Klee left Munich, briefly returned to Bern, and then set out for Italy with his friend Hermann Haller, a painter who later became one of Switzerland's leading sculptors of the early 20th century. Visiting Milan, Genoa, Rome, Naples, and Pompeii, Klee was particularly drawn to the works of such great masters of the Italian Renaissance as Michelangelo, Botticelli, Tintoretto, and Pinturicchio.

Artistic development. He returned to Bern in May of 1902 and lived in the Miinchenbuchsee house of his childhood until his marriage. Artistically and intellectually, this was an important period in Klee's life. In art he decided he would like to begin everything again by himself, without taking account of the accomplishments of the past, although this attitude did not prevent him from studying anatomy and the handling of the mediums of the visual arts. He also continued to read voraciously.

In 1905, from May 31 to June 13, Klee visited Paris, where he saw an important retrospective exhibition of the works of the American artist James McNeill Whistler (1834–1903) and was overwhelmed by the art of the French Impressionist Pierre-Auguste Renoir (1841–1919). Returning to Bern, he collected into a portfolio 15 etchings he had executed and submitted them to the jury of the Neuen Miinchner Sezession exhibition. Ten of these were selected for the show, including "Jungfrau im Baum" ("Virgin in a Tree") and "Der Held mit dem Flügel" ("Hero with the Wing'). In these etchings, with their aggressive, fantastic figures, Klee reveals an almost menacing humour. He escaped the dullness and stifling atmosphere of Bern by this black humour and through his precisely detailed, grotesque imagery, exemplified in the etching "Zwei Manner, einander in hoherer Stellung vermutend, begegnen sich" ("Two Men Meet, Each Believing the Other to Be of a Higher Rank"). Working from nature as well as his imagination, Klee also executed drawings, watercolours, and paintings on glass. After having modelled some statuettes in Plasticine, Klee went to live in Munich in 1906.

Satirical
etchings

After marrying, the Klees lived in Schwabing, a suburb of Munich. They resided there until Klee was called to teach at the Bauhaus in the autumn of 1920. And it was in Schwabing that his son Felix was born on November 30, 1907. Lily, a pianist, largely supported the family by teaching music; Klee did not begin to sell his paintings until 1914. Although the Klees lived in relative poverty, Paul felt freer and more at home than in Bern, for he was able to choose between a wider variety of exhibitions and concerts, as well as encounter more stimulating contemporaries in the arts.

First
exhibits in
Switzerland
and
Germany

In 1911–12 Klee did the filiform pen-and-ink illustrations for an edition (1920) of Candide, a satirical work by the 18th-century French writer Voltaire. He also had his first one-man shows that year. They were held in Switzerland at the museums of Ziirich, Bern, Basel, and Winterthur. Having made the acquaintance of the German Expressionist painters Wassily Kandinsky and Franz Marc in 1912, Klee participated in the second Munich exhibition of the avant-garde Blaue Reiter (Blue Rider) group. He began to receive many invitations to exhibit his works from important private galleries such as the Sonderbund Gallery in Cologne and Galerie "Der Sturm" in Berlin.

During a 16-day stay in Paris in April 1912, the influential German collector Wilhelm Uhde introduced Klee to the leading Cubist painters working in France. Klee was especially taken with the colouristic works of Robert Delaunay, the originator of Orphic Cubism. He was also moved by the works of Vincent Van Gogh. The proto-Expressionist works of this Dutch painter disturbed Klee deeply, for he saw behind their intensity "a brain that suffers from the combustion of a star." The engravings of another late-19th-century proto-Expressionist, the Belgian artist James Ensor, also interested him at this time. Although showing a definite preference for the expressionism of northern European art, Klee placed Paul Cézanne above all recent painters and began to be impressed by his contemporary, the great French master of 20th-century painting Henri Matisse.

In April 1914 Klee undertook a trip to Tunis in the company of two other painters, Louis Moilliet and August Macke. The "three wise men of the West," as someone called them, were each profoundly influenced by this North African experience. While painting watercolours at Qayrawān (Tunisia), Klee experienced a revelation of the nature of colour. "Colour possesses me . . ." he wrote in his diary. "It will possess me always . . . . That is the meaning of this happy hour: colour and I are one." Although his Tunisian trip lasted only 12 days, it changed the course of his art from a descriptive image of natural reality to a less figurative art and to being, as Klee wrote, "abstract, with memories."

On August 1, 1914, World War I broke out. Klee's friend August Macke was killed September 26 on the Champagne front in France. Another of his friends, Franz Marc, one of the pioneers of German Expressionism, fell at Verdun on March 4, 1916. Called up for duty a few days after Marc's death, Klee served in the German army and was stationed at several locations, including the aviation depot at Schleissheim near Munich. where he painted and polished airplanes. It cannot be said that military life frightened or disturbed him greatly; he found it endurable, and its overall effect on him was that of a "fantastic dream." His superiors respected his reputation and permitted him to live in town and visit his family. He also obtained permission to write the preface to the catalog for an exposition of Franz Marc's paintings. In moments of leisure he painted in watercolours, sketched, and read. Demobilized after the defeat. he rented a studio in the Schlosschen Suresnes in Munich. The wealthy Bern collector Hermann Rupf requested some of his watercolours, for himself and for Kahnweiler, the Paris dealer and champion of the Cubists.

In 1919 he began to paint primarily in oil. His paint became increasingly thicker. Far from being a transcription of the tonalities of the external world, Klee's colour was invented, corresponding to the inner leaps of his spirit. In November 1920 the Bauhaus, a school of design founded by the German architect Walter Gropius on the principle that "to build is a biological and not an aesthetic phenomenon," invited Klee to join the staff as an instructor of painting. Klee accepted and left Munich for Weimar in January of the following year. At the Bauhaus, the general educational method was to emphasize the technical aspect of art. The ideal was not "art for art's sake" but a utilitarian art, an inspired craftsmanship, that would be applicable to decorative or monumental projects. Through the Bauhaus would be created "the new edifice . . . born of innumerable hands." One wonders how Klee, such an internal and poetic individual, was able to venture into this communal atmosphere. But he possessed a thorough knowledge of pictorial optics and a unique pedagogical gift. Klee taught in accordance with a method that he himself discovered and expounded in the Padagogisches Skizzenbuch (1925; Pedagogical Sketchbook).

Bauhaus
association

In the summer of 1924 Klee spent six weeks in Sicily—at Taormina, where he painted watercolours, and at Syracuse, which seemed to him an "abstract landscape." After continual attack by the press and public of Weimar, the Bauhaus was forced to close its doors in 1925. Encouraged by the German dramatist Gerhart Hauptmann, however, the Bauhaus moved its activities to Dessau, where, in 1926, it reopened in a building constructed by Gropius. In July the Klees moved to Dessau, where their neighbour was Kandinsky. Work in Klee's studio alternated with classes, music, lectures, and collaboration on the magazine Bauhaus.

On December 20, 1928, Klee embarked at Genoa for Egypt. Visiting Cairo, Luxor, and Aswan in a few days, this trip, like his earlier Tunisian journey, exerted a profound effect on him. Klee resigned his Bauhaus post in 1931 and accepted a position at the Diisseldorf Academy. He no longer had to teach, being able to support himself by the sale of his work, but he needed to satisfy his pedagogic nature.

Nazi harassment

Last years. Klee's existence in Germany was doomed when Adolf Hitler was appointed chancellor in January 1933. Attacked by the Nazis, Klee was treated as a barbarian and a corrupted foreigner. He left Germany, travelling to Italy, Switzerland, and France. Profoundly disgusted by the Hitler regime, Klee again took up residence in politically neutral Switzerland. Settling in Bern in 1933, he met his old friend Moilliet, who had become involved with creating stained-glass windows. In 1934 Klee had his first London exhibition; while in Bern and Basel, an important retrospective of his work was held in 1935. During the summer an attack of bronchitis followed by measles brought about pulmonary and cardiac complications. Ultimately, Klee's condition was diagnosed as scleroderma, a rare disease that results in a drying up of the mucous membranes and ends by striking the heart. Klee was initially unconcerned. He continued his work, took cures at Tarasp, and went to recuperate at Montana-sur-Sierre in the Swiss canton of Valais. Gradually, however, his hope of recovering diminished. In 1937 he became feverishly active and did not interrupt his work except for short walks. His palette took on brilliant strength, as seen in the pastel "Figur im Garten" ("Figure in the Garden"). In the spring, the French painter Georges Braque visited him, and in November, after having unveiled his "Guernica" in Paris, Pablo Picasso came to see Klee. In the same year, an exhibition of confiscated art, called Degenerate Art, opened in Munich. It included, among the many masterpieces of modern art condemned by the Nazis, 17 works by Paul Klee. On the occasion of Klee's 60th birthday, in 1939, he received telegrams and presents from everywhere, except official Germany.

In 1940 Klee wrote, "It is no accident that I have entered on the tragic path. Plenty of sheets of drawings have pointed the way and said: the time has come." Klee executed that same year a series of angels, which are closer to those of Islām, especially the ones described by Ḥāfeẓ, the 14th-century Persian poet, than to the angels of Christianity. He also painted "Tod und Feuer" ("Death and Fire"), his *Dies Irae*, which seems to foreshadow his approaching cremation. Klee began his final illness at the sanitarium of Orselina-Locarno on May 10. He was taken to the Saint Agnes clinic at Muralto-Locarno, where he died of a heart attack on June 29, 1940. On July 1 he was cremated at Lugano, and the urn was finally buried in September 1942 in the Schosshalden cemetery at Bern. The tombstone is inscribed with a passage from his diary: "I cannot be grasped in this world. For I am as much at home with the dead as with those beings who are not yet born."

Paul Klee is generally acclaimed one of the greatest visionaries of all time, an artist to whom the universe opened the secret of its metamorphosis. His work reveals a prodigious knowledge of pictorial illusion. Imbued with autohypnosis, Klee's art communicates a poetic spell created by a seemingly magical transfiguration of the real.

MAJOR WORKS

PAINTINGS: "Zoological Garden" (1918; Klee Foundation, Bern); "Villa R" (1919; Kunstmuseum, Basel); "Graduated Shades of Red-Green" (1921; Yale University Art Gallery); "A Young Lady's Adventure" (1922; Tate Gallery, London); "Dance, Monster, to My Soft Song!" (1922; Solomon R. Guggenheim Museum, New York); "Magic Theatre" (1923; Klee Foundation, Bern); "Around the Fish," (1926; Museum of Modern Art, New York); "Pastorale" (1927; Museum of Modern Art, New York); "Monument at the Edge of an Orchard" (1929; Klee Foundation, Bern); "The Mocker Mocked" (1930; Museum of Modern Art, New York); "Arab Song" (1932; Phillips Collection, Washington, D.C.); "Child Consecrated to Suffering" (1935; Alhright-Knox Art Gallery, Buffalo, New York); "Rich Harbour" (1938; Kunstmuseum, Basel); "Demonry" (1939; Klee Foundation, Bern); "Death and Fire" (1940; Klee Foundation, Bern).

DRAWINGS: (All but one at Klee Foundation, Bern): "Furniture Caricature" (1910); "War Destroying the Country" (1914; Kunstmuseum, Basel); "Before Birth" (1926); "Wandering Animals" (1928); "Abstract Script" (1931); "Please!" (1932); "Symptom to Be Recognized in Time" (1935); "Fear Erupting" (1939).

GRAPHICS: "Comedian II," etching (1904); "Destruction and Hope," lithograph (1916).

WRITINGS: *Pädagogisches Skizzenbuch* (1925; ***Pedagogical Sketchbook,*** 1953); ***Tagebiicher von Paul Klee, 1898–1918,*** ed. by Felix Klee (1957; ***The Diaries of Paul Klee, 1898–1918,*** 1964).

BARR, JR., ***Paul Klee: Museum of Modern Art, New York, March 13–April 2, 1930,*** long preface to the catalog of 63 exhibited works (reprinted with revisions, 1941); KLEE-GESELLSCHAFT, BERN, ***Paul Klee,*** vol. 1, ***Dokumente und Bilder aus den Jahren 1896–1930*** (1949), with writings by Klee; WERNER HAFTMANN, ***Paul Klee, Wege bildnerischen Denkens*** (1950; Eng. trans., ***The Mind and Work of Paul Klee,*** 1954), a good analysis of the painter's mind and method; CAROLA GIEDION-WELCKER, ***Paul Klee*** (1952); GAULTIERI DI SAN LAZZARO, ***Klee, la vie et l'oeuvre*** (1957; Eng. trans., ***Klee: A Study of His Life and Work,*** 1957), copiously illustrated; PIERRE COURTHION, ***Klee*** (1953), a sketch of the artist's personality (in France); "Hommage à Paul Klee," ***XXème Siècle,*** 4:30–36 (1938); and ***Klee, un art prophétique*** (1967); HERBERT READ, ***Klee (1879–1940)*** (1948).

(P.Co.)

Knox, John

The foremost leader of the Scottish Reformation, John Knox set the austere moral tone of the Church of Scotland and shaped the democratic form of government it came to adopt in contrast to the rule by bishops that prevailed in England. Important political consequences resulted, both in his day and later, from his enunciation of the belief that man may rightfully resist rulers in order to obey God. In him, too, the Scottish Reformation found its historian.

Knox, engraving from *Icones*, by T. Beza, 1580.

Early life. Almost nothing is known of Knox's life before 1540, the accounts given by his earlier biographers being mostly fanciful. He was born in the vicinity of Haddington, East Lothian; the traditional date of his birth (1505) has been abandoned, and a date around

1514 is now accepted. Of his parentage it is known only that his mother's name was Sinclair (Knox used the name "John Sinclair" as an incognito in times of danger); that his father's name was William; and that he and both Knox's grandfathers had fought, and two of them had died—perhaps at the Battle of Flodden against Henry VIII's troops. The family may have been farmers.

It is supposed that Knox trained for the priesthood under the scholar John Major, most probably at St. Andrews University. Knox did not take a master's degree, but he ended his training with a mind imbued with that delight in abstract thought and dialectical disputation, which, even in that age, was recognized all over Europe as typical of Scottish scholarship. He was in priest's orders by 1540 and was in 1543 known to be also practicing as an apostolic notary in the Haddington area, which would seem to indicate that he was in good standing with the ecclesiastical authorities.

Involvement in the Reformation. *Relationship with political Protestantism.* Two years later, however, Knox was in more equivocal company as tutor to the sons of two gentlemen of East Lothian deeply involved in the intrigues of political Protestantism. Under their protection, George Wishart, a Scottish Reformation leader who was to become an early martyr for the cause, began a preaching tour in the Lothians in December 1545. Knox was much in his company; and his complete conversion to the Reformed faith dates from his contact with Wishart, whose memory he cherished ever afterward. Wishart was burned for heresy in March 1546 by Cardinal David Beaton, archbishop of St. Andrews, who, rather than the weak governor, was the real ruler of Scotland. Wishart's execution began a chain of events that profoundly altered Knox's life. Three months later, Beaton was murdered by Protestant conspirators who fortified themselves in St. Andrews castle.

Conversion to Protestantism

Meantime, Knox, accompanied by his pupils, was moving from place to place to escape persecution and arrest. His desire was to go to Germany to study there at the Protestant seats of learning; but his employers sent word to him to take their sons to St. Andrews and continue their education under the protection of the castle. Thus, in April 1547, 11 months after the cardinal's murder, and against his own desire Knox arrived with his pupils in St. Andrews—still an unknown man. The three months he spent there transformed him, against his own predisposition, into the acknowledged spokesman and protagonist of the Reformation movement in Scotland. The Protestants in the castle had become involved in controversy with the university; several of them, becoming aware that a man of uncommon gifts had joined them, pressed upon Knox's conscience the duty of taking up "the public office and charge of preaching." Knox's inclination was for the quiet of the study and the schoolroom, not for the responsibilities and perils of the life of a preacher of a proscribed and persecuted faith. He resisted the call with tears, and only after great hesitation was he persuaded to preach in the town of St. Andrews a sermon that convinced friend and foe alike that the great spokesman of Scottish Protestantism had been found. This was the turning point of Knox's life;' from this time forward he regarded himself as called to preaching by God, and he was the more certain of the divine origin and compulsion of the call in that it ran counter to every inclination of his own.

At the end of June 1547, French assistance reached the governor of Scotland. The garrison of St. Andrews castle, bombarded from without and assailed by plague within, capitulated on terms that were not kept; Knox and others were carried off to slavery in the French galleys. English intervention secured his release 19 months later, though with permanently broken health.

Propagator of Protestantism in Scotland. In England the Protestant government of Edward VI was endeavouring to hurry clergy and people into the Reformation faster, if anything, than most of them were willing to go. For this program preachers and propagandists were urgently required; and since a return to a Scotland under Roman Catholic rule was impossible for Knox at this time, the English government promptly made him one of a select corps of licensed preachers and sent him north to propagate the Reformation in the turbulent garrison town of Berwick-upon-Tweed. He brought order to the town and established a congregation on Puritan lines, and there he met Marjorie Bowes, who was to become his wife. Early in 1551 he was given a new assignment in Newcastle and a little later was appointed to be one of the six royal chaplains whose duties included periodic residence at, and preaching before, the court as well as itinerant evangelism in areas where the regular clergy were lacking in Protestant zeal. The accession to power of the duke of Northumberland, who virtually ruled England from 1549 to 1553 during the minority of Edward VI, marked a governmental swing toward more extreme Protestantism; and Knox, now a leading figure of the Protestant camp, was pressed to accept the bishopric of Rochester. His refusal was motivated not by any doctrinaire objection to episcopacy but by his complete distrust of Northumberland's government and by a determination not be be bound to it by gifts or preferments. Later he refused the vicarage of Allhallows, London, mainly because it would have required his compliance with usages that he considered to be not yet sufficiently Reformed. He continued, under the patronage of the government, to exercise an itinerant ministry mainly, but not exclusively, in Buckinghamshire, Kent and London.

Appointment as a royal chaplain

Influence on the Church of England. In three respects Knox left his mark on the Church of England: He took part in the shaping of its articles. He secured the insertion into *The Book of Common Prayer* of the so-called black rubric that denies the corporal presence of Christ in the consecrated bread and wine used in Holy Communion and explains that kneeling at communion implies no adoration of the elements. And he was one of the chief foster fathers of English Puritanism, a reform movement started within the state church with a view to the more rigorous application of Reformation principles in doctrine and worship. In this connection, however, it should be noted that Knox regarded all sectarianism with horror. He could see no place for any religious body or sect apart from the national Protestant Church; and throughout his life he used his considerable influence in England to persuade the Puritans to remain within the English Church.

Escape to the Continent. On the accession of Mary Tudor, a Roman Catholic, to the throne in 1553, Knox was one of the last of the Protestant leaders to flee the country. He escaped to the Continent disturbed by the realization that the fate of "true religion" in England had turned on the religious opinions of one woman. He could see no security for the Reformation anywhere if the personal whim of a sovereign was permitted to settle the religion of a nation. Might it not be legitimate for Protestant subjects, in such circumstances, to resist—if necessary by force—the subversion of their religion by a Roman Catholic ruler? Knox laid this question before the Protestant leaders on the Continent. John Calvin, in Geneva, and Heinrich Bullinger, in Zürich, were prepared to counsel only patience and prayer, certainly not armed resistance. From the French Protestant theologian Theodore Beza, Knox may have received greater encouragement, for in 1554 Beza wrote his *Traité de l'authorité du Magistrat* in which he developed ideas significantly similar to those of Knox. Be that as it may, Knox formulated his fateful conclusion, later to be applied in Scotland, that God-fearing magistrates and nobility have both the right and the duty to resist, if necessary by force, a ruler who threatens the safety of true religion. Also in 1554 Knox published his *Faithful Admonition* to the Protestants who remained in England. Its extremism and intemperate language served to increase the sufferings of those to whom it was addressed; and, coming as it did from one who was in comparative safety, it alienated many in England from him.

Minister to English exiles

In the same year, on the insistence of Calvin, Knox became minister of a congregation of English refugees, mainly Puritan, in Frankfurt am Main; but he remained there for only a few months. He then became minister of the growing congregation of English exiles in Geneva, a pastorate that lasted until his final return to Scotland in 1559, but was interrupted at the outset by a visit (1555–

56) to Berwick and a nine-month sojourn in Scotland, in the course of which he married Marjorie Bowes. She died, having borne him two sons, in 1560.

In Edinburgh Knox was astounded by the progress made by the Reformed cause and by the eager reception given to him by all classes in the community. To the nobility, in visits to their country houses, he propounded his doctrine of "justifiable resistance" to Roman Catholic rulers who attacked the faith of Protestant subjects and urged them to withdraw from all the rites and ceremonies of the Roman Church and to band themselves together for the defense of Protestantism in case that should prove necessary. A peremptory summons from his congregation called him back to Geneva; but he left to the faithful in Scotland an important ***Letter of Wholesome Counsel*** (1556) enjoining not only private family worship but weekly meetings of believers for corporate Bible study and discussion. From these weekly meetings, Reformed congregations grew apace, and from the leaders of these congregations came the elders of the Reformed Church.

Geneva was to Knox a beloved city, "the most perfect school of Christ on earth since the days of the Apostles." There he spent the happiest years of his life, highly esteemed, in peace, and among kindred souls. From this period (1556–58) dates his elaborate and rather tedious treatise on ***Predestination*** as well as his ***first blast of the trumpet against the monstruous regiment*** [rule] ***of women,*** in which he states with uncurbed vehemence the common belief of his day that the exercise of authority by women is contrary to both natural law and revealed religion. The pamphlet was aimed at the three women who were holding the reins of government in England, France, and Scotland and were oppressing Protestantism; but, unfortunately for Knox, publication coincided with the accession in England of the Protestant Elizabeth I who indignantly and permanently debarred the rash author from her realm.

The religious crisis in Scotland

Recall to Scotland. In Scotland matters reached a crisis in the spring of 1559. Two years earlier the Protestant lords had signed a "band," or covenant, on Knox's advice, pledging themselves to foster and defend "The Congregation of the Lord" and its ministers (hence their name "Lords of the Congregation"). The queen regent, the French-born Mary of Guise, had deemed it politic to make concessions to them. But when hostilities between Spain and France ended early in 1559, opening the possibility of stronger French intervention in Scotland, the Queen Regent felt that the time had come to call a final halt to the expansion of Protestantism. To this end she summoned the Protestant preachers, as ringleaders of the growing Protestant insubordination, to appear before her on May 10, at Stirling. The Protestants replied by recalling Knox from Geneva, and the Protestant lords, lairds, and commoners mustered at Dundee. On May 4 Knox joined them and they advanced to Perth, where, after a vehement sermon by Knox, the friaries were sacked.

By the end of June, Edinburgh was temporarily in Protestant hands and Knox was preaching in St. Giles'; but the triumph was illusory and Knox knew it. The voluntary army of Protestants could not keep the field for more than a few weeks; the mercenary army of the Queen Regent could keep the field indefinitely and strike a crushing blow as Protestant strength declined. At this juncture Henry II of France died and power fell into the hands of the Guises, the brothers of the Queen Regent and uncles of the young queen of France—Mary, queen of Scots. Strong French intervention in Scotland was now assured in furtherance of the Guise plan to displace Queen Elizabeth of England and to unite France, Scotland, and England under Francis II, of France, and Mary. Thus a political issue of critical international importance cut athwart the religious issue in Scotland. A French victory in Scotland would place Elizabeth and England in peril. It therefore behooved England to make common cause with the Scottish Protestants. Knox lost no opportunity of driving this fact home to Elizabeth and her chief minister William Cecil (afterward Lord Burghley) though Cecil was already well aware of the peril and was held back only by the vacillation of his royal mistress. The autumn and winter of 1559 saw the Scottish Protestants in desperate plight. Only Knox's superhuman exertions and indomitable spirit kept the cause in being. In the blackest hour his great sermon at Stirling put fresh heart into the despairing Protestant leaders and staved off defeat at the hands of the government's French mercenaries. On Knox's resolution alone in these months hung the fate not only of Scottish Protestantism but of Elizabeth's England.

In the spring of 1560, Elizabeth at last consented to English action. In April 10,000 English troops joined the Scottish Protestants, the Queen Regent died in Edinburgh castle, and the disheartened French gave up the struggle. By treaty, French and English troops were then withdrawn, leaving the victorious Scottish Protestants to set their own house in order. The chances were heavily against a satisfactory settlement, for there was no strong central authority to take control. Queen Mary was a Roman Catholic and an absentee in France, and all her sympathies, religious and political, were with the defeated side. The Estates (Scottish Parliament) had never exercised much power; but now, meeting in August without royal authority, they proceeded to grapple with the religious issue. The Scots Confession (hurriedly prepared by Knox and three others), a document moderately Calvinist in tone but with greater emphasis on the sacraments than Calvin had advocated, was adopted as the faith of the nation. Papal jurisdiction was abolished, and the saying of mass prohibited, with death as the penalty for a third offense—though this penalty was inflicted in only one recorded instance.

Shaping the Reformed Church. It remained to set down the form of government and constitution of the Reformed Church. Knox, aided by a committee of distinguished churchmen, laid before the Estates the ***First Book of Discipline*** containing proposals for the constitution and finance of the Reformed Church. Worship was to be regulated by the ***Book of Common Order*** (also called Knox's Liturgy), a revision of the order used by Knox in Geneva. According to Knox's Liturgy, congregations were to be governed by elders elected annually by the people, and the elders were to aid the minister to maintain firm moral discipline among the people. Ministers were to be elected by the people but to be appointed only after rigorous examination of life and doctrine by their ministerial brethren. The ablest ministers were to be appointed superintendents of areas roughly corresponding to the old dioceses; they were to supervise the ministers and congregations in the area and were to be assisted by provincial synods of ministers and elders. Implied in the proposal is that final authority is to lie with a general assembly of the church containing both elders and ministers. This form of government is obviously not the "presbyterianism" of a later generation, which was based on government by a number of courts composed of clerical and lay elders, neither is it episcopacy, for the superintendents are not consecrated and do not constitute any kind of higher order but are in all points subject to the general assembly. But in the high place given to the laity, Knox's system contains the most essential element of later Presbyterianism.

The Book of Common Order

The ***Book of Discipline*** proceeds to outline a most elaborate educational scheme from parish school up to university, compulsory in its early stages for all and free to the poor, with equal opportunity of advancement for the son of peasant and of peer in the service of the church and commonwealth. It also lays plans for a much-needed scheme of systematic aid of the poor, a project dear to Knox's heart. Finally it urges that the endowments of the old church should be made available for the financing of these admittedly very costly schemes of the new church.

But the proposals thus outlined foundered on the rock of finance. The endowments of the old church were plunder in a poor land for the nobility, who had scant sympathy with Knox's "devout imaginings." The Estates refused to accept the ***Book of Discipline*** and the church was left to organize itself to the best of its ability. The Estates shelved the financial problem by the temporary expedient of granting to the remaining Roman Catholic clergy the life-rent of their benefices, provided they contributed to the maintenance of the Reformed Church out of their revenues. Knox was deeply embittered by the enforced abandonment of his schemes for education and poor relief and by the scant provision for the Reformed Church. Thus the financial question drove a wedge between Knox and the nobles who had been his friends and supporters, and between the church and the government. The rift was widened when the return of Queen Mary created a court party that resented the extremism of the ministers. Yet the poverty of the Reformed Church created a bond of sympathy between ministers and people, and governmental neglect or hostility compelled it to develop a sturdy autonomous life of its own that resisted later attempts to subject it to state control.

Relations with Queen **Mary**

Mary arrived in Scotland in 1561 already persuaded that Knox was to be her archenemy and that the country could not hold them both. Knox, who hoped at first that the young queen would prove pliable in Protestant hands, soon reached a similar conviction. The first three of his celebrated audiences with Mary were polite skirmishes; in the fourth, battle was joined in grim earnest. Hearing that Mary was contemplating mamage with Don Carlos of Spain, a match that would have had fatal consequences for the Scottish Reformation and probably for England as well, Knox sounded the Protestant alarm with all the vehemence at his command. Mary, enraged at this intervention by a heretic preacher and commoner in affairs of state, summoned Knox, berated him with hysterical fury, and charged him with treason; but the Privy Council refused to convict him. Knox filled Mary's cup of bitterness in 1564 by marrying, without the royal assent, Margaret Stewart, the 17-year-old daughter of the impoverished Lord Ochiltree, who was distantly related to the queen.

The hatred between Knox and Mary was now personal, deep, and vindictive. But Mary's sun was setting. In 1564 she dismissed her Protestant advisers and undertook the mismanagement of her own affairs. For a time the Reformed Church was in real danger, but in 1567 came Mary's ruin and abdication (Knox would have preferred her execution) and Knox's old friend James Stewart, earl of Moray, became regent. In him the Reformed Church would have found a powerful patron; and Knox, believing that the long battle of the Reformation was ended, was contemplating a peaceful retirement to Geneva when Moray was murdered and the country plunged into a struggle between the supporters of the queen and the regency. Knox was anxiously involved in the turmoil, but his strength was overtaxed and he suffered a paralytic stroke. When Edinburgh became a battleground between the factions in 1571, the leaders on both sides insisted on his removal to safety in St. Andrews, from where he returned in 1572 to die. When the news of the St. Bartholomew's Day Massacre of French Protestants reached Scotland, Knox dragged himself to his pulpit in St. Giles' and in white heat drove home the lesson of that tragedy to his hearers. He stood one more time in the pulpit of St. Giles' to introduce his successor. On November 24, 1572, he died in Edinburgh.

Assessment. Knox was and is a controversial figure, and his work and influence will always be differently assessed by men of differing religious and political views. Certainly his conviction that the Reformation was God's cause and must triumph, a conviction he had a remarkable power of impressing upon other minds, was the rock upon which the Reformed Church in Scotland was built. His power as a preacher lay in his capacity to fuse reason with emotion and to be a passionate logician in the pulpit, convincing mind and heart with equal force. Intolerant he undoubtedly was, but not more so than most religious leaders of his day; and his Calvinism was a good deal more moderate than that of a later age. He may justly be blamed for his "rude vehemence," his acrid judgments, and sometimes mischievous utterances; yet he was more temperate in action than in speech, and his private letters reveal an unexpected tenderness. His singleminded, lifelong, and incorruptible devotion to what he believed to be his duty, in an age when such qualities were rare indeed, must command respect. There is ample historical testimony that his moral life was in keeping with his rigorous creed. Knox's most considerable literary work is his ***History of the Reformation in Scotland.***

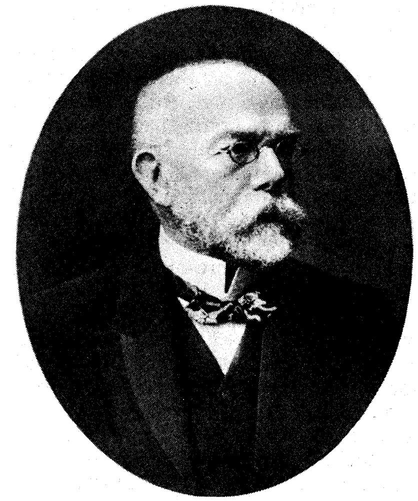
Koch, Robert

Robert Koch, one of the pioneers of the science of bacteriology, was born on December 11, 1843, at Klausthal, near Hanover, Germany. He attended the local secondary school and the nearby University of Gottingen, where he studied medicine, graduating in 1866. He then became a physician in various provincial towns. After serving briefly as a field surgeon during the Franco-Prussian War of 1870–71, he became district surgeon in Wollstein, in what was then Germany, where he built a small laboratory. Equipped with a microscope, a microtome (an instrument for cutting thin slices of tissue), and a homemade incubator, he began his study of algae, switching later to pathogenic organisms.



Koch.

One of Koch's teachers at Gottingen had been the anatomist and histologist Friedrich Gustav Jacob Henle, who, in 1840, published the theory that infectious diseases were caused by living microscopic organisms. In 1850 the French parasitologist Casimir-Joseph Davaine, who was among the first to observe organisms in the blood of persons suffering certain diseases, reported the transmission of anthrax by the inoculation of healthy sheep with the blood of animals dying of the disease and the finding of microscopic rod-shaped bodies in the blood of the dead sheep. Inspired by the work of the French microbiologist Louis Pasteur, Davaine in 1863 showed that it was highly probable that, because the sheep did not become diseased in the absence of these rodlike bodies, anthrax was due to the presence of such organisms in the blood. The natural history of the disease was, nevertheless, far from complete.

It was at this point that Koch began. He cultivated the anthrax organisms in suitable media on microscope

Discovery of the life cycle of anthrax

slides, demonstrated their growth into long filaments, and discovered the formation within them of oval, translucent bodies—dormant spores. Koch found that the dried spores could remain viable for years, even under exposed conditions. This finding explained the recurrence of the disease in pastures long unused for grazing, for the dormant spores could, under the right conditions, develop into the rod-shaped bacilli that cause anthrax. The anthrax life cycle, which Koch had discovered, was announced and illustrated at Breslau in 1876, on the invitation of Ferdinand Cohn, an eminent botanist. Julius Cohnheim, a famous pathologist, was deeply impressed by Koch's presentation. "It leaves nothing more to be proved," he said. "I regard it as the greatest discovery ever made with bacteria and I believe that this is not the last time that this young Robert Koch will surprise and shame us by the brilliance of his investigations." Cohn, whose discovery of spores was published earlier in 1876, was also very much impressed and generously helped to prepare the engraving for Koch's epochal paper, which he also published. One of Cohn's pupils, Joseph Schroeter, found that chromogenic (colour-forming) bacteria would grow on such solid substrates as potato, coagulated egg white, meat, and bread and that these colonies were capable of forming new colonies of the same colour, consisting of organisms of the same type. This was the starting point of Koch's pure-culture techniques, which he worked out a few years later. That a disease organism might be cultured outside the body was a concept introduced by Louis Pasteur, but the pure-culture techniques for doing so were perfected by Koch, whose precise and ingenious experiments demonstrated the complete life cycle of an important organism. The anthrax work afforded for the first time convincing proof of the definite causal relation of a particular bacillus to a particular disease.

In 1877 Koch published an important paper on the investigation, preservation, and photographing of bacteria. His work was illustrated by superb photomicrographs. In this paper he described his method of preparing thin layers of bacteria on glass slides and fixing them by gentle heat. Koch also invented the apparatus and the procedure for the very useful hanging-drop technique, whereby micro-organisms could be cultured in a drop of nutrient solution on the underside of a glass slide. In 1878 Koch summarized his experiments on the etiology of wound infection. By inoculating animals with material from various sources, he produced six types of infection, each due to a specific micro-organism. He then transferred these infections by inoculation through several kinds of animals, reproducing the original six types. In this study, he also observed differences in pathogenicity for different species of hosts and demonstrated that the animal body is an excellent apparatus for the pure cultivation of bacteria.

Discovery of tubercle bacillus

Koch, now recognized as a scientific investigator of the first rank, obtained a position in Berlin in the German Health Office, where he set up a laboratory in bacteriology. With his collaborators, he devised new research methods. To obtain a pure culture outside the body, Koch mixed the organisms in melted gelatin; then, after solidification and growth, he placed portions of pure colonies into separate tubes of broth or other media. Koch also concentrated his efforts on the study of tuberculosis, with the aim of isolating its cause. Although it was known that tuberculosis was due to an infective agent, the organism had not yet been isolated and identified. By modifying the method of staining, the bacillus was discovered and its presence established in preparations of tuberculous material. A fresh difficulty arose when, for some time, it proved impossible to grow the organism in pure culture. But, eventually, Koch succeeded in isolating the organism on a succession of media. Its etiologic role was now established. On March 24, 1882, Koch announced before the Physiological Society of Berlin that he had isolated and grown the tubercle bacillus, which he believed to be the cause of all forms of tuberculosis.

Meanwhile, Koch's work was interrupted by the appearance of cholera in Egypt and the danger of its transmission to Europe. As member of a German government commission, Koch went to Egypt to investigate the disease; although he soon had reason to suspect a particular comma-shaped bacillus as the specific cause of cholera, he was frustrated by the cessation of the epidemic. Nevertheless, he discovered the cause of amoebic dysentery and the bacilli of two varieties of Egyptian conjunctivitis. Proceeding to India, where cholera is endemic, he completed his task, discovering the cholera organism and its transmission via drinking water, food, and clothing.

Resuming his studies of tuberculosis, Koch investigated what effect an injection of dead bacilli would have on a person who subsequently received a dose of living ones; he concluded that the local reaction produced might prove the means by which the disease could not only be diagnosed but, in the early stages, perhaps even cured. In his studies, he used as the active agent a sterile liquid produced from cultures of the bacillus. But this liquid (tuberculin, 1890) proved disappointing as a curative agent, and, consequently, its importance as a means of detecting a present or past tubercular state was not immediately recognized.

Additional work on tuberculosis came later in Koch's career, but, after the seeming debacle of tuberculin, he was occupied (1891–99) with a great variety of investigations into diseases of man and animals—studies of leprosy, rinderpest, bubonic plague, surra, Texas fever, and malaria. The spread of malaria was still a mystery; Koch had nearly satisfied himself that it was transmitted by mosquitoes when the British bacteriologist Ronald Ross published his findings pointing to the same conclusion.

In 1901 Koch reported work done on the pathogenicity of the human tubercle bacillus for domestic animals. He believed that infection of human beings by bovine tuberculosis is so rare that it is not necessary to take any measures against it. This conclusion was rejected by commissions of inquiry in Europe and America in an extensive and important work that was stimulated by Koch's theory, even though it proved to be partly wrong. But, in most cases, the successful measures of prophylaxis were those firmly laid down by Koch.

Not an eloquent speaker, Koch was, nevertheless, by example, demonstration, and precept, one of the most effective of teachers, and his numerous pupils—from the entire Western world and the Orient—were the creators of the new era of bacteriology. His work on trypanosomes was of direct use to the eminent German bacteriologist Paul Ehrlich; this is only one example of Koch's instigation of epochal work both within and beyond his own immediate sphere. His discoveries and his technical innovations were matched by his fundamental concepts of the etiology of disease. He was awarded the Nobel Prize for Physiology or Medicine in 1905 for his tuberculosis research. Koch died on May 27, 1910, in Baden-Baden, but, long before his death, his place in the history of science was universally recognized.

Koko Nor (Lake)

Koko Nor (Ch'ing Hai) is the largest drainless mountain lake of Central Asia ***(nor [nuur]*** and ***hai,*** "lake" in Mongolian and Chinese, respectively). It is situated at an altitude of 10,515 feet (3,205 metres) in the Nan Shan (Nan Mountain) system of China in a depression at approximately 37° N, 100" E. Mongolians occupy the northern shores and Tibetans the southern shores. There are some sizable settlements (Ch'iang-hsi-k'ou, Ta-la-ma-ho) lying on the Hsi-ning to Lhasa road, close to the southern shore of the lake. On the northern shore lies the small settlement of Kang-ch'a.

Physical characteristics. The length of the lake approaches 65 miles, the width 40 miles; the surface of the lake is approximately 2,300 square miles (about 6,000 square kilometres) in area in years when the water level is high, and about 1,600 square miles (4,200 square kilometres) in area when the water level is low. The greatest known depth is 123 feet. The water is azure in colour, the name deriving from the Mongolian term for sky blue.

Koko Nor's origin

The Koko Nor depression originated between the Pliocene and the Pleistocene epochs (some 2,500,000 years ago). The lake that formed in the depression originally drained into the Ma-ch'u Ho, but the rise of the basin's mountainous frame made this impossible. Melting waters from ancient glaciers thus accumulated and formed a big, deep lake in the late Pleistocene (at least 10,000 years ago). At this time the ancient lake was nearly one-third larger than its present size, and its depth extended to almost 160 feet. The subsequent exhaustion of the glaciers brought about a reduction in the level of the Koko Nor to its present position.

The depression in which the lake is set is a plain more then 10,500 feet high. A rolling, hilly relief, with many low mountains, prevails in the north. In the south the depression is bordered by the Nan Koko Nor Shan (South Koko Nor Mountains), which form a narrow chain connecting with distinct peaks. These are continually snowcapped and go to the eastern edge of the lake. Further to the east the ridge drops sharply, becoming flat and opening out.

The depression is covered with mainly red and gray sandstone and light-gray and claylike limestones. Traces of human activity are present in mountain loesses.

The shores of the Koko Nor open out gently; the delta of the Pu-k'o Ho (Pu-k'o River) empties into the western part of the lake. Along the shores woods spread in terraces, the highest of which extends up over the lake to a height of 160 feet. On the eastern shore there are many small, isolated lakes and a rising, wooded shore area. Numerous sandy islands dot the lake; the largest has a length of 5,410 feet and a width of more than 1,000 feet. Bottom deposits are formed mainly by silts—black, yellow, and pale yellow. In places sand can be found, but close to the shore there are pebbles. The mineral content of the water changes greatly from year to year, but sodium chloride is always present. The water is brackish and unsuitable for drinking.

Twenty-three rivers and streams empty into the Koko Nor, the biggest being the Pu-k'o Ho. They flow fastest in summer, causing a rise in the lake level.

Precipitation

Climate. The Koko Nor basin is distinguished by a comparatively dry climate. During the winter, snowstorms rage through the first half of March. The amount of snow that settles, however, is not great. Most precipitation (more than 70 percent) occurs in July and August, partly by thunderstorm, partly by cloudburst. On the southwest shore of the lake and on the slopes of the Nan Koko Nor Shan there is an annual precipitation of ten to 12 inches, while on the northern shore 14 to 16 inches falls annually, increasing up to 20 inches in the mountains to the north of the depression. During the summer water in the lake warms to 64°–68° F (18°–20° C). From November to March the lake freezes over, the ice becoming as much as two feet thick.

Flora and fauna. Adjacent to the lake are luxuriant multigrain steppe grasses, providing one of the best grazing areas in the Nan Shan. The principal vegetation is of wormwood (absinthe) and derris. Nettles, hollyhocks, and asters are common, and numerous other plants are found. In the mountains there are fir forests.

Fish are found in the lake, mainly of the carp family. There are few large mammals in the neighbouring area, as the territory is populated. The kulankiang (wild ass) and the Przhevalsky horse are found. The oaran-kukuyaman (blue sheep) lives in the mountains. Wolves are also found. The waterfront and the adjacent slopes are inhabited by a large variety of birds, including skylarks, grouse, sandpipers, cormorants, falcons, eagles, gray geese, and a few types of duck and gull.

The chief occupation of the local population is nomadic cattle raising and tending of sheep, horses, and camels.

(N.T.K.)

Kokoschka, Oskar

Oskar Kokoschka, Austrian painter, humanist, and poet, has pursued a complex and productive career impelled by the dual concerns of art and humanitarianism. Most famous as an Expressionist artist, he has also written numerous plays. Both his art and his writing have reflected his political concern for the victims of war and dictatorship in the first half of the 20th century, and his outspoken political beliefs have forced him to spend much of his life in exile.

"The Tempest," self-portrait with Alma Mahler by Oskar Kokoschka, oil on canvas, 1914. In the Kunstmuseum, Basel, Switzerland. 1.81 X 2.21 m.

Oskar Kokoschka was born March 1, 1886, in the small Austrian town of Pöchlarn. When he was three, his father lost everything in a financial crash. The family was forced to move to Vienna, where his father worked as a travelling salesman, and his mother raised the children on limited means. Tragedy entered Kokoschka's life early, when his eldest brother died in 1891. Kokoschka attended elementary and high school in Vienna and received his first artistic impressions from the stained glass and Baroque frescoes of the Piarist church where he sang in the choir.

When he was 18, Kokoschka won a scholarship to the Kunstgewerbeschule (School of Arts and Crafts) in Vienna. Soon he became an assistant teacher, giving lessons at night and studying during the day. By 1907 he had also become a member of the Wiener Werkstatte (Vienna Crafts Studio), which supplied him with commissions until 1909. At the Kunstgewerbeschule he learned drawing, lithography, bookbinding, and other crafts. He was profoundly dissatisfied with the school, however, because it was devoted entirely to the decorative arts and completely omitted from its curriculum the study of the human figure. The Wiener Werkstatte, too, supported work only in the restrictive field of the decorative arts. From the beginning Kokoschka's primary artistic interest was the human figure; this interest is perhaps rooted in the deep concern for humanity that transcended even his concern for art. He tried to find practical means to pursue this interest. In his night classes he introduced the thin, muscular children of acrobats as models for his pupils, teaching the latter to make quick sketches—an innovation completely opposed to the aims of the school. He used the human figure as a decorative motif in the postcards, bookbindings, and bookplates he designed for Wiener Werkstatte commissions. Still, his real desire was to paint monumental pictures of people. He taught himself to paint in oils and executed some canvases; but economic necessity forced him to spend most of his time with decorative work, and the general artistic milieu in which he found himself continued in its failure to support his creative aspirations.

Friendship with Adolf Loos and early style

In 1908 he met the prominent Viennese architect Adolf Loos, who, having been impressed by one of Kokoschka's early paintings, took an active interest in the young artist. Like Kokoschka, Loos rejected the prevailing decorative ideal, and he enthusiastically launched Kokoschka's artistic career by introducing him to sympathetic artists, securing him commissions for paintings, and providing him with much-needed spiritual inspiration and support. During this early period Kokoschka painted mostly landscapes, developing a technique of vibrant, fluid lines and colours expressive of mood that formed the basis for all of his subsequent paintings. At first glance Kokoschka's landscapes seem to follow the principles of the Impressionist school because of their bright colours, ephemeral delineation of shapes, with tangled, multicoloured lines, and preoccupation with light. His vision, however, was different from that of the Impressionists, who sought, albeit in a revolutionary way, to represent only what strikes the eye. Kokoschka sought to express through his colours the inner sensibility of the observer viewing a scene. This aim is exemplified in one of his earliest paintings, "Dent du Midi," a snowscape in which the colours are warm, reflecting the response of the observer to the scene, rather than cool, evoking the actual light that must have emanated from the snow.

Humanist philosophy in Expressionist plays

At about this time Kokoschka began his career as a writer, composing several plays that heralded the new Expressionist theatre and expressed his compassionately humanist philosophy. The most important of them was Morder *Hoffnung* der Frauen (1907; "Murder Hope of Women"), a play that expressed his sensitivity to the moral crises of modern life and that was outspoken in condemning the political injustices of contemporary European society. He said in 1933 that in it he

> contrasted the callousness of our male society with my basic conception of man as mortal and woman as immortal; in the modern world it is only the murderer who wishes to reverse this state of affairs.

After a year in Berlin, where his first collective show was held, Kokoschka returned to Vienna in 1911, resuming his teaching at the Kunstgewerbeschule. At this point he used only models in motion for his classes. He exhibited paintings and drawings at Der Sturm gallery, along with works of the Russian Wassily Kandinsky, the Swiss Paul Klee, and the German Franz Marc. Soon public reaction to Kokoschka's plays caused such a scandal that he was dismissed from his teaching post.

In 1911 he met Alina Mahler, seven years his senior and the widow of the Austrian composer Gustav Mahler. He fell in love with her, and for three years they pursued a tempestuous affair that Kokoschka much later described as "the most unquiet time of my life." He succeeded in ending his involvement with her only with the outbreak of World War I and his enlistment in the Austrian Army.

Evolution of Kokoschka's portrait style

Shortly before his return to Vienna, Kokoschka had begun to paint more portraits, which show an extremely sensitive preoccupation with the character of the subjects and an increasing concern with expressing this character through colour. The earlier of these portraits make use of delicate, agitated lines describing figures painted in relatively naturalistic colours; solid colours are varied with multihued highlights, and certain features and gestures characteristic of the sitters or expressive of their psychology are exaggerated. Later, these portraits, still concentrating on hands and faces, are painted with increasingly broader strokes of more varied colour and heavier outlines, which, however, are broken and no longer solidly enclose forms. Kokoschka's most important painting of this period ("The Tempest") shows the artist and Alma Mahler resting together in a huge cockleshell in the midst of a raging sea. In this virtually monochromatic composition, all the forms are described by large, loose strokes of colour, and the direction of the strokes seems to cause the entire composition to swirl and spin. In all of these paintings, as with the landscapes, the involvement of the artist with the subject is an essential element, and this element continued to be the basis of his art throughout Kokoschka's life. In 1962 Kokoschka was to say,

> Painting . . . isn't based on three dimensions, but on four. The fourth dimension is a projection of myself. . . . The other three dimensions are based on the vision of both eyes . . . ; the fourth dimension is based on the essential nature of vision, which is creative.

Political disillusionment after World War I

Kokoschka saw active duty in the war for only a short time. In 1916 he was severely wounded and was taken to a military hospital in Vienna, then to one in Dresden. While recovering in Dresden he wrote, produced, designed, and staged three plays. In Orpheus und Eurydike (1918; "Orpheus and Eurydice") he expressed the terror he had experienced after being wounded. This play was adapted as an opera in 1926 by the German composer Ernst Krenek. The war and the takeover of the Russian Revolution by the Bolshevik regime disillusioned Kokoschka, as it did many intellectuals who had identified revolution with humanitarianism. He began to see revolution as a purely destructive force, and in 1920 he wrote a "Dresden Manifesto," which denounced all militancy in politics for its lack of human concern. Political and humanitarian themes disappeared for several years from his writing and art. The next ten years he taught, primarily as a professor of fine arts at the Dresdener Akademie (1919–23), and travelled in Europe, North Africa, and the Middle East.

Revival of humanitarian themes

In 1931 Kokoschka returned again to Vienna, where he completed his first political commission since the war, a joyful painting of children playing at an orphanage established by the Socialist city council. This painting was meant as a protest against the reactionary policies of the current Austrian chancellor. In 1934 he moved to Prague, where he met Olda Palkovska, his future wife. In Prague he was commissioned to do a portrait of the president of the Czech Republic, the philosopher Tomáš Masaryk. During the sittings he discussed with the aged statesman the philosophy of the 17th-century Moravian theologian John Amos Comenius, whose humanitarian views Kokoschka had admired from his youth. Kokoschka placed Comenius in the background of Masaryk's portrait, creating an allegory of the humanistic spirit from past to present. Comenius also became the subject of another play (*Comenius*, begun 1935).

In 1937 all of Kokoschka's works in Germany were removed by the Nazis from museums and collections as "degenerate art." This act outraged Kokoschka less for his own sake than because it boded ill for the future of culture and humanity. The same year, a great Kokoschka exhibition was held in Vienna, but Kokoschka was not encouraged. After the Munich Agreement between the English prime minister Neville Chamberlain and Adolf Hitler in 1938, he fled to London with Olda Palkovska.

Kokoschka's financial situation was so desperate in London that he was forced to paint mainly in watercolour. He began, however, a number of large canvases, entitled "The Red Egg," "Anschluss-Alice in Wonderland," "Loreley," "Marianne-Maquis," and "What We Are Fighting For," which were an anti-Fascist manifesto. They express his distress at the sufferings of humanity and are free from narrow ideological considerations; the series is an indictment of all the powers, not just the Fascist, that had caused suffering in World War II. In 1942 Kokoschka also painted a portrait of the Russian ambassador to London, Ivan Maysky, which contains a subtle warning against Soviet imperialism. The style of this painting is loose and expressive but calmer and more solid than that of his second Viennese period. He donated the fee for the portrait to the Red Cross for the care of German and Russian soldiers wounded at Stalingrad.

Public recognition and material success

After the war, beginning with a large but still basically unappreciated exhibition in Vienna, there began a series of shows of Kokoschka's works all over Europe and the United States. Kokoschka was financially secure for the first time. He continued to paint portraits and landscapes, and in 1950 he began his first great mythological composition, the three paintings of the "Prometheus Saga."

In 1953 Kokoschka established a seminar called Schule des Sehens (School of Seeing) at the Internationalen Sommerakademie für bildende Kunst (International Summer Academy for Visual Arts) in Salzburg. He continued to paint, completing in 1954 a second mythological trilogy, "Thermopylae." In the 1950s he designed tapestries and theatrical scenery and worked increasingly in lithography. He also continued his political art; his two moving posters of 1937 and 1945 protesting the effects of the Spanish Civil War and World War II on the children of Europe were followed in 1956 by a poster for Hungarian relief showing a stricken mother and a dead child.

Kokoschka's painting in the 1960s is perhaps best characterized by his "Herodotos" (1960–63), a luminously painted picture of the Greek historian inspired by visionary historical figures that appear in the space above his head. Kokoschka's late style is calmer, brighter, and more monumental than that of his early works. Although some critics have missed in the late paintings the agitation and surface intensity of his early works, the art historian Hans Maria Wingler expresses a true understanding of this most mature development of Kokoschka's style:

> What will determine the verdict of history is that the promise of his brilliant opening notes was fulfilled in the mature works of his old age, in which Kokoschka is drawing the balance of all his insight and experience. His power of transforming the inner substance of his mind into pictorial terms has grown with the years.

MAJOR WORKS

"Dent du Midi" (1909, private collection, Ziirich); "Still Life with Tortoise and Hyacinth" (1909; Österreichische Galerie, Vienna); "Adolf Loos" (1909; Staatliche Museen Preussischer Kulturbesitz, Berlin); "Portrait of Dr. Tietze and His Wife" (1909; Museum of Modern Art, New York); "Double Portrait (Oskar Kokoschka and Alma Mahler)" (1912; Edgar Horstman Collection, Hamburg); "The Tempest" ("Die Windsbraut"; 1914; Kunstmuseum, Basel, Switzerland); "Knight Errant" ("Der Irrende Ritter"; 1915; Solomon R. Guggenheim Museum, New York); "The Power of Music" (1919; Stedelijk van Abbemuseum, Eindhoven, The Netherlands); "Dresden, Augustus Bridge with Steamer" (1923; Stedelijk van Abbemuseum, Eindhoven); "London Bridge View of the Thames" (1926; Albright-Knox Art Gallery, Buffalo); "Tigon" (1926; Museum of Modern Art, New York); "Adele Astaire (Lady Cavendish)" (1926; Kunsthaus, Zurich); "Venice. Santa Maria Della Salute II" (1927; private collection, Paris); "Courmayeur" (1927; Phillips Collection, Washington, D.C.); "Self-Portrait with Cap" (1932; private collection, Epsom, England); "Tomaš G. Masaryk" (1935–36; Museum of Art, Carnegie Institute, Pittsburgh); "The Red Egg" (1940–41; Národní Galerie, Prague); "Anschluss-Alice in Wonderland" (1942; private collection, London); "Ambassador Maysky" (1942; Tate Gallery, London); "Loreley" (1942; private collection, Villeneuve); "Marianne-Maquis" (1943; private collection, Villeneuve); "What We Are Fighting For" (1943; private collection, Ziirich); "Cathleen, Countess of Drogheda" (1944–47; private collection, London); "Prometheus Saga" (1950; Count Antoine Seilern Collection, London); "View of Hamburg Harbour" (1951; Museum of Modern Art, New York); "Galatea" (1953; private collection, London); "Thermopylae" (1954; Universitat, Hamburg); "Sir Stanley Unwin" (1959; George Allen and Unwin Ltd. Collection, London); "Double Portrait (Oskar Kokoschka and His Wife Olda)" (1963–64; private collection, Villeneuve, France).

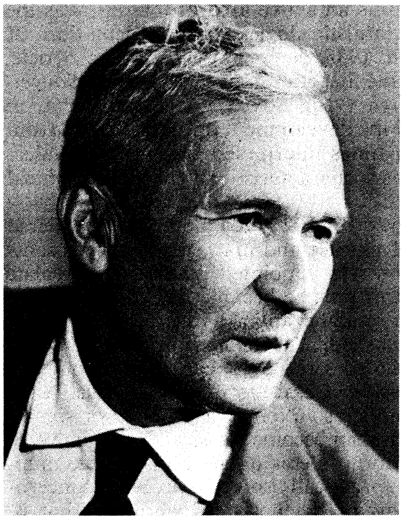
(L.Go.)

Kolmogorov, A.N.

Andrey Nikolayevich Kolmogorov, the 20th century's most influential Soviet mathematician, contributed original general ideas in a number of branches of modern mathematics and, as a teacher, guided many young men to a mathematical maturity equal to his own. Raised to a high rank in the Academy of Sciences of his own country, he has been honoured in many other countries as well. His original contributions to abstract theories that describe chance include axioms that put probability theory on a nonintuitive logical basis. He is among the founders of the theory of stochastic processes (that is, infinite collections of random variables), particularly those called Markov processes, and his work has been honoured with equations that bear his name. Topology (the study of geometric structure that endures under continuous transformation), the representation of functions by Fourier series (or periodic components), and the theory of finite automata, which is at the confluence of logic and the theory of computing machines, have all been influenced by Kolmogorov. As a teacher of advanced mathematics as well as a leader in the state program of mathematics in the U.S.S.R. elementary schools, Kolmogorov has been known for his lectures and writing.

Novosti Press Agency



Kolmogorov, 1986.

Kolmogorov was born on April 25, 1903, in the central Russian town of Tambov. His father was an agronomist; his mother was from a family that adhered to progressive ideas. The young Andrey was raised by the sisters of his mother, after she died in childbirth.

Early career. At the age of 17 Kolmogorov graduated from the secondary school in Tambov and was enrolled in the Moscow State University. In the early period of his study in the university, he showed keen interest in Russian history and actively participated in a seminar conducted by Professor Sergey V. Bakhrushin, as a result of which he wrote a scientific paper on the registration of real estate in the ancient Novgorod republic in the 15th and 16th centuries. At this time Kolmogorov's interest embraced the ancient Russian arts, and, in fact, his interest in such art has been retained throughout his life. The lectures on mathematics that he attended during his first course at the university were delivered by professors Nikolay N. Luzin, Aleksey Vlasov, and Pavel S. Uryson, all among his country's most eminent teachers. Kolmogorov's active participation in Professor Vyacheslav V. Stepanov's seminar on trigonometrical series was especially important for his later career.

Set theory

In the autumn of 1921, when Kolmogorov was in the second course, he worked on a number of complex problems in the theory of trigonometrical series and operations on sets. Thus began his first highly productive period of research, which was closely tied with the basic directions of the Moscow mathematical school of that time, namely, with ideas in the theory of functions of real variables. In the spring of 1922 he completed a study in the theory of operation of sets (later published in 1928). In this period he also proved a theorem that gives a broad generalization to **a** well-known theorem, which was first formulated by a Soviet mathematician named Mikhail Souslin, concerning the necessary and sufficient conditions for a set to be of a certain type called a "Borel" set. Kolmogorov's result greatly influenced the research of a number of prominent mathematicians who later worked on this subject.

In June of 1922, Kolmogorov succeeded in attaining a result that was an outstanding sensation of that period: he constructed an integrable function whose Fourier series diverged at every point. His result, together with later work done in 1966 and 1967 by the Swedish mathematician Lennart Carleson and the U.S. mathematician Richard Hunt, settled the problem of convergence of Fourier series.

This period provided numerous publications on problems of differentiation, integration, and measurable sets —in every general problem Kolmogorov made considerable contributions.

Later Kolmogorov expanded his sphere of interest into problems of mathematical logic and the foundations of mathematics. One of the first results in this research, which he continued as an active area of interest, was the identification of "intuistic logics" with calculation of problems. Thus, in 1938, he published a large article, "Mathematics," in the first edition of the *Bolshaya Sovyetskaya Entsiklopediya* ("Big Soviet Encyclopaedia"), in which he described the development of mathematics from ancient to modern times interpreted in terms of dialectical materialism, as is characteristic of this philosophical attitude.

Law of large numbers

Probability theory. In 1925 Kolmogorov graduated from the faculty of physics and mathematics of Moscow State University and was appointed a research associate of the faculty. At this time he became interested in probability theory. In collaboration with another Soviet mathematician, Aleksandr Y. Khinchin, he studied problems of convergence of series composed of random elements. There followed a cascade of publications, each giving either a complete solution of a problem or significant progress, which then became classical. Thus, in 1928, he made advances in problems of the law of large numbers and in 1929 he practically solved a problem concerning the so-called law of the iterated logarithm (that is, the law of large deviations from the average in a prolonged sequence of statistically independent trials). He also augmented his significant study of conditions for the strong law of large numbers, the particular case of this work being a theorem generalized by him a little later: if random variables are mutually independent and have the same distribution, then their arithmetic mean, extended over *n* terms, converges with a probability of one to their common mathematical expectation.

Of great importance was a paper "General Theory of Measure and Probability Theory" published in 1929, which gave the first description of an axiomatic construction of probability theory based on measure theory. Ideas of this kind, aside from the earlier use of measure theory in the probabilistic researches of U.S. mathematician Norbert Wiener (*q.v.*), previously were put forward by Émile Borel, a French mathematician, and Anton Lomnicki, a Polish mathematician. The complete axiomatics of probability theory, as accepted in the latter half of the 20th century, were first given in the aforementioned publication. In 1933 Kolmogorov expanded the paper into the monograph *Grundbegriffe der Wahrscheinlichkeitsrechnung*, now well-known among mathematicians. In 1950 the monograph was translated into English under the title *Foundations of The Theory of Probability.*

Stochastic processes and topology. In 1931 Kolmogorov was elected a professor of Moscow State University; two years later he was appointed a director of the Institute of Mathematics of the university. This marked the second period of his scientific activities, which lasted about a quarter of a century and was characterized by broad conceptions of his studies. It is notable, first, that he elaborated the principles of stochastic process theory without aftereffect in the monograph *Analytical Methods of Probability Theory*. Other contributions concerned aspects of functional analysis—a comparatively recent branch of mathematics in which the traditional techniques of algebra and calculus are applied to entire collections of functions, which are mappings from one space to another, or equivalently ordered pairs of numbers. He also made contributions to studies of topology and turbulent flow.

Markov processes

Application of probability theory. In the study of probability theory, which is considered his basic speciality, Kolmogorov not only gave generalizations to a number of fundamental facts but also established new directions in research that drastically changed probability theory and, to a considerable extent, widened the possibilities of its application in numerous and different ways. In the publication concerning analytical methods in probability theory mentioned above, he laid down a theory of continuous processes without aftereffect, or, as it is called at present, Markov processes. He formulated two systems of equations in partial derivatives that bear his name; they have since become famous and are consistent with transition probabilities controlling the process. The elaboration of the theory was an answer to problems in physics and the theories of Brownian motion and diffusion. The work marked a new period in the development of probability theory and its application in physics, chemistry, civil engineering, and biology. Many prominent mathematicians worked in this direction; among them were U.S. mathematicians J.L. Doob and William Feller.

This fundamental study in probability was succeeded by a series of works that either continued the development of established ideas, introduced particular details of the theory, or expanded its application to classical problems of probability theory, physics, and chemistry. Of fundamental significance for limiting theorems concerning sums of independent random values were two papers on homogeneous stochastic processes without aftereffects. A fundamental study of Markov chains contained many new ideas in the theory of dynamic systems and served as a starting point for numerous works of other mathematicians.

Of considerable importance were Kolmogorov's investigations in problems of random stationary processes, the theory of which he related to Hilbert space geometry and the applications of which were numerous, including consequences for local isotropic turbulent flow. These investigations are widely known and much valued by mathematicians throughout the world. Wiener, the founder of cybernetics (the theory of control and communication as applied to animals and machines), had independently investigated many aspects of stationary processes, particularly those identified with statistical prediction, and he pointed out that the investigations by Kolmogorov were relevant to the statistical theory of information upon which the science of cybernetics in part depended.

Operator theory

In topology, Kolmogorov, simultaneously with U.S. mathematician James Alexander but independently of him, put forward certain considerations relating to an operator called the nabla operator and applied these to complexes and later to any topological space. Related algebraic structures called nabla groups turned out to be very effective and provided suitable instrumentation in the study of numerous problems of topology, including continuous maps. On this foundation, Kolmogorov put forward a conception of a homological ring, an important idea in topology. His formulation of the duality law (on equivalent representations of certain mathematical properties) was very important for the period of 1935–36. In this context the duality law concerned closed sets situated in a topological space that is locally bicompact and fully regular.

This period was also marked by works in geometry "On Topological Group Formulation of Geometry" and "On Formulation of Projective Geometry," as well as work in the areas of functional analysis and the optimum approximation of functions.

As a professor of the university and the director of its Institute of Mathematics, Kolmogorov always paid great attention to training young mathematicians in different branches of mathematics. Among those who were influenced by his thinking were Izrail M. Gelfand (functional analysis), Anatoly I. Maltsev (mathematical logics), Boris V. Gnedenko (probability theory), Grigory Bavli (probability theory), Ivan Verchenko (theory of real variable functions), Sergey M. Nikolsky (theory of real variable functions), and others who later became well-known mathematicians and were elected members of the Academy of Sciences and corresponding academy members in union republics and foreign countries.

In 1939 Kolmogorov was elected an academician of the Academy of Sciences of the U.S.S.R. and, a little later, an academician-secretary of the department of physical and mathematical sciences of the academy for a term of three years. He then guided the activities of the department, which was established to unite and direct scientific work of the most prominent researchers in this field.

In 1940, jointly with Khinchin, Kolmogorov was awarded the U.S.S.R. State Prize for investigations in the theory of stochastic processes.

During World War II Kolmogorov conducted comprehensive research in theories of firing and turbulent flow in what he considered to be his patriotic contribution to the struggle of the Soviet people against Nazi Germany.

Postwar period. In the mid-1950s, the third period of Kolmogorov's activities began. He became interested in information theory, dynamic-system theory, interconnections of information theory with function theory, classical mechanics, the 13th Hilbert Problem (representation of functions of a large number of variables by functions of a lesser number of arguments), finite automata, and complex theory. In all these topics Kolmogorov derived fundamental results. In this third period, as before, Kolmogorov was surrounded by numerous young talented mathematicians.

Contributions to education

Throughout the latter part of his life, Kolmogorov paid great attention to problems of mathematical education of schoolchildren. He was appointed chairman of the Commission for Mathematical Education under the Presidium of the Academy of Sciences of the U.S.S.R., he delivered lectures in a boarding school for talented young mathematicians gathered from all parts of the country, he wrote a number of introductory textbooks for general education, and he published numerous papers in pedagogy for parents and teachers. Under his leadership a new state program of training in mathematics in the Soviet general school was developed and introduced. In accordance with his proposal, an optional mathematics course was introduced in the ninth and tenth forms of general schools in the Soviet Union to permit fuller development of the scientific interests of schoolchildren.

The merits of Kolmogorov are praised both in the Soviet Union and abroad. He has been awarded the honourable title of Hero of Socialist Labour, the gold medal "Hammer and Sickle," the four highest Orders of Lenin, and the Order of Red Banner of Labour. Besides being the U.S.S.R. State Prize winner, he also won the Lenin Prize. Many foreign academies of sciences have elected him to membership: Paris Academy of Sciences, Royal Society of London, U.S. National Academy of Sciences, Polish Academy of Sciences, Romanian Academy of Sciences, and others. Kolmogorov is an honorary member of many mathematical societies and the American Meteorological Society, and holds an honorary doctorate of the Paris, Stockholm, and Warsaw universities.

Konoe Fumimaro

Prince Konoe Fumimaro was a political leader during one of the most eventful periods in Japanese history—the mid-1930s to the end of World War II. As prime minister in 1937–39 and 1940–41, he tried unsuccessfully to restrict the power of the military forces and to keep Japan's war with China from widening into a world conflict.

Early life

Konoe was born October 12, 1891, to the foremost of the five families from among which regents (*sesshō*) and Imperial advisers (*kampaka*) were chosen. His father, Atsumaro, was a prominent statesman.

Konoe was an intelligent and sensitive child, but he tended to be nervous and timid, and he developed a cynical attitude toward society. He was educated with the intellectual elite of the nation, first attending Tokyo Imperial University and then Kyōto Imperial University, from which, during Japan's participation in World War I, he was graduated by the law faculty.

Konoe Fumimaro.

As a student he became intimate with Western philosophy, literature, sociology, and social and economic problems, particularly the problems of the poor. One of his major advisers at Kyōto University later became one of Japan's leading Marxist economists. During this period, Konoe translated into Japanese Oscar Wilde's essay "The Soul of Man Under Socialism" (1891), which was published in an intellectual journal. Its sale was prohibited by the government because it was judged dangerous to the public order.

Unlike most politicians in Japan before World War II, Konoe did not begin his political career either through civil-service examination or through membership in a political party. Instead, he entered (*c.* 1920) under the tutelage of the *genrō* (elder statesman) Saionji Kimmochi, a perceptive advocate of parliamentary government and a member of the court aristocracy.

After the war Konoe was an attendant of the Japanese delegation to the Paris Peace Conference. At this time he wrote an article rejecting the Anglo-American principle of pacifism as a convenient cover for maintaining the status quo by nations which, unlike Japan, already possessed extensive spheres of influence. He also vigorously criticized as impractical the principle of an international league as a means of abolishing economic imperialism and racial prejudice.

Konoe entered the upper house of the Diet by virtue of his rank as prince. He advocated reform of that house and of the peerage system, opposed Fascism, and called for reform of the army general staff to prevent army interference in foreign affairs. His goal was the expansion of parliamentary politics. From the outbreak of war with China in Manchuria (1931), Konoe felt that a complete political renovation of the Japanese militaristic power structure, carried out by political leaders, was required in order to realize the nation's destiny. After serving as vice president of the upper house, Konoe was appointed president in 1933. He declined to form a Cabinet in 1936, when on Saionji's recommendation, he was asked to by the Emperor. But in June 1937 he agreed to form a non-party Cabinet, which he hoped would gain the support of the nation. He decided to adopt the most reasonable of the army's demands while controlling its more reckless elements. He declared that he sought to realize social and international righteousness and to alleviate internal friction and discord.

Prime minister

In July Chinese and Japanese forces clashed near Peking, and the two countries soon were engaged in full-scale, although undeclared, war. Konoe made various unsuccessful efforts to end the conflict, and in January 1939 his Cabinet fell. He was appointed head of the Privy Council and was given a Cabinet post in the Hiranuma Kiichirō Cabinet.

Konoe's first Cabinet had been plagued by the separation of state affairs and the army's right of supreme command. He believed that to restrain the army and to settle the war required a government based on political power derived from a national organization. In June 1940 he resigned as head of the Privy Council, planning to develop such a mass national movement, but, before his plans were fully developed, he was persuaded to form his second Cabinet. His plan for a mass, popular organization was finally realized later that year with the formation of the Imperial Rule Assistance Association.

That September Japan concluded a military alliance—the Tripartite Pact—with Germany and Italy. Meanwhile, amid steadily deteriorating relations with Great Britain and the United States, Konoe tried to prevent a widening of the Sino-Japanese conflict and thus avert American participation; in April 1941 he concluded a nonaggression pact with the Soviet Union.

Faced with a further deterioration of Japanese–American relations and an American encirclement of Japan, Konoe concluded that a solution to the Sino-Japanese conflict could be reached only through American mediation. Thus, from April 1941, he devoted all his energy to Japanese–American negotiations, hoping to enter into discussions with the U.S. president, Franklin D. Roosevelt. In July, the third Konoe Cabinet was formed in order to eliminate Foreign Minister Matsuoka Yōsuke, who opposed these negotiations. But in October Konoe resigned over differences with the army minister Tōjō Hideki.

With the widening of the war following the Japanese attack on Pearl Harbor in December 1941, Konoe came under military surveillance and was forced to leave the centre of politics. In 1944 he cooperated with other leading political figures to bring about the collapse of the Tōjō Cabinet. After the war, in 1945, he became deputy minister of national affairs in the Higashikuni Cabinet. In January 1946 he was served with an arrest warrant by the occupation army on suspicion of being a war criminal. On January 16, the day he was to report, he committed suicide by drinking poison.

BIBLIOGRAPHY. TEIJI YABE, *Konoe Furnimaro,* 2 vol. (1958), is an excellent and detailed biography (in Japanese). YOSEIITAKE OKA, *Konoe Fumimaro: Unmei no Seijika* (1972), provides a unique account of Konoe's personality and character in the historical context of his age.

Koppen, Wladimir Peter

Wladimir Peter Koppen, Russian-born German meteorologist and climatologist, best known for his systematic method of identifying and mapping the world's climates, played a major role in the advancement of climatology and meteorology for more than 70 years. His achievements, practical and theoretical, profoundly influenced the development of atmospheric science.

Koppen was born September 25, 1846, in St. Petersburg (now Leningrad), and remained in Russia until he was 20. His grandfather was one of the German physicians invited to Russia by the empress Catherine the Great to improve sanitation in the provinces. He later became personal physician to the tsar. His father, Peter von Koyyen (1793–1864). worked at the Academy in St. Petersburg as geographer, statistician, and historian. In gratitude for his services to Russian culture, Tsar Alexander II (reigned 1855–81) appointed him Academician, highest academic rank in Russia. He also granted him in 1858 a seaside estate called Karabakh on the south coast of Crimea.

His father's scholastic success and versatility inspired Koppen at an early age to apply his own intellect and perception to the varied environment of the Crimea. The complex geography of the low mountain ranges along the Black Sea coast provided the setting for his first explorations. While attending secondary school at Simferopol (1858–64), some 30 miles north of Karabakh, where the coastal ranges yield to extensive plains, he frequently travelled the mountain route inland from the sea. The floral richness and climatic variety of the region, he later emphasized, first awakened his lasting interest in the geography of the plant world and its relationship to climate.

Early interest in geography

In 1864 Koppen began study at the University of St. Petersburg, specializing in botany. Koppen returned to Karabakh many times, and the environmental changes he saw between the dark northern forests and the subtropical shores of the Crimea broadened his geographical perspectives.

In 1867 Koppen transferred to the University of Heidelberg, completed his doctoral dissertation on the relation of plant growth to temperature, and received his degree in 1870. A mark of Koppen's extraordinary integrity was his insistence on travelling for his final examinations from Heidelberg, where the faculty might have been prejudiced in his favour, to the University of Leipzig to assure the impartiality of his examiners. Following the Franco-Prussian War (1870–71), in which he served in the ambulance corps, Koppen returned to St. Petersburg as assistant at the Central Physical Observatory. Three years later he accepted a position with the German Naval Observatory at Hamburg as head of the newly established division of weather telegraphy, storm warning systems, and marine meteorology. In 1879 he was given the new title of meteorologist of the observatory, and in 1884 he produced a world map of temperature belts, ranging from polar to tropical latitude, each distinguished by the number of months having temperatures above or below certain mean values.

Climatic classification system

A climax in geographical climatology was reached in 1900 when Koppen introduced his mathematical system of climatic classification. Each of five major climate types was assigned a mathematical value according to temperature and rainfall. Since then, many of the systems introduced by other scholars have been based on Koppen's work.

Koppen retired from his position at the Hamburg observatory in 1919 and moved to Graz, Austria, in 1924. In 1927 he undertook, with Rudolph Geiger, the editorship of a five-volume *Handbuch der Klimatologie*, which was nearly completed when he died on June 22,1940.

Throughout his distinguished career Koppen retained his intellectual flexibility. Well-informed on a broad range of subjects, he was keenly receptive to new ideas and methods, especially those offered by youthful scientists, who found in him a patient and constructive listener. Although he was not widely travelled, he knew a great deal about the world, and he saw his work and his nonprofessional interests in full global perspective. The deep concern he felt for his fellow man was evident in the time and energy he devoted to problems of land-use reform, school reform, improved nutrition for the underprivileged, alcoholism, and calendar reform. In the cause of world peace he strongly advocated widespread use of Esperanto, which he spoke as fluently as he did German and Russian. Between 1868 and 1939 he produced more than 500 publications, some of which he translated into Esperanto.

Work as social reformer

Koppen's fondness for children was well known. He was a founder of the Eimsbütteler Boys Home at Hamburg, where he was a frequent and regular worker. He also accepted into his family, which included his wife and their five children, a nephew and niece whose father had died. When a group of Russian students fled to Germany, he arranged housing for them in Hamburg and later assisted some of them to reach America. These selfless acts called for considerable sacrifice, for his means were limited.

Koppen was a small, dignified man. He was modest: he eschewed his inherited right to use "von" before his name, he rarely referred to his many honours, and he preferred to travel by third-class railway carriage. Köppen was one of the last scholars of an era when an erudite man could attain competence in, and make significant contributions to, many branches of natural science. Prominent among scholars of his own time, he helped to, pave the way for the scientific specialists of the 20th century.

BIBLIOGRAPHY. No English language study of Koppen **has** been published. In German, a scholarly biography by Koppen's daughter, ELSE **WEGENER-KOPPEN**, *Wladimir Koppen,* ein Gelekrtenleben (1955), is available.

Köprülü Family

The Kopriilu family was a famous family of statesmen considered to have been responsible for preventing the Ottoman Empire from decline in the second half of the 17th century. The founder of the family, Kopriilu Mehmed Pasha, became grand vizier (chief minister) in 1656 when the Ottoman Empire was in a critical situation. Venetians were then threatening Istanbul after their capture of Tenedos (Turkish Bozca Ada) and Lemnos (summer 1656). Cut off from supplies, the city was in distress. Rising prices and continuous financial crisis had put the troops and the populace in the capital in a rebellious mood. The palace clique with the mother of the Sultan at its head was prepared to relinquish its power to a strong man. When Kopriilii was offered the grand vizierate, he asked the Sultan's mother, who was the real ruler behind the Sultan, to promise solemnly never to interfere or let anybody interfere with the grand vizier's absolute authority in the government. The pledge was solemnly reiterated by the Sultan himself at the ceremony of appointment (September 14, 1656).

Kopriilii Mehmed Pasha. For more than half a century power in the Ottoman state had been determined as a result of struggles and compromises between rival groups. Grand viziers who were supposed to represent the Sultan's absolute power had virtually become dependent on the Palace and the Janissary corps, or provincial forces, with the result that there was a lack of authority and complete disorder in the administration. Faced with crisis, the Palace chose Kopriilu Mehmed, an old vizier in retirement, recommended to the Sultan's mother by a clique as the wisest and most experienced man available. A product of the peculiar Ottoman institution of trained palace pages, he came from Rojnik, a village near Berat in Albania. After his services and training in the palace, he became a governor general in the provinces of Trabzon (Trebizond; 1644), Egri (Eger) (1647), Karaman (1648), and Anadolu (1650), and sat as vizier in the imperial council for only a week in 1652, and then, dismissed, he retired to Koprii, his father-in-law's seat, a small town in northern Anatolia, thence his nickname Kopriilii, of Koprii.

Well informed in the most complicated Ottoman politics, Kopriilu, once grand vizier, began by placing his supporters at the key positions and mercilessly repressing opponents and rivals. When challenged by the *sipahi*s (the Ottoman cavalry), who wanted to put another man, a former leader of the Anatolian mercenaries, in power, Kopriilii secured the support of Janissaries (the core of the Ottoman standing army) and *shaykh al-islām*, head of the *ʿulamāʾ* (scholars trained in Muslim religion and law), and thus nipped the rebellion in the bud. His second test came when he organized and led an expedition against the Venetians the next summer. His success in repelling the Venetian navy in the Dardanelles (July 19, 1657) and the subsequent recovery of Tenedos (September 4) and Lemnos (November 15) won him the prestige he needed to establish his authority. During this expedition, he was unusually severe against the Janissaries and others who had neglected their duties. Enjoying the absolute confidence of the Palace, Köprülü tried to re-establish central authority over the vassal princes beyond the Danube and in the provinces of Anadolu, Syria, and Egypt. An expedition against George II (Gyorgy Rákóczi), prince of Transylvania, resulted in Rákóczi's replacement by a new prince loyal to the court (1658) and later in the annexation of the provinces of Yanova (Jeno) (August 1, 1660) and Várad (August 27, 1660). But the Ottoman expansion in Transylvania opened a period of rivalry and wars between the Ottomans and Habsburgs for the next four decades.

Military victories

As a protest against Köprülü's unusually despotic government the principal governors general in Anatolia and Syria had not joined the imperial army in Transylvania. In the fall of 1658, while Kopriilu was in the field, they rose up and marched toward the capital. Abaza Hasan, then Pasha of Aleppo and chief of the rebels, held his power as the leader of the sekbans, unruly mercenary troops in Anatolia. The skillful tactics of the old vizier eventually made his rivals powerless and all the rebel pashas were executed (February 1659). In the summer of the same year Kopriilu sent a general inspector to Anatolia with authority to exclude from the state registers all those from among the *reaya* (non-Muslim taxpayers) who claimed to belong to the military class. This measure, aimed primarily. at the suppression of the sekbans, reestablished central authority in the region. When Koprulu died in Adrianople on October 31, 1661, he had succeeded in restoring the central authority in the Ottoman Empire in accordance with its age-old principles of government. He had won the confidence and respect of the young sultan and his mother by his loyalty to the interests of the state. The Sultan followed his advice in appointing as grand vizier his son Fazıl Ahmed, a young man of 26, who had served as his deputy in his last days.

Fazıl Ahmed. The eldest son of Kopriilu Mehmed, Fazıl Ahmed was born at Köprü in 1635. His father had chosen for him a career in the learned professions. At 16 he was made professor but entered the civil service when his father became grand vizier. He was made governor general of Erzurum (1659) and then Damascus (1660) before he was called as deputy grand vizier during an illness of his father. Ahmed became grand vizier on November 1, 1661 and proved to be as energetic and skillful as his father in asserting his authority. When, during his first campaign against the Austrians in 1663, he learned of a plot against himself fomented by Şâmî-zâde Mehmed, chief of the secretaries and member of the clique who brought Kopriilii Mehmed to power, he did not hesitate to have him executed. Against those who belittled him and struggled against him he always had the unswerving support of the Sultan. Whenever Ahmed was away from the capital, Kara Mustafa, husband of his sister, was left there as his deputy. In the battlefield he also had the close cooperation of Gurcii Mehmed, Kaplan Mustafa, his brother-in-law, and other able generals. The prestige of the empire that his father had re-established was so great as to bring under his command during his campaigns in central Europe the auxiliary forces of the vassal principalities—Transylvania, Moldavia, Walachia, and the Crimean Khanate. He also followed his father's reforms aiming at ieducing the number of the Janissaries and *sipahi*s and also made them more efficient by restoring discipline among them. Ahmed also placed emphasis on the age-old Ottoman policy of protection of the reaya, which was possible only under a strong central government. Though his failure at the battle of St. Gotthard (August 1, 1664) tarnished his earlier success against the Austrians—the capture of Érsekújvar in September 1663—he was able to make a treaty favourable to the Ottomans at Vasvár (August 10, 1664). The Sultan received him in Edirne with great favours. Ahmed won unparalleled prestige when he conquered Candia (modern Iráklion) in Crete (September 27, 1669) after a siege of 28 months and thus terminated a long and dangerous war with Venice. An expedition against Poland in 1672 in which the Sultan himself took part was a great achievement for Kopriilii. Under the Treaty of Buczacz (October 18, 1672) Podolia was annexed to the empire and the Ukraine was surrendered to the Cossacks under Ottoman suzerainty. Poland was also to pay a yearly tribute of 22,000 gold pieces. But the Poles under John Sobieski rejected these onerous conditions and took up a counteroffensive, which caused the war to continue four more years until the Treaty of 26-rawno, October 17, 1676. Russian intervention in the Ukraine led Ahmed to invade the region (summer 1674). Exhausted and for some time ill as a result of long expe-

Fazıl Ahmed's appointment as grand vizier

The Kopriilii Family

Hasan Ağa
Amca-zbde Hiiseyin, grand vizier (1697–1702)
daughter = Kara Mustafa grand vizier (1676–83)
Siyâvuş = daughter grand vizier (1687–88)
Fazıl Mustafa, grand vizier (1689–91)
Fazıl Ahmed, grand vizier (1661–76)
SULTAN MUSTAFA II
Ali, vizier = Safiye (died 1722)
SULTAN MUSTAFA II
Ayge = Numan, grand vizier (1710, died 1719)
Abdullah, vizier (died 1735)
Esad, vizier (died 1726)
Abdurrahman, vizier (died 1733)
Hafız Ahmed, vizier (died 1769)
Mehmed, mudarris (died 1719)

ditions and excessive use of wine, Ahmed died on November 3, 1676. Contemporary Ottoman sources found in him all the qualities requisite for an Oriental statesman —wide knowledge, wisdom, justice, and generosity. He also distinguished himself in Islāmic law and Persian literature. He left a cash fortune of over 300,000 gold pieces. Like other pashas he maintained a private force of *sekban*s (1,500 in number).

Kara Mustafa. After Ahmed the grand vizierate was given to Kara Mustafa, his brother-in-law. Ottoman power then at its zenith was used by this ambitious man to establish once and for all Ottoman sovereignty in the Ukraine by the war against Russia, 1678–1681, and central Europe by the siege of Vienna, 1683. His failure outside Vienna caused the collapse of the whole edifice the first two Kopriiliis had erected. The Austrian Emperor, Venice, and Poland made a Holy League (1684) against the Ottomans, in which Russia joined two years later.

Decline of the family

Consequent to the defeat at Vienna the Köprülü family lost its influence. Fazıl Mustafa, younger brother of Ahmed (born in 1637 at Koprii), vizier since 1680, had to resign. But later when his brother-in-law Siyâvuş became grand vizier he was made second vizier (October 2, 1687), and they both played a major role in deposing Mehmed IV. But soon rebels turned against them, and Fazıl Mustafa saved his life only with the protection of the Sultan. In 1689 when the Austrian army advanced in the Balkans Mustafa was called to the grand vizierate. In the campaign of 1690 he liberated Nish and Belgrade from occupation; he was killed fighting an imperial army under Louis of Baden at Slankamen on August 19, 1691; Mustafa was mortally shot while rushing to support his right wing.

Other members of thefamily. It fell to Kopriilii Mehmed's nephew Amca-zâde Hiiseyin Pasha, grand vizier between September 13, 1697, and September 29, 1702, to conclude the peace treaty with the allies at Carlowitz (January 26, 1699). Another grand vizier of the Kopriilii family was Numan Pasha, eldest son of Fazıl Mustafa. Becoming grand vizier on June 16, 1710, he was soon dismissed on August 17 because of his timid policy toward Russia and his inexperience in the political manoeuvres. His brother Abdullah Pasha, vizier in 1700 and commander in chief of an army sent against Iran in 1734, was killed in the battlefield (June 14, 1735). The third son of Fazıl Mustafa, Esad, vizier on February 19, 1718, was not good at administration and pursued a literary career. He died in Retimo in September 1726.
