The stratificational framework, presented in Lamb's work, consistently separates compositional and realizational units, the former being designated by terms ending in the suffix -on (semon, lexon, morphon, phonon), the latter by terms ending in the suffix *-eme* (sememe, lexeme, morpheme, phoneme). Ons are components or compounds of emes on the same stratum (semons are components of sememes, lexons are composed of lexemes, etc.) and emes realize ons of the stratum above (phonemes realize morphons, morphemes realize lexons, etc.). Each stratum has its own combinatorial pattern specifying the characteristic combinations of elements on that stratum. Syllable structure is specified on the phonemic stratum, the structure of word forms on the morphemic stratum, the structure of phrases on the lexemic stratum, and the structure of clauses and sentences on the sememic stratum. Phonons are roughly equivalent to phonological distinctive features and include such properties or components of phonemes as labial, nasal, and so on. Sememes are roughly equivalent to what other linguists have called semantic components or features and include such aspects of the meaning of the lexeme "man" as "male," "adult," "human," and so forth. Once again, however, compositional function is distinguished from interstratal realizational function, so that no direct equivalence can be established with nonstratificational terminology. In more recent work in stratificational grammar, the notion that emes are composed of ons has been abandoned, and greater emphasis is laid upon the fact that emes are points, or positions, in a relational network; they are connected to other points in the network but have themselves no internal structure.

Interstratal relationships. One of the principal characteristics of the stratificational approach is that it sets out to describe languages without making use of rules that convert one entity into another. (Reference has been made above to the antipathy many linguists have felt towards describing languages in terms of processes.) The stratificationalist would handle the phenomena in terms of the interstratal relationships of realization. Various kinds of interstratal relationships, other than that of one-to-one correspondence may be recognized: diversification, in which one higher unit has alternative realizations; zero realization, in which a higher unit has no overt realization on the lower stratum; neutralization, in which two or more higher units are mapped into the same lower level unit; and so on. All these interstratal one–many or many–one relations are then analyzed in terms of the logical notions of conjunction and disjunction (AND-relations versus OR-relations), of ordering (*x* precedes y in an AND-relationship, *x* is selected in preference to y in an OR-relationship), and the directionality ("upward towards meaning, or "downward" towards sound). Many of the phenomena that are described by other linguists in terms of processes that derive one unit from another can be described elegantly enough in terms of interstratal relationships of this kind.

Types of interstratal relationships

Critics, however, have objected to the proliferation of strata and theoretical constructs in stratificational grammar, arguing that they result from an a priori commitment to the notion of realization and that the only stratal distinction for which there is any independent evidence is the distinction of phonology and grammar. It has been suggested by Lamb that stratificational grammar provides a model for the way in which linguistic information is stored in the brain and activated during the production and reception of speech. But little is known yet about the neurology of language and speech, and it would be premature to draw any firm conclusions about this aspect of stratificational grammar (see below Psycholinguistics).

THE PRAGUE SCHOOL

What is now generally referred to as the Prague school comprises a fairly large group of scholars, mainly European, who, though they may not themselves have been members of the Linguistic Circle of Prague, derived their inspiration from the work of Vilém Mathesius, Nikolay Trubetskoy, Roman Jakobson and other scholars based in Prague in the decade preceding World War II.

Combination of structuralism and functionalism. The most characteristic feature of the Prague school approach is its combination of structuralism with functionalism. The latter term (like "structuralism") has been used in a variety of senses in linguistics. Here it is to be understood as implying an appreciation of the diversity of functions fulfilled by language and a theoretical recognition that the structure of languages is in large part determined by their characteristic functions. Functionalism, taken in this sense, manifests itself in many of the more particular tenets of Prague school doctrine.

One very famous functional analysis of language, which, though it did not originate in Prague, was very influential there, was that of the German psychologist Karl Biihler, who recognized three general kinds of function fulfilled by language: *Darstellungsfunktion*, Kundgabefunktion, and Appelfunktion. These terms may be translated, in the present context, as the cognitive, the expressive, and the conative (or instrumental) functions. The cognitive function of language refers to its employment for the transmission of factual information; by expressive function is meant the indication of the mood or attitude of the speaker (or writer); and by the conative function of language is meant its use for influencing the person one is addressing or for bringing about some practical effect. A number of scholars working in the

Various functions of language

Prague tradition have suggested that these three functions correlate in many languages, at least partly, with the grammatical categories of mood and person. The cognitive function is fulfilled characteristically by 3rd-person nonmodal utterances (*i.e.*, utterances in the indicative mood, making no use of modal verbs); the expressive function by 1st-person utterances in the subjunctive or optative mood; and the conative function by 2nd-person utterances in the imperative. The functional distinction of the cognitive and the expressive aspects of language has also been applied by Prague school linguists in their work on stylistics and literary criticism. One of their key principles is that language is being used poetically or aesthetically when the expressive aspect is predominant, and that it is typical of the expressive function of language that this should be manifest in the form of an utterance and not merely in the meanings of the component words.

Phonemes as distinctive features

Phonological contributions. The Prague school is best known for its work on phonology. Unlike the American phonologists, Trubetskoy and his followers did not take the phoneme to be the minimal unit of analysis. Instead, they defined phonemes as sets of distinctive features. For example, in English, /b/ differs from /p/ in the same way that /d/ differs from /t/ and /g/ from /k/. Just how they differ in terms of their articulation is a complex question. For simplicity, it may be said that there is just one feature, the presence of which distinguishes /b/, /d/, and /g/ from /p/, /t/, and /k/, and that this feature is voicing (vibration of the vocal cords). Similarly, the feature of labiality can be extracted from /p/ and /b/ by comparing them with /t/, /d/, /k/, and /g/; the feature of nasality from /n/ and /m/ by comparing them with /t/ and /d/, on the one hand, and with /p/ and /b/, on the other. Each phoneme, then, is composed of a number of articulatory features and is distinguished by the presence or absence of at least one feature from every other phoneme in the language. The distinctive function of phonemes, which depends upon and supports the principle of the duality of structure, can be related to the cognitive function of language. This distinctive feature analysis of Prague school phonology as developed by Jakobson has become part of the generally accepted framework for generative phonology (see above).

Two other kinds of phonologically relevant function are also recognized by linguists of the Prague school: expressive and demarcative. The former term is employed here in the sense in which it was employed above (*i.e.*, in opposition to "cognitive"); it is characteristic of stress, intonation, and other suprasegmental aspects of language that they are frequently expressive of the mood and attitude of the speaker in this sense. The term demarcative is applied to those elements or features that in particular languages serve to indicate the occurrence of the boundaries of words and phrases and, presumably, make it easier to identify such grammatical units in the stream of speech. There are, for example, many languages in which the set of phonemes that can occur at the beginning of a word differs from the set of phonemes that can occur at the end of a word. These and other devices are described by the Prague school phonologists as having demarcative function: they are boundary signals that reinforce the identity and syntagmatic unity of words and phrases.

Marked and unmarked features

Theory of markedness. The notion of markedness was first developed in Prague school phonology but was subsequently extended to morphology and syntax. When two phonemes are distinguished by the presence or absence of a single distinctive feature. one of them is said to be marked and the other unmarked for the feature in question. For example, /b/ is marked and /p/ unmarked with respect to voicing. Similarly, in morphology, the regular English verb can be said to be marked for past tense (by the suffixation of *-ed*) but to be unmarked in the present (cf. "jumped" versus "jump"). It is often the case that a morphologically unmarked form has a wider range of occurrences and a less definite meaning than a morphologically marked form. It can be argued, for example, that, whereas the past tense form in English (in simple sentences or the main clause of complex sentences) definitely refers to the past, the so-called present tense form is more neutral with respect to temporal reference: it is nonpast in the sense that it fails to mark the time as past, but it does not mark it as present. There is also a more abstract sense of markedness, which is independent of the presence or absence of an overt feature or affix. The words "dog" and "bitch" provide examples of markedness of this kind on the level of vocabulary. Whereas the use of the word "bitch" is restricted to females of the species, "dog" is applicable to both males and females. "Bitch" is the marked and "dog" the unmarked term, and, as is commonly the case, the unmarked term can be neutral or negative according to context (cf. "That dog over there is a bitch" versus "It's not a dog, it's a bitch"). The principle of markedness, understood in this more general or more abstract sense, is now quite widely accepted hy linguists of many different schools, and it is applied at all levels of linguistic analysis.

Recent contributions. Current Prague school work is still characteristically functional in the sense in which this term was interpreted in the pre-World War II period. The most valuable contribution made by the postwar Prague school is probably the distinction of theme and rheme and the notion of "functional sentence perspective" or "communicative dynamism." By the theme of a sentence is meant that part that refers to what is already known or given in the context (sometimes called, by the scholars, the topic or psychological subject); by the rheme, the part that conveys new information (the comment or psychological predicate). It has been pointed out that, in languages with a free word order (such as Czech or Latin), the theme tends to precede the rheme, regardless of whether the theme or the rheme is the grammatical subject and that this principle may still operate, in a more limited way, in languages, like English, with a relatively fixed word order (cf. "That book I haven't seen before"). But other devices may also be used to distinguish theme and rheme. The rheme may be stressed ("Jóhn saw Mary") or made the complement of the verb "to be" in the main clause of what is now commonly called a cleft sentence ("It's Jóhn who saw Mary").

Case grammar

The general principle that has guided research in "functional sentence perspective" is that the syntactic structure of a sentence is in part determined by the communicative function of its various constituents and the way in which they relate to the context of utterance. A somewhat different but related aspect of functionalism in syntax is seen in current work in what is called case grammar. Case grammar is based upon a small set of syntactic functions (agentive, locative, benefactive. instrumental, and so on) that are variously expressed in different languages but that are held to determine the grammatical structure of sentences. Although case grammar does not derive directly from the work of the Prague school, it is very similar in inspiration.

III. Historical (diachronic) linguistics

LINGUISTIC CHANGE

All languages change in the course of time. Written records make it clear that 15th-century English is quite noticeably different from 20th-century English, as is 15th-century French or German from modern French or German. It was the principal achievement of the 19th-century linguists not only to realize more clearly than their predecessors the ubiquity of linguistic change but also to put its scientific investigation on a sound footing by means of the comparative method (see the section on the History of *linguistics: The* 19th century). This will be treated in greater detail in the following section. Here various kinds, or categories, of linguistic change will be listed and exemplified.

Sound change. Since the beginning of the 19th century, when scholars observed that there were a number of systematic correspondences in related words between the sounds of the Germanic languages and the sounds of what were later recognized as other Indo-European languages, particular attention has been paid in diachronic linguistics to changes in the sound systems of languages.

Certain common types of sound change, most notably assimilation and dissimilation, can be explained, at least partially, in terms of syntagmatic, or contextual, conditioning. By assimilation is meant the process by which one sound is made similar in its place or manner of articulation to a neighbouring sound. For example, the word "cupboard" was presumably once pronounced, as the spelling indicates, with the consonant cluster pb in the middle. The p was assimilated to b in manner of articulation (*i.e.*, voicing was maintained throughout the cluster), and subsequently the resultant double consonant bb was simplified. With a single b in the middle and an unstressed second syllable, the word "cupboard," as it is pronounced nowadays, is no longer so evidently a compound of "cup" and "board" as its spelling still shows it to have been. The Italian words *notte* "night" and otto "eight" manifest assimilation of the first consonant to the second consonant of the cluster in place of articulation (cf. Latin *nocte*(*m*), octo). Assimilation is also responsible for the phenomenon referred to as umlaut in the Germanic languages. The high front vowel *i* of suffixes had the effect of fronting and raising preceding back vowels and, in particular, of converting an a sound into an *e* sound. In Modern German this is still a morphologically productive process (cf. *Mann* "man": Manner "men"). In English it has left its mark in such irregular forms as "men" (from **manniz*), "feet" (from **fotiz*), and "length" (from **langþa*).

Umlaut

Dissimilation refers to the process by which one sound becomes different from a neighbouring sound. For example, the word "pilgrim" (French *pèlerin*) derives ultimately from the Latin *peregrinus;* the *l* sound results from dissimilaton of the first r under the influence of the second r. A special case of dissimilation is haplology, in which the second of the two identical or similar syllables is dropped. Examples include the standard modern British pronunciations of "Worcester" and "Gloucester" with two syllables rather than three and the common pronunciation of "library" as if it were written "libry." Both assimilation and dissimilation are commonly subsumed under the principle of "ease of articulation." This is clearly applicable in typical instances of assimilation. It is less obvious how or why a succession of unlike sounds in contiguous syllables should be easier to pronounce than a succession of identical or similar sounds. But a better understanding of this phenomenon, as of other "slips of the tongue," may result from current work in the physiological and neurological aspects of speech production.

Not all sound change is to be accounted for in terms of syntagmatic conditioning. The change of p, t, and k to f, θ (the th sound in "thin"), and h or of b, *d*, g to p, t, and k in early Germanic cannot be explained in these terms. Nor can the so-called Great English Vowel Shift that, in the 15th century, modified the quality of all the long vowels (cf. "profane" : "profanity"; "divine" : "divinity"; and others). Attempts have been made to develop a general theory of sound change, notably by the French linguist André Martinet. But no such theory has yet won universal acceptance, and it is likely that the causes of sound change are multiple.

Phonetic vs. phonological sound change

Sound change is not necessarily phonological; it may be merely phonetic (see above Structural *linguistics*: Phonology). The pronunciation of one or more of the phones realizing a particular phoneme may change slightly without affecting any of the previously existing phonological distinctions; this no doubt happens quite frequently as a language is transmitted from one generation to the next. Two diachronically distinct states of the language would differ in this respect in the same way as two coexistent but geographically or socially distinct accents of the same language might differ. It is only when two previously distinct phonemes are merged or a unitary phoneme splits into two (typically when allophonic variation becomes phonemic) that sound change must definitely be considered as phonological. For example, the sound change of p to *f*, ***t*** to *θ*(*th*), and k to ***h***, on the one hand, and of b to p, *d* to *t*, and g to k, on the other, in early Germanic had the effect of changing the phonological system. The voiceless stops did not become fricatives in all positions; they remained as voiceless stops after s. Consequently, the *p* sound that was preserved after *s* merged with the p that derived by sound change from b. (It is here assumed that the aspirated p sound and the unaspirated p sound are to be regarded as allophones of the same phoneme). Prior to the Germanic sound shift the phoneme to be found at the beginning of the words for "five" or "father" also occurred after *s* in words for "spit" or "spew"; after the change this was no longer the case.

Grammatical change. A language can acquire a grammatical distinction that it did not have previously, as when English developed the progressive ("He is running") in contrast to the simple present ("He runs"). It can also lose a distinction; *e.g.*, modern spoken French has lost the distinction between the simple past (*Il marcha* "he walked") and the perfect (*Il* a *marché* "he has walked"). What was expressed by means of one grammatical device may come to be expressed by means of another. For example, in the older Indo-European languages the syntactic function of the nouns and noun phrases in a sentence was expressed primarily by means of case endings (the subject of the sentence being in the nominative case, the object in the accusative case, and so on); in most of the modern Indo-European languages these functions are expressed by means of word order and the use of prepositions. It is arguable, although it can hardly be said to have been satisfactorily demonstrated yet, that the grammatical changes that take place in a language in the course of time generally leave its deep structure unaffected and tend to modify the ways in which the deeper syntactic functions and distinctions are expressed (whether morphologically, by word order, by the use of prepositions and auxiliary verbs, or otherwise), without affecting the functions and distinctions themselves. Many grammatical changes, especially changes in the morphology of a language, are traditionally accounted for in terms of analogy (see above History of Linguistics).

Semantic change. Towards the end of the 19th century, a French scholar, Michel Bréal, set out to determine the laws that govern changes in the meaning of words. This was the task that dominated semantic research until the 1930s, when scholars began to turn their attention to the synchronic study of meaning. Many systems for the classification of changes of meaning have been proposed, and a variety of explanatory principles have been suggested. So far no "laws" of semantic change comparable to the phonologist's sound laws have been discovered. It seems that changes of meaning can be brought about by a variety of causes. Most important, perhaps, and the factor that has been emphasized particularly by the so-called words-and-things movement in historical semantics is the change undergone in the course of time by the objects or institutions that words denote. For example, the English word "car" goes back through Latin carrus to a Celtic word for a four-wheeled wagon. It now denotes a very different sort of vehicle; confronted with a model of a Celtic wagon in a museum, one would not describe it as a car. Semantic change of this kind is continuous.

Causes of changes in meaning

Some changes in the meaning of words are caused by their habitual use in particular contexts. The word "starve" once meant "to die" (cf. Old English steorfan, German *sterben*); in most dialects of English, it now has the more restricted meaning "to die of hunger," though in the north of England "He was starving" can also mean "He was very cold" (*i.e.*, "dying" of cold, rather than hunger). Similarly, the word "deer" has acquired a more specialized meaning than the meaning "wild animal" that it once bore (cf. German Tier); and "meat," which originally meant food in general (hence, "sweetmeats" and the archaic phrase "meat and drink") now denotes the flesh of an animal treated as food. In all such cases, the narrower meaning has developed from the constant use of the word in a more specialized context, and the contextual presuppositions of the word have in time become part of its meaning.

Borrowing. Languages borrow words freely from one another. Usually this happens when some new object or institution is developed for which the borrowing language has no word of its own. For example, the large number of words denoting financial institutions and operations borrowed from Italian by the other western European languages at the time of the Renaissance testifies to the importance of the Italian bankers in that period. (The word "bank" itself, in this sense, comes through French from the Italian banca). Words now pass from one language to another on a scale that is probably unprecedented, partly because of the enormous number of new inventions that have been made in the 20th century and partly because international communications are now so much more rapid and important. The vocabulary of modern science and technology is very largely international.

THE COMPARATIVE METHOD

Reconstruction of an earlier language

The comparative method in historical linguistics is concerned with the reconstruction of an earlier language or earlier state of a language on the basis of a comparison of related words and expressions in different languages or dialects derived from it. The comparative method was developed in the course of the 19th century for the reconstruction of Proto-Indo-European and was subsequently applied to the study of other language families. It depends upon the principle of regular sound change—a principle that, as explained above, met with violent opposition when it was introduced into linguistics by the Neogrammarians in the 1870s but by the end of the century had become part of what might be fairly described as the orthodox approach to historical linguistics (see above History of *linguistics:* The *19th* century). Changes in the phonological systems of languages through time were accounted for in terms of sound laws.

Grimm's law. The most famous of the sound laws is Grimm's law (though Grimm himself did not use the term law). Some of the correspondences accounted for by Grimm's law are given in Table 1. It will be observed that, when other Indo-European languages, including Latin and Greek, have a voiced unaspirated stop (*b*, d), Gothic has the corresponding voiceless unaspirated stop (p, t) and that, when other Indo-European languages have a voiceless unaspirated stop, Gothic has a voiceless fricative (f, *θ*). The simplest explanation would seem to be that, under the operation of what is now called Grimm's law, in some prehistoric period of Germanic (before the development of a number of distinct Germanic languages), the voiced stops inherited from Proto-Indo-European became voiceless and the voiceless stops became fricatives. The situation with respect to the sounds corresponding to the Germanic voiced stops is more complex. Here there is considerable disagreement between the other languages: Greek has voiceless aspirates (*ph*, th), Sanskrit has voiced aspirates (bh, dh), Latin has voiceless fricatives in word-initial position (f) and voiced stops in medial position (*b*, d), Slavic has voiced stops (*b*, *d*), and so on. The generally accepted hypothesis is that the Proto-Indo-European sounds from which the Germanic voiced stops developed were voiced aspirates and that they are preserved in Sanskrit but were changed in the other Indo-European languages by the loss of either voice or aspiration. (Latin, having lost the voice in initial position, subsequently changed both of the resultant voiceless aspirates into the fricative f, and it lost the aspiration in medial position.) It is easy to see that this hypothesis yields a simpler account of the correspondences than any of the alternatives. It is also in accord with the fact that voiced aspirates are rare in the languages of the world and, unless they are supported by the coexistence in the same language of phonologically distinct voiceless aspirates (as they are in Hindi and other north Indian languages), appear to be inherently unstable.

Table 1: Labial and Dental Stops in the Indo-European Languages

Greek	Latin	Gothic	Sanskrit	Slavic
p	p	f	P	P
b	b	p	b	b
ph	f/b	b	bh	b
t	t	θ	t	t
d	d	t	d	d
th	f/d	d	dh	d

Proto-Indo-European reconstruction. Reconstruction of the Proto-Indo-European labial stops (made with the lips) and dental stops (made with the tip of the tongue touching the teeth) is fairly straightforward. More controversial is the reconstruction of the Proto-Indo-European sounds underlying the correspondences shown in Table 2.

Table 2: Velar and Palatal Stops in the Indo-European Languages

Greek	Latin	Gothic	Sanskrit	Slavic
k	k	h	s	s
g	g	k	j	z
kh	h/g/f	g	h	z
p/t/k	qu	wh	k	k
b/d/g	v/gu	q	g	g
ph/th/kh	f/v/gu	w	gh	g

Controversy concerning Proto-Indo-European velar consonants

According to the most generally accepted hypothesis, there were in Proto-Indo-European at least two distinct series of velar (or "guttural") consonants: simple velars (or palatals), symbolized as *k, *g, and *gh, and labiovelars, symbolized as *k^w, *g^w, and *g^wh. The labiovelars may be thought of as velar stops articulated with simultaneous lip-rounding. In one group of languages, the labial component is assumed to have been lost, in another group the velar component; and it is only in the Latin reflex of the voiceless *k^w that both labiality and velarity are retained (cf. Latin quis from *k^wi-). It is notable that the languages that have a velar for the Proto-Indo-European labiovelar stops (*e.g.*, Sanskrit and Slavic) have a sibilant or palatal sound (s or 5) for the Proto-Indo-European simple velars. Earlier scholars attached great significance to this fact and thought that it represented a fundamental division of the Indo-European family into a western and an eastern group. The western group—comprising Celtic, Germanic, Italic, and Greek—is commonly referred to as the centum group; the eastern group—comprising Sanskrit, Iranian, Slavic, and others—is called the satem (*satam*) group. (The words centum and satem come from Latin and Iranian, respectively, and mean "hundred." They exemplify, with their initial consonant, the two different treatments of the Proto-Indo-European simple velar~.) Nowadays less importance is attached to the centum–satem distinction. But it is still generally held that in an early period of Indo-European, there was a sound law operative in the dialect or dialects from which Sanskrit, Iranian, Slavic and the other so-called satem languages developed that had the effect of palatalizing the original Proto-Indo-European velars and eventually converting them to sibilants.

Steps in the comparative method. The information given in the previous paragraphs is intended to illustrate what is meant by a sound law and to indicate the kind of considerations that are taken into account in the application of the comparative method. The first step is to find sets of cognate or putatively cognate forms in the languages or dialects being compared: for example, Latin *decem* = Greek deka = Sanskrit *daśa* = Gothic taihun, all meaning "ten." From sets of cognate forms such as these, sets of phonological correspondences can be extracted; *e.g.*, (1) Latin *d* = Greek *d* = Sanskrit d = Gothic t; (2) Latin *e* = Greek e = Sanskrit a = Gothic ai (in the Gothic orthography this represents an *e* sound); (3) Latin c (*i.e.*, a *k* sound) = Greek k = Sanskrit *ś* = Gothic *h*; (4) Latin em = Greek a = Sanskrit *a* = Gothic *un*. A set of "reconstructed" phonemes can be postulated (marked with an asterisk by the standard convention) to which the phonemes in the attested languages can be systematically related by means of sound laws. The reconstructed Proto-Indo-European word for "ten" is ***dekm***. From this form the Latin word can be derived by means of a single sound change, *m changes to em (usually symbolized as *m > em); the Greek by means of the sound change *m > u (*i.e.*, vocalization of the

Phonological correspondences in cognate forms syllabic nasal and loss of nasality); the Sanskrit by means of the palatalizing sound law, **k* > *ś* and the sound change **m* > *a* (whether this is assumed to be independent of the law operative in Greek or not); and the Gothic by means of Grimm's law (**d* > *t*, **k* > *h*) and the sound change **m* > *un*.

Most 19th-century linguists took it for granted that they were reconstructing the actual word forms of some earlier language, that **dekm*, for example, was a pronounceable Proto-Indo-European word. Many of their successors have been more skeptical about the phonetic reality of reconstructed starred forms like **dekm*. They have said that they are no more than formulae summarizing the correspondences observed to hold between attested forms in particular languages and that they are, in principle, unpronounceable. From this point of view, it would be a matter of arbitrary decision which letter is used to refer to the correspondences: Latin d = Greek d = Sanskrit *d* = Gothic *t*, and so on. Any symbol would do, provided that a distinct symbol is used for each distinct set of correspondences. The difficulty with this view of reconstruction is that it seems to deny the very raison d'être of historical and comparative linguistics. Linguists want to know, if possible, not only that Latin *decem*, Greek *deka*, and so on are related, but also the nature of their historical relationshiphow they have developed from common ancestral form. They also wish to construct, if feasible, some general theory of sound change. This can be done only if some kind of phonetic interpretation can be given to the starred forms. The important point is that the confidence with which a phonetic interpretation is assigned to the phonemes that are reconstructed will vary from one phoneme to another. It should be clear from the discussion above, for example, that the interpretation of **d* as a voiced dental or alveolar stop is more certain than the interpretation of **k* as a voiceless velar stop. The starred forms are not all on an equal footing from a phonetic point of view.

Model of the family tree

Criticisms of the comparative method. One of the criticisms directed against the comparative method is that it is based upon a misleading genealogical metaphor. In the mid-19th century, the German linguist August Schleicher introduced into comparative linguistics the model of the "family tree." There is obviously no point in time at which it can be said that new languages are "born" of a common parent language. Nor is it normally the case that the parent language "lives on" for a while, relatively unchanged, and then "dies." It is easy enough to recognize the inappropriateness of these biological expressions. No less misleading, however, is the assumption that languages descended from the same parent language will necessarily diverge, never to converge again, through time. This assumption is built into the comparative method as it is traditionally applied. And yet there are many clear cases of convergence in the development of well-documented languages. The dialects of England are fast disappearing and are far more similar in grammar and vocabulary today than they were even a generation ago. They have been strongly influenced by the standard language. The same phenomenon, the replacement of nonstandard or less prestigious forms with forms borrowed from the standard language or dialect, has taken place in many different places at many different times. It would seem, therefore, that one must reckon with both divergence and convergence in the diachronic development of languages: divergence when contact between two speech communities is reduced or broken and convergence when the two speech communities remain in contact and when one is politically or culturally dominant.

The comparative method presupposes linguistically uniform speech communities and independent development after sudden, sharp cleavage. Critics of the comparative method have pointed out that this situation does not generally hold. In 1872 a German scholar, Johannes Schmidt, criticized the family-tree theory and proposed instead what is referred to as the wave theory, according to which different linguistic changes will spread, like waves, from a politically, commercially, or culturally important centre along the main lines of communication, but successive innovations will not necessarily cover exactly the same area. Consequently, there will be no sharp distinction between contiguous dialects, but, in general, the further apart two speech communities are, the more linguistic features there will be that distinguish them (see below *Dialectology and linguistic geography*).

Use of irregular forms for reconstruction

Internal reconstruction. The comparative method is used to reconstruct earlier forms of a language by drawing upon the evidence provided by other related languages. It may be supplemented by what is called the method of internal reconstruction. This is based upon the existence of anomalous or irregular patterns of formation and the assumption that they must have developed, usually by sound change, from earlier regular patterns. For example, the existence of such patterns in early Latin as *honos* : *honoris* ("honor" : "of honor") and others in contrast with *orator* : *oratoris* ("orator" : "of the orator") and others might lead to the supposition that *honoris* developed from an earlier **honosis*. In this case, the evidence of other languages shows that **s* became *r* between vowels in an earlier period of Latin. But it would have been possible to reconstruct the earlier intervocalic **s* with a fair degree of confidence on the basis of the internal evidence alone. Clearly, internal reconstruction depends upon the structural approach to linguistics.

The most recent development in the field of historical and comparative linguistics has come from the theory of generative grammar (see above *Transformational-generative grammar*). If the grammar and phonology of a language are described from a synchronic point of view as an integrated system of rules, then the grammatical and phonological similarities and differences between two closely related languages, or dialects, or between two diachronically distinct states of the same language can be described in terms of the similarities and differences in two descriptive rule systems. One system may contain a rule that the other lacks (or may restrict its application more or less narrowly); one system may differ from the other in that the same set of rules will apply in a different order in the one system from the order in which they apply in the other. Language change may thus be accounted for in terms of changes introduced into the underlying system of phonological and grammatical rules (including the addition, loss, or reordering of rules) during the process of language acquisition. So far these principles have been applied principally to sound change. There has also been a little work done on diachronic syntax.

LANGUAGE CLASSIFICATION

There are two kinds of classification of languages practiced in linguistics: genetic (or genealogical) and typological. The purpose of genetic classification is to group languages into families according to their degree of diachronic relatedness. For example, within the Indo-European family, such subfamilies as Germanic or Celtic are recognized; these subfamilies comprise German, English, Dutch, Swedish, Norwegian, Danish, and others, on the one hand, and Irish, Welsh, Breton, and others, on the other. So far, most of the languages of the world have been grouped only tentatively into families, and many of the classificatory schemes that have been proposed will no doubt be radically revised as further progress is made.

Typological classifications

A typological classification groups languages into types according to their structural characteristics. The most famous typological classification is probably that of isolating, agglutinating, and inflecting (or fusional) languages, which was frequently invoked in the 19th century in support of an evolutionary theory of language development. Roughly speaking, an isolating language is one in which all the words are morphologically unanalyzable (*i.e.*, in which each word is composed of a single morph); Chinese and, even more strikingly, Vietnamese are highly isolating. An agglutinating language (*e.g.*, Turkish) is one in which the word forms can be segmented into morphs, each of which represents a single grammatical category. An inflecting language is one in which there is no one-to-one correspondence between particular word segments and particular grammatical categories.

The older Indo-European languages tend to be inflecting in this sense. For example, the Latin suffix -is represents the combination of categories "singular" and "genitive" in the word from *hominis* "of the man," but one part of the suffix cannot he assigned to "singular" and another to "genitive," and *-is* is only one of many suffixes that in different classes (or declensions) of words represent the combination of "singular" and "genitive."

There is, in principle, no limit to the variety of ways in which languages can be grouped typologically. One can distinguish languages with a relatively rich phonemic inventory from languages with a relatively poor phonemic inventory, languages with a high ratio of consonants to vowels from languages with a low ratio of consonants to vowels, languages with a fixed word order from languages with a free word order, prefixing languages from suffixing languages, and so on. The problem lies in deciding what significance should be attached to particular typological characteristics. Although there is, not surprisingly, a tendency for genetically related languages to be typologically similar in many ways, typological similarity of itself is no proof of genetic relationship. Nor does it appear true that languages of a particular type will be associated with cultures of a particular type or at a certain stage of development. What has emerged from recent work in typology is that certain logically unconnected features tend to occur together, so that the presence of feature A in a given language will tend to imply the presence of feature B. The discovery of unexpected implications of this kind calls for an explanation and gives a stimulus to research in many branches of linguistics.

IV. Linguistics and other disciplines

PSYCHOLINGUISTICS

The term psycholinguistics was coined in the 1940s and came into more general use after the publication of Charles E. Osgood and Thomas A. Sebeok's *Psycholinguistics: A Survey of Theory and Research Problems* (1954), which reported the proceedings of a seminar sponsored in the United States by the Social Science Research Council's Committee on Linguistics and Psychology.

The boundary between linguistics (in the narrower sense of the term: see the introduction of this article) and psycholinguistics is difficult, perhaps impossible, to draw. So too is the boundary between psycholinguistics and psychology. What characterizes psycholinguistics as it is practiced today as a more or less distinguishable field of research is its concentration upon a certain set of topics connected with language and its bringing to bear upon them the findings and theoretical principles of both linguistics and psychology. The range of topics that would be generally held to fall within the field of psycholinguistics nowadays is rather narrower, however, than that covered in the survey by Osgood and Sebeok.

Language learning by children. One of the topics most central to psycholinguistic research is the acquisition of language by children. The term acquisition is preferred to "learning," because "learning" tends to be used by psychologists in a narrowly technical sense, and many psycholinguists believe that no psychological theory of learning, as currently formulated, is capable of accounting for the process whereby children, in a relatively short time, come to achieve a fluent control of their native language. Since the beginning of the 1960s, research on language acquisition has been strongly influenced by Chomsky's theory of generative grammar, and the main problem to which it has addressed itself has been how it is possible for young childen to infer the grammatical rules underlying the speech they hear and then to use these rules for the construction of utterances that they have never heard before. It is Chomsky's conviction, shared by a number of psycholinguists, that children are born with a knowledge of the formal principles that determine the grammatical structure of all languages, and that it is this innate knowledge that explains the success and speed of language acquisition. Others have argued that it is not grammatical competence as such that is innate but more general cognitive principles and that the application of these to language utterances in particular situations ultimately yields grammatical competence. Many recent works have stressed that all children go through the same stages of language development regardless of the language they are acquiring. It has also been asserted that the same basic semantic categories and grammatical functions can be found in the earliest speech of children in a number of different languages operating in quite different cultures in various parts of the world.

Theories of language acquisition

Although Chomsky was careful to stress in his earliest writings that generative grammar does not provide a model for the production or reception of language utterances, there has been a good deal of psycholinguistic research directed toward validating the psychological reality of the units and processes postulated by generative grammarians in their descriptions of languages. Experimental work in the early 1960s appeared to show that nonkernel sentences took longer to process than kernel sentences and, even more interestingly, that the processing time increased proportionately with the number of optional transformations involved. More recent work has cast doubt on these findings, and most psycholinguists are now more cautious about using grammars produced by linguists as models of language processing. Nevertheless, generative grammar continues to be a valuable source of psycholinguistic experimentation, and the formal properties of language, discovered or more adequately discussed by generative grammarians than they have been by others, are generally recognized to have important implications for the investigation of short-term and long-term memory and perceptual strategies.

Speech perception. Another important area of psycholinguistic research that has been strongly influenced by recent theoretical advances in linguistics and, more especially, by the development of generative grammar is speech perception. It has long been realized that the identification of speech sounds and of the word forms composed of them depends upon the context in which they occur and upon the hearer's having mastered, usually as a child, the appropriate phonological and grammatical system. Throughout the 1950s, work on speech perception was dominated (as was psycholinguistics in general) by information theory, according to which the occurrence of each sound in a word and each word in an utterance is statistically determined by the preceding sounds and words. Information theory is no longer as generally accepted as it was a few years ago, and more recent research has shown that in speech perception the cues provided by the acoustic input are interpreted, unconsciously and very rapidly, with reference not only to the phonological structure of the language but also to the more abstract levels of grammatical organization.

Information theory and speech perception

Other areas of research. Other areas of psycholinguistics that should be briefly mentioned are the study of aphasia and neurolinguistics. The term aphasia is used to refer to various kinds of language disorders; recent work has sought to relate these, on the one hand, to particular kinds of brain injury and, on the other, to psychological theories of the storage and processing of different kinds of linguistic information. One linguist has put forward the theory that the most basic distinctions in language are those that are acquired first by children and are subsequently most resistant to disruption and loss in aphasia. This, though not disproved, is still regarded as controversial. Two kinds of aphasia are commonly distinguished. In motor aphasia the patient manifests difficulty in the articulation of speech or in writing and may produce utterances with a simplified grammatical structure, but his comprehension is not affected. In sensory aphasia the patient's fluency may be unaffected, but his comprehension will be impaired and his utterances will often be incoherent.

Neurolinguistics should perhaps be regarded as an independent field of research rather than as part of psycholinguistics. In 1864 it was shown that motor aphasia is produced by lesions in the third frontal convolution of the left hemisphere of the brain. Shortly after the connection had been established between motor aphasia and damage

Speech area in the brain

to this area (known as Broca's area), the source of sensory aphasia was localized in lesions of the posterior part of the left temporal lobe. More recent work has confirmed these findings. The technique of electrically stimulating the cortex in conscious patients has enabled brain surgeons to induce temporary aphasia and so to identify a "speech area" in the brain. It is no longer generally believed that there are highly specialized "centres" within the speech area, each with its own particular function; but the existence of such a speech area in the dominant hemisphere of the brain (which for most people is the left hemisphere) seems to be well established. The posterior part of this area is involved more in the comprehension of speech and the construction of grammatically and semantically coherent utterances, and the anterior part is concerned with the articulation of speech and with writing. Little is yet known about the operation of the neurological mechanisms underlying the storage and processing of language. (See also the articles entitled PERCEPTION; SPEECH, PHYSIOLOGY OF.)

SOCIOLINGUISTICS

Delineation of the field. Just as it is difficult to draw the boundary between linguistics and psycholinguistics and between psychology and psycholinguistics, so it is difficult to distinguish sharply between linguistics and sociolinguistics and between sociolinguistics and sociology. There is the further difficulty that, because the boundary between sociology and anthropology is also unclear, sociolinguistics merges with—and, some would say, subsumes—anthropological linguistics (see below).

It is frequently suggested that there is a conflict between the sociolinguistic and the psycholinguistic approach to the study of language, and it is certainly the case that two distinct points of view are discernible in the literature at the present time. Chomsky has described linguistics as a branch of cognitive psychology, and neither he nor most of his followers have yet shown much interest in the relationship between language and its social and cultural matrix. On the other hand, many modern schools of linguistics that have been very much concerned with the role of language in society would tend to relate linguistics more closely to sociology and anthropology than to any other discipline. It would seem that the opposition between the psycholinguistic and the sociolinguistic viewpoint must ultimately be transcended. The acquisition of language, a topic of central concern to psycholinguists, is in part dependent upon and in part itself determines the process of socialization; and the ability to use one's native language correctly in the numerous socially prescribed situations of daily life is as characteristic a feature of linguistic competence, in the broad sense of this term, as is the ability to produce grammatical utterances. Some of the most recent work in sociolinguistics and psycholinguistics has sought to widen the notion of linguistic competence in this way. So far, however, sociolinguistics and psycholinguistics tend to be regarded as relatively independent areas of research.

Language and socialization

Social dimensions. Language is probably the most important instrument of socialization that exists in all human societies and cultures. It is largely by means of language that one generation passes on to the next its myths, laws, customs, and beliefs, and it is largely by means of language that the child comes to appreciate the structure of the society into which he is born and his own place in that society.

As a social force, language serves both to strengthen the links that bind the members of the same group and to differentiate the members of one group from those of another. In many countries there are social dialects as well as regional dialects, so that it is possible to tell from a person's speech not only where he comes from but what class he belongs to. In some instances social dialects can transcend regional dialects. This is notable in England, where standard English in the so-called Received Pronunciation (RP) can be heard from members of the upper class and upper middle class in all parts of the country. The example of England is but an extreme manifestation of a tendency that is found in all countries: there is less regional variation in the speech of the higher than in that of the lower socioeconomic classes. In Britain and the United States and in most of the other English-speaking countries, people will almost always use the same dialect, regional or social, however formal or informal the situation and regardless of whether their listeners speak the same dialect or not. (Relatively minor adjustments of vocabulary may, however, be made: an Englishman speaking to an American may employ the word "elevator" rather than "lift" and so on.) In many communities throughout the world, it is common for members to speak two or more different dialects and to use one dialect rather than another in particular social situations. This is commonly referred to as code-switching. Code-switching may operate between two distinct languages (*e.g.*, Spanish and English among Puerto Ricans in New York) as well between two dialects of the same language. The term diglossia (rather than bilingualism) is frequently used by sociolinguists to refer to this by no means uncommon phenomenon.

Variables influencing language usage

In every situation, what one says and how one says it depends upon the nature of that situation, the social role being played at the time, one's status vis-à-vis that of the person addressed, one's attitude towards him, and so on. Language interacts with nonverbal behaviour in social situations and serves to clarify and reinforce the various roles and relationships important in a particular culture. Sociolinguistics is far from having satisfactorily analyzed or even identified all the factors involved in the selection of one language feature rather than another in particular situations. Among those that have been discussed in relation to various languages are: the formality or informality of the situation; power and solidarity relationships between the participants; differences of sex, age, occupation, socioeconomic class, and educational background; and personal or transactional situations. Terms such as style and register (as well as a variety of others) are employed by many linguists to refer to the socially relevant dimensions of phonological, grammatical, and lexical variation within one language. So far there is very little agreement as to the precise application of such terms. (For further treatment of sociolinguistics, see the article DIALECTS.)

OTHER RELATIONSHIPS

Anthropological linguistics. The fundamental concern of anthropological linguistics is to investigate the relationship between language and culture. To what extent the structure of a particular language is determined by or determines the form and content of the culture with which it is associated remains a controversial question. Vocabulary differences between languages correlate obviously enough with cultural differences, but even here the interdependence of language and culture is not so strong that one can argue from the presence or absence of a corresponding cultural difference. For example, from the fact that English—unlike French, German, Russian, and many other languages—distinguishes lexically between monkeys and apes, one cannot conclude that there is an associated difference in the cultural significance attached to these animals by English-speaking societies. Some of the major grammatical distinctions in certain languages may have originated in culturally important categories (*e.g.*, the distinction between an animate and an inanimate gender). But they seem to endure independently of any continuing cultural significance. The "Whorfian hypothesis" (the thesis that one's thought and even perception are determined by the language one happens to speak), in its strong form at least, is no longer debated as vigorously as it was a few years ago. Anthropologists continue to draw upon linguistics for the assistance it can give them in the analysis of such topics as the structure of kinship. A more recent development, but one that has not so far produced any very substantial results, is the application of notions derived from generative grammar to the analysis of ritual and other kinds of culturally prescribed behaviour (see also LANGUAGE).

The "Whorfian hypothesis"

Dialectology and linguistic geography. Dialectology, the scientific investigation of regional dialects, was stimulated towards the end of the 19th century by the desire to answer some of the questions posed by the findings of historical and comparative linguistics. It was expected and frequently found to be true that older forms that had disappeared from the standard language as a result of analogical levelling or borrowing were preserved in one or another of the local dialects. It was soon discovered, however, that nonstandard regional dialects could not be assumed to be invariably more conservative than the standard language in this respect or more impervious to borrowing. The investigation of regional dialects may be carried out from two rather different points of view. The speech of a local community may be analyzed without reference to the standard language or neighbouring dialects to produce a more or less complete phonological and grammatical description. Various dialects of the major European languages have been described in this way. Alternatively, a sample of the local dialects in a particular area may be systematically compared in order to discover in what respects they resemble or differ from one another. The latter kind of investigation is commonly called dialect geography; its results are usually published in the form of a dialect atlas that shows the distribution of particular phonological or grammatical features or particular words. Dialect geography has confirmed the wave theory (see above Historical [diachronic] Linguistics) and has demonstrated the impossibility of drawing a sharp distinction between contiguous dialects. Every feature has its own distribution. If a line, or isogloss, is drawn on the map between the localities that differ with respect to each of a set of selected features, the result will be a network of isoglosses; the fewer isoglosses that separate any two localities, the more similar are the dialects spoken in the two localities (see also the article DIALECTS).

Use of computers in linguistic research

Computational linguistics. By computational linguistics is meant no more than the use of electronic digital computers in linguistic research. At a theoretically trivial level, computers are employed to scan texts and to produce, more rapidly and more reliably than was possible in the past, such valuable aids to linguistic and stylistic research as word lists, frequency counts, and concordances. Theoretically more interesting, though much more difficult, is the automatic grammatical analysis of texts by computer. Considerable progress was made in this area by research groups working on machine translation and information retrieval in the United States, Great Britain, the Soviet Union, France, and a few other countries between the mid-1950s and the mid-1960s. But much of the original impetus for this work has disappeared, in part because of the realization that the theoretical problems involved in machine translation are much more difficult than they were at first thought to be and in part as a consequence of a loss of interest among linguists in the development of discovery procedures. Whether automatic syntactic analysis and fully automatic high-quality machine translation are even feasible in principle is a controversial question.

Mathematical linguistics. What is commonly referred to as mathematical linguistics comprises two areas of research: the study of the statistical structure of texts and the construction of mathematical models of the phonological and grammatical structure of languages. These two branches of mathematical linguistics, which may be termed statistical and algebraic linguistics, respectively, are typically distinct. Attempts have been made to derive the grammatical rules of languages from the statistical structure of texts written in those languages, but such attempts are generally thought not only to have been unsuccessful so far in practice but also to be in principle doomed to failure. That languages have a statistical structure is a fact well known to cryptographers. Within linguistics it is of considerable typological interest to compare languages from a statistical point of view (the ratio of consonants to vowels, of nouns to verbs, and so on). Statistical considerations are also of value in stylistics (see below).

Algebraic linguistics

Algebraic linguistics derives principally from the work of Noam Chomsky in the field of generative grammar (see above *Chomsky's* grammar). In his earliest work Chomsky described three different models of grammar—finite-state, phrase-structure, and transformational—and compared them in terms of their capacity to generate all and only the sentences of natural languages and, in doing so, to reflect in an intuitively satisfying manner the underlying formal principles and processes. Other models have also been investigated, and it has been shown that certain different models are equivalent in generative power to phrase-structure grammars. The problem is to construct a model that has all the formal properties required to handle the processes found to be operative in languages but that prohibits rules that are not required for linguistic description. It is an open question whether such a model, or one that approximates more closely to this ideal than current models do, will be a transformational grammar or a grammar of some radically different character.

Stylistics. The term stylistics is employed in a variety of senses by different linguists. In its widest interpretation it is understood to deal with every kind of synchronic variation in language other than what can be ascribed to differences of regional dialect. At its narrowest interpretation it refers to the linguistic analysis of literary texts. One of the aims of stylistics in this sense is to identify those features of a text that give it its individual stamp and mark it as the work of a particular author. Another is to identify the linguistic features of the text that produce a certain aesthetic response in the reader. The aims of stylistics are the traditional aims of literary criticism. What distinguishes stylistics as a branch of linguistics (for those who regard it as such) is the fact that it draws upon the methodological and theoretical principles of modern linguistics.

Philosophy and linguistics. The analysis of language has always been a subject of particular concern to philosophers, and traditional grammar was strongly influenced by the dominant philosophical attitudes of the day. Modern linguistics and modern philosophical theories have so far had little influence on one another. Some philosophers have shown an interest in Chomsky's controversial suggestion that work in generative grammar lends support to the rationalists in their long-standing dispute about the source of human knowledge. Potentially more fruitful, perhaps, is the interest shown by a number of linguists in philosophical treatments of reference, quantification, and presupposition, in systems of modal logic, and in the work of the so-called philosophers of ordinary language. (For a more detailed treatment of philosophy and linguistics, see SEMANTICS.)

Language teaching

Applied linguistics. In the sense in which the term applied linguistics is most commonly used nowadays it is restricted to the application of linguistics to language teaching. Much of the recent expansion of linguistics as a subject of teaching and research in the universities in many countries has come about because of its value, actual and potential, for writing better language textbooks and devising more efficient methods of teaching languages. Linguistics is also widely held to be relevant to the training of teachers of the deaf and speech therapists. Outside the field of education in the narrower sense, applied linguistics (and, more particularly, applied sociolinguistics) has an important part to play in what is called language planning; *i.e.*, in advising governments, especially in recently created states, which language or dialect should be made the official language of the country and how it should be standardized.

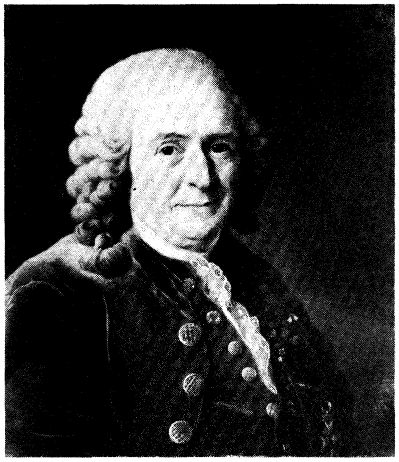
Linnaeus

Carolus Linnaeus (the Latinized form of Carl von Linne), Swedish botanist, was the first to enunciate the principles for defining genera and species and to adhere to a uniform use of two names (one for genus and one for species) for naming plants and animals. He was born on May 23, 1707, at South Råshult, where his father was a curate. His love of flowers developed at an early age; when only eight years old he was nicknamed "the little botanist." He studied at the universities of Lund and Uppsala, receiving his degree in medicine from the latter.

By courlesy of the Svenska Portrattarkivet Stockholm



Linnaeus. portrait by A. Roslin, 1775. In the Svenska Portrattarkivet, Stockholm

At Uppsala he met the veteran botanist Olof Celsius, who had a profound influence on Linnaeus' subsequent career. Linnaeus was appointed lecturer in botany in 1730 and two years later conducted explorations in Lapland for the Uppsala Academy of Sciences. The results of his journey were published in Amsterdam in 1737 as the *Flora Lapponica* and in English by Sir J.E. Smith as *Lachesis Lapponica* (1811). His reputation was firmly established by this work and, even more, by the appearance in 1735 of his *Systema Naturae* and of the *Genera Plantarum* two years later (the *Species Plantarum* was not published until 1753). For purposes of nomenclature of flowering plants and ferns, the first edition of the *Species Plantarum* has been internationally agreed upon as the starting point, together with the fifth edition of the *Genera Plantarum*, published in 1754.

Major work

The *Systema Naturne*, which Linnaeus had shown to the botanist Jan Fredrik Gronovius in manuscript, so impressed Gronovius that he published it at his own expense. Linnaeus' system was based mainly on flower parts, which tend to remain unchanged during the course of evolution. Although artificial, as Linnaeus himself recognized, such a system had the supreme merit of enabling students rapidly to place a plant in a named category. It came into use at a period when the richness of the world's vegetation was being discovered at a rate that outstripped more leisurely methods of investigation. So successful was his method in practice that its facile application was the greatest obstacle to its replacement by the more natural systems that superseded it.

In 1736 Linnaeus visited England, where he met the botanist and physician Sir Hans Sloane in London and Johann Jakob Dillenius, the first professor of botany at Oxford. He returned to Holland to complete his work on the *Hortus Cliffortianus* and in Paris visited the three Jussieu brothers, distinguished botanists with whom he established a close friendship. Soon afterward, he went once again to Sweden, and in 1738 he settled in Stockholm as a practicing physician, a profession in which he attained considerable success. In 1739 he married Sara Moraea, the daughter of a physician. Two years after his marriage he was appointed to the chair of medicine at Uppsala, but a year later he exchanged this for the chair of botany, his true calling. An inveterate classifier, he not only systematized the plant and animal kingdoms but even classified the mineral kingdom and drew up a treatise on the kinds of diseases known in his day.

His later years were taken up by teaching and the preparation of other works: *Flora Suecica* (1745) and *Fauna Suecica* (1746); two volumes of observations made during journeys in Sweden, *Vastgota resa* (1747) and *Skånska resa* (1751); *Hortus Upsaliensis* (1748); his *Philosophia Botanica* (1751); and the important *Species Plantarum* (1753), in which the specific names are fully set forth. In 1755 he declined an invitation from the King of Spain to settle in that country with a liberal salary and full liberty of conscience. In 1761 he was granted a patent of nobility, antedated to 1757, from which time he was styled Carl von Linne. An apoplectic attack in 1774 greatly weakened him, and he died on January 10, 1778, at Uppsala, in the cathedral in which he was interred. The Linnaean manuscripts and his herbarium and collections of insects and shells, purchased by Sir J.E. Smith in 1783, are carefully preserved by the Linnean Society at Burlington House, London.

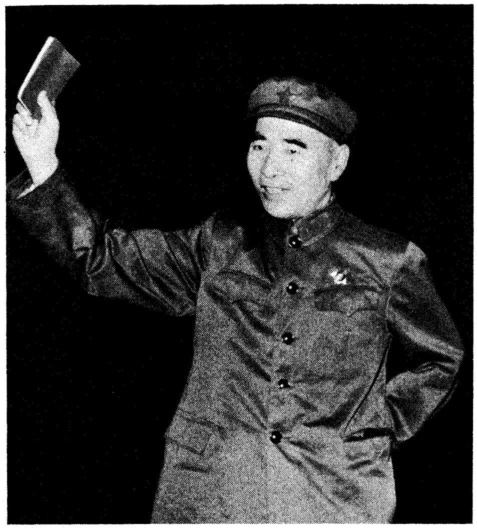
BIBLIOGRAPHY. The most comprehensive work on Linnaeus is T.M. FRIES, *Linné, Lefnadsteckning*, 2 vol. in 11 pt. (1903: Eng. trans., *Linnaeus*, 1923), including a selective but extensive bibliography. Other studies recommended are: OSCAR LEVERTIN, *Carl von Linné* (1906); J.M. HULTH, *Bibliographia Linnaeana* (1907); WILHELM JUNK, *Linné im Lichte neuerer Forschung* (1925); NORAN GOURLIE, *The Prince of Botanists: Carl Linnaeus* (1953); KNUT HAGBERG, *Carl Linnaeus* (1951; Eng. trans., 1952); W.T. STEARN, "The Background of Linnaeus's Contributions to the Nomenclature and Methods of Systematic Biology," *Syst. Zool.*, 8:4–22 (1959); B.D. JACKSON. *Linnaeus* (1923); GEORGE H.M. LAWRENCE, "Linnaeus," *Horticulture*, 42:22–23 (1964); WILFRED BLUNT. *The Complear Naturalist: A Life of Linnaeus* (1971); and JAMES L. LARSON, *Reason and Experience: The Representation of Natural Order in the Work of Carl von Linné* (1971).

(E.J.S.)

Lin Piao

One of modern China's outstanding military leaders, Lin Piao (in Pinyin romanization, Lin Biao), as a field commander of the Red Army, made substantial contributions to the Communists' 22-year struggle for power under the direction of Mao Tse-tung (Mao Ze-dong) and to their eventual triumph in 1949. He became, in 1966, Mao's heir apparent as ruler of the new China, but since his mysterious death in 1971 he has been vilified as a renegade and a traitor.

Lin Piao was born on December 5, 1907, to a family of modest means in Huang-kang (Huang-gang) county of Hupeh (Hu-bei) Province in Central China. He received his primary education in the village school and then entered middle school in Wu-ch'ang (Wu-chang), the provincial capital, in 1921. In middle school, he was deeply



Lin Piao, 1967
Easifoto

affected by the social and cultural upheaval then taking place, which some have called the Chinese Renaissance. He soon became interested in Socialism and Communism, and in 1925, after his graduation from middle school, he joined the Socialist Youth League.

Military career. Also in 1925, Lin Piao went south to Canton to enroll in the Whampoa Academy and there began his military career. China at this time suffered from the twin evils of warlordism and imperialism; *i.e.*, internal disunity and foreign encroachment. In order to fight the warlords and curb the imperialists, the Nationalists, led by Sun Yat-sen until his death in March 1925, had secured the assistance of the Soviet Union and the cooperation of the fledgling Chinese Communist Party and were then preparing a military expedition from their base in Canton. The Whampoa Academy, headed by Sun's successor, Chiang Kai-shek, was to train the officers for the revolutionary army. Lin Piao had been at the academy less than a year when Chiang launched the Northern Expedition in July 1926. Despite the brevity of his formal training, Lin quickly demonstrated his military prowess. A few months later, when the expedition reached the Yangtze River in Central China, he had risen from deputy platoon leader to battalion commander. But, when Chiang then turned savagely against his Communist allies in 1927, Lin forsook his mentor and fled with the Communists.

Northern Expedition of 1926

In the spring of 1928, Lin Piao joined Mao Tse-tung in the hills of south central China and established himself at once as one of the ablest and most active commanders in Mao's small but growing Red Army. From 1928 to 1934 he helped to enlarge the Communist-controlled territory in Kiangsi (Jiang-xi) Province and defended it against repeated attacks by the Nationalists. In 1932 he was promoted to corps commander. When the Communists were finally driven from their Kiangsi base in 1934 by the Nationalists, Lin's First Army Corps formed the vanguard of the epic retreat known as the Long March, which brought them a year later into the northern province of Shensi (Shen-xi), where they were able to regroup. By then the 28-year-old Lin was already a legendary figure with a reputation of never having lost a battle. In Shensi he became the president of the Red Army Academy and was among the handful of commanders who ranked just below the important military leaders Chu Teh (Zhu De) and P'eng Te-huai (Peng De-huai).

In 1937 the bitter civil war between the Nationalists and the Communists ended temporarily as the two sides formed a united front against the common foe, Japan. In September 1937, just after the outbreak of war, Lin Piao, in command of one of the Red Army's three divisions, scored an important early victory over the Japanese invaders. But he was wounded in battle the following spring and retired from the field for the rest of the war. When his wound did not heal, he went to the Soviet Union for medical treatment and stayed three years. After his return to China in 1942, he served briefly as a member of the Communist liaison team with the Nationalists. In 1943 he resumed the presidency of the Military and Political Academy in the Communist capital of Yen-an (Yan-an). As the war with Japan neared its end in 1945, he was elected for the first time to the Communist Party's 44-member Central Committee.

Conquest of Manchuria

When World War II ended, the civil war in China resumed. Returning to the field once more, Lin Piao went to Manchuria, in northeastern China, as commander of what later became the Fourth Field Army. In a brilliant display of Maoist strategy, he first abandoned the cities of Manchuria to the Nationalists and concentrated instead on securing the support of the peasants in the countryside. Using guerrilla warfare, he then patiently and methodically whittled away at his numerically superior enemy. Gradually, he isolated the Nationalists in the cities and eventually forced garrison after garrison to surrender. By the end of 1948, his army, which had originally numbered 100,000, had grown to 800,000, and he had captured all of Manchuria. Lin's victory in Manchuria ensured the rapid collapse of Chiang Kai-shek's Nationalists in the rest of China. His own forces, moving south, captured Peking (Bei-jing) in January 1949, Wu-han in May, and Canton in October.

Positions in the People's Republic. With the establishment of the People's Republic in October 1949, Lin Piao was appointed to many high posts in the government and the party. At first he was both administrative head and party chief of the six-province "Central-South" region of China. In 1954, when the central government was reorganized, he was named a vice premier of the State Council (or Cabinet) and a vice chairman of the National Defense Council. Among army officers he ranked only behind the aging Chu Teh and P'eng Te-huai, then the minister of defense. In 1955 he was elevated within the party to the Central Committee's 13-man Politburo and then in May 1958 to the Politburo's seven-man Standing Committee. But throughout these early years of Communist rule Lin, who may have been in chronic ill health, seldom appeared in public and was probably only occasionally active at his various posts.

Minister of defense

In late 1958, Lin Piao suddenly began to assume a more active and important role in the army and the party. In September 1959 he succeeded P'eng Te-huai as minister of defense, after P'eng was ousted for opposing Mao's economic and defense policies. Lin then inaugurated a reformation of the army that both intensified the political education of its soldiers and upgraded their military training. As a result, Lin's army became in the early 1960s both an example of how, according to Mao's teachings, professional expertise may be combined with political consciousness and a model for the rest of society, including the party itself, to emulate. This movement to "learn from the People's Liberation Army" eventually developed in 1965 into the extensive purge of the party known as the Great Proletarian Cultural Revolution, whose principal casualty was Liu Shao-ch'i (Liu Shao-qi), the party organizer who for more than 20 years had been Mao's second in command. In August 1966, the 58-year-old Lin Piao replaced Liu as the future successor to Mao; this position was formalized in April 1969, when Lin was so designated by the new constitution. From 1966 to 1971, the army took over the role previously played by the party in ruling China, By 1971, however, Lin and the army may have amassed more political authority than Mao thought desirable. In a desperate move to avoid being purged, Lin and others of the military high command plotted a coup that failed. It was announced that Lin Piao was killed on September 13, 1971, in an airplane crash in Mongolia as he was fleeing to the Soviet Union. Since then he has been posthumously criticized as a rightist reactionary and a traitor to the cause of Chinese Communism.

Assessment. Throughout his life, Lin Piao was more a doer than a thinker. His writings are few and uninspiring. They deal primarily with questions of military strategy and tactics, especially the latter (of which he was a master), or with the importance of political indoctrination.

As a leader, Lin lacked Mao's wit and charisma and Chou En-lai's charm and urbanity. In contrast to these other two members of the ruling triumvirate in the late 1960s, Lin seemed almost colourless. Even as a military commander, he was characterized more by caution and deliberation than by dash and flamboyance. Lin Piao was married at least twice. His last wife, Yeh Ch'iin (Ye Qun), rose to political prominence herself during the Cultural Revolution; in April 1969 she joined the 21-member Politburo. It was reported that she died with her husband and their son, Lin Li-guo, in the airplane crash.

BIBLIOGRAPHY. The best accounts of Lin's life are two studies by THOMAS W. ROBINSON, *A Politico-Military Biography of Lin Piao, Part I,* 1907–1949 (1971) and "Lin Piao as an Elite Type," in ROBERT A SCALAPINO (ed.), *Elites in the People's Republic of China* (1972). Other biographic accounts are the brief entries in DONALD W. KLEIN and ANNE B. CLARK, *Biographic Dictionary of Chinese Communism,* 1921–1965, 2 vol. (1971); and HOWARD L. BOORMAN (ed.), *Biographical Dictionary of Republican China,* vol. 2 (1968). MICHAEL Y.M. KAU (ed.), *The Lin Piao Affair: Power Politics and Military Coup* (1975), discusses the circumstances of Lin's death and contains a compendium of documents including a translation of Lin's official biography as of 1969.

(E.J.M.R.)

Lin Tse-hsii

A leading Chinese scholar and official of the Ch'ing (Manchu) dynasty, Lin Tse-hsii (in Pinyin romanization, Lin Ze-xu) was a proponent of the revitalization of traditional Chinese thought and institutions, a movement known as the "Statecraft school." He could, however, neither comprehend the implications of the European challenge nor overcome the weakness and conservative opposition of his contemporaries. Later, the so-called Self-strengthening Movement adopted Lin's program of reform; still later generations of revolutionaries abandoned Chinese culture in order to save China but accepted Lin as a national hero because of his courage and example in opposing the British before the Opium War (1839–42).

Rise as administrator

Lin was born in Hou-kuan (Hou-guan) in Fukien Province in 1785; his father was a teacher, who, though poor, was determined that his sons should have the grounding in the Confucian Classics that alone could advance them in the governmental bureaucracy. Lin Tse-hsii, the second son, proved immensely capable and passed the initial examinations in 1804. He then was selected as an aide to the governor of his native province, an informal apprenticeship that served to balance the abstract, moral, and largely literary content of his early education. In 1811 Lin passed the highest of the examinations, the *chin-shih,* and joined the Hanlin Academy, which advised the Emperor and helped him to draft documents. In 1820 he took up his first regular administrative post and rose through a number of the most responsible offices in the bureaucracy. After starting in the salt monopoly, he supervised water-control systems in several localities, administered the collection of taxes, and served a term as a local judge, during which he earned the respectful nickname "Lin the Clear Sky." Lin's quick rise showed him to be an effective organizer and ambitious bureaucrat.

Role in the Opium War

Following the traditional period of mourning and retirement at the death of his father, a time that also served for reflection and literary activity, Lin returned to official life in the upper reaches of the government. When, in the middle of the 1830s, the Tao-kuang (Dao-guang) emperor became alarmed over the growth of the opium trade by British and Chinese smugglers—both for the obvious moral reasons and for the more practical one that even illegal imports had to be paid for with the export of Chinese silver—Lin submitted a memorial condemning a suggestion that the trade be legalized. In support of his position he cited the measures by which he had suppressed the drug traffic in the provinces of which he was then governor general. The Emperor, who for almost two decades had vainly attempted to enforce the ban on the importation of opium, responded by appointing Lin Imperial Commissioner in late 1838, vesting him with extraordinary powers. After an unusual 19 personal audiences with the Emperor, Lin proceeded to Canton, the hub of the trade. His diary for this period survives and conveys a vivid picture of a Chinese official of the time at work: making the arduous journey from Peking (Bei-jing); perspiring in the heat of Canton's subtropical climate as he kowtows before the very written instructions of the Emperor; peremptorily summoning the British merchants and officials; vainly trying to make the corrupt Chinese officials, grown soft on the profits and use of opium, perform their duties; and composing an ode of apology to the god of the sea for defiling his ocean with confiscated opium.

Lin was only too successful. He forced foreign merchants to surrender their stocks of opium for destruction and put pressure on them to guarantee that they would cease importing the cargo. Yet, when the British retaliated by ravaging large parts of South China, the Emperor, who had personally approved Lin's tough policies, quickly dismissed him. Although exiled to the northwest frontier, Lin served quietly and loyally, was soon called back to important service, and was rewarded with the title of Grand Guardian of the Heir Apparent for pacifying rebel Muslims in the province of Yunnan (Yün-nan). He died in 1850, on his way to help suppress the Taiping Rebellion.

Assessment

Lin's significance goes beyond his career. He belonged to a small but later influential group of reform officials and scholars whose slogan was "find in antiquity the sanction for present-day reform." This "Statecraft school" pioneered in the compilation of practical information for use in governing on many subjects, including geography and the knowledge of the history of foreign countries. Yet when Lin, one of the most experienced and well-informed men of his day, went to Canton, he had no idea that his success in stopping the opium trade would only open up his country to the humiliating and ruinous penetration by foreign interests that were to hasten its downfall. He simply drew on the precedents of generations of officials whose policy against the Central Asian tribes had been to play them off against each other and to whom commercial considerations were somewhat petty matters; he did not comprehend the significance of the British demands for free trade and international equality, which were based on their concept of a commercial empire. This concept was a radical challenge to the Chinese world order, which knew only an empire and subject peoples; at his arrival in Canton, Lin still thought of the British as dependent on the Chinese and was convinced that they would perish from constipation without Chinese tea and rhubarb. In a famous letter to Queen Victoria, written when he arrived in Canton, Lin asked whether she would allow the importation of such a poisonous substance into her own country, and requested her to forbid her subjects to bring it into his. Lin relied on aggressive moral tone, meanwhile proceeding relentlessly against British merchants in a manner that could only insult their government. The only lesson Lin drew from China's humiliation was that it was necessary to learn more about these "barbarians" and to import their technology. The task of fathoming the relation between the technology of the "barbarians" and their politics and economics was left to later generations.

(C.W.H.)

Lipid

Lipids, or fats, are best defined as a diverse group of organic compounds found in plants, in animals, and in microorganisms. Characteristically, they are greasy to the touch and insoluble in water but soluble in alcohol, ether, and other organic solvents. Lipids comprise one of the three large classes of foods and, with proteins and carbohydrates, are components of all living cells. The proportion of lipids in foodstuffs varies; it is 0.2 percent in white potatoes and 70 percent in some nut kernels. Fats such as olive oil and cod-liver oil contain a mixture of fatty substances, lipids called triglycerides. Triglycerides comprise almost 90 percent of the adipose, or fat, tissue of animals. Contrary to popular opinion, adipose tissue is an energy source and can be utilized when needed. In fact, triglycerides are sometimes called nature's storehouse of energy because, on a weight basis, they contain more than twice as much energy as do carbohydrates and proteins.

The lipids made by cells are important not only because they serve as an energy source but also because they form structural components. Lipids such as lecithin and cephalin, which are soluble in both water and fats, serve a vital role in the cell by binding water-soluble compounds such as proteins to lipid-soluble substances. Lecithin is an important structural component of the cell membrane, where it maintains continuity between the water and lipid phases inside and outside the cell. The function of certain enzymes (biological catalysts) depends upon their attachment to lipids such as lecithin.

The structure of lipids varies from simple chainlike molecules consisting of hydrogen, carbon, and oxygen to complex ring, or cyclic, structures with side chains of varying composition and complexity. Many naturally occurring lipids are associated with proteins, in combinations called lipoproteins. The type of lipids dealt with in this article include neutral lipids (or triglycerides; *i.e.*, fatty-acid esters of the alcohol glycerol), phosphoglycerides (or phospholipids; *i.e.*, fatty-acid esters of glycerol and phosphoric acid or one of its derivatives), and sphingolipids (complex lipids containing compounds—sphingosine or phytosphingosine—other than glycerol). The characteristics of fatty acids, which are important components of many lipids, also are described. Lipoproteins and the preparation and analysis of lipids are dealt with briefly. Sterols and carotenoids, also included here as lipids, are considered in detail in two related articles—STEROID and ISOPRENOID. Other related articles include METABOLISM; OILS, FATS, AND WAXES; and MEMBRANE, BIOLOGICAL.

IMPORTANCE

Lipids as food reserves in cells. The most important role of the fatty-acid components of neutral lipids in plant and animal tissues is to provide a fuel supply for cells; *i.e.*, neutral lipids comprise a reserve supply of potential energy and are broken down, when needed, in such a manner that the energy liberated is employed to make an energy-rich compound called adenosine triphosphate (ATP), which in turn is utilized in energy-requiring cellular processes such as muscle contraction and the synthesis of cell constituents. The energy in a fatty-acid molecule is transformed into ATP by a process known as fatty-acid oxidation (or beta oxidation). For a detailed discussion of the mechanism of fatty-acid oxidation, see METABOLISM.

Triglycerides and fatty acids are formed during digestive processes in animals. After a mammal ingests a fatty meal, the fats are acted upon by digestive secretions containing the enzyme lipase, which breaks down at least part of the triglycerides. The breakdown products and the remaining intact triglycerides then are absorbed through the intestinal cell wall and are recombined, at least in part, to form triglycerides and phospholipids. These lipids, in the form of very small droplets (chylomicrons), are transported in blood and in chyle (a milky fluid from the small intestine) to points of utilization or storage in the body.

One function of bile salts in digestion is to promote the linkage of (*i.e.*, emulsify) lipid-soluble groups with water-soluble ones (such as those in enzymes) and also to increase the solubility of lipids in water. Both emulsification and solubilization are necessary because lipids are completely metabolized only at the lipid–water interface created by bile salts and by the salts of fatty acids (soaps), which are formed during the partial breakdown of lipids (see also DIGESTION AND DIGESTIVE SYSTEMS).

If an animal ingests more energy-rich substances (*e.g.*, fats, carbohydrates) than it can utilize in energy-requiring functions, excess fatty acids combine with glycerol to form neutral lipids, which are stored in the animal; *e.g.*, in adipose tissue in mammals. If the energy requirements of the animal increase, the stored neutral lipids may then be broken down, each molecule forming three molecules of fatty acid and one molecule of glycerol. The three molecules of fatty acid combine with a protein (albumin) in mammalian blood plasma and are carried in the bloodstream to various tissues and organs that require energy. It is probably also as depots of concentrated energy that neutral lipids function in plant reproductive structures such as pollen grains and seeds; *i.e.*, the lipids serve as a food reserve for the developing embryo.

Neutral
lipids as
depot
material

The types of neutral lipids in an individual animal may vary according to the animal species and the composition of fats in the food it consumes. Fats used by or stored in animal tissues come from two sources---diet and enzymatic synthesis. The lipids synthesized from carbohydrates or proteins are characteristic of the animal species, whereas those resynthesized from dietary fats are characteristic of the food ingested. Many animals require some lipids containing one or more specific fatty acids, usually linoleic, linolenic, and arachidonic, to prevent the development of an essential fatty-acid deficiency, which is manifested by skin lesions, scaliness, poor hair growth, and low growth rates. The so-called essential fatty acids cannot be synthesized by the animal and must, therefore, be supplied in the diet (see also NUTRITIONAL DISEASES AND DISORDERS).

Lipids as structural components of cells. Neutral lipids. Subcutaneous deposits of neutral lipids insulate animals against cold because of the low rate of heat transfer in fats, a property especially important to animals commonly found in cold waters or cold climates; *e.g.*, whales, walruses, and bears. Neutral lipids also provide structural support or padding for organs.

Phosphoglycerides. Phosphoglycerides, or phospholipids, are important constituents of cell membranes and of the membranes of cell components such as mitochondria; they function in the conduction of nerve impulses, in the insulation of nerve cells (see NERVE IMPULSE), in certain enzyme-catalyzed reactions within cells, and in blood coagulation and the transport of lipids from the liver to other tissues and organs in mammals.

Phosphoglycerides contain acidic (negatively charged) and basic (positively charged) groups as well as fatty-acid groups. Because they have both charged, water-attracting (hydrophilic) groups and lipid-attracting, water-repelling (hydrophobic) groups, phosphoglycerides are moderately soluble in both water and lipids and serve, therefore, an important role in the cell in binding both types of compounds together; lecithin is a naturally occurring phosphoglyceride of special importance in the cell membrane because its hydrophilic groups maintain continuity between the water outside and that inside the cell, and its hydrophobic groups dissolve lipid materials, allowing them to enter the cell (see MEMBRANE, BIOLOGICAL).

Phosphoglycerides in blood bodies called platelets function in the process of blood-clot formation. Blood coagulation in mammals involves the conversion of a soluble protein (fibrinogen) into an insoluble derivative (fibrin clot). This reaction in part is catalyzed by the enzyme thrombin, which is derived from another protein (prothrombin) by the action of the enzyme prothrombinase. Prothrombinase in turn is formed by the interaction of two blood-plasma proteins, a phosphoglyceride, and calcium. The exact role of the phosphoglyceride in this reaction, however, has not yet been established with certainty.

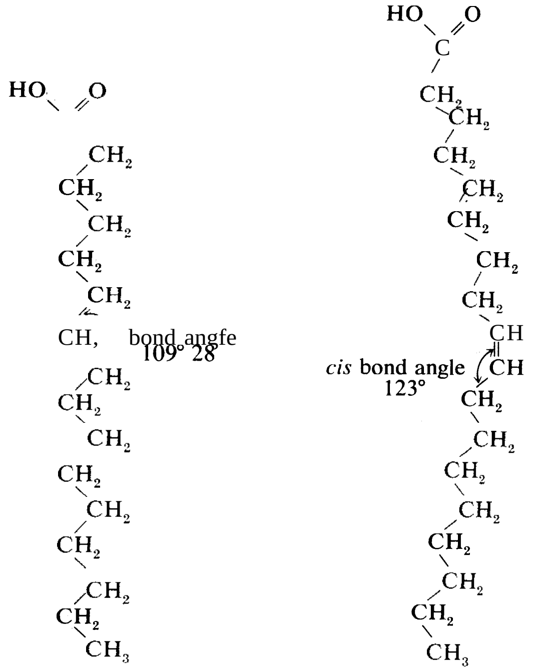
Sphingolipids. Lipids found in nervous tissue (especially the brain) and necessary for its normal function include the sphingolipids, among them sphingomyelins, cerebrosides, sulfatides, and gangliosides. Schwann cells, the source for the membranous sheath surrounding certain nerve fibres, release a lipid material (myelin) that contains sphingomyelins. Myelination of nerve fibres is necessary for the normal development of nerve tissue, and absence or alteration of the myelination process may result in severe mental retardation in man. Sphingolipids have not been studied as exhaustively as some of the other lipids because they are difficult to isolate and separate into homogeneous components.

Sterols and carotenoids. Sterols include cholesterol in vertebrates and saponins and digitaloids in plants; cholesterol, with phospholipids, plays a role in membrane structure and an important role in the synthesis of numerous other biologically active sterols, commonly referred to as steroids—*e.g.*, bile acids, certain hormones, vitamin D. Carotenoids, widely distributed in living things, are pigments (coloured molecules) and function in the photosynthetic process in plants. These substances are discussed in detail in STEROIDS; ISOPRENOIDS.

FATTY ACIDS

The fatty acids of the naturally occurring lipids have an even number of carbon (C) atoms because they are synthesized from acetyl groups, each of which contains two carbon atoms. Fatty acids with 16 (palmitic acid) and 18 (stearic acid) carbon atoms are most commonly found in nature, but the reasons for their abundance have not yet been established. Important constituents of lipids in plants, animals, and micro-organisms, fatty acids usually are not found in free form but, instead, are bound to other compounds to form fatty-acid-containing lipids; *e.g.*, neutral lipids (tryglycerides), sterols, phosphoglycerides such as lecithin, and sphingolipids such as sphingomyelin. Two typical fatty acids are palmitic and oleic.

Fatty-acid-containing lipids



palmitic acid

oleic acid

The most stable arrangement of methylene groups ($-CH_2-$ groups), which comprise the hydrocarbon moiety of the molecule, is represented in the formula for palmitic acid; the double bond ($-CH=CH-$) in the oleic acid molecule, whose structure differs from that of palmitic acid only in the double bond between carbon atoms 9 and 10 (the carbon in the carboxyl, or $-COOH$, group is number 1), changes the shape of the molecule from that of palmitic acid. The double bond, which indicates that the acid contains two fewer hydrogen atoms than its counterpart (palmitic acid), makes the oleic acid molecule almost symmetrical because it is located exactly in the middle of the hydrocarbon chain. An additional change in the shape of fatty-acid molecules occurs in those acids that contain two double bonds; *e.g.*, linoleic acid. Fatty-acid molecules containing one or more double bonds ($-CH=CH-$) are called unsaturated fatty acids; those without double bonds are saturated acids. Double bonds give rise to a phenomenon called geometrical isomerism; *i.e.*, the positions of certain atoms in the acid molecule may lie on the same side of an imaginary plane through the molecule, in which case a bond is said to be cis, or on opposite sides of the plane, in which case the bond is said to be trans. Unsaturated fatty acids of mammalian tissues usually contain cis double bonds (see structural formulas for palmitic and oleic acids); in addition, fatty acids found in mammals usually consist of long, chainlike arrangements of the hydrocarbon portion of the molecule (*e.g.*, as in palmitic acid) rather than branched or cyclic structures. On the other hand, fatty acids with cyclic and branched structures occur in plants and bacteria.

Classes of fatty acids. Saturated fatty acids. Typical naturally occurring saturated fatty acids are chainlike (nonbranched) compounds with an even number of carbon atoms; *e.g.*, palmitic acid, stearic acid. Names given to fatty acids other than the more commonly used, or trivial, names are called systematic names (*n*-hexadecanoic acid for palmitic and *n*-octadecanoic acid for stearic); they provide information about either the correct geometric form of an unsaturated fatty acid or the exact location of substituted groups in the molecule.

Although palmitic acid and stearic acid are the major saturated fatty acids found in animal and plant tissues, significant amounts of other saturated fatty acids, such as myristic acid and lauric acid, occur in certain tissues, and lignoceric acid and behenic acid are found in high concentrations in brain sphingolipids. Small amounts of fatty acids with an odd number of carbon atoms also are known; *e.g.*, pentadecanoic acid and heptadecanoic acid. A list of the most common saturated chainlike fatty acids (*i.e.*, those containing 12 or more carbon atoms), including their usual sources, is presented in Table 1. Several important short-chain fatty acids include butyric acid (four carbon atoms, or C_4) and caproic acid (C_6), which are important constituents of milk lipids, and octanoic acid (C_8) and decanoic acid (C_{10}), which are present in palm oil.

Table 1: Some Naturally Occurring Saturated Fatty Acids

trivial name	systematic name	chain length*	typical sources
Lauric acid	*n*-dodecanoic acid	12	palm-kernel oil, nutmeg
Myristic acid	*n*-tetradecanoic acid	14	palm-kernel oil, nutmeg
Palmitic acid	n-hexadecanoic acid	16	olive oil, animal lipids
Stearic acid	n-octadecanoic acid	18	cocoa butter, animal lipids
Behenic acid	n-docosanoic acid	22	brain tissue, radish oil
Lignoceric acid	*n*-tetracosanoic acid	24	brain tissue, carnauba wax

*In carbon atoms.

Unsaturated fatty acids. Unsaturated fatty acids have structures similar to those of saturated ones but contain at least one or more olefinic, or double bond. Fatty acids with one double bond are called monounsaturated fatty acids; those with two or more are called polyunsaturated ones. The naturally occuring unsaturated fatty acids may be distinguished solely by the degree of unsaturation and usually contain one or two double bonds; fatty acids containing acetylenic, or triple bonds ($-C\equiv C-$), also have been found in nature.

Mono- and polyunsaturated fatty acids

Monounsaturated fatty acids (also called monoethenoic, monoenoic, ethylenic, olefinic, or alkenoic acids) contain two fewer hydrogen atoms (H) than do corresponding saturated acids and thus have one double bond (*i.e.*, $-CH_2-CH_2$ becomes $-CH=CH-$); monounsaturated acids comprise the largest group of unsaturated fatty acids. The major and most representative monounsaturated acids in animal and plant tissues, oleic acid and palmitoleic acid, have the following formulas:

$$CH_3(CH_2)_7CH=CH(CH_2)_7COOH$$

oleic acid

$$CH_3(CH_2)_5CH=CH(CH_2)_7COOH.$$

palmitoleic acid

These two widely distributed fatty acids exist in abundant quantities in nature and have several common features; *i.e.*, a double bond between carbon atoms 9 and 10 (counting from the —COOH, or carboxyl, end) and a cis configuration at this double bond. Fatty acids with a double bond at other positions are listed in Table 2; *e.g.*, nervonic acid has a double bond between carbon atoms 15 and 16, as indicated by the systematic name, cis-15-tetracosenoic acid.

Table 2: Types of Monounsaturated Long-Chain Fatty Acids

trivial name	systematic name	chain length*	typical source(s)
Palmitoleic acid	cis-9-hexadecenoic acid	16	marine algae, pine oil
Oleic acid	cis-9-octadecenoic acid	18	animal tissues, olive oil
Gadoleic acid	cis-9-eicosenoic acid	20	fish oils (cod, sardine)
Erucic acid	cis-13-docosenoic acid	22	rapeseed oil
Nervonic acid	cis-15-tetracosenoic acid	24	elasmobranch fishes, brain

*In carbons.

Polyunsaturated acids (also called polyethenoic, polyenoic, alkapolyenoic, alkadienoic, or alkatrienoic acids) are found in much smaller amounts in naturally occurring lipids than are monounsaturated ones. The formulas of the three common polyunsaturated fatty acids are given below.

$$CH_3(CH_2)_4CH=CHCH_2CH=CH(CH_2)_7COOH$$

linoleic acid

$$CH_3CH_2CH=CHCH_2CH=CHCH_2CH=CH(CH_2)_7COOH$$

linolenic acid

$$CH_3(CH_2)_4CH=CHCH_2CH=CHCH_2CH=$$
$$CHCH_2CH=CH(CH_2)_3COOH.$$

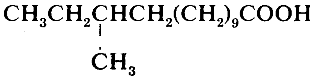
arachidonic acid

Linoleic acid and arachidonic acid comprise most of the polyunsaturated fatty acids found in animal tissues. The double bonds usually are located at specific positions, as in linoleic and arachidonic acids. The most important polyunsaturated acids, which contain 18 to 22 carbon atoms, are listed in Table 3.

Most mammals cannot synthesize linoleic acid, even though they are able to convert it to other unsaturated acids; *e.g.*, arachidonic acid and the eicosapolyenoic acids. The polyunsaturated fatty acids in mammals therefore are derived largely from the diet, *i.e.*, they are essential fatty acids.

Alkyl-, hydroxy-, and alicyclic-substituted fatty acids

Fatty acids *with* substituted groups. Alkyl-substituted, or alkylalkanoic, fatty acids have one alkyl group on the molecule. An alkyl group is a hydrocarbon group with the general formula C_nH_{2n+1}; the methyl group ($-CH_3$) is the alkyl group in the example below. Methyltetradecanoic acid is found in butterfat.

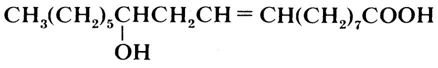


$$CH_3CH_2\underset{\displaystyle CH_3}{\underset{|}{C}}HCH_2(CH_2)_9COOH$$

12-methyltetradecanoic acid (anteiso)

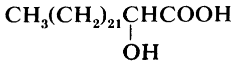
An excellent source of alkyl-substituted fatty acids is the bacterium that causes human tuberculosis; the acid is called tuberculostearic acid, or D-(1)-10-methyloctadecanoic acid. Other saturated acids isolated from tubercle bacilli include phytomonic acid (a 10- or 11-methylnonadecanoic acid), phthioic acid (a mixture containing fatty acids with 23 to 31 carbon atoms), mycocerosic acid (a polymethylated fatty acid with 31 carbon atoms), and a number of alkyl branched-chain, unsaturated fatty acids.

Several hydroxy fatty acids (*i.e.*, containing one — OH group) occur in various lipid sources. Ricinoleic acid and cerebronic acid are typical examples.



$$CH_3(CH_2)_5\underset{\displaystyle OH}{\underset{|}{C}}HCH_2CH=CH(CH_2)_7COOH$$

ricinoleic acid
(*d*-12-hydroxy-cis-9-octadecanoic acid)

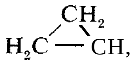


$$CH_3(CH_2)_{21}\underset{\displaystyle OH}{\underset{|}{C}}HCOOH$$

cerebronic acid
(2-hydroxytetracosanoic acid)

Ricinoleic acid occurs in castor oil, and cerebronic acid is present in brain tissue; a-hydroxynervonic acid (an unsaturated fatty acid with 24 carbon atoms) also occurs in brain tissue. Very small amounts of other hydroxy fatty acids are found in animal and bacterial lipids.

Alicyclic-substituted fatty acids, which contain a cyclopropane group



attached at or near the centre of the molecule, occur in certain bacteria. One such acid, lactobaciilic acid, comprises about 30 percent of the total fatty acids of the bacterium Lactobacillus *arabinosus*. Fatty acids containing cyclopropane groups have not yet been found in animal tissues. A series of compounds similar in structure has, however, been found in the chaulmoogra oils.

Several alicyclic acids, called prostaglandins, occur in seminal fluid and in certain glands of sheep and man. Hormone-like substances with widespread physiological effects, prostaglandins lower blood pressure, and stimulate the contraction of smooth muscles.

Physical and chemical properties of fatty acids. Solubility. Long-chain fatty acids (*i.e.*, with ten or more carbon atoms) are insoluble in water; short-chain fatty acids (two to eight carbon atoms), however, mix easily with water. The reason for the low solubility of long-chain fatty-acid molecules is that the methylene groups ($-CH_2-$) comprising the hydrocarbon chain are not ionized (*i.e.*, lack charge) and thus are nonpolar; they are more important in determining solubility properties of the acids than is the carboxyl (— COOH) component, which is ionized and therefore polar. Common table salt is about 1,000 times more soluble in water than is stearic acid; glucose is about 3,300 times more soluble. Fatty acids dissolve in nonpolar solvents or solvents that are less polar than water.

Reactivity of the carboxyl *group*. The low water solubility of fatty acids, which are members of a large group of organic acids known as carboxylic acids, makes difficult the determination of their properties as acids. Small amounts of fatty acids, which are weak acids compared with mineral acids such as hydrochloric and nitric, do not completely dissociate into ionized (charged) moieties in water. The carboxyl group (— COOH) is responsible for the acidic properties of fatty acids (see also CARBOXYLIC ACIDS AND THEIR DERIVATIVES).

Chlorides, esters, and amides

Most reactions at the carboxyl group of fatty acids involve the hydroxyl moiety (— OH) but are influenced by the carbonyl moiety ($-C=O$). Several reactions are typical of fatty acids; *e.g.*, formation of chlorides, esters, and amides. Fatty-acid chlorides, called acyl chlorides, are formed by the reaction of a fatty acid with the compound thionyl chloride ($SOCl_2$). Salts of fatty acids are formed in reactions with bases (*e.g.*, sodium hydroxide), in which case the products are called soaps, or with alcohols to form esters. If palmitic acid reacts with the alcohol methanol (CH_3OH), the product, called methyl palmitate, is the methyl ester of palmitic acid; the methyl esters of fatty acids are often used to determine the properties of the acids. The reaction of a fatty acid with ammonia in the presence of heat results in the formation of a product called an amide; the amides of fatty acids also are useful in characterizing them. Amides are found in nature.

Reactivity of the hydrocarbon chain. The most chemically reactive part of a hydrocarbon chain of a fatty acid is the double bond. Halogens (*e.g.*, chlorine, bromine, iodine) and their derivatives, called halides, react with unsaturated fatty acids to remove the double bonds, thereby forming saturated acids; this is known as an addition reaction. Halides such as hydriodic acid (HI) readily attack a double bond to form derivative compounds.

In the presence of a suitable catalyst (*e.g.*, platinum oxide, palladium on charcoal), hydrogen undergoes an addition reaction with unsaturated fatty acids; that is, hydrogen is added to the positions at which double bonds are found. This hydrogenation reaction results in the formation of saturated fatty acids. The double bonds of polyunsaturated fatty acids are hydrogenated in a specific order; linolenic acid (a fatty acid with 18 carbon atoms and three double bonds; Table 3), for example, is hydrogenated first at the bond between carbon atoms 12 and 13 to form a 9,15-octadecadienoic acid, which can then be further hydrogenated to form a saturated acid. For a discussion of the commercial use of the hydrogenation process, see OILS, FATS, AND WAXES.

Table 3: Types of Polyunsaturated Fatty Acids

trivial name	systematic name	chain length*	typical source(s)
Linoleic acid	cis-9-, cis-12-octadecadienoic acid	18	corn oil, animal tissues, bacteria
Linolenic acid	cis-9-, cis-12-, cis-15-octadecatrienoic acid	18	animal tissues
	5,8,11-eicosatrienoic acid	20	
	8,11,14-eicosatrienoic acid	20	brain tissue
	7,10,13-docosatrienoic acid	22	phospholipids
	8,11,14-docosatrienoic acid	22	
Arachidonic acid	5,8,11,14-eicosatetraenoic acid	20	liver, brain tissue
	4,7,10,13-docosatetraenoic acid	22	brain tissue
	4,7,10,13,16,19-docosahexaenoic acid	22	brain tissue

*In carbon atoms.

Bond alternation, which is defined as any change involving double bonds such as those found in unsaturated fatty acids, also occurs in living cells. The first type of bond alternation, called autoxidation, is a nonenzymatic process; the second, lipoxidation, is an enzyme-catalyzed reaction. Both involve oxygen.

Autoxi-
dation

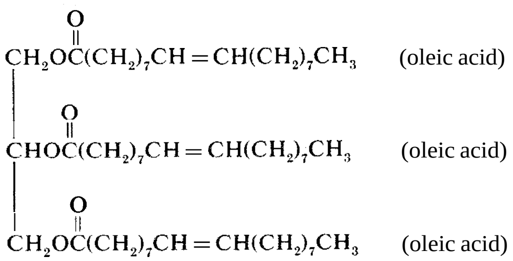
Autoxidation, or rancidification, which occurs slowly and spontaneously in air, involves the absorption of oxygen by an unsaturated fatty-acid molecule, with the formation of a compound called a hydroperoxide, which decomposes. Autoxidation may occur during the drying or handling of certain oils, under adverse conditions of fat storage, and in certain mammalian deficiencies; *i.e.*, vitamin E deficiency. The acids that undergo autoxidation usually are the polyunsaturated ones; *e.g.*, linoleic acid and arachidonic acid.

Lipoxidation contrasts with autoxidation in that an enzyme (lipoxidase) catalyzes the addition of oxygen to a double bond in linoleic acid. Lipoxidase is found in legume seeds (for example, soybeans) and in adipose (fat) tissue.

DERIVATIVES OF FATTY ACIDS

As was previously emphasized, naturally occurring fatty acids are normally found in cells bound to other substances to form triglycerides (neutral lipids), phosphoglycerides (phospholipids), and sphingolipids. Neutral lipids are found almost exclusively in the cytoplasmic compartment of cells, phosphoglycerides and sphingolipids almost exclusively in the membranous structures. For metabolic aspects of these lipids, see METABOLISM.

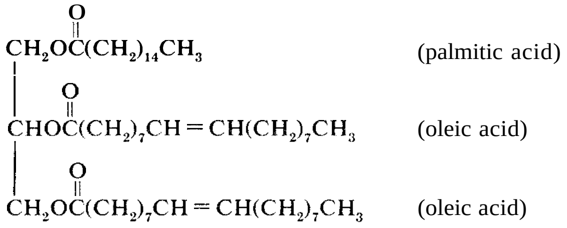
Neutral lipids. *General features.* Triglycerides, or neutral lipids, are compounds consisting of glycerol and three fatty acids; the structural formula of a typical triglyceride, triolein, is shown below.



$$\begin{array}{ll}
\mathrm{CH_2O\overset{O}{\overset{\|}{C}}(CH_2)_7CH=CH(CH_2)_7CH_3} & \text{(oleic acid)}\\
\mathrm{CHO\overset{O}{\overset{\|}{C}}(CH_2)_7CH=CH(CH_2)_7CH_3} & \text{(oleic acid)}\\
\mathrm{CH_2O\overset{O}{\overset{\|}{C}}(CH_2)_7CH=CH(CH_2)_7CH_3} & \text{(oleic acid)}
\end{array}$$

Triolein is called a simple triglyceride since it contains only one type of fatty acid (oleic acid). Naturally occurring triglycerides, however, usually are mixed triglycerides; *i.e.*, they contain more than one type of fatty acid. An example of a mixed triglyceride is palmitodiolein, the fatty-acid composition of which is, as the name indicates, one molecule of palmitic acid and two molecules of oleic acid.

This triglyceride may have structural arrangements other than the one shown; *i.e.*. the fatty-acid molecules may be arranged with palmitic acid occupying any of the two possible different positions. (There are only two chemically different positions since the top and the bottom positions in the above formula are undistinguishable.)



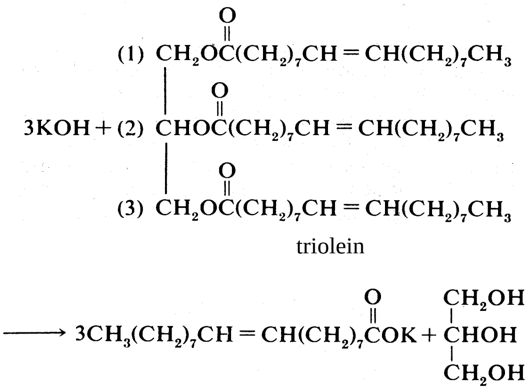
$$\begin{array}{ll}
\mathrm{CH_2O\overset{O}{\overset{\|}{C}}(CH_2)_{14}CH_3} & \text{(palmitic acid)}\\
\mathrm{CHO\overset{O}{\overset{\|}{C}}(CH_2)_7CH=CH(CH_2)_7CH_3} & \text{(oleic acid)}\\
\mathrm{CH_2O\overset{O}{\overset{\|}{C}}(CH_2)_7CH=CH(CH_2)_7CH_3} & \text{(oleic acid)}
\end{array}$$

palmitodiolein

Physical and chemical characteristics. Triglycerides, called neutral lipids because they possess no charged groups, do not migrate in an electrical field and are insoluble in water. Information about the structure of naturally occurring mixed triglycerides containing different fatty acids may be obtained by chemical, enzymatic, and physical methods. Chemical and enzymatic techniques are summarized below.

Saponifi-
cation

Triglyceride molecules undergo reactions with bases such as potassium hydroxide (KOH). The reaction, shown below, often called a saponification reaction, results in the formation of an alkali soap (potassium oleate) and glycerol.

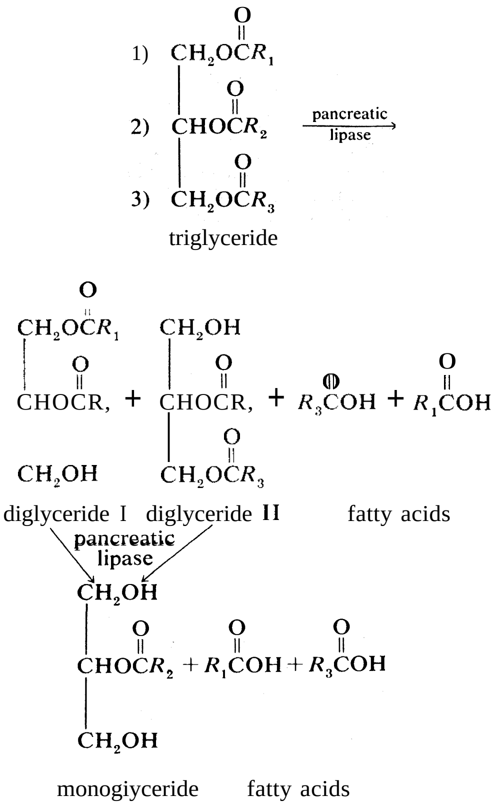


$$\begin{array}{l}
\mathrm{(1)\ CH_2O\overset{O}{\overset{\|}{C}}(CH_2)_7CH=CH(CH_2)_7CH_3}\\
\mathrm{3KOH+(2)\ CHO\overset{O}{\overset{\|}{C}}(CH_2)_7CH=CH(CH_2)_7CH_3}\\
\mathrm{(3)\ CH_2O\overset{O}{\overset{\|}{C}}(CH_2)_7CH=CH(CH_2)_7CH_3}\\
\text{triolein}\\
\longrightarrow \mathrm{3CH_3(CH_2)_7CH=CH(CH_2)_7\overset{O}{\overset{\|}{C}}OK + \begin{array}{c}CH_2OH\\ |\\ CHOH\\ |\\ CH_2OH\end{array}}
\end{array}$$

potassium oleate glycerol

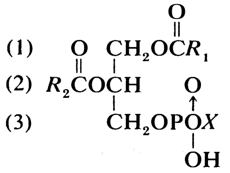
If acid is added to a solution containing the soap, free fatty acids are formed. Although the saponification reaction is useful in establishing the general nature of the fatty acids associated with a specific triglyceride, it provides no information on their specific locations on the glycerol molecule [positions (1), (2), or (3) in the triolein formula above].

The distribution of fatty acids on the glycerol molecule is determined by using an enzyme (pancreatic lipase) that is found in mammals and plays a role in lipid digestion. Pancreatic lipase acts only at positions (1) and (3) of the triglyceride molecule in the sequence outlined below; the overall reaction occurs in two steps. The first products of the lipase reaction are two molecules of glycerol, each containing two fatty acids (labeled diglycerides I and II) and two molecules of free fatty acids (represented by the general formula RCOOH) from positions (1) and (3) of the triglyceride. The lipase next reacts with the two diglycerides. A monoglyceride that contains one fatty acid at position (2), and free fatty acids from positions (1) and (3) of the diglycerides are the products of this second reaction. R_1, R_2, and R_3 in the reaction sequence represent hydrocarbon chains of fatty acid ester groups.



The various products of the enzyme-catalyzed reactions may be isolated and analyzed to provide information about the chemical nature of the fatty acids at each of the three positions.

Phosphoglycerides (phospholipids). The most simple phosphoglyceride contains fatty acids combined with glycerophosphate; *i.e.*, glycerol, containing a molecule of phosphoric acid at position (3), as shown below in the general formula. R_1 and R_2 represent hydrocarbon chains of fatty-acid ester groups at positions (1) and (2) of glycerol; X at position (3) may be a hydrogen atom or an organic compound (*e.g.*, serine, inositol, choline, glycerol, glycerophosphoric acid, or a diglyceride).



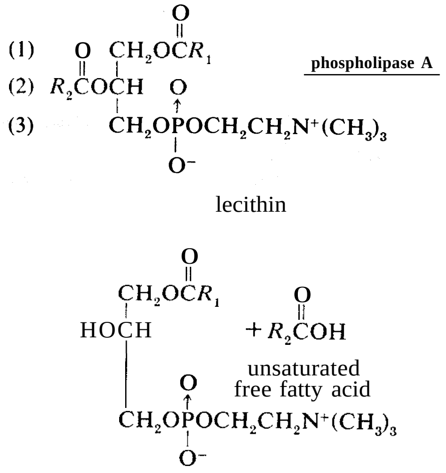
Variations from the general structure occur; phospholipids called plasmalogens, for example, contain an unsaturated ether group ($-OCH=CHR_1$) in position (1) instead of a fatty-acid ester group, and other phospholipids called glyceryl ether phospholipids contain a saturated ether group ($-OCH_2CH_2R$) in position (1). The properties and characteristics of several phosphoglycerides are summarized in the following sections.

Phosphatidyl moiety

The term phosphatidyl is used to describe the portion of the phosphoglyceride molecule containing the fatty-acid ester groups and glycerophosphate.

Phosphatidyl choline. This phospholipid, also known as lecithin, is the difatty-acid derivative of glyceryl-3-phosphorylcholine and is perhaps the most representative of all the phosphoglycerides. A lecithin molecule has a nonpolar portion (the two fatty-acid ester groups), which is insoluble in water, and a polar portion (phosphorylcholine), which is soluble in water. Since lecithin molecules contain both polar and nonpolar components, they can orient themselves in a specific way at oil–water or water–air interfaces. The nitrogen-containing component of lecithin (choline) is a strongly basic compound and has a positive charge; since phosphoric acid has a negative charge, lecithin has both acidic and basic groups and behaves as a zwitterion (*i.e.*, a dipolar ion); it does not, therefore, migrate in an electrical field.

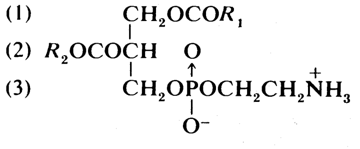
In animal tissues, the fatty-acid ester groups of lecithin are specific with regard to type and position; *e.g.*, reactions (see example below) using the enzyme phospholipase A (from snake venom) as a catalyst show that lecithins from different sources have saturated fatty acids predominately at position (1) and unsaturated fatty acids at position (2). The action of this enzyme on lecithin results in the liberation of the unsaturated fatty acid at position (2); the remainder of the molecule is called a lysolecithin. R_1 and R_2 represent hydrocarbon chains of fatty-acid ester groups in the equation below.



lysolecithin

The reaction proceeds most efficiently in a diethyl ether solution, which removes liberated fatty acids from the surfaces of the enzyme molecules. The free fatty acid represents the unsaturated fatty-acid ester group at position (2) in lecithin; the lysolecithin has a saturated fatty acid ester group at position (1). The specificity of the fatty-acid positions may act in metabolic utilization.

Phosphatidyl ethanolamine. The structure of this phosphoglyceride, found in most sources containing phosphatidyl choline, is represented below; R_1 and R_2 represent hydrocarbon chains of fatty-acid ester groups. The fatty acids in phosphatidyl ethanolamine, as in phosphatidyl choline, usually occupy specific positions; saturated fatty acids are located primarily at position (1), unsaturated fatty acids at position (2). Ethanolamine ($\overset{+}{N}H_3CH_2CH_2OH$) is a nitrogen-containing basic compound derived from the amino acid serine. This phosphoglyceride, unlike phosphatidyl choline, is not a zwitterion and exists in various ionic, or charged, forms.

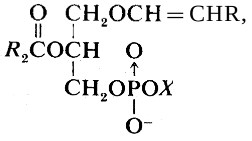


phosphatidyl ethanolamine

Phosphatidyl serine. Although amino acids other than serine may occur in natural phospholipids, phosphatidyl serine is the most representative one. It is a minor chemical component of cells, compared with phosphatidyl choline and phosphatidyl ethanolamine.

Plasmalogens. These naturally occurring phosphoglycerides, under certain conditions, release an organic compound called an aldehyde. The substituent at the (1) position in the general formula below is called a vinyl ether ($-OCH=CHR_1$); that on position (2) is a fatty-acid ester, usually of an unsaturated fatty acid. The nitrogen base (X) in most plasmalogens is ethanolamine; choline-containing plasmalogens occur in lesser amounts.

Another phospholipid, similar in general structure to plasmalogens, is found in eggs, brain tissue, and red blood cells of cows; it contains a saturated ether $(-OCH_2CH_2R)$ substituent instead of a vinyl ether.



$$\begin{array}{l} \overset{O}{\overset{\|}{R_2C}}O\overset{CH_2OCH=CHR_1}{\overset{|}{C}}H \\ \qquad\;\; \overset{|}{C}H_2O\underset{O^-}{\overset{\overset{O}{\uparrow}}{P}}OX \end{array}$$

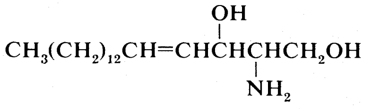
general structure of plasmalogens

Phosphatidyl inositol. Phosphatidyl inositol, which is not present in large amounts in animals or plants, contains an alcohol (inositol) with a ring structure. Several similar compounds have been isolated from brain tissue, including phosphogylcerides containing inositol polyphosphates; *e.g.,* L-myo-inositol-1,4,5-triphosphate and L-myo-inositol-2,4,5-triphosphate. More complex inositol-containing phospholipids may contain ethanolamine, tartaric acid, or the sugar galactose.

Phosphatidic acids

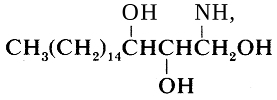
Minor phosphoglycerides. Not all of the glycerol-containing phospholipids are represented by the structures already described. Minor phosphoglycerides (*e.g.*, phosphatidic acids, phosphatidylglycerol, bisphosphatidic acid, and diphosphatidylglycerol, or cardiolipin) usually are present in cells in very small amounts, less than 2 or 3 percent, and often occur in tissues as salts. Phosphatidic acids, which are glycerol phosphate molecules containing two molecules of fatty acid, are important in the biosynthetic pathways that result in the formation of phosphoglycerides and neutral lipids. Small amounts of phosphatidic acids occur in mammals, but they are abundant in plants (*e.g.*, cabbage). Cardiolipin, or diphosphatidylglycerol, which is found in heart muscle, usually contains only unsaturated fatty acids; it has been used in the diagnosis of syphilis. Phosphatidylglycerol, which occurs in a variety of sources, may be involved in both the synthesis and breakdown of phosphatidic acids.

Sphingolipids. The sphingolipids, a group of complex lipids, contain either sphingosine or the closely related compound phytosphingosine instead of glycerol.



$$CH_3(CH_2)_{12}CH{=}CH\overset{OH}{\overset{|}{C}}H\underset{NH_2}{\underset{|}{C}}HCH_2OH$$

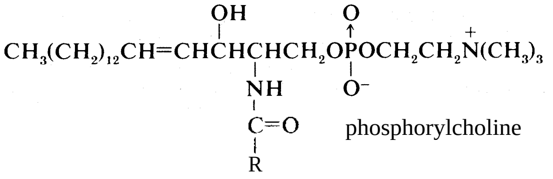
sphingosine



$$CH_3(CH_2)_{14}\overset{OH}{\overset{|}{C}}H\underset{OH}{\underset{|}{\overset{NH_2}{\overset{|}{C}}}}HCH_2OH$$

phytosphingosine

Sphingosine is found in the sphingolipids of animals, phytosphingosine in those of plants. Animal sphingolipids occur in high concentration in the brain, in the peripheral nerves, and in the myelin sheaths surrounding nerve fibres; they occur in lower amounts in several other tissues; *e.g.*, liver, blood plasma, kidney. Sphingomyelins are the most frequently encountered sphingolipids in animals: R represents the hydrocarbon chain of a fatty-acid ester group in the formula below.



$$CH_3(CH_2)_{12}CH{=}CH\overset{OH}{\overset{|}{C}}H\underset{\underset{\underset{R}{|}}{\underset{C=O}{\underset{|}{NH}}}}{\underset{|}{C}}HCH_2O\underset{O^-}{\underset{|}{\overset{\overset{O}{\uparrow}}{P}}}OCH_2CH_2\overset{+}{N}(CH_3)_3$$

a sphingomyelin

Other sphingolipids include glycosphingolipids, or glycolipids, which contain a sugar instead of the phosphoryl choline unit. A typical glycosphingolipid, present primarily in brain tissue, is the *O*-galactosido derivative of N-acyl sphingosine; it is generally called a cerebroside. The sugar component of the molecule is galactose, a hexose sugar (*i.e.*, containing six carbon atoms). The fatty acids found in cerebrosides usually contain 24 carbon atoms and have either a double bond or a hydroxyl group. Some cerebrosides contain sulfuric acid linked to galactose; these molecules are called sulfatides. Other glycosphingolipids are called gangliosides; they differ from the cerebrosides in the more complex chemical nature of the sugar group on the sphingosine molecule. The various ganglioside molecules usually differ in the number of sugar molecules.

Sialic acids

The neuraminic acid component, usually present as N-acetyl-*O*-*N*-diacetyl-, or N-glycolylneuraminic acid, is commonly known as a sialic acid. Naturally occurring sialic acids, which are found as components of gangliosides and other complex molecules, are widely distributed in animal tissues and in bacteria.

STEROLS AND CAROTENOIDS

Widely distributed in nature, sterols and carotenoids usually are closely associated with the fatty-acid-containing lipids in cells. The most commonly occurring natural sterol in vertebrates is cholesterol, which is the starting substance, or precursor, for many other important biologically active sterols (often referred to as steroids). The carotenoids, which are sometimes referred to as tetraterpenes (C_{40}), are widely distributed in plants and micro-organisms and to a lesser extent in animals, in which they probably originate in dietary sources, since animals cannot synthesize them. A frequently encountered caroteniod is β-carotene, a precursor of vitamin A alcohol, which functions in mammalian vision. Other carotenoids function in photosynthesis in plants. These lipids are discussed in detail in ISOPRENOIDS; STEROIDS.

LIPOPROTEINS

Lipids in living cells normally are associated with proteins. Lipid–protein complexes, or lipoproteins, occur either as soluble components (*e.g.*, those in the blood plasma of mammals or in egg yolk) or as more insoluble types (*e.g.*, those in membranes of cells). The discussion that follows is concerned primarily with composition, structure, and biological behaviour of the soluble lipoproteins in blood plasma, which are relatively easy to isolate and purify and thus have been studied extensively.

One outstanding feature of the association between lipids and proteins is the lack of significant chemical bonds between them. Since lipids can be separated from the protein component, it is assumed that lipoproteins are held together by weak physical forces.

Lipoproteins isolated from various sources usually fall into one of two general groups. In one group are the highly ordered lipoproteins, which are characterized by high protein and low lipid content; the other group consists of disorganized lipoproteins, which are characterized by low protein and high lipid content. A large number of different lipoproteins have been isolated; their molecular weights and lipid contents vary over a wide range. A suitable characterization of a lipoprotein includes several criteria; *e.g.*, solubility characteristics, behaviour when spun in a centrifuge, and chemical composition.

Physical characteristics. The physical character of lipoproteins resembles that of proteins. Lipoproteins that differ with respect to physical properties can be separated by differences in solubility, in electrophoretic behaviour (migration of a charged particle in an electrical field), and in centrifugal behaviour. A well-established method for separating proteins (salt fractionation) is also useful for separating lipoproteins; it has been replaced to a great extent, however, by a more effective method, centrifugation, mentioned below. Another method now largely replaced by centrifugation involves the separation, using ethanol, or protein components in human blood plasma to obtain two major lipoprotein fractions, designated as α_1-lipoprotein and β-lipoprotein.

Centrifugation

Lipoproteins were first identified in human blood when it was spun in a centrifuge at extremely high speeds (ultracentrifugation). Lipoproteins separate from other serum constituents after 20 to 24 hours of centrifugation. The lipoproteins gather as a uniform layer at the top of the centrifuge tube. If the density (mass per unit volume) of a solution containing the serum lipoproteins is adjusted by the addition of a soluble material such as a salt, so that the solution at the bottom of the tube has a higher density than that at the top, and if the mixture then is spun in an ultracentrifuge, the lipoproteins become distributed according to the densities of the components. The degree of separation of various lipoproteins, therefore, depends on the density adjustment of the solution before ultracentrifugation.

The physical characterization of low-density lipoproteins (*i.e.*, high lipid content) is often expressed in S_f values; S_f indicates low density lipoprotein flotation rate in a sodium chloride solution of density 1.063 grams per cubic centimetre at 26° C (79" F) in a unit centrifugal field and is described in Svedberg units (10^{-13} centimetres/second/dyne/gram).

Chemical nature. The chemical nature of the three groups of human-blood-plasma lipoproteins, the very low density lipoproteins (VLDL), the low-density lipoproteins (LDL_1), and the high-density lipoproteins (HDL_3), which differ from each other in various ways (*e.g.*, types and amounts of both lipids and proteins, immunochemical properties), are summarized in Table 4. Variations in age and sex of individuals is reflected by differences in distribution of low-density lipoproteins (LDL_1) and high-density lipoproteins (HDL_3) in their blood serums. The chylomicrons occur as transient components produced during the intestinal absorption of lipids.

Table 4: Characteristics of Human Blood Plasma Lipoproteins
(a composite picture)

	HDL_3	LDL_1	VLDL
Lipid, in percent	37	48	90
Component lipids, in percent of total lipid			
Phosphatidyl choline Sphingomyelin	44	24	20
Triglyceride	20	16	56
Cholesterol ester	24	12	8
Cholesterol	6	12	8
Free fatty acid	6	1	1
Protein, in percent	45	15	10
Water, in percent	18	37	...
Diameter, in angstrom units	84	185	500
Density, hydrated (grams per cubic centimetre)	1.13	1.04	0.91
Molecular weight (approx.)	300,000	2×10^6	8×10^6

PREPARATION AND ANALYSIS OF LIPIDS

The isolation and identification of lipids is a challenging task. The procedures involve the separation of lipids from other cellular constituents using organic solvents (*e.g.*, chloroform, methanol), in which the lipids dissolve. Two solvents usually are used to separate lipids from other cellular constituents. One solvent, usually methanol, separates the lipoproteins into lipid and protein components; the other, usually chloroform, dissolves the lipids. After this mixture is treated to remove low-molecular-weight compounds, such as inorganic salts, amino acids, and sugars, the lipids are separated by column chromatography into individual components. A typical chromatographic separation of the total lipids, however, does not necessarily result in separation of the components into pure compounds. Additional analytical techniques, such as thin-layer chromatography, mass spectrometry, infrared spectrometry, and optical activity, are needed to establish the identity of each component.

Lippi, Fra Filippo

The painter Fra Filippo Lippi lived and worked in mid-15th-century Italy, in the generation immediately following that of Masaccio, one of the great initiators of the Renaissance, whose austere influence Lippi combined with the more medieval tradition of the International Gothic style. But Lippi was more than an eclectic or transitional artist. Instead, he is seen to have had a rich artistic personality of his own, a clear artistic vision, and an openness toward innovating experience, indicated not only by his pictures but also by his colourful adventures.

Filippo Lippi was born in Florence, probably in 1406. After the death of both his father and mother, he stayed with an aunt for some years, and in 1421 he pronounced the vows of a Carmelite monk at Sta. Maria del Carmine, in Florence. The Brancacci chapel of this monastery was at this time being decorated with frescoes by Masaccio. These frescoes, which were to be among the most glorious and influential paintings of the Renaissance, were Lippi's first important contact with art.

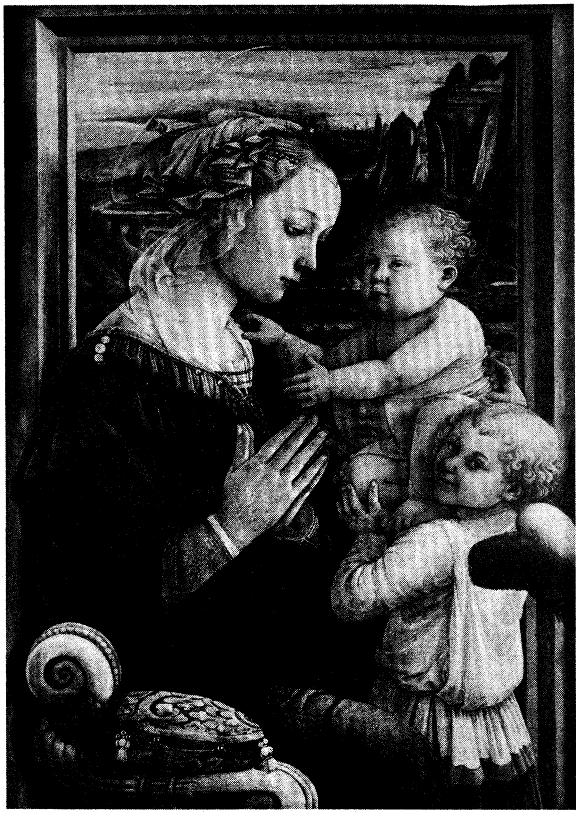
In 1432 Lippi left the monastery after having painted some frescoes in the church and in the cloister. According to the Renaissance biographer Giorgio Vasari, who wrote a lively and fanciful profile of the painter, Lippi was abducted with some companions by the Moors on the Adriatic, held as a slave for 18 months, and then freed after he painted a portrait of his owner. It is known that in 1434 the artist was at Padua. None of the works executed in the period at Padua are known, but the effect of his presence may be recognized in the paintings of others there, such as Mantegna.

Association with the Medicis

In 1437 Lippi returned to Florence, protected by the powerful Medici family, and was commissioned to execute several works for convents and churches.

The qualities he acquired during his years of travel are affirmed with clarity in two works of 1437, immediately after he returned from Padua: "The Virgin and Child Between SS. Frediano and Augustin" and the "Madonna and Child." In both of these altarpieces, the influence of Masaccio is still evident, but it is absorbed into a different style, having the pictorial effect of bas-relief, rendered more evident by lines, so that it resembles the reliefs of the sculptors Donatello and Jacopo della Quercia. In these works, the colour is warm, toned down with shadings, approaching the limpid chromatics of his great contemporary Fra Angelico. Still further testimony of Lippi's development is the painting "The Annunciation" (Galleria Nazionale d'Arte Antica), formerly believed to be a late work but now dated between 1441 and 1443. It is composed in a new way, using the newly discovered effects of perspective and skillful contrasts between colour and form; the suggested movement of the light garments of the two frightened young girls at the door is rendered with such sensitivity as to anticipate Botticelli.

A famous altarpiece of the same time, Lippi's well-known "Coronation of the Virgin," is a complex work crowded with figures. The celebrated altarpiece is so sumptuous in appearance that it seems to have been painted in competition with Angelico; it marks a historic



"The Madonna and Child with Two Angels," by Fra Filippo Lippi, c. 1465. In the Uffizi, Florence.
Alinari

point in Florentine painting in its success in uniting as one scene the various panels of a polyptych.

The altarpieces are characterized by a solemnity of composition that is absent from the paintings in which he developed a typical motive of 15th-century Florentine art: the Madonna with the Child at her breast. The masterpiece of these is "Madonna with Child and Scenes from the Life of Mary," a circular painting now in the Pitti Palace in Florence; it is a clear and realistic mirror of life, transfigured in a most intimate way, and it had a great effect on Renaissance art.

A second "Coronation of the Virgin," executed about 1445, displays a marked change in the style of Lippi—from the plastic values suggested by his study of Masaccio to the serene chromatics of Angelico.

Elopement with Lucrezia Buti

In 1442 Lippi had been made rector of the church of S. Quirico at Legnaia. His life, however, became constantly more eventful, and tradition has given him the reputation (borne out in great part by documents) of a man dominated by love affairs and impatient of methodical or tranquil conduct. His adventures culminated in 1456 in his romantic flight from Prato, where he was painting in the convent of the nuns of Sta. Margherita, with a young woman of the convent, Lucrezia Buti. The Pope later gave permission to the former priest-painter to marry her, and from this union was born a son, Filippo, called Filippino, who was to be one of the most noted Florentine painters of the second half of the 15th century.

The bright and active city of Prato, a short distance from Florence, was the second home of Filippo Lippi. He returned to Prato often, staying there for long periods, painting frescoes and altarpieces. Accompanied by Fra Diamante, who had been his companion and collaborator since he was a young man, Lippi began to redecorate the walls of the choir of the cathedral there in 1452. He returned in 1463 and again in 1464, remaining in the city this time until 1467. At the centre of his activity in Prato stand the frescoes of the cathedral, with the four Evangelists and scenes from the lives of St. John the Baptist and St. Stephen. Perhaps the most solemn scene of the life and death of St. Stephen is the burial; at the sides of the funeral bed of the Saint stand a crowd of prelates and illustrious persons in mourning, among them Cardinal Carlo de' Medici, Fra Diamante, and the artist himself.

In 1467 Lippi and Fra Diamante left for Spoleto, where he had received a commission, through the Medici family, for another vast undertaking: the decorations and frescoes of the choir of the cathedral, which included the "Nativity," the "Annunciation," the "Death of Mary," and—in the centre of the vault of the apse—the "Coronation." These frescoes were Lippi's final work; they were interrupted by his death, for which there are two documented dates—according to the monks' necrology of Sta. Maria del Carmine in Florence it is October 8, 1469, and in the archives of Spoleto it is recorded as October 10, 1469. The Medici had a splendid sepulchre, designed by his son, erected for him in the Cathedral of Spoleto.

Assessment

Posthumous judgments of Filippo Lippi were often coloured by the traditions of his adventurous life. Moreover, his works have been criticized from time to time for their borrowings from other painters; nevertheless, it has also been recognized that his art was not diminished but rather enriched and rendered more balanced by what he took from Masaccio and Fra Angelico. He was constantly seeking the techniques to realize his artistic vision and the new ideas that made him one of the most appreciated artists of his time.

The 20th-century critic Bernard Berenson, who maintained that Lippi's true place as an artist was among the "painters of genius," also described him as "a high-class illustrator," intending by this to underline the importance of expressive content and the presentation of reality in his works. Later critics have recognized in Lippi a "narrative" spirit that reflected the life of his time and translated into everyday terms the ideals of the early Renaissance.

MAJOR WORKS

"The Reform of the Carmelite Rule" (fresco, 1432; Sta. Maria del Carmine, Florence); "Madonna of Humility" (c. 1432; Castello Sforzesco, Milan); "Madonna and Child (1437; Galleria Nazionale d'Arte Antica, Rome); "The Virgin and Child Between SS. Frediano and Augustin" (1437; Louvre, Paris); "Madonna and Child Enthroned (*c*. 1437; Metropolitan Museum of Art, New York); "Annunciation" (*c*. 1437–40; S. Lorenzo, Florence); "The Coronation of the Virgin" (1441–47; Uffizi, Florence); "The Madonna Enthroned with Saints" (1441–42; Uffizi); "Virgin and Child (1441–42; Museo Mediceo, Florence); "The Annunciation" (1441–43; Galleria Nazionale d'Arte Antica, Rome); "Annunciation" (*c*. 1442–47; Alte Pinakothek, Munich); "St. Lawrence Enthroned with SS. Cosmo and Damian and Alessandro Alessandri and Two of His Sons; St. Benedict; St. Anthony Abbott" ("Alessandri Altarpiece"; *c*. 1442–47; Metropolitan Museum of Art, New York); "Adoration of the Magi" (*c*. 1445–47; National Gallery of Art, Washington, D.C.); "Coronation of the Virgin" (*c*. 1445; Vatican Museum, Rome); "St. Bernard's Vision of the Virgin" (1447; National Gallery, London); choir frescoes (1452–64; cathedral, Prato); "Madonna with Child and Scenes from the Life of Mary" (1452; Pitti Palace, Florence); "The Virgin Enthroned and Two Saints" (1453; Museo Comunale, Prato); "The Adoration of the Child with St. Hilary" (*c*. 1455; Uffizi); "Seven Saints" (1458–60; National Gallery, London); "The Virgin Adoring the Child" (*c*. 1460; Staatliche Museen Preussischer Kulturbesitz, Berlin); "The Adoration of the Child with St. Bernard" (*c*. 1463; Uffizi); "The Madonna and Child with Two Angels" (*c*. 1465; Uffizi); choir and apse frescoes (commissioned 1466, begun 1467–69; cathedral, Spoleto).

BIBLIOGRAPHY. MARY PITTALUGA, "Fra Filippo Lippi," in the *World Encyclopedia of Art*, vol. 9, col. 257–261 (1964), a biographical and critical synopsis with modern bibliography; and *Filippo Lippi* (1949), includes a critical evaluation (in Italian) of the artist and precise attributions; EDWARD C. STRUTT, *Fra Filippo Lippi* (1901), the first systematic biography with comments on the principal works; BERNARD BERENSON, *The Study and Criticism of Italian Art*, 2nd Series (1902) and *Italian Pictures of the Renaissance* (1932), contain important critical evaluations of the artist; I.B. SUPINO, *Fra Filippo Lippi* (1902), in Italian; HENRIETTE MENDELSOHN, *Fra Filippo Lippi* (1909), in German; GIUSEPPE FIOCCO, *La pittura toscana del Quattrocento* (1945); ROBERT OERTEL, *Fra Filippo Lippi* (1942), a critical study (in German) with attributions; MARIO SALMI (ed.), *Filippo Lippi: Gli Affreschi nel duomo di Prato* (1944), with illustrations of particular frescoes and comments and notes.

(V.M.)

Liquid State

Most simple substances can exist in any of the three states of matter—solid, liquid, and gas—within certain ranges of temperature. A solid is almost rigid; any stress that a solid object is subjected to is proportional to the strain set up in it, and stresses that are sufficiently small are withstood by the body for indefinite periods of time. Two kinds of stress are important in this definition: tensile stress tends to pull the body apart, while shear stress tends to press one part past another. On a microscopic level, a crystalline solid is characterized by a high degree of spatial order in the arrangement of the molecules (see SOLID STATE OF MATTER). In the liquid and gas states (see GASEOUS STATE), collectively called the fluid states, stress is proportional to the rate of strain, and a shearing stress produces a viscous flow of parts. The spatial order of the molecules is less obvious than that of a solid; in a gas of low density it is almost negligible, while in a dense gas or in a liquid it can be described only in terms of averages over many different configurations. Such averages are called probability distribution functions and are treated below.

Types of liquid state

General considerations. Clear distinctions between the one solid and the two fluid phases, gas and liquid, hold only for those substances whose molecules are composed of a small number of atoms. When the number exceeds about 20, the liquid may often be cooled below the true melting point to form a glass (see GLASSY STATE): which has many of the mechanical properties of a solid but lacks crystalline order. If the number of atoms in the molecule exceeds about 100–200, then the classification into solids, liquids, and gases ceases to be useful. At low temperatures such substances are usually glasses or amorphous solids, and their rigidity falls with increasing temperature—*i.e.*, they do not have fixed melting points; some may, however, form true liquids. With these large molecules, the gaseous state is usually not attainable, because they decompose chemically before the temperature is high enough for the liquid to evaporate. Synthetic and natural high polymers, such as nylon and rubber, behave in this way.

If the molecules are large, rigid, and either roughly planar or linear, as in cholesteryl acetate or *p*-azoxyanisole, the solid may melt to an anisotropic liquid (not uniform in all directions) in which the molecules are free to move about but have great difficulty in rotating. Such a state is called liquid crystal, and the anisotropy produces changes of the refractive index (a measure of the change in direction of light when it passes from one medium into another) with the direction of the incident light and hence leads to unusual optical effects; however, no inorganic compounds and fewer than one in 200 of the known organic compounds form liquid crystals.

The theory of normal liquids is. therefore, predominantly the theory of the behaviour of substances consisting of simple molecules.

Thus, a liquid lacks both the strong spatial order of a solid, though it has the high density of solids, and the absence of order of a gas that results from the low density of gases; *i.e.*, gas molecules are relatively free of each other's influence. The combination of high density and of partial order in liquids has led to difficulties in developing quantitatively acceptable theories of liquids. Understanding of the liquid state, as of all states of matter, came with the kinetic molecular theory, which stated that matter consisted of particles in constant motion and that this motion was the manifestation of thermal energy. The greater the thermal energy of the particle, the faster it moved.

Transition to the liquid state

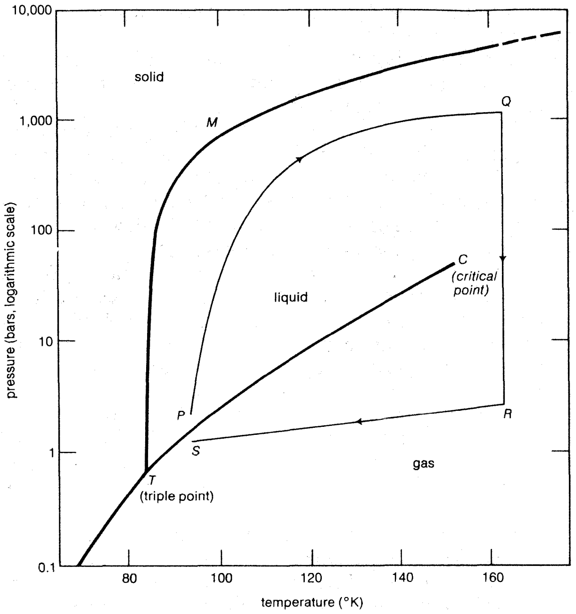
In very general terms, the particles may be molecules, atoms, charged atoms called ions, or electrons. In a gas, the particles are far enough away from one another and are moving fast enough to escape each other's influence, which may be of various kinds, such as the attraction or repulsion due to electrical charges, and specific forces of attraction that involve the electrons orbiting around atomic nuclei. The motion of particles is in a straight line, and the collisions that result occur with no resulting loss of energy although an exchange of energies may result between colliding particles. When a gas is cooled, its particles move more slowly, and those that are slow enough to linger in each other's vicinity will coalesce, because a force of attraction will overcome their lowered kinetic energy (energy of motion) and, by definition, thermal energy. Each particle, when it joins the liquid state with others, gives up a measure of heat called the latent heat of liquefaction, but each continues to move at the same speed within the liquid as long as the temperature remains at the condensation point. The distances the particles can travel in a liquid without colliding are of the order of molecular diameters. As the liquid is cooled, the particles move more slowly still, until at the freezing temperature the attractive energy produces so high a density that the liquid freezes into the solid state. They continue to vibrate, however, at the same speed, as long as the temperature remains at the freezing point, and the freezing process releases their latent heat of fusion. Heating a solid will provide the particles with the heat of fusion necessary to escape one another's influence enough to move about in the liquid state, and further heating will provide the liquid particles with their heat of evaporation, which will enable them to escape one another altogether and form the vapour of the liquid, or the gaseous state. Of course, this starkly simplified view of the states of matter ignores a great many complicating factors, most important being the fact that no two particles need be moving at the same speed in a gas or liquid or solid and the related fact that even in a solid some particles may have acquired all the energy they need to be gas particles, while even in a gas some particles may be practically motionless for a brief span of time. It is the average kinetic energy of the particles that has to be considered, together with the fact that the motion is random. At the interface between liquid and gas and between liquid and solid, an exchange of particles is always taking place, slow gas molecules condensing at the liquid surface and fast liquid molecules escaping into the gas. An equilibrium state is reached in any closed system, so that the number of exchanges in either direction is the same. Because the kinetic energy of particles in the liquid state can be defined only in statistical terms (*i.e.*, every possible value can be found), discussion of the liquid state, as of the gaseous state, involves formulations in terms of probability functions.

THE NATURE AND STRUCTURE OF LIQUIDS AT EQUILIBRIUM

Gibbs phase rule

Behaviour of liquids at equilibrium. The number of phases (or distinct states of a substance) that are present in a system at equilibrium is governed by a natural law called the phase rule by J. Willard Gibbs. All the properties of a homogeneous phase of a single substance (*e.g.*, a pure liquid) are determined if, in the absence of external forces, the two variables of pressure and temperature are specified. Such a system is, therefore, said to have two degrees of freedom. If there is more than one phase (*e.g.*, ice and water) or more than one substance present (*e.g.*, water and alcohol) or both, then the number of degrees of freedom (symbolized by F) is related to the number of phases (symbolized P) and the number of substances or components (symbolized C), by Gibbs phase rule, which states that the sum of the number of phases and degrees of freedom equals the sum of the number of components and the number two. This is written $P + F = C + 2$. Hence, for a single substance (when $C = 1$), the number of coexisting phases cannot exceed three, since F cannot be negative, though it can be zero. Solid, liquid, and gas can exist together in equilibrium only for one fixed pair of values of pressure and temperature, and at this point $F = 0$, since, being fixed, there is no freedom to choose the values of these variables. With two phases—solid and liquid or liquid and gas—the equation becomes $2 + F = 1 + 2$; hence, $F = 1$; *i.e.*, the system has one degree of freedom: either the pressure or the temperature can be chosen at will (within certain ranges), and the other is then fixed by the nature of the substance.

These relations are summarized in the Figure, the phase diagram of argon, in which one phase is shown as an



Phase diagram of argon.
Heavy lines show the boundaries between liquid and gas (*TC*) and between liquid and solid (TM). Line PQRS describes path from typically liquid state (P) to typically gaseous state (*S*) (see text).

area, two as a line, and three as the meeting of the lines at the triple point, T. The diagram shows that the liquid phase is merely a part of a single fluid state. There are abrupt changes in physical properties (*e.g.*, density, heat capacity, viscosity, dielectric constant) on crossing the lines that separate the liquid from the solid on one side and from the gas on the other. The second line, the vapour-pressure curve, ***TC*** (obtained by measuring the pressure at every temperature), does not continue to arbitrarily high temperatures but ends at the temperature and pressure that describe the critical point, C. At the critical point, two phases in equilibrium become identical and form one phase. A liquid at the pressure and temperature indicated at point *P* can be heated without changing its density along the line *PQ;* at *Q*, the pressure is lowered, while the temperature is kept constant, and the volume of the liquid is expanded along *QR;* at R, the gas is cooled along *RS*, to *S*, where it is changed from a liquid to a gas without undergoing that abrupt change of properties associated with boiling or evaporation. The path *PQRS* demonstrates the essential continuity of state between liquid and gas, which differ in degree but which comprise together the one fluid state. Strictly speaking, the term liquid should be applied only to the more dense of the two phases on the line TC, but it is generally extended to any dense fluid state at low temperatures; that is, to the area lying within the angle ***CTM***.

Phases in equilibrium

The line ***TM*** is the melting curve and is initially much steeper than the vapour-pressure curve; hence, as the pressure is changed, the temperature does not change much, and the melting temperature is little affected by pressure. No substance has been found to have a critical point on this line, and there are theoretical reasons for supposing that it continues indefinitely to high temperatures and pressures, until the substance is so compressed that the molecules break up into atoms, ions, and electrons. At pressures above 10^6 bars (the unit of pressure; one bar is approximately equal to the pressure of the atmosphere at sea level), it is believed that most substances pass into a metallic state, but steady pressures of this magnitude are not yet obtainable in the laboratory.

There are a few substances, such as water and bismuth, for which the density of the solid is less than that of the liquid at the triple point. For these two substances, the volume change for solid to liquid is negative; hence, the melting temperatures fall with increasing pressure. With water, this negative volume change (*i.e.*, shrinking) persists to 2.1 kilobars and —22" C (—8° F), at which point the normal form of ice changes to a more dense form, and, thereafter, the change in volume is positive.

It is often possible to cool a gas at constant pressure to a temperature lower than that of the vapour-pressure line without producing immediate condensation, since the liquid phase forms readily only in the presence of suitable nuclei, generally particles of dust or ions, about which the drops can grow. Unless the gas is scrupulously cleaned, these nuclei are always present; a supercooled vapour state is unstable, and liquid will ultimately condense. It is similarly possible to superheat a liquid to a temperature where, though still a liquid, the gas is the stable phase. Again, this occurs most readily with clean liquids heated in smooth vessels, because gas bubbles will collect around foreign particles or sharp points. When the superheated liquid changes to gas, it does so with almost explosive violence, a phenomenon familiar as the "bumping" noise of a heated liquid. A liquid also may be supercooled to below its freezing temperature; this is quite easy to do under carefully controlled conditions. It is not possible, however, to superheat a solid.

Triple-point temperature

Triple-point temperatures range from 14" K (0° K equals —273.15" C [—460" F]) for hydrogen to temperatures too high for accurate measurement; *e.g.*, around 4,500" K for diamond. Triple-point pressures are generally low, that of carbon dioxide at 5.2 bars being one of the highest. Most are around 10^{-3} bar, and those of some hydrocarbons are as low as 10^{-7} bar. The normal melting point of a substance is defined as the melting temperature at a pressure of one atmosphere (exactly equivalent to 1.01325 bars); it differs little from the triple point because of the steepness of melting lines (TM in the Figure). Critical temperatures (maximum temperature at which a gas can be liquefied by pressure) range from helium, at 5.2° K, to temperatures too high to measure. Critical pressures (at which liquid and vapour phases are identical) are generally about 40–100 bars. The normal boiling point is the temperature at which the vapour pressure reaches one atmosphere. The normal liquid range is defined as the temperature interval between the normal melting point and the normal boiling point, but such a restriction is artificial, the true liquid range being from triple point to critical point. Substances whose triple-point pressures are above atmospheric (*e.g.*, carbon dioxide) have no normal liquid range but sublime (*i.e.*, pass from solid phase to gas phase) at atmospheric pressure.

Many of the properties of a liquid near its triple point are closer to those of the solid than to those of the gas. It has a high density (typically 0.5–1.5 grams per cubic centimetre), a high refractive index (a measure of the change in direction of light rays passing from one medium into another; for liquids the index varies from 1.3 to 1.8), a high heat capacity at constant pressure (two to four joules per gram per °K, one joule being equal to 0.239 calorie), and a low compressibility ($0.5–1 \times 10^{-4}$ per bar). The compressibility falls to values characteristic of a solid (0.1×10^{-4} per bar, or less) as the pressure increases. A simple and widely used equation describes the change of specific volume with pressure. If $V(p)$ is the volume at pressure p, $V(0)$ is volume at zero pressure, and A and B are positive parameters (constants whose values may be arbitrarily assigned), then the difference in volume resulting from a change in pressure equals the product of A, the pressure, and the volume at zero pressure, divided by the sum of B and the pressure. This is written:

$$V(0) - V(p) = \frac{ApV(0)}{(B+p)}.$$

The pressure B is close to the pressure at which the compressibility has fallen to half its initial value and is generally about 500 bars for liquids near their triple points. It falls rapidly with increasing temperature.

As a liquid is heated along its vapour-pressure curve, TC, its density falls and its compressibility rises. Conversely, the density of the saturated vapour in equilibrium with the liquid rises; *i.e.*, the number of gas molecules in a fixed space above the liquid increases. Liquid and gas states approach each other with increasing rapidity as the temperature approaches C, until at this point they become identical and have a density about one-third of that of the liquid at T. The change of saturated-gas density (ρ_g) and liquid density (ρ_l) can be expressed by a simple equation when the temperature is close to the critical. If ρ_c is the density at the critical temperature T_c, then the difference between densities equals the difference between temperatures raised to a factor called beta, β. This is written:

$$(\rho_l - \rho_c) = (\rho_c - \rho_g) = (T_c - T)^{\beta},$$

and β is about 0.34. The compressibility and the heat capacity of the gas at constant pressure (C_p) become infinite as T approaches T_c from above along the path of constant density. The infinite compressibility implies that the pressure no longer restrains local fluctuations of density. The fluctuations grow to such an extent that their size is comparable with the wavelength of light, which is therefore strongly scattered. Hence, at the critical point, a normally transparent liquid is almost opaque and usually dark brown in colour. The classical description of the critical point and the results of modern measurement do not agree in detail, but recent considerations of thermodynamic stability show that there are certain regularities in behaviour that are common to all substances.

Shape of drops

Between a liquid and its vapour there is a dividing surface that has a measurable tension; work must be done to increase the area of the surface at constant temperature. Hence, in the absence of gravity or during free fall, the equilibrium shape of a volume of liquid is one that has a minimum area; *i.e.*, a sphere. In the Earth's field this shape is found only for small drops, for which the gravitational forces, since they are proportional to the volume, are negligible compared with surface forces, which are proportional to the area. The surface tension falls with rising temperature and vanishes at the critical point. There is a similar dividing surface between two immiscible liquids, but this usually has lower tension. It is believed that there is a tension also between a liquid and a solid, though it is not directly measurable because of the rigidity of the solid; it may be inferred, however, under certain assumptions, from the angle of contact between the liquid and the solid; *i.e.*, the angle at which the liquid's surface meets the solid. If this angle is zero, the liquid surface is parallel to the solid surface and is said to wet the solid completely.

Structure. A liquid lacks regular arrangement of its molecules; *i.e.*, it lacks the regular crystalline order of a solid. The molecular structure of a liquid, therefore, can be described and measured only on the basis of probability. Probability is computed by a mathematical operation that yields distribution functions; a distribution function measures the probable distribution of some property of molecules through the liquid. Distribution functions that describe liquid structure are formulated as follows.

Distribution functions for liquids

If the volume of a minute quantity of liquid that may be called an element of the liquid, symbolized by dr, is small compared with the volume of a molecule and is in a fixed position symbolized by r, sometimes it will contain the centre of a molecule, and sometimes it will not. The probability that it will do so, in a liquid at equilibrium, is the product of the number of molecules in the total volume, symbolized by N, and of the ratio of dr to the total volume, V. Written out, this equals Ndr/V. The ratio N/V is called the number density and is written as n. Thus, probability is the product ndr. If two elements of volume are considered, dr_1, or dr_2, and if they are separated by a distance symbolized as r_{12}, which is large compared with the size of a molecule, the probability that each such element of volume contains the centre of a molecule is given by the product of the probabilities of independent occupancy; that is, by $ndr_1 \times ndr_2$, or $n^2dr_1dr_2$. If r_{12}, the distance between r_1 and r_2, is comparable with the size of a molecule, the probabilities are not independent, and the joint probability can be written as the product of the probabilities of independent occupancy (of a particular state) and a function of r_{12} denoted by $g^{(2)}(r_{12})$. This function is called the pair distribution function and is the simplest measure of the structure of a liquid.

If the pair distribution function equals one—that is, if $g^{(2)} = 1$—this value corresponds to no order or structure, since the positions of the molecules are mutually independent. Such a limit of no structure at all is [illegible] in a gas in which the molecules are far apart; *i.e.*, in effect, a hypothetically perfect gas. In a more dense gas, where molecules do affect one another, it is found that a useful approximation to $g^{(2)}$ is a value called the Boltzmann factor of the energy of interaction of a pair of molecules, symbolized as $u(r)$. The energy can be found from the properties of a dilute gas, from calculations using quantum mechanics, and in some cases from molecular-beam-scattering experiments. For the noble gas argon, which is highly unreactive, $u(r)$ is large and positive (*i.e.*, the molecules repel each other) if r is less than 3.3 angstroms (one angstrom equals 10^{-7} of a millimetre), and $u(r)$ is negative (*i.e.*, the molecules attract one another) if the distance is greater than 3.3 angstroms; the value reduces to zero at large separations of the molecules.

More detailed mathematical calculations in terms of molecular forces are beyond the scope of this article.

In a liquid, the pair distribution function $g^{(2)}$ is a more complex function of r and depends on both the number density, n, and the absolute temperature, T. When r is less than the collision diameter (3.3 angstroms for argon), $g^{(2)}$ is essentially zero, since two molecules cannot "overlap." At slightly larger separations—when $g^{(2)}$ is greater than one—there is a more than average chance of finding a pair of molecules. This enhancement arises in part from the Boltzmann factor of $u(r)$ but, more importantly, from the geometric necessity of there being many pairs at such separations in a liquid whose density is little less than that of a solid. Minor maxima and minima at larger separations are the remnants in the liquid of the much stronger extrema found in the solid (for which the pair distribution function $g^{(2)}$ along a crystal axis consists of a set of many narrow peaks separated by regions in which it is zero). Thus, a liquid lacks the long-range order of a solid but shows appreciable order at short separations.

Importance of distribution function

A knowledge of the pair distribution function $g^{(2)}$ is the minimum information needed for the discussion of the thermodynamic properties of a liquid, since molecules interact predominantly in pairs, through the potential energy u (r), and since $g^{(2)}$ describes the statistics of the distribution of such pairs. The macroscopic properties of internal or cohesive energy of a liquid, u, and of the departure of the pressure from its value in a perfect gas can be calculated from averages over $g^{(2)}$. These results show that a knowledge of $g^{(2)}$ is the link between the microscopic energies and forces and the macroscopic properties.

The theory of liquids at equilibrium reduces to a large degree to the measurement and calculation of the pair distribution function $g^{(2)}$. 'Finer details of the structure can be codified formally in higher distribution functions that specify the probabilities of there being molecules at three specified positions, but little is known about these functions.

Pair distribution function. There are two methods of measuring the pair distribution function $g(r)$ (from which the superscript may be omitted): first, by X-ray or neutron diffraction from simple fluids and, second, by computer simulation of the molecular structure and motions in a liquid. In the first, the liquid is exposed to a specific, single type (monochromatic) radiation and the observed results are then subjected to a mathematical treatment known as a Fourier transform.

The second method of obtaining the pair distribution function $g(r)$ supposes that the energy of interaction, $u(r)$, for the liquid under study is known. A computer model of a liquid is set up, in which between 100 and 1,000 molecules are contained within a cube. There are now two methods of proceeding, by Monte Carlo calculation or by what is called molecular dynamics; only the latter need be discussed here. Each molecule is assigned a

Use of a computer model

random position and velocity, and Newton's equations of motion are solved to calculate the path of each molecule in the changing field of all the others. A molecule that leaves the cell is deemed to be replaced by a new one entering through the corresponding point on the opposite wall with equal velocity. After a few collisions per molecule, the distribution of velocities conforms with equations worked out by the British physicist James Clerk Maxwell, and after a longer time the mean positions are those appropriate to the density and mean kinetic energy (*i.e.*, temperature) of the liquid. Functions such as the pair distribution function $g(r)$ can now be evaluated by taking suitable averages as the system evolves in time. Since 1958 such computer experiments have added more to the knowledge of the molecular structure of simple liquids than all the theoretical work of the previous century.

The theory of liquids at equilibrium cannot be discussed without extensive mathematical analysis. It is, to a large degree, the theory of the calculation of the total correlation function, $h(r)$, for which $h(r)$ is $g(r) - 1$, in terms of the pair potential $u(r)$, which, for the purposes of this theory, is assumed to be known. Equations can be derived that can be interpreted by saying that the total function h is composed of a direct term, c, and of chains of direct terms through all other molecules in the liquid. The direct function c can be determined from X-ray-diffraction experiments (by means of a Fourier transform) and also from other calculations, including computer results based on the assumption that a liquid behaves to a first approximation as a hard-sphere fluid.

The structure of a simple liquid (*e.g.*, argon) is determined, to a large degree, by the problem of packing at high density molecules with strong repulsive forces between them. The above approach is, of course, not a complete theory of liquids because of its basis in computer experiments. In any event, molecules as polar as water, for example, cannot be included quantitatively in any general scheme—such liquids must be discussed individually. No simple theory can account for the fact that water has a maximum density at 4° C (39° F) and expands on cooling below that temperature.

MECHANICAL AND THERMAL PROPERTIES OF LIQUIDS

Transport properties. A liquid in which there exists a gradient of the concentration, temperature, or velocity is not at equilibrium and responds to these variations, which may be considered "forces," by an appropriate movement of a quantity of matter, energy, or momentum through a unit area, called a flux. Unless the gradients are extremely large (as in a shock wave), the flux is proportional to the force, and this relation is embodied in several laws of diffusion and conduction, for which the mathematical formulations are beyond the scope of this article.

Velocity is a vector property, and so the laws governing the transport of momentum and, hence, of viscous flow are more complicated than those of diffusion and conduction. The simplest case is the fluid that obeys Newton's laws, for which stress is proportional to rate of strain (see above).

Diffusion

Diffusion coefficients are about 10^{-9} m^2/s near the triple point and rise with increasing temperature and decreasing density. The thermal conductivity of a liquid is about ten times that of the gas. It generally rises with increasing temperature and appears to become infinitely large at the critical point in the same way as the heat capacity at constant volume. The thermal conductivities of liquid metals are unusually high, since most of the energy is carried by the free electrons. Hence, the thermal conductivity is closely related to the electrical conductivity.

The shear viscosity varies with the molecular complexity of the liquid; thus, in argon and liquid air it is a fraction of that in water, and in heavy oils it rises to hundreds of times that. The bulk viscosity was not detected in a monatomic liquid until 1965 and is discussed below in connection with the speed of sound.

The theory of transport properties (that is, of the relation between certain properties such as diffusion and viscosity and the mass, structure, and interaction potential of the molecules) is in a less developed state than that of the equilibrium properties. In a gas, the mechanism of transport is by convection on a molecular scale; that is, matter, energy, and momentum are carried by the actual movement of molecules. In a liquid, this is true also for diffusion, but the the major contribution to viscosity and thermal conductivity is through collisions. When a pair of molecules collide there is virtually instantaneous transfer of energy and momentum over a distance equal to the molecular diameter. In a gas, this distance is negligible compared with the mean free path of molecular travel, and so such transfer is unimportant; in a liquid with the molecules touching, it is dominant. The molecules spend much of their time moving in "cells" to which they are confined by their neighbours, but this restriction on their movement does not hinder transfer by collisions. Hence, diffusion is slow in a liquid, but the coefficients of viscosity and thermal conductivity are large compared with those of a gas. This simple division into transfer by convection and transfer by collision has been put into more quantitative form by making simplifying assumptions about the movement of molecules within their cells and about the activation energy needed to escape to a neighbouring cell. The resulting theory, however, although pictorially attractive, is not a satisfactory route to a theory of transport processes.

A proper theory of transport properties must proceed through the distribution functions. Since the liquid is not at equilibrium, these will be functions not only of the separations of the molecules but also of their velocities; moreover, they will change with time.

Some of the most useful results have come not from a direct attack on the central theoretical problem but from the use of theory to interrelate different properties of the liquid. One approach, started by Albert Einstein and continued by others, introduces a correlation between a function at time zero and its value at a later time, t.

Transport properties of dense fluids

A theory of the transport properties of dense fluids was developed by assuming (1) that the molecules were hard spheres, so that only binary collisions occur, and (2) that the velocities of two colliding molecules are uncorrelated before collision. Velocity correlation is neglected in the description of the fluid. This approach is satisfactory at moderate densities but less so as the true liquid density is reached. The cells in which molecules are effectively confined at high densities mean that two neighbouring molecules may well collide more than once before they diffuse apart. Hence, their velocities are not uncorrelated at the second and subsequent collisions. Attempts to remove this defect lead to mathematical difficulties that do not lend themselves to ready summary; these are now an active field of research.

Propagation of sound in liquids. A sound wave is a series of longitudinal compressions and expansions that travels through a liquid at a speed of about one kilometre per second, or about three times the speed of sound in air. The compressions and expansions are adiabatic (changes that take place without transfer of heat) and reversible if the frequency is not too high. Conduction of energy from the hot (compressed) to the cold (expanded) regions of the liquid introduces irreversible effects, which are dissipative, and so such conduction leads to the absorption of the sound. A longitudinal compression (in the direction of the wave) is a combination of a uniform compression and a shearing stress (a force that causes one plane of a substance to glide past an adjacent plane). Hence, both bulk and shear viscosity also govern the propagation of sound in a liquid.

These dissipative effects are small in simple liquids, which may be virtually "transparent" to sound at frequencies up to 100 megahertz (10^9 cycles per second). At these high frequencies, that elusive coefficient, the bulk viscosity, can be observed. More complex liquids, such as hydrocarbons, esters, and even so simple a liquid as carbon disulfide, show strong absorption of sound below one megahertz. The absorption is accompanied by dispersion—that is, by the change of speed with frequency—and that can be described formally in terms of a frequency-dependent bulk viscosity. The cause is either a failure of the vibrational modes of the molecule to acquire and lose energy, if the time of heating and cooling is less than 10^{-6} of a second, or a structural change of the liquid on compression, which needs a similar time to occur. The first is certainly the cause in carbon disulfide, and the latter is exemplified by the association and dissociation of acetic acid into paired molecules and hence the strong absorption of sound of high frequency in this liquid. Hydrocarbons may combine both effects.

Electrical and magnetic properties. If a liquid is placed in a static electric field, the field exerts a force on any free carriers of electric charge in the liquid, and the liquid, therefore, conducts electricity. Such carriers are of two kinds, mobile electrons and ions; *i.e.*, atoms or molecules that have lost or gained electrons. The former are present in abundance in liquid metals, which have conductivities that are generally about one-third of the conductivity of the solid. The fall in conductivity on melting arises from the greater disorder of the positive ions in the liquid and hence their greater ability to scatter electrons. The contribution of the ions is small, less than 5 percent in most liquid metals, but is the sole cause of conductivity in molten salts (consisting of negative and positive ions) and in their aqueous solutions. Such conductivities vary widely but are much lower than those of liquid metals.

Non-ionic liquids

Non-ionic liquids (composed of molecules that do not dissociate into ions) have negligible conductivities, but they are polarized by an electric field; that is, the liquid develops positive and negative poles and also a dipole moment (pole strength times distance between poles) that is oriented against the field, from which the liquid therefore acquires energy. This polarization is of three kinds; in the first, called electron polarization, the electrons in each atom are displaced from their usual positions, thus giving each molecule a small dipole moment. The molecules act independently, and their reaction to the static electric field is the same as to the fluctuating electrical component of the field of electromagnetic radiation. The contribution of electron polarization to the dielectric constant (a measure of the electric stress) of the liquid is numerically equal to the square root of its refractive index (the measure of the change in direction when light enters the liquid). A second effect of an electric field is to produce atomic polarization, in which there is a relative change in the mean positions of the atomic nuclei within one molecule. This generally small effect is observed at radio frequencies but not at optical, and so it is missing from the refractive index. The third effect is that of orientation polarization. If the molecules have permanent dipole moments, they are partially aligned by the field and contribute heavily to the polarization. Thus, the dielectric constant of a nonpolar liquid, such as a hydrocarbon, is about 2, that of a weakly polar liquid, such as chloroform or ethyl ether, about 5, while those of highly polar liquids, such as ethanol and water, lie between 25 and 80.

The partial alignment occurs in a static electrical field or in one whose frequency is less than the reciprocal of the time it takes the polar molecule to rotate. Hence, orientation polarization does not contribute to the refractive index. The degree of alignment is less than might be expected from independent dipoles because of the polar intermolecular forces. The full effects of the independent dipoles can be observed only in the gas phase or, in a reasonable measure, in a dilute solution of a polar substance in a nonpolar solvent.

Most liquids are diamagnetic (opposing the magnetizing force). The exceptions are those whose molecules have unpaired electrons (*e.g.*, nitric oxide) and the liquid metals. Even those metals that are ferromagnetic (strongly magnetic) in the solid state are only paramagnetic (slightly magnetic) in the liquid state.

Absorption and scattering of radiation. Knowledge of the structure of liquids is derived principally from the study of their interaction with radiation. One example, the determination of $g(r)$ at equilibrium from X-ray or neutron diffraction, has been touched upon above under ***Pair distribution function.*** In the more general case of the scattering of radiation, the cause of the scattering is different for different kinds of radiation; thus, light is scattered by the outer electrons of an atom, X-rays by all the electrons, and neutrons by the nuclei. If the atoms in liquids move as entities, however, then all types of scattering can be described by the atomic or molecular distribution functions.

Lisbon

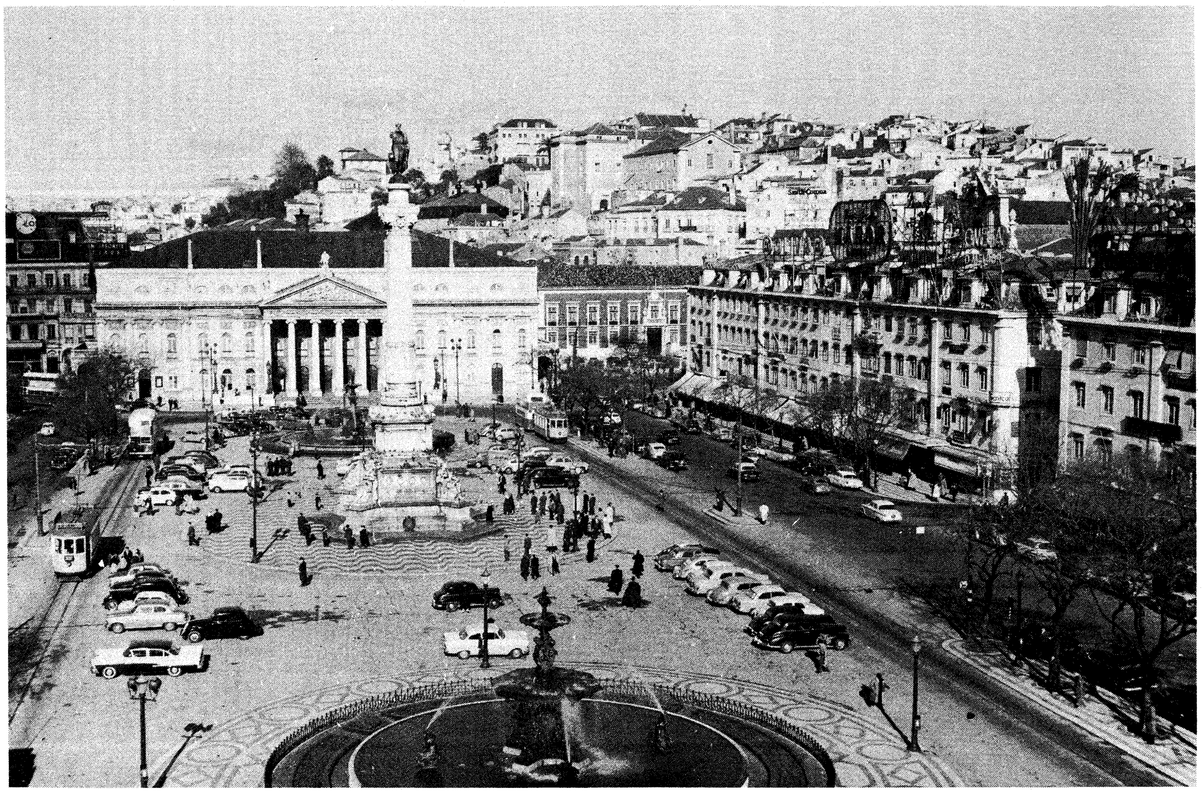
The capital, chief port, and largest city of Portugal—with, at more than 780,000 inhabitants, 10 percent of the national population—Lisbon (Portuguese, Lisboa) stands on the westernmost point of land of the European continent, where the Tagus River flows into the Atlantic Ocean. In the eight miles from the sea upstream to the city, the river is almost straight and about two miles wide. Just beyond the soaring gateway to Lisbon, the Salazar suspension bridge, which is the longest in western Europe, the waters suddenly broaden into a bay seven miles wide called the ***mar de palha,*** the straw sea—named for the sheen of its water, not its pollution. It is one of the continent's most beautiful harbours.

Scenically spectacular though it may be, the hill-cradled basin of burnished water also serves as a modern port, handling 9,000,000 tons of cargo a year. Amid the freighters, warships, liners, and ferryboats, a persistently picturesque note is struck by the ***fragatas*** with their Phoenician silhouettes, black hulls, and sepia sails; they perform most of the harbour's lighterage. The port maintains an intimacy with its city that was common in the days before steam. Vessels tie up at quays open to the everyday life of the town, where the clang of the trolley cars blends with the sound of ships' bells. At dawn, fishing smacks deposit their catch at the town's front doorstep for noisy auction to Lisbon dealers; while the fishwives, often barefoot, wait to fill the baskets they will peddle through the streets. Later the fish market gives way to the equally colourful and clamorous fruit and vegetable market.

The role of the river

It is traditional for Lisbon's poets to refer to the entwining Tagus as the city's lover. The river is indeed an ever-present part of the city's decor, visible from the many heights on which the town is built. The official entrance to Lisbon is a broad marble stair mounting from the water to a vast, arcaded square, the Praça do Comércio. The three landward sides of the square are surrounded by uniform 18th-century buildings, sea-green and white. This formal, baroque-flavoured composition is pierced by a monumental archway, built a century later, marking the entry into the central city. In the middle of the square, King Joseph (José) I, on horseback, is attended by a regiment of parked automobiles.

To the east, on the hill where Lisbon was first founded, the Castle of St. George (São Jorge in Portuguese; named for England's patron saint, in honour of an alliance made in 1386) still watches over the city. Just below it, the Church of St. Vincent-Outside-the-Walls guards the remains of the saint, which were—as depicted on the Lisbon coat of arms—miraculously brought to the city guided by two ravens. (Lisbon has a large number of local saints. Somewhat to the dismay of fellow townsmen, its most famous, St. Anthony, is known as St. Anthony of



The Rossio, in the commercial heart (Baixa) of Lisbon. In the centre, between twin fountains circled by mosaic, stands a statue of Pedro IV. The National Theatre of Dona Maria II overlooks the square in the background.

H. Armstrong Roberts

Padua. A church stands over his birthplace near the cathedral.) The towers of the dozen other old churches can still be picked out of the mass of buildings, but they have relinquished the skyline to the high-rise buildings of Lisbon's latest rebirth.

THE CITY'S ASPECT AND CHARACTER

Despite architectural change, the general outlines of the city remain as they were. It is still a city of balconies and vistas. On 17 of its prominences (many Lisbonese profess to see only seven traditional hills, as in Rome) the *miradouros,* garden balconies maintained by the city, are still frequented by citizens of all ages who gaze out from them down onto their city and river.

For centuries the citizens have been discussing the symptoms of an affliction they say is endemic in their strip of the Iberian Peninsula: *saudade,* very approximately translated as "melancholy," a variety of a state of anxiety tempered by fatalism. *Saudade* is said to be reflected in the music called *fado*, which is sung in its original form only in Lisbon, and in Lisbon only in two hillside plebeian precincts, Alfama and Bairro Alto. The word *fado* means "fate," usually unkind in the songs throbbingly sung to a penetrating but melodic music.

Saudade and dignity

One aspect of the Lisbonese character readily noticeable on the streets is self-respect, a nonaggressive esteem for human dignity. It can be seen in the waiter's pride in his deftness, in the cleanliness of the white shirt worn by the beggar gently soliciting alms among the café tables. (Lisbon, judged by net median family income, is the capital of western Europe's poorest people.) The pride is visible in the bearing and enthusiasm of the newspaper vendor, though he may be among the 40 percent illiterate in the Portuguese population.

Among the more affluent citizenry there are some indications that *saudade* may have soured into a sense approaching inferiority, and that the pride behind the facade of courtesy prickles with a dueller's sensitivity. Their baleful stares at tourists can be a reminder that much of Lisbon's history is a list of wars, uprisings, and assassinations.

A cross section of the population is visible during the late afternoon thronging of men in the Chiado neighbourhood, on the heights, and on the Rossio (city square), just below. Originally, the strolling began around three o'clock as a sort of peripatetic club for the professional men who could take time off to visit the intellectual coffeehouses. Today the coffeehouses have almost all gone, and the listless crowd scenes begin after office hours with a less distinguished cast.

The old, red brick bullring, with its Moorish arches and cupolas, still finds a public for its spectacle in which the bull is first tired either by a *cavaliero* who implants his darts from horseback or by a *toureiro* on foot who puts in the *farpas.* Next, a squad of eight acrobatic men stop the bull-eventually — with their bare hands. The bull is not slain. Near the bullring is the Arco en Cego housing development, most of whose occupants prefer to travel several miles north or west to find an outlet for their sporting enthusiasm at one of the three major football stadiums.

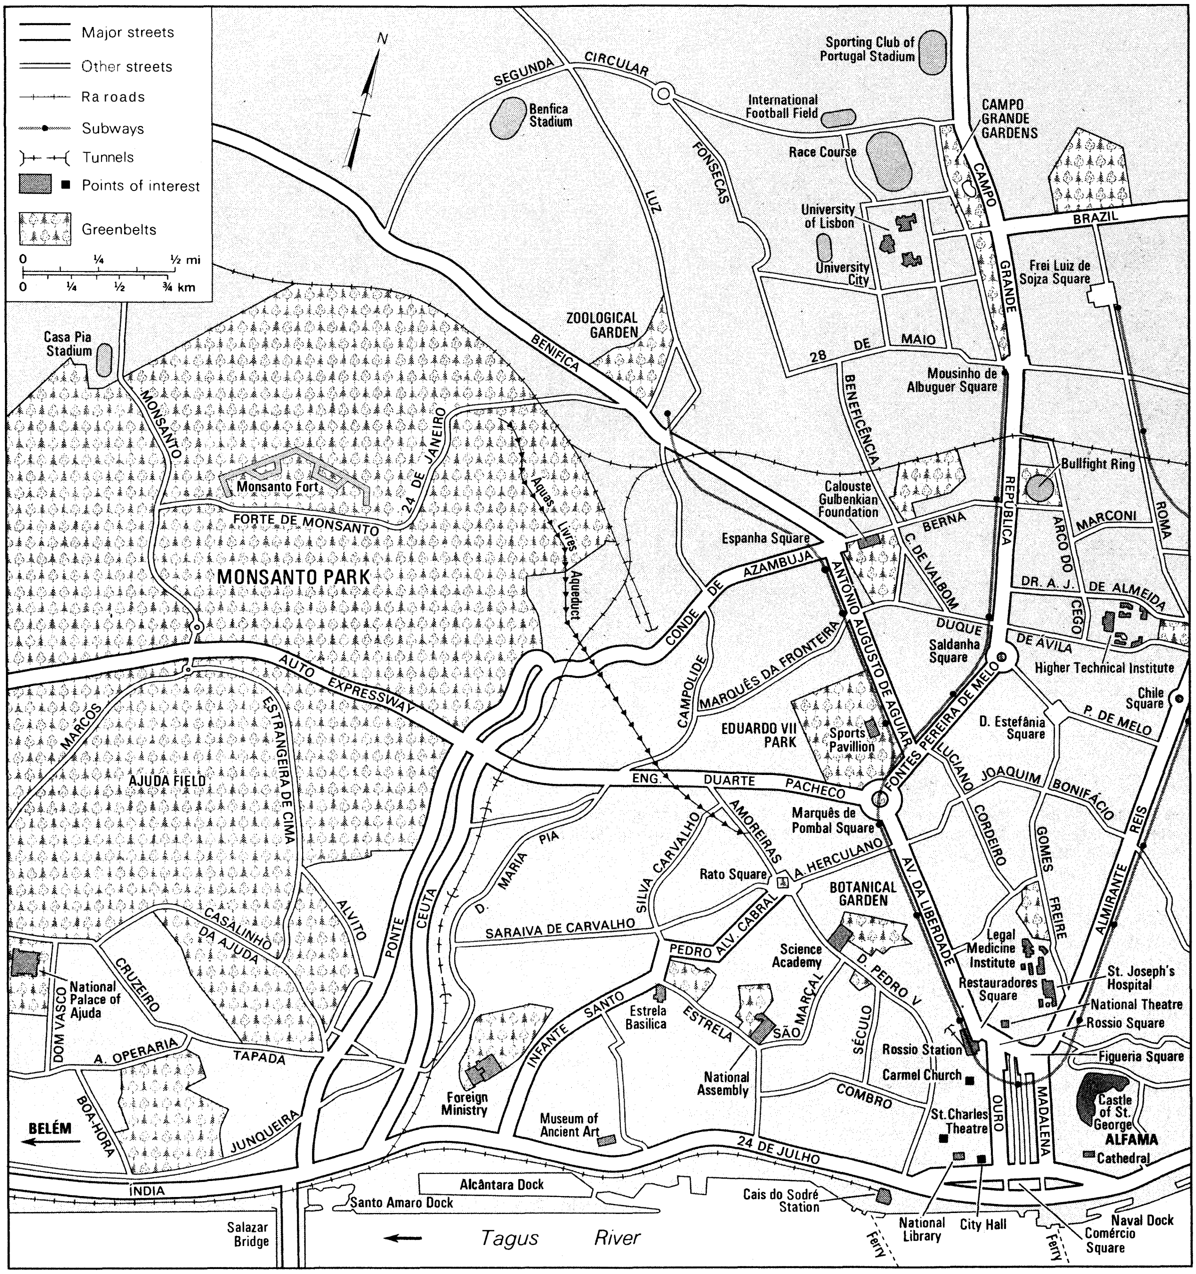
Finally, it may be observed that two aspects of life in Lisbon remain intact among the confusions of the city's sudden awakening from its long slumber: prejudice — religious and racial — and vandalism are virtually unknown.

THE HISTORY OF THE CITY

Prehistoric to Moorish times. The valley in which the heart of Lisbon now lies was, in prehistoric times, the bed of a forked branch of the Tagus. (The subway now forks at the same spot.) No evidence has yet been uncovered to show who were the first residents on the hills surrounding the valley, and there is no unassailable proof of the story favoured in Lisbon that the city was founded *c.* 1200 BC as a trading station by the far-ranging Phoenicians. In the city's ancient — and possibly Phoenician — name, Olisipo, lie the origins of the legend that the city's founder was Ulysses.

Origins of the city

During the Roman occupation (250 BC to c. AD 409), Julius Caesar raised the settlement to the dignity of a *municipium* and named it Felicitas Julia. A few inscribed stones testify that the Romans were there. They lost the city to the migratory peoples known as the Alani, who were driven out by the Suebi, who in turn were conquered



The city of Lisbon.

by the Visigoths. The base plan of the original fortifications is thought to be Visigothic and, if so, is the sole vestige of their reign.

The Muslims of North Africa took Lisbon when they overran the Iberian Peninsula in the 8th century; they stayed for **433** years, despite incursions by the Normans in **844** and by Alfonso VI of León in **1093.** Under the Moors the city was known under variations of "Lisbon": Luzbona, Lixbuna, Ulixbone, and Olissibona. Some authorities contend that the Muslims took this name from the conquered Roman castle, but Lisbon historians suggest that it derives from *água* ***boa*** ("good water").

The Portuguese conquest. Behind their walls, the Moors were able to hold out for months when the city was assailed by crusader forces—English, Flemish, Norman, and Portuguese under Afonso Henriques, the Portuguese king. The city finally fell in **1147** and successfully resisted Moorish attempts to win it back. The mosque was rebuilt as a church (presently the Sé [Cathedral], which has been restored in the styles of many periods, after fires and earthquakes), and the Moorish alcazar was transformed into a Portuguese royal palace.

Although **1,400** years of non-Portuguese occupation and invasion have left almost no trace among the stones of the capital, the presence of the outlander is still visible in the faces of the inhabitants, which range in cast from the Scandinavian to the Mauritanian.

After winning Lisbon, King Afonso established his court **105** miles to the north-northeast, atop a cliff at Coimbra. Lisbon did not become the national capital until more than a century later, in **1256.** Within its Moorish walls, of which some traces still remain, medieval Lisbon measured **1,443** feet at its widest and **1,984** feet at its longest, descending the hill below the castle. Even before the Portuguese conquest, some houses had already been built outside the walls down toward the river. The site of this first Lisbon is occupied by the lively Alfama quarter, which has kept the labyrinthine medieval street plan.

The medieval core

King Dinis I **(1279–1325)** decreed that Portuguese, the dialect of the Porto region, was to be the national language and founded **(1290)** the university. During his reign, other hilltops around the central valley were crowned with convents and churches.

In **1375** Lisbon was besieged and burned by the Castilians, after which King Ferdinand I swiftly erected new defenses. His wall—more than three miles long, with **77** towers and **38** gates and enclosing more than **247** acres—withstood the renewed Castilian attack of **1384.**

The Age of Discovery. When the Portuguese Age of Discovery (1420–1578) began, a city census showed 65,000 inhabitants occupying 23 parishes. A considerable number of them became rich, and the city was endowed with bigger and more luxurious buildings. African slaves became a familiar Lisbon sight, the trade in "black ivory" being another discovery in which Portugal led the rest of Renaissance Europe. After the great explorer Vasco da Gama led a Portuguese fleet to India in 1498, the Venetian monopoly on Oriental trade was broken; and colonies of German, Flemish, Dutch, English, and French traders set up in Lisbon. Greeks, Lombards, and Genoese who had lost their trading enclaves in Constantinople when that city fell to the Turks in 1453 also came to Lisbon.

King Manuel I (1495–1521) dominated this epoch. He was on the throne when the discovery of Brazil was announced, da Gama voyaged under his aegis, and in his name Albuquerque took Goa, in India. It was under Manuel that Portugal developed its sole contribution to European architecture, a style of decoration that one authority has described as "the high-water mark of late Gothic frenzy."

Manueline architecture

The elements of Manueline decoration celebrated the voyages of discovery, Manuel, and God. The cross topped the arms and the armillary spheres of the king, which crowned an assortment of hawsers, cordage, cork, seaweed, coral, shells, flowers, leaves, and fruit. Around balustrades, windows, arches, and columns these elements writhe and wreathe and knot themselves. The source of this overripe sculpture—unmistakable in the ivory and mother-of-pearl marquetry of the period's furniture—would seem to be Portuguese India, a unique reversal of the cultural current between western Europe and the colonies.

The prime examples of Manueline at Lisbon, the Tower of Belém and the Jerónimos Monastery, about four miles downstream from the city centre, are far less exuberant than those at the rival Portuguese cities of Batalha and Tomar. The tower and the monastery are nevertheless the most important architectural monuments in the capital. The five-story Tower of Belém on the riverbank was built in 1515 as a fort in the middle of the Tagus, which subsequently altered course. Girt by a cable carved in the stone, it has a stern Gothic interior but exhibits its North African touches on its turrets and crenellations and presents rounded Renaissance arches for the windows.

The monastery with its church and cloisters was begun in 1502 by an architect of French origin, Boytac (Boitaca), and was not finished until the end of the century. The work of four other architects succeeded one another, their styles passing from the Gothic through the Renaissance to the Baroque. Smoothed by time, the ensemble is harmonious and proudly Portuguese.

Manuel I promoted the urbanization of the central valley between Lisbon's hills, creating a city square, the Rossio, which at once became, and remains, Lisbon's "living room." Down by the Tagus he constructed a new palace, the Paços da Ribeira, with a large square laid out along its eastern flank—the Palace Terrace (Terreiro do Paço). Today the Praça do Comércio, constructed on the site after the 1775 earthquake, is often called by its 16th-century name. The area between the Rossio and the Palace Terrace was soon strewn with streets wandering among the new shops, churches, and hospitals of what had become a phenomenally prosperous city.

Decline in the 16th century

The prosperity was chimeric. Even as Magellan's ships returned from around the world in 1522, the realities had begun to rasp through the gilding of Portugal's Golden Age. John (João) the Pious, who had succeeded Manuel, invited the Jesuits and the Inquisition to come to Portugal to counter the ungodly materialism of Lisbon. He transferred (1537) the university to the royal palace at Coimbra, far from the capital's excesses, and invited professors from France, Italy, and Spain, thus creating one of the intellectual centres of Europe. Lisbon was visited with plagues and earthquakes during this time, but they proved easier to meet than the bill for 50 years of glory. Literally half the nation's population had vanished in pursuit of wealth in the new colonies. With farms deserted, food was imported from other European countries at crippling prices, and with so many skilled men absent, wages rose sharply, as did the cost of building and manufacturing materials. The colonial treasures, which had made Lisbon such a sybaritic queen of the seas, in the end cost more than they could fetch.

In 1578 King Sebastian of Portugal was killed while losing his entire army in an invasion of Morocco: two years later, the Spanish pushed into Portugal, and Philip II of Spain became king of both countries. In 1588 it was from Lisbon that the Invincible Armada sailed against England, Portugal's oldest ally. In the half century that followed, Lisbon lived relatively well as a port for the riches of the Spanish Main. In 1640 a conspiracy of Lisbon nobles struck for freedom and drove out the Spaniards. The square just north of the Rossio, Praça dos Restauradores, is named for them.

Disaster and reconstruction. In the first half of the 18th century the profits from the plantations and the gold and diamond deposits of Brazil brought a new flurry of optimism and excitement to Lisbon. This ended on the morning of November 1, 1755. The churches were crowded to honour the dead on All Saints' Day when the city was devastated by one of the greatest earthquakes ever recorded. There were two shocks, 40 minutes apart; and the waters of the Tagus, lifted from their bed, roared through the city. Then came fire. It is believed that 30,000 lives were lost, and more than 9,000 buildings were destroyed.

The great earthquake of 1755

Physically, Lisbon recovered with a celerity astonishing for the time, but the shock left its mark upon the thinking of generations to come. The reconstruction—a good deal of foreign aid was forthcoming—was achieved by Joseph I's prime minister, Sebastiaõ José de Carvalho, the virtual ruler of the nation. He put Manuel da Maia, engineer in chief of the realm, in charge of five architects and soon had a plan for remaking the totally devastated centre of the town, the Baixa. The riverside palace had been destroyed, and its terrace was expanded to create the new arcaded Praça do Comércio. Northward from there, a grid work of 48 streets led inland to the Rossio and a neighbouring new square, Figueria.

The two-story, uniform buildings were topped by two tiers of dormers projecting from a tiled roof. The corners of the eaves, in the Lisbon tradition, turned up curiously, in faint echo of a pagoda. The building style, evolved for fast, cheap construction, was Baroque, but virtually stripped of decoration. After the minister was rewarded with the title of marquês de Pombal, the style became known as the ***estilo*** pombalino.

The Sé and most of the churches were repaired or rebuilt, but the 14th-century Carmo (Carmel) Church was left as it was. Looming from its hilltops over the Baixa, the roofless Gothic shell now serves as an archaeological museum, while its cloister serves as a police barracks. The Palace of the Inquisition, utterly flattened, was not rebuilt when Pombal enlarged and realigned the Rossio, and on its site, 75 years later, the National Theatre of Dona Maria II was erected. Pombal banished the Jesuit order and transformed their establishment into St. Joseph's Hospital to replace the destroyed All Saints Hospital. The medical school scrambled for room at St. Joseph's until it acquired a new building of its own late in the 19th century. The Jesuit novice house was converted to serve as the Nobles' School. Later governments expelled more religious orders, whose buildings became barracks, hospitals, royal academies, and government offices. The modern National Assembly convenes in a transformed convent.

Nineteenth-century expansion. During the Peninsular War of the early 1800s, Lisbon alternated between French and British control, and after Napoleon's defeat, it was embroiled in civil war until 1834. That conflict was followed by ten years of revolutionary outbursts. Nineteenth-century Lisbon nevertheless continued to expand and, by 1885, embraced 20,378 acres while the population had doubled in 100 years to reach 300,000. Public buildings, such as the new city hall and the Ajuda Royal Palace, had been built, the harbour had been modernized and quays constructed on land reclaimed from the river. The railway had appeared, and with it the ornate neo-Manueline station in the Rossio. A system of horse cars served the lower town.

The opening of Avenida da Liberdade

The greatest change in the city, and the one most important for its future growth, was the opening of a new main street in 1880—the 460-foot-long and 27-foot-wide Avenida da Liberdade. (The 20-acre formal garden at the upper end was added early in the 20th century and named Eduardo VII in honour of a state visit by the British monarch.) The lower end, including the Praça dos Restauradores, had been the leafy gardens of the Passeio Publico (Public Promenade), and the paving operation was greeted by hostility on the part of the public. The municipality bordered the central six-lane carriageway with wide blue mosaic sidewalks graced with palms and shade trees, fountains, and ornamental waters stocked with goldfish and swans. So the street remains today, with the addition of outdoor cafés beneath the trees.

In conjunction with the new thoroughfare, a series of new streets, the "Avenidas Novas," expanded the city northward, and new neighbourhoods sprang up as well on the borders of the Avenida da Liberdade. In 1901 the electric streetcar made its appearance, enabling more people to live farther away from their employment in the Baixa. Three cable cars shuttled up and down the adjacent hills, and Alexandre-Gustave Eiffel designed the giant elevator that hisses grandly between the town's upper and lower levels.

New water supplies, augmenting those of the 1748 aqueduct of Águas Livres, of which the Lisbonese are still proud, were introduced from Alviela. Consequently, water was piped directly into houses, eliminating the ancient calling of *galego*, or water porter.

Salazar to the 1960s. In 1908 Portugal's king and crown prince were assassinated on a corner of the Terreiro do Paço. Two years later the new king, Manuel II, abdicated. A republic was declared, and a period of national instability ensued. When António Salazar took control of the near-bankrupt nation in 1932, he erected a corporate state of which he alone determined the policies until his retirement in 1968. As the president of the municipal council of Lisbon is appointed by the national executive, as is his colleague, the civil governor of the Lisbon District, the national oligarchy controls the administration of the capital. A group of career professionals with the title of director formulate projects and regulations for the municipal departments, and these are passed to the municipal council for discussion and to the council president for decision. With the economy controlled in minute detail, strikes illegal, and press, radio, and television censored, nothing happens in the capital that is not approved on a high level. Few changes have been approved, and these as much out of national pride as out of local need: the new University City, the huge new teaching hospital attached to modern buildings for the medical school, the large Higher Technical Institute, several express highways, a model housing development, and completion of the first leg of the subway system.

A new era of expansion

In the 1960s national policy began to change, allowing some economic expansion. The 30-year-old austerity program of stability and self-sufficiency (at an admittedly low level of investment and consumption) was somewhat softened. The flood of international tourists and international corporations began to be accommodated. In 1966, well ahead of schedule (and with $77,000,000 in aid from the United States), the Salazar Bridge was completed. New hotels and office buildings began changing the face of the city, and major improvements were made in the port.

THE CONTEMPORARY CITY

The rage to build has continued into the 1970s. The pastel-tinted and somewhat sleepy Lisbon that offered a neutral, 19th-century haven to 200,000 war refugees in the 1940s is disappearing in the din and dust of new construction. Lisbon is emerging as a bustling modern metropolis. Pombal's Baixa remains rigorously protected from change, but the four-story buildings of the Avenida da Liberdade and its ancillary streets have been almost totally replaced by ten-story buildings in an anonymous style sometimes categorized as airport modern. The new construction has also gained the hills, even the Alfama, whose established residents continue to hang laundry across the narrow streets and grill sardines on doorstep braziers.

The municipality has built whole new neighbourhoods in the north and northwest sectors of town, around the airport (the airport will be replaced in 1978 by a mammoth installation 50 miles south across the Tagus). Other building is pushing westward toward Belém as replacement for decayed neighbourhoods. These new structures, some of them 14 stories high, are designed by Lisbon architects who produced handsome, colourful, contemporary buildings. Usually about 40 percent of the new lodgings are reserved for the poorest families (a certain number pay nothing at all); 30 percent for people of moderate means; 20 percent for those with higher incomes; and 10 percent for the most prosperous. The newest project, in the Chelas District, implanted on heathland previously considered too difficult to build upon, housed 10 percent of the 1971 Lisbonese population. The mobile and moneyed in the late 1960s began to move out of town, and more and more villas were appearing in the countryside of the "Portuguese Riviera," which lies between Lisbon and the town of Estoril, 16 miles to the west.

Allocation of new housing by income groups

Parks, museums, and cultural life. The new housing developments are planted with trees and grass and given small parks to add to Lisbon's collection of more than 40 public gardens. The biggest, Monsanto, covers about eight square miles. Planted in the 1920s as a windbreak for the town, its rolling hills are now thickly forested, and recreational facilities (camping, swimming pool) are being enlarged. There are also two botanical gardens and a zoological garden within the city. The Castle of St. George is more garden than castle, richly planted within and without the ramparts and with superb views over the city.

Lisbon's newest cultural centre (October 1969), consisting of low-built modem structures set in a garden, was built by the Calouste Gulbenkian Foundation, about half a mile north of Eduardo VII Park. The centre presents music and ballet as well as exhibits of the other fine arts. It also houses the broad-ranging personal collection that Calouste Gulbenkian, an Armenian oil-lease negotiator, willed to the Portugese nation.

The city has more than a dozen other museums, including those of modern, antique, sacred, decorative, and folk art. In the latter, the visitor may ponder the differences between the innocent beauty of native artifacts and the ugliness of the corrupt versions in souvenir shops.

Theatres and theatrical churches

There are two principal theatres, the St. Charles (São Carlos) and the National Theatre of Dona Maria II. The St. Charles, constructed in the late 18th century, has a beautiful elliptical interior, and the National, built about 1840, displays a facade of six giant columns saved from the earthquake-destroyed convent church of St. Francisco. The interior, gutted by fire in 1966, has been restored.

Neither of these edifices is as theatrical as the interiors of some of the churches built or restored after the 1755 earthquake. In gold, marble, carved wood, rare tiles, these interiors are decorated in Baroque, Rococo, or rocaille. Lisbon is further distinguished in religion as one of the three places in the world whose chief Roman Catholic clergyman bears the title of patriarch.

Commerce and industry. Two of the forces acting to uproot 18th- and 19th-century Lisbon and transplant it into the 20th century were tourism and commerce. Lisbon's five largest banks increased the number of their branches from 50, in 1964, to 75, five years later. Their deposits rose from more than 12,000,000,000 escudos to more than 75,000,000,000 during the same period. To the long established local industries of soapmaking, munitions, and steel manufacture were added glassmaking, electronics, margarine manufacture and—with the raw gems coming from Portuguese Angola—diamond cutting. The petroleum refinery, largely state supported, was greatly expanded.

The greatest development has come just outside the city limits on the south bank of the Tagus, now readily accessible because of the new bridge; that district has become Portugal's most important manufacturing centre. The industrial belt is expected to continue growing from the river down to Setdbal, 25 miles south. One of the world's largest cement plants is found on the far bank, along with grain elevators, a steelmaking complex, a cork factory, and a plastics plant.

The port of Lisbon, with 19 miles of docks, now has special facilities for handling container-ship cargoes, and a new facility for car ferries. On the far bank two dry docks handle tankers of 326,000 tons and 100,000 tons, and a third is planned for 1,000,000-ton supertankers. The fishing port has a specialized dock attached to its refrigerating plants. In 1970 the port handled 400,000 passengers; more than five times that number arrived by air. The Salazar Bridge is the first in Lisbon's long history to span the Tagus. Built between the end of 1962 and mid-1966, it is 694 feet long, with a central span of 309 feet suspended 21 feet above mean water level. There is space under the roadway to carry two railroad tracks.

To the southeast of the bridge rises a gigantic figure of Christ. Visitors may climb to the top of it and avail themselves of a panoramic view of the city.

Lister, Joseph

Celebrated British surgeon and medical scientist, Joseph Lister was the pioneer of antisepsis—the use of chemicals to prevent surgical infections—which in the latter half of the 19th century reduced surgical mortality to one-third of its previous levels. While his method, based on the use of antiseptics, is no longer employed, his principle—that bacteria must never gain entry to an operation wound—remains the basis of surgery to this day.

Joseph Lister was born in Essex on April 5, 1827, the second son of Joseph Jackson Lister and his wife Isabella Harris, members of the Society of Friends, or Quakers. J.J. Lister, a wine merchant and amateur physicist and microscopist, was elected a fellow of the Royal Society for his discovery that led to the modern achromatic (non-colour-distorting) microscope.

While both parents took an active part in Lister's education, his father instructing him in natural history and the use of the microscope, Lister received his formal schooling in two Quaker institutions, which laid far more emphasis upon natural history and science than did other schools. He became interested in comparative anatomy, and, before his 16th birthday, he had decided upon a surgical career.

After taking an arts course at University College, London, he enrolled in the faculty of medical science in October 1848. A brilliant student, he was graduated a bachelor of medicine with honours in 1852; in the same year he became a fellow of the Royal College of Surgeons and house surgeon at University College Hospital. A visit to Edinburgh in the fall of 1853 led to Lister's appointment as assistant to James Syme, the greatest surgical teacher of his day, and in October 1856 he was appointed surgeon to the Edinburgh Royal Infirmary. In April he had married Syme's eldest daughter. Lister, a deeply religious man, joined the Scottish Episcopal Church. The marriage, although childless, was a happy one, his wife entering fully into Lister's professional life.

Lister, 1857.

When three years later the Regius Professorship of Surgery at Glasgow University fell vacant, Lister was elected from seven applicants. In August 1861 he was appointed surgeon to the Glasgow Royal Infirmary, where he was in charge of wards in the new surgical block. The managers hoped that hospital disease (now known as operative sepsis—infection of the blood by disease-producing micro-organisms) would be greatly decreased in their new building. The hope proved vain, however. Lister reported that, in his Male Accident Ward, between 45 percent and 50 percent of his amputation cases died from sepsis between 1861 and 1865.

Beginning of antisepsis

In this ward Lister began his experiments with antisepsis. Much of his earlier published work had dealt with the mechanism of coagulation of the blood and role of the blood vessels in the first stages of inflammation. Both researches depended upon the microscope and were directly connected with the healing of wounds. Lister had already tried out methods to encourage clean healing and had formed theories to account for the prevalence of sepsis. Discarding the popular concept of miasma—direct infection by bad air—he postulated that sepsis might be caused by a pollen-like dust. There is no evidence that he believed this dust to be living matter, but he had come close to the truth. It is therefore all the more surprising that he became acquainted with the work of the bacteriologist Louis Pasteur only in 1865.

Pasteur had arrived at his theory that micro-organisms cause fermentation and disease by experiments on fermentation and putrefaction. Lister's education and his familiarity with the microscope, the process of fermentation, and the natural phenomena of inflammation and coagulation of the blood impelled him to accept Pasteur's theory as the full revelation of a half-suspected truth. At the start he believed the germs were carried solely by the air. This incorrect opinion proved useful, for it obliged him to adopt the only feasible method of surgically clean treatment. In his attempt to interpose an antiseptic barrier between the wound and the air, he protected the site of operation from infection by the surgeon's hands and instruments. He found an effective antiseptic in carbolic acid, which had already been used as a means of cleansing foul-smelling sewers and had been empirically advised as a wound dressing in 1863. Lister first successfully used his new method on August 12, 1865; in March 1867 he published a series of cases. The results were dramatic. Between 1865 and 1869, surgical mortality fell from 45 percent to 15 percent in his Male Accident Ward.

In 1869, Lister succeeded Syme in the chair of Clinical Surgery at Edinburgh. There followed the seven happiest years of his life when, largely as the result of German experiments with antisepsis during the Franco-German War, his clinics were crowded by foreign visitors and eager students. In 1875 Lister made a triumphal tour of the leading surgical centres in Germany. Next year he visited America but was received with little enthusiasm except in Boston and New York.

Opposition and vindication

Lister's work had been largely misunderstood in England and the United States. Opposition was directed against his germ theory rather than against his "carbolic treatment." The majority of practicing surgeons were unconvinced; while not antagonistic, they awaited clear proof that antisepsis constituted a major advance. Lister was not a spectacular operative surgeon and refused to publish statistics. Edinburgh, despite the ancient fame of its medical school, was regarded as a provincial centre. Lister understood that he must convince London before the usefulness of his work would be generally accepted.

His chance came in 1877, when he was offered the chair of Clinical Surgery at King's College. On October 26, 1877, Lister, at King's College Hospital, for the first time performed the then-revolutionary operation of wiring a fractured patella, or kneecap. It entailed the deliberate conversion of a simple fracture, carrying no risk to life, into a compound fracture, which often resulted in generalized infection and death. Lister's proposal was widely publicized and aroused much opposition. Thus, the entire success of his operation carried out under antiseptic conditions forced surgical opinion throughout the world to accept that his method had added greatly to the safety of operative surgery.

More fortunate than many pioneers, Joseph Lister saw the almost universal acceptance of his principle during his working life. He retired from surgical practice in 1893, after the death of his wife in the previous year. Many honours came to him. Created a baronet in 1883, he was made Baron Lister of Lyme Regis in 1897 and appointed one of the 12 original members of the Order of Merit in 1902. Throughout his life, he remained a gentle, shy, unassuming man, firm in his purpose because he humbly believed himself to be directed by God. He was uninterested in social success or financial reward. In person he was handsome, with a fine athletic figure, fresh complexion, hazel eyes, and silver hair. After some years of almost complete blindness and deafness, he died at Walmer, Kent, on February 10, 1912.

BIBLIOGRAPHY. Lister wrote no books but contributed many papers to professional journals. These are contained in *The Collected Papers of Joseph, Baron Lister, 2* vol. (1909). The authoritative biography is SIR RICKMAN J. GODLEE, *Lord Lister* (1917). Simpler biographies are FREDERICK F. CARTWRIGHT, *Joseph Lister* (1963); and RHODA TRUAX, *Joseph Lister* (1944). For personal reminiscences, see J.R. LEESON, *Lister As I Knew Him* (1927).

(F.F.C.)

Liszt, Franz

Hungarian composer and the greatest piano virtuoso of his time, Franz Liszt revolutionized the technique of piano playing and invented the "piano recital" as it is known today. He discovered new methods of writing for the piano that laid the foundations for the modern technique of piano composition; he also invented the symphonic poem for orchestra and the method of "transformation of themes," by which one or two themes in different forms can provide the basis for an entire work—a principle from which Richard Wagner derived his system of so-called leitmotifs in his operas. Liszt also considerably expanded the harmonic language of his time, and some of his later works anticipate 20th-century harmonic methods. He was in contact with all the leading artistic and social personalities of his time and did a great deal to encourage the performance of music of previously neglected masters such as Johann Sebastian Bach, Ludwig van Beethoven, and Franz Schubert and music of his contemporaries Hector Berlioz, Robert Schumann, and Wagner. He also helped younger composers, including the Norwegian Edvard Grieg, the Russians Mily Balakirev and Aleksandr Borodin, and the Frenchman Claude Debussy; and he taught a number of pupils who themselves became famous virtuosi.

Liszt, lithograph by Joseph Kriehuber, 1846.

Youth and early training. Liszt was born at Raiding, Hungary, on October 22, 1811. His father, Ádám Liszt, was an official in the service of Prince Nicolas Eszterházy, whose palace in Eisenstadt was frequented by many celebrated musicians, including Joseph Haydn, Luigi Cherubini, and Johann Hummel. Ádám Liszt was a talented amateur musician who played the cello in the court concerts. By the time Franz was five years old he was already attracted to the piano and was soon given lessons by his father. He began to show interest in church and Gypsy music. He also developed into a very religious child, again because of the influence of his father, who, during his youth, had spent two years in the Franciscan order.

First public appearance as a pianist

Franz began to compose at the age of eight. When only nine he made his first public appearance as a concert pianist at Sopron and Pozsony (now Bratislava, Czechoslovakia). His playing so impressed the local Hungarian magnates that they put up a sum of money to pay for his musical education for the next six years. Ádám obtained leave of absence from his post and took Franz to Vienna, where he had piano lessons with Karl Czerny, a composer and pianist who had been a pupil of Beethoven, and studied composition with Antonio Salieri, the musical director at the Viennese court. He gave several concerts in Vienna, with great success. Beethoven was persuaded to attend one of them, and at the end he mounted the platform and kissed the boy on the forehead. Liszt was also invited to contribute a variation on a waltz by the publisher Anton Diabelli to a symposium in which 50 Austrian composers, including Schubert, Czerny, Hummel, and Ignaz Moscheles took part. Beethoven refused to subscribe to the symposium but instead wrote his own famous set of 33 variations on the theme.

Liszt moved with his family to Paris in 1823, giving concerts in Germany on the way. He was refused admission to the Paris Conservatoire because he was a foreigner; instead, he studied with Anton Reicha, a theorist who had been a pupil of Haydn's brother Michael, and Ferdinando Paer, the director of the Théâtre-Italien in Paris and a composer of light operas. Liszt's Paris debut on March 7, 1824, was sensational. Other concerts quickly followed, as well as a visit to London in June. He toured England again the following year, playing for George IV at Windsor Castle and also visiting Manchester, where his *New Grand Overture* was performed for the first time. This piece was used as the overture to his one-act opera *Don Sanche*, which was performed at the Paris Opéra on October 17, 1825. Liszt also composed a number of piano works at this time, including the *Etude en 48 exercices,* which was later transformed into the *Etudes d'exécution transcendante.*

In 1826 he toured France and Switzerland, returning to England again in the following year. Suffering from nervous exhaustion, Liszt expressed a desire to become a priest. His father took him to Boulogne to take sea-baths to improve his health; there Ádám died of typhoid fever. Liszt returned to Paris, and sent for his mother to join him; she had gone back to the Austrian province of Styria during his tours.

Despondency and period of doubt

Liszt now earned his living mainly as a piano teacher, and in 1828 he fell in love with one of his pupils, the daughter of the Comte de Saint-Cricq, who was the minister of commerce to Charles X of France. When the count insisted that their attachment be broken off, Liszt again became extremely ill; he was considered so close to death that his obituary appeared in a Paris newspaper. After his illness he underwent a long period of depression and doubt about his career. For over a year he did not touch the piano and was dissuaded from joining the church only through the efforts of his mother. He experienced much religious pessimism. He also conversed with the violinist Chrdtien Urhan, who introduced him to the Saint-Simonians, a socio-religious movement espousing a kind of universal brotherhood of men.

During this period Liszt took an active dislike to the career of a virtuoso. He made up for his previous lack of education by reading widely, and he came into contact with many of the leading artists of the day, including the writer and statesman Alphonse de Lamartine, Victor Hugo, and Heinrich Heine, the German poet and essayist. With the July Revolution of 1830 resulting in the abdication of Charles X and the coronation of Louis-Philippe, he sketched out a *Revolutionary Symphony.*

Between 1830 and 1832 he met the three men who were to have considerable influence on his artistic life. At the end of 1830 he first met Berlioz and heard the first performance of his *Symphorzie fantastique.* From Berlioz he inherited the command of the romantic orchestra and also the diabolic quality that remained with him for the rest of his life. He achieved the seemingly impossible feat of transcribing Berlioz' *Symphonie fantastique* for the piano in 1833, and he helped Berlioz considerably by transcribing other works of his and playing them in concert. In March 1831 he heard Paganini play for the first time. He again became interested in virtuoso technique and resolved to transfer some of Paganini's fantastic violin effects to the piano, writing a fantasia on his *Campanella.* At this time he also met Frédéric Chopin, whose poetical style of music exerted a profound influence on Liszt.

Years with Marie d'Agoult. In 1834 Liszt emerged as a mature composer with the single piece *Harmonies poétiques et religieuses*, based on a collection of poems by Lamartine, and the set of three *Apparitions.* The lyrical style of these works is in marked contrast to his youthful compositions, which reflected the style of his teacher Czerny. In the same year, through the poet and dramatist Alfred de Musset, he met the novelist George Sand and also Marie de Flavigny, comtesse d'Agoult, with whom he began an affair. In 1835 she 'left her husband and family to join Liszt in Switzerland; their first daughter, Blandine, was born in Geneva on December 18. Liszt and Madame d'Agoult lived together for four years, mainly in Switzerland and Italy, though Liszt made occasional visits to Paris. He also taught at the newly founded Geneva Conservatory and published a series of essays "On the Position of Artists," in which he endeavored to raise the status of the artist—who up to then had been regarded as a kind of superior servant—to that of a respected member of the community.

Composition of *Années de pèlerinage*

Liszt commemorated his years with Madame d'Agoult in the first two books of the *Années de pèlerinage (Years of Pilgrimage),* which are poetical evocations of Swiss and Italian scenes. He also wrote the first mature version of the *Transcendental Studies,* based on his youthful *Étude en 48 exercices,* but here transformed into pieces of terrifying virtuosity. He transcribed for the piano six of Paganini's pieces—five studies and *La campanella*—and also three Beethoven symphonies, some Schubert songs, and further works of Berlioz. He made these transcriptions to make the work of these men more available and thus spread the appreciation of their music, which was still greatly neglected at that time. Liszt also wrote a number of fantasias on popular operas of the day and dazzled audiences with them at his concerts.

His second daughter, Cosima, was born in 1837 and his son Daniel in 1839, but toward the end of that year his relations with Madame d'Agoult became strained and she returned to Paris with the children. Liszt then returned to his career as a virtuoso to raise money for the Beethoven Memorial Committee in Bonn for the completion of its Beethoven monument.

For the next eight years Liszt travelled all over Europe, giving concerts in countries as far apart as Ireland, Portugal, Turkey, and Russia. He continued to spend his summer holidays with Madame d'Agoult and the children on the island of Nonnenwerth in the Rhine River until 1844; then they finally parted and Liszt took the children to Paris. Liszt's brilliance and success were at their peak during these years as a virtuoso. Everywhere he was received with great adulation; gifts and decorations were showered on him; he had numerous mistresses, including the dancer Lola Montez and Marie Duplessis, the prototype of *La Dame aux camélias (The Lady of the Camellias),* a novel by Alexandre Dumas *(fils).* Nevertheless, he still continued to compose, writing songs as well as piano works.

His visit to Hungary in 1839–40, the first since his boyhood, was an important event. His renewed interest in the music of the Gypsies laid the foundations for his *Hungarian Rhapsodies* and other works composed in the Hungarian style. He also wrote a cantata for the Beethoven Festival of 1845, his first work for choius and orchestra, and some smaller choral works.

Affair with Carolyne Sayn-Wittgenstein

Compositionsat Weimar. In February 1847 Liszt met the princess Carolyne Sayn-Wittgenstein at Kiev and later spent some time at her estate in Poland. She quickly persuaded him to give up his career as a virtuoso and to concentrate on composition. He gave his final concert at Yelizavetgrad (modern Kirovograd) in September of that year. Having been director of music extraordinary to the Weimar court in Germany since 1843, and having conducted concerts there since 1844, Liszt decided to settle there permanently in 1848. He was later joined by the Princess, who had unsuccessfully tried to obtain a divorce from her husband. They resided together in the Altenburg, and Liszt now had ample time to compose, as well as to conduct the court orchestra in operas and concerts. This was the period of his greatest production: the first 12 symphonic poems, the Faust and Dante symphonies, the piano sonata, the two piano concerti, the *Totentanz* for piano and orchestra, revised versions of the *Transcendental* and *Paganini Studies* and of the first two books of the *Annkes de pèlerinage*, choral works, and numerous others. Some of these works had been sketched out in the 1840s or earlier, but even so, his productivity in this period remains astonishing. He also conducted a number of operas by modern composers, including Wagner's *Tannhäuser* in 1849 and the world premiere of *Lohengrin* in 1850; Schumann's *Genoveva* and his incidental music to *Manfred;* and Berlioz' *Benvenuto Cellini*, as well as operas by Giuseppe Verdi and Gaetano Donizetti and a number of works by lesser composers. In addition, he performed his own works with the Weimar orchestra and made numerous revisions as a result. For a time the composers August Conradi and Joachim Raff helped him with the preparation of his orchestral scores, but the final versions of all of them were by Liszt himself.

Hostility toward Liszt

The avant-garde composers of the day regarded Weimar as the one city where modern composers could be heard, and many of them came to Liszt as pupils. The so-called New German school hoisted the banner of modernism, which naturally annoyed the more academic musicians. Some members of the Weimar court also were upset by Liszt's continued support of Wagner, who had had to flee in 1849 with Liszt's help from Germany to Switzerland because of his political activism. The straitlaced citizens of Weimar also objected strongly to the Princess openly living with Liszt, and the Grand Duchess of Weimar was under pressure from her brother, Nicholas I of Russia, to ban Princess Sayn-Wittgenstein from all court functions. Furthermore, the Grand Duke who originally appointed Liszt died in 1853, and his successor took little interest in music. As a result, the director of the theatre was able to intrigue against Liszt and decrease the number of music productions in favour of inferior plays. Things came to a climax in 1858 at the first performance of *The Barber of Bagdad* by Liszt's pupil Peter Cornelius. Liszt conducted the work himself, and when the audience mounted a demonstration against the music, Liszt took it to be directed against him personally and handed in his resignation to the Grand Duke.

Though Liszt remained in Weimar until 1861, his position there became more and more difficult. His son Daniel had died in 1859 at the age of 20. Liszt was deeply distressed and wrote the oration for orchestra *Les Morts* in his son's memory. In May 1860 the Princess had left Weimar for Rome in the hope of having her divorce sanctioned by the Pope, and in September, in a troubled state of mind, Liszt had made his will. He left Weimar in August of the following year, and after travelling to Berlin and Paris, where he saw Marie d'Agoult, he arrived in Rome. He and the Princess hoped to be married on his 50th birthday. At the last moment, however, the Pope revoked his sanction of the Princess's divorce; they both remained in Rome in separate establishments.

Attempts to create a new kind of religious music

Eight years in Rome. For the next eight years Liszt lived mainly in Rome and occupied himself more and more with religious music. He completed the oratorios *Die Legende von der heiligen Elisabeth* and *Christus* and a number of smaller works. He hoped to create a new kind of religious music that would be more direct and moving than the rather sentimental style popular at the time. Liszt was one of the few 19th-century musicians to be interested in Gregorian plainsong, but his efforts were frowned on by the ecclesiastical authorities, and much of his sacred music remained unpublished until many years after his death.

In 1862 his daughter Blandine died at the age of 26. Liszt wrote his variations on a theme from the Bach cantata *Weinen, Klagen (Weeping, Mourning)* ending with the chorale *Was Gott tut das ist wohlgetan (What God Does Is Well Done)*, which must have been inspired by this event. The Princess's husband died in 1864, but there was no more talk of marriage; and in 1865 Liszt took the four minor orders of the Roman Catholic Church, though he never became a priest. In 1867 he wrote the *Hungarian Coronatiort Mass* for the coronation of the emperor Francis Joseph I of Austria as king of Hungary. This commission renewed his links with his native country. Meanwhile, his younger daughter Cosima, who, at the age of 19, had married Liszt's favourite pupil, Hans von Bülow, was having an affair with Wagner. She had an illegitimate child by Wagner, which led to a quarrel between the two composers that lasted until 1872.

Last years. In 1869 Liszt was invited to return to Weimar by the Grand Duke to give master classes in piano playing, and two years later he was asked to do the same in Budapest. From then until the end of his life he divided his time between Rome, Weimar, and Budapest. Numerous pupils and composers visited him, including Anton Rubinstein, Isaac Albéniz, Aleksandr Borodin, Camille Saint-Saens, and Gabriel-Urbain Fauré. After reconciliation with Wagner in 1872, he regularly attended the Bayreuth festivals. He appeared occasionally as a pianist in charity concerts and continued to compose. His later works anticipate the harmonic style of Claude Debussy. One late work called *Bagatelle Without Tonality* anticipates Béla Bartók and even Arnold Schoenberg. In the winter of 1882–83 he stayed with Wagner and Cosima in Venice. There a sudden premonition caused him to interrupt his work on the oratorio *Die Legende vom heiligen Stanislaus* and write two pieces called *La lugubre gondola (The Gondola of Mourning)*, inspired by the funeral processions he saw on the canals. Only two months later Wagner died in Venice, and his body was carried in a similar procession.

In 1886 Liszt left Rome for the last time. He attended concerts of his works in Budapest, Liège, and Paris and then went to London—his first visit there in 45 years. Several concerts of his works were given, including a performance of St. *Elisabeth*. He then went on to Antwerp, Paris, and Weimar. He played for the last time at a concert in Luxembourg on July 19. Two days later he arrived in Bayreuth for the festival. His health had not been good for some months, and he went to bed with a high fever, though he still managed to attend two Wagner performances. His illness developed into pneumonia, and his condition was not helped by the callous behaviour of Cosima, who left him alone in order to supervise the running of the festival. He died on July 31.

Assessment. Apart from his more than 700 compositions, Liszt wrote books on Chopin, Hungarian Gypsy music, Wagner's *Lohengrin* and *Tannhäuser*, John Field's nocturnes, the lieder of Robert Franz, and the Goethe Foundation in Weimar. His published essays and correspondence fill many volumes. A controversial figure in his time, he was attacked for his innovations, and his rivals were jealous of his brilliance and panache. For a long time he was regarded merely as a superficial composer of brilliant trifles, but in recent years his true stature has been seen more clearly as that of a composer who revolutionized the music of his time and anticipated many later developments. As Princess Carolyne said, "Liszt has flung his spear far into the future."

MAJOR WORKS

Orchestral works

TONE POEMS: Thirteen, also *A Faust Symphony* in three charactcr-pictures (after Goethe, 1854, rev. 1857–61); *A Symphony to Dante's Divina Commedia* (1855–56); *Trois Odes Funèbres* (1860–66).

PIANO AND ORCHESTRA: *Concerto No.* I *in E Flat Major* (1849, rev. 1853 and 1856); *Concerto No.* 2 *in A Major* (1839, rev. 1849, 1853, 1857, and 1861); *Fantasia on Hungarian Folk Tunes* (*c.* 1852); *Totentanz* (1849, rev. 1853 and 1859).

Solo piano

Apparitions (1834); *Album d'un voyageur* (1835–36); *Années ile pèlerinage* (1835–77); *Etudes d'exdcution transcendante d'après Paganini* (1838); *Harmonies poétiques et religieuses* (1845–52); *Concert Studies* (*c.* 1848 and *c.* 1862–63); *Études d'exe'cution transcendante* (1851); *Grandes Études de Paganini* (1851); *Sonata in B Minor* (1852–53); *Ldgendes* (*c.* 1863); *Historische ungarische Biidnisse* (1885).

Vocal music

SACRED CHORAL WORKS: *Missa solennis zur Einweihung der Basilika irt Gran* (called the *Gran Mass;* 1855, rev. 1857–58); *Christus*, oratorio (1855–66); *Die Legende von der heiligen Elisabeth,* oratorio (1857–62); *Requiem*, two tenors, two bass soloists, male chorus, organ, and brass (1867–68); *Die heilige Cäcilia*, mezzo-soprano, chorus, orchestra, or piano (*c.* 1874); 70 songs.

BIBLIOGRAPHY. The most detailed catalog of works in English is in *Grove's Dictionary of Music and Musicians,* 5th ed., vol. 5 (1954), updated in HUMPHREY **SEARLE**, *The Music of Liszt,* 2nd rev. ed. (1966); another catalog with different numbering is in the symposium, edited by ALAN WALKER, *Franz Liszt: The Man and His Music* (1970). A detailed catalog in German is in PETER **RAABE**, *Franz Liszt,* vol. 2 (1968). The most complete bibliography is LUDWIG KOCH, *Franz Liszt: Ein bibliographischer Versuch* (1936). The principal collections of Liszt manuscripts are in the Liszt Museum, housed in the Goethe-und-Schiller Archiv, Weimar, East Germany; the Hungarian National Museum, Budapest; the Library of Congress, Washington, D.C.; the Bibliothèque du Conservatoire National, Paris; and the British Museum. The chief editions of Liszt's letters in English are *Franz Liszts Briefe* (1893; Eng. trans. of vol. 1–2, *Letters* of *Franz*

Liszt, 1894 and 1968) and *Briefwechsel zwischen Franz Liszt und Hans von Bülow* (1898; Eng. trans., *Letters of Liszt and von Bülow,* 1898), both trans. by CONSTANCE BACHE; *Briefwechsel zwischen Wagner und Liszt,* 2 vol. (1887; Eng. trans. by FRANCIS HUEFPER, *Correspondence of Wagner and Liszt,* 2 vol., 1897, new ed. 1969); *Alexandre Borodine, d'après la biographie et la correspondance* (1893; Eng. trans. of pt. 2 by ROSA NEWMARCH, *Liszt, As Sketched in the Letters of Borodin,* 1895); and *The Letters of Franz Liszt to Marie zu Sayn-Wittgenstein,* trans. and ed. by HOWARD E. HUGO (1953). The best biography in English is SACHEVERELL SITWELL, *Liszt,* rev. ed. (1955, reprinted 1966). The official biography is by LINA RAMANN, *Franz Liszt: Als Künstler und Mensch, 2* vol. (1890–94), only the first volume of which has been translated into English: *Franz Liszt: Artist and Man,* 2 vol. (1882). Other useful biographical sources in English are AMY FAY, *Music Study in Germany* (1890, reprinted 1965); the *Life and Letters of Sir Charles Halle* (1896); the *Memoirs of Count Apponyi* (1935); and ALAN WALKER, *Liszt* (1971). The principal biographies in other languages are EMILE HARASZTI, *Franz Liszt* (1967), in French; and PETER RAABE, *Franz Liszt,* vol. *1* (1968), in German. The chief critical studies in English of Liszt's music are BENCE SZABOLCSI, *Liszt Ferenc estéje* (1956; Eng. trans., *The Tivilight of Ferenc Liszt,* 1959), concentrating on Liszt's later works; ALAN WALKER (*op. cit.*); and HUMPHREY SEARLE, *The Music of Liszt,* 2nd rev. ed. (1966). Other major studies are PETER RAABE, *Frani Liszt,* vol. *2* (1968), in German; FRIEDRICH SCHNAPP, "Verschollene Kompositionen Franz Liszts," in *Von Deutscher Tonkunst* (1942), dealing with doubtful or unknown works; and the Liszt-Bartók volume of *Studia Musicologica* (1963), essays, in various languages, on Liszt's life and works.

(H.Se.)

Literary Criticism

Criticism
and
scholarship

Construed loosely, literary criticism is the reasoned consideration of literary works and issues. It applies, as a term, to any argumentation about literature, whether or not specific works are analyzed. Plato's cautions against the risky consequences of poetic inspiration in general in his *Republic* are thus often taken as the earliest important example of literary criticism. More strictly construed, the term covers only what has been called "practical criticism," the interpretation of meaning and the judgment of quality. Criticism in this narrow sense can be distinguished not only from aesthetics (the philosophy of artistic value) but also from other matters that may concern the student of literature: biographical questions, bibliography, historical knowledge, sources and influences, and problems of method. Thus, especially in academic studies, "criticism" is often considered to be separate from "scholarship." In practice, however, this distinction often proves artificial, and even the most single-minded concentration on a text may be informed by outside knowledge, while many notable works of criticism combine discussion of texts with broad arguments about the nature of literature and the principles of assessing it. Criticism will here be taken to cover all phases of literary understanding, though the emphasis will be on the evaluation of literary works and of their authors' places in literary history. The development of literary criticism will be treated briefly, focussing on what is distinctive to literary criticism. A longer and more theoretical discussion of the role of criticism will be found in the article ARTS, CRITICISM OF THE, and a discussion of criticism as a form in which works of literature are sometimes cast, in the article LITERATURE, NONFICTIONAL PROSE. One particular aspect of literary criticism is covered in the article TEXTUAL CRITICISM. The following article deals with criticism largely in the context of Western literature. Its role in other literatures, along with the history of the literatures themselves, is treated in LITERATURE, EAST ASIAN, and in articles on the arts of various peoples, such as SOUTH ASIAN PEOPLES, ARTS OF; and AFRICAN PEOPLES, ARTS OF. Criticism and theory associated with particular genres of literature, such as tragedy and comedy, will be found in separate articles on such subjects.

FUNCTIONS OF LITERARY CRITICISM

The functions of literary criticism vary widely, ranging from the reviewing of books as they are published to systematic theoretical discussion. Though reviews may sometimes determine whether a given book will be widely sold, many works succeed commercially despite negative reviews, and many classic works, including Herman Melville's *Moby Dick* (1851), have acquired appreciative publics long after being unfavourably reviewed and at first neglected. One of criticism's principal functions is to express the shifts in sensibility that make such revaluations possible. The minimal condition for such a new appraisal is, of course, that the original text survive. The literary critic is sometimes cast in the role of scholarly detective, unearthing, authenticating, and editing unknown manuscripts. Thus, even rarefied scholarly skills may be put to criticism's most elementary use, the bringing of literary works to a public's attention.

The variety of criticism's functions is reflected in the range of publications in which it appears. Criticism in the daily press rarely displays sustained acts of analysis and may sometimes do little more than summarize a publisher's claims for a book's interest. Weekly and biweekly magazines serve to introduce new books but are often more discriminating in their judgments, and some of these magazines, such as *The* (London) *Times Literary Supplement* and *The New York Review of Books,* are far from indulgent toward popular works. Sustained criticism can also be found in monthlies and quarterlies with a broad circulation, in "little magazines" for specialized audiences, and in scholarly journals and books.

Criticism
as a
target of
criticism

Because critics often try to be lawgivers, implicitly or explicitly declaring which works deserve respect and presuming to say what they are "really" about, criticism is a perennial target of resentment. Misguided or malicious critics can discourage an author who has been feeling his way toward a new mode that offends received taste. Pedantic critics can actually obstruct a serious engagement with literature by deflecting attention toward inessential matters. As the contemporary French philosopher-critic Jean-Paul Sartre observed, the critic may announce that French thought is a perpetual colloquy between Pascal and Montaigne not in order to make those thinkers more alive but to make thinkers of his own time more dead. Criticism can antagonize authors even when it performs its function well. Authors who customarily regard literature as needing no advocates or investigators are less than grateful when told that their works possess unintended meaning or are imitative or incomplete.

What such authors may tend to forget is that their works, once published, belong to them only in a legal sense; their true owner is the public, which will appropriate them for its own concerns whether or not the critic urges them to. The critic's responsibility is not to the author's self-esteem but to the public and to his own standards of judgment, which are usually more exacting than the public's. The justification for his role rests on the premise that literary works are not in fact self-explanatory. A critic is socially useful to the extent that his society wants, and receives from him, a fuller understanding of literature than it could have achieved without him. In filling this appetite the critic whets it further, helping to create a public that cares about artistic quality. Without sensing the presence of such a public an author may either prostitute his talent or squander it in sterile acts of defiance. In this sense the critic is not a parasite but, potentially, someone who is responsible in part for the existence of good writing in his own time and afterward.

Although some critics believe that literature should be discussed in isolation from other matters, criticism usually seems to be openly or covertly involved with social and political debate. Since literature itself is often partisan, is always rooted to some degree in local circumstances, and has a way of calling forth affirmations of ultimate values, it is not surprising that the finest critics have never paid much attention to the alleged boundaries between criticism and other types of discourse. Especially in modern Europe, literary criticism has occupied a central place in debate about cultural and political issues. Sartre's own *What Is Literature?* (1947) is typical in its wide-ranging attempt to prescribe the literary intellectual's idea! relation to the development of his society and to literature as a manifestation of human freedom. Similarly, some prominent American critics, including Alfred Kazin, Lionel Trilling, Kenneth Burke, Philip Rahv, and Irving Howe, began as political radicals in the 1930s and sharpened their concern for literature on the dilemmas and disillusionments of that era. Trilling's influential *The* Liberal Imagination (1950) is simultaneously a collection of literary essays and an attempt to reconcile the claims of politics and art.

Such a reconciliation is bound to be tentative and problematic if the critic believes, as Trilling does, that literature possesses an independent value and a deeper faithfulness to reality than is contained in any political formula. In Marxist states, however, literature has usually been considered a means to social ends, and criticism has been cast in forthrightly partisan terms. Dialectical materialism does not necessarily turn the critic into a mere guardian of party doctrine, but it does forbid him to treat literature as a cause in itself, apart from the working class's needs as interpreted by the party. Where this utilitarian view prevails, the function of criticism is taken to be continuous with that of the state itself, namely, furtherance of the social revolution. The critic's main obligation is not to his texts but to the masses of people whose consciousness must be advanced in the designated direction. In periods of severe orthodoxy the practice of literary criticism has not always been distinguishable from that of censorship.

HISTORICAL DEVELOPMENT

Antiquity. Although almost all of the criticism ever written dates from the 20th century, questions first posed by Plato and Aristotle are still of prime concern, and every critic who has attempted to justify the social value of literature has had to come to terms with the opposing argument made by Plato in *The* Republic. The poet as a man and poetry as a form of statement both seemed untrustworthy to Plato, who depicted the physical world as an imperfect copy of transcendent ideas and poetry as a mere copy of the copy. Thus, literature could only mislead the seeker of truth. Plato credited the poet with divine inspiration, but this, too, was cause for worry: a man possessed by such madness would subvert the interests of a rational polity. Poets were therefore to be banished from the hypothetical republic.

In his Poetics—still the most respected of all discussions of literature—Aristotle countered Plato's indictment by stressing what is normal and useful about literary art. The tragic poet is not so much divinely inspired as he is motivated by a universal human need to imitate, and what he imitates is not something like a bed (Plato's example) but a noble action. Such imitation presumably has a civilizing value for those who empathize with it. Tragedy does arouse emotions of pity and terror in its audience, but these emotions are purged in the process (*katharsis*). In this fashion Aristotle succeeded in portraying literature as satisfying and regulating human passions instead of inflaming them.

Although Plato and Aristotle are regarded as antagonists, the narrowness of their disagreement is noteworthy. Both maintain that poetry is mimetic, both treat the arousing of emotion in the perceiver, and both feel that poetry takes its justification, if any, from its service to the state. It was obvious to both men that poets wielded great power over others. Unlike many modern critics who have tried to show that poetry is more than a pastime, Aristotle had to offer reassurance that it was not socially explosive.

Aristotle's practical contribution to criticism, as opposed to his ethical defense of literature, lies in his inductive treatment of the elements and kinds of poetry. Poetic modes are identified according to their means of imitation, the actions they imitate, the manner of imitation, and its effects. These distinctions assist the critic in judging each mode according to its proper ends instead of regarding beauty as a fixed entity. The ends of tragedy, as Aristotle conceived them, are best served by the harmonious disposition of six elements: plot, character, diction, thought, spectacle, and song. Thanks to Aristotle's insight into universal aspects of audience psychology, many of his dicta have proved to be adaptable to genres developed long after his time.

Later Greek and Roman criticism offers no parallel to Aristotle's originality. Much ancient criticism, such as that of Cicero, Horace, and Quintilian in Rome, was absorbed in technical rules of exegesis and advice to aspiring rhetoricians. Horace's verse epistle *The* Art of Poetry is an urbane amplification of Aristotle's emphasis on the decorum or internal propriety of each genre, now including lyric, pastoral, satire, elegy, and epigram, as well as Aristotle's epic, tragedy, and comedy. This work was later to be prized by Neoclassicists of the 17th century not only for its rules but also for its humour, common sense, and appeal to educated taste. On the *Sublime*, by the Roman-Greek known as "Longinus," was to become influential in the 18th century but for a contrary reason: when decorum began to lose its sway encouragement could be found in Longinus for arousing elevated and ecstatic feeling in the reader. Horace and Longinus developed, respectively, the rhetorical and the affective sides of Aristotle's thought, but Longinus effectively reversed the Aristotelian concern with regulation of the passions.

Horatian
and
Longinian
tendencies

Medieval period. In the Christian Middle Ages criticism suffered from the loss of nearly all the ancient critical texts and from an antipagan distrust of the literary imagination. Such Church Fathers as Tertullian, Augustine, and Jerome renewed, in churchly guise, the Platonic argument against poetry. But both the ancient gods and the surviving classics reasserted their fascination, entering medieval culture in theologically allegorized form. Encyclopaedists and textual commentators explained the supposed Christian content of pre-Christian works and the Old Testament. Although there was no lack of rhetoricians to dictate the correct use of literary figures, no attempt was made to derive critical principles from emergent genres such as the fabliau and the chivalric romance. Criticism was in fact inhibited by the very coherence of the theologically explained universe. When nature is conceived as endlessly and purposefully symbolic of revealed truth, specifically literary problems of form and meaning are bound to be neglected. Even such an original vernacular poet of the 14th century as Dante appears to have expected his Divine Comedy to be interpreted according to the rules of scriptural exegesis.

The Renaissance. Renaissance criticism grew directly from the recovery of classic texts and notably from Giorgio Valla's translation of Aristotle's Poetics into Latin in 1498. By 1549 the Poetics had been rendered into Italian as well. From this period until the later part of the 18th century Aristotle was once again the most imposing presence behind literary theory. Critics looked to ancient poems and plays for insight into the permanent laws of art. The most influential of Renaissance critics was probably Lodovico Castelvetro, whose 1570 commentary on Aristotle's Poetics encouraged the writing of tightly structured plays by extending and codifying Aristotle's idea of the dramatic unities. It is difficult today to appreciate that this obeisance to antique models had a liberating effect; one must recall that imitation of the ancients entailed rejecting scriptural allegory and asserting the individual author's ambition to create works that would be unashamedly great and beautiful. Classicism, individualism, and national pride joined forces against literary asceticism. Thus, a group of 16th-century French writers known as the Pléiade—notably Pierre de Ronsard and Joachim du Bellay—were simultaneously classicists, poetic innovators, and advocates of a purified vernacular tongue.

Classicism,
individualism, and
national
pride
as
literary
forces

The ideas of the Italian and French Renaissance were transmitted to England by Roger Ascham, George Gascoigne, Sir Philip Sidney, and others. Gascoigne's "Certayne notes of Instruction" (1575), the first English manual of versification, had a considerable effect on poetic practice in the Elizabethan Age. Sidney's Defence of Poe*sie* (1595) vigorously argued the poet's superiority to the philosopher and the historian on the grounds that his imagination is chained neither to lifeless abstractions nor to dull actualities. The poet "doth not only show the way, but giveth so sweet a prospect into the way, as will entice any man to enter into it." While still honouring the traditional conception of poetry's role as bestowing pleasure and instruction, Sidney's essay presages the Romantic claim that the poetic mind is a law unto itself.

Neoclassicism and its decline. The Renaissance in general could be regarded as a neoclassical period, in that ancient works were considered the surest models for modern greatness. Neoclassicism, however, usually connotes narrower attitudes that are at once literary and social: a worldly-wise tempering of enthusiasm, a fondness for proved ways, a gentlemanly sense of propriety and balance. Criticism of the 17th and 18th centuries, particularly in France, was dominated by these Horatian norms. French critics such as Pierre Corneille and Nicolas Boileau urged a strict orthodoxy regarding the dramatic unities and the requirements of each distinct genre, as if to disregard them were to lapse into barbarity. The poet was not to imagine that his genius exempted him from the established laws of craftsmanship.

Neoclassicism had a lesser impact in England, partly because English Puritanism had kept alive some of the original Christian hostility to secular art, partly because English authors were on the whole closer to plebeian taste than were the court-oriented French, and partly because of the difficult example of Shakespeare, who magnificently broke all of the rules. Not even the relatively severe classicist Ben Jonson could bring himself to deny Shakespeare's greatness, and the theme of Shakespearean genius triumphing over formal imperfections is echoed by major British critics from John Dryden and Alexander Pope through Samuel Johnson. The science of Newton and the psychology of Locke also worked subtle changes on neoclassical themes. Pope's *Essay on Criticism* (1711) is a Horatian compendium of maxims, but Pope feels obliged to defend the poetic rules as "Nature methodiz'd"—a portent of quite different literary inferences from Nature. Dr. Johnson, too, though he respected precedent, was above all a champion of moral sentiment and "mediocrity," the appeal to generally shared traits. His preference for forthright sincerity left him impatient with such intricate conventions as those of the pastoral elegy.

Progress of a cult of “feeling”

The decline of Neoclassicism is hardly surprising; literary theory had developed very little during two centuries of artistic, political, and scientific ferment. The 18th century's important new genre, the novel, drew most of its readers from a bourgeoisie that had little use for aristocratic dicta. A Longinian cult of "feeling" gradually made headway, in various European countries, against Neoclassical canons of proportion and moderation. Emphasis shifted from concern for meeting fixed criteria to the subjective state of the reader and then of the author himself. The spirit of nationalism entered criticism as a concern for the origins and growth of one's own native literature and as an esteem for such non-Aristotelian factors as "the spirit of the age." Historical consciousness produced by turns theories of literary progress and primitivistic theories affirming, as one critic put it, that "barbarous" times are the most favourable to the poetic spirit. The new recognition of strangeness and strong feeling as literary virtues yielded various fashions of taste for misty sublimity, graveyard sentiments, medievalism, Norse epics (and forgeries), Oriental tales, and the verse of plowboys. Perhaps the most eminent foes of Neoclassicism before the 19th century were Denis Diderot in France and, in Germany, Gotthold Lessing, Johann von Herder, Johann Wolfgang von Goethe, and Friedrich Schiller.

Romanticism. Romanticism, an amorphous movement that began in Germany and England at the turn of the 19th century, and somewhat later in France, Italy, and the United States, found spokesmen as diverse as Goethe and August and Friedrich von Schlegel in Germany, William Wordsworth and Samuel Taylor Coleridge in England, Madame de Stael and Victor Hugo in France, Alessandro Manzoni in Italy, and Ralph Waldo Emerson and Edgar Allan Poe in the United States. Romantics tended to regard the writing of poetry as a transcendentally important activity, closely related to the creative perception of meaning in the world. The poet was credited with the godlike power that Plato had feared in him; Transcendental philosophy was, indeed, a derivative of Plato's metaphysical Idealism. In the typical view of Percy Bysshe Shelley, poetry "strips the veil of familiarity from the world, and lays bare the naked and sleeping beauty, which is the spirit of its forms."

Wordsworth's preface to *Lyrical Ballads* (1800), with its definition of poetry as the spontaneous overflow of powerful feelings and its attack on Neoclassical diction, is regarded as the opening statement of English Romanticism. In England, however, only Coleridge in his *Biographia Literaria* (1817) embraced the whole complex of Romantic doctrines emanating from Germany; the British empiricist tradition was too firmly rooted to be totally washed aside by the new metaphysics. Most of those who were later called Romantics did share an emphasis on individual passion and inspiration, a taste for symbolism and historical awareness, and a conception of art works as internally whole structures in which feelings are dialectically merged with their contraries. Romantic criticism coincided with the emergence of aesthetics as a separate branch of philosophy, and both signalled a weakening in ethical demands upon literature. The lasting achievement of Romantic theory is its recognition that artistic creations are justified, not by their promotion of virtue, but by their own coherence and intensity.

Late 19th century. The Romantic movement had been spurred not only by German philosophy but also by the universalistic and utopian hopes that accompanied the French Revolution. Some of those hopes were thwarted by political reaction, while others were blunted by industrial capitalism and the accession to power of the class that had demanded general liberty. Advocates of the literary imagination now began to think of themselves as enemies or gadflies of the newly entrenched bourgeoisie. In some hands the idea of creative freedom dwindled to a bohemianism pitting "art for its own sake" against commerce and respectability. Aestheticism characterized both the Symbolist criticism of Charles Baudelaire in France and the self-conscious decadence of Algernon Swinburne, Walter Pater, and Oscar Wilde in England. At an opposite extreme, realistic and naturalistic views of literature as an exact record of social truth were developed by Vissarion Belinsky in Russia, Gustave Flaubert and Émile Zola in France, and William Dean Howells in the United States. Zola's program, however, was no less anti-bourgeois than that of the Symbolists; he wanted novels to document conditions so as to expose their injustice. Post-Romantic disillusion was epitomized in Britain in the criticism of Matthew Arnold, who thought of critical taste as a substitute for religion and for the unsatisfactory values embodied in every social class.

Merging intellectual currents

Toward the end of the 19th century, especially in Germany, England, and the United States, literary study became an academic discipline "at the doctoral level." Philology, linguistics, folklore study, and the textual principles that had been devised for biblical criticism provided curricular guidelines, while academic taste mirrored the prevailing impressionistic concern for the quality of the author's spirit. Several intellectual currents joined to make possible the writing of systematic and ambitious literary histories. Primitivism and Medievalism had awakened interest in neglected early texts; scientific Positivism encouraged a scrupulous regard for facts; and the German idea that each country's literature had sprung from a unique national consciousness provided a conceptual framework. The French critic Hippolyte Taine's *History of English Literature* (published in French, 1863–69) reflected the prevailing determinism of scientific thought; for him a work could be explained in terms of the race, milieu, and moment that produced it. For other critics of comparable stature, such as Charles Sainte-Beuve in France, Benedetto Croce in Italy, and George Saintsbury in England, historical learning only threw into relief the expressive uniqueness of each artistic temperament.

The 20th century. The ideal of objective research has continued to guide Anglo-American literary scholarship and criticism and has prompted work of unprecedented accuracy. Bibliographic procedures have been revolutionized; historical scholars, biographers, and historians of theory have placed criticism on a sounder basis of factuality. Important contributions to literary understanding have meanwhile been drawn from anthropology, linguistics, philosophy, and psychoanalysis. Impressionistic method has given way to systematic inquiry from which gratuitous assumptions are, if possible, excluded. Yet demands for a more ethically committed criticism have repeatedly been made, from the New Humanism of Paul Elmer More and Irving Babbitt in the United States in the 1920s, through the moralizing criticism of the Cambridge don F.R. Leavis and of the American poet Yvor Winters, to the most recent demands for "relevance."

No sharp line can be drawn between academic criticism and criticism produced by authors and men of letters. Many of the latter are now associated with universities, and the main shift of academic emphasis, from impressionism to formalism, originated outside the academy in the writings of Ezra Pound, T.S. Eliot, and T.E. Hulme, largely in London around 1910. Only subsequently did such academics as I.A. Richards and William Empson in England and John Crowe Ransom and Cleanth Brooks in the United States adapt the New Criticism to reform of the literary curriculum—in the 1940s. New Criticism has been the methodological counterpart to the strain of modernist literature characterized by allusive difficulty, paradox, and indifference or outright hostility to the democratic ethos. In certain respects the hegemony of New Criticism has been political as well as literary; and anti-Romantic insistence on irony, convention, and aesthetic distance has been accompanied by scorn for all revolutionary hopes. In Hulme conservatism and classicism were explicitly linked. Romanticism struck him as "spilt religion," a dangerous exaggeration of human freedom. In reality, however, New Criticism owed much to Romantic theory, especially to Coleridge's idea of organic form, and some of its notable practitioners have been left of centre in their social thought.

Multiplicity and factionalism

The totality of Western criticism in the 20th century defies summary except in terms of its restless multiplicity and factionalism. Schools of literary practice, such as Imagism, Futurism, Dadaism, and Surrealism, have found no want of defenders and explicators. Ideological groupings, psychological dogmas, and philosophical trends have generated polemics and analysis, and literary materials have been taken as primary data by sociologists and historians. Literary creators themselves have continued to write illuminating commentary on their own principles and aims. In poetry, Paul Valéry, Ezra Pound, Wallace Stevens; in the theatre, George Bernard Shaw, Antonin Artaud, Bertolt Brecht; and in fiction, Marcel Proust, D.H. Lawrence, and Thomas Mann have contributed to criticism in the act of justifying their art.

PRESENT STATE AND PROSPECTS

Most of the issues debated in 20th-century criticism appear to be strictly empirical, even technical, in nature. By what means can the most precise and complete knowledge of a literary work be arrived at? Should its social and biographical context be studied or only the words themselves as an aesthetic structure? Should the author's avowed intention be trusted, or merely taken into account, or disregarded as irrelevant? How is conscious irony to be distinguished from mere ambivalence, or allusiveness from allegory? Which among many approaches—linguistic, generic, formal, sociological, psychoanalytic, and so forth—is best adapted to making full sense of a text? Would a synthesis of all these methods yield a total theory of literature? Such questions presuppose that literature is valuable and that objective knowledge of its workings is a desirable end. These assumptions are, indeed, so deeply buried in most critical discourse that they customarily remain hidden from critics themselves, who imagine that they are merely solving problems of intrinsic interest.

What separates modern criticism from earlier work is its catholicity of scope and method, its borrowing of procedures from the social sciences, and its unprecedented attention to detail. As literature's place in society has become more problematic and peripheral, and as humanistic education has grown into a virtual industry with a large group of professionals serving as one another's judges, criticism has evolved into a complex discipline, increasingly refined in its procedures but often lacking a sense of contact with the general social will. Major modern critics, to be sure, have not allowed their "close reading" to distract them from certain perennial questions about poetic truth. the nature of literary satisfaction, and literature's social utility, but even these matters have sometimes been cast in "value-free" empirical terms.

Science as the outstanding influence

Recourse to scientific authority and method, then, is the outstanding trait of 20th-century criticism. The sociology of Marx, Max Weber, and Karl Mannheim, the mythological investigations of Sir James George Frazer and his followers, Edmund Husserl's phenomenology, Claude Levi-Strauss's anthropological structuralism, and the psychological models proposed by Sigmund Freud and C.G. Jung have all found their way into criticism. The result has been not simply an abundance of technical terms and rules, but a widespread belief that literature's governing principles can be located outside literature. Jungian "archetypal" criticism, for example, regularly identifies literary power with the presence of certain themes that are alleged to inhabit the myths and beliefs of all cultures, while psychoanalytic exegetes interpret poems in exactly the manner that Freud interpreted dreams. Such procedures may encourage the critic, wisely or unwisely, to discount traditional boundaries between genres, national literatures, and levels of culture; the critical enterprise begins to seem continuous with a general study of man. The impetus toward universalism can be discerned even in those critics who are most skeptical of it, the so-called historical relativists who attempt to reconstruct each epoch's outlook and to understand works as they appeared to their first readers. Historical relativism does undermine cross-cultural notions of beauty, but it reduces the record of any given period to data from which inferences can be systematically drawn. Here, too, in other words, uniform methodology tends to replace the intuitive connoisseurship that formerly typified the critic's sense of his role.

The debate over poetic truth may illustrate how modern discussion is beholden to extraliterary knowledge. Critics have never ceased disputing whether literature depicts the world correctly, incorrectly, or not at all, and the dispute has often had more to do with the support or condemnation of specific authors than with ascertainable facts about mimesis. Today it may be almost impossible to take a stand regarding poetic truth without also coming to terms with positivism as a total epistemology. The spectacular achievements of physical science have (with logic questioned by some) downgraded intuition and placed a premium on concrete, testable statements very different from those found in poems. Some of the most influential modern critics, notably I.A. Richards in his early works, have accepted this value order and have confined themselves to behavioristic study of how literature stimulates the reader's feelings. A work of literature, for them, is no longer something that captures an external or internal reality, but is merely a locus for psychological operations; it can only be judged as eliciting or failing to elicit a desired response.

Literature as a form of knowing

Other critics, however, have renewed the Shelleyan and Coleridgean contention that literary experience involves a complex and profound form of knowing. In order to do so they have had to challenge Positivism in general. Such a challenge cannot be convincingly mounted within the province of criticism itself and must depend rather on the authority of antipositivist epistemologists such as Alfred North Whitehead, Ernst Cassirer, and Michael Polanyi. If it is now respectable to maintain, with Wallace Stevens and others, that the world is known through imaginative apprehensions of the sort that poetry celebrates and employs, this is attributable to developments far outside the normal competence of critics.

The pervasive influence of science is most apparent in modern criticism's passion for total explanation of the texts it brings under its microscope. Even formalist schools, which take for granted an author's freedom to shape his work according to the demands of art, treat individual lines of verse with a dogged minuteness that was previously unknown, hoping thereby to demonstrate the "organic" coherence of the poem. The spirit of explanation is also apparent in those schools that argue from the circumstances surrounding a work's origin to the work itself, leaving an implication that the former have caused the latter. The determinism is rarely as explicit or relentless as it was in Taine's scheme of race, milieu, and moment, but this may reflect the fact that causality in general is now handled with more sophistication than in Taine's day.

Whether criticism will continue to aim at empirical exactitude or will turn in some new direction cannot be readily predicted, for the empiricist ideal and its sanctuary, the university, are not themselves secure from attack. The history of criticism is one of oscillation between periods of relative advance, when the imaginative freedom of great writers prompts critics to extend their former conceptions, and periods when stringent moral and formal presciptions are laid upon literature. In times of social upheaval criticism may more or less deliberately abandon the ideal of disinterested knowledge and be mobilized for a practical end. Revolutionary movements provide obvious instances of such redirection, whether or not they identify their pragmatic goals with the cause of science. It should be evident that the future of criticism depends on factors that lie outside criticism itself as a rationally evolving discipline. When a whole society shifts its attitudes toward pleasure, unorthodox behaviour, or the meaning of existence, criticism must follow along.

Literature
as a
source
of order

As Matthew Arnold foresaw, the waning of religious certainty has encouraged critics to invest their faith in literature, taking it as the one remaining source of value and order. This development has stimulated critical activity, yet, paradoxically, it may also be responsible in part for a growing impatience with criticism. What Arnold could not have anticipated is that the faith of some moderns would be apocalyptic and Dionysian rather than a sober and attentuated derivative of Victorian Christianity. Thought in the 20th century has yielded a strong undercurrent of anarchism which celebrates libidinous energy and self-expression at the expense of all social constraint, including that of literary form. In the critical writings of D.H. Lawrence, for example, fiction is cherished as an instrument of unconscious revelation and liberation. A widespread insistence upon prophetic and ecstatic power in literature seems at present to be undermining the complex, irony-minded formalism that has dominated modern discourse. As literary scholarship has acquired an ever-larger arsenal of weapons for attacking problems of meaning, it has met with increasing resentment from people who wish to be nourished by whatever is elemental and mysterious in literary experience.

An awareness of critical history suggests that the development is not altogether new, for criticism stands now approximately where it did in the later 18th century, when the Longinian spirit of expressiveness contested the sway of Boileau and Pope. To the extent that modern textual analysis has become what Hulme predicted, "a classical revival," it may not be welcomed by those who want a direct and intense rapport with literature. What is resisted now is not Neoclassical decorum but impersonal methodology, which is thought to deaden commitment. Such resistance may prove beneficial if it reminds critics that rationalized procedures are indeed no substitute for engagement. Excellent work continues to be written, not because a definitive method or synthesis of methods has been found, but on the contrary because the best critics still understand that criticism is an exercise of private sympathy, discrimination, and moral and cultural reflection.

BIBLIOGRAPHY. A useful compilation of essential texts is MARK SCHORER, JOSEPHINE MILES, and GORDON MCKENZIE (eds.), *Criticism,* rev. ed. (1958). The best survey of critical history is WILLIAM K. WIMSATT, JR., and CLEANTH BROOKS, *Literary Criticism: A Short History* (1957); G.M.A. GRUBE, *The Greek and Roman Critics* (1965); JOEL E. SPINGARN, *A History of Literary Criticism in the Renaissance,* 5th ed. (1925, paperback edition 1963); WALTER J. BATE, *From Classic to Romantic* (1946, reprinted 1961); and RENE WELLEK, *A History of Modern Criticism, 1750–1950*, 4 vol. (1955–65), are more specialized historical studies. Important theoretical statements are I.A. RICHARDS, *Principles of Literary Criticism* (1924, reprinted 1961); M.H. ABRAMS, *The Mirror and the Lamp* (1953); RENE WELLEK and AUSTIN WARREN, *Theory of Literature,* 3rd rev. ed. (1966); NORTHROP FRYE, *Anatomy of Criticism* (1957); and WAYNE C. BOOTH, *The Rhetoric of Fiction* (1961). WILLIAM EMPSON, *Seven Types of Ambiguity,* 3rd ed. (1956, reprinted 1963); ERICH AUERBACH, *Mimesis* (1946; Eng. trans., 1953); and LIONEL TRILLING, *The Liberal Imagination* (1950), are representative examples of modern criticism, combining theory with analysis of a wide variety of texts.

(F.C.C.)

Literature, Art of

Definitions of the word literature tend to be circular. *The Concise Oxford Dictionary* says it is "writings whose value lies in the beauty of form or emotional effect." The 19th-century critic Walter Pater referred to "the matter of imaginative or artistic literature" as a "transcript, not of mere fact, but of fact in its infinitely varied forms." But such definitions really assume that the reader already knows what literature is. And indeed its central meaning, at least, is clear enough. Deriving from the Latin *littera*, "a letter of the alphabet," literature is first and foremost mankind's entire body of writing; after that it is the body of writing belonging to a given language or people; then it is individual pieces of writing.

But already it is necessary to qualify these statements. To use the word writing when describing literature is itself misleading, for one may rightly speak of "oral literature" or "the literature of preliterate peoples." The art of literature is not reducible to the words on the page; they are there because of the craft of writing. As an art, literature is the organization of words to give pleasure; through them it elevates and transforms experience; through them it functions in society as a continuing symbolic criticism of values.

THE SCOPE OF LITERATURE

Literature is a form of human expression. But not everything expressed in words—even when organized and written down—is counted as literature. Those writings that are primarily informative—technical, scholarly, journalistic—would be excluded from the rank of literature by most, though not all, critics. Certain forms of writing, however, are universally regarded as belonging to literature as an art. Individual attempts within these forms are said to succeed if they possess something called artistic merit and to fail if they do not. The nature of artistic merit is less easy to define than to recognize. The writer need not even pursue it to attain it. On the contrary, a scientific exposition might be of great literary value and a pedestrian poem of none at all.

The purest (or, at least, the most intense) literary form is the lyric poem, and after it comes elegiac, epic, dramatic, narrative, and expository verse. Most theories of literary criticism base rhemselves on an analysis of poetry, because the aesthetic problems of literature are there presented in their simplest and purest form. Poetry that fails as literature is not called poetry at all but verse. Many novels—certainly all the world's great novels—are literature, but there are thousands that are not so considered. Most great dramas are considered literature (although the Chinese, possessors of one of the world's greatest dramatic traditions, consider their plays, with few exceptions, to possess no literary merit whatsoever).

Distinction
between
poetry
and
verse

The Greeks thought of history as one of the seven arts, inspired by a goddess, the muse Clio. All of the world's classic surveys of history can stand as noble examples of the art of literature, but most historical works and studies today are not written primarily with literary excellence in mind, though they may possess it, as it were, by accident.

The essay was once written deliberately as a piece of literature: its subject matter was of comparatively minor importance. Today most essays are written as expository, informative journalism, although there are still essayists in the great tradition who think of themselves as artists. Now, as in the past, some of the greatest essayists are critics of literature, drama, and the arts.

Some personal documents (autobiographies, diaries, memoirs, and letters) rank among the world's greatest literature. Some examples of this biographical literature were written with posterity in mind, others with no thought of their being read by anyone but the writer. Some are in a highly polished literary style; others, couched in a privately evolved language, win their standing as literature because of their cogency, insight, depth, and scope.

Many works of philosophy are classed as literature. The *Dialogues* of Plato (4th century BC) are written with great narrative skill and in the finest prose; the *Meditations* of the 2nd-century Roman emperor Marcus Aurelius are a collection of apparently random thoughts, and the Greek in which they are written is eccentric. Yet both are classed as literature, while the speculations of other philosophers, ancient and modern, are not. Certain scientific works endure as literature long after their scientific content has become outdated. This is particularly true of books of natural history, where the element of personal observation is of special importance. An excellent example is Gilbert White's *Natural History and Antiquities of Selbourne* (1789).

Role of oratory in literature

Oratory, the art of persuasion, was long considered a great literary art. The oratory of the American Indian, for instance, is famous, while in classical Greece, Polymnia was the muse sacred to poetry and oratory. Rome's great orator Cicero was to have a decisive influence on the development of English prose style. Abraham Lincoln's Gettysburg Address is known to every American schoolchild. Today, however, oratory is more usually thought of as a craft than as an art. Most critics would not admit advertising copywriting, purely commercial fiction, or cinema and television scripts as accepted forms of literary expression, although others would hotly dispute their exclusion. The test in individual cases would seem to be one of enduring satisfaction and, of course, truth. Indeed, it becomes more and more difficult to categorize literature, for in modern civilization words are everywhere. Man is subject to a continuous flood of communication. Most of it is fugitive, but here and there—in high-level journalism, in television, in the cinema, in commercial fiction, in westerns and detective stories, and in plain, expository prose—some writing, almost by accident, achieves an aesthetic satisfaction, a depth and relevance that entitle it to stand with other examples of the art of literature.

LITERARY COMPOSITION

Critical theories. *Western.* If the early Egyptians or Sumerians had critical theories about the writing of literature, these have not survived. From the time of classical Greece until the present day, however, Western criticism has been dominated by two opposing theories of the literary art, which might conveniently be called the expressive and constructive theories of composition.

The Greek philosopher and scholar Aristotle (384–322 BC) is the first great representative of the constructive school of thought. His *Poetics* (the surviving fragment of which is limited to an analysis of tragedy and epic poetry) has sometimes been dismissed as a recipe book for the writing of potboilers. Certainly, Aristotle is primarily interested in the theoretical construction of tragedy, much as an architect might analyze the construction of a temple, but he is not exclusively objective and matter of fact. He does, however, regard the expressive elements in literature as of secondary importance, and the terms he uses to describe them have been open to interpretation and a matter of controversy ever since.

The 1st-century Greek treatise On *the Sublime* (conventionally attributed to the 3rd-century Longinus) deals with the question left unanswered by Aristotle—what makes great literature "great"? Its standards are almost entirely expressive. Where Aristotle is analytical and states general principles, the pseudo-Longinus is more specific and gives many quotations: even so, his critical theories are confined largely to impressionistic generalities.

Constructive and expressive theories of criticism

Thus, at the beginning of Western literary criticism, the controversy already exists. Is the artist or writer a technician, like a cook or an engineer, who designs and constructs a sort of machine that will elicit an aesthetic response from his audience? Or is he a virtuoso who above all else expresses himself and, because he gives voice to the deepest realities of his own personality, generates a response from his readers because they admit some profound identification with him? This antithesis endures throughout Western European history—Scholasticism versus Humanism, Classicism versus Romanticism, Cubism versus Expressionism—and survives to this day in the common judgment of our contemporary artists and writers. It is surprising how few critics have declared that the antithesis is unreal, that a work of literary or plastic art is at once constructive and expressive, and that it must in fact be both.

Eastern. Critical theories of literature in the Orient, however, have been more varied. There is an immense amount of highly technical, critical literature in India. Some works are recipe books, vast collections of tropes and stylistic devices; others are philosophical and general. In the best period of Indian literature, the cultural climax of Sanskrit (c. 320–490), it is assumed by writers that expressive and constructive factors are twin aspects of one reality. The same could be said of the Chinese, whose literary manuals and books on prosody and rhetoric are, as with the West, relegated to the class of technical handbooks, while their literary criticism is concerned rather with subjective, expressive factors—and so aligns itself with the pseudo-Longinus' "sublime." In Japan, technical, stylistic elements are certainly important (Japanese discrimination in these matters is perhaps the most refined in the world), but both writer and reader above all seek qualities of subtlety and poignancy and look for intimations of profundity often so evanescent as to escape entirely the uninitiated reader.

Broad and narrow conceptions of poetry. Far Eastern literary tradition has raised the question of the broad and narrow definitions of poetry (a question familiar in the West from Edgar Allan Poe's advocacy of the short poem in his "Poetic Principle" [1850]). There are no long epic poems in Chinese, no verse novels of the sort written in England by Robert Browning or Alfred Lord Tennyson in the 19th century. In Chinese drama, apart from a very few of the songs, the verse as such is considered doggerel. The versified treatises on astronomy, agriculture, or fishing, of the sort written in Greek and Roman times and during the 18th century in the West, are almost unknown in the Far East. Chinese poetry is almost exclusively lyric, meditative, and elegiac, and rarely does any poem exceed 100 lines—most are little longer than Western sonnets; many are only quatrains. In Japan this tendency to limit length was carried even further. The ballad survives in folk poetry, as it did in China, but the "long poem" of very moderate length disappeared early from literature. For the Japanese, the tanka is a "long poem": in its common form it has 31 syllables; the *sedōka* has 38; the *dodoitsu*, imitating folk song, has 26. From the 17th century and onward, the most popular poetic form was the haiku, which has only 17 syllables.

This development is relevant to the West because it spotlights the ever-increasing emphasis which has been laid on intensity of communication, a characteristic of Western poetry (and of literature generally) as it has evolved since the late 19th century. In the Far East all cultivated people were supposed to be able to write suitable occasional poetry, and so those qualities that distinguished a poem from the mass consequently came to be valued above all others. Similarly, as modern readers in the West struggle with a "communication avalanche" of words, they seek in literature those forms, ideas, values, vicarious experiences, and styles that transcend the verbiage to be had on every hand.

Literary language. In some literatures (notably classical Chinese, Old Norse, Old Irish), the language employed is quite different from that spoken or used in ordinary writing. This marks off the reading of literature as a special experience. In the Western tradition, it is only in comparatively modern times that literature has been written in the common speech of cultivated men. The Elizabethans did not talk like Shakespeare nor 18th-century people in the stately prose of Samuel Johnson or Edward Gibbon (the so-called Augustan plain style in literature became popular in the late 17th century and flourished throughout the 18th, but it was really a special form of rhetoric with antecedent models in Greek and Latin). The first person to write major works of literature in the ordinary English language of the educated man was Daniel Defoe (1660?–1731), and it is remarkable how little the language has changed since. *Robinson Crusor* (1719) is much more contemporary in tone than the elaborate prose of 19th-century writers like Thomas De Quincey or Walter Pater. (Defoe's language is not, in fact, so very simple: simplicity is itself one form of artifice.)

Ambiguity. Other writers have sought to use language for its most subtle and complex effects and have deliberately cultivated the ambiguity inherent in the multiple or shaded meanings of words. Between the two world wars, "ambiguity" became very fashionable in English and American poetry and the ferreting out of ambiguities—from even the simplest poem—was a favourite critical sport. T.S. Eliot in his literary essays is usually considered the founder of this movement. Actually, the platform of his critical attitudes is largely moral, but his two disciples, I.A. Richards in *Principles of Literary Criticism* (1924) and William Empson in *Seven Types of Ambiguity* (1930), carried his method to extreme lengths. The basic document of the movement is Charles Kay Ogden and I.A. Richards' *The Meaning of Meaning* (1923), a work of enormous importance in its time. Only a generation later, however, their ideas were somewhat at a discount.

Translation. Certainly, William Blake or Thomas Campion, when they were writing their simple lyrics, were unaware of the ambiguities and multiple meanings that future critics would find in them. Nevertheless, language is complex. Words do have overtones; they do stir up complicated reverberations in the mind that are ignored in their dictionary definitions. Great stylists, and most especially great poets, work with at least a half-conscious, or subliminal, awareness of the infinite potentialities of language. This is one reason why the essence of most poetry and great prose is so resistant to translation (quite apart from the radically different sound patterns that are created in other-language versions). The translator must project himself into the mind of the original author; he must transport himself into an entirely different world of relationships between sounds and meanings, and at the same time he must establish an equivalence between one infinitely complex system and another. Since no two languages are truly equivalent in anything except the simplest terms, this is a most difficult accomplishment. Certain writers are exceptionally difficult to translate. There are no satisfactory English versions, for example, of the Latin of Catullus, the French of Baudelaire, the Russian of Pushkin, or of the majority of Persian and Arabic poetry. The splendour of Sophocles' Greek, of Plato at his best, is barely suggested even in the finest English versions. On the other hand, the Germans insist that Shakespeare is better in German than he is in English, a humorous exaggeration perhaps. But again, Shakespeare is resistant to translation into French. His English seems to lack equivalents in that language.

The very greatest translations may become classics in their own right, of enduring literary excellence (the King James Version of the Bible, appearing in 1611, is the outstanding example), but on the whole the approximate equivalence of most translations to their originals seems to have a very short life. The original work remains the same, of lasting value to its own people, but the translation becomes out of date with each succeeding generation as the language and criteria of literary taste change. Nothing demonstrates the complexity of literary language more vividly. An analogous process takes place when a reader experiences a literary work in his own language; each generation gets a "new version" from its own classics.

Yet the values of great literature are more fundamental than complexity and subtleties of meaning arising from language alone. Works far removed from contemporary man in time and in cultural background, composed in a variety of languages utterly different from one another in structure, have nevertheless been translated successfully enough to be deeply moving. The 20th century has seen an immense mass of the oral literature of preliterate peoples and of the writings of all the great civilizations translated into modern languages. Understanding the growth of literature and its forms in other civilizations has greatly enriched the understanding of our own.

Craftsmanship. *Prosody.* Literature, like music, is an art of time, or "tempo": it takes time to read or listen to, and it usually presents events or the development of ideas or the succession of images or all these together in time. The craft of literature, indeed, can be said to be in part the manipulation of a structure in time, and so the simplest element of marking time, rhythm, is therefore of basic importance in both poetry and prose. Prosody, which is the science of versification, has for its subject the materials of poetry and is concerned almost entirely with the laws of metre, or rhythm in the narrowest sense. It deals with the patterning of sound in time; the number, length, accent, and pitch of syllables; and the modifications of rhythm by vowels and consonants. In most poetry, certain basic rhythms are repeated with modifications (that is to say, the poem rhymes or scans or both) but not in all. It most obviously does neither in the case of the "free forms" of modern poetry; but neither does it in the entire poetry of whole cultures. Since lyric poetry is either the actual text of song or else is immediately derived from song, it is regular in structure nearly everywhere in the world, although the elements of patterning that go into producing its rhythm may vary. The most important of these elements in English poetry, for example, have been accent, grouping of syllables (called feet), number of syllables in the line, and rhyme at the end of a line (and sometimes within it). Other elements such as pitch, resonance, repetition of vowels (assonance), repetition of consonants (alliteration), and breath pauses (cadence) have also been of great importance in distinguishing successful poetry from doggerel verse, but on the whole they are not as important as the former, and poets have not always been fully conscious of their use of them. Greek and Latin poetry was consciously patterned on the length of syllables (long or short) rather than on their accent; but all the considerations of "sound" (such as assonance and alliteration) entered into the aesthetically satisfactory structure of a poem. Similarly, both the French and Japanese were content simply to count the syllables in a line—but again, they also looked to all the "sound" elements.

Elements of prosody

The rhythms of prose are more complicated, though not necessarily more complex, than those of poetry. The rules of prose patterning are less fixed; patterns evolve and shift indefinitely and are seldom repeated except for special emphasis. So the analysis of prose rhythm is more difficult to make than, at least, the superficial analysis of poetry.

Structure. The craft of writing involves more than mere rules of prosody. The work's structure must be manipulated to attract the reader. First, the literary situation has to be established. The reader must be directly related to the work, placed in it—given enough information on who, what, when, or why—so that his attention is caught and held (or, on the other hand, he must be deliberately mystified, to the same end).

Aristotle gave a formula for dramatic structure that can be generalized to apply to most literature: presentation, development, complication, crisis, and resolution. Even lyric poems can possess plot in this sense, but by no means are all literary works so structured, nor does such structure ensure their merit—it can be safely said that westerns, detective stories, and cheap melodramas are more likely to follow strictly the rules of Aristotle's *Poetics* than are great novels. Nevertheless, the scheme does provide a norm from which there is infinite variation. Neoclassical dramatists and critics, especially in 17th-century France, derived from Aristotle what they called the unities of time, action, and place. This meant that the action of a play should not spread beyond the events of one day and, best of all, should be confined within the actual time of performance. Nor should the action move about too much from place to place—best only to go from indoors to outdoors and back. There should be only one plot line, which might be relieved by a subplot, usually comic. These three unities—of time, place, and action—do not occur in Aristotle and are certainly not observed in Classical Greek tragedy. They are an invention of Renaissance critics, some of whom went even further, insisting also on what might be called a unity of mood. To this day there are those who, working on this principle, object to Shakespeare's use of comic relief within the tragic action of his plays—to the porter in *Macbeth,* for instance, or the gravediggers in *Hamlet.*

Unities of
time, place,
and action

Assiduous critics have found elaborate architectural structures in quite diffuse works—including Miguel de Cervantes' *Don Quixote* (1605–15), Sterne's *Tristram Shandy* (1759–67), Casanova's *Icosameron* (1788; 1928). But their "discoveries" are too often put there after the event. Great early novels such as the Chinese *Dream of the Red Chamber* (1754; first published in English 1929) and the Japanese *Tale of Genji* (early 11th century) usually develop organically rather than according to geometrical formulas, one incident or image spinning off another. Probably the most tightly structured work, in the Neoclassicists' sense, is the Icelandic *Njál's saga.*

The 19th century was the golden age of the novel, and most of the more famous examples of the form were systematically plotted, even where the plot structure simply traced the growth in personality of an individual hero or heroine. This kind of novel, of which in their very diverse ways Stendhal's *The Red and the Black* (1830) and Dickens' *David Copperfield* (1850) are great examples, is known as *Bildungsroman.* Gustave Flaubert's *Madame Bovary* (1857) is as rigorously classicist in form as the 17th-century plays of Racine and Corneille, which were the high point of the French classical theatre, although Flaubert obeys laws more complex than those of the Aristotelians. Novels such as Tolstoy's *War and Peace* (1865–69), Dostoyevsky's *Brothers Karamazov* (1880), and the works of Balzac owe much of their power to their ability to overwhelm the reader with a massive sense of reality. The latter 19th and early 20th centuries witnessed an attack on old forms, but what the new writers evolved was simply a new architecture. A novel like James Joyce's *Ulysses* (1922), which takes place in a day and an evening, is one of the most highly structured ever written. Novelists such as Joseph Conrad, Ford Madox Ford, Virginia Woolf, and, to a lesser extent, Henry James developed a multiple-aspect narrative, sometimes by using time shifts and flashbacks and by writing from different points of view, sometimes by using the device (dating back to Classical Greek romances) of having one or more narrators as characters within the story. (This technique, which was first perfected in the verse novels of Robert Browning, in fact reached its most extreme development in the English language in poetry: in Ezra Pound's *Cantos,* T.S. Eliot's *The Waste Land,* William Carlos Williams' *Paterson,* and the many long poems influenced by them.)

Narrative
devices in
the novel

CONTENT OF LITERATURE

The word as symbol. The content of literature is as limitless as the desire of human beings to communicate with one another. The thousands of years, perhaps hundreds of thousands, since the human species first developed speech have seen built up the almost infinite systems of relationships called languages. A language is not just a collection of words in an unabridged dictionary but the individual and social possession of living men, an inexhaustible system of equivalents, of sounds to objects and to one another. Its most primitive elements are those words that express direct experiences of objective reality, and its most sophisticated are concepts on a high level of abstraction. Words are not only equivalent to things, they have varying degrees of equivalence to one another. A symbol, says the dictionary, is something that stands for something else or a sign used to represent something, "as the lion is the symbol of courage, the cross the symbol of Christianity." In this sense all words can be called symbols, but the examples given—the lion and the cross—are really metaphors: that is, symbols that represent a complex of other symbols, and which are generally negotiable in a given society (just as money is a symbol for goods or labour). Eventually a language comes to be, among other things, a huge sea of implicit metaphors, an endless web of interrelated symbols. As literature, especially poetry, grows more and more sophisticated, it begins to manipulate this field of suspended metaphors as a material in itself, often as an end in itself. Thus, there emerge forms of poetry (and prose, too) with endless ramifications of reference, as in Japanese waka and haiku, some ancient Irish and Norse verse, and much of the poetry written in western Europe since the time of Baudelaire that is called modernist. It might be supposed that, at its most extreme, this development would be objective, constructive—aligning it with the critical theories stemming from Aristotle's *Poetics.* On the contrary, it is romantic, subjective art, primarily because the writer handles such material instinctively and subjectively, approaches it as the "collective unconscious," to use the term of the psychologist Carl Jung, rather than with deliberate rationality.

Themes and their sources. By the time literature appears in the development of a culture, the society has already come to share a whole system of stereotypes and archetypes: major symbols standing for the fundamental realities of the human condition, including the kind of symbolic realities that are enshrined in religion and myth. Literature may use such symbols directly, but all great works of literary art are, as it were, original and unique myths. The world's great classics evoke and organize the archetypes of universal human experience. This does not mean, however, that all literature is an endless repetition of a few myths and motives, endlessly retelling the first stories of civilized man, repeating the Sumerian *Epic of Gilgamesh* or Sophocles' *Oedipus the King.* The subject matter of literature is as wide as human experience itself. Myths, legends, and folktales lie at the beginning of literature. and their plots, situations, and allegorical (metaphorical narrative) judgments of life represent a constant source of literary inspiration that never fails. This is so because mankind is constant—men share a common physiology. Even social structures, after the development of cities, remain much alike. Whole civilizations have a life pattern that repeats itself through history. Jung's term "collective unconscious" really means that mankind is one species, with a common fund of general experience. Egyptian scribes, Soviet bureaucrats, and junior executives in New York City live and respond to life in the same ways; the lives of farmers or miners or hunters vary only within narrow limits. Love is love and death is death, for a South African Bushman and a French Surrealist alike. So the themes of literature have at once an infinite variety and an abiding constancy. They can be taken from myth, from history, or from contemporary occurrence, or they can be pure invention (but even if they are invented, they are nonetheless constructed from the constant materials of real experience, no matter how fantastic the invention).

Use of
symbols
and myths
in
literature

The writer's personal involvement. As time goes on, literature tends to concern itself more and more with the interior meanings of its narrative, with problems of human personality and human relationships. Many novels are fictional, psychological biographies which tell of the slowly achieved integration of the hero's personality or of his disintegration, of the conflict between self-realization and the flow of events and the demands of other people. This can be presented explicitly, where the characters talk about what is going on in their heads; either ambiguously and with reserve, as in the novels of Henry James, or

Presentation of
characters

overtly, as in those of Dostoyevsky. Alternatively, it can be presented by a careful arrangement of objective facts, where psychological development is described purely in terms of behaviour, and where the reader's subjective response is elicited by the minute descriptions of physical reality, as in the novels of Stendhal and the greatest Chinese novels like the *Dream of the Red Chamber*, which convince the reader that through the novel he is seeing reality itself, rather than an artfully contrived semblance of reality.

Literature, however, is not solely concerned with the concrete, with objective reality, with individual psychology, or with subjective emotion. Some deal with abstract ideas or philosophical conceptions. Much purely abstract writing is considered literature only in the widest sense of the term, and the philosophical works that are ranked as great literature are usually presented with more or less of a sensuous garment. Thus, Plato's *Dialogues* rank as great literature because the philosophical material is presented in dramatic form, as the dialectical outcome of the interchange of ideas between clearly drawn, vital personalities, and because the descriptive passages are of great lyric beauty. Karl Marx's *Das Kapital* (1867–95) approaches great literature in certain passages in which he expresses the social passion he shares with the Hebrew prophets of the Old Testament. Euclid's *Elements* and St. Thomas Aquinas' *Summa theologica* give literary, aesthetic satisfaction to some people because of their purity of style and beauty of architectonic construction. In short, most philosophical works that rank as great literature do so because they are intensely human. The reader responds to Pascal's *Pensées*, to Montaigne's *Essays,* and to Marcus Aurelius' *Meditations* as he would to living men. Sometimes the pretense of purely abstract intellectual rigour is in fact a literary device. The writings of the 20th-century philosopher Ludwig Wittgenstein, for example, owed much of their impact to this approach, while the poetry of Paul Valtry borrows the language of philosophy and science for its rhetorical and evocative power.

Relation of form to content. Throughout literary history, many great critics have pointed out that it is artificial to make a distinction between form and content, except for purposes of analytical discussion. Form determines content. Content determines form. The issue is, indeed, usually only raised at all by those critics who are more interested in politics, religion, or ideology than in literature; thus, they object to writers who they feel sacrifice ideological orthodoxy for formal perfection, message for style.

Style. But style cannot really be said to exist on paper at all; it is the way the mind of the author expresses itself in words. Since words represent ideas, there cannot be abstract literature unless a collection of nonsense syllables can be admitted as literature. Even the most avant-garde writers associated with the Cubist or Non-Objective painters used language, and language is meaning, though the meaning may be incomprehensible. Oscar Wilde and Walter Pater, the great 19th-century exponents of "art for art's sake," were in fact tireless propagandists for their views, which dominate their most flowery prose. It is true that great style depends on the perfect matching of content and form, so that the literary expression perfectly reflects the writer's intention; "poor style" reveals the inability of a writer to match the two—in other words, reveals his inability to express himself. This is why we say that "style expresses the man." The veiled style of Henry James, with its subtleties, equivocations, and qualifications, perfectly reflects his complicated and subtle mind and his abiding awareness of ambiguity in human motives. At the other extreme, the style of the early-20th-century U.S. novelist Theodore Dreiser—bumbling, clumsy, dogged, troubled—perfectly embodies his own attitudes toward life and is, in fact, his constant judgment of his subject matter. Sometimes an author, under the impression that he is simply polishing his style, may completely alter his content. As Flaubert worked over the drafts of *Madame Bovary,* seeking always the apposite word that would precisely convey his meaning, he lifted his novel from a level of sentimental romance to make it one of the great ironic tragedies of literature. Yet, to judge from his correspondence, he seems never to have been completely aware of what he had done, of the severity of his own irony.

Coordination of content and form in good style

Literature may be an art, but writing is a craft, and a craft must be learned. Talent, special ability in the arts, may appear at an early age; the special personality called genius may indeed be born, not made. But skill in matching intention and expression comes with practice. Naive writers, "naturals" like the 17th-century English diarist Samuel Pepys, the late 18th-century French naïf Restif de la Bretonne, the 20th-century American novelist Henry Miller, are all deservedly called stylists, although their styles are far removed from the deliberate, painstaking practice of a Flaubert or a Turgenev. They wrote spontaneously whatever came into their heads; but they wrote constantly, voluminously, and were, by their own standards, skilled practitioners.

Objective–subjective expression. There are certain forms of literature that do not permit such highly personal behaviour—for instance, formal lyric poetry and classic drama. In these cases the word "form" is used to mean a predetermined structure within whose mold the content must be fitted. These structures are, however, quite simple and so cannot be said to determine the content. Racine and Corneille were contemporaries; both were Neoclassic French dramatists; both abided by all the artificial rules—usually observing the "unities" and following the same strict rules of prosody. Yet their plays, and the poetry in which they are written, differ completely. Corneille is intellectually and emotionally a Neoclassicist—clear and hard, a true objectivist, sure of both his verse and the motivations of his characters. Racine was a great romantic long before the age of Romanticism. His characters are confused and tortured; his verse throbs like the heartbeats of his desperate heroines. He is a great sentimentalist in the best and deepest meaning of that word. His later influence on poets like Baudelaire and Paul Valtry is due to his mastery of sentimental expression, not, as they supposed, to his mastery of Neoclassic form.

Predetermined structure of classic drama

Verse on any subject matter can of course be written purely according to formula. The 18th century in England saw all sorts of prose treatises cast in rhyme and metre, but this was simply applied patterning. (Works such as *The Botanic Garden* [2 vol., 1794–95] by Erasmus Darwin should be sharply distinguished from James Thomson's *The Seasons* [1726–30], which is true poetry, not versified natural history—just as Virgil's *Georgics* is not an agricultural handbook.) Neoclassicism, especially in its 18th-century developments, confused—for ordinary minds, at any rate—formula with form and so led to the revolt called Romanticism. The leading theorists of that revolt, the poets William Wordsworth and Samuel Taylor Coleridge, in the "Preface" (1800) to *Lyrical Ballads* urged the observance of a few simple rules basic to all great poetry and demanded a return to the integrity of expressive form. A similar revolution in taste was taking place all over Europe and also in China (where the narrow pursuit of formula had almost destroyed poetry). The Romantic taste could enjoy the "formlessness" of William Blake's prophetic books, or Walt Whitman's *Leaves of Grass,* or the loose imagination of Shelley—but careful study reveals that these writers were not formless at all. Each had his own personal form.

Form and formlessness in modern literature

Time passes and the pendulum of taste swings. In the mid-20th century, Paul Valéry, T.S. Eliot, and Yvor Winters would attack what the latter called "the fallacy of expressive form," but this is itself a fallacy. All form in literature is expressive. All expression has its own form, even when the form is a deliberate quest of formlessness. (The automatic writing cultivated by the surrealists, for instance, suffers from the excessive formalism of the unconscious mind and is far more stereotyped than the poetry of the Neoclassicist Alexander Pope.) Form simply refers to organization, and critics who attack form do not seem always to remember that a writer organizes more than words. He organizes experience. Thus, his organization stretches far back in his mental process. Form is the other face of content, the outward, visible sign of inner spiritual reality.

LITERATURE AND ITS AUDIENCE

Folk and elite literatures. In preliterate societies oral literature was widely shared; it saturated the society and was as much a part of living as food, clothing, shelter, or religion. In barbaric societies, the minstrel might be a courtier of the king or chieftain, and the poet who composed liturgies might be a priest. But the oral performance itself was accessible to the whole community. As society evolved its various social layers, or classes, an "elite" literature began to be distinguishable from the "folk" literature of the people. With the invention of writing this separation was accelerated until finally literature was being experienced individually by the elite (reading a book), while folklore and folk song were experienced orally and more or less collectively by the illiterate common people.

Elite literature continuously refreshes itself with materials drawn from the popular. Almost all poetic revivals, for instance, include in their programs a new appreciation of folk song, together with a demand for greater objectivity. On the other hand folk literature borrows themes and, very rarely, patterns from elite literature. Many of the English and Scottish ballads that date from the end of the Middle Ages and have been preserved by oral tradition share plots and even turns of phrase with written literature. A very large percentage of these ballads contain elements that are common to folk ballads from all over western Europe; central themes of folklore, indeed, are found all over the world. Whether these common elements are the result of diffusion is a matter for dispute. They do, however, represent great psychological constants, archetypes of experience common to the human species, and so these constants are used again and again by elite literature as it discovers them in folklore.

Modern popular literature. There is a marked difference between true popular literature, that of folklore and folk song, and the popular literature of modern times. Popular literature today is produced either to be read by a literate audience or to be enacted on television or in the cinema; it is produced by writers who are members, however lowly, of an elite corps of professional literates. Thus, popular literature no longer springs from the people; it is handed to them. Their role is passive. At the best they are permitted a limited selectivity as consumers.

Certain theorists once believed that folk songs and even long, narrative ballads were produced collectively, as has been said in mockery "by the tribe sitting around the fire and grunting in unison." This idea is very much out of date. Folk songs and folk tales began somewhere in one human mind. They were developed and shaped into the forms in which they are now found by hundreds of other minds as they were passed down through the centuries. Only in this sense were they "collectively" produced. During the 20th century, folklore and folk speech have had a great influence on elite literature-on writers as different as Franz Kafka and Carl Sandburg, Selma Lagerlöf and Kawabata Yasunari, Martin Buber and Isaac Bashevis Singer. Folk song has always been popular with bohemian intellectuals, especially political radicals (who certainly are an elite). Since World War II the influence of folk song upon popular song has not just been great; it has been determinative. Almost all "hit" songs since the mid-century have been imitation folk songs; and some authentic folk singers attract immense audiences.

Influence of folklore on modem literature

Popular fiction and drama, westerns and detective stories, films and television serials, all deal with the same great archetypal themes as folktales and ballads, though this is seldom due to direct influence; these are simply the limits within which the human mind works. The number of people who have elevated the formulas of popular fiction to a higher literary level is surprisingly small. Examples are H.G. Wells's early science fiction, the western stories of Gordon Young and Ernest Haycox, the detective stories of Sir Arthur Conan Doyle, Georges Simenon, and Raymond Chandler.

The latter half of the 20th century has seen an even greater change in popular literature. Writing is a static medium: that is to say, a book is read by one person at a time; it permits recollection and anticipation; the reader can go back to check a point or move ahead to find out how the story ends. In radio, television, and the cinema the medium is fluent; the audience is a collectivity and is at the mercy of time. It cannot pause to reflect or to understand more fully without missing another part of the action, nor can it go back or forward. Marshall McLuhan in his book ***Understanding Media*** (1964) became famous for erecting a whole structure of aesthetic, sociological, and philosophical theory upon this fact. But it remains to be seen whether the new, fluent materials of communication are going to make so very many changes in civilization, let alone in the human mind—mankind has, after all, been influenced for thousands of years by the popular, fluent arts of music and drama. Even the most transitory television serial was written down before it was performed, and the script can be consulted in the files. Before the invention of writing, all literature was fluent because it was contained in people's memory. In a sense it was more fluent than music, because it was harder to remember. Man in mass society becomes increasingly a creature of the moment, but the reasons for this are undoubtedly more fundamental than his forms of entertainment.

LITERATURE AND ITS ENVIRONMENT

Social and economic conditions. Literature, like all other human activities, necessarily reflects current social and economic conditions. Class stratification was reflected in literature as soon as it had appeared in life. Among the American Indians, for instance, the chants of the shaman, or medicine man, differ from the secret, personal songs of the individual, and these likewise differ from the group songs of ritual or entertainment sung in community. In the Heroic Age, the epic tales of kings and chiefs that were sung or told in their barbaric courts differed from the folktales that were told in peasant cottages.

Reflection of class distinction in literature

The more cohesive a society, the more the elements—and even attitudes–evolved in the different class strata are interchangeable at all levels. In the tight clan organization that existed in late medieval times at the Scottish border, for example, heroic ballads telling of the deeds of lords and ladies were preserved in the songs of the common people. But where class divisions are unbridgeable, elite literature is liable to be totally separated from popular culture. An extreme example is the classic literature of the Roman Empire. Its forms and its sources were largely Greek—it even adopted its laws of verse patterning from Greek models, even though these were antagonistic to the natural patterns of the Latin language—and most of the sophisticated works of the major Latin authors were completely closed to the overwhelming majority of people of the Roman Empire.

Printing has made all the difference in the negotiability of ideas. The writings of the 18th-century French writers Voltaire, Rousseau, and Diderot were produced from and for almost as narrow a caste as the Roman elite, but they were printed. Within a generation they had penetrated the entire society and were of vital importance in revolutionizing it.

Class distinctions in the literature of modem times exist more in the works themselves than in their audience. Although Henry James wrote about the upper classes and Émile Zola about workingmen, both were, in fact, members of an elite and were read by members of an elite—moreover, in their day, those who read Zola certainly considered themselves more of an elite than did the readers of Henry James. The ordinary people, if they read at all, preferred sentimental romances and "penny dreadfuls." Popular literature had already become commercially produced entertainment literature, a type which today is also provided by television scripts.

The elite who read serious literature are not necessarily members of a social or economic upper class. It has been said of the most ethereal French poet, Stéphane Mallarmé, that in every French small town there was a youth who carried his poems in his heart. These poems are perhaps the most "elite" product of western European civilization, but the "youths" referred to were hardly the sons of dukes or millionaires. (It is a curious phenomenon that, since the middle of the 18th century in Europe and in the United States, the majority of readers of serious literature—as well as of entertainment literature—have been women. The extent of the influence that this audience has exerted on literature itself must be immense.)

Hippolyte Taine's ecological theory of literature

National and group literature. Hippolyte Taine, the 19th-century French critic, evolved an ecological theory of literature. He looked first and foremost to the national characteristics of western European literatures, and he found the source of these characteristics in the climate and soil of each respective nation. His *History of English Literature* (5 vol., 1863–69) is an extensive elaboration of these ideas. It is doubtful that anyone today would agree with the simplistic terms in which Taine states his thesis. It is obvious that Russian literature differs from English or French from German. English books are written by Englishmen, their scenes are commonly laid in England, they are usually about Englishmen and they are designed to be read by Englishmen—at least in the first instance. But modern civilization becomes more and more a world civilization, wherein works of all peoples flow into a general fund of literature. It is not unusual to read a novel by a Japanese author one week and one by a black writer from West Africa the next. Writers are themselves affected by this cross-fertilization. Certainly, the work of the great 19th-century Russian novelists has had more influence on 20th-century American writers than has the work of their own literary ancestors. Poetry does not circulate so readily, because catching its true significance in translation is so very difficult to accomplish. Nevertheless, for the past 100 years or so, the influence of French poetry upon all the literatures of the civilized world has not just been important, it has been pre-eminent. The tendentious elements of literature—propaganda for race, nation, or religion—have been more and more eroded in this process of wholesale cultural exchange.

Popular literature on the other hand is habitually tendentious both deliberately and unconsciously. It reflects and stimulates the prejudices and parochialism of its audience. Most of the literary conflicts that have seized the totalitarian countries during the 20th century stem directly from relentless efforts by the state to reduce elite literature to the level of the popular. The great proletarian novels of our time have been produced, not by Russians, but by American Negroes, Japanese, Germans, and—most proletarian of all—a German-American living in Mexico, B. Traven. Government control and censorship can inhibit literary development, perhaps deform it a little, and can destroy authors outright; but, whether in the France of Louis XIV or in the Soviet Union of the 20th century, it cannot be said to have a fundamental effect upon the course of literature.

Effect of censorship on literary development

The writer's position in society. A distinguishing characteristic of modern literature is the peculiar elite which it has itself evolved. In earlier cultures the artist, though he may have been neurotic at times, thought of himself as part of his society and shared its values and attitudes. Usually the clerkly caste played a personal, important role in society. In the modern industrial civilization, however, "scribes" became simply a category of skilled hired hands. The writer shared few of the values of the merchant or the entrepreneur or manager. And so the literary and artistic world came to have a subculture of its own. The antagonism between the two resultant sets of values is the source of what we call alienation—among the intellectuals at least (the alienation of the common man in urban, industrial civilization from his work, from himself, and from his fellows is another matter, although its results are reflected and intensified in the alienation of the elite). For about 200 years now, the artistic environment of the writer has not usually been shared with the general populace. The subculture known as bohemia and the literary and artistic movements generated in its little special society have often been more important—at least in the minds of many writers—than the historical, social, and economic movements of the culture as a whole. Even massive historical change is translated into these terms—the Russian Revolution, for instance, into Communist-Futurism, Constructivism, Socialist Realism. Western European literature could be viewed as a parade of movements—Romanticism, Realism, Naturalism, Futurism, Structuralism, and so on indefinitely. Some of the more journalistic critics, indeed, have delighted to regard it in such a way. But after the manifestos have been swept away, the meetings adjourned, the literary cafés of the moment lost their popularity, the turmoil is seen not to have made so very much difference. The Romantic Théophile Gautier (1811–72) and the Naturalist Emile Zola (1840–1902) have more in common than they have differences, and their differences are rather because of changes in society as a whole than because of conflicting literary principles.

Literary subcultures and movements

At first, changes in literary values are appreciated only at the upper levels of the literary elite itself, but often, within a generation, works once thought esoteric are being taught as part of a school syllabus. Most cultivated people once thought James Joyce's *Ulysses* incomprehensible or, where it was not, obscene. Today his methods and subject matter are commonplace in the commercial fiction of the mass culture. A few writers remain confined to the elite. Mallarmé is a good example—but he would have been just as ethereal had he written in the simplest French of direct communication. His subtleties are ultimately grounded in his personality.

Literature and the other arts. Literature has an obvious kinship with the other arts. Presented, a play is drama; read, a play is literature. Most important films have been based upon written literature, usually novels, although all the great epics and most of the great plays have been filmed at some time and thus have stimulated the younger medium's growth. Conversely, the techniques required in writing for film have influenced many writers in structuring their novels and have affected their style. Most popular fiction is written with "movie rights" in mind, and these are certainly a consideration with most modern publishers. Literature provides the libretto for operas, the theme for tone poems—even so anomalous a form as Nietzsche's *Thus Spake Zarathustra* was interpreted in music by Richard Strauss—and of course it provides the lyrics of songs. Many ballets and modern dances are based on stories or poems. Sometimes, music and dance are accompanied by a text read by a speaker or chanted by a chorus. The mid-19th century was the heyday of literary, historical, and anecdotal painting, though, aside from the Surrealists, this sort of thing died out in the 20th century. Cross-fertilization of literature and the arts now takes place more subtly, mostly in the use of parallel techniques—the rational dissociation of the Cubists or the spontaneous action painting of the Abstract Expressionists, for example, which flourished at the same time as the free-flowing uncorrected narratives of some novelists in the 1950s and '60s.

LITERARY GENRES

Critics have invented a variety of systems for treating literature as a collection of genres. Often these genres are artificial, invented after the fact with the aim of making literature less sprawling, more tidy. Theories of literature must be based upon direct experience of the living texts and so be flexible enough to contain their individuality and variety. Perhaps the best approach is historical, or genetic. What actually happened, and in what way did literature evolve up to the present day?

Oral literature

There is a surprising variety of oral literature among surviving preliterate peoples, and, as the written word emerges in history, the indications are that the important literary genres all existed at the beginning of civilized societies: heroic epic; songs in praise of priests and kings; stories of mystery and the supernatural; love lyrics; personal songs (the result of intense meditation); love stories; tales of adventure and heroism (of common peoples, as distinct from the heroic epics of the upper classes); satire (which was dreaded by barbaric chieftains); satirical combats (in which two poets or two personifications abused one another and praised themselves); ballads and folktales of tragedy and murder; folk stories, such as the tale of the clever boy who performs impossible tasks, outwits all his adversaries, and usually wins the hand of the king's daughter; animal fables like those attributed to Aesop (the special delight of Black Africa and Indian America); riddles, proverbs, and philosophical observations; hymns, incantations, and mysterious songs of priests; and finally actual mythology—stories of the origin of the world and the human race, of the great dead, and of the gods and demigods.

Epic. The true heroic epic never evolved far from its preliterate origins, and it arose only in the Heroic Age which preceded a settled civilization. The conditions reflected in, say, the *Iliad* and *Odyssey* are much the same as those of the Anglo-Saxon *Beowulf,* the German *Nibelungenlied,* or the Irish stories of Cdchulainn. The literary epic is another matter altogether. Virgil's *Aeneid,* for instance, or Milton's *Paradise Lost* are products of highly sophisticated literary cultures. Many long poems sometimes classified as epic literature are no such thing—Dante's *La divina Commedia,* for example, is a long theological, philosophical, political, moral, and mystical poem. Dante considered it to be a kind of drama which obeyed the rules of Aristotle's *Poetics.* Goethe's *Faust* is in dramatic form and is sometimes even staged—but it is really a philosophical poetic novel. Modern critics have described long poems such as T.S. Eliot's *Waste Land* and Ezra Pound's *Cantos* as "philosophical epics." There is nothing epic about them; they are reveries, more or less philosophical.

Lyric poetry. Lyric poetry never gets far from its origins, except that some of its finest examples—Medieval Latin, Provençal, Middle High German, Middle French, Renaissance—which today are only read, were actually written to be sung. In the 20th century, however, popular songs of great literary merit have become increasingly common—for example, the songs of Bertolt Brecht and Kurt Weill in German, of Georges Brassens and Anne Sylvestre in French, and of Leonard Cohen, Bob Dylan, and Joni Mitchell. It is interesting to note that, in periods when the culture values artificiality, the lyric becomes stereotyped. Then, after a while, the poets revolt and, usually turning to folk origins, restore to lyric poetry at least the appearance of naturalness and spontaneity.

Diverse forms of satire

Satire. The forms of satire are as manifold as those of literature itself—from those of the mock epic to the biting epigram. A great many social and political novels of today would have been regarded as satire by the ancients. Many of the great works of all time are satires, but in each case they have risen far above their immediate satirical objectives. The 16th-century medieval satire on civilization, the *Gargantua and Pantagruel* of Rabelais, grew under the hand of its author into a great archetypal myth of the lust for life. Cervantes' *Don Quixote,* often called the greatest work of prose fiction in the West, is superficially a satire of the sentimental romance of knightly adventure. But, again, it is an archetypal myth, telling the adventures of the soul of man—of the individual—in the long struggle with what is called the human condition. *The Tale of Genji* by Murasaki Shikibu has sometimes been considered by obtuse critics as no more than a satire on the sexual promiscuity of the Heian court. In fact, it is a profoundly philosophical, religious, and mystical novel.

The earliest prose fiction

Prose fiction. Extended prose fiction is the latest of the literary forms to develop. We have romances from classical Greek times that are as long as short novels; but they are really tales of adventure—vastly extended anecdotes. The first prose fiction of any psychological depth is the *Satyricon,* almost certainly attributed to Petronius Arbiter (died AD 65/66). Though it survives only in fragments, supposedly one-eleventh of the whole, even these would indicate that it is one of the greatest picaresque novels, composed of loosely connected episodes of robust and often erotic adventure. The other great surviving fiction of classical times is the *Metamorphoses* (known as *The Golden Ass)* by Apuleius (2nd century AD). In addition to being a picaresque adventure story, it is a criticism of Roman society, a celebration of the religion of Isis, and an allegory of the progress of the soul. It contains the justly celebrated story of Cupid and Psyche, a myth retold with psychological subtlety. Style has much to do with the value and hence the survival of these two works. They are written in prose of extraordinary beauty, although it is by no means of "classical" purity. The prose romances of the Middle Ages are closely related to earlier heroic literature. Some, like Sir Thomas Malory's 15th-century *Le Morte Darthur,* are retellings of heroic legend in terms of the romantic chivalry of the early Renaissance, a combination of barbaric, medieval, and Renaissance sensibility which, in the tales of Tristram and Isolt and Launcelot and Guinevere, produced something not unlike modem novels of tragic love.

The Western novel is a product of modem civilization, although in the Far East novels began a separate development as early as the 10th century. Extended prose works of complex interpersonal relations and motivations begin in 17th-century France with *The Princess of Cleves* (1678) by Madame de La Fayette. Eighteenth-century France produced an immense number of novels dealing with love analysis but none to compare with Madame de La Fayette's until Pierre Choderlos de Laclos wrote *Les Liaisons dangereuses* (1782). This was, in form, an exchange of letters between two corrupters of youth; but, in intent, it was a savage satire of the *ancien régime* and a heart-rending psychological study. The English novel of the 18th century was less subtle, more robust—vulgar in the best sense—and is exemplified by Henry Fielding's *Torn Jones* (1749) and Laurence Sterne's *Tristram Shandy.* The 19th century was the golden age of the novel. It became ever more profound, complex, and subtle (or, on the other hand, more popular, eventful, and sentimental). By the beginning of the 20th century it had become the most common form of thoughtful reading matter and had replaced, for most educated people, religious, philosophical, and scientific works as a medium for the interpretation of life. By the late 1920s the novel had begun to show signs of decay as a form, and no works have since been produced to compare with the recent past. This may prove to be a temporarily barren period, or else the novel may be losing its energy as a narrative art form and in this sense giving way to the medium of film.

Current state of the novel

Drama. Like lyric poetry, drama has been an exceptionally stable literary form. Given a little leeway, most plays written by the beginning of the 20th century could be adjusted to the rules of Aristotle's *Poetics.* Before World War I, however, all traditional art forms, led by painting, began to disintegrate, and new forms evolved to take their place. In drama the most radical innovator was August Strindberg (1849–1912), and from that day to this, drama (forced to compete with the cinema) has become ever more experimental, constantly striving for new methods, materials, and, especially, ways to establish a close relationship with the audience. All this activity has profoundly modified drama as literature.

Future developments. In the 20th century the methods of poetry have also changed drastically, although the "innovator" here might be said to have been Baudelaire (1821–67). The disassociation and recombination of ideas of the Cubists, the free association of ideas of the Surrealists, dreams, trance states, the poetry of preliterate people—all have been absorbed into the practice of modern poetry. This proliferation of form is not likely to end. Effort that once was applied to perfecting a single pattern in a single form may in the future be more and more directed toward the elaboration of entirely new "multimedia" forms, employing the resources of all the established arts. At the same time, writers may prefer to simplify and polish the forms of the past with a rigorous, Neoclassicist discipline. In a worldwide urban civilization, which has taken to itself the styles and discoveries of all cultures past and present, the future of literature is quite impossible to determine.

WRITINGS ON LITERATURE

Scholarly research. Research by scholars into the literary past began almost as soon as literature itself—as soon

Ancient literary scholarship

as the documents accumulated—and for many centuries it represents almost all the scholarship that has survived. The most extensive text of the Sumerian *Epic of Gilgamesh,* the first of the world's great classics, is a late Assyrian synthesis that must have required an immense amount of research into clay tablets, written in several languages going back to the beginning of Mesopotamian civilization. Many Egyptian poems and the philosophic creation myth known as the "Memphite Theology" survive in very late texts that carefully reproduce the original language of the first dynasties. Once the function of the scribe was established as essential, he invented literary scholarship, both to secure his position and to occupy his leisure. The great epoch of literary scholarship in ancient times centred on the library (and university) of Alexandria from its foundation in 324 BC to its destruction by the Arabs in AD 640. Hellenistic Greek scholars there developed such an academic and pedantic approach to literary scholarship and scholarly literature that the term Alexandrine remains pejorative to this day. To them, however, is owed the survival of the texts of most of the Greek classics. Roman literary scholarship was rhetorical rather than analytic. With the coming of Islām, there was established across the whole warm temperate zone of the Old World a far-flung community of scholars who were at home in learned circles from India to Spain. Judaism, like Islām, was a religion of the book and of written tradition, so literary scholarship played a central role in each. The same is true of India, China, and later Japan; for sheer bulk, as well as for subtlety and insight, Oriental scholarship has never been surpassed. In a sense, the Renaissance in Europe was a cultural revolution led by literary scholars who discovered, revived, and made relevant again the literary heritage of Greece and Rome. In the 19th century, literary scholarship was dominated by the exhaustive, painstaking German academician, and that Germanic tradition passed to the universities of the United States. The demand that every teacher should write a master's thesis, a doctor's dissertation, and, for the rest of his career, publish with reasonable frequency learned articles and scholarly books, has led to a mass of scholarship of widely varying standards and value. Some is trivial and absurd, but the best has perfected the texts and thoroughly illuminated the significance of nearly all the world's great literature.

Literary criticism. Literary criticism, as distinguished from scholarly research, is usually itself considered a form of literature. Some people find great critics as entertaining and stimulating as great poets, and theoretical treatises of literary aesthetics can be as exciting as novels. Aristotle, Longinus, and the Roman rhetorician and critic Quintilian are still read, although Renaissance critics like the once all-powerful Josephus Scaliger are forgotten by all but specialized scholars. Later critics, such as Poe, Sainte-Beuve, Taine, Vissarion Belinsky, Matthew Arnold, Walter Bagehot, Walter Pater, and George Saintsbury, are probably read more for themselves than for their literary judgments and for their general theorizing rather than for their applications (in the case of the first three, for instance, time has confounded almost all the evaluations they made of their contemporaries). The English critics have survived because they largely confined themselves to acknowledged masterpieces and general ideas. Perhaps literary criticism can really be read as a form of autobiography. Aestheticians of literature like I.A. Richards, Sir C.M. Bowra, Paul Valéry, Suzanne Langer, and Ernst Cassirer have had an influence beyond the narrow confines of literary scholarship and have played in our time something approaching the role of general philosophers. This has been true on the popular level as well. The Dane Georg Brandes, the Americans James Gibbons Huneker, H.L. Mencken, and Edmund Wilson—these men have been social forces in their day. Literary criticism can play its role in social change. In Japan, the overthrow of the shogunate, the restoration of the emperor, and the profound change in the Japanese social sensibility begins with the literary criticism of Moto-ori Norinaga (1730–1801). The 19th-century revolution in theology resulted from the convergence of Darwinian theories of evolution and the technical and historical criticism of the Bible that scholars had undertaken. For many modern intellectuals, the literary quarterlies and weeklies, with their tireless discussions of the spiritual significance and formal characteristics of everything from the greatest masterpiece to the most ephemeral current production, can be said to have filled the place of religion, both as rite and dogma.

BIBLIOGRAPHY. The best introduction to literature is literature itself, a systematic reading of the world's classics. Today there is a multitude of inexpensive editions of these works available, both in hardcover and paperback, many of them newly translated into English and often containing up-to-date critical notes and introductions. Writings by major critics of the English language are being issued in the "Regents Critics Series," to be followed by the writings of critics in other languages.

Literature, East Asian

The literatures of the countries of East Asia—of China, Korea, and Japan—exhibit the same strong similarities that are evident in their other arts as well as profound differences emerging from the distinctive histories and institutions of the individual lands. As in the visual and performing arts and elsewhere, China provided vital literary influences to its neighbours, in the examples of written language and of literary genres, allowing the Japanese and Korean peoples to transform the gifts through their own particular geniuses.

Generalizations about the literatures of these countries cannot be made across great periods of time—written Chinese literature is perhaps the oldest in the world—nor are they always as applicable to one country as to another. Certain tendencies, often submerged or redirected at various periods, do assert themselves in comparison to Western literatures, however, at least until the 20th century, when the full scope of Western genres was exploited by writers in the East. Songs and lyric poetry comprised some of the very earliest known examples of East Asian writings, and a vein of lyricism and of concern with the interactions of nature with man and his emotions has overweighed the development of intellectual or analytical systems of thought and exposition. For long periods in China, historical and didactic writing were considered, with poetry, to constitute literature, and fictional writings were assigned a very low place. Though the ballad emerged in some countries of East Asia, the epic form as constructed in the West was unknown. Characteristic, also, was a sense of authority from the past that, though it did not prohibit change in literary expression, served to inhibit the kind of experimentation and search for whatever is new that has impelled Western literature into relatively rapid alternations in taste and mode. Perhaps the most formative influence on the literatures of East Asia has been the religions of the region, not only Confucianism, Taoism, and Shintō that were indigenous but also Buddhism, which was imported at an early date from South Asia.

But too much can be made of such generalities. A full understanding of East Asian literatures can be achieved only through reference to the great influences on thought and philosophy which are contained in the articles BUDDHIST SACRED LITERATURE; CONFUCIAN TEXTS, CLASSICAL; HINDU SACRED LITERATURE; and TAOIST LITERATURE. See also BUDDHIST MYSTICISM; CHINESE MYTHOLOGY; HINDU MYTHOLOGY; and SHINTO. For coverage of closely related forms, see DANCE AND THEATRE, EAST ASIAN; KABUKI THEATRE; and NO THEATRE. The contemporary cultural status of the countries is incorporated in the articles CHINA; JAPAN; KOREA, NORTH; and KOREA, SOUTH.

This article is divided into the following major sections:

I. Chinese literature
  - General characteristics
  - History
    - Origins: *c.* 1400–220 BC
    - Ch'in and Han dynasties: 221 BC–AD 220
    - The Six Dynasties and Sui dynasty: AD 221–618
    - T'ang and Five Dynasties: 618–960
    - Sung dynasty: 960–1279
    - Yüan dynasty: 1279–1368
    - Ming dynasty: 1368–1644
    - Ch'ing dynasty: 1644–1912
    - Modern Chinese literature: 1916 to the present

II. Korean literature
  - Traditional forms and genres
    - Lyric poems
    - Prose
    - Oral literature
    - Literature in classical Chinese
  - Historical development
    - The earliest literature: before 57 BC
    - Literature of the Three Kingdoms: 57 BC–AD 668
    - Literature of Unified Silla: 668–935
    - Literature of Koryŏ: 935–1392
    - Literature of the early Chosŏn period: 1392–1598
    - Literature of the later Chosŏn period: 1598–1894
    - Transitional literature: 1894–1910
    - Modern literature: 1910 to the present

III. Japanese literature
  - Earliest literature
  - Classical literature: Heian period (794–1185)
  - Medieval literature: Kamakura, Muromachi, and Azuchi-Momoyama periods (1192–1600)
    - Kamakura period (1192–1333)
    - The Muromachi (1338–1573) and Azuchi-Momoyama (1574–1600) periods
  - Literature during the Tokugawa period (1603–1867)
    - Early Tokugawa period (1603–c. 1770)
    - Late Tokugawa period (*c.* 1770–1867)
  - Modern literature

(Ed.)

I. Chinese literature

GENERAL CHARACTERISTICS

Chinese literature is one of the major literary heritages of the world, with a number of distinctive phenomena and characteristics.

First of all, it has an uninterrupted history of more than 3,000 years, dating back at least to the 14th century BC. Its medium, the Chinese language, has retained its unmistakable identity in both its spoken and written aspects in spite of generally gradual changes in pronunciation, the emergence of regional and local dialects, and several stages in the structural representation of the written graphs, or "characters." Even the partial or total conquests of China for considerable periods by non-Chinese ethnic groups from outside the Great Wall failed to disrupt this continuity; for the conquerors were forced to adopt the written Chinese language as their official medium of communication because they had none of their own. Since the Chinese graphs were inherently nonphonetic, they were at best unsatisfactory tools for the transcription of a non-Chinese language; and attempts at creating a new alphabetic–phonetic written language for empire building proved unsuccessful on three separate occasions. The result was that after a period of alien domination, the conquerors were culturally assimilated (except the Mongols, who retreated en masse to their original homeland after the collapse of the Yuan [or Mongol] dynasty in 1368). Thus, there was no disruption in China's literary development.

Second, through cultural contacts, Chinese literature has profoundly influenced the literary traditions of other Asian countries, particularly Korea, Japan, and Vietnam. Not only was the Chinese script adopted for the written language in these countries but some writers adopted the Chinese language as their chief literary medium.

Third, the graphic nature of the written aspect of the Chinese language has produced a number of noteworthy effects upon Chinese literature and its diffusion: (1) Chinese literature, especially poetry, recorded in handwriting or in print purports to make an aesthetic appeal to the reader that is visual as well as aural. A poem composed of five-syllable lines, for example, could be recorded in such a way as to reveal automatically to the eye as well as the ear the uniformity of line length without making the attempt seem artificial. (2) This visual appeal of the graphs has in fact given rise to the elevated status of calligraphy in China, where it has been regarded for at least the last 16 centuries as a fine art comparable to painting. Scrolls of calligraphic renderings of poems and prose selections have continued to be hung alongside paintings in the homes of the common people as well as the elite, converting these literary gems into something to be enjoyed in everyday living. (3) On the negative side, such a writing system has been an impediment to education and the spread of literacy, thus reducing the number of readers of literature; for even a rudimentary level of reading and writing requires knowledge of more than 1,000 graphs, together with their pronunciation. (4) On the other hand, the Chinese written language, even with its obvious disadvantages, has been a potent factor in perpetuating the cultural unity of the growing millions of the Chinese people, including assimilated groups in far-flung peripheral areas. Different in function from recording words in an alphabetic–phonetic language, the graphs are not primarily indicators of sounds and can therefore be pronounced in variant ways to accommodate geographical diversities in speech and historical phonological changes without damage to the meaning of the written page. As a result, the major dialects in China never developed into separate written languages as did the Romance languages and, although the reader of a Confucian Classic in southern China might not understand the everyday speech of someone from the far north, Chinese literature has continued to be the common asset of the whole Chinese people. By the same token, the graphs of China could be utilized by speakers of other languages as their literary mediums.

Fourth, the pronunciation of the Chinese graphs has also influenced the development of Chinese literature. The fact that each graph had a monophonic pronunciation in a given context created a large number of homonyms, which would lead to misunderstanding and confusion when spoken or read aloud without the aid of the graphs. One corrective was the introduction of tones or pitches in pronunciation. As a result, metre in Chinese prosody is not concerned with the combination of syllabic stresses, as in English, but with those of syllabic tones, which produce a different but at least equally pleasing cadence. This tonal feature of the Chinese language has brought about an intimate relationship between poetry and music in China. All major types of Chinese poetry were originally sung to the accompaniment of music. Even after the musical scores were lost, the poems were, as they still are, more often chanted—in order to approximate singing—than merely read.

Relationship between poetry and music

Chinese poetry, besides depending on end rhyme and tonal metre for its cadence, is characterized by its compactness and brevity. There are no epics of either folk or literary variety and hardly any narrative or descriptive poems that are long by the standards of world literature. Stressing the lyrical, as has often been pointed out, the Chinese poet refrains from being exhaustive, marking instead the heights of his ecstasies and inspiration or the depths of sorrow and sympathy. A short poem in Chinese sometimes resembles a cablegram, wherein verbal economy is highly desirable. "Pronouns and conjunctions are almost always omitted. A word or two frequently indicates an allusion to a very complex thought or situation that may require paragraphs of elucidation ” This explains why some poems have been differently interpreted by learned commentators and competent translators.

It has also been observed that the line of demarcation between prose and poetry is much less distinctly drawn in Chinese literature than in other national literatures. This is clearly reflected in three genres. The fu, for example, "stands on the border line of poetry and prose. Strictly neither the one nor the other, it contains elements of both." It uses rhyme and metre and not infrequently also antithetic structure, but despite occasional flights into the realm of the poetic, it retains the features of prose without being necessarily prosaic. This accounts for various labels given to it in English by writers on Chinese literature—poetic prose, rhyme prose, prose poem, and prose poetry.

Another genre belonging to this category is *p'ien* wen ("parallel prose"), characterized by antithetic construction and balanced tonal patterns without the use of rhyme, which is suggestive of "a team of paired horses," as is implied in its Chinese designation. Despite the polyphonic effect thus produced, which approximates that of poetry, it has often been made the vehicle of proselike exposition and argumentation. Another genre, a peculiar mutation in this borderland, is the pa-ku wen ("eight-legged essay"). Now generally regarded as unworthy of classification as literature, for centuries (from 1487 to 1901) it dominated the field of Chinese writing as the principal yardstick in grading candidates in the official competitive civil-service literary examinations. A unique example of rhetorical gymnastics and verbal acrobatics, it exploited antithetical construction and contrasting tonal patterns to the limit by requiring pairs of columns consisting of long paragraphs, one responding to the other, word for word, phrase for phrase, sentence for sentence. A fad that stifled literary creativity and stunted intellectual advancement, despite its neat schematic architectonics and artificial euphony, it is no wonder that it was the only genre incapable of surviving the test of time.

The two kinds of prose

Chinese prose writing has been diverted into two streams, separated at least for the last 1,000 years by a gap much wider than the one between folk songs and so-called literary poems. Classical, or literary, prose (ku-wen, or wen-yen) aims at the standards and styles set by ancient writers and their distinguished followers of subsequent ages, with the Confucian Classics and the early philosophers as supreme models. While the styles may vary with individual writers, the language is always far removed from their spoken tongues. Sanctioned by official requirement for the competitive examinations and dignified by traditional respect for the cultural accomplishments of past ages, this medium became the linguistic tool of practically all Chinese prose writers. Vernacular prose (pai-hua), in contrast, comprises writings in the living tongue, the everyday language of the authors. Traditionally considered inferior, the medium was piously avoided for creative writing until it was adopted on occasion by novelists and playwrights from the 13th century on.

HISTORY

Origins: c. 1400–220 **BC.** The oldest specimens of Chinese writing extant are inscriptions on bones and tortoise shells dating back to the last three centuries of the Shang dynasty (c. 1384–c. 1122 BC) and recording divinations performed at the royal capital. These inscriptions, like those engraved on ceremonial bronze vessels toward the end of the Shang period, are usually brief and factual and cannot be considered literature. Nonetheless, they are significant in that their sizable vocabulary (about 3,400 characters, of which nearly 2,000 have been reliably deciphered) has proved to be the direct ancestor of the Chinese script of today. Moreover, the syntactical structure of the language bears a striking resemblance to later usages. From the frequent occurrences in the bone inscriptions of such characters as "dance" and "music," "drum" and "chimes" (of stone), "words" and "southern" (airs), it can safely be inferred that, by the Shang dynasty, songs were sung to the accompaniment of dance and music; but these songs are now lost.

First anthology of poetry: Shih Ching

Poetry. The first anthology of Chinese poetry, known as the Shih *Ching* ("Classic of Poetry") and consisting of temple, court, and folk songs, was given definitive form somewhere around the time of Confucius (551–479 BC).

But its 305 songs range in date from the very beginning of the Chou dynasty *(c.* 1122 BC) to around 585 BC, when the dynasty was already declining.

The ***Shih Ching*** is generally accounted the third of the five Confucian Classics, the other four of which are: (1) the **I** ***Ching*** ("Classic of Changes"), a book of divination; (2) the ***Shu Ching*** ("Classic of History"), a collection of official documents; (4) the ***Li chi*** ("Record of Rites"), a book of rituals with accompanying anecdotes; and (5) the ***Ch'un-ch'iu*** ("Spring and Autumn") annals, a chronological history of the feudal state of Lu, where Confucius was born, consisting of topical entries of major events from 722 to 481 BC. The Five Classics have been held in high esteem by Chinese scholars since the 2nd century BC. (For a discussion of the **I** ***Ching*** and ***Shu Ching,*** see below ***Prose.)***

The poems of the ***Shih Ching*** were originally sung to the accompaniment of music; and some of them, especially temple songs, were accompanied also by dancing.-(In all subsequent periods of Chinese literary history, new trends in poetry were profoundly influenced by music.) Most of the poems of the ***Shih Ching*** have a preponderantly lyrical strain whether the subject is hardship in military service or seasonal festivities, agricultural chores or rural scenes, love or sports, aspirations or disappointments of the common folk and of the declining aristocracy. Apparently, the language of the poems was relatively close to the daily speech of the common people, and even repeated attempts at refinement during the long process of transmission have not spoiled their freshness and spontaneity. In spite of this, however, when the songs are read aloud and not sung to music their prevailing four-syllable lines conduce to monotony, hardly redeemed by the occasional interspersion of shorter or longer lines; a sample (in modern pronunciation) illustrates this:

Kuan kuan tsui chiu
Tsai he chih chou
Miao t'iao shu nü
Chün tzu hao ch'iu
"Kuan kuan" *cry* the ospreys
On the islet in the river.
Lovely is the good lady,
Fit bride for our lord.

If there ever was an epic tradition in ancient China comparable to that of early India or the West, only dim traces of it persist in the written records. The ***Shih Ching*** has a few narrative poems celebrating heroic deeds of the royal ancestors, but these are rearranged in cycles and only faintly approximate the national epics of other peoples. One cycle, for example, records the major stages in the rise of the Chou kingdom, from the supernatural birth of its remote founder to its conquest of the Shang kingdom. These episodes, which, according to traditional history, cover a period of more than 1,000 years, are dealt with in only about 402 lines. Other cycles, which celebrate later military exploits of the royal Chou armies, are even briefer.

The ***Shih Ching*** exerted a profound influence on Chinese poetry that, generally speaking, has stressed the lyrical rather than the narrative element; a dependence more on end rhymes for musical effect than on other rhetorical devices; regular lines, consisting of a standard number of syllables; and utilization of intonation inherent in the language for rhythm, instead of the alternation of stressed and unstressed syllables as in Western poetry. The high regard in which this anthology has been held in China is due both to its antiquity and to the legend that Confucius himself edited it. It was elevated in 136 BC to the position of a major classic in the Confucian canon.

Ch'u tz'u

Meanwhile, another type of poetry, also originating in music and dance, had developed in the south, in the basin of the Yangtze River, an area dominated by the principality of Ch'u—hence the generic appellation ***Ch'u tz'u,*** or "songs of Ch'u." These southern songs, though adorned with end rhymes like the songs of the ***Shih Ching,*** follow a different metrical pattern: the lines are usually longer and more irregular and are commonly (though not always) marked by a strong caesura in the middle, with a syllable representing a sigh. Their effect is thus rather plaintive, and they lend themselves to chanting instead of singing. The beginning of this tradition is obscure because most of the early samples were eclipsed by the brilliant 4th/3rd-century BC compositions of the towering genius Ch'ii Yüan, China's first known poet.

Among some 25 elegies attributed to Ch'ii Yuan, the most important and longest is ***Li sao*** ("On Encountering Sorrow"), which has been described as a politico-erotic ode, relating by means of a love allegory the poet's disappointment with his royal master and describing his imaginary travels in distant regions and the realms of heaven, in an attempt to rid himself of his sorrow. Ch'ii Yiian committed suicide by drowning in the Mi-lo River; and his tragic death, no less than his beautiful elegies, helped to perpetuate the new literary genre. In contrast to the poems of the ***Shih Ching,*** which had few successful imitators, the genre created by Ch'ii Yüan was cultivated for more than five centuries, with later revivals.

Prose. Prior to the rise of the philosophers in the 6th century BC, brief prose writings were reported to be numerous; but of these only two collections have been transmitted: the ***Shu,*** or ***Shu Ching*** ("Classic of History"), consisting of diverse kinds of primitive state papers, such as declarations, portions of charges to feudal lords, and orations; and the **I,** or **I** ***Ching*** ("Classic of Changes"), a fortune-telling manual. Both grew by accretion and, according to a very doubtful tradition, were edited by Confucius himself. Neither can be considered literature, but both have exerted influence on Chinese writers for over 2,000 years as a result of their inclusion in the Confucian canon.

Earliest writings claiming individual authorship

The earliest writings claiming individual "authorship," in the loose sense of the term, are the ***Lao-tzu,*** or ***Tao-te Ching*** ("Classic of the Way of Power"), attributed to Lao-tzu, who is credited with being the founder of Taoism and who might have been an older contemporary of Confucius, and the ***Lun yü,*** or ***Analects*** (selected miscellaneous passages), of Confucius. Neither philosopher wrote extensively, and the gist of their teachings was recorded by their followers. Thus, the ***Lao-tzu*** consists of brief summaries of Lao-tzu's sayings, many in rhyme and others in polished prose to facilitate memorization. Likewise, the ***Analects*** is composed of collections of the sage's sayings, mostly as answers to questions or as a result of discussions because writing implements and materials were expensive and scarce. The circumstances of the conversations, however, were usually omitted; and as a consequence the master's words often sound cryptic and disjointed, despite the profundity of the wisdom.

By about 400 BC, writing materials had improved, and a change in prose style resulted. The records of the discourses became longer, the narrative portions more detailed; jokes, stories, anecdotes, and parables, interspersed in the conversations, were included. Thus, the ***Mencius,*** or ***Meng-tzu,*** the teachings of Mencius, not only is three times longer than the ***Analects*** of Confucius but also is topically and more coherently arranged. The same characteristic may be noticed in the authentic chapters of the ***Chuang-tzu,*** attributed to the Taoist sage Chuang-tzu, who "in paradoxical language, in bold words, and with subtle profundity, gave free play to his imagination and thought. . . . Although his writings are inimitable and unique, they seem circuitous and innocuous. Although his utterances are irregular and formless, they are unconventional and readable . . ." (quoted from the epilogue of the ***Chuang-tzu).***

Well-developed essay

The first real example of the well-developed essay, however, is found neither in the ***Mencius*** nor in the ***Chuang-tzu*** but in the ***Mo-tzu,*** attributed to Mo Ti, or Mo-tzu, a predecessor of Mencius and Chuang-tzu, whose singular attainments in logic made him a forceful preacher. His recorded sermons are characterized by simplicity of style, clarity of exposition, depth of conviction, and directness of appeal.

The prose style continued to be developed by such outstanding philosopher-essayists as Hsiin-tzu and his pupil, the Legalist Han-fei-tzu. The peak of this development, however, was not reached until the appearance of the first expertly arranged full-length book, ***Lii-shih Ch'un Ch'iu***

("The Spring and Autumn [Annals] of Mr. Lü"), completed in 240 BC under the general direction of Lü Pu-wei. The work, 60 essays in 26 sections, summarizes the teachings of the several schools of philosophy as well as the folklore of the various regions of China.

The *fu* genre

Ch'in and Han dynasties: 221 BC–AD 220. *Poetry.* Following the unification of the empire by the Ch'in dynasty (221–206 BC) and the continuation of the unified empire under the Han (206 BC–AD 220), literary activities took new directions. At the Imperial and feudal courts, the *fu* genre, a combination of rhyme and prose (see above *General characteristics),* began to flourish. Long and elaborate descriptive poetic compositions, the *fu* were in form a continuation of the Ch'u elegies, now made to serve a different purpose—the amusement of the new aristocracy and the glorification of the empire—by dwelling on such topics as the low table and the folding screen or on descriptions of the capital cities. But even the best *fu* writing, by such masters of the art as Mei Sheng and Ssu-ma Hsiang-ju, bordered on the frivolous and bombastic. Another major *fu* writer. Yang Hsiung, in the prime of his career remorsefully realized that the genre was a minor craft not worthy of a true poet. Nonetheless, the *fu* was almost universally accepted as the norm of creative writing, and nearly 1,000 pieces were produced that have survived.

A more important contribution to literature by the Han government was the reactivation in 125 BC of the Yüeh Fu, or Music Bureau, which had been established at least a century earlier to collect songs and their musical scores. Besides temple and court compositions of ceremonial verse, this office succeeded in preserving a number of songs sung or chanted by the ordinary people, including songs from the border areas, which reveal alien influences. This category—called *yiieh-fu,* after the Music Bureau—includes not only touching lyrics but also charming ballads.

Ballads

One such ballad, "The Orphan," tells of an orphan's hardships and disappointments; the form of the poem—lines of irregular length, varying from three to six syllables (or graphs)—represents the singer's attempt to simulate the choking voice of the sufferers. *Lo-fu hsing* ("The Song of Lo-fu"; also called *Me shang sang,* "Roadside Mulberry Tree"), containing 53 five-syllable lines, recounts how a pretty young lady declined a carriage ride offered her by a government commissioner. The most outstanding folk ballad of this period is *K'ung-chiieh tung-nan fei* ("Southeast the Peacock Flies"). The longest poem of medieval China (353 lines), it relates the tragedy of a young married couple who had committed suicide as the result of the cruelty of the husband's mother. The ballad was probably first sung shortly after AD 200 and grew by accretion and refinement in oral transmission until it was recorded in final form for the first time around 550. *Yiieh-fu* songs, most of which are made up mainly of five-syllable lines, became the fountainhead of a new type of poetry, *Ku shih* ("ancient style poems"); contemporary Han dynasty poets at first merely refined the originals of the folk songs without claiming credit, and later imitated their fresh and lively metre.

Prose. Prose literature was further developed during the Ch'in and Han dynasties. In addition to a prolific output of philosophers and political thinkers—a brilliant representative of whom is Liu An, prince of Huai-nan, whose work is called *Huai-nan-tzu (c.* 140 BC; "The Master of Huai-nan")—an important and monumental category of Han dynasty literature consists of historical works. Outstanding among these is the *Shilz-chi (c.* 85 BC; "Historical Records") by Ssu-ma Ch'ien. A masterpiece that took 18 years to produce, it deals with major events and personalities of about 2,000 years (down to the author's time), comprising 130 chapters and totalling more than 520,000 words. The *Shill-chi* was not only the first general history of its kind attempted in China, it also set a pattern in organization for dynastic histories of subsequent ages. An artist as well as a historian, Ssu-ma Ch'ien succeeded in making events and personalities of the past into living realities for his readers. His great successor, the poet-historian-solider Pan Ku, author of the *Han shu* (history of the Han dynasty), which totals over 800,000 words, performed a similar tour de force but did not equal Ssu-ma Ch'ien in either scope or style.

Promotion of a standard literary language in the Han dynasty

Pan Ku's prose style, though not necessarily archaic, was more consciously literary—a result of the ever-widening gap between the spoken and written aspects of the language. This anomaly was more evident in China than elsewhere. and it was to have far-reaching effects on the evolution of Chinese literary tradition. In an attempt to resolve the difficulties of communication among speakers of many dialects in the empire, a standard literary language, *ku-wen,* or *wen-yen,* was promoted from the Han dynasty on. Perpetuated for more than 2,000 years, the literary language failed to keep pace with changes in the spoken tongue, and eventually it became almost unintelligible to the illiterate masses.

The Six Dynasties and Sui dynasty: AD 221–618. After the fall of the Han dynasty, there was a long period of political division (AD 221–589), with barely four decades of precarious unification (AD 280–317). Despite the social and political confusion and military losses, however, the cultural scene was by no means dismal. Several influences upon the development of literature are noteworthy. First, Buddhism, introduced earlier, had brought with it religious chants and Indian music, which helped to attune Chinese ears to the finer distinctions of tonal qualities in their own language. Second, aggressive northern tribes, who invaded and dominated the northern half of the country from 316, were being culturally absorbed and converted. Third, the political division of the empire between the South and the North (as a result of the domination of non-Chinese in the north) led to an increase in cultural differences and to a subsequent rivalry to uphold what was regarded as cultural orthodoxy, frequently resulting in literary antiquarianism.

Poetry. Folk songs flourished in both regions. In the South, popular love songs, originating in the coastal areas, which now come increasingly under Chinese political and cultural domination, attracted the attention of poets and critics. The love songs of the North were more militant. Reflecting this spirit most fully is the "Ballad of Mu Lan," which sings of a girl who disguised herself as a warrior and won glory on the battlefield.

Ts'ao Chih and T'ao Ch'ien

Soon the number of writers of "literary" poetry greatly increased. Among them, two poets deserve special mention. Ts'ao Chih (3rd century), noted for his ethereal lyricism, gave definite artistic form to the poetry of the five-syllable line, already popularized in folk song. T'ao Ch'ien (4th–5th centuries), also known as Tao Yüan-ming, is one of China's major poets and was the greatest of this period. A recluse, he retired from a post in the bureaucracy of the Chin dynasty at the age of 33 to farm, contemplate nature, and write poetry. His verse, written in a plain style, was echoed by many poets who came after him. Using several verse forms with seemingly effortless ease—including the *fu,* for *Kuei-ch'ii-lai tz'u* ("Homeward Bound")—he was representative of the trend of the age to explore various genres for lyrical expression. One of his best loved poems is the following *ku shih* (ancient style poem), translated by Arthur Waley; it is one of 12 he wrote at different times after he had been drinking.

I built my hut in a zone of human habitation,
Yet near me there sounds no noise of horse or coach.
Would you know how this is possible?
A heart that is distant creates a wilderness round it.
I pluck chrysanthemums under the eastern hedge,
Then gaze long at the distant hills.
The mountain air is fresh at the dusk of day;
The flying birds two by two return.
In these things there lies a deep meaning;
Yet when we would express it, words suddenly fail us.

Prose. As orthodox Confucianism gradually yielded to Taoism and later to Buddhism. nearly all of the major writers began to cultivate an uninhibited individuality. Lu Chi, 3rd-century poet and critic, in particular emphasized the importance of originality in creative writing and discredited the long-established practice of imitating the great masters of the past. Still, his celebrated essay on literature (*Wen fu*), in which he enunciated this princple, was written as a *fu*, showing after all that he was a child of his own age. The 3rd/4th-century Taoist philosopher Ko Hung insisted that technique is no less essential to a writer than moral integrity. The revolt of the age against conventionality was revealed in the new vogue of *ch'ing-t'an* ("pure conversation"), intellectual discussions on lofty and nonmundane matters, recorded in a 5th-century collection of anecdotes entitled *Shih shuo* ("Sayings of the World") by Liu Yi-ch'ing. Though prose writers as a whole continued to be most concerned with lyrical expression and rhetorical devices for artistic effect. there were notable deviations from the prevailing usage in the polyphonic type of prose called *p'ien-wen* ("parallel prose"). In this form, parallel construction of pairs of sentences and counterbalancing of tonal patterns were the chief requirements. *P'ien-wen* was used especially in works concerned with philosophical disputes and in religious controversies; but it was also used in the first book-length work of literary criticism, *Wen-hsin tiao-lung* ("Carving of the Literary Dragon"), by the 6th-century writer Liu Hsieh.

Development of **poly-**phonic prose: *p'ien-wen*

Among prose masters of the 6th century, two northerners deserve special mention: Yang Hsien-chih, author of *Lo-yang Chia-lan chi* ("Record of Buddhist Temples in Lo-yang"), and Li Tao-yiian, author of *Shui Ching chu* ("Commentary on the Water Classic"). Although both of these works seem to have been planned to serve a practical, utilitarian purpose, they are magnificent records of contemporary developments and charming storehouses of accumulated folklore, written with great spontaneity and artistry.

This age also witnessed the first impact of Buddhist literature in Chinese translation, which had been growing in size and variety since the 2nd century.

T'ang and **Five** Dynasties: **618–960.** During the T'ang dynasty (618–907), Chinese literature reached its golden age.

Poetry. In poetry, the greatest glory of the period, all the verse forms of the past were freely adopted and refined, and new forms were crystallized. A new form, which had been gradually evolving for over a century, was perfected early in the dynasty and given the definitive name *lü shih* ("regulated verse"). A poem of this kind consists of eight lines of five or seven syllables—each line set down in accordance with strict tonal patterns—calling for parallel structure in the middle, or second and third, couplets. The following poem by Shen Ch'üan-ch'i. addressed to the grandfather of the great T'ang poet Tu Fu in 705, illustrates the *lü shih* form (the Cantonese used here approximates the T'ang pronunciation then in use at the capital):

T'in cheung tei fut ling tau fan
Hui kwok lei ka kin puak wan
Lok p'o fung kwong ho soh ch'i
Sung shaan cheung lai pat ham man
Naam fau cheung hoi yan hoh chue
Pak mong hang yeung ngan kei kw'an
Leung tei kong shan maan yue lei
Hoh shi ch'ung kin shing ming kwan
The sierra divides the vast heaven and the wide earth.
Far away from country and home appear the same white clouds.
The scenery on the banks of the Lo River, what does it resemble?
The pestilential vapours of the Sung Mountain are unbearable!
Floating southward on the surging seas, where is my friend?
Going northward toward Hengyang [city], how many flocks are there of swans?
Between us are mountains and rivers stretching over ten thousand miles.
How soon are we again to see our sage and enlightened emperor?

Chüeh chii verse form

Another verse form much in vogue is the *chüeh chü* ("truncated verse"). An outgrowth and a shortened version of the *lü shih*, it omits either the first four lines, the last four lines, the first two and the last two lines, or the middle four lines. Thus, the tonal quality of the *lü shih* was retained, whereas antithetic structure was made optional. These poems of four lines, each consisting of five or seven words (syllables or characters), had to depend for their artistry on suggestiveness and economy comparable to The *Rubdiydt* of Omar Khayyam and the Japanese haiku. The following example is by Li Po (romanization in Mandarin):

Pu chien Tung Shan chiu
Ch'iang-wei chi tu hua
Pai yün huan tzu san
Ming Yiieh lo shui chia
For long *l* have not seen the Eastern Hill.
How many times has the rose flowered?
Do the white clouds as then scatter themselves?
And behind whose dwelling sets the moon?

The fine distinctions of tonal variations in the spoken language had reached their height during this period, with eight tones; and rules and regulations concerning the sequence of lighter and heavier tones had been formulated. But since the observance of strict rules of prosody was not mandatory in the *ku shih* ("ancient style") form still in use, it was possible for an individual poet to enjoy conformity or freedom as he saw fit.

Of the more than 2,000 T'ang poets whose works—totalling over 48,900 pieces—have been preserved, only a few can be mentioned. Meng Hao-jan, who led the life of a recluse, excelled in poems of five-syllable lines reminiscent of the spirit of T'ao Ch'ien. Wang Wei, a musician and the traditional father of monochrome landscape painting, was also a great poet. Influenced by Buddhism, he wrote exquisite meditative verse of man's relation to nature that exemplified his own dictum that poetry should have the beauty of painting and vice versa. Li Po, one of the two major poets of the T'ang dynasty, a lover of detachment and freedom, deliberately avoided the *lü shih*, or regulation poetry, and chose the less formal verse forms to sing of friendship or wine. An example is the poem "To Tan-Ch'iu," translated by Authur Waley.

My friend is lodging high in the Eastern Range,
Dearly loving the beauty of valleys and hills.
At green Spring he lies in the empty woods,
And is still asleep when the sun shines on high.
A pine-tree wind dusts his sleeves and coat;
A pebbly stream cleans his heart and ears.
1 envy you, who far from strife and talk
Are high-propped on a pillow of blue cloud.

The works of Tu Fu

Generally considered the greatest poet of China was Tu Fu, a keen observer of the political and social scene who criticized injustice wherever he found it and who clearly understood the nature of the great upheaval following the rebellion of dissatisfied generals in 755, which was a turning point in the fortunes of the T'ang. As an artist, Tu Fu excelled in all verse forms, transcending all rules and regulations in prosody while conforming to and exploiting them. His power and passion can perhaps be suggested by a single line (translated by Robert Payne): "Blue is the smoke of war, white the bones of men."

One of the admirers of Tu Fu as a poet-historian was Po Chü-i who, like his great predecessor, was deeply concerned with the social problems of his age. Po Chü-i sought to learn from ordinary folk not only naturalness of language but also their feelings and reactions, especially at the height of his career when he wrote what he called the *Hsin yiielz-fu shih* ("New Music Bureau Poems").

At the end of the T'ang and during the Five Dynasties, another new verse form developed. Composed normally of lines of irregular length and written as lyrics to musical tunes, this form came to be known as *tz'u*, in contrast with *slrih*, which includes all the verse forms mentioned above. Since the lines in a *tz'u* might vary from one to nine or even 11 syllables, they were comparable to the natural rhythm of speech and therefore easily understood when sung.

Development of *tz'u*

First sung by ordinary folk, they were popularized by professional women singers and finally, before the end of the T'ang, attracted the attention of poets. It was not, however, until the transitional period of the Five Dynasties (907–960), a time of division and strife, that *tz'u* became the major vehicle of lyrical expression. Of *tz'u* poets in this period, the greatest was Li Yü, last monarch of the Southern T'ang, who was seized in 976 as the new Sung dynasty consolidated its power. Li Yii's *tz'u* poetry is saturated with a tragic nostalgia for better days in the south; it is suffused with sadness—a new depth of feeling notably absent from earlier *tz'u*, which had been sung at parties and banquets. The following is typical, translated by Jerome Ch'en and Michael Bullock:

Lin hua hsieh liao ch'un hung
T'ai ch'ung ch'ung
Wu nai chno lai hart yii wan lai feng
Yen chih lei
Hsiang liu tsui
Chi shih ch'ung
Tzu shih jen sheng ch'ang hen shui ch'ang tung
The red of the spring orchard has faded.
Far too soon!
The blame is often laid
on the chilling rain at dawn
and the wind at dusk.
The rouged tears
That intoxicate and hold in thrall—
When will they fall again?
As a river drifts toward the east
So painful life passes to its bitter end.

Folk literature. Besides the early *tz'u*, the end of the T'ang saw the evolution of another new folk form: *pien-wen* ("popularizations," not to be confused with *p'ien-wen*, or balanced prose), utilizing both prose and verse to retell episodes from Buddha's life and, later, non-Buddhist stories from Chinese history and folklore.

Han Yü's reform of prose

Prose. In prose writing a major reform was led by Han Yii against the peculiarly artificial prose style of *p'ien-wen*, which, cultivated by the literati for almost 1,000 years; had become so burdened with restrictive rules as to make forthright expression virtually impossible. Han Yii boldly advocated the use of Chou philosophers and early Han writers as models for prose writing. This seemingly conservative reform had, in fact, a liberalizing effect; for the sentence unit in prose writing was now given perfect freedom to seek its own length and structural pattern as logic and content might dictate, instead of slavishly conforming to the rules of *p'ien-wen*. This new freedom enabled Liu Tsung-yuan, Han Yii's chief associate in the literary reform, to write charming travel and landscape pieces. It also accelerated the development of a new genre in prose: well-made tales of love and romance, of heroic feats and adventures, of the mysterious and supernatural, and of imaginary incidents and fictionalized history. Among the 9th-century writers of such prose romances were Han Yii's pupil Shen Ya-chih and Po Hsing-chien, younger brother of the poet Po Chu-i, as well as many other literary notables. These prose romances, generally short, were written in the more natural *ku wen*, or classical prose style, for the amusement of the literati and did not reach the masses until some of the popular ones were adapted by playwrights in later ages.

Sung dynasty: 960–1279. The Sung dynasty was marked by cultural advancement and military weakness. During this period, literary output was spectacularly increased, thanks mainly to the invention and improvement of printing from the 8th century and to the establishment of public schools throughout the empire from 1044. Nearly all the literary genres in verse and prose were continued; and some trends, begun in T'ang times, were accelerated.

Prose. In prose, the reform initiated by Han Yü in the name of ancient, more straightforward style *(ku-wen)* was re-emphasized by such 11th-century writers as Ou-yang Hsiu and Su Tung-p'o. Both men held high rank in the civil service and were great painters as well as leading poets. Nevertheless, their contribution to prose writing in *ku-wen* style was as important as their poetry. The *ku-wen* movement was further supported by men whose primary interest was not belles-lettres, such as Ssu-ma Kuang, the statesman-historian, and Chu Hsi, the scholar-philosopher and principal formulator of Neo-Confucianism, both of whom advocated greater naturalness in prose writing.

Sung trends in prose fiction

In prose fiction there were two distinct trends. Short tales in *ku-wen* were written in ever greater bulk but failed to maintain the level achieved in the T'ang dynasty. The subject matter became more fragmentary and anecdotal and the style duller. In sharp contrast to the *ku-wen* school, which was still a literary language despite the movement toward naturalness of expression, there arose a school of storytelling in the vernacular. Almost purely oral in origin, these tales remained unrecorded except for the bare outlines followed by the storyteller who entertained audiences gathered in marketplaces, fairgrounds, or temple yards. These promptbooks were gradually expanded and elaborated on, so that in the 12th century they became fairly lengthy, connected stories, especially those dealing with fictionalized history. This elevation of the everyday speech of the common people as a medium of story writing of the *hua-pen* ("story roots") type was to open up new vistas in prose fiction in later periods.

Poetry. Poetry of the conventional type (shih) was cultivated by numerous rival schools, each claiming many illustrious members. On the whole, the rival literary movements were significant as steps toward greater naturalness in syntax, and a few outstanding writers approximated the spoken vernacular language. Among the many shih poets of the Sung dynasty, Lu Yu, who flourished in the 12th century, was a towering figure. A traveller and patriot, he wrote throughout his long career no fewer than 20,000 poems, of which some 9,200 have been preserved.

But it was in their utilization of the newer verse form, *tz'u*, that Sung poets achieved their greatest distinction, making *tz'u* the major genre of the dynasty. As noted above, the *tz'u* form had been popularized at first orally by women singers; and the first generation of *tz'u* writers had been inspired and guided by them in sentiment, theme, and diction; their lyrics were thus redolent with the fragrance of these women. Later in the 12th century, as men (and one great woman) of letters began to take over, the *tz'u* form reached the heights of great art. Ou-yang Hsiu and Li Ch'ing-chao, the latter generally considered the greatest woman poet of China, may be considered representatives of this trend. Li Ch'ing-chao's poems, paralleling her life, are intensely personal. They at first dealt with the joys of love, but gradually their tone darkened to one of despair, caused first by frequent and lengthy separations from her husband, who was in government service, and then by his untimely death.

Other masters of the *tz'u* were Su Tung-p'o and Hsin Ch'i-chi, the latter a soldier turned recluse. It was Hsin Ch'i-chi who imbued the writing of tz'u with new characteristics by rising above rules without breaking them, surpassing in this respect his contemporaries as well as those who came after.

Yiian dynasty: 1279–1368. Fleeing from the Chin (Ju-chen) Tatars, who captured the Sung capital in 1126, the Sung dynasty retreated southward. For almost a century and a half, China was again divided. And in spite of political reunification by Kublai Khan, founder of the Yuan, or Mongol, dynasty (beginning in 1260 in the North and comprising the whole of China in 1280), the cultural split persisted. In the South, where China's historic traditions found asylum, racial and cultural homogeneity persisted. In fact, the centre of Chinese philosophy and traditional literature never again returned north of the Yangtze Delta. But in the North new developments arose, which led to wholly new departures. First, the migration and fusion of the various ethnic groups gave birth to a common spoken language with fewer tones, which later was to become the basis of a national language; second, with the southward shift of the centre of traditional culture, the prestige of the old literature began to decline in the North, especially in the eyes of the conquerors. Thus, in contrast to the South, North China under the Yuan dynasty provided a unique milieu for unconventional literary activities.

Drama. In this period, dramatic literature came into a belated full flowering. The skits and vaudeville acts, the puppet shows and shadow plays of previous ages had laid the foundation for a full-fledged drama; but the availability of Indian and Iranian models during the Yiian dynas-

Development of a new literary type

ty may have been a more immediate cause for its accelerated growth. Many Chinese men of letters refused to cooperate with the alien government, seeking refuge in painting and writing. As the new literary type developed—the drama of four or five acts, complete with prologue and epilogue and including songs and dialogue in language fairly close to the daily speech of the people—many men of letters turned to playwriting. Between 1234 and 1368, more than 1,700 musical plays were written and staged, and 105 dramatists were recorded: moreover, there is an undetermined number of anonymous playwrights whose unsigned works have been preserved but discovered only in recent decades. This remarkable burst of literary innovation, however, failed to win the respect of the orthodox critics and official historians. No mention of it was made in the copious dynastic history, *Yiian shih*; and casual references in the collected works of contemporary writers were few. Many plays were allowed to fall into oblivion. It was not until 1615 that a bibliophile undertook to reprint, as a collection, 100 of the 200 plays he had seen. Even after ardent searches by 20th-century librarians and specialists, the number of extant Yuan dramas has been increased to only 167, hardly 10 percent of the number produced. Moreover, since the musical scores have been lost, the plays cannot be produced on the stage in the original manner.

Among the Yuan dramatists, the following at least deserve special mention. Kuan Han-ch'ing, the author of some 60 plays, was the first to achieve distinction. His *Tou-o yuan* ("Injustice Suffered by Tou-o") deals with the deprivations and injustices suffered by the heroine, Tou-o, which begin when she is widowed shortly after her marriage to a poor scholar and culminate in her execution for a crime she has not committed. Wang Shih-fu, Kuan's contemporary, wrote *Hsi hsiang chi* ("Romance of the Western Chamber"), based on a popular T'ang prose romance about the amorous exploits of the poet Yuan Chen, renamed Chang Chun-jui in the play. Besides its literary merits and its influence on later drama, it is notable for its length, two or three times that of the average Yuan play. Ma Chih-yuan, another contemporary, wrote 14 plays, of which the most celebrated is *Hart kung ch'iu* ("Sorrow of the Han Court"). It deals with the tragedy of a Han dynasty court lady, Wang Chao-chun, who, through the intrigue of a vicious portrait painter, was picked by mistake to be sent away to Central Asia as a chieftain's consort. Like the "Romance of the Western Chamber," this play has been translated into western European languages.

Characteristics of the new literary genre

This new literary genre acquired certain distinct characteristics: (1) All extant compositions may be described as operas; (2) each play normally consists of four acts following a prologue; (3) the language of both the dialogue (for the most part in prose) and the arias—which alternate throughout the play—are fairly close to the daily speech of ordinary people; (4) all of the arias are in rhymed verse, and only one end rhyme is used throughout an act; (5) all of the arias in an act are sung by only one actor; (6) nearly all of the plays have a happy ending; (7) the characters in most of the plays are people of the middle and underprivileged classes—poor scholars, bankrupt merchants, Buddhist nuns, country innkeepers, peasants, thieves, kidnappers, abductors, and women entertainers—antedating a similar trend in European drama by nearly four centuries.

At least 12 of the playwrights thus far identified were Sinicized members of originally non-Chinese ethnic groups—Mongols, Juchens, Uighur, and other Central Asians.

Poetry. Another literary innovation, preceding but later interacting with the rise of the drama, was a new verse form known as *san-ch'ü* ("non-dramatic songs"), a liberalization of the *tz'u,* which utilized the spoken language of the people as fully as possible. Although line length and tonal pattern were still governed by a given tune, extra words could be inserted to make the lyrics livelier and to clarify the relationship between phrases and clauses of the poem. The major dramatists were all masters of this genre.

Vernucular fiction. Similarly, fiction writers who wrote in a semi-vernacular style began to emerge, continuing the tradition of storytellers of the past but writing their stories rather than reciting them orally. The authors of fiction differed significantly from the prose romance writers of the T'ang and Sung. Their works not only were much longer but also were written almost entirely in the vernacular. Clearly, these fiction works were addressed to the masses and not to the authors' fellow literati. All of the early pieces of this type of book-length fiction were poorly printed and anonymously or pseudonymously published. The first known master of the art was Lo Kuan-chung, a bold social critic in his 14th-century historical and supernatural romances, the best known of which are *San Kuo chih yen-i (Romance of the Three Kingdoms*, 1925), *Shui-hu chuan (The Water Margin,* also translated as *All Men are Brothers),* and *P'ing yao chuan* ("The Subjugation of the Evil Phantoms"). The best of the three from a literary standpoint is the *Shui-hu chuan*, which gives full imaginative treatment to a long accretion of stories and anecdotes woven around a number of enlightened bandits—armed social and political dissenters—whose exploits were recorded in the official dynastic history and given fictional treatment in a Sung *hua pen* ("story root"). In the *Shui-hu chuan*, the number of characters is increased from 36 to 108; the thread of the main narrative is more complex; many subplots are introduced; and characterization and description are elaborate. The language is almost completely vernacular.

The works of Lo Kuan-chung

Ming dynasty: 1368–1644. The Yuan dynasty was succeeded by the Ming dynasty, under which cultural influences from the South—expressed in movements toward cultural orthodoxy—-again became important. Nearly all the major poets and prose writers in traditional literature were southerners, who enthusiastically launched and supported antiquarian movements based on a return to models of various ages of the past. With the restoration of competitive literary examinations, which had been virtually discontinued under the Mongols, the highly schematic *pa-ku wen* ("eight-legged essay"; see above) was adopted as the chief yardstick in measuring a candidate's literary attainments. Despite occasional protests, it continued to engage the attention of aspirants to official literary honours from 1487 to 1901.

Classical literature. Although Ming poets wrote both *shih* and *tz'u* and their output was prodigious, poetry on the whole was imitative rather than freshly creative. Tirelessly, the poets produced verses imitating past masters, with few individually outstanding attainments.

Prose writers in the classical style were also advocates of antiquarianism and conscious imitators of the great masters of past ages. Rival schools were formed, but few writers were able to rise above the ruts of conventionalism. The Ch'in-Han school tried to underrate the achievements of Han Yü and Liu Tsung-yiian, along with the Sung essayists, and proudly declared that post-Han prose was not worth reading. The Tang-Sung school, on the other hand, accused its opponents of limited vision and re-emphasized Han Yü's dictum that literature should be the vehicle of Tao, equated with the way of life taught by orthodox Confucianism. These continuous squabbles ultimately led nowhere, and the literary products were only exquisite imitations of their respective models.

The Kung-an school of prose writers

The first voice of protest against antiquarianism was not heard until the end of the 16th century; it came from the Kung-an school, named after the birthplace of three brothers, of whom the middle one was the best known. Yuan Hung-tao challenged all of the prevailing literary trends, advocating that literature should change with each age and that any attempt at erasing the special stamp of an era could result only in slavish imitation. Declaring that he could not smile and weep with the multitude, he singled out "substantiality" and "honesty with oneself" as the chief prerequisites of a good writer.

This same spirit of revolt was shared by Chung Hsing and T'an Yuan-ch'un, of a later school, who were so unconventional that they explored the possibilities of writing intelligibly without observing Chinese grammatical usages. Although their influence was not long lasting, these two schools set the first examples of a new subgenre in prose—the familiar essay.

Vernacular literature. It was in vernacular literature that the writers of this period made a real contribution. In drama, a tradition started in the Sung dynasty and maintained in southern China during the period of Mongol domination was revitalized. This southern drama, also musical and known as *ch'uan-ch'i* ("tales of marvels"), had certain special traits: (1) a *ch'uan-ch'i* play contains from 30 to 40 changes of scene; (2) the change of end rhymes in the arias is free and frequent; (3) the singing is done by many actors instead of by the hero or heroine alone; (4) many plots, instead of being extracted from history or folklore, are taken from contemporary life.

Since there were no rules regulating the structure of the *ch'uan-ch'i*, playlets approaching the one-act variety were also written. This southern theatre movement, at first largely carried on by anonymous amateurs, won support gradually from the literary men until finally, in the 16th century, a new and influential school was formed under the leadership of the poet-singer Liang Ch'en-yii and his friend the great actor Wei Liang-fu. The K'un school, initiating a style of soft singing and subtle music, was to dominate the theatre to the end of the 18th century.

Aside from drama and *ta-ch'ü* (a suite of melodies sung in narration of stories), which in the South were noticeably modified in spirit and structure, becoming more ornate and bookish—it was prose fiction that made the greatest progress in the 16th century. Three important novels took shape at that time: Wu Ch'eng-en's *Hsi-yu chi (Monkey)* is a fictionalized account of the pilgrimage of the Chinese monk Hsüan Tsang to India in the 7th century. The subject matter was not new; it had been used in early *kua-pen,* or "story root," books and Yüan drama; but it had never been presented at length in such a lively and rapid-moving narration. Of all of the 81 episodes of trial and tribulation experienced by the pilgrim, no two are alike. Among the large number of monsters introduced, each has his unique individuality. Like the *Shui-hu chuan (The Water Margin;* see above *Yuan dynasty: Vernacular fiction),* it reveals the influence of the style of the oral storytellers, for each chapter ends with the sentence "in case you are interested in what is to follow, please listen to the next instalment, which will reveal it." Unlike the *Shui-hu chuan,* which was written in a kind of semi-vernacular, the language used was the vernacular of the living tongue. For the author the choice must have been a deliberate but difficult one, for he had the novel first published anonymously to avoid disapproval. Besides eliciting numerous commentaries and "continuations" in China, it has two English translations.

Important novels of the 16th century

Lo Mao-teng's *Hsi yang chi* ("Adventure to Western Ocean") is an embellished tale of the 15th-century explorer Cheng Ho, who sailed the South China Sea and the Indian Ocean seven times and saw the northeast coast of Africa more than half a century before Columbus embarked upon his maritime venture in 1492. Utilizing the records of the journeys as he saw fit, Lo gave such free play to his imagination that his masterpiece was a combination of the traits of *Gullivers Travels* and *Robinson Crusoe.*

The title of the third novel (the author of which is unknown), *Chin P'ing Mei,* is composed of graphs from the names of three female characters. Written in an extremely charming vernacular prose style, the novel is a well-knit, long narrative of the awful debaucheries of the villain Ch'ing Hsi-men. The details of the different facets of life in 16th-century China are so faithfully portrayed that it can be read almost as a documentary social history of that age. Even the sexual perversions of the characters are so elaborately depicted that Western translators have had to resort to Latin in rendering a number of indelicate passages. The novel has been banned in China more than once, and all copies of the first edition of 1610 were destroyed.

Ch'ing dynasty: 1644–1912. The conquest of China by the Manchus, a Mongol people from the region north of China who set up the Ch'ing dynasty in 1644, did not disrupt the continuation of major trends in traditional literature. (During the literary inquisition of the 18th century, however, many books suspected of anti-Manchu sentiments were destroyed; and numerous literati were imprisoned, exiled, or executed.) Antiquarianism dominated literature as before, and excellent poetry and prose in imitation of ancient and medieval masters continued to be written, many works rivalling the originals in archaic beauty and cadence. Although the literary craftsmanship was superb, genuine creativity was rare.

Poetry and prose nonfiction. In the field of *tz'u* writing, the 17th-century Manchu poet Nara Singde (Sinicized name, Na-lan Ch'eng-te) was outstanding; but even he lapsed into conscious imitation of Southern T'ang models except when inspired by the vastness of open space and the beauties of nature. In nonfictional prose, Chin Jen-jui continued the familiar essay form.

The prose romances of P'u Sung-ling

Prose fiction. P'u Sung-ling continued the prose romance tradition by writing in *ku-wen* ("classical language") a series of 431 charming stories of the uncanny and the supernatural titled *Liao-chai chih-i (Strange Stories from a Chinese Studio).* This collection, completed in 1679, was reminiscent of the early literary tale tradition, for it contained several T'ang stories retold with embellishments and minor changes to delineate the characters more realistically and to make the plots more probable. Such traditional supernatural beings as fox spirits, assuming in these stories temporary human form in the guise of pretty women, became for the first time in Chinese fiction humanized and likable. Despite the seeming success of these tales, the author soon became aware of the limitations of the *ku-wen* style for fiction writing and proceeded to produce a vernacular novel of 1,000,000 words, the *Hsing shih yin yuan* ("Tale of a Conjugal Union to Rouse the World"). This long story of a shrew and her henpecked husband was told without any suggestion of a solution to the problems of unhappy marriages. Unsure of the reaction of his colleagues to his use of the vernacular as a literary medium, P'u Sung-ling had this longest Chinese novel of the old school published under a pseudonym.

Wu Ching-tzu satirized the 18th-century literati in a realistic masterpiece *Ju-lin wai-shih* (*c.* 1750; "Informal History of the Literati"), 55 chapters loosely strung together in the manner of a picaresque romance. Unlike P'u Sung-ling, whom he far surpassed in both narration and characterization, he adopted the vernacular as his sole medium for fiction writing.

Better known and more widely read was Ts'ao Chan's *Hung-lou meng (Dream of the Red Chamber), a* novel of a love triangle and the fall of a great family, also written in the vernacular and the first outstanding piece of Chinese fiction with a tragic ending. Because its lengthy descriptions of poetry contests, which interrupt the narrative, may seem tiresome especially to non-Chinese readers, they have been largely deleted in Western translations. Nevertheless, some Western critics have considered it one of the world's finest novels.

Drama. In drama, the Ming tradition of *ch'uatz-ch'i* ("tales of marvels") was worthily continued by several leading poets of the conventional school, though as a whole their dramatic writings failed to appeal to the masses. Toward the end of the 18th century, folk dramas of numerous localities began to gain popularity, converging finally at the theatres of Peking and giving rise to what came to be designated as Peking drama—a composite product that has continued to delight large audiences in China.

Popularity of folk dramas

19th-century translations of Western literature. By the early 19th century, China could no longer ward off the West and, after the Opium War (1839–42), China's port cities were forcibly opened to increased foreign contacts. In due course, many Western works on diverse subjects were translated into Chinese. The quality of some of these was so outstanding that they deserve a place in the history of Chinese literature. One distinguished translator was Yen Fu, who had studied in Great Britain and whose renderings of Western philosophical works into classical Chinese were acclaimed as worthy of comparison, in literary merit, with the Chou philosophers. Another great translator was Lin Shu, who, knowing no foreign language himself but depending on oral interpreters, made available to Chinese readers more than 170 Western novels, translated into the literary style of the Han historian Ssu-ma Ch'ien.

19th-century native prose and poetry. Meanwhile, writers of native fiction, especially in central and southern China, began to be seriously influenced by Western models. Using the vernacular and mostly following the picaresque romance structure of the "Informal History of the Literati," they wrote fiction usually intended for serial publication and satirizing Chinese society and culture. One of these writers was Liu E, whose *Lao Ts'an yu chi* (1903; "Travel Records of Lao Ts'an"), a fictional account of contemporary life, pointed to the problems confronting the tottering Ch'ing dynasty.

19th-century developments in poetry

Poetry, long stagnant, at last began to free itself from the shackles of traditionalism. The most prominent poet, Huang Tsun-hsien, inspired by folk songs and foreign travel, tried to write poetry in the spoken language and experimented with new themes, new diction, and new rhythm. His young friend Liang Ch'i-ch'ao not only fervently supported Huang and his associates in what they called "the revolution in Chinese poetry," but also ventured forth in new directions in prose. Liang's periodical publications, especially, exerted an extensive influence on the Chinese people in the early years of the 20th century. Fusing all the unique and attractive features of the various schools of prose writing of the past into a new compound, Liang achieved a vibrant and widely imitated style of his own, distinguished by several characteristics: flexibility in sentence structure so that new terms, transliterations of foreign words and phrases, and even colloquial expressions could be accommodated; a natural liveliness; a touch of infectious emotionalism, which the majority of his readers enjoyed. Although he was too cautious to use the vernacular, except in fiction and plays, he did attempt to approximate the living speech of the people, as Huang Tsun-hsien had done in poetry.

As part of a Westernization movement, the competitive literary examination system, which had been directly responsible for excessive conservatism and conventionality in thought as well as in literature, was abolished in 1905.

Modern Chinese literature: **1916** to the present. *1916–36.* The real literary revolution, however, did not get under way until after the establishment of the republic in 1911, when the monarchical institution of more than three millennia had ended.

Role of Hu Shih

The Chinese literary revolution, the aim of which was to bring about a thoroughgoing modernization of all aspects of Chinese literature, was touched off in 1916 by Hu Shih, who had studied in the United States. While in the U.S., he had come to advocate in private discussions with his Chinese fellow students the urgent need for a new national literature for China, to be written in the living language of the people. Hu Shih was well prepared to defend his proposal; for as early as 1906, when he was still only a preparatory school student in Shanghai, he had founded a quarterly magazine in which the vernacular was used and had published in it popular essays and an unfinished Utopian novel. Ever since his arrival in the United States in 1910, and especially since his decision in 1912 to change his field of specialization from agriculture to philosophy, he had become convinced that China's literary reform had to be consciously accelerated.

It was not until January 1917, however, that his proposals were published in Shanghai in the influential monthly *Hsin ch'ing-nien* ("New Youth") edited by Ch'en Tu-hsiu. Ch'en gave Hu Shih immediate support and declared his arguments to be irrefutable. Ironically, Hu Shih's article, "Some Tentative Suggestions for the Reform of Chinese Literature," was written in simple classical Chinese. As he himself observed later, he "was too much tempered by the moderation of a historian to be successful in revolutionary activities." His caution and willingness to listen to the opposition were effectively counterbalanced, however, by the activism of Ch'en Tu-hsiu, who also published an article, "On the Literary Revolution" (February 1917), in which he hoisted the banner of rebellion against the aristocratic, archaic classical, and regressive literary traditions of the old China.

Hu Shih's history of Chinese philosophy

In 1919 the literary revolution was given new dignity with the publication of the first volume of Hu Shih's *Chung-kuo che-hsüeh shih ta-kang (An Outline of the History of Chinese Philosophy,* 1919), written entirely in the vernacular, which had never been used before in a scholarly work. Open-minded scholars of the older generation, such as Liang Ch'i-ch'ao, soon followed suit; although Lin Shu and a few other conservatives remained resolutely opposed to the innovation. The May Fourth student movement of the same year, in which thousands of students demonstrated to protest against the weak position taken by China's delegates at the Versailles Peace Conference, which concluded World War I, spread the use of the vernacular to the whole nation. Student appeals to the unlettered masses of necessity used the language the people could understand. Many new periodicals and daily papers adopted the vernacular exclusively, and there were few creative writers of the younger generation who did not follow the new trend. Finally, in 1921, the vernacular was given official sanction by the government, being called *kuo yii,* or "national language," until the Communist regime, when the term was replaced by *p'u-t'ung-hua,* "the common language."

Meanwhile. the foundations of the literary revolution were strengthened by a whole crop of writers of varied background and training. Among the more experienced and dedicated of these were the brothers Lu Hsun (pseudonym of Chou Sbu-jen) and Chou Tso-jen, who were associated with Ch'en Tu-hsiu and Hu Shih on the monthly *Hsin ch'ing-nien.* The brothers had been brought up in the orthodox classical tradition, enriched by their acquaintance with Western literature. Lu Hsün was known especially for stories and familiar essays in which he exposed and ridiculed social foibles. In "The True Story of Ah Q" (Chinese, 1921; Eng. trans. 1926), the hero is the epitome of the ultraconservative forces in Chinese society—repugnant, obsolete, and yet so pitiable that he elicits sympathy rather than disdain and censure. "A Madman's Diary" (May, 1918) presents the jottings of a man diagnosed as insane, who, in his inspired moments, gives proof that he has not quite lost his mind; he suspects that the world is mad and he alone sober and sane. The aim of Lu Hsün's essays and epigrams is similar to that of his stories. Hurling invective at his opponents, he subjects traditional usages and customs to pitiless scrutiny and devaluation. His younger brother, Chou Tso-jen, a man of entirely different temperament, was not more conservative than Lu Hsun but a milder and gentler critic, with manners and refinements reminiscent of the best traditions of the Six Dynasties period.

The works of Lu Hsun

A new drama, modelled after Western prototypes and first introduced toward the end of the 19th century as an experiment, took firm root and flourished side by side with traditional drama of the operatic variety without displacing it. Although the achievements in poetry were not as plentiful as in fiction, new and bold experiments were continually carried on. (S.Y.C.)

1937 to the present. From 1937 to 1945 all writers, whether leftist, rightist, or nonpartisan, were in one way or another engaged in a national struggle against Japanese aggression. They all stressed the importance of literature as an effective way of boosting the morale of the people and thus helping to win the war against the Japanese. It was the leftists, however, who played the predominant role in the field of literary theory and production. In May 1942 the didactic and utilitarian function of literature was redefined by Mao Tse-tung in his "Tsai Yen-an wen-i tso-t'an-hui shang-te chiang-hua" ("Talks at the Yenan Forum on Art and Literature"). In his opinion, literature should be intended for the people—that is, workers, peasants, soldiers, and urban petty bourgeoisie. While stressing the need for popularizing literature, he attached great importance to elevating the people's level of literary appreciation. He advocated "unity of the revolutionary political content and the highest possible degree of perfection in artistic form." Most important of all, he believed that literature should eulogize "the proletariat,

Mao Tse-tung's dictum on literature

the Communist Party, New Democracy, and socialism." This kind of proletarian utilitarianism was later identified with Socialist Realism and became the guiding literary principle for Communist writers.

Under the influence of Mao's theory, countless literary works were produced in the Communist regions from 1942 to the founding of the People's Republic of China in 1949. Whatever literary form they took, they all reflected Communist policies and activities during their war against the Japanese as well as against the Chinese Nationalists. In 1951, when China's relations with the Soviet Union were still intimate and friendly, Stalin prizes for literature were awarded to three works: *T'ai-yang chao tsai Sang-kan-ho shang (The Sun Shines Over the Sang-kan River),* a novel by Ting Ling; *Pao-feng tsou-yii (The Hurricane),* a novel by Chou Li-Po; and *Pai-mao nü (The White-Haired Girl),* a musical drama by Ho Ching-chih and Ting Yi. Among the writers of the younger generation, Chao Shu-li was perhaps the most popular and distinguished. According to Communist literary critics, his works of fiction, such as *Hsiao Erh-hei chieh hun (Hsiao Erh-hei's Marriage)* and *Li Yu-ts'ai pan-hua (Rhymes of Li Yu-ts'ai),* adequately met Mao's criterion of unity of political content and artistic form.

During the 1950s, the Chinese underwent a series of ideological remolding campaigns, all of which profoundly affected literary circles. Many influential writers, such as Ting Ling, Ai Ch'ing, Hu Feng, and Feng Hsiieh-feng, were subjected to harsh criticism and denunciation because of their nonconformity with Mao's theory or the Communist Party line. During the 1956–57 movement for "letting a hundred flowers blossom and letting a hundred schools of thought contend," writers enjoyed the fullest freedom of expression, but before long that freedom, along with the movement, vanished like a dream. Socialist Realism, which remained the guiding literary principle, required that a literary work be both true to life and ideologically correct. It was not only a high standard, hard to attain, but also a principle open to various interpretations under various circumstances.

In spite of all difficulties, however, literary production continually increased from the establishment of the People's Republic until the Great Proletarian Cultural Revolution broke out in 1966. The famous authors of the older generation, however, except for a passionate few like Lao She, chose to be silent; it was the well-indoctrinated younger writers who became increasingly productive. Whatever they wrote was either directly or indirectly tied to politics, their themes changing as the major policies and objectives of the government changed. Thus, after 1949, they successively dealt with such events as the land reform, the Korean War, the suppression of counterrevolutionaries, the so-called three-anti and five-anti drives against illegal practices, the Hundred Flowers Campaign, the anti-rightist drive, and the Great Leap Forward.

Revision and re-editing of traditional works

While some authors were energetically creating works of their own, others directed their efforts toward revising and re-editing traditional masterpieces in conformity with Communist literary theory. The entire literary heritage of China was to be critically re-evaluated and reinterpreted so as to fit into the Communist ideological pattern. As a result, many traditional novels, short stories, operas, and songs appeared in newly revised versions. Some of the revised operas, such as *Liang Shan-po and Chu Ying-t'ai* and *The Story of the White Snake,* were considered great successes in terms of their readability and popular appeal. Traditional forms, such as the novel and the opera, were designated national literary forms, to be preserved and imitated. Many creative works did, in fact, appear in such forms, existing without incongruity side by side with Western types of literary works.

During the Cultural Revolution of 1966–69, practically all creative activities in literature came to a standstill, and countless writers and literary critics became victims of the Red Guards' harassment and denunciation. The literary scene in mainland China was indeed bleak. In the early 1970s, there was an indication of a swing toward relative relaxation and reinvigorated literary productivity. (T.-y.L.)

II. Korean literature

Although Korea has had its own language for several thousand years, the invention of a writing system came comparatively late. As a result, early literary activity was in Chinese characters, either in a syllabary (a set of written characters each one of which is used to represent a syllable) called *idu,* which used the characters to transcribe the sounds of Korean, or in the traditional manner of classical Chinese. Whether or not works written in classical Chinese should be considered Korean literature has been much debated, the situation being complicated by the fact that classical Chinese was extensively used in composition even into the early years of the 20th century, in spite of the creation and promulgation of a national alphabet, *han'gŭl,* in the mid-15th century.

The three categories of Korean literature

In general, then, literature written in Korea falls into three categories: works written in *han'gŭl*, those written in *idu,* and those written in classical Chinese. Although the last category may not be strictly Korean literature, its long tradition of creative development in Korean literary history makes it worthy of consideration.

TRADITIONAL FORMS AND GENRES

Since the study of Korean literature is relatively recent, a complete classification of its genres cannot be given. The most general categories, however, are lyric poems, prose, oral literature, and literature in classical Chinese.

Lyric poems. Lyric poems originally were meant to be sung rather than read, as European lyric poems originally were. The oldest are the *hyangga,* poems composed in *idu* between AD 600 and 1000, during the late middle period of the Silla dynasty and in the early period of the Koryŏ dynasty. The poems were written in four, eight, or 10 lines, the 10-line form being the most characteristic. The poets were usually of the Silla nobility––either Buddhist priests or chivalrous *hwarang* youth, leaders who were trained in civil and military virtues and who consciously cultivated sensitivity. The poems generally deal with Buddhist themes. Twenty-five *hyangga* are extant, 14 in *Samguk yusa* (1285; "Memorabilia of the Three Kingdoms") and 11 in *Kyungŏ chdn* (1075; "Life of the Poet Priest Kyunyŏ"). *Pyŏlgok*, also called *changga* or *ydyo,* was a verse form written during the middle and late Koryŏ dynasty (AD 935–1392). Characteristically, it is a group of several six-line stanzas. The poets were anonymous. So many examples of *pyŏlgok* have survived that this may be called the representative poetic form of the Koryb dynasty. The subject matter is generally love, and the style of expression is quite openly passionate.

Sijo and *kasa*

Sijo is historically the longest enduring and the most widely representative form of Korean poetry. It became an established form at the end of the Koryŏ dynasty and was written throughout the Yi dynasty. *Sijo* was still being written in the second half of the 20th century. It is usually defined as a three-line poem because the meaning of the poem falls into three distinct units. Each of the three lines generally has 14 to 16 syllables, and the total number of syllables never exceeds 45. Each line is in turn divided into smaller groups of varying lengths, the first group in the third line always having three syllables. *Sijo* frequently deals with Confucian ethical values, but there are also many poems about nature and love. The principal writers of *sijo* were members of the Confucian upper class (*yangban*) and *kisaeng* girls (like the Greek *hetairai,* highly cultivated courtesans). In the latter part of the Yi dynasty, a longer form, called *sasŏl sijo* ("narrative *sijo*"), evolved. The writers of this form, when they did not remain anonymous, were mainly common people; hence, the subject matter included more down-to-earth topics, such as trade, immorality, and corruption, as well as the traditional topic of love between the sexes. In addition, *sasŏl sijo* frequently employed slang, vulgar language, and onomatopoeia (the use of words the sound of which suggests the sense).

Another form that developed at approximately the same time as *sijo* is *kasa.* In its formative stage, *kasa* borrowed the form of the Chinese *t'zu* (lyric poetry) or fu (prose poetry). *Kasa* tends to be much longer than other forms of Korean poetry and is usually written in balanced couplets. Either line of a couplet is divided into two groups, the first having three or four syllables and the second having four syllables. The history of *kasa* is clearly divided into two periods, the division being marked by the Japanese invasion of 1592–97. During the earlier period the poem was generally about 100 lines long and dealt with such subjects as female beauty, war, and seclusion. The writers were usually *yangban*. During the later period the poem tended to be longer and to concern itself with moral instruction, travel accounts, banishment, and the writer's personal misfortunes. The later writers were usually commoners.

Akchang poems

Immediately after the founding of the Yi dynasty at the end of the 14th century and the establishment of the new capital in Seoul, a small group of poetic songs called *akchang* (literally, "words for songs") were written to celebrate the beginning of the new dynasty. In its earliest examples the form of *akchang* was comparatively free, borrowing its style from early Chinese classical poetry. Whereas the early *akchang* are generally short, the later *Yongbi ŏch'ŏn-ga* (a compilation of *akchang*) consists of *125* cantos, and *Worin ch'ŏn'-gangji-gok* seems to have originally consisted of about 500 cantos.

Prose. Korean prose literature can be divided into three groups: narratives, fiction, and essays. Narratives include myths, legends, and folktales found in the written records. The principal sources of these narratives are the two great historical records compiled during the Koryb dynasty: *Sarnguk sagi* and *Samguk yusa*. The most important myths are those concerning the sun and the moon, the founding of Korea by Tan'gun, and the lives of the ancient kings. The legends touch on place and personal names and natural phenomena. The folktales include stories about marriage, birth, ethical problems, prophecies, heroism, dreams, and animals. Because the writer of *Samguk yusa* was a Buddhist priest, some stories about the history of Buddhist temples are also recorded. The compilations made in the Koryb period preserved the stories of prehistoric times, of the Three Kingdoms, and of the Silla dynasty and have remained the basic sources for such material, but later compilations, such as *Taedong yasŭng* and *P'aerim*, were made during the Yi dynasty. Such compilations served as a major source of materials for later Yi dynasty fiction.

Korean fiction can be classified in various ways. First, there is fiction written in Chinese and that written in Korean. Second, there are the short works of one volume, "medium" works of about ten volumes, and long works of more than ten volumes. And third, there are works of *yangban* writers and those of common writers. In respect to the last classification, however, there is also a group of fictional works that combine the viewpoints of the *yangban* and the commoner. Most of this fiction was based on the narratives mentioned above, the author adding incidents and characters of his own to the original story. It is not possible to assign definite dates or authors to most of these works. The stories are generally didactic, emphasizing correct moral conduct, and almost without exception they have happy endings. Another general characteristic is that the novels written by *yangban* authors are set in China, whereas those written by commoners are set in Korea.

There has been very little study of Korean essays, but some diaries, travel accounts, letters, and other writings are of definite literary value because of the expression of emotions and experiences in them.

Oral literature. Oral literature includes all those texts that were orally transmitted from generation to generation until the invention of *han'gŭl—i.e.*, ballads, legends, mask plays, puppet-show texts, and *p'ansori* ("story singing") texts.

In spite of the highly developed literary activity from early in Korean history, many song lyrics were never recorded until the invention of *han'giil*. These orally transmitted texts are categorized as ballads and are classified according to singer (male or female), subject matter (prayer, labour, leisure), and singing style (capital area, western, and southern). The songs of many living informants have yet to be recorded, and the gradual decline of traditional singing makes the collection of these texts particularly urgent.

Legends include all those folk stories handed down orally and not recorded in any of the written records. These legends were for long the principal form of literary entertainment enjoyed by the common people. They deal, as do the legends of every major culture, with personified animals, elaborate tricks, the participation of the gods in human affairs, and the origin of the universe.

Mask plays

The mask plays are found in Hahoe, Chinju, Tan'gyŏng, Kimhae, and Tongnae in North and South Kyŏngsang provinces; Yangju in Kybnggi Province; Pongsan in Hwanghae Province; and Pukch'ong in south Hamgybng Province. The most representative plays are *Sandae Kuk* of Yangju, *Pyŏlsin kut* of Hahoe, and *Okwangdae nori* (five-actor play) of Chinju. Although the origin of these plays is uncertain, they are generally presumed to have developed from primitive communal ceremonies. Gradually, the ceremonial aspect of the plays disappeared. and their dramatic and comic possibilities were exploited. The dialogue was somewhat flexible, the actors being free to indulge in more or less satire as the occasion demanded. The plays were not performed on a stage, and there were no precise limits as to the space or time in which the performances took place. The audience also traditionally responded vocally to the play as well as passively watching it. The organization of the mask plays —through repetition and variety—achieves a remarkable effect of dramatic unity.

Only two puppet-show texts are extant, *Kkoktukaksi nori* (also known as *Pak Ch'ŏm-ji*) and *Man Sŏk-chung nori*. Both titles are derived from names of characters in the plays. No theory as to the origin and development of these plays has been formulated. The plots of the puppet plays, like those of the mask plays, are full of satiric social criticism. The characters—Pak Ch'ŏm-ji, governor of P'yŏngam, Kkoktukaksi, Buddhist monk, and Hong Tong-ji—dance and sing, enacting familiar tales that expose the malfeasance of the ruling classes.

The final type of folk literature is found in the texts of *p'ansori*, "story singing" of the Yi dynasty, which is often compared to medieval European minstrelsy. These texts were first recorded as a type of poetry, but the written forms were later expanded to be *p'ansori* novels, widely read among the common people. This transformation from poem to novel was easily accomplished, since *p'ansori* is always narrative. Originally the entire *p'ansori* performance repertoire consisted of 12 *madang* ("titles"). Although all 12 remain in novel form, only five of them are sung today. The texts evolved gradually from the legends, which provided their sources and were altered and expanded as they were passed from one performer to another.

Literature in classical Chinese. With the declining importance of Chinese characters in Korean life and the continuing promotion of *han'gŭl* by the government, Korean literature in Chinese became increasingly neglected. Many excellent works that compare very favourably with the classics of China lie unread in libraries and book collections. Fortunately, however, a considerable number of these works in Chinese were being translated into Korean in the second half of the the 20th century with the financial assistance of the government. As they are translated and more widely known, they will surely achieve the recognition due them.

HISTORICAL DEVELOPMENT

Ancient Korean songs

The earliest literature: before 57 BC. Judging from historical records and folklore, it seems that the earliest literary activity was mainly poetic. Ancient Korean songs seem to have been connected with the religious and farm life of the people. Their form was collective rather than individualistic, and they give evidence of the outstanding creativity of that age. From existing folk songs and folk dances—for example, the songs "Kuai-che-na-ch'ing-ch'ing-na-ne"—it is known that the earliest poetic songs found their theme in the praise of nature and richly expressed man's feelings concerning his environment. Though the actual function of these songs is unknown, the Chinese translations lead one to believe that they were used for collective dancing.

Three songs have been handed down in Chinese translation, "Ke-chi Ka" (or "Yongsin'gun-ga," "Song for Welcoming the Gods," found in *Sarnguk yusa*), "Huang-chou Ka" ("Song of the Yellow Birds," in *Satnguk* yusa), and "Kong-mu To-ha Ka" (or "Konghu-in," in *Haedong yoksa*). Although 'Ke-chi Ka" is related to the myth of the founding of the Karak tribe (one of the early tribes of Korea), the poetic intent of the song originally was to express sexual desire in an intense and simple way. It was first sung by women to tempt men but gradually became a kind of magic incantation, finally developing into the myth of the founding of Karak. "Huang-chou Ka" seems to be a fragment of a love song that was sung at religious ceremonies by bachelors who were trying to convince young girls to marry them and who lamented their lack of success. "Kong-mu To-ha Ka" deals with a mythological story and was probably a widely sung lyric poem. The hero, Paek-su Kwang-bu, is the equivalent of the Greek god Bacchus. and his wife is a river nymph. Both the hero and the heroine, being gods, were able to transcend life and death and to enter the water world freely. Even at her husband's death, the nymph plays the harp and sings an elegy. The story also includes human characters, such as the sailor, Kwangni chango; his wife, YB-ok; and her friend, Yo-yong.

Possible beginning of secular poetry

Another work, "Tosol-ga," is mentioned in *Samguk sagi* as having been written in the time of King Yuri of the Silla dynasty, but the poem itself has not survived. This poem is cited by historians as the beginning of secular poetry *(ka-ak,* literally, "songs and music"), and there may be some truth in this claim, as the reign of King Yuri is known to have been a time of political and social change. It was probably during this time that the roles of the tribal chiefs and the priests became clearly separated, the chiefs being divested of their. former religious powers. Hence, the artistic efforts of the people might have become more secular in outlook. It is clear, however, that the poem was free of religious elements and dealt with human emotions in a lyrical manner. It apparently was not, as the three earlier poems were, concerned with a narrative. In this respect, also, it is unusual.

Literature of the Three Kingdoms: 57 BC–AD **668.** In contrast to the literature of the earliest ages, which is characterized by collective artistic activity, that of later ages shows the effects of political, economic, and cultural changes as the peninsula increased in wealth and widened its contacts with other areas. Influences from the mainland on the traditional religious views and life patterns of the people brought about new possibilities for development from a primitive to a creative society. The introduction of Buddhism and Chinese characters to the Three Kingdoms made their literature rich and changed their world view greatly. In consequence, their artistic activity advanced far beyond collective singing and dancing to the direct expression of individual feelings of joy and anger, grief and pleasure. The heroes of this literature were human beings with individual personalities, in contrast to the more monumental tribal heroes of earlier times.

The three kingdoms of this period were Koguryŏ, in the north; Paekche, in the southwest; and Silla, in the southeast. The writers of Koguryci, the geographical location of which provided close contact with the Chinese mainland, seem to have retained something of the original pioneer spirit from the times when Koreans came from the northern regions and settled on the peninsula, and their poems tended to be heroic tales in epic form. According to *Samguk sagi,* the representative epic of Koguryŏ was the myth of the founding of Korea by King Tongmybng. The stories of Ondal, King Mich'bn, Prince Hodong, the crown prince Yuri, and others that had their origin in Koguryb are still used today as the bases for plays and movies.

In contrast to that of Koguryci, the literature of Paekche and Silla tended to be lyrical, perhaps because of the milder climate and easier life in the south. Very little literature from Paekche remains today, but the legends and songs contained in the *Samguk sagi* give a hint of the original extent and richness of Paekche's literature, which perhaps equalled that of Silla; for example, "Chŏngŭp-sa," a song passed down from Paekche through the Koryŏ and Yi dynasties, is still performed and admired in the 20th century. In addition, the considerable cultural influence of Paekche on Japan gives evidence of its high level of artistic achievement.

Silla led the other two kingdoms both politically (as proved by its subsequent unification of Korea) and artistically, in spite of the fact that it was farthest removed from contact with Chinese culture. The geographical and cultural distance from China, however, seems to have been an advantage, since the culture of Silla was able to create a true synthesis of native and foreign elements.

Absorption of Chinese culture

Literature of **Unified Silla: 668–935.** After the mid-7th century Silla absorbed Koguryŏ and Paekche and created a stable political system covering the whole nation in the 8th century. During the Silla dynasty many students were sent at government expense to study in T'ang China. The consequent absorption of Chinese culture and the flourishing of Korean Buddhism both contributed to the remarkable artistic flowering of Silla. In particular, the spiritual life of the Silla nobility—the priests and the chivalrous *hwarang* youth—was dominated by Buddhism, which thus became the driving force behind virtually all artistic activity.

The *hyangga* was the crown of Silla's literary achievement. In these poems the nobility expressed a lofty outlook on life in stories based on their own style of living. Their form was marked by a flexible, delicate, and mystical style. The influence of Buddhism can be seen in the tendency to base the poems on a philosophy of seeking a new, ideal society. The Buddhistic emphasis on future life makes it natural that the subject matter of *hyangga* should be otherworldly. Ancient historians described this flowering of Silla dynasty literature by saying that the streets were never empty of music and that all the houses were filled with song and dance throughout the night.

The work of collecting *hyangga* was either encouraged or actually done by two of the most important *hyangga* writers, the Buddhist high priest Nung-jun and Tae-guhwasang. The result of their efforts was the collection of 25 *hyangga* in *Samdaemok*. The most famous poems are "Che-mang-mae-ga" ("Religious Song to a Deceased Sister"), by the priest Wiilmybng, and "Ch'an-gi-p'a-rangga" ("Song in Praise of Ki-p'a-rang"), by the priest Ch'ungdam. Both of these men were Buddhist priests. All of the poems in the collection were either by Buddhist priests or *hwarang*.

Since the Korean language had no written form during this period of history, the Silla scholars invented a syllabary. called *idu,* that used the Chinese characters to transcribe the sounds of Korean, and it was in this form that the *hyangga* were recorded. At this time Chinese characters were also extensively used in the classical Chinese manner, and much epic literature was written in Chinese. This epic literature, most of which consisted of narratives relating to the building of Buddhist temples, was no less important than the *hyangga* in the development of Buddhist literature. The large number of narratives that appear in *Satnguk yusa* are evidence of the superior imagination of the Silla writers. In addition to these narratives, the epic literature contains outstanding stories of chivalrous deeds and sexual exploits by *hwarang* youth at the time of the founding of Unified Silla.

Influenced by Chinese novels, many narratives of the Silla dynasty became the basis of the classical novel that formed the backbone of later Yi dynasty literature.

Literature of Koryd: **935–1392.** *Hyangga* was passed from Silla to Koryŏ, but it soon became so conventionalized that writers lost interest in it. The last important poet to write *hyangga* was the 10th-century high priest Kyunyb, of whose work 11 poems remain. Even these poems are remarkable more for their refined technique than for their expressive power. By this time *hyangga* had lost its function as an expression of the poet's desire to experience the Buddhist paradise and became a formalized hymn. For the most part Koryŏ intellectuals were not interested in the too highly conventionalized *hyangga* and

A new poetic form, the *pyiilgok*

created a new poetic form called *pydlgok* (special or different song). This eventually became the typical literary form of Koryŏ. *Pyŏlgok* was intended for large-scale stage performances on festive occasions, such as P'algwan-hoe (feasts of the local gods) and Yondŭng-hoe (a festival at which people burned candles to Buddha as prayers for blessing). In contrast to the poetic forms of Silla, which had only one stanza, *pydlgok* had several stanzas. Gradually evolving during middle Koryii, *pyŏlgok* reached its definitive form in later Koryŏ.

The Koryŏ dynasty was a time of social instability. Internal and external crises abounded due to the arrogance and oppressiveness of the courtiers and the army, as well as the savage invasions of the Mongols. Under such conditions the viewpoint of the *pyiilgok* writers tended to be introspective and hedonistic. Consequently, the new intellectuals, who had adopted Chinese dualistic thought as their philosophy, were dissatisfied with *pyiilgok* and sought a different form of poetic expression. This was the genesis of *sijo,* which was to become the principal form of the Yi dynasty. At first, *sijo* was rather stilted, the result of the mixture of a classical Chinese poetic style with Korean inflectional endings. Gradually, the stiffness disappeared, and *sijo* developed its lyricism and its tender, elegant, and simple style in Korean.

The Koryii dynasty also saw the development of epic literature. The origin of this literature was in the narratives of the Silla dynasty. These epics include myths, legends, folklore, and the history of Buddhism and Buddhist temples, and they are preserved in the historical records of the time. They were modified, however, to a considerable degree by the personal desires of the scribes and the tradition of the ages. One notable class of epics is that in which the hero is a personified inanimate object, as in *Kuk-sun-jŏn* ("Tale of Pure Malt") and *Kong-bang-jŏn* ("Tale of the Square-Holed Coin"), both by Im Ch'un. The masterpieces of epic literature are *Tongmyŏng wang* ("King Tongmyŏng"), by Yi Kyu-bo, and *Chewang ŭn'gi* (Imperial records in poetic form), by Yi Sŭng-hyu. *Tongmyŏng wang* records the heroic deeds of the founder of the Koguryŏ kingdom in an extravagant style. It is written in quatrains with five Chinese characters in each line. *Che-wang-ŭngi* gives an account of Korean history in quatrains with either five or seven characters to a line.

Literature of the early **Chosŏn** period: **1392–1598.** The literature of the Yi dynasty falls naturally into two periods, with the end of the Japanese invasion (1597) serving as a convenient dividing line. The early period is notable for its poetry; the later, for its prose. Inheriting the tradition of Silla and Koryii, the writers of the early Yi dynasty raised Korean literature to new heights.

Invention of Korean alphabet

The early Yi dynasty also marks the initiation of a new era in Korean literary history with the invention of the Korean alphabet, *han'gŭl,* in 1446, soon after the founding of the Yi dynasty. This important event, which finally enabled Korean writers to record works in their native language, occurred at approximately the same time that European writers of the Renaissance were breaking away from Latin and beginning to write in their national languages. Similarly, Korean writers began to renounce their cultural dependence on Chinese culture and the Chinese language.

The extraordinary King Sejong the Great not only invented *han'gŭl,* or *hunmin-jŏngŭm* as it is also called, but he also had his scholars compile *Yongbi ŏch'ŏn-ga;* and he himself compiled *Wdrin ch'ŏn'gangji-gok*, two long poetic works, in *han'gŭl* to demonstrate its practicality as a means of literary expression. The latter poem was written in praise of the blessings of Buddha. These two poems were the prototype of a new form called *akchang.* The form was adopted by the nobility, who wrote many *akchang* with considerable stylistic variations. It was also adopted by the more conservative Confucianists, who valued the Chinese classics very highly and still sang the *Pyŏlgok-ch'e* of the Koryŏ dynasty. The popularity of the *akchang*, however, was always limited, and it was soon eclipsed by the most important forms of the Yi dynasty—*sijo* and *kasa.*

These forms owe their popularity to two factors. First, their style of expression was rich and at the same time natural, for which reason they were widely appreciated by readers. Second, they were popular with writers because the forms together provided ideal outlets for the two sides of the Confucian temper: the brief and simple *sijo* was a perfect vehicle for intense lyrical expression, whereas the longer *kasa* gave writers an opportunity to expound at greater length on the more practical aspects of Confucian thought.

The expressive content of *sijo* ranges from the idealistic union of man and nature (often coupled with the poet's pride in his poverty) to the praise of sovereigns by loyal subjects (in which poems an analogy is drawn between fidelity and romantic love) to the deeper exploration of human problems. Writers include Maeng Sa-sŏng, Yi Hyŏn-bo, Yi Hwang, and Yi I, who extolled the virtues of the life that can enjoy the Tao while being impoverished. Representative poets of *kasa* include Chdng Kug-in and Pak In-no.

Even after the invention of *han'gŭl* and of literary forms that depended on the use of *han'gŭl*, most prose continued to be written in Chinese. The important exceptions, such as *Kŭmo sinwha* by Kim Si-sup, *P'ae-gwan chap-ki* by Oh Silk-kwiin, and *Yong-jae Ch'ŏng-hwa* by Song Hyon, are of great literary value and influenced the growth and development of *han'gŭl* prose literature in the later Yi dynasty.

Shift from poetry to prose

Literature of the later **Chosŏn** period: **1598–1894.** As has been mentioned, after the Japanese invasion the emphasis in literature shifted from poetry to prose. This change represents a significant step in the evolution toward modern literature. It also reflects a basic change in the philosophical outlook of Korean society. The Yi dynasty had suffered from the rigid formalism of the Confucianists, whose ideals were based especially on the principles of the 12th-century Chinese philosopher Chu Hsi. Confucianism was gradually replaced by practical idealism. Unlike the older philosophy, which emphasized unquestioning acceptance of authoritative principles, practical idealism was based on reason and the scientific spirit of criticism. The new literary form, prose, arose in answer to the need for a vehicle by which to best express the new philosophy.

Practical idealism gave impetus to literary activity and awakened the self-consciousness of the common people. Whereas the poetry in the early period had been dominated by the nobility, in the later period it was dominated by the common people. Women also were admitted into the literary world as the principal audience for traditional novels, a further step toward modernization. The later active compilation of the anthology and the comprehensive compilation of the narratives reveal the awakening interest in rediscovering and reappraising the past.

Prose. The origins of the traditional novel and of *p'aegwan munhak* (literary tales recorded by official scribes) can be traced to the narrative literature derived from folklore. *Kŭmo sinwha*, influenced both by *p'aeg-wan munhak* and by classical Chinese novels, was the first romantic novel written in Korea. The second important novel was *Hong Kiltong-jdn* ("The Life of Hong Kiltong"), by Hŏ Kyun. Building on the style of these two works, Kim Man-jung wrote two famous novels, *Ku-un-mong* (1687–88, *Cloud Dream of the Nine*) and *Sassi namjŏng-gi* (1689–92, "Story of Lady Sa"), a satire against the institution of concubines. The most popular novels of the 18th century were all anonymous: *Ch'unhyang-jŏn* (*Fragrance of Spring*), *Simch'ŏng-jŏn* ("Tale of a Faithful Daughter of a Blindman"), *Chang-hwa-hongnyŏn-jŏn* ("Tale of Rose Flower and Pink Lotus"), and *Hŭngbu-jŏn* ("Tale of Honest Hŭngbu"). The characters in these novels were common people, and the style in which they were written was simple and natural. Together with *Hong Kiltong-jŏn*, these works form a body of literature the stories of which have become deeply rooted in the consciousness of Korea. At the end of the 18th century, this kind of literature reached its culmination, and a new style emerged that combined the outlook of the nobility and of the common people.

Palace literature

During the Yi dynasty, palace literature written by court ladies also flourished. The most significant works of this genre include *Hanjungnok* (the memoirs of Hegybng-gung Hongssi [died 1815], who was the Lady Hong of Hegybng Palace, the mother of King Chongjo); *Kech'uk Ilgi* (the diary of King Sonjo's second queen, Inmok [died 1632], who, after the assassination of her son Prince Yongch'ang, was confined in the western palace), as recorded by one of the Queen's maids in a realistic and sensitive style; and *Inhyŏn Wang-hu-jŏn*, the tragic story of Queen Inhybn and a realistic work that squarely confronted the social problems of the times.

Korean prose of *han'gŭl*, produced in smaller quantity than that in Chinese characters, includes diaries, travel accounts, women's letters, and other miscellaneous writings. Since their contents are prosaic, these works are classified as prose, but they are written in verse form because their writers, being common people, were not fully experienced in the art of adapting the prosaic language.

Poetry. The later Yi dynasty also saw a great flowering of poetry, which, remarkably, was written primarily by common people.

The most gifted poet of the period was Yun Sbn-do, who achieved what is generally considered the definitive style in *p'ydng sijo* (standard *sijo),* which he raised to new heights of expressiveness. His works are characterized by freshness of diction and structural elegance.

Gradually, *sijo* was superseded in popularity by *sasŏl sijo,* a new narrative poetic genre produced by the common people, which can be regarded as a mixture of *kasa* and *sijo.* Though both were lyric poetry, *sasdl sijo* was more realistic, included more dialogue, and was structurally more complex. It boldly allegorized facts rather than ideas and attempted to express strong human emotions freely and to expose the naked self by means of allusion, witticism, and vulgarism.

Change in the *kasa* form

Pak In-no was the most important of the traditional *kasa* writers in the later Chosbn period, although he does not reach the stature of Yun Sbn-do. He merely succeeded in expressing Confucian doctrine in a sombre spirit. The desire to re-evaluate the past and to re-create the world of literature led to changes in the *kasa,* 2s exemplified in the anonymous works of the *nae-bang kasa (kasa* written by women in their secluded quarters) and in those of the common people. The writers of the *nae-bang kasa* were mainly women from the southern regions of Korea. They depicted their joy, anger, grief, pleasure, the etiquette of entertaining guests, religious rites, principles of being a wise mother and a good wife, and the like. The *kasa* of the common people, or *p'ydng-min kasa,* was marked by the same style as the *nae-bang kasa* and played a similar role in the literary activity of the general masses.

In addition to the *nae-bang,* the nobility produced two other new categories of *kasa: kihaettg kasa,* which were accounts of their travels, and *yubae kasa,* which were accounts of their life in exile. *Iltong-changyu-ga*, written by Kim In-gyom in 1763 upon his return from an official trip to Japan, and *Ydn-haeng-ga,* written by Hong Sunhak in 1866 upon his return from an official trip to Peking, are representative of the *kihaeng kasa* style. The three most widely known *yubae kasa* are *Pukkwan-gok* ("Song from the Banished North"), written by Song Chu-sbk, after following his grandfather Song Si-ybl to his exiled place of Togwbn, in south Hamgybng Province; *Manŏnsa* ("Song of Ten Thousand Words"), by An Cho-hwan, written while he was banished to the lonely isle of Ch'uja in the south; and *Pukch'ŏn-ga* ("Song from the Banished North"), written in 1853 by Kim Chin-hyŏng, depicting the experience of life in exile in Mybngch'on, north Hamgyŏng Province.

Oral literature. Another feature of the later Yi dynasty was the formation, by the common people, of *p'ansori* ("story singing") texts. *P'ansori* seems to have originated during the reign of Sukchong (1675–1720), when *kŭnwon sŏlhwa* (original stories, thought by some to have been the basis for the *p'ansori* texts) were first sung. Their style and form was fixed by the *kwang-dae,* or professional actor-singers, and a group of amateurs in Chŏlla and Ch'ungch'bng provinces. Originally, there were 12 *p'ansori.* Later, the master *p'ansori* writer Sin Chae-hyo (1812–84) revised and readjusted them into six fixed forms during the reign of King Kojong (1863–1907).

Mask plays and puppet shows

Finally, the mask play and the puppet show should be mentioned. The representative mask play is *Sandae To-gam kŭk.* Of unknown origin, it was usually performed on a stage in 12 scenes, or acts. The masked actors followed a script that presented a story in dialogue interspersed with dances and songs. As the puppets of the *Kkoktukaksi kiik* show were made of *pak* (a gourd, rhyming with the Korean name Pak), it was also referred to as *Pak Ch'ŏm-ji kŭk* ("Old Pak's play"). Through keen satire presented in a unique and distinguished style, the contents of the masked drama and the puppet show strongly reflect the environment and the feelings of the common people of the later Yi dynasty.

Transitional literature: 1894–1910. By the time of the 1894 reforms, enough social and intellectual change had occurred to suggest the beginnings of a division between traditional and modern literature. But, just as stubborn conservative reaction did not favour sudden changes in the political and social structure, it was unavoidable that literature, too, faced a long period of transition toward its modern transformation.

Schools were established by the educational ordinance of 1895, and the organization of learned societies and "enlightenment" movements followed soon after as cultural modernization began in earnest, limited though it was to modern education and what was called the "new-life" movement. Vernacular publications, the "Independent" and the "Imperial Press," along with the establishment of the Korean Language Institute and the scientific study, consolidation, and systematization of Korean grammar, also helped open the way for the modern literary movement.

The first literary forms to appear after the 1894 reforms were the *sinsosŏl* ("new novel") and the *ch'angga* ("song"). These transitional literary forms, lying midway between traditional and modern literature, were stimulated by the adaptation of foreign literary works and the rewriting of traditional novels in the vernacular. The *ch'angga,* which evolved from hymns sung at churches and schools in the 1890s, became very popular upon the publication of the "Aeguk ka" ("National Anthem"), by Yi Yong-u, and "Tongsim ka" ("The Mind of a Boy"), by Ti Chung-wbn, in an 1896 issue of the "Independent." The early *ch'angga* had a syllabic pattern reminiscent of the *kasa,* but later, under the influence of Japanese poetry, it made wide use of a typical Japanese pattern, particularly after the publication in 1904 of "Kybngbu ch'blto ka" ("Seoul–Pusan Railroad Song"), by Ch'oe Nam-sŏn. The content of the song was chiefly an explanation and praise of the Western thought being introduced during the modernization period.

The *sinsosŏl*

The *sinsosŏl,* which, like the adapted novel, was written by professional writers, was far better literature than the *ch'angga.* As its name implies, the *sinsosŏl* ("new novel") was a transitional literary form bridging the period from the decline of the traditional novel after the 1894 reforms to Yi Kwang-su (1892–1950) and the rise of the modern novel after 1910. Three distinctly traditional elements were inherited by the *sinsosŏl.* First was the basic moral stance of the traditional novel, the reproving of vice and the rewarding of virtue. Owing to the nature of the enlightenment period, the advocates of modernization, of course, were cast as the virtuous, while the wicked were invariably conservative. Second, the development of the plot was governed by coincidence, just as in the traditional novel, and events that lacked causality were illogically connected. Finally, there was no distinction between the dialogue and the accompanying narrative, which were fused into one expository structure. But the *sinsosŏl* also had its pioneering aspects that balanced off the traditional legacy. It was written wholly in prose, whereas a considerable part of the traditional novel had been in verse. The *sinsosŏl* tried to depict a plausible human existence with backgrounds and events that more closely resembled reality than was the case in the traditional novel, which always followed certain model stories with their established plot lines and stereotyped characterizations. And, in accord with the vernacular (*ŏnmun ilch'i*) movement, initiated after the reforms of 1894, the *sinsosŏl* adopted a colloquial style. Typical *sinsosŏl* writers and their works are: Yi In-jik, *Kwi-ui sŏng* (1907, "A Demon's Voice"); Yi Hae-jo, *Chayujong* (1910, "Liberty Bell"); and Ch'oe Ch'an-sik, *Ch'uwŏlsaek* (1912, "Autumn Moon"). In their novels these writers advocated modernization, a spirit of independence, contact with advanced countries, and study abroad; they also emphasized the wonder and diffusion of science and technology, the breakdown of conventions and superstition, and the pernicious internal conflicts of a society.

Modern literature: 1910 to the present. Even while the "modern" period is said to have begun around 1910 with the poetry of Ch'oe Nam-sbn and the novels of Yi Kwang-su, it was not until the late 1930s that Korea finally achieved a modern literature that was mature in international terms.

Ch'oe Nam-sŏn and Yi Kwang-su played leading roles in the literature of enlightenment that characterized the decade after 1910. Generally, the starting point of modern Korean poetry is taken to be the poem *Hae-egesŏ sonyŏn-ege* ("From the Sea to the Youth"), published in 1908 by Ch'oe Nam-sŏn. This poem was the first attempt to break away from traditional verse forms and from the *ch'angga*. Though rather loose in its structure, the poem is a valuable example of the ideas of equality and the consciousness of modernization that are typical of early modern Korean literature. Yi Kwang-su introduced Western literature and, as a literary pioneer, wrote "Chŏlmun kkum" (1915, "A Youthful Dream") and other short stories that were aimed at fostering social enlightenment. He further contributed to the development of the Korean novel with his long work *Mujŏng* (1918, "Heartless").

The Independence Movement of 1919, an inevitable explosion of the pent-up resentment of a people who had been deprived of their sovereignty, ended with the massacre and imprisonment of many Koreans by the Japanese. Young men, utilizing the only outlet left them by the Japanese authorities with which to express their youthful ardour, pooled their efforts in publishing literary magazines. In addition to the pace-setting magazine *Paekcho* ("White Tide"), which appeared in 1922, the period also saw the emergence of *Sŏgwang* ("Aurora") and *Ch'angjo* ("The Creation") in 1919, *Kaebyŏk* ("Genesis") and *P'aehŏ* ("The Ruin") in 1920, *Kŭmsŏng* ("Venus") and "Renaissance" in 1923, and *Chosŏn mundan* ("Korean Literary Circle") in 1924. The writers experimented with Romanticism, *décadentisme* (a literary movement that sought inspiration in the morbid and decadent), Symbolism, and Neoromanticism and introduced miscellaneous *fin de siècle* (the climate of sophistication, world-weariness, and fashionable despair that characterized much Western art and literature at the end of the 19th century) literary themes in search of individual expression for their emotions. Because this sudden inrush of eclectic foreign literary thought could not be quickly absorbed and, digested, the poetic harvest of the 1920s—consisting of some memorable poems written by Yi Sang-hwa and Kim So-wŏl—was meagre. The significant short stories published in the literary magazines of the 1920s demonstrate a growing interest in outward details, the use of such devices as letters, diaries, and dialogues, human psychology and a dramatization of daily life, and the use of properties to help forward the action. Outstanding short stories of the decade include "Paettaragi" (1920, "The Sailor's Song") and "Kamja" (1928, "The Potato"), by Kim Tong-in; "P'yobonsil-ui ch'ong kaeguri" (1920, "The Green Frog in the Specimen Room"), by Ybm Sang-sbp; and "Pinch'b" (1921, "The Poor Wife"), by Hybn Chin-gŏn.

Short stories of the 1920s

If the 1920s are to be viewed as a period of upheaval in Korean literature, the 1930s may be called a period of growth in which an early, developing modern literature gave way to a mature one. Early experimental elements began to disappear from the lyric works that appeared in the magazine *Simunlzak* ("Poetic Literature," founded in 1930), from the products of the Kuinhoe (The Nine-Man Group), organized in 1934, and also from the works of the Intellectual school that employed techniques of contemporary Western literature. The stream-of-consciousness method (a first-person narrative technique that renders the apparently random thoughts and associations that go through the character's conscious mind), introduced by Yi Sang, attracted much notice around 1935, and many writers remained interested in it until the 1950s. Some writers, on the other hand, stuck to the earlier Naturalistic technique (which puts the emphasis on external action).

In this period, Chbng Chi-yang, a pioneer in late modern poetry, fully demonstrated the potential of the Korean language as a poetic medium. Yi Hyo-sŏ described his fictional reality in poetic language, as in the short story "Memilkkot p'il-murybp" (1936, "When the Buckwheat Blooms"). Kim Ki-rim also exercised great influence in poetry until the 1950s, as did Yi Sang in the novel. Toward the end of the 1930s there was a turn toward nature and the rustic life. In poetry the Ch'ongnokp'a (Blue Deer School) reflected this trend, and in fiction a similar tendency appeared in antiurban, pastoral novels. The return to the native soil was possibly a reaction to the political reality with which writers were confronted. Generally, the first half of the 1940s was a dark period in Korean literature. When World War II was at its height, the Japanese did not allow Korean writers even the escape that nature and the pastoral life offered. Korean became an outlaw language.

When the war was over, however, Korean literature made a fresh start based on the inheritance of the 1930s. In 1950, when Korean literature had just begun to take root again, the Korean War began. The literature that followed the war was so remarkably different from that which had gone before that many critics saw it as marking the beginning of a new period, which they called Post-War Literature. To many, it seemed a new generation of Korean writers had appeared, one which knew nothing of the Japanese occupation and filtered knowledge but which was making its own fresh discovery of international literary ideas after a darkness of more than ten years. The resulting new flood of Western thought reminded many of the 1920s. (B.-W.C.)

III. Japanese literature

Both in quantity and quality, Japanese literature ranks as one of the major literatures of the world, comparable in age, richness, and bulk to English literature, though the course of development has been quite dissimilar. The surviving works extend from the 7th century AD to the present; during all of this time there was never a "dark age" devoid of literary production. Not only do poetry, the novel, and the drama have long histories in Japan, but some literary genres not so highly esteemed in other countries—including diaries, travel accounts, and books of random thoughts—are also prominent. A considerable body of writing by Japanese in the Chinese classical language, of much greater bulk and importance than comparable Latin writings by Englishmen, testifies to the Japanese literary indebtedness to China. Even the writings entirely in Japanese present an extraordinary variety of styles, which cannot be explained merely in terms of the natural evolution of the language. Some styles were patently influenced by the importance of Chinese vocabulary and syntax; but others developed in response to the internal requirements of the various genres, whether the terseness of haiku (a poem in 17 syllables) or the bombast of the dramatic recitation.

Problems in reading Japanese literature

The difficulties of reading Japanese literature can hardly be exaggerated; even a specialist in one period is likely to have trouble deciphering a work from another period or genre. Japanese style has favoured ambiguity, and the particles of speech necessary for easy comprehension of a statement are often omitted as unnecessary or as fussily precise. Sometimes the only clue to the subject or object of a sentence is the level of politeness in which the words are couched; for example, the verb *mesu* (meaning "to eat," "to wear," "to ride in a carriage," etc.) designates merely an action performed by a person of quality. In many cases, ready comprehension of a simple sentence depends on a familiarity with the background of a particular period of history. The verb miru, "to see," had overtones of "to have an affair with" or even "to marry" during the 11th century, when men were generally able to see women only after they had become intimate. The long period of Japanese isolation in the 17th and 18th centuries also tended to make the literature provincial, or intelligible only to persons sharing a common background; the phrase "there was a little smoke" (*sukoshi* no *kemuri* atte) was all readers of the late 17th century needed to realize that an author was referring to the Great Fire of 1682 that ravaged the city of Edo (Tokyo).

Despite the great difficulties arising from such idiosyncrasies of style, Japanese literature of all periods is exceptionally appealing to modern readers, whether read in the original or in translation. Because it is prevailingly subjective and coloured by an emotional rather than an intellectual or moralistic tone, its themes have a universal quality almost unaffected by time. To read a diary by a court lady of the 10th century is still a moving experience because she described with such honesty and intensity her deepest feelings that the modern reader forgets the chasm of history and changed social customs separating her world from his own.

The "pure" Japanese language, untainted and unfertilized by Chinese influence, contained remarkably few words of an abstract nature. Just as English borrowed such words as morality, honesty, justice, and the like from the Continent, the Japanese borrowed these terms from China; but if the Japanese language was lacking in the vocabulary appropriate to a Confucian essay, it could express almost infinite shadings of emotional content. A Japanese poet who was dissatisfied with the limitations imposed by his native language or who wished to describe unemotional subjects—whether the quiet outing of aged gentlemen to a riverside or the poet's awareness of his insignificance as compared to the grandeur of the universe—naturally turned to writing poetry in Chinese. From the 16th century on, many words that had been excluded from poetry because of their foreign origins or their humble meanings, following the dictates of the codes of poetic diction established in the 10th century, were adopted by the practitioners of the haiku, originally an iconoclastic, popular verse form. For the most part, however, the Japanese writers, far from feeling dissatisfied with the limitations on expression imposed by their language, were convinced that virtuoso perfection in phrasing and an acute refinement of sentiment were more important to poetry than the voicing of intellectually satisfying concepts.

Effect of the language on literary forms

The Japanese language itself also shaped poetic devices and forms. Because it lacks a stress accent, meaningful rhymes (all words end in one of five simple vowels), or quantity, poetry was distinguished from prose mainly in that it consisted of alternating lines of five and seven syllables; however, if the intensity of emotional expression was low, this distinction alone could not save a poem from dropping into prose. The difficulty of maintaining a high level of poetic intensity may account for the preference for short verse forms that could be polished with perfectionist care. But however moving a tanka (verse in 31 syllables) is, it clearly cannot fulfill some of the functions of longer poetic forms; and there are no Japanese equivalents of Paradise Lost, The Rape of the Lock, or *Tintern* Abbey, Instead, the poets devoted their efforts to perfecting each syllable of their compositions, expanding the content of a tanka by suggestion and allusion and prizing shadings of tone and diction more than originality or boldness of expression.

The fluid syntax of the prose affected not only style but content. Japanese sentences are sometimes of inordinate length, responding to the subjective turnings and twistings of the author's thought; and the writers considered smooth transitions from one statement to the next, rather than structural unity, the mark of excellent prose. The longer works accordingly betray at times a lack of overall structure of the kind associated in the West with Greek concepts of literary form but consist instead of episodes linked chronologically or by other associations. The difficulty experienced by Japanese writers in organizing their impressions and perceptions into sustained works may explain the development of the diary and travel account, genres in which successive days or the successive stages of a journey provide a structure for otherwise unrelated descriptions. Japanese literature contains some of the world's longest novels and plays; but its genius is most strikingly displayed in the shorter works, whether the tanka, the haiku, the Nō plays, or the poetic diaries.

An acute literary sensibility, fostered especially by the traditions of the court, encouraged the creation of "codes" of poetic practice and of a considerable body of criticism, extending back to the 10th century, that was usually composed by the leading poets or dramatists themselves. These codes exerted an inhibiting effect on new forms of literary composition, but they also helped to preserve a distinctively aristocratic tone.

Relation to Chinese and Korean literature

Japanese literature absorbed much direct influence from China, but the characteristic literary works are strikingly dissimilar. The tradition of feminine writing, especially of such introspective works as diaries, gave a colouring to Japanese prose quite unlike the more objective, masculine Chinese writings. Although the Japanese have been criticized for their imitations of Chinese examples (even by some Japanese), the Japanese novel in fact antedates any Chinese novels by centuries; and the theatre developed quite independently. Because the Chinese and Japanese languages are unrelated, the poetry naturally took different forms, although Chinese poetic examples and literary theories were often in the minds of the Japanese poets. Japanese and Korean are probably related languages, but Korean literary influence was negligible, though Koreans served an important function in transmitting Chinese literary and philosophical works to Japan. Poetry and prose written in the Korean language were unknown to the Japanese until relatively modern times.

From the 8th to the 19th centuries Chinese literature enjoyed greater prestige among educated Japanese than their own; but a love for the Japanese classics, especially those composed at the court in the 10th and 11th centuries, gradually spread among the entire people and influenced literary expression in every form, even the songs and tales composed by humble people totally removed from the aristocratic world portrayed in classical literature.

EARLIEST LITERATURE

The first writing of literature in Japanese was occasioned by influence from China. The Japanese were still comparatively primitive and without writing when, in the first four centuries AD, knowledge of Chinese civilization gradually reached them. They rapidly assimilated much of this civilization, and the Japanese scribes adopted Chinese characters as a system of writing, although an alphabet (if one had been available to them) would have been infinitely better suited to the Japanese language. The characters, first devised to represent Chinese monosyllables, could be used only with great ingenuity to represent the agglutinative forms of the Japanese language. The ultimate results were chaotic, giving rise to one of the most complicated systems of writing ever invented. The use of Chinese characters enormously influenced modes of expression and led to an association between literary composition and calligraphy lasting many centuries.

The earliest Japanese texts were no doubt written in Chinese because no system of transcribing the sounds and grammatical forms of Japanese had as yet been invented. The oldest known inscription, on a sword that dates from about AD 440, already shows some modification of normal Chinese usage in order to transcribe Japanese names and expressions. The most accurate way of writing Japanese words was by using Chinese characters not for their meanings but for their phonetic values, giving each character a pronunciation approximating that used by the Chinese themselves. In the oldest extant works, the ***Koji-ki*** (712; "Records of Ancient Matters") and ***Nihon shoki*** (720; "Chronicles of Japan"), more than 120 songs, some perhaps dating back to the 5th century AD, are given in phonetic transcription, doubtless because the Japanese attached great importance to the sounds themselves.

In these two works, both officially commissioned "histories" of Japan (though larded with myths and legends), many sections are written entirely in Chinese; but parts of the *Koji-ki* were composed in a complicated mixture of language that made use of the Chinese characters sometimes for their meaning and sometimes for their sound.

The myths in the ***Koji-ki*** are occasionally beguiling, but the only truly literary parts of the work are the songs. The early songs lack a fixed metrical form; the lines, consisting of an indeterminate number of syllables, were strung out to irregular lengths, showing no conception of poetic form. Some songs, however, seem to have been reworked—perhaps when the manuscript was transcribed in the 8th century—into what became the classic Japanese verse form, the tanka (short poem), consisting of five lines of five, seven, five, seven, and seven syllables. Various poetic devices employed in these songs, such as the *makura-kotoba* ("pillow word"), a kind of fixed epithet, remained a feature of later poetry.

Origin of the tanka in the ***Koji-ki***

Altogether, some 500 primitive songs have been preserved in various collections. Many describe travel, and a fascination with place-names, evident in the loving enumeration of mountains, rivers, and towns with their mantic epithets, was developed to great lengths in the gazetteers (*fudoki*) compiled at the beginning of the 8th century. These works, of only intermittent literary interest, devote considerable attention to the folk origins of different place-names, as well as to other local legends.

A magnificent anthology of poetry, the *Manyō-shū* (compiled after 759), is the single great literary monument of the Nara period (710–784), although it includes poetry written in the preceding century, if not earlier. Most of the 4,500 or so poems are tankas; but the masterpieces of the ***Manyd-shii*** are the 260 ***chdka*** (long poems), ranging up to 150 lines in length and cast in the form of alternating lines in five and seven syllables followed by a concluding line in seven syllables. The amplitude of the ***chdka*** permitted the poets to treat themes impossible within the compass of the tanka—whether the death of a wife or child, the glory of the Imperial family, the discovery of a gold mine in a remote province, or the hardships of military service.

The greatest of the *Manyō-shū* poets, Kakinomoto Hitomaro, served as a kind of poet laureate in the late 7th and early 8th centuries, accompanying the sovereigns on their excursions and composing odes of lamentation for deceased members of the Imperial family. Modern scholars have suggested that the *chōka* may have originated as exorcisms of the dead, quieting the ghosts of recently deceased persons by reciting their deeds and promising that they will never be forgotten. Some of Hitomaro's masterpieces describe the glories of princes or princesses he may never have met but so convincingly as to transcend any difference between "public" expressions of grief and his private feelings. Hitomaro's ***chdka*** are unique in Japanese poetry thanks to their superb combination of imagery, syntax, and emotional strength; they are works of truly masculine expression. He showed in his tanka, however, that he was also capable of the evocative, feminine qualities typical of later Japanese poetry.

The ***chdka*** often concluded with one or more ***hanka*** ("envoys") that resumed central points of the preceding poem. The *hanka* written by the 8th-century poet Yamabe Akahito are so perfectly conceived as to make the *chōka* they follow at times seem unnecessary; the concision and evocativeness of these poems, identical in form with the tanka, are close to the ideals of later Japanese poetry. Nevertheless, the supreme works of the *Manyō-shū* are the ***chdka*** of Hitomaro, Ōtomo Tabito, Otomo Yakamochi (probably the chief compiler of the anthology), and Yamanoe Okura.

The most striking quality of the *Manyō-shū* is its powerful sincerity of expression. The poets were certainly not artless songsmiths exclaiming in wonder over the beauties of nature, a picture that is often painted of them by sentimental critics; but their emotions were stronger and more directly expressed than in later poetry. The corpse of an unknown traveller, rather than the falling of the cherry blossoms, stirred in Hitomaro an awareness of the uncertainty of human life.

The *Manyō-shū* is exceptional in the number of poems composed outside the court, whether by frontier guards or persons of humble occupation. Perhaps some of these poems were actually written by courtiers in the guise of commoners, but the use of dialect and familiar imagery contrasts with the strict poetic diction imposed in the 10th century.

The diversity of themes and poetic forms also distinguishes the *Manyō-shū* from the more polished but narrower verse of later times. In Okura's famous "Dialogue on Poverty," for example, two men---one poor and the other destitute---describetheir miserable lots, revealing a concern over social conditions that would be absent from the classical tanka. Okura's visit to China in 701, as the member of a Japanese embassy, may account for Chinese influence in his poetry. His poems are also prefaced in many instances by passages in Chinese stating the circumstances of the poems or citing Buddhist parallels.

The *Manyō-shū* was transcribed in an almost perversely complicated system that used Chinese characters arbitrarily, sometimes for meaning and sometimes for sound. The lack of a suitable script probably inhibited literary production in Japanese during the Nara period. The growing importance, however, of Chinese poetry as the mark of literary accomplishment in a courtier may also have interrupted the development of Japanese literature after its first flowering in the *Manyō-shū*.

Eighteen *Manyō-shū* poets are represented in the collection *Kaifūsō* (751), an anthology of poetry in Chinese composed by members of the court. These poems are little more than pastiches of ideas and images borrowed directly from China; the composition of such poetry reflects the enormous prestige of Chinese civilization at this time.

CLASSICAL LITERATURE: HEIAN PERIOD (794–1185)

The foundation of the city of Heian-kyō (later known as Kyōto) as the capital of Japan marked the beginning of a period of great literary brilliance. The earliest writings of the period, however, were almost all in Chinese because of the continued desire to emulate the culture of the continent. Three Imperially sponsored anthologies of Chinese poetry appeared between 814 and 827, and it seemed for a time that writing in Japanese would be relegated to an extremely minor position. The most distinguished writer of Chinese verse, the 9th-century poet Sugawara Michizane, gave a final lustre to this period of Chinese learning by his erudition and poetic gifts; but his refusal to go to China when offered the post of ambassador, on the grounds that China no longer had anything to teach Japan, marked a turning point in the response to Chinese influence.

Poetry. The invention of the kana phonetic syllabary, traditionally attributed to the 9th-century Shingon priest and Sanskrit scholar Kūkai, enormously facilitated writing in Japanese. Private collections of poetry in kana began to be compiled about 880; and in 905 the ***Kokin-shū,*** the first major work of kana literature, was compiled by the poet Ki Tsurayuki and others. This anthology contains 1,111 poems divided into 20 books arranged by topics, including six books of seasonal poems, five books of love poems, and single books devoted to such subjects as travel, mourning, and congratulations. The two prefaces are clearly indebted to the theories of poetry described by the compilers of such Chinese anthologies as the ***Shih Ching*** and ***Wen*** *hsüan*, but the preferences they express would be shared by most tanka poets for the next 1,000 years. The preface by Tsurayuki, the oldest work of sustained prose in kana, enumerated the circumstances that move men to write poetry; he believed that melan-

The first major work of kana

choly, whether aroused by a change in the seasons or by a glimpse of white hairs reflected in a mirror, provided a more congenial mood for writing poetry than the harsher emotions treated in the *Manyō-shū*. The best tanka in the *Kokin-shū* captivate the reader by their perceptivity and tonal beauty, but these flawlessly turned miniatures obviously lack the variety of the *Manyō-shū*.

Skill in composing tanka became an asset in gaining preference at court; it was also essential to a lover, whose messages to his mistress (who presumably could not read Chinese, still the language employed by men in official documents) often consisted of poems describing his own emotions or begging her favours. In this period the tanka almost completely ousted the *chdka* because the shorter poems were more suited to the lover's billet-doux or to competitions on prescribed themes, a frequent court pastime.

For the poets of the *Kokin-shū* and the later court anthologies, originality was less desirable than perfection of language and tone. The critics, far from praising novelty of effects, condemned deviations from the standard poetic diction (established by the *Kokin-shū*) of some 2,000 words and insisted on absolute adherence to the poetic conventions. Although these restrictions saved Japanese poetry from lapses into bad taste or vulgarity, they froze it for centuries in prescribed modes of expression. Only a skilled critic can distinguish a tanka of the 10th century from one of the 19th century. The *Kokin-shii* set the precedent for later court anthologies, and a knowledge of its contents was indispensable to all poets as a guide and source of literary allusions.

Love poetry occupies a prominent place in the *Kokin-shū*, but the joys of love are seldom celebrated; instead, the poets wrote in the melancholy vein prescribed in the preface, describing the uncertainties before a meeting with the beloved, the pain of parting, or the sad realization that an affair had ended. The invariable perfection of diction, unmarred by any indecorous cry from the heart, may sometimes make one doubt the poet's sincerity. This is not true of the great *Kokin-shū* poets of the 9th century —Ono Komachi, Ise, Ariwara Narihira, and Tsurayuki himself—but even Buddhist priests, who presumably had renounced carnal love, wrote love poetry at the court competitions; and it is hard to detect any difference between such poems and those of sincere lovers.

The preface of the *Kokin-shii* lists judgments on the principal poets of the collection. This criticism is unsatisfying to a modern reader because it is so terse and unanalytical; but it nevertheless marks a beginning of Japanese poetic criticism, an art that developed impressively during the course of the Heian period.

The literary diary

Prose. Ki Tsurayuki is celebrated also for his *Tosa nikki* (935; *The Tosa Diary*, 1912), the account of his homeward journey to Kyōto from the province of Tosa, where he had served as governor. Tsurayuki wrote this diary in Japanese, though men at the time normally kept their diaries in Chinese (perhaps it was in order to escape reproach for adopting this unmanly style that he pretended a woman in the governor's entourage was the author). Events of the journey are interspersed with the poems composed on various occasions. The work is affecting especially because of the repeated, though muted, references to the death of Tsurayuki's daughter in Tosa.

Tosa rzikki is the earliest example of a literary diary. Tsurayuki pretended he was a woman, but the later Heian diarists who wrote in the Japanese language were, in fact, court ladies; their writings include some of the supreme masterpieces of the literature. *Kagerd nikki (The Gossamer Years,* 1964) describes the life between 954 and 974 of the second wife of the prime minister. The first volume, related long after the events, is in the manner of an autobiographical novel; even the author confesses that her remembrances are probably tinged with fiction. The second two volumes approach a true diary, with some entries apparently made on the days indicated. The writer (known only as "the mother of Michitsuna") describes, with many touches of self-pity, her unhappy life with her husband. She evidently assumed that readers would sympathize, and often this is the case, though her self-centred complaints are not endearing. In one passage, in which she gloats over the death of a rival's child, her obsession with her own griefs shows to worst advantage; yet her journal is extraordinarily moving precisely because the author dwells exclusively on universally recognizable emotions and omits the details of court life that must have absorbed the men.

Other diaries of the period include the anecdotal *Murasaki Shikibu nikki* (Eng. trans. 1920), at once an absorbing literary work and a source of information on the court life the author described more romantically in her masterpiece *Genji inonogatari* ("The Tale of Genji," c. 1010), and *Izumi Shikibu nikki* (Eng. trans. 1969), which is less a diary than a short story liberally ornamented with poetry.

These "diaries" are closely related in content and form to the *uta monogatari* (poem tales) that emerged as a literary genre later in the 10th century. *Ise monogatari (Tales of Ise, c.* 980) consists of 143 episodes, each containing one or more poems and an explanation in prose of the circumstances of composition. The brevity and often the ambiguity of the tanka gave rise to a need for such explanations, and when these explanations became extended or (as in the case of *Ise monogatari)* were interpreted as biographical information about one poet (Ariwara Narihira), they approached the realm of fiction.

Along with the poem tales, there were works of religious or fanciful inspiration going back to *Nihon ryōi-ki*, an account of Buddhist miracles in Japan compiled by the priest Kyōkai in 822. These stories, written in Chinese, were probably used as a source of sermons by the priests with the intent of persuading ordinary Japanese, incapable of reading difficult works of theology, that they must lead virtuous lives if they were not to suffer in hell for present misdeeds. No such didactic intent is noticeable in *Taketori monogatari* (10th century; *Tale of the Bamboo Cutter*, 1956), a fairy tale about a princess who comes from the moon to dwell on earth in the house of a humble bamboo cutter; the various tests she imposes on her suitors, fantastic though they are, are described with humour and realism.

Early development of the novel

The first lengthy "novel," *Utsubo monogatari* ("The Tale of the Hollow Tree"), was apparently written between 956 and 983 by Minamoto Shitagau, a distinguished courtier and scholar. This uneven, ill-digested work is of interest chiefly as an amalgam of elements in the poem tales and fairy tales; it contains 986 tanka, and its episodes range from early realism to pure fantasy.

The contrast between this crude work and the sublime *Genji monogatari* is overwhelming. Perhaps the difference is best explained in terms of the feminine traditions of writing, exemplified especially by the diaries, which enabled Murasaki Shikibu to discover depths in her characters unsuspected by the male author of *Utsubo monogatari*. The *Genji monogatari* is not only the finest work of the Heian period but of all Japanese literature and merits being called the first important novel written anywhere in the world. *Genji monogatari* was called a work of *mono no aware* ("a sensitivity to things") by the great 18th-century literary scholar Moto-ori Norinaga; the hero, Prince Genji, is not remarkable for his martial prowess or his talents as a statesman but as an incomparable lover, sensitive to each of the many women he wins. The story is related in terms of the successive women Genji loves; each of them evokes a different response from this marvellously complex man. The last third of the novel, describing the world after Genji's death, is much darker in tone; and the principal figures, though still impressive, seem no more than fragmentations of the peerless Genji.

The success of *Genji monogatari* was immediate. The author of the touching *Sarashina nikki (As I was Crossing a Bridge of Dreams,* 1971) described how as a girl she longed to visit the capital so that she might read the entire work (which had been completed some ten years earlier). Imitations and derivative works based on *Genji monogatari*, especially on the last third of it, continued to be written for centuries, inhibiting the fiction composed by the court society.

Aware and *okashi*

Makura-no-sdshi (c. 1000; *The Pillow Book of Sei Shōnagon,* 1967) is another masterpiece of the Heian period that should be mentioned with *Genji rnonogatari.* Japanese critics have often distinguished the *aware* of *Genji monogatari* and the *okashi* of *Makura-no-sōshi. Aware* meant sensitivity to the tragic implications of a moment or gesture, *okashi,* the comic overtones of perhaps the same moment or gesture. The lover's departure at dawn evoked many wistful passages in *Genji monogatari,* but in *Makura-no-sōshi* the author noted with unsparing exactness the lover's fumbling, ineffectual leave-taking and his lady's irritation. Murasaki Shikibu's *aware* can be traced through later literature—sensitivity always marked the writings of any author in the aristocratic tradition—but Sei Shbnagon's wit belonged to the Heian court alone.

Folk tales and songs

The Heian court society passed its prime by the middle of the 11th century, but it did not collapse for another 100 years. Long after its political power had been usurped by military men, the court retained its prestige as the fountainhead of culture. But in the 12th century, literary works belonging to a quite different tradition began to appear. *Konjaku monogatari,* a massive collection of religious and folktales, drawn not only from the Japanese countryside but also from Indian and Chinese sources, described elements of society that had never been treated in the court novels. These stories, though crudely written, provide glimpses of how the common people spoke and behaved in an age marked by warfare and new religious movements. The collection of folk songs *Ryōjin hishō,* compiled in 1179 by the emperor Shirakawa II, suggests the vitality of this burgeoning popular culture even as the aristocratic society was being threatened with destruction.

MEDIEVAL LITERATURE: KAMAKURA, MUROMACHI, AND AZUCHI-MOMOYAMA PERIODS (1192–1600)

Kamakura period (1192–1333). *Poetry.* The warfare of the 12th century brought to undisputed power military men (samurai) whose new regime was based on martial discipline. Though the samurai expressed respect for the old culture, some of them even studying tanka composition with the Kybto masters, the capital of the country moved to Kamakura. The lowered position of women under this feudalistic government perhaps explains the noticeable diminution in the importance of writings by court ladies; indeed, there was hardly a woman writer of distinction between the 13th and 19th centuries. The court poets, however, remained prolific: 15 Imperially sponsored anthologies were completed between 1188 and 1439; and most of the tanka followed the stereotypes established in earlier literary periods.

The *Shin kokin-shū* anthology

The finest of the later anthologies, the *Shin kokin-shū* (1206), was compiled by Fujiwara Teika, or Sadaie, among others, and is considered by many as the supreme accomplishment in tanka composition. The title of the anthology—"the new *Kokin-shū*"—indicates the confidence of the compilers that the poets represented were worthy successors of those in the 905 collection; they included (besides the great Teika himself) Teika's father Fujiwara Toshinari (Shunzei), the priest Saigyō, and the former emperor Toba II. These poets looked beyond the visible world for symbolic meanings. The brilliant colours of landscapes filled with blossoms or reddening leaves gave way to monochrome paintings; the poet, instead of dwelling on the pleasure or grief of an experience, sought in it some deeper meaning he could sense if not fully express. The tastes of Teika especially dominated Japanese poetic sensibility, thanks not only to his poetry and essays on poetry but to his choices of the works of the past most worthy of preservation.

Prose. Teika is credited also with a novel, *Matsura-no-miya monogatari.* Though unfinished and awkwardly constructed, its dreamlike atmosphere lingers in the mind with the overtones of Teika's poetry; dreams of the past were indeed the refuge of the medieval romancers, who modelled their language on the *Genji monogatari,* though it was now archaic, and borrowed their themes and characters from the Heian masterpieces. Stories about wicked stepmothers are fairly common; perhaps the writers, contrasting their neglect with the fabled lives of the Heian courtiers, identified themselves with the maltreated stepdaughters; and the typical happy ending of such stories—the stepdaughter in *Sumiyoshi monogatari* is married to a powerful statesman and her wicked stepmother humiliated—may have been the dream fulfillment of their own hopes.

Various diaries describe travels between Kyoto and the shogun's capital in Kamakura. Courtiers often made this long journey in order to press claims in lawsuits, and they recorded their impressions along the way in the typical mixture of prose and poetry. *Izayoi nikki* (Eng. trans. 1951) tells of a journey made in 1277 by the nun Abutsu. A later autobiographical work that also contains extensive descriptions of travel is the superb *Towazu-gatari* by Lady Nijō, a work (discovered only in 1940) that provides a final moment of glory to the long tradition of introspective writing by women at court.

Although these writings in the aristocratic manner preserved much of the manner of Heian literature, works of quite different character were even more prominent in the medieval period. There are many collections of Buddhist and popular tales, of which the most enjoyable undoubtedly is the *Ujishūi monogatari* (Eng. trans. 1970)—a compilation over a period of years of some 197 brief stories. Although the incidents described in these tales are often similar to those found in *Konjaku monogatari,* they are told with considerably greater literary skill.

Gunki monogatari established as a literary genre

An even more distinctive literary genre of the period is the *gunki monogatari,* or war tale. The most famous, *Heike monogatari,* was apparently first written at the court about 1220, probably by a nobleman who drew his materials from the accounts recited by priests of the warfare between the Taira and the Minamoto families in the preceding century. The celebrated opening lines of the work, a declaration of the impermanence of all things, also states the main subject, the rise and fall of the Taira family. The text, apparently at first in three books, was expanded to 12 in the course of time, as the result of being recited with improvisations by priest-entertainers. This oral transmission may account not only for the unusually large number of textual variants but also for the exceptionally musical and dramatic style of the work. Unlike the Heian novelists, who rarely admitted words of Chinese origin into their works, the reciters of the *Heike monogatari* employed the contrasting sounds of the imported words to produce what has been acclaimed as the great classic of Japanese style. Although the work is curiously uneven, effective scenes being followed by dull passages in which the narrator seems to be stressing the factual accuracy of his materials, it is at least intermittently superb; and it provided many later novelists and dramatists with characters and incidents for their works.

Heike monogatari was by no means the earliest literary work describing warfare; and other writings, mainly historical in content, were graced by literary flourishes uncommon in similar Western works. *Ōkagami* (c. 1120?; Eng. trans. 1967), the most famous of the "mirrors" of Japanese history, undoubtedly influenced the composition of *Heike monogatari,* especially in its moralistic tone. *Hōgen monogatari* (Eng. trans. 1971) and *Heiji monogatari* (Eng. trans. 1951), chronicle warfare that antedates the events described in *Heike monogatari* but were probably written somewhat later.

War tales continued to be composed throughout the medieval period. The *Taihei-ki* (Eng. trans. 1959), for example, covers about 50 years, beginning in 1318, when the emperor Daigo II ascended the throne. Though revered as a classic by generations of Japanese, it possesses comparatively little appeal for Western readers, no doubt because so few of the figures come alive.

Characters are more vividly described in two historical romances of the late 14th century, *Soga monogarari* and *Gikei-ki* (Eng. trans. 1966), describing the life of Minamoto Yoshitsune. Though inartistically composed, these portraits of resourceful and daring heroes caught the imaginations of the Japanese; and their exploits are still prominent on the Kabuki stage.

Another important variety of medieval literature was the reflective essays of Buddhist priests. *Hōjō-ki* (1212; The Ten Foot Square Hut, 1928) by Kamo Chōmei is a hermit's description of his disenchantment with the world and his discovery of peace in a lonely retreat. The elegiac beauty of its language gives this work, brief though it is, the dignity of a classic. Chōmei was also a distinguished poet, and his essay *Mumyō-shō* (1210–12; Eng. trans. 1968) is perhaps the finest example of traditional Japanese poetic criticism.

A later priest, Yoshida Kenkō, writing during the days of warfare and unrest that brought an end to the Kamakura shogunate in 1333, the brief restoration of Imperial authority under the Emperor Daigo II from 1333 to 1335, and the institution of the Ashikaga shogunate in 1338, barely hints at the turmoil of the times in his masterpiece *Tsurezuregusa* (1330–36; Essays *in* Idleness. 1967); instead he looks back nostalgically to the past, seeking out the survivals of happier days. Kenkō's aesthetic judgments, often based on a this-worldly awareness rather surprising in a Buddhist priest, gained wide currency, especially after the 17th century, when *Tsurezuregusa* was read by every educated man.

Renga becomes preferred poetic form

The Muromachi **(1338-1573)** and **Azuchi-Momoyama (1574-1600)** periods. Poetry. In the 15th century a poetic form of plebeian origins displaced the tanka as the preferred medium of the leading poets. Renga (linked verse) had begun as the composition of a single tanka by two people and was a popular pastime even in remote rural areas. One person would compose the first three lines of a tanka, often giving obscure or even contradictory details in order to make it harder for the second person to complete the poem intelligibly. Gradually, renga spread to the court poets, who saw the artistic possibilities of this diversion and drew up "codes" intended to establish renga as an art. These codes made possible the masterpieces of the 15th century, but their insistence on formalities (*e.g.*, how often a "link" on the moon might appear in 100 links, and which links must end with a noun and which with a verb) inevitably diluted the vigour and freshness of the early renga, itself a reaction against the excessively formal tanka. Nevertheless, the renga of the great 15th-century master Iio Sōgi and his associates are unique in their shifting lyrical impulses, moving from link to link like successive moments of a landscape seen from a boat, avoiding any illusion that the whole was conceived in one person's mind.

Prose. The short stories of the 15th and 16th centuries cannot be said to have high literary value. Many still look back to the world of the Heian court, but others introduce folk materials or else elements of the miraculous in the attempt to interest readers who lacked the education to appreciate the conventional literary manner. Even though many promising stories are ruined by absurdities before their course is run, for a few moments they often give unforgettable glimpses of a society torn by disorder. The stories are anonymous, but the authors seem to have been both courtiers and Buddhist priests.

Nō plays

Drama. Unquestionably the finest literary works of the 15th century are the Nb dramas, especially those by Zeami Motokiyo. They were written in magnificent poetry (often compared to "brocade" because of the many allusions to the poetry of the past) and were provided with a structure that is at once extremely economical and free. Many are concerned with the Buddhist sin of attachment: an inability to forget his life in this world prevents a dead man from gaining release but forces him to return again and again as a ghost to relive the violence or passion of his former existence. Only prayer and renunciation can bring about deliverance. Zeami's treatises on the art of Nō display extraordinary perceptivity. His stated aims were dramatic conviction and reality, but these ideals meant ultimates to him and not superficial realism. Some Nō plays, it is true, have little symbolic or supernatural content, but the central elements of a typical program of five Nō plays were found in the highly poetic and elusive masterpieces that suggest a world invisible to the eye but evokable by the actors through the beauty of movements and speech. Unhappiness over a world torn by disorder may have led writers to suggest in their works truths that lie too deep for words. This seems to have been the meaning of yzigen ("mystery and depth), the ideal of the Nō plays. Parallel developments occurred in the tea ceremony, the landscape garden, and monochrome painting, all arts that suggest or symbolize rather than state.

LITERATURE. DURING THE TOKUGAWA PERIOD (1603-1867)

Role of printing in creating a popular literature

The restoration of peace and the unification of Japan were achieved in the early 17th century, and for approximately 250 years the Japanese enjoyed almost uninterrupted peace. During the first half of the Tokugawa period, the cities of Kyoto and Osaka dominated cultural activity; but from about 1770 Edo (the modern Tokyo) became paramount. From 1638 to 1853 Japan was closed, by government decree, to contact with the outside world. Initially, this isolation encouraged the development of indigenous forms of literature; but, eventually, in the virtual absence of fertilizing influence from abroad, it resulted in provincial writing. The adoption of printing in the early 17th century made a popular literature possible. The Japanese had known the art of printing since at least the 8th century, but they reserved it exclusively for reproducing Buddhist writings. The Japanese classics existed only in manuscript form. Perhaps the demand for copies of literary works was so small that it could be satisfied with manuscripts, costly though they were; or perhaps aesthetic considerations made the Japanese prefer manuscripts in beautiful calligraphy, sometimes embellished with illustrations. Whatever the case, not until 1591 was a nonreligious work printed. About the same time, Portuguese missionaries in Nagasaki were printing books in the Roman alphabet. In 1593, in the wake of the Japanese invasion of Korea, a printing press with movable type was sent as a present to the emperor Yōzei II. Printing soon developed into the hobby or extravagance of the rich, and many examples of Japanese literature began to appear in small editions. Commercial publication began in 1609; by the 1620s even works of slight literary value were being printed for a public eager for new books.

Early Tokugawa period **(1603–c. 1770).** Poetry. Poetry underwent many changes during the early part of the Tokugawa period. At first the court poets jealously maintained their monopoly over the tanka, but gradually other men, many of them kokugakusha ("scholars of national learning"), changed the course of tanka composition by attempting to restore to the form the simple strength of Manyd-shzi poetry. The early-18th-century poet Kamo Mabuchi was the best of the neo-*Manyō-shū* school, but his tanka rarely rise above mere competence in the ancient language.

Emergence of haiku

The chief development in poetry during the Tokugawa shogunate was the emergence of the haiku as an important genre. This exceedingly brief form (17 syllables arranged in lines of five, seven, and five syllables) had originated in the hokku, or opening verse of a renga sequence, which had to contain in its three lines mention of the season, the time of day, the dominant features of the landscape, etc., making it almost an independent poem. The hokku became known as the haiku late in the 19th century, when it was entirely divested of its original function of opening a sequence of verse; but today even the 17th-century hokku are usually called haiku.

As early as the 16th century haikai renga, or comic renga, had been composed by way of diversion after an evening of serious renga composition, reverting to the original social, rather than literary, purpose of making linked verse. As so often happened in Japan, however, a new art, born as a reaction to the stultifying practices of an older art, was "discovered," codified, and made respectable by practitioners of the older art, generally at the cost of its freshness and vitality. Matsunaga Teitoku, a conventional 17th-century poet of tanka and renga who revered the old traditions, became almost in spite of himself the mentor of the new movement in comic verse, largely as the result of pressure from his eager disciples. Teitoku brought dignity to the comic renga and made it a demanding medium, rather than the quip of a moment.

His haiku were distinguishable from serious renga not by their comic conception but by the presence of a *haigon*—a word of Chinese or recent origins that was normally not tolerated in classical verse.

Inevitably, a reaction arose against Teitoku's formalism. The poets of the Danrin school, headed by Nishiyama Sbin and Ihara Saikaku, insisted that it was pointless to waste months if not years perfecting a sequence of 100 verses. Their ideal was rapid and impromptu composition; and their verses, generally colloquial in diction, were intended to amuse for a moment rather than to last for all time. Saikaku especially excelled at one-man composition of extended sequences; in 1684 he composed the incredible total of 23,500 verses in a single day and night, too fast for the scribes to do more than tally.

The haiku was perfected into a form capable of conveying poetry of the highest quality by Matsuo Bashd. After passing through an apprenticeship in both Teitoku and Danrin schools, Bashb founded a school of his own, insisting that a haiku must contain both a perception of some eternal truth and an element of contemporaneity, combining the characteristic features of the two earlier schools. Despite their brief compass, Bashb's haiku often suggest, by means of the few essential elements he presents, the whole world from which they have been extracted; the reader must participate in the creation of the poem. Bashō's best known works are travel accounts interspersed with his verses; of these, *Oku-no-hosomichi* (1694; *The Narrow Road Through the Deep North,* 1966) is perhaps the most popular and revered work of Tokugawa literature.

Prose. The general name for the prose composed between 1600 and 1682 is *kana-zōshi,* or "kana books," the name originally having been used to distinguish popular writings in the Japanese syllabary from more learned works in Chinese. The genre embraced not only fiction but works of a near historical nature, pious tracts, books of practical information, guidebooks, evaluations of courtesans and actors, and miscellaneous essays. Only one writer of any distinction is associated with the *kana-zōshi*—Asai Rydi, a samurai who became the first popular and professional writer in Japanese history. Thanks to the development of relatively cheap methods of printing and a marked increase in the reading public, Rydi was able to make a living as a writer. Although some of his works are Buddhist, he wrote in a simple style, mainly in kana. His most famous novel, *Ukiyo monogatari* ("Tales of the Floating World," *c.* 1661), is primitive both in technique and in plot; but under his mask of frivolity Ryōi attempted to treat the hardships of a society where the officially proclaimed Confucian philosophy concealed the gross inequalities in the lots of different men.

The first important novelist of the new era was Ihara Saikaku. Some Japanese critics rank him second only to Murasaki Shikibu in all Japanese literature, and his works have been edited with the care accorded only to great classics. Such attention would surely have surprised Saikaku, whose fiction was dashed off almost as rapidly as his legendary performances of comic renga, with little concern for the judgments of posterity.

Saikaku's novels of the *ukiyo*

Saikaku's first novel, *Kōshoku ichidai otoko* (1682; *The Life of an Amorous Man,* 1964), changed the course of Japanese fiction. The title itself had strong erotic overtones, and the plot describes the amorous adventures of one man, from his precocious essays at lovemaking as a child of seven to his decision at the age of 60 to sail to an island populated exclusively by women. The licensed quarters of prostitution established in various Japanese cities by the Tokugawa government (despite its professions of Confucian morality), in order to help control unruly samurai by dissipating their energies, became a centre of the new culture. Expertise in the customs of the brothels was judged the mark of the man of the world. The old term *ukiyo,* which had formerly meant the "sad world" of Buddhist stories, now came to designate its homonym, the "floating world" of pleasure; this was the chosen world of Saikaku's hero, Yonosuke, who became the emblematic figure of the era.

Saikaku's masterpiece, *Kdshoku gonin onna* (1686; *Five Women Who Loved Love,* 1956), described the loves of women of the merchant class, rather than prostitutes; this was the first time that women of this class were given such attention. In other works he described, sometimes with humour but sometimes with bitterness, the struggles of merchants to make fortunes. His combination of a glittering style and warm sympathy for the characters lifted his tales from the borders of pornography to high art.

Saikaku was a central figure in the renaissance of literature of the late 17th century. The name Genroku (an era name designating the period 1688–1703) is often used of the characteristic artistic products: the *ukiyo-e* ("pictures of the floating world"); the *ukiyo-zōshi* ("tales of the floating world"); the Kabuki and *jōruri,* or puppet theatres; and haiku poetry. Unlike its antecedents, this culture prized modernity above conformity to the ancient traditions; to be abreast of the floating world was to be up-to-date, sharing in the latest fashions and slang, delighting in the moment rather than in the eternal truths of Nō plays or medieval poetry.

Another, darker side to Genroku culture is depicted in Saikaku's late works, with their descriptions of the desperate expedients to which men turned in order to pay their bills. Saikaku seldom showed much sympathy for the prostitutes he described; but the chief dramatist of the time, Chikamatsu Monzaemon, wrote his best plays about unhappy women, driven by poverty into their lives as prostitutes, whose only release from the sordid world in which they were condemned to dwell came when they joined their lovers in double suicides. In the world of merchants treated by Chikamatsu, a lack of money, rather than the cosmic griefs of the Nb plays, drove men to death with the prostitutes they loved but could not afford to buy.

Chikamatsu's plays for the puppet theatre

Drama. Chikamatsu wrote most of his plays for the puppet theatre, which, in the 18th century, enjoyed even greater popularity than Kabuki. His plays fell into two main categories: those based, however loosely, on historical facts or legends, and those dealing with contemporary life. The domestic plays are rated much higher critically because they avoid the bombast and fantastic displays of heroism that mark the historical dramas; but the latter, adapted for the Kabuki theatre, are superb acting vehicles.

The mainstays of the puppet theatre were written not by Chikamatsu but by his successors; his plays, despite their literary superiority, failed to satisfy the audiences' craving for displays of puppet techniques and for extreme representations of loyalty, self-sacrifice, and other virtues of the society. The most popular puppet play (later adapted also for the Kabuki actors) was *Kanadehon chūshingura* (1748, "The Treasury of Loyal Retainers") by Takeda Izumo and his collaborators; the same men were responsible for half a dozen other perennial favourites of the Japanese stage. The last great 18th-century writer of puppet plays, Chikamatsu Hanji, was a master of highly dramatic, if implausible, plots.

Later developments of tanka and haiku

Late Tokugawa period (c. 1770–1867). *Poetry.* The literature of the late Tokugawa period is generally inferior to earlier achievements, especially those of the Genroku masters. Authentic new voices, however. were heard in traditional poetic forms. Later *neo-Manyd-shii* poets such as Ryōkan, Ōkuma Kotomichi, and Tachibana Akemi proved that the tanka was not limited to descriptions of the sights of nature or disappointed love but could express joy over fish for dinner or wrath at political events. Some poets who felt that tanka did not provide ample scope for the display of such emotions turned, as in the past, to writing poetry in Chinese. The early-19th-century poet Rai Sanyd probably wrote verse in Chinese more skillfully than any previous Japanese.

Later Tokugawa poets also added distinctive notes of their own to the haiku. Yosa Buson, for example, introduced a romantic and narrative element, and Kobayashi Issa employed the accents of the common people.

Prose. A great variety of fiction was produced during the last century of the Tokugawa shogunate, but it is commonly lumped together under the somewhat derogatory heading of *gesaku* (playful composition). The word

Gesaku fiction

"playful" did not necessarily refer to the subject matter but to the professed attitude of the authors, educated men who disclaimed responsibility for their compositions. Ueda Akinari, the last master of fiction of the 18th century, won a high place in literary history mainly through his brilliant style, displayed to best advantage in *Ugetsu monogatari* (1776; "Tales of Moonlight and Rain"), a collection of supernatural tales. The ***gesaku*** writers, however, did not follow Akinari in his perfectionist attention to style and construction; instead, they produced books of almost formless gossip, substituting the raciness of daily speech for the elegance of the classical language, and relying heavily on the copious illustrations for success with the public.

The ***gesaku*** writers were professionals who made their living by sale of their books. They aimed at as wide a public as possible, and when a book was successful it was usually followed by as many sequels as the public would accept. The most popular of the comic variety of ***gesaku*** fiction was *Tōkaidō dōchū hizakurige* (1802–22; ***Hizakurige*, 1929**), by Jippensha Ikku, an account of the travels and comic misfortunes of two irrepressible men from Edo along the Tōkaidō Road to Kyōto. ***Shunshoku*** *umegoyomi* (1832; "The Plum Calendar"), by Tamenaga Shunsui is the story of Tanjirō, a peerlessly handsome but ineffectual young man for whose affections various women fight. The author at one point defended himself against charges of immorality: "Even though the women I portray may seem immoral, they are all imbued with deep sentiments of chastity and fidelity." It was the standard practice of ***gesaku*** writers, no matter how frivolous their compositions might be, to pretend that their intent was didactic.

Didactic nature of the ***yomihon***

The ***yomihon*** ("books for reading"—so called to distinguish them from works enjoyed mainly for their illustrations) were much more openly moralistic. Although they were considered to be ***gesaku,*** no less than the most trivial books of gossip, their plots were burdened with historical materials culled from Chinese and Japanese sources, and the authors frequently underlined their didactic purpose. But despite the serious intent of the ***yomihon,*** they were romances, rather than novels; and their characters, highly schematized, tended to be witches, fairy princesses, and impeccably noble gentlemen. Where they succeeded, as in a few works by Takizawa Bakin, they are absorbing as examples of storytelling rather than as embodiments of the principle of ***kanzen*** *chōaku* ("the encouragement of virtue and the chastisement of vice"), Bakin's professed aim in writing fiction.

Japanese literature in general was at one of its lowest levels at the end of the Tokugawa period. A few tanka poets and the Kabuki dramatist Kawatake Mokuami are the only writers of the period whose works are still read today. It was an exhausted literature that could be revived only by the introduction of fresh influences from abroad.

MODERN LITERATURE

Even after the arrival of Commodore Perry's fleet in 1853 and the gradual opening of the country to the West and its influence, there was little noticeable effect on Japanese literature. The long closure of the country and the general sameness of Tokugawa society for decades at a time seems to have atrophied the imaginations of the ***gesaku*** writers. Even the presence of curiously garbed foreigners, which should have provoked some sort of reaction from authors searching for new materials, at first produced little effect. The ***gesaku*** writers were oblivious to the changes in Japanese society, and they continued to grind out minor variants on the same hackneyed themes of the preceding 200 years.

It was only after the removal in 1868 of the capital to Edo (renamed Tokyo) and the declaration of the emperor Meiji that he would seek knowledge from the entire world that the ***gesaku*** writers realized their days of influence were numbered. They soon fell under attack from their old enemies, the Confucian denouncers of immoral books, and also from advocates of the new Western learning. Although the ***gesaku*** writers responded with satirical pieces and traditional Japanese fiction deriding the new learning, they were helpless to resist the changes transforming the entire society.

Early translations and their influence

Introduction of Western literature. Translations from European languages of nonliterary works began to appear soon after the Meiji Restoration. The most famous example was the translation (1870) of Samuel Smiles's ***Self-Help;*** it became a kind of bible for ambitious young Japanese eager to emulate Western examples of success. The first important translation of a European novel was *Ernest Maltravers*, by the British novelist Edward Bulwer-Lytton, which appeared in 1879 under the title *Karyū shunwa* ("A Spring Tale of Blossoms and Willows"). The early translations were inaccurate, and the translators unceremoniously deleted any passages they could not understand readily or which they feared might be unintelligible to Japanese readers. They also felt obliged to reassure readers that, despite the foreign names of the characters, the emotions they felt were exactly the same as those of a Japanese.

It did not take long. however, for the translators to discover that European literature possessed qualities unknown in the Japanese writings of the past. The literary scholar Tsubouchi Shōyō was led by his readings in European fiction and criticism to reject didacticism as a legitimate purpose of fiction; he insisted instead on its artistic values. His critical essay ***Shōsetsu shinzui*** ("The Essence of the Novel," 1885) greatly influenced the writing of subsequent fiction not only because of its emphasis on realism as opposed to didacticism but because Tsubouchi, a member of the samurai class, expressed the conviction that novels, hitherto despised by the intellectuals as mere entertainments for women and children, were worthy of even a scholar's attention.

Ukigumo (1887–89; ***The Drifting Cloud,*** 1967) by Futabatei Shimei was the first modern Japanese novel. The author was familiar with Russian literature and contemporary Western literary criticism. Futabatei wrote *Ukigumo* in the colloquial, apparently because his readings in Russian literature had convinced him that only the colloquial could suitably be used when describing the writer's own society. Despite Futabatei's success with this experiment, most Japanese writers continued to employ the literary language until the end of the century. This was due, no doubt, to their reluctance to give up the rich heritage of traditional expression in favour of the unadorned modern tongue.

Western influences on poetry

Poetry. Translations of Western poetry led to the creation of new Japanese literary forms. The pioneer collection, *Shintaishi-shō* (1882; "Selection of Poems in the New Style"), contained not only translations from English but also five original poems by the translators in the poetic genres of the foreign examples. The translators declared that although European poetry had greater variety than Japanese poetry—some poems are rhymed, others unrhymed, some are extremely long, others abrupt —it was invariably written in the language of ordinary speech:

> They never borrow words from foreign countries, nor do they pad their language with archaic words not used for a thousand years. As a consequence anyone, even a small child, can understand poetry, providing only that he is familiar with the language of the country.

The insistence on modern language and the discovery of the many forms available to the poet were not the only lessons learned from European poetry. The translators also made the Japanese public aware of how much of human experience had never been treated in the tanka or haiku forms.

Innumerable Western critics have sarcastically commented on the Japanese proclivity for imitating foreign literary models and on their alleged indifference to their own traditions. It is true that without Russian examples Futabatei could not have written *Ukigumo,* and without English examples such poets as Shimazaki Tōson could not have created modern Japanese poetry; but far from recklessly abandoning their literary heritage, most writers were at great pains to acquaint themselves with their traditional literature. The outstanding novelists of the

1890s—Ozaki Kōyō, Kōda Rohan, Higuchi Ichiyd, and Izumi Kyōka—all read Saikaku and were noticeably influenced by him. Ichiyō's short novel ***Takekurabe*** (1895; ***Growing Up,*** 1956) described the children of the Yoshiwara quarter of Edo in a realistic manner quite unlike that of the usual stories about prostitutes and their customers, but she used the language of Saikaku for her narration. Izumi Kydka, though educated partly at a Western mission school, wrote superbly in the vein of late Tokugawa fiction; something of the distant Japanese literary past prevaded even his writings of the 1930s, the final years of his life.

In poetry, too, the first products of Western influence were comically inept experiments with rhyme and with such unpromising subjects as the principles of sociology. Shimazaki Tdson's "Song of the Autumn Wind" (1896), however, is not merely a skillful echo of Shelley but a true picture of a Japanese landscape; and the irregular lines of his poem tend to fall into the traditional pattern of five and seven syllables.

A decade after the works of such English Romantic poets as Shelley and Wordsworth had influenced Japanese poetry, the translations made by Ueda Bin of the French Parnassian and Symbolist poets made an even more powerful impression. Ueda wrote, "The function of symbols is to help create in the reader an emotional state similar to that in the poet's mind; symbols do not necessarily communicate the same conception to everyone." This view was borrowed from the West, but it accorded perfectly with the qualities of tanka.

Because of the ambiguities of traditional Japanese poetic expression, it was natural for a given poem to produce different effects on different readers; the important thing, as in Symbolist poetry, was to communicate the poet's mood. If the Japanese poets of the early 1900s had been urged to avoid contamination by foreign ideas, they would have declared that this was contrary to the spirit of an enlightened age. But when informed that eminent foreign poets preferred ambiguity to clarity, the Japanese responded with double enthusiasm.

Revitalization of tanka and haiku

Even the traditional forms, tanka and haiku, though moribund in 1868, took on new life, thanks largely to the efforts of Masaoka Shiki, a distinguished late-19th-century poet in both forms but of even greater importance as a critic. Yosano Akiko, Tshikawa Takuboku, and Saitd Mokichi were probably the most successful practitioners of the new tanka. Yosano Akiko's collection *Midaregami* (1901; ***Tangled Hair,*** 1971) stirred female readers especially, not only because of its lyrical beauty but because Akiko herself seemed to be proclaiming a new age of romantic love. Takuboku emerged in the course of his short life as perhaps the most popular tanka poet of all time. His verses are filled with strikingly individual expressions of his intransigent personality. Saitō Mokichi combined an absorption with *Manyō-shū* stylistics and a professional competence in psychiatry. Despite the austere nature of his poetry, he was recognized for many years as the leading tanka poet. In haiku, Takahama Kyoshi built up a following of poets strong enough to withstand the attacks of critics who declared that the form was inadequate to deal with the problems of modern life. Kyoshi himself eventually decided that the function of haiku was the traditional one of an intuitive apprehension of the beauties of nature; but other haiku poets employed the medium to express entirely unconventional themes.

Most tanka and haiku poets continued to use the classical language, probably because its relative concision permitted them to impart greater content to their verses than modern Japanese permits. Poets of the "new style," therefore, were readier to employ the colloquial. Hagiwara Sakutarō, generally considered the finest Japanese poet of the 20th century, brilliantly exploited the musical and expressive possibilities of the modern tongue. Other poets, such as Horiguchi Daigaku, devoted themselves mainly to translations of European poetry, achieving results so compelling in Japanese that these translations are considered to form an important part of the modern poetry of Japan.

The novel between 1905 and 1941

Prose. The dominant stream in Japanese fiction since the publication of ***Hakai*** ("The Broken Commandment," 1906), by Shimazaki Tdson, and ***Futon*** ("The Quilt," 1907), by Tayama Katai, has been naturalism. Although originally inspired by the works of the 19th-century French novelist Émile Zola and other European naturalists, the movement quickly took on a distinctively Japanese colouring, rejecting (as a Confucian scholar might have rejected ***gesaku*** fiction) carefully developed plots or stylistic beauty in favour of absolute verisimilitude in the author's confessions or in his minute descriptions of the lives of unimportant people hemmed in by circumstances beyond their control.

By general consent, however, the two outstanding novelists of the early 20th century were men who stood outside the naturalist movement, Mori Ogai and Natsume Sdseki. Ōgai began as a writer of autobiographical fiction with strong overtones of German Romantic writings. Midway in his career he shifted to historical novels that are virtually devoid of fictional elements but are given literary distinction by their concise and masculine style. Sdseki gained fame with humorous novels such as ***Botchan*** (1906; ***Botchan,*** 1972), a fictionalized account of his experiences as a teacher in a provincial town. His later works have an increasingly dark and introspective character, culminating in the unfinished ***Meian*** (1916; ***Light and Darkness,*** 1971), which is a study of alienation and loneliness.

An amazing burst of creative activity occurred in the decade following the conclusion of the Russo-Japanese War in 1905. Probably never before in the history of Japanese literature were so many important writers working at once. Some of the novelists who first emerged into prominence at this time were Nagai Kafū, Tanizaki Jun-ichird, and Akutagawa Ryiinosuke. Revealing a powerful attraction to the Japanese past, tempered by a modern, essentially Western sensibility, their works were the finest of those written during the period of the 1920s and 1930s.

In some of Tanizaki's novels, especially ***Tade kuu mushi*** (1929; ***Some Prefer Nettles,*** 1955), the conflict between traditional and Western-inspired ways was a central theme. Problems of a quite different kind—of social injustice—aroused writers of the "proletarian literature" school, such as Kobayashi Takiji, to compose works that would promote revolutionary change in Japan. Still other writers, convinced that the essential function of literature was artistic rather than propagandistic, formed such opposing schools as the "Neo-sensualists," whose associates included Yokomitsu Riichi and Kawabata Yasunari. Kawabata's work, for which he was awarded the Nobel Prize for Literature in 1968, is uniquely Japanese in its lyricism and intuitive construction.

Japanese critics have divided the fiction of the period up to 1941 into many schools, each consisting of a leading writer and his disciples. Probably the most influential author was Shiga Naoya. His characteristic literary form was the closely autobiographical story, related with stylistic beauty and great intelligence but not remarkable for invention or structure. Because of Shiga's commanding presence, the ***shishōsetsu*** ("I novel") came to be more highly esteemed than outright works of fiction.

The postwar novel

The aggressive wars waged by the Japanese militarists in the 1930s inhibited literary production; and during World War II (the Pacific War of 1941–45) almost all serious writing ceased. The end of the war, however, signalled an extraordinary period of activity, both by the older generation and by new writers. Tanizaki had begun publication of his most celebrated novel, ***Sasarne-yuki*** (1943–48; ***The Makioka Sisters,*** 1957), during the war, but publication was halted by official order, and only after the war did it appear. Kawabata also completed his masterpiece ***Yukiguni*** (1935–47; ***Snow Country,*** 1956) shortly after the war. Neither writer touched on the hardships undergone during the war years or on the painful period that followed Japan's defeat. This period is vividly described, however, in the novels of Dazai Osamu; and perhaps the most powerful expression of revulsion at the war was ***Nobi*** (1951; ***Fires on the Plain***) by

Ōoka Shōhei. The dropping of the atomic bomb also inspired much poetry and prose, of which *Kuroi ame* (1967; *Black Rain)* by Ibuse Masuji was the most artistic example.

The Japan of the immediate postwar period and the prosperous Japan of the 1950s and 1960s provided the background for most of the works of Mishima Yukio, an exceptionally brilliant and versatile novelist and playwright who became the first Japanese writer generally known abroad. Mishima's best known works include *Kinkaku-ji (The Temple of the Golden Pavilion,* 1959), a psychological study of a young monk who burned a famous architectural masterpiece, and *Hōjō no Umi* (*The Sea of Fertility),* the tetralogy he completed on the day of his death. Abe Kbbb was notable among modem writers in that he managed, sometimes by resorting to avant-garde techniques, to transcend the particular condition of being a Japanese and to create myths of suffering humanity in such a work as *Suna no onna* (1960; *Woman in the Dunes,* 1964). The powerful writings of be Kenzaburō have given promise of a gifted new generation to come.

Drama. The modem Japanese theatre also began with translations and adaptations of Western plays. This new theatre originated at the end of the 19th century, when the public was still too much under the influence of Kabuki to appreciate plays without music or dance. Even in the 20th century, a distinguished dramatist such as Kishida Kunio rarely had the opportunity to see his works performed. The development of modem drama no doubt was hampered by the introduction, at about the same time, of motion pictures, which had a much greater appeal for the public. The most successful playwrights of the 1920s and 1930s, such as Mayama Seika, wrote works that, although the products of modem minds, exploited the special talents of Kabuki actors by treating historical themes and by preserving the traditional stage language. Various distinguished writers were attracted from time to time to the theatre, but they were forced to devote their major efforts to writing fiction, if only because they were so badly remunerated for their plays. It was not until after World War II that modern dramas worthy of an international audience were written and staged.

BIBLIOGRAPHY

Chinese literature: (General works): *Ssu-pu ts'ung-k'an* (reprinted 1920–22); KARL LO, *A Guide to the Ssū pu ts'ung k'an* (1965); HU SHIH, *Pai-hua wen-hsiieh shih* ("History of Vernacular Literature," 1929); CHENG CHEN-TO, *Chung-kuo wen-hsueh shih* ("History of Chinese Literature," 1932); CH'EN SHOU-YI, *Chinese Literature: A Historical Introduction* (1961); LIU WU-CHI, *An Introduction to Chinese Literature* (1966); translations by ARTHUR WALEY too numerous to be listed; EUGEN FEIFEL (ed.), *Geschichte der chinesischen Literatur* (1945); GEORGES MARGOULIES, *Evolution de la prose artistique chinoise* (1929), *Histoire de la littérature chinoise: prose* (1949), and *Histoire de la littérature chinoise: poésie* (1951). *(Contemporary Chinese literature):* Most of the novels and plays mentioned in the article above are available in English translation. For English translations of representative modern Chinese poems and short stories, see KAI-YU HSU (ed. and trans.), *Twentieth Century Chinese Poetry: An Anthology* (1963); CHIH-TSING HSIA, with the assistance of JOSEPH S.M. LAU, *Twentieth-Century Chinese Stories* (1971); and CHI-CHEN WANG (trans.), *Contemporary Chinese Stories* (1944). TING YI, *A Short History of Modern Chinese Literature* (1959), is an informative but excessively pro-Communist survey. For concise and lucid historical accounts, see ADOLPHE C. SCOTT, *Literature and the Arts in Twentieth Century China* (1963); and the introductions to the three volumes edited by WU-CHI LIU and TIEN-YI LI, *Readings in Contemporary Chinese Literature,* rev. ed. (1964–68). C.T. HSIA, *A History of Modern Chinese Fiction,* 2nd ed. (1971), is a highly readable critical study of some representative novelists and their works. MERLE GOLDMAN, *Literary Dissent in Communist China* (1967), gives a thorough analysis of the conflict between the Chinese Communist party and the intellectuals in the 1940s and 1950s. Outstanding among monographs on individual authors are: OLGA LANG, *Pa Chin and His Writings: Chinese Youth Between the Two Revolutions* (1967); and DAVID TOD ROY, *Kuo Mo-jo: The Early Years* (1971).

Korean literature: PETER H. LEE, *Korean Literature: Topics and Themes* (1965), an introduction to Korean literature; *Anthology of Korean Poetry from the Earliest Era to the Present* (1964); and *Studies in the Saenaennorae: Old Korean Poetry* (1959), studies in the hyangga; TU-SU SO (ed. and trans.), *The Korean Literary Reader with a Short History of Korean Literature,* by DOO SOO SUH (1965), anthology of Korean literature with annotation; INSTITUTE OF ASIAN STUDIES (ed.), *Korean Studies Today: Development and State of the Field* (1970), historical and critical writings about Korean culture; INEZ KONG PAI (ed. and trans.), *The Ever White Mountain: Korean Lyrics in the Classical Sijo Form* (1965), anthology of sijo; W.E. SKILLEND, *Kodae Sosol: A Survey of Korean Traditional Style Popular Novels* (1969), catalog of Korean fiction with annotation; CHONG IN-SOP (ed. and trans.), *Folk Tales from Korea* (1952), a collection of Korean folk tales: DUK-SOON CHANG *et al.* (eds.), *The Folk Treasury of Korea: Sources in Myth, Legend, and Folktale,* trans. by TAE-SUNG KIM (1970), a collection of Korean oral literature.

Japanese literature: (General works): DONALD KEENE, *Japanese Literature: An Introduction for Western Readers* (1953) and *Landscapes and Portraits* (1971); and MAKOTO UEDA, *Literary and Art Theories in Japan* (1967), are essays on different periods of Japanese literary history. DONALD KEENE (ed.), *Anthology of Japanese Literature* (1955) and *Modern Japanese Literature* (1956), offer selections from earliest times with introductions. GEOFFREY BOWNAS and ANTHONY THWAITE, *The Penguin Book of Japanese Verse* (1964), gives examples in every form. ROBERT H. BROWER and EARL R. MINER, *Japanese Court Poetry* (1961), is an excellent study extending from the earliest period to the 14th century. EARL R. MINER, *Japanese Poetic Diaries* (1969), contains examples from the Heian period to the 19th century. *(Early and Nara periods)*: DONALD L. PHILIPPI'S translations of the *Kojiki* (1969) and *This Wine of Peace, This Wine of Laughter* (1968), incorporate recent scholarship. NIPPON GAKUJUTSU SHINKOKAI (trans.), *The Manydshzi* (1940 and 1965), is the most readable version of this great anthology. *(Heian period)*: IVAN MORRIS (trans.), *The Pillow Book of Sei Shōnagon*, 2 vol. (1967) and *As I Crossed a Bridge of Dreams* (1973); EDWARD SEIDENSTICKER (trans.), *The Gossamer Years* (1964); and ARTHUR WALEY (trans.), *The Tale of Genji* (1926–33, reprinted 1960), are free and poetic renderings of these classics. EDWIN A. CRANSTON (trans.), *The Izurni Shikibu Diary* (1969); and HELEN C. MCCULLOUGH (trans.), *Tales of Ise* (1968), are more literal versions with scholarly introductions. IVAN MORRIS, *The World of the Shining Prince* (1964), gives the social and historical background to the Heian literary masterpieces. *(Middle Ages):* DONALD KEENE (trans.), *Essays in Idleness* (1967) and *Twenty Plays of the Nō Theatre* (1970), are readable but fairly literal; ARTHUR WALEY (trans.), *The Nd Plays of Japan* (1922), gives freer and more poetic versions of the Nō plays. HELEN C. MCCULLOUGH (trans.), *Taiheiki* (1959) and *Yoshitsune* (1966), are accurate versions in somewhat old-fashioned language of these war tales. ERWIN O. REISCHAUER and JOSEPH K. YAMAGIWA (eds. and trans.), *Translations from Early Japanese Literature* (1951), gives painstakingly literal versions. D.E. MILLS (trans.), *A Collection of Tales from Uji* (1970), is readable and scholarly. *(Tokugawa period)*: WILLIAM T. DE BARY (trans.), *Five Women Who Loved Love* (1957); HOWARD HIBBETT (trans.), *The Floating World in Japanese Fiction* (1959); G.W. SARGENT (trans.), *The Japanese Family Storehouse* (1959); and IVAN MORRIS (trans.), *The Life of an Amorous Woman* (1963), are excellent translations of Saikaku's most important works with good introductions. HAROLD G. HENDERSON (ed. and trans.), *An Introduction to Haiku* (1958), is well-written and gives literal as well as artistic translations of the poems. DONALD KEENE (trans.), *Major Plays of Chikamatsu* (1961) and *Chzishingura* (1971), are representative masterpieces of the puppet drama. *(Modern period)*: IVAN MORRIS (ed.), *Modern Japanese Stories* (1961), contains examples from many different schools. YOSHIE OKAZAKI (ed.), *Japanese Literature in the Meiji Era* (1955), is overly detailed but sometimes useful for that reason. MARLEIGH G. RYAN, *Japan's First Modern Novel: Ukigumo of Futabetai Shimei* (1967), is a study and translation of an important work. EDWARD SEIDENSTICKER, *Kafū the Scribbler* (1965), is a biography of Nagai Kafū with selected translations. EDWIN MCCLELLAN, *Two Japanese Novelists* (1969), discusses the major works of Natsume Sōseki and Shimazaki Tbson. TAKAMICHI NINOMIYA and D.J. ENRIGHT (eds.), *The Poetry of Living Japan* (1957); and ICHIRO KONO and RIKUTARO FUKUDA, *An Anthology of Modern Japanese Poetry* (1957), give selections from Meiji and later poetry.

Literature, Nonfictional Prose

Defining literature in nonfictional prose is an immensely challenging task: it may denote any writing done with an aim, however dimly perceived, of producing an impression of beauty upon the hearer or the reader. This task is much more difficult than defining poetry, which has for centuries proved a challenging enough task for many critics, even though some exterior criteria, such as prosody and music, imagery, a certain exaltation of tone, and some elevation in the themes may be invoked.

Although nonfictional prose literature differs from bald statements of fact, such as those recorded in an old chronicle or inserted in a business letter or in an impersonal message of mere information, there have been increasing attempts since the 18th century to banish all adornment, all resort to modifiers and metaphors, from writing, even from fiction or autobiography. The 19th-century French novelist Stendhal said he sought the dryness of the Civil Code in his prose, though he seldom lived up to his claims. With many other authors, the very word literature has come to have a denigrating sense, connoting a lack of sincerity and an excess of meretricious embellishments. Such a mood was not altogether absent from earlier ages; but it took on a new impetus among the modems, especially in countries of continental Europe with a long literary tradition. There, in the reaction against the bombast and the artificiality of some romantic, symbolist, and self-styled decadent authors, literature has been treated with contempt as a mendacious and idle exercise that disregards or distorts truth. With a number of late-19th-century authors such as Nikolay Gogol and even Tolstoy in Russia and Arthur Rimbaud in France, as well as several later Americans, that condemnation of literature by the very men who practiced it became a characteristic feature of a sophisticated age in revolt against sophistication.

The word literature was derived via Latin from the Greek word meaning "the knowledge of what is written." As used in a broad sense in this article, it designates writing intended to instruct (but not highly scientific and erudite writings in which no aesthetic concern is evinced), to impart wisdom or faith, and especially to please. The existence of literature, at first oral but sooner or later entrusted to writing, has proved of immense significance in the history of mankind. Some countries have left a mark in history chiefly through their folktales, epics, ballads, or prose chronicles. Others have gained a universal audience and struck the imagination of mankind chiefly thanks to their novelists, poets, moralists. The favourable interest and emotional attachment thus gained by Russia through its 19th-century authors, and by the United States and some South American nations in the 20th century, has been incalculably precious. One of the miracles of ancient Greece is that of the survival of its literary forms through 25 centuries and several continents. The emergence of some cultures to self-consciousness—their reawakening after centuries of the somnolence that often results from foreign rule—has been fostered by the romantic movement that, in the early 19th century, aroused the Scandinavians, the Magyars, the Poles, the Slovaks, the Croatians, and many others to nationalism. Through literature they recovered their lost traditions, a sense of their identity, and a will to live.

This article is one of a number dealing with the genres of literature. Comparable articles on genres of fictional prose literature, for example, are NOVEL; and SHORT STORY. A major article dealing with a particular form of nonfictional prose literature is BIOGRAPHICAL LITERATURE. Further discussion of types of nonfictional prose literature in particular cultures may be found in articles such as LITERATURE, WESTERN; and LITERATURE, EAST ASIAN; and in articles on the arts of various peoples, such as SOUTH ASIAN PEOPLES, ARTS OF. Methods of using language for literary purposes are discussed in RHETORIC; and PROSODY; and to some extent, in ORATORY.

This article is divided into the following sections:

I. Nature and elements

NATURE

The role of poetry—narrative, epic, lyrical, and in a smaller number of nations, dramatic—has been significant in the history of culture. Virtually all literatures began with poetry. In some countries, such as Ireland, or England in the age of Bede (*c.* 673–735), or France in the early Middle Ages, the development of poetry was inhibited by church-imposed religious doctrines and manuals. Even in these instances, however, the religious literature was written in the language of the church, such as Latin, or Church Slavonic in what became Russia, and therefore touched the people only indirectly. Epics composed in the vernacular, such as ***Beowulf*** in Old English, and ***The Song of Roland*** in French. contributed to the creation of a cultural and, after a fashion, a national consciousness. After 10 to 12 centuries of Christianity, when the church appeared to have established Latin in the West as the universal language, the people, having reached a more advanced degree of literacy and of refinement, caused the break-up of that community of language and of thought. Separate literatures and national moods developed their own individuality. By the 13th century a prose, often nonfictional, had arisen for entertainment, aesthetic, and moral purposes.

Literature and national consciousness

Nonfictional prose inevitably covers an almost infinite variety of themes, and it assumes many shapes. In quantitative terms, if such could ever be valid in such nonmeasurable matters, it probably includes more than half of all that has been written in countries having a literature of their own. The short story, the satire, the sonnet, the ode, and even the novel are all comparative newcomers in modern letters and encompass much more restricted areas. Some countries can hardly boast a dramatic literature of any value; others have not developed an original craft of fiction; still others for centuries lacked the individualistic spirit that appears to be required for composing lyrical poetry. Nonfictional prose, however, has flourished in nearly all countries with advanced literatures. The forms it took included political and polemical writings, biographical and autobiographical literature, and religious writings and others that popularized a philosophy or imparted a moral message. After the Renaissance, from about the 16th century onward in Europe, a personal manner of writing grew in importance. The author strove for more or less disguised self-revelation and introspective analysis, often in the form of letters, private diaries, confessions. Also of increasing importance were aphorisms after the style of the ancient Roman philosophers Seneca and Epictetus, imaginary dialogues, and historical narratives, and later, journalistic articles and extremely diverse essays. From the 19th century, writers in Romance and Slavic languages especially, and to a far lesser extent British and American writers, developed the attitude that a literature is most truly modern when it acquires a marked degree of self-awareness and obstinately reflects on its purpose and technique. Such writers were not content with imaginative creation alone: they also explained their work and defined their method in the guise of prefaces, reflections, essays, self-portraits, and critical articles. The 19th-century French poet Charles Baudelaire asserted that no great poet could ever quite resist the temptation to become also a critic: a critic of others and of himself. Indeed, most modern writers, in lands other than the United States, whether they be poets, novelists, or dramatists, have composed more nonfictional prose than poetry, fiction, or drama. In the instances of such monumental figures of 20th-century literature as the poets Ezra Pound, T.S. Eliot, and perhaps William Butler Yeats, or the novelists Thomas Mann and Andre Gide, that part of their output may well be considered by posterity to be equal in importance to their more imaginative writing.

It is virtually impossible to attempt a unitary characterization of nonfictional prose. The concern that any definition is a limitation, and perhaps an exclusion of the essential, is nowhere more apposite than to this inordinately vast and variegated literature. Ever since the ancient Greek and Roman philosophers devised literary genres, some critics have found it convenient to arrange literary production into kinds or to refer it to modes. Periodically, other critics, less prone to dogmatism and distrustful of what has been called rage for order, have ridiculed the contention that an author deliberately sets out to write a novel, a short story, a pastoral tale, a tragicomedy, or a melodrama. The French classical critics of the 17th century, and even more their followers in the 18th and 19th centuries, earnestly taught generations of Europeans that there existed distinct genres, as neatly separate from each other as mammals or vertebrates may be from oviparous or invertebrate species. The theory was driven to ridiculous lengths by Ferdinand Brunetière (1849–1906), who envisaged tragedy, comedy, bourgeois drama, fiction, and even criticism as so many genres coming to existence at a definite time, growing from infancy to childhood and maturity, and then swept away into decline. His conviction, like that of many theorists of genres, was that literature, having divorced itself from the norms of the pure genres, as he saw them, from reason, and from clarity could not but sink into utter confusion and decrepitude in the 20th century.

The hazards of classification

The classification into genres may be comforting to some commentators, aghast at the proliferation of books around them and fearful lest they be not in possession of standards guaranteeing a safe judgment of them. Confusion, however, can also be worse confounded in some doctrines. For genres may be endlessly subdivided into short or long short stories; *récits* or short novels; allegorical novels; parables and fables; didactic novels; fiction *à thèse* (*i.e.*, with a purpose), etc. And that convenient pigeon-holing presupposes that a tragedy should arouse certain emotions and not others, as Aristotle once perhaps taught; that other kinds of literature are composed with a clear and steady purpose in the author's mind; that the mimetic and the didactic do not encroach on each other; and that few writers are such naive mortals as to write merely for the purpose of giving pleasure to their audiences.

Most literary works resist such categorizing. Neither Henry Fielding in the 18th century, nor Stendhal in the 19th, nor Marcel Proust nor Alberto Moravia in the 20th century decided beforehand whether he was writing a mimetic, or a satiric, or a comic novel. Even when an author thought he knew what he was endeavouring to do, as Henry James did, he could not know whether he was not doing only that, and not much else besides. Faith in literary genres has misled many a creator into believing that laws exist for the composing of a short story, a novel, or a fable. Other creators, however, refusing to be imprisoned by those paralyzing rules, plunge into chaos, hoping ultimately to discover their own order and to set standards that will not hamper their talent. Periodically, there is a protest that existing molds have to be broken up and prevailing models ignored, so that the ascending generations may propose their own and chart new territories. Some critics, compounding the difficulty of classifying the unwieldy mass of writing accumulating around them, have even contended that the novel—the genre on which Flaubert, James, and their successors reasoned so diligently in order to endow it with autonomy—does not in truth exist as a new form, but rather as an epic, a tragedy. a comedy, a pastoral, or a form of lyricism.

ELEMENTS

Obviously, a realm as boundless and diverse as nonfictional prose literature cannot be characterized as having any unity of intent, of technique, or of style. It can be defined, very loosely, only by what it is not. Many exceptions, in such a mass of writings, can always be brought up to contradict any rule or generalization. No prescriptive treatment is acceptable for the writing of essays, of aphorisms, of literary journalism, of polemical controversy, of travel literature, of memoirs and intimate diaries. No norms are recognized to determine whether a dialogue, a confession, a piece of religious or of scientific writing, is excellent, mediocre, or outright bad, and each author has to be relished, and appraised, chiefly in his own right. "The only technique," the English critic F.R. Leavis wrote in 1957, "is that which compels words to express an intensively personal way of feeling." Intensity is probably useful as a standard; yet it is a variable, and often elusive, quality, possessed by polemicists and by ardent essayists to a greater extent than by others who are equally great. "Loving, and taking the liberties of a lover" was Virginia Woolf's characterization of the 19th-century critic William Hazlitt's style: it instilled passion into his critical essays. But other equally significant English essayists of the same century, such as Charles Lamb or Walter Pater, or the French critic Hippolyte Taine, under an impassive mask, loved too, but differently. Still other nonfictional writers have been detached, seemingly aloof, or, like the 17th-century French epigrammatist La Rochefoucauld, sarcastic. Their intensity is of another sort.

Reality and imagination. Prose that is nonfictional is generally supposed to cling to reality more closely than that which invents stories, or frames imaginary plots. Calling it "realistic," however, would be a gross distortion. The systematic attempt to convey reality faithfully in art and letters is a late development. It usually occurs in advanced fictional works, long after mankind has become wearied with the unreality of legends, dreams, and myths. Since nonfictional prose does not stress inventiveness of themes and of characters independent of the author's self, it appears in the eyes of some moderns to be inferior to works of imagination. In the middle of the 20th century an immensely high evaluation was placed on the imagination, and the adjective "imaginative" became a grossly abused cliché. Many modern novels and plays, however, were woefully deficient in imaginative force, and the word may have been bandied about so much out of a desire for what was least possessed. Many readers are engrossed by travel books, by descriptions of exotic animal life, by essays on the psychology of other nations, by Rilke's notebooks or by Samuel Pepys's diary far more than by poetry or by novels that fail to impose any suspension of disbelief. There is much truth in Oscar Wilde's remark that "the highest criticism is more creative than creation and the primary aim of the critic is to see the object as in itself it really is not." A good deal of imagination has gone not only into criticism but also into the writing of history, of essays, of travel books, and even of the biographies or the confessions that purport to be true to life as it really happened, as it was really experienced.

Imagination in nonfictional prose

The imagination at work in nonfictional prose, however, would hardly deserve the august name of "primary imagination" reserved by the 19th-century English poet Samuel Taylor Coleridge to creators who come close to possessing semidivine powers. Rather, imagination is displayed in nonfictional prose in the fanciful invention of decorative details, in digressions practiced as an art and assuming a character of pleasant nonchalance, in establishing a familiar contact with the reader through wit and humour. The variety of themes that may be touched upon in that prose is almost infinite. The treatment of issues may be ponderously didactic and still belong within the literary domain. For centuries, in many nations, in Asiatic languages, in medieval Latin, in the writings of the humanists of the Renaissance, and in those of the Enlightenment. a considerable yart of literature has been didactic. The concept of art for art's sake is a late and rather artificial development in the history of culture, and it did not reign supreme even in the few countries in which it was expounded in the 19th century. The ease with which digressions may be inserted in that type of prose affords nonfictional literature a freedom denied to writing falling within other genres. The drawback of such a nondescript literature lies in judging it against any standard of perfection, since perfection implies some conformity with implicit rules and the presence, however vague, of standards such as have been formulated for comedy, tragedy, the ode, the short story and even (in this case, more honoured in the breach than the observance) the novel. The compensating grace is that in much nonfictional literature that repudiates or ignores structure the reader is often delighted with an air of ease and of nonchalance and with that rarest of all virtues in the art of writing: naturalness.

Style. The writing of nonfictional prose should not entail the tension, the monotony, and the self-conscious craft of fiction writing. The search for *le mot juste* ("the precise word") so fanatically pursued by admirers of Flaubert and Maupassant is far less important in nonfictional prose than in the novel and the short story. The English author G.K. Chesterton (1874–1936), who was himself more successful in his rambling volumes of reflections and of religious apologetics than in his novels, defined literature as that rare, almost miraculous use of languge "by which a man really says what he means." In essays, letters, reporting, and narratives of travels, the author's aim is often not to overpower his readers by giving them the impression that he knows exactly where he is leading them, as a dramatist or a detective-story writer does. Some rambling casualness, apparently irrelevant anecdotes, and suggestions of the conclusions that the author wishes his readers to infer are often more effective than extreme terseness.

The role of eloquence

There is also another manner of writing that is more attentive to the periodic cadences and elegance of prose, in the style of the ancient Roman orator Cicero. The 19th-century English essayist William Hazlitt praised the felicities of style and the refinements of the prose of the British statesman Edmund Burke (1729–97) as "that which went the nearest to the verge of poetry and yet never fell over." A number of English writers have been fond of that harmonious, and rhetorical prose, the taste for which may well have been fostered not only by the familiarity with Cicero but also by the profound influence of the authorized version of the Bible (1611). Martin Luther's translation of the New Testament (1522) and of the Old Testament (1534) likewise molded much of German prose and German sensibility for centuries.

In the 20th century that type of prose lost favour with American and British readers, who ceased to cherish Latin orators and Biblical prose as their models. In German literature, however, in which harmonious balance and eloquence were more likely to be admired, and in other languages more directly derived from Latin, a musical style, akin to a prolonged poem in prose, was cultivated more assiduously, as exemplified in Italian in the writings of Gabriele d'Annunzio, in French in those by André Gide, and in German in ***Die Aufzeichnungen des Malte Laurids Brigge (The Notebooks*** of ***Malte Laurids Brigge)*** by the poet Rainer Maria Rilke. Such an elaborate style appears to be more easily tolerated by the readers in nonfictional writing, with its lack of cumulative continuity and, generally speaking, its more restricted size, than in novels such as Pater's ***Marius the Epicurean*** (1885) and occasionally in Thomas Mann's fiction, in which such a style tends to pall on the reader. Similarly, it is easier for the nonfictional prose writer to weave into his style faint suggestions of irony, archaisms, alliterations, and even interventions of the author that might prove catastrophic to credibility in fiction. Critics have argued that too close attention to style was harmful to the sweep necessary to fiction: they have contended that many of the greatest novelists, such as Dickens, Balzac, Dostoyevsky, and Zola at times "wrote" badly; assuredly, they treated language carelessly more than once. Essayists, historians, orators, and divines often affect a happy-go-lucky ease so as to put them on the same footing with the common reader, but they realize that language and style are vital. They must know what resources they can draw from vivid sensations, brilliant similes, balanced sentences, or sudden, epigrammatic, effects of surprise.

Author presence. The one feature common to most authors of nonfictional prose (a few staid historians and even fewer philosophers excepted) is the marked degree of the author's presence in all they write. That is to be expected in epistolary literature, and, although less inevitably, in the essay, the travel book, journalistic reporting, and polemical or hortatory prose. Although the 17th-century French religious philosopher Pascal hinted that "the ego is hateful," the author's presence is still strongly felt. This presence endows their works with a personal and haunting force that challenges, converts, or repels, but hardly ever leaves the reader indifferent. Saint Paul's epistles owe their impact—perhaps second to none in the history of the Western World—to the self that vehemently expresses itself in them, showing no concern whatever for the niceties of Attic prose. In the treatises, discourses, and philosophical argumentation of the great writers of the Enlightenment, such as Voltaire, Diderot, and Rousseau, they frequently resort to the first person singular, which results in a vivid concreteness in the treatment of ideas. To think the abstract concretely, a precept reminiscent of the 18th-century philosophers, was also the aim of the 20th-century philosophers Jean-Paul Sartre and Maurice Merleau-Ponty when they naturalized Existentialist thought in France.

The growth of personal literature in its myriad shapes is one of the striking features of modern literary evolution. In France, Italy, and Germany it invaded fiction under the banner of the personal novel. With Charles Baudelaire in poetry and with Marcel Proust in prose, memory appears to have stepped in the place of imagination as the main force in lyrical and fictional literature of the 20th century. Inevitably, such fiction is obsessed with the presence of him who is reminiscing, since "one only remembers oneself," as the philosopher Henri Bergson put it.

The very fact that the writer of nonfictional prose does not seek an imaginary projection to impart his vision, his anguish, and his delights to readers also underlines the nature of his intention. A school of critics has vigorously attacked "the intentional fallacy," which leads biographers and some literary historians to ask what an artist intended before evaluating the completed work of art. In dramatic, fictional, and lyrical works, the artist only discovers his own intentions through the process of creation; the finished work may be a product alien to him, at least to the part of him that is conscious and lucid. But in a work of apologetics or of homiletics, in a work of history or of sociology, in a critical or even in a desultory and discursive essay, and certainly in aphorisms or maxims or both, the intention of the author remains omnipresent. This intention may be disguised under the mask of a parable, under the interlocutors of a philosophical dialogue, or under the admonitions of a prophet, but the reader is never oblivious of the thinker's intent. His pleasure is not that of an addict to thrillers or of the devotee of fiction who hastens to devour incidents and metamorphoses of the characters to rush to the denouement. It is the more sophisticated enjoyment of one who shares the creator's intent and travels familiarly along with him. He respects and enjoys in those authors the exercise of an intelligence flexible enough to accept even the irrational as such.

APPROACHES

In terms of approach, that is, the attitude of the writer as it can be inferred from the writing, the distinguishing features of nonfictional prose writings are the degree of presence of the ego and of the use of a subjective, familiar tone. Such devices are also used, of course, by authors of fiction, but to a lesser extent. Similarly, the basic modes of writing—the descriptive, the narrative, the expository, and the argumentative—are found in both nonfictional literature and in fiction, but in different degrees.

The descriptive mode. Figuring prominently in the fiction of the 19th century, the descriptive mode found a much smaller role in the later novel, except perhaps in that of Russia. In nonfictional prose, however, essayists, moralists, naturalists, and others regularly evoked nature scenes. The most sumptuous masters of prose composed landscapes as elaborately as landscape painters. The French writer and statesman Chateaubriand (1768–1848), for example, who was not outstandingly successful in inventing plots or in creating characters independent from his own self, was a master of description; his writings influenced the French Romantic poets, who set the impassive splendour of outward nature in contrast to the inner anguish of mortals. The 19th-century English art critic John Ruskin had a more precise gift of observation, as revealed in his descriptions of Alpine mountains and of the humblest flowers or mosses, but his ornate and sonorous prose was the climax of a high-flown manner of writing that later read like the majestic relic of another era. American nonfictional writers of the same period such as Ralph Waldo Emerson and Henry Thoreau scrupulously described the lessons of organization, of unity, and of moral beauty to be deciphered from the vicissitudes of nature. Russian essayists vied with novelists in their minute yet rapturous descriptions of the thaw releasing the torrents of spring or the implacable force of the long Northern winters. Writers more inclined to the observation of social life, in satirical sketches of the mechanically polite and artificial habitués of salons, helped the novel of social life come into existence in several Western countries.

Narrative. The narrative element is less conspicuous in writing that does not purport to relate a story than in fictional works, but there is a role for narrative in letters, diaries, autobiographies, and historical writing. Most often, an incident is graphically related by a witness, as in letters or memoirs; an anecdote may serve to illustrate a moral advice in an essay; or an entertaining encounter may be inserted into an essay or a travel sketch. Digression here represents the utmost in art; it provides a relief from the persistent attention required when the author is pursuing his purpose more seriously. Similarly, such writing provides a pleasant contrast to the rigid structure of the majority of novels since the late 19th century. In historical writing, however, simplicity and clarity of narrative are required, though it may be interspersed with speeches, with portraits, or with moral and polemical allusions. The tampering with time and the flashbacks of modern fiction, however, would strain the credibility of a reader of history to an unbearable point. In other forms of nonfictional prose, the meandering fancy of the author may well produce an impression of freedom and of truth to life unattainable by the more carefully wrought novel. Many writers have confessed to feeling relieved when they ceased to create novels and shifted to impromptu sketches or desultory essays. The surrealist essayists of the 20th century poured their scorn on detective fiction as the most fiercely logical form of writing. In contrast, the author of essays or other nonfictional prose may blend dreams and facts, ventures into the illogical, and delightful eccentricities.

Oratory

Expository and argumentative modes. The rules of old-fashioned rhetoric apply better to expository and argumentative prose than to the other modes. These rules were first set down in ancient Greece by teachers who elicited them from the smooth eloquence of Socrates, the impassioned and balanced reasoning of Demosthenes, and others. The ancient Romans went further still in codifying figures of speech, stylistic devices, and even the gestures of the orator. Such treatises played a significant part in the education of the Renaissance humanists, of the classical and Augustan prose writers of 17th-century England and France, of the leaders of the French Revolution in the 18th century, and even in 19th-century historians and statesmen such as Guizot in France and Macaulay and Gladstone in Britain. And in the middle of the 20th century teachers of English composition, in America in particular, have attempted to reformulate and modernize those rules of rhetoric. Confronting the difficulty of setting standards of style and evaluating writing, they resorted to training students in time-honoured, and often outworn, rhetorical devices such as metonymy, anacoluthon, synechdoche, oxymoron, etc. But the sophisticated oratory of such 18th-century British orators as Richard Brinsley Sheridan, Edmund Burke, and Charles Fox or, more recently, that of Winston Churchill, hardly seems attuned to audiences in the age of television.

It has been suggested by students of German history that Adolf Hitler, in his vituperative speeches at Nuremberg in the 1930s, fascinated the Germans because they had been unaccustomed, unlike other Western nations, to eloquence in their leaders. If a large part of a population is illiterate, such as the Cubans under Fidel Castro, unending flows of eloquence may constitute a convenient means of educating the masses. Elsewhere, a more familiar and casual type of address from political leaders tends to be preferred in an era of mass media. The gift of a superior orator has been facetiously defined as that of saying as little as possible in as many words as possible. Like sermons, many types of formal address such as lectures, political speeches, and legal pleadings appear to be doomed as documents of literary value, as Burke's or Lincoln's orations and addresses were when they were learned by heart by the younger generations and helped mold the style and contribute to the moral education of men.

II. Forms of nonfictional prose

Both in the substance and in the form, nonfictional prose is much less subject to the influence of antecedents in ancient literatures, to conventions, to rules of rhetoric, and to stylistic conventions than other types of literature. Its vitality derives from its use of the language current in the author's time, flavoured with suggestions of the study of past masters. Quaintness is only bearable for a limited time, and archaisms soon detract from the impact on the readers. Virtuoso displays of verbal fireworks and of felicities of style make the writer's presence excessively obtrusive. The normal evolution of the writer's style has been from a youthful delight in the cadences and the alliterative and rhetorical effects of prose to a sinewy robustness and a deliberate stripping of adornments. Montesquieu, Rousseau, Flaubert, and Gide, to mention a few of those credited with writing of the most perspicuous and most accomplished prose, illustrate that trend.

THE ESSAY

In modern literatures, the category of nonfictional prose that probably ranks as the most important both in the quantity and in the quality of its practitioners is the essay.

Modern origins. Before the word itself was coined in the 16th century by Montaigne and Bacon, it was called a "treatise," and its attempt to treat a serious theme with consistency deprived it of the seductive charm relished in the later examples of that form of literature. In this sense, the word "essay" would hardly fit the didactic tone of Aristotle's ***Rhetoric*** or his ***Metaphysics.*** There were, however, ancient masters of an early form of the essay, such as Ciceso discoursing on the pleasantness of old age or on the art of "divination"; Seneca, on anger or clemency; and Plutarch, more superficially and casually, on the passing of oracles. The relentless desire to analyze one's own contradictions, especially among Christians, who, like Saint Paul, were aware of their duality and of "doing the evil which they would not," also contributed to the emergence of the essay. But Christian writing tended to be highly didactic, as may be seen in the work of Saint Augustine of the 5th century, or of the 12th-century theologian Abélard, or even in the Latin writings on "the solitary life" or on "the scorn of the world" by the 14th-century Italian poet Petrarch. Not until the Renaissance, with its increasing assertion of the self, was the flexible and deliberately nonchalant and versatile form of the essay perfected by Montaigne.

Montaigne's pre-eminence as an essayist

Montaigne left his mark on almost every essayist who came after him in continental Europe, and perhaps even more in English-speaking countries. Emerson made him one of his six ***Representative Men*** along with others of the stature of Plato, Shakespeare, and Goethe. Hazlitt lauded Montaigne's qualities as precisely those that "we consider in great measure English," and another English romantic writer, Leigh Hunt, saw him as "the first man who had the courage to say as an author what he felt as a man." And the 20th-century poet T.S. Eliot declared him to be the most important writer to study for an insight into the literature of France. With Montaigne, the essay achieved for the first time what it can achieve better than any other form of writing, except perhaps the epistolary one: a means of self-discovery. It gave the writer a way of reaching the secret springs of his behaviour, of seizing the man and the author at once in his contradictions, in his profound disunity, and in his mobility. The essay was symbolic of man's new attitude toward himself, revelling in change, and hence in growth, and forsaking his age-old dream of achieving an underlying steadfastness that might make him invulnerable and similar to the gods. Now he set out to accept himself whole, with his body and his physical and behavioural peculiarities, and thereby repudiate medieval asceticism. He would portray his foibles and unworthiness, hoping to rise above his own mediocrity, or, at the other extreme, he would exalt himself in the hope that he might become the man he depicted. Montaigne in his essays pursued an ethical purpose, but with no pompousness or rhetoric. He offered an ideal that was adopted by his successors for 200 years: perfecting man as a tolerant, undogmatic, urbane social being. But, unlike medieval Christian writers, he would not sacrifice to others the most dearly cherished part of himself. To others he would lend himself, but his personality and his freedom were his own, and his primary duty was to become a wiser human being.

No essayist after Montaigne touched on so many varied aspects of life with such an informal, felicitous, and brilliant style. The later writers who most nearly recall the charm of Montaigne include, in England, Robert Burton, though his whimsicality is more erudite, Sir Thomas Browne, and Laurence Sterne, and in France, with more self-consciousness and pose, Andrd Gide and Jean Cocteau.

The uses of the essay. In the age that followed Montaigne's, at the beginning of the 17th century, social manners, the cultivation of politeness, and the training of an accomplished gentleman became the theme of many essayists. This theme was first exploited by the Italian Baldassare Castiglione in his ***Il cortegiano*** (1528; ***The Courtier).*** The influence of the essay and of genres allied to it, such as maxims, portraits, and sketches, proved second to none in molding the behaviour of the cultured classes, first in Italy, then in France, and, through French influence, in most of Europe in the 17th century. Among those who pursued this theme was the 17th-century Spanish Jesuit Baltasar Gracián in his essays on the art of worldly wisdom.

With the advent of a keener political awareness with the age of Enlightenment, in the 18th century, the essay became all-important as the vehicle for a criticism of society and of religion. Because of its flexibility, its brevity, and its potential both for ambiguity and for allusions to current events and conditions, it was an ideal tool for philosophical reformers. ***The Federalist Papers*** in America and the tracts of the French Revolutionaries, are among the countless examples of attempts during this period to improve the condition of man through the essay.

The advantage of this form of writing was that it was not required to conform to any unity of tone or to similar strictures assigned to other genres since it was for a long time not even considered a genre. After ponderous apologies for traditional faith failed to repulse the onslaught of deism and atheism, traditionalists of the 19th and 20th centuries, such as Burke and Coleridge, abandoned unwieldy dogmatic demonstrations in favour of the short, provocative essay. In the defense of the past, it sewed as the most potent means of educating the masses. French Catholics, German pietists, and a number of individual English and American authors confided to the essay their dismay at what they saw as modern vulgarity and a breakdown of the coherence of the Western tradition. Essays such as Paul Elmer More's long series of *Shelburne* ***Essays*** (published between 1904 and 1935), T.S. Eliot's ***After Strange Gods*** (1934) and ***Notes Towards*** *the* ***Definition*** of ***Culture*** (1948), and others that attempted to reinterpret and redefine culture, established the genre as the most fitting to express the genteel tradition at odds with the democracy of the new world.

Journalistic essays

The proliferation of magazines in the United States, and the public's impatience with painstaking demonstrations and polemics, helped establish the essay just as firmly as a receptacle for robust, humorous common sense, unpretentiously expressed, as in the writings of Oliver Wendell Holmes (1809–94). Creative writers resorted to it to admonish their compatriots when they seemed too selfishly unconcerned by the tragedies of the world. Archibald MacLeish, for instance, did so in ***A Time to Speak*** (1941). Lewis Mumford, Allen Tate, and other literary and social critics became crusaders for moral and spiritual reform; others seized upon the essay for scathingly ironical and destructive criticism of their culture: for example, James Gibbons Huneker (1860–1921), an admirer of iconoclasts and of egoists, as he called them, proposed European examples to Americans he deemed to be too complacent and lethargic; and, more vociferously still, H.L. Mencken (1880–1956), a self-appointed foe of prejudices, substituted his own for those he trounced in his contemporaries.

In other new countries. or in cultures acquiring an awareness of their own ambitious identity, the essay became semipolitical, earnestly nationalistic, and often polemical, playful, or bitter. Such essays sometimes succeeded in shaking the elite out of its passivity. In Uruguay, for example, Josd Enrique Rod6 (1872–1917), in an analogy to the characters in Shakespeare's ***Tempest,*** compared what should be the authentic South American to the spirit Ariel, in a work thus entitled, in contrast to the bestial Caliban, representing the materialism of North America. In Canada Olivar Asselin (1874–1937) used the essay to advocate the development of a genuine French-Canadian literature. Among the older cultures of Europe, Salvatore Quasimodo (1901–1968), the Italian poet and Nobel laureate, appended critical and hortatory essays to some of his volumes of verse, such as *Il falso* ***e vero verde*** (1956; "The True and False Green"). Other European heirs to this tradition of the essay include Stefan Zweig and Hugo von Hofmannsthal in Austria and Thomas Mann and Bertolt Brecht in Germany; their sprightly and incisive essays on the arts can be traced to the 19th century German philosopher Arthur Schopenhauer.

Essays for entertainment

One of the functions of literature is to please and to entertain; and the essay, as it grew into the biggest literary domain of all, did not lose the art of providing escape. Essayists have written with grace on children, on women, on love, on sports, as in Robert Louis Stevenson's collection ***Virginibus Puerisque*** (1881), or Willa Cather's pleasant reflections in ***Not under Forty*** (1936). Ernest Renan (1823–92), one of the most accomplished French masters of the essay, found relief from his philosophical and historical studies in his half-ironical considerations on love, and Anatole France (1844–1924), his disciple, and hosts of others have alternated playful essays with others of high seriousness. Sports, games, and other forms of relaxation have not been so often or so felicitously treated. Izaak Walton's ***The Compleat*** ***Angler*** (1653), however, enjoys the status of a minor classic, and the best of the modern Dutch essayists, Johan Huizinga (1872–1945), has reflected with acuteness on ***Homo*** *ludens,* or man at play. A Frenchman, Jean Prdvost (1901–44), who was to die as a hero of the Resistance to the German occupation of France during World War II, opened his career as an essayist with precise and arresting analyses of the Plaisirs des sports (1925). But there are surprisingly few very significant works, except in chapters of novels or in short stories, on the joys of hunting, bullfighting, swimming, or even, since Anthelme Brillat-Savarin's overpraised essay, Physiologie du *goût* (1825; "The Physiology of Taste") on gourmet enjoyment of the table.

Serious speculations, on the other hand, have tended to overburden the modern essay, especially in German and in French, and to weigh it with philosophy almost as pedantic as that of academic treatises, though not as rigorous. The several volumes of Jean-Paul Sartre's Situations, published from 1947 on, constitute the most weighty and, in the first two volumes in particular, the most original body of essay writing of the middle of the 20th century. Albert Camus' *Mythe* de Sisyphe (1942; Myth of Sisyphus) and his subsequent *Homme révolté* (1951; The Rebel) consist of grave, but inconsistent and often unconvincing, essays loosely linked together. Émile Chartier (1868–1951), under the pseudonym Alain, exercised a lasting influence over the young through the disjointed, urbane, and occasionally provoking reflections scattered through volume after volume of his essays, entitled Propos.

Political essays

Apart from philosophical speculation, which most readers prefer in limited quantities, the favourite theme of many modern essays has been speculation on the character of nations. It is indeed difficult to generalize on the national temper of a nation or on the characteristics of a given culture. The authors who have done it—Emerson in his essay on English Traits (1856), Hippolyte Taine in his studies of the English people, Alexis de Tocqueville in his Democracy in America (1835, 1840)—blended undeniable conclusions with controversial assertions. Rather than systematic studies, desultory essays that weave anecdotes, intuitions, and personal remarks, ever open to challenge, have proved more effective in attempting to delineate cultures. In the 20th century, the masters of this form of writing have been among the most able in the art of essay writing: Salvador de Madariaga in Spanish, Hermann Keyserling in German, and Elie Faure in French. Some nations are much more prone than others to self-scrutiny. Several of the finest Spanish essayists were vexed by questions of what it meant to be a Spaniard, especially after the end of the 19th century when Spain was compelled to put an end to its empire. Angel Ganivet in his essay on *Idearium español* (1897; Spain: An Interpretation), Ortega y Gasset in *España* invertebrada (1922; Invertebrate Spain), and Miguel de Unamuno in almost every one of his prose essays dealt with this subject. A Spanish-born essayist, George Santayana (1863–1952), was one of the most accomplished masters of written English prose; because of his cosmopolitan culture and the subtlety of his insights, he was one of the most percipient analysts of the English and of the American character.

Laments on the decline of the essay in the 20th century have been numerous since the 1940s, when articles in most journals tended to become shorter and to strive for more immediate effect. As a result, the general reader grew accustomed to being attacked rather than seduced. Still, the 20th century could boast of the critical essays of Virginia Woolf in England, of Edmund Wilson in America, and of Albert Thibaudet and Charles du Bos in France, all of whom maintained the high standards of excellence set by their predecessors of the previous century. It is regrettable that, in the language in which the best modern essays have been written, English, the term "essay" should also have acquired the connotation of a schoolboy's attempts at elementary composition. For the essay requires vast and varied information, yet without pedantry or excessive specialization. It must give the impression of having been composed spontaneously, with relish and zest. It should communicate an experience or depict a personality with an air of dilettantism, and of love of composition, and it should make accessible to the reader knowledge and reflection and the delight of watching a fine mind at work. The essayist should possess the virtues that one of the most influential English essayists, Matthew Arnold, praised in Culture and Anarchy (1869): "a passion . . . to divest knowledge of all that was harsh, uncouth, difficult, abstract, professional, exclusive; to humanize it."

HISTORICAL AND CRITICAL FORMS

History as literature. Among the ancient Greeks and Romans, history was the branch of literature in which the most expert and the most enduring prose was written. It only recovered its supreme rank in nonfictional prose in the 18th century. Earlier, however, at the beginning of the 16th century, in Florence, Italy, Niccolb Machiavelli and Francesco Guicciardini prepared the way for history to become great literature by marrying it to the nascent science of politics and by enlarging its scope to include elements of the philosophy of history. In the 18th century Voltaire, tersely and corrosively, and Edward Gibbon, with more dignity, established history again as one of the great literary arts. In the 19th century, their lessons were taken to heart, as writers and readers realized that, in Thomas Carlyle's words, "every nation's true Bible is its history." In some nations: historians, together with epic and political poets, instilled into the people a will to recover the national consciousness that had been stifled or obliterated. Macaulay's ambition, to see history replace the latest novel on a lady's dressing table, was endorsed as an eminently reasonable and beneficent ambition by scholars throughout the 19th century. After an eclipse during the first half of the 20th century, when erudition and distrust of elaborate style prevailed, the poetry of history has again been praised by the most scrupulous practitioners of that discipline. Poetry, in that context, does not mean fiction or unfaithfulness to facts, or a mere prettification, which would be tantamount to falsification; rather, it is the recognition that, as G.M. Trevelyan, Regius professor at Cambridge University, proclaimed "The appeal of history to us all is in the last analysis poetic." Few historians today would wholly agree with the once sacrosanct formula of Leopold von Ranke (1795–1886) that their task is to record the past as it really took place. They well know that, for modern history, facts are so plentiful and so very diverse that they are only meaningful insofar as the historian selects from them, places them in a certain order, and interprets them. Since World War II, as history drew increasingly on sociology, anthropology, political and philosophical speculation, and psychoanalysis, the conviction that objectivity could be maintained by a scholar dealing with the past came to be questioned and in large measure renounced. The Italian philosopher Benedetto Croce's laconic warning that all history is contemporary history (*i.e.*, bound to the historian's time and place, hence likely to be replaced by another one after a generation) has come to be generally accepted. Nietzsche, who had sharply questioned the historical methods of his German countrymen in the 1870s, stressed the need to relate history to the present and to present it in a living and beautiful form, if it is to serve the forces of life. "You can only explain the past," he said, "by what is highest in the present."

Interpretive history

In Germany, Italy, Spain, England, America, and most of all in France, where the vogue of sheer, and often indigestible, erudition was never wholeheartedly adopted, more literary talent may have gone into historical writing than into the novel or the short story. Many reasons account for the brilliance, and the impact, of this branch of nonfictional prose. Modern man has a powerful interest in origins—of civilization, of Christianity, of the world initiated by the Renaissance, or the French Revolution, or the rise of the masses. History invites an explanation of what is in terms of its genesis, not statically but in the process of becoming. The breadth of men's curiosity has expanded significantly since the 18th century, when belief in the absolutes of religious faith tended to be supplanted by greater concern for the relative world in which men live, move, and exist. A primary factor in the increasing importance of history is the bewilderment concerning the revolutions that occurred in or threatened so many countries in the latter part of the 20th century. As fiction, philosophy, and the exact sciences failed to provide a plausible explanation, many anguished readers turned to the record of brutal change in earlier periods. The historians who addressed themselves to those immense subjects, with their myriad ramifications, often composed monumental works of a synthetical character, such as those of Arnold Toynbee or Henri Pirenne, but they also cultivated the essay. Sometimes these essays appeared as short and pregnant volumes of reflections, such as Isaiah Berlin's ***Historical Inevitability*** (1954), sometimes in collections of articles that first appeared in magazines.

20th-century academic critics

Criticism. If the 19th century was the golden age of history, the 20th deserves the title of the age of criticism. The spread of higher education in advanced countries resulted in vast numbers of young scholars learning to write critical and analytical essays and theses. The training of imagination, however, or even of sensitivity to works of art, failed to keep pace with the development of the critical faculties, probably because it poses much more difficult problems to educators. The mass of writing produced in book form combined with the limited leisure time for reading created a need for a growing number of advisers to the public. Many gifted persons were drawn to literary criticism and, to a lesser degree, to criticism of music, painting, architecture, and the cinema. When they apply themselves to current productions, these critics inevitably proffer value judgments, informing their readers of the merits and demerits of a book or of the success or failure of a show. Thus, a significant function of these critics is to convert their readers--or to prevent their conversion—into purchasers, devotees, supporters, and patrons. Critics who seek to express themselves in less hurried fashion in regard to creative work prefer to write on the past, to re-evaluate, for example, a Shakespearean play or a 19th-century Russian novel. Criticism of the second sort has tempted most academic writers on literature and the arts in the 20th century. They feel, by instinct and by profession, closer to the past. Thus, they would be less likely to repeat the disastrous mistakes of their predecessors, who had failed to acknowledge the greatness of Beethoven, Holderlin, Shelley, Baudelaire, Cézanne, and most other great talents between 1800 and 1920. These academic critics have perfected techniques for the analysis of texts and for the discovery of structure hidden behind disorder. They can discern symbolic or esoteric meanings in the simplest of poems and plays. One of their faults is that, having acquired more subtlety than the creator himself, and being eager to descry layers of meaning or of allusions unperceived by others, they tend to display chiefly their own finer subtlety. The often unsophisticated, or uncouth, imaginative author, or the instinctive craftsman, such as the poet Rimbaud, the sculptor Brancusi, or the painter Soutine, becomes a mere pretext for the abstruse lucubrations of the critic.

Authors of imaginative works have bitterly inveighed against critics who allegedly failed to understand them ever since the Romantic era. Each artist must believe in the integrity and in the uniqueness of what he is accomplishing. Artists who are original are of necessity men who refuse to be the followers of an earlier tradition. Since they are different from their predecessors, they realize that they must overstress that difference combatively, that they must themselves create the taste according to which they will eventually be appreciated. The proliferation of critics around them thus leads them to become more provocative iconoclasts than they might naturally have been.

The 20th century has seen a burgeoning of critics and reviewers, many of them highly sophisticated, invading more and more journals with their prose, in New York, London, and Paris. Many literary talents who in earlier times might have been drawn to fiction or to drama have been attracted to criticism instead. Criticism offers a readier outlet for their writing, and, owing to the support of academic presses and foundations and to teaching and lecturing positions, it enjoys generous subsidies. Criticism has been called the substitute Muse of the universities.

Still, some of the huge mass of criticism that has grown up around literature and the arts since the Renaissance is nonfictional prose of merit. Most likely to endure is the occasional criticism by creators: the pronouncements of Molière, Wordsworth, or Goethe, and their judgments of others, are enlightening and irreplaceable. No statue was ever raised to a critic, remarked the irate and long-neglected Finnish composer Jean Sibelius. Nonetheless, critical works that belong to the literary heritage of the Western world include such work as the defenses of poetry of Joachim du Bellay (1522–60) and John Dryden (1631–1700), the partial but unforgettable verdicts of Dr. Samuel Johnson (1709–1784), and the critical works of Denis Diderot (1713–84) and Gotthold Lessing (1729–81).

The leisurely critical essay of the 19th century

A leisurely, Epicurean, urbane, and gently ironical type of critical essay was practiced in the 19th century. It is read to this day by students of letters and by those nostalgic for a bygone age, which they envision as less subject to the worship of vulgarity than their own. The French critic Charles Sainte-Beuve (1804–69), notwithstanding his gross unfairness to almost all his contemporaries, remains the master of a type of biographical and psychological criticism unmatched by his sucessors. Hippolyte Taine (1828–93), when he was not carried away by his rigid formulas, composed remarkable and very influential essays on Balzac, Goethe, and on a number of English writers. He attempted to explain the appearance of a work of genius and to analyze it in its inner structure. Less professional and more intimate and humorous in tone were several British critics of the late Victorian era, such as Leslie Stephen (1832–1904) and George Saintsbury (1845–1933). The most sedulously artistic master of prose among them, and long the most prestigious, was Walter Pater (1839–94).

That art has not completely died in the 20th century. Remy de Gourmont and Paul Valéry in France, Virginia Woolf in England, Lionel Trilling in America, and Dámaso Alonso in Spain have sustained the tradition of writing penetrating and original critical essays that stand as minor literary masterpieces in their own right. They never forgot that the critic must necessarily live at second hand and that his craft remains the handmaid of creation. The American critic Edmund Wilson, especially in his early volumes of essays on French and Russian authors and on Dickens, was, if not the most creative, certainly the most influential man of letters of his generation. Most of these critics were appraisers of already recognized works rather than pioneers venturing into the new and establishing young reputations. These critics, and probably few others, rank among the masters of nonfictional prose, along with the creators themselves, when they condescend to write as critics either of their own work or of that of others, such as Goethe, Stefan George, Victor Hugo, Baudelaire, Zola, Gide, T.S. Eliot, or D.H. Lawrence.

DOCTRINAL. PHILOSOPHICAL, AND RELIGIOUS PROSE

The question of how much of doctrinal writing, dealing with faith, ethics, and philosophy, can be called literature can only be answered subjectively by each reader, judging each case on its own merits. There have been philosophers who felt in no way flattered to be included among what they considered unthinking men of letters. The prejudice lingers in some quarters that profundity and clarity are mutually exclusive and that philosophy and social sciences therefore are beyond the reach of the layman. On the other hand, many writers, while often profound and fastidiously rigorous in their thought, such as Paul Valéry, have vehemently objected to being called philosophers. Nonetheless, a vast number of philosophical works owe their influence and perhaps their greatness to their literary merits.

In periods when philosophical speculation became very abstruse, as in Germany in the 19th century, men of letters often acted as intermediaries between the highly esoteric thinkers and the public. Much of the impact of the erudite 19th-century German philosopher Georg Wilhelm Friederich Hegel was due to the more easily approachable writings of those who took issue with him, such as the existentialist thinker Søren Kierkegaard, or to those who reinterpreted him, such as Karl Marx. Similarly, the thoughts of 20th-century German phenomenologist Edmund Husserl achieved wider circulation by receiving more literary expression in the writings of Jean-Paul Sartre. In modern Europe, the men of letters of Germany were long the most deeply imbued with abstract philosophy. After World War II, however, French writers appeared to take on a zest for abstract speculation, for turgid prose, and for the coining of abstruse terms. Much of French literature in the years after the war has been characterized as "literature as philosophy."

A very few philosophers have reached greatness by evolving a coherent, comprehensive system, ambitiously claiming to account for the world and man. Such harmonious constructions by the greatest philosophers, such as Descartes and Spinoza, might be compared to epic poems in sometimes embracing more than there actually appears to be between heaven and earth. These philosophical systems were conceived by powerful imaginative thinkers whose creative abilities were not primarily of an aesthetic order. The ability and the ambition to produce such systems has appeared in very few countries or cultures. The Slavic, the Spanish, and Spanish-American cultures have been richer in thinkers than in philosophers; that is, in men who reflected on the problems of their own country, who attempted to evolve a philosophy from history, or who applied a broad view to moral or political questions, rather than in men who constructed abstract philosophical systems.

More and more in the 20th century, the sciences that are called in some countries "social" and in others "humane" have replaced the all-encompassing philosophical systems of past ages. In Spain, Miguel de Unamuno (1864–1936) and José Ortega y Gasset (1883–1955) marked the thought and the sensibility of Spanish-speaking peoples far more than systematic philosophers might have done. Their writing, which disdains impeccable logic, is no less thought-provoking for being instinct with passion and with arresting literary effects.

Russian philosophical essays

In Russia, the doctrinal writers whose thought was most influential and often most profound were also those whose prose was most brilliant. They generally centred their speculations on two Russian preoccupations: the revival of Christian thought and charity in the Orthodox faith; and the relationship of Russia to Western Europe, branded by the Slavophiles as alien and degenerate. The consistency of ancient Greek and later Western thinkers, from Aristotle through Descartes, was of scant concern to them, but in the vitality of their style, some of these Russian theorists were masters, whose turbulent, paradoxical ideas were taken to heart by novelists, poets, and statesmen. Among these masters, Aleksandr Herzen (1812–70) combined romantic ardour and positivism, formulating a passionately Russian type of socialism; he left his mark in autobiography, political letters, fiction, and chiefly philosophy of history in ***From the Other Shore*** (1851). Nikolay Danilevsky (1822–85), a scientist who turned to philosophy, attempted to convince his compatriots that the manifest destiny of their country was to offer a purer and fresher ideology in lieu of that of the decadent West. V.V. Rozanov (1856–1919) was an apocalyptic prophet preaching an unusual interpretation of Christian religion; a number of his intuitions and passionate assertions are found in the novel ***The Possessed*** (1871–72), by Fyodor Dostoyevsky, whose own nonfictional prose is of considerable quality and conviction. The strangest and most contradictory, but also the most brilliant prose writer, among those thinkers who were torn between East and West, between a jealous Orthodox faith and the attraction of Catholic Rome, was Vladimir Solovyov (1853–1900). He blended the most personal type of visionary mysticism with an incisive humour in a manner reminiscent of Kierkegaard. His philosophical essay-dialogue-treatise, ***Three Conversations on War, Progress and the End of Human History*** (1900), is representative of the nonfictional Russian prose that, while not widely known outside Russia, is as revealing as the Russian novel of the permanent contradictions and aspirations of the Slavic character.

The American novel was never as close to the religious and political ideas of the country as imaginative literature was elsewhere. Yet, the role of nonfictional prose in the American literature of ideas is significant, as can be seen in several of Emerson's philosophical essays and addresses; in Walt Whitman's *Democratic* ***Vistas*** (1871); in William James's pleasantly written essays on religious experience and on sundry psychological and ethical topics; in George Santayana's dexterous and seductive developments on beauty, on nature, on poets, on the genteel tradition, all envisaged with ironical sympathy. Irving Babbitt (1865–1933), Thorstein Veblen (1857–1929), and Lewis Mumford (1895–) are among the many American writers who, in the 20th century, maintained the tradition of writing on abstract or moral themes with clarity and elegant simplicity. Earlier, Thomas Jefferson and Benjamin Franklin had expressed their lay philosophy in a manner they wished to be widely accessible.

In France the tradition ***haute vulgarisation — "higher*** vulgarization" or popularization—never died and was seldom slighted by the specialists. There, and to a slightly lesser extent in Britain, much of the most valuable writing in prose was an elucidation of the view of life underlying the creations of eminent men in many fields. Such doctrinal writing, expounding innermost convictions and sometimes representing a diversion from more intensive pursuits, constitutes a by no means negligible portion of the writings of the philosopher Bertrand Russell, of the poet William Butler Yeats, and others. The novelist or the poet may well use nonfictional prose to purge his own anger, to give vent to his vituperation against his confrères, and to relieve his imagination of all the ideological burden that might otherwise encumber it. D.H. Lawrence preserved the purity of his storyteller's art by expressing elsewhere his animadversions against Thomas Hardy or Sigmund Freud. Albert Camus stripped his fiction and short stories of the ideological musings found in his philosophical volumes. Marcel Proust succeeded in incorporating many abstract discussions of the value of art, love, and friendship in his very original and loose type of fiction; but his great work, A ***la recherche du temps perdu*** (1913–27; *Remembrance* ***of Things Past)*** might well have gained even more from the excision of those dissertations and the writing of more volumes like his ***Ckroniques*** (1927) or *Contre Sainte-Beuve* (1954). The masters of nonfictional prose in French in the 20th century have been those thinkers who were also superb stylists and who deemed it a function of philosophy to understand the aesthetic phenomenon: Henri Bergson (1859–1941), Paul Valéry (1871–1945), and Gaston Bachelard (1884–1962). No more poetical advocate of reverie has arisen in the 20th century than ***La Poétique de la*** *rêverie* (1960; ***The Poetics of Reverie)*** and the posthumous collection of essays, ***Le Droit de*** *rêver* (1970; ***"The Right to Dream"),*** by Bachelard, who was also a philosopher of science. A major influence on him, as on several earlier poets endowed with profound intellect, such as Baudelaire and Valéry, was Edgar Allan Poe, the impact of whose essays on poetics, on cosmology, and on dreams and reveries has been immense and beneficent. More than a century after his death, many of Poe's American compatriots have conceded that the storyteller and the poet in Poe counted for less, as his European admirers had divined, than the writer of critical and doctrinal prose rich in dazzling intuitions.

Religious literature

Although lectures, articles, and other prosaic admonitions have tended to take their place, sermons, funeral orations, allegories, and the visions of eternal punishment brandished by theologians constitute some of the most unforgettable prose. This form of nonfictional prose literature dates from before the Christian Era; Jewish thought and style were molded by commentaries on the Old Testament and compilations of the wisdom of the sages. Later, and more nearly literary, works of this nature include Sebastian Brant's didactic, poetical, and satirical ***Narrenschiff*** (1494; ***Ship of Fools),*** and the mystic writings of Jakob Bohme (1575–1624) in Germany, the moving sermons of Jón Vidalin (1666–1720) in Iceland. In England, Richard Baxter (1615–91) and John Bunyan

(1628–88) were among the most eloquent of the 17th-century Puritans who composed doctrinal works of literary merit; along with the epic poet John Milton (1608–74), whose prose works hardly count for less than his poetry, they exercised a powerful influence on the English language through their doctrinal prose. Their contemporary, the Anglican Jeremy Taylor (1613–67), wrote the most sustained and dignified prose of an age that, on the continent, would be called Baroque. A little later, in northern Europe, the Norwegian Ludvig Holberg (1684–1754), who spent most of his life in Denmark and became best known as a comic writer, also advised his contemporaries how to live morally in his *Ethical Thoughts* and other didactic treatises. The Swede Emanuel Swedenborg (1688–1772), less gifted as a writer but far more original in his blend of mysticism and science, outshone all previous Scandinavians in impressing the imagination of other Europeans. No less influential, Søren Kierkegaard (1813–55), because of his stimulating ambiguities, his bold treatment of traditional theology and philosophy, and his extraordinary ability to write vivid, biting, and provoking prose, was, a century after his death, one of the most potent forces in the literature and thought of Western civilization.

Many 20th-century readers experience a feeling of remoteness in this kind of doctrinal writing, which stems in part from a lack of vital interest in the beliefs it embodies and from a coolness toward religious dogmatism or fanaticism. Intolerance has shifted from religion to the domain of politics. But the contemporary estrangement from that rich literary heritage is due also to a distrust of high-flown eloquence. Cotton Mather's *Essays to do good* (1710) has few readers in present-day New England, despite that region's Puritan tradition, and Jonathan Edwards (1703–58), a writer of great spiritual warmth and imaginative style who was the first of the great prose writers of America, is admired today chiefly by specialists.

A less sonorous style, one that does not ring so monotonously ornate to the reader's ears, is now preferred. In Spain, Antonio de Guevara (*c.* 1481–1545), a preacher who was at his best in his familiar and satirical moments, and St. Teresa of Avila (1515–82), in her records of her mystical ecstasies, have withstood the changing tides of taste. The French also succeeded in maintaining their appreciation of their two greatest religious writers, Pascal and Bossuet, at the very top of the nonfictional prose writers; both are still revered and occasionally imitated. Pascal took over traditional theology and treated it as literature; his unfinished *Pensées* have exercised far more influence than the rationalism of the greatest French philosophers on the sensibilities of the French. Bossuet's orations reveal the magnificent but refrigerating decorum that seems inseparable from eulogies of the dead—a genre that precludes full sincerity and cultivates tremulous emotion to a dangerous degree. Bossuet's sermons and treatises, however, include masterpieces of simple, terse, direct oratory, which show him as the majestic defender of the unity of faith, of absolutism, and of tradition. His was the last significant endeavour in the 17th century to arrest the flow of relativism and of rebellious individualism, which had engulfed Western civilization with the Renaissance, the Reformation, and Humanism. The two most brilliant writers of religious prose in France in the 20th century were Pierre Teilhard de Chardin (1881–1955), a poetical writer with a luxury of images, and Simone Weil (1909–43), more terse and restrained; they steered a middle course between dogmatism and humility in luring the lay reader to their ardent expressions of conviction.

POLITICAL, POLEMICAL, AND SCIENTIFIC PROSE

In the 20th century, political, economic, and social thought has attempted to reach scientific precision through the use of quantitative data, processing machines, and mathematical formulas. Through such means, other disciplines eventually were elevated to the status of sciences. Literature lost a great deal as a result of this scientific urge, and political and economic thought may have lost even more; for example, the ability to be understood, and perhaps applied, by men of affairs and leaders of nations. The result has been that momentous decisions may be made independent of political theory, which is more often called upon to explain them afterward. Albert Einstein remarked that politics is much more baffling and difficult than physics, and that consequences of errors in politics are likely to make far more difference to the world than the miscalculations of science. Politics is often defined as the art of the possible; it is also an art of improvisation, since the fleeting occasions must be grasped when they appear, and risks must be taken without a full array of scientific data. Like military action, however, political action can be studied in historical writings and in the literary testimonials of men who ran the affairs of their country. Thucydides, Cicero, Caesar, Milton, Burke, Napoleon, and Jefferson were such men of action who were also endowed with uncommon literary gifts. In varying degrees, Benjamin Disraeli, Winston Churchill, Woodrow Wilson, Clemenceau, Lenin, and de Gaulle owed some of their insight and effectiveness to their literary efforts.

Authors, however, are by no means infallible in dealing with the unpredictable course of political life. Interpreting and channelling public opinion proved insuperably difficult, for example, to Alphonse de Lamartine in the revolutionary period of 1848–49 in France, to the bookish Aleksandr Kerensky during the 1917 revolution in Russia, and to a number of brilliant writers who attempted to guide the Spanish Republic in the 1930s. Crowds often can be moved more readily by vapid, repetitious, or inflammatory speeches than by profound or wise counsel. Abraham Lincoln's Gettysburg Address, Churchill's speeches during Britain's finest hour early in World War II, and de Gaulle's lofty eloquence regarding the crises of three decades in France were admired less when they were delivered than afterward. As they are collected, studied, and engraved in the mental make-up of millions of future citizens, such speeches have an effectiveness second to no other form of nonfictional prose. Novels may exercise immense influence through the acute social criticism they embody, but their impact upon the sensibility and the behaviour of their readers is probably less than that of political prose.

Spanish political essays

Although the Spanish language cannot boast of any political thinker comparable to Plato, Machiavelli, or Rousseau, it may boast a large number of fine writers on political topics. Generally, these writers reveal a restrained and terse style, like the poets of Spain, the Latin country least addicted to inflation of language. Garcilaso de la Vega (1539–1616), the son of an Inca mother, wrote with courage and talent of the Peruvians and other cultures of the New World cruelly wrecked by their Catholic conquerors. The Argentinian Domingo Faustino Sarmiento (1811–88) fought in battle and with his pen against his country's dictator and left a masterpiece of social insight, written with rare effectiveness, *Facundo* (1845). Miguel Ángel Asturias (1899–1974), from Guatemala, scathingly depicted the evils of dictatorship in Central America. Like many others in South America, where versatility is not uncommon, Francisco de Miranda (1750–1816) of Venezuela was both a political writer and a statesman.

Italy, after Machiavelli, failed to produce political writers of very great eminence, even during its liberation and unification in the 19th century. The universal thinker Benedetto Croce (1866–1952), however, had the courage to publish, during the Fascist era, the most impassioned defense of liberty in volumes such as *La Storia come pensiero e come azione* (1938; *History as the Story of Liberty*). Another Italian, but from another political direction, Antonio Gramsci (1891–1937), one of the most intelligent exponents of Communism in western Europe, was aware of the vital significance of literary form to spread political ideas. He bitterly deplored the lack, in his country, of a popular literature that reflected the morality and sentiment of the people.

In France political speculation was more comprehensive: few political theoreticians have proved as influential as the philosophers of the Enlightenment, especially Montesquieu and Rousseau. It was the good fortune of the French that during their Revolution at the end of the 18th century and throughout the 19th century, its keenest political minds were also writers of admirable prose. Tocqueville's observations became a sacred text for many a student of America and of pre-Revolutionary France. Since the French seldom give ideas serious consideration unless they are well expressed, however, it was a misfortune that most political speculation after the Napoleonic age was written by gifted, often brilliant, conservatives, such as Joseph de Maistre, Auguste Comte, Frédéric Le Play, Renan, Taine, and Charles Maurras. Those advocating a socialistic view, such as Jean Jaurès and the more elegant and genteel Léon Blum, failed to express their theories in classic prose. The level of political comment in the magazines and newspapers in France is consistently high, but the writers tend to be either too clear-sighted or too arrogant to grant their statesmen a chance to act. "Fair play" is an untranslatable phrase in French, and politics in France, unlike some other countries, is never regarded as a game or sport. Rather, it is a passionate affair of the heart and intellect, conducted in a mood of intransigence. The English essayist Walter Bagehot (1826–77), observing the French at the time of the 1851 Coup d'Etat, commented wryly that "the most essential quality for a free people, whose liberty is to be progressive, permanent and on a large scale, is much stupidity. . . . Stupidity is nature's favorite resource for preserving steadiness of conduct and consistency of opinion."

English and American political works, from the 17th century on, excel all others; they constitute the richest form of nonfictional prose in the English language. John Milton's *Areopagitica* (1644) and his other political pamphlets are monuments of political prose that survive to this day as classics. Edmund Burke's *Letter to a Noble Lord* (1796) was praised a century and a half after its composition as the greatest piece of invective in the English language. William Godwin's *Political Justice* (1793) does not compare in the majesty of its prose to those supreme models, but it did inflame Shelley and other men of letters of the time. Walter Bagehot wrote equally well on literature, politics, and economics, and *The Economist*, which he founded, was the best written weekly of its kind in any language. John Stuart Mill and Thomas Carlyle also helped to maintain the tradition of political and social thought expressed as literature through the 19th century.

The decline of polemics

Polemical prose significantly declined in the modern era. Few moderns express the rage for invective seen in the verse of satirists such as the ancient Roman Juvenal, or Alexander Pope in 17th-century England, or even in the writings of Christian disputants such as Martin Luther. Voltaire rejoiced in flaying not only his enemies but also some, such as Montesquieu and Rousseau, who were fundamentally in agreement with him in the fight against the religion of his age. Literary polemics of a high order were employed against the cultural imperialism of the French in Gotthold Lessing's *Hamburgische Dramaturgie* (1767–69; *Hamburg Dramaturgy).* Besides these examples, the polemics of more recent periods seems tame, or else gross and venomous. Later practitioners of the literature of insult include Émile Zola, particularly in his celebrated article on the Dreyfus affair, *J' Accuse* (1898). Later writers, however, often overreach themselves; their rhetoric sounds vapid and their epigrams strained.

The rift between the two cultures, scientific and humanistic, is probably not as pronounced or final as it has been alleged to be. Around the time the division was enunciated, in mid 20th-century, it was possible to point to a number of eminent scientists who were also masters of prose writing—Jules-Henri Poincaré, Jean Rostand, and Gaston Bachelard in France; Bertrand Russell and Alfred North Whitehead in England; and Rent Dubos and Robert Oppenheimer in the U.S. The peril for scientists who undertake to write for laymen appears to lie in a temptation to resort to florid language and to multiply pretentious metaphors and elaborate cadences in their prose. Some scientists who wrote on astronomy, on anthropology, and on geology have not altogether escaped that pitfall: Sir James Jeans, Loren Eiseley, Sir James Frazer, Teilhard de Chardin. The marriage of the "two cultures" in one mind, which was no less concerned with scientific truth than with beauty of form, was found frequently in older times; Aristotle, Hippocrates, Galileo, Newton, and Goethe all showed strong interest in both. The popularization of science reached a level of a lucid and elegant art with the writings of Bernard de Fontenelle (1657–1757) in French, Francesco Algarotti (1712–64) in Italian, and later, with a masterpiece of scientific rigour expressed in flexible and precise prose, *Introduction à l'étude de la médecine expérimentale*, by the physiologist Claude Bernard (1813–78).

OTHER FORMS

Reportage. Journalism often takes on a polemical cast in countries in which libel laws are not stringent. Polemical journalism flourished in continental Europe when a journalist's insults could be avenged only in a duel; one of the great journalists of this heroic era of the press in France, Armand Carrel, died in such a duel with another journalist in 1836. Most journalistic literature, however, deserves none of the ill-repute that is associated with its more polemical expressions. Rather, it is a remarkably elastic form, as adaptable to sarcasm and the puncturing of illusions as to reflection, subtle persuasion, and infectious geniality. Among the eminent writers who explored its possibilities in the 18th century, Joseph Addison and Richard Steele offered models of polished English prose in the journals *The Tatler* and *The Spectator*, and Jonathan Swift and Oliver Goldsmith also used it effectively in England. In France Voltaire, the novelist Abbé Prévost, and the dramatist Pierre-Carlet de Marivaux all found effective use for the form. By the 19th century, most eminent men of letters attempted to broaden their audiences by means of articles and essays in the press, and in the 20th century, the influence of journalism pervaded the most important works of some authors. Some of the works of G.B. Shaw and H.G. Wells, for example, were reminiscent of journalism in the manner in which they sought topical controversy and challenged social and political prejudices. Many of the finest essays of Virginia Woolf, John Middleton Murry, and Aldous Huxley represented British literary journalism at its most intelligent level. In America, the more heterogeneous public to which authors must address themselves and, later, the competition of the audiovisual media, were not propitious to the flowering of literary journalism of that type. In a more ephemeral genre, that of political reflections couched in clear, pungent style, Walter Lippmann composed models of commentaries on politics and ethics.

Ego in journalistic style

The more self-centred and passionate writers seldom succeeded in journalistic prose as well as those who could forget their ego and adapt their style to a public that wanted to be entertained, moved, or convinced, perhaps, but whose attention span extended no further than the 15 minutes of a train ride or of a hurried breakfast. In France, Proust dreamt for years of appearing as a journalist on the first column of the journal *Le Figaro*. But he and his contemporaries Gide, Claudel, and Valéry, and, later, the imperious and nervous André Malraux, did not conform to the limitations of the newspaper article. On the other hand, Colette, Paul Morand, and François Mauriac proved conspicuously successful in writing the brief, gripping, taut article dear to readers of many of the better continental dailies and weeklies.

The insidious appeal of journalistic writing to thinkers, novelists, and poets is similar to the siren charm of conversation for the author who enjoys talking brilliantly at dinner parties. As Oscar Wilde ruefully remarked, conversationalists and journalists, intent on reporting on the ephemeral, pour whatever genius is theirs into their lives, and only their talent into their works.

Aphorisms and sketches. Authors of maxims and aphorisms, on the contrary, strive for the brevity of inscriptions on medals and public buildings and for a diamond-like resistance to the devastation of time upon diffuse and padded writing. This form is periodically revived. In modern letters, in the latter half of the 20th century, a condensed and enigmatic sort of prose was preferred to poetry by several poets, who invested their sensations, their illuminations, or their reflections with the mystery and éclat of aphorisms. Among the French. who have always favoured the maxim for philosophical, psychological, and ethical advice, a great poet, René Char (1907–), came to be more and more fascinated by that epigrammatic form, harking back to the ancient Greek philosopher whom he admired most, Heracleitus. Char found in the aphorism a means of "pulverizing language" and of allowing the isolated words or groups of words, freed from rhetoric and from the exigencies of clarity, to emerge like rocks from a sunken archipelago. Other French prose writers, including Camus, Char's warmest admirer, and Malraux, likewise scattered through their prose works striking aphorisms that summed up the sense of a situation or the experience of a lifetime. French novels, from the 18th century through the 20th, reflect the influence of the unforgettable maxims coined by the 17th-century moralists Pascal, La Rochefoucauld, and La Bruyère. The novelist could never long resist the seduction of brevity, the challenge of condensing wisdom into a neat, usually bitter, formula, which usually suggested to the reader not to expect overmuch from life and to take revenge upon its little ironies by denouncing it in advance.

Maxims and other pointed and epigrammatic phrases of the sort the ancient Romans called *sententiae* can become too sophisticated or can too obviously strive for effect. This form of expression reached its point of perfection, balancing profundity and solidity of content with pointedness of form, with the moralists of the 17th and 18th centuries in France, whom Nietzsche ranked above all other writers. They included Pascal and La Rochefoucauld and, later, Stbastien Chamfort (1740/41–94), a satirical pessimist often quoted by Schopenhauer and Joseph Joubert (1754–1824). This form, even more than poetry, represents the most economical means of communicating long experience and for imparting moral advice. In a very few words, or at most a few lines, an aphorism may enclose enough matter for the plot of a novel. It may trounce the prejudices of snobbery more vigorously than a long, meandering novel of manners. The greatest of the 19th-century poets, Goethe, Novalis, Leopardi, Vigny, and Baudelaire, as well as painters such as Delacroix, Cézanne, Degas, and later Braque, cherished the epigrammatic, incisive form of expression. One of the advantages of the aphorism or *pensée* is that it can easily produce an impression of depth when it may be only a commonplace pungently expressed. Another is that it allows several approaches to a subject by the skilled prose writer. If he is of a fiery temperament, prone to enthusiasms and lashing out in wrath against what he deems to be false, he can, like Nietzsche, embrace contradictions and sponsor opposed attitudes. If Epictetus, Pascal, and Nietzsche had expressed their reflections consistently and systematically, their works would probably be forgotten. Nonetheless, as Pascal shrewdly remarked. the aphoristic prose style is, of all the manners of writing, the one that engraves itself most lastingly in the memories of men.

That form, in verse and in prose, probably constitutes the most widespread form of literature. It is found in many nations that long lived without fiction, epics, or even popular poetry. It is found in ancient sayings that interlard the speeches of the 20th-century leaders both of the U.S.S.R. and of China; in the book of Proverbs of the Bible; in the Qur'ān; in the Afrikaans language of South Africa in the 20th-century writings of J. Langenhoven. Proverbs, maxims, riddles, and even conundrums make up a large part of African Negro folklore. The animal tales of these people also provide lessons in the form of aphorisms that are neither as platitudinous nor as didactic as Aesop's fables.

Portraits and character sketches

Portraits and sketches are a form of literature that thrives in cultures in which the court, the salon, or the café plays an important role. The few examples left by the ancient Greeks, such as by Theophrastes, pale beside the vivid portraits of real individuals drawn by the ancient Roman historian Tacitus and by the impassioned orator Cicero. In the Classical age of 17th-century France, the character sketch was cultivated in the salons and reached its summit with La Bruyère. That form of writing, however, suffered from an air of artificiality and of virtuosity. It lacked the ebullience and the imagination in suggesting telltale traits that characterize the portraits of the duc de Saint-Simon (1675–1755). Collections of sketches and characters, however, tend to strike the reader as condescending and ungenerous insofar as the writer exempts himself of the foibles he ridicules in others.

Humorous essays

The humorous article or essay, on the other hand, is a blend of sympathy and gentle pity with irony, a form of criticism that gently mocks not only others but the mocker himself. Humour strikes deep roots in the sensibility of a people, and each nation tends to feel that its own brand of humour is the only authentic one. Its varieties of humorous writing are endless, and few rules can ever be formulated on them. Humorous literature on the highest literary level includes that of Cervantes in Spain, of Sterne, Lamb, and Thackeray in England. of Jean Paul in Germany, and of Rabelais, Montaigne, and Voltaire in France. Romantic authors have, as a rule, been too self-centred and too passionate to acquire the distance from their own selves that is essential to humour. In the 20th century, some of the most original examples of what has been called the "inner-directed smile" are in the works of the Argentine Jorge Luis Borges (1899–) and by one of the writers he admires most, the English essayist G.K. Chesterton (1874–1936). In both writers, and in other virtuosos of the intellectual fantasy, there is a persistent refusal to regard themselves as being great, though greatness seems to be within their reach. The humorist will not take himself seriously. Chesterton hides the depth of his religious convictions, while Borges facetiously presents his prodigious erudition and indulges in overelaborate and flowery prose. Borges likes to put on and take off masks, to play with labyrinths and mirrors, but always with a smile. By sketching what appear to be fanciful portraits rather than overtly fictional stories, he creates a half-imaginary character whose presence haunts us in all his writings—that of the author himself.

Dialogues. The dialogue form has long been used as a vehicle for the expression of ideas. It is especially cherished by authors eager to eschew the forbidding tone of formality that often accompanies the expression of serious thought. The writer of a dialogue does not directly address his public, but instead revels in the multiple facets of ideas. By playing this dialectical game he can appear to present contrary views as their respective proponents might and then expose the errors of those he opposes, leading the readers to accept his own conclusions. The advantages of the dialogue are clear: ideas that might have remained abstruse and abstract become concrete and alive. They assume dramatic force. A constant element in the dialogue is irony; etymologically, the term derives from a form of interrogation in which the answer is known beforehand by the questioner. The earliest models of the genre, by the ancient Greeks Plato and Lucian, have never been excelled. Sophistry is another element of the dialogue. In Plato and in the dialogues of Pascal's *Provinciales* (1656–57; "Provincial Letters"), the protagonist plays with the naiveté of his opponents, who always end by surrendering. The writer of a dialogue cannot affect the same casual and self-indulgent attitude as the author of a personal essay since the characters and their statements must be plausible. Nor can he pursue an argument consistently, as he might in a critical, historical, or philosophical essay. Something must persist in the dialogue of the spontaneity and the versatility of an actual conversation among witty and thoughtful people.

There was much seriousness and occasionally some pedantry in early dialogues in several literatures. The dialogues of Bardesanes (154–222) in Syriac, rendered into English as *On Fate*, are on the subject of the laws of the country. A hundred years earlier, Lucian, who was also Syrian, proved himself a master of flowing and ironical Greek prose in his satirical dialogues. The Italian Renaissance writer Pietro Aretino (1492–1556) proved himself the equal of Lucian in verve in his ***Dialogues*** using the same mold and the same title as Lucian. Others who used the dialogue form included Castiglione and Pietro Bembo (1470–1547) in Italy; and in Spain Juan Luis Vives (1492–1540), León Hebreo (1460–*c.* 1521), and Juan de Valdés (*c.* 1498–1541), who treated questions of faith and of languages in dialogues. The genre flourished in the 18th century: Lessing, Diderot, and the Irish philosopher George Berkeley. Diderot's works largely consist of sprightly, iambling, and provocative discussions between the various aspects of his own remarkable mentality. Bold conjectures, determined onslaughts on prejudices, insights into physiology and biology, and erotic fantasies all enter into his dialogues. In the 19th century a number of complex literary personalities, who were capable of accepting the most diverse, and even conflicting points of view, such as Renan and Valéry, had a predilection for the dialogue. Among the devices used by authors of dialogue — many of whom lacked the sustained inventiveness required by fiction— was to attribute their words to the illustrious dead. The French prelate Fénelon, for example, composed *Dialogues des morts* (1700–18), and so did many others, including the most felicitous master of that prose form, the English poet Walter Savage Landor, in his *Imaginary Conversations* (1824) and *Pentameron* (1837).

Travel and epistolary literature. The literature of travel has declined in quality in the age when travel has become most common — the present. In this nonfictional prose form, the traveller himself has always counted for more than the places he visited, and in the past, he tended to be an adventurer or a connoisseur of art, of landscapes, or of strange customs who was also, occasionally, a writer of merit. The few travel books by ancient Greek geographers, such as Strabo and Pausanias of the 1st and 2nd centuries AD, are valuable as a storehouse of remarks on ancient people, places, and creeds. Travel writing of some literary significance appears in the late-13th-century writings of Marco Polo. Works of a similar vein appeared in the 17th century in the observations of Persia two French Huguenots, Jean-Baptiste Tavernier and Jean Chardin, whose writings were lauded by Goethe. Many books of documentary value were later written by English gentlemen on their grand tour of the Continent. The 18th-century Italian egotist Casanova and his more reliable and sharper compatriot Giuseppe Baretti (1719–89) also produced significant travel writings.

The form comprises many of the finest writings in prose during the Romantic age. Not only were the Romantics more alive to picturesqueness and quaintness but also they were in love with nature. They were eager to study local colours and climates and to depict them in the settings for their imaginative stories. Also, travel gave the Romantic writer the illusion of flight from his wearied self. The leisurely record of Goethe's journey to Italy in 1786–88 counts more readers than most of his novels. The *Letters* of *a Russian Traveller* (1795) by Nikolay Karamzin is one of the earliest documents in the development of Russian Romanticism. Ivan Goncharov (1812–91), the Russian novelist who stubbornly limited his fiction to his own geographical province, recorded in *Frigate Pallas* his experience of a tour around the world. Nowhere else in the whole range of literature is there anything comparable to *Saint-Petersburg* (1913), by a virtuoso of poetic style, Andrey Bely; it is a travel fantasy within a city that is both real and transfigured into a myth. Neither James Joyce's Dublin nor Balzac's Paris is as vividly recreated as the former Russian capital in Bely's book. Other travel writers of note include the multinational Lafcadio Hearn (1850–1904), who interpreted Japan with sensitivity and insight. Earlier, two other Westerners wrote on Asia, the English historian Alexander W. Kinglake (1809–91), in *Eothen* (1844), and, more incisively, the French diplomat Joseph-Arthur, comte de Gobineau (1816–82); both blended a sense of the picturesqueness of the East with shrewdness in the interpretation of the people. One of the most thoughtful and, in spite of the author's excessive self-assurance, most profound books on Asia is *Das Reisetagebuch eines Philosophen* (1919; *Travel Diary of a Philosopher),* by the German thinker Hermann Keyserling (1880–1946). With an insatiable interest in countries, Keyserling also interpreted the soul of South America and, less perceptively, analyzed the whole spectrum of European nations. Among the thousands of travel books on Italy, there are a few masterpieces of rapturous or humorous prose: in English, the writings of D.H. Lawrence on Sardinia, on Etruscan Italy, and on the Italian character are more lucid and less strained than other of his prose cogitations. Venice, "man's most beautiful artifact," as Bernard Berenson called it, inspired Rousseau, Chateaubriand, Maurice Barrès, Anatole France, and hundreds of other Frenchmen to write some of their finest pages of prose. After World War I, there was a distinct yearning for new possibilities of salvation among war-ridden Europeans, dimly descried in Asia, in Russia, or in America, and travel literature assumed a metaphysical and semireligious significance. The mood of the writers who expressed this urge was somewhat Byronic; they were expert at poetizing the flight from their own selves. Blaise Cendrars (1887–1961) in his novel *Emmkne-moi au bout du monde* (1956; "Take me away to the end of the world"), epitomizes the urge to seek adventures and a rediscovery of oneself through strange travels. The very theme of travel, of the protagonist being but a traveller on this earth, has been, from Homer's *Odyssey* onward, one of the most laden with magical, and symbolical, associations in literature. Countless authors have played moving and delicate variations on it.

The letter as a genre

Of all the branches of nonfictional prose, none is less amenable to critical definition and categorization than letter writing. The instructions of the ancient grammarians, which were repeated a thousand times afterward in manuals purporting to teach how to write a letter, can be reduced to a few very general platitudes: be natural and appear spontaneous but not garrulous and verbose; avoid dryness and declamatory pomp; appear neither unconcerned nor effusive; express emotion without lapsing into sentimentality; avoid pedantry on the one hand and banter and levity on the other. Letters vary too much in content, however, for generalizations to be valid to all types. What is moving in a love letter might sound indiscreet in a letter of friendship; an analysis of the self may fascinate some readers, while others prefer anecdotes and scandal. La Bruyère, at the end of the 17th century, remarked that women succeed better than men in the epistolary form. It has also been claimed that a feminine sensibility can be seen in the letters of the most highly acclaimed male masters of this form, such as Voltaire, Mirabeau, Keats, and Baudelaire. Advice to practitioners of the art of letter writing usually can be expressed in the often-quoted line in Shakespeare's *Hamlet:* "To thine own self be true." The English biographer Lytton Strachey (1880–1932), a copious and versatile letter writer himself, wrote: "No good letter was ever written to convey information, or to please its recipient: it may achieve both those results incidentally; but its fundamental purpose is to express the personality of the writer." There are, however, numerous and even contradictory ways of expressing that personality.

Although critics have issued endless disquisitions on the craft of fiction and other genres, they have generally remained silent on the epistolary genre, though it has sometimes been the form of prose that outlives all others. Ever since the expression of the writer's personality became one of the implicit purposes of writing in the 18th century, the letters of such eminent authors as Diderot, Rousseau, Byron, and Flaubert have probably offered at least as much delight as any of their other writings. Impressive monuments of scholarship have been erected on the presentation of the complete letters of Thackeray, George Eliot, Swinburne, and Henry James. The literatures of France and England are notably richer in letter writing of the highest order than are the literatures of the United States and Germany. Contrary to many pessimistic predictions regarding the effect on letter writing of modern means of communication, such as the telephone, together with an apparently increasing penchant for haste, some of the richest, most revealing, and most thoughtful letters of all times have been written in the 20th century; those of the English writers Katherine Mansfield and D.H. Lawrence are paramount among them.

Personal literature. The cult of the ego (that is, a preoccupation with self-analysis) is a late development in the history of literature. There were, to be sure, men in ancient times who were absorbed in their own selves, but there is almost no autobiographical literature from ancient Greece and, in spite of Cicero and Pliny the Younger, there is little from ancient Rome. The confession, made as humble as possible and often declamatory in the exposition of the convert's repented sins, was an outgrowth of Christianity; masters of confessional literature were Saint Augustine, Petrarch, and the English Puritans. Autobiographical writing took a different form in the 18th century in the work of men who would have agreed with Goethe that personality is the most precious possession. After the publication of Rousseau's *Confessions* in France in 1781, the passion for looking into one's heart (and other organs as well) spread to other literatures of western Europe. Many a novelist thereafter kept a precise record of his cogitations, anxieties, and harrowing moments of inability to create. Poets and painters, including Delacroix, Constable, and Braque, have often done the same. There is only a very tenuous separation between fiction of this sort from nonfiction; the introspective novel in the first person singular has much in common with a diary, or a volume of personal reminiscences. In his long novel *A la recherche du temps perdu,* Proust revealed himself in three ways—as the author, as the narrator, and as the characters who are projections of his own self. An autobiography once was ordinarily written toward the end of a life, as a fond recollection or an impassioned justification of a lifetime's deeds. More and more, it has come to be written also by men and women in their prime. The names of writers whose autobiographical writings have become classics is legion. Henry Adams (1838–1918) owes his place in American letters chiefly to his book on his education; in 20th-century English letters, Osbert and Sacheverell Sitwell, Leonard Woolf, and Stephen Spender may similarly survive in literature through autobiographical works. André Gide, always uncertain of his novelist's vocation, felt more at ease laying bare the secret of his life in autobiographies and journals.

Although imaginative fiction has probably suffered from excesses of introspection and of analyses of the author's own artistic pangs, knowledge of man's inner life has been enriched by such confessions. The most profound truths on human nature, however, have been expressed not in the form of autobiography but in its transposition into fiction. Readers generally have found more truth in literature created from the possibilities of life than from the personal record of the one life that the author has lived.

In conclusion, the variety of nonfictional prose is prodigious. It can be written on almost any conceivable subject. Almost any style may be used, from casual digressions or sumptuous and sonorous sentences to sharp maxims and elliptical statements. But nonfictional, prose seldom gives the reader a sense of its being inevitable, as does the best poetry or fiction. Nonfiction prose seldom can answer positively the question that Rilke and D.H. Lawrence suggest that any potential writer should ask: Would I die if I were prevented from writing?

BIBLIOGRAPHY. The following comprehensive works, touching on the literatures of a great many nations, are useful to consult: H.M. and N.K. CHADWICK, ***The Growth of Literature,*** 3 vol. (1932–40); RAYMOND QUENEAU (ed.), ***Encyclopédie de la Pléiade***, vol. 1, *Histoire des Litte'ratures,* 3 vol. (1956–58); and J.T. SHIPLEY (ed.), ***Encyclopedia of Literature, 2*** vol. (1946). The last two works contain articles by many authors on all the literatures of the world, treated historically. On the essay, see R.D. O'LEARY, ***The Essay*** (1928), which analyzes the essay theoretically and examines several categories of essayists. DAVID DAICHES gives a brief and lively introduction to his anthologies of essays: ***A Century of the Essay: British and American*** (1951), and ***More Literary Essays*** (1968). On letter writing in general, the best piece is by GUSTAVE LANSON, in French: Introduction to ***Choix de lettres du XVIIe siècle***, 5th rev. ed. (1898), reprinted in Lanson's, ***Essais de méthode, de critique et d'histoire littéraire,*** pp. 243–258 (1965). On personal literature, the diary, autobiography, and the questions raised by those forms of prose, see HENRI PEYRE, ***Literature and Sincerity*** (1963).

(H.M.P.)

Literature, Western

Diverse as they are, European literatures, like European languages, are parts of a common heritage. Greek, Latin, Germanic, Baltic and Slavic, Celtic, and Romance languages are all members of the Indo-European family. (Finnish and Hungarian and Semitic languages of the eastern Mediterranean, such as Hebrew, are not Indo-European. Literatures in these languages are, however, closely associated with major Western literatures and are treated here.) The common literary heritage is essentially that originating in ancient Greece and Rome. It was preserved, transformed, and spread by Christianity and thus transmitted to the vernacular languages of the European Continent, the New World, and other regions settled by Europeans. To the present day, this body of writing displays a unity in its main features that sets it apart from the literatures of the rest of the world. The subject is treated under seven major period divisions: ancient, medieval, Renaissance, 17th century, 18th century, 19th century, and 20th century. The section on each period is further subdivided into subsections on each of the literatures that flourished then.

The first, ancient, period ended with the fall of the Roman Empire in the West (AD 476). Between 800 BC and that date, ancient civilization had created the major types, or genres—epic, tragedy, comedy, lyric, satire, history, biography, and prose narrative—that were to determine much of the future formal development of Western literature. It also bequeathed to its successors a vast collection of mythological lore and a complex philosophical literature that decided the course of Western thought.

The second period, the Middle Ages, extending to about the end of the 15th century, is defined by the establishment of Christianity and the prevalence of a Christian world view in the territories of the former Roman Empire. Though it did not retain its classically refined form, Latin remained an international language in the West, while the vernacular languages gradually came into their own as vehicles of written literature. By the end of the period there existed major works and writers in most of the chief European vernaculars.

By about the middle of the 15th century a new spirit was discernible in some European writing, but the end of the Middle Ages and the beginning of the Renaissance was not an occurrence that can be assigned a single definite date. Gradually, the medieval Catholic world view changed, giving way to a more secular conception of men and the universe. This third period was characterized by a renewed interest in learning, especially a revival of classical learning (Humanism). Renaissance literature also showed the effects of the Protestant Reformation and a sense of cultural expansion that resulted from explorations and discoveries of the time.

The remaining periods, divided according to century from the 17th to the 20th, are somewhat arbitrary divisions; they are justified by a few fundamental developments that affected the literature of each period.

The 17th century in most European countries was characterized by political and religious turbulence. Literature was responsive to these disturbances as well as to increasingly skeptical and rationalist tendencies that accompanied the rise of science as the prevailing intellectual mode in the West.

The next period, the 18th century, is accurately described as the Age of Reason or the Enlightenment. The rational aspect of the period was reflected in a literature of wit, argument, and satire. At the same time, however, an interest in the passions, the sensibility, and other irrational qualities in man inspired another kind of writing: Gothic prose, with its emphasis on terror and the supernatural; poetry concerned with the cultivation of the emotions and the sublime; and the psychological novel.

The effects of the French Revolution (1789) and the

Industrial Revolution were felt in the writing of the 19th century, during which time literary interests developed earlier were explored further in the works of Romantic poets and great 19th-century novelists.

The typical features of 20th-century literature first began to emerge after World War I, and essential forms and themes of modern writing were to be seen in ferment and growth from the 1920s onward.

These sections, with their major headings, appear as follows:

I. Ancient literature

CHARACTERISTICS OF ANCIENT LITERATURE

The stark fact about ancient Western literature is that the greater part of it has perished. Some of it had been forgotten before it was possible to commit it to writing; fire, war, and the ravages of time have robbed posterity of most of the rest; and the restitutions that archaeologists and paleographers achieve from time to time are small. Yet surviving writings in Greek and far more in Latin have included those that on ancient testimony marked the heights reached by the creative imagination and intellect of the ancient world.

Four ancient civilizations in the Near East and in the West, Babylon and Assyria, Egypt, Greece, and Rome, and a fifth, the culture of the Israelites in Palestine, each came into contact with one or more of the others. The two most ancient, Assyro-Babylonia, with its broken clay tablets, and Egypt, with its rotted papyrus rolls, make no direct signal to the modern age; yet Babylon produced the first full code of laws and two epics of archetypal myth which came to be echoed and re-echoed in distant lands; and Egypt's mystical intuition of a supernatural world caught the imagination of the Greeks and Romans. Hebrew culture exerted its greatest literary influence on the West because of the place held by its early writings as the Old Testament of the Christian Bible; and this literature profoundly influenced Western consciousness through translation from about the time of St. Augustine of Hippo (AD 354–430) onward into every vernacular language as well as into Latin. Until then, Judaism's concentrated spirituality set it apart from the Greek and Roman world.

Though influenced by the religious myths of Mesopotamia, Asia Minor, and Egypt, Greek literature has no direct literary ancestry and appears as self-originated. Roman writers looked to Greek precept for themes, treatment, and choice of verse and metre. Rome eventually passed the torch on to the early Middle Ages, by which time Greek had been subsumed under a wholly Latin tradition and was only rediscovered in its own right at the Renaissance—the "classical" tradition afterward becoming a threat to natural literary development, particularly when certain critics of the 17th century began to insist that the subjects and style of contemporary writing should conform with those employed by Greece and Rome.

All of the chief kinds of literature were established by the Greeks and Romans, and later developments have for the most part been secondary extensions. The Greek epic of Homer was the model for the Latin of Virgil; the lyric fragments of Alcaeus and Sappho were echoed in the work of Catullus and Ovid; the history of Thucydides was succeeded by that of Livy and Tacitus; but the tragedy of the great Athenians of the 5th century BC had no worthy counterpart in Roman Seneca nor had the philosophical writings of Plato and Aristotle in those of any ancient Roman, for the practical Romans were not philosophers. Whereas Greek writers excelled in abstraction, the Romans had an unusually concrete vision, and, as their art of portraiture shows, were intensely interested in human individuality.

In sum, the work of these writers and others and perhaps especially that of Greek authors expresses the imaginative and moral temper of Western man. It has helped to create his values and to hand on a tradition to distant generations. Homer's epics extend their concern from the right treatment of strangers to behaviour situations of deep involvement among hero rivals, their foes, and the overseeing gods; the tragedies of Aeschylus and Sophocles are a sublime expression of man's breakthrough into moral awareness of his situation. Among Roman authors an elevated Stoicism stressing the sense of duty is common to many, from Naevius, Ennius, and Cato to Virgil, Horace, and Seneca. A human ideal is to be seen in the savage satire of Juvenal and in Anacreon's songs of love and wine, as it is in the philosophical thought of Plato and Aristotle. It is given voice by a chorus of Sophocles, "Wonders are many, but none is more wonderful than man, the power that crosses the white sea. . . ." The human ideal held up in Greek and Latin literature, formed after civilization had emerged from earlier centuries of barbarism, was to be transformed, before the ancient world came to its close, into the spiritual ideal of Judeo-Christianity, whose writers foreshadowed medieval literature.

ASSYRO-BABYLONIAN LITERATURE

Akkadian, the language of ancient Babylonia and Assyria, is the earliest recorded Semitic language and hence of considerable importance for comparative linguistics. Its writing system was borrowed from Sumerian, the world's oldest written language. In the Assyro-Babylonian culture that flourished on the banks of the Tigris and Euphrates rivers, Akkadian replaced Sumerian as a spoken language in the 3rd millennium BC, though Sumerian continued in written usage almost to the end of the active use of Akkadian in the 1st century AD.

Many of the records of this civilization are of linguistic and historical rather than literary interest. There are numerous word lists of names of gods and of common words, the purpose of which was encyclopaedic: the systematic collection of all possible words and concepts. These lists may also have served pupils as spelling guides. Lists giving a word sign or signs with the Sumerian pronunciation and the Akkadian equivalent arranged in columns served as vocabularies, various types of which remained in use until the end of Babylonian scholarly activity. Of historical as well as linguistic interest are the earliest royal inscriptions, simple dedications of objects or buildings of the type "To god X has A, son of B, king of the city Y, given this vase" or "built this temple!' The Assyrians further developed this pattern into what are known as "annals," detailed accounts of a king's military exploits for each year. Although popular and sometimes even mythological stories appear in some of these entries, their importance is chiefly historical.

The *Epic of Creation* and the *Epic of Gilgamesh*

Assyro-Babylonian literary texts have been found on tablets that are dated as early as *c.* 2500 BC and were about myths, epics about the deeds of early kings, hymns, and wisdom literature (proverbs). Of the greatest literary significance are two epics. ***Enuma elish*** (the ***Epic of Creation***) told how Marduk, the city god of Babylon, slew the monster Tiamat and created the world out of her body, a deed for which the other gods rewarded him by granting him universal rule. The ***Epic of Gilgamesh,*** probably the most important work in Akkadian, related the story of the Sumerian hero Gilgamesh and his companion Enkidu.

The fullest text extant is that on tablets found at Nineveh in the library of Ashurbanipal, king of Assyria (668–627 BC). The epic was a creation of the Babylonians. It incorporated Sumerian stories about Gilgamesh and his friend and introduced a new motif, Gilgamesh's quest for immortality after the death of Enkidu. Of particular interest in the epic is the Babylonian version of the Flood, analogous to Noah's Flood in the Bible, which is recounted to Gilgamesh by a survivor, Utnapishtim. The Gilgamesh story, which was current in Asia Minor in languages other than Akkadian, may possibly have influenced the Greek ***Odyssey;*** and themes from it may occur also in the folklore of the Pacific.

ANCIENT EGYPTIAN LITERATURE

Egyptian literature has survived largely in the form of hieratic texts on papyrus, or school copies written on tablets and ostraca (potsherds and flakes of limestone). Some 70 works have been identified, but many of them are fragmentary and can represent only a fraction of the literary achievement of the ancient Egyptians, most of which is lost. The texts may be classified as historically and mythologically based popular romances, secular and religious poems, model letters, and collections of moral precepts or "instructions."

Among the popular tales that have survived are the story of "King [Cheops] Khufu and the Magicians," a lively series of episodes involving famous ancient kings; "The Shipwrecked Sailor," about a castaway on an island who is entertained by a monster serpent; "The Tale of the Two Brothers," which seems to be involved with the myth of Osiris, god of the underworld, and the theme of the struggle between good and evil; and "The Contendings of Horus and Seth," in which the gods play semi-comic roles. Other popular tales contain no supernatural elements: "The Tale of the Eloquent Peasant" tells of a peasant whose eloquent pleading secures him justice; "The Story of Sinuhe" relates how an exiled fugitive receives the pharaoh's pardon and returns home; and "The Report of Wenamun" describes the adventures of an envoy sent to Phoenicia to buy timber.

Didactic literature of Egypt

The Maxims and Instructions belong to the genre of didactic or wisdom literature, of which the sayings of Ptahhotep, of Kagemni, of Ani, and of Amenemope are examples. They were generally expressed as advice given by an old man to his son, or a king to his heir; some of them contain parallels with Hebrew wisdom literature.

Similarly moral, but of a different, pessimistic flavour are the "Songs of the Harpers" engraved on the walls of tombs. The most remarkable text of this sort is "The Man Who Was Tired of Life," in which a man seems to be meditating on suicide. Such works are in contrast to poems in praise of the sun god and other deities. Although few complete myths have survived in literary form, temple inscriptions contain long ritual texts, often with a mythological content, and the Book of the Dead, a hodgepodge of magic and mythology, contains many references to the world of the gods. Full treatment of Egyptian legends is to be found mainly in the works of later Greek or Latin authors who were responsive to the richness and antiquity of Egyptian mythology.

ANCIENT HEBREW LITERATURE

Literature in Hebrew was produced uninterruptedly from the early 12th century BC, and certain excavated tablets may indicate a literature of even greater antiquity. From 1200 BC to AD 200, Hebrew was a spoken language in Palestine, first as biblical Hebrew, then as Mishnaic Hebrew, a later dialect that does not derive directly from the biblical dialect and one that gained literary status as the Pharisees began to employ it in their teaching in the 2nd century BC. The Hebrew language, whether spoken at the time or not, always adapted itself to the needs of changing literary tastes. It was at various times the vehicle for sophisticated religious thought, scientific precision, and fervid mysticism. It is through the enormous literary influence of the Bible that Hebrew, directly or in translation, has chiefly affected Western literature.

Pre-exilic period, c. 1200–587 BC. All that is preserved of the literature of this period is slightly more than 20

The principle of parallelism in biblical poetry

of the 39 books included in the Old Testament (the remainder being from the next period). In all probability poetry preceded prose. Biblical poetry was based on the principle of parallelism; *i.e.*, the two halves of a verse express the same idea, either by repeating it in different words or by stressing different aspects of it. Examples are found in the book of Psalms: "But they flattered him with their mouths; they lied to him with their tongues" (Ps. 78:36); "He turned their rivers to blood, so that they could not drink of their streams" (Ps. 78:44). To this "rhyme of meaning" was added a simple rhythm, consisting mainly in having each half of a line divided into an equal number of stressed words. There were also folk songs, to which belonged perhaps large parts of the Song of Solomon, dirges, epic chants, and psalms. The use of various forms of poetry in the work of the prophets appears to be a later literary development.

The earlier prose texts were still very close to poetry in structure and language. The first real prose may well have been some of the laws recorded in the Pentateuch. In Jeremiah and Deuteronomy a high standard of prose rhetoric was achieved: some of the conversations in the historical books were attempts to reproduce in writing the style of ordinary talk. (See also BIBLICAL LITERATURE.)

Period of the Second Temple, 538 BC–AD 70. The literary output of this period was large, only part of it belonging to the biblical canon. The biblical Hebrew of the writings was artificial because it had ceased to be spoken and had been replaced by Aramaic, a related Semitic language, and Mishnaic Hebrew. Works that are included among the Dead Sea Scrolls belonged to this period. Some of these works provide evidence of a new kind of writing, the homiletic, or sermonizing, commentary to the Bible called Midrash. The only work of real literary merit among the scrolls was the fervent personal poetry of the Hymns of Thanksgiving.

Parts of the biblical books of Ezra and Daniel and certain works among the Dead Sea Scrolls are in an early form of Aramaic. This period also began to provide translations, called Targums, into a slightly later Aramaic of most of the Hebrew Bible.

Talmudic literature. In contrast to the works of the Bible and the Second Temple were the collections of writings concerned with Jewish civil and religious law. Whereas the former were lengthy writings bearing the imprint of their authors or editors, early rabbinic literature consisted entirely of collections of individual statements loosely strung together. The individual paragraphs exhibit the influence of Hellenistic rhetoric. Collections that follow the arrangement of biblical books are called Midrash, as opposed to works such as the Mishna, where the material is arranged according to subject. The Mishna was the main work of the period c. 100 BC–AD 200. The following period, AD 200–500, was notable for two main innovations: the appearance of an additional literary centre in Babylonia (southern Iraq), where Jewry flourished in contrast to the oppressive rule of Rome and later Byzantium in Palestine; and the literary use of the spoken local dialects of Aramaic alongside Hebrew. The Talmuds produced by Palestine and Babylonia in this period contained a large proportion of Haggada, statements dealing with theological and ethical matters and using stories, anecdotes, and parables to illustrate certain points. This material was later influential on Hebrew fiction of the Middle Ages and of the modern period. (See also TALMUD AND MIDRASH.)

The Mishna and Midrash

ANCIENT GREEK LITERATURE

The ancient Greeks comprised several racial groups that settled, in successive waves of migration, in Greece and along the coast of Asia Minor, on numerous Aegean islands, including Crete, and in Sicily and southern Italy (together known as Magna Graecia). By about 1000 BC there existed three groups, each speaking its own dialect of Greek: the Dorians in southern Greece, where Sparta was their chief city; the Aeolians in central and northern Greece, whence they colonized Lesbos and the neighbouring coast of Asia Minor; and the Ionians in Attica, the area around Athens, and the islands of the central Aegean, and in their settlements on the shore of Asia Minor opposite. The Ionian dialect in its Attic form later became the literary language of all Greece.

Greek literature has a continuous history extending from the 1st millennium BC to the present day, and in it are to be found most of the acknowledged literary genres—epic, drama, lyric poetry, and various types of prose works. From the beginning its authors were Greeks living not only in Greece proper but also in the peripheral territories. Later, after the conquests of Alexander the Great, as Greek became the common language of the eastern Mediterranean lands and then of the Byzantine Empire, Greek literature was produced over a much wider area and also by persons whose mother tongue was not Greek. The cultural centre of the Greek-speaking world shifted gradually during the centuries in which its literature was produced. Until the 5th century BC, the coastal cities of Asia Minor were dominant. Athens became the centre in the 5th and 4th centuries BC. Thereafter Alexandria was the seat of Greek literary activity until the entire area was taken into the Roman Empire. Of the literature of ancient Greece only a relatively small proportion survives, yet its influence on other literatures throughout the ages has been very great.

Stylistic periods. The history of ancient Greek literature may be divided into three periods: pre-Classical (to the end of the 6th century BC); Classical (5th and 4th centuries BC); Hellenistic and Grew-Roman (3rd century BC onward). These periods are summarized below, and the article then treats of the literary genres that arose in them and of the writers associated with the genres.

Pre-Classical period, to the end of the 6th century BC. The Greeks created poetry before they made use of writing for literary purposes, and from the beginning their poetry was intended to be sung or recited. (The art of writing was little known before the 7th century BC. The script used in Crete and Mycenae [Linear B] is not known to have been employed for other than administrative purposes, and after the destruction of the Mycenaean cities it was forgotten.)

Its subject was myth—part legend, based sometimes on the dim memory of historical events; part folktale; and part primitive religious speculation. But since the myths were not closely associated with religious ritual, even though they often treated of gods and heroic mortals, they were not authoritative and could be varied by a poet to express new concepts.

Thus, at an early stage Greek thought was advanced as poets refashioned their materials; and to this stage of pre-Classical literature belonged the epics of Homer, the ***Iliad*** and the ***Odyssey***, retelling intermingled history and myth of the Mycenaean Age. These two great poems, standing at the beginning of Greek literature, established most of the literary conventions of the epic poem. The didactic poetry of Hesiod (c. 700 BC) was probably later in composition than Homer's epics and, though different in theme and treatment, continued the epic tradition.

Types of early Greek poetry

The several types of Greek lyric poetry originated in the pre-Classical period among the poets of the Aegean islands and of Ionia on the coast of Asia Minor. Archilochus of Paros, of the 7th century BC, was the earliest Greek poet to employ the forms of elegy (in which the epic verse line alternated with a shorter line) and of personal lyric poetry. His work was very highly rated by the ancient Greeks but survives only in fragments; its forms and metrical patterns—the elegiac couplet and a variety of lyric metres—were taken up by a succession of Ionian poets. At the beginning of the 6th century, two poets composing in the Aeolic dialect of Lesbos, Alcaeus and Sappho, produced lyric poetry mostly in the metres named after them that Horace was later to adapt to Latin poetry. No other poets of ancient Greece entered into so close a personal relationship with the reader as Alcaeus, Sappho, and Archilochus do. They were succeeded by Anacreon of Teos, in Ionia, composing his lyrics in the Ionian dialect, like Archilochus. Choral lyric, with musical accompaniment, belonged to the Dorian tradition and its dialect, and its representative poets in the period were Alcman at Sparta and Stesichorus of Sicily.

Both tragedy and comedy had their origins in Greece. "Tragic" choruses are said to have existed in Dorian Greece around 600 BC, and in a rudimentary dramatic form tragedy became part of the City Dionysia at Athens about 534. Comedy, too, originated partly in Dorian Greece and developed in Attica, where it was officially recognized rather later than tragedy. Both were connected with the worship of Dionysus, god of fertility and demonic possession.

Written codes of law were the earliest form of prose and were appearing by the end of the 7th century, when knowledge of reading and writing was becoming more widespread. No prose writer is known earlier than Pherecydes (*c.* 550 BC) of Syros, who wrote about the beginnings of the world; but the earliest considerable author was Hecataeus of Miletus, who wrote about both the mythical past and the geography of the Mediterranean and surrounding lands. To Aesop, a semi-historical, semi-mythological character of the mid 6th century, have been attributed the moralizing beast fables copied by later writers.

Classical period, 5th and 4th centuries FC. True tragedy was created by Aeschylus and reached its culmination with Sophocles and Euripides in the second half of the 5th century. Aristophanes, the greatest of the comic poets, lived on into the 4th century, but the Old Comedy did not survive the fall of Athens in 404.

The sublime themes of Aeschylean tragedy, in which man stands answerable to the gods and receives awe-inspiring insight into their purposes, are exemplified in the *Oresteia,* his only trilogy that is complete in all its three plays. The tragedy of Sophocles made a progress toward both dramatic complexity and naturalness while remaining orthodox in its treatment of religious and moral issues. The youngest of the three great tragic playwrights, Euripides, handled his themes on the plane of skeptical enlightenment and doubted the traditional picture of the gods. Corresponding development of dramatic realization accompanied the shift of vision: the number of individual actors was raised to three, each capable of taking several parts.

The three stages of dramatic comedy

The Old Comedy of Aristophanes was established a little later than tragedy but preserved more obvious traces of its origin in ritual; for the vigour, wit, and indecency with which it keenly satirized public issues and prominent persons clearly derived from the primitive ribaldry of the Dionysian festival. Aristophanes' last comedies show a transition, indicated by the dwindling importance of the chorus, toward the Middle Comedy, of which no plays are extant. This phase in its turn was followed toward the beginning of the 3rd century by the New Comedy, introduced by Menander, which turned for its subjects to the private fictional world of ordinary people. Later adaptations of New Comedy in Latin by Plautus and Terence carried the influence of his work on to medieval and modern times.

In the 5th century, Pindar, the greatest of the Greek choral lyrists, stood outside the main Ionian-Attic stream and embodied in his splendid odes a vision of the world seen in terms of aristocratic values that were already growing obsolete. Greek prose came to maturity in this period. Earlier writers as Anaxagoras the philosopher and Protagoras the sophist used the traditional Ionic dialect, as did Herodotus the historian. His successors in history, Thucydides and Xenophon, wrote in Attic. Thucydides was the most intellectually brilliant of the three, and his style and authority make him the foremost Greek historian. The oldest extant piece of Attic prose was an anti-democratic essay on the constitution of Athens, falsely attributed to Xenophon but dated *c.* 430.

The works of Plato and Aristotle, of the 4th century, are the most important of all the products of Greek culture in the intellectual history of the West. They were preoccupied with ethics, metaphysics, and politics as man's highest study and, in the case of Aristotle, extended the range to include physics, natural history, psychology, and literary criticism. They have formed the basis of Western philosophy and, indeed, they determined, for centuries to come, the development of European thought.

This was also a golden age for rhetoric and oratory, first taught by Corax of Syracuse in the 5th century. A study also raising questions of truth and morality in argument, it was of concern to the philosopher as well as to the advocate and the politician and was expounded by teachers among whom Isocrates was outstanding. The orations of Demosthenes, a statesman of 4th-century Athens and the most famous of Greek orators, are pre-eminent for force and power.

Hellenistic and Greco-Roman periods. In the huge empire of Alexander the Great, Macedonians and Greeks composed the new governing class; and Greek became the language of administration, a new composite dialect based to some extent on Attic and called the Koine, or common language. Everywhere the traditional city state was in decline, and the individual was becoming aware of his isolation and seeking consolidation and satisfaction outside corporate society. Artistic creation now came under private patronage, and, except for Athenian comedy, compositions were intended for a small, select audience that admired polish, erudition, and subtlety.

Importance of the Museum at Alexandria

An event of great importance for the development of new tendencies was the founding of the Museum, the shrine of the Muses with its enormous library, at Alexandria. The chief librarian was sometimes a poet as well as tutor of the heir apparent. The task of accumulating and preserving knowledge begun by the Sophists and continued by Aristotle and his adherents was for the first time properly endowed. Through the researches of the Alexandrine scholars, texts of ancient authors were preserved. Frequently the scholars were the poets of the Hellenistic age, and their scholarship influenced their poetry.

The Hellenistic period lasted from the end of the 4th to the end of the 1st century BC. For the next three centuries, until Constantinople became the capital of the Byzantine Empire, Greek writers were conscious of belonging to a world of which Rome was the centre.

The *Iliad* and the *Odyssey*

The genres. *The epic tradition.* At the beginning of Greek literature stood the two great epics, the *Iliad* and the *Odyssey,* poems with roots reaching far into the Mycenaean age, perhaps to 1500 BC, but traditionally ascribed to Homer; in something like their present form they probably date back to the 8th century. The *Iliad* was the tragic story of the wrath of Achilles, son of a goddess and richly endowed with all the qualities that make men admirable. Being slighted by Agamemnon, the Greek leader, he refuses to take any further part in the war against Troy. The Greeks become hard pressed, Agamemnon in vain offers amends; and eventually the plight of the Greeks worsens. Achilles is so far moved by pity that he sends his friend Patroclus in his own armour to their aid; Patroclus saves the Greeks but is killed himself; Achilles, in a frenzy of grief, returns to the war and kills Hector, the Trojan hero who had slain Patroclus, and outrages his corpse. Finally he brings himself to restore the body to Priam, Hector's father, and the poem ends in reconciliation. Achilles' end is outside the poem, but from the beginning the brilliant hero is shadowed by the knowledge of early death. With his readiness to sacrifice all to honour, Achilles embodies the Greek heroic ideal; and the contrast between his superb qualities and his short and troubled life reflects the sense of tragedy always prevalent in Greek thought. Whereas the *Iliad* is tragedy, the *Odyssey* is tragicomedy. It is an enriched version of the old folk tale of the wanderer's return and of his triumph over those who were usurping his rights and persecuting his wife at home. Odysseus too represents a Greek ideal. Though by no means inadequate in battle, he works mainly by craft and guile; only so can he defeat the superior strength of the Cyclops and the superior numbers of the suitors who have taken possession of his palace. During his ten-year journey home from Troy he loses all his comrades and ships, and back in Ithaca he moves disguised as a beggar in his own palace. Through all these hazards it is by mental superiority that he survives and prevails.

Both poems were based on plots that grip the reader, and the story is told in language that is simple and direct, yet eloquent. The *Iliad* and the *Odyssey,* though they are the oldest European poetry, are by no means primitive. They marked the fulfillment rather than the beginning of the literary form to which they belong. They were essentially oral poems, handed down, developed, and added to over a vast period of time, a theme upon which successive nameless poets freely improvised. The world they reflect is full of inconsistencies; weapons belong to both the Bronze and Iron Ages, and objects of the Mycenaean period jostle others from a time five centuries later. Certain mysteries remain: the date of the great poet or poets who gave structure and shape to the two epics; the social function of poems that take several days to recite; and the manner in which these poems came to be recorded in writing probably in the course of the 6th century BC.

In the ancient world the ***Iliad*** and ***Odyssey*** stood in a class apart among epic poems. Of these, there were a large number known later as the epic cycle. They covered the whole story of the wars of Thebes and Troy as well as other famous myths. A number of shorter poems in epic style, the Homeric Hymns, are of considerable beauty.

Didactic poetry

Didactic poetry was not regarded by the Greeks as a form distinct from epic. Yet the poet Hesiod belongs to an altogether different world from Homer. He lived in Boeotia in central Greece about 800 BC. In his ***Works and Days*** he describes the ways of peasant life and incidentally describes the dreary Boeotian plain afflicted by heat, cold, and the oppression of a "gift-devouring" aristocracy. He believed passionately that Zeus cares about right and wrong and that Justice is his daughter. His other surviving poem, the ***Theogony,*** attempts a systematic genealogy of the gods and recounts many myths associated with their part in the creation of the universe. Near Eastern influence is clearly to be seen, especially in some of the cruder speculation about the origin of the universe.

By the end of the 6th century the epic tradition was a spent force until its revival in the Hellenistic period, and the few composers of epic narrative left little but their names.

Lyric poetry. Hesiod, unlike Homer, tells something of himself, and the same is true of the lyric poets. Except for Pindar and Bacchylides at the end of the Classical period, only fragments of the works of these poets survive. There had always been lyric poetry in Greece. All the great events of life as well as many occupations had their proper songs, and here too the way was open to advance from the anonymous to the individual poet.

Kinds of lyric poetry

The word "lyric" covers many sorts of poem. On the one hand, poems sung by individuals or chorus to the lyre, or sometimes to the flute, were called melic; elegiacs, in which the epic hexameter, or verse line of six metrical feet, alternated with a shorter line, were traditionally associated with lamentation and a flute accompaniment; but they were also used for personal poetry, spoken as well as sung. Iambics (verse of iambs, or metrical units, basically of four alternately short and long syllables) were the verse form of the lampoon. Usually of an abusive or satirical—burlesque and parodying-character, they were not normally sung.

If Archilochus of Paros was really writing as early as 700 BC, he was the first of the post-epic poets. The not very numerous fragments suggest a trenchant personality to which he gave uninhibited expression. They reflect the turbulent life of an embittered adventurer. Scorn both of men and of convention is the emotion that seems uppermost, and Archilochus was possessed of tremendous powers of invective. Though much of his poetry was unedifying, he was regarded throughout antiquity as a major poet.

Of lesser stature than Archilochus were his successors, Semonides (often mistakenly identified with Simonides) of Amorgos and Hipponax of Ephesus.

Like the iambic writers, the elegiac poets came mostly from the islands and the Ionian regions of Asia Minor. Chief among them were Callinus of Ephesus and Mimnermus of the neighbouring city of Colophon, a contemporary of the Athenian statesman Solon. On the mainland of Greece, Tyrtaeus roused the spirit of the Spartans in their desperate struggle with the Messenian rebels in the years after 650. His martial poems are perhaps valued more for historical than for literary interest. The same is to some extent true of the poems in elegiac, iambic, and trochaic (the latter a metre basically of four alternately long and short syllables) metres by Solon, who used his poetry as a vehicle for propaganda. Xenophanes (born about 560 BC) rather in the same way used his poems to propagate his revolutionary religious and ethical ideas. The elegiacs attributed to Theognis seem to be poems of various dates suitable for use at drinking parties. Many of them were actually by Theognis himself (about 540 BC). Some give uninhibited expression to his hatred of the lower class rulers who had ousted the aristocracy of Megara; others are love poems to the boy Cyrnus; still others are gnomic, commonplaces of Greek wisdom and morality.

About the beginning of the 6th century a new kind of poetry made its appearance in the island of Lesbos. It was composed in the local Aeolic dialect by members of the turbulent and factious aristocracy. Alcaeus (born about 620 BC), absorbed in political feuds and in civil war, expressed with striking directness searing hate and blind exultation. With the same directness and infinite grace, Sappho, a younger contemporary who seems to have enjoyed a freedom unknown to the women of mainland Greece, told of her loves and hates, though little is known of her relations with the girls named in her poems. The surviving works by their successor in personal lyric, Anacreon of Teos, suggest a more convivial amorousness.

Choral lyric was associated with the Dorian parts of the Greek mainland and the settlements in Sicily and south Italy, whereas poetry for solo performance was a product of the Ionian coast and the Aegean islands. Thus choral song came to be conventionally written in a Doric dialect.

Choral lyric, which had lyre and flute accompaniments, was highly complicated in structure. It did not use traditional lines or stanzas; but the metre was formed afresh for each poem and never used again in exactly the same form, though the metrical units from which the stanzas, or strophes, were built up were drawn from a common stock and the form of the strophe was usually related to the accompanying dance. This elaborate art form was connected mainly with the cult of the gods or, as in the case of Pindar, the celebration of the victors in the great Hellenic games.

The earliest poet of choral lyrics of whose work anything has survived was Alcman of Sparta (about 620 BC). Somewhat later Stesichorus worked in Sicily, and his lyric versions of the great myths marked an important stage in the development of these stories. Simonides of Ceos, in Ionia, was among the most versatile of Greek poets. He was famed for his pathos, but today he is best known by his elegiac epitaphs, especially those on the Greek soldiers who fell in the struggle against Persia.

Pindar's odes

The supreme poet of choral lyric was Pindar from Thebes in Boeotia (born 518 or possibly 522–died after 446 BC), who is known mainly by his odes in honour of the victors at the great games held at Olympia, Delphi, the Isthmus of Corinth, and Nemea. In honouring athletes in the hour of glory, when they were exalted almost to the level of the heroes of old from whom they claimed descent, Pindar felt he was making no unworthy use of his gift. The last of the lyric poets was Bacchylides (flourished 5th century BC), whose work, though often exquisite, is empty, reflecting the declining significance of myth.

Tragedy. Tragedy is generally believed to have developed from the dithyramb, the choral cult song of the god Dionysus. Arion of Lesbos, who worked at Corinth in about 600, was the first to write serious poetry in this medium. Thespis (6th century BC), possibly combining with dithyrambs something of the Attic ritual of Dionysus of Eleutherae, invented tragedy by introducing an actor who conversed with the leader of the chorus. These performances became a regular feature of the great festival of Dionysus at Athens about 534 BC. Aeschylus (525/524–456), created true tragedy by introducing a second actor, though his drama was still centred in the chorus, to whom, rather than to each other, his actors directed themselves.

At the tragic contests at the Dionysia each of three competing poets produced three tragedies and a satyr play, or burlesque, in which there was a chorus of satyrs. Aeschylus, unlike later poets. usually made of his three tragedies a dramatic whole, treating a single story, as in the *Oresteia,* the only complete trilogy that has survived. His main concern was not dramatic excitement and the portrayal of character but rather the presentation of human action in relation to the overriding purpose of the gods.

The tragedies of Aeschylus, Sophocles, and Euripides

His successor was Sophocles (*c.* 496–406 BC), who abandoned for the most part the practice of writing in trilogies, reduced the importance of the chorus, and introduced a third actor. His work too was based on myth, but whereas Aeschylus tried to make more intelligible the working of the divine purpose in its effects on man's life, Sophocles was readier to accept the gods as given and to reveal the values of life as it can be lived within the traditional framework of moral standards. Sophocles' skill in control of dramatic movement and his mastery of speech were devoted to the presentation of the decisive, usually tragic, hours in the lives of men and women at once "heroic" and human, such as Oedipus.

Euripides (*c.* 480–406), last of the three great tragic poets, belonged to a different world. When he came to manhood, traditional beliefs were scrutinized in the light of what was claimed by Sophist philosophers, not always unjustifiably, to be reason; and this was a test to which much of Greek religion was highly vulnerable. The whole structure of society and its values was called into question. This movement of largely destructive criticism was clearly not uncongenial to Euripides. But as a dramatic poet he was bound to draw his material from myths, which, for him, had to a great extent lost their meaning. He adapted them to make room for contemporary problems, which were his real interest. Many of his plays suffer from a certain internal disharmony, yet his sensibilities and his moments of psychological insight bring him far closer than most Greek writers to modern taste. There are studies, wonderfully sympathetic, of wholly unsympathetic actions in the *Medea* and *Hippolytus;* a vivid presentation of the beauty and horror of religious ecstasy in the *Bacchae*; in the *Electra*, a reduction to absurdity of the values of a myth that justifies matricide; in *Helen* and *Iphigeneia in Tauris*, melodrama with a faint flavour of romance.

Comedy. Like tragedy, comedy arose from a ritual in honour of Dionysus, in this case full of abuse and obscenity connected with averting evil and encouraging fertility. The parabasis, the part of the play in which the chorus broke off the action and commented on topical events and characters, was probably a direct descendant of such revels. The dramatic element may have been derived from the secular Dorian comedy without chorus, said to have arisen at Megara, which was developed at Syracuse by Epicharmus (*c.* 530–c. 440). Akin to this kind of comedy seems to have been the mime, a short realistic sketch of scenes from everyday life. These were written rather later by Sophron of Syracuse; only fragments have survived but they were important for their influence on Plato's dialogue form and on Hellenistic mime. At Athens, comedy became an official part of the celebrations of Dionysus in 486 BC. The first great comic poet was Cratinus. About 50 years later Aristophanes and Eupolis refined somewhat the wild robustness of the older poet. But even so, for boldness of fantasy, for merciless invective, for unabashed indecency, and for freedom of political criticism, there is nothing like the Old Comedy of Aristophanes, whose work alone has survived. Cleon the politician, Socrates the philosopher, Euripides the poet were alike the victims of his masterly unfairness, the first in *The Knights;* the second in *The Clouds;* and the third in the *Thesmophoriazusae* and *The Frogs;* whereas in *The Birds* the Athenian democracy itself was held up to a kindlier ridicule. Aristophanes survived the fall of Athens in 404, but the Old Comedy had no place in the revived democracy.

The gradual change from Old to Middle Comedy took place in the early years of the 4th century. Of Middle Comedy, no fully developed specimen has survived. It seems to have been distinguished by the disappearance of the chorus and of outspoken political criticism and by the growth of social satire and of parody; Antiphanes and Alexis were the two most distinguished writers. The complicated plots in some of their plays led to the development of the New Comedy at the end of the century, which is best represented by Menander. One complete play, the *Dyscolos,* and appreciably fragments of four others out of Menander's 105 plays are extant on papyrus. New Comedy was derived in part from Euripidean tragedy; its characteristic plot was a translation into terms of city life of the story of the maiden—wronged by a god—who bears her child in secret, exposes it, and recognizes it years after by means of the trinkets she had put into its cradle. The god becomes a young man about town, the child a courtesan with whom a young man about town of the next generation is involved and whom he joyfully marries when she is revealed as the daughter of free parents.

History. The first great writer of history was Herodotus of Halicarnassus, who was also a geographer and anthropologist. The theme of his history, written in large part for Athenian readers, is the clash between Europe and Asia culminating in the Persian War. The account of the war itself, which occupies roughly the second half of the work, must have been composed by means of laborious inquiry from those whose memories were long enough to recall events that happened when Herodotus was a child or earlier. The whole history, though in places badly put together, is magnificent in its compass and unified by the consciousness of an overriding power keeping the universe and mankind in check. The fluent simplicity of his prose gives Herodotus a peculiar charm.

The histories of Thucydides and Xenophon

Thucydides (*c.* 460–c. 400) was perhaps the first person to apply a first class mind to a prolonged examination of the nature of political power and the factors by which policies of states are determined. As a member of the board of generals he acquired inside knowledge of the way policy is shaped. After his failure to save Amphipolis in 424, he spent 20 years in exile, which he used as an opportunity for getting at the truth from both sides. The result was a history of the war narrowly military and political but of the most penetrating quality. Thucydides investigated the effect on individuals and nations both of psychological characteristics and of chance. His findings were interpreted through the many speeches given to the characters of his history. There is little apparent bias in Thucydides, but his admiration of the Athenian statesman Pericles and detestation of his opponent Cleon are easy to see.

Just as Thucydides had linked his work to the point at which Herodotus had stopped, so Xenophon (431–died before 350) began his *Hellenica* where Thucydides' unfinished history breaks off in 411. He carried his history down to 362. His work was superficial by comparison with that of Thucydides, but he wrote with authority of military affairs and accordingly appears at his best in the *Anabasis,* an account of his participation in the enterprise of the Greek mercenary army, with which the Persian prince Cyrus tried to expel his brother from the throne, and of the adventurous march of the Greeks, after the murder of their leaders by the Persians, from near Babylon to the Black Sea coast. Xenophon also wrote works in praise of Socrates, of whom his appreciation was very incomplete.

No other historical writing of the 4th century has survived except for a substantial papyrus fragment containing a record of events of the years 396–395. Later, history declined to being merely a province of rhetoric.

Rhetoric and oratory. In few societies has the power of fluent and persuasive speech been more highly valued than it was in Greece, and even in Homer there are speeches that are pieces of finished rhetoric. But it was the rise of democratic forms of government that provided a great incentive to study and instruction in the arts of persuasion, which were equally necessary for political debate in the assembly and for attack and defense in the law courts.

Origin of the study of rhetoric

The formal study of rhetoric seems to have originated in Syracuse *c.* 460 BC with Corax and his pupils Tisias and Gorgias (died *c.* 376); Gorgias was influential also in Athens. Corax is reputed to have been the first to write a handbook on the art of rhetoric, dealing with such topics as arguments from probability and the parts into which speeches should be divided. Most of the Sophists had pretensions as teachers of the art of speaking, especially Protagoras, who postulated that the weaker of two arguments could by skill be made to prevail over the stronger, and Prodicus of Ceos, who distinguished five shades of meaning.

Antiphon (c. 480–411), the first professional speech writer, was an influential opponent of democracy. Three speeches of his, all dealing with homicide cases, have been preserved, as have three "tetralogies," sets of two pairs of speeches containing the arguments to be used on both sides in imaginary cases of homicide. In them primitive ideas are expressed concerning bloodguilt and the duty of vengeance. Antiphon's style is bare and rather crudely antithetical. Gorgias from Sicily, who visited Athens in 427, introduced an elaborate balance and symmetry emphasized by rhyme and assonance. Thrasymachus of Chalcedon made a more solid contribution to the evolution of a periodic and rhythmical style.

Andocides (c. 440–died after 391), an orator who spent much of his life in exile from Athens, wrote three speeches containing vivid narrative; but as an orator he was admittedly amateurish. Lysias (c. 455–died after 380) lived at Athens for many years as a resident alien and supported himself by writing speeches when he lost his wealth. His simple, lucid style has obvious charm. His speeches, some of them written for litigants of humble station, show dexterous adaptation to the character of the speaker; though the most interesting of all is his own attack on Eratosthenes, one of the Thirty Tyrants imposed on Athens by the Spartans in 404 BC; this speech contains a brilliant account of the Thirty's reign of terror.

Orators of the 4th century BC

The 12 extant speeches of Isaeus, who was active in the first half of the 4th century BC, throw light on aspects of Athenian law. Isocrates, who was influential in Athens for half a century before his death in 338, perfected a periodic prose style that, through the medium of Latin, was widely accepted as a pattern; and he helped give rhetoric its predominance in the educational system of the ancient world. In his writings, which took the form of speeches but were more like pamphlets, Isocrates shows some insight into the political troubles besetting Greece, with its endless bickering between cities incapable of cooperation. Yet he lacks incisiveness and is usually monotonous in style.

The greatest of the orators was Demosthenes (384–322), supreme in vehemence and power, though lacking in some of the more delicate shadings of rhetorical skill. His speeches were mainly political, and he is best remembered for his energetic opposition to the rise of Macedon under its king Philip II, embodied in the three "Philippics." After Demosthenes, oratory faded, together with the political setting to which it owed its pre-eminence. Two more. 4th-century-BC writers need only be mentioned, Hyperides (c. 390–322) and Lycurgus (c. 390–324).

Plato and Aristotle

Philosophy. Philosophic prose, the greatest literary achievement of the 4th century, derived from Socrates (who himself wrote nothing) and his characteristic method of teaching by question and answer, which led naturally to the dialogue. Alexamenus of Teos and Antisthenes, both disciples of Socrates, were the first to use it; but the greatest exponent of Socratic dialogue was the Athenian Plato (c. 428–348/347). Shortly after Socrates' death in 399 Plato wrote some dialogues, mostly short; to this group of work belong ***The Apology, Protagoras,*** and ***Gorgias.*** In the decade after 385 he wrote a series of brilliant works, ***Phaedo, Phaedrus, Symposium,*** and ***The Republic.*** His Socrates is the most carefully drawn character in Greek literature. Subsequent dialogues became more austerely philosophical; Socrates tended increasingly to be a mere spokesman for Plato's thought; and in the last of his works, the *Laws*, he was replaced by a colourless "stranger." Plato's style is a thing of matchless beauty, though ancient critics, who were likely to entangle themselves in the rules they had invented, found it too poetical. All human experience is within its range; it fits itself to every nuance of a developing argument, rises to the heights of earnest eloquence in discourse on man's destiny, and reflects with equal faithfulness the wit and gaiety of a drinking party and the grandeur of Socrates in the condemned cell.

Plato's pupil Aristotle (384–322) was admired in antiquity for his style; but those of his works that have survived are all of the "esoteric" sort, intended for use in connection with his philosophical and scientific school, the Lyceum. They are without literary grace, and at times they approximate lecture notes. His works on literary subjects, the ***Rhetoric,*** and above all, the ***Poetics,*** had an immense effect on literary theory in the centuries after the Renaissance. In the ancient world, Aristotelian doctrine was known mainly through the works of his successor Theophrastus (*c.* 372–288/287), now lost except for two books on plants and a famous collection of 30 ***Characters,*** sketches of human types much imitated by English writers of the 17th century.

With Theophrastus, Attic prose died out for a time. Technical prose in this period was produced in abundance; and rhetoric, a mere literary exercise divorced from political influence, became ornate and flowery in manner.

Late forms of poetry. The creative period of the Hellenistic age was practically contained within the span of the 3rd century BC. To this period belonged three outstanding poets: Theocritus, Callimachus, and Apollonius of Rhodes. Theocritus (*c.* 310–250), born at Syracuse, is best known as the inventor of bucolic mime, or pastoral poetry, in which he presented scenes from the lives of shepherds and goatherds in Sicily and southern Italy. He also dramatized scenes from middle class life; and in his second idyll the character Simaetha, who tries by incantations to recover the love of the man who has deserted her, touches the fringe of tragedy. He also used another Hellenistic form, the epyllion, a short scene of heroic narrative poetry in which heroic stature is often reduced by playful realism and delicate psychology. In his hands the hexameter attained a lyric purity and sweetness unrivalled elsewhere. He was the first of the nature poets, succeeded by Moschus and Bion.

The ***Aitia*** of Callimachus

Callimachus (flourished about 260) was a scholar as well as a poet. His most famous work, of which substantial fragments survive, was the ***Aitia,*** an elegiac poem describing the origins of various rites and customs. It was heavy with learning but diversified by passages of entertaining narrative. His six hymns show immense poetic expertise but no religious feeling, for the gods of Olympus had long since become obsolete. Callimachus also wrote epigrams, and fragments survive of *iambi* ("iambs"). The form was widely used throughout the 3rd century to denounce the vanities of the world. Sometimes, in a mixture of prose and verse, these pieces had links with satire; and their chief exponents were Bion the Borysthenite, Menippus of Gadara, Cercidas and Phoenix of Colophon.

Callimachus avoided epic in favour of the greater intensity possible in shorter works. The last surviving classical Greek epic was written by his successor at Alexandria, Apollonius of Rhodes (born about 295). Apollonius' account of the voyage of the Argonauts is so full of local legend that the coherence of the poem is lost; but the story of Medea's wild passion for Jason, the leader of the Argonauts, is marked by a new sort of romantic awareness that is fully realized in the episode of Dido's passion for Aeneas in Virgil's *Aeneid.*

The desire to combine learning with poetry led to the revival of didactic verse. The ***Phaenomerza*** of Aratus of Soli (*c.* 315–c. 240) is a versification of a treatise on the stars by Eudoxus of Cnidus (c. 390–c. 340). Chance has preserved the poems of Nicander (probably 2nd century) on the unlikely subjects of cures for bites and antidotes to poisons.

The mimes of Herodas (3rd century), short realistic sketches of low life in iambic verse, have affinities with the non-pastoral mimes of Theocritus. They perhaps give a hint as to the character of the literature of popular entertainment, now largely lost. Mime, especially pantomime, was the main entertainment throughout the early Roman Empire.

After the middle of the 3rd century, poetic activity largely died away, though the great period of scholarship at Alexandria and at Pergamum was still to come. The names of a few poets are known: Euphorion (born about 275) of Chalcis and Parthenius (flourished 1st century BC), the teacher of Virgil. Thereafter Greek poetry practically ceased, apart from a sporadic revival in the 4th century AD. An exception exists in the case of epigrammatic poetry in elegiac couplets, surviving mainly in two compilations, the Planudean and Palatine anthologies.

Late forms of prose. Almost all of the great mass of Hellenistic prose—and later prose, historical, scholarly, and scientific—has perished. Among historians Polybius (c. 200–c. 118 BC), the most outstanding, has survived in a fragmentary condition. Present at Rome when it was succumbing to the first influences of Greek literature, he wrote mainly of events of which he had direct experience, often with great insight; his work covered the period from 264 to 146. Diodorus Siculus' universal history (1st century BC) is important for the sources quoted there. The most considerable of lost historians was Timaeus (c. 350–c. 250), whose history of the Greeks in the west down to 264 provided Polybius with his starting point. Later historians were Dionysius of Halicarnassus (flourished about 20 BC); Appian of Alexandria (2nd century AD), who wrote on Rome and its conquests; and Arrian (c. AD 96–c. 180) from Bithynia, who is the most valuable source on Alexander the Great.

The criticism of Longinus and Dionysius of Halicarnassus

The most important works of criticism, of which little has survived, were by Dionysius of Halicarnassus and the obscure Longinus. Longinus' treatise *On the Sublime* (c. AD 40) is exceptional in its penetrating analysis of creative literature. The *Bibliotheca* attributed to Apollodorus (c. 180 BC) is a handy compendium of mythology.

Scientific work such as the astronomy and geography of Eratosthenes (c. 276–c. 194) of Alexandria is known mainly from later summaries; but much that was written by the mathematicians, especially Euclid (flourished c. 300 BC) and Archimedes (c. 287–212), has been preserved.

Much survives of the writings of the physician Galen (AD 129–199). His contemporary Sextus Empiricus is an important source for the history of Greek philosophy. The survey of the Mediterranean by Strabo in the time of Augustus preserved much valuable information; and so, in a more limited field, did the description of Greece by Pausanias (2nd century AD). Greek achievement in astronomy and geography was summed up in the work of Ptolemy of Alexandria in the 2nd century AD.

Greek became the language of the large settlement of Jews at Alexandria, and the Septuagint, the Greek version of the Old Testament, was completed by about the end of the 2nd century BC. Much of the Apocrypha was composed in Greek, and the New Testament was written in popular Greek (Koine). Of the early Christian writers in Greek the most notable were Clement of Alexandria (c. AD 150–c. 215) and Origen (c. AD 185–c. 254), together with Clement of Rome and Ignatius of Antioch.

Plutarch's *Lives*

The *Parallel Lives* of famous Greeks and Romans by Plutarch (c. AD 46–c. 119) of Chaeronea in Boeotia was for centuries one of the formative books for educated Europeans. Great figures from an idealized past are presented for the edification of the lesser men of his own day; and the anecdotes with which the *Lives* abound are of various degrees of credibility. They belong to biography rather than to history, though they are an important source for historians. A number of shorter works on a wide variety of subjects have come down under the title *Moralia*, which show the intellectual tide of Greece on the ebb.

There was much concern over a question that had been argued ever since the days when Athens had ceased to be a free city: to what extent was Attic prose a norm that writers and especially orators were bound to follow? Many had shunned it in favour of a more ornamental Asiatic style. But at the end of the 1st century AD there was a revival of the Attic dialect. Speeches and essays were written for wide circulation. This revival is known as the Second Sophistic movement, and chief among its writers were Dio Chrysostom (1st century AD), Aelius Aristides (2nd century), and Philostratus (early 3rd century). The only writer of consequence, however, was Lucian (c. 120/125–c. 190). His works are mainly slight and satirical; but his gift of humour, even though repetitive, cannot be denied. *Lives and Opinions of Famous Philosophers* was a valuable work of the 3rd century by Diogenes Laertius, a writer otherwise unknown.

Philosophical activity in the early empire was mainly confined to moralizings based on Stoicism, a philosophy advocating a life in harmony with nature and indifference to pleasure and pain. Epictetus (born about AD 55) influenced especially the philosophic Roman emperor Marcus Aurelius (121–180), whose *Meditations* have taken their place beside works of Christian devotion. Many of Plutarch's *Moralia* were Platonic, with vaguely mystical tendencies; but Plotinus (c. 205–260/270) was the last major thinker in the classical world, giving new direction to Platonic and Pythagorean mysticism.

Erotic romances

The latest creation of the Greek genius was the novel, or erotic romance. It may have originated as early as the 1st century BC; but its roots reach back to such plays of triumphant love as the lost *Andromeda* of Euripides, to the New Comedy, to Xenophon's daydreams about the education of Cyrus, and to the largely fictitious narratives that were one extreme of what passed for history from the 3rd century BC onward. Of these last, the best known examples are the Alexander romances, a wildly distorted and embroidered version of the exploits of Alexander the Great, which supplied some of the favourite reading of the Middle Ages. Erotic elegy and epigram may have contributed something and so may the lost *Milesian Tales* of Aristides of Miletus (c. 100 BC), though these last appear to have depended on a pornographic interest that is almost completely absent from the Greek romances. Only fragments survive of the Ninos romance (dealing with the love of Ninos, legendary founder of Nineveh), which was probably of the 1st century BC; but full-length works survive by Chariton (2nd century AD), Heliodorus (3rd century AD), Xenophon (2nd or 3rd century AD) of Ephesus, and Achilles Tatius (2nd century AD). All deal with true lovers separated by innumerable obstacles of human wickedness and natural catastrophe and then finally united. *Daphnis and Chloe* by Longus (between 2nd and 3rd century AD) stands apart from the others because of its pastoral rather than quasi-historical setting. The works of Dictys Cretensis and Dares Phrygius belong to the same period. They claim to give a pre-Homeric account of the Trojan War. The Greek originals are almost wholly lost, but the Latin version was for the Middle Ages the main source for the story of Troy.

ANCIENT LATIN LITERATURE

Latin literature was a product of the Roman Republic and the Roman Empire. After Rome fell, Latin remained the literary language of the Western medieval world until it was superseded by the Romance languages it had generated and by other modem languages.

Literature in Latin began as translation from the Greek, a fact that largely conditioned its development. The Greeks themselves valued originality of treatment above invention. Latin literature was even more traditional in its use of former writers as sources of stock motifs or arguments. Whereas the Greeks excelled in abstraction, the Romans had concrete vision, illuminating Greek generalizations with vivid illustration. They were more distinguished as verbal artists than as thinkers. Intensely interested in human individuality, their genius was moral and political. Their noblest ideal was *humanitas*, a blend of culture and kindliness, approximating the quality of being "civilized" as the word is used today of individuals.

Little need be said of the preliterary period. Hellenistic influence came from the south, Etrusco-Hellenic from the north. Improvised farce, with stock characters in masks, may have been a native invention from Campania (the countryside of modern Naples). The historian Livy traced quasi-dramatic satura (medley) to the Etruscans. The statesman-writer Cato and the scholar Varro said that in former times the praises of heroes were sung after feasts, sometimes to the flute, which was perhaps an Etruscan custom. If they existed, these carmina *convivalia*, or festal songs, would be behind some of the legends that came down to Livy. There were also the rude verses improvised at harvest festivals and weddings and liturgical formulas, whose scanty remains show alliteration and assonance. The nearest approach to literature must have been in public and private records and in recorded speeches.

Stylistic periods. Latin literature may be conveniently divided into four periods: early writers, to 70 BC; Golden Age, 70 BC–AD 18; Silver Age, AD 18–133; later writers. These periods are outlined below, and their literary genres and the writers associated with them are described afterward.

Greek influence of Livius Andronicus

Early writers. The ground for Roman literature was prepared by the capture in 272 BC of the Spartan colony of Tarentum and the subsequent influx of Greek slaves, some of whom were put to tutoring young Roman nobles. Among them was Livius Andronicus, who was later freed and who is considered to be the first Latin writer. In 240 BC, to celebrate the victory over Carthage, he composed a genuine drama adapted from the Greek. His success established a tradition of performing such plays alongside the cruder native entertainments. He also made a translation of the Odyssey. For his plays Livius adapted the Greek metres to suit the Latin tongue; but for his Odyssey he retained a traditional Italian measure, as did Gnaeus Naevius for his epic on the First Punic War (the first of three waged by Rome against Carthage). Scholars are uncertain as to how much this metre depended on quantity or stress. Ennius (239–169) from Calabria, who was half Greek, adopted and latinized the Greek hexameter for his epic *Annales.* His range of subjects was remarkable: he acquainted Rome with the Hellenistic world, but unfortunately his work survives only in fragments.

The Greek character thus imposed on literature made it more a preserve of the educated elite. Now emerged coteries in Rome, such as the circle formed around the Roman consul and general Scipio Aemilianus (185/184–129), who had led Rome to final victory against Carthage in the Third Punic War. This circle contained the statesman-orator Gaius Laelius; the Greek Stoic philosopher Panaetius; the Greek historian Polybius; the satirist Lucilius; and an African-born slave of genius, the comic playwright Terence. Greek influence increased after the acquisition of Greece as a Roman province and the ensuing influx of Greek scholars. Greek soon became a second language to educated Romans. Early in the 1st century BC, however, Latin declamation established itself, and, borrowing from Greek, it attained polish and artistry.

Plautus, the leading poet of comedy, is one of the chief sources for colloquial Latin. But Ennius, following Livius, sought to heighten epic and tragic diction by using archaisms; and from his time onward, with a few exceptions such as the short poems (nugae) of Catullus, Lucilius' and Horace's satires, and Petronius' Satyricon, the language of literature and its rhythms became ever more divorced from that of the people, until reaction came in the 2nd century AD.

The Ciceronian period

Golden Age, 70 BC–AD ***18.*** The Golden Age of Latin literature spanned the last years of the republic and the virtual establishment of the Roman Empire under the reign of Augustus (27 BC–AD 14). The first part of this period, from 70 to 42 BC, is justly called the Ciceronian. It produced writers of distinction, most of them also men of action, among whom Julius Caesar stands out. The most prolific was Varro, "most learned of the Romans," but it was Cicero, statesman, orator, poet, critic, philosopher, who developed the Latin language to express abstract and complicated thought with clarity. Subsequently, prose style was either a reaction against, or a return to, Cicero's. As a poet, although uninspired, he was technically skillful. He edited the *De rerum natura* of the philosophic poet Lucretius. Like Lucretius, he admired Ennius and the old Roman poetry and, though apparently interested in Hellenistic work, spoke ironically of its extreme champions, the nedteroi ("newer poets").

After the destruction of Carthage and Corinth in 146 BC, prosperity and external security had allowed the cultivation of otiunz ("leisure"), living for oneself, and hence literature of self-expression and literature for entertainment. In this climate flourished the *neōteroi*, a new school of poets, largely non-Roman Italians from the north, who introduced the mentality of "art for art's sake." None is known at first hand except Catullus of Verona. These poets reacted against the grandiose, the Ennian tradition of "gravity," and their complicated allusive poetry consciously emulated the Callimacheans of 3rd-century Alexandria. The Neoteric influence persisted into the next generation through Cornelius Gallus to Virgil.

Virgil, born near Mantua and schooled at Cremona and Milan, chose Theocritus as his first model. His Eclogues aimed at recapturing Theocritus' cadences and at creating beauties of sound to match the beauties of the idyllic life of shepherds, depicted in a fanciful landscape. Epicurean, escapist poems, they are shot through with topical allusions, and in the fourth he already appears as a national prophet. Virgil was drawn into the circle being formed by Maecenas, Augustus' chief minister. In 38 BC he and Varius introduced the promising young poet Horace to Maecenas; and by the final victory of Augustus in 30 BC, the circle was consolidated.

The Augustan Age

With the reign of Augustus began the second phase of the Golden Age, known as the Augustan Age. It gave encouragement to the classical notion that a writer should not so much try to say new things as to say old things better. The rhetorical figures of thought and speech were mastered until they became instinctive. Alliteration and onomatopoeia (accommodation of sound and rhythm to sense), overdone by the Ennians and therefore eschewed by the nedteroi, were now used effectively with due discretion. This studied perfection of form characterizes the odes of Horace; elegy too became more polished.

The decade of the first impetus of Augustanism, 29–19 BC, saw the publication of Virgil's Georgics and the composition of the whole Aeneid by his death in 19 BC; Horace's Odes, books I–III and Epistles, book I; in elegy, books I–III of Propertius (also of Maecenas' circle) and books I–II of Tibullus, with others from the circle of Marcus Valerius Messalla Corvinus, and doubtless the first recitations by a still younger member of his circle, Ovid. About 28 or 27 BC Livy began his monumental historical work.

Maecenas' circle was not a propaganda bureau. True, he seems to have suggested occasionally that some public theme was ripe for celebration; witness the ingenious poems of graceful refusal. But the tone of these indicates that refusing was easy and that he was as much friend as patron. Poetic promise was the qualification for entry; Propertius, when admitted, was simply a youth with an anti-Caesarian background who had gained favour with passionate love elegies. He and Horace quarrelled, and after Virgil's death the circle faded out. Would-be poets now abounded, such as Horace's protégés, who occur in the Epistles; Ovid's friends, whom he remembers wistfully in exile; and Manilius, whom no one mentions at all. Poems were recited in literary circles and in public, hence the importance attached to euphony, smoothness, and artistic structure. They thus became known piecemeal and might be improved by friendly suggestions. When finally they were assembled in books, great care was taken over arrangement, which was artistic or significant (but not chronological).

Meanwhile, in prose the Ciceronian climax had been followed by a reaction led by Sallust. In 43 BC he began to publish a series of historical works in a terse, epigrammatic style studded with archaisms that eschewed the rhythmic copiousness of Cicero. Later, eloquence, deprived of political influence, migrated from the forum to the schools, where cleverness and point counted rather than rolling periods. Thus developed the epigrammatic style of the younger Seneca and, ultimately, in an extreme form, of Tacitus. Spreading to verse, it conditioned the witty couplets of Ovid, the tragedies of Seneca, and the satire of Juvenal. Though Livy stood out, Ciceronianism only found a real champion again in the rhetorician Quintilian.

Silver Age, AD 18–133. After the first flush of enthusiasm for Augustan ideals of national regeneration, literature under the empire paid the price of political paternalism. Without freedom, it was subtly sterilized; and Ovid was but the first of many writers actually suppressed or inhibited by fear. Only Tacitus and Juvenal, writing under tolerant emperors, turned emotions pent up under Domitian's reign of terror into the driving force of great literature. Late Augustans such as Livy already sensed that Rome had passed its summit. Yet the title of Silver Age is not undeserved by a literary century that produced, in addition to Tacitus and Juvenal, the elder Seneca, his son, his nephew Lucan, the two Plinys, Quintilian, Petronius, Statius, Martial, and, of lesser stature, Manilius, Persius, Valerius Flaccus, Silius Italicus, and Suetonius.

Later writers. The decentralization of the empire under Hadrian and the Antonines weakened the Roman pride and passion for liberty. Romans began again to write in Greek as well as in Latin. The "new sophistic" movement in Greece affected the "novel poets" such as Florus. An effete culture devoted itself to grammar, metric, and philology, to archaism and preciosity. After Juvenal, 250 years elapsed before Ausonius of Bordeaux (4th century AD) and the last of the true classics, Claudian (flourished about 400), appeared. The interim produced only the anonymous ***Pervigilium Veneris*** ("Vigil of Venus"), presaging the Middle Ages in its vitality and touch of stressed metre. Ausonius, though in the pagan literary tradition, was a Christian and was contemporary with a truly original Christian poet, the Spaniard Prudentius. Henceforward, Christian literature overlaps pagan and generally surpasses it.

The ***Meditations*** of Marcus Aurelius

In prose these centuries have somewhat more to boast, though the greatest work by a Roman was written in Greek, the ***Meditations*** of the emperor Marcus Aurelius. ***Elocutio novella,*** a fashionable blend of archaisms and colloquial speech, is seen to best advantage in Apuleius (born about 125). Other writers of note were Aulus Gellius and Macrobius. The 4th century AD was the age of the grammarians and commentators, but in prose some of the most interesting work is again Christian, by Tertullian, Ambrose, Jerome, and Augustine; Boethius (*c.* 480–524), the last Roman philosopher and probably a Christian, lived after imperial Rome had fallen. His ***Consolation of Philosophy*** was enormously popular throughout medieval Europe.

The genres. ***Comedy.*** Roman comedy was based on the New Comedy fashionable in Greece, whose classic representative was Menander. But whereas this was imitation of life to the Greeks, to the Romans it was escape to fantasy and literary convention. Livius' successor, Naevius, who developed this "drama in Greek cloak" ***(fabula palliata),*** may have been the first to introduce recitative and song, thereby increasing its unreality. But he slipped in details of Roman life and outspoken criticisms of powerful men. His imprisonment warned comedy off topical references, but the Roman audience became remarkably alert in applying ancient lines to modern situations and in demonstrating their feelings by appropriate clamour.

Plautus and Terence

Unlike his predecessors, Plautus specialized, writing only comedy involving high spirits, oaths, linguistic play, slapstick humour, music, and skillful adaptation of rhythm to subject matter. His plays must be thought of almost as comic opera. Part of the fun consisted in the sudden intrusion of Roman things into this conventional Greek world. "The Plautine in Plautus" consists in pervasive qualities rather than supposed innovations of plot or technique. Nevertheless, he is not a favourite Latin author because of his stereotyped characters and situations.

As Greek influence on Roman culture increased, Roman drama became more dependent on Greek models. Terence's comedy was very different from Plautus'. Singing almost disappeared from his plays, and recitative was less prominent. From the Greek dramatist Menander he learned to appreciate and exhibit refinements of psychology and to construct ingenious plots; but he lacked comic force, being uninterested in raising laughs from the crowd. His pride was refined language—the avoidance of vulgarity, obscurity, oaths, or slang. His characters were less differentiated in speech than those of Plautus, but their discourse has an elegant charm. The society Terence portrayed was more sensitive than that of Plautine comedy; lovers tended to be loyal and sons obedient. His historical significance has doubtless been enhanced by the loss of nearly all of the comedies of Menander.

Though often revived, plays modelled on Greek drama were rarely written after Terence. The Ciceronian was the great age of acting, and in 55 BC Pompey gave Rome a permanent theatre. Plays having an Italian setting and Italian dress now came into vogue, their framework being Greek New Comedy but their subject Roman society. A native form of farce was also revived. Under Julius Caesar, this yielded in popularity to verse mime of Greek origin that was realistic, often obscene, and also full of quotable and often edifying apothegms. Finally, when mime gave rise to the dumb show of the ***pantomimus*** with choral accompaniment and when exotic spectacles had become the rage, Roman comedy faded out.

Tragedy. Livius introduced both Greek tragedy ***(fabula*** *crepidata*, "buskined") and comedy to Latin. He was followed by Naevius and Ennius, who, like the Hellenistic Greeks, loved Euripides. Pacuvius, probably a greater tragedian, liked Sophocles, and heightened tragic diction even more than Ennius. His successor, Accius, was more rhetorical in style and impetuous in spirit. The fragments of these poets betoken grandeur in "the high Roman fashion," but they also have a certain ruggedness. They did not always deal in Greek mythology: occasionally they exploited Roman legend or even recent history. The Roman chorus, unlike the Greek, performed on stage and was inextricably involved in the action.

Classical tragedy ceased being composed after Accius, though its plays were constantly revived. Writing plays, once a function of slaves and freedmen, became a pastime of aristocratic dilettantes. Such writers had probably no thought of production: post-Augustan drama was for reading. The nine extant tragedies of the younger Seneca were clearly not written for public performance. They are melodramas of horror and violence. They exhibit faults latent or incipient in Euripides: sensational realism and rhetorical cleverness. Seneca strains after each point. Characterization is crude, and Stoic moralizing obtrusive. The iambic verse is competent but facile. Yet he was the great model for 16th- and early 17th-century tragedy, especially in France. Shakespeare's ***Richard III*** and the ghost scenes in ***Julius Caesar, Hamlet,*** and ***Macbeth*** are reminiscent of him.

Epic and *epyllion.* Livius' pioneering ***Odyssey*** was, to judge from the fragments, primitive, as was the ***Bellum Punicum*** of Naevius, important for Virgil because it began with the legendary origins of Carthage in Phoenicia and Rome in Troy. But Ennius' ***Annales*** soon followed. This compound of legendary origins and history was in Latin, in a transplanted metre, and by a poet who had imagination and a realization of the emergent greatness of Rome. In form his work must have been ill-balanced; he almost ignored the First Punic War in consideration of Naevius and became more detailed as he added books about his own times. But his great merit shines out from the fragments—nobility of ethos matched with nobility of language. On receptive spirits, such as Cicero, Lucretius, and Virgil, his influence was profound. For a century and a half he was unapproached in epic.

Virgil's ***Aeneid***

Little is known of the "strong epic" for which Virgil's friend Varius is renowned, but Virgil's ***Aeneid*** was certainly something new. Recent history would have been too particularized a theme. Instead, Virgil developed Naevius' version of Aeneas' pilgrimage from Troy to found Rome. The poem is only superficially an Odyssey of travel (with an interlude of love) followed by an Iliad of conquest, and is more a symbolic epic of deep contemporary relevance. The hero is Rome, Aeneas is the archetypal Roman, and the subject is his conversion from an individualistic leader to the dedicated servant of Rome's destiny. He learns what he must do from a succession of ever clearer prophetic promises. His fault was to have lingered at Carthage. The command to leave the Carthaginian queen Dido shakes him ruthlessly out of the last great temptation to seek individual happiness. But it is only the vision of Rome's future greatness, seen when he visits Hades, that kindles obedient acceptance into imaginative enthusiasm. It was just such a sacrifice of the individual that the Augustan ideal demanded. The second half of the poem represents the fusing in the crucible of war of the civilized graces of the Trojans with the manly virtues of the Italians. The tempering of Roman culture by Italian hardiness was another part of the Augustan ideal. So was a revival of interest in ancient customs and religious observances, which Virgil could appropriately indulge. The verse throughout is superbly varied, musical, apt, and rhetorical in the best sense,

With his ***Hecale,*** Callimachus had inaugurated the short, carefully composed hexameter narrative that is called epyllion to replace grand epic. The ***Hecale*** had started a convention of insetting an independent story. Catullus inset the story of Ariadne on Naxos into that of the marriage of Peleus and Thetis, and the poem has a monotonous beauty. But the story of Aristaeus at the end of Virgil's ***Georgics,*** with that of Orpheus and Eurydice inset, shows what heights epyllion could attain.

Ovid's *Metamorphoses*

Ovid's ***Metamorphoses*** is a nexus of some 50 epyllia with shorter episodes. He created a convincing imaginative world with a magical logic of its own. His continuous poem, meandering from the creation of the world to the apotheosis of Julius Caesar, is a great Baroque conception, executed in swift, clear hexameters. Its frequent irony and humour are striking. Thereafter epics proliferated. Statius' ***Thebaid*** and inchoate ***Achilleid*** and Valerius' ***Argonautica*** are justly less read now than they were. Lucan's unfinished ***Pharsalia*** has a more interesting subject, the struggle between Caesar and Pompey, whom he favours. He left out the gods. His brilliant rhetorical style almost makes the poem a success, but it is too strained, and the treatment too episodical.

Didactic poetry. Ennius essayed didactic poetry in his ***Epicharmus,*** a work on the nature of the physical universe. Lucretius' masterpiece, ***De rerum natura,*** was its first noteworthy successor, driven as it is by Lucretius' anxiety to rid himself of fear of death and the supernatural. He is not an original thinker but attained an imaginative conception of the effect of Epicurus' atomism on everything in and around him. His poem is truly didactic; some of the finest poetry is in digressions, but the grandeur of the total vision is missed if the detailed and impassioned argument is shirked.

The appearance of this poem must have profoundly affected Virgil, but his poetic reaction was delayed for some 17 years; and the ***Georgics,*** though deeply influenced by Lucretius, were not truly didactic. Countrybred though he was, Virgil wrote for literary readers like himself, selecting whatever would contribute picturesque detail to his impressionistic picture of rural life. The ***Georgics*** portrayed the recently united land of Italy and taught that the idle Golden Age of the ***Eclogues*** was a mirage: relentless work, introduced by a paternal Jupiter to sharpen men's wits, creates "the glory of the divine countryside." The compensation is the infinite variety of civilized life. Insofar as it had a political intention, it encouraged revival of an agriculture devastated in wars, of the old Italian virtues, and of the idea of Rome's extending its works over Italy and civilizing the world.

Ovid's ***Ars amatoria*** was comedy or satire in the burlesque guise of didactic, an amusing commentary on the psychology of love. The ***Fasti*** was didactic in popularizing the new calendar; but its main object was clearly to entertain, and true didactic poetry was diminishing.

Satire. Satura meant a medley. The word was applied to variety performances introduced, according to Livy, by the Etruscans. Literary satire begins with Ennius, but it was Lucilius who established the genre. After experimenting, he settled on hexameters, thus making them its recognized vehicle. A tendency to break into dialogue may be a vestige of a dramatic element in nonliterary *satura.* Lucilius used this medium for self-expression, fearlessly criticizing public as well as private conduct. He owed much to the Cynic-Stoic "diatribes" (racy sermons in prose or verse) of Greeks such as Bion; but in extant Hellenistic literature he is most clearly presaged by the fragments of Callimachus' iambs. "Menippean" satire, which descended from the Greek prototype of Menippus of Gadara and mingled prose and verse, was introduced to Rome by Varro.

The satire of Horace and Juvenal

Horace saw that satire was still awaiting improvement: Lucilius had been an uncouth versifier. ***Satires*** I, 1–3 are essays in the Lucilian manner. But Horace's nature was to laugh, not to flay. and his incidental butts were either insignificant or dead. He came to appreciate that the real point about Lucilius was not his denunciations but his self-revelation. This encouraged him to talk about himself. In ***Satires*** II he developed in parts the satire of moral diatribe presaging Juvenal. But he was still composing ***sermones*** ("talks"), whereas his successor Persius blended Lucilius, Horace, diatribe, and mime into sermons in verse full of contemporary rhetoric. The great declaimer was Juvenal, who fixed the idea of satire for posterity. Gone was the personal approach of Lucilius and Horace. Anger, bottled up under Domitian's reign, may have become a self-indulgent habit of mind or have been cultivated for the purpose. Essentially, Juvenal was writing for effect; but his epigrammatic power makes him stimulating and at his best he is brilliant.

The younger Seneca's ***Apocolocyntosis*** was a medley of prose and verse, but its pitiless skit on the deification of the emperor Claudius was Lucilian satire. The ***Satyricon*** of Petronius is also Menippean inasmuch as it contains varied digressions and occasional verse; essentially however, it comes under fiction.

With Lucilian satire may be classed the fables of Augustus' freedman Phaedrus, the Roman Aesop, who in his beast fables could not resist contemporary social and political allusions.

Iambic, lyric, and epigram. The short poems of Catullus were called by himself ***nugae*** ("trifles"). They vary remarkably in mood and intention, and he uses iambic metre normally associated with invective not only for his abuse of Caesar and Pompey but also for his tender homecoming to Sirmio. Some of these poems are fine lyrics. Catullus and the Neoterics markedly influenced later poets in this medium.

Horace was a pioneer. In his ***Epodes*** he used iambic verse to express devotion to Maecenas, though in general he adopted with the metre the offensive posture of the Greek poet Archilochus. But his primary aim was to create literature, whereas his models had been venting their feelings. There are several poems in this collection with no Archilochian element. In the ***Odes*** he adapted other Greek metres to the Latin language. The resultant verse forms compensated for loss of fluent spontaneity with artistic elegance and dignity. Horace claimed immortality as the introducer of early Greek lyric to Latin. The ***Odes*** rarely show the passion nowadays associated with lyric; but the qualities of their originals are transfigured in them, forming something peculiarly Horatian and well-nigh perfect as meditated works of art.

Martial went back to Catullus for his metres and for his often obscene wit. He fixed the notion of epigram for posterity by making it characteristically pointed. But Martial is certainly no Catullus; he was a paltry-spirited flatterer. His social information is nevertheless valuable.

Catullus' love poems

Elegy. The elegiac couplet of hexameter and pentameter (verse line of five feet) was taken over by Catullus, whose temperament broke in tradition filling elegy with personal emotion. One of his most intense poems in this metre, about Lesbia, extends to ***26*** lines; another is a long poem of involved design in which the fabled love of Laodameia for Protesilaus is incidentally used as a paradigm. These two poems make him the inventor of the "subjective" love elegy dealing with the poet's own passion. Gallus, whose work is lost, established the genre; and Tibullus and Propertius developed it and smoothed out the metre.

Propertius' first book is still Catullan in that it seems genuinely inspired by his passion for Cynthia: the involvement of Tibullus is less certain. Already in book II Propertius also is beginning to write love elegy as a form having its own commonplaces and conventions, which were often borrowed from other forms. Tibullus' elegy is constructed of sections of placid couplets with subtle transitions. These two poets established the convention of the "soft poet," valiant only in the campaigns of love, immortalized through them and the Muses. Propertius was at first impervious to the Augustan ideals then taking shape, glorying in his abject slavery to love and his naughtiness *(nequitia),* though later he became acclimatized to Maecenas' circle.

Tibullus, a lover of peace, country life, and old religious customs, had charm and grace, and a quiet humour. Propertius, too, could be charming, but he was far more. He often wrote impetuously, straining language and associative sequence with passion or irony or sombre imagination. He could betray bad taste in overdoing mythological parallels, but he was a true and exciting poet.

Ovid had a different aim: not to unburden his soul, nor to move the reader's, but to entertain. In the *Amores* he is outrageous and amusing in the role adopted from Propertius, his Corinna being probably a fiction. Elegy became his characteristic medium. He carried the couplet of his predecessors to its logical extreme, characterized by parallelism, regular flow and ebb, and a neatness that pointed his wit. He had no successor worthy of the name.

Cicero's influence on oratory

Rhetoric** and **education. Speaking in the forum and law courts was the essence of a public career at Rome and hence of educational practice. After the 2nd century BC, Greek art affected Latin oratory. The dominant style in Cicero's time was the "Asiatic"—emotional, rhythmical, and ornate. Cicero, Asiatic at first, early learned to tone down his style. Criticized later by the revivers of plain style, he insisted that style should vary with subject. But in public speaking he held that crowds were swayed less by argument than emotion. He was the acknowledged master speaker from 70 BC until his death (43 BC). He expounded the history of Roman oratory in the *Brutus* and his own principles and practice in the *De oratore.*

The establishment of monarchy robbed eloquence of its public importance, but rhetoric remained the crown of education. Insofar as this taught boys to marshal material clearly and logically and to express themselves cogently, it performed the function of the modern essay; but insofar as the temptations of applause made it strained and affected, it did harm.

In the *De oratore*, Cicero had pleaded (through Crassus) that an orator's training should be in all liberal arts. Education without rhetoric was inconceivable; but what Cicero was proposing was to graft onto it a complete system of higher education. Quintilian, in his *Institutio oratoria,* went back to Cicero for inspiration as well as style. Much of that work is conventional, but the first and last books in particular show admirable commonsense and humanity; and his work greatly influenced Renaissance education.

History. Quintus Fabius Pictor wrote his pioneering history of Rome during the Second Punic War, using pontifical and family annals (*i.e.*, dating events from records kept officially by the priestly college and privately by great families) and writing in Greek. His immediate successors followed suit. Latin historical writing began with Cato's *Origines.* After him there were as many historiasters, or worthless historians, as the poetasters disdained by Cicero. The first great exception is Caesar's *Commentaries,* a political apologia in the guise of unvarnished narrative. The style is dignified, terse, clear, and unrhetorical.

Sallust took Thucydides as his model. He interpreted, using speeches, and ascribed motives. In his extant monographs *Bellum Catilinae* and *Bellum Jugurthinum*, he transcended the annalistic method, using history to emphasize the decadence of the dominant caste. The revolution in style he inaugurated gives him importance in an account of Latin literature. Though a Caesarian, he at least affected a Thucydidean detachment. He rebuked the extravagance of the dying republic.

Livy began his 40 years' task as Augustus came to power. His work consummated the annalistic tradition. If in historical method he fell short of modern standards, he had the literary virtues of a historian. He could visualize and vividly describe past events and interpret the participants' views in eloquent speeches. He inherited from Cicero his literary conception of history, his copiousness, and his principle of accommodating style to subject. Indeed, he was perhaps the greatest of Latin stylists. His earlier books, where his imagination has freer play, are the most readable. In the later books, the more historical the times become, the more disturbing are his uncritical methods and his patriotic bias. Livy's work now is judged mainly as literature.

The histories of Tacitus

Tacitus, on the other hand, stands higher now than in antiquity. Though his anti-imperial bias in attributing motives is plain, his facts can rarely be impugned; and his evocation of the terrors of tyranny is unforgettable. He is read for his penetrating characterizations, his drama, his ironical epigrams, and his unpredictability. His is an extreme development of the Sallustian style, coloured with archaic and poetic words, with a careful avoidance of the commonplace.

Suetonian biography apart, historiography thereafter degenerated into handbooks and epitomes until Ammianus Marcellinus appeared. He was refreshingly detached, rather ornate in style, but capable of vivid narrative and description. He continued Tacitus' account from Domitian's death to AD 378, more than half his work dealing with his own times.

Biography and letters. The idea of comparing Romans with foreigners was taken up by Cornelius Nepos, a friend of Cicero and Catullus. Of his ***De viris illustribus*** all that survive are 24 hack pieces about worthies long dead and one of real merit about another of his friends, Atticus. The very fact that Atticus and Tiro decided to publish nearly 1,000 of Cicero's letters is evidence of public interest in people. Admiration of these fascinating letters gave rise to letter writing as a literary genre. The younger Pliny's letters, anticipating publication, convey a possibly rose-tinted picture of civilized life. They are nothing to his spontaneous correspondence with Trajan, where one learns of routine problems, for instance with Christians' confronting a provincial governor in Bithynia. The letter as a verse form, beginning with striking examples by Catullus, was established by Horace. Some of his ***Epistles*** I look like real letters, though others approximate to "talks."

Suetonius' biographies

Suetonius' lives of the Caesars and of poets contain much valuable information, especially since he had access to the imperial archives. His method was to cite in categories whatever he found, favourable or hostile, and to leave this raw material to the judgment of the reader. The *Historia Augusta,* covering the emperors from 117 to 284, is a collection of lives in the Suetonian tradition. Tacitus' ***Agricola*** was an admiring, but not necessarily overcoloured, biographical study.

Some of the most valuable autobiography was incidental, such as Cicero's account of his oratorical career in the *Brutus.* Horace's largely autobiographical ***Epistles*** I was significantly sealed with a miniature self-portrait. Ovid, in exile and afraid of fading from Rome's memory, gave an invaluable account of his life in *Tristia* IV.

Philosophy and learning. The practical Roman mind produced no original philosopher. The only name that demands consideration is Cicero's. He was trained at Athens in the eclectic New Academy, and eclectic he apparently remained, seeking a philosophy to fit his own constitution rather than a logical system valid for all. He used the dialogue form, avowedly in order to make people think for themselves instead of following authority. Essentially, he was a philosophic journalist, composing works that became one of the means by which Greek thought was absorbed into early Christian thinking. The ***De officiis*** is a treatise on ethics. The dialogues do not follow the Platonic or dialectic pattern but the Aristotelian, in which speakers expounded already formed opinions at greater length.

Nor were the Romans any more original in science. Instead, they produced encyclopaedists such as Varro and Celsus. Pliny's ***Natural History*** is a fascinating ragbag, especially valuable for art history, though it shows to what extent Hellenistic achievement in science had become confused or lost.

Horace's *Ars poetica*

Literary criticism. Cicero's *Brutus* and the tenth book of Quintilian's *Institutio* ***oratoria*** provide examples of general criticism. Cicero stressed the importance of a well-stocked mind and of native wit against mere handbook technique. By Horace's day, however, it had become more timely to insist on the equal importance of art. Some of Horace's best criticism is in the ***Satires*** (I, 4 and 10; II, 1), in the epistle to Florus (II, 2), and in the epistle to Augustus (II, 1), an outspoken vindication of the Augustans against prejudiced archaists. But it was his epistle to a Piso and his sons (later called ***Ars*** *poetica*) that was so influential throughout Europe in the 18th century. It was a cunningly devised treatise based on a hellenistic critic, Neoptolemus of Parium. It supported, among acceptable if trite theses, the dubious one that poetry is necessarily best when it mingles the useful (particularly moral) with the pleasing. Much of the work concerned itself with drama. The Romans were better at discussing literary trends than fundamental principles—there is much good sense about this in Quintilian, and Tacitus' *Dialogus* is an acute discussion of the decline of oratory.

Fiction. Republican and early imperial Rome knew no Latin fiction beyond such things as Sisenna's translation of Aristides' ***Milesian Tales.*** But two considerable works have survived from imperial times. Of the ***Satyricon*** attributed to Petronius there are extracts from books XV and XVI. It was apparently a rambling picaresque novel. The disreputable characters have varied adventures and talk lively colloquial Latin. The satirical description of the vulgar parvenu Trimalchio's banquet is justly famous. Apuleius' ***Metamorphoses (The Golden Ass)*** has a hero, Lucius, who has accidentally been changed into an ass. After strange adventures he is restored to human shape by the great goddess Isis. Many passages, notably the story of Cupid and Psyche, have a beauty that culminates in the apparition of Isis and in the initiation of the hero, now assimilated to the author, into her mysteries.

II. The Middle Ages

CHARACTERISTICS OF THE PERIOD

The term medieval, "belonging to the Middle Ages," is used here to refer to the literature of Europe and the eastern Mediterranean from as early as the establishment of the Eastern Roman, or Byzantine, Empire about AD 300 for medieval Greek, from the period following upon the fall of Rome in 476 for Latin, and from about the time of Charlemagne and the Carolingian Renaissance he fostered in France (*c.* 800) to the end of the 15th century for most written vernacular literatures. The term is thus given a wider application here than a use that restricts it to the years between 1000 and *c.* 1450.

In the centuries following the fall of the Western Roman Empire one major event occurred that permanently altered the course of European development. The establishment of Christianity throughout the territories that formed the Roman Empire meant that Europe was exposed to and tutored in the systematic approach to life, literature, and religion developed by the early Church Fathers. In the West, the fusion of Christian and classical philosophy formed the basis of the medieval habit of interpreting life symbolically. Through St. Augustine, Platonic and Christian thought were reconciled: the permanent and uniform order of the Greek universe was given Christian form; nature became sacramental, a symbolic revelation of spiritual truth. Classical literature was invested with this same symbolism; exegetical, or interpretative, methods first applied to the Scriptures were extended as a general principle to classical and secular writings. The allegorical or symbolic approach that found in Virgil a pre-Christian prophet and in the *Aeneid* a narrative of the soul's journey through life to paradise (Rome) belonged to the same tradition as Dante's allegorical conception of himself and his journey in ***The Divine Comedy.***

The role of the church in preserving ancient literatures

The church not only established the purpose of literature but preserved it. For various reasons, access to Greek learning was blocked in western Europe until the 12th and 13th centuries; St. Benedict's monastery at Monte Cassino in Italy was established in 529, and other monastic centres of scholarship followed, particularly after the 6th- and 7th-century Irish missions to the Rhine and Great Britain and the Gothic missions up the Danube. These monasteries were able to preserve the only classical literature available in the West through times when Europe was being raided by Goths, Vandals, Franks, and, later, Norsemen in succession. The classical Latin authors so preserved and the Latin works that continued to be written predominated over vernacular works throughout most of the period. St. Augustine's ***City of God,*** the Venerable Bede's ***Ecclesiastical History,*** the Danish chronicle of Saxo Grammaticus, for example, were all written in Latin, as were most major works in the fields of philosophy, theology, history, and science.

The main literary values of the period are found in vernacular works. The pre-Christian literature of Europe belonged to an oral tradition that was reflected in the ***Poetic Edda*** and the sagas, or heroic epics, of Iceland, the Anglo-Saxon ***Beowulf,*** and the German ***Song of Hildebrand.*** These belonged to a common Germanic alliterative tradition, but all were first recorded by Christian scribes at dates later than the historical events they relate, and the pagan elements they contain were fused with Christian thought and feeling. The mythology of Icelandic literature was echoed in every Germanic language and clearly stemmed from a common European source. Only the Scandinavian texts, however, give a coherent account of the stories and personalities involved. Numerous ballads in different countries also reflect an earlier native tradition of oral recitation. Among the best known of the many genres that arose in medieval vernacular literatures were the romance and the courtly love lyric, both of which combined elements from popular oral traditions with those of more scholarly or refined literature and both derived largely from France. The romance used classical or Arthurian sources in a poetic narrative that replaced the heroic epics of feudal society, such as ***The Song of Roland,*** with a chivalrous tale of knightly valour. In the romance, complex themes of love, loyalty, and personal integrity were united with a quest for spiritual truth, an amalgam which was represented in every major western European literature of the time. The love lyric has had a similarly heterogeneous background. The precise origins of courtly love are disputed, as is the influence of a popular love poetry tradition; it is clear, however, that the idealized lady and languishing suitor of the poets of southern and northern France were imitated or re-interpreted throughout Europe—in the Sicilian school of Italy, the minnesingers (love poets) of Germany, and in a Latin verse collection, ***Carmina Burana.***

Medieval drama began in the religious ceremonies that took place in church on important dates in the Christian calendar. The dramatic quality of the religious service lent itself to elaboration that perhaps first took the form of gestures and mime and later developed into dramatic interpolations on events or figures in the religious service, and this elaboration increased until drama became a secular affair performed on stages or carts in town streets or open spaces. The players were guild craftsmen or professional actors and were hired by towns to perform at local or religious festivals. Three types of play developed: the mystery, the miracle, and the morality. The titles and themes of medieval drama remained religious but their pieces' titles can belie their humorous or farcical and sometimes bawdy nature. One of the best known morality plays was translated from Dutch to be known in English as ***Everyman.*** A large majority of medieval literature was anonymous and not easily dated. Some of the greatest figures—Dante, Chaucer, Petrarch, and Boccaccio—came late in the period, and their work convincingly demonstrates the transitional nature of the best of medieval literature, for, in being master commentators of the medieval scene, they simultaneously announced the great themes and forms of Renaissance literature.

MEDIEVAL LATIN LITERATURE

The history of Latin literature in the Middle Ages reflected directly the history of the society that gave it birth. The vast corpus of written Latin produced in the West during the 1,000 years that separated the end of the Western Empire from the Renaissance could never have come into being but for the widespread dominion of Rome during the previous 500 years. So long as Rome was a cultural metropolis, a unitary classical literature remained a possibility, while the maintenance of Latin as the language of the empire's governing class prevented any growth of rival vernacular literatures. When the power of Rome was broken by barbarian invasions and truncated by the rise of Byzantium as the separate eastern half of the empire and when its religion gave way to Christianity, persistence of anything that could be called a Latin literature was made possible only by the church. Rome became the centre of a new ecumenical culture, and learning and literature were preserved and produced in monasteries and monastic and cathedral schools and later in nascent universities.

Latin prose of the Middle Ages consisted—apart from official documents, chronicles, laws, treaties, diplomatic correspondence, and the like—of theological, philosophical, and scientific treatises, devotional exercises, works of biblical exegesis and ecclesiastical controversy, history, biography, hagiography, and personal correspondence: writers had practical rather than literary ends in view. The poetry was not so utilitarian or so predominantly religious. It comprised secular as well as sacred epics, didactic poems, and "occasional" verse of every description; but, except for its hymns and romantic lyrics, it is of negligible literary merit.

The contrast between classical and post-classical literature, both in quantity and in character, is striking; and in both respects it is easily accounted for: only a few—and on the whole, no doubt, the best--of the classical writers have survived, while the bulk of the medieval texts, good, bad, and indifferent, have been preserved; and there was nothing in classical times to match the influence that Christianity exercised over literate persons in the Middle Ages: the church dominated their lives, and religion coloured their minds and saturated their writings. Religion operated both positively, by supplying subject matter and inspiration and providing new, liturgical verse forms, and negatively, by treating the classics as pagan productions to be read principally as an accessory to biblical studies. Nevertheless, classical texts were studied in the monasteries and transcribed; certain of them, such as those of the Roman poet Virgil, were "baptized" for Christian use by being interpreted allegorically, while the classical liberal arts still served as the basis of medieval education in the trivium (grammar, rhetoric, and logic) and the quadrivium (geometry, arithmetic, astronomy, and music), with medicine and architecture also counted among the liberal arts. Concentration on these *artes* (arts) at the expense of the *auctores* (authors) and a debased conception of rhetoric were fatal to literary quality and led poets to indulge in acrostics and similar involved and often trivial forms that delighted the medieval mind.

The classical liberal arts

Christian Latin literature, written in a new and varied vocabulary that was conditioned by specifically Christian needs, began in the 3rd and 4th centuries with a group of African writers who had been trained in the schools of grammar and rhetoric. The most important of these were Tertullian, Minucius Felix, Cyprian, Arnobius, and Lactantius. The problem of the attitude to be taken by educated Christians toward secular literary culture was discussed by St. Augustine, bishop of Hippo, in his *De doctrina Christiana* (On *Christian Doctrine*). *A* former teacher of rhetoric himself, Augustine gave a qualified sanction to an acceptance by Christians of classical pagan learning and methods. The influence of secular classics was also a problem for St. Jerome, but in the Vulgate (his translation of the Bible), which was to exercise a profound influence throughout the Middle Ages, he produced a masterpiece of Christian Latin. Most prose of the 4th century was concerned with doctrinal matters; only the *Confessiones (Confessions)* of St. Augustine could be said to survive as literature.

The close of the 4th century saw the end of poetry that was both pagan in feeling and classical in form; Ausonius and Claudian were its last representatives; Paulinus, bishop of Nola, stood at the parting of the ways; Prudentius, a Spaniard who created the Christian ode, delivered a Christian message in classical accents. The most original literary creation of the 4th century was the Latin Christian hymn. In it, classical quantitative metres were displaced by rhymed or unrhymed measures depending on syllabic symmetry, accent, and rhythm. The hymns of St. Ambrose were the first exploration of this, the richest vein of Medieval Latin poetry.

Between 500 and 700 the chief contribution made to literature came about through the foundation of the monasteries, which provided centres for a transmission of classical texts. Among original works calling for mention were those by two pagan writers of the 5th century: a commentary on Cicero's *Somnium Scipionis (Dream of Scipio*) by Macrobius and *De nuptiis Philologiae et Mercurii* ("On the Marriage of Philology and Mercury"), an introduction to the seven liberal arts by Martianus Capella—writings that were to have influence later in medieval schools. The *Etymologiae* ("Etymologies") of Isidore, bishop of Seville, served as an encyclopaedia for many generations. In the hymns of Venantius Fortunatus a fervent Christian feeling is expressed in classical form. The *De consolatione philosophiae* (*On the Consolation of Philosophy)* of Boethius, a lofty philosophic work in prose and verse, retained its hold on the literate world throughout the Middle Ages and beyond.

The 7th and 8th centuries were a sterile period: learning sought refuge from political turmoil on the Continent in the monastic establishments of Britain and Ireland, whence missionary scholars reconveyed it across the English Channel. Most notable among British scholars were Aldhelm, remarkable more for learning than for literary grace, and the Venerable Bede, whose history of the English Church is a monument of scholarship and historical genius.

The close of the 8th century saw a revival of letters under the strong and enlightened government of Charlemagne, after whom the period is named Carolingian. He summoned Alcuin, himself a poet as well as a scholar, to come from England in order to help in the organization within the Frankish domains of schools designed to educate a literate clergy. A flourishing band of poets frequented Charlemagne's court—at their head Theodulf of Orléans, an accomplished classicist who succeeded Alcuin in charge of the palace school at Aachen—and a plentiful flow of verses, sacred and profane, in classical and in rhythmic metres, issued from the Frankish monasteries. Two poets showed especial originality in lyric measures: Walafrid Strabo and Gottschalk, both pupils of Rabanus Maurus, a learned abbot of Fulda, another of whose pupils, Lupus of Ferrières, displayed in his letters a remarkable passion for literature and the classics.

The Carolingian Renaissance

If the Carolingian Renaissance deserves its name, however, it is by reason of its regard for literature, its zeal in scholarship, and its expertise in copying manuscripts, rather than its original literary productions. The most memorable prose work of the period was the *De divisione naturae* ("On the Division of Nature") by John Scotus Erigena, an Irish scholar, in which is expounded a philosophical theory of the universe that draws on Greek sources. Otherwise, there was nothing in the Latin prose of the 9th century that deserved to survive by reason of literary merit.

Among the numerous theologians, chroniclers, authors of saints' lives, and poets of the 10th and 11th centuries, there were few that produced literature of outstanding importance, religious or secular. The most notable development in the 11th century was in the secular lyric poem, which revealed for the first time, in metre and stanzaic form, the influence of the religious "sequence." An original poetical creation of the Latin Middle Ages, the sequence was written to be sung at the mass, between the reading of the epistle and the gospel. A number of anonymous poems illustrating the use of the sequence in secular pieces occur in the Cambridge Songs, an 11th-century anthology composed in Germany.

At the turn of the 11th and 12th centuries a good deal of verse written for specific occasions and formed on classical models came out of the French cathedral schools. Examples are the poets Marbod of Rennes, Hildebert of Lavardin, and Baudry of Bourgueil, all of whom also composed hymns in accentual measures.

In the 12th century these cathedral schools, precursors of the universities, replaced monasteries as centres of literature. A wider range of studies was established, with a more intelligent devotion to auctores (authors). At the cathedral school at Chartres in France appeared a group of writers who reflected the influence of the philosophy of Plato. Most notable of these were Bernard Silvestris and Alain de Lille (Alanus de Insulis), both of whom wrote works of which later poets writing in the vernacular made use. In England, John of Salisbury, a famous medieval Humanist, owed much to his masters at Chartres. Two other English authors who wrote in Latin deserve mention: the *Historia regum Britanniae* (The History *of* the Kings of Britain) by Geoffrey of Monmouth had an unprecedented success in a century that took a great interest in romantic tales; and Walter Map, a member of the same literary circle at Canterbury to which John of Salisbury belonged, produced a mixture of gossip, folklore, and satire in his *De nugis curialium* ("On the Jests of the Courtiers").

Other great names of the 12th and 13th centuries—Peter Abelard and Thomas Aquinas, Bernard of Clairvaux, Duns Scotus, and Roger Bacon—are memorable for their contributions to philosophy or religion. In verse, the triumphs of this period were its hymns: Abelard displayed originality in the creation of new forms of stanza, while Adam of St. Victor brought the "sequence" form to perfection. In the 13th century a new note of personal passion, infused by the influence of St. Francis of Assisi, pervaded both religious life and religious literature, finding triumphant expression in the "Laude" ("Praise") of Jacopone da Todi and in such Latin hymns as the Stabat Mater.

A wave of new feeling had for a century or more been making itself felt also in the secular verse of the time, both in Latin and in vernacular writings. Its products were preserved in such collections as the *Carmina Burana*—love lyrics, drinking songs, and poems whose subject matter is as various as their form and invariably spontaneous, unliterary, fresh. Most of them were the work of "wandering scholars" and other unknown hands, but some authors can be identified: Walter of Châtillon, a mysterious Hugh Primas, and an anonymous "Archpoet," some of whose poems are good examples of a rollicking tavern verse.

Italian precursors of the Renaissance

Long before 1453, when the fall of Constantinople brought into the West a wave of Greek texts and scholars able to expound them, there had been writers of Latin in Italy who rejected medieval barbarities of form and vocabulary and, in defiance of ecclesiastic disapproval, turned to classical writers as models for their own compositions. Notable among these precursors of the Renaissance were Albertino Mussato (1261–1329), writer of tragedies modelled on those of Seneca; Petrarch, of epistles modelled on Horace and of the epic Africa; and Giovanni Boccaccio, author of *De genealogia deorum gentilium* ("On the Genealogy of the Gods of the Gentiles"), an encyclopaedia of mythology. Teachers like Guarino Veronese and Vittorino da Feltre and librarians and collectors of manuscripts like Coluccio Salutati and Poggio Bracciolini ministered to a passion for classical learning and humane literature that by the middle of the 15th century pervaded the schools and universities of Italy. This passion was fostered by powerful patrons—the Medici of Florence, the Aragonese court of Naples, and the papal court at Rome under Pius II (pope from 1458 to 1464)—and by associations of literary men. Recently established presses helped to disseminate works of current as well as of classical writers in Latin. By 1500 there existed in Italy a flourishing Latin literature written by men who cared (sometimes over much) about form, modelled their style (sometimes too mechanically) upon classical prototypes, and used Latin prose and verse as a vehicle for an expression of their personalities and for conveying an adult and humane view of life.

FRENCH LITERATURE IN THE MIDDLE AGES

Human settlement was ancient in Gaul, or France, especially in the south and centre. During the 1st millennium BC, much of the country was conquered by Celts. Their tribal names survive in the names of French cities, but knowledge of Celtic myth and legend comes almost entirely from insular sources, not France. It was the Romans who introduced written literature, and until the 12th century all documents and almost all written literature were in Latin.

The political bases of modern France were laid by the Franks, who ruled in what is now southern Belgium and in the Rhineland c. AD 500–900 and eventually controlled much of central Europe. The subjugation of Saxony by Charlemagne in 772–804 undermined the stability of the heathen north, and consequent attacks by Vikings and the political immaturity of the Frankish ruling classes led to the collapse of Charlemagne's empire (the Carolingian Empire). A western kingdom slowly emerged and took the old name Francia, "France." In this kingdom two forms of "rustic" or vernacular Latin arose: the langue d'oïl in the north and the langue d'oc in the south (*oïl* and *oc* being the two different pronunciations of the word for "yes"), each dialect becoming the vehicle of an important literature. Lyric poetry developed in the south, while a more varied, mainly narrative literature arose in the north.

Many beside the Franks contributed to the cultural heritage of northern France. After the Roman withdrawal, Celts reoccupied what is modern Brittany. Significantly, the best known themes of Old French literature, those of the Arthurian cycle, were Celtic in origin, King Arthur being a hero to Cornishmen and Bretons. Norse settlements in 911 formed the basis of the powerful duchy of Normandy, which dominated the political development of France to 1210, and the conquest of England and south Wales by Norman dukes strengthened ties between France and the Nordic and Celtic worlds: some of the oldest and finest French narrative poems, dating from the 12th century—St. Brendan, Tristan, *Haveloc*—described the adventures of Irish, Cornish, and Anglo-Scandinavian heroes. In 1154, when Henry Plantagenet, duke of Normandy, count of Anjou, and husband of Eleanor of Aquitaine, became Henry II of England, this Anglo-Norman state was incorporated into a vast Angevin empire, stretching from southeastern Ireland to the foothills of the Pyrenees.

The international status of Old French literature. The emergence of Old French, the langue d'oïl, as a vehicle of song, story, law, and administration in countries far beyond France was attributable to demographic change, foreign conquests of feudal barons, and the revival of literary studies in the cathedral schools of northern France. During the formative period of French literature (1050–1210) French barons were pre-eminent in a new kind of knightly warfare. The First Crusade, dominated by French commanders, established a kingdom in Palestine and feudal principalities in Syria. In 1204 a French ruler was placed on the throne of Byzantium. While Anglo-Norman and Anglo-Angevin poets composed couplet verse on Celtic and Danish legends, settlers in the Middle East used prose to describe their battles. Old French literature between c. 1100 and c. 1400 was widely dispersed, but everywhere it reflected the tastes, opinions, and interests of the military caste responsible for its spread.

Oral poetry and the chansons de geste. The brief written texts of the 9th and 10th centuries were little more than philological curiosities, and the 11th century was devoid of any texts in Old French. A manuscript of the ***Chanson de Roland (Song of Roland),*** greatest of the Old French epics, contains the only important literary text that is certainly datable before 1150; the manuscript is Anglo-Norman, but the poem itself, in assonanced stanzas of 10-syllabled lines, is continental and derives from an ancient tradition of oral poetry.

The contribution of the minstrels

After the collapse of the Carolingian dynasty, first attempts to unite the warrior caste were made in the 11th century, and, supported by reformed Benedictine monasteries under Cluny, military aid was organized for the Christian principalities of northern Spain. Warriors, merchants, and ecclesiastics travelled along the routes that converged on the Pyrenean passes of Roncevaux and the Somport, and thence to a pilgrimage centre, Santiago de Compostela, and for their entertainment a body of epic poetry deriving its themes from all parts of France came into being. Oral narratives on traditional themes were developed by minstrels (jongleurs), servants of great barons and ecclesiastics, but occasionally men of knightly rank or of clerical training. The main subject matter of these epic cycles—the decline of the Carolingian dynasty—depended on deep-rooted memories of the 8th-century struggles between Franks, Gascons, and Mozarabic (Arabicized Christian) emirs for control of southern France. These memories coalesced in the poetic imagination with later rebellions and dynastic conflicts.

The title chansons de geste ("dynastic histories") was occasionally given by their authors themselves to about 80 epic poems in written form, largely anonymous, at the core of which were legends concerning Charlemagne as emperor and champion of Christendom, though many chansons de geste were about individual barons, such as Girart de Roussillon, Doon de Mayence, Ogier the Dane, the Loherains (a group from Lorraine), and Raoul de Cambrai. The poems all have in common their essentially heroic themes and treatment, with a particular predilection for the description of great battles—whether of Christians against "Saracens," of the army of one great baron against another, father against son, brother against brother—and of single combats between individual champions. The ***Chanson de Roland*** was set in the context of Charlemagne's wars against the Saracens. Roland, hero of the Battle at Roncesvalles (or Roncevaux), was portrayed as a paragon of an unyielding warrior, victorious in defeat. The theme of individual honour and revenge was subordinated to that of crusading Europe united against the infidel. The 12th-century ***Pèlerinage de Charlemagne*** ("The Pilgrimage of Charlemagne") related various adventures of Charlemagne and his peers—Roland, Olivier, Guillaume d'Orange, Ogier the Dane, and others—in the context of Charlemagne's pilgrimage to Constantinople and Jerusalem. Guillaume d'Orange was the central hero of about 24 epics of the 12th and 13th centuries. There is little doubt that Guillaume was the same person as Wilhelmus, a Frankish nobleman and cousin of Charlemagne. ***Huon de Bordeaux*** involved fantastic materials, the hero being aided in his tasks by Oberon, king of faerie; that epic was known, in an English translation, to Edmund Spenser, Shakespeare, and John Keats.

Romance. Another form of narrative, difficult to define in formal terms, originated in 12th-century France. Formally, romance is distinguished from epic by being written in rhyming octosyllabic couplets instead of assonanced stanzas, or laisses. Romances were traditionally classified according to subject matter. Those based on the "matter of Britain" were concerned with stories about the legendary exploits of King Arthur's knights. Those based on the "matter of Rome," more accurately called ***romans d'antiquite'*** ("romances of antiquity"), dealt with Alexander the Great, Aeneas, and the legends of Thebes and Troy. A third group, known as *romans d'aventure* ("romances of adventure"), which contains a variety of themes, is best illustrated by such narrative poems as ***Floire et*** *Blanchefleur* and *L'Escoufle* ***(c.*** 1200) by Jean Renart.

Distinction between romance and epic and religious narrative

Romance as a separate genre is distinguished from epic and religious narrative by the fact that it recounted fictions for the delight and wonder they evoked, and not for any religious, political, didactic, or moral purpose. The romances of love, chivalry, and adventure that arose in 12th-century France were, at the outset, a creation of professional writers who had been educated in the study of the medieval trivium—grammar, rhetoric, and logic—and wrote for the amusement of aristocratic patrons. The term ***romanz,*** originally meaning the "vernacular" as opposed to Latin, became used about 1140 for vernacular translations or adaptations of Latin works the content of which was historical or pseudo-historical. Thus Wace's translation of Geoffrey of Monmouth's ***Historia*** *regum Britanniae* was known as ***Li Romanz de Brut*** (after Brut or Brutus, the mythical founder of Britain), and an anonymous adaptation of Virgil's ***Aeneid,*** as ***Li Romanz*** *d'Enéas.* It was with these and similar works—the story of Alexander the Great and the tales of Thebes and Troy—that the romance, both as a name and as a literary genre, began its evolution.

The Alexander romances, in style and form an epic rather than a romance, related the fictional biography of Alexander the Great as transmitted to the Middle Ages through Latin intermediaries. The ***Roman d'Alexandre,*** to which several authors contributed, was begun by Alberic de Briançon, grew up piecemeal over more than half a century, and was given final shape by Alexandre de Bernai. Like the chansons de geste, much of it dealt with wars and battles, but it is noteworthy for its fantastic elements, and especially for a section on the marvels of India by Lambert le Tort, and it was mainly to these exotic and marvellous features that it owed its great popularity.

The ***Roman de Thebes*** ("Romance of Thebes"), ***Roman d'Enéas*** ("Romance of Aeneas"), and ***Roman de Troie*** were all composed in the period 1150–65. They medievalized the classical world, in that they showed the warriors of antiquity behaving very much like medieval knights. More noteworthy is their technique, which reflected the influence of contemporary rhetoric in elaborate set descriptions and long passages in which the characters indulge in internal debate or self-examination, generally in connection with affairs of the heart. ***Troie*** and ***Enéas*** had a strong love interest, based on Ovid's conception of love as a restless malady. ***Troie*** also gave the story of faithless Brisei's, who abandoned Troilus, which. as expanded by Giovanni Boccaccio, formed the basis for Chaucer's ***Troilus and Criseyde*** and for Shakespeare's ***Troilus and Cressida.***

With Geoffrey of Monmouth's ***History of the Kings of Britain*** (1137), adapted into French verse in Wace's ***Brut*** (1155), a new world of imagination, that of Britain and the court of King Arthur, was opened up to writers of romance. Chrétien de Troyes (flourished 1165–80) was by far the most outstanding writer in this kind, and the impact of the Arthurian legend and courtly romance on later literature would have been less decisive had it not been handled by so accomplished a writer. Chrétien's romances, ***Erec et Enide, Cligès, Le Chevalier de la*** *charette* ("The Knight of the Cart"), ***Yvain,*** and ***Perceval,*** or ***Li conte del graal,*** were not limited to one type of subject. Chrktien told with equal zeal a story of a marriage between a lord and a poor girl ***(Erec);*** a love story of a young knight and the wife of the Emperor of Byzantium (*Cligès*); a tale of how Lancelot, the lover of Guinevere, the wife of his overlord, King Arthur, rescues his mistress from captivity ***(Le Chevalier de la charette);*** the adventures of a man who marries the widow of a man he has killed in single combat and who undertakes a series of adventures in which he is helped by a grateful lion ***(Yvain);*** and the story of a young and inexperienced knight's progress toward maturity, combined with the first known attempt at introducing the Grail theme into the Arthurian world ***(Perceval).*** Among the other themes that occur in Old French romances was that of the persecuted child regaining, after many adventures, his lost inheritance; ***Huon de Bordeaux,*** technically an epic, was a variant on this theme. The exceptionally popular ***Floire et Blanchefleur,*** which was translated into

English, Norse, Middle High German, and Middle Dutch, was a romance built around another popular theme: that of the separation and reunion of young lovers. But by far the most important medieval love romance was the story of Tristan and Iseult, originally composed in the form in which it is known in the second or third quarter of the 12th century, but preserved in its adaptations only, both in French and in other European languages—German, English, Old Norse, and Italian. The narrative poems of Béroul and Thomas (late 12th century) and Gottfried von Strassburg's *Tristan (c.* 1210) rank among the great masterpieces of the Middle Ages.

What Chrétien de Troyes's intention was in introducing the Grail theme into the last of his Arthurian romances it is hard to say, but the work had important consequences for the development of romance. About 1200, Robert de Borron, a Burgundian knight, produced a poem dealing with the origins of the Grail. Robert's apparent aim was to connect the Grail (interpreted as the vessel of the Last Supper) with the coming of a redeemer in the days of King Arthur. This notion of a predestined Grail hero appearing during Arthur's reign became the subject of two prose romances, *Perceval* and *Perlesvaus.* These works marked the beginnings of Arthurian prose romance, and prose thereafter became the leading romance form. The Arthurian romance in its classical stage was most fully developed in an anonoymous "vulgate" cycle of romances with its complex harmony of interwoven tales about the maimed Fisher King, the bleeding lance, the Waste Land, the love of Lancelot for Guinevere, the wizardry of Merlin, and the treachery of Mordred. Most of these tales are readily available to English readers in Sir Thomas Malory's *Morte Darthur*, the great example of creative adaptation, which secured the survival of Arthurian romance in the modern age.

Early lyric poetry. It was the poetic imagination of the trouvkres that shaped early lyric poetry in northern France. Poet-musicians of the 12th and 13th centuries writing in the langue d'oïl, they were largely influenced by the southern troubadours (see below). The word trouvère probably meant in the first place "maker of tropes" (that is, interpolations into the ecclesiastical chant). Whereas the troubadour school had reached its zenith by 1150, lyric poetry in the north is rarely attested before the Third Crusade (1189),

As in Provence, many of these lyrics were an expression of courtly love. The essential feature of this "love service" was the worship of the beloved by the lover, who conceived of her as a being altogether more excellent than himself and who was ennobled by the servitude of love and the suffering it entailed. This courtly attitude received unusual emphasis in all the lyric poetry of this period.

Northern verse forms

The verse forms of the north were remarkably similar to those of the troubadours: the solemn chanson, the medieval equivalent of the classical ode, usually addressed by the poet to his lady, but sometimes dealing with crusading themes; a variety of dance songs, characterized by a refrain, such as the rondeau, virelai, and ballade; and pieces in quasi-dramatic form, such as the *pastourelle* (pastoral) and the *aube* (dawn song). The *chanson de toile* was a song supposedly sung by a lady at her needlework. The term *sirventois,* which derives from the Provençal *sirventes,* meant a ribald satire suitable to a hired trooper *(sirvent),* but in the north it was soon applied to the pious hymns of the "servant" of the Virgin Mary. All these types of poetry were written to be sung.

Many of the lyrics were anonymous, but the names of some authors are known. Guy de Coucy and Blondel de Nesle acquired a legendary status: the former died on the crusade of 1203, while Blondel's name is remembered in association with that of Richard I of England. The most eminent trouvkre was Thibaut IV of Champagne, king of Navarre. Nearly half the extant trouvkre lyrics were the work, not of feudal lords, but of the citizen-poets of Arras, who formed themselves into a guild. The ablest among them was Adam de la Halle, who with Jean Bretal and others carried on the tradition of the *jeu-parti,* or debate in verse. A still more original note was struck by Colin Muset, who moved about the châteaus of the upper Marne Valley. He distinguished sharply between grasping and generous patrons and combined the conventional themes of young love with a realistic portrayal of his personal tastes (a good fire in winter, fat capons, and strong wine). The autobiographic and gastronomic theme was taken up by the versatile Rutebeuf, much of whose work involved controversy and satire aimed at the friars. Rutebeuf was the last of the trouvkres and the first modern poet and all-around man of letters.

Drama. The earliest drama in France, as elsewhere in Europe, consisted of liturgical plays, of which the best known were *mystères* (meaning originally "ceremonial acts," but by the 14th century "dramatic performances," and not to be taken as the exact French equivalent of the English "mystery" plays). These used biblical material, whereas the *miracles* were based on non-biblical legends about the saints. The offices of the church, themselves essentially dramatic, required little more than development by writers of *mystères.* The occasional revels of the lower clergy, such as the Feast of Fools, celebrated at Christmas and New Year, helped toward a development of drama distinct from that embedded in the liturgy.

The *mystères* and the *miracles*

The earliest dramatic works to use the vernacular were all anonymous 12th-century pieces: the *Sponsus*, partly in Provençalized French, partly in Latin; the Beauvais *Daniel* (in Latin, but with some liturgical refrains in French); and the *Mystère* (or *Jeu) d'Adam*, in French (from an apparently Anglo-Norman original) except for its Latin stage directions and readings. The earliest surviving *miracles* in French, Jehan Bodel's *Jeu de Saint h'icolas* (1200) and Rutebeuf's *Miracle de Thhophile (c.* 1261), were outstanding examples of this genre. Typical of the earliest known secular pieces were the short *Courtois d'Arras* (before 1228), a lively dramatization with a contemporary setting of the parable of the prodigal son; and *Le Garcon et I'aveugle* ("The Boy and the Blind Man"). The first wholly secular comic work of any worth was Adam de la Halle's *Jeu de la feuillée* (written after 1275), which poked fun at Adam's family, friends, and fellow citizens in a mixture of satire and fantasy and used characters from folklore (*e.g.*, the "three fairies" of many traditional tales). His *Jeu de Robin et Marion* (*c.* 1280) was a dramatized *pastourelle,* with songs and dances.

From the end of the 13th century onward, plays dealing with the Passion of Christ were produced with success. The *Passion de Semur* was characteristic of the type: consisting of 9,500 lines, it took two days to perform, began with the creation, and ended with the Ascension. Arnoul Greban's *Mystère de la Passion* (1450), which required four days to perform, is the most famed, poetic, and tragic of French passion plays.

Such plays, popular until the mid-16th century, began to give way in the 15th century to *moralifks, farces,* and *soties,* three kinds of comedy difficult to distinguish. The *moralité* could be serious or comic but was always didactic in intention; as it was often tedious, it was given variety by the introduction of farce. The *sotie,* or comedy played by *sots* ("fools," who dressed in costumes to suit their roles), was openly satirical. The *sotie* eventually perished as a result of its use in political attack; for example, Pierre Gringoire's *Jeu du prince des sots et mère sotte* ("Play of the Prince of Fools and Mother Fool," 1512), aimed at Pope Julius II, was later forbidden, being replaced as a weapon by prose pamphlets and by more general forms of satire. The *farce* had neither moral nor political intention and therefore was in no danger of extinction. Farcical interludes were interpolated in the *mystères* and were used to liven up the *moralitks.* In subject matter and style, medieval *farces* resembled the fabliaux (see below), their probable source. Treatment is narrative rather than dramatic, and liveliness of dialogue makes up for their lack of structurally planned plots.

The *sotie*

Allegory. Allegory, the capacity to find recurrent patterns in nature and to see analogies in different realms of human experience, was acquired by medieval man in school days (for instance, by reading Ovid with moral interpretations of the myths). While allegory is a kind of parallelism (as in treating man's life as a journey beset with dangers and distractions), the poetic symbol is somewhat different: it has been defined as "a clear visual image" that is "given much more intensity by having a meaning." The Grail is a symbol in this sense, and so is the cluster of images associated with the rose in the famous allegory of Guillaume de Lorris, the ***Roman de la rose*** (*c.* 1230; "The Romance of the Rose").

The *Roman de la rose*

The ***Roman de la rose*** began with a dreamer who enters a walled garden and looks into a transparent pool or wellspring, wherein he sees the rose reflected; the pool may represent the beloved's eyes, but, says the poet, it is also that well in which Narcissus drowned when he gazed too long at his own image. Upon this world of ambivalent symbols a formal allegory was superimposed: the dreamer seeks to obtain the rose and is aided or rebuffed by actors who personify the beloved's feelings, Fair Welcome, Disdain, and so forth. Before the outcome of the lover's quest had been revealed, Guillaume abandoned the work, unfinished; it was continued (*c.* 1275) by Jean de Meung, who used it as a vehicle for a series of sophistic debates. Nature and Genius expound the purpose of sex and procreation; Hypocrisy gives an inside account of the machinations of the mendicant friars in the University of Paris; and various political doctrines are canvassed. This most popular but most chaotic of medieval poems, which began as a delicate poetic fancy and ended as an "outline of modern knowledge," showed the medieval laity at the crossroads, politically illiterate yet eager to share in the heady speculations of the medieval university clergy.

Old French literature in its classical phase. A new start had been made in national history with the ***Grandes Chroniques de Saint-Denis*** (1274 onward) and the life of Louis IX by his companion, Jean de Joinville. The latter work is an attractive account of the saintly king, of which the core relates to day-to-day experiences during an ill-fated attack on the Nile Delta in the crusade of 1248–49, but it was retouched by the writer (1304–09) after his patron had been canonized.

Didactic literature of many kinds flourished at this period. Philippe de Rémi, sire de Beaumanoir (*c.* 1250–96), a romance writer, compiled the customary laws of his local region, the Beauvais (the ***Coutume de Beauvaisis,*** "Custom of the Beauvais"), first of a long series of such attempts. French was becoming the official language of the law in England and in the surviving coastal towns of the Kingdom of Jerusalem. The earliest French grammatical treatises were written in England in the 15th and 16th centuries and complete scientific encyclopaedias had been composed in French verse by Gautier (or Gossouin) de Metz and by the Italian Brunetto Latini.

The popularity of fabliaux

The 14th century brought an enormous extension in the scope and popularity of existing genres. Fabliaux (from the Old French noun ***fable),*** mainly produced in the 13th century, were preserved in manuscripts dating from the 13th and 14th centuries. These short narrative poems had a fair amount of realistic detail and were written to entertain and to arouse laughter. Sometimes the basis was a simple situation that could have been mirrored in real life, and the merriment provoked by many fabliaux depended on either indecorous or frankly obscene situations and observations. The most celebrated authors of fabliaux were the professional poets Jehan Bodel, Rutebeuf, and Jean de Condé, though there were also some talented amateur authors such as Henri d'Andeli and Philippe de Rémi, sire de Beaumanoir. Fables, especially the animal tales belonging to the cycle of Reynard the Fox (the ***Roman de Renart),*** also grew in popularity.

Though, before the 15th century, verse was the favourite medium, moral and educational works were also early written in prose; and household books containing, with accounts, family histories and suchlike material have been preserved from as early as the 13th century. Travellers' tales, especially by pilgrims to the Holy Land, culminated in the famous ***Voyages*** of "Sir John Mandeville" (flourished 1356), written in Anglo-Norman French. To the 14th century also belonged the ***Livre du Chevalier de la Tour Landry,*** written by the Chevalier to educate his daughters.

Eustache Deschamps, a journalist in verse who used the ballade to express the ephemeral interests of the knightly classes, is also notable as the first writer on French versification, in his ***Art de dictier,*** forerunner of a long series of ***Artes poeticae,*** while the greatest poet and musician of the age was Guillaume de Machaut. Deschamps's counterpart in prose was the last and greatest of the medieval chroniclers, Jean Froissart; for all his merits as a diarist in a brillant, disturbed epoch, Froissart is less interesting politically than are the historians of the preceding age (from Guernes de Pont-Sainte-Maxence to Joinville and Philip of Novara), who were both more critical and closer to the sources of power.

The true position of French in the literary Europe of the 14th century can be gauged most accurately from its reflection in writers from countries that had already moved some way toward literary maturity. Geoffrey Chaucer in England, Dafydd ap Gwilym in Wales, the Arcipreste de Hita in Castile, Giovanni Boccaccio in Italy were all in various ways steeped in French—its stories and its poetic metres, its manners and its rhetoric—yet each preserved and defined his national ethos and his personal originality within a European framework that, at the level of lay culture, had become distinctively and inescapably French.

The Middle French period (1380–1530). The later stages of the Hundred Years' War, and the papal exile at Avignon, form a new era in western Europe, in which the Valois rulers of France at first enjoyed immense influence. This was challenged by England and Flanders, and later by the ramifying Burgundian empire, which collapsed with the death of Charles the Bold in 1477. French ambitions revived in the 1490s with the first of a long series of invasions of Italy and intermittent occupations of Piedmont and Milan; but after the disastrous Battle of Pavia (1525), at which Francis I was taken prisoner, the Habsburg Empire, while retaining its hold on Flanders and Hainaut, annexed by treaty the whole of Artois as far as Arras and kept it for over a century. In the course of these wars, the centres of French culture shifted southward to the Loire Valley and Lyons, which at the end of this period had become the great mercantile and cultural centre of France.

In this age, France, no longer the main centre of European learning and chivalry, became a nation-state vying with others in a Europe whose military techniques and political geography had utterly changed. Under Charles V and in the early reign of Charles VI, a deeper devotion to the monarchy can be perceived; a small group of Humanists under court patronage—first the great translators Pierre Bersuire and Nicole d'Oresme, then Jean de Montreuil and Gontier Col and the first deeply learned woman writer in Europe, Christine de Pisan—mark the real origins of the Renaissance in France. The madness of Charles VI in 1392 led to a series of disasters for France, accompanied by clan feuds; at Agincourt (1415) the French chivalry was massacred by English crossbowmen, and the London government took over. Alain Chartier, secretary to the proscribed dauphin and the most versatile writer of his age, composed a dramatic poem depicting the plight of four ladies whose lovers had been killed, taken prisoner, or reported missing, or had simply fled with ignominy from the fatal field. In a terror-ridden postwar society, in which the bourgeoisie held great wealth, women in some circles greatly outnumbered men; new weapons had destroyed an ancient social caste, and a curiously modern, experimental attitude prevailed. There were "new men" proclaiming by costly tournaments and grotesque grave monuments a chivalry and piety that were confirmed by nothing in their ancestry or mores. Outrageous fashions in dress and bizarre views of sexual relations prevailed, leading to resounding literary controversies such as those initiated by Christine de Pisan, with her bitter, feminist critique of the ***Roman de la rose,*** and by Alain Chartier, with his sparkling dialogue between an arrogantly celibate lady and her despairing lover ***(La Belle Dame sans merci).***

To contemporaries, Alain Chartier was the great poet of the age; most modern critics, however, regard Charles d'Orléans as a superior writer of graceful poems in which an artificially contrived and imposed pattern of versification helps, by its recurrent lines and modulated rhythms, to provide something of a musical accompaniment even to poems not written for music. Though his ballades are inferior to those of François Villon, Charles's rondels (or rondeaux) are unequalled. Villon (died after 1463) was an incomparable figure in later medieval French literature. His main works, Le Testament and Le *Lais* (or Le Petit Testament), were written in eight-line octosyllabic stanzas, interspersed with lyrical poems in ballade or rondeau form. There was little in Old French literature to compare with the best of these, while the composition of the works as a whole was marked by both vigour and pathos.

Humanism, translation from the Greco-Latin classics, and Italian influence had already modified the language; a new and decisive influence was the use of French for administrative purposes throughout the kingdom. The final departure of the English from the provinces, some of which they had controlled for three centuries, led to the establishment by the monarchy of local high courts, or *parlements*, staffed by a legal caste, or noblesse de robe, deeply attached to the royal cause, who used French in their public deliberations but dialect, often Provençal or Gascon, in daily life. The pellucid grace, the phonetic purity, and the delicate sense of semantic values, characteristic of Old French in its classical phase, soon disappeared when French became the vernacular of an embryo nation-state.

Individualist aspects of the Renaissance, obsession with public success, and the rise and fall of military leaders found expression in the great school of contemporary historians that flourished at the court of Burgundy: Georges Chastellain (died 1474), Jean Molinet (died 1507), and Oliver de la Marche (died 1502). The greatest was Philippe de Commynes (died 1511), who left the service of Charles the Bold for that of Louis XI in 1472 and after a complex diplomatic career at court ended as ambassador to Venice during the French invasions of Italy in 1494–95. His Memoires, which span four decades, have won him the title of the first modern French historian.

An age of self-conscious modernity produces on the whole a literature of ideas—and nothing fades more quickly. Hence 15th-century literature is little read and studied, even by scholars. But the old medieval literature, with its deep humour and humanity, survived in the *nouvelle*, successor to the fabliau, and in dramatic literature, farces, and mystery plays, which are the living literature of the age. Lyric verse, wedded to music, preserved the ancient trouvère tradition and and even developed it to unprecedented achievements. Polyphonic music after Machault reached dizzy heights of mathematical complexity, and it was quite commonplace to sing simultaneous texts in different languages and on different themes, much as in certain scenes of modern opera. France, England, Flanders, Burgundy, and northern Italy entered into a kind of cultural symbiosis, which was not definitely modified until the Reformation era, when, with the northern breach with Rome and the decisive shift of French culture to a new Lyonnese centre, another literary period began.

ANGLO-NORMAN LITERATURE

The literature in the French dialect of medieval England is also known as Norman-French or Anglo-French. Though it had been introduced to English court circles in Edward the Confessor's time, its history really began with the Norman Conquest in 1066, when it became the vernacular of the court, the law, the church, schools, universities, parliament, and later of municipalities and of trade. For the aristocracy it became an acquired tongue and its use a test of gentility, and the more widely it was known the more it was corrupted. It was introduced into Wales and Ireland and used to a limited extent in Scotland before and during the wars of independence. The earliest extant literary texts belonged to the reign of Henry I, the latest to that of Henry IV. The diminution of friendly relations with France during the Hundred Years' War started an increasing use of English, the last strongholds of a French dialect being parliament and the law, in both of which it still survives in a few formulas.

Most types of literary works were represented in Anglo-Norman as in French, with a slight difference of emphasis. The chanson de geste was an exception. The type was not unknown in England (*e.g.*, the only surviving manuscript of the assonanced version of the *Chanson de* Roland is Anglo-Norman), but there seem to be no original works of the kind. Conversely, Anglo-Norman works were known, copied, or imitated on the Continent. One important difference between continental and Anglo-Norman literature is that the Fourth Lateran Council of 1215 led to an outpouring of doctrinal and devotional works for the laity in England not paralleled in France, which perhaps explains the fact that in the early periods England was often in advance of the Continent in the development of new literary forms. History was popular both in Normandy and on the Continent; and although, after the Norman Conquest, Latin replaced English in documents and chronicles, examples of both are found in Anglo-Norman. Religious houses caused lives of native saints to be written, and the nobility had a taste for romances about imaginary English ancestors. Thus social and political differences between the two countries prevented Anglo-Norman literature from being a mere imitation of French.

Influence of the Fourth Lateran Council

Religious and didactic writings. In the 12th century the oldest substantial Anglo-Norman prose work, "The Book of Kings," was written in England, as were many versions of the Psalter. Sanson de Nanteuil translated into verse the proverbs of Solomon, with commentary; and in the 13th century Robert of Greatham wrote the Sunday Gospels for a noble lady. The same century saw the beginning of the magnificent series of Anglo-Norman apocalypses, best known for their superb illustrations, which served as a model for a series of tapestries at Angers, France. In the 14th century an Anglo-Norman Bible was begun, though never completed. Anglo-Norman was rich in literature of legends of saints, of which Benedeit's "Voyage of St. Brendan" was perhaps the oldest purely narrative French poem in the octosyllabic couplet. Wace led the way in writing a saint's life in standard form but was followed by Anglo-Norman writers in the 12th century who wrote numerous lives, many connecting religious houses with their patron saints.

The oldest play in French, the Mystdre *d'Adam*, is Anglo-Norman. The resurrection play La Seinte *Resureccion* was probably 12th century but was rewritten more than once in the 13th century; it is unique in having stage setting and action described in passages of verse that seem to have been designed to be read during the performance. There were a few religious allegories, the most important, the "Castle of Love," being the oldest in French.

The Fourth Lateran Council of 1215 led to the compilation of instructive works, the oldest and most attractive being the Merure de seinte *église* ("Mirror of Holy Church") by St. Edmund of Abingdon. In the 13th–14th century countless treatises appeared on technical subjects—manuals for confession, agriculture, law, medicine, grammar, and science, together with works dealing with manners, hunting, hawking, and chess. Spelling treatises produced in the late 13th, 14th, and 15th centuries are valuable for the light they shed on continental French as well as Anglo-Norman.

Romances. Anglo-Norman literature was well provided with romances. In the 12th century one Thomas wrote a courtly version of the Tristan story, which survived in scattered fragments and was used by Gottfried von Strassburg in *Tristan* und *Isolde* as well as being the source of the Old Norse, Italian, and Middle English versions of the story. Béroul's Tristan, also 12th century, was probably written in England, but by a Norman; *Waldef*, a long, confused story of an imaginary king of East Anglia and his sons, has passages of remarkable originality. In the 12th century some romances were composed in the form of the chanson de geste; for example, ***Horn,*** by Master Thomas, which is connected with the Middle English ***Horn Childe and Maiden Rimnild.*** Yet another Thomas wrote the ***Roman de toute chevalerie*** ("Romance of All Chivalry"), an independent version of the Alexander romance and the source of the Middle English romance ***King Alisaunder.*** In the 13th century the more courtly type of romance reappeared in *Adamas et Idoine* and in *Amis et Amiloun,* perhaps derived from the same source as the Middle English poem ***Amis and Amiloun.***

The *Lais* of Marie de France

Lais and fabliaux. Marie de France, earliest named French woman poet, about whom little is actually known, wrote fables based on an English source and 12 narrative lays (dedicated, probably, to Henry II of England) in octosyllabic rhymed couplets. She claimed that they had Breton lays as their originals. The ***Lais*** combined realistic and fairy-tale elements, and their author was skillful in the analysis of love problems and often showed a keen interest in contemporary life. A few fabliaux have been found copied in manuscripts from religious houses, probably for exemplary purposes.

Political and historical writings. Anglo-Norman lyrics were few in number and unoriginal in form, but numerous political satires and songs were written. Fragments of political songs are found in Peter Langtoft's ***Chronicle,*** which begins as a ***Brut—a*** complete chronicle of British history—but became a source for the times of Edward I; while the Dominican Nicholas Trevet wrote a prose chronicle of European history from which Chaucer derived his "Man of Law's Tale." Earlier than these was an Anglo-Norman verse, ***Estoire des Engleis,*** by Geffrei Gaimar (*c.* 1140), the earliest chronicle in French. Two magnificent biographies of the 1st earl of Pembroke (William Marshal) and of Edward, the Black Prince, were written for English patrons by foreigners. Official documents were often in Anglo-Norman, and the ***Yearbooks,*** unofficial reports of cases in the common pleas, ran from the reign of Edward I to that of Henry VIII. English began to be used in Parliament alongside French in the late 14th century.

Natural history and science. One of the earliest writers in Anglo-Norman, Philippe de Thaon or Thaün, wrote ***Li Cumpoz (The Computus),*** the first French bestiary, and a work on precious stones. Simund de Freine based his ***Roman de philosophie*** on Boethius, to whom the 13th-century ***Petite Philosophie*** also owes much. All these are allegorical or didactic.

MEDIEVAL PROVENCAL

The literature written in the oc-speaking southern France and, for a limited period, in Italian and Spanish cultural dependencies can be divided into three periods, two of which fall outside the scope of this section: the first, a period of unity during which a literary language called "classic Provenqal" was universally written, if not spoken (11th–15th century); the second, a period of dispersion in which a variety of provincial dialects were developed (16th–18th century); and the third, a period of partial recovery (19th–20th century).

Poetry. The oldest piece of Provenqal verse extant, a refrain in a Vatican manuscript, probably belonged to the 10th century. More important are a fragment of didactic verse preserved in an Orléans manuscript and the beginning of an anonymous adaptation of Boethius' treatise ***On the Consolation of Philosophy.*** At the close of the 11th century, there were the poems of William IX, duke of Aquitaine (Guilhem VII of Poitiers), 11 strophic pieces (in stanza form with repeat lines) meant to be sung. Several were love songs, and the most important expressed the writer's regret for the frivolity of his past and apprehension at bidding farewell to his country and his son. The contrast between Boethius' poem and the stanzas of William IX indicates that by the 11th century Provenqal poetry was developing in various directions. Apparently Romance poetry sprang out of a popular poetry from Roman times, which was gradually refined, in keeping with its aristocratic audience. The origins of the poets were indicated by Latin chroniclers, who mention ***ioculares,*** men of a class not highly regarded, whose profession consisted in amusing their audience by juggle tricks, exhibiting performing animals or by recitation and song. They were called ***joglars*** in Provençal, ***jongleurs*** in French. From among them rose the troubadours, who originally may have been *joglars* skilled in poetry.

Provenqal love songs

Provenqal love songs reflected social conditions in the Midi (southern France) under feudalism. Daughters of territorial lords were married for political reasons and welcomed attentions of courtiers, who addressed songs of love to them. As the poets were usually far beneath the ladies in social status, they wrote in a most guarded style. This profession of "courtly," or "chivalrous," love became a matter of convention, but it would be a mistake to assume that the real experiences were as platonic as the expression of them.

The troubadours. By the end of the 11th century a clear distinction had been drawn between the lower sort of *joglars* and refined poets, troubadours of both lower and noble ranks of society. William IX had been the first of the troubadours. In the first part of the 12th century, Cercamon, a Gascon, composed pastorals, and his pupil Marcabrun wrote about 40 pieces, several of which were concerned with contemporary history. Jaufré Rudel of Blaye, a nostalgic singer of the ***amor de lonh*** (distant love), is scarcely less famous. Slightly later in the same century Bernart de Ventadour composed songs of elegant simplicity, some of which may be taken as perfect specimens of Provenqal poetry. His contemporary Bertran de Born is famous for the part he is said to have played both with his sword and his *sirventes* (a form of Provençal lay) in the struggle between Henry II of England and his rebel sons. Other troubadours include Arnaut Daniel, a master of complicated versification and difficult form; Guiraut de Borneil, an acknowledged master of ***trobar clus*** or "close" style, though he also composed songs of charming simplicity; Arnaut de Mareuil, noteworthy for his exquisite delicacy of sentiment; the somewhat eccentric Peire Vidal of Toulouse; the chivalrous Raimbaut de Vaqueyras; Folquet de Marseille (a monk who became bishop of Toulouse); the truculent monk of Montaudon; and the satirical Peire Cardenal.

Effects of the Albigensian Crusade

When in the first decades of the 13th century the Albigensian Crusade had ruined a large number of nobles of the Midi, the profession of troubadour ceased to be lucrative, and many went to spend their last days in the north of Spain and Italy, where Provenqal poetry was esteemed. Following their example, other poets began to compose in Provenqal, but from the middle of the 13th century they began to abandon the foreign tongue and took to the local dialects. About the same time in the Midi itself poetry had died out save in a few places, and in the 14th century works were mainly for instruction and edification: the poetry of the troubadours was dead.

Chansons de geste and historical poems. Provenqal literature has some highly important specimens of the chansons de geste (poems in stanzas in indefinite length, with a single rhyme). The first place belongs to ***Girart de Roussillon,*** a poem of 10,000 lines, which related the struggles of Charles Martel with his vassal Gerard of Roussillon; it was a recast of an older poem no longer extant, probably of French or Burgundian origin. Midway between legend and history was the Provenqal chanson on the siege of Antioch. To history proper belonged a chanson of the crusade against the Albigensians, which, in its present state, is composed of two poems. The first was the work of Guilhem de Tudela; the second, different in language, style, and opinions, was a masterpiece of Provenqal literature.

Narrative poems. Only three Provenqal romances of adventure have survived: ***Jaufré, Blandin de Cornoalha,*** and ***Guillem de la Barra.*** Connected with the romance of adventure was the ***novel*** (in Provenqal, plural, ***novas),*** which was originally an account of an event recently happened. Some of them could be ranked with the most graceful works in Provenqal literature. Two were by the Catalan author Ramon Vidal de Besalú: the ***Castia-gilos*** was an elegant treatment of a story of the husband who disguises himself as his wife's lover, and the other was a recital of a question of the law of love. Mention may also be made of ***Novas del Papagai*** by Arnaut de Carcassès, in which the principal character is an eloquent parrot, who assists his master's amorous enterprises. Novels came to be extended to the proportions of a long romance, and ***Flamenca*** was a poem of over 8,000 lines, in which a lady by ingenious devices eludes the vigilance of her jealous husband: no book in medieval literature had more quickness of intellect or was more instructive about the manners and usages of polite society in the 13th century.

Didactic and religious poetry. The more important works were a very early Boethius poem already mentioned, an early metrical translation of the ***Disticha de moribus*** of Dionysius Cato, and Daude de Prades's ***Auzels cassadors***, a source for the study of falconry. More original were some compositions whose general object was the education of ladies of rank. Of metrical lives of saints, there remain about a dozen, including a life of St. Fides, a life of St. Enimia by Bertran of Marseilles, and one of St. Honoratus of Lérins, distinguished for variety and elegance of versification but almost entirely a translation from Latin, by Raimon Feraut.

Drama. The dramatic literature of the Midi consisted of mysteries and miracle plays seldom exceeding 2,000 or 3,000 lines and generally belonging to the 15th or 16th century. The oldest appears to be the "Mystery of St. Agnes," written in Arles. Later came a mystery on the Passion of Christ and another on the marriage of the Virgin, the latter partly adapted from a French poem of the 13th century.

Prose. In the 12th century, in Languedoc, sermons whose importance is more linguistic than literary were written, and, about the same time, in Limousin, St. John's Gospel was being translated. Various translations of the New Testament and of some parts of the Old were made in Languedoc and Provence during the 13th and 14th centuries. To the 13th century belonged certain lives of troubadours intended to be prefixed to and to explain their poems, many of them being written before 1250, when the first anthologies of troubadour poetry were compiled. To the same period belonged ***Las Razos de trobar*** of the troubadour Ramon Vidal de Besalu (treatise on various points of grammar and the poetic art). A leading prose work of this period was a treatise on grammar, poetry, and rhetoric known as ***Leys d'amor,*** composed in Toulouse. The decay of Provençal literature, caused by political circumstances, arrived too soon to allow a full development of prose.

MEDIEVAL ENGLISH LITERATURE

The Old English period. Since the effects of the Norman Conquest on English literature began to be apparent in the early 12th century, pre-Chaucerian writings are conveniently divided between an Old English (Anglo-Saxon) and an Early Middle English period, with the division at about 1100.

Poetry. The Angles, Saxons, and Jutes that settled in Britain in the 5th and 6th centuries AD had an oral poetic tradition, but no poetry from the pre-Christian period has survived except as fragments in gnomic verses and heroic poetry composed in Christian times. The metre of Old English poetry, with a rich poetic diction suited for heroic themes, had its roots in the pagan past. It was sometimes sung to the harp, not only by minstrels but also by humbler performers, the peasants in the Venerable Bede's story of Caedmon. According to Bede, whose ***Historia ecclesiastica gentis Anglorum (Ecclesiastical History of the English Nation)*** is a main source for Anglo-Saxon history, it was a Northumbrian peasant, Caedmon, who first used the traditional metre and diction for Christian religious poetry. He entered the monastery of Whitby, where he composed many poems, but only the first nine lines of a hymn on the creation have survived. Biblical poems are also contained in the Junius (Caedmon) manuscript and three poems known collectively as ***Christ and Satan.*** This manuscript was one of the four manuscript collections of Old English poetry, all written *c.* 1000. The others were the Beowulf manuscript, The Vercelli Book, and The Exeter Book. Most of the poetry in these manuscripts dated from the 8th or 9th century. Outside these collections, there remain a few short pieces in 8th-century form from various sources.

Manuscript sources of poetry in Old English

Since Old English literature was preserved almost entirely by religious houses, it is not surprising that the extant poetry is largely religious. Besides didactic poetry and some close handlings of biblical material, such as Genesis and Daniel (from the Junius manuscript), there is in Exodus (from the same source) a heroic picture of Moses by an original and imaginative poet and in "Judith" (from the Beowulf manuscript) a colourful apocryphal story. Heroic tradition also influenced "Elene" and "Juliana" by Cynewulf, and two other poems of his are extant, "The Fates of the Apostles" and "The Ascension" ("Crist" II). All his work was marked by clarity and metrical skill, using rhyme as an additional ornament. By far the most remarkable religious poem was "The Dream of the Rood," with its moving account of the crucifixion placed in a dream framework in which the dreamer sees the cross dominating the universe; in depth of feeling and expression this is one of the greatest religious poems.

The terms lyric and elegiac are applied to The Exeter Book poems: "The Wanderer," "The Seafarer," "The Ruin," "The Wife's Complaint," "The Husband's Message," and "Deor." All were poems written with great power and told of the sentiments of individuals in typical situations. "Deor" made use of heroic legends, for in it a legendary minstrel consoles himself for loss of his post by remembering how various heroes have passed through affliction to better times. Had The Exeter Book been lost, the existence of this body of sensitive and poignant lyric would never have been suspected.

Only the fragments "Waldere" and "The Fight at Finnesburg" remain to give a glimpse of the dramatic quality of heroic narrative poetry. Allusions to such stories were used for various purposes in "Deor" and in ***Beowulf.*** In this poem, the most important of all that survive, the narrative of the hero's exploits against monsters was placed in a context of the heroic past. ***Beowulf*** is more than a heroic poem; it has deep religious significance, the monsters being depicted as the enemies of God and the human acts of violence, disloyalty, and ambition being shown to bring retribution. In diction, vividness, and narrative power, it takes first place among surviving poetry from this age.

The heroic and religious in ***Beowulf***

Finally, there was some poetry on historical themes, notably, "The Battle of Brunanburh" and the fragmentary "Battle of Maldon" (written soon after 991), a dramatic and vigorous narrative showing that heroic ideals of loyalty and courage were still fully alive.

Prose. The writing of Old English prose began soon after the conversion of the English to Christianity following the mission led by St. Augustine of Canterbury to southeast England in 596–597. The laws of Aethelberht I were written down c. 602–603, though they survived only in a 12th-century manuscript. The turning of the Lord's Prayer and the creed into English were equally early. Seventh-century kings of Kent issued legal codes, and in the 9th century it was common for wills and other deeds to be written in English; before the century closed King Alfred claimed that many persons could read English. From his reign (871–899) survived the first literary prose, and, though much was based on Latin originals, it is a mistake to dismiss it as uninteresting. Even the translation of St. Gregory's ***Dialogues*** by Werferth and Alfred's rendering of ***Cura Pastoralis (Pastoral Care)*** contained passages not in the original works; the version of Bede's ***History*** translated from the Latin included sections in vivid, natural prose. Of far greater literary interest are Alfred's adaptations of Boethius' ***Consolation of Philosophy*** and of St. Augustine's ***Soliloquies,*** which used other sources and also included original passages of high quality. The version of Orosius' ***Historia adversus paganos*** ("History Against the Pagans"), attributed to Alfred, was freely rendered: it was greatly compressed but retained a general theme of the working out of God's will in history and revealed an individual point of view influenced by heroic tradition.

It was in Alfred's reign that ***The Anglo-Saxon Chronicle***

The Anglo-Saxon Chronicle

was first compiled. It recorded briefly events prior to the 9th century, except that an untypically vivid account of a feud was inserted into the annal for 755. The events of the 9th century were related in plain narrative styles, which continued to the death of Edward the Elder in 924. Chronicle writing was in abeyance for some 50 years; and when it was resumed, its writing shared the great advance that characterized the writing of the period after the 10th century monastic revival, which was one of the great periods of English prose. Its most famous exponents were Abbot Aelfric and Archbishop Wulfstan of York, both in Aethelred's reign. Aelfric wrote in a restrained style of great beauty and elegance, while Wulfstan ranged from impassioned appeal to measured statement of religious truths. Much of the content of the works of this time came from Latin sources but was so handled as to make the results literature in their own right. Bishop Aethelwold of Winchester translated the Benedictine Rule, and the Gospels and parts of the Old Testament were also translated at this time. As a result of all this activity, a remarkable vocabulary developed. Interest in science was shown by Byrhtferth's ***Manual*** and by Aelfric's ***De temporibus,*** both based on Bede's scientific works. Finally, some literature of entertainment has come down. Three pieces on marvels in the Beowulf manuscript, a fragmentary ***Life of St. Christopher, Alexander's Letter to Aristotle,*** and ***Wonders of the East*** were written in indifferent prose, but the Greek romance ***Apollonius of Tyre*** was lucidly and cogently rendered.

Throughout the period, from the late 7th century on, Latin works were produced; yet it was the creation of a large body of vernacular literature, in verse and prose, that was one of the most remarkable achievements of the Anglo-Saxons, without parallel among other European races of early times. The excellent writing of the ***Chronicle*** continued, and great activity in the production of manuscripts, some of them beautifully illuminated, was maintained throughout the 11th century. In literature (as in several other respects) the civilization of the Anglo-Saxons was superior to that of the Normans, who conquered them in 1066.

Early Middle English period. The extant texts suggest that the Norman Conquest had little immediate effect on English writing: during William the Conqueror's reign even royal writs and charters continued sometimes to be issued in English. Changes came about gradually, through influence from continental culture.

Prose. ***The Anglo-Saxon Chronicle*** continued until 1154, maintaining and at the same time modifying old traditions. The last two sections contain a famous description of the anarchy in Stephen's reign and the black comedy of Henry of Angély's abbacy at Peterborough. The abandonment of English historical writing was mainly due to a growing use of Latin for all work intended as more than ephemeral entertainment: a consequence not so much of the Conquest as of the 12th-century revival of learning throughout western Europe. A brilliant school of Anglo-Latin chroniclers arose, the earliest being Edmer of Canterbury and the best known William of Malmesbury. By the 1130s Latin chronicling merged into prose fiction, with Geoffrey of Monmouth's ***History of the Kings of Britain,*** one of the earliest surviving treatments of the Arthurian legend, here blended with the legend of how Britain had been colonized by Brutus of Troy. Latin was used even for works of local interest and for lives of such contemporary English saints as Wulfric of Haselbury, William of Norwich, and Aelred of Rievaulx. In this field French verse also soon came to be used. Before 1140 Geffrei Gaimar had compiled his ***Estoire des Engleis,*** and other Anglo-Norman metrical chronicles included Wace's ***Roman de Rou.*** By about 1300, metrical chronicles and saints' lives were appearing in English, the best known of such chronicles being those of Robert Mannyng and Robert of Gloucester.

Early Middle English devotional writing

Yet despite competition from Latin and French, English prose was still used for devotional writing, presumably because in this type of work neither intellectual pretension nor aristocratic patronage counted for as much as general intelligibility. The most famous English prose works of this period were the collection known as the ***Katherine Group*** and a long treatise on the religious life known as the ***Ancren Riwle*** or ***Ancrene Wisse*** ("Guide for Anchoresses"). Though contrasting in style (the ***Katherine Group*** being old-fashioned in diction and heavily alliterative, the ***Ancrene Wisse*** supple in style and language, including numerous French loanwords), they had in common the influence of continental thought.

Verse. For verse the range of genres was wider, and competition and influence from Latin and French traditions were more complex. Latin hymns had been current wherever the Roman Church had reached; and, with the patronage of secular literature in the hands of the Anglo-Norman aristocracy, French verse flourished in post-Conquest England. The oldest and best manuscript of France's great early national epic, the ***Chanson de Roland,*** was Anglo-Norman. With many in England bilingual and some trilingual, Latin and French verse could not but affect English modes. By the late 12th century these influences had transformed English prosody. While Layamon's ***Brut*** used an irregular metre, a compromise between the Anglo-Saxon alliterative line and the French octosyllabic couplet, the ***Ormulum,*** a series of metrical homilies composed about the same time by Orm, used a 14-syllable line of Latin origin, with alliteration only for ornament and emphasis. ***The Owl and the Nightingale*** (late 12th century) used an adaptation of the commonest French metre, the octosyllabic couplet, soon to be established as the standard English metre for narrative and discursive writing, and the poem exhibited a poised acceptance of continental themes as well as forms: staging a debate between the two birds, the poet ranged over many topics—witchcraft, the church, and marriage—although whether the birds had any consistent symbolism is disputed. Much of the poem's merit lies in its diction, natural and lively, yet elegant.

Layamon's ***Brut***

Layamon's ***Brut*** contrasts with the ***Owl*** in every way. Translated from Wace's ***Roman de Brut*** (his translation of Geoffrey of Monmouth's Latin ***History of the Kings of Britain),*** it rendered its material in Anglo-Saxon heroic terms, suppressing the chivalric elements. Archaic even in its own time, the diction assimilated King Arthur to early Germanic heroes. The first Arthurian work in English, Layamon's ***Brut*** may have remained the only one until ***Arthour and Merlin*** appeared toward the end of the 13th century.

As a bourgeois counterpart to the aristocratic Arthurian cycle stood the ***Roman de Renart,*** irreverent and satirical. How well this was known and appreciated in England is implied by widespread use of motifs from it in carvings; but only one pre-Chaucerian tale, ***The Vox and the Wolf,*** has survived. In the same manuscript was ***Dame Sirith,*** the only pre-Chaucerian English representative of the realistic, usually ribald, verse tale known as the fabliau.

Other narrative genres are more amply represented. The verse romance was widely cultivated in English by the mid-13th century, the earliest example extant being probably ***King Horn (c.*** 1225). Most early romances in English seemed meant for popular rather than aristocratic audiences. ***Havelok the Dane,*** which told how a Danish prince in exile as a Grimsby fisherman's son regained his inheritance, gave a scullion's view of castle life and endowed its hero with working class virtues, while ***Floris and Blauncheflur***, translated from a French tale of Oriental origin, excised sentimental embellishment so as to allow concentration on the plot. Within the romance genre was the "Breton lay," a tale of love and magic, often with a Celtic setting, as in the ***Lais*** of Marie de France. The most attractive English "Breton lay," ***Sir Orfeo,*** which retold the Orpheus legend in Celtic terms, is notable for the simple elegance of its structure and diction.

Early Middle English lyric works

The most novel genre in early Middle English was the lyric. In Old English lyric metres were unknown, "Deor" and some of the ***Charms*** representing the nearest approach; nor did the dominant themes of love and springtime much concern Old English poets. In western Europe generally, the vernacular lyric began only in about 1100, with the work of the Provençal troubadours, but spread rapidly appearing in English by the early 13th century. Before 1170 simple hymns were composed by St. Godric of Finchale, and, according to Giraldus Cambrensis, whose contemporary accounts are a valuable source for this period, dance songs with refrains were current among the peasantry in the late 12th century. The earliest English secular lyric extant was *c.* 1200; the earliest noted with music were "Mirie it is while sumer ilast," from about 1225, and the famous "Sumer is icumen in." From the mid-13th century on, lyric anthologies survived in fair number, the most famous being the "Harleian Miscellany," probably compiled 1330–40. Its contents are mixed, the same hand copying secular and religious pieces, verse and prose, French, Latin, and English.

Thus the early Middle English period showed English literature being transformed by influences from the Continent, but gradually and without losing its own identity.

From Chaucer to the Renaissance. ***Poetry: the alliterative tradition.*** The middle of the 14th century saw the beginning of a new fertility in the composition of long poems in an alliterative metre. Among the early group were very varied themes—love romances such as ***William of Palerne*** (before 1361); quasi-historical fragments on the life of Alexander; political satire such as ***Winner and Waster;*** and religious legend such as ***Joseph of Arimathie*** (*c.* 13-50), treating of the Holy Grail. Surviving records give an impression that alliterative verse had suddenly been taken up again after a long interval, and the movement is generally called the alliterative revival. The differences from Old English technique were due largely to developments in the language, and the "revival" should therefore be seen as a striking expansion of an existing way of writing. It was a western and northern movement, contrasting with the rhyming technique widespread in London and the east. This kind of verse continued to be written in Scotland up to the early 16th century. There is a considerable volume of it, and the best work, all apparently 14th-century, is equal to the finest that Chaucer wrote. The "heroic romance" ***Morte Arthure*** is virile and noble and served as Sir Thomas Malory's model for part of his ***Morte Darthur. Piers Plowman*** (earliest version *c.* 1370; attributed to William Langland) expressed in a complex allegory, with unique power and richness, the author's faith in man's need for Christian truth and charity. The poem is long and irregularly constructed; its language is often unpolished and its metre loose. But its intensity of feeling and range of thought have no parallel. It is a magnificent statement of the mind and faith of the late 14th century and one of the greatest of English poems.

Piers Plowman and ***Sir Gawayne and the Grene Knight***

In a very different tone was the chivalric romance ***Sir Gawayne and the Grene Knight,*** in which the author told a tale of enchantment in an Arthurian setting; but he depicted his characters and his hero's moral dilemma with such subtle understanding that the poem becomes a serious reflection upon human conduct: Gawayne is represented as a devout Christian, humanly imperfect. The alliterative lines are tautly constructed, and the vocabulary is extraordinarily rich—strongly influenced by French but coloured also by dialect words of northwest England. The blend of sophisticated atmosphere, psychological depth, and regional language produces an effect unlike that of any other work of the time. In the same manuscript as ***Sir Gawayne*** and with so many stylistic similarities that they are generally attributed to the same author were two alliterative poems of moral teaching, "Patience" and "Purity" (Cleanness), and an ostensibly elegiac poem called "Pearl," in which the poet sees a vision of his daughter who died in infancy and is instructed by her in submission to God's will. He conducts a theological debate with intricate technique, showing in descriptions an enjoyment of colour and light as in ***Sir Gawayne;*** yet for all this complexity he conveys a poignant sense of personal grief.

Poetry: the Chaucerian tradition. The alliterative revival reached great heights, yet it was the end of a line. The future lay mainly with the tradition of Middle English verse modelled on French in the early Middle English period. Soon after the alliterative revival began this other tradition acquired new life from the early works of Geoffrey Chaucer, which, however, for all their skill, still owed an enormous debt to France—the influence of the *Roman* ***de la rose,*** which Chaucer says he translated, was very great. The ***Book of the Duchess*** and the ***House of Fame*** take up the humorous detachment foreshadowed in ***The Owl and the Nightingale*** and employ the same verse form. It was with the *Parliament of Fowles* that Chaucer established himself as a powerful new genius. It has some philosophical depth as well as humour, and the dialogue looks forward to the superb conversation scenes of ***Troilus and Criseyde.*** In the ***Parliament*** Chaucer used, for the first time in a major English poem, the ten-syllable line, which has been important ever since. He adopted it from French, with the additional example of the Italian poets, whom he had begun to read and imitate. The *Parliament* was arranged in stanzas of seven lines, the "rime royal" that Chaucer used again in ***Troilus and*** *Criseyde.*

Continental influences on Chaucer

It was in the "Prologue" to the ***Legend of Good Women*** that he first used the ten-syllable line in couplets, which he continued to use in most of ***The Canterbury Tales.*** Chaucer's absorption of continental influences is most strongly seen in ***Troilus and Criseyde;*** his plot was derived from Boccaccio, much philosophical background from Boethius and Dante, much of his attitude to his leading characters from conventions of courtly love—but he transformed Boccaccio's direct narrative, especially by deepening the treatment of character. Yet though ***Troilus and Criseyde*** may be considered Chaucer's masterpiece, it cannot finally stand against ***The Canterbury Tales.*** Though the tales vary in interest, the finest of them are immensely rich in the subtle play of incident and character, and the pilgrims who tell them are revealed, in the linking passages and in the incomparable "Prologue," with the greatest shrewdness and penetration.

Chaucer was early recognized as a great master of English poetry but seemed less pre-eminent than he does today. John Gower, an older contemporary, was much praised up to Elizabethan times. Like Chaucer, he was a court poet, and his principal English work consisted also of a series of stories, ***Confessio*** *amantis* ***(Confession of a Lover).*** He also wrote two long didactic allegories, the ***Mirour de*** *l'omme* ("Mirror of Mankind") in French and ***Vox clamantis*** in Latin, which merit the address "O moral Gower" with which Chaucer dedicated to him ***Troilus and Criseyde.*** Gower's work helped to consolidate the literary use of the cultivated language of London and the rhymed verse characteristic of the south and east. After Chaucer the practice of rhyme and all that accompanies it in diction and manner became dominant.

Chaucer's successors acknowledged their debt to him. Thomas Hoccleve, in ***The Regement of Princes,*** called him "the first fynder of our faire langage." Hoccleve's works were for the most part naïvely didactic, and one of his main faults was the affecting of Latinate vocabulary, which became a very common habit. It was much practiced, especially in his shorter poems, by John Lydgate, who also felt intense admiration for Chaucer and imitated him as far as he could, writing ***The Falle of Princis*** in the rime royal that Chaucer had used in ***Troilus and Criseyde.*** Lydgate's long poems were verbose and laboured, but some shorter ones, such as the satire of ***Chichevache and Bycorne,*** were more successful. He was greatly admired in his own day and his influence on other writers was greater than his merits.

After Lydgate the Chaucerian, or "courtly," tradition persisted mainly in minor works. Many short love lyrics have been preserved, some by known authors such as William de la Pole and Charles d'Orléans, the best of them being highly accomplished, though generally skillful variations upon familiar themes. Of longer poems perhaps the finest was the anonymous ***The Flower and the Leaf,*** a graceful "debate" poem in rime royal, purporting to be written by a woman. The tradition continued into the 16th century.

Non-courtly poetry. The courtly tradition was not the only poetic field cultivated in the 15th century: there was

Carols and ballads

a great body of religious poetry. The prayers and songs were often rather formal; the best were the simplest, perhaps the finest of all the famous "I syng of a mayden that is makeles." This song was close in spirit to Christmas carols, and it was in the 15th century that the carol first appeared in English in great numbers, most of those that survive being anonymous. An important group was formed by the "lullaby" carols, which descended from the type of a 14th-century song, "Lullay lullay, litel child, whi wepest thou so sore?"

Beside the richness of the devotional verse secular non-courtly poetry was limited in interest, but there were highlights. The outstanding poem was "The Nut-Brown Maid," a delightfully managed dialogue on women's constancy. This, with its theme of the outlaw, had affinities with the Robin Hood ballads, and these too flourished in the 15th century, though they must have originated much earlier. How far late forms of ballads such as "Chevy Chase" and "Sir Patrick Spens" date from this period is debatable; but there was a wide range of ballad themes: dramatic scenes of battle, romantic elopements and pursuits, supernatural visitations. Nearly all were northern or Scottish in language and setting, and many achieved, with their austere technique, great power of feeling. Political themes appeared in a good deal of 15th-century verse, whose topics extended from a carol of thanksgiving for the victory of Agincourt to coarse triumph over a defeated opponent. The most important political poem was the anonymous *Libelle of Englyshe Polycye* (c. 1436–37). There was also still a public for chivalric romances, several of which were translated or adapted from French, whereas others were more or less independent compositions, though heavily derivative in incident and language. Some show a fair control of plot and some capacity for lively description, but in the main they are shapeless and unoriginal. Much of this later romance fully merited the ridicule that Chaucer poured upon the genre in *Sir Thopas.*

The works of John Skelton

Toward the end of the century came the unique figure of John Skelton, who fit into no tradition yet who was rather a reactionary than a man of the Renaissance. His most characteristic verse, a succession of short rhyming couplets, was all his own and was most effective in passages of violent action or invective but could also be strangely successful in tender moods—the lyrics in the "Garlande of Laurell" (1523) have a freshness that looks forward to the great flowering of Elizabethan song. In the keenness of his mind, the depth of his human sympathy, and his mastery of words Skelton was the greatest English poet of his time.

The Wakefield cycle

Drama. The beginnings of English religious drama belonged to the 13th century, but only two fragments have survived from c. 1300. The most important texts were the cycles from Chester, York, Wakefield, and the so-called *Ludus Coventriae* or *Hegge Plays,* which probably were from Norfolk. The Chester cycle covered in 25 plays Bible stories of the history of mankind from the Fall of Lucifer to the Day of Judgment. The work of the "Wakefield Master," who contributed five plays and parts of others to the Wakefield cycle, was distinguished by a stanza form combining rhyme and alliteration, and a humorously realistic treatment of character and original command of colloquial language. The Wakefield plays were the finest in variety of interest and in literary quality. All these cycles were plays for performance on the Feast of Corpus Christi and were acted by craft guilds. There were also a number of individual plays, which were mainly narrative treatments of their subjects, not associated with cycles, some on the lives of saints—called miracle plays in distinction from the mysteries, which were based on Scripture. Beside them arose a different type of play in which the characters were abstract qualities or types and the plot was allegory; these are called moralities, the most important of the earlier ones being *The Castell of Perseverance* and of the later *Everyman.* They rise to simple solemnity in treating the theme of death and the fate of man's soul.

Prose. In the later medieval period English prose took on a new importance. The devotional tradition of Richard Rolle and Walter Hilton was carried on in *The Cloud of Unknowing* (probably late 14th century) and other anonymous treatises: in *The Sixteen Revelations of Divine Love* by Dame Julian of Norwich; and in such work as that of Nicholas Love, especially his translation (printed 1486) of the *Meditationes Vitae Christi* as *The Mirror of the Blessed Life of Jesus Christ.* Much of this prose is beautifully lucid, simple and easy in movement (some has a rhythmical cadence which removes it from the field of normal prose), but well before the 14th century ended plain prose began to be used for a much greater range of subject. John Wycliffe was the author or source of controversial works in which clarity of style matched vigour of thought, and, in addition, he inspired a great translation of the Bible that is known by his name. The later version, attributed to John Purvey, won great popularity, maintained until William Tyndale brought out his New Testament in 1526. Chaucer also wrote rather stiff prose in "The Tale of Melibee," "The Parson's Tale," and his rendering of Boethius, while more important as a symptom of the trend of writing was his use of prose for a scientific purpose in *A Treatise of the Astrolabe.*

From the later 14th century, English prose came to be used for all kinds of secular purposes. John of Trevisa translated Ranulph Higden's universal history *Polychronicon* and a great 13th-century encyclopaedia, *De proprietatibus rerum.* There were several English versions of Mandeville's *Travels,* traveller's tales of the East, originally in French. Many chronicles of national and local affairs were written, including over 120 manuscripts of the *Brut.* Three translations of the 13th-century *Gesta Romanorum,* a collection of anecdotes and tales, met a popular taste for stories. The style of such works was close to the language of conversation, and this is found again in private letters, of which the collections of the Paston family of Norfolk is the best known. These were the first documents of their kind in English, and, although not literature in the ordinary sense, they give an intimate picture of the life of the time, the best showing a remarkable command of language. A comparable plainness and vigour characterized the remarkable autobiography of Margery Kempe, a mystic who, apparently illiterate, dictated an account of her religious experiences and pilgrimages.

The greatest writer of the century was Sir Thomas Malory, whose collection of Arthurian stories was printed by William Caxton in 1485 under the title *Morte Darthur* (finished 1469–70). From sources in English verse and French prose Malory composed a masterpiece of dignified romance and nostalgic tragedy, in a style conspicuous for its sonority of rhythm that yet used the simple language of his day.

The first printing in England

The introduction of printing into England in 1476 by Caxton revolutionized the dissemination of literary works. He made accessible to a wider public than ever before most of the important English writings of the preceding century and also published many translations both by others and by himself. Caxton's prologues and epilogues were livelier than some of the books they accompany, for he was keenly concerned to write readily intelligible English, and, by circulating large numbers of books in a fairly homogeneous type of English, he contributed much to the stabilization of the language of London as the general literary medium.

The new learning. For most of the 15th century, English literature was closely linked to what had gone before and was little affected by the new Humanism that had arisen in Italy in the 14th century. Cultivated Englishmen were aware of the movement but as patrons rather than practitioners, and it was not until the beginning of the 16th century that the full tide of Renaissance Humanism reached England. Even then the effects on literature were slow. An epoch-making work of English Humanism, the *Utopia* (printed 1516) of Sir Thomas More, was written in Latin, still the language of scholarship. More did write English prose clearly, but it continued the informality of earlier prose rather than imitating classical models. Good English prose was written, too, by men concerned with education—Sir Thomas Elyot, Sir John Cheke, Sir Thomas Wilson, Roger Ascham—and by the Bible translators Tyndale and Miles Coverdale. The educationists, too, became involved in the controversy over “inkhorn terms”—words borrowed wholesale from Latin by scholars and stylists writing in English, often to excess and with ludicrous results. Nevertheless, practice in the classics did much to give form to the English sentence; yet its strongest rhythms derived from the simplicities of English speech. Edmund Spenser inherited his fable from Malory and much of his language from Chaucer. Though great masterpieces at the end of the medieval period were few, its importance for the understanding of the wealth that followed was immense.

Scottish literature in Scots and English. Apart from poems of doubtful authorship the earliest extant literature appeared in the second half of the 14th century. No doubt much earlier literature has been lost, as neither John Barbour's ***Bruce*** (completed 1376) nor ***Susannah, or Pistill of Susan*** (*c.* 1360, ascribed to Huchown of the Awle Ryale) can be called primitive in technique. These poems represent two traditions, the former being in octosyllabic rhyming couplets, the latter having the alliterative rhyming stanza that reached Scotland through Middle English alliterative writers of the north and became a characteristic Scottish poetic form. To the first tradition belonged Andrew of Wyntoun's ***Orygynale Cronykil*** (*c.* 1420), a history of Scotland; and ***The Buik of Alexander*** and ***Legends of the Saints,*** which belonged to Barbour's time and region. The second tradition developed romance and fantasy and included Richard Holland's ***Buke of the Howlat***, an anonymous ***Golagrus and Gawain, Rauf Coilyear,*** and shorter pieces such as ***The Gyre-Carling***, William Dunbar's ***Kynd Kittok,*** and Robert Henryson's ***Sum Practysis of Medecyne.*** The rather dry style of John Barbour suited his own patriotic narrative but had little influence on later poetry. His ***Bruce,*** national epic in kind if not in value, was an isolated poem. The more flamboyant alliterative tradition had a lasting effect well beyond the medieval period and was valuable in forging a link between popular and sophisticated verse, which in Scotland was not broken to the same extent as in England.

The ***makaris,*** or Scottish Chaucerians

The great period of the ***makaris*** ("makers"; *i.e.*, poets), or Scottish Chaucerians (c. 1425–1550), included the four chief pre-union poets: Robert Henryson, William Dunbar, Gavin Douglas, and Sir David Lyndsay. To them must be added the author of ***The Kingis Quair*** (probably James I of Scotland, and the author of ***Schir William Wallace*** (traditionally Harry the Minstrel, Blind Harry). Scottish poetry has never been so confident, dexterous, or varied as in the century that produced Henryson's ***Testament of Cresseid,*** Dunbar's ***Tua Mariit Wemen and the Wedo***, Douglas' ***Eneados,*** and Lyndsay's drama ***Ane Satyre of the Thrie Estaits.*** The rough, precarious culture that nourished this literature has often the appearance of a rejuvenated medievalism rather than of a premature Renaissance. What was not medieval was a keen linguistic consciousness and a desire to expand the vernacular, which followed the political self-determination of Scotland in the 14th century. The elaborate style of the ***makaris*** has been criticized as artificial and excessive; but such excesses, which had their parallel in Elizabethan England, were a necessary stage in the development of a literary medium. Gavin Douglas, justifying his borrowings from other tongues in his translation of Virgil, spoke of his desire for "fouth (copiousness) of language." His powerful descriptions burst with words and have a rich etymological and idiomatic texture.

The ***makaris*** gained from Chaucer an ideal of poetic utterance, a rhetoric or a diction, and metrical forms like the decasyllabic couplet. Nevertheless, this was only one influence among many; others included the elements of satire and fantasy (from romance to farce), which had always been strong in Scottish poetry. Both Chaucer and Dunbar were connected with the court circles of their day and addressed a courtly and educated audience; yet Dunbar as well as Gavin Douglas and Lyndsay had a good deal of social give-and-take, perhaps not unexpected in a small country that had been only partly and haphazardly feudalized. "A man's a man for a' that" is a recurring statement in Scottish literature.

MEDIEVAL CELTIC LITERATURE

Irish Gaelic. The Celtic language spoken in Ireland from the earliest historic period, often described as Gaelic or Goidelic, probably reached Ireland not long before the beginning of the Christian Era. The earliest evidence consists of sepulchral inscriptions in the ogham alphabet not unlike Scandinavian runes. These inscriptions, usually ascribed to the 4th and 5th centuries, show an archaic state of language. Writings in the Roman alphabet date from 8th-century glosses in Old Irish, but works of 7th- or even 6th-century composition are preserved in manuscripts of a much later date.

The functions of the ***filid***

Irish literature was from the earliest times aristocratic, kept in the hands of a professional class, the ***filid.*** These poets, together with other men of learning, such as druids, judges, and historians, probably belonged to the same privileged ruling class as the landed aristocracy, and the early laws defined their status. Their duties were to know the sagas and genealogies and to compose encomiastic poems; that is, to serve the past and present glory of the ruling class. The ***filid*** were a proud, even arrogant, class, whose demands were extravagant and could be enforced by the threat of a lampoon (***a'er***), which could not only take away a man's reputation byt also damage him physically and even kill him. The laws set out penalties for abuse of the ***a'er,*** and a belief in its powers continued up to modern times. The official work of the ***filid*** has been preserved in fragments of annals and treatises.

Early verse. The earliest verse has been preserved mainly in passages incorporated into later documents, both literary and legal; most of these passages have suffered in transmission and are difficult to elucidate. There remains also the ***Eulogy*** on St. Columba (*c.* 521–597) in rhetorical short sentences linked by alliteration, ascribed to Dallán Forgaill, chief poet of Ireland. This device of alliterative rhythmical prose was used again in the sagas. Probably the oldest actual metre was that in which two half lines were linked by alliteration—a system reminiscent of early Germanic verse. Rhyme was used from the 7th century; the requirement was only that there should be identity of vowel and syllabic length and that consonants should belong to the same phonetic class —a system found also in early Welsh. The quatrain (seven or eight syllables to a line and rhyme between second and fourth lines) was derived from Latin hymn metres. A metre later to become the most popular of all was the ***debide*** (literally "cut in two"), in which the quatrains consisted of two couplets with the two lines of each couplet rhyming.

Much early verse was of an official nature, but that of the church was hardly more lively than that of the ***filid,*** who often affected a deliberately obscure style. More interesting was the 10th-century ***Psalter,*** a biblical history in 150 poems, which contained much strange learning. But it was not ponderous works that constituted the real glory of Irish verse but rather the personal ones by anonymous poets who composed poems such as the famous address to Pangur, a white cat. They avoided complicated metres and used a language that had been cultivated for centuries, with a freshness of insight denied to the ***filid.*** That the ***filid*** could, however, adapt their technique was shown by an 11th-century poem on the sea, where the preface, choice of theme, and free use of metaphorical expressions all suggest Scandinavian influence. This and other nature poetry carried on a tradition of native lyrics, sagas, and seasonal songs that showed remarkable sensitivity to natural beauty. The monastic movement in the Irish Church also provided a strong impetus to nature poetry. Exile from men brought hermits very close to their environment. This almost Franciscan poetry had an especial appeal to monastic scribes, so that a considerable amount of it has been preserved.

Historical verse arose partly because remembrance of the past was an important part of the work of the ***filid;***

some of the earliest poems were metrical genealogy. As time went on the necessity for compendiums of information grew, and these were again often in metrical form. They were especially numerous toward the end of the early period. In a long poem, Fianna bhtar in Emain ("The Warriors Who Were in Emain"), Cináed ua Artacáin summed up the saga material, while Fland Mainistrech collected the work of generations of filid who had laboured to synchronize the history of Ireland with that of the outside world. Equally important is a great collection, in prose and verse forms, called the Dindshenchus, which gave appropriate legends to famous sites of Ireland. Indeed, the development of a loose debide form, making rhyming easy, produced mnemonic verse on all sorts of subjects.

The early Irish epic

Early prose. The early Irish epic was a prose narrative that usually contained non-narrative passages in a heightened style, often in dialogue form. The resemblance between this and the type of epic found in early Sanskrit suggests that the tradition went back to Indo-European times. The oldest sagas were composed in a language that suggests that they were first written down in the 7th and 8th centuries, from an oral tradition. These were imperfectly preserved, since there is no extant manuscript earlier than the 12th century; Scandinavian invasions in the 9th and 10th centuries disrupted literary studies and everything else. Not until the 11th century did life become sufficiently settled for works to be collected in monasteries, but this revival was uneven. The great codex The Book of the Dun Cow, written early in the 12th century, showed older treatments of saga material than are found in the Book of Leinster, written years later. Only the shortest stories were preserved in forms approximating to the original; the rest have suffered from uncritical editorial handling, and the rhythmic prose used in heightened passages of older stories became unintelligible. Although they tended to be grouped in cycles, they ranged over a period from the earliest fables to the 11th century, and in the catalogs they were arranged by type rather than by period, under headings such as stormings, cattle raids, courtships, battles, voyages, and so on. Thus they have preserved a picture of primitive society—fighting from chariots, the taking of heads as trophies, the position of the druids, the force of taboo—for which there is little or no evidence from strictly historical sources.

The Ulaid cycle

The most important cycle was that of the Ulaid, a people who gave their name to Ulster. Conchobar, king of the Ulaid; Cú Chulainn, a boy warrior; Medb, queen of Connaught; and Noisi and Déirdre, doomed lovers, were outstanding in early Irish literature, and it was on elements from the sagas of the Ulaid that the nearest approach to an Irish epic was built—Thin *Bó Cúailnge* (The Cattle Raid of Cooley). It is probable that even when first put together, in the 7th or 8th century, the *Táin* was not very coherent; it is striking chiefly for the terse vividness of its narrative and the wit of its dialogue. The longer stories are no more than loosely connected incidents. Undoubtedly the finest section is that in which Fergus, an exile from Ulster, recalls the deeds of Cú Chulainn's youth; this story of the boyhood of a hero is obviously the work of an accomplished artist. But the value of the *Táin* generally lies in that, as it was being continually worked over, it provides a record of the degeneration of Irish style. The Thin collected around itself a number of ancillary stories, including that of its revelation to the filid in the 7th century by the ghost of Fergus and the tragedy of Noisi and Déirdre. (The latter has come down to modern times, notably through the work of J.M. Synge and William Butler Yeats.)

In this period stories with an origin outside a recognized tradition began to appear. An exotic element was represented by The Taking of Troy and The Story of Alexander, which appeared in the oldest saga lists, but classical learning had comparatively small effect until the next period. The same was true of the stories of Finn; the traditions went back to an early period, but their real development was at the time when the filid were no longer in control. The "wild man of the woods" cycle associated with Suibne Geilt had its origins in Strathclyde, where Irish and Brythonic literature must have been in contact at an early date; this mixture of hagiographical, saga, and nature material was one of the most attractive stories of the later period.

Although Irish was used for didactic purposes from the earliest period, the material was mostly derived from Latin, and that belonging to the earliest period consisted mainly of monastic rules, exempla to illustrate a moral, and anecdotes about saints. The lives of the saints were mainly works of fantasy, increasingly incorporating elements from folklore and saga material. The emphasis was always on the miraculous, but they contain a great deal of information about everyday life in early Ireland and are valuable as social documents. Another important type of religious work was the vision, the best known example of which was The Vision of Adamnan, whose soul is represented as leaving his body for a time to visit heaven and hell under the guidance of an angel. Both the saints' lives and the visions tended to degenerate into extravagance, so that parodies were composed, notably Aislinge Meic Con *Glinn* (The Vision of *MacConglinne*).

Theory has always been important in Irish cultural life, and the filid built up a considerable body of academic speculation. Very little has survived, but there are fragments on the nature of inspiration and the origin of language, combined with practical instructions on matters of metrics and style. At an early stage this learning became interpenetrated with that of Latin, and a technical vocabulary was built up to deal with Latin, as well as Irish, grammar. In several ancient texts discussion of the art of the poet was mixed with questions relating to his legal status.

The rise of the bards

In the 12th century the oldest surviving codices were being written in monasteries, preserving literature many centuries earlier with remarkable fidelity, while a new literary order arose that elaborated verse forms to a far greater extent than before and used a language that must have been very near the vernacular of the day. After the 12th century the hereditary bardic families became custodians of Irish literature and continued in that function until the collapse of the Gaelic polity. They were at first completely divorced from ecclesiastical influence, but soon they were sending their sons into the recently introduced orders, above all to the Franciscans, who were to become by the end of this period the greatest custodians of the tradition.

Later verse. The bardic reform of verse was sweeping. The language was brought up-to-date, the large number of metres used by the filid was greatly reduced, and a greater strictness in rhyme and lavishness in ornament was insisted on. The scope of the verse narrowed; the bulk was praise poetry, addressed to the poet's patron or to God. No longer associated with monastic foundations, the bards were dependent upon patronage for the high standard of living that they claimed as their right, for the bards (who trained for six or seven years) were no less arrogant than the filid whom they replaced. Modern taste finds little of interest in even the best of official bardic poetry; it is the occasional verse that shows real worth. One of the earliest poets of the great bardic family of Ó Dálaigh, Muireadhach Albanach, left, as well as a stirring defense of his action in killing a tax collector, an extremely fine elegy on the death of his wife. A new note was brought into Irish literature by the Norman invaders, that of courtly love, and the combination of this exotic element with the wit and felicity of the bardic style left a number of enchanting poems. A different kind of departure from praise poetry was the croshnacht, a poem in which verse was frequently interspersed with humorous or satirical prose passages.

The Fenian cycle

Later *prose*. Most native prose of this period was concerned with the hero Finn and his war band (*fian*). Stories about Finn, Oisin, Caoilte, and the rest must have existed among the people for many centuries. The outstanding work was Agallamh *na Seanórach* ("The Interrogation of the Old Men"), in which Oisin and Caoilte are represented as surviving the Battle of Gabhra and living on until the time of Patrick, whom Caoilte accompanies through Ireland, explaining to him the origin of the names of the places that they visit. But whereas in the Ulster cycle the introduction of the hero of former times was a way of authenticating the story, in the Fenian stories it was a nostalgia for past glory. The Fenian stories never received such careful literary treatment as did those of the older tradition, and the old form was soon abandoned for prose tales and ballads, which were easier reading and may be regarded as the beginnings of popular, as opposed to professional, literature in Irish. The metres represented a drastic simplification of the bardic technique, and a distinct change in theme occurred as this literature passed into the hands of the people.

Retellings of stories popular with the *filid* continue to be found, but these steadily dropped out of favour. Sometimes they were combined with folktale elements, as was the case with the very old saga of Fergus mac Léti, which was rewritten, perhaps in the 14th century, to include a story of a people of tiny stature—the leprechauns. Most important of all, a flood of translations from Latin and English began. The stories of Marco Polo, Sir John Mandeville, Prester John, and Guy of Warwick, as well as classical and Arthurian stories in their medieval adaptations, became well-known in Ireland. The new religious orders were responsible for the translation of many spiritual and devotional works, and the churchmen made the experiment, remarkable for the time, of handling philosophical material in the vernacular. There was also a considerable amount of technical writing; most important was the grammatical and metrical teaching, which was set out in elaborate tracts, giving examples of correct and incorrect usage. Continental teaching seems to have superseded the native tradition during this period.

By the 15th century the printing press was beginning to make literature available to larger numbers in most European countries. In Ireland, in spite of the fact that Irish was the language of most of the country and that the literature was flourishing at that period, the Irish did not control towns and had no access to printing. Irish literature remained an aristocratic one, the preserve of those who could afford to maintain the writers and supply them with costly vellum; inevitably this literature had little effect on the masses of the people.

The Lismore compilation

Scottish Gaelic. The earliest extant document containing Gaelic matter is ***The Book of Deer,*** in which portions of the Gospels in Latin, written in an Irish hand, with illuminations, were accompanied by marginalia in Gaelic and Latin. Those in Gaelic were of the 12th century but are without literary interest. Many other manuscripts of later date belong to the common Scots-Irish tradition and contained versions of heroic tales and sagas, poetry, ecclesiastical writings, and miscellaneous matter. The most important of these was the ***Book of the Dean of Lismore,*** an anthology of verse compiled between 1512 and 1526 by Sir James MacGregor, dean of the diocese of Lismore in Argyllshire, and his brother Duncan. The poems fall into three main groups: those by Scottish authors, those by Irish authors, and ballads concerned with Ossian, the mythical warrior and bard. This was the earliest extensive anthology of heroic Gaelic ballads in either Scotland or Ireland. The poems by Scottish authors range from about 1310 to 1520. The bard best represented was Fionnlagh Ruadh, bard to John, chief of clan Gregor (died 1519). There were three poems by Giolla Coluim mac an Ollaimh, a professional poet at the court of the Lord of the Isles and almost certainly a member of the MacMhuirich bardic family, the famous line of hereditary bards whose work spans nearly 500 years from the 13th century to the 18th. He lamented the downfall of the Isles family in the late 15th century. Perhaps the most notable of the other poets were Giolla Críost Brúilingeach and two women, Aithbhreac Inghean Coirceadail and Isabella, countess of Argyll.

Taliesin and Aneirin

Welsh. ***Poetry.*** Welsh literature has extended in an unbroken tradition from about the middle of the 6th century to the present day, but, except for two or three short pieces, all pre-Norman poetry has survived only in manuscripts written from the 12th century onward to the 15th, and it is clear that many of the poems are very much older than the manuscripts in which they have survived. Welsh had developed from the older Brythonic by the middle of the 6th century. In the ***Historia Brittonum (c.*** 800) attributed to the Welsh author or compiler Nennius, references are made to Welsh poets of the 6th century. Works by two of them, Taliesin and Aneirin, have survived. Taliesin wrote odes, or ***awdlau,*** in praise of the warlike deeds of his lord, Urien of Rheged, a kingdom in present-day southwest Scotland. To Aneirin is attributed a long poem, Y ***Gododdin,*** commemorating an ill-starred expedition sent from the region where Edinburgh stands today to take Catraeth (Catterick, Yorkshire) from the invading Saxons. The background, inspiration, and social conventions of the poems of Taliesin and Aneirin are typically heroic, the language is direct and simple, and the expression terse and vigorous. These poems, and others that have not been preserved, set standards for later ages. The alliterative verse and internal rhyme found here were developed by the 13th century into the intricate system of consonant and vowel correspondence, or consonant correspondence and internal rhyme, called ***cynghanedd.***

The heroic tradition of poetry existed in Wales proper and was continued after the break with North Britain in the mid-7th century; the earliest surviving example is a poem, perhaps by Taliesin, in praise of Cynan Garwyn of Powys, whose son Selyf was slain in the Battle of Chester. This poem struck a note that remained constant in all Welsh eulogies and elegies down to the fall of the Welsh bardic system: Cynan is the bravest in the field, the most generous in his home, all others are thrall to him and sing his praises.

The period between the 7th and 10th centuries is represented by a few scattered poems, most of them in the heroic tradition. The few authentic poems still extant include "The Eulogy of Cadwallon" (by Afan Ferddig?), the elegy on Cynddylan ap Cyndrwyn of Powys in the first half of the 7th century, and, more peaceful in atmosphere, "The Eulogy of Tenby," by an unknown South Wales poet toward the end of the 9th century. Early vaticinatory poetry is represented by "The Great Prophecy of Britain," a stirring appeal to the Welsh to unite with other Britons (those of the north, of Cornwall, and of Brittany), with the Irish, and with the Norse of Dublin to oppose the Saxons and to refuse the unjust demands of their "great king," probably Athelstan of Wessex. Poetry outside the main bardic tradition is preserved in ***englynion*** (stanzas of three of four lines), a dialogue between Myrddin and Taliesin, and in "The Song of the Wind," a riddle poem that contains the germ of the later convention known as ***dyfaliad,*** or comparison.

The poems of Llywarch Hen

The poems associated with the name Llywarch Hen are the verse remains of at least two sagas composed toward the middle of the 9th century by an unknown storyteller of Powys, whose basic material was the traditions that had gathered around the historical Llywarch and Heledd, sister to Cynddylan ap Cyndrwyn. In these, prose (now lost) was used for narrative and description and verse for dialogue and soliloquy. The metrical form was embellished by alliteration, internal rhyme, and incipient ***cynghanedd.*** The theme of both sagas was lamentation for the glory that once had been. The background was the heroic struggle of the Welsh of Powys against the Saxons of Mercia. Many other such sagas have failed to survive, though there do exist fragments of poetry preserved in the ***Black Book of Carmarthen*** (12th century), which were parts of soliloquies or dialogues from those lost sagas. Examples are a conversation between Arthur and the porter Glewlwyd Mightygrasp, a monologue of Ysgolan the Cleric, verses in praise of Gereint, son of Erbin, and a fragment of what may be an early native version of the Drystan and Esyllt (Tristan and Iseult) story. Other groups of verses in the same manuscript show that there once existed a legend of Myrddin Wyllt, a wild man of the woods who went mad at the sight of a battle, a legend associated with Suibne Geilt in Ireland and with Lailoken in Scotland. This Myrddin (later better known as Merlin) had the gift of prophecy. The historical poet Taliesin also became the central figure in a folk tale that was given literary form in the 9th or 10th century, but that has survived only in certain monologues preserved in ***The Book of Taliesin*** and in a 16th-century text, ***Hanes Taliesin*** ("Story of Taliesin"). As portrayed in the monologues Taliesin was the young bardic prodigy who surpassed everyone in his knowledge of the past, present, and future. Hence he too, like Myrddin, came to be regarded as a prophet.

Nature, a source of similes in the heroic poetry and of symbolism in verse remains of the sagas, was sometimes a subject of song in its own right. Generally, treatment of the subject was remarkable for its sensitive objectivity, its awareness of form, colour, and sound, and its concise, often epigrammatic, expression. In mood, matter, and form (that of the ***englyn)*** it often overlapped with gnomic poetry, which consisted of sententious sayings about man and nature. Most gnomic and nature poetry was probably produced in the 10th and 11th centuries by poets other than professional bards. Toward the end of the pre-Norman period a few poems on religious, biblical, and other subjects showed acquaintance with non-native legends. Saga poetry gradually died out, for prose became the recognized medium for storytelling.

The poets of the princes

With the consolidation of the principality of Gwynedd under Gruffudd ap Cynan (1054–1137) and his descendants, court poetry arose in the country, composed by the ***gogynefeirdd,*** or poets of the princes, who continued and developed the tradition of their predecessors, the *cynfeirdd.* In the bardic system, bards were divided into grades, the upper grade, or ***pencerdd*** ("chief of song"), being a high officer of the court whose duty it was to sing the praises of his lord and his family and of God and the saints. He was forbidden to sing of love and nature, and his choice of song was prescribed. Under him came the ***bardd teulu*** ("the bard of the king's war band), who did for the king's household what the ***pencerdd*** did for the king himself. He also was restricted but might sing of love and nature and such songs as would please ladies but be distasteful to warriors. Last of all came many kinds of ***cerddorion*** ("minstrels"), who were restricted in subject and might be permitted ribaldry and satire and who told the ***cyfarwyddyd,*** or oral tale.

Across this classification cuts another, based on an entirely different principle—the grading of the bards according to degrees of proficiency. This classification was educational, and its essential feature, the relation of disciple and teacher, remained into the modern period. It led, in the time of Henry IV, to the holding of an eisteddfod, or a session of bards to confer certificates of proficiency and to prevent the lower orders from proliferating and drifting into mendicancy. One of the results of a bardic system of this type was a remarkable conservatism in literature. Most of the 13th-century bards used a conventional diction that was consciously archaic in its vocabulary, grammar, and idiom and incomprehensible to anyone uneducated in poetry.

Bardism often went by families, and the first names of the new period were those of Meilyr, his son Gwalchmai, and his grandson Meilyr ap Gwalchmai, who were attached to the court of Gwynedd at Aberffraw. Gwalchmai in his "Praise of Owain," displayed one characteristic of all the ***gogynfeirdd,*** description of water, whether of river or sea. Official bards of this period all used the same material in the same way. Song and its modes were prescribed for them; the poetry of the bardic tradition was not measured by depth of thought but by exquisiteness. It sought not to interpret life but to adorn it. Two poet-princes, Owain Cyfeiliog of Powys and Hywel ab Owain of Gwynedd, stood out from contemporary bards. Cyfeiliog's most famous work was the ***Hirlas*** ("The Long Gray Drinking Horn"), in which he described his warriors making merry after a victorious raid; Hywel ab Owain's departure from convention was even more striking; for the first time in Welsh literature love of country and of beauty in the modern sense appeared: land and sea and women and the Welsh language spoken in cultured accent by his lady love awoke in him the feeling of awe and wonder. The ***gogynfeirdd*** alternated throughout this period between ***marwnad*** ("elegy") and ***moliant*** ("eulogy"), and the period closed with the most famous of all the elegies, sung by Gruffudd ab yr Ynad Coch after the death in 1282 of Llywelyn ap Gruffudd, last native prince of Wales.

The religious verse of the ***gogynfeirdd*** was generally simpler in style than the eulogies and elegies. A set type was the ***marwysgajn*** ("deathbed song"), in which the poet, sensing the approach of death, confessed his sins and prayed for forgiveness. Other religious poems were in praise of God and the Trinity, in honour of saints, on the torments of hell, and on the birth of Christ. They illustrate the gradual widening of the bardic horizon.

With the princes and their pageantry, there passed away the older modes and conventions of Welsh poetry. An audience that could once understand the intricate and involved ***awdl*** (a long stanza with a single rhyme throughout) could no longer find the means to educate themselves for the understanding of it. The old metres still remained. but the language became simpler. Poets in the years between the English conquest (1282) and Dafydd ap Gwilym (flourished ***c.*** 1340–70) seem to have returned to an earlier poetic fashion or to have been influenced by new ideas from other lands. Whereas in the early period exquisiteness was sought in archaic precision and in the suggestion of older modes, the new poets employed colour and form to an extent hitherto unknown in Welsh poetry and unparalleled later. Famous names in the 14th century were those of Gruffudd ap Maredudd, Gruffudd ap Dafydd, and Casnodyn.

The golden age of the ***cywydd***

The conquest of Wales by Edward I transferred the patronage of court poetry at Gwynedd and Powys from prince to landed aristocracy. The *pencerdd,* or chief poet, lost his superiority over the lower bardic ranks, who were no longer restricted in choice of content and style, and who, especially in South Wales (where the Norman Conquest had been established for a whole century before the conquest of Gwynedd), became more vocal as the older bardic song began to decline. The new poets of the south were well established before their works began to be preserved. The most important of them was Dafydd ap Gwilym, a contemporary of Chaucer, who in his first period wrote according to two entirely distinct traditions: on the one hand he wrote *awdlau,* poems in strict alliterative verse, in which the same rhyme was used throughout and which followed the traditions of the later *gogynfeirdd;* on the other, he wrote ***cywyddau,*** freer verse more in the style of the ***beirdd teulu,*** the lower class of poets, with couplets of seven-syllable lines rhyming in alternately stressed and unstressed final syllables. Dafydd may have invented the *cywydd*, a verse form consisting of couplets of seven-syllable lines rhyming in alternately stressed and unstressed final syllables, but his main advance was a simplicity that he introduced to his poetic language. His successors followed his lead; the old diction became obsolete, and he thus established the standards of modern Welsh. The substance of his poetry was also new, for he seems to have borrowed many of his themes from the wandering minstrels and trouvères of France. He wrote some love poetry but is best known for the descriptive nature poetry this included.

Dafydd's influence was twofold: the ***cywydd*** was established as the leading form, and the new subjects were recognized as fit themes for poetry. One of his contemporaries was Gruffudd ab Adda, who went much farther than Dafydd in the direction of a modern conception of nature; another was Iolo Goch, whose poem to the husbandman shows traces of English ideas, as seen in ***Piers Plowman.*** Llywelyn Goch Amheurug Hen wrote some early poems in the ***gogynfeirdd*** tradition, but his "Elegy to Lleucu Llwyd" successfully combined the Welsh elegy tradition with the imported serenade form. Other poets almost contemporary with Dafydd were Gruffudd Llwyd ap Dafydd, who wrote two superb poems to Owen Glendower, the rebel hero, and Rhys Goch Eryri, who is chiefly remembered for his quarrel on the nature of true poetry with Llywelyn ab y Moel and Siôn Cent, the last an elusive figure to whom are attributed semi-political poems in the form of prophecies and a number of songs lamenting the decadence of the world.

Dafydd ap Gwilym's successors

In the 15th century the cywydd was purified and refined. Although Dafydd Nanmor was inferior to most of Dafydd ap Gwilym's contemporaries in treatment of his subject and in imagination, in his mastery of the cywydd form he had no equal. Further advances in the cywydd metre were made by Lewis Glyn Cothi and Guto'r Glyn, in whose work a real consciousness of nationhood among the Welsh is detected, perhaps for the first time.

Prose. The earliest examples of Welsh prose were utilitarian: notes and glosses on Latin texts dealing with weights and measures, a record of an agreement, a list of church dues, and a commentary about a problem in astronomy. Shortly before the middle of the 10th century Howel (Hywel) Dda, according to tradition, had the Welsh laws codified. The oldest extant version is in Latin, but the Welsh version in The Black Book of Chirk (c. 1200) is derived from an earlier exemplar.

The Mabinogion collection of tales

The stylistic merits of the legal texts were reflected in a more conscious literary use of prose by storytellers (*cy*farwyddiaid), who recited oral tales made up of a medley of mythology, folklore, and heroic elements. Some of these were recorded in writing; the most famous collection is the Mabinogion, preserved in The White Book of Rhydderch (c. 1300–25) and *The* Red Book of *Hergest* (c. 1375–1425). The Mabinogion was composed of 11 tales, all anonymous, that were conscious literary compositions, based on older oral material. The greatest were the four related stories "The Four Branches of the *Mabi*nogi," composed in the second half of the 11th century by a writer from Dyfed. The author of Culhwch and *Olwen* (c. 1100), using the same basic material that underlies the "Four Branches," appears to have kept closer to the oral tale, but his inferior stylistics presaged the later decadent areithiau ("rhetorics"), which were in part parodies of the Mabinogion. Three of the Mabinogion tales, "Owein and Luned" (or "The Lady of the Fountain"), "Geraint and Enid," and "Peredur Son of Efrawg," represented a transition from purely native tales to those composed under Norman influence. The basic material was largely native, but there was French influence in certain names, social conventions, and atmosphere. These tales correspond to the Yvain, Erec, and Perceval of Chrétien de Troyes, and the exact relationship between the Welsh and French texts has long been a subject of debate. These romances, with their extreme sophistication, showed a decline from the native tales with their directness, restraint, and disciplined selection of material.

Many translations from Latin and French played a part in the evolution of a prose that could express aspects of human thought and activities not often touched upon in the tales. Most of them dated from the 13th and 14th centuries and were probably made by monks. Notable among them were translations from the Latin of Geoffrey of Monmouth's *Historia regum Britanniae* and the French of the Queste *del* Saint Graal. Their prose was largely experimental and influenced in varying degrees by the language and style of the originals, but at its best it was a not unworthy development of the prose of the law tracts and native tales.

In summary, the development of medieval prose was hampered by a lack of alliance between the heirs of Welsh literary tradition and those who cultivated the wider learning of western Europe. The inspiration for the fashioning of a prose, able to express all facets of thought and activity, arose toward the middle of the 16th century from the upheavals of the Renaissance and the Reformation; the foundations were laid by the Humanists, both Protestant and Catholic.

Cornish. The oldest remains of Cornish are proper names in the Bodmin Gospels and in the Domesday Book, 10th-century glosses on Latin texts, and a 12th-century vocabulary based on Aelfric's Latin–Anglo-Saxon glossary. The first literary text was a Middle Cornish fragment of a dramatic nature (c. 1400) in which a girl is offered as wife, praised for her virtues, and counselled on her behaviour. The 15th-century long poem *Pascon* Agan *Arluth* ("The Passion of Our Lord") has only slight literary merit.

The Ordinalia trilogy

The most important Cornish literary remains are a series of long dramatic compositions related to the miracle and morality plays that included a 15th-century trilogy called the *Ordinalia*. The first part, Origo Mundi, related the main events of biblical history; the second, Passio *Domini*, tells the story of Christ from the temptation to the crucifixion. The third, *Ressurectio Domini*, ends with the Resurrection and the Ascension. The dialogue is generally dull and there is little dramatic invention except in the scenes of ribaldry, but it is greater in bulk than all other remains of Cornish. Similar in form and technique but of greater variety was a play written in 1504 by "Dominus Hadton"—*Beunans* Meriasek, on the life of Meriasek, patron saint of Camborne. Also highly derivative was the play Gwreans an Bys ("The Creation of the World"). Later literary remains include a folktale, a few songs, translations of passages of Scripture, and several versions of the Apostles' Creed.

MEDIEVAL GERMAN LITERATURE

Old High German. Although Gothic was the earliest recorded Germanic language and the only east Germanic language on which there is trustworthy information, only a translation of the Bible by Ulfilas (c. 311–c. 383), a Gothic bishop, has survived in fragments. It is of linguistic rather than literary interest.

The first written records of the western German tribes dated from the second half of the 8th century. There is, however, evidence of an earlier, orally transmitted literature, consisting of short Heldenlieder (songs celebrating the exploits of famous heroes), hymns connected with pagan religious rites, battle songs, and laments for the dead. Although none of these was recorded, their substance formed the basis of later popular heroic epics. As in other areas, the first significant texts were a product of the efforts to spread Christianity. Many were translations from Latin, for example, the Alemannic version (c. 800) of De fide *catholica* ("Concerning the Catholic Faith") by Isidore of Seville (c. 570–636), Spanish churchman and scholar, and the translation of Boethius' *Consolation* of Philosophy made about 1000 by Notker Lateo, of the Swiss monastery of St. Gall.

The few extant verse works were more original, although religious and didactic in subject. The largest of these, the Evangelienbuch (c. 870; "Book of the Gospels") by the monk Otfrid of Weissenburg, presented the life of Christ in a form rivalling that of the Heldenlieder. Although handicapped by didactic passages, the poem is noteworthy as the first German work to replace the alliteration of Germanic tradition with the end rhyme of Medieval Latin verse.

Pagan works

Despite the church's opposition to interest in anything pagan, there survived a few pagan works, such as the Zauberspriiche — magic spells to protect domestic animals or for use against the common cold and other everyday concerns. The fragmentary *Hildebrandslied* (c. 800; "Song of Hildebrand")—a grim Germanic account of a duel between father and son—is more interesting and is important as the sole relic of heroic verse in Old High German. Throughout the period the vernacular was sporadically used as a literary medium, but scholars continued to prefer Latin. The movement for ascetic reform, which spread from the monastery of Cluny in France all over western Europe in the first half of the 10th century, discouraged churchmen from writing for the laity, and hence there was even less recorded literature in the vernacular for about a century. By the time the vernacular was written again, important changes had occurred in the language and the old ecclesiastical didacticism had been replaced by courtly feudalism.

Middle High German. The changes concomitant with these events marked the transition from Old to Middle High German, one important point being that the knight replaced the cleric as a poet. Early works still reflected the clerical tradition, but already in Heinrich von Melk's Von des *tôdes* gehugede (c. 1160; "Remembrance of Death"). the feudal knight's love of combat was used to illustrate the transient nature of life. The main literary forms at this time were *Minnesang* (love lyric) and epic. Poets, mainly noblemen, expressed their love according to courtly convention or told traditional tales of combat and romance.

The epic of local tradition had been created by the *Spielmann* (wandering minstrel), who collected and recited heroic songs on popular legends and began to link together the *Heldenlieder* to form longer epic narratives. Probably the earliest such composition was King *Rother* (c. 1160), a repetitive tale of violent bride abduction. The poets often provided interesting, sometimes amusing, commentaries on the life of their times. *Salman und Morolf* treated the conflict between Christian and pagan communities, reflecting an interest aroused by the Crusades also evident in *Orendel* and Sankt Oswald. With the *Alexanderlied* (c. 1130), a free rendering of a French work of the same name, German poets began drawing on successful French epics.

The Nibelung*enlied*

The anonymous Austrian *Spielmann* who wrote the *Nibelungenlied* ("Song of the Nibelungs") displayed great dramatic skill and poetic ability in recounting a well-integrated story of the hero Siegfried that combined songs of heroic legends about historical events and an epic concerning the destruction of the Burgundians, or Nibelungs, in 437. Gudrun, composed c. 1210, centred on the heroine Gudrun's steadfastness in the face of abduction, while a collection, Das *Heldenbuch* ("The Book of Heroes"). includes romances about Theodoric the Great, a popular hero in south Germany.

Court epics. The nationalistic epics, popular principally in the south, were counterbalanced in the west by the development of court epics based on French models. The first notable work, by Eilhart von Oberg, dealt with the Arthurian subject of Tristant und *Isolde* (c. 1170). Although Dutch, Heinrich von Veldeke (Henric van Veldeke) established himself as the father of the German court epic with his Aeneid (c. 1175–86), which was based on a French source. The three most famous poets of the court epic were Hartmann von Aue, Wolfram von Eschenbach, and Gottfried von Strassburg. Their work, dated largely between 1190 and 1210, was concerned with the knightly virtues of moderation, constancy, loyalty, and the duty of service to superiors and to God. Hartmann was an artistic and lucid storyteller. In Erec and *Iwein*, based on the French romances by Chrétien de Troyes, he handled the conflict between private inclination and public responsibility that existed for the medieval knight, and in Gregorius and Der *Arme Heinrich* ("Poor Heinrich"), illustrated man's relationship with God. Wolfram von Eschenbach's famous Parzival employed highly original imagery in a subtle and ambitious treatment of man's search for truth in his relationship with God, its hero Parzival progressing in maturity to become keeper of the Holy Grail. Gottfried von Strassburg took Thomas of Brittany as his source for his Tristan epic; a careful master of form and artistry, he was less concerned with otherworldly considerations and concentrated on an ideal primacy of love in this life.

Later epic poets cannot equal these three, though emulators abounded. Heinrich von Türlin's epic Din Krone ("The Crown") followed Hartmann but was excessively long and badly written. Despite the prolific writing of Rudolf von Ems and Konrad von Wiirzburg, the epic tradition gradually weakened. Although Meier *Helm*brecht (c. 1250), by Wernher the Gardener, movingly described the lawlessness and violence of decadent feudal society, both the social level of its subject and its realistic approach announced the end of courtly literature. By the mid-15th century a new satirical and didactic tone of middle class realism had taken over.

Courtly lyric. The other important literary form, *Minnesang*, the courtly love lyric, like the court epic, borrowed its content and stanza form from French or Provençal models. Its poets were minor noblemen who often became court poets to the higher nobility or travelled as minstrels throughout Germany, Austria, and Switzerland. Many of the poems representative of *Minnesangsfrühling* ("springtime of *Minnesang*") were recorded in an early-14th-century manuscript collection, the Codex Manesse, attributed to Swiss-born Rudiger Manesse (1224–1304). About 1190 Reinmar von Hagenau became court poet to the dukes of Austria, shortly after he had tutored Walther von der Vogelweide in Vienna.

The love lyrics of Walther von der Vogelweide

Walther's love lyrics, which united the courtly style for which Reinmar became famous with popular, natural love poetry, constituted the finest collection of medieval German lyrics, and his influence was reflected in later poets throughout Austria and the Tirol. His equally famous Spriiche—moral and political poems—dealt with his relationship with various patrons, the struggle between empire and papacy, and the spiritual value of crusade and pilgrimage. This interest in satire and worldly wisdom was continued by the Bavarian Neidhart von Reuenthal and again reflected by the popularity of Freidank's Bescheidenheit (c. 1230; "Modesty" or "Moderation") and Hugo von Trimberg's Renner (*c.* 1300; "The Runner").

Prose and drama. Medieval German prose literature was less substantial than that in verse. Berthold von Regensburg's sermons were eloquent vernacular works, and the writing of Mechthild von Magdeburg served as an early example of the mysticism that became important in the 14th century. The *Ackermann* aus *Böhmen* (c. 1400; "Plowman from Bohemia") by Johann von Tepl marked the beginning of the Humanistic tradition in Germany, and the quality of von Tepl's prose was unrivalled until the Reformation. Notable non-religious works were the Saxon Weltchronik ("World Chronicle") and *Sachsenspiegel* (c. 1225; "Mirror of Saxony"), which were representative examples of fanciful historical and legal writing, respectively.

Early works in drama—the fragmentary Easter play of Muri and the St. Gall Passion play (*c.* 1330)—ledontoa growing volume of popular morality and miracle plays, which were part of the church's campaign to instruct and inspire the lower orders. By the beginning of the 15th century, popular drama for secular entertainment appeared in the form of *Fastnacht*, or carnival, plays. These farcical comedies became increasingly popular, finally gaining respectability in the 16th century at the hands of Hans Sachs.

MEDIEVAL DUTCH LITERATURE

Of the earliest inhabitants of the Netherlands only the Frisians have survived, and, although the modern province of Friesland is a small part of the territory once held by them, they have maintained their own separate language and literature from the time of Bernlêf, who lived in the 8th century. The remainder of the Netherlands was overrun and colonized by the Saxons and Franks between the 3rd and 9th centuries, resulting in a predominantly Frankish culture in the south and Saxon or an amalgam of Saxon and Frankish language and culture elsewhere.

Under the less nomadic Franks the south prospered more than the north, and it was there that a literary language first developed, but only very gradually, because of marked differences between the dialects of the east, the centre, and the west (Flanders, with features that linked the coastal dialects with Old English). In the early Middle Ages, when Latin and, later, French were the languages of the educated, the vernacular was largely confined to unrecorded oral legend and folk songs. The earliest text that can claim to contain Old Dutch was the early-10th-century "Wachtendonk Psalm Fragments."

Poetry and prose. The work of the earliest known poet, Henric van (Heinrich von) Veldeke, typified the age's religious zeal, which emanated from the French centres of learning. In addition to a chivalrous rendering of the Roman poet Virgil's Aeneid (c. 1185) and love lyrics, which were important for German poets, Heinrich's *Servatius* was a rendering of a saint's life in the Limburg dialect. Dutch 13th- and 14th-century texts were generally written in the cultural centres of Flanders and Brabant, where for reasons of trade the prevailing influence was French. Throughout Europe the Crusades brought courtly romances into vogue, and Dutch romances, following French models, were written about events from classical history, such as Segher Diergotgaf's Paerlement *van* Troyen ("Parliament of Troy"), about Oriental subjects, or, most popular of all, on themes from Celtic sagas, including the Arthurian cycle. But, while Jacob van Maerlant was writing his ***Merlijns boeck*** ("Merlin's Book") and ***Historie van Troyen*** in the 1260s, chivalry was on the decline; and the titles of his later works bear witness to a late-13th-century reaction against romance. Maerlant's compendia of knowledge, including his ***Der naturen bloeme*** ("The Flower of Nature") and ***Spieghel historiael*** ("The Mirror of History") answered a demand for the kind of self-instructional literature that long remained a characteristic of Dutch literature. The change in social patterns at this time is also evident in two epic tales. ***Karel ende Elegast*** ("Charles and Elegast"), probably an original Flemish chanson de geste of the 12th or 13th century, describes with feudal reverence Charlemagne's adventures in the magic world of folklore. ***Van den vos Reinaerde*** (*c.* 1240; "Reynard the Fox") is the Flemish poet Willem's version of a translation by another Fleming, Aernout, of the French ***Le Plaid,*** which, by contrast, brilliantly satirizes feudal society and the epic manner.

Mystical writing

Mystical writing reached a remarkable lyrical intensity in the poetry and hortatory prose of a Brabantine laywoman, Hadewijch (late 12th, early 13th century), and this inspired later mystics, greatest of whom was Jan van Ruysbroeck, a disciple of the German mystic Meister Eckehart and the Netherlands' greatest medieval prose writer. His most important work was ***Die chierheit der gheestliker brulocht*** (1350; ***The Adornment of the Spiritual Marriage,*** 1916), concerning the soul in search of God. His work was part of a renewed ecclesiastic concern to instruct the laity, resulting in a considerable body of literature: Bible stories, legends, and didactic short stories that were all widely current at this time. Of these, ***Beatrijs,*** an early-14th-century Flemish verse rendering of a popular legend, is told with such humanity and restraint that it still inspires modern versions (*e.g.*, by Maurice Maeterlinck and Pieter Cornelis Boutens).

Songs, drama, and the rhetoricians. The earliest recorded songs suggest a Germanic rather than a Romance tradition, and since the first extant plays, the 14th-century ***Abele spelen*** ("seemly plays"), were entirely secular (and may have been the first of such in Europe), incorporating romantic themes from the earlier songs, there is reason to attribute the emergence of drama in the Netherlands as much to mime and song as to liturgical action. The only evidence of early liturgical drama is the Latin ***Officium stellae*** of the 14th century, after which there is nothing until 1448–55, when the play cycle on the seven joys of Mary was first performed at Brussels. Of the many miracle and morality plays, two deserve special mention: ***Mariken van Nieumeghen*** (late 15th century; "Mary of Nijmegen") and ***Elckerlyc*** (of about the same date). The first anticipates the Renaissance in its psychology and treatment; the second, still entirely medieval in its conception, is the original of the English ***Everyman.*** Both were written by members of ***rederijkers karners,*** or chambers of rhetoric, institutions that spread from the French border in the 15th century and were organized like guilds, with functions similar to those of the French medieval dramatic societies. They were commissioned by the town protecting them to provide the ceremonial and entertainment at religious and secular festivals and were influential in popularizing art and morals. Drama by this time was in the hands of the laity rather than the church, and the introduction of secular themes necessitated the use of stages or carts outside religious buildings. The chambers depended on literary performance in order to survive, and rhetoricians organized national festivals and competitions for drama and poetry.

The "chambers of rhetoric"

SCANDINAVIAN LITERATURE IN THE MIDDLE AGES

The literature of Scandinavia and, in particular, of Iceland has reflected two extraordinary features of the social and cultural history of pagan Europe and of Iceland. The way in which names such as Siegfried, Brunhild, and Attila cropped up again and again in different European literatures has borne witness to the dissemination of legends and traditions, common to the early Germanic tribes of Europe, starting from the great movements westward in the 4th, 5th, and 6th centuries. The literature of Iceland provides not only the most detailed descriptions available of the life-style of early Germanic peoples but constitutes the most complete account of their literature and literary traditions. Although the sagas and poems were first written down by Christian scribes, they present a picture of a pre-Christian European culture that reached its heights in the new settlements in Iceland.

A second feature directly concerns the peoples of Scandinavia. A remarkable characteristic of Scandinavian literature was the accuracy with which it described the geography of northern Europe. This was not to be ascribed to unusually imaginative writing but to accuracy born of actual knowledge. From the late 8th century until well into the Middle Ages, the history of the Norsemen was one of unceasing movement toward western and central Europe. The Norsemen discovered Iceland, as early Icelandic historians had it, through their ships being blown off course about 860. The next century found the Vikings pushing west by way of Britain, Ireland, and France to Spain and then through the Mediterranean to North Africa and east to Arabia. Across land they reached the Black Sea, by sailing north they came to the White Sea, and finally, turning westward again, they reached America long before Columbus.

At worst the literature associated with this period in Scandinavia could reflect some part of these remarkable forays across the Northern Hemisphere; because of its high literary quality, it does in fact offer far more.

The classical period in Iceland. The best known Icelandic literature belongs to the classical period, which was roughly equivalent to the early and medieval periods in west European literature. From. Icelandic manuscripts was derived knowledge of a large part of European myth and legend, which was in part common to all Germanic peoples. Stories of the Norse gods and myths—of Odin, god of war; Balder the Beautiful; Thor, god of thunder; and Valhalla, hall of the slain—formed the nucleus of early Icelandic literature.

Almost all extant early Scandinavian poetry was recorded in Icelandic manuscripts, although some was clearly composed before the Scandinavian peoples reached Iceland in the late 9th century. Much of the oldest poetry was recorded in the Codex Regius manuscript, which contained the ***Poetic Edda*** (*c.* 1270). The poetry is sometimes called Eddaic and falls into two sections: heroic lays, which, broadly speaking, dealt with the world of men; and mythological lays, which dealt with the world of the gods.

The ***Poetic Edda***

The heroic lays. The heroic lays followed the mythological in the Codex Regius and were probably the earlier of the two. Many of the legends on which they were based originated in Germany or even among the Goths. Oldest of all was perhaps the *Hamdismál* ("Lay of Hamdr"), which forcefully expressed the heroic ideals of Germanic tribal life. The story closely resembled one told by Jordanes, a Gothic historian of the mid-6th century, and his account suggested that his source was an even earlier poem about Hamdir. Another of the older lays in the ***Poetic Edda*** was the ***Atlakvida*** ("Lay of Atli"), which referred to events that took place in 5th-century western Germany, Atli (or Attila) being king of the Huns from 434 to 453. Nearly all heroic lays were associated with the story of Sigurd (or Siegfried), the valiant hero, and his ill-fated love for Brunhild, who, too, figured to varying extent in different lays. Many critics hold that the lays concerned with the spiritual conflict of the heroines Brunhild and Gudrun, which tend to be romantic and sentimental, were later compositions than the austere heroic lays. The ***Poetic Edda*** contained only a small portion of the poetry known in Iceland in the Middle Ages and now lost. Fragments of ancient lays appeared in 13th- and 14th-century sagas, such as the *Hlödskvida* ("Lay of Hlöd") in the ***Reidreks saga*** and mention of Danish and Swedish heroes in some fragments that must also have been known to the author of the Old English epic poem ***Beowulf.***

The mythological lays. Mythological lays about the Norse gods made up the first half of the ***Poetic Edda.*** It was unlikely that any of these originated outside Norway, Iceland, and Norse colonies in the British Isles. The *Völuspá* ("Sibyl's Prophecy") was a striking poem on the history of the world of gods, men, and monsters, from the beginning until the "twilight of the gods." Many passages in the poem are obscure, but most modern scholars agree that it was composed in Iceland about the year 1000, when the people were turning from the old religion to the new. An interesting story of the gods was told in the *Skírnismál* ("Words of Skirnir"): sitting in "Gate Tower," throne of Odin, the god Freyr, lord of the world, gazes into the world of giants and falls in love with a giant maiden; to win her, he sends his messenger Skirnir, who first offers gifts and then threatens the maiden until she agrees to make a tryst with Freyr. Scholars have seen an ancient fertility myth in this story, and it was certainly one of the older mythological poems in the ***Edda*** and probably originated in Norway before Iceland was settled by Norwegians.

The mythological poems so far mentioned were all narrative, but many of those in the ***Edda*** were didactic. The *Hávamál* ("Words of the High One"; *i.e.*, Odin) consisted of fragments of at least six poems. In the first section, the god speaks of relations between man and man and lays down rules of social conduct; in other sections he discourses on relations between men and women and tells how love of women may be lost or won; the last two sections are about runes and magic power. Most of the poems were probably composed in Norway in the 9th and 10th centuries. Another didactic poem, the ***Words of Vafþrúdnir***, related a contest between Odin and a giant.

Some important mythological lays appeared in other manuscripts. ***Baldrs draurnaer*** ("Balder's Dreams") described how the god Balder dreamed that his life was threatened and how his father Odin rode to the grave of a prophetess to force her to reveal the fate in store for Balder.

The Eddaic verse forms. Three metres are commonly distinguished in Eddaic poetry: the old story or epic measure, the speech measure, and the song measure. Most narrative poems were in the first measure, which consisted of short lines of two beats joined together in pairs by alliteration. The number of weakly stressed syllables might vary, but the total number of syllables in the line was rarely fewer than four. In these respects it resembled the measure used by Anglo-Saxon and early Germanic poets. The speech measure used in the *Atlamál* ("Words of Atli") differed very little from the epic measure, although its lines generally had a greater number of weakly stressed syllables. The song measure was the most irregular of the Eddaic verse forms, and its origins were the most obscure. It was chiefly in didactic poems and generally consisted of strophes of six lines divided into half strophes of three lines.

Skaldic verse. Norwegians and Icelanders of the 9th to 13th century also composed skaldic poetry (from the Icelandic word *skáld*, "poet"). It was not composed in the free variable metres of the ***Edda*** but was strictly syllabic: every syllable had to be counted and every line had to end in a given form. Like Eddaic lines, the skaldic lines were joined in pairs by alliteration, often using internal rhyme or consonance; but this poetry differed in syntax and choice of expression. Word order is freer than in Eddaic poetry, and a highly specialized poetic vocabulary employed periphrases, or kennings, of such complexity that the poetry resembles riddles. Little is known about skaldic verse forms, but they are thought to have been developed in Norway during the 9th century and could have been influenced by forms and diction of Irish poets of the period. The earliest known poet was Bragi the Old, who probably wrote in Norway in the latter half of the 9th century. Harald I (died *c.* 940) of Norway was eulogized by several poets, among them Thorbjom Hornklofi, whose poem the ***Haraldskvaedi*** ("Lay of Harald) was partly Eddaic and partly skaldic in style.

The distinction between Icelandic and Norwegian literature at this period is difficult to make. Skaldic verse seemed to have originated in Norway and to have been developed by Icelandic poets who either, like Egill Skallagrimsson (910–990), spent much time in Norway or wrote in praise of Norwegian kings, as did Sigvatr (*c.* 995–1045), counsellor and court poet of Olaf II of Norway. Although its complexity means that skaldic poetry is now less appreciated than it deserves, the orally transmitted poems of the 10th and 11th centuries were valuable sources for Icelandic historians in the following centuries.

Prose. Iceland's adoption of Christianity in 1000 opened the way for powerful influences from western Europe. Missionaries taught Icelanders the Latin alphabet, and they soon began to study in the great schools of Europe. One of the first was fsleifr (*c.* 1005–80), who after being educated and ordained as a priest was consecrated bishop. His school at Skálholt in south Iceland was for many centuries the chief bishopric and a main centre of learning. The earliest remembered historian was Saemundr the Wise (1056–1133), but Ari Thorgilsson (*c.* 1067–1148) is regarded as father of history in the vernacular, a short history, ***Libellus Islandorum*** (***Íslendingabók***, or "The Book of the Icelanders"), and the more detailed ***Landna'mabdk*** ("Book of Settlements") being associated with his name. Extant works of the period are few or anonymous. Annals of contemporary events date from the 13th century and the oldest religious manuscripts, consisting of homilies and saints' lives, from c. 1150. Larger collections of religious literature appeared in late-12th- and early-13th-century manuscripts. As elsewhere, the most popular books were often lives of the Apostles and saints.

Influence of Christian missionaries on Iceland

The sagas. The word saga is used in Icelandic for any kind of story or history, whether written or oral. In English it is used to refer to the biographies of a hero or group of heroes written in Iceland between the 12th and 15th centuries. These heroes were most often kings of Norway, early founders of Iceland, or legendary Germanic figures of the 4th to 8th century. The oldest saga is the fragmentary ***Oldest Ólafs saga helga*** ("First Saga of St. Olaf"), written about 1180. In form it is a hagiographic narrative, laying emphasis on miracles worked through the agency of the saint. It was probably written in the monastry of Thingeyrar, which played an important part in cultural life in the late 12th and early 13th centuries.

Several sagas about King Olaf Tryggvason, at whose instigation the Icelanders adopted Christianity, were also written at Thingeyrar, where the work of the monks was fanciful rather than realistic. A more critical style of history was established in the south by Saemundr and Ari, and several notable works were written at Skálholt or nearby in the 13th century, such as the ***Hungrvaka*** ("The Appetizer"), a short history of the bishops of Skálholt from fsleifr to Kloengr. In the late 12th century several short histories of Norwegian kings were brought from Norway to Iceland, where they influenced Icelandic historians. The ***Ágrip***, a summary of the histories, or sagas, of Norwegian kings, written in the vernacular in Norway, was particularly influential. The ***Fagrskinna*** ("Fine Skin") covered the same period in more detail, while the ***Morkinskinna*** ("Rotten Skin"), probably written earlier, covered the period from Magnús the Good (1035–47) to the late 12th century.

The role of Snorri Sturluson

Snorri Sturluson (1179–1241) wrote many kinds of works and played an important role in political wrangles in his time. Among works ascribed to him was the ***Prose Edda***, a handbook of prosody and poetic diction. He twice visited Norway, and a large part of his work consisted of lives of its early kings: he combined his ***Ólafs saga*** with lives of other Norwegian kings to form the ***Heimskringla*** ("Orb of the World"). The value of these as historical sources has long been debated. Snorri was certainly well read in vernacular history and attempted to write faithful accounts of what he had read in earlier records. He did not aim to write scientific history; his work was creative and therefore portrayed his heroes imaginatively. The stirring ***Egils saga*** (on the skald Egill Skallagrumsson) is generally attributed to Snorri.

The Icelanders', or family, sagas. These sagas were about heroes supposed to have lived in the 10th and 11th centuries. Their origins are unclear, and it is debatable whether they were faithful records of history. One theory is that they were composed in the 11th century and transmitted orally until written down in the 13th century; though researchers now reject this view, it is true that the sagas owed much to oral tales and the tradition of oral verse. Their historicity is difficult to verify, since their content and form were shaped both by the sources used and by the author's intentions. While the earlier writers probably intended to write factual history, others relied more on their imagination, anticipating the historical novel by giving speeches to various characters.

It is also difficult to determine the date of many of the sagas. The obviously early works were somewhat crudely structured and express Norse ideals of loyalty and heroism. The ***Gisla saga,*** written before the middle of the 13th century, showed a development of artistic skill and contained rich descriptions of nature and verses of considerable beauty and tragic feeling. The ***Laxdaela saga*** ("Saga of the Men of Laxárdal"), written a few years later, was a delicately worked tragedy in which the author showed an unusual appreciation of visual beauty. One work that was clearly the author's creation was the ***Hrafnkels saga Freysgoda*** ("Saga of Hrafnkell, Freyr's Priest"): despite realistic detail, the saga contained little historical fact. As the century progressed, a taste for fantastic and romantic elements grew. The ***Grettis saga*** ("Saga of Grettir the Strong") included several motifs from folklore and portrayed a hero fighting against trolls and ghosts.

The saga of Njáll and Gunnar

The greatest of Icelanders' sagas, the ***Njáls saga,*** had in fact two heroes, Njáll and Gunnar. Gunnar is young and inexperienced and Njáll is a wise and prudent man endowed with prophetic gifts; he embodies traditional Norse ideals of loyalty and bravery, yet faces his death by burning with the resignation of a Christian martyr.

The heroic sagas. The fantastic element was further developed in the ***fornaldar sogur,*** literally, "the sagas of antiquity," whose heroes were supposed to have lived in Scandinavia and Germany before Iceland was settled. The best known, the ***Völsunga saga (c. 1270),*** retold in prose stories from heroic lays of Sigurd, the Burgundians, and Jormunrekr, and the ***Hrdlfs saga kraka*** incorporated ancient traditions about Danish and Swedish heroes who also appeared in the Old English poems "Widsith" and *Beowulf.* Although not equal to the Icelanders' sagas in literary value, these heroic sagas provide valuable information about early legend and lost heroic poetry.

Many of the works on contemporary history were combined about 1300 in the ***Sturlunga saga,*** including the ***Íslendinga saga*** by Sturla Thórdarson.

Translations from Latin. A quantity of secular literature was translated from Latin between the 12th and 14th centuries. The "Prophecies of Merlin," already translated in verse by a Thingeyrar monk, were combined with a complete translation of Geoffrey of Monmouth's history and titled ***Breta sogur*** ("Stories of the Britons"). In one 14th-century manuscript this was preceded by the ***Trójumanna saga*** ("Story of the Trojans"), translated from Dares Phrygius. A Norwegian translation of the Bible was begun in the reign of Haakon V Magnusson (1299–1319).

Romances. Romances were also translated or adapted from continental romances. Interest in romance began in Norway and soon took root in Iceland. The earliest romance was probably the ***Tristrams saga*** (1226), written for King Haakon IV and taking the Anglo-Norman poet Thomas as its source, while the ***Karlamagnús saga*** ("Saga of Charlemagne") was a collection of prose renderings of French chansons de geste, including a Norse version of the ***Chanson de Roland.*** Romances in Icelandic were numerous, and their effect on the style of later writers is evident in such sagas as the ***Laxdaela saga*** and ***Grettis saga.***

Post-classical literature in Iceland. In the period following the classical age, little was written that attracted attention outside Iceland. Realism and detached objectivity declined, and sentimentality and fantasy gained the upper hand. The decline in literary standards is sometimes attributed to Iceland's loss of independence in 1262 and the changes that followed. Interest in earlier manuscripts continued, and many 14th- and 15th-century manuscript collections of 13th-century material were made. The most beautiful of all Icelandic manuscripts, the ***Flateyjarbdk,*** included versions of sagas of Olaf Tryggvason and St. Olaf, together with texts from other sagas or about heroes associated with Iceland.

Prose. Prose literature of the 14th century included several sagas. Among them were the ***Finnboga saga ramma*** ("Saga of Finnbogi the Strong"), about a 10th-century hero, and another telling the love story of its hero Viglundr. Sagas about bishops, already a theme in the 13th century, became more numerous, as did lives of foreign saints. A large collection of exempla (moral tales) was also made, each short tale illustrating some moral precept.

Ásgrímsson's ***Lilja***

Poetry. Much poetry was written up to the Reformation, and many new forms were devised. The best poems were religious pieces, in honour of the Virgin, the Apostles, or other saints. The well-known *Lilja* ("The Lily") by Eysteinn Asgrimsson, a monk from Thykkvabaer in the south, gave an account of the fall of Satan, the creation, the first sin, and the birth, life, and Passion of Christ. The term *rímur*—rhymes—is used of the narrative poetry developed after 1500 that consisted of mainly four-line strophes: the lines had end rhyme. The metrical forms, although apparently derived from Latin hymns, inherited the alliterative system of earlier poetry. Ballads written in Icelandic never attained the popularity of Danish ballads in Denmark nor achieved the high standard of the Norwegian ***Draumkvaede*** ("Dream Ballad"). Most of those preserved dated from the 14th to the 16th century and were free translations of Danish and Norwegian originals.

Swedish. Swedish literature proper began in the late Middle Ages when, after a long period of linguistic change, Old Swedish emerged as a separate language. The foundations of a native literature were established in the 13th century. The oldest extant manuscript in Old Swedish was the *Västgötalagan* ("Law of West Gotland"), part of a legal code compiled in the 1220s. These legal documents often employed concrete images, alliteration, and a solemn prose rhythm suited to their proclamatory nature, and a number of them have survived.

Early Swedish ballads

The poetry of chivalry was first represented in ***Eufemiavisorna*** ("The Songs of Euphemia"), written in doggerel between 1303 and 1312, which included a translation of Chrétien de Troyes' romance ***Yvain.*** Anonymous ballads probably dating from the 14th and 15th centuries also reflected a new interest in romance and combined courtly themes with native. One of the best known, the ballad of ***Ebbe Skammelsson*** (of Danish origin), told a grim story of love and revenge, tempered with traces of chivalrous and Christian ideals. These ballads, though mostly derived from foreign sources and combining the imported ideals of courtly love with native, pagan themes and historical events, formed the most accessible genre of what can be called Swedish medieval literature.

Danish. Denmark's first literature appeared in the runic inscriptions scratched on stone or carved in metal, mainly epitaphs of warriors, kings, and priests, that occasionally had short, unrhymed alliterative verses in the Viking spirit. Runic inscriptions were used in Denmark from about 250, but most of those preserved date from 800–1100. With the introduction of Christianity, Latin became the predominant literary language, and Denmark's first important contribution to world literature, Saxo Grammaticus' ***Gesta Danorum*** (written between 1185 and 1222; "The Deeds of the Danes"), which contained, for example, the Hamlet story, was written in Latin. The medieval ballads of Denmark are among the most important in Europe; 539 are known in more than 3,000 versions, but nearly all were written down after the end of the Middle Ages, the first printed edition appearing in 1591.

ITALIAN MEDIEVAL LITERATURE

Early vernacular writing. Until the 13th century almost all literary work was written in Latin, was predominantly practical in nature, and was produced by writers trained in ecclesiastical schools. In literary quality and variety it fell short of the standard set by France. Only small fragments of Italian vernacular verse before the end of the 12th century have been found, although a number of legal documents were written in the vernacular. All the surviving 12th- and 13th-century verse reflected French literary influence, the extent of which is indicated by the intermingling of French and Italian subjects and dialects in the work of the Provençal poet Raimbautz de Vaqueiras (Raimbaut de Vaqeyras), one of whose poems was a dialogue between a Provençal lover and a Genoese lady with verses written in Provençal and Genoese dialect alternately.

“Franco-Italian.” French prose and verse romances were popular in Italy from the 12th to the 14th century. Stories from the Carolingian and Arthurian cycles, together with free adaptations from the classics, were read by the literate, while French minstrels recited verse in public places throughout north Italy. By the 13th century a “Franco-Italian” literature had developed; Italians copied French stories, often adapting and extending various episodes and sometimes creating new romances in French about characters from French works. Examples of these new works were the *Entrée d'Espagne*, the *Prise de Pampelune*, the prose *Aquilon de Bavière* ("North Wind of Bavaria") by Raffaele Marmora, and poems on classical themes, such as *Hector, Pharsale,* and *Attila.* In all this literature, though the language used was French, the writers often unconsciously introduced elements from their own dialects, according to their varying knowledge of French. Writers of important prose works such as Martino Canale and Brunetto Latini—who wrote the *La Cronique des Veniciens* and *Li Livres dou trésor* ("The Books of the Treasure"), respectively—were much better acquainted with French, while poets such as Sordello of Mantua wrote lyrics in Provençal revealing an exact knowledge of the language and of Provençal versification. Provençal love lyrics were, in fact, as popular as the French romances, and Italian writers carefully studied anthologies of the verse.

The origins of the vernacular lyric

The Sicilian school. In the cultured environment of the Sicilian court of the Holy Roman emperor Frederick II, who ruled the Sicilian kingdom from 1208 to 1250, lyrics modelled on Provençal forms and themes were written in the vernacular. Poets were careful to eliminate narrowly local elements from their language and used words characteristic of the troubadour tradition. Poetry was considered an escape from serious matters of life, and it is significant that it was the love poetry of Provence—and not the political poetry—that was imitated by the Sicilian school. The Emperor himself, author of at least two poems, seems to have used it in this way, and his chancellor, Piero della Vigna, wrote about political theory in Latin prose and of love in Sicilian verse. The poets did not treat love very seriously, and many poems were stiffly conventional, although Giacomo da Lentinio, who is among those credited with inventing the sonnet, and Giacomo Pugliese wrote with invigorating freshness.

The Tuscan poets. Sicilian poetry continued to be written after the death of Frederick II, but the centre of literary activity moved to Tuscany, where interest in the Sicilian lyric had led to several imitations by Guittone d'Arezzo and his followers. Although Guittone experimented with elaborate verse forms, his language mingled dialect elements with Latinisms and Provençalisms and had none of the beauty of the southern school. The Tuscan poets wrote conventional and dull love poetry. They showed more originality in taking over political themes from the troubadours, reflecting perhaps the situation in central Italy, where the free communes were rent by factions. In addition to lyric verse, Tuscany produced some longer allegorical poems, such as Brunetto Latini's *Tesoretto.*

The "novo" style. While Guittone and his followers were still writing, a new development appeared in love poetry, marked by a concern for precise and sincere expression and a new, serious treatment of love. It became customary to speak of a new school of poets of the *dolce stil novo,* or *nuovo* ("sweet new style"), an expression used by Dante Alighieri in La *divina commedia* ("Purgatorio," Canto XXIV, line 27) in a passage where he emphasized delicacy of expression suited to the subject of love. The major *stil novo* poets were Guido Guinizelli of Bologna, Guido Cavalcanti, Dante (in his poems in *La vita nuova*), and Cino da Pistoia, together with the lesser poets Lapo Gianni, Gianni Alfani, and Dino Frescobaldi.

Dante's La *vita nuova*

These poets seem to have been influenced by each other's work. Guido Guinizelli was best known for his canzone, or poem, beginning “Al cor gentil ripara sempre amore” ("Love always finds shelter in the gentle heart"), which posed the question of the relationship between love of woman and love of God. His poetry was immediately appreciated by Cavalcanti, a serious and extremely talented lyric poet. Most of his poems were tragic and denied the ennobling effect of love suggested by Guinizelli. Dante greatly admired Cavalcanti, but his concept of love, inspired by his love for Beatrice, who died young (in 1290), had much more in common with Guinizelli's. Dante's *La vita nuova (c.* 1293) is the story of his love in poems linked by a framework of eloquent prose: God is the "root" of Beatrice, and she is able to mediate God's truth and love and inspire love of God—but her death is necessary for her lover to reach a state of purification. Cino da Pistoia used the vocabulary of the *stilnovisti,* as these poets were called, in an original and lighthearted way. A comparison of their language with the earlier Tuscan poets reveals extensive refinement of Tuscan dialects. Purely local characteristics were removed, and the standard literary language of Italy had been created.

"Comic" verse. Giocoso, or "comic," verse was a complete contrast to serious love poetry. The language was often deliberately unrefined, colloquial, and sometimes obscene, in keeping with the themes dealt with in the poetry. This kind of verse belongs to a European tradition, owing something to the satirical "Goliard poets of the 12th and 13th centuries, who wrote Latin verses in praise of pleasure or in vituperation of women or personal enemies or the church. The comic poets—whose usual verse form was the sonnet—were all cultured men. The earliest of them was Rustico di Filippo, who produced both courtly love poetry and coarse, sometimes obscene verse of the "realistic" kind. The best known and most versatile was Cecco Angiolieri, whose love poetry often skillfully parodied the *stil novo* writers and whose favourite subject was his father's meanness. Folgore di San Gimignano was known for his sonnets (following Latin models) on the worldly pleasures he considered as suitable to different months and different days of the week. A fervent interest in politics, expressed with great directness and satiric force in works by Pietro dei Faitinelli, was a more serious aspect of the comic poets' work. Dante himself in his *Tenzone* ("Correspondence") with Forese Donati wrote in comic style.

Religious poetry. The beautiful and famous *Cantico di frate sole (c.* 1225; "Canticle of the Sun"), or *Laudes creaturarum*, of St. Francis of Assisi was one of the earliest Italian poems. It was written in rhythmical prose that used assonance in place of rhyme and was in the Umbrian dialect; in it God is praised through all the things of his creation. It is probable that St. Francis also composed a musical accompaniment, and after his death the *lauda* became a common form of religious song used by the confraternities of lay people who gathered to sing the praises of God and the saints and to recall the life and Passion of Christ. The one real poet of the *laude* was Jacopone da Todi, a Franciscan and a mystic. His *laudi* were mostly concerned with the theme of spiritual poverty. Though Jacopone did not write with conscious art, some of the *laudi* were very fine.

The pessimism of north Italian poetry

In north Italy religious poetry was mainly moralistic and pervaded by a pessimism rooted in heretical ideas derived from Manichaeism, which saw this world and the body as being evil and under Satan's control. Giacomino da Verona, a Franciscan, author of *De Jerusalem celesti* and *De Babilonia infernali,* was the liveliest and most imaginative of this group. Two of the most interesting of

Bonvesin da la Riva's works are a dialogue between the Virgin and Satan and one between Soul and Body. All this north Italian verse was written in a language that is distinct from central Italian dialects but that avoids narrowly local or colloquial elements.

Prose. Literary vernacular prose began in the 13th century, though Latin continued to be used for writings on theology, philosophy, law, politics, and science. Much early Italian prose consisted of translations from French and Latin, the latter affecting the sentence structure of the developing prose style and influencing the artistic consciousness of the translators. The earliest original literary prose consists of letters that follow medieval rhetorical rules for Latin prose and use rhythmical patterns for the ending of clauses and sentences, rhymed or assonanced prose, and abundant figures of speech and plays on words.

The founder of Italian rhetorical prose style, Guido Faba, a rhetorician, illustrated his teaching by examples of prose styles in Bolognese. Guittone d'Arezzo, his most notable follower in epistolography, tended toward an extravagant style. In contrast with Guittone's style is the clear scientific prose of Ristoro d'Arezzo's ***Composizione del mondo*** and the simple narrative of the Florentine collection of tales ***Il novellino.*** The masterpiece of 13th-century prose is Dante's La ***vita nuova*** *(c.* 1293; ***The New Life).*** Though not yet completely at ease in vernacular prose and occasionally too involved or repetitious, Dante combined simplicity with great delicacy and a poetic power that derived from the mysterious depth beneath certain key words.

The 14th century. The literature of 14th-century Italy dominated Europe for centuries to follow and may be regarded as the starting point of the Renaissance. Three names stand out: Dante, Petrarch, and Boccaccio.

La divina commedia

Dante. Dante Alighieri is one of the most important and influential names in all European literature, but it was only after his exile (1302) that he set out to write more ambitious works. ***Il convivio*** (*c.* 1304–07; "The Banquet"), revealing his detailed knowledge of scholastic philosophy, was the first great example of a treatise in vernacular prose: its language avoided the ingenuity of popular writers and the artificiality of the translators from Latin. ***De vulgari eloquentia*** ("Of Eloquence in the Vulgar Tongue"), written about the same time, contained the first theoretical discussion and definition of the Italian literary language. Both these works remained unfinished. In a later doctrinal work, ***Monarchia*** (*c.* 1313; "On the Monarchy"), Dante expounded his political theories, which demanded the coordination of the two medieval powers, pope and emperor. Dante's genius found its fullest development in La ***divina commedia*** ***(c.*** 1310–21; ***The Divine Comedy),*** an allegorical poem in terza rima (stanzas of three lines of 11 syllables each, rhyming ***aba, bcb, cdc,*** etc.), the literary masterpiece of the Middle Ages and one of the greatest products of any human mind. The central allegory of the poem was essentially medieval, taking the form of a journey through the world beyond the grave, with, as guides, the Roman poet Virgil and Beatrice, who symbolize reason and faith, respectively. The poem is divided into three ***cantiche,*** or narrative poems: "Inferno," "Purgatorio," and "Paradiso," which are all subdivided into various schematically symbolic areas, and each contains 33 cantos, with one canto as an overall prologue. Dante, through his experiences and encounters on the journey, gains understanding of the gradations of damnation, expiation, and beatitude, and the climax of the poem is his momentary vision of God. The greatness of the poem lies in complex imaginative power of construction, inexhaustible wealth of poetry, and continuing significance of spiritual meanings.

Petrarch. The intellectual interests of Francesco Petrarca (Petrarch, died 1374) were literary rather than philosophical; his political views were more realistic than Dante's and his poetic technique more elaborate though less powerful. Petrarch's influence on literature was enormous and lasting—stretching through the Italian Humanists of the following century to poets and scholars throughout western Europe. He rejected medieval Scholasticism and took as his models the classical Latin authors and the Church Fathers. This convergence of interests is apparent in his philosophical and religious works. Humanist ideals inspired his Latin poem ***Africa*** and his historical works, but the autobiographical ***Secretum meum*** is most important for a full understanding of his conflicting ideals. The ***Rime,*** or ***Canzoniere—a*** collection of sonnets, songs, six-line verses, ballads, and madrigals—gave these ideals poetic expression. Although this collection of vernacular poems intended to tell the story of his love for Laura, it was in fact an analysis and evocation not of present love but of the passion that he had overcome. The main element of this poetry was therefore in the elaboration of its art, even if it always reflected the genuine spiritual conflicts exposed in the ***Secretum.*** In addition to the ***Canzoniere*** Petrarch wrote a vernacular allegorical poem, ***Trionfi*** ("Triumphs"), in the medieval tradition, but it lacked the moral and poetical inspiration of Dante's great poem.

Petrarch's influence

The literary phenomenon known as Petrarchism developed rapidly within the poet's lifetime and continued to grow during the following three centuries, deeply influencing the literatures of Italy, Spain, France, and England. His followers did not merely imitate but accepted his practice of strict literary discipline and his forms, including that for the sonnet—without which the European literary Renaissance would be unthinkable.

The ***Decameron***

Boccaccio. Boccaccio's writings were purely literary, without any ideological implications. His first novel, ***Il filocolo,*** derived from the French romance ***Floire et Blancheflor,*** was little more than literary experiment. Inability to write on an epic scale was evident in his two poems ***Il filostrato*** and ***Teseida,*** while his ***Ninfale d'Ameto*** (1341–42), a novel written in prose and verse, and his ***Fiammetta,*** a prose novel, showed the influence of classical literature on the formation of his style. The ***Decameron*** (1348–53), a prose collection of 100 stories divided into 10 "days," was Boccaccio's most mature and important work. Its treatment of contemporary urban society ranged from the humorous to the tragic. Stylistically the most perfect example of Italian classical prose, it had enormous influence on Renaissance literature.

Boccaccio shared the Humanist interests of his age, as shown in his Latin epistles and treatises. An admirer of Dante, he also wrote a ***Trattatello in laude di Dante*** and a commentary on the first 17 cantos of the "Inferno." He contributed to allegorical poetry with ***L'amorosa visione*** (1342–43).

Popular literature and romances. During the second half of the 14th century, Florence remained a centre of culture, but its literature developed a more popular character. The best known representative of this development was Antonio Pucci (died 1388), whose vast production included the ***Centiloquio,*** a versification of Giovanni Villani's ***Cronica.*** Florentine narrative literature was represented by the ***Pecorone*** ("Dullard"), stories written by Ser Giovanni Fiorentino according to a pattern established by Boccaccio, and Franco Sacchetti's ***Trecentonovelle*** ("300 Short Stories"), which provide colourful and lively descriptions of people and places.

The recasting of the Carolingian and Arthurian cycles continued along lines established during the 13th century. Compilations in prose and verse became commoner, and Franco-Venetian literature gained in literary value. Epic legends were turned into romantic stories, which appealed more to their audiences in town squares and other public places. Novels by Andrea da Barberino, ***cantari*** with legendary subjects by Antonio Pucci, and the anonymous ***Pulzella gaia, Bel Gherardino, Donna del Vergiù, and Liombruno*** were written in the popular style consistent with their practical aim. Prose and verse compilations of classical subjects such as the ***Fatti di Cesare*** ("Deeds of Caesar") and versions of the ***Roman de Troie*** were similar in style and character. The most accomplished of these is perhaps the ***Fiore d'Italia*** ("Flower of Italy") by Guido da Pisa.

Religious, didactic, and historical literature. Religious literature of the period was closely connected with the popular literature. It consisted of sermons, treatises, moral epistles, hagiography, ***laudi,*** and miracle plays. None of the authors of ***laudi*** reached the standard of the earlier Jacopone da Todi. Versifications of stories from the Gospels, such as the ***Passion*** ascribed to Niccolò Cicerchia, were even more popular in style and spirit, but it is the religious prose .of the 14th century that is most interesting. The most important author in this field was Jacopo Passavanti, whose ***Specchio di** vera penitenza* ("The Mirror of True Penitance") was a collection of sermons preached in 1354. Less polished, but of greater literary value, were translations of legends collected in the anonymous ***Fioretti di San** Francesco* ("Little Flowers of St. Francis").

The Florentine chroniclers

Vernacular historiography of this period could be described as popular literature, with Florence as its main centre, whose two principal chroniclers were Dino Compagni and Giovanni Villani. Compagni wrote his chronicle between 1310 and 1312, after having taken part in the political struggles of his town; his dramatic account of the episodes and the liveliness of his prose made it the most original work of medieval historiography. Villani's ***Cronica*** in 12 books was less personal; it followed the medieval tradition by beginning with the building of the Tower of Babel and included many legends. The last six books, which cover the period from Charles of Anjou's Italian expedition (1265) to the author's own time, are of importance to historians. His prose lacked the dramatic power of Compagni's but his work may be described as the greatest achievement of Italian vernacular historiography during the Middle Ages. After Villani's death, the ***Cronica*** was continued by his brother Matteo and by the latter's son Filippo.

From Boccaccio's death to about the middle of the 15th century, Italian poetry suffered a decline. The following period was to be characterized by critical and philological activity rather than by original creative work.

MEDIEVAL LITERATURE OF THE IBERIAN PENINSULA

The medieval literature of the Iberian Peninsula is treated below according to language.

Castilian. ***The beginnings of vernacular writing.*** By the time of the Muslim invasion (beginning in 711), the Latin spoken in the Iberian Peninsula was in process of transformation into Romance. The 10th-century glosses, or marginal notes, to Latin texts in manuscripts belonging to the monasteries of San Millán de la Cogolla and Silos, in La Rioja, reveal traces of a vernacular already substantially developed. The earliest texts in Mozarabic (the Romance dialect of Spaniards living under the Muslims) were recovered from Hebrew and from Arabic *muwashshaḥ*s (poems in strophic form, with subjects such as panegyrics on love and wine), the last strophe of which was the ***markaz*** (theme stanza). They provide evidence of a popular poetry that may have begun as early as the 10th century and explain much in the traditional Spanish lyric types (***e.g.,*** the ***villancico,*** "carpl") of the later Middle Ages and the Renaissance. The ***markaz*** was generally a woman's love song, and, the motif, in Romance, was a cry of passion on which the whole poem was based.

Tales of the Cid

The rise of heroic poetry. The earliest surviving monument of Spanish literature, and one of its most distinctive masterpieces was the *Poema* (or *Cantar)* ***de mío Cid*** ("Song of My Cid"), an epic poem of the mid-12th century (the existing manuscript is an imperfect copy of 1307). It tells of the fall from and restoration to royal favour of a Castilian noble, Rodrigo Diaz de Vivar (*c.* 1043–YY), known by the Arabic title ***sidi,*** "lord." The setting and personages, the topographical detail, the realistic tone and treatment, and the proximity in time of the poet to his hero have led to the acceptance of historical authenticity as a characteristic of the poem and of the Castilian epic in general. The last two of the three sections were, however, wholly imaginative and the mere six lines given to the Cid's taking of Valencia from the Muslims make it clear that the scale of values is subjective and that the work is essentially poetic in conception. It won fame, nevertheless, as a popular embodiment of the Castilian character and lived on in epic, chronicle, ballad, and drama. The only other surviving epic text, a fanciful and decadent ***Cantar de Rodrigo*** ("Song of Rodrigo"), tells of the Cid's early manhood, from which the later legend of the Cid took shape. Frequent allusions in vernacular chronicles to the heroic narratives of minstrels make it clear that many narrative poems must have been lost. The chroniclers accepted these as historically authentic and "prosified" them, so that themes and even fragments of text can be reconstructed. Heroic narratives about which some information is available are ***Los siete infantes de Lara*** ("The Seven Princes of Lara"), ***Fernán González, El cerco de Zamora*** ("The Siege of Zamora"), ***Bernardo del Carpio,*** and others treating themes integral to the feudal history of Castile that were closer to a remote Visigothic past than to any French epic.

The beginnings of prose. A major influence on prose was exercised by Arabic. Oriental learning came to Spain with the capture (1085) of Toledo from the Muslims. The city became a centre of translation from Oriental languages. An anonymous translation from Arabic (1251) of the "beast fable" ***Kalilah wa Dimnah*** was the first example of storytelling in Spanish. An Oriental romance of the Seven Sages, known as the ***Sendebar,*** was translated likewise through Arabic, and other collections of Eastern stories soon followed.

Alfonso the Wise. The middle of the 12th century saw the recovery of Córdoba, Valencia, and Seville by the Christians. A more propitious intellectual ,atmosphere resulted in the founding of universities, and under Alfonso X of Castile and Leon (reigned 1252–84) literature achieved official prestige. Alfonso, in whose chancery Castilian replaced Latin, could be described as the father of Castilian prose. His vast enterprise of translation and compilation aimed at fusing all knowledge-classical, Oriental, Hebrew, and Christian—in the vernacular. The works, often under his personal editorship, included the great legal code Las Siete Partidas ***(The Seven Divisions of Law,*** 1931), a mine of information on the life of the time, and compilations from Arabic sources such as treatises on astronomy, on the magical properties of precious stones, and on games, especially chess. With the ***Crónica general,*** a vast history of Spain, and the ***General estoria,*** an attempt at a universal history from the creation, Alfonso founded Spanish historiography. The former, carried by Alfonso to AD 711 and completed by his son Sancho IV, was the most influential single work of the Spanish Middle Ages. Himself a poet, Alfonso made one of the greatest collections of medieval poetry and music, the ***Cantigas de Santa** María* ("Songs to the Virgin"), in Galician, the then accepted language for lyric.

The ***Crdnica general*** and the ***General estoria***

Learned narrative poetry. A new school of poetry, indebted to France and linked with the monastery and a literate public, became known as the ***mester de clerecia,*** "clerkly craft." Adapting the French Alexandrine in the "fourfold way"—*i.e.,* four-line single-rhyme stanza with a 14-syllable line—it dealt with religious, didactic, or pseudo-historical matter. It was best exemplified in Gonzalo de Berceo (***c.*** 1195–c. 1268), the earliest Spanish poet known by name, who versified in the vernacular the lives of saints, miracles of the Virgin, and other devotional themes with an ingenuous candour and an accumulation of picturesque and affectionately observed detail. Also of the 13th century were the ***Libro de Alexandre,*** much more erudite and pretentious; a version of the Latin romance on Apollonius of Tyre; and the *Poema de Fernán González,* a clerical reworking of a lost epic.

The 14th century. The period of translation and compilation was succeeded by one of brilliant original creation, best represented in the prose of Alfonso's nephew Juan Manuel and in the poetry of Juan Ruiz, archpriest of Hita. Juan Manuel's ***Libro de** los exemplos **del Conde Lucanor** et **de Patronio*** ("Book of the Exemplary Tales of Count Lucanor and Patronio"), a collection of 50 moral tales, still drew on Arabic sources, but its individuality places it high in the beginnings of Spanish fiction.

Under the influence of the Arthurian, or Breton, cycle, which had been circulating in translation, there had appeared (*c.* 1305) the first Spanish romance of chivalry and the first Spanish novel, *El caballero Cifar* ("The Knight Cifar"), on the theme of St. Eustace, the Roman general miraculously converted to Christianity. Cifar's squire, Rihaldo, was a distant precursor of Don Quixote's Sancho Panza and an early token of an impinging of the real on the ideal so characteristic of Spanish literature. About the same time the *Amadís de Gaula,* a chivalric romance related to the Arthurian cycle, whose author may have been a Galician or Portuguese troubadour in exile at the Castilian court, was circulating and was destined to hold the imagination throughout the 16th century through its sentimental idealism, lyrical atmosphere, and supernatural adventure.

The works of Juan Ruiz

Juan Ruiz was the most intensely alert and individual of early poets. His *Libro de buen amor* (1330, expanded 1343; "Book of Good Love"), a collection of disparate elements — Ovid, Aesop, the 12th-century Latin *Pamphilus de amore*, and the liturgy — suggested a Muslim way of thinking in the mingling of eroticism with devotion and an invitation to the reader to intepret for himself equivocal teachings. His Trotaconventos, ancestress of La Celestina, was the first great character in Spanish literature. The Alexandrine metre he handled with new vigour and plasticity, and the text was interspersed with religious, pastoral–farcical, amorous, or satirical lyrics of great metrical variety.

More exotic elements occurred in the verse *Proverbios morales* (*c.* 1355) of Santob de Carrión de los Condes and in an Aragonese version of the story of Joseph, based on the Qur'ān and written in Arabic characters, which was the chief example of "barbarian" literature in Spanish. The *Proverbios* of Santob introduced the grave sententiousness of Hebrew poetry with its extreme aphoristic concision; Santob's sources were the Old Testament, the Talmud, and the Hebrew poet and Arabic philosopher Ibn Gabirol.

Pedro López de Ayala, chancellor of Castile, dominated the poetry and prose of the later part of the century with his *Rimado de palacio* ("Poem of Palace Life"), the last major relic of the "fourfold-way," and his chronicles of Peter I, Henry II of Trastamara, John I, and Henry III of Castile, which stimulated the writing of personal, contemporary history; an early Humanist, he translated and imitated Livy and Boccaccio, Boethius, St. Gregory, and St. Isidore.

The 15th century. The early 15th century witnessed a renewal of poetry under Italian influence. The contrast was strong during the reign of John II between the anarchy of feudalism in its death throes and the cultivation of polite letters, which was becoming a mark of birth and breeding. Collections of poems such as the *Cancionero de Baena,* made for the King by Juan Alfonso de Baena (a converted Jew and a poet), containing 583 poems by 55 poets from the highest nobles to the humblest versifiers, showed not merely the decadence of the Galician–Portuguese troubadour but also the stirrings of more intellectual poetry using symbol, allegory, and classical allusion in the treatment of moral, philosophical, or political themes. Francisco Imperial, a Genoese settled in Seville and a leader of the new poetry, drew on Dante, while the Marques de Santillana, poet, scholar, soldier, and statesman, collected masterpieces of foreign literatures and stimulated translation. His *Proemio e carta al condestable de Portugal* (1449; "Preface and Letter to the Constable of Portugal"), the earliest work of literary history and criticism in Spanish, drew on his reading in contemporary foreign languages and translated classics. Imperial had already sought to acclimatize the Italian hendecasyllable. Santillana's sonnets in the "Italian style" marked the beginnings of the formal enrichment of Spanish poetry. His role as precursor is still acknowledged, though the sonnets and long poems, which reflected his Italian-influenced training, are neglected in favour of his charming rustic songs of native inspiration.

Italian influence on Castilian poetry

Juan de Mena's vast allegorical poem of the drama of history past, present, and to come (*El laberinto de fortuna,* 1444; "The Labyrinth of Fortune"), a more conscious attempt to rival Dante, was weighed down by pedantry and over-Latinization of syntax and vocabulary.

An outstanding anonymous poem of the early part of the 15th century, the *danza de la muerte* ("Dance of Death"), was the finest example of a theme then popular with poets, painters, and composers. Related to the earlier *Danse macabre* at Paris but written with greater satiric force, it introduced characters (*e.g.*, a rabbi) not included in the French cycle. It presented a cross section of society in the form of a dialogue between Death and his protesting victims, and, although not intended for dramatic presentation, formed the basis for later drama.

Catalan. The old Catalan language of northeastern Spain was a branch of peninsular rather than southern Gallo-Romance. Nevertheless it had traces of Provençal, and the literature long used the Languedoc (the dialects of Old French spoken south of the Loire River) and the poetic forms of troubadours north of the Pyrenees.

Poetry. The early Catalan troubadours Guillem de Bergadh, Hug de Mataplana, Guillem de Cervera, and others were genuine Provencal poets. About 100 years later, in the late 14th century, Provençal influence apparently lessened, and poets turned for inspiration to northern France. They took over the long French narratives on romance themes such as the Arthurian cycle and the *noves rimades* metre, a sequence of octosyllabic rhymed couplets. Several poets working in this tradition carried the new interest in the Langue D'oïl (the dialects of Old French spoken north of the Loire) to the extent of incorporating passages of French poetry in their poems.

The great period of Catalan poetry

The great period of Catalan poetry was the 15th century, after John I of Aragon had established in 1393 a poetic academy in Barcelona on the model of the academy in Toulouse with *jocs florals* ("floral games." or poetry congresses), including literary competitions. This royal encouragement continued under Martin I and Ferdinand I and helped to emancipate the literary style from foreign influences. As the century advanced, Valencia emerged as a new focus of literary activity: a school of poetry developing there was noted for its characteristic use of eight-line decasyllabic verses with crossed, or "chained," rhymes and final four-line refrain, illustrating a turning away from French models and a new inspiration from Italy. The *cants d'amor* and *cants de mort* ("songs of love" and "songs of death") by Ausiàs March, an inspired and profound poet, contained the finest verses ever written in Catalan, exerted influence in 16th-century Castile, and continue to influence modern Catalan poets. Jaume Roig's *Lo Spill o llibre de les dones* (*c.* 1460; "The Mirror or Book of Women") was very different — a caustic satire on woman, written in more than 16,000 four-syllable lines, portraying contemporary Valencian life vividly. Johan Roiç de Corella, a great Valencian lyricist, was perhaps the best representative of the Renaissance.

After the union of Aragon with Castile, the Castilian language predominated throughout Spain, spelling a long eclipse of Catalan literature. Nevertheless a Catalan, Juan Boscán Almogáver, inaugurated a new Castilian school of poetry, and Castilians regard him as a landmark in the history of their Renaissance; by the time Boscán's works were published (1543), Catalan poetry had been dead for 50 years.

Prose. Though the oldest document (the text of an oath by a bishop of Urgel) dates from *c.* 1100, literary prose only began at the end of the 13th century. It was written in the everyday speech found in charters from the time of James I's accession to the Aragonese throne in 1213; four great chronicles that survive represent the peak of medieval Catalan prose. The anonymous *Llibre dels feyts del rey en Jacme* ("Book of the Deeds of King James"), compiled after James I's death in 1276, and Ramon Muntaner's account of the Catalan Grand Company's expedition to the Morea in southern Greece and of James II's conquest of Sardinia .were distinguished by skill of narration and quality of language. Bernat Desclot's chronicle deals with the reign of Peter I the Great; though the account of Peter IV the Ceremonious is ascribed to Bernat Descoll, it was planned and revised by the King himself.

The works of Ramon Llull

Ramon Llull was unequalled in his encyclopaedic production, in Catalan, Arabic, and Latin, covering every branch of medieval knowledge and thought. His exhaustive theological treatise *Llibre de contemplacid en Déu* ("Book of the Contemplation of God") began Catalonia's golden age of literature, providing incidentally a mine of information on contemporary society. The *Llibre d'Evast e Blanquerna* founded Catalan fiction. It included the *Llibre d'amic e amat* ("Book of the Lover and the Beloved"), a masterpiece of mysticism, while his *Fèlix* and *Llibre de l'orde de cavaylería* ("Book of the Order of Chivalry") were instructive works in a narrative framework. A century later, Francesc Eximenis, with a similar intellectual amplitude but lacking the originality and driving force of Llull, planned *Lo chrestid* ("The Christian"), an exhaustive treatise on theology, morals, and politics for the layman. It provided vivid pictures of the medieval scene, while his *Llibre de les dones* ("Book of Women"), a manual of devotion and domestic economy, was similarly informative on women's life.

Bernat Metge began the "classical age" by translating Boccaccio's story of Griselda from Petrarch's Latin version and, clothing his scholastic learning with poetic imagination, achieved the stylistic masterpiece of Catalan prose.

The beginnings of drama were represented by a 15th-century Assumption play, *Misteri d'Elch*, which is still performed annually at Elche on the Feast of the Assumption.

Galician. Galician is closely related to Portuguese, and there is no separating the two languages in the three great repositories of medieval verse, the 14th-century *Cancioneiros* ("Songbooks") *de Ajuda, da Vaticana,* and *Colocci-Brancuti.* Indigenous lyric origins were overlaid by Provençal influence, and a dominance of emotion over thought identified Galician with subjective lyricism, so that for over a century Castilian poets made it their medium for lyrics. Macías El Enamorado (flourished mid-14th century), who died for love and became a legend, was the last Galician troubadour; Galicians thereafter wrote in Castilian, and, though there were echoes of their tradition, the Renaissance and Castilian political hegemony together finally ended Galician literature until the 19th-century revival.

Portuguese. *Poetry.* Though no literary documents belonging to the first century of Portugal's history as a nation have survived, there is evidence of the existence of an indigenous popular poetry. A few compositions from before 1200 survive; one, attributed to Sancho I, is the earliest extant *cossante,* or brief, repetitive lyrical poem marked by a wistful sadness, which is never wholly absent from Portuguese literature. The accession in 1248 of Afonso III, who had lived 13 years in France, inaugurated a period of poetic activity illustrated in the *Cancioneiro da Ajuda,* the oldest collection of peninsular verse. Soon literary norms of Provence and of northern France were concurrent, subtlety of form and device taking precedence over thought or emotion.

Diniz' encouragement of literature

The peak of this palace poetry was reached in the early years of the reign of Afonso's son Diniz (or Denis), who had been educated by Aymeric of Cahors, a Frenchman. Diniz founded his country's first university at Coimbra in 1290 and stimulated translation into Portuguese of outstanding works from Spanish, Latin, and Arabic. He founded vernacular prose in Portugal and was also considered the best poet of his age in the Peninsula. To his court came troubadours from Leon, Castile, and Aragon to enjoy the last of a cult dying elsewhere, and about 2,000 poems by its 200 poets were preserved in the three great *Cancioneiros da Ajuda, da Vaticana,* and *Colocci-Brancuti.* Although this poetry lacked ideas and was conventional in form and expression, the language had highly developed musical qualities.

In contrast with the restricted horizons of courtly verse, themes of adventure, war, and chivalry mingled with love, religion, and the sea in a collection of ballad poetry known as the *romanceiro.* Few of these ballads can be dated earlier than the 15th century; they belonged to an anonymous poetry kept alive by oral transmission, with a late artificial flowering from known poets in the 16th and 17th centuries.

Prose. Prose literature in Portugal took much longer than verse to perfect. Religious writings, brief annals of the early kings, and books of descent formed the earliest texts. The *Livro de Linhagens* of Pedro, count of Barcelos, constituted a landmark by going beyond genealogy to history and legend. The early popularity of subject matter based on Celtic tradition is attested in the five songs based on Breton lays with which the *Cancioneiro Colocci-Brancuti* opens: the ideals of chivalry and the spirit of sentimental adventure associated with the knights of the Round Table made strong appeal to the Portuguese temperament, a *História dos Cavaleiros da Mesa Redonda e da Demanda do Santo Graal,* adapted from the French, being the chief relic of considerable activity in this field; from it derived *Amadís de Gaula,* which was the progenitor of a long succession of chivalric romances in Spain and Portugal and whose original was probably Portuguese, at least for the first three books of *c.* 1350, possibly by Vasco de Lobeira.

MEDIEVAL LITERATURE OF THE EASTERN MEDITERRANEAN

Byzantine Greek. Byzantine literature, the literature written in Greek during the Byzantine period (330–1453), is, after Byzantine art, the most direct expression of the self-contained medieval Christian culture that was a continuation of Greco-Roman civilization. Its character was determined by the centralized structure of the Byzantine Empire and particularly by the court life of Constantinople (Byzantium). After Constantine the Great, the Christian Church assumed guardianship of Greco-Roman cultural traditions, and literature written in Greek was affected by a deep linguistic conservatism. It was felt that literary language had to preserve the forms of speech of the Greek New Testament and the Church Fathers and, on the other hand, those of Attic models from the great literary past. Thus literary language was not permitted to display the simplifying influences it underwent in daily use in the mouths of the people. While the language of daily life developed into modern Greek, in the literary field Byzantium clung to speech forms artificially frozen at the Hellenistic Greek stage. Imitation of the ancients became the principle behind all literary forms, and this smothered any sense of originality of content and invention. Though the traditionalism of the Byzantines saved for posterity the best of ancient Greek literature, a consciousness of being in sole possession of the intellectual treasures inherited from the ancients led to an overrating of erudition—hence the pedantic, obtrusively didactic form of many Byzantine writers.

Deliberate archaism of literary Greek

In spite of the admiration that the West entertained for Byzantine culture, any effect of one on the other was small throughout the Middle Ages. Knowledge of Greek was lost in the West during most of the medieval period, and literary contact also suffered from a mistrust that was increased by religious schism and rivalries aroused by the Crusades. In Egypt and Asia Minor Greek literature gave way to writing in the vernaculars (Coptic, Syriac). But Byzantine literature exercised a strong influence on the people of eastern Europe, especially the Slavs.

Non-literary Byzantine works

Much of Byzantine writing was not primarily of literary interest. A vast number of prose works were produced in the fields of theology, hagiography, history, geography, philosophy, military science, and law. In theology, the important writers. all of the 4th and 5th centuries, were Athanasius, the creator of the pattern for Byzantine hagiography; Eusebius, who wrote the first ecclesiastical history; Basil of Caesarea (St. Basil the Great), who organized Eastern monasticism; his brother, Gregory of Nyssa, the earliest Greek ascetical author; and Gregory of Nazianzus, a theologian and poet. In hagiography, mention need only be made of the number of popular saints' lives from which gradually developed a form of religious novel, the best known example of which is the story of Barlaam and Josaphat.

Religious poetry. The oldest surviving religious poetry was composed in ancient Greek metres for use in private devotions. This included the so-called maiden's song in the ***Symposium*** of Methodius of Philippi and the religious poems of Gregory of Nazianzus (written between 381 and 389). More important than this private religious poetry were the Byzantine liturgical hymns. The need for congregational hymns developed to counteract the success that the esoteric religious movement of the Gnostics and the heretic Arius (died 336) had with their religious poetry set to folk music. The model for the poetical development may well have been Syrian church hymns, the most prolific and successful writer of which was a Syrian, Romanos Melodos (6th century). In the 7th century, church poetry entered a new state, characterized by an increase in artistic finish and a falling off in poetical vigour, with the composition of the *kanōn*, a poem built up out of eight or nine lyrics, all differently constructed, of which Andrew of Crete has been regarded as the inventor and of which the most celebrated writers were John of Damascus and Cosmas of Jerusalem (both first half of the 8th century).

Secular poetry. Epic popular poetry began with the vernacular Greek literature (see below); but there were several literary works that can be compared with the epics of the Alexandrian age. Nonnus (flourished c. 400) wrote, while still a pagan, an epic on the god Dionysus and, as a Christian, a lengthy versification of St. John's Gospel. The historic epic was also carefully preserved by the Byzantines, and in the 7th century George the Pisidian described the wars of the emperor Heraclius, though more as an encomiast than as an epic poet. Later, a deacon, Theodosius (10th century), immortalized the capture of Crete by the emperor Nicephorus Phocas.

In the 12th-century revival of culture, some long poems imitated ancient Greek romances: the story of Rodanthe and Dosicles by Theodore Prodromus, the love story of Aristander and Callithea by Constantine Manasses, and one in prose, the story of Hysmine and Hysminias by Eustathius Macrembolites.

The detached and ascetic point of view that dominated the whole Byzantine period was fatal to a dwelopment of secular lyrical poetry. A few poems by John Geometres and Christopher (11th century) of Mytilene and others are placed in this category. The dominant form for all subjective poetry was the epigram, George the Pisidian treating most diverse themes epigrammatically and, in the 9th century, Casia, Byzantium's only poetess, writing several epigrammatic productions and church hymns. Epigrammatic poetry reached its highest development in the 10th and 11th centuries in the productions of John Geometres, Christopher of Mytilene, and John Mauropus, the 10th century also dating the most valuable collection of ancient epigrammatic poems, the ***Anthologia Palatina.***

The epigram

The didactic poem was much loved among the Byzantines, a form in line with their tendency to instruct their fellow men. John Tzetzes wrote metrical commentaries on Homer, Hesiod, Pindar, Aeschylus, Euripides, and Aristophanes.

Dramatic poetry was completely lacking among the Byzantine Greeks. Apart from some moralizing allegorical dialogues (by Theodore Prodromus, Manuel Philes, and others), the only work of the Byzantine period resembling a drama, at least in external form, was the ***Christos paschon,*** which was actually a cento of classical citations.

Vernacular writing. The vernacular literature stood alone, both in form and in content. It showed originality of conception and entirely new medieval matter, and in it poetry took first place. Though a few preliminary attempts were known, longer Greek vernacular works were written down only from the 12th century onward. Toward the close of the 15th century, rhyme came into use. In Constantinople a mixture of the learned and the popular language was first used in poems of admonition, praise, and supplication. To this oldest, 12th-century class of vernacular poetry belonged the admonitory *Spaneas* and (partly, at least) a supplicatory poem composed in prison by a chronicler, Michael Glycas. In the succeeding period, erotic poems began to be written, such as the Rhodian love songs.

Long epic poems, in which were treated such subjects as the legends of Troy, of Achilles, and of Alexander. formed a separate group. To these may be added romances in verse in the artificial classical language—*e.g.*, ***Callimachus and Chrysorrhoe, Belthandrus and Chrysantza***—and those after the Western pattern—such as ***Phlorius and Platziaphlora*** (the old French story of ***Floire et Blanchefleur***), ***Imberius and Margarona,*** and ***Apollonius of Tyre.*** Well-known stories from the ***Physiologus*** ("The Naturalist") about animals, plants, and stones were put into verse in this period, and other animal tales in verse were also popular. There were also poems in which famous heroes and historical events are celebrated: the exploits of Belisarius (Justinian I's general), the fall of Constantinople (1453), and the taking of Athens (1458). The chief of these was the great heroic epic of Digenis Akritas, preserved in several versions, the oldest of which dates from the 13th century. Digenis Akritas represented the bold frontier warrior ***(akrites)*** on the Euphrates frontier in the 8th–10th centuries. His feeling for nature and strong family affections forecast much that is best in modern Greek popuiar poetry.

Heroic epics

Hebrew. In the 6th century, some Jewish groups attempted to enforce the exclusive use of Hebrew in the synagogue, this tendency being part of a Hebrew revival that began in Palestine and spread westward but did not reach Babylonia until the 10th century.

Piyyuṭim. Synagogues began in this period to appoint official precentors, part of whose duty it was to compose poetical additions to the liturgy on special sabbaths and festivals. The authors were called *payṭanim* (from Greek *poiētēs*, "poet"), their poems *piyyuṭim.* The keynote is messianic fervour and religious exuberance. Besides employing the entire biblical, Mishnaic, and Aramaic vocabularies, the *payṭanim* coined thousands of new words. Such poems, presupposing a highly educated audience, abound in recondite allusions and contain exhaustive lists of rites and laws. It is known that the most outstanding poets—Phineas the Priest, Yose ben Yose, Yannai, and Eleazar ha-Kalir or ben Kalir—lived in that order, but when or where in Palestine any of them lived is not known. The currently accepted datings are 3rd century and 5th–6th century AD. Many *piyyuṭim* are still used in the synagogue.

Biblical Hebrew was re-established as the literary idiom about 900 by Saadiah Gaom, grammarian and religious polemicist. The Arabic system of quantitative metre was adapted for Hebrew during this period (900–1000), probably by Dunash ben Labrat. At first the *piyyuṭ* form was retained for religious poems, and the new metres were used only for secular poetry, which closely imitated Arabic models and, like the latter, was chiefly employed for laudatory addresses to prominent people.

Adoption of Arabic metre

The Palestinian tradition in Europe, 800–1300. From Palestine, the Hebrew renaissance soon spread into the Byzantine Empire. In Sicily and southern Italy (which belonged to Byzantium) several important *paytanim* were at work, and before 1000 a secular literature began to arise in Italy: a fantastic travelogue of Eldad the Danite; a historical romance, ***Sefer ha-yashar;*** and ***Josippon,*** a revision of Josephus' ***Antiquities*** filled with legendary incidents—this last-named book was popular until modern times and was translated into many languages. Nathan ben Yehiel completed in 1101 at Rome a dictionary of Talmudic Aramaic and Hebrew, the ***'Arukh,*** which is still used.

In the middle of the 10th century members of the north Italian family Kalonymos brought Talmudic studies and *piyyuṭim* to Mainz, Germany, where the academy became a centre of studies under the direction of Gershom ben Judah, known as "the Light of the Exile." As a poet, he established a distinctive style of European *piyyuṭ* in poems that read very much like early European popular poetry. The greatest alumnus of the Mainz academy was Rashi, an author of complete commentaries on the Bible and on the Babylonian Talmud, himself a poet of note.

Slaughter during the Crusades drove large masses of Jews into eastern Europe, whither they carried their German speech but hardly any literary culture. In Germany accounts of the disaster were written in a new prose style permeated with poetry; liturgical poetry became henceforth mainly a chronicle of persecutions. These sufferings inspired an important mystical movement, largely propagated through stories, of which the chief collections are the *Maʿaseh Book* and the *Sefer Ḥasidim*, the latter attributed to Judah ben Samuel, "the Hasid" of Regensburg (died 1217).

The golden age in Spain, 900–1200. Spanish Jewry began to flourish in Muslim Spain under the caliphate of Córdoba, where Hasdai ibn Shaprut, a vizier, was the first great patron of Hebrew letters. His secretary, Menahem ben Saruq (died *c.* 970), wrote a biblical lexicon, which was criticized by Dunash ben Labrat when the latter arrived in Spain with philological ideas from the East. Samuel ha-Nagid, vizier of Granada (990–1055), himself a poet and philologist, gathered around him a group of poets, most outstanding among whom was Ibn Gabirol. Moses ibn Ezra of Granada (died c. 1139) was the centre of a brilliant circle of poets. Moses' kinsman Abraham ibn Ezra, a poet, philosopher, grammarian, and Bible commentator, attacked the language and style of the early *payṭanim;* he and Judah ben Samuel Halevi were the first to use Arabic metres in religious poems. Dominated by Arab standards of taste, the secular poetry dealt with themes of Arabic poetry and often reproduced Arabic phrases; it was written to be appreciated by a small circle of connoisseurs and declined with the collapse of Jewish prosperity in Muslim Spain. The last major poet in Spain was Judah ben Solomon Harizi, who translated various philosophical works into Hebrew.

The poets of Granada

The use of biblical Hebrew was made possible by the work of philologists. Of great importance was the creation of comparative linguistics by Judah ibn Kuraish (flourished about 900) and Isaac ibn Barun (flourished 1100). Judah Hayyuj, a disciple of Menahem ben Saruk, recast Hebrew grammar, and, in the form given to it by David Kimhi of Narbonne (died *c.* 1235), the new system was taken over by the Christian humanists and through them by modem scholarship. The first complete Hebrew grammar, *Kitāb al-lumaʿ*, was written by Ibn Janāḥ of Córdoba (died 1050).

Jewish medieval philosophers in Spain wrote in Arabic, not Hebrew, until the 13th century. Apart from Isaac Israeli (north Africa, died *c.* 940) few medieval Jews made original contributions to science, but the Spanish Jews shared the best scientific education. Abraham bar Hiyya Savasorda (*i.e.*, "chief of police"; died *c.* 1136) of Barcelona was an original mathematician who wrote in Hebrew works on mathematics, astronomy, and philosophy. When the Almohads expelled the Jews from Muslim Spain in 1148, many learned refugees went to Languedoc and Provence and there translated scientific and philosophical works.

The period of retrenchment. From 1200 to 1750 was the era of the ghetto, during which the area of western Hebrew culture shrank to a remnant in Italy, while an entirely different culture arose in eastern Europe. The appearance of the Hebrew version of Maimonides' *Guide of the Perplexed* (1204), which applied Neoplatonic and Aristotelian philosophy to biblical and rabbinic theology, provoked orthodox circles into opposition to all secular studies. As a result of Maimonides' work, there was a return to Neoplatonist mysticism in a form known as Kabbala. This culminated in the theosophy of the *Zohar*, which is ascribed to Moses de Leon and which exercised an influence comparable only with that of the Bible and Talmud. Hebrew culture, however, was reduced to a miniature scale in the West after the expulsion of the Jews from England (1290), from France (1306), and from Spain (1492). It continued in Italy, where it remained in contact with contemporary Christian thought. The most outstanding figure was the mystical philosopher M.H. Luzzatto, who wrote a work on poetics and three remarkably modern plays.

Coptic. Almost entirely religious in character, literature in Coptic contained, as well as translations from Greek, original writings by the Greek Fathers and founders of Eastern monasticism and texts throwing light on early Gnosticism and Manichaeism (a dualistic gnostic world religion). From the 3rd century, when Coptic began to be widely used as a literary language, to its decline in the 7th and 8th centuries, examples are extant of every kind of religious writing. The earliest original writings in Coptic—letters by St. Anthony of Egypt, first of the "Desert Fathers"—date from the 2nd century; and in the 3rd and 4th centuries many ecclesiastics and monks wrote in Coptic, among them St. Pachomius, whose monastic rule (the first cenobitic rule; for solitary monks gathered in communities) survives only in Coptic; St. Athanasius, the first patriarch of Alexandria to use Coptic, as well as Greek, for didactic homilies; Macarius (the Elder) of Egypt, a famous ascetic desert solitary; and St. Serapion, bishop of Thmuis, whose liturgical texts are a valuable source for early church worship. The first to realize fully the language's literary potentialities was Shenute (Shenoud; *c.* 348–457), abbot of the White Monastery (Deir el-Abyad), near Atripe, Upper Egypt. In sermons, treatises, and homilies he showed mastery of style and the forceful character that made him (though unknown in the West till the 20th century) the most influential personality of his period in Egypt, where he is still regarded as a saint. His works remain the outstanding original writings in Coptic, equalled in intensity only by 7th- and 8th-century hymns sung antiphonally to traditional tunes and written to encourage the Coptic Christians during the persecutions that followed the 7th-century Muslim invasions.

Ethiopian. The literature of Ethiopia (Abyssinia) consists of writings in the classical Ge'ez (Ethiopic) language, constituting very largely a literature of translations from Greek and Arabic and works in Amharic, the modern official language. The earliest extant literary works in Ge'ez are translations of religious writings from Greek, which may have influenced their style and syntax.

Early works in Ge'ez

From the 7th century to the 13th, a period marked by political disturbances, there was no new literary activity, but with the restoration of the "Solomonian" dynasty, *c.* 1270, there began the most productive era of Ge'ez literature, again characterized by translation, not from Greek but from Arabic, though the originals were frequently Coptic, Syriac, or Greek. The subject matter was mostly theological or strongly flavoured by religious considerations. The most interesting work occurring at the beginning of this period was *Kebra nagast* ("Glory of the Kings"), a combination of mythical history, allegory, and apocalypse, the central theme of which is the visit of the Queen of Sheba to Solomon and the birth of a son, Menelik, who became the founder of the Ethiopian dynasty.

Abba Salama, an Egyptian Copt who became metropolitan of Ethiopia in 1350, was not only responsible for a revision of the text of the Bible but translated or induced others to translate several books popular among the Ethiopian faithful. The rhapsodical *Weddase Maryam* ("Praise of Mary") is appended to the Psalter and thus has almost canonical status. In a slightly later period, about the beginning of the 15th century, various separate lives of saints and martyrs, including St. George (the patron saint of Ethiopia), were written. At this time was undertaken a translation of the Arabic Synaxarium, containing lives of saints--one or more for every day in the year.

The early 15th century saw the translation of several apocalyptic books, which inspired two original compositions. *Fekkare Iyasus* ("Elucidation of Jesus") was written during the reign of Theodore I (1411–14); "Mystery of Heaven and Earth" was written somewhat later and is noteworthy for a vigorous account of the struggle between Michael and Satan. This book must not be confused with another original work of the same period, the "Book of Mystery" by Giyorgis of Sagla, a refutation of heresies. The large hymnals and antiphonaries called *Deggua, Mawase'et,* and *Me'raf* also probably dated from this time, though some of the anthems may be older. Another type of religious poetry first composed during the 15th century was the *malk'e* (likeness), consisting generally of about 50 five-line rhyming stanzas, each addressed to a different physical or moral attribute

Apocalyptic works of the 15th century of the saint apostrophized. As a last example of the religious literature of the "golden age" may be mentioned the "Miracles of Mary," translated from Arabic in 1441–42; enormously popular, it went through several recensions, or critical revisions.

Syriac. Apart from its interest to Semitic scholars, Syriac literature is of importance for the study of Syrian Christianity, for the fact that it has preserved Greek Christian texts, and for its role as an intermediary between ancient Greek learning and the Islamic world.

Poetry. The works of St. Ephraem Syrus (4th century) stood at the beginning of Syrian literature and were never surpassed by any later author. Two poetic forms were employed by him, one for spoken speech in metrical form, whether a narrative or didactic epic, the other a more artful composition in strophes to be sung by a choir or double choir. At the beginning of Nestorian Christianity came Narsai (died c. 503), the greatest poet of the East Syrians. The elegance of his poetry and the beauty of his style earned him a reputation as the "harp of the Holy Spirit."

Translations from Greek. The Syrians began their literary activity by making Greek Christian writings available in Syriac. Almost all important authors and documents of Christian Greek were translated by Syrians. This mass of Greco-Syrian translated literature is an essential source for works of Greek Christian literature that have not survived in their original language. The translators also put into Syriac most of the works of Aristotle and other ancient Greek philosophers, together with writings of the chief medical and scientific authors of ancient Greece. These translations formed an important preparatory work for the rise of Islamic civilization, for it was much easier to translate from Syriac into Arabic than directly from Greek into Arabic; thus, for instance, to take the works of Galen alone, 130 were translated into Arabic from Syriac and only nine directly from Greek originals into Arabic. For this reason many works of Greek learning exerted their influence on the Muslim world through the medium of Syriac.

Armenian. There is evidence that a pagan oral literature existed in Armenia before the invention of the alphabet in the 5th century AD, but, owing to the zeal of the early Christian priests, little of this has been preserved. For about a century after their conversion to Christianity (c. 300), the Armenians had to rely on Greek and Syriac versions of the Bible and other religious books. These languages were unintelligible to the common people, and to remedy this St. Mesrop invented the Armenian alphabet (c. 410). The catholicos Sahak the Great and St. Mesrop formed a school of translators who were reputedly sent to Edessa and to Constantinople to procure and translate Syriac and Greek copies of important works.

The importance of religious translations and histories

Much of the literary activity of the 5th century, the golden age of Armenian literature, was devoted to such translations; original works, however, were not wanting, such as the histories of Eghishe and Ghazar of Pharp. The masterpiece of classical Armenian writing is the "Refutation of the Sects" by Eznik Koghbatzi. This was a polemic work, composed partly from Greek sources, in defense of orthodox Christian belief against—and thereby providing valuable information about—pagan Armenian superstitions, Iranian dualism, Greek philosophy, and the Marcionite heresy. Its pure classical style is unsurpassed in Armenian literature. The work of translation of such authors as SS. John Chrysostom and Cyril of Alexandria continued in the 6th–8th centuries. The so-called Hellenistic (Yunaban) school produced excessively slavish translations from Greek grammatical, theological, and philosophical works, including those of Plato, Aristotle, and Philo of Alexandria.

Literatures of the Balkans. Just as the history of the various peoples of modern Yugoslavia has differed over the past thousand years, so the literatures of the Serbs, Croats, Slovenes, and Macedonians have developed independently. From an early date Croats and Slovenes formed part of the central European cultural heritage, whereas Serbs and Macedonians were part of the Eastern, Byzantine, culture and, later, of the Turkish sultanate. Since 1918, when they were united, the Yugoslavs have had three literary languages—Serbo-Croat, Slovene, and Macedonian—and two alphabets, the Latin and the Cyrillic. The Serbs and Croats speak a common language but use the Cyrillic and Latin alphabets, respectively. The Slovenes, with a language akin to Serbo-Croat, use the Latin alphabet and the Macedonians the Cyrillic. The peoples of Yugoslavia continue to develop their national and cultural individualism within the framework of a common federal state.

Serbian. Serbian literature originated in the use of the Old Church Slavonic language in the translation of religious works from Greek into the Glagolitic alphabet (traditionally invented by St. Cyril) by the apostles to the Slavs, St. Cyril (died 869) and St. Methodius (died 885). Originally forming part of South Slav literature, from the 12th century Serbian acquired its own characteristics, as in the illuminated Miroslav Gospel; biblical stories; hagiographies, notably St. Sava's, patron saint of Serbia; and tales such as that of Barlaam and Josaphat.

Croatian. The Croats were converted to Christianity at the turn of the 9th century by disciples of SS. Cyril and Methodius. The first ecclesiastical works were written in the Glagolitic alphabet, and fragments have survived in the Kiev Missal-pieces (11th century). From the 12th century the national language was widely used for inscriptions and legal documents, but from the 14th century Latin was increasingly used. Immediately before the age of Humanism (second half of the 15th century), literature consisted mainly of biblical stories, legends, folklore, and popular stories (of Troy, Alexander the Great. and others). Among other works, a chronicle by a priest, Dukljanin, is outstanding. Parallel with the widening of literary themes was a development of religious drama ("The Torments of Jesus," 15th century) and of religious poetry.

Slovene. The dissolution of the independent state of Carantania (now Carinthia: 821) and a merging of the upper classes into German feudal society retarded any development of Slovene literature. Among medieval manuscripts that have been preserved, the most remarkable are the *Brižinski spomeniki* (Freising manuscripts, c. 1000), containing two forms of general confession and a sermon on sin and penance, which are the first written examples of the Slovene, and perhaps of any Slavic language. Among other important manuscripts is the *Stiški* rokopis (c. 1428, 1440; "The Manuscript of Stična"), which includes a new form of general confession and the first known record of an Easter song in Slovene translation. Besides these few preserved proofs of the use of the Slovene language in catechesis, though not in liturgy, rich folk poetry—lyrical as well as epic—flourished among the Slovene peasants. Ballad motifs prevailed in epic poetry, which has been preserved with all of its archaisms in the remote Alpine valleys of the Venetian Slovenia.

The Freising manuscripts

Macedonian. Like other Slavic literatures, literature in Macedonia began in the 9th century with the translations of religious works by SS. Cyril and Methodius and with the first Slavonic "university" that emerged at Ohrid (then in Bulgaria; see below) under St. Clement (died 916), a disciple of SS. Cyril and Methodius. With this orthodox religious literature, there developed an apocryphal, heretic Bogomil literature. In the 16th century, with a fusion of Old Church Slavonic and vernacular languages, a popular Damascene literature developed: *Damaskini* were translations from the works of Damascenus the Studite. This lasted until the beginning of the 19th century, when books written in modern Macedonia were first published.

MEDIEVAL LITERATURE OF EASTERN EUROPE

Bulgarian. Slavo-Bulgarian literature stems from the Christianization of the Slavs beginning with Khan (Tsar) Boris I's adoption in 870 of the Eastern Orthodox faith for his court and people. This political decision, combined with geographical proximity to Byzantium, determined a key role for Bulgaria in the Balkan development of the first Slavic written language and its corpus of ecclesiastical writings known as Old Bulgarian literature.

Following this religious conversion, the pupils of Cyril and Methodius were soon to establish the first Slavic literary school (893–971), under patronage of the royal court of Preslav, capital of Tsar Simeon (died 927) and Tsar Peter (died 969). Arising from its mission to Macedonian Devol and Ohrid, an illustrious, first Slavic "university" was also founded by St. Clement, patron of Bulgaria's modern Sofiiski Universitet "Kliment Ohridsky." Among monastic centres at Preslav and Ohrid were St. Panteleimon foundations. In this Golden, or Old Bulgarian, period, medieval Bulgarian culture aspired to rival even the "Imperial City" (called Tsarigrad by the Slavs), Constantinople itself, as suggested by John the Exarch's *Shestodnev* ("Hexameron"; *i.e.*, "Six Days [of Creation]"). Tsar Simeon's own name is closely linked with work on his *Simeonov sbornik* ("Simeon's Collection [of Gospel Commentaries]") and with the *Zlatostruy* ("Golden Stream"), the first Slavic version from the Greek of St. John Chrysostom. The predominant role played in this early Slavic literature by translating from (and so Slavicizing) the Greek reflects the determination of these Bulgarian writers to promote and mature the Slav dialect and to convey, in structure and spelling, all the complexities and sophistication of Byzantine thought.

The 13th–14th-century Middle Bulgarian, or Silver, age of the Asen and Shishman dynasties excelled in sheer graphic virtuosity (script, layout, illumination, binding) of its manuscripts, such as the Vatican *Manasses Chronicle* of 1345 and the London *Tsar Ivan Aleksandur Gospel* of 1356. In content, too, Byzantine influences and translations from the Greek continued to yield, as in the Old Bulgarian period, abundant literary resources. The Asenid taste for historical and temporal themes was succeeded in the late 14th century by the mystical doctrines of Hesychasm, with its quest for "inner light." This was the doctrine of Theodosius of Turnovo (noted for his Kilofarevo monastery school) and his most celebrated pupil, Patriarch Evtimy (died c. 1404). Both were leading figures in the Turnovo literary school, famous for its endeavours to standardize and purify the Old Church Slavonic (OCS) tradition as closely as this could still feasibly be related to its pristine 9th–10th-century forms. The withdrawal, if not the close, of Bulgarian medieval literature features a curious genre of contemporary travelogue—the conveyance of saints' relics from Turnovo to Tsar Ivan Stratsimir's Bdin (Vidin) or farther west. Such Bulgarian scholars as Grigory Tsamblak and Konstantin of Kostenets ("the Philosopher") also migrated westward, taking with them literary skills and tradition. With these last scions of the early and late medieval Bulgarian literatures often went, too, the actual heritage of Old Church Slavonic.

Important as this sophisticated ecclesiastical literary tradition proved to be in its Bulgarian (and wider Balkan and Slav) contexts, it never displaced the other, less refined, and certainly quite uncanonical medieval literary streams that flowed more broadly over biblical, historical, and even heathen grounds to fill Balkan legends with classical, Christian, and apocryphal themes. Such fiction, with its moral didactic intentions, includes an early-10th-century Bulgarian short story (probably the earliest Slavic example in this prolific genre) of Simeon's credulous cavalryman's "miraculous encounter" with the Magyars ("Chudo s bulgarina") and the tales of "Mikhail the Warrior," "Teofana the Innkeeper," "Stefanit and Ihnilat," and, based probably on Boris I's daughter Praksi, "Bulgarian Queen Persika." Here also belong, very definitely outside the ecclesiastical and royal pale, the body of writings, doctrinal and apocryphal, of the Bulgarian Bogomil heresy, provoking from official quarters those lively and informative reactions of Presbyter Kozma and of Tsar Boril's synodal convocation of 1211. Finally, on ground common to both the Old Bulgarian ecclesiastical and the more popular literatures, are the accounts of St. John the Rila, the traditional patron saint of Bulgaria and founder of the first monastery. Notable here, alongside the popular versions, are Patriarch Evtimy's "The Life of Our Most Blessed Father Yoan of Rila" and Vladislav Gramatik's "The Rila Story: Conveyance of St. Yoan's Relics to the [Re-founded] Rila Monastery."

Russian. *Old Russian.* The earliest works of Old Russian literature arose in the 11th century. Since the development of literature was connected from the first with the acceptance of Christianity by St. Vladimir in 988 and the country's Christianization, Old Russian literature was primarily religious and didactic? and didactic works were influenced by Byzantine literature in translations from the Greek. Secular literature was influenced by oral folk poetry, which had existed among the East Slavs long before Russia had a written literature. The most valuable heritage of Old Russian folklore was an epic or heroic folk song, the *bylina,* already being composed in the 10th century and later ranging widely in theme and subject; these folk songs were produced in Kiev, Novgorod, and Galicia.

The Kievan period. The first phase of Old Russian literature, from the 11th to the early 13th century, is called the Kievan period or, sometimes, because of the Tatar Mongol invasion that followed it, the pre-Mongol period. The chief concentration of literary activity was in southern Russia, mainly in Kiev, although isolated works were written in other towns in the south and in the north. The language of both northern and southern writers was basically the same—the old literary language of the East Slavs, which had absorbed to a greater or lesser extent elements of Old Church Slavonic.

The literature of the Kievan period possessed from the first many translations, mainly from Greek but some also from Latin. Among them were service books, mostly in Old Bulgarian, that included prayers and chants. Several kinds of biblical books appeared, among them "Aprakos" Gospels, in which readings from the Gospels were arranged by days of the week as part of the church service; the earliest surviving manuscript of an "Aprakos" Gospel is *Ostromir's Evangelium,* copied in 1056–57, and the oldest known manuscript of the Four Gospels was the *Galician Gospel* (1144). Other translated works included apocryphal literature, saints' lives, chronicles, books about the creation of the world, an Alexander romance, and versions of the Troy legend and various Byzantine romances.

Old Russian chronicles and sermons

One of the oldest literary genres, widely developed in Old Russian, was the chronicle. As early as the mid-11th century, compilations of chronicles were beginning to be made, and by the early 12th century a compilation of outstanding historical and literary significance was taking definite shape. This was the *Povest vremennykh let (The Russian Primary Chronicle),* the first version of which was compiled *c.* 1112, probably by Nestor, a monk of the Kiev-Pechersk Monastery.

Sermons occupied an important place in the literature of the Kievan period, the best example being *Slovo o zakone i blagodati* ("The Discourse on Law and Grace") by Ilarion, written before his appointment as the first Russian metropolitan in 1051. In the 12th century, the second Russian metropolitan, Kliment Smolyatich, and, in particular, Kirill, bishop of Turov, were outstanding exponents of the art of ecclesiastical oratory in Kievan Rus. Of early hagiographical works, the anonymous *Skazaniye* ("Legend") of the princes Boris and Gleb, the sons of St. Vladimir, merits particular attention. It resembles the historical legend rather than the traditional Byzantine saint's life; and it is full of lyrical laments, monologues, prayers, and meditations.

In the first quarter of the 13th century a work was written that later was called *Kievo-Pechersky paterik* ("The Paterikon of the Kiev-Pechersk Monastery"). It is based on correspondence between Simeon, bishop of Vladimir, a former monk of the Kiev-Pechersk Monastery, and Polikarp, a monk at the monastery. The literature of pilgrimage to the Holy Land originated in Kievan Russia. The most noteworthy work of this kind was a *Khozhdeniye* ("Pilgrimage") to Palestine in 1106–08 of Daniil, prior of a southern Russian monastery.

The most outstanding work of Kievan Russia was *Slovo o polku Igoreve* ("The Lay of Igor's Host"), an account of the unsuccessful campaign in 1185 by Prince Igor of Novgorod-Seversky and the princes allied with him against the Polovtsians. It was written between 1185 and 1187 and was preserved in a single manuscript, discovered in 1795 and lost in the burning of Moscow during Napoleon's invasion of Russia in 1812. The copies that were made before it was lost have been authenticated, and the events narrated in the "Lay" were probably written shortly after they took place. Deeply patriotic in spirit and remarkable for its literary mastery, the lay ranks as an outstanding medieval epic.

Development of regional literatures. During its brief existence Kievan Russia created a literature distinguished for both artistry and ideas. From the mid-12th century, nevertheless, a gradual decline set in, accentuated in the 13th century by the Tatar Mongol invasion, and there was a marked falling off of literary activity.

Works recounting the Tatar invasion

The Tatar invasion was reflected as a great disaster in a number of 13th-century works. As literature, most noteworthy is ***Povest o razoreni Ryazani Batyem*** ("The Story of the Destruction of Ryazan by Batu Khan"). The eloquent, fiery sermons of Serapion, archimandrite of the Kiev-Pechersk Monastery, are full of grief at the Tatar invasion. At the end of the 13th or in the early 14th century, a life of Prince Alexander Nevsky was written in the traditional form of a hagiography but closely akin to a war narrative; it was dominated by the epic figure of Alexander. An outstanding literary work of 13th-century southern Russia was "The Galich-Volynsk Chronicle," describing events from 1201 to 1292, which formed part of a copy of a compilation of chronicles called the Hypatian collection, written in the 1420s.

The regional character of Russian literature resulted from increased lack of communication between the territories of Russia and was still apparent in the 14th and 15th centuries. But by the beginning of the 15th century the literature of Moscow began to predominate, for Moscow had, from the mid-14th century, played the part of a unifying centre for Great Russian nationalism. Tendencies toward unification are particularly clear in the tales of *Mamayevo poboishche* ("The Rout of Mamay"), composed at the end of the 14th century about the Battle of Kulikovo (1380). The conquest of Constantinople by the Turks in 1453 inspired Nestor-Iskander's ***Povest o vzyati Tsargrada*** ("Tale of the Taking of Tsargrad"—*i.e.,* Constantinople), mainly written in the style of a traditional war narrative. In the late 15th and early 16th centuries other stories were written in Moscow on the theme of Russia's political succession to the inheritance of Byzantium.

Also of the 15th century was the *Khozhdeniye* ***za tri morya*** ("Journey Across Three Seas") by Afanasy Nikitin, a merchant from Tver who from 1466 to 1472 travelled in India and Persia. The "Journey" was written in lively, colloquial Russian, with an admixture of Persian, Arabic, and Turkish words. Regional traits are also absent from ***Povest o Petre i Fevroni*** ("The Tale of Peter and Fevronia"), which may be ascribed to the 15th century.

Of other 15th-century regional literatures, that of Novgorod was particularly highly developed, producing a succession of literary works written in defense of Novgorod's political and ecclesiastical independence. In the literature of Tver, which vied with that of Moscow, the most outstanding work was a eulogistic discourse on the Orthodox Great Prince Boris Aleksandrovich, written c. 1453. The most significant work of the literature of Pskov was ***O pskovskom vzyati,*** describing the subjugation of Pskov by Moscow in 1510.

The surge of literary activity beginning at the end of the 14th century was connected with the influx from Bulgaria and Serbia of clerics into Russia after the conquest of their countries by the Turks. As well as in retranslations from the Greek, the content and style of South Slavonic literature was brought to Russia largely in hagiographical works.

Literature of unified Russia. The establishment of a unified Russian state dated from the reign of Ivan III the Great. In 1480 the liberation of Russia from two and a half centuries of Tatar domination was finally achieved, and autocratic power centralized in the Moscow state. In about the middle of the 16th century, Ivan IV the Terrible (died 1584) began an energetic campaign against the powerful feudal princelings, the boyars. This struggle was reflected in literature. The most notable spokesman for the new nobility, created by Ivan in opposition to the boyars, was Ivan Peresvetov, whose work included several propagandist tales and two petitions to Ivan the Terrible. The boyars were represented by a publicist of exceptional literary gifts, Prince Andrey Mikhaylovich Kurbsky. In his ***Istoriya o*** *velikom* ***knyaze moskovskom*** (written in the 1560s and 1570s; "History of Ivan IV"), Kurbsky severely castigated Ivan for his persecution of innocent boyars.

Effects of the campaign against the boyars

Georgian. The literary history of Georgia, like that of neighbouring Armenia, began with the conversion to Christianity in the 4th century and a need to invent an alphabet for the propagation of the Scriptures in the vernacular. The Gospels were translated in the 5th century from Armenian, and the acts of the Apostles and Psalms were translated soon afterward, as well as works of early Greek Fathers.

Original Georgian literature began with lives of saints, the first one being that of St. Shushanik (c. 480), and other early works include an account of the conversion of Georgia by St. Nino and stories about King Vakhtang I Gorgasal, a 5th-century hero. The Georgians were the first to give a Christian colouring to a Buddhist legend of Barlaam and Josaphat, which reached them in the 9th century through an Arabic version.

Ecclesiastical literature was rooted in Byzantine Greek culture, and romance and epic blended the civilization of Persia with original elements of Caucasian folklore. Important prose romances were the *Visramiani* ("Visramiani: The Story of the Loves of Vis and Ramin"), adapted from an Iranian romance going back to Parthian times, and ***Amiran-Darejaniani,*** a cycle of fantastic tales. Secular poetry started with Ioann Shavteli and Chakhnt-khadze, who wrote odes in honour of King David II (died 1125) and Queen Tamara (died 1213). The supreme achievement of Georgia's golden age was Shota Rustaveli's epic ***Vep'khis-tqaosani*** ("The Man in the Panther's Skin") on the themes of ideal comradeship, courtly love, and heroic endeavour. His poetic tradition, broken by Mongol invasions, was renewed in the 17th century by the royal poets Teimuraz I and Archil II.

Czech. The earliest preserved texts in the Czech language were written in the latter part of the 13th century. The courts of the Přemyslids kings Wenceslas (Vaclav) I (died 1253) and Otakar II (died 1278) gave encouragement to courtly literature in German; but there is no certain evidence of a significant body of literature in Czech before the end of the century.

The 14th century saw a continuous stream of Czech literary production. A group of verse "Legends," written in the first quarter of the century, already showed considerable maturity of technique. The earliest secular work was the epic ***Alewandreis,*** a life of Alexander the Great, showing contact with a German Alexander epic by Ulrich von Eschenbach. The Czech poem is a minor masterpiece of courtly literature. Another striking epic, "The Dalimil Chronicle," portrayed the history of the Czechs in a vivid, forthright style. Under the emperor Charles IV learning and literature flourished in Bohemia in Czech and German. The greatest achievement of this period was a verse "Legend of St. Catherine."

From about 1350 prose genres began to be cultivated, first lives of saints and chronicles and then, no doubt for a growing urban middle class, versions of several popular medieval tales. From the last part of the century dated a group of verse satires and didactical poems showing great originality and character, especially the anonymous satires of the Hradec manuscript and a political allegory. ***Nova rada*** ("The New Council"), written by Smil Flaška of Pardubice to defend the rights of the Bohemian nobility against the power of the crown.

A preoccupation with social and moral questions coloured much Czech writing in the last part of the 14th century. Thomas of Štítný wrote treatises in the vernacular that anticipated one of the main tendencies of the Hussite movement. This reform movement, inspired by Jan Hus, dominated the life of Bohemia for the first half of the 15th century; amid the religious controversy and civil strife of this period it was natural for vernacular writing to be directed largely to practical and polemical purposes. Hus's own importance lay not only in his vernacular sermons and in his letters but also in the reform of the Czech orthography advocated in the treatise De *orthographia Bohemicu.* A direct product of the reform movement was the simple and moving hymns composed by the Hussites, while the events of the Hussite wars were reflected in the poems of the Bautzen manuscript and in a number of chronicles and other prose works.

Influence of the Hussite movement

Among the successors of Hus the most original was Petr Chelčický, who developed his radical social ideas and his pacifism in a series of striking treatises and homilies. It was from Chelčický's ideas that the Bohemian Brethren drew their inspiration: this sect, prototype of the Moravian Church, was to be one of the most important sources of vernacular Czech literature in the next two centuries.

Polish. As in other European countries, Latin was at first the only literary language of Poland, and early writings included saints' lives and annals and chronicles written by monks and priests. Two of them, the first and the last, are most important: the *Chronicon,* compiled c. 1115 by an anonymous Benedictine of French origin known as Gallus, and the *Annales seu cronicae inclyti Regni Poloniae*, written *c.* 1480 by Bishop Jan Długosz. The two works introduced Polish history and literature into the culture of Europe. Use of the vernacular was allowed by the church where Latin could not meet particular needs—in prayers, sermons, and songs; and the oldest surviving text of poetry in Polish is traditionally but erroneously considered to be a song in honour of the Virgin Mary, "Bogurodzica," in which language and rhythm were used with high artistic craftsmanship. Preaching in Polish became established toward the end of the 13th century; the earliest known example of Polish prose, the *Kazania świetokrzyskie* ("Sermons of the Holy Cross"), dating from the end of the 13th or the beginning of the 14th century, was discovered in 1890. Part of a translation of the Bible, made in 1455 by Jdrzej of Jaszowice for Queen Sofia, widow of Władysław II Jagiełlo, has also survived.

Secular works began to appear toward the end of the 15th century. There was a satire on the Pope (c. 1449) by Jędrzej Galka, a follower of reformers John Wycliffe and Jan Hus, and a high literary standard was achieved in a morality verse dialogue, *Rozmowu mistrza Polikarpa ze Snzierciq* ("Dialogue Between Master Polycarp and Death"). The style of the medieval period lasted late in Poland. Marcin Bielski represented this late medievalism in his *Kronika wszystkiego świata* (1551; "Chronicle of the World"), the first general history in Polish.

The best examples of Polish literature imply a continuous literary tradition. Although its themes were those of the common European heritage, Polish writing of this period could be intensely personal within its anonymous framework. The groundwork for a leap into the ranks of major literatures was laid during the reign of Casimir III the Great, who in 1364 founded the University of Cracow.

Hungarian. The first written traces of the Hungarian language consisted of Hungarian words embedded in the Latin text of legal or ecclesiastical documents. The 13th century saw many translations from Latin, only one of which has come down, a free version of a poem by Godefroy de Breteuil. The 14th century also produced translations of the legends of St. Margaret and of St. Francis of Assisi. The 15th century saw the first translations from the Bible. A great part of the vocabulary, created for the purpose, is still in use. Other translations included the first Hungarian drama, "On Three Christian Virgins," and a translation of the Song of Solomon.

Hungarian literature was not entirely religious. The existence of a history of the Trojan war and of a Hungarian version of the Alexander romance can be inferred from South Slavonic translations. In the 14th century, conditions for the development of secular literature greatly improved, as more laymen went to study at universities abroad and on their return tried to introduce the literary forms they had learned.

Finnish. From the mid-12th century until 1809, Finland belonged to Sweden, and Swedish remained the language of the upper classes until the end of the 19th century, when use of Finnish as a cultural medium increased. The oldest literature, however, consisted of folk poetry in Finnish, orally transmitted and first recorded in the late 18th century. This was rich, with a wide range of forms. The metre, a trochaic four-stress line, was well suited to Finnish and to the memorizing of long passages. Most of the poems were epic sequences or short songs. The epics centred upon mythical events or the deeds of a hero. Into this category fell an early poem about the creation of the world and those on the quest of the Sampo, the adventures of Lemrninkainen, and the tragic legend of Kullervo. In many, the central character is Väinämöinen, regarded by some as mythical, by others as historical. These stories also formed part of the national epic, the *Kalevala.* The lyrics, many by women, dealt with everyday griefs and joys; many were love songs or described the moods of a solitary soul, and the setting was rural—a landscape of forests and lakes, with glimpses of a village community.

Finnish folk poetry

In oral transmission many poems have changed or become confused with one another. The oldest were mythological, dating from pagan times (lasting in remoter areas till the 12th century), and may be thousands of years old. Many were of medieval origin and contained datable events and persons. Systematic collection of folk poetry began in the second half of the 18th century, and the best known collector, Elias Lonnrot, concluded that the epic poems could be composed as a continuous folk epic. He joined a number together with connective material of his own and imposed a unifying "plot": the result was the *Kalevala* (final form, 1849), which was based on folk material but in structure was Lönnrot's creation. Lonnrot also published a selection of the lyrics, *Kanteletar,* and their influence and that of the *Kalevala* as a whole on the Finnish national consciousness, art, and culture has been immense.

III. The Renaissance

CHARACTERISTICS OF THE AGE

The term Renaissance (literally meaning Rebirth) is given to the historical period in Europe that succeeded the Middle Ages. The awakening of a new spirit of intellectual and artistic inquiry, which was the dominant feature of this political, religious, and philosophical phenomenon, was essentially a revival of the spirit of ancient Greece and Rome; in literature this meant a new interest in and analysis of the great classical writers. Scholars searched for and translated "lost" ancient texts, whose dissemination was much helped by developments in printing in Europe from about 1450.

The characteristic features of the age gathered under the label Renaissance are generally agreed to be those that are most evident in the greatest works of art and literature, which reached a level unattained in any previous period. What these characteristics were in individual authors or works is harder to define than the sources of the themes and concerns reflected in them. Of these characteristics, the three most important were undoubtedly, first, the new interest in learning, mirrored by the classical scholars known as Humanists and instrumental in providing suitable classical models for the new writers; second, the new form of Christianity, initiated by the Protestant Reformation led by Martin Luther, which drew men's attention to the individual and his inner experiences and stimulated a response in Catholic countries summarized by the term Counter-Reformation: third, the voyages of the great explorers that culminated in Christopher Columbus' discovery of America in 1492 and had far-reaching consequences on the countries that developed overseas empires, as well as on the imagina-

Humanism, Protestantism, and exploration tions and consciences of the most gifted writers of the day.

To these may be added many other factors, such as the developments in science and astronomy and the political condition of Italy in the late 15th century. The new freedom and spirit of inquiry in the Italian city-states had been a factor in encouraging the great precursors of the Renaissance in Italy, Dante, Petrarch, and Boccaccio. The flowering of the Renaissance in France appeared both in the poetry of the poets making up the group known as the Pléiade and in the reflective essays of Michel de Montaigne, while Spain at this time produced its greatest novelist, Miguel de Cervantes. Another figure who stood out above his contemporaries was the Portuguese epic poet Luis Camões, while drama flourished both in Spain and Portugal, being represented at its best by Lope de Vega and Gil Vicente. In England, too, drama dominated the age, a blend of Renaissance learning and native tradition lending extraordinary vitality to works of Christopher Marlowe, Ben Jonson, John Webster, and others, while Shakespeare, England's greatest dramatic and poetic talent, massively spanned the end of the 16th century and the beginning of the 17th. The impetus of the Renaissance carried well into the 17th century, when John Milton reflected a spirit of Christian Humanism to be linked with Desiderius Erasmus. The name Erasmus was perhaps the one most often linked with Humanism, the spirit of critical enquiry, regard for classical learning, intolerance of superstition, and high respect for man as God's most intricate creation.

An aspect of the influence of the Protestant Reformation in literature was the number of great translations of the Bible into vernacular languages during this period, setting new standards for prose writing. In eastern Europe the 16th century was remarkable as a golden age of both Hungarian literature, as represented by a passionate cavalier poet, Balint Balassi, and Polish literature, where the father of Polish writing, Mikołaj Rej, was quickly joined by many rivals and imitators, especially the satiric, lyric, and tragic poet Jan Kochanowski.

The following account has kept in view the importance of national, political, and language divisions while at the same time following the general "spread" of the Renaissance from Italy outward and drawing comparisons and parallels demanded by political or linguistic proximity, as, for example, in the case of Spain and Portugal.

Beginning with an account of the "international language," Latin, the Renaissance's inheritance from the Middle Ages, which was so crucial to a dissemination of the ideas of men such as Erasmus, the account then treats the flowering of vernacular literatures, beginning with the Romance languages of Italian, French, Spanish, and Portuguese and following with the Germanic (starting with English) and Scandinavian groups and then finally with the literatures of eastern Europe.

RENAISSANCE LATIN LITERATURE

The term Renaissance Latin is associated, for 14th-century Italy, mainly with Dante, Petrarch, and Boccaccio, though mention should also be made of the Florentine historian Leonardo Bruni and the Humanist scholars Albertino Mussato, Coluccio Salutati, and Aeneas Silvius Piccolomini (Pope Pius II). In verse there was a general return to classical models and elegance, while in prose Latin was still a necessary medium for the abundant Humanistic, scientific, philosophical, and religious literature that was a mark of the new age.

In Italy there were three main centres of learning and literature in the 15th and 16th centuries: Florence, Rome, and Naples. Each of these centres had its own circle of writers and scholars. The Florentine group was chiefly noted for the Platonist philosophers Poggio Bracciolini, Marsilio Ficino, Giovanni Pico della Mirandola, and a poet and scholar, Angelo Poliziano. Rome was the centre for a grammarian, Pietro Bembo, and for Marco Vida, author of a Latin epic on the redemption, while Naples was the home of many poets and scholars, notably Giovanni Pontano, Jacopo Sannazzaro, Lorenzo Valla, and Girolamo Fracastoro.

Germany and the Low Countries also made a large contribution in prose and verse to Latin literature in the 15th and 16th centuries. Many Humanists owed their early education to the Brethren of the Common Life, a Dutch Christian community that laid great emphasis on the classics. Among these was Erasmus, the greatest figure of the northern Renaissance. Bred in the rhetorical tradition of literary Humanism, he had little interest in the scientific premonitions of the age. As an editor and expositor of classical texts and the writings of the Church Fathers, as a commentator on the ecclesiastical conflicts of his time, and as a scholar, wit, and satirist, he was unsurpassed by any Humanist in northern Europe. A German abbot, Johannes Trithemius, was a historian. and scholar with an immense range of interests and knowledge; Conradus Celtis was conspicuous as a Humanist and poet, while Petrus Lotichius wrote elegant verse.

Influence of the Brethren of the Common Life

Spanish Humanism was best seen in the scholar and friend of Erasmus, Juan Vives, while in England the statesman and scholar Sir Thomas More was the outstanding figure. Polydore Virgil, an Italian, brought the new methods of historical writing into England, though a poet and historian, Tito Livio Frulovisi, had written a life of Henry V that influenced later English writers. Among many Latin poets should be mentioned George Buchanan and John Barclay, both Scots. The strong English tradition of classical verse composition in the schools was shown in the Latin poems of such 17th-century poets as John Milton, Henry Vaughan, Richard Crashaw, and Abraham Cowley.

In France, where, as in England, the Renaissance came late, some members of the group of writers known as the Pléiade wrote Latin verse. Despite the eventual triumph of the French vernacular, Latin poems continued to be written, and several hymns composed in classical forms were included in church services in the 17th and 18th centuries.

Until the early 18th century, Latin was recognized as the best medium for historical and scientific work if it were to reach a European audience. For this reason Marsilio Ficino and Pico della Mirandola, Erasmus and More, and, later, the scientists and philosophers Francis Bacon, Hugo Grotius, René Descartes, Benedict de Spinoza, and Sir Isaac Newton used what was still an international language.

The Humanists were the first to see the literature of a people in its totality as a cultural achievement. They were not content merely to write classical Latin. Desiring to equal the cultural triumphs of antiquity, they attempted every classical genre, thus giving imitation a range it had not had before. And this was also an age when the national literatures of Europe were attaining their maturity so that imitation was no longer limited to Latin. It was practiced in national languages and with striking success.

By 1550 the Humanist tradition, embodied in the rhetorical works of Erasmus, had a firm grip on education, but Latin, on which that education rested, was no longer the unique medium of education, and the vernaculars had absorbed all they could throngh imitation of classical models. A new approach was required. As early as the end of the 15th century the Dutch Humanist Rodolphus Agricola recommended that writers should develop their subjects with reference to species, causes, effects, similarities, and opposites and suggested 30 such headings, analogous to the "topics" of classical rhetoric. In the 16th century in France Petrus Ramus (Pierre de la Ramée) popularized Agricola's ideas and had an enormous influence. Ramus detached invention and disposition from rhetoric, leaving it only with style and delivery. Rhetoric was thus severely limited in scope by losing all concern for content.

Petrus Ramus and the revival of rhetoric

ITALIAN LITERATURE OF THE RENAISSANCE

The age of Humanism. The European Renaissance had really begun in 14th-century Italy with Petrarch and Boccaccio. The 15th century, devoid as it was of major poetic works, was nevertheless of very great importance because it was the century in which a new vision of human life, embracing a different conception of man and life as well as more modern principles of ethics and politics, gradually found its expression. This was the result, on the one hand, of the rediscovery of classical antiquity, and, on the other, of political conditions quite different from those of previous centuries. With regard to the second point, nearly all Italian princes competed with each other in the 15th century to promote culture by patronizing research, offering hospitality and financial support to literary men of the time, and founding libraries. As a consequence, their courts became centres of research and discussion, thus making possible the great cultural revival of the period. The most notable courts were that of Florence, under Lorenzo de' Medici, "the Magnificent"; that of Naples, under the Aragonese kings; that of Milan, first under the Visconti and later the Sforza family; and finally the papal court at Rome, which gave protection and support to a large number of Italian and Byzantine scholars. As for the first point, the search for lost manuscripts of ancient authors, begun in the second half of the previous century, led to an extraordinary revival of interest in classical antiquity: in particular, much research was devoted to Plato and Greek philosophy in general, a fact that was to have profound influence on the thinking of the Renaissance as a whole.

Italian Humanist view of man

By and large, the new culture of the 15th century was a revaluation of man. Humanism opposed the medieval view of man as a being with relatively little value and extolled him as the centre of the universe, the power of his soul as linking temporal and spiritual, and earthly life as a realm in which the soul applies its powers. These concepts, which mainly resulted from the new interest in Plato, were the subject of many treatises, the most important of which were Giannozzo Manetti's *De dignitate et excellentia hominis* and Pico della Mirandola's *Oratio de hominis dignitate.* The Humanist vision evolved during this period condemned many religious tenets of the Middle Ages still widely prevalent: monastic ideals, for example, were attacked by Leonardo Bruni, Lorenzo Valla, and Poggio Bracciolini. Forthright though these attacks were, Humanism was not essentially anti-Christian, for it generally remained faithful to Christian beliefs, and the papal court itself regarded Humanism as a force to be assimilated rather than defeated.

In the first half of the century Humanists, with their enthusiasm for Latin and Greek literature, had a disdain for the Italian vernacular. Their poetic production, inspired by classical models and written mostly in Latin or occasionally Greek, was abundant but of little value. Writing in a dead language and closely following a culture to which they had enslaved themselves, they rarely showed originality as poets. Among the few notable exceptions are Giovanni Pontano, Michele Marullo Tarcaniota, Angelo Ambrogini Poliziano (Politian), and Jacopo Sannazzaro. These poets sometimes succeeded in creating sincere poetry in which the conventional themes of 15th-century lyrics were expressed with new, original intimacy and fervour.

The rise of vernacular literature. Toward the middle of the 15th century Italian began to oust Latin as the literary language. The Certame Coronario, a public poetry competition held in Florence in 1441 with the intention of proving that the spoken language was in no way inferior to Latin, marked a definite change. In the second half of the century there were a number of works of merit inspired either by Carolingian legends or by the new Humanist culture.

The chivalrous epic of Carolingian legends, which had degenerated into clichés, was given a new lease on life by two poets of very different temperament and education: Matteo Maria Boiardo, whose *Orlando innamorato* (1483; "Orlando in Love") reflected past chivalrous ideals as well as contemporary standards of conduct and popular passions; and Luigi Pulci, whose *Morgante,* published before 1480, was pervaded by a new bourgeois and popular morality.

The new ideals of the Humanists were most complete in Angelo Ambrogini Poliziano (Politian), Jacopo Sannazzaro, and Leon Battista Alberti, three outstanding figures who combined a wide knowledge of classical antiquity with a personal and often profound inspiration. Politian's most important Italian work was *Stanze per la giostra* (1475–78; "Stanzas for the Joust"), which created a mythical world in which concepts of classical origin were relived in a new way. The same could be said of Sannazzaro's *Arcadia* (1504), a largely autobiographical work in verse and prose that remained widely influential up to the 18th century. A more balanced view of contemporary reality was given in Alberti's literary works, which presented a gloomy picture of human life, dominated by man's wickedness and the whims of fortune. As for Lorenzo de' Medici, patron of many men of letters, he himself had a vast poetic output, though this is more notable for documentary than for literary value.

Pietro Bembo's view of language

Pietro Bembo of Venice published his *Prose della volgar lingua* (one of the first grammars of Italian) in 1525. In this work Bembo demanded an Italian literary language based on 14th-century Tuscan models, particularly Petrarch and Boccaccio. He was opposed by those who thought that a literary language should be based on existing linguistic developments, particularly by Gian Giorgio Trissino, who developed Dante's theories on Italian as a literary language. In practice the problem was both linguistic and stylistic, and there were in the first half of the 16th century a great number of other contributors to the question, but Bembo's theories did finally triumph in the second part of the century. This was due to a large extent to the activities of the Florentine Accademia della Crusca, and this more scientific approach to the language question resulted in the academy's first edition of an Italian dictionary in 1612.

During the first decades of the 16th century, treatises on poetry were still composed according to Humanist ideas and the teachings of the Roman Augustan poet Horace. It was only after 1536, when the original classical Greek text of Aristotle's *Poetics* was first published, that a gradual development became apparent in aesthetic theory. The traditional principle of imitation was now better analyzed, emphasis being given to the imitation of classical authors rather than to that of nature. The three unities of tragedy (time, space, action) were among the rhetorical rules then re-established. The classical conception of poetry as a product of imagination supported by reason was at the basis of 16th-century rhetoric, and it was this conception of poetry, revived by Italian literature, that triumphed in France, Spain, and England during the following century.

Political and moral literature. Niccolò Machiavelli's works reflected Renaissance thought in its most original aspects, particularly in the objective analysis of human nature. Machiavelli has been described as the founder of a new political science: politics divorced from ethics. His own political experience was at the basis of his ideas, which he developed according to such general principles as the concepts of *virtù* ("power") and *fortuna* ("chance"). He considered *virtù* to be power with a practical aim that should struggle against *fortuna,* which represented the forces of violence and irresponsibility. His famous treatise *Il principe (The Prince),* composed in 1513, revealed the author's prophetic attitude, based on observation of contemporary political affairs. Its description of a model ruler became a code for the wielding of absolute power throughout Europe for two centuries. Machiavelli's *Discorsi . . . sopra la prima deca di Tito Livio* (*c.* 1513–21: "Discourses on the First Decade of Titus Livius"), showed the same realistic attitude: public utility was placed above all other considerations, and political virtue was distinguished from moral virtue. His seven books on *L'arte della guerra* (1519–20; *The Arte of Warre,* 1560), concerning the creation of a modern army, were more technical, while historical works, including the *Zstorie fiorentine* (1520–25, "Florentine History"), exemplified theories expounded in his treatises. Machiavelli also holds a place in the history of literature, above all for *La Mandragola* (1518), one of the outstanding comedies of the century.

The Prince

Although more of an individualist and pragmatist than Machiavelli, Francesco Guicciardini was the only 16th-century historian who could be placed within the framework of the political theories he constructed. He drew attention to the self-interest of those involved in political actions and made Machiavelli's theories appear idealistic by contrast. One of Guicciardini's main works, the ***Ricordi*** (1528, 1530; "Remarks"), was one of the most lucid and original literary works of the century. Among other historical works of the period an autobiographical ***Vita*** ("Life") of the sculptor and goldsmith Benvenuto Cellini was interesting for its spontaneous style and use of popular Florentine language.

Castiglione's *Il cortegiano*

The highest moral aspirations of the Renaissance are expressed in Baldassare Castiglione's ***Il cortegiano*** (published 1528; ***The Courtyer,*** 1561), which deals with the perfect courtier, the noble lady, and the relationship between courtier and prince. It became one of the most influential books of the century. Giovanni della Casa was the author of another famous treatise, the ***Galateo*** (*c.* 1551–54; Eng. trans., 1576), a book on manners in which the author's witty mind and the refinement of contemporary Italian society found full expression. The life of the period was also vividly reflected in the work of Pietro Aretino, who was called "the scourge of princes" by Ariosto. His *Ragionamenti* (1534–36; "Discussions") were written in a spontaneous style and showed a sensuous and unscrupulous nature.

Poetry. Lyric poetry in the 16th century was dominated by the model of Petrarch mainly because of the acceptance of the Renaissance theory of imitation and the teaching of Bembo. Almost all the principal writers of the century wrote lyric poems in the manner of Petrarch. Some originality was to be found in Della Casa's poems, and Galeazzo di Tarsia stood out from contemporary poets by virtue of a vigorous style.

The tradition of autobiographical, humorous, and satirical verse was kept alive during the 16th century, when it reached some real stature with Francesco Berni, whose burlesque poems, mostly dealing with indecent or trivial subjects, showed his stylistic skill. Didactic poetry, already cultivated by Humanist writers, was also continued during this period, chiefly by Giovanni Rucellai, who recast in ***Le api*** ("The Bees") the fourth book of the Roman poet Virgil's ***Georgics,*** and Luigi Alamanni in six books about rustic life called ***Della coltivazione.***

The most refined expression of the classical taste of the Renaissance was to be found in Ludovico Ariosto's ***Orlando furioso*** (first version published 1516; Eng. trans., 1591), which embodied many episodes derived from popular medieval and early Renaissance epics; but the poem's unique qualities derived from Ariosto's sustained inspiration and technique and detached ironical attitude to his characters. The ***Orlando furioso*** was the most perfect expression of the literary tendencies of the Italian Renaissance at this time, and it exercised enormous influence on later European Renaissance literature. Ariosto also composed comedies that, by introducing imitation of Latin comedy, marked the beginning of Renaissance drama in the vernacular.

There were also attempts to renew the epic by submitting the tradition of chivalry to Aristotle's rules of composition. Gian Giorgio Trissino, a theorist on language, wrote according to the strictest Aristotelian rules, while Luigi Alamanni tried to focus the narrative on a single character in ***Girone il cortese*** ("Girone the Courteous") and ***Avarchide*** (an imitation of the ***Iliad*** of Homer). Giambattista Giraldi, more famous as a tragic playwright, was a literary theorist who tried to apply his theories to his own poem ***Ercole.***

Fidenziano and macaronic poetry

Two burlesque medley forms of verse were invented during the century. ***Fidenziano*** poetry derives its name from a work by Camillo Scroffa, a poet who wrote in a combination of Latin words and Italian syntax. Macaronic poetry, on the other hand, is a term given to verse consisting of Italian words used according to Latin syntax. Teofilo Folengo, a Benedictine monk, was the best representative of macaronic literature, and his masterpiece was a poem in 20 books called *Baldus* (first version 1517). A tendency to parody, ridiculing the excesses of Humanist literature, was present in both the *fidenziano* and macaronic verse.

Torquato Tasso was the last great poet of the Italian Renaissance and one of the greatest of Italian literature. In his epic ***Gerusalemme liberata*** (completed 1575, first published 1581; "Jerusalem Delivered") he summed up a literary tradition typical of the Renaissance: the classical epic renewed according to the spiritual interests of his own time. His work shows a conflict between a desire to express himself according to classical ideals and a tendency to moralize. Some of Tasso's works, however, reflected his spontaneous inspiration. *L'Aminta* (1573), a joyous and uninhibited drama, was the best example of Tasso's youthful poetry and belonged to the new literary genre of pastoral (dealing with idealized rural life). ***Gerusalemme liberata*** was the result of a balance in the poet's conflicting aspirations: a Christian subject dealt with in a classical way. In the subsequent ***Gerusalemme*** *conquistata* (1593; "Jerusalem Vanquished"), Tasso recast his poem according to strict Aristotelian rules and the ideals of the Catholic Church's reaction against the Protestant Reformation, known as the Counter-Reformation. Tasso's conflict had ended in the victory of the moralistic principle: poetically the new poem was a failure. Tasso also wrote shorter verses throughout his life, including religious poems, and his prose works show a style no longer exclusively dominated by classical models.

Drama. Trissino's ***Sofonisba*** (written 1514–15, first produced 1562) was the first regular tragedy of Italian vernacular literature; its structure derived from Greek models, but its poetic qualities were somewhat mediocre. Toward the middle of the 16th century Giambattista Giraldi (Cinzio) reacted against imitation of Greek drama by proposing the Roman tragedian Seneca as a new model, and in nine tragedies and tragicomedies—written between 1541 and 1549—he showed some independence from Aristotelian rules. He greatly influenced European drama, particularly the English of the Elizabethan period.

Italian comedies

Italian comedies of the century, inspired by Latin models, possessed greater artistic value than tragedies, and they reflected contemporary life more fully: they could be considered as the starting point for modern European drama. To the comedies of Ariosto and Machiavelli should be added a lively play, the ***Calandria*** (first performed 1513), by Cardinal Bernardo Dovizi da Bibbiena and five equally amusing comedies written by Pietro Aretino. Giordano Bruno, a great Italian philosopher who wrote dialogues in Italian on his new cosmology and anti-Humanist ideas, wrote also a comedy, *Il candelaio* (1582; "The Candlemaker").

Narrative. The classicist trend established by Pietro Bembo also affected narrative literature, for which the obvious model was Boccaccio's ***Decameron.*** Originality and liveliness of expression were to be found in the 22 stories called ***Le cene*** ("The Suppers"), of the Florentine apothecary Anton Francesco Grazzini. The worldly monk Agnolo Firenzuola produced several stories, including the fable ***Asino d'oro,*** a free version of Apuleius' ***Golden Ass.*** A cleric and short-story writer, Matteo Bandello, started a new trend in 16th-century narrative with 214 stories that were rich in dramatic and romantic elements while not aiming at classical dignity. This trend was partly followed also by Giraldi Cinzio in his collection of 112 stories called *Ecatommiti* (1565).

FRENCH LITERATURE OF THE RENAISSANCE

The 16th century was one of France's richest and most varied literary periods. Three names—François Rabelais, Pierre de Ronsard, and Michel de Montaigne—tower above a host of others. It was the century that saw the birth of the Renaissance in France and the passing of the Middle Ages; it was also a period when the movement for religious reform, at first closely connected with the rebirth in learning, finally came into conflict with it.

Drama. The break with the Middle Ages was most marked in drama. The religious mysteries and miracle plays (relatively simple presentations of well-known religious themes) began to die out by the middle of the 16th century, largely because of clerical opposition. Some medieval forms of drama continued to be performed until the end of the century, but in Paris, at least, the Renaissance swept away all other vestiges of the drama of the Middle Ages. The change came from Italy, mainly because of the importation of Italian translations of the classics. New translations were made of other works, including the *Electra* of Sophocles from the classical Greek, and French Humanists hastened to write original tragedies on the classical model. Etienne Jodelle wrote the first modern tragedy, *Cléopâtre captive* (performed 1552 or 1553), and the first modern comedy, *Eugène* (1552). The chief tragic playwright of the period, Robert Garnier, chose his subjects from classical, sacred, and medieval literature. His most famous play, *Les Juives* (1583; "The Jews"), was a biblical tragedy; and he wrote the first French tragicomedy, *Bradamante,* based in part on Ariosto's *Orlando furioso.* Garnier's best plays were lyrical, eloquent, and quite moving. The chief comic playwright of the century was Pierre de Larivey, whose best play was, perhaps, *Les Esprits* (1579; "The Ghosts").

Poetry. There was an enormous variety and wealth of poetry in this period. The first important poet was Clément Marot, in whom were to be found forms and themes typical of both the Middle Ages and the Renaissance. Marot composed some allegorical and mythical poetry. His poems were remarkable for their easy and polished style, their light and graceful wit, and an elegance new in French literature. His patroness, Margaret of Angoulême, was a poet who wrote in a religious as well as an amorous vein, her chief work being *Les Marguerites de la marguerite des princesses* (1547; "The Pearls of the Pearl of Princesses").

At Lyons there flourished a group of able poets, chief of whom was Maurice Scève, famous for a long series of love verses dedicated to *De'lie* (1544). A most talented poet was Louise Labé, whose three elegies and 24 sonnets told a passionate love story in accents of purest poetry.

Ronsard and the Pléiade

The principal poet of the French Renaissance was Pierre de Ronsard, whose chief studies were carried out under a Humanist and poet, Jean Dorat. These two, together with five other writers—Joachim du Bellay, Jean-Antoine de Baïf, Rémy Belleau, Pontus de Tyard, and Étienne Jodelle—made up the famous group known as La Pléiade, from the seven stars of the Pleiades star cluster. Their object was to create a French literature to rival that of the Renaissance Italy, first, by bringing the French language to a level with the classical tongues and, second, by reproducing in French regular tragedy such classical verse forms as the Pindaric and Horatian odes and the Petrarchan sonnet. The Pléiade's manifesto was written by du Bellay and called the *Dkfense et illustration de la langue Françoise* (1549; *The Defence and Illustration of the French Language,* 1939). The men of the Pléiade achieved much that they aimed to achieve, and they often produced important results. They occasionally went too far and thus were responsible, to some extent, for the reaction led by François de Malherbe at the beginning of the 17th century. Ronsard wrote an enormous amount—sonnets, odes, elegies, philosophical and reflective poems, and even the beginning of an epic. His odes and sonnet sequences were particularly fine, and he produced excellent poetry from the late 1540s to the early 1580s. Next to him in stature (but far less in range) came du Bellay, whose sonnets were written with consummate skill, especially those in the sequence *Les Regrets* (1558). Belleau was polished, light, and gracious and wrote a great deal, notably a vast *Bergerie* (pastoral sequence).

The poets of the Pléiade, in particular Ronsard, had many imitators. Jacques Peletier du Mans championed the theories of the Pléiade and himself wrote several worthy lyric poems after the manner of Ronsard. Among many who were influenced by Ronsard, Jacques Tahureau wrote *Sonnets de l'admirée* (1554; "Sonnets of the Admired") and Olivier de Magny *Les Soupirs* (1557; "Sighs"); Jean Vauquelin de La Fresnaye wrote several graceful poems, including *ldillies* (1605; "Idylls") and a fine verse, *Art poktique;* and Philippe Desportes, a favourite court poet and seen as a successor to Ronsard by his contemporaries, occasionally produced a really good poem such as the sonnet about Icarus.

The second half of the 16th century was a period of bitter civil strife, and many poets gave vent to vehement political and religious feeling. Perhaps the most notable was Théodore Agrippa d'Aubigné, whose main work was *Les Tragiques.* D'Aubigné was both a religious (Calvinist) and a violently satirical poet. Guillaume du Bartas, also a Protestant, achieved great fame for his epic work, *La Semaine* (1578; "The Week"), in which he set out to describe the whole process and product of the creation. Jean de Sponde, rediscovered by 20th-century scholars, was a Protestant who became converted to Catholicism. His *Essay de quelques poèmes chrestiens* (1588; "Sample of Some Christian Poems") was written in an impassioned and ornamental style. Jean-Baptiste Chassignet, who wrote a long sonnet sequence containing several remarkable similes and metaphors, was another modern rediscovery. Among other minor talents, Jacques du Perron and Gabrielle de Coignard were religious poets who both wrote several good poems.

The contributions of Rabelais

Prose. In quantity, 16th-century prose fiction was not considerable, but its quality was enhanced by one of the most outstanding French writers of all time—François Rabelais. His great work was written in several parts—*Pantagruel* (1532), *Gargantua* (1535), the *Tiers Livre* (1546; "Third Book"), the *Quart Livre* (1552; "Fourth Book"), and a fifth book—the authenticity of which has been contested—published in 1564 after his death. With immense erudition, representing almost every aspect of contemporary knowledge, with untiring invention, and above all with acute observation and satire, Rabelais reached a depth of insight and poetical imagination that was unique. His work was an exposition of and commentary on the thoughts, feelings, aspirations, and knowledge of a particular time and nation expressed in a most attractive literary form, and with the richest, imaginative language—by a man who was unusual in combining practical knowledge of the world with great power of literary expression.

Other storytellers worthy of note included Margaret of Angoulême, more famous as a poet, whose collection of short stories, the *Heptamkron,* was an imitation of Boccaccio's *Decameron.* By contrast, the tales of Bonaventure des Périers were shorter, simpler, and more homely, showing more wit and less refinement. An original storyteller was Noel du Fail, whose work revealed direct observation of peasants and their way of life.

In history and memoirs the writers of the 16th century hardly compared with those of the Middle Ages. Perhaps the best known is Pierre de Brantôme, a courtier and soldier whose memoirs contained lives of great captains and soldiers, as well as scandalous episodes of the French court. The chief political writer of the period was Jean Bodin, who in the protracted argument between the royalists and the reformers took the royalist side in his *Rkpublique* (1576), arguing in favour of unlimited monarchy. Perhaps the most able writer supporting the opposite view was Étienne de La Boétie, who protested against the monarchical theory in his brilliant essay *Contr'un* (1576; "Against One"). Religion was closely linked to politics at this time, and this was particularly evident in the *Satire Ménippée* (1594), a prose and verse satire written by a number of authors against the Holy League, the Catholic political party.

The religious controversy

Of the many theological works, the great textbook of the French Reformation was Calvin's *Institutes of the Christian Religion* (Latin, 1536; French, 1541). This was the first great composition in argumentative French prose and influenced thought in France and other countries. Even before the *Institutes* was written, a Humanist, Jacques Lefèvre d'Étaples, who first translated the whole Bible into French, and his disciple Guillaume Farel had seen the importance of using French for religious and other prose works. Another follower of Lefèvre, Pierre Viret, helped Calvin and himself wrote a large number of theological and moral dialogues. The pattern of religious polemical writing on both Protestant and Catholic sides continued throughout the century, though some religious writers, such as the Protestant Philippe Duplessis-Mornay, achieved a wider outlook. On its side, the Catholic Church had St. Francis de Sales, bishop of Geneva, whose ***Introduction à la vie dkvote*** (1608; "An Introduction to Devout Life") remains a popular classic. Pierre Charron, finally, should be mentioned for ***Les Trois Vkrities*** (1593; "The Three Truths") and the ***Trois Livres de la sagesse*** (1601; "Three Books of Wisdom"), in which he discussed the evidence for knowledge of the existence and nature of God.

Three outstanding writers of scientific and learned works were Jacques Arnyot, Henri Estienne, and Étienne Pasquier. Amyot, bishop of Auxerre, was best known for his translations of Latin classics, and the essayist Michel de Montaigne declared that his contemporaries owed to Amyot their knowledge of how to write and speak French. His masterpiece is a translation (1559; 1565 ff.) from the ancient Greek of Plutarch's ***Lives,*** which, perhaps more than any other classic, coloured the thoughts and writings of the 16th century. Estienne, a printer and lexicographer, wrote several pungent and eloquent treatises on the French language, while Pasquier was one of the first great French literary critics to write in French, and his *Recherches* ***de la France*** ("French Studies") is a masterpiece of balanced criticism and good French. Among minor writers in this field, the famous surgeon Ambroise Paré achieved literary importance for the use of French in surgical treatises and in his autobiography.

Montaigne's *Essais*

The essayist Michel de Montaigne stands alone. Literature received one of its greatest acquisitions in his famous *Essais* (1580–88; ***Essays).*** The principle of this work was not skepticism but egotism, and, its author being by nature skeptical, this quality of mind appeared naturally rather than intentionally. The ***Essais*** expressed the attitude of mind of the latter part of the century as completely as Rabelais expressed that of the earlier part. Inquiry and protest, ebullience, and imagination run riot had given way to a placid conviction that little of importance remains to be discovered and that it does not greatly matter. Though neither business nor pleasure was decried, both were regarded as useful pastimes incidental to a man's life rather than with the eager appetite for them characteristic of the Renaissance. The style is remarkable for its absence of pedantry, its rich vocabulary, and picturesque brilliance. It is one of the best loved books in the French language, an infinite source of pleasure, to be read at leisure, to be put down and taken up again at will.

Provencal. During the late 15th century, Provençal literature had waned without fading entirely, and the town of Toulouse never wholly ceased to supply funds of some kind to its College of Rhetoric. Fresh prizes for poetry had been introduced; but in 1513 poems in French were admitted to the competitions, and (after 1679) under Louis XIV these were alone held eligible. In the two centuries that followed a glorious medieval period there was a succession of works in Provençal, chiefly of a didactic and edifying character, that nevertheless served to keep alive some kind of literary tradition.

In the 16th century there were signs of a strong movement toward a Provençal Renaissance. The Gascon Pey de Garros, author of the remarkable ***Eglogues,*** raised his native dialect to the rank of a literary language with translations of the Psalms of David and ***Poesias*** *gasconas* (1567; "Gascon Poems"). At the other end of oc-speaking southern France, in Provençal proper, the movement toward poetry in native dialect began with Louis Bellaud de la Bellaudière.

SPANISH LITERATURE OF THE RENAISSANCE: THE SIGLO DE ORO

The beginning of the "Golden Age." The unification of Spain in 1479 and Columbus' discovery of the New World (1492), following the introduction of printing (1474) and concurrent with the cultural traffic with Italy (Naples had been since 1443 a dependency of Aragon), may be taken as opening the era of the Renaissance in Spain. In this period—known as the Siglo de Oro, or "Golden Age"—Spanish literature reflected the wealth of new experience born of overseas adventure and the detached questioning attitude to the rediscovered norms of classical authority. The early Spanish Humanists included the first grammarians and lexicographers of any Romance tongue. Juan Luis Vives, a figure of European eminence, the brothers Juan and Alfonso de Valdés, and others were followers of Erasmus, whose writings circulated in translation from 1536 and whose influence was seen in the Counter-Reformation figure of St. Ignatius of Loyola, founder of the Society of Jesus, and, later, in a religious writer and poet, Fray Luis de León.

La Celestina

The masterpiece of the early Renaissance is the ***Comedia de Calixto y Melibea*** (1499), a novel in dialogue form published anonymously but attributed to a converted Jew, Fernando de Rojas. The dominant character, a procuress called Celestina, depicted with a realism unsurpassed in Spanish letters, gave this work the title by which it is most commonly known, ***La Celestina.*** The analysis of passion and the dramatic conflict that its pursuit involved were worked out with such psychological intensity as to make this the first masterpiece of Spanish prose and Spain's first realistic novel.

Poetry. Spanish ballads ***(romances)*** link medieval heroic epic to 20th-century poetry and drama; they lay at the heart of the national consciousness; and their expansion and capacity for survival, from Salonika to Chile and from the Low Countries to North Africa, reflect the far-flung boundaries of Spain's prestige in its age of greatness. The earliest datable ***romances*** (mid-15th century) treated of frontier incidents or lyrical themes. The ballads on medieval heroic themes had importance because they formed everyman's source book on national history and character. Traditional ballads were collected in the Antwerp ***Cancionero de romances*** ("Ballad Songbook") and in the ***Silva*** *de* ***varios romances*** ("Miscellany of Various Ballads"), both ***c.*** 1550, and thereafter repeatedly. Soon the form (octosyllabic, alternate lines having a single assonance throughout) was exploited for lyrical purposes by the most famous poets of the age, and it has remained the chosen medium for popular narrative verse.

The rebirth of the lyric

The earlier attempt to Italianize Spanish poetry had failed because Spanish language and verse techniques were still incapable of sustaining the burden. The Catalan Juan Boscán Almogárer, reintroducing Italian metres, prepared the way for a much greater poet, Garcilaso de la Vega, with whom the lyric was reborn. To his mastery of poetic technique derived from medieval and classical poets he added an intense personal note in the use of characteristic Renaissance themes. His short poems, elegies, and sonnets largely determined the course of lyric poetry throughout the Siglo de Oro.

Fray Luis de León, adopting some of Garcilaso's verse techniques, typified the "Salamanca school," with its emphasis on content rather than form. The poet and critic Fernando de Herrera headed a contrasting school of Seville, which, deriving equally from Garcilaso, was concerned rather with subtleties of refined sentiment; in a quartet of remarkable odes he gave vibrant expression to topical heroic themes. A defense of the short native metres, associated chiefly with the satiric poet Cristbbal de Castillejo, was reinforced by the aforementioned traditional ballad collections ***(romanceros)*** and by the evolving drama.

For epic poetry the models were Ariosto and Tasso, but the themes and heroes were those of overseas conquest and expansion or defense of the empire and the faith. Alonso de Ercilla y Zúñiga came nearest to real achievement with his ***Araucana*** (published 1569–90), telling of native resistance to the Spanish conquest of Chile. Other typical examples of the attempt at epic include Lope de Vega's ***Dragontea*** (1598), a verse history of Sir Francis Drake's last voyage and death, and ***Corona*** *trágica* (1627; "The Tragic Crown"), on Mary, Queen of Scots.

Early drama. The origins of drama in Spain are to be sought, as elsewhere, in the church. The ***Auto de*** *los* ***reyes*** *magos* ("Play of the Three Wise Kings"), an incomplete play of an Epiphany cycle, is the only surviving text of medieval Spanish drama. The characterization of the Magi and of Herod and his advisers was realistic, and the medley of metres foreshadowed one aspect of later development of the drama in Spain.

A reference in King Alfonso X's legal code suggested also the existence of some form of secular drama in the 13th century, but no texts have survived. These *juegos* (short satiric entertainments given by travelling players) were the forerunners of the short plays and interludes—*pasos, entremeses, sainetes—that* formed one of Spain's main contributions to dramatic genres.

Juan del Encina marked the emancipation of the drama from ecclesiastical ties by performances for a noble patron. His *Cancionero* (1496; "Songbook") contains pastoral–religious dramatic dialogues in a rustic dialect, but he soon turned to secular themes or vivid farce. Some of his plays showed a conception of drama changed by his long stay in Italy, in which native medievalism was transformed into bold Renaissance experimentation.

Encina's Portuguese disciple Gil Vicente, a court poet at Lisbon who wrote also in Castilian, showed a great advance in naturalness of dialogue, acuteness of observation, and sense of situation. His weakness lay in plot, his distinction in a lyricism expressed in some of the finest Spanish poetry of the period.

The emergence of the drama from court to marketplace and the creation of a public were largely the work of Lope de Rueda, who toured Spain with his modest troupe and a repertoire of his own composition. His four prose comedies were clumsy, but the ten *pasos* (comic interludes between the acts of longer plays) showed his dramatic merits, and he had the distinction of fathering the one-act play, which may be regarded as the most vital and popular dramatic form in Spain.

The first dramatist to realize the possibilities of the ballads in the theatre was Juan de la Cueva. His comedies and tragedies were mostly taken from classical antiquity, but in ***Los siete infantes de Lara*** ("The Seven Princes of Lara"), ***El reto de Zamora*** ("The Challenge of Zamora"), and ***La libertad de España por Bernardo del Carpio*** ("The Liberation of Spain by Bernardo del Carpi~"), all published in 1588, he turned to early heroic stories already familiar in ballad; and thus, although not an accomplished dramatist, he helped to found a "national" drama.

Prose. ***Historical writing.*** Prose before the advent of the Counter-Reformation produced some notable dialogues, especially from Alfonso de Valdés in ***Dia'logo de Mercurio y Carón*** (1528; "Dialogue Between Mercury and Charon"). His brother Juan wrote a ***Dia'logo de la lengua*** ("Dialogue About the Language") of great critical value. History continued to be cultivated, patriotism waxing higher as Spain's greatness cast its shadow over Europe; its last flowering was seen in Juan de Mariana's own translation into Spanish (from 1601) of his Latin history of Spain, which marked the triumph of the vernacular for all literary purposes.

Narratives by the explorers

But the landmarks in historical writing came from the New World and showed the transmitting of vital experience into literature with a vividness unknown in Spain. Columbus' letters and accounts of his voyages, the letters and accounts to Charles V of the famous explorer Hernán Cortés, and many other narratives by more humble conquistadores ("conquerors") opened up new horizons to the reader and, in the attempt to capture exotic landscapes in words, enlarged the resources of the language. Most engaging, though not published until 50 years after his death, was the ***Historia verdadera de la conquista de la Nueva España*** (1632; "True History of the Conquest of New Spain"), by an explorer and chronicler, Bernal Díaz del Castillo, who had a phenomenal memory and an infallible eye for detail. Bartolomé de Las Casas, the "Apostle of the Indies," wrote a ***Brevísima relacidn de la destruccidn de las Indias*** (published 1552; "Very Brief Account of the Destruction of the Indies"), criticizing Spanish colonial policy and the ill-treatment of the native population, which gave rise among Spain's enemies to the famous *leyenda* ***negra,*** or black legend.

The novel. Popular taste in the novel was dominated for a century by the progeny of the medieval courtly romance ***Amadís de Gaula.*** These interminable romances kept alive certain ideals of medieval chivalry, but, having lost touch with life at every point, they represented pure escapism and in due course evoked such literary reactions as the pastoral novel. Naturalized from Italy and filled with nostalgia for an arcadian golden age, its shepherds were courtiers and poets who, like the knights-errant of chivalric romance, turned their backs on reality.

A more positive reaction was in the picaresque novel initiated in 1554 with the brief, anonymous ***Lazarillo de Tormes.*** This genre, native to Spain and influential in many other literatures, had as its hero a picaro ("rogue"), essentially an antihero, living by his wits and concerned only to stay alive, who, passing from master to master, depicted life from underneath. Important in guiding fiction back to direct observation of life, the picaresque formula had little to contribute to development of the novel as an art form.

Don Quixote

Miguel de Cervantes, the culminating figure in Spanish literature, produced in ***Don Quixote*** (part *1*, 1605; part 2, 1615) the prototype of the modem novel. Nominally a satire on the moribund chivalric romance, Cervantes' conception allowed the presentation of reality on two levels: the "poetic truth" of Don Quixote and the "historic truth" of his squire, Sancho Panza. In the constant interaction of these rarely compatible attitudes, Cervantes revealed the novel's scope as a philosophical commentary on existence, and in the interplay of the two characters he established psychological realism in contrast with the static characterization of previous fiction. In the *Novelas ejemplares* (1613; "Exemplary Tales") Cervantes particularized his claim to be the first to write *novelas* (short stories in the Italian manner) in Spanish by differentiating between those that interest by the action and those whose merit lies in the mode of telling.

Mystical writings. The great period of Spanish mysticism coincided with the Counter-Reformation. though it had antecedents, particularly in the expatriate Spanish Jew León Hebreo, whose *Dialoghi di amore* (1535; "The Dialogues of Love") exercised a profound influence on 16th-century and later Spanish thought. The literary importance of the mystics derives from the consideration that in trying to transcend limitations of language they were liberating previously untapped resources of expression. In the writings of St. Teresa of Avila, particularly in her autobiography and letters, there were the gifts of a great novelist in embryo. A Humanist and theologian, Fray Luis de León, in his prose as in his poetry, showed passionate devotion, sincerity, and profound feeling for nature in a style of singular purity. St. John of the Cross achieved pre-eminence through three poems expressing in exalted style the experience of mystic union.

The works of Lope de Vega

Later drama. The drama achieved its true splendour in the genius of Lope de Vega. Its manifesto was Lope's own treatise, ***Arte nuevo de hacer comedias en este tiempo*** (1609; "New Art of Writing Plays at This Time"), which rejected the classical and Neoclassical "rules," opted for a blend of comedy and tragedy and metrical variety, and made public opinion the arbiter of good taste.

The new ***comedia*** ("drama") was therefore a "social" drama, ringing changes on the triple foundation of society: respect for crown, church, and the human personality, the last symbolized in the "point of honour" that Lope commended as the best theme of all. This was a matter of convention, "honour" being equivalent more or less to reputation. It was a drama less of character than of action and intrigue, which rarely grasped the essence of tragedy. What the great Spanish playwrights did possess was a remarkable sense of stagecraft and the ability to make the most intricate plot gripping.

Lope, who claimed authorship of more than 1,800 ***comedias,*** towered over his contemporaries. He had an unerring sense of what could move an audience to respond to a reflection on the stage of some of the ingredients of its country's greatness. Through Lope the drama became "national" in the truest sense. The two main categories of his work are the native historical and the ***capa y***

espada ("cloak-and-sword") plays of contemporary manners. Lope ransacked the literary past for heroic themes, chosen to illustrate aspects of the national character or of that social solidarity on which Spain rested.

The cloak-and-sword play, which dominated drama after Lope, was pure diversion, with much use of disguise, falling in and out of love, false alarms about honour, and a duplication of the plot by the humorous lackey and the lady's maid. It gave pleasure by its dexterity, sparkling dialogue, and entanglements in relations between the sexes, and showed the pleasures of the moment in an irresponsible world.

The greatest of Lope's immediate successors was Tirso de Molina, whose ***Burlador de Sevilla*** (1630; "The Trickster of Seville") presented the Don Juan legend on stage for the first time. La ***prudencia en la mujer*** (1634; "Prudence in Woman") figured among the greatest of Spanish historical dramas, as did ***El condenado por desconfiado*** (1635; ***The Doubter Damned,*** 1956) among theological, while Tirso's cloak-and-sword comedies were among the liveliest of the type. Mexican-born Juan Ruiz de Alarcón y Mendoza struck a distinctive note. His 20 plays were sober, studied, and imbued with serious moral purpose, and his ***Verdad sospechosa*** (1634; "The Truth Suspected") inspired the great French dramatist Pierre Comeille's ***Merzteur.*** Comeille's famous ***Cid*** similarly had its source in the conflict between love and honour posed in ***Las mocedades del Cid*** ("The Youthful Exploits of the Cid") by Guillén de Castro y Bellvís. These and many others with more or less distinction and dwindling originality bridged the transition from Lope to Calderón.

PORTUGUESE LITERATURE OF THE RENAISSANCE

The influence of the Aviz dynasty

The 15th century. Under King John (João) I (1385–1433), founder of the new dynasty of Aviz, the Portuguese court became once again a literary centre. The King himself wrote a treatise on hunting. His son Duarte (Edward) collected a rich library of the ancients and of medieval poems and histories and composed a moral treatise, ***Leal Conselheiro*** (*c.* 1430; "Loyal Counselor"), which revealed a conscious stylist. His brother Pedro's ***Tratado da Virtuosa Benfeitoria*** was a version of Seneca's ***De beneficiis.*** But the historical chronicle distinguished the age, with credit to King Edward, who in 1434 created the office of ***Cronista mor do reino,*** or "chief chronicler of the realm," and appointed Fernão Lopes, father of Portuguese historiography and author of chronicles of the first ten kings of Portugal, of which only those of Pedre I, Ferdinand I, and John I survive. Vividness of style combined with serious documentation to produce in Lopes the finest achievement of medieval Portuguese prose.

His successor in office, Gomes Eanes de Zurara, continued the chronicle on a lower level of artistry. His chief work was ***Crdnica*** do ***Descobrimento e Conquista da Guiné*** ("Chronicle of the Discovery and Conquest of Guinea"). Rui de Pina, if likewise not of the stature of Lopes, was free from the rhetorical defects of Zurara, and his chronicles were characterized by a notable frankness.

The *Cancioneiro Geral*

Poetry was cultivated in the mid-15th century after a long eclipse, but much had changed. The dominant influence came now from Spain, and Portuguese poets initiated the long chapter of allegiance to Spain. Apart from the ballads, popular poetry had disappeared along with that of the troubadours. The constable Dom Pedro de Portugal initiated the fashion of writing in Castilian. As one of the first to adopt the new Spanish trend toward allegory and the cult of classical antiquity derived from Italy, his influence on his compatriots was doubly important. His own poems were inspired by deep feeling and much reflection on life, and he was one of almost 200 poets represented in an anthology of poetry, the ***Cancioneiro Geral*** (1516), of the chronicler Garcia de Resende, covering the preceding three-quarters of a century. The main subjects of these 1,000-odd poems, in Portuguese and Castilian, were love, satire, and epigram. Resende was a better poet than most of his contributors.

Gil Vicente and early drama. The emergence of the modern play may be traced in the works of Gil Vicente, court dramatist and the greatest name in the Portuguese theatre. Eleven of his 44 plays were written wholly, and another 17 partly, in Spanish. The trilogy of the ***Barcas*** (1517–19) revealed his dramatic power and a fondness for comic relief; in this lay his strength, and in construction lay his weakness. The phenomenon of a potential national theatre, however, died with its founder, and his real influence was felt in Spain.

The Inquisition, introduced into Portugal in 1536, early declared war on the popular theatre on the charge of grossness. Vicente's own plays, which figured on the Spanish Index of 1559, were reduced in number to 35 and were sadly mutilated in the second edition of 1586; no new edition appeared for another 250 years.

The Renaissance in Portugal. The Renaissance reached Portugal both indirectly through Spain and directly from Italy, with which country there had been close cultural relations through the 15th century. In the following century many famous Humanists took up residence in Portugal. In 1547 John III reformed the University of Coimbra, and distinguished Portuguese teachers returned from abroad to assist the King in his task. At home Portugal produced scholars of note, including André de Resende, author of ***De antiquitatibus Lusitaniae*** (1593; "Of the Antiquities of Portugal"), and Francisco de Holanda, painter, architect, and author of ***Quatro Didlogos da Pintura Antiga*** ("Four Dialogues on Ancient Painting").

Luís de CamBes and *Os Lusíadas*

The Italianate school of poetry and drama. The return in 1526 of the poet Francisco de Sá de Miranda after a six years' stay in Italy initiated a literary reform of far-reaching effect. Like his contemporary Garcilaso de la Vega in Spain, he introduced the new poetic forms of sonnet, canzone, ode, and epistle, and he gave fresh vigour to the national verse forms, mainly through his ***Satires.*** His chief disciple, António Ferreira, a convinced classicist, wrote sonnets superior in form and style. Other poets continued the erudite school, which definitely triumphed with Luis de CamBes. CamBes, for all his eminence in the epic, is, in the opinion of some, greater still as a lyric poet. Here, a profound classical education combined with perfect mastery of his instrument and a lifetime of varied experience to produce in sonnets, eclogues, odes, elegies, and *canções* the greatest poetry in the language. ***Os Lusíadas*** (1572; ***The Lusiads,*** 1952), his epic narrative of Portuguese achievement in the East, is the national poem ***par excellence*** and the greatest of all Renaissance epics after the pattern of the Roman poet Virgil. Of the many who were moved to emulation by its success, none approached CamBes in inspiration or poetic gifts.

In the drama Sá de Miranda and his followers substituted prose for verse. Taking the Roman dramatist Terence as their model, they produced not Portuguese characters but Romano-Italian types. This revived classical comedy was to be short-lived. Sá de Miranda, avowedly to combat the school of Vicente, wrote ***Os Estrangeiros*** ("The Strangers"), the first prose comedy, and ***Vilhalpandos,*** both actions being set in Italy. Antonio Ferreira, a greater dramatist, likewise attempted both kinds: ***O Cioso,*** Italian even to the names of the personages, came nearer to being a comedy of character, but his fame rests chiefly on ***Castro*** (*c.* 1557), which treated one of the most moving tragic themes in the nation's history—the murder of Inês de Castro—by reference to the ancient Greek dramatists Sophocles and Euripides. From the comic playwright Jorge Ferreira de Vasconcelos came a "new invention" of another kind with ***Eufrósina,*** written under the influence of the Spanish novel La ***Celestina.*** This and his other plays, ***Ulissipo*** and ***Aulegrafia,*** resembled novels in dialogue and contained a treasury of popular lore and wise and witty sayings introduced with a moral purpose.

Prose. ***16th-century history.*** Discovery and conquest in Africa, Asia, America, and on the ocean inspired historians as well as poets. Their records gained in vividness what they might have lost in scientific detachment. In the three "Decades" of his ***Asia,*** the chronicler João de Barros told in vigorous language the deeds of compatriots overseas down to 1526. His first "Decade" undoubtedly influenced Camões, and together, one by his prose and the other by his verse, these two fixed the written language. This work, continued by the more critical and inclusive Diogo do Couto, can rank as the noblest historical monument of the century. In his *Soldado* ***Prdtico,*** Diogo do Couto added acute observations on the causes of Portuguese decadence in the East. Ten years of investigation in India underlay the ***Histdria do Descobrimento e Conquista da fndia pelos Portugueses*** (1552–54 and 1561) of the chronicler and notary Fernão Lopes de Castanheda, a work that ranks close to those of Barros and do Couto.

Literature of the Portuguese Empire

From this spate of writing on expansion overseas attention returned, by way of chronicles of the monarchs who presided over the work, to the history of Portugal itself. Damião de Góis, diplomat, traveller, Humanist, and intimate friend of Erasmus, possessed an encyclopaedic mind and was one of the most critical spirits of the age: his ***Crdnica de D. Manuel*** (1566–67) was most valuable where the author's own feelings of experience came into play. Its chief fault was that it—like other chronicles of the time—allowed Eastern affairs to overshadow events at home.

Works of travel abounded, and their authors were often the first Europeans to visit the countries in question. Among the more noteworthy was a much-translated classic, ***Histdria da Vida do Padre Francisco Xavier*** (1600), by Padre João de Lucena. Important both as history and as human documents were the *cartas,* or "letters," written home by Jesuits in China and Japan. An anonymous ***Descobrimento da Frolida*** ("Discovery of Florida") and a ***Tratado Descritivo do Brasil em 1587*** of Gabriel Soares de Sousa were reminders that Portugal was also present and active in the New World to the west. In all this literature of travel the palm is still held for curious interest by the ***Peregrinação*** ("Peregrination"), which Fernão Mendes Pinto, prince of adventurers throughout the East, composed in his old age, and for tragic pathos by the ***Histdria Trágico-marítima,*** a collection of contemporary narratives, told by survivors or based on their accounts, of the more notable disasters that befell Portuguese ships between 1552 and 1604.

The novel and other prose. The poet Bernardim Ribeiro, whose five eclogues introduced pastoral poetry to Portugal, was equally an innovator in the pastoral novel with his ***Livro das Saudades*** (published 1554–57; "Yearnings"), better known by its opening words "Menina e Moça" ("Child and Damsel"). This tale of rustic love and melancholy with chivalric elements transferred themes and emotions previously found only in poetry to a new medium. From it a musician and poet, Jorge de Montemor, drew some part of his inspiration for ***Diana*** (c. 1559), which, written in Spanish, started a fashion subscribed to by Cervantes and Lope de Vega among many others and represented one of the outstanding contributions of Portugal to the neighbouring literature. Both countries shared in the new enthusiasm of the 16th century for the romance of chivalry, in an age when imperial enterprise to east and west was such as to blur the dividing line between fact and the most improbable flights of the imagination. The first work of João de Barros, historian of empire, was a ***Crdnica do Imperador Clarimundo*** (1520), concerning the adventures of a fictitious progenitor of the kings of Portugal. The dramatist Jorge Ferreira de Vasconcelos kept alive memories of the Arthurian cycle with ***Sagramor,*** or ***Memorial . . . da Segunda Távola Redonda*** (1567).

Among moralists and theologians, three ranked as masters of prose style: Frei Heitor Pinto, for his ***Imagem da Vida Cristã*** (1563); Bishop Amador Arrais for ten ***Diálogos*** on religious and other topics; and Frei Tomé de Jesus for a mystic and devotional treatise, ***Trabalhos de Jesus*** (1602–09). The work of scientists included that of a cosmographer and mathematician, Pedro Nunes, and of a botanist, Garcia de Orta, whose ***Coldquios dos Simples e Drogas*** (1563) was the first book to be printed in the East (at Goa in India).

ENGLISH LITERATURE OF THE RENAISSANCE

Effects of Renaissance culture. Humanism was disseminated in England from 1500 on one hand by such followers of the Dutch Humanist Desiderius Erasmus as John Colet, Sir John Cheke, Sir Thomas Elyot, Thomas Wilson in his ***Arte of Rhetorique*** (1553), and Roger Ascham, especially in ***The Scholemaster*** (1570): they put forward the classics both as the true staple of a liberal education and as the pattern for vernacular prose, an ideal furthered by a series of classical translations and the rapid growth of the universities at Oxford and Cambridge. Sir Thomas More's ***Utopia*** (Latin, 1516; Eng. trans., 1551) exemplified classical disciplines as a source of new and independent thinking.

Qn the other hand, the Renaissance in England was complicated by the transmission of classical authors through Italian and French Humanists, so that an Englishman's knowledge of Seneca and classical literary theory, for example, was derived from continental Senecan tragedies. Throughout Elizabeth I's reign strong native traditions of thought and expression worked with and modified the new ideas from Europe—the ideal of the "complete man," as exemplified in the person of Leonardo da Vinci and the hope that the mind of man provided infinite promise of achievement and hope of stability—and produced a fruitful and vigorous culture. Until 1580, however, this blending showed little prose or verse of any permanent value. Such theological works as the Great Bible (1539) of William Tyndale and Miles Coverdale, Archbishop Cranmer's ***Book of Common Prayer*** (1549), and John Foxe's ***Book of Martyrs*** (1563) are the most important inheritance from the first part of the 16th century.

Prose and poetry. ***Poetry before 1580.*** A sudden flourish of lyric poetry at the court of Henry VIII was the only true Renaissance achievement of the first half of the century. Leaders of the movement were Sir Thomas Wyat and Henry Howard, earl of Surrey. Wyat's short lyrics, mostly on conventional subjects, and sonnets showed a genuine originality of handling. In a very large number of poems, a single line reveals at once his own poetic genius and the potentialities of the language. Surrey showed, in contrast, greater technical assurance, but his pages rarely glow with Wyat's sudden splendour. His great metrical achievement was his use of blank verse in his translation of books II and IV of the ***Aeneid.*** His importation of the metre from Italy marked the introduction of the cardinal measure of English verse.

The miscellanies

The poems of Wyat and Surrey were not printed until 1557, in Richard Tottel's ***Miscellany,*** the first of a series of collections of lyric verses. Its successors included ***A Handeful of pleasant delites, The Paradyse of daynty devises,*** and ***A gorgious Gallery, of gallant Inventions.*** The publication of miscellanies continued throughout the century; one of the best, Francis and Walter Davison's ***Poetical Rhapsody,*** appeared in 1602. The one large literary project of the age, ***A Myrrour for Magistrates,*** was not successful. It originally contained 19 legends from English history "wherein may be seen by example of other, with howe grevous plages vices are punished," and it was issued with enlargements several times until 1621: the 1563 edition contained a famous "Induction" by Thomas Sackville, an accomplished poem in itself. Otherwise the years between Surrey and Sir Philip Sidney showed little that recalled Wyat or anticipated Edmund Spenser, except delightful single poems by such generally undistinguished writers as Richard Edwards, George Turberville, George Gascoigne, and George Whetstone.

Prose before 1580. Spoken English changed slowly in the 16th century. It is possible to learn how the language was spoken, with its gradual assimilation of classical influences, from early plays, state documents, the sermons of Hugh Latimer, letters and memoirs, and such works as William Bullein's ***Dialogue . . . against the fever Pestilence.*** In more formal prose writing, Latin ideals were adopted more rapidly but always at first with the intention of strengthening English. Humanists such as Thomas Wilson, Cheke, and Ascham were constantly vigilant against pedantic Latinisms and Italian affectations. Some of the best prose of this period was to be found in writers on rhetoric and in works of churchmen and such translators as Sir Thomas Hoby, who translated Castiglione's ***Il cortegiano (The Courtyer)*** in 1561. The finest example of a prose rich in Ciceronian cadences and yet unmistakably native was the English ***Book of Common Prayer*** (1549, 1552, 1559), while the successive versions (1525, 1535, 1537, 1539, 1560, 1568) of the Scriptures provided a noble and enduring pattern for vast heroic narrative and sublime lyrical prose. The chroniclers, antiquarians, and voyagers were an important group. The chronicle of Edward Hall and Raphael Holinshed's ***Chronicles of England, Scotlande, and Irelande*** (1577) used plain English style. Imaginative prose, however, did not flourish: the collections by William Painter, Sir Geoffrey Fenton, and George Pettie of stories from classical and continental authors were more valuable as sources of stage plots than as models for English novelists.

Euphues and its sequel

The novel, 1580–1600. The first English novels, ***Euphues*** (1578) and its sequel, ***Euphues and His England,*** by John Lyly, were far livelier than the novellas translated from Italian and met with immediate success. They presented an idealized picture of polite society, embodied many fragments of philosophy, natural history, or sociology, were of a faultless moral tone, and were written in a circuitous style displaying the most elaborate artifices of the rhetorician, which came to be called euphuism.

Sir Philip Sidney's ***Arcadia*** (published 1590) was a picaresque pastoral romance, written in adorned prose with grandiose phrases used to dignify a simple act, that under cover of fiction offered a guide to conduct. ***Arcadia*** and ***Euphues*** were in style and matter extremely influential, although their successors, such as Robert Greene's ***Pandosto*** and Thomas Lodge's ***Rosalynde,*** were much below them.

Of more realistic novels the best were ***The Unfortunate Traveller*** (1594) by Thomas Nashe, a brutal and realistic tale of adventure, narrated with speed and economy, and ***Jacke of Newberie*** (probably 1597) by Thomas Deloney. After this brief burst from 1578 to 1600 the English novel had to wait a century before it again achieved even minor importance.

Other prose, 1580–1600. English prose was naturally used for works of literary theory and accounts of voyages. Sidney's ***Defence of Poesie*** (1595) was the first work to introduce in English the ideas of the Neo-Platonic theorists of the Renaissance. He wrote in a lofty but clear style, commenting acutely on the state of contemporary English literature and expressing noble ideas of the poet's gift of creating an ideal "golden" world that would convey in its beauty "the form of goodness which seen we cannot but love." The discoverers were well represented in the ***Principall Navigations*** of Richard Hakluyt, a wide-ranging collection of travellers' accounts by various authors, including Sir Walter Raleigh, but the capabilities of English prose were better dispalyed in the great theological controversies. The two branches of the new Protestant Church of England—the Puritans and the more moderate Episcopalians—were in violent conflict, particularly about the relation of civil and ecclesiastical powers. They conducted their disputes in a series of long and learned works, culminating in the work of an Episcopalian bishop, Richard Hooker, whose ***Of the lawes of ecclesiasticall politie*** (1593–1662) expressed a liberal view of the nature of the Church of England in a Latinized but limpid style.

The religious pamphleteers seem almost to parody the erudite disputations of the great divines by conducting the same arguments in a series of scurrilous pamphlets. On the Puritan side the most effective were the seven anonymous Marprelate Tracts, which attacked the bishops in a sharp colloquial prose. The replies to these were also made anonymously, but the authors of the replies probably included Lyly and Nashe. Nashe (with Greene, until his death in 1592) also exchanged insulting pamphlets at intervals from 1590 to 1596 with the brothers Gabriel and Richard Harvey. Many lesser disputants joined issue in a similar way. Other writers produced pamphlets on an extraordinary variety of topics. The most lively were those that described in an appropriately informal style the low life of London, partly in admonition and partly in admiration: those of Greene are justly the most celebrated.

The Marprelate Tracts

Even among such diverse writers a general development may be traced from an ornamental Latinate rhetorical style, often florid but often eloquent, to a simpler, more flexible prose, much more closely related to English speech and capable of expressing with equal ease the commonplace and the sublime. The prose passages in Shakespeare's plays provide a good specimen of the later style.

The poetry of Spenser and Sidney. Edmund Spenser and Sir Philip Sidney were the first considerable poets of Elizabeth's reign. Sidney was the greatest of all those Elizabethans who regarded poetry only as one of the necessary accomplishments of the complete courtier; yet in his sonnets and in ***Astrophel and Stella*** (1591), his sonnet sequence, he attempted and achieved more than did any of his predecessors. His sonnets, many of which comment on contemporary fashions in poetry, were compressed but rarely contorted.

Spenser's popular ***Shepheardes Calender*** (1579) was notable especially for its deliberate use of archaic language and dialect. Spenser was most successful when his form or his content imposed limits on the fluency of his genius, as in the "April" and "November" sections of ***The Shepheardes Calender*** or in ***Epithalamion*** and ***Prothalamion,*** these latter two being poems of intricate and sustained melody.

For his unfinished masterpiece, ***The Faerie Queene*** (1590–1609), Spenser chose an infinitely looser form, the long poetic romance made popular by such writers as the Italian poet Ludovico Ariosto, and broadened it to accommodate an extended allegory in the medieval manner. Spenser's explanatory letter to Raleigh declared that he designed 12 books, portraying "the twelve private moral virtues, as Aristotle hath devised." The title virtues of the extant books are holiness, temperance, chastity, friendship, justice, and courtesy. The heroic adventures were of a kind with which English readers would be familiar from Arthurian legend—the rescue of maidens from enchanters, the capture of the strongholds of the wicked, tournaments and single combats, and the use of magic weapons. Blended with this medieval matter and Renaissance aim of fashioning "a gentleman or noble person in virtuous and gentle discipline" was a third level of meaning using such contemporary events as the subjugation of Ireland and such personages as, inevitably, Queen Elizabeth herself, who was represented as Gloriana, the "Faerie Queene."

Arthurian legend in ***The Faerie Queene***

Spenser's handling of rhymed verse was unsurpassed in English but, like his story, moved slowly and without excitement. His nine-line stanzas gave him room to amplify every incident; to this he was so often tempted that the current of his story, never fast, sometimes checked and stood motionless:

> The waies, throgh which my weary steps I guide,
> In this delightfull land of Faery,
> Are so exceeding spacious and wyde,
> And sprinkled with such sweet varietie,
> Of all that pleasant is to ear or eye,
> That I nigh ravisht with rare thoughts delight
> My tedious travell doe forget thereby;
> And when I gin to feele decay of might,
> Its strength to me supplies, and cheares my dulled spright.
> (***The Faerie Queene,*** Book ***VI,*** lines 1–9)

The successors of Spenser. The most original of Spenser's successors were the brothers Giles and Phineas Fletcher. Giles Fletcher in ***Christs Victorie, and Triumph*** (1610) retained Spenser's control over a long stanza but anticipated Milton in the burning solemnity of his vision of heaven. Phineas Fletcher's ***Purple Island*** (1633) was a long and detailed allegory of the human body and soul. Fletcher's fine metaphysical intuitions and his command of a condensed version of the ***Faerie Queene*** stanza made ***The Purple Island*** the most successful of the poems inspired by Spenser. These poets wrote with more fervour than "grave morall Spenser" and to win the reader not to the classical virtues but to an active Christian belief. In this they looked forward to the great religious poems of the 17th century.

Michael Drayton may be taken as the type of the Elizabethan poet. He followed Spenser in pastoral, the fashion of the age in the sonnet, Samuel Daniel in chronicle and legend, and Christopher Marlowe in mythological story and yet remained himself. The work of Drayton most often mentioned and least read was his *Polyolbion* (1612–22), a vast and pious effort to versify the scenery, legends, customs, and particularities of every English county. In his "Epistle to Henry Reynolds" Drayton gave a brief survey in easy-paced verse of the state of English poetry until his own day. In it he said of Samuel Daniel, "His rimes were smooth, his meeters well did close, But yet his manner better fitted prose." This is a just account of Daniel's long chronicle poems, such as his *Civile Wares* (1595–1609), but in his sonnets and shorter poems he displayed a cultivated and equable artistry.

Sonnets and mythological poetry. The English love sonnet, introduced by Wyat and revived by Sidney, enjoyed its greatest popularity between 1591 and 1598. Lovely lines, passages, and complete sonnets abound in such sequences as Samuel Daniel's *Delia,* Thomas Watson's *Tears of fancie,* Barnabe Barnes's *Parthenophil and Parthenophe,* Henry Constable's *Diana,* Spenser's *Amoretti,* and Bartholomew Griffin's *Fidessa.* In most of these sonnet series the form was that of three separate sections of four lines with the closing couplet for emotional and dramatic climax. The sense of personal revelation in these cycles was strong but often misleading. While, for example, Shakespeare's *Sonnets* were addressed to definite persons and were charged with sincere poetic emotion, the three strands of imitation, invention, and reminiscence were inseparably intertwined, and it would be extremely dangerous to treat them as autobiographical records.

Shakespeare's *Sonnets*

The amorous mythological tale in verse derived ultimately from Ovid, whose *Metamorphoses* and *Heroides* furnished descriptions, decorations, and many tales, so that within ten years, between 1589 and 1598, appeared Thomas Lodge's *Scillaes Metamorphosis,* Shakespeare's *Venus and Adonis* and *The Rape of Lucrece,* Thomas Edwards' *Cephalus and Procris,* Drayton's *Endimion and Phoebe,* and Marlowe's *Hero and Leander.* Marlowe's unfinished poem promised to be a major achievement; the common fault of the others was that the love situations were used as convenient occasions for the display of technical virtuosity.

Lyric poetry. As has been said above, the first English lyric poet of the 16th century was Sir Thomas Wyat. His translations and adaptations from the Italian embodied one feature that became almost a convention in all subsequent lyrics. The favourite subject was the poet's sorrow —such as the pain of parting or the death of a lover—yet the poems are light and exuberant. This was not a lack of sincerity: the strength of many of the lyrics lay in this very tension between subject and manner. Further characteristics inherited from Wyat were immediacy of subject and concreteness of imagery in the lyrics. They reflected every side of Elizabethan life; poets were not deterred by fear of seeming unpoetical from using the stuff of everyday affairs as material for lyrics.

The introduction of Italian music, with its favourite metrical schemes, powerfully schooled and coloured lyric. Italian poems were often translated in their own measure, line by line, and the musical setting was retained: these tunes were then coupled with new and original poems. Both kinds of lyric appeared together in the songbooks of the lutenist John Dowland, William Byrd, Thomas Morley, and especially those of Thomas Campion. Much of the best lyric verse of the period appeared in songbooks or in the miscellanies, which, after Tottel, were published regularly. *The Phoenix Nest* (1593), *England's Helicon* (1600), and Francis Davison's *Poetical Rhapsody* (1602) contained poems of a surprisingly high and even quality.

A third source of lyric was in the plays of the period. From the time of Lyly it had been customary for playwrights to diversify their action with a song, and, although for their full effect the songs require their context, even in isolation they are of singular power and beauty. Shakespeare was here, of course, pre-eminent, but Lyly, George Peele, Greene, and Thomas Dekker had an art as fine, though slighter.

Everywhere from 1580 to 1600, and intermittently thereafter, the nation found words for its lovely airs and madrigals. The poems of men such as Lodge, Raleigh, Nicholas Breton, Watson, Nashe, Donne (in his earlier poems), and Constable are among the happiest and most durable monuments of the Renaissance in England. After 1600 disillusionment with the material prosperity of England, with the slack restraints of the Reformed Church, and with certain Humanistic ideals influenced poetry deeply, but there were few satirists concerned with the state of society. Wyat had, as so often, shown the way and established the manner, but his successors in the 16th century were heavy-handed.

Despite the large number of writers who turned their hands to lyric and the chance of immortality, the general impression of Elizabethan verse of the great period is that it was uniformly high. No doubt the lyric became gradually overconventional, and its diction lost immediate force; yet at its matchless best it fittingly expressed the temper of Elizabethan England, half springtime and half golden age.

Elizabethan and Jacobean drama. *The transition from medieval drama.* Out of the medieval morality play, with its edifying personification of vices and virtues, had grown up the shorter interlude, usually a debate in a realistic setting between characters representing different types or trades and often lightened by comic plays about a "vice" or incarnation of grotesque roguery. The value of the interlude was most clearly seen when its separate elements broke away to form new dramatic compounds. For instance, when the interlude dealt with issues such as man's duties to his king, it clearly involved affairs of state and suggested a possible way of writing a historical play. When it drew a moral lesson from the fall of a king or a great man through ill fortune or as retribution for ill deeds, it clearly approached different kinds of tragic pattern; yet if it showed the good rewarded and the wicked confounded, it was closer to comedy. The vice himself was a distant ancestor of the Machiavellian prince (such as Richard III), the ogre-like villain (such as Marlowe's Jew of Malta), and the scheming servant whose intrigues spin the plot of many later comedies.

Senecan imitations

The simple medieval idea of tragedy as the rise and fall of a great man was complicated by the Senecan plays of Italy and by those of Seneca himself, all moral melodramas of violent passions marked by revenge, usually bloodthirsty, ghosts, and Stoic philosophy. Such direct English imitations as *Gorboduc* (performed 1561) by Sackville and Thomas Norton were poor things; yet the Senecan form was only barren in England, as the heroic tragedies of Corneille and Racine in France, also derived from Seneca, show. The Senecan tradition was, however, important for later playwrights, bequeathing to them the pattern of high tragical action swayed by large ideas of fate and retribution and also such points of stage mechanics as the ghost, the chorus, and the play within the play. At the same time the use of iambic pentameter blank verse (unrhymed line of five feet, each foot consisting basically of an unstressed syllable followed by a stressed) became standard thereafter in English verse tragedy and epic poetry.

From about 1550 various academic writers produced comic plays in English, accepting disciplines, mainly through the classical Latin playwright Plautus, such as the five-act structure and unity of action, but choosing native themes and treating them with realism. The most celebrated comedies of the middle of the century were *Ralph Roister Doister* by Nicholas Udall and the broad rustic farce *Gammer Gurton's Needle.*

By 1580 a number of chronicle plays and historical interludes such as John Bale's *Kynge Johan* had already appeared, and thus all the major dramatic forms had been foreshadowed. As Sidney pointed out in his *Defence of Poesie,* however, they were not clearly distinguished and were often ruinously entangled. It was to be a characteristic of the English drama to prefer in general mixed modes to a classical purity of tone.

The "university wits" and Kyd. Of the playwrights who flourished between 1580 and 1595, the "university wits" (who included Lyly, George Peele, Greene, Nashe, and Marlowe) were the most notable. Lyly, the most polished, wrote renderings of classical legends or fanciful superstitions, such as *Campaspe* and *Endimion,* with a close regard for unity of action and employed with assurance many devices that later became conventional—the ready introduction of light but poised lyric, the handling of a comic subplot as a foil to romance, and above all the use for high comedy of a highly wrought prose. Peele and Greene wrote lively blank, or unrhymed, verse and contributed to the tone of idyllic romance that characterized later comedy—Peele in *The Araygnement of Paris* and *The Old Wives Tale* and Greene in *The Honorable Historie of Frier Bacon, and frier Bongay*.

The Spanish Tragedie (*c.* 1590) by Thomas Kyd was as popular as it was influential. Drawing freely on Seneca and Machiavelli, Kyd established the theme of revenge that was to be the staple of much later tragedy. The play is a series of terrifying theatrical shocks, until the wronged Hieronimo takes a spectacular revenge and dies in his moment of triumph.

In the plays of Christopher Marlowe, *Tamburluine, Doctor Faustus, The Jew of Malta,* and *Edward II* (all written between about 1587 and 1592), which were in the widest sense morality plays, the heroes aspired to boundless dominion, forbidden knowledge, ideal beauty, or limitless wealth, inevitably overreaching themselves and ending in destruction. The plays are borne irresistibly forward in the theatre by Marlowe's verse, which, though sometimes rhetorical and bombastic, rose often to a classical serenity.

The histories

Shakespeare. Perhaps the first poet to combine appreciation of the freedom of the Renaissance with a profound intuition of the spiritual needs and potentialities of man was William Shakespeare. But, apart from *Titus Andronicus,* a tragedy of blood strongly influenced by Kyd, his first plays were little different from those that already held the London stage. *Henry VI* (three parts) broke no new ground and lacked the vigour of its successor, *Richard III.* These plays formed Shakespeare's first historical cycle. His later histories, *Richard II, Henry IV* (two parts), and *Henry* V, showed his increasing power to transcend the mere subject of a play, reaching beyond it to a larger view of the world. In the eight plays, Shakespeare used the tragic histories of the Plantagenet kings to show the transmission of evil from one generation to the next. The plays differed sharply in dramatic technique. While *Henry V* had much in common with a patriotic pageant and *Richard II* with a morality play, *Henry IV* was something more. The creation of Falstaff and the way his life in Eastcheap is compared to the King's marked a new complexity in the drama and showed Shakespeare exercising upon the past of England the creative powers of a poet. He wrote two more history plays: *King John* and *Henry VIII,* his last play, a complimentary but dignified attachment of the Plantagenet cycle to the reign of Elizabeth.

The comedies

Shakespeare's early comedies showed his willingness to follow any fashion that seemed profitable. In *Love's Labour's Lost* he displayed admiration for the courtly comedy of Lyly; yet he excelled him in human interest and diversified diction. Similarly, since Greene in *Frier Bacon, and frier Bongay* had successfully mixed sentiment, comedy, sensation, and mystery, Shakespeare continued the style in *The Two Gentlemen of Verona. The Comedy of Errors* was of the same type as *Ralph Roister Doister;* yet it was unmistakably the work of a poet. The first play Shakespeare wrote in a form new to the English stage was *A Midsummer Night's Dream,* developing a pattern of gentleness and magnanimity in the main plot set against the humbler virtues of honesty and conviviality in the subplot, a pattern that was repeated in *The Merchant of Venice* and his three mature comedies, *Much Ado About Nothing, Twelfth Night,* and *As You Like It.* Each of these had a unified tone: the threat of tragedy or the uncertainty of fate induces contemplation of the transience of happiness, while the robust subplots prevent sentimentality. Above all, what distinguished these plays from earlier and later English comedy was that they were written mainly in blank verse. Shakespeare varied it with expert prose, courtly or vulgar as the action required, but his staple was verse of unprecedented flexibility.

By 1600 the gradual darkening of the tone of literature had begun: Shakespeare's later comedies, *All's Well That Ends Well* and *Measure for Measure,* strain continuously against the conventionally happy ending of their plots. These plays and *Troilus and Cressida* closely resembled the bitter but powerful *Timon of Athens* in their cynical view of fate and human nature.

The tragedies and the last plays

Shakespeare's second tragedy, *Rotneo and Juliet,* written at about the same time as *A Midrummer Night's Dream,* shared that play's tone of youth and hope, but Shakespeare's conception of the purposes of tragedy deepened before *Hamlet, Othello, Macbeth, King Lear, Anthony and Clropatra,* and *Coriolanus.* These tragedies were not merely studies of the flawed virtue of their heroes but were a complete vision of the human condition explored with the burning curiosity of the Renaissance. In them Shakespeare's consummate command of blank verse gave the poetry unity of thought and poetic expression without loss of dramatic impact.

From 1608 Shakespeare showed an increasing interest in plays in which the action contained all the potentialities of tragedy but in which tragedy was eventually averted, usually through supernatural powers. *Pericles, Cymbeline, The Wittier's Tale,* and *The Tempest* abounded in violent emotions, crimes, and disasters; yet in each play characters thought to be dead were found to be living, parents and children were reunited.

Although Shakespeare's plays dealt profoundly with cosmic themes, he never lost sight of the dramatic needs of the theatre or the relevance of contemporary events. His plays were in the widest sense topical, so that when a Scottish king ascended the throne of England, as James I (James VI of Scotland) did, he wrote a play about another Scottish king, Macbeth. His ability to combine dramatic power with poetic power raised him to his unquestioned position of greatness in literature.

Jonson. Shakespeare's only rival among his contemporaries was his friend Ben Jonson, whose sardonic comedies exercised a lasting influence on English drama. Jonson condemned romantic Elizabethan comedy for its fairy-tale plots, amorality, and mingling of dancing, music, and drama, since he had learned dramatic practice from the works of the Roman dramatist Plautus and from Aristotle's *Poetics.* His early comedies, *Every Man In his Humour* (performed 1598) and *Every Man Out of his Humour,* were based on the theory that the humours, fluids in the body, determined the characteristics of men; but in *Volpone* (1606) and *The Alchemist* (1610) Jonson modified the theory, allowing more scope for development of character and anatomizing and correcting the vices of his own time. Unlike many Elizabethan dramatists, Jonson carefully created a series of plots of great ingenuity. He divided men into cheats and gulls (dupes). His plots demonstrated the villainy of the cheats and then laid bare with a deadly expertness the true nature and motives of the hypocrites, misers, and braggarts who were caught by the bait. His Roman plays, *Sejanus his fall* (1603) and *Cataline his Conspiracy* (1611), appeared formal and contrived, but his later comedies, such as *The Devil is an Ass* and *Bartholomew Fair* (1614), were abundant in life. Jonson was very much an Elizabethan in the delight he took in language, and he achieved a distinctive metallic splendour, admirably fitted for his hard and energetic comedy.

Jacobean tragedy. Apart from Jonson, Jacobean drama was chiefly tragedy. A sombre tone was evident in the satiric comedy of Jonson and in the tragedies and dark comedies of Shakespeare but was even plainer in the

Influence of Machiavelli

work of the other Jacobean dramatists, many of whom were fascinated by the doctrines of Machiavelli. Such a view of humanity set its own problems. It was when their characters were at the point of death that the Jacobean tragedians were confronted with the dilemma implicit in all Renaissance literature. They searched for a compromise between Humanism and a desire for immortality but found none. Their heroes thus died in tragic defiance, bewildered doubt, or at best Stoic resignation. The plays are fairly termed revenge tragedies. Crime was heaped on crime, and the last act saw the spectacular death of all those contaminated by sin. The plays emphasized man's viciousness or helplessness.

Only John Webster in *The White Divel* (*c.* 1612) and *The Dutchesse of Malfy* (*c.* 1613) offered more than his material of murder, madness, torture, and treachery. Yet each of his plays ended in despair, with only the vaguest hints that men are anything but "the stars' tennis balls, struck and bandied/Which way please them." The most positive thing in the plays was Webster's poetry, which, even when its subject and theme were most despairing, glowed with an iridescent light, illuminating the dark places of the mind and offering some promise that beauty could exist even in a charnel house.

Although Cyril Tourneur's *Revengers Tragedie* (published 1607) was concerned with the same theme as Kyd's *Spanish Tragedie,* that of the wronged man, Tourneur, from the opening scene in which Vendice apostrophizes his dead mistress' skull, gave revenge a much more sinister interpretation. Everything in the play is vicious: Vendice, set to cleanse this world, is himself sinning in taking his murderous revenge. By contrast, *The Atheist's Tragedie* (published 1611) was pervaded by the idea that private revenge defeats its own ends. In both plays Tourneur wrote verse rich in macabre imagery; in neither did he offer a view of man that was more elevated than that of his corrupt villains.

Thomas Middleton, similarly, in *The Changeling* (performed 1622), in which William Rowley collaborated, saw the dramatic possibilities of a series of murders and the horror that strikes to the soul at the prospect of further crimes and degradation. His heroine and her hireling lover were portrayed in all the complexity of their relationship with an insight and psychological thoroughness unique in the literature of the period.

The work of John Marston was patently that of a less gifted poet. His most famous work, *The Malcontent* (1604), is singular since the wronged man kills none of his victims but preserves them in suspense for the denouement, when the minor villains reform and the archvillain is expelled with ridicule. George Chapman's plays were crammed with poetry of the spacious majesty to be expected from the translator of Homer. His historical tragedies on French themes were the highest expression in English drama of the Stoic philosophy. Philip Massinger, on the other hand, was a craftsman of the theatre. His tragedy *The Roman Actor* (1626) is a demonstration of what happens when the Machiavellian has attained supreme dominion. John Ford maintained, until the Puritan ordinance closed the theatres in 1642, the tradition of tragedy wrung from human emotion and human depravity. *The Broken Heart* and *Tis Pitty Shees a Whore* (both published 1633) depicted the inevitability of fate and the pettiness of man's defiance, even while they recall Webster's ability to extract beauty from despair.

Jacobean comedy. A similar change of tone could be traced in comedy, where *The Shomakers Holiday* (first performed 1599) by Dekker was, apart from the romances, perhaps the last play without overt social criticism. With Dekker and Thomas Heywood should be named the professional journeymen playwrights who did not lack power but wrote usually in collaboration, such as Henry Chettle, Michael Drayton, and William Rowley, who supplied underplots of rough, lively comedy or tragedy. A more considerable comic writer was Middleton, whose play *A Chast Mayd In Cheape-side* (1613?) offered a particularly penetrating examination of matrimony that was, like the bulk of Elizabethan and Jacobean comedy, not for the polite. Most of the humour was obscene, a taste of the time, but many of the jokes were plays upon words of which one meaning has now become unfamiliar. The shifts of vulgar speech have scarcely affected Massinger's famous comedy *A New Way To Pay Old Debts* (published 1633), which was as firmly built as any play of Jonson's. Massinger showed here and in *The City-Madam* (1632) his ability to imply moral values through the action of his plays.

Beaumont and Fletcher

The work written in collaboration by Francis Beaumont and John Fletcher ran through all available forms from riotous topical burlesque, as in *The Knight of the Burning Pestle* (1607), to pathetic melodrama, as in *The Maides Tragedy*. The tradition of tragicomedy persisted in the fluent writings of James Shirley. He was happiest in the realm of light comedy, where his best work, such as *The Gamester* and *The Lady of Pleasure* (1635), looked forward to the comedy of the Restoration.

Minor plays and masques. Many minor plays, powerful domestic tragedies, chronicle plays, melodramas, citizen comedies, academic entertainments, pastoral plays in the Italian style, and Senecan dramas intended only for the study showed that the great vitality and esteem of the drama was not confined to major playwrights. The masque, a symbolic entertainment involving lavish sets, music, and dancing, called for the most exquisite combination of lyric, melody, and setting. Masques were usually written and performed as private entertainments for the nobility. From Jonson onward the country was enriched by a series of masques that stand as a graceful memorial to the Renaissance.

GERMAN LITERATURE OF THE RENAISSANCE

From Middle High German to Baroque. The fall of Constantinople to the Turks (1453) created a fear of the Turk in western Europe that was often reflected in literature of the 16th and 17th centuries, while territorial rulers in Germany grew more independent at the expense of the empire. The invention of printing with movable type around 1440 revolutionized printing and literature. The old art forms continued, however, beyond 1440—medieval allegory, folk songs, songs of love and nature, drinking and conviviality, and ballads survived in profusion. Hans Folz introduced more liberal rules to revive the art of the Meistersinger (members of guilds for cultivating singing and poetry). In the south, *Fastnachtsspiele* ("Shrovetide plays") became a vehicle of satire and broad humour, while in the north they were more restrained. Collections of comic anecdotes (*Schwänke*) evolved, often grouped around a single hero; anecdotes connected with Till Eulenspiegel, a 14th-century peasant jester, acquired a European reputation.

From about 1450 a new bourgeois realism that rejected the medieval knightly tale in favour of Humanism and new classicism evolved.

The courtly revival. At some princely courts the Burgundian "renaissance" fostered a revived interest in medieval chivalry. At Innsbruck, Duchess Eleonore of Austria wrote a prose version of a French chivalrous romance, *Pontus und Sidonia;* at Rottenburg, Jacob Piiterich von Reichertshausen's work fostered a cult of the medieval poet Wolfram von Eschenbach. Medieval poems were printed, either in their original verse form or in prose versions of little literary distinction. The allegorical works of the Holy Roman emperor Maximilian I, *Weisskunig* ("The White King") and *Theuerdank* ("Noble-Mind"), represented probably the last attempt to live by medieval chivalrous ideals.

Humanism. In sharp contrast to this courtly renaissance stood the new element in German literature after 1450: the Humanist movement. The Humanists between 1450 and 1480 drew their inspiration from Italy. Albrecht von Eyb, Heinrich Steinhowel, Niklas von Wyle, "Arigo" (probably the pseudonym of Heinrich Schlüsselfelder), and Antonius von Pforr were chiefly translators who produced versions of many Latin classics, some Greek and Indian ones, and Italian works, including Boccaccio's *Decameron.*

German Humanism presented quite a different picture after 1480. Conradus Celtis, Eobanus Hessus, and others were closely associated with university circles and wrote almost entirely in Latin. A strong patriotic and political strain was demonstrated in the ***Germania*** of Jakob Wimpfeling and the diplomatic activities of Konrad Peutinger. A lively interest in German history appeared in the work of Beatus Rhenanus, the ***Chronik der Äbbebte von St. Gallen*** (1533; "Chronicle of the Abbots of St. Gall") of Joachim Vadianus (pseudonym of Joachim von Watt), and the ***Bayerische Chrortik*** ("Bavarian Chronicle") of Aventinus. But the masses were not influenced as they were to be later by the Lutheran Reformation.

Revitalization of drama by Humanism

The Humanist impact was more direct in the drama. A lively dramatic tradition was established as part of university courses. Roman comedies and Latin plays by modern authors were performed for moral instruction and to teach eloquence. These plays contrasted sharply with the medieval dramatic types, and from them 16th-century German drama developed. Later this Latin drama was turned to the service of the Reformation,

The concentration on Latin by the most gifted writers of the age goes far to explain why vernacular literature between 1490 and 1520 was so scarce. Satirical or didactic works predominated; the most famous work of the 15th century, ***Das Narrenschiff*** (1494; "The Ship of Fools"), by Sebastian Brant, reviewed all the major and minor vices of the age. In the Low German ***Reynke de Vos*** (1498; "Reynard the Fox"), the verse was accompanied by an extensive prose commentary applying the satirical episodes to contemporary evils.

The Reformation. The Reformation and the vigorous protest of Martin Luther against ecclesiastical abuses affected life in Germany; it left little room for purely aesthetic considerations. The Humanists, who favoured reform without doctrinal changes, mostly held aloof, though with certain notable exceptions: Ulrich von Hutten, hoping for a political reformation too, supported Luther's cause in a series of pamphlets; Philipp Melanchthon, a Greek scholar, introduced the Humanist tradition into Protestant schools. But apart from the Humanists, almost every writer of note was preoccupied with the Reformation.

From the torrent of printed works that swept over Germany a few had literary merit: Luther's own many and various writings, his eloquent Reformation pamphlets of 1520, for example, or his terrible condemnation of the peasants' revolt; ***Die* 15 *Bundsgenossen*** (1521–23; "Fifteen Comrades"), in which Johann Eberlin von Giinzburg attacked religious abuses; Thomas Murner's ruthless satires in defense of the old religion; the fierce anti-Catholic satire in the ***Fastnachtsspiele*** of Niklas Manuel of Bern; and the writings of Sebastian Franck, an independent radical thinker.

Luther's influence

In three respects the Reformation had a lasting effect on German literature. First, Luther's Bible translation (New Testament, 1522; Old Testament complete, 1534) was not only based for the first time on Hebrew and Greek texts but also achieved a vigorous, popular German style. It has exercised an incalculable influence on the style and ideas of later German writers. Second, Luther established congregational hymn singing as an essential part of the Protestant service and himself wrote several hymns. His example established a tradition of hymn writing that has been a major German contribution to the Christian world. Third, Luther had commended certain biblical subjects as suitable for plays, encouraging many dramatists—of whom Sixtus Birck, Paul Rebhuhn, Joachim Greff, Burkhard Waldis, and Jorg Wickram were the most outstanding—to write plays in German as vehicles of Lutheran teaching. Modelled closely on the Latin school drama, these plays marked a break with medieval types of drama.

The Reformation, despite its importance, did not account for all the vernacular literature after 1520. In scholarly works, for example, such as the treatises of the Swiss doctor, alchemist, and scientist Paracelsus (Theophrastus von Hohenheim), German was gradually beginning to replace Latin. But satirical or didactic works remained predominant, as in the collection of proverbs by Johann Agricola. The fable enjoyed revival: Luther's own translations from Aesop had no special merit, but Erasmus Alberus in his ***Fabeln*** (1534) and Burkhard Waldis in his ***Esopus*** (1548) turned the fable into a lively minor genre. ***Grobianus*** by Friedrich Dedekind, a satirical Latin guide to table manners, was translated into German by Kaspar Scheidt.

The works of Hans Sachs

Apart from Luther, the most prolific and characteristic writer of the century was Hans Sachs of Niirnberg. His works, didactic in aim but entirely unpolemical, reflected ideals of the devout, upright, industrious Lutheran townsman and artisan. By common consent the greatest of the Meistersinger, he brought the form to perfection and virtually to an end, despite attempts at revivals by later poets. Sachs was at his best in comic verse anecdote and *Fastnachtsspiel.*

Light literature. As the tide of Reformation polemics receded, works of pure entertainment came into greater prominence. The popular chapbooks were often prose versions of medieval verse romances or were adapted from foreign sources. The stories of Fortunatus, Magelone, Melusine, and many others were favourite reading far beyond the 16th century. Men found distraction also in collections of anecdotes, a type of work that went back at least to Eulenspiegel. The *Schimpf und Ernst* (1522: "Jest and Earnestness") of Johannes Pauli had didactic aims, but entertainment was the sole aim of Jorg Wickram's ***Rollwagenbiichlein*** ("Coach Book") and of similar collections by others. About this time the modern novel began in Wickram's more substantial prose narrative—*e.g.*, ***Der Goldfaden*** (1557; "The Gold Thread") —and in the German translation of the Spanish chivalrous romance ***Amadís de Gaula.***

The close of the 16th century. The Council of Trent (1545–63), which attempted to reform the Roman Church, and the advent of the Catholic Society of Jesus gave religious controversy a new turn. The Jesuits adapted the Latin school drama for their own educational purposes, but no outstanding dramatists appeared until the 17th century. Meanwhile, the Protestant academy in Strassburg, especially under a Christian Humanist, Johannes Sturm, developed a rich educational and dramatic tradition.

Source of the Faust story

In the last quarter of the century the most outstanding author was Johann Fischart, many of whose works were directed against the Jesuits, the Counter-Reformation, and notably a brilliant preacher, Johannes Nas. In all Fischart's writings, the didactic aims of the age were combined with an interest in literary form. ***Das glückhafft Schiff*** (1576; "The Ship of Good Fortune") was, formally and stylistically, one of the most distinguished poems of the century. Fischart's comtemporary Philipp Nikodemus Frischlin was the last notable Latin dramatist of the century. On the other hand, the versions of Psalms by Paul Schede Melissus and Ambrosius Lobwasser, on the Calvinist model of Clément Marot, added a new element to the rich tradition of Protestant hymn writing, while an anonymous chapbook, ***Historia von Dr. Johann Fausten*** (1587), gave rise to the whole European Faust tradition. A noteworthy feature in the last years of the century was the arrival in Germany of troupes of English actors whose repertoire included versions of contemporary English plays. They influenced Jakob Ayrer and Duke Heinrich Julius of Brunswick; the latter composed 11 plays. With this new influence German literature moved into the Baroque age.

Swiss–German literature of the Reformation. The activities of the religious reformer Huldrych Zwingli had only an indirect influence on literature. Zwingli himself wrote mainly in Latin. The so-called Ziirich Bible of 1529 was gradually adapted to conform with the Luther Bible, which tightened the connection between Swiss and German writings. An important result of Zwingli's work was that the Protestant majority of German-speaking Switzerland established a permanent connection with Protestant parts of western Switzerland and with Protestant countries abroad. The anonymous play about William Tell from the canton of Uri was a forceful and popular expression of Swiss patriotism. Gilg Tschudi's ***Chroni-***

con Helveticum, covering the years 1000–1470 in Swiss history, endured as literature.

Austrian literature of the Renaissance. In Austria the vast expansion of the Habsburg Empire brought the imperial chancellery from the Prague of the Luxembourg dynasty to the Vienna of the Habsburgs, carrying with it a double heritage: the German literary language and a Humanist disposition and care for style. The emperor Maximilian I, himself a writer, made Vienna, through its chancellery and university, the leading Humanist city in Germany, helped by Conradus Celtis. Johannes Spiessheimer (Cuspinian), and Joachim Vadianus (von Watt).

Development of the theatre in Vienna

Vienna acquired a theatre at the Renaissance with the court plays of Conradus Celtis and the monastery plays of the abbot of the Schottenkloster ("Scottish," *i.e.*, Irish, monastery), Benedictus Chelidonicus. The German plays of the schoolmaster Wolfgang Schmeltzl were first performed in the Schottenkloster. From 1554 onward the Jesuits created out of the dynastic alliance of Austria and Spain a community of religious conviction and mental inclination. They began to perform a considerable repertoire of plays, and at the same time the Italian opera developed and was patronized especially by the emperors. The Viennese Baroque theatre became one of the artistic triumphs of Europe.

The individual regions flourished too. Tirol had its own courts from time to time. From 1430 there was an abundance of sacred and secular drama. A century later, in Sterzing, Vigil Raber was collecting and rewriting the plays of the people. About 1570 Archduke Ferdinand of Tirol led a poets' court, whose preacher was Johannes Nas, while the monk Laurentius von Schnüffis, from being theatrical producer to a duke, became a mystical lyricist. Salzburg had a life of its own, shining through a Humanist, Paul von Hofhaimer, who set its tone, through the theatre of the archbishop's court, and through the Benedictine university founded in 1620. Styria had a wide range of artistic interest in the great monasteries such as Kremsmünster, where Simon Rettenbacher wrote religious plays. Christoph van Schallenberg, Wolfgang Helmhard von Hohberg, and Katharina von Greiffenberg were poets of the nobility. It was the emperor Ferdinand II, sometime ruler of Styria, who decided the battle against the Reformation, first in Styria and then in his other lands. The voice of the triumphing church was uplifted in Vienna by Abraham a Sancta Clara, Habsburg court preacher and master of Baroque German prose.

DUTCH LITERATURE OF THE RENAISSANCE

The literature of Flanders and Holland must be considered as a whole until about 1582, when the fall of Antwerp marked the final rift between the Protestant north and the Catholic south. The 16th century was characterized by a diversity of literary forms, which reflected an age in decline confronted by the first articulation of the new art coming to the Netherlands from Italy through France. The Renaissance in the Netherlands began with several writers such as Lucas de Heere, who had fled from the Catholic southern provinces for religious reasons. Chapbooks, containing prose versions of medieval romances, folk songs, and *rederijkers* ("rhetoricians' ") verse; Reformation propaganda, marching songs of the Calvinist revolt against Spain; these and the first sonnets, the first dissertations in the vernacular, and the first grammars of the Dutch language displayed the restlessness of an age of change. So, while the Catholic Anna Bijns was fulminating against Lutheranism in her glowing satirical versa, which was countered later by the Calvinist Marnix van Sint Aldegonde in his polemical attack on the Catholic Church, the echoes of classical antiquity were reaching the Netherlands in the odes, sonnets, and translations of Jan van der Noot and Jan van Hout. Carel van Mander, painter and poet, introduced scholarly vernacular prose writing, though the Latin prose of Erasmus had been famous throughout Europe for nearly a century.

Van der Noot's collection of Petrarchan sonnets in the manner of the French poet Pierre de Ronsard was published in London, where he was then in exile on account of his participation in an insurrection in 1567. The two great moderates of the age were the Erasmians J.H. Spiegel and Dirk Volkertszoon Coornhert, both liberal Humanists with a social, undogmatic Christian ethic. Spiegel's poetry is generally more intellectual than Coornhert's prose, which was influenced by Montaigne and the Bible, with a remarkably supple and lucid, even entertaining, style. It was Coornhert and his successors, in particular the translators of the Dutch authorized version of the Bible, who laid the foundations of the standard language.

SCANDINAVIAN LITERATURE OF THE 16TH CENTURY

Swedish. Two dates mark the beginning of modern Swedish history: 1523—the breach with Denmark and Gustav I Vasa's accession; and 1527—the breach with Rome and the establishment of a national Lutheran Church. The political revolution that eventually brought Sweden to the position of a European power had no considerable effect on literature until a century later, but the Reformation wholly dominated Swedish letters during the 16th century.

The Swedish translation of the Bible

The most important literary event of this period was the translation of the Bible in 1541, which inaugurated modern Swedish and provided an inexhaustible source for poets of subsequent times. Closely involved in the Bible translation were the apostles of the Swedish Reformation, Olaus Petri and his brother Laurentius. Olaus Petri's vigorous approach was revealed in his published sermons and in a Swedish chronicle, the first historical Swedish work based on critical research. Olaus Petri may also have written the biblical *Tobie comedia* (published 1550), the first complete extant Swedish play.

As a consequence of the Reformation, two of Sweden's most distinguished scholars of the period were driven into exile. In his history of all the kings of the Goths and Swedes, Johannes Magnus provided Sweden with a number of valiant kings unknown to critical historians. Johannes' brother Olaus Magnus wrote the first geographical and ethnographical account of Scandinavia, *Historia de gentibus septentrionalibus* (1555; "History of the Northern Peoples").

Meanwhile, academic learning was in decline. The University of Uppsala, founded in 1477, was closed in 1515 because of political unrest and was not revived until late in the century. Associated with it was Johannes Messenius, who wrote several mythical-historical plays.

Danish. In 1536 the Lutheran Reformation was carried through in Denmark, and the beginning of the 16th century was characterized by many pamphlets for or against the Roman Catholic Church. European Humanism and the Renaissance made their influence felt also in Denmark, where Christiern Pedersen was the most prominent Humanist who supported the Reformation. He edited *Gesta Danorum* by the 13th-century historian Saxo Grammaticus. translated the New Testament, adapted Martin Luther's pamphlets into Danish, and above all participated in a translation of the Bible (1550). Poul Helgesen was the most gifted opponent of the Lutheran Reformation and Hans Tausen its most talented spokesman. The *Visitation Book* by the Lutheran bishop Peder Palladius is an important literary document. The two most important historians (both belonging to the transition between the 16th and 17th century) were Anders Sørensen Vedel and Arild Huitfeldt.

Sixteenth-century Danish poetry was religious or polemical, with fine love poetry and hymns. The earliest plays date from the beginning of the century. The most important playwright of the period was Hieronyrnus Justesen Ranch, whose farce *Karrig Nidding* ("The Miserly Rascal") was his best play. The full force of the Renaissance in literature was not felt till the next century.

Icelandic. The chief political figure and poet of the Reformation was Jon Arason, last Catholic bishop of Hólar, beheaded in 1550. By his life Jon showed that he was a Viking as well as a martyr, although most of his surviving poetry is religious.

The effect of the Reformation on Icelandic learning and literature was that Catholic poetry was discarded and attempts were made by the first Lutheran bishops to replace it with hymns poorly translated from Danish and German.

Lutheran teachers instructed the people in Protestant dogma, and several translations of sermons and books of instruction by German Lutherans were printed in Icelandic from as early as 1540. Gudbrandur Thorláksson was the most energetic and wisest of the Lutheran teachers. In translating the Bible he used earlier Icelandic versions of some books of the Old Testament and Oddur Gottskálksson's Icelandic translation of the New Testament. In his psalmbook he showed appreciation of Icelandic poetic tradition and adhered to Icelandic alliteration and form.

RENAISSANCE LITERATURE OF EASTERN EUROPE

Hungarian. Until the 16th century, Latin remained the language of serious literature in Hungary, a result partly of Humanist influences. In the second half of the 14th century, Italian influence had become predominant in Hungary, and in 1367 the first Hungarian university was founded. In the middle of the 15th century, with the accession of King Matthias I Corvinus, the court became a centre of Humanism. The King established a university and the first Hungarian press and was famous for his library. Latin literature reached its peak in Janus Pannonius. the greatest Humanist of Hungary, who was educated in Italy. He wrote numerous elegies, inspired by the troubles of a responsible statesman, difficulties in combatting the Turks, love of country, and personal sorrows.

Writers of the Hungarian Reformation

The 16th century brought changes, under the shadow of the Turkish wars. After the Battle of Mohács (1526) the country was split into three, and centres of Humanist and literary thought were destroyed. There followed the dawn of a new era—the Reformation—with which Hungarian national literature really began. Mention must be made of three forerunners of this new era: Benedek Komjáti, Gábor Pesti, and János Sylvester, who were disciples of Erasmus. With methods infinitely superior to those employed 100 years earlier by the Hussite teachers, they translated parts of the Bible with philological accuracy. Pesti made a very readable translation of Aesop's ***Fables*** and published a Latin–Hungarian dictionary. Sylvester published the first Hungarian grammar and, to show the adaptability of the vernacular to classical verse forms, wrote the first Hungarian poem in couplets. In 1541 he published a translation of the New Testament.

With the spread of the new religion, translations were made of the Psalms and of hymns. András Szkhárosi Horvát wrote didactic poems, versified sermons, and paraphrased biblical stories, and he was perhaps the greatest Hungarian satirist,

The second half of the 16th century saw the beginnings of Hungarian drama. ***Balassi Menyhárt árulásáról irott komédia*** ("Comedy on the Betrayal of Menyhárt Balassi"), a satire by an unknown author, was perhaps the most interesting literary achievement of the Reformation. Péter Bornemisza's literary activity consisted mainly in sermons, but he gave an entrancing view of Hungarian life, teeming with fresh observations, vivid descriptions, and original comments. His volume ***Ördögi Kísértetek*** ("On the Temptations of the Devil") offered an interesting consideration of moral and sexual problems in the 16th century. A poem of farewell, written on leaving the country, was one of the gems of early Hungarian poetry.

Perhaps the greatest single literary achievement of the Hungarian Reformation was a translation of the Bible by Gáspár Károli (1590); this translation played a role in the development of Hungarian similar to that of the Authorized Version in English.

Up to the 16th century, religious literature seems to have fared better than secular literature partly because secular literature was not written down. The late-16th-century minstrels were more learned than their predecessors, often driven to their profession by difficult economic conditions. Perhaps the most important was Sebestyén Tinódi, by temperament more historian than poet. He described the wars against the Turks with remarkable accuracy, but his verse was monotonous. Peter Ilosvai Selymes was the author of a romance, ***Miklds Toldi*** (written 1574), which achieved great popularity in Hungary and served as a basis for a masterpiece by János Arany in the 19th century. The 14th-century hero, a man of immense strength, was a popular figure in Hungarian literature. This romance was the one original piece in the flow of the mere entertainment literature characteristic of the 16th century, whose principal genre was the ***széphistoria*** ("beautiful story"), adapted from western European originals. Perhaps the best was the ***Argirus historiája*** ("The Romance of Argirus") by Albert Gergei, from an Italian original but interwoven with Hungarian folklore.

Originality of Bálint Balassi

A great poet emerged in Bálint Balassi (1554–94), who was highly original and comparable with the later Cavalier poets of English literature in dash and frivolity. But he had a depth that they lacked. Balassi enjoyed fighting, love, and the good things in life, but his poetry was shot through with sudden and deep religious impulse. Technically, his verses were unmatched in early Hungarian literature, and he had many imitators and followers.

Polish. Although the Renaissance reached Poland comparatively late, it was the golden age of Polish literature. External security, constitutional consolidation, and the Reformation contributed to this flowering: the first permanent press was established at the turn of the 15th century, and the first book printed entirely in Polish was issued in about 1513. The modern literary language dates from this time.

The first generation of writers influenced by the Italian Humanists wrote in Latin, and it included Jan Flachsbinder (Joannes Dantiscus), author of incidental verse, love poetry, and panegyric; Andrzej Krzycki (Cricius), an archbishop who wrote witty epigrams, political verse, and religious poems; and Klemens of Januszkowo (Janicki, Janicius), a peasant who studied in Italy and became poet laureate and the first original Polish poet.

Mikołaj Rej of Nagłowice combined medieval and Renaissance aspects. Self-educated, he was the first idiomatically Polish talent and widely read writer of his time, being known as "the father of Polish literature." He wrote satirical epigrams, but of more importance were his prose works, especially ***Postilla,*** a collection of Calvinist sermons, and the ***Żywot cztowieka poczciwego*** (1558; "Life of an Honest Man"), a description of an ideal nobleman.

The Humanist poet Jan Kochanowski

The second generation of Humanist poets, and indeed the whole Renaissance period, was dominated by Jan Kochanowski. The son of a country squire, he wrote in the vernacular and was the first Polish writer to attempt both satirical poetry and classical tragedy, but his lyrical works surpassed these experiments. His crowning achievement, the first Polish work to equal the great poems of western Europe, was ***Treny*** (1580; ***Laments,*** 1920), inspired by despair after the death in 1579 of his infant daughter, to be succeeded by a final recovery of his spiritual harmony. In Kochanowski's poetry the archaisms still apparent in Rej's work had almost disappeared; language and idiom were modern. The flexibility and assurance of his poetic genius were immediately recognized as a sign that the literary language had attained its maturity.

The most notable of Kochanowski's followers was Szymon Szymonowic (Simonides). He introduced in his ***Sielanki*** (1614; "Eclogues") a poetic genre that was to retain its vitality until the end of the 19th century. These pastoral idylls exemplified the processes of imitation, adaptation, and assimilation by which Renaissance writers brought foreign models into the native tradition.

The numerous poems, in Latin and Polish, of Sebastian Klonowic were of interest for their description of contemporary life. ***Worek Judaszdw*** (1600; "Judas' Sack") was a satirical poem on the plebeian life of Lublin, of which he was mayor.

The prose of the 16th century ranked with its poetry in vitality and range. The most eminent writer in Latin was Andrzej Frycz-Modrzewski. In ***Commentariorum de republic~emendanda libri quinque*** (1551, 1555), he evolved a bold social and political system, based on the principle of equality before God and the law. Another notable writer in Latin was Marcin Kromer, scholar, Humanist, historian, and Catholic apologist. Of his controversial works, most interesting is the Polish *Rozmowy dworzanina z mnichen* (1551–54; "Dialogues Between the Courtier and the Monk"), a defense of Catholicism. Many historical and polemical writings and translations of the Bible were also published during this period; the Catholic translation by Jakub Wujek is an outstanding literary work.

Polish literature had become a national literature, reflecting Poland's position as a great power with far-flung boundaries, the evolution of the nobility as a ruling class, and the country's economic prosperity. Its influence spread east, above all to Moscow, and to the west its culture was represented by men of such high repute as the scientist and astronomer Nicolaus Copernicus (Mikołaj Kopernik).

Russian. About the middle of the 16th century Moscow's conception of itself as a centre of learning, of Orthodoxy, and of political authority began to take shape. There appeared a succession of literary undertakings aimed at exalting and strengthening Muscovite ecclesiastical and political traditions and at demonstrating that these had come down from the very beginning of Russian statehood. In 1552 there appeared the grandiose compilation known as the *Velikiye Minei-Cheti* ("Grand Minei Cheti"), by the metropolitan of Moscow, Makary, which collected numerous works of original and translated ecclesiastical literature. It was followed bv the *Stevennava Xniga* ("Book of Degrees"—*i.e.*, generations), containing biographies of Russian princes and ecclesiastical figures and completed in 1563 by Makarios' successor. At this period also were collected the important Muscovite chronicle compilations. An enormous collection, the *Litsevoy svod* ("Illuminated Compilation"), was produced, which begins with the creation and ends in the 1560s. Other works such as the *Domostroy* ("Household Management") and the Stoglav (Council of a Hundred Chapters) aimed at strengthening moral, social, and political standards of conduct. The introduction of printing in Moscow did much to help Russian unification, and the first dated book, *Apostol,* was printed in 1564.

Czech. In the 16th century there was a mass of prose literature in which didactic and scholarly writing predominated. The influence of Humanism was apparent in the elegant style of the legal historian Viktorin Kornel of Všehrdy. Of considerable interest is the small group of travel books from this period. The development of Czech prose culminated in the translation of the Bible made by a group of scholars of the Unitas Fratrurn and known as the Kralice Bible (1579–93). The language of this version became the model of classical Czech.

Croatian. In the 15th and early 16th centuries the most outstanding Croatian writer was Marko Marulić, author of the epic *Judita* (1501), in which he encouraged his countrymen in their struggle against the 'Turks. Under the influence of classical and Italian literature and Croat folklore, the Petrarchan lyric was developed in Dalmatia and in Dubrovnik. One of the most prominent poets was Hanibal Lucić, author of *Robinja* ("The Slave Girl"), the first Yugoslav secular play. Among the best known writers of Old Croat literature was Marin Držić, who wrote pastoral dramas and comedies portraying Renaissance Dubrovnik. His comedy *Dundo Maroje* (written *c.* 1551) was performed throughout western Europe.

Slovene. At the end of the 1620s, Protestant activity began in Slovenia. The demand to replace Latin with a liturgical language that all could understand gave impetus to literary activity. The Protestant reformer Primož Trubar, who as a supporter of Lutheranism had to flee to Saxony, published the first printed Slovene book *Abecedariutn* (1550), a catechism (1551), parts of the Bible, the constitution of the Slovene church (1564), and polemic writings, and with his followers founded a rich religious literature. This activity reached its height in 1584, when an outstanding translation of the Bible by Jurij Dalmatin and the first Slovene grammar, *Articae horulae successivae de latinocarniolana literatura*, written by educationalist Adam Bohorič were published. The Protestant writers also published seven books of songs (1551, 1563, 1567, 1574, 1579, 1584, 1595) intended for liturgical needs, as well as the German–Latin–Slovene–Italian Dictionary (1592, 1608), compiled by Hieronym Magiser. The basis thus created for literary Slovene, together with the peasant risings of this time, formed the starting point of Slovene national consciousness.

Romanian. The first book printed in Walachia in 1508 was a Slavonic liturgical book. A certain Deacon Coresi printed translations of the Acts of the Apostles (1563). Others of his publications that survive are the *Talcul Evangheliilor şi Molitvenic* ("Sermons and Book of Prayers") and *Evanghelia cu invătatura* (1581; "Commentary on the Gospels"), and these all encouraged the use of Romanian.

In this period some secular literature was also produced, but it consisted mainly of translations from Greek, Slavonic, Byzantine, and Oriental books (*e.g.*, a history of Alexander III the Great, *Aesop's Fables,* and *The Thousand and One Nights).*

CELTIC LITERATURE IN THE RENAISSANCE

Welsh. After the pre-eminence of Dafydd ap Gwilym and his followers in the *cywydd,* there arose for a short time a school of literary formalists. The chief of these was Dafydd ab Edmwnd: the main characteristic of his poetry was its ingenuity. His poetic heirs were Tudur Aled (died 1526), a bard of great craft, and Gutun Owain (flourished *c.* 1460–1500).

Effects of the Reformation and the accession of the Tudors

The Reformation broke the hold of the Catholic educational system in Wales, which resulted in a diminution of literary appreciation and in the standards of the language. The Tudor policy of encouraging the spread of English at the expense of Welsh and of inducing the Welsh aristocracy to emigrate to England almost destroyed the old Welsh culture, which was completely bound up with the language. Yet fine work was written by the satirists Siôn Tudur and Edmwnd Prys. Other masters of the *cywydd* deserving of mention were William Llŷn and Siôn Phylip.

The rise of modern prose. As printing made its appearance in Wales in the 16th century, the traditional prose was abandoned by the Humanists of the Renaissance. The new prose they fashioned was based on bardic language and classical authors, enriched by new formations and borrowings. The first Welsh printed book, *Yn y lhyvyr hwnn* (1547; "In This Book"), so named because of its opening words, consisted of extracts from the Scriptures and the prayer book: from this time Welsh prose began to take definite form.

The Reformution. The most important figure of the Reformation was William Salesbury, who translated the New Testament by 1567. Marred though it was by philological foibles and the mechanical means used to make the language intelligible in every part of Wales, it was nonetheless a fine piece of translation. In the same year was published the Welsh Prayer Book, also translated mainly by Salesbury in collaboration with Richard Davies, bishop of St. David's. The Welsh Bible translated by William Morgan, bishop of St. Asaph, aided by Edmwnd Prys, was published in 1588. The revised version, published in 1620, is still used. It would be difficult to exaggerate the importance of these three translations in the development of Welsh prose. From 1588 onward there was no break in the production of Welsh prose books. The first were translations from English and Latin aimed at grounding the Welsh nation in the principles of the Reformation.

The Counter-Reformation. During the years in which the reformed religion was being established in Wales, Welsh society and the Welsh language were at their lowest ebb. The Catholic writers of the Counter-Reformation regarded the new religion as something imported from England—and they thought that the way to preserve the old religion was to insist on the old Catholic culture. As a result there appeared *Dosparth Byrr,* the earliest printed primer of Welsh grammar, the work of Gruffudd Robert (*c.* 1522–c. 1610), and also several religious works, many of which were published on the Continent.

The Welsh Renaissance. Just as Italy and other European countries under the Renaissance turned to the Latin and Greek classics, so Wales turned to its own classical tradition of bardism. In addition to Gruffudd Robert's primer mentioned above, there appeared a set of rules for bardic poetry and principles of the Welsh language compiled by Siôn Dafydd Rhys and a dictionary and a grammar by John Davies of Mallwyd.

Breton. Breton literature. like the ianguage, divides into three periods—old, middle, and modern. Old Breton (8th to 11th century) is only found in lists and glosses in documents or as names in Latin books and charters. From the Middle Breton period (11th to 17th century) the 11th- to 15th-century compositions were mainly oral, and little except a few scraps of verse is extant until the late 15th century, when there appeared the *Catkolicon* of Jean Lagadeuc, a Breton–Latin–French dictionary printed in 1499, and Quiquer de Roscoff's French–Breton dictionary and conversations (printed 1616).

The waulking songs

Scottish Gaelic. Some Gaelic poetry from the 16th century survived in oral tradition until the mid-18th century, when it was written down, such as *An Duanag Ullamh*, composed in honour of Archibald Campbell, 4th earl of Argyll, or the lovely lament *Griogal Cridhe,* composed *c.* 1570. It is certain that the poetry recorded in the *Book of the Dean of Lismore* was not an isolated outburst; much must have been lost, both of the work of the professional bards and of the popular songs. Songs in the nonsyllabic, accented measures survived, again orally, from the earliest years of the 17th century. This was the tradition that produced the work songs—*e.g.*, waulking songs used as an accompaniment to the fulling of cloth (a process of thickening and shrinking), better known from 17th- and 18th-century examples.

In 1567 the first book printed in Gaelic in Scotland appeared: Bishop John Carswell's *Foirm na Nurrnuidheadh*, a translation of John Knox's liturgy, in classical common Gaelic.

IV. The 17th century

CHARACTERISTICS OF THE AGE

The 17th century was a period of unceasing disturbance and violent storms, no less in literature than in politics and society. The great question of the century, which confronted serious writers from Donne to Dryden, was Michel de Montaigne's "What do I know?" or, in expanded terms, the ascertainment of the grounds and relations of knowledge and faith and reason and authority in religion, metaphysics, ethics, politics, economics, and natural science.

The questioning attitude that characterized the period is seen in the works of its great scientists and philosophers: Descarte's *Discourse on Method* (1637) and Pascal's *Pensées* (written 1657–58) in France; Bacon's *Advancement* of *Learning* (1605) and Hobbes's *Leviathan* (1651) in England. The importance of these works has lain in their application of a skeptical, rationalist (and thereby scientific) mode of thought not only to scientific problems but to political and theological controversy and general problems of understanding and perception. This fundamental challenge to both thought and language had profound repercussions in man's picture of himself and was reflected in what T.S. Eliot described as "the dissociation of sensibility," which Eliot claimed set in in Enland after the Civil War, whereby, in contrast to the Elizabethan and Jacobean writers who could "devour any kind of experience," later poets in English could not think and feel in a unified way.

In any division as arbitrary as one that begins and ends with the turn of a century, some acceptance of the overlapping of movements and influences is required. This is particularly true of the early part of the 17th century, which in many countries, particularly England, was still under the influence of the Renaissance. Thus, for the general convenience of the division, there have been included here those writers who belong chronologically to the 17th century (such as Donne, Milton, and Marvell) and who are yet a late flowering of Renaissance Humanism. From the point of view of influence alone, it has been necessary to discuss the plays of Jonson in the section on dramatists in *English literature of the Renaissance,* above, and yet to analyze in some degree Jonson's effect on poets of the early 17th century such as Robert Herrick.

If in most literatures the 17th century was ushered in by the Renaissance, real understanding of the forces at work in the period must take into account the way in which the 16th-century revival of interest in the classics and philosophy and the mighty challenge delivered to accepted dogma by the Protestant Reformation in religion prepared a receptive environment essential to the dissemination of the ideas of the new science and philosophy—of the work of Bacon, Descartes, and Hobbes.

The effects of war on 17th-century literature

A true picture of the period must also take into account the enormous effect of social and political upheavals, reflecting the struggle between the constituent "estates" of most emerging national states and the growing power of a centralized administration, during the early and middle parts of the century, which from many points of view provide a convenient breaking-off point for a new age. In England, where the literary history of the period is usually divided into two parts, the break seems to fall naturally with the outbreak of the Civil War (1642–51), marked by a closure of the theatres in 1642, and a new age beginning with the restoration of the monarchy in 1660. In France the bitter internecine struggle of the Fronde (1648–53) similarly divided the century and preceded possibly the greatest period of all French literature —the age of Molibre, Racine, Boileau, and La Fontaine. In Germany the early part of the century was dominated by the religious and political conflicts of the Thirty Years' War (1618–48) and thereafter by the attempts of German princes to emulate the central power and splendour of Louis XIV's French court at Versailles. The Netherlands was also involved in the first part of the century in a struggle for independence from Spain (the Eighty Years' War, 1568–1648) that resulted not only in the achievement of this but also in the "Golden Age" of Dutch poetry—that of Heinric Spieghel, Daniel Heinsius, and Gerbrand Bredero.

Baroque literature

The civil, political, and religious conflicts that dominated the first half of the century were in many ways also the characteristic response of the Catholic reaction to the Protestant Reformation known as the Counter-Reformation. The pattern of religious conflict was reflected in literary forms and preoccupations. One reaction to this —seen particularly in Italy, Germany, and Spain but also in France and England—was the development of a style in art and literature known as Baroque. This development manifested itself most characteristically in the works of Giambattista Marino in Italy, Luis de Góngora in Spain, and Martin Opitz in Germany. For long regarded by many critics as decadent, Baroque literature is now viewed in a less condemning light and is understood to denote a style the chief characteristics of which are elaboration and ornament, the use of allegory, rhetoric, and daring artifice.

If Baroque literature was the characteristic product of Italy and Germany in this period, Metaphysical poetry was the most outstanding feature in English verse of the first half of the century. This term, first applied by Dryden to John Donne and expanded by Dr. Johnson, is now used to denote a range of poets who varied greatly in their individual styles but who possessed certain affinities with Baroque literature, especially in the case of Richard Crashaw.

The conflict between the classics and the new science

Perhaps the most characteristic of all the disputes of the 17th century was that in which the tendency to continue and develop the Renaissance imitation of the classics came into conflict with the aspirations and discoveries of new thinkers in science and philosophy and new experimenters with literary forms. In France this appeared in a struggle between the Anciens and Modernes, between those who thought that literary style and subject should be modelled on classical Greek and Latin literature and supporters of native tradition. In Spain a similar conflict was expressed in a tendency toward ornament, Latinization, and the classics (*culteranismo*) and that toward a more concise, profound, and epigrammatic style *(conceptismo)*. This conflict heralded through the Modernes in France and the idea of *conceptismo* in Spain a style of prose writing suitable to the new age of science and exploration. The Modernes in France were largely, therefore, followers of Descartes. In England a similar tendency was to be found in the work of the Royal Society in encouraging a simple language, a closer, naked, natural way of speaking, suitable for rational discourse, paralleled by the great achievements in prose of John Milton and John Dryden.

ENGLISH LITERATURE IN THE 17TH CENTURY

The disturbed and violent climate of the 17th century in England resulted from many converging and conflicting ideas. It was often a conflict between tradition and innovation, as in the Anglican appeal to established order and expediency against Puritan simplicity and adherence to a literal interpretation of the Bible, or in King James's conception of the divine right of kings opposed to the many new theories of democracy. It is also seen in Thomas Hobbes's sacrifice of democratic liberties to the necessities of order as against John Milton's Puritan republicanism. But the predominant tone throughout all this is one of questioning examination and analysis.

Early prose. Most books were works of edification and instruction, so that the theory and practice of prose style moved from the rhetorical but disciplined flexibility achieved in the 16th century by writers such as Richard Hooker to the scientific and realistic style inaugurated in the 17th century by Francis Bacon. Whereas a balanced, rotund style imitative of Cicero was the natural vehicle for accepted truth, the skeptical new age found the stylistic irregularities of Seneca and Tacitus more suitable. While Elizabethan writers had thought and felt in metaphor, in prose as well as poetry, in the new age science promoted a breakdown of the old unity of thought and feeling. The scientific mind tended to outlaw metaphor and image, except as illustration, and to seek precisely denotative language. At all times plain prose was being written by travellers, men of affairs, and pamphleteers, who, innocent of theories, wrote in the pungent language they spoke.

The King James Version of the Bible

Translations and books of travel. This was the great age of translation. Philemon Holland, translating chiefly from the classics, combined scholarship with colour. John Florio's translation (1603) of the ***Essays*** of Michel de Montaigne, Thomas Shelton's ***Don Quixote,*** and Sir Thomas Urquhart's ***Works*** by Rabelais were done with a racy gusto that has made them English classics. Greatest of all English translations, the King James (Authorized) Version of the Bible, was mainly the work of a succession of 16th-century translators (and hence was somewhat archaic in 1611), yet Jacobean translators must share the glory through their taste in phrase and rhythm. Modem versions embody advances in learning and accuracy but suffer immeasurably by comparison. The cultural effects of the century's saturation in the English Bible are impossible to estimate.

Observation of foreign countries was a duty of the Renaissance Humanist that was to make the Grand Tour of Europe an obligatory part of the education of young aristocrats. Those at home found diversion in books of travel by such men as the eccentric Thomas Coryate, William Lithgow, Fynes Moryson, and Peter Mundy. Of the value of such narratives to imaginative writers ***The Tempest*** of Shakespeare is one example; and George Sandys' ***Relation of a Journey*** left traces in Milton's ***Paradise Lost.*** Among the absorbing pictures of American settlements were those of the amazing Capt. John Smith. For travels of all kinds, Samuel Purchas' collection ***Hakluytas Posthumas or Purchas his Pilgrimes*** (1625) revealed him a successor to the 16th-century voyager Richard Hakluyt.

The essay and "character." Increasing analysis of self and society was manifested in the development of the essay and the "character" (modelled on the brief sketches of ethical types by the ancient Greek author Theophrastus). Early essayists, such as Sir William Cornwallis, Ben Jonson in ***Timber: or, Discoveries,*** and Owen Felltham in ***Resolves,*** carried on the ethical preoccupations of Renaissance Humanism. Francis Bacon's ***Essayes*** (1597, much enlarged 1612 and 1625) were an integral part of a scheme for the advancement of knowledge, and his mundane scale of values was that of an objective social psychologist examining motives and behaviour. James Howell's *Epistolae* ***Ho-Elianae*** (1645–55) was a lively reminder of the kinship between the letter and the familiar essay. Robert Burton's ***Anatomy of Melancholy*** (1621) was a learned treatise on the related maladies of body and mind, but no other psychological treatise has been a treasured bedside book. This cloistered scholar was the master of a colloquial style, an ironic observer of the human comedy, and a wise, compassionate counsellor.

The best known books of "character" are Joseph Hall's ***Characters of Virtues and Vices*** (1608); the lighter and wittier collection of Sir Thomas Overbury; the ***Microcosmographie*** (1628–33) of John Earle, who combined wit, penetrating irony, and humanity; and Thomas Fuller's edifying and amusing conduct book ***The Holy State (The Profane State)*** (1642).

History and biography. Classical and modern foreign historians emancipated English historians from the naïve methods of the older chroniclers. The first really critical historian was William Camden, whose ***Britannia*** (1586) was translated from Camden's Latin by Philemon Holland in 1610. Sir Walter Raleigh's ***History of the World*** (1614) is apocalyptic, revealing history as a working out of God's providential will. Raleigh showed poetic vision in his brooding on the mortality of men and empires and military sagacity in his discussion of logistics. The nonapocalyptic tradition of Machiavelli and Tacitus was behind Bacon's study of statecraft, ***Historie of the Raigne of King Henry the Seventh*** (1622), whereas Thomas Fuller's ***Church-History of Britain*** (1655) was a moving story of the church's trials.

Memoirs and letters

The leading biographical writers were the clerical Fuller and a businessman, Izaak Walton, friend and eulogist of clerics, and the unclerical John Aubrey. Fuller, essayist, humorist, and antiquary, showed his love of anecdote and oddity in ***The Holy State (The Profane State)*** and in ***The Historie of the Worthies of England*** (1662), the first dictionary of national biography. Izaak Walton turned into a semi-professional biographer; his lives of Donne, Sir Henry Wotton, Hooker, George Herbert, and Robert Sanderson were printed during 1640–78; they have remained delightful and valuable through their author's sweetness of temper and his concern for truth and style. Fulke Greville's monument to Sir Philip Sidney was less of a biography than a political treatise. The period yielded a wealth of memoirs and letters that are nearly all highly readable. Perhaps the most famous were the poet-philosopher Lord Herbert of Cherbury's account of himself in a swashbuckling role; ***Eikon Basilike*** (1649), a stained-glass image of the royal martyr—the joint work of King Charles and John Gauden—which became a potent weapon of propaganda; and that idyllic "picture of my own disposition," Walton's ***Compleat Angler*** (1653). Among collections of letters, those of Dorothy Osborne stand first for their humour, pathos, and charm.

The influence of religion. In the national arena, religious issues were a more or less central force interwoven with politics and economics, and writers engaged in controversies that accompanied war and revolution.

In this century the sermon was the only literary form familiar to all classes of people. Although preaching was much more stressed by Puritans than by Anglicans, the names that chiefly survive are Anglican. Among the best are the "witty" and minute critical analysis and austere exaltations of Lancelot Andrewes and the large body of Donne's sermons. Jeremy Taylor is known for his richly pictorial images from nature and earnest moral counsel. He was in the classical tradition, having nothing of Donne's agonized involvement and little rhetorical violence. The best sellers were manuals of piety by Arthur Dent and Lewis Bayly and books of meditation and guidance, including Andrewes' ***Private Devotions*** (1647); Donne's very individual ***Devotions upon Emergent Occa-***

sions (1624); Taylor's *Rule and Exercises of Holy Living* and *Rule and Exercises of Holy Dying* (1650–51); the Puritan Richard Baxter's popular *Saint's Everlasting Rest* (1650); *The Whole Duty of Man* (1658) by Richard Allestree; and Thomas Traherne's radiant visions, which circulated in manuscript and were much later printed as *Centuries of Meditations* (1908).

Religion, science, and philosophy. The conflict between religion and science first took shape in the 17th century. The great Elizabethan exposition of divine and human reason and law had been the first book of Richard Hooker's *Of the lawes of ecclesiasticall politie*, which sought to adapt the traditional study of Aristotle, Augustine, and Aquinas to the Anglican Church's situation. This classical Christian philosophy of order and harmony encountered three agents of disintegration: Calvinism, with its emphasis on the arbitrary omnipotence of God and the impotent depravity of man; the Baconian doctrine of scientific progress, which tended to enthrone "things" and bestow power upon man; and traditional skepticism and naturalism fortified by scientific discovery and thought in the mechanistic philosophies of René Descartes in France and Hobbes in England.

Influence of Francis Bacon

Francis Bacon, an eminent lawyer, judge, and statesman, was the prophet and philosopher of a new conception of progress. In *Advancement of Learning* (1605), the broadest statement of his grand scheme and a monument of his massive prose, he arraigned traditional modes of education and inquiry and proposed new lines of exploration. His prime interest was science as the achievement of a mastery of nature for the use and benefit of man. His inspiring vision and his inductive method were set forth in *Novum Organum* (1620). His dream of cooperative research in *New Atlantis* (1627) to some degree played its part in the formation of the Royal Society.

The disruption of traditional religious thought proceeded rapidly. The dualism of Descartes led either to the philosophy of Idealism, with its concentration on God and the mind, or to Materialism (or Pantheism), which emphasized that matter was the only reality. For Hobbes, already a thoroughgoing Materialist, mind was, like everything else, a system of bodies moving in space and time; and his bare, trenchant style, as in *Leviathan* (1651), suited his thought. The deterministic philosopher was attacked on all sides. In the face of irrational Calvinism and irreligious Materialism, the Cambridge Platonists reasserted traditional Christian Humanism in partly new terms. Henry More and Ralph Cudworth were philosophically important in trying to accommodate science to liberal Christianity and vindicate metaphysical and ethical Idealism. More influenced Sir Isaac Newton and, in the 20th century, W.B. Yeats.

Sir Thomas Browne's *Religio Medici* (1642) was the work of a young scientist and a Christian Platonist conscious of a Rationalist climate. In this central book his rhetorical Senecan style gives foretastes of his later splendours. *Pseudodoria Epidemica* (1646) was a soberly scientific attempt to fulfill Bacon's desire for a sifting of popular errors, especially in natural history. Browne's chief later works were the. sombre *Letter to a Friend, The Garden of Cyrus*, and *Hydriotaphia, Urne-Buriall* (1658). In the last two, antiquarian in impulse with richly imaginative meditations on life and death, time and eternity, Browne blended Christian and pagan ideas with simple Saxon and complex Latinate words: he was the supreme metaphysical poet in prose.

Early poetry. Poets who spanned the end of the 16th century, such as the followers of Spenser, notably Giles and Phineas Fletcher and Michael Drayton, were in the mainstream of Elizabethan thought and are treated under *English literature in the Renaissance,* above. Samuel Daniel, in "Musophilus" (1599) and some weighty epistles, and George Chapman, in *The Teares of Peace,* upheld culture and Stoic integrity and wisdom against sensual or intellectual distractions. But, while Daniel wrote with a smooth half-prosaic clarity, the texture of Chapman's expression was metaphysical in its complexity. Fulke Greville's treatises in verse and his philosophical sonnet sequence had a sinewy toughness that is nearer Chapman than Daniel; but his dark religious view of man's corruption could not share the optimism of their Humanistic creed or the scientific optimism of his fellow statesman, Bacon.

Verse translations. The 17th century opened with some famous translations, including George Chapman's of Homer (1598–1615), Edward Fairfax's *Godfrey of Bulloigne* (1600), and George Sandys' translation of Ovid's *Metamorphoses* (1626). Chapman's elaborate metaphors and moralizing interpolations were rather obtrusive, but his translations were truly heroic poems in the Renaissance tradition. Fairfax's translations of the 16th-century Italian poet Tasso, in Spenserian style, has remained a standard English version. Joshuah Sylvester's *Divine Weekes and Workes* (1605), a translation of du Bartas' *Création du monde*, was the Protestant epic of creation until displaced by John Milton's *Paradise Lost.* Some of these translations, notably Sandys', contributed to a development of the closed, balanced couplet, which culminated in Dryden's translation of Virgil's *Aeneid* and in *Fables Ancient and Modern* (1700). In the vocabulary they developed to render "philosophic" poems, Sylvester and Sandys illustrate the beginnings of the "poetic diction" of the Augustan Age of Queen Anne, and Sandys' allegorical commentary on Ovid, one of the last flowerings of a potent tradition that could not be assimilated by Augustan reason, was to revive in the mythological imagination of John Keats.

Donne and the Metaphysical poets. The revival of general interest in the poetry of John Donne and the Metaphysicals in the 20th century and the effects of this upon modern poetry and criticism have altered the present perspective. Some elements of their poetry are "wit"; a forcible yoking of apparently unrelated ideas and things; organic rather than merely illustrative images; concrete particulars; fusion of thought and feeling, or an intellectualization of feeling; tension between opposed ideas and emotions, and hence complexity, obliquity, irony, paradox; colloquial language and rhythms; and an expressive rendering of experience. Many poets, from Shakespeare down, were more or less Metaphysical; but Donne carried into the poetry of love and religion the technique that Elizabethan decorum reserved for satire. In his love poetry he could be cynical or sensual or outsoar Petrarchan hyperbole. He was concerned with the relations of body and soul and, in some of his best poems, found in love the only reality. His explorations were presented with explosive force and originality; they were witty and serious, dialectical and passionate. The religious poems, including the holy sonnets, were mostly written in the years 1607–12. Although Donne was ordained only in 1615, he had always been a Christian and re-enacted in his soul the drama of human guilt and divine love.

Characteristics of Metaphysical poetry

Donne's poems circulated in manuscript and exerted a strong influence on secular and religious poetry. Of the chief religious writers, Herbert, Crashaw, Henry Vaughan, and Traherne, only the first really wrote Metaphysical poetry. Herbert's richly symbolic wit was demonstrated in a poet-priest's celebrations of Christ and church and in personal poems in which he strove to subdue his will or quicken his zeal. Tensions made impact through his subtle craftsmanship, organic structure and unified imagery, his understatement, colloquial language, and variety of rhythm. Crashaw's work, that of a Catholic convert, was the very embodiment of Baroque poetry, and the Italianate and Spanish style of his devotional ecstasies had little of the English Metaphysical. Vaughan, a Christian Neoplatonist who, but for intimations of God in nature, felt an exile on earth and longed for eternity, was a poet of contemplative vision.

Secular poets included Lord Herbert, Henry King (author of the splendid "Exequy" on his young wife), the fantastic and satirical John Cleveland, and Abraham Cowley, author of clever amatory verse, the unfinished epic *Davideis,* and loose, irregular *Pindarique Odes* (1656) on public themes. The finest of them was Andrew Marvell. In "To His Coy Mistress," "The Garden," "The Picture of Little T.C.," "A Dialogue Between the Soul and Body," "The Coronet," and "An Horatian Ode upon

Marvell's poetry

Cromwell's Return from Ireland," all written about 1650–53, Marvell combined complex metaphysical intelligence and sensibility with the grace of a Cavalier and a structural and stylistic symmetry, economy, and clarity that may be called classical.

Ben Jonson and his influence. In the golden age of English music, before and after 1600, numberless musicians created a wealth of song. Thomas Campion is the most noted example of the composer-poet. Along with elaborate lyricism went the simpler popular tradition; the songs of Jonson and Shakespeare illustrate both. Jonson's classicism extended from the ethical and Stoic ideals of Renaissance Humanism (embodied in reflective poems) to the artistic ideals that molded his songs and epigrams. He cultivated disciplined impersonality, symmetry, and clarity; his style was rational and urbane, without shocks or extravagance.

Among the many writers who felt Jonson's influence, perhaps the purest disciple and the most original was Robert Herrick. His Metaphysical wit, his instinct for the concrete particular, for ambiguity, paradox, and surprise, was half concealed by his classical elegance, which included an exquisite feeling for word and rhythm. Herrick could live in the pagan world of his fancy or in the Christian world of his belief. The Cavalier poets Thomas Carew, Sir John Suckling, and Richard Lovelace were also heirs of Jonson. Carew, the most studied artist, praised Donne's originality but showed little of Donne's passion and intellectualism. He preferred a classical pattern, one controlling idea and image. If Carew elevated the sensual game of love into a courtly ritual, Suckling speaks with the nonchalance of a courtier and man-about-town. Lovelace lives in a few songs of the ideal Cavalier, but even in these simplicity is touched with complexity.

John Milton. Milton's career, one of continuous development, fell into three periods: the early poems in Latin and English; the years 1641–60, given to public affairs (and occasional sonnets); and the last phase of his three major poems. The volume of 1645 included the ode of Baroque beauty "On the Morning of Christ's Nativity" and the two companion pieces "L'Allegro" and "Il Penseroso," which develop the Jonsonian manner; his masque, now known as *Comus*, diversified in its stylistic texture, unified in its Christian Platonism; and "Lycidas," one of the most complex poems in the language, a first effort to justify God's ways to men, in which religious, political, and personal tensions are powerfully stated in the metaphor of classical pastoral. The Metaphysical current left the young classicist almost untouched; he began in the Spenserian line but was from the start a master of original power.

Milton dreamed of writing the great modern heroic poem, but his sense of responsibility impelled him to give 20 years to the Puritan struggle for liberty. He wrote five tracts against episcopacy; four on divorce; "Of Education"; "Areopagitica" (1644), a plea for freedom of the press; and, on the eve of the Restoration, a defiant plea for a republic. They record his increasingly radical thought, his hopes of a reformation, and his successive disillusionments.

Paradise Lost

When he came to compose ***Paradise Lost*** (1667), Milton was no longer a militant revolutionary; his three major works deal with the temptations, defeats, and victories of individual man. His early ardour gave way to reasserting in the face of science and oppressive power the Christian Humanist view of God, man, and nature through an inspired use of the biblical myth of the Fall of man. Eve, in her desire for the godlike knowledge Satan promises, and Adam, in his curiosity and his following of Eve, re-enact the sin of Satan, pride and rebellion. His heroic villain, Satan, is a personality of grandeur, but in balancing this with his corruption Milton could rely upon his audience's reaction to evil.

He wrote as the conscious heir of the ancients, revivifying the conventions and details of the classical epics. Images blend the general with the particular, and his bold, idiosyncratic style is elevated above common speech, though ornate stylization includes both simplicity and complex density of suggestion and overtone. The use of blank, or unrhymed, verse (10-syllabled lines of alternately stressed syllables) for a long poem was a radical novelty, and Milton's handling of it enlarged English prosody.

Paradise Regained and ***Samson Agonistes*** (both 1671) show still further artistic developments. The former is in a style of almost biblical simplicity; the latter, the only English drama on the Greek model that can stand with those of the ancients, is in ruggedly irregular verse that comes close to speech. The hero of ***Paradise Regained***, in a conflict of mounting tension, Christ displays the obedience and integrity rhat Adam and Eve have lacked. In the drama of Samson, a sinful human hero—isolated, like the half-human Christ, even from human sympathy—achieves inward regeneration. These three poems of faith and fortitude stand out against the rest of Restoration literature.

The Restoration period. The restoration of the monarchy in 1660 heralded a political and cultural break, but new developments came from the ferment and confusion of new and old. The year 1667 saw the appearance not only of the first edition of the old Milton's ***Paradise Lost*** but also of a modish poem, the young Dryden's ***Annus Mirabilis.*** Isaac Newton in physics and mathematics, Robert Boyle in chemistry, and developments in biology strengthened radical change in the picture of the physical world, propagated by the newly formed Royal Society, which profoundly affected the intellectual temper of the age. A new political feeling emerged, in some ways cynical, corrupt, and self-seeking yet marked by increasing toleration and humanity. It allowed the growing consciousness of the self that is found from Francis Bacon onward and that produced the diaries of Samuel Pepys and John Evelyn.

The court returned from exile with many French tastes and fashions. London became a European capital of high civilization. The theatre, reopened under royal patronage, became a preserve of the upper class and flourished. The literary forms of the modern world—the novel, biography, history, travel writing, and journalism—had their beginnings in the Restoration period, when English literature could be seen remaking itself in the face of new scientific and philosophic concepts and new social and economic conditions that caused the disappearance of patronage, the emergence of mass readerships, and the formation of the literary market.

Prose. The year 1660 marked a development in English prose. Men became increasingly interested in things rather than in words as science came to play a greater part in human affairs and the custom of writing emotional prose disappeared and a more familiar diction took its place. The Royal Society played some part: its origins were much earlier than 1662, when it received its first charter. The society was interested in prose style and soon after its foundation appointed a committee "for improving the English language." Thomas Sprat, in his ***History of the Royal-Society of London*** (1667), really a work of propaganda, laid down rules for a plain English style, though many scientific works, such as those by the great naturalist John Ray, were in Latin. Robert Plot's ***Natural History of Oxfordshire*** (1677) was in a simple style, but he still thought it necessary to write:

The Royal Society

> I intend to deliver as succinctly as may be, in a plain easie and unartificial Stile, studiously avoiding all ornaments of language, it being my purpose to treat of things, and therefore would have the Reader expect nothing less than words.

Hobbes, in his ***Leviathan*** (1651), had scorned and derided "obscure, confused and ambiguous Expressions, also all metaphorical Speeches, tending to the stirring-up of Passion," but probably the rise of journalism was as influential as any other cause. During the Civil War and the Commonwealth, pamphlets had been abundant. They were plain and simple, as a political pamphlet must be if it is to be effective.

The sermon, too, became simpler after 1660. John Wilkins, bishop of Chester, advocated a plain style in his discourse on preaching, ***Ecclesiastes*** (1646), and in his ***Essay towards a Real Character and a Philosophical Lan-***

guage (1668) he made a gallant attempt to substitute ciphers for words so that their associations should be lost. But it was probably the influence of a few individual writers rather than vague tendencies of the time that made a simpler prose the usual method of expression. John Tillotson was a lucid and logical preacher. He almost belonged to the 18th century in manner, and his influence was for a time very great. Dryden considered Tillotson a writer akin to himself.

Dryden's prose

Dryden was the most influential prose writer from 1660 to the end of the century. His first long piece of prose, the "Letter to Sir Robert Howard" prefixed to *Annus Mirabilis*, was followed by *Of Dramatick Poesie, an Essay* (1668) and some dedications and prefaces and, in 1700, by his masterpiece, the preface to *Fables Ancient and Modern*. Dryden's was a style both lucid and conversational. Under all his seeming ease he took great care and actually revised the syntax of *Of Dramatick Poesie* in the second edition. There is no doubt that the subject matter with which he and his contemporaries were dealing led to a change in style.

No longer were problems such as the transience of life or death itself, which lent themselves to rhetorical treatment, discussed, but rather attention was turned to matters of immediate concern, such as criticism or politics. Innumerable books were written showing disapproval of pedantry. The most amusing and popular was John Eachard's *Grounds and Occasions of the Contempt of the Clergy*. In 1672 Marvell introduced a vein in prose called "drolling" (or "banter"). In *The Rehearsal Transpros'd* and *The Rehearsal Transpros'd: The Second Part*, he ridiculed Samuel Parker, later bishop of Oxford, for his bigotry. In 1675 Herbert Croft, bishop of Hereford, argued that Protestants differed about nothing essential, a view furiously attacked. Marvell took Croft's side in *Mr. Smirke; Or the Divine in Mode*, producing an amusing satire. Marvell helped to make prose lighter and more familiar.

In 1678–79 there was an outpouring of pamphlets over the Popish Plot, supposedly a conspiracy to recover England for the Roman Catholic Church but in fact a fabrication of Titus Oates. One writer stood out: George Savile, marquess of Halifax, who wrote *A Letter to a Dissenter* to try to heal differences in the state and *The Character of a Trimmer* to defend his own position. His masterpieces were the *Maxims and Character of King Charles the Second*.

Bunyan's works

John Bunyan belonged to the world of artisans, wage earners, yeomen, and shopkeepers whose culture was founded on Bible reading and the Puritan sermon, ballads, songs, newsbooks, and romances. A tinker by trade, he was one of many "mechanick preachers" of the period who printed sermons and religious discourses. His first notable book was the spiritual autobiography *Grace Abounding* (1666). His masterpiece, *Pilgrim's Progress* (first part, 1678), grew directly out of *Grace Abounding*. It is a translation into allegorical terms of the soul's journey to salvation. It gives a vivid picture of the life of the high road and small country towns of the reign of Charles II. In the second part (1684), the realistic and humorous elements are more prominent. Among Bunyan's other works the most memorable are *The Life and Death of Mr. Badman* (1680) and *The Holy War* (1682), an allegory on a grand scale. Bunyan can be regarded as the last medieval allegorist and as the first great master of realistic and psychological fiction.

The writings of the Cambridge Platonists (a group of philosophico-religious thinkers who hoped to reconcile Christian ethics and Renaissance Humanism) were among the influences that led to simplification of prose style. Most notable were John Smith's *Select Discourses*, and the *Select Sermons* (1698) and *Moral and Religious Aphorisms* (1753) of Smith's master, Benjamin Whichcote, and *A Discourse of the Freedom of the Will* (1675), by Peter Sterry, the most imaginative and poetical of the group. A great Puritan leader, Richard Baxter was one of the most important religious writers, remembered for *The Saint's Everlasting Rest, A Call to the Unconverted* (1657), *A Breviat of the Life of Margaret . . . Charlton*, and *Reliquiae Baxterianae* (1696), his autobiography, a fascinating account of his attempts to heal the differences between Christians of different persuasions.

Restoration interest in biography

One of the most important developments in Restoration prose was an interest in biography: the word seems to have been first used in English *c.* 1660. Earlier biographies had tended to be either eulogy, in the tradition of funeral oration, or hagiography, deriving from lives of saints. The famous *Lives* by Izaak Walton, though still containing hagiography, were landmarks in the development of English biography. They were based on observation and research and contain invaluable records of personal traits and conversations and examples of correspondence. Almost equally important is Roger North's *Lives of the Norths*. The life of John North is of particular interest in that it successfully describes an extremely neurotic man. The Earl of Clarendon's *History of the Rebellion* was first published in 1702–04, and his autobiography appeared in 1759. Bishop Gilbert Burnet's *History of His Own Time* was published in 1724–34, although lives of the Earl of Rochester, Sir Matthew Hale, and Bishop William Bedell, with an "essay in memory" of Queen Mary II, were published much earlier. Despite their publication dates, however, both these great histories were written during the Restoration period. *Athenae Oxonienses* (1691–92; "Oxonian Athens"), by an Oxford antiquary, Anthony à Wood, was the first serious attempt at an English biographical dictionary. It was partly the work of John Aubrey, whose own *Brief Lives* is vivid and entertaining. It is hardly necessary to mention the diaries of John Evelyn and Samuel Pepys except to remind the reader that, whereas Evelyn's *Diary* extended from 1631 to 1706, Pepys's ended in 1669. As Evelyn often wrote up his diary some days after the events recorded, his dates cannot always be trusted. Neither was published until the early 19th century.

During the Restoration, the problem of translation troubled many. No doubt a more exact scholarship than that of the Elizabethans raised in an acute form the question of what a translation should be: whether it should be an exact reproduction of the original or a paraphrase. The problem was not, and never can be, solved. Dryden produced admirable versions of portions of Lucretius, while his Virgil (1697), if not Virgil, has its own splendours, and his work helped to form the poetic diction of Augustan verse. Hobbes made complete translations of the *Iliad* and the *Odyssey*, which Dryden called "bald," adding that Hobbes began studying poetry as he did mathematics, when it was too late. The taste for translations must have been keen, as they are so often found in the miscellanies of verse of the time.

Critical essays in verse and prose ranged over literature in general. The most outstanding work was Robert Wolseley's preface to the Earl of Rochester's version (1685) of John Fletcher's tragedy *Valentinian*. It attempted to solve the problem of the relation of art to morals, and, with the exception of Dryden's prefaces, it is the most significant piece of Restoration criticism. *A Short view of the Profaneness and Immorality of the English Stage* (1698), by Jeremy Collier, effected its purpose to some extent in making plays more decorous. Collier's violence gave him an advantage over William Congreve, Sir John Vanbrugh, and others who attempted replies.

Poetry. The impulse to the writing of ceremonial verse was given by the restoration of Charles II. Robert Wild's *Iter Boreale* ("Northern Journey") greeted the King's return. Dryden was soon in the field with *Astraea Redux*. In 1661 he wrote a panegyric on the coronation and in the next year addressed a poem to Clarendon. These poems helped to establish the use of the heroic couplet (rhymed pair of 10-syllabled lines), as they were technical improvements on the poems in couplets that had preceded them. But all these thin folios could not compare in popularity with Samuel Butler's mock-heroic satire *Hudibras* (first part 1663). Much of this remarkable work had been written a good while before the Restoration. The poem delighted all Royalists, but it was less an attack on the Puritans than on the folly and pedantry of mankind in general. Though never finished, it is a great work and remained popular until the 19th century. ***Hudibras*** was constantly imitated, notably by Swift.

Dryden's poetry

Dryden presided over the age. Apart from his prose, he wrote nearly 40 plays as well as a great deal of verse. His most famous poems were nearly all satires. ***Mac Flecknoe,*** his attack on Thomas Shadwell, was published surreptitiously in 1682, though written earlier. His best known poem, ***Absalom and Achitophel*** (1681), had the supreme merit of satire in being reasonably fair and was immensely popular. ***The Medall,*** also a political poem, followed in 1682, as did his ***Religio Laici,*** which indicated the evolution of Dryden's religious opinions. ***The Second Part of Absalom and Achitophel,*** although by Nahum Tate, contains about 200 of Dryden's most telling lines. In 1687 he published ***The Hind and the Panther,*** an able argument for Roman Catholicism. Among Dryden's greatest achievements are his Pindaric odes in irregular rhyming verse. He took this form from Abraham Cowley and gave it a new strength in his superb elegaic ode "To the pious Memory of the accomplisht Young Lady Mrs. Anne Killigrew" and in memorable poems written for a London musical society, "A Song for St. Cecilia's Day" (1687) and "Alexander's Feast" (1697), in which colourful rhythm and magnificence of imagery combine with touches of wit to produce effects unique in English poetry.

At the Revolution of 1688, Dryden lost his posts of poet laureate and historiographer royal. With unflagging vigour, late in life, he poured out a series of works, including some fine plays, his translation of the Roman poet Virgil, and ***Fables Ancient and Modern,*** containing some of his most mature writing, including three verse tales founded on stories by the 14th-century Italian Boccaccio, which were admired and imitated by Lord Byron and John Keats. His alliance with the publisher and anthologist Jacob Tonson was a literary event of importance. The translation of Virgil published by Tonson in 1697 was the first large-scale publishing venture in England and probably the first to bring considerable profits to an author.

Poets surviving from the reign of Charles I, such as Abraham Cowley, Sir John Denham, and Edmund Waller, continued to produce competent verse. More typical was the poetry of the group of Restoration "court wits," which included Rochester, Sir Charles Sedley, Charles Sackville, and Sir George Etherege. Sedley, Sackville, and Etherege wrote admirable light verse continuing the courtly tradition of Carew and Suckling and at times catching the note of the contemporary popular street ballad. Rochester was the one considerable poet among the group. His best lyrics had an intense feeling and a purity of melodic form. His verse satires were among the most notable of the century, ranging from the devastating political comments of "The History of Insipids" (1676) to the powerful attack on facile optimism in ***A Satyr Against Mankind*** (1675), his masterpiece. Indeed, these works were apparently written before Dryden had published his satires, and there is little doubt that he owed a considerable debt to Rochester's example.

Drama. The Restoration period is chiefly remembered for its many plays. The King and the Duke of York gave their patronage to the drama and re-established the London theatres, closed in 1642. Drury Lane, known as the King's house, and Dorset Garden, known as the Duke's, were founded soon after the King's return.

Heroic plays

There were few real tragedies, their place being taken by heroic plays, mostly dealing with the conflict between private life (love) and duty (political power or status). These offsprings of heroic romance and French tragedy were a mixture of bombast with occasional fine passages. Dryden's ***Conquest of Granada*** (performed 1670–71) *is* the best known, and ***All for Love*** (1677) can be read with enjoyment if it is remembered that it is not meant to be an imitation of Shakespeare's ***Antony and Cleopatra*** but a re-ordering of Shakespeare's themes. Two of his comedies, ***Marriage-A-la-Mode*** (published 1673) and *Amphitryon* (published and performed 1690), are excellent.

Of other playwrights, Thomas Otway wrote well-constructed plays. His masterpiece, a topical political melodrama, was ***Venice Preserv'd*** (performed 1682), which has a tide of passionate language and bold delineation of character. Real comedy began with Sir George Etherege, who, in ***The Man of Mode,*** mirrored the gaiety and insolence of the world he knew. William Wycherley was a writer of comedy with a serious purpose: his ***Country-Wife*** (published 1675) has great power, while ***The Plain-Dealer*** (1677) is a skillful transplantation of Molière's ***Misanthrope.*** Wycherley scavenges in the most callous good spirits and with careful cynicism, and his prose is excellent. The apex was reached by William Congreve, who, had his plots been coherent, would have been one of the world's great dramatists. His dialogue in ***Love for Love*** (performed 1695) and ***The Way of the World*** (1700) has hardly been surpassed for sheer wit. Sir John Vanbrugh wrote ***The Provok'd Wife*** and ***The Relapse*** (both published 1697); and though he was a less stylish writer than Congreve, his plays are full of vigour and humour. The coarse, powerful comedies of Thomas Shadwell formed a link between the art of Ben Jonson and the realistic fiction of the age of Henry Fielding.

Scottish literature. With the union of the crowns in 1603 and the transference of the court to London, Scottish writing became increasingly Anglicized. Although James VI showed that he could turn out a lyric in Scots, the new poets wrote almost exclusively in English. The best of these, William Drummond, was "well-languaged," but his lyrics lack intensity and force. Vernacular poetry was kept alive in popular songs and ballads, such as Robert Sempill's ***Life and Death of Habbie Simson.*** Whether grim and tragic, as in the older ballads, or amusing, as in ***Habbie Simson,*** this tradition was of the heart rather than the head, and the absence of an intellectual and critical quality has been a besetting weakness in later Scots verse.

The first original literary prose appeared in the theological writing of John Ireland (*c.* 1435–c. 1500). The prose of these works had not yet developed great variety or flexibility of construction. Early in the 16th century there was an attempt at a less Latinized prose in Murdoch Nisbet's version of Wycliffe's New Testament, but the language is too southern to be quite successfully idiomatic. Some English influence is seen also in the 16th-century historical writings of John Bellenden, John Leslie, and Robert Lindesay of Pitscottie and to a greater extent in works such as the Scottish Reformation leader John Knox's ***Historie of the reformaiioun of religioun within the realm of Scotland*** (1586). These writers, however, had a good command of narrative, and Pitscottie and Knox had also the gift of style. Almost as vivid as Knox's writing was the autobiographical ***Historie of the Lyff of James Melvill,*** which covered the second half of the 16th century. The remarkable anonymous ***Complaynt of Scotlande*** (1548–49) is interesting both as the work of a well-read Scottish patriot and as the first work of a Scottish experimenter in prose style. The need to reach English readers is seen in the writings of James VI: the manuscript of his ***Basilikon Doron*** was in Scots, but, when published in 1599, it had been translated into English. William Drummond's ***Cypresse Grove*** (1623) was in careful, grave, mannered English; and not much Scots prose occurred after that date. A general justification for this turning to English may well be seen in Sir Thomas Urquhart, "the free'st spoke Scot of any," whose translation of François Rabelais and extraordinary original works displayed an ornateness that would have cracked the molds of Scots as it did those of English.

Anglo-Irish literature. Until the 17th century the language of Ireland was Irish. The Anglo-Irish were a small colony, a garrison holding a perilous outpost, constantly yielding linguistic as well as physical ground to the resurgent Gael; and even among the colonists English had to struggle for supremacy with Latin and French. A few manuscripts have survived, showing the existence of a vernacular poetry of no great originality or distinctiveness. The most striking example is the 13th-century satire ***Land of Cockaygne.***

The first notable Irish writer in English was Richard Stanyhurst, who contributed sections on Ireland to Raphael Holinshed's *Chronicles* (1577) and attempted to write English verse on Latin models. As the colony grew and the conquest of the whole country was attempted, the stream of Anglo-Irish writing increased, and Gaelic as well as English names began to appear. In the next century there were Sir John Denham, author of the much admired *Cooper's Hill* (1642), and Lord Roscommon, Nahum Tate, and Nicholas Brady, among minor poets. Sir John Temple (1600–77) may be mentioned among minor historians, but there was as yet no major name.

CELTIC LITERATURE IN THE 17TH CENTURY

Welsh. *Prose.* So far, writers of Welsh prose had contented themselves with translation, until Morgan Llwyd produced his religious works. A Puritan, he made an original contribution to Welsh religious thought, chiefly in *Llyfr y Tri Aderyn* (1653; "The Book of the Three Birds", a disquisition on the theory of government and on religious liberty, and *Llythur ir Cymru Cariadus* (*c.* 1653; "Letter to the Beloved Welsh"), which expounded a mystical gospel. During this period and well into the 19th century, there still appeared many translations, mostly of theological works and often inspired by the Society for Promoting Christian Knowledge. Among the clergy who produced these works were Edward Samuel; Moses Williams, a diligent searcher into manuscripts; Griffith Jones, the father of Welsh popular education; and Theophilus Evans, author of *Drych* y *Prif Oesoedd,* which, like the *Llyfr y Tri Aderyn,* is established as a classic in the annals of Welsh literature. Ellis Wynne o Lasynys is often regarded as the greatest of Welsh prose writers. His two great works were *Rheol Buchedd Sanctaidd,* a translation of Jeremy Taylor's *Rule and Exercises of Holy Living,* and *Gweledigaetheu y Bardd Cwsc,* an adaptation of a translation of the *Sueños* of the Spanish poet Quevedo.

Poetry. When Henry VII came to the throne, the old Welsh gentry turned toward England for recognition and preferment, and interest in their own country waned. Soon, poets of the older school had no audience, and the only ones to keep the old tradition were the rich gentlemen farmers. A new school, however, was rising that combined a vast store of folk song, previously despised and unrecorded, with imitation of contemporary English popular poetry and sophisticated lyrics. The first landmark of this new development was the publication of Edmund Prys's metrical version of the Psalms and Rhys Prichard's *Canwyll y Cymry* (1659–72; "The Welshman's Candle"). These were written in the so-called free metres like those of English poetry and not in the strict metres peculiar to Wales. The metrical Psalter is of particular importance, as it contained the first metrical hymns. Prichard's work consisted of moral verses in the metres of the old folk songs (*penillion telyn*). Many other poets wrote in these metres, but they were generally crude until handled by the greatest poet of the period, Huw Morus, who was particularly famous for his love poems. Later came Lewis Morris, the inspirer and patron of Goronwy Owen and thus a strong link with the next period, which Goronwy Owen initiated and which was to be one of the most productive in Welsh poetry.

The folk
element in
Welsh
poetry

Breton. A 17th-century collection entitled *Cantiques bretons* (1642) names several Breton airs. All the remaining works of the middle period (11th to 17th centuries) were religious and mostly in verse. Three mystery plays were probably the most significant products of the period: *Buez santez Nonn* ("Life of St. Nonn"), *Burzud bras Jezuz* ("The Great Mystery of Jesus"), and *Buhez santes Barba* ("Life of St. Barbara"). Three long poems, "Tremenvan an itron gwerches Maria" ("The Passing of the Virgin Mary"), "Pemzec levenez Maria" ("The Fifteen Joys of Mary"), and "Buhez mabden" ("The Life of Man"), were all probably based on French versions. A book of hours in verse, a prose extract from the Leon missal, and a prose catechism also belong to this period, as does the prose *Buhez an itron sanctes Cathell, guerches ha merzeres* ("Life of St. Catherine, Virgin and Martyr"). *Am Mirouer an Confession* ("The Mirror of Confession") and *Doctrin an Christenien* ("Christian's Doctrine") are translated from the French. A collection of carols, *An Nouelou ancient ha devot,* appeared in 1650, and a book of metrical meditations appeared in 1651. In general, the Middle Breton literature lacked originality, and the indigenous culture of Brittany seems to have been entirely neglected by the educated classes, who introduced an enormous number of French words into the preponderantly religious works published.

Scottish Gaelic. The 17th century was a period of great interest in Gaelic Scotland. The political, ecclesiastical, and social structures of Scotland were gradually changing, and so was the relationship between the central government and the Gaelic area. Enough survives of the Gaelic poetry to show that there was a large number of poets of great talent, and there seems to have been a diffusion of artistic talent scarcely matched in any other period in Scottish Gaelic history. It was the great age of the work songs (or waulking songs) and of the classical music of the bagpipes. Some of the poetry and prose was contained in three 17th-century manuscripts. The first two were the *Black* and the *Red Books of Clanranald,* written by members of the MacMhuirich family, who were latterly hereditary bards to the MacDonalds of Clanranald. They were probably written for the most part in the 17th century but contained poems by earlier representatives of the family. The other important document was the Fernaig manuscript, compiled between 1688 and 1693, containing about 4,200 lines of verse, mostly political and religious. The poets represented belonged to the 16th and 17th centuries, although little work by the major 17th-century poets was given.

The two best known poets of the 17th century were Mary Macleod and Iain Lom. The former, known as Màiri Nighean Alasdair Ruaidh, was closely associated with the households of the Macleods of Harris and Dunvegan. Her poems show deep personal emotion, and her style is fresh and natural. She inherited the imagery of the bardic poets but placed it in a new setting, and her metres were the comparatively new strophic ones (having repeating patterns of lines) rather than the strict syllabic metres of the classical bards. John Macdonald, known as Iain Lom, took an active part in the events of his time. His life spanned an eventful period in Highland history, and his poetry reflected this. He composed poems about the Battles of Inverlochy and Killiecrankie, a lament for the Marquess of Montrose, a poem on the restoration of Charles II in 1660, several poems dealing with the Keppoch murder of 1663, and a song bitterly opposing the union of the Parliaments in 1707. The breadth of his interest in national affairs was notable. His versification was less melodious than Mary Macleod's, but he had that compression and concentration of expression lacking in so much later Gaelic poetry. A significant body of bardic verse by Cathal MacMhuirich survives.

Mary
Macleod
and
Iain Lom

Other 17th-century poets of whose works interesting fragments have survived include Donnchadh MacRaoiridh, whose best known poem consists of four calm, resigned verses composed on the day of his death. The work of Alasdair MacKenzie and of Murdoch Mackenzie was represented in the Fernaig manuscript. Roderick Morison, known as An Clàrsair Dall (the Blind Harper), became harper to Iain Breac Macleod of Dunvegan. Little of his work has survived, but the strong texture and poetic intensity of his *Oran Mór MhicLeòid* and his *Creack na Ciadain* were remarkable. Dorothy Brown and Silis na Ceapaich were women poets of great talent, and Dorothy Brown's poem on Alasdair Mac Colla and Silis na Ceapaich's laments for Lachlan MacKinnon and for Alasdair of Glengarry were moving and artistic utterances.

Four other poets mark, in various ways, the transition from the poetry of the 17th century to that of the 18th. They were Lachlan MacKinnon (Lachlann Mac Thearlaich Oig), John Mackay (Am Piobaire Dall), John Macdonald (Iain Dubh Mac Iain 'Ic Ailein), and John Maclean (Iain Mac Ailein). All four were born *c.* 1655–65. Much of their work lacked the economy of the best 17th-century poetry and also its richness of imagery.

John Macdonalds' ***Oran nam Fineachan*** was not the worst of those tedious jingles in praise of the various clans that were popular with 18th-century poets. John Maclean showed a great interest in early Gaelic legend, and he composed amusing verses in a mock-heroic style. John Mackay's ***Coire an Easa*** was significant in the development of Gaelic nature poetry. Finally, bardic poetry continued to be composed into the 18th century by two members of the MacMhuirich family, Niall and Domhnall.

Irish. During the reign of Elizabeth I, English policy succeeded in breaking the power of the Irish and Anglo-Irish nobility, and the process was completed by the middle of the 17th century. The dispossession of this nobility entailed the disappearance of the bards who were its dependents and propagandists. Their eyes fixed on the past, the bards had shown no interest in the renaissance of learning; with their elimination the old tradition was doomed. From this time Irish itself began to slip from its position as the common speech of the country.

Verse. Hardly any correct bardic verse was written in Ireland after 1650, but just as the bards had taken over from the ***filid***, the first professional seers or poets, 500 years before, so new poets took over from the bards. And just as the bardic measures had been in preparation for centuries before they established themselves as canonical, so the song metres that replaced them had existed for centuries among the people. The new poets abandoned the syllable counting by lines with a fixed number of stresses; the stressed vowels rhymed in patterns that might be very simple or, later, bewilderingly intricate, but simple vocalic assonance took the place of earlier rhyme. The language of poetry moved toward that of the people. While they had little patronage, there was at least an increasing supply of paper, so that their works, still barred from the printing press, were able to circulate. The tone of verse throughout the 17th century was of passionate defiance of the new regime. In it is found the first coherent expression of patriotism conceived as devotion to an abstract ideal rather than as loyalty to an individual, but much of the verse represents a mere nostalgia for the past.

Structural changes in poetry

The greatest poet of the song metres was Dáibhidh Ó Bruadair, who still had some patrons. After him the poetic tradition, while remaining subtle in craftsmanship, was preserved only among the common people. But it had real vigour in satire and ***pastourelle,*** and peasant poets maintained the tradition until the end of the 18th century.

Prose. During the 17th century a good deal of prose was produced, mainly antiquarian and of inestimable value today, for the writers drew on sources now lost. The most important is ***Annála Rioghachta Éireann*** ("The Annals of the Four Masters"), a compilation of all available material on the history of Ireland to 1616, directed by Michael O'Clery. Geoffrey Keating, writing dignified, simple prose based on bardic language, produced the first historical (as opposed to annalistic) work in his ***Foras Feasa ar Eirinn*** ("Foundation of Knowledge of Ireland") as well as some fine verse in both old and new metres and two spiritual treatises.

An interesting development in prose style was the satire ***Pairliment Chloinne Tomáis*** ("Parliament of Clan Thomas"). It appears to be by a representative of the bardic order, for it attacked with equal savagery the new ruling class and the native peasantry, using a style close to that of the earlier *crosánacht* but with prose now predominating over verse. It found several imitators, but the old tradition was by this time too attenuated for so aristocratic an attitude to be maintained. The imaginative prose was of a more popular kind; it consisted of developments of the Fenian themes or of romances in which themes from Irish and foreign medieval literature were mingled with folklore and ***fabliau*** (short metrical tale) elements. As in the case of the song metres, these romances had a considerable tradition before they appeared in writing. Nevertheless, the public was growing apathetic and less able to read Irish, so there was little real hope for prose production.

AMERICAN LITERATURE IN THE 17TH CENTURY

American literature at first was naturally a colonial literature, by authors who were Englishmen and who thought and wrote as such. John Smith, a soldier of fortune, is credited with initiating American literature. His chief books included ***A True Relation of . . . Virginia . . .*** (1608) and ***The generall Historie of Virginia, New England, and the Summer Isles*** (1624). Although these volumes often glorified their author, they were avowedly written to explain colonizing opportunities to Englishmen. In time, each colony was similarly described: Daniel Denton's ***Brief Description of New York*** (1670), William Penn's ***Brief Account of the Province of Pennsylvania*** (1682), and Thomas Ashe's ***Carolina*** (1682) were only a few of many works praising America as a land of economic promise for English colonists.

Such writers acknowledged British allegiance, but others stressed the differences of opinion that spurred the colonists to leave their homeland. More important, they argued questions of government involving the relationship between church and state. The attitude that most authors attacked was jauntily set forth by Nathaniel Ward of Massachusetts Bay in ***The Simple Cobler of Aggawam in America*** (1647). Ward amusingly defended the status quo and railed at colonists who sponsored newfangled notions. A variety of counter-arguments to such a conservative view were published. John Winthrop's ***Journal*** (written 1630–49) told sympathetically of the attempt of Massachusetts Bay Colony to form a theocracy—a state with God at its head and with its laws based upon the Bible. Later defenders of the theocratic ideal were Increase Mather and his son Cotton. William Bradford's ***History of Plymouth Plantation*** (through 1646) showed how his pilgrim Separatists broke completely with Anglicanism. Even more radical than Bradford was Roger Williams, who, in a series of controversial pamphlets, advocated not only the separation of church and state but also the vesting of power in the people and the tolerance of different religious beliefs.

Theocratic writings

The utilitarian writings of the 17th century included many sorts—biographies, treatises, accounts of voyages, and sermons. There were few achievements in drama or fiction, since there was a widespread prejudice against these forms, but more in the field of poetry. Bad but popular poetry appeared in the ***Bay Psalm Book*** of 1640 and in Michael Wigglesworth's summary in doggerel verse of Calvinistic belief, ***The Day of Doom*** (1662). There was some poetry, at least, of a higher order. Anne Bradstreet of Massachusetts wrote some lyrics published in ***The Tenth Muse*** (1650), which movingly conveyed her feelings concerning religion and her family. Ranked still higher by modern critics is a poet whose works were not discovered and published until 1939: Edward Taylor, an English-born minister and physician who lived in Boston and Westfield, Massachusetts. Less touched by gloom than the typical Puritan, Taylor wrote lyrics that showed his delight in Christian belief and experience.

The poet Edward Taylor

All 17th-century American writings were in the manner of British writings of the same period. John Smith wrote in the tradition of geographical literature, Bradford echoed the cadences of the King James Bible, while the Mathers and Roger Williams wrote bejewelled prose typical of the day. Anne Bradstreet's poetic style derived from a long line of British poets, including Spenser and Sydney, while Taylor was in the tradition of such Metaphysical poets as George Herbert and John Donne. Both the content and form of the literature of this first century in America were thus markedly English.

FRENCH LITERATURE IN THE 17TH CENTURY

For many readers, the 17th century is still the central and supreme period of French literature, but the attempt to characterize it or distinguish its main movements and limits is a complex task. The death of one great king (Henry IV) in 1610 and of another (Louis XIV) in 1715 provide convenient points for a beginning and end (though the period after 1685, the date of the revocation of the Edict of Nantes, can also be regarded as one of transition to the 18th century), but it was not the kings who were decisive influences in creative writing or even in establishing the type of society in which writers lived. Royal encouragement was only one among many influences: of greater importance were economic prosperity, the leisure of a rising middle class, fashion in reading, and, perhaps most of all, an absence of long-continued civil or foreign war.

The example of Malherbe

The first half of the century. ***Poetry and prose.*** French society in the 17th century had not achieved stability; it was energetic and unregulated, and death and personal violence were intrusive. The polish and elegance of poems and novels were escapes from anarchy and reflected a desire for stability in a changing world. This was especially true of the early years of the century. A virtual end of civil war in 1598 and a return to peaceful conditions were shown by the appearance of collections of verse in which the poetry was carefully defined and restrained. This tendency was embodied in an individual, François de Malherbe, who from 1605 worked in Paris, enjoyed royal support, and became increasingly appreciated. Nicolas Boileau rejoiced that at last there had appeared a French poet who satisfied the modern taste for regular and smooth verse—a fair picture of what most Frenchmen in the 17th century thought Malherbe had accomplished. In addition to Malherbe's imitators and disciples, the generation born around 1590 produced a number of poets of distinction who all inclined to free thought: a nature poet, Thhophile de Viau; a dramatist and literary agent of Richelieu, François de Boisrobert; and Girard de Saint-Amant, best known in his own days as author of a biblical epic, ***Moïse sauvk*** ("Moses Delivered"). The last of these continued to write throughout the 1630s, when the most popular name was that of Vincent Voiture, a writer of social verse and a leading light of the salon of the Hôtel de Rambouillet (see below).

The poetic language of 1630 was probably more varied and interesting than it seems now and included even a metaphysical element in the religious poets Jean de Sponde and Jean de La Ceppbde, whose poetry had a personal force rarely found in classical verse, and a satirical movement, found chiefly in Mathurin Régnier, who, like many poets of the period, was esteemed more in his own time than today.

The new poetry appealed to a smaller circle, however, than did the new fiction, especially when a brilliant writer emerged in Honor6 d'Urfé, whose ***Astrée*** (1607–27; ***Astrea,*** 1657–58) was more than just a fashionable success. Many of Urfé's characters were for many generations what those of Scott or Dickens were for Victorian England, and his work inspired a host of imitators at home and abroad.

The acadkmies and salons. The literary activity of the time was not confined to the production of verse and novels: under Louis XIII small groups of people, spoken of as ***académies*** or salons, developed a taste for literary discussion. According to recent research, ***acadkmies*** were of two types: the first, a 16th-century development of centres of learned discussion for men; the second, scientific societies concerned with new knowledge and experiments. One of the ***acadkmies*** was taken over by Richelieu and became the Acadhmie Française. The salons were more general social and literary assemblies, an invention of the Renaissance that played a fluctuating part in French life until the 19th century. In many cases, notably that of the Hôtel de Rambouillet, presided over by Catherine de Vivonne, marquise de Rambouillet, their function was simply to provide a friendly meeting ground for upper class persons interested in talk and manners.

As well as the presiding figure, usually a fashionable woman such as Mme des Loges, the salons tended to have one major literary figure: in the case of that of Mme des Loges, this was Guez de Balzac, a keen critic and a master of expression, whose letters and literary quarrels gave him a great reputation. Another critic, Claude Favre de Vaugelas, acquired great authority in discussions of language; his ***Remarques sur la langue françoise*** (1647) became famous as a plea for intelligent usage. Most of these critics were possibly more successful than they knew in creating a standard of literary taste and in making the French language a supple intrument of expression.

The influence of Descartes

The ***académies*** that undertook scientific research were all influenced by or in some way associated with the great philosopher and mathematician René Descartes (1596–1650), whose influence seems to have pervaded the entire century. His views on vortices, doubt, innate ideas, or proofs of God were not, it would seem, accepted widely or for very long. It seems rather to have been his cast of mind and temper that suggested a new attack on old problems, a new way of thinking and arguing. His vision of science leading to mastery of nature found expression in the final section of the ***Discours de la mkthode*** (1637; ***Discourse on Method,*** 1950). His effect on the way intellectuals thought was summarized by one of his followers: "Before Descartes argument was easier; past ages are fortunate not to have known him" (Bernard de Fontenelle).

The theatre. Another prominent feature in the first half of the century was a rise in prestige of the Parisian theatre. It is hard to say where the new vigour and skill came from. In 1625 there was still only one licensed theatre in Paris. A dramatist of talent, Alexandre Hardy wrote about 600 plays that offered both Renaissance pathos and real dramatic suspense. Gradually the whole public attitude to the theatre changed; it became a polite entertainment, and, as with so many other social habits, this was partly caused by the active encouragement of Louis XIII's chief minister, Cardinal de Richelieu. A new generation of authors appeared: Jean Mairet, who appeared at a decisive moment, was to achieve most. His ***Sylvanire*** (performed 1630) was the first successful "new" play using the Italian convention of the unities of time, place, and action and thereby concentrating the action within strict limits. Other young dramatists, notably Boisrobert, in ***Pyrande et Zisimène*** (1633), and the great Pierre Corneille, in ***Clitandre*** (1630–31), showed how the new fashion could admit the adventures that the public wanted. Some resisted the new style, but eventually fresh new talent appeared with Jean de Rotrou's ***Hercule mourant*** ("Hercules Dying") and Jean Mairet's ***Sophonisbe*** (both 1634 or 1635). Corneille's famous ***Cid*** (1637) was therefore part of a movement and at first indistinguishable from the rest.

Corneille and the Classical theatre

The great success of ***Le Cid*** and the famous polemic connected with it (which used to be attributed to the jealousy of Richelieu but seems rather to have been caused by the vanity of Corneille) have caused the play to be seen in a false perspective. ***Le Cid*** is not the solitary emergence of French Classicism; it is simply a brilliant play. In a sense it was what followed that demonstrated its greatness. Corneille took three years over his next play, ***Horace*** (1640), a work of great dramatic power. Corneille used the Roman historian Livy's famous story of the Horatii and the Curiatii to give force to a tragic split within a family between patriot and pacifist. With incredible inventiveness he produced three plays of similar brilliance within a few years: ***Cinna*** (1640 or 1641), a drama of political conspiracy; ***Polyeucte*** (1641 or 1642), the social tragedy of a Christian martyr; and ***Rodogune*** (1644 or 1645), a powerful study of a virago. Thus, by supplying a body of plays that were treated within a generation as classics, Corneille almost singlehandedly created the French Classical theatre. Rotrou, in ***Le Véritable Saint Genest*** (1645 or 1646), wrote a martyr play as interesting as ***Polyeucte*** and, in ***Venceslas*** (1647), a tragedy of politics; he adapted Plautus in ***Les Sosies*** ("The Doubles") and Lope de Vega in ***Laure persécutée.*** Thus at the death of Richelieu (1642), France seemed to be in full literary revival with an abundance of talent, a new public, and a rapidly forming tradition.

The classical period. The civil war known as the Fronde (1648–53) cuts the century in two, sociologically no less than by date. There is no clear evolution from the best literature of the 1640s to the classicism of the 1660s. Certain features persisted, but there was a change of attitude. The war left its mark on the middle classes, which supplied the authors and most of the reading public; it left the writers, and no doubt their readers, more sophisticated, more cynical, less inclined for heroics. It should be remembered that there was no recognized profession of letters; writers lived by patronage, and the Fronde produced a new type of patron. Both Boileau and Molitre started their careers as hack writers for Louis XIV's chief minister, Nicolas Fouquet, and it was Fouquet who induced Corneille to return to the theatre and attempt a version of the chief tragic theme of antiquity, the Oedipus story. ***Oedipe,*** Corneille's first play since ***Pertharite*** (1652), was played in 1659.

Pascal's ***Pense'es***

Blaise Pascal, the greatest mind of the age, wrote within the orbit of the Jansenist religious movement—a movement that never succeeded in overcoming the King's suspicion that it was subversive. The new spirit is clearly seen in the series of pamphlets written by Pascal known as ***Les Provinciales*** (1656–57). Here, used to brilliant effect, are all the novelties of Guez de Balzac, with a relevance, force, and polemic gift that he could not command. Pascal devoted his last energies to planning an apology for the Christian religion. It got no further than the plan and a mass of partly arranged fragments, but, known as the ***Pense'es (Thoughts),*** these formed the most profound work of French Classicism. They influenced later thinkers even more than they impressed the first readers of 1670. Left in note form, and with the vigour, even violence, of expression that seems to have been natural to Pascal, this was the only French Classical work to have survived in its primitive state—a marvel of compression and annotation.

The new realism appeared in the plays of the poet and wit Paul Scarron and the later volumes of the novels of Madeleine de Scudéry. The existence of a public alive to intellectual subtleties allowed Molière to bring his theatrical company back to Paris and to introduce to a royal audience, after a performance of Corneille's tragedy *Nicomède,* an entertainment of his own that was a prelude to 15 years of intense dramatic activity, the results of which are now called Classical comedy.

It was the same spirit that animated a great work unpublished during the 17th century: the ***Me'moires*** (published 1717) of Jean-François-Paul de Gondi, cardinal de Retz. One of the chief participants in the Fronde, he embodied its spirit in these caustic and brilliant pages. Retz could brilliantly convey an awareness of things and an uninhibited attitude to human behaviour. This quality was outstanding, too, in the collection of epigrams, known as the ***Maximes,*** published in 1665 by the moralist La Rochefoucauld. These mordant and brilliant epigrams offer, within a severely classical form, a pitiless analysis of the characteristics of his time—the self-seeking attitude to morality, the cynical pessimism, and the discovery of what is now called the subconscious. They attacked individualism, idealism, stoicism, and intellectualism with wit and force.

Classical works of the 1660s and early 1670s. These years have some claim to be the most creative decade in the history of French literature. Moiltre's first attempt at a five-act comedy, *L'École des femmes* (1662; ***School for Wives,*** published 1948), aroused a controversy as animated as that of ***Le Cid.*** Boileau's first satires and the ***Maximes*** circulated about the same time. Jean Racine's first masterpiece, ***Andromaque,*** appeared in 1667, and Jean de La Fontaine's first collection of ***Fables*** in 1668. All these were distinguished by a new sense of the dignity of the language, by powerful imagination devising new forms for literary communication, and by an intellectual ability to renew the commonplace and the ordinary.

The comedy of Molibre

There was apparently no intention to create "Classical" works and very little collusion among the creators. The emergence of this body of great writing after 1660 has never been explained. It is possible to trace the course of a slow apprenticeship in each of the writers, but they did not belong to a single generation. The most impressive talent to watch at work in the 1660s and early 1670s is probably that of Molibre. Modern research has shown that he was, in fact, fighting to keep a dramatic company on its feet and that when he began writing his main concern was to fill a blank in its repertory; it was only when the public unmistakably favoured his own pieces that he assumed his full creative role. It seems that he succeeded best with his occasional shorter plays, such as ***Le*** *Médecin malgré lui* ***(The Doctor in Spite of Himself)*** and ***Le Bourgeois gentilhomrne (The Prodigious Snob).*** He spent much time on ***Le Misanthrope (The Misanthrope)*** and *L'Avare* ***(The Miser),*** where the success was short-lived, and on ***Tartuffe,***which took him five years to put on the stage. But to watch, in retrospect, the way his plays mount in range and intensity gives one some idea of what it meant at that time to run a Paris theatre and supply it with plays. In the season of 1666 Molitre wrote five new plays for his company; six years later, in 1671, the company put on 15 of his plays, three of which were new. Fame came to him fairly soon, but he appears to have had neither leisure to write nor freedom from financial worry; as late as 1669 the company was saved from collapse only by the fantastic success of ***Tartuffe.*** Most of the plays were hurriedly composed to please a discriminating public. Yet this haste devised characters of astonishing comic force, compared with which all previous French comedy looks fumbling and feeble. As Voltaire said: "Molitre has created comedy from chaos."

One of the neglected features of French Classical literature is its poetry. Nicolas Boileau, in the famous ***Art*** *poétique* of 1674 and in his epistles and satires, handled certain styles with entire mastery: puns, rhymes, paradox, topical allusion, all are easily and forcefully expressed. Each of his works was an experiment and there can be few poets who have exercised influence in such different directions.

The poet and scholar Jean de La Fontaine commanded a greater range of both irony and fantasy than did Boileau. Steeped in the ancient poets, he added his own distinctive and imaginative expression to his works. The delight given by the ***Fables*** cannot be accounted for otherwise than by their poetic renewal of the details of common life and by the relationship of the author to such material.

Racine's tragedies

Apart from these two poets the real achievements of Classical poetry in these years were in tragedy. What the great tragedian Jean Racine achieved was no doubt due to the competition of many authors now forgotten—not only, as is so often claimed, to that of Corneille. They, no less than he, attempted to recover the ancient Greek themes in ballet, opera, and tragedy. But Racine's recoveries of ancient tragic suspense and emotion were impressive, not least by their frequency. Several good judges think that his first success, ***Andromaque,*** was never surpassed. The limits of concentration would seem to have been reached in *Bérénice,* which confined the tragic subject to the farewell of a queen to two lovers and to the poignant opposition of public and private interests. Yet in 1672 Racine produced a profound study of primitive violence in *Bajazet,* to be followed a year later by ***Mithridate,*** where an equally violent character was opposed by one of great integrity. *Iphigénie* (1674) and ***Phèdre*** (1677) show an intentional return to themes where gods and men form a more complex symbolism. In the supreme achievements of ***Phèdre*** many have seen the classic 17th-century statement of the tragic gulf between passion and purity. The final irony of this unique career was that after a silence of 20 years he wrote for a girl's school two biblical plays that have evoked as much admiration as any of the others ***(Esther*** [1689] and *Athalie* [1691]).

Writings of churchmen. Although the role of the church in 17th-century life was immense, its contribution to literature was very limited; but no fair account of writing of this time can omit two great ecclesiastical figures who were colourful, contrasting personalities, Jacques Bossuet and François de la Mothe Fénelon. Bossuet, older than Fénelon by 24 years, was an orator and bishop in a traditional mold—a man of integrity, intelligence, and fabulous industry. Though most of the ideas he defended came to be rapidly discredited, he is always readable, always direct, forceful, and capable at any moment of sustained beauty of language. His funeral orations, such as that on Queen Henrietta Maria in 1669, have been unjustly called "false masterpieces"; Bossuet recovered for the church what in ancient times was the distinction of statesmen and lawyers—the power to express in noble language the praise of the dead. His attempts to show the plan of universal history in his ***Discours sur l'histoire universelle*** or to refute the Protestants and Quietists are now seen to be the weakest part of his work. He was so wedded to the hierarchical and orthodox view of things that he condemned all independent thought and even defined a heretic as "anyone who holds an opinion." But his expositions of religion remain unsurpassed.

By contrast, Fénelon, the temperamental opposite of Bossuet, was able to see both sides and to convince each that he was of their view. (His work and that of other churchmen of the end of the century is treated under *French* ***literature in*** *the* ***18th century,*** below, as representative of a period of transition.)

Women in the literary world. One mark of this period was the success of women in the literary world, both in fostering the discussion of literature and as writers, though as the latter they had to use pseudonyms. The greatest woman writer of the time, the Marquise de Sévigné, did not publish anything at all, but her ***Letters*** to her daughter in Provence made hers one of the great names of French culture. Intelligence, wit, imagination, argument, and temper were displayed, as in Pascal's notes, with an abandon that intended publication would have ruined, and she conveyed aspects of her time that no precise documentary evidence could suggest.

Her friend Mme de La Fayette, a more careful and a more limited artist, was the author of a single masterpiece, ***La Princesse*** *de Clèves* (1678). This novel's psychology and restrained pathos make it as impressive to read as a tragedy by Racine.

The satire of La Bruyhre. Jean de La Bruyère is a lonely figure in literary history. Yet he wrote in the popular tradition of satirical moralizing, and he was chiefly responsible for the fact that his contemporaries are forgotten—his portraits seem more alive than their models.

He sheltered his reflections at first behind a translation of the "characters" of Theophrastus (1688), but his pen pictures proved such a success that he greatly increased his book in later editions; keys to the characters, claiming to say who was meant by each satiric portrait, were circulated.

Les Caractères of La Bruyère

It was not primarily as satirical portraiture that ***Les Caructbres*** won the later admiration of Gustave Flaubert and the Goncourts; they praised La Bruyère as a stylist. His biting sketches of French upper class immorality, of the effects of money and fashion, of human vanity and social climbing took many forms, from the epigram to the rudimentary short story.

La Bruyère is the youngest of a group of writers that modern research has not made easier to describe or sum up. The old conception of them as illustrating Cartesian notions of literature under the chairmanship of Boileau has had to be abandoned, and with it what used to be called "the Decline of the Age of Louis XIV." As the king got older, times certainly got harder; society and, by inference, letters give the impression of decline. But that is not so in kindred fields: in scholarship, in ideas, in science, in polemic. The readers of Fontenelle and Pierre Bayle were as intelligent and as well versed as were those of Corneille and Pascal. The artistic vigour of the middle years may seem to have abated, but this is to say no more than that one or two of the supreme artists are now missing. But the duc de Saint-Simon continued to write, and, thanks to the secrecy in which he composed his memoirs, we are able to read pages of unexampled vigour and power.

The Anciens and Modernes. The dispute between those who maintained that the classics were the only models for good literature (the Anciens) and those who challenged the supremacy of classical writers and recommended subjects from romance legends and the Bible (the Modernes) was a major feature of French literature during the 17th century from about 1659.

Of the main writers of the period, Boileau was supported by La Fontaine and La Bruyère, and Charles Perrault chiefly by Fontenelle. Eventually and inevitably the controversy waned, but not before the bitter exchanges ended with Boileau's apology to Perrault in 1700, recognizing the virtues of the 17th century as equal in some ways to those of antiquity. The influence of the quarrel was felt in England, chiefly in inspiring Jonathan Swift to write his "Battle of the Books" in 1704.

Provençal. In Gascony, an entire school developed after Pey de Garros, of which Guillaume Ader, author of an admirable poem on Henry IV ***(Lou Gentilorne*** *gascoun*, 1610), is the chief representative. But the most conspicuous among the poets of the south during this period was certainly Pierre Goudelin of Toulouse, "the Malherbe of Oc," who, had he written in French, would have ranked with the best poets of the period. Nicolas Saboly excelled in the popular form known as the ***noel.***

Other 17th-century Provençal writers worth mentioning are the playwrights Claude Brueys, remarkable chiefly for comedies, and Gaspar Zerbin. The *avocat* ("barrister") Bonnet, author of the best among the open-air plays that were annually performed at Béziers on Ascension Day, the *Jugement de* ***Paris,*** and Nicolas Fizes of Frontignan, author of the vaudeville ***Opéra de Frontig****nan* (1679). both show real literary gifts.

A number of Toulouse poets, mostly from the academy, may be termed followers of Goudelin, and the classical revival that may be noted about this time is also generally ascribed to Goudelin's influence. Its most distinguished representative was Jean de Vales of Montech, who translated and wrote a brilliant burlesque of the ancient Roman poet Virgil. The best of the pastoral poets was François de Cortète of Prades, whose comedies, *Ramounet* and ***Miramoundo*** (published 1684), were written with such true feeling and in so pure a style that they can still be read with pleasure.

Walloon. At the beginning of the 17th century, Wallonia—particularly the district of Liège—became conscious of the literary possibilities of dialect, and from then on the number of writings increased. An "Ode" in the Liege dialect appeared in 1620, and *pasquèyes* (*paskeyes*, *paskeilles*), poems describing local life and history, enjoyed a vogue.

GERMAN LITERATURE IN THE 17TH CENTURY

German 17th-century literature, widely known as Baroque literature, was a product of the times and of the social situation in Germany. Ushered in against a background of witch burning, religious strife, social and political uncertainty, the early period was dominated by the Thirty Years' War and the shadow it cast over life. The local context was one of princely absolutism, each ruler emulating Louis XIV's court of Versailles and champions of the Reformation struggling against supporters of the Counter-Reformation. The new scientific discoveries were set in a society overshadowed by the influence of Luther, Machiavelli, Petrarch, and the Renaissance figures of the preceding century.

The affinities of the 20th-century situation with that of the 17th century, together with the modern rejection of concepts of the importance of confessional elements in literature (an inheritance of the great German 18th-century writer Goethe), account for modern appreciation of Baroque literature. It is dominated by writers who were guided by a sense of occasion rather than by the value of experience. They did not express themselves subjectively but used a medium of conventional images and strict formal patterns that heightened the emotional tensions of the themes. The themes were those common to European literature of the period and appeared in the lyric, epic, and drama: "fickle fortune" presides over a world ruled by chance, worldly pleasures are illusory, and man's duty is to fulfill his actor's role on the stage of life. Baroque literature presented these roles as examples of how man may escape the toils of fortune and cheat time: the martyr scorns the world and aspires to eternity, the statesman uses the present to his advantage, the stoic endures steadfastly, the hermit flees, while the pastoral figures escape to make-believe and the mystic seeks union with God. The writers themselves secured relative immortality through their work.

Martin Opitz's influence

Lyric poetry. Lyric poetry quickly reached a high standard, particularly in areas where poets congregated, such as at Heidelberg, Niirnberg, and Konigsberg and in Silesia. In critical works such as the *Buch von der deutschen Poeterey* (1624; "Book on German Poetry"), Martin Opitz demonstrated an elevated literary style in German, formulated rules such as the observance of stress in lines, and made other introductions and suggestions that he further demonstrated in his own poetry. His contemporaries quickly adopted his ideas, and thus Opitz had an important formative influence on later and superior poets such as Georg Weckherlin and Paul Fleming.

Given the basic similarity of many of its themes, the variety of Baroque verse is surprising. Paul Fleming's love poems and sonnets revealed emotional depth and lyric power, Andreas Gryphius was simultaneously pessimistic and religious, while formal dexterity in the patriotic poet and novelist Philipp von Zesen and verbal exuberance in the nature poetry of Johann Klaj illustrated an urge to experiment, often with an effect of creative spontaneity. Baroque poets wear masks: Gryphius regally expressed the existential problems of the day; Christian von Hofmannswaldau was a virtuoso of form who was intellectually flamboyant or soberly sincere according to his theme. In an age concerned with ultimate values, poets wrote both secular and religious verse, and in both this variety was present. The outstanding Lutheran poet Paul Gerhardt wrote hymns of quiet simplicity and warmth, the Jesuit Friedrich von Spee wrote religious pastoral lyrics, while Quirinus Kuhlmann was a mystic visionary.

The intellectual temper of the age found admirable expression in the epigram, which was developed to a fine art by Daniel Czepko, Angelus Silesius, and Friedrich von Logau. The variety of Baroque lyric poetry was matched by its volume. The surprising thing is that it maintained the high standard it did.

Drama. In the first half of the century, vernacular drama was relatively uninspired. Heinrich Julius, duke of Brunswick, introduced plays that reflect the influence of English players—revealing how backward the language of vernacular drama was. Later, with Daniel Caspar von Lohenstein, a dichotomy between excess of feeling and acuteness of intellectual perception was expressed in full-blown rhetoric, and there were two notable dramatists—Jakob Bidermann and Gryphius. Bidermann was a successful Jesuit who dealt with themes of mutability, worldly vanity, and the urgency of salvation with great dramatic effectiveness. Gryphius' tragedies and comedies dealt with stoicism and personal integrity. His work was literary rather than popular and so had little permanent influence, despite its artistic merit. The increasing popular masques, ballets, and operas were to lay the foundations of the later, very different drama of Germany.

The achievement of *Simplicissimus*

The novel. The development of the novel was considerably influenced by Spanish, French, and neo-Latin sources. A host of foreign translations followed the appearance of that of Mateo Alemán's *Guzmán de Alfarache* in 1615. Many were large, diffuse works, amalgams of moral and didactic elements with fantasy and amusement designed to satisfy the thirst for knowledge of the times. Some read like formal exercises in a particular form, but two writers stood out: Johann Beer (1655–1700), who foreshadowed 18th-century realism, and H.J.C. von Grimmelshausen, whose *Abentheuerliche Simplicissimus Teutsch* (1668–69; *The Adventurous Simplicissimus,* 1912) was one of the great novels of German literature, incorporating the principal themes of the age with metaphysical depth and religious insight.

Philosophy and criticism. The Silesian mystic Jakob Bohme was outstanding as an original and influential philosopher whose doctrines inspired several religious separatist movements. G.W. Leibniz's achievements in philosophy summed up the age and pointed toward the literature of the 18th century, when Baroque was to be rejected until its rediscovery in the 20th century.

DUTCH LITERATURE IN THE 17TH CENTURY

The Spanish hold on the Catholic south of the Netherlands during and after the Eighty Years' War (1568–1648) caused a decline in Brabant and Flanders; by contrast there was a spectacular expansion in Holland, to which artists, intellectuals, and financiers had fled from the Spanish armies. The rise of Amsterdam and The Hague as emergent capitals of an empire and the birth of civic pride in the writers of the "Golden Age" symbolize the final passing of a medieval age belonging to Ghent, Bruges, Liège, and Antwerp.

Henric Laurenszoon Spieghel was the greatest of a generation straddling the old and the new, and he wrote for both the burgher and the scholar. His *Nieu jaar liedekens* ("New Year Songs") and *Lieden op 't Vader Ons* ("Songs on the Lord's Prayer") continued a medieval tradition in a Renaissance style echoing Erasmian moderation; at the same time his learned *Twe-spraack vande Nederduitsche letterkunst* (1584, "Dialogue on Dutch Literature") was intended to popularize the use of a national language. His most scholarly work, the unfinished *Hert-spieghel* (1614, "Mirror of the Heart"), was particularly abstruse because it was a first attempt at philosophizing in the vernacular and in poetry.

The dichotomy inherent in the Renaissance—between popular religious revival and Humanism—was particularly marked in Holland because of the incompatibility of Calvinistic principles with the ideals of pagan antiquity. This caused a tense ambivalence in many writers of the 17th century who took both their religion and art seriously. Daniel Heinsius, a celebrated Humanist at the University of Leiden, wrote Latin plays, but he also added to the vernacular by writing *Hymnus oft lof-sanck van Bacchus* (1614; "Hymn in Praise of Bacchus") and an equally devout *Lof-sanck van Jesus Christus* (1615).

A poet, playwright, and painter, Gerbrand Adriaenszoon Bredero took his material from the life of the commoner; his medium was the folk song, farce, or comedy. His secular songs in medieval style and devotional songs in Renaissance verse told of a passionate devotion to women and yearning for religious moderation. His three tragicomedies were not successful, and he wrote three farces that marked the zenith of the medieval genre, but it was contemporary life in Amsterdam that provided material for his two comedies, including his masterpiece, *De Spaanschen Brabander* (performed 1617).

Amsterdam was also the home of the poet and dramatist Joost van den Vondel. Like Bredero, he was a self-educated man, and he resolved the conflict between artistic and religious leanings only when he entered the Roman Catholic Church at the age of 54. This was a courageous act of faith at a time when Catholics formed an unpopular minority. It is a measure of Vondel's indomitable personality that his attitude toward contemporary people and events, of which he was a fearless chronicler, still prevails even when history has recorded a different view. His plays, however, are too austere to find favor now, although in his Sophoclean *Jeptha* (1659) and in his Baroque masterpieces, *Lucifer* (1654) and *Adam in ballingschap* (1664; *Adam in Exile,* 1952), he was as great an artist of the Counter-Reformation as his contemporary, the Flemish painter Rubens.

Italian Baroque influence

If Bredero was the noble commoner and Vondel the noble citizen, Pieter Corneliszoon Hooft was certainly the noble "aristocrat." He was one of a fortunate few in Holland to bring the refinements of the new art direct from Italy. He lavished an Italianate flourish alike on his sonnets, his plays, on the studied prose of his letters, and on a monumental unfinished history of the war against Spain. His castle at Muyden became a centre for the entertainment of artists and scholars attracted by mutual interest in poetry, music, and learning and by the charm of such gifted young women as the Roemer Visscher daughters.

Anna Visscher in verse, like her father Roemer in prose, popularized ethics in the manner that was to bring Jacob Cats such unmerited fame. Cats's prolix moralizing, pedestrian doggerel, and patronizing tone force their way into the literature of his country if only because of the disastrous influence they had on the taste of the middle classes.

A more harmonious individual, Constantijn Huygens had all the qualities to which the Dutchman of his day might aspire. Of strict Calvinist principles, he was an able diplomat who wrote trenchant, shrewd, and witty verse and made excellent translations of John Donne's poetry.

There were also five poets, three of whom were clerics, who contributed religious verse of considerable merit. The Roman Catholic Joannes Stalpaert van der Wiele's ***Den schat der geestelycke lofsangen*** (1634; "The Treasury of Devotional Praise") contained songs of medieval simplicity and devotion. Jacobus Revius, stern poet of Calvinist orthodoxy, was a master of the Renaissance forms and the sonnet, using them to express the vigour and sincerity of his dogmatism. By a strange fate Revius, teaching the faith of many in a language they could understand, was almost unread, whereas Dirk Rafaelsz Camphuysen, who was removed from his parish because of his unorthodoxy, satisfied a widespread demand for personal, devotional poetry in ***Stichtelycke rymen*** (1624; "Edifying Poems"). Equally popular were the introspective collections of mystical poetry by the ascetic Jan Luyken, a layman who had started by writing hedonistic songs in ***De Duytse lier*** (1671; "The Dutch Lyre"), containing fine love lyrics. The last important poet and playwright of the Baroque period was a Fleming, Michiel de Swaen, whose religiously inspired verse compares favourably with that of most writers of the time. In general, however, the decline that had set in earlier in the south became noticeable throughout Dutch literature of the late 17th century.

ITALIAN LITERATURE IN THE 17TH CENTURY

The 17th century in Italian literature is usually described as a period of "decadence" in which writers who were devoid of sentiment resorted to exaggeration and tried to cloak an utter poverty of matter beneath an exuberance of form. In this period, it is said, freedom of thought was fettered by the Accademia della Crusca of Florence (the aim of which was to maintain the purity of the Tuscan tongue), the Counter-Reformation, and the political supremacy of Spain. This was not, however, simply an Italian phenomenon. It was at this time that "Gongorism" (the ingenious, metaphorical style of the poet Luis de Gdngora) flourished in Spain and the witty, figurative verse of the Metaphysical poets in England. Far from being exhausted, indeed, this was an extremely vital period, so much so that a new and more comprehensive understanding of the literature of the Italian Baroque has been formulated by scholars conversant with the changing attitude toward this phase of civilization in Germany, France, and England.

Poetry and prose. The popularity of satire was a reaction against prevailing conditions. Prominent in this genre was Salvator Rosa, who attacked in seven satires the vices and shortcomings of the age. Alessandro Tassoni acquired great fame with La ***secchia rapita*** (1622; ***La Secchia Rapita; or, The Rape of the Bucket,*** 1825), a mock-heroic poem that is both an epic and a personal satire. The greatest poet of the period was Tommaso Campanella, a Dominican friar, less well-known for his rough-hewn, philosophical verses than for the ***Città del sole*** (1602; ***Campanella's City of the Sun,*** 1885), a vision of political utopia, in which he advocated the uniting of humanity under a theocracy based on natural religion.

The influence of Marino

The principal representative of Italian writing during this period was Giambattista Marino, author of a large collection of lyric verse (***La lira*** [1608–14; "The Lyre"] and La ***sampogna*** [1620; "The Syrinx"]), and a long mythological poem, ***Adone*** (1623). Marino derived inspiration from the poetry of the late 16th century, but his aim—typical of his age—was to excite wonder by novelty. His work is characterized by "conceits" of fantastic ingenuity, far-fetched metaphor, sensuality, extreme facility, and a superb technical skill. His imitators were innumerable, and most 17th-century Italian poets were influenced by his work.

Gabriello Chiabrera, more sober in style than Marino, was successful in imitating the metres of classical poetry (especially of the Greek Pindar) and excelled in the composition of musical ***canzonette*** (short lyrical verses). Toward the end of the century a patriotic sonneteer, Vincenzo da Filicaia, and Alessandro Guidi, who wrote exalted odes, were hailed as major poets, though Guidi's verse is now seen as little more than rhetoric.

Among prose writers the satirist Traiano Boccalini stood out with ***Ragguagli di Parnaso*** (1612–13; ***Advertisements from Parnassus,*** 1656) in the fight against Spanish domination. A history of the Council of Trent (which defined Catholic doctrines in reaction to the Reformation) was written by Paolo Sarpi—advocate of the liberty of the Venetian state against papal interference—and a history of the rising of the Low Countries against Spain by Guido Bentivoglio. The Venetian novels of Girolamo Brusoni are still of interest, as are the travels of Pietro della Valle and the tales of Giambattista Basile. All the restless energy of this period reached its climax in the work of Galileo, a scientist who laid the foundations of mathematical philosophy and earned a prominent place in the history of Italian literature through the vigour and clarity of his prose.

The **music drama; Accademia dell'Arcadia.** With the rise of the music drama and the opera, Italian authors worked to an increasing extent with the lyric stage. Librettos written by poets such as Ottavio Rinuccini were planned with dramatic and musical artistry. During the 17th century a popular spirit entered the opera houses: intermezzi (short dramatic or musical light entertainments) were required between the acts; this practice undermined the dramatic unity of the performance as a whole, and toward the end of the century every vestige of theatrical propriety was abandoned. The spread of Marino's influence was felt by many to be an abuse. In 1690 the Accademia dell'Arcadia was founded in Rome for the express purpose of eradicating "bad taste." The purpose of Arcadia was in tune with a genuinely felt need. Many of its members were rationalist followers of Descartes with severe classical sympathies, but their reaction consisted mainly in imitating the simplicity of the nymphs and shepherds who were supposed to have lived in the golden age. Thus a new artifice replaced an old one: extreme sophistication and a flight from reality took the place of bombast and rhetoric. Typical exponents of the Arcadian lyric were Giovan Mario Crescimbeni, a founder member of Arcadia, Faustina and Giambattista Zappi, Paolo Rolli, and Pietro Metastasio, the 18th-century reformer of the operatic libretto.

SPANISH LITERATURE IN THE 17TH CENTURY

In poetry and prose the early 17th century in Spain was marked by the rise and spread of two interrelated stylistic movements. That known as ***culteranismo,*** the high-flown style of which Luis de Gdngora y Argote was archpriest, resumed attempts to ennoble the language by re-Latinizing it. This process was not only carried to extremes in vocabulary, syntax, and word order, but expression was garbed in classical myth and allusion and complicated by every subtlety of metaphor. It was an attempt to achieve a poetry that, if rediscovered after hundreds of years, could be still fresh through the immortality of its Latinism. His example (***Soledades,*** 1613; "Solitudes") invited many untalented imitations. The other stylistic movement, ***conceptismo,*** played on ideas as ***culteranismo*** did on language. Aiming always at the semblance of profundity, the style was concise and epigrammatic and thus belonged to prose, especially satire, since it was much concerned with stripping appearances from reality. Its best outlet was the essay. Francisco Gómez de Quevedo y Villegas, the greatest satirist of his age and one of Spain's masters of language, was, in ***Sueños*** (1627; "Dreams"), an outstanding exponent. Baltasar Gracián y Morales reduced its refinement to an exact code in his ***Agudeza*** y ***arte de ingenio*** ("The Conceit, a Treatise on Style"), as he also tried to codify in a series of treatises the art of living. Gracián was certainly a thinker, and his allegorical novel ***El criticón*** ("The Animadverter"), a pessimistic interpretation of life as a "daily dying," was to influence La Rochefoucauld, Schopenhauer, and Nietzsche.

Pedro Calderón de la Barca spanned the century of Spain's decline, and his drama constituted a studied ex-

Calderón's plays of the Counter-Reformation

pounding of patterns of behaviour or belief. He wrote 80 ***autos sacramentales*** (one-act allegorical plays on the Holy Sacrament), and these, with ***La vida es sueño*** (written 1635; ***Life Is a Dream,*** 1959), ***La devocidn de la cruz*** (*c.* 1625; ***Devotion to the Cross,*** 1961), and ***El mágico prodigioso*** (1637; ***The Wonder-Working Magician,*** 1961), which gave what dramatic tension is possible to a highly intellectualized exposition of Catholic dogma, made him the perfect literary representative of the Counter-Reformation. In the plays about questions of honour, such as ***El mkdico de su honra*** (1635; ***The Surgeon of His Honour,*** 1960), ***A secreto agravio, secreta venganza*** (1635; ***Secret Vengeance for Secret Insult,*** 1961), ***El pintor de su deshonra*** (*c.* 1645; ***The Painter of His Own Dishonour,*** 1906), ***El mayor monstruo los celos*** ("The Greatest Monster, Jealousy"), the cold logic with which an unreal code of behaviour is pursued to the extreme becomes repugnant. ***El alcalde de Zalamea*** (*c.* 1640; ***The Mayor of Zalamea,*** 1958), a reworking of a play by Lope de Vega, was perhaps his most successful play. ***La vida es sueño*** raised profound philosophical issues and gave him great fame abroad. After Calderón's death Spanish drama lay dead for a hundred years. ***Culteranismo*** and ***conceptismo,*** though symptoms rather than causes of decline, played their part in stifling imaginative literature, and by the close of the century little remained of its former greatness.

PORTUGUESE LITERATURE IN THE 17TH CENTURY

The influence of the Spanish poet Góngora

From a literary and political point of view, the 17th century found Portugal in a state of decadence. Before the loss of independence to Spain in 1580, Spanish influence had introduced the Inquisition and, with it, censorship of books and the preparation of an Index of Forbidden Books. Between 1552 and 1555 the Jesuits gained control of higher education. The cult of classical Latin was already present, in the work of Camões and others, before the example of the Spanish poet Luis de Góngora y Argote was felt; but with the exhaustion of the national spirit that underlay political eclipse the influence of Góngora penetrated deeply. Its extent may be seen in the five volumes of the ***Fénix Renascida*** (1716–28; "Phoenix Reborn"), which anthologizes the poetry of the preceding century and reveals the futilities to which good talents could devote themselves. The trend survived the throwing-off of the Spanish yoke in 1640; Portuguese editions of Góngora continued to appear.

The foremost literary figure of the age was the encyclopaedic Francisco Manuel de Melo, a classic of Spanish and—with his series of historical episodes, ***Epanáforas*** de ***Vdria Histdria Portuguesa*** (1660), and dialogues on literary and social topics, ***Apdlogos Dialogais--of*** Portuguese literature who strove, more successfully in prose than in verse, to free himself from subservience to Spanish form and style. Most lyricists of the period remained steeped in Gongorism. Epic poets continued active, but few of their productions were more than rhymed chronicles.

Frei Bernardo de Brito, beginning his ponderous ***Monarquia Lusitana*** (2 parts, 1597, 1609) with the Creation, reached only to the founding of the monarchy. His work was a mass of legends without foundation or critical sense, but here and in the ***Crdnica de Cister*** (1602) he proved himself a great stylist. Frei Antonio Brandão, a man of high intelligence and a learned and conscientious historian, continued the ***Monarquia Lusitana*** from Afonso Henriques to John II and was the best of the four continuers of the work. Frei Luis de Sousa, another monastic chronicler, won fame as a stylist with his ***Vida do Arcebispo D. Frei Bartolomeu dos Mártires*** (1619) and the ***Histdria de São Domingos*** (3 parts, 1623, 1662, 1678). Another notable biography, one of the best known works of the century, was Jacinto Freire de Andrade's ***Vida de Dom João de Castro*** (1651). A Jesuit, António Vieira, missionary and diplomatist and regarded for his ***Cartas*** ("Letters") and ***Sermões*** ("Sermons") as one of the greatest of all writers in Portuguese, repeated his triumphs of Bahia and Lisbon in Rome, which proclaimed him the prince of Catholic orators. Padre Manuel Bernardes, a priest and recluse whose sermons and oratorical works ***Luz e Calor*** ("Light and Warmth"), ***Nova Floresta*** (published 1706–28; "New Forest"), and ***Exercícios Espirituais*** (1686; "Spiritual Exercises") breathed a serenity and naturalness alien to Vieira and exerted a powerful influence in freeing the language from outworn "conceits." Padre Ferreira de Almeida's translation of the Bible had considerable linguistic importance.

The popular theatre lived on obscurely with mostly anonymous plays that were never printed. Those that survived were mainly religious and showed the common Gongoristic abuse of metaphor and simile. All through the century most dramatists who aspired to be heard wrote in Spanish. The court after 1640 preferred Italian opera, French plays, and Spanish operettas—to the detriment alike of native drama and of acting.

LATIN-AMERICAN LITERATURE IN THE 17TH CENTURY

By 1600 the day of the conqueror was past and the New World began a less spectacular development for two more centuries under Spanish–Portuguese dominion. The first printing press in the Americas was established in Mexico City about 1539, another in Lima in 1584, and both cities were granted university charters in 1551. In Brazil no university was founded or printing permitted until the close of the colonial period. But everywhere in the Americas a growing leisure class devoted more time to intellectual and artistic pursuits, and close ties with the homeland encouraged the development of parallel literary patterns. Life became a reflection of trends across the Atlantic, and there was little in these two centuries that had originality.

The theatre, emerging from medieval forms at the time of the conquest, served during the 16th century as a missionary medium in the Indian tongues for the conversion of the natives. But for the Creoles and the growing mestizo class, the dramatic repertoire was mainly Spanish and Portuguese, and even plays written in America were patterned after the drama of the Golden Age; those of the greatest of these native dramatists, the Mexican Juan Ruiz de Alarcón, more properly belong to Spain.

Fiction, banned by the Spanish crown, only emerged with independence, leaving the field in prose to historical and biographical works. One of the best was the travelogue ***El lazarillo de ciegos caminantes*** (*c.* 1773; ***A Guide for Inexperienced Travelers,*** 1965), written by a Spanish postal official, Alonso Carrió de la Vandera (better known as Concolorcorvo), based on a journey between Buenos Aires and Lima.

The writings of the Mexican nun Sor Juana Inés de la Cruz

Poetry was the most popular form of literature, and a contest held in Mexico in 1585 attracted more than 300 versifiers, indifferent disciples of the cult of Luis de Góngora y Argote. Their poems are in the curious anthology ***Ramillete de varias flores pokticas*** (1675; "A Nosegay of Poetic Flowers"), gathered by Jacinto de Evia of Ecuador. One later poet stood out above all: the Mexican nun Sor Juana Inks de la Cruz. Her admirers all over the Western world kept her in the limelight, where she added further to her fame as Mexico's first feminist and as a polemist bold to enter the lists even against the most eloquent Jesuit missionary of the day, António Vieira. Sor Juana's plays, religious tracts, a revealing autobiographical piece, and above all her sacred and profane lyrics of simple beauty and emotional appeal, free of Gongorist excesses, are still held among the greatest literary achievements of Latin America.

As the colonial period ended, an occasional voice protested against the decadence of viceregal life and letters; the Peruvian Juan del Valle y Caviedes and Gregório de Matos Guerra, the epigrammatic "devil's mouthpiece" of Brazil, were both influenced by the Spanish satirist Francisco Gómez de Quevedo y Villegas. Their verse circulated widely and was extremely popular.

SCANDINAVIAN LITERATURE IN THE 17TH CENTURY

Swedish. In the first half of the 17th century, Swedish literature remained limited in scope and quantity. A unique contribution, however, was made by Lars Wivallius, whose lyrics, many of them written in prison, re-

Georg Stiernhielm and his followers

vealed a feeling for nature new to Swedish poetry. With its intervention in the Thirty Years' War, Sweden established itself as a European power, and this led to a development of national pride and culture, as revealed in literature of this epoch. The outstanding work was the allegorical epic ***Hercules,*** by Georg Stiernhielm, which reflected many of the social and political problems of the time. Stiernhielm was the foremost literary figure of the 17th century and was often in attendance at the court of Queen Christina, an outstanding patroness of the arts. His followers included the two brothers Columbus, one of whom, Samuel, wrote ***Odae sueticae*** (1674; "Swedish Odes") and the prose ***Mdl-roo eller roo-mdl,*** a charming collection of anecdotes that illumine Stiernhielm's character. A rival to Stiernhielm was the unidentified "Skogekar Bargbo," whose ***Wenerid*** (1680) was the first sonnet cycle in Swedish. Several of Stiernhielm's admirers, including Urban Hiarne, formed a coterie at Uppsala in the 1660s. Hiarne led a troupe of student actors who, in 1665, performed his play ***Rosimunda*** before the young Charles XI. He aiso wrote iyrics and the prose pastoral *Stratonice* (1666–68), the first "psychological" narrative in Swedish.

Stiernhielm aimed at an integration of Sweden's cultural heritage with the accepted ideals of continental classicism. His ***Hercules*** is full of old Swedish words that he was eager to revive. Columbus also demanded a more vigorous, flexible language as did "Skogekär Bargbo" in ***Thet swenska språkets klagemål*** (1658; "The Lament of the Swedish Language"). National pride and religious feeling are combined in the works of the bishops Haquin Spegel and Jesper Swedberg, father of the Swedish mystic Emanuel Swedenborg. Spegel contributed to Swedberg's new hymnbook of 1695, which became the poetry book of the Swedish people and was of lasting influence. Even Lucidor was represented in it, giving intense expression to the contrasting moods of the period: in his love songs and, above all, in his drinking songs, he was as pagan and reckless as he was devout in his hymns and funeral poems.

At Uppsala, meanwhile, the scholar Petrus Lagerlof attempted to impose purer classical standards on native literature, and Olof Verelius edited and translated Icelandic sagas. It was Olof Rudbeck, however, who became interested in Verelius' work and enthusiastically developed a theory that Sweden was the lost Atlantis and had been the cradle of Western civilization. These theories he launched in a massive work, ***Atland eller Manheim*** (1679–1702), which translated into Latin as *Atlantica,* attained European fame.

Baroque and classicist tendencies ran parallel in late-17th-century Swedish literature. Gunno Eurelius (Gunno Dahlstierna) wrote an elaborate epic, ***Kungaskald*** ("Hymn to the King") for King Charles XI's funeral in 1697. Simpler in style was Johan Runius, who expressed a Christian stoicism of the kind found among Swedes during the disastrous early decades of the 18th century. Jacob Frese was a gentler and more intimate poet; his lyrics and hymns contained some of the emotional pietism that became a feature of 18th-century thought.

Danish. In the 17th century the literary Renaissance reached Denmark and led to a strict adherence to classical patterns and blind belief in authority in political, religious, and literary matters. In religious literature Latin dogmatics and pamphlets reflecting the superstitions of the century were dominant.

The revival of interest in Scandinavian antiquity

It was, however, a great era of science and scholarship. Ole Worm is famous for his book on the runic inscriptions, *Monumenta Danica* (1643). Thormod Torfaeus and Árni Magnússon introduced the study of Old Norse literature, and Peder Hansen Resen edited and translated some of the poetry of the Old Norse ***Edda;*** Erik Pontoppidan and Peder Syv introduced the linguistic study of Danish.

Danish poetry in the 17th century tended to follow the classics slavishly, and the favourite forms were the hexameter, the Alexandrine, and the sonnet. Simplicity is deliberately avoided; the style is precious; allegories, euphemisms, and metaphors abound. Anders Arrebo translated the Psalms and wrote ***Hexaemeron*** (1661), a Danish version of the 16th-century French poet Guillaume du Bartas' ***La Semaine.*** The century was rich in occasional poetry celebrating weddings and birthdays or mourning for a deceased paragon of virtue; didactic and pastoral poems were also common. Anders Bording, an interesting exponent of Danish Baroque poetry, was also the founder of the first Danish newspaper, ***Den danske mercurius*** (from 1666), in which the news appeared in rhymed alexandrines. The only truly great poet was Thomas Kingo, a supreme master in almost every kind of poetry. His hymns reflect a violent, passionate character, worldly and yet deeply religious. Among the few playwrights, Mogens Skeel deserves mention.

Of special interest among Danish prose works of the 17th century were the memoirs of Leonora Christina, daughter of Christian IV, a fascinating document, discovered in 1869, about her 20 years' imprisonment in the Blue Tower of Copenhagen.

Norwegian. Political union between Denmark and Norway started in 1380, and the Danish language eventually became the official and the literary medium; Copenhagen, with its university, established itself as the cultural capital of the two countries. Not until after the Reformation were there signs of renewed literary activity in Norway itself; *e.g.,* in the nostalgic apologia for Norway, ***Om Norgis rige*** (written 1567), by Absalon Pederssøn Beyer. The most original and most conspicuously Norwegian writer of this age was Petter Dass, whose ***Nordlands trompet (The Trumpet of Nordland)*** gives a lively picture in verse of the life of a clergyman in northernmost Norway; although probably completed before the turn of the century, this work was not printed until 1739.

Icelandic. In Iceland the foremost poet of the 17th century was Hallgrímur Pétursson, a Lutheran pastor who struggled against poverty and ill health. His ***Passíusálmar*** (1666; "Hymns on the Passion") is among the most popular books in Iceland. Another interesting poet was Stefan Ólafsson, remembered both for religious and secular works, the latter notable for exuberantly humorous portrayal of contemporaries and satirical observation of manners and customs.

As in other countries, interest in antiquity was stirred during the 17th century, and modern learning may be said to date from that period. Arngrímur Jónsson called the attention of Danish and Swedish scholars to Icelandic traditions and literature in a series of works in Latin, some containing abstracts of sagas now lost. Later in the century Árni Magnitsson systematically collected the early Icelandic manuscripts. Although an age of learning, the 17th century was also an age of superstition, as shown in the *Píslarsaga* ("Passion Story") of the pastor Jón Magnitsson, describing his persecution by magicians; his complaints led to the burning of two unfortunate victims in 1656. The story's lurid language is an interesting example of the period's prose.

EASTERN EUROPEAN LITERATURE IN THE 17TH CENTURY

Literature of the Time of Troubles

Russian. The end of the 16th century and the beginning of the 17th in Russia were marked by stormy political events characterized by an intense anti-feudal struggle, into which were drawn both the peasants, who were impoverished by serfdom, and the boyars, who had been defeated by the feudal nobility. The situation was complicated by the intervention of the Swedes and Poles, who were repulsed only by the united efforts of the Russian people. The events of the Time of Troubles were described in a succession of tales, echoing the social and political upheavals and commemorating the surge of patriotism against foreign intervention. The elegance and artistry of the Muscovite literary tradition was shattered; new writers and readers farther down the social scale introduced secular themes, realism, and folklore into literature. Examples are the stories of the capture of the town of Azov in 1637 by the Don Cossacks and its siege in 1641 by the Turks, which are outstanding literary works. The international relations of the state of Muscovy helped the flow of secular literature from the West. The secular translated story, the tale of chivalry, and the humorous tale replaced Byzantine religious didactic literature or existed alongside it, and folklore began to intrude noticeably.

The original Russian secular story began to appear from about the second half of the 17th century. Side by side with tales in which the conservative tradition of the church still predominated, there appeared comic tales such as *Povest o Frole Skobeyeve* ("The Tale of Frole Skobeyeve") and *Povest* o *Karpe Sutulove* ("The Story of Karp Sutulov"), both free from accepted moral and religious principles. Satire and parody of the court, church, and legal procedure also began to be written. The autobiography of the head of the Old Believers, the archpriest Avvakum, written between 1672 and 1675 *(Zhitiye protopova Avvakuma, im samim napisannoye* ["The Life of the Archpriest Avvakum by Himself"]) turns the canonical form of a typical hagiography into a polemically incisive narrative written in vivid conversational speech.

At the beginning of the 17th century, mainly under the influence of Polish models, verse began to develop. At first it was clumsy and rhythmically unorganized, but later syllabic verse was introduced and developed. In 1672, with the help of a German Lutheran pastor in Moscow, Iogann Gotfrid Gregori, a secular court theatre was created, with a basically western European repertory. Almost at the same time in Moscow Simeon of Polotsk's first attempts at school drama appeared. His *Komediya pritchi o bludnom syne* (published 1685; "Comedy of the Parable of the Prodigal Son"), in which the biblical story was adapted to treat the subject of fathers and sons in Russia, is particularly interesting. Thus it can be seen that Russian literature in the second half of the 17th century was transitional between the old literature and the literature of modern times, which dates from the beginning of the 18th century.

Polish. The Baroque period began very early in Poland. In 1564 Poland invited the Jesuits to settle in the country, and from about 1570 Protestant influence began to wane. The Baroque style and outlook were congenial to the Polish spirit; the period was one of considerable literary output, in spite of almost incessant wars. Indeed, perhaps it mirrored, in its stylistic tension, the external strife characteristic of the 17th century.

A forerunner of Baroque poetry was Mikołaj Sęp Szarżyński, who wrote predominantly religious poetry akin to that of the English Metaphysical poets. In this period satire and pastoral were the most popular forms. Foremost among satirists was Krzysztof Opaliński. His *Satyry* (1650) is bitter, pessimistic, and wide-ranging. The pastoral was represented by Samuel Twardowski, author of *Daphnis* (1638) and a romance *Nadobna Pasqualina* (1655; "Enchanting Pasqualina"), a tale of sacred and profane love, in which Polish Baroque achieves its most finely wrought splendour. The *Roxolanki* (1654), a collection of love songs by Szymon Zimorowic and the *Sielanki* (1663; "Pastorals"), written by his brother Bartlomiej, introduced topical dramatic elements into the traditional pastoral lyric; images of war and death are superimposed upon the pastoral background, with macabre effect and typical Baroque incongruity. A parallel but less formalized rustic genre produced much verse celebrating rural life. One of the more successful examples is the *Votum* by Zbigniew Morsztyn, whose finest achievement, however, was in religious poetry. In contrast was the work of his cousin, Jan Andrzej Morsztyn, whose language was marked by the extravagant style of 16th-century Italian. The formal complexity and skill of his verse was unsurpassed; and his translation of the French dramatist Pierre Corneille's *Cid* has remained the standard Polish version.

Polish Epics

The age was characterized by ambition to write heroic epics—a preoccupation to be explained perhaps by historical events: wars with Sweden, Russia, and Turkey, internal revolts, and attempts to introduce constitutional reforms. The Italian poet Torquato Tasso's *Gerusalemme liberata,* brilliantly translated by Piotr Kochanowski, inspired attempts at epics on national themes, notably the vigorous *Wojna chocimska* (written 1670; "The War of Chocim") by Wactaw Potocki. Another epic, the *Psalmodia polska* (1695), by Wespazjan Kochowski, was written under the impact of John III Sobieski's victory over the Turks at Vienna in 1683, at which Kochowski was present. The work was the first example of a theme developed by writers of the Romantic movement—the messianic interpretation of Poland's destiny.

The prose of the period did not rise to the level of its poetry, though there was a wealth of diaries and memoirs. Outstanding were the memoirs of Jan Chryzostom Pasek, a country squire and soldier. The period was also notable for the emergence of the letter as a literary form. The letters of John III Sobieski to his wife are remarkable for their passion and tenderness and for their day-by-day account of his experiences of battles and diplomacy. Another interesting development was the rise of a popular anonymous literature, exemplified by the *komedia rybattowska* ("ribald comedies"). These were generally popular satiric comedies and broad farces written mainly by playwrights of plebeian birth. One of the few whose names are known was Piotr Baryka, author of a carnival comedy. *Ž chtopa król* (performed 1633; "The Peasant-King"), which developed the theme of the induction to Shakespeare's *Taming of the Shrew.* Some 30 anonymous examples of this type of comedy survive, and they include realistic depictions of popular customs and grotesquely humorous situations, parodying the lofty themes of "official" literature and so expressing an indirect protest against social inequality.

The last stage of Baroque literature (*c.* 1675–c. 1750) displayed a long process of decline, marked only by the emergence of the first women writers and by the major figure of Stanislaw Konarski, a reformer of education, literature, and the political system, who wrote poetry in Latin, a tragedy in Polish (*Tragedia Epaminondy*), and political treatises.

It was not until the mid-20th century that the literature of the Baroque period was fully appreciated. It may well be regarded as the most enduring of Polish styles, for many of its features have recurred in the Romantic period and in modern writing.

Armenian. There were signs in the 17th century that the Armenians were emerging from the cultural decadence of the preceding centuries. The deeds of Turkish and Persian overlords figured prominently in histories by Araqel of Tabriz, Zaqaria the Deacon, and Eremia Chelebi Komiirjian, but there was some contact with Western scholars and works in Latin. Oskan of Erevan, born in 1614 in the newly founded trading colony of New Julfa, Isfahan, collaborated with the Dominican Pirandelli and printed the first Armenian Bible in Amsterdam in 1666. From the 13th century imaginative writing had been represented by a succession of popular troubadours, the most famous of these being Nahapet Kuchak (16th century), one of the rare Armenian poets to sing of physical love; Hovnatan Naghash (1661–1722); and in the following century, most famous of all, Aruthin Sayadian, called Sayat-Nova.

Hungarian. In the 17th century Hungary was still divided into three parts. The first, under Turkish rule, played no part in the development of Hungarian literature. The second, under Habsburg rule, was open to Italian and German and Catholic influence; the third part, Transylvania, was in close relationship with Dutch and English Protestant thought. The leading Protestant scholar and writer of the 17th century was János Apáczai Csere. His chief work, a Hungarian encyclopaedia in which he endeavoured to sum up the knowledge of his time, marked a development in technical vocabulary.

Effects of the Counter-Reformation

By the end of the 16th century the Counter-Reformation was gaining momentum in western Hungary. A Jesuit cardinal, Péter Pázmány was outstanding as a master of Hungarian prose, an orator and essayist of the first order. Vigour of style, clear though far from simple, use of popular expressions and solidity of argument were the chief qualities of his work, which was all controversial. His *Isteni igazságra vezérlő kalauz* (1613; "Guide to Divine Truth") was a refutation of non-Catholic religious doctrines and a masterpiece of Baroque prose.

Under the influence of the Jesuits, many Hungarian aristocrats returned to the Catholic faith and sent their sons to the Austrian Catholic universities and to Rome, where they became acquainted with the Baroque style, which can be seen in the work of Miklós Zrinyi, a great Hungarian statesman and general of his time. Most of his prose work was an exposition of political and strategic ideas. His greatest literary achievement was an epic, *Szigeti Veszedelem* ("The Peril of Sziget"), in 15 cantos, on the siege in 1566 of Szigetvdr, defended against the Turks by Zrínyi's great-grandfather. Though the influence of classical epics is clear, the work remains profoundly original and Hungarian. Zrinyi succeeded in imbuing the historical facts with a symbolic value, which conveyed his own political ideas. Another epic poet of this time, Istvdn Gyongyosi, composed many epithalamia, or nuptial poems, was inventive and handled rhyme with ease, and was much read during the 17th and 18th centuries. During this period, writing poetry seems to have become a fashion among all classes. The ***kuruts*** (Hungarian partisans fighting against the Germans and the Habsburgs) wrote poems with gripping descriptions of their poverty and misery, their joys, and the deeds of great figures of the insurrection. Many Hungarian poets have sought inspiration in these ***kurut*** songs, which have high artistic merit.

Czech. The defeat of the Protestant Bohemian forces by the Habsburgs in 1620 at the Battle of the White Mountain brought the integration of the Czech provinces into the Habsburg empire and the eradication of Protestantism from the country. The nobility was replaced by newcomers with little knowledge of Czech. It was only among the émigrés that Czech literary traditions continued. Among these exiles Jan Amos Komenský (John Amos Comenius) was pre-eminent. His Latin works on educational and theological problems and his works in Czech revealed him as a writer and thinker of European stature. His ***Labyrint světa a ráj srdce*** (1631; ***"Labyrinth of the World and Paradise of the Heart")*** was one of the supreme achievements of Czech prose literature. Some of the new Jesuit literature was of high quality, notably the poetry of Bedřich Bridel and the Latin works of Bohuslav Balbin, whose Czech patriotism expressed itself in studies of his country's past and in a remarkable defense of the Czech language.

By the beginning of the 18th century, Czech had practically ceased to be used for higher literary purposes. Rough vernacular dramas and chapbooks were produced, together with popular poetry, which included not only folk songs but forceful expressions of peasant discontent.

Croatian. In Croatian literature of the 17th and 18th centuries, the most important position belonged to Ivan Gundulić, author of a stirring epic, ***Osman,*** describing the Polish victory over the Turks in 1621. Ivan Bunić-Vučićević wrote a number of good lyrics, and the poet Ignjat Durdević and Antun Kanižlić wrote poetry in the Baroque style. Andrija Kačić Miošić treated historical themes in the popular verse forms of the travelling minstrel in a cycle on south Slav history from Alexander the Great (regarded as a Slav hero) to his own time (1756). Tito Brezovački wrote comedies and typified in his satirical verse the spirit of this age.

Gundulić's epic

Slovene. The half century of Protestant literary output in Slovene from the mid-16th century was, save for the Bible, destroyed by the Counter-Reformation. Only in about 1700 was there a revival of religious literature, with collections of Baroque sermons by Janez Svetokriški and Rogerij and the plays for Passion Week, which were written by Romuald in a comparatively pure style. The most interesting secular work was the learned patriotic description in German of Carniola by baron Janez Vajkard Valvasor.

Romanian. The printing of Romanian religious books was continued in the 17th century and was given new impetus in Transylvania, Walachia, and Moldavia by the controversy resulting from the Reformation. In Moldavia, where monasteries were centres of theological scholarship, reaction against the Reformation found expression in the *Răspuns* (1645; "Reply") of a metropolitan Varlam to the Calvinist catechism printed in 1642. A Moldavian metropolitan, Dosoftei, a great scholar and theologian, fled to Poland during the fighting between Poland and Turkey and, in 1673, published there the first Romanian metrical psalter, which was also the first poetry to be written in Romanian. He returned to Moldavia in 1675 and in 1679 translated the liturgy from the Greek. His other outstanding contribution to Romanian literature was his *Vieaţa şi* ***petrecere*** *sfinţilor* (1682–86; "Lives of the Saints"), in which he introduced popular idioms and encouraged development of a more flexible prose style.

Toward the end of the 17th century the monastery of Snagov, near Bucharest, became a centre of literary activity, and books were printed in Romanian, Greek, Slavonic, and Arabic. A Romanian printer, Mihai Stefan, introduced the press into the Caucasus, where he printed the first Georgian books. Religious literature reached its climax with a translation of the Bible (1688) that became the basis for all later translations.

Historiography was at its height with the Humanist historiographers of 17th-century Moldavia, whose leader was Miron Costin. He wrote in Polish a chronicle of Moldavia and a poem on the history of his country. The chronicle was continued by his son Niculae, who also pioneered the collection of folklore and legends. Dimitrie Kantemir, prince of Moldavia, a great linguist and historiographer, wrote Latin histories of Romania, of Moldavia, and of the Ottoman Empire. A special place among Moldavian historians is occupied by Nicolae Milescu, who wrote theological, historical, and travel works. The Walachian chroniclers were on the whole less original and more personal.

Romanian historiography

V. The 18th century

THE CHARACTERISTICS OF THE AGE

To call the 18th century the Age of Reason is to seize on a useful half-truth but cause confusion in the general picture, because the primacy of reason had also been a mark of certain periods of the previous age. It is more accurate to say that the 18th century was marked by two main impulses: reason and passion. The respect paid to reason was shown in pursuit of order, symmetry, decorum, and scientific knowledge; the cultivation of the feelings stimulated philanthropy, exaltation of personal relationships, religious fervour, and the cult of sentiment, or sensibility. In literature the rational impulse fostered satire, argument, wit, plain prose; the other inspired the psychological novel and the poetry of the sublime.

The cult of wit, satire, and argument is evident in England in the writings of Alexander Pope, Jonathan Swift, and Samuel Johnson, continuing the tradition of John Dryden from the 17th century. The novel was established as a major art form in English literature partly by a rational realism shown in the works of Henry Fielding, Daniel Defoe, and Tobias Smollett and partly by the psychological probing of the novels of Samuel Richardson and of Laurence Sterne's *Tristram* ***Shandy.*** Reflective nature poems like James Thomson's ***Seasons*** were partly scientific and partly embodiments of sensibility, while the Gothic novel combined the empirical fruits of the study of the past, which was becoming fashionable, with the modish sentiment of the supernatural and the frightening. In France the major characteristic of the period lies in the philosophical and political writings of the Enlightenment, which had a profound influence throughout the rest of Europe and foreshadowed the French Revolution. Voltaire, Jean-Jacques Rousseau, Charles de Montesquieu, and the Encyclopédistes Denis Diderot and Jean d'Alembert all devoted much of their writing to controversies about social and religious matters, often involving direct conflict with the authorities. In the first part of the century, German literature looked to English and French models, although innovative advances were made by the dramatist and critic Gotthold Ephraim Lessing. The great epoch of German literature came at the end of the century, when cultivation of the feelings and of emotional grandeur found its most powerful expression in what came to be called the *Sturm* ***und*** *Drang* ("Storm and

Stress") movement. Associated with this were two of the greatest names of German literature, Johann Wolfgang von Goethe and Friedrich Schiller, both of whom in drama and poetry advanced far beyond the turbulence of *Sturm und Drang.*

ENGLISH LITERATURE IN THE 18TH CENTURY

After the civil wars of the 17th century, the primary desire in England was for calm and consolidation. There was a practical interest in the norm, which became the basis of satire and much historical and travel writing, which appealed to all reasonable men, whose cultivated judgment could be recognized as taste. All of this gave a solid social support for artistic achievement in writing and thought, as well as in the public arts of architecture and painting. The complex of ideas collected under "Nature" was the bridge between order and the life of the heart. A taste for landscape gardening, "Nature methodized," existed simultaneously with a taste for wild scenery, ruins, "Gothic" architecture, and chinoiserie, or decorative art in the Chinese style. In literature the "horrors" of the Gothic novel and the extravagance of the Oriental tale were counterparts of the controlling influence of reason. Among philosophers, the property-based social speculation of Thomas Hobbes and John Locke was complemented by the philosophical Idealism of George Berkeley and the work of David Hume, a great thinker of the later 18th century, who carried rational introspection as far as it would go, until he met the intractable passions within man.

Poetry of the Augustan Age. The virtues of order and balance and respect for classical Latin and Greek authors were most prized in England at the end of the 17th century, when the work of John Dryden was modelled on and sometimes directly imitated Virgil and other Latin poets of the age of the emperor Augustus, and the same was to be true of Alexander Pope, the greatest satirical and moral poet of the 18th century. The name Augustan Age was applied to the reign (1702–14) of Queen Anne by Oliver Goldsmith (died 1774); it had already been applied in France to the age of Racine, Corneille, and Molière.

Pope's early work

The early poetry of Alexander Pope is mainly literary in inspiration. In the poems collected in his first volume (1717) he handled the genres of "local poetry" ("Windsor-Forest"), didactic *(An Essay on Criticism),* heroic epistle ("Eloisa to Abelard"), and mock-heroic *(The Rape of the Lock)* with remarkable sensitiveness and dexterity. Although his ten-syllable rhyming heroic couplets have less majesty than Dryden's, they display more warmth and variety and as much brilliance and wit. The influence of classical authors can be seen throughout his life—in translations (of Homer's *Iliad* [1720] and *Odyssey* [1725–26]) and in imitations *(Imitations of Horace* [1733–38]). *The Imitations of Horace* are distinguished by spirited attacks on figures of his time, presenting Pope's judgment of the literary and public scene; the irony and invective are made more weighty by Pope's careful statement of his point of view as a satirist in moving autobiographical passages that often celebrate the virtue of loyal friendship. Pope's brilliance is seen at its height in *The Dunciad* (1728), a satire on dullness in three books, to which a fourth was added later, which deepens the effect of the satire by employing reminiscences of the classical epics and the great cosmological poems of Dante and Milton.

The qualities of rational intelligence, sensitivity, and poetic dexterity are evident in Pope's later poetry on moral and social themes. In the "Moral Essays" and *An Essay on Man* (1733–34) he presented his vivid and imaginative response to the intellectual attitudes of his time. The two aspects of Pope—the satirist and the moral poet—exemplify the Augustan balance between reason and feeling.

The Scriblerus Club

Pope was a member of a Tory and literary group, the Scriblerus Club, an informal gathering that included Jonathan Swift, John Arbuthnot, John Gay, and Thomas Parnell and was dedicated to writing the memoirs of an imaginary pedant named Martinus Scriblerus. Some of the satires produced by the club were collaborative, but these writers were remarkably diverse. Many of Swift's poems are distinguished by a playful fantasy and racy idiom. John Gay's reputation rests on his offbeat masterpiece *The Beggar's Opera* (1728), but his *Trivia; or; The Art of Walking the Streets of London,* a mock Georgic, and his verse *Fables* (1727) deserve recognition. Thomas Parnell, in his *Night-Piece on Death* (published posthumously), is an important early influence on the poetry of feelings, which found its most important expression in Edward Young's *Night-Thoughts* (1742–45) and the graveyard poets. Pope had many imitators but few successors. Oliver Goldsmith, in *The Deserted Village* (1770), shows the displacement of Pope's tough argument by pathos. After Pope, the one great satirist was Samuel Johnson, whose *London* (1738) and *Vanity of Human Wishes* (1749) have all of the melancholy force of their originals in Juvenal's Latin, with a finality of phrasing that is an irreplaceable contribution to English verse.

Newspapers and periodicals

Essayists and pamphleteers. The remarkable development of English prose in the 18th century owed much to the spread of popular journalism. The lapse of the restrictive Licensing Act (1695) whetted public appetite for controversy but increased the risk of prosecution for treason or sedition and so turned writers to fiction, allegory, and irony as loopholes of escape from punishment. Nearly a score of newspapers were in publication during the first decade, along with countless polemical tracts; and, although few deserved the name of literature, much of *The Craftsman* (1726–47)—a periodical run by Bolingbroke and Chesterfield attacking the prime minister Sir Robert Walpole—and Daniel Defoe's *Review of the Affairs of France* (1704–13) assuredly did. The clarity and sense of contact with the reader demanded by argument in print are common in the prose writing of the period.

The convergence of journalism and literature is best seen in the work of Defoe, whose rough but workmanlike and clear prose surpassed immediate commercial or political concerns. In works such as his *Journal of the Plague Year* (1722), he showed an astonishing ability to project himself into a situation of which he had only read or been told. When, at the age of nearly 60, he turned to novels, he showed the same shrewdness and exploited his ability to assume another's voice in his narrative for powerful imaginative effect.

The influence of Addison and Steele

Within the fictional framework of the periodicals *The Tatler* (1709–11) and *The Spectator* (1711–12), the imaginary members of the Spectator Club are mouthpieces for their authors' ideas about society. The fiction elaborated a social microcosm within which to establish a tone at once grave, good-humoured, and flexible. The authors were free to consider any topic, either behind a mask, as in Sir Richard Steele's account of Sir Roger de Coverley's views on marriage, or straight, as in Joseph Addison's papers on John Milton's poem *Paradise Lost. The Tatler* and *The Spectator* steered serious discussion clear of religious and political partisanship and made it the pastime of the leisured middle class. The new periodicals created the public for which the novelists wrote and ensured that the new prose was both entertaining and, as in the "essays" interspersed in Fielding's novels, essentially serious and improving. Addison brought not only literature but philosophy and science to tea tables and coffeehouses. It was Steele, in *The Tatler,* who provided a moral impetus, and his writing has a friendliness that afforded needful emotional support for Addison's more dispassionate style. Their collaboration was more than the sum of its parts: separated, neither was again at his best.

The genuine *Spectator* tradition persists in Johnson's *Rambler* (1750–52) and in Goldsmith's *Citizen of the World* (1762). Intellectually, Johnson's essays are more impressive than Addison's, but they lack the charm with which *The Spectator* meets the reader on his own level without condescension. Goldsmith more freely depicted humanity's odd and touching aspects. He was more the exponent of personal sensitivity than Addison but less so than the later essayist Charles Lamb.

During the second half of the century the periodical essay was gradually absorbed by the newspaper. Johnson's "Idler" essays appeared in ***The Universal Chronicle,*** Goldsmith's ***Citizen*** (as "Chinese Letters") in ***The Public Ledger.***

Swift's irony and satirical methods

The satire of Swift. Jonathan Swift, Irish-born of English parents and educated in Ireland, became both a dominant literary figure in England and the idol of Ireland for his championship of its wrongs. He was a man of subtle wit and wide reading, much of whose work was devoted to deriding the arrogant claims of the unsupported intellect. He ridiculed whatever he thought pretentious in religion, philosophy, or science by solemnly pretending to agree with his opponents and then assuming that they would agree with him in his logical reduction of their case to absurdity. The title of his brilliant tract "An Argument To prove, That the Abolishing of Christianity in England, May, as Things now stand, be attended with some Inconveniences and perhaps not produce those many good Effects proposed thereby" (1711) demonstrates the method. Here the irony is at its most deft. In A ***Modest Proposal For Preventing the Children of Poor People From being a Burthen to their Parents, or the Country*** (1729)—by rearing them as food for the tables of the rich—a pamphlet devoted to shaming the public into awareness of Irish poverty, it is at its most trenchant. The "Drapier's Letters" (1724–25) raised pamphleteering to the status of literature. ***Gulliver's Travels*** (1726) is a "true narration" like Defoe's ***Robinson Crusoe;*** in "The Battle of the Books" (1704), he makes use of the mock-heroic allegory, a form popular in political pamphleteering, to savage the complacent insensitivity of "modem" critics and thinkers egotistically interested in progress at the expense of a proper awareness of human frailty and sin; in his most varied and ingenious work, A ***Tale of a Tub*** (1704), all these forms are exploited. He used man's less agreeable physical functions to symbolize moral shortcomings, the allowed method of satire in all ages. Disappointed ambition may have chastened the sheer brilliance of Swift's cutting wit, yet that he did not see himself as righteous and the rest of mankind as vile is evident from the fourth book of ***Gulliver's Travels,*** in which Gulliver's position between depraved and virtuous creatures (represented, respectively, as apelike Yahoos and noble horselike Houyhnhnms) is a representation of Swift's own. His invention was inexhaustible, and he could write brilliantly on any subject.

Swift's friend George Berkeley, bishop of Cloyne in Ireland, is remembered chiefly as a philosopher, though his tracts and Platonic dialogues are also of some literary importance. Like Swift, he was a lover of his country and expressed strong views about its welfare in his ***Querist.***

Criticism. Criticism, appearing for the first time as a continuous and widespread literary activity, placed the reputations of the major English poets—Shakespeare, Milton, and, to a lesser degree, Chaucer and Spenser--on a firm critical basis in historical perspective. The foundations of modem texts of Shakespeare were laid by Johnson (1765) and, most notably, by Lewis Theobald, whose ***Shakespeare restored*** (1726) and an edition of the plays (1733) represented pioneer work in textual criticism.

Shaftesbury's influence

Individual critics such as John Dennis, Addison, Pope, and Johnson worked within the frame of Neoclassical rules expounded by such French critics as Nicolas Boileau, but bent them to accommodate their feelings and personal vision. Critical theory dealt largely with the nature of poetic inspiration and aesthetic taste, an increasingly psychological account of the literary process. Lord Shaftesbury's ***Characteristics of Men, Manners, Opinions, Times*** (1711; revised and enlarged 1714, 1723) deprecates enthusiasm or imagination in religion and insists on its importance in literature to exalt the mind to serene contemplation. The preoccupation is with sublimity, a concept only vaguely apprehended but strongly felt not only in the century's criticism but also in its poetry. Shaftesbury posited a "moral sentiment" that draws man naturally to what is good and beautiful. He sought to lift criticism above the level of religious or political squabbling, and Addison, a brilliant popularizer of difficult theory rather than an original thinker, had a balanced approach to literature that made the way easier for later critics who developed this kind of judgment.

Johnson condemned those who judge by precept rather than by perception and insisted that literary judgment must be related to experience. He believed that literature was valuable only if it clarified human experience. His greatness as a critic lies in his wide, humane reading and in the fact that his grounds for criticism are always apparent and seldom capricious. These grounds are, in a broad sense, moral. When his judgment is at fault the failure is rather from inadequacy of experience than want of critical perception. For Johnson, as for most critics of his day. singularity implied deformity; nature, as experience common to all men, was the business of literature. Johnson's position in English criticism may be inferred from the words of his preface to his edition of Shakespeare: "Let the fact be first stated. and then examined."

Johnson's ***Dictionary***

What made Johnson a great critic made him also the great conversationalist depicted in James Boswell's ***Life of Johnson*** and the great prose stylist of ***Rasselas*** (1759) and ***The Rumbler.*** Johnson's ***Dictionary of the English Language*** (1755), though not the first English dictionary, introduced methods of illustrating the use of words that have changed little since it was first published. As a lexicographer he was always concerned with accuracy, and, like Sir Thomas Browne, on whom he modelled his style, he found in Latin derivatives the most precise and compact form of denotation.

The revolution of taste. During the second half of the century, the trend intensified toward a psychological expression of literary judgment based on unique, personal feeling. Sir Joshua Reynolds' ***Discourses*** (1769–91) uphold Neoclassical traditions of imitation, but Edward Young's ***Conjectures on Original Composition*** (1759) put original genius above learning. Young, like the Neoplatonist Shaftesbury, had a great influence in Europe.

Thomas Warton's ***History of English Poetry*** (1774–81) and ***Observations on the Faerie Queene*** (1754) and Bishop Richard Hurd's ***Letters on Chivalry and Romance*** (1762) all demonstrated a growing interest in medieval and Renaissance literature. It is seen too in James Macpherson's ***Ossian*** (1762), the "medieval" poems of Thomas Chatterton, and collections of earlier poetry, notably Bishop Thomas Percy's ***Reliques of Ancient English Poetry*** (1765). Another important pointer to changing critical opinion was the first part of Joseph Warton's "Essay on the Writings and Genius of Pope," with its emphasis on sublimity as the mark of "true" poetry and on freedom of expression. His praise of "poetical enthusiasm" and the poet's "creative imagination" indicates the basis on which the Romantic poets and critics built. All these works stress the importance of fancy or imagination in poetry, but their originality lies in their emphasis rather than in a revolutionary approach. Perhaps the most revolutionary work was Thomas Tyrwhitt's "Essay on the Language and Versification of Chaucer" (1775), which destroyed an earlier illusion of Chaucer as a clumsy metrist. William Blake's marginal comments on Reynolds' ***Discourses*** were more indignant outbursts against academic precept than revolutionary criticism, although when taken with Blake's other work they represent a consistent literary theory.

The novel. The growth of the English novel is as indigenous as the development of the periodical. Daniel Defoe's picaresque heroes had prototypes in the Elizabethan fiction of Thomas Nashe, Robert Greene, and Thomas Deloney, but ***Moll Flanders*** (1722), ***Colonel Jack,*** and ***Captain Singleton*** were also imaginative heightenings of actual rogue histories of the time, and Defoe's most famous novel, ***Robinson Crusoe*** (1719), was based on contemporary fact. The novels of Samuel Richardson drew on original sources. *Pamela* (1740) was based on his own ***Letters Written to and for Particular Friends,*** a collection of model letters to enable "country readers" to "endite for themselves," prescribing "the requisite Style and Forms" and "how to think and act justly and prudently, in the Common Concerns of Human Life." In *Clarissa* (1747–48) Richardson produced a seminal work of prose fiction and psychological analysis of sombre power that has had a profound influence on the development of the novel throughout western Europe.

Richardson and Fielding

The success of *Pamela,* with its concentration on moral respectability and neglect of recognized literary genres, irritated Henry Fielding, a man of refinement and extensive social experience, and he ridiculed it in *Shamela.* As the work advanced, turning into the substantial autonomous work *Joseph Andrews* (1742), Fielding obviously found more in the form, and especially in the character of Parson Adams, than he had expected. His later description of the episodic *Joseph Andrews* as the "comic epic poem in prose" better fits the tightly organized *Tom Jones* (1749), which showed him more clearly as the conscious artist. Introductory chapters to each book endow the novel with a critical rationale and constitute an important technical advance, for in them the author himself appeared as the shaping spirit of the story. Hitherto in realistic fiction authors (even Richardson) had commended their stories by claiming historical accuracy; Fielding asserted the author's right to manipulate his narrative openly in the interests of artistic truth. To suggest that his achievement is chiefly technical would be to ignore the unity of his artistic and philosophic outlook.

Smollett and Sterne

Another journalist who found fame as a novelist was Tobias Smollett, who, in his life as in his novels, resembled Defoe. Like him he was multifarious—naval surgeon, unsuccessful medical practitioner, hack writer, translator, historian—and he too knew prison from the inside. Such life, varied and arduous, was the source of *Roderick Random* (1748). Smollett's good-hearted déclassé heroes move through loosely connected episodic adventures, much as Defoe's; but whereas Defoe's characters derive their individuality from their surroundings, Smollett's are creations in their own right, an individuality expressed often by brilliant caricature. Smollett's writing lacks Richardson's sense of tragic predicament or Fielding's awareness of human comedy. His picture of life is crude but a telling expression of a feeling for the brutality and brutalization of implacable fortune. His flair for making haunting imaginative use of peculiarities and idiosyncracies of human behaviour, especially in *Humphry Clinker* (1771), has been matched only by Charles Dickens in the 19th century.

The development of the novel was rapid and diverse. In the 40 years after *Robinson Crusoe,* it retained the framework of a more or less chronological sequence of events leading to an outcome foreseen by the omniscient author. Laurence Sterne radically altered this chronological framework in the creation of the first impressionistic novel and one of the greatest works in the language—*Tristram Shandy* (1760, dated 1759)—which wittily presents life as a flux of events without relationship except in the consciousness of the person experiencing them. His true successors in developing these possibilities of the novel were to be found in the 20th century.

Horace Walpole's *Castle of Otranto* (1765) is important as the first in the line of Gothic novels, titilating the reader by stimulating fear and horror at tales of the supernatural in an exotic scene located in the past. In this tradition were Clara Reeve (*The Champion of Virtue,* 1777), Ann Radcliffe (*The Mysteries of Udolpho,* 1794), and Matthew Lewis (*The Monk,* 1796). The sentimental romance was another aspect of the cult of sensibility to be seen in Goldsmith's *Vicar* of *Wakefield* (1766), Henry Mackenzie's *Man of Feeling* (1771), Henry Brooke's *Fool of Quality* (1764–70), and in Sterne's *Sentimental Journey* (1768), which, by describing the author's feelings and not what he sees, had considerable influence on conceptions of "sentiment" and the cult of the "feeling heart." The exotic possibilities of the Gothic tale were further developed in William Beckford's Oriental romance *Vathek* (1786). Beckford's *Dreams, Waking Thoughts, and Incidents* (1783) had shown a developing sensibility in describing personal experiences during his travels that also had its place in the revolution of taste.

Fanny Burney's *Evelina* (1778), her most successful novel, manifests the qualities that made her a great diarist—spontaneous interest in life and cool appraisal of social convention. She learned something from Smollett's portrayal of eccentricity but had a firm sense of obvious structure.

Later poetry. *Reflective poetry.* The cult of solitude and the contemplation of nature's solemnities was explicit in Shaftesbury's writings, and as early as 1726 James Thomson's *Winter* was winning general approval. *The Seasons* (1730), a longer poem that developed from *Winter,* retaining the poet's sensibility as the sole unifying thread, is not only vivid in its detail but dramatic in its portrayal of observed natural phenomena and landscape. Goldsmith's *Deserted Village* (1770) vindicated the Augustan theory of generalized description in its depiction of both human and nonhuman nature. William Cowper's *Task* (1785) was perhaps the last in this line of succession. Cowper turned to the hills and snowbound woods of his home at Weston in Buckinghamshire as a relief from religious terror. *The Task,* discursive and with a placid tone and masterly yet unostentatious handling of language, had the comforting tranquility of poetry written for its own sake, seldom touched by the ratiocinative urge of Thomson or the sensuous brilliance of Christopher Smart, the author of *A Song to David* (1763) and *Hymns,* poems that glorified the particularities (rather than the universal plan) of nature as symbolizing God's love for man. William Collins, a fine lyric poet, devoted himself to the ode, a poetical form that for the Augustans exalted the connective power of the poet's imagination over the skeleton of rational argument. Thomas Gray's "Elegy Written in a Country Church Yard" (published 1751), in the universality of its themes and its dignified yet intimate tone, epitomized the Augustan ideal of reflective poetry.

Gray's "Elegy"

The poetry of Burns and Blake, The two great lyric poets Robert Burns and William Blake lie, in some measure, outside the traditions of the century. Burns's *Poems, Chiefly in the Scottish Dialect* (1786) had a contemporary success only in part due to the increasing interest in "primitive" poetry, though this interest was often scholarly or dilettante. Burns's vocabulary and rhythms, however, sprang not from any poetic theory but from the vernacular speech of his native Ayrshire and from the wealth of song of the Scottish people, for whose old tunes he composed and restored many sets of words. Burns was a lively and successful personal and social satirist. Because his background was not academic, his reading nourished his genius without subduing it to the requirements of "learning" (which hampered even such poets as Gray), and he is one of the few writers of the age who has retained a worldwide popular image. Blake's *Songs of Innocence* (1789) and *Songs of Experience* (1794) are, indeed, descendants of the hymns of Isaac Watts; but what Watts perceived by the light of moral doctrine, Blake perceived intuitively and, by a unique, original technique, fashioned into precise, moving poems marked by a strangely personal vision, "the lost traveler's dream." Pressing his private associations, Blake deepened his isolation from any responsive audience, and his work moved farther into the complex, mystical symbolisms of the later "prophetic" books, such as *The First Book of Urizen* or *The Book of Los* (1795), which he did not "publish" in the generally accepted sense but laboriously engraved by a process that frustrated much possibility of immediate free communication, though it resulted in the superb illuminated books in which poem and illustration are fully complementary. Like Burns, Blake was in revolt against human limitations, and it is this that distinguished these two poets from others of their age.

Blake's "prophetic" books

Imaginative and learned prose. The increase of travel and a new sense of leisure and connoisseurship among the wealthier families speedily united with the increasing importance of individual observation to produce in England a crop of those elaborate collections of letters and memoirs that earlier had reached their summit in France with those of Mme de Sévigné and the Duc de Saint-Simon. In 1709 began the letters of Lady Mary Wortley Montagu; 17 years more saw the commencement of Lord Hervey's *Memoirs of the Reign of George 11,* while Lord Chesterfield and Horace Walpole both began their series of *Letters* about 1740. Less modish but pleasing in their unostentatious charm, the letters of Gilbert White, published in 1789 as *The Natural History and Antiquities of Selborne*, show that the countryman's loving eye for detail was not only active in the Romantic period. William Cowper also produced a collection of beautiful, perceptive, and graceful private letters. Stylistically at the opposite extreme is Chesterfield, who in treating of manners and social amenity deliberately sought a form of expression that is the perfection of tact, good order, and savoir faire. The most frivolous and also the most pungent of letter writers was Horace Walpole, whose writings are an epitome of the taste, history, and biography of the Georgian era. He was in some ways a corrective to the complacency of his generation, a vast dilettante, a lover of Gothic, of curios, costly printing, old illuminations, and stained glass.

Long known for his celebrated *Life of Johnson*, Boswell was also established as a master of English prose. When his journals were published in the 20th century, he became known as a pioneer in the exploration of the human unconscious and an informative commentator on the 18th-century London scene. *The Diary and Letters of Mme d'Arblay* (Fanny Burney) and the *Autobiography* of the historian Edward Gibbon are in their different ways also representative of 18th-century excellence.

It was not until the second half of the century that English historical writing escaped its reputation of lagging behind France, Italy, and Germany. David Hume published the first volume of his *History of England* in 1754. William Robertson's *History of Scotland* appeared in 1759 and his *History of the Reign of the Emperor Charles V* in 1769, adding to the growing contribution from Edinburgh of philosophical and sociological writing. Edward Gibbon's *History of the Decline and Fall of the Roman Empire* came in 1776–88. This monumental work is notable for its indefatigable attention to detail and its shrewd judgments. Gibbon's style was portentous in its dignity; he combined with the Skepticism of Hume and the method of Robertson an ordered harmony of thought and prose and a pleasing malice all his own.

Gibbon's *Decline and Fall*

In the philosophical and political writing of the latter part of the century, free thought was beginning to sap the defenses of the religious apologists, in the writings of Thomas Paine, Joseph Priestley, William Godwin, and Sir James Mackintosh. The greatest champion of the continuity of tradition and conservation and the perfect master of emotional prose was Edmund Burke, one of the most commanding intellects in the field of political letters—and in this respect a striking contrast to "Junius," the pseudonym of an unidentified author, whose journalistic talent for invective had a quite ephemeral value.

Drama. An age of great actors, such as Samuel Foote and David Garrick, the 18th century in England was poor in drama. With the exception of Fielding, a playwright of some originality, and Goldsmith (*She Stoops to Conquer*, 1773), the men of literary genius, though many wrote plays, were not men of the theatre. Toward the end of the century, in *The Rivals* (1775) and more especially *The School for Scandal* (1777), Richard Brinsley Sheridan showed that he alone possessed both the literary and theatrical qualities for great drama in the orthodox sense.

Sheridan's plays

Scottish literature in English and Scots. While Scottish prose writers were preparing to challenge English on its own terms, and while the union of 1707 was suggesting an even closer cultural binding of the two countries than had been possible a century before, a contrary impulse was making itself felt in poetry. Almost in the year of the union appeared James Watson's first volume of *Choice Collection of Comic and Serious Scots Poems* (1706), which contained (among English pieces) vernacular poetry, from *Christis Kirk on the Green* and *The Cherry and the Slae* to recent verse like *Habbie Simson* and *The Blythesome Bridal*. This was followed by Allan Ramsay's *Ever Green* (1724) and *Tea-Table Miscellany* (1724 ff.) and by the later collections of David Herd, John Pinkerton, James Johnson, and George Thomson. These anthologies testify to a new national consciousness that began with a deliberate invocation of past achievements and eventually produced original work in the tradition of these achievements. As political identity was lost, cultural differences were increasingly recognized as significant. Educated speech was slowly but surely following written prose into anglicization, but in poetry the heart of the language was still felt to beat, however faintly, as it was also in common speech and in the old songs and ballads that were being reprinted. Ramsay's own poetry, like that of Robert Fergusson (1750–74) and Robert Burns (1759–96), flourished on a union of these elements: the racy vigour of Scots speech, the musical lilt of the songs, and the poetic forms and techniques, such as the Habbie Simson stanza, the humorous elegy, and the verse epistle, with which recent poets like the Sempills and William Hamilton of Gilbertfield had helped to solder the vernacular tradition. This new poetry lacked the range and also the intellectual power of the makaris' verse. Nevertheless, its qualities were notable and infinitely attractive: in the love songs "Duncan Gray" and "O, Wert Thou in the Cauld Blast"; in the voice given to the joy and pathos of "randie gangrel bodies" in "The Jolly Beggars"; in the unembittered descriptive tartness of Fergusson's "Auld Reikie" and "Butterfly." Burns excelled in both satires and love lyrics; in the former he carried on where Dunbar left off, and in the latter he crystallized the floating anonymous songs in forms at once popular and authoritative. Many traditions meet in Burns, and his poetry reaffirms, perfects, and consolidates existing poetic modes and themes in a way that even in his own lifetime made it apparent that he was going to be a national bard. If any poet has deserved the epithet "life-giving" it is Burns, and yet by one of the ironies of literary history he proved a liberator for the poetry of England but not for that of his own country.

Among minor poets of the period, some of the best were women: Lady Grizel Baillie, Jane Elliot, Lady Anne Lindsay, and Lady Nairne. Of writers in English, James Thomson in *The Seasons* (1726–30) shares with Gavin Douglas the ability to make winter more impressive than summer, and produces some heavily drawn pictures of "Caledonia, in romantic view." Robert Blair's *Grave* (1743) shows a grim, macabre relish not uncommon in Scottish poetry. William Falconer's *Shipwreck* (1762), admired by Burns, deserves mention; and James Beattie's *Minstrel* (1771–74) has historical importance as an early Romantic poem. Here must also be noted three popular and influential works of the time: John Home's tragedy *Douglas* (1756), Scottish in theme but not in language; the cloudy grandeurs of James Macpherson's Ossianic fragments, which presented Europe with a version of the noble Gael; and that "bosom favorite" of the young Burns, Henry Mackenzie's tear-strewn novel *The Man of Feeling* (1771).

AMERICAN LITERATURE IN THE 18TH CENTURY

In America in the early years of the 18th century, some writers, such as Cotton Mather, carried on the older traditions. His huge history and biography of Puritan New England, *Magnalia Christi Americana*. in 1702, and his vigorous *Manuductio ad Ministerium*, or introduction to the ministry, in 1726, were defenses of ancient Puritan convictions. Jonathan Edwards, initiator of the Great Awakening, a religious revival that stirred the eastern seacoast for many years, eloquently defended his burning belief in Calvinistic doctrine—of the concept that man, born totally depraved, could attain virtue and salvation only through God's grace—notably in the philosophical treatise *Freedom of Will* (1754). He supported his claims by relating them to a complex metaphysical system and by reasoning brilliantly in clear and often beautiful prose.

But Mather and Edwards were defending a doomed cause. Liberal New England ministers such as John Wise and Jonathan Mayhew moved toward a less rigid religion. Samuel Sewall heralded other changes in his amusing *Diary*, covering the years 1673–1729. Though sincerely religious, he showed in daily records how commercial life in New England replaced rigid Puritanism with more worldly attitudes. The *Journal* of Mme Sara Knight comically detailed a journey that lady took to New York in 1704. She wrote vividly of what she saw and commented upon it from the standpoint of an orthodox believer, but a quality of levity in her witty writings showed that she was much less fervent than the Pilgrim founders had been. In the South, William Byrd of Virginia, an aristocratic plantation owner, contrasted sharply with gloomier predecessors. His record of a surveying trip in 1728, *The History of the Dividing Line,* and his account of a visit to his frontier properties in 1733, *A Journey to the Land of Eden,* were his chief works. Years in England, on the Continent, and among the gentry of the South had created gaiety and grace of expression, and, although a devout Anglican, Byrd was as playful as the Restoration wits whose works he clearly admired.

William Byrd's prose

The wrench of the American Revolution emphasized differences that had been growing between American and British political concepts. As the colonists moved to the belief that rebellion was inevitable, fought the bitter war, and worked to found the new nation's government, they were influenced by a number of very effective political writers, such as Samuel Adams and John Dickinson, both of whom favoured the colonists, and Loyalist Joseph Galloway. But two figures loomed above these—Benjamin Franklin and Thomas Paine.

Franklin, born in 1706, had started to publish his writings in his brother's newspaper, the *New England Courant,* as early as 1722. This newspaper championed the cause of the "Leather Apron" man and the farmer and appealed by using easily understood language and practical arguments. The idea that common sense was a good guide was clear in both the popular *Poor Richard's* almanac, which Franklin edited between 1733 and 1758 and filled with prudent and witty aphorisms purportedly written by uneducated but experienced Richard Saunders, and in the author's *Autobiography,* written between 1771 and 1788, a record of his rise from humble circumstances that offered worldly wise suggestions for future success.

Franklin's self-attained culture, deep and wide, gave substance and skill to varied articles, pamphlets, and reports that he wrote concerning the dispute with Great Britain, many of them extremely effective in stating and shaping the colonists' cause.

Thomas Paine's "Common Sense"

Thomas Paine went from his native England to Philadelphia and became a magazine editor and then, about 14 months later, the most effective propagandist for the colonial cause. His pamphlet "Common Sense" (January 1776) did much to influence the colonists to declare their independence. *The American Crisis* papers (December 1776–April 1783) spurred Americans to fight on through the blackest years of the war. Based upon Paine's simple Deistic beliefs, they showed the conflict as a stirring melodrama with the angelic colonists against the forces of evil. Such white and black picturings were highly effective propaganda. Another reason for Paine's success was his poetic fervour, which found expression in impassioned words and phrases long to be remembered and quoted.

The Federalist papers

The new nation. In the postwar period some of these eloquent men were no longer able to win a hearing. Thomas Paine and Samuel Adams lacked the constructive ideas that appealed to those interested in forming a new government. Others fared better—for example, Franklin, whose tolerance and sense showed in addresses to the constitutional convention. A different group of authors, however, became leaders in the new period—Thomas Jefferson and the talented writers of *The Federalist* papers, a series of 85 essays published in 1787 and 1788 urging the virtues of the proposed new constitution. They were written by Alexander Hamilton, James Madison, and John Jay. More distinguished for insight into problems of government and cool logic than for eloquence, these works became a classic statement of American governmental theory. At the time they were highly effective in influencing legislators who voted on the new constitution. Hamilton, who wrote perhaps 51 *Federalist* papers, became a leader of the Federalist Party and, as first secretary of the treasury (1789–95), wrote messages that were influential in increasing the power of national government at the expense of the state governments.

Thomas Jefferson was an influential political writer during and after the war. The merits of his great summary, the Declaration of Independence, consisted, as Madison pointed out, "in a lucid communication of human rights . . . in a style and tone appropriate to the great occasion, and to the spirit of the American people." After the war he formulated the exact tenets of his faith in various papers but most richly in his letters and inaugural addresses, in which he urged individual freedom and local autonomy—a theory of decentralization differing from Hamilton's belief in strong federal government. Though he held that all men are created equal, Jefferson thought that "a natural aristocracy" of "virtues and talents" should hold high governmental positions.

Poets and poetry. Poetry became a weapon during the American Revolution, with both Loyalists and Continentals urging their forces on, stating their arguments, and celebrating their heroes in verse and songs such as "Yankee Doodle," "Nathan Hale," and "The Epilogue," mostly set to popular British melodies and in manner resembling other British poems of the period.

The most memorable American poet of the period was Philip Freneau, whose first well-known poems, Revolutionary War satires, served as effective propaganda; later he turned to various aspects of the American scene. Although he wrote much in the stilted manner of the Neoclassicists, such poems as "The Wild Honey Suckle," "To a Caty-did," and "On a Honey Bee" were romantic lyrics of real grace and feeling that were forerunners of a literary movement destined to be important in the 19th century.

Drama and the novel. In the years toward the close of the 18th century, both dramas and novels of some historical importance were produced. Though theatrical groups had long been active in America, the first American comedy presented professionally was Royall Tyler's *Contrast* (1787). This drama was full of echoes of Goldsmith and Sheridan, but it contained a Yankee character (the predecessor of many such in years to follow) who brought something native to the stage.

William Hill Brown wrote the first American novel, *The Power of Sympathy* (1789), which showed authors how to overcome ancient prejudices against this form by following the sentimental novel form invented by Samuel Richardson. A flood of sentimental novels followed to the end of the 19th century. H.H. Brackenridge followed Cervantes' *Don Quixote* and Henry Fielding with some popular success in *Modern Chivalry* (1792–1815), an amusing satire on democracy and an interesting portrayal of frontier life. Gothic thrillers were to some extent nationalized in Charles Brockden Brown's *Wieland* (1798), *Arthur Mervyn,* and *Edgar Huntly* (1799). But all such works were more interesting as beginnings than as outstanding artistic achievements.

FRENCH LITERATURE IN THE 18TH CENTURY

The years of transition. A new era in French literature can be regarded as having begun in 1685 with the revocation of the Edict of Nantes, which had led to the suppression of all forms of Protestant expression; the outbreak of the French Revolution in 1789 can conveniently be taken as the end. Molière, Corneille, La Rochefoucauld, Racine, and most other major writers had faded from the scene, but the spirit and the genius of Classicism was not yet extinct. In Jean de La Bruyère's *Caractères* this Classical attitude is tempered by the author's social conscience, which shows him to be a precursor of 18th-century philanthropy.

The shift to critical writing

Meanwhile, the main preoccupation of many writers had become critical rather than creative. Charles Perrault, remembered for his fairy tales, *Contes de ma mère l'oye* (1697; *The Tales of Mother Goose,* 1785), attacked the prestige of the ancient world in his poem *Le Siècle de Louis le Grand* (1687), in which he maintained that the age of Louis XIV was comparable with that of the Roman emperor Augustus. Perrault's views were ill received by Nicolas Boileau, La Fontaine, and La Bruyère, and reconciliation between the Anciens, Boileau's party, and the Modernes (quarreling as to whether the ancient Greek and Latin authors were the only models for literary excellence) did not take place until 1701.

Although posterity was to regard Racine's return to the stage with ***Esther*** (first performed 1689) and especially *Athalie* (1691) as by far the greatest event in the history of tragedy in Louis XIV's last 30 years, another dramatist, Prosper Jolyot de Crébillon, was at the time carried to the height of fame by blood-curdling horrific tragedies, of which the best known is ***Rhadamiste et** Zénobie* (1711), replete with murders, mistaken identities, and Oedipal conflicts.

Jean-François Regnard wrote many lighthearted but superficial comedies relying on the techniques of farce. ***Le Joueur*** (1695; ***The Gamester,*** 1705) was the best known of these. Florent Carton d'Ancourt, known as Dancourt, was another prolific writer of comedies, with a particular skill in the portrayal of social types. A higher standard was reached by Alain-René Lesage, whose first successes on the stage were ***Crispin, rival de son*** *maître* (1707; ***Crispin, Rival of His Master,*** 1915) and ***Turcaret*** (1709), both of them bold and vivacious.

The most important novel of these years was ***Les Aventures de Télémaque*** (published 1699) by François Fénelon, who was already renowned not only as an ecclesiastic but also, after his "Trait6 de l'éducation des filles" (1687; "The Education of Girls," 1805), as a man of letters and an innovator. ***Télémaque***, narrating in engaging prose the travels of Telemachus, son of Ulysses, after the siege of Troy, was written for the Duc de Bourgogne, heir to the French throne, and it was immediately extremely successful. Fénelon expressed advanced ideas of a political and social character, often involving implicit criticism of the policies of Louis XIV, and proposing a curious blend of medieval feudalism and enlightened despotism. In his hands the novel became an instrument for the spreading of specific and developed ideas.

A retreat from the categorical orthodoxy of the churchman Jacques-Bénigne Bossuet (whose work is treated in ***French literature in the 17th century,*** above) was shown by other ecclesiastics: by Esprit Fléchier, bishop of Nîmes, by Jean-Baptiste Massillon, bishop of Clermont, by the Jansenist Pasquier Quesnel, and especially by Fénelon, whose emotional and quasi-mystical ***Explications des maximes des saints sur la vie inte'rieure*** was condemned by the Roman Catholic Church. Richard Simon, whose application to biblical criticism of rigorous methods of interpretation in the ***Histoire critique du Vieux Testament*** (1678) led him into heterodoxy, was expelled from the religious order to which he belonged.

The growth of relativism

A spirit of cosmopolitan relativism—the view that good and bad are only relative concepts, that what may be good in one society may be bad in another—is revealed in the works of Charles de Saint-Denis de Saint-Évremond, who from 1661 until his death in 1703 lived in exile in England and Holland. An individualist and a freethinker, he had an acute and satirical intelligence. Relativism was encouraged also by the ***Voyages*** and ***Mémoires sur l'Amérique*** (1703) of Baron de La Hontan and by the translation (1704–17) of the ***Arabian Nights*** by Antoine Galland.

Relativism marked most of the work of Bernard Le Bovier, sieur de Fontenelle, whose style and incisive mind had won him renown before 1690. His ***Entretiens sur la pluralité des mondes*** (1686; ***A Plurality of Worlds,*** 1688) are perhaps unequalled as an example of scientific popularization as well as a vigorous attack on prejudice. Here and in the ***Histoire des oracles*** (1687) he revealed a skeptical mind, unimpressed by religious or philosophical authority.

Pierre Bayle, exiled as a Protestant, was essentially a controversialist, attacking superstition and discussing the virtues of the atheist in his ***Pensées diverses sur la comète*** (1682; "Various Thoughts on the Comet") and defending liberty of conscience in the ***Commentaire philosophique*** (1686). His greatest and most influential work was the ***Dictionnaire historique et critique*** (1697). This vast compendium of knowledge is perhaps the greatest mass of erudition ever to have come from one man. In the 18th century, Bayle was regarded as a skeptical agnostic, but some modern readers impute to him a firm religious sentiment.

Fontenelle and Bayle were the most significant precursors of the movement known as the Enlightenment, others being the anonymous writer of ***Les Soupirs de la France esclave*** (1689–90; "The Sighs of France Enslaved") and Abb6 Castel de Saint-Pierre.

Creative literature. *Drama.* The success of Crébillon tempted the young François-Marie Arouet—writing under the pen name Voltaire—to the tragic stage, and in 1718 his ***Oedipe*** was performed, the first of about 30 tragedies, of which several attained glowing success, especially *Zaïre* (first performed 1732) and ***Mahomet*** (1742). Vigorous rhetoric, melodramatic effects often inspired by Shakespeare, only intermittent respect for the decorum of the previous age—these characteristics marked a genre that became for him a weapon in philosophical controversy. Other writers enjoyed great fame in their day. Houdar de la Motte's ***Inès de Castro*** (1723) broke all records of financial success, and the plays of Buyrette de Belloy were frequently performed.

The plays of Marivaux and Beaumarchais

Philippe-Néricault Destouches wrote comedies of character with a moral aim; ***Le Glorieux*** (1732: ***The Conceited Count,*** 1923) is the best known. Alexis Piron's ***MCtromanie*** (1738) satirized poets. The two writers of comedies of greatest talent, however, were Pierre Carlet de Chamblain de Marivaux and Pierre-Augustin Caron de Beaumarchais. Marivaux wrote prose comedies of gentle intrigue, in which love is the motive force, his best known being ***Le Jeu de Pamour et du hasard*** (1730; ***The Game of Love and Chance,*** 1923). His psychological analysis is subtle, his style highly polished, and his characters sophisticated. His plays portray fashionable Parisian society of the 18th century.

Beaumarchais, a political adventurer and financial intriguer, wrote a number of plays, of which ***Le Barbier de Séville*** (1775) and ***Le Mariage de Figaro*** (1784) are the greatest. Refinement of wit, bold social criticisms of the nobility, and above all the character of Figaro, carefree, eloquent, and unscrupulous, have ensured their lasting success.

Various attempts were made to escape from the rigid classical distinction between tragedy and comedy. Nivelle de La Chaussée, whose principal plays are ***Le Préjugé à la mode*** (1735; "Fashionable Prejudice") and ***Mélanide*** (1741), wrote comedies from which the comic was banished and that represented domestic crisis and anxiety. More lasting in importance was the domestic drama, the ***tragédie bourgeoise,*** or "middle class tragedy," developed by Denis Diderot. Influenced by English examples, Diderot devised a theory of a play in which the passions are as elevated as in tragedy, but the characters are of a more humble social status. He believed that the traditional genres were exhausted. He regarded the drama, moreover. as a useful instrument for the inculcation of those social lessons that were dear to the 18th century. He wrote two plays as exemplars of the new genre, ***Le Fils nature1*** (published 1757, first performed 1771; ***Dorval; or, The Test of Virtue,*** 1767), and ***Le Père de famille*** (1758; ***The Father,*** translation published 1770). Other writers followed Diderot's example, notably Michel-Jean Sedaine with ***Le Philosophe sans le savoir*** (1765; ***The Duel;*** 1772) and Sébastien Mercier with an adaptation of ***Rorneo and Juliet*** under the title ***Les Tombeaux de Vérone*** (published 1782). The new genre was important because it prepared the way for the Romantic drama of the 19th century.

Poetry. There are several poems of merit among the ***Odes chrétiennes et philosophiques*** (published 1771) of Le Franc de Pompignan. Louis Racine, son of the great Racine, deserves mention for his poem ***La Religion*** (1742), which expresses the austere but unorthodox sentiments of Jansenist Catholicism in language that echoes that of Pascal, as does Charles-Pierre Colardeau for his popular epistles, the ***Héroïdes.*** The principal poetic figure until late in the century was, however, Voltaire, who alone in his age was able to write a successful epic, ***La Henriade*** (1723). Many of his poems are biting satires, while some, such as the ***Poème sur le désastre de Lisbonne*** (1756), show great compassion.

In the second half of the century Jacques Delille published *Les Jardins* (1782; *The Gardens,* 1798), a descriptive and didactic poem in four books, and Antoine-Léonard Thomas wrote an *Ode sur le temps* (1762; "Ode on Time"). But greater than any of these was André Chénier, who was born in Constantinople and died on the guillotine. His poems, such as *Odes, Élégies,* and *Iambes* (*Oeuvres complktes,* published 1819), show personal emotion and chastened classical beauty.

Manon Lescaut

The novel. The novel in the 18th century was in the ascendant. Alain-René Lesage, after *Le Diable boiteux* (1707; *The Devil upon Two Sticks,* 1708), a satirical tale, published *Gil Blas* in three stages at ten-year intervals (1715, 1724, 1735). In this novel, which owed much to Spanish literature, the travels of Gil Blas are described through good and ill fortune across Spain. Satirical portraits are numerous. But when Abbé (Antoine-François) Prévost (d'Exiles), in the last volume of his *Mémoires et aventures d'un homme de qualité qui s'est retiré du monde,* produced *Manon Lescaut,* the novel advanced far beyond this. The heroine Manon is beauty and treachery incarnate, while her lover des Grieux, whose conscience is always feebler than his passion, represents the heightened emotionalism that was known as *sensibilitk.* The novels of Marivaux (*La Vie de Marianne* [1731–41; *The Life of Marianne,* 1736–42] and *Le Paysan parvenu* [1735–36; *The Fortunate Peasant,* 17351) are comparatively placid. The vigour of Prévost is found also in *La Nouvelle Héloïse* (1761) by Jean-Jacques Rousseau, inspired by the English writer Samuel Richardson. This novel in letter form enjoyed great renown. The characterization is vivid, the descriptions of natural beauty, unusual in the 18th century, are frequent; the work represents the climax of *sensibilitk* in heralding Romanticism. This line of development was further marked by the publication of the exotic novel *Paul et Virginie* (1787) of Bernardin de Saint-Pierre; *Les Liaisons dangereuses* (1782; *Dangerous Acquaintances,* 1924), also in letter form, of Choderlos de Laclos; and Diderot's novels. The philosophical short stories of Voltaire, such as *Zadig* (1747) and *Candide* (1759), combine brilliant political satire with a crisp and witty style and retain their brilliance after two centuries.

Rousseau's *Confessions*

Comparable to the growth of the novel in the 18th century was that of the autobiographical memoir, which is now useful to both the historian and the literary historian. The *Mémoires* of the Duc de Saint-Simon provide a valuable source of information about court life and political activity from 1691 to 1723. The other important figure was Rousseau, whose *Confessions* (written 1765–70; published posthumously, 1781–88) are frankly and almost morbidly introspective. They give a character analysis that is of rare penetration and set forth with great literary skill. It was a new kind of autobiography, which showed Rousseau as a pre-Romantic.

The Enlightenment. The 18th century in France was remarkable less for the conventional genres of literature than for the development of its thought, the currents of which combined to form what is known now as the Enlightenment. A new orientation, skeptical and rationalist, had been given to French thought by Fontenelle and Bayle and by translations of the English philosopher John Locke. The *Lettres persanes* (1721; *Persian Letters,* 1722) of Charles-Louis de Secondat de Montesquieu contained more advanced ideas, clad in a seductively witty form: the greater importance of morality than of faith; religion viewed primarily as a social phenomenon, stripped of its revealed elements and reduced to the light of reason; the desirability of religious toleration; and the iniquity of despotism. These notions, new to the 18th-century French reader, stimulated thought and shook prejudice, and the *Lettres persanes* enjoyed great success.

Deist and atheist treatises circulated widely during the next decade. Henri de Boulainvilliers, biographer of Muhammad, argued for the rights of the nobility against the central government and produced a celebrated theory of the Germanic origin of the French state in his *Histoire de l'ancien gouvernement de la France* (1727).

Discussion of similar political themes, often deceptively innocuous, occurred at the Club de l'Entresol, where nobles and bourgeois met as equals. Established in 1724, it was organized by the abbé Alary and included the abbt de Saint-Pierre, René-Louis, marquis d'Argenson, later for a short time foreign minister, and, at least once, Montesquieu. Discussions were uninhibited and opinions unorthodox. Certainly they were displeasing to authority, for the club was dissolved in 1731 by the chief minister, the Cardinal de Fleury.

Voltaire and Montesquieu

Great developments came in the next 20 years, the first person responsible being Voltaire, in whose *Lettres philosophiques* or *Lettres sur les Anglais* (1734), criticism of the clergy, criticism of the nobility, and mockery of out-of-date philosophers were expressed in the simplest language and in a brilliant mixture of gentle raillery and mordant satire. The work's two main positive achievements were the presentation of English civilization, by inference, as a model to be imitated and the introduction on a popular level of the philosophy of Locke. After 1734, sensationalism, the theory that all ideas come from the senses, was one of the central beliefs of the French Enlightenment. The *Lettres philosophiques* was condemned by the Parlement, or court of judicature, of Paris and ordered to be burned.

In the same year appeared Montesquieu's *Considerations sur les causes de la grandeur des Romains et de leur décadence* (1734), in which the underlying causes—physical, intellectual, military, and political—of the greatness and decline of Rome are set forth. Many comments and analogies make the work one of actuality, and it contains political theory as well as historical method. The hatred of despotism shown by Montesquieu was expressed also by Fénelon in his *Examen de conscience d'un roi* (first published 1734; *Proper Heads of Self-examination for a King,* 1747).

Alexander Pope's *Essay on Man* was printed in French more than 60 times before 1789, and the doctrines of order, harmony, and optimism were welcomed by a public already prepared for them by the philosophy of Gottfried Wilhelm Leibniz. Voltaire's seven *Discours en vers sur l'homme* (1738; "Discourses in Verse on Man") were directly inspired by the *Essay on Man.*

Vigorous propaganda in favour of the ideas of Locke is the keynote of *La Philosophie du bon sens* (1737; *Philosophical Dissertations on the Uncertainty of Human Knowledge,* 1753) by the Marquis d'Argens. The same task was undertaken for Sir Isaac Newton, first by the astronomer and mathematician Pierre-Louis Moreau de Maupertuis and then by Voltaire in his *Éléments de la philosophie de Newton* (1738). The increased receptiveness of public opinion is shown by the publication in 1743 of a tiny volume of five treatises bearing the significant title *Nouvelles libertés de penser* ("New Freedom in Thought"); two of the essays have been attributed to Fontenelle and one, the most interesting, "Le Philosophe," to the grammarian and contributor to the *Encyclopédie* Ctsar Chesneau Dumarsais. "Le Philosophe" describes the philosopher as a human machine that, by means of its mechanical constitution, reflects on its movements; he is moved by reason. This notion of a Philosophe, or sage, as a member of a non-Christian elite, guided by reason, more inclined to doubt than to believe, and leaning to materialism was characteristic of the French Enlightenment. It was the 18th century's first clear definition of the term.

The *Introduction à la connaissance de l'esprit humain* (1746; "Introduction to the Understanding of the Human Spirit") of Luc de Clapiers, marquis de Vauvenargues, contains elements of Utilitarianism and traces of influence of the Earl of Shaftesbury's *Inquiry concerning Virtue,* translated into French in 1745 by Diderot, whose *Pensées philosophiques* (1746; *Philosophic Thoughts,* 1916), in which he argued clearly and succinctly for Deism, was at once burned by the public executioner. Diderot followed this by a *Lettre sur les aveugles* (1749; *An Essay on Blindness, c.* 1750), an outspoken examination of the moral consequences of sensationalism, for which he was imprisoned. *Les Moeurs* (1748; *Manners,* 1751), by François-Vincent Toussaint, was a bulkier defense of Deism and natural morality. It enjoyed great popularity and was publicly burned. The more extreme works of Julien Offroy de La Mettrie argued for complete materialism; and he openly denied the existence of the soul in his *Histoire naturelle de l'âme* (1745; "Natural History of the Soul"). In 1748 was published Montesquieu's *De E'esprit des lois* (*The Spirit of Laws,* 1750), one of the great monuments of French thought. Preferring, in relation both to religious and to political systems, to explain rathei than to judge, Montesquieu nevertheless found himself engaged in bitter controversy. His main legacy was his theory of constitutional monarchy with separation of the powers, and the theory of the influence of climate on the character of peoples. *De l'esprit des lois* gave to French 18th-century philosophy a political bias that had not previously been conspicuous.

There had also been some anti-philosophical literature. The abbé Jean-Baptiste Gaultier sought to prove the impiety of the *Essay on Man* and of the *Lettres persanes;* Diderot's *Pense'es philosophiques* was assailed by *Pense'es raisonnables* and *Pense'es anti-philosophiques;* many critiques were written of *De l'esprit des lois,* but the best anti-philosophical work of the first half of the century was the *Anti-Lucretius* (1747) of Cardinal Melchior de Polignac, who endeavoured in dignified Latin to defend the philosophy of Descartes against the growing materialism of his day.

The *Encyclopédie* of Diderot and d'Alembert

In the second half of the century the philosophical movement was marked by great achievement and by violent opposition. This is particularly evident in the case of the *Encyclope'die.* Diderot and Jean d'Alembert were put in charge of the project, which soon expanded into the production of an original compendium of knowledge with a theoretical basis of the study of knowledge and cultural history, outlined by d'Alembert in his *Discours préliminaire.* Many of the articles expressed the new ideas in relation to religion and politics. At two stages in the course of publication the *Encyclope'die* encountered grave difficulties. The first occasion was when one of the *Encyclopédie*'s contributors, the abbé Jean-Martin de Prades, was censured for heresy because of a thesis he had written; the second was a result of the coincidence of the publication of some dangerous articles (notably one by d'Alembert on Geneva) with a crisis provoked by an attempt on the King. Diderot succeeded with the aid of the chevalier Louis de Jaucourt in bringing the work to completion in 1765. This and the Comte de Buffon's monumental *Histoire naturelle* (1749–1804), which covered geology, botany, and zoology with remarkable penetration, contributed greatly to the advancement of knowledge. More significant, however, was its contribution to the theory of progress, belief in which is found in most philosophical works of this period; it was the theme of a lecture at the Sorbonne in 1750 by the future chief minister Turgot; it inspired utopian writings and received its final expression in a work that sums up all the aspirations of the 18th century, the *Esquisse d'un tableau historique des progrès de l'esprit humain* (1795; *Sketch for a Historical Picture of the Progress of the Human Mind,* 1955) by the mathematician, philosopher, and revolutionary the Marquis de Condorcet.

An apparent dissenter from this theory of progress was Jean-Jacques Rousseau, who argued for the natural goodness of man and the corrupting influence of society in his *Discours sur les sciences et les arts* (1750; "Discourses on the Sciences and Arts") and *Discours sur l'origine et le fondement de l'inégalité parmi Ies hommes* (1755; *A Discourse upon the origin and foundation of the inequality among nzankind,* 1761), in which the institution of property is denounced and the right of insurrection against a tyrant is asserted. This was followed by the boldly outspoken Socialist work *Le Code de la nature* by Morelly. He denounced property as the cause of all evil and laid down the principles of good society with a constitution and code of laws. Étienne de Condillac in his *Traite' des systèmes* (1749) surveyed previous philosophies and sought a means of avoiding their errors. He laid great stress on the linguistic element in philosophy. His *Traité des sensations* (1754) is the most rigorously sustained expression of the theory of sensationalism.

The philosopher Claude-Adrien Helvétius, in his well-written treatise *De l'esprit* (1758; "Of the Mind"), attacked all forms of morality based on religion and set forth the principles of utilitarianism. The publication of *De E'esprit,* which appeared openly and with royal privilege carelessly given, provoked a grave crisis. Helvétius was made to recant, publication of the *Encyclope'die* was stopped, and *De l'esprit* was burned, along with various other philosophical works, including Voltaire's innocuous *Poème sur la loi naturelle.*

The growth of atheism and realism

The fortunes of the Philosophes rapidly and surprisingly improved, however, because of the government's hostility to their worst enemy, the Society of Jesus, culminating in 1764 in the suppression of the order in France. The *Encyclope'die* was allowed to resume and publication was completed. Meanwhile, Rousseau published *Du contrat social* (1762; *The Social Contract,* 1902). In it he declared that primitive man is free from all constraint, that society comes into existence by man's free acceptance of the social contract, and that in any legitimate society the sovereign power rests in the people. Two years later appeared the posthumously published *Considérations sur le gouvernement ancien et présent de la France* by the Marquis d'Argenson, who argued for an extension of democracy within the framework of the French monarchy.

Almost simultaneously with *Du contrat social,* Rousseau published his *Émile, ou de I'e'ducation,* which evoked a great storm of criticism. The "Profession de foi du vicaire savoyard" ("Profession of Faith by a Savoyard Vicar"), which it contains, is perhaps the century's most eloquent plea for constructive Deism, while the book as a whole had a profound and lasting influence on European education.

An unknown parish priest, Jean Meslier, left a lengthy denunciation of all religion and an advocacy of atheism, and in 1762 Voltaire published an *Extrait des sentiments de Jean Meslier,* in which Meslier's hostility to Christianity retained its vigour of expression. Paul-Henri Dietrich, baron d'Holbach, followed up *Le Christianisme dévoilé* (1761; *Christianity Unveiled,* 1795) with a series of anti-religious treatises and in 1770 published his most famous work, the *Système de la nature.* Here the anti-religious thought of the 18th century reaches its climax. The soul is defined as a false idea, God is denied, and necessity is declared to govern all human actions.

From the finality of d'Holbach's views there could be no advance, and in relation to religion and metaphysics it is the Enlightenment's extreme position. Meanwhile, however, Diderot, in such dialogues as the *Supplément au voyage de Bougainville* (written 1772; published 1796) and *Le Rêve de d'Alembert* (written 1769; published 1830; "D'Alembert's Dream") showed materialist doctrine resting on a personal interpretation of natural science and particularly of biology. With great suppleness of mind Diderot asked more questions than he answered.

The social and political thought of the Enlightenment was taken further by Abbé Raynal in his *Histoire philosophique et politique des établissements et du commerce des Européens dans les deux Indes* (1770, revised 1774 and again in 1780 with daring additions; "Philosophical and Political History of the European Establishment and Commerce in the Two Indies") and by Abbé Mably, who expressed some Socialistic ideas in *De la législation* (1776), while d'Holbach's own *Système social* (1773) is the best French exposition of a Utilitarian political philosophy.

After the accession of Louis XVI in 1774 there was little new in French thought for many years. The Philosophes had overstated their case; they nevertheless handed on what was to be a permanent acquisition to human thought.

Provencal. In the 18th century, priests were mainly responsible for the literary output of Languedoc. The *Sermon de moussu Sistre,* of the abbé J.-B. Favre, is a masterpiece. He also wrote a mock-heroic poem *(Lou Sikge de Cadaroussa).* a novel depicting the country manners of the time (*Istoria de Jan l'an pres*), and two comedies. Another priest, Jean-Claude Peyrot de Pradinas, published *Les Quatre Saisons* in 1781. Two genuine poets are the brothers Rigaud of Montpellier: Auguste and Cyrille. Pierre Hellies of Toulouse, a poet of the people, has a certain rough charm. In Provence, Toussaint Gros, of Lyons, holds undisputed sway. His style and language are admirable, but unfortunately he wasted his gifts largely on trival occasional pieces. In Gascony the most celebrated poet is Cyrien Despourrins.

Walloon. Use of the patois broadened in the 18th century. The success of comic opera at Liège resulted in several noteworthy librettos. *Li Voyadjue di Tchaudfontaine* (1757; "The Journey to Chaudfontaine"), *Li Lîdjwès Egagî* ("The Enlisted Liégeois"), and *Les Hypocondres* ("The Hypochondriacs") resulted in the formation of the Théâtre Liégeois. In lyric poetry the cramignon (a type of song for dancing) and the *Noels* (Christmas carols and dialogue) adopted a genuine realism.

SWISS LITERATURE IN THE 18TH CENTURY

French Swiss. Although the beginnings of French Swiss literature proper go back to the Reformation, it was not until the later 18th century that French Swiss writers of international importance emerged. The chief of these was Jean-Jacques Rousseau, whose work is discussed above. Rousseau was born in Geneva and described himself in *Du contrat social* as a "citizen of a free state." He shared the political and psychological conceptions of all Switzerland, as can be seen in *Considérations sur le gouvernement de Pologne* ("Considerations on the Government of Poland"). Swiss subject matter was also dealt with by H.B. de Saussure, one of the founders of modern geology, in his *Voyages dans les Alpes* (1779–96).

German Swiss. The beginning of 18th-century literature in German-speaking Switzerland is marked by the works of a Bernese poet, Albrecht von Haller, whose "Die Alpen" gives expression to the beauty and sublimity of Alpine scenery and the moral purity of its inhabitants. Salomon Gessner is read for his prose pastoral idylls. The most important work of Johannes von Müller, *Geschichten schweizerischer Eidgenossenschaft* (1786–1808; "The History of the Swiss Confederation"), though a fragment, became the most representative piece of historical writing in German Neoclassicism and had a far-reaching influence on the style of historical writing. A Zürich school of criticism, including J.J. Bodmer and J.J. Breitinger, opposed French Rationalism and Classicism and promoted an appreciation of English literature in Germany. Their work started a revival of religious and national conceptions. J.H. Pestalozzi wrote the first village story in German but included in it the nucleus of his later meditations on the nature and destiny of man.

GERMAN LITERATURE IN THE 18TH CENTURY

The age of Enlightenment. If religion was the dominant factor in German intellectual and spiritual affairs in the 17th century, the Enlightenment of the 18th brought about a reaction. Man now claimed to be able to understand the universe by virtue of his possession of the divine gift of reason. Empirical and Idealist thinkers alike were united in rejecting traditional authority. In a rational universe, governed by the law of cause and effect, there was room neither for mystery nor for the doctrines of original sin and predestination. Evil was the result of irrational conditions of life, and man had it in his power to improve his lot by the pursuit of science and education. An optimistic belief in human perfectibility was generally held; it lay in the cultivation of reason and tireless effort in the service of human improvement. The man of the world being more highly regarded than the devout Christian, good taste and common sense came to be demanded, and literature assumed a markedly didactic character.

Rationalism. The intellectual life of Germany had recovered rapidly from the social upheavals of the Thirty Years' War. The foundations of Rationalism were laid by Gottfried Leibniz, the first of the great German philosophers. With him, the relationship of God and man to each other ceased to be considered within the limits of Christian dogma. German religious life was marked by a revival of Pietism, which left its traces in the sphere of religious poetry. The main emphasis lay not in conformity but in the individual's spiritual experience.

The influence of English translations

In literature the new ideas soon began to emerge. Translations and imitation of the English *Spectator*, *Tatler*, and *Guardian* helped to regenerate literary taste. One of the most marked features of German literature in the 18th century was the progressive influence of English literature: first, of Joseph Addison, Jonathan Swift, Daniel Defoe, and Alexander Pope; later of James Thomson, John Milton, and Edward Young. Samuel Richardson had much effect upon the growth of the moral novel, while Young's *Conjectures on Original Composition* heralded a new epoch in German literature that was to be profoundly affected by the Scots poet James Macpherson's *Ossian*, Bishop Percy's *Reliques of Ancient English Poetry*, and Shakespeare—the epoch of the *Sturm und Drang* ("Storm and Stress") movement.

The reaction against Rationalism. Between 1724 and 1740 the critic Johann Christoph Gottsched succeeded in establishing in Leipzig literary reforms in accord with French 17th-century Classicism. He purified the stage and laid down principles according to which good literature was to be produced and judged. The limitations of Gottsched soon drew resistance from two Swiss scholars, J.J. Bodmer and J.J. Breitinger. Basing their arguments on John Milton's poem *Paradise Lost*, they insisted that the imagination should not be dominated by reason. The effects of the controversy appeared toward the middle of the century in a group of Leipzig writers of Gottsched's own school, the Bremer Beitrager, or "Bremen Contributors," as they are usually called after the paper in which they published their work. In this—the *Neue Beiträge zum Vergnügen des Verstandes und* Witzes—there appeared in 1748 the first installment of an epic by F.G. Klopstock, *Der Messias* (completed 1773; *The Messiah*, first complete verse translation 1821), whose theme created a sensation when the first cantos appeared. Klopstock's genius was, however, more suited to the lyric, and his odes, in which both patriotic and sentimental themes were prominent, gained an immense reputation. Friedrich von Hagedorn in Hamburg showed to what perfection occasional verse could be brought, while Ewald Christian von Kleist wrote admirable sentimental nature poetry. Meanwhile, a rising interest in Germanic antiquity aided the growth of the "bardic" movement led by H.W. von Gerstenberg, F.F. Kretschmann, and Michael Denis, the translator of Macpherson's *Ossian*.

The influence of Lessing. As Klopstock had been the first of modern Germany's inspired poets, so Gotthold Ephraim Lessing was the first critic who brought credit to the German name throughout Europe. Like Gottsched he had unwavering faith in Neoclassicism, but classic meant for him, as for his contemporary J.J. Winckelmann, Greek art and literature rather than French pseudo-Classicism, though it is true that Lessing's own exposition of Aristotle's theory of tragedy was full of the moral preoccupations of the Enlightenment. He looked to England rather than to France for the regeneration of the German theatre. His own dramas were pioneer works in this direction. *Miss Sara Sampson* (first performed 1755) was a bourgeois tragedy on the English model; *Minna von Barnhelm* (1767), a comedy in the spirit of George Farquhar; in *Emilia Galotti* (1772) Lessing remodeled the "tragedy of common life" in a form that came to be acceptable to the *Sturm und Drang;* and finally in *Nathan der Weise* (1779; *Nathan the Wise*, 1781) he won acceptance for iambic blank verse as a medium for elevated drama.

Lessing's dramatic works

Because of Lessing, German literature made a great leap forward beyond the feeble achievements of the first half of the century. The domestic tragedy, its plot centred upon the problem of class distinction, foreshadowed plays involving marked political and social criticism in the *Sturm und Drang* period, while *Nathan* was an important forerunner of the "drama of ideas" of Weimar Neoclassicism. Lessing's theoretical work placed criticism in the forefront of affairs in literary Germany. His sharp rejection of descriptive poetry had a great effect upon the writing of the next generation, while his attack upon the literary authority of France prepared the way both for a greater attention to English examples and for the search for native originality.

C.M. Wieland

To the widening of the German imagination C.M. Wieland contributed by introducing remote and exotic literary settings, largely under French inspiration. With the exception of his verse-romance ***Oberon*** (published 1780), his work fell into neglect; he did excellent service, however, to the development of German prose fiction with his psychological novel ***Agathon*** (1766–67) and his satire ***Die Abderiten*** (1774; "The Simpletons"). Wieland had a considerable following, and the German novel owed much to the example of ***Agathon,*** but its groundwork and form were borrowed from English models.

The age of Goethe: Sturm und Drang. The period of Neoclassicism and Romanticism, the greatest epoch in German literature, fell within the lifetime of Johann Wolfgang von Goethe. The age of Goethe went beyond the Enlightenment's substitution of science for religion, inasmuch as it ascribed to science only a peripheral position in relation to the ultimate questions of life. It insisted upon the value of feeling in face of the limitations of reason. Impulse, instinct, emotion, fancy, and intuition acquired a quasi-religious significance as being the links that connect man with divine nature. The ideal of the classical age, soon to be called ***Humanität*** ("humanness"), was that of the fully developed personality in which intellect and feeling should be harmoniously balanced. Three phases may be distinguished in the evolution of this new outlook: ***Sturm und Drang,*** Classicism, and Romanticism.

Goethe belonged to and profoundly affected the movement known as ***Sturm und Drang*** ("Storm and Stress"), which aimed at overthrowing the cult of Rationalism. Seeds of the new growth were to be found in Klopstock, in the spiritual force of Pietism, and in the rising resistance to French Classical taste, while the influence of Rousseau, Edward Young, and James Macpherson and of the recently translated Shakespeare was of prime importance. Nature, genius, and originality were the slogans of the new epoch. An increasingly oppressive sense of dissatisfaction with the civilization of the day assailed the new generation. The cult of nature completely replaced orthodox religion. No law was recognized as being above the individual conscience. The standard outlook thus demanded unceasing effort, like that of Faust. Strain, protest, revolt, yearning, disillusion were obvious on all sides, and egotism became a dominating feature in literature and thought.

The influence of Herder

The critical writings of H.W. von Gerstenberg stressed personal feeling in matters of taste, but the chief impetus came from Johann Georg Hamann who emphasized the inspirational and symbolical function of language. His pupil was Johann Gottfried von Herder, who grasped, as no thinker before him had done, the idea of historical evolution and engendered the main current of the ***Sturm und Drang.*** Herder's doctrine of ***Humanitat*** was fundamental to German Neoclassicism. He stressed the value of historical continuity in literature and pointed to the folk songs, ballads, and romances of the Middle Ages as sources of inspiration to which Bishop Thomas Percy's ***Reliques of Ancient English Poetry*** had recently drawn attention. The ***Reliques*** also affected the poets who founded in 1772 the Gottinger Hain, or, literally, Gottinger Grove, and who belonged mainly to the peasant class or the lower bourgeoisie; J.H. Voss, the leader of the group and author of the famous idyll ***Luise*** (1795), was a typical North German peasant.

The ***Sturm und Drang*** was intimately associated with Goethe. Goethe had made the acquaintance of Herder, who interested him in Gothic architecture, the ***Volkslied*** ("folk song"), and Shakespeare. A pamphlet, "Von deutscher Art und Kunst" (1773; "Concerning German Nature and Art"), was a kind of manifesto of the ***Sturm und Drang.*** The new ideas seemed at once to set Goethe's genius free. His ***Gotz von Berlichingen*** (published 1773), the first important drama of the ***Sturm und Drang,*** was followed by the first novel of the movement, ***Die Leiden des jungen Werthers*** (1774; ***The Sorrows of Young Werther),*** which made the author world famous. In all forms of literature he set the fashion for his time. The Shakespearean restlessness of ***Gotz von Berlichingen*** found imitators in J.M.R. Lenz, F.M. von Klinger, J.A. Leisewitz, H.L. Wagner, and Friedrich Müller. The dramatic literature of the ***Sturm und Drang*** was its most characteristic product; it was inspired by the desire to present upon the stage figures of Shakespearean grandeur impelled by gigantic passions, all considerations of plot, construction, and form being subordinated to character, and all accepted authority—literary, social, political, or moral—being rejected.

With the production of ***Die Rauber*** (1781; ***The Robbers,*** 1792) by Friedrich Schiller, the drama of the ***Sturm und Drang*** entered upon a new phase. Schiller's tragedy was more skillfully adapted to the exigencies of the theatre than those of his predecessors had been; it and the succeeding dramas, ***Die Verschworung des Fiesko zu Genua*** and ***Kabale und Liebe,*** were fine pieces of high promise. Germany owed to the ***Sturm und Drang*** period its national theatre; permanent theatres were established in these years at Hamburg, Mannheim, and Gotha, and the Burgtheater (now the Hofburgtheater) was founded at Vienna in 1776.

Neoclassicism. Self-discipline was lacking as a ***Sturm und Drang*** theme, and the movement soon exhausted itself. A more positive form of moral idealism appeared in the poetry of Goethe and Schiller, as well as in the philosophy of Immanuel Kant. The problem of freedom was rendered acute by the impact of the French Revolution, which German literature generally regarded as a warning. Schiller believed the antagonism between duty and inclination could be resolved once morality became "second nature" and this could be achieved only through the contemplation and production of beauty. Art thus acquired an educational function, and aesthetic education was one of the major objectives of Neoclassicism.

Goethe's Weimar period

For Goethe a new phase in his development began with his departure for Weimar in 1775, while after ***Don Carlos*** (1787) Schiller turned from poetry to study history and philosophy. The first 10 years of Goethe's life in Weimar were marked by his renewed friendship with Herder, by his public service as a minister of state, and by his emotional attachment to Charlotte von Stein. He did not achieve greater clarity in his ideas until after his sojourn in Italy (1786–88). In Italy he turned his attention to three dramatic works; he gave ***Iphigenie auf Tauris*** its final form, completed ***Egmont,*** and replanned ***Torquato Tasso. Wilhelm Meisters Lehrjahre (Wilhelm Meister's Apprenticeship,*** 1824), Goethe's most important novel, had become, by the time it appeared in 1795–96, a book on the conduct of life. It is an outstanding example of the ***Bildungsroman,*** or "educational" novel, a characteristic German novel form, and profoundly affected future practitioners of the genre.

Before ***Wilhelm Meister*** appeared, however, German thought and literature had arrived at that degree of stability in form and ideas essential to a great literary period. In the year of Lessing's death (1781), Kant had published his ***Kritik der reinen Vernunft (Critique of Pure Reason).*** Under the influence of Kant, Schiller turned to the study of aesthetics, the first fruits of which were his philosophical lyrics and his treatises "Über Anmut und Wiirde" (1793), and, between 1795 and 1796, "Briefe iiber die ästhetische Erziehung des Menschen" ("Letters on the Aesthetic Education of Man") and "Über naive und sentimentalische Dichtung" ("On Naive and Sentimental Poetry").

The years 1794 to 1805, when Goethe and Schiller were united in close friendship in Jena and Weimar, mark the culmination of literary Neoclassicism. Schiller provided the theoretical basis; Goethe, as director of the ducal theatre, influenced the whole practice of dramatic production in Germany. Under his encouragement Schiller turned from philosophy to poetry and between 1798 and his death in 1805 wrote a series of Classical dramas that are Germany's greatest: the trilogy ***Wallenstein, Maria Stuart, Die Jungfrau von Orleans (The Maid of Orleans),*** Die Braut von Messina (The Bride of Messina), Wilhelm Tell, closing with the fragment *Demetrius.*

Apart from these two great poets, however, literature was in no very healthy condition; the stage was dominated by the extraordinarily popular plays of A. von Kotzebue; and there is a wide gap between K.P. Moritz's Anton Reiser or the philosophical novels which F.M. von Klinger wrote in his later years and Goethe's Wilhelm *Meister*.

Goethe's Faust

The supreme work of Goethe's latter years is Faust, Germany's greatest contribution to the literature of the world. In Part I (1808) is set out Faust's despair, his pact with Mephistopheles, and his love for Gretchen; Part II (1832) covers the magician's life at court, the winning of Helen of Troy, and Faust's purification and salvation. The doctrine of the fulfillment of life by striving and selfless activity revealed in Faust was fundamental to Goethe's mature writing. The tragic novel Die *Wahlverwandtschaften* (1809) had insisted on the theme of renunciation. Wilhelm Meisters *Wanderjahre* (1821–29; Wilhelm Meister's Travels, 1827), with its social utopianism and teaching of restraint, offered a criticism of the rise of industrialism. The autobiographical Dichtung und Wahrheit (1811–33; Poetry and Truth: From My Own Life, 1908), dramatic pieces, scientific writings, and lyrics indicate the manysidedness of Goethe's achievement.

The first phase of the Romantic movement. The Romantic movement began not so much as a protest against the Neoclassicism of Weimar but as a radical extension of some of its beliefs and interests, especially at first, its emphasis upon Greek antiquity, longed for like some lost paradise. The Romantic poet could create his own world from reality or from fancy and he could turn whatever he liked into poetry. The nature of individuality and its modes of approach being infinitely varied, there was to be no end to the innovations made in content and style by the great wealth of literary talents who now emerged all over Germany and from various strata of society. The rising generation felt free and able to revise all accepted representative values, not only in art and literature but in other spheres as well. The subconscious became a subject of serious study and the supernatural came into vogue, while in religion, Romantic subjectivism led to mysticism. In the evolution of German Romanticism no small part was played by the philosopher J.G. Fichte and the theologian F.D.E. Schleiermacher.

Holderlin and Jean Paul

It was inevitable that disappointment and disillusion should result from this new brand of egotism in thought and literature. Friedrich Holderlin, one of Germany's greatest lyrical poets and author of the novel *Hyperion* (1797–99), grew up as an admirer of Schiller; he sank into despair on realizing the impossibility of his longing for an age of heroic idealism and beauty such as that of ancient Greece. Johann Friedrich Richter, known as Jean Paul, was a disciple of Herder. His sentiment, ingenuity, whimsical style, and lavish detail gained for his shapeless novels a vast degree of popularity; his sustained attention to contemporary life was a new feature, and his work foreshadowed the Dorfgeschichte, or "village story," of later decades. His principal novels, written between 1795 and 1804, were *Hesperus*, *Quintus Fixlein*, Siebenkas, Titan, and Flegeljahre ("The Awkward Age").

The first Romantic school proper was founded at Jena in 1798. Ludwig Tieck, a leading member of the school, early developed a lifelong enthusiasm for Shakespeare and the Elizabethan and Spanish drama. The theoretical basis of Romanticism was laid down by the two brothers August Wilhelm and Friedrich von Schlegel. These Romantic critics maintained that the first duty of criticism was to understand and appreciate. The greatest imaginative achievement is to be found in the lyrics and fragmentary novels of Novalis (pseudonym of Friedrich von Hardenberg), in which Christian mysticism, romantic medievalism, and symbolism transfer the reader into the realm of the *Märchen*, or fairy tale, particularly in Hrinrich von Ofterdingen (1802). The universal sympathies of the movement were exemplified by many admirable translations, of which the greatest was A.W. Schlegel's translations of Shakespeare's plays. The critical essays and aphorisms of F. von Schlegel argued that modern (or Romantic) literature should deal with modern life in all its manifestations, and they put forward *Wilhelm* Meister as the model to be followed.

DUTCH LITERATURE IN THE 18TH CENTURY

The appearance in 1669 of the first literary society (dichtgenootschap) was an omen of a decline in Dutch literature lasting through the 18th century. Material well-being sapped the vitality of the nation. Even the talented poet Hubert Poot suffered from the delusion of his day that rococo flourish and prescribed form were the criteria of poetry. Prose, too, now consisted almost exclusively of translations and bombastic disquisitions. Significantly, Justus van Effen wrote in French before he founded De *hollandsche* spectator (1731–35). The simple style of his moralizing essays contrasts with the work of his contemporaries, and his descriptive realism links him with two popular authors on the Dutch domestic scene, Elizabeth Wolff-Bekker and Aagje Deken.

The first Dutch novel

Elizabeth Wolff-Bekker, essayist and poet, blended rationalism and romanticism in her creative genius. Her association with Agatha Deken as friend and fellow writer produced Sara Burgerhart (1782) in letter form, dedicated to "Dutch young ladies," the first Dutch novel. Remarkable for its wit and realism, it owed much to the English novelist Samuel Richardson. Elizabeth's intelligence and humour also dominated the original purpose of morally educating the young in their eight-volume *Willem Leevend* (1784–85).

By the end of the century a number of poets, including Hieronymus van Alphen, Rhijnvis Feith, Jacobus Bellamy, and Antony Staring were reacting against Neoclassicism, but only Staring achieved more than an echo of German sentimentalism, through his descriptive talent and subtlety. His contemporaries preferred Willem Bilderdijk, whose genius was almost smothered with excesses of rhetoric, but whose Protestant zeal had repercussions in the Réveil ("Revival"), a spiritual movement which gave impetus to the literary revival of the 1830s.

ITALIAN LITERATURE IN THE 18TH CENTURY

Tragedy. In 1713 Francesco Scipione Maffei, an antiquary of Verona, produced Merope—a tragedy which met with great success and pointed the way toward reform of the Italian tragic theatre. Between 1726 and 1747 Antonio Conti—an admirer of Shakespeare—wrote four Roman tragedies in blank verse. It was not until 1782 and the writing of Saul, however, that an important Italian tragedian finally emerged in the person of Vittorio Alfieri. In strong contrast with Pietro Metastasio's and Paolo Rolli's melodramtni—librettos set to music or sometimes performed as plays in their own right—Alfieri's tragedies are harsh, bitter, and unmelodious. He chose classical and biblical themes and through his hatred of tyranny and love of liberty he aspired to move his audience with magnanimous sentiments and patriotic fervour. Alfieri's influence in the Romantic period and the Risorgimento was immense, and, like Carlo Goldoni, he wrote an important autobiography, which gives a revealing account of his struggles to provide Italy with a corpus of drama comparable with that of the other European nations.

Comedy. Metastasio's reform of the operatic libretto was paralleled in the mid-18th century by Goldoni's reform of comedy. Throughout the 17th century the commedia dell'arte—a colourful pantomime of improvisation, singing, mime, and acrobatics, often performed by actors of great virtuosity—had gradually replaced regular comedy, but by the early 18th century it had degenerated into mere buffoonery and obscenity with fixed characters and mannerisms. The dialogue was mostly improvised, and the plot—a complicated series of stage directions, known as the scenario—dealt mainly with forced marriages, star-crossed lovers, and the intrigues of servants and masters. Goldoni succeeded in replacing this traditional type of improvised farce with comedies whose composition was preserved in a written script. His characters are acutely described, but, unlike Molière, he did not plunge into psychological depths. He portrayed the Venetian scene especially with wit and vigour, writing many of his best comedies in Venetian dialect. Goldoni's rival and a bitter controversialist, his fellow-Venetian Carlo Gozzi also wrote comedy and satirical verse.

The world of learning. Giambattista Vico, Ludovico Antonio Muratori, Apostolo Zeno, and Scipione Maffei were writers who reflected the awakening of historical consciousness in Italy. Muratori collected the primary sources for the study of the Italian Middle Ages; Vico, in the *Scienza nuova* (1725–44; "New Science"), investigated the laws governing the progress of the human race and from the psychological study of man endeavoured to infer the laws by which civilizations rise, flourish, and fall. Giovanni Maria Mazzuchelli and Gerolamo Tiraboschi devoted themselves to literary history. Literary criticism also attracted attention; Gian Vincezo Gravina, Vico, Maffei, Ludovico Antonio Muratori, and several others, while advocating the imitation of the classics, realized that it should be cautious and thus anticipated critical standpoints that were later to come into favour.

The Enlightenment. With the end of Spanish domination and the spread of the ideas of the Enlightenment from France, reforms were gradually introduced in various parts of Italy. The new spirit of the times led men—mainly of the upper middle class—to enquire into the mechanics of economic and social laws. The ideas and aspirations of the Enlightenment as a whole were effectively voiced in such organs of the new journalism as Pietro Verri's periodical *Il Caffè* (1764–66).

Parini and the literary revival

More than anyone else, Giuseppe Parini, the Alexander Pope or the Boileau of Italy, seems to embody the literary revival of the 18th century. In *Il giorno* (published in four parts, 1763–1801; "The Day"), a long social satire of the rights of blood, he described a day in the life of a young Milanese patrician and revealed with masterly irony, the irresponsibility and futility of a whole way of life. His *Odi* ("Odes"), which are imbued with the same spirit of moral and social reform, are among the classics of Italian poetry.

The satire in the *Sermoni* (1763) of Gasparo Gozzi (elder brother of Carlo) is less pungent, though directed at similar ends, and in his two periodicals—La *Gazzetta Veneta* and *L'Osservatore*—he presented a lively chronicle of Venetian life and indicated a practical moral with much good sense. Giuseppe Baretti—an extremely controversial figure who published a critical journal called *La Frusta Letteraria* ("The Literary Whip"), in which he castigated "bad authors"—had learned much through a lengthy sojourn in England, where his friendship with Samuel Johnson helped to give independence and vigour, if not always accuracy, to his judgments. The *Viaggi di Enrico Wanton* (1749–64), a philosophical novel in the form of an imaginary voyage by the Venetian Zaccaria Seriman, was the most all-embracing satire of the time.

SPANISH LITERATURE IN THE 18TH CENTURY

With the establishment of the Bourbon dynasty after the War of the Spanish Succession (1701–14), renewal of the country's intellectual life began. Numerous academies were created, the most influential being the Real Academia de la Lengua Española (now the Real Academia Española), founded in 1713 to maintain the purity of the language. Men of letters began again to study abroad and discovered how far Spain had deviated from the intellectual course of western Europe. A new spirit of inquiry into the national heritage caused scholars to go back and unearth forgotten medieval literature. Gregorio Mayáns y Siscar, librarian at the royal library, wrote the first biographical study of Spain's greatest novelist, Miguel de Cervantes. A church historian Enrique Flórez, embarking on a vast historical enterprise, *España sagrada*, helped resurrect the whole cultural background of medieval Christian Spain. Landmarks of even greater importance were the publication of the 12th-century epic *Poema de mio Cid*, the works of Gonzalo de Berceo, and Juan Ruiz' *Libro de buen amor*, all for the first time. From all this there resulted a debate between old and new that, waged throughout the middle decades of the century, compelled both sides to reason out their positions and marked the birth of a new critical approach to literature. Two names stand out: Ignacio de Luzán Claramunt, whose work on poetics launched the great Neoclassical polemic in Spain, and Benito Jerónimo Feijóo y Montenegro, a Benedictine monk who, in assailing error, prejudice, and superstition wherever he found them, made a monumental contribution to the intellectual emancipation of Spain. Imaginative prose produced the *Noches lúgubres* (published 1789–90; "Sad Nights") of José Cadalso Vázquez. looking forward to Romanticism, and the *Fray Gerundio* (1758) of José Francisco de Isla, a satire looking back to the picaresque novel.

First publication of the Cid

Poetry, moribund for nearly 100 years, raised a timid head in a small group at Salamanca, led by Diego González, which toward 1775 turned for inspiration to Luis de León, just as two decades later a group at Seville sought to revive the glories of Herrera. Juan Meltndez Valdés, who learned to think from the English philosopher John Locke and to feel from the English poet Edward Young, best exemplified the combination of new influences at work. A conscious artificer rather than a great poet, he helped poetry through the painful apprenticeship necessary to its rehabilitation.

In drama, the second half of the century saw a great battle over the classical "rules" (meaning chiefly the unities of place, time, and action). *La Raquel* (1778), by Vicente Antonio Garcia de la Huerta y Muñoz, showed the capabilities of the reformist school. It fell to Ramón de la Cruz to bridge the gap by his resurrection of the earlier *paso* (one-act prose skit) and longer *entremeses* (interludes) of Lope de Rueda, Cervantes, and Luis Quiñones de Benavente. Based on satirical observation of the Madrid scene, his one-act sketches did not transgress the unities or offend the purist; at the same time they delighted the public and brought the drama back to commenting on life and society. Leandro Fernández de Moratin applied the lesson to the full-length play and produced comedies imbued with deep social seriousness which were yet good theatre. His dialogue in *La conzedia nueva* (1792; "The New Comedy") and El *sí de las niñas* (1806; *The Maiden's Consent*, 1963) ranks among the best prose of the 18th century.

PORTUGUESE LITERATURE IN THE 18TH CENTURY

The 18th century, in Portugal as in Spain, was predominantly prosaic, even in poetry. Yet signs gradually appeared of a literary revolution which developed eventually into the Romantic movement. Luis António Verney poured scorn on prevailing methods of education in *Verdadeiro Método de Estudar* (1746; "True Method of Studying"). Men of liberal ideas went to France and England, and to their example were largely due the reforms that invaded every branch of letters. Of such were Alexandre de Gusmão, Xavier de Oliveira, Antdnio Ribeiro Sanches, José Correia da Serra, Avelar Brotero, and Francisco Manuel do Nascimento. New literary societies called *arcádias* cooperated in the task of reform. In 1720 King John V established the Academia Real da História Portuguesa, which counted among its members such men as Manuel Caetano de Sousa, author of a colossal *História Genealdgica de Casa Real Portuguesa* (1735–49; "Genealogical History of the Portuguese Royal House"). The Academia Real das Ciências, founded in 1779, initiated research into the study of Portuguese literary history. In its ranks were found nearly all the scholars of note at the end of the century, such as the ecclesiastical historian Frei Manuel do Cenáculo; a scientist, Antdnio Ribeiro dos Santos: João Pedro Ribeiro, perhaps his country's first modern historian; and critics Francisco Alexandre Lobo and Frei Fortunato de São Boaventura.

Establishment of the Portuguese Academy

In 1756 António Dinis da Cruz e Silva established the Arcádia Lusitana (or Ullissiponese), its first aim being the uprooting of Spanish influence. The bucolic verse of Dómingos dos Reis Quita signified a return to the native tradition of two centuries earlier. Sincerity and suffering spoke in the justly more famous *Marília de Dirceu* (1792), love lyrics in a pastoral setting, by Tomás António Gonzaga. In 1790, a Nova Arcadia came into being, its two most distinguished members being the rival poets Manuel Maria Barbosa du Bocage and José Agostinho de Macedo.

Outside the Arcadias stood the "Dissidents," among whom were at least two writers of distinction. Few Portuguese satirists have possessed such a command of ridicule as Nicolau Tolentino de Almeida, who painted the customs and follies of his day with devastating accuracy. Francisco Manuel do Nascimento (better known by his pseudonym, Filinto Elísio) addressed himself perseveringly to purifying the language and to restoring the cult of the 16th-century poets. A convert to Romanticism shortly before his death, he prepared the way for its triumph in Portugal.

The attempted revival of drama in Lisbon

Early in the century popular authors attempted a revival of the drama in Lisbon. The *Operas Portuguesas* (1733–41) of António José da Silva owe their name to the interspersing of the prose dialogue with arias, minuets, and *modinhas* (popular light songs). The Arcádia Lusitana sought to raise the tone of the stage, finding its ideals in the classics of antiquity or of the 16th century but immediate inspiration in the contemporary French theatre. Its efforts failed from lack of dramatic talent and of popular appeal. Manuel de Figueiredo was typical; setting out to write pieces "morally and dramatically correct," he produced 14 volumes of plays in prose and verse on national subjects. Utterly lacking in life, they were never acted.

SCANDINAVIAN LITERATURE IN THE 18TH CENTURY

Swedish. After the death of Charles XII (1718) and the collapse of his empire, a utilitarian attitude to life and letters gradually developed in Sweden. Olof von Dalin was the outstanding popularizer of the new ideas of the French and English Enlightenment. Educated at Lund, he later went to Stockholm and began to publish, anonymously, *Then swänska Argus* (1732–34; "The Swedish Argus"), a weekly periodical modelled on that of the Englishman Joseph Addison. One of the first serious journalistic ventures in Sweden, it marked the beginning of a new era, in which orthodoxy gave way to skepticism and enlightenment, baroque to classicism, and German influence to English and French; at this time the middle class began gradually to take over the function of chief upholder of literature. In *Argus* Dalin ridiculed the foibles of the capital and in *Sagan om hasten* (1740; "The Story of the Horse") he showed himself a master of allegorical satire. He also wrote some pseudo-classicist plays that, like many dramatic ventures of the early and mid-18th century, are academic and lifeless. An exception is *Den Svenska sprätthöken* (1740; "The Swedish Fop"), a comedy by Count Carl Gyllenborg.

With the second phase of the Enlightenment, marked by the influence of Rousseau, are associated Hedvig Charlotta Nordenflycht, the epicurean Gustav Philip Creutz, and his stoic friend Gustaf Fredrik Gyllenborg. In *Den Sörgande turturdufwan* (1743; "The Sorrowing Turtledove"), Fru Nordenflycht laments the death of her husband in highly personal lyrics. Creutz was a more sophisticated personality. He wrote little, but his few writings, of which the pastoral *Atis och Camilla* (1762) is the most important, reveal a mastery of form and versification.

The first Swedish novel

Prose—particularly the novel—developed more slowly. The first genuine novel was *Adalrik och Giöthildas äfventyr* (1742–44), by Jacob Mork and Anders Torngren, showing the influence of the Icelandic sagas. Only two 18th-century Swedish writers were of European reputation, and both were scientists: Carl von Linné (Linnaeus; 1707–78) and the mystic Emanuel Swedenborg (1688–1772).

The Gustavian period takes its name from King Gustav III (1746–92), a brilliant man and a patron of art and letters. He was especially interested in drama and opera and thanks to his patronage, a proper theatrical tradition was developed. Gustavus himself sketched out some works, the best of which was an historic opera *Gustaf Vasa*, which was finished in collaboration between Johan Henrik Kellgren and the composer J.G. Naumann. Kellgren, a great academic poet and arbiter of taste, ruled that Swedish literature should be modelled on classicist French patterns, but, beginning as a rationalist and satirist after the fashion of Voltaire, he reluctantly accepted pre-Romantic ideas later. In *Stockholmsposten*, the main organ of literary opinion in the capital, Kellgren used his polemical wit against Thomas Thorild, a truculent champion of individual genius. After Kellgren's death the controversy was carried on by Carl Gustaf af Leopold, who imposed pseudo-classical standards on the academy and applied them in his own rhetorical odes and tragedies. Johan Gabriel Oxenstierna did his most original work while a diplomat in Vienna; his *Skordarne* (1796; "Harvests") and his *Ode to Camilla* reveal pre-Romantic feeling for the beauty of nature. Bengt Lidner was the chief exponent of pre-Romanticism in poetry. His most successful work was the ode *Grefvinnan Spastaras dod* (1783).

Carl Michael Bellman stands apart from the conflicting ideals of the time. A poet and musician, he combined stylized realism with humour and the most uniquely delicate sense of language and rhythm. He was the greatest Swedish lyricist of the 18th century.

The dissertation *Om upplysning* (1793; "On Enlightenment") by Nils von Rosenstein, the first secretary of the Swedish Academy, expressed the ideals of the Gustavian epoch. Various memoirs by G.J. Adlerbeth, G.J. Ehrensvard, and others evoke the witty but artificial atmosphere of Gustav III's court. Gustav IV, who followed, did not encourage literature; nevertheless, the energetic Anna Maria Lenngren wrote some of her best verse satires between 1795 and 1800, many aimed at aristocratic foibles. The sentimental idylls of Frans Mikael Franzén are full of pre-Romantic idealism from German and English sources. As a bishop he wrote some of the most popular hymns of the Swedish Church.

The comedies of Ludvig Holberg

Danish. The 18th century was a fertile period in Danish literature. The great name in the first half of the century was that of Ludvig Holberg, a Norwegian by birth. His most important contributions, written for the Danish theatre which opened in 1722, were 32 comedies of character and manner, including some moral allegories in his old age. His aim was to create a modern Danish literature on European lines and to make people laugh at their own follies. Influenced by English and French thinking, he was a rationalist and a moderate. He also wrote satires; *e.g.*, *Peder Paars* (1719), a mock-heroic poem, and *Nicolai Klirnii iter Subterraneum* (Latin, 1741; *Journey of Niels Klim to the World Underground*, 1960). His *Moralske tanker* (1744; "Moral Thoughts") and his *Epistler* (1748–54; "Letters") are the finest examples of a Danish political essay form. He also contributed a number of valuable historical works.

Among Holberg's contemporaries the finest lyrical poets are H.A. Brorson, a mystic whose pietist hymns often have a background of personal sorrow or agony, and Ambrosius Stub, whose poems are mainly religious and moralizing verses, witty epigrams, or drinking songs. A satirist, Christian Falster, was a conservative counterpart to Holberg; Friedrich Eilschov and Jens Schelderup Sneedorff, the latter of whom edited *Den patriotiske Tilskuer* ("The Patriotic Spectator"), a Danish *Spectator*, were both rationalist disciples of Holberg.

A significant revival of Danish literature took place toward the end of the century. The Norwegian Johan Herman Wessel, one of the greatest humorists to use the Danish language, wrote *Kierlighed uden strømper* ("Love Without Stockings") in 1772, a parody of the Danish imitations of Italian operas and French tragedies that had superseded Holberg's comedies, especially those of Niels Krog Bredal and Johan Nordahl Brun. His light humorous poems and versified narratives are still very popular.

The works of Johannes Ewald

At the same time a revival of emotional poetry was taking place, influenced by German and English literature. Johannes Ewald, perhaps Denmark's greatest lyrical poet, was the first to delve into Scandinavian antiquity and discover the poetic wealth in the *Gesta Danorum* of

Saxo Grammaticus, in the myths, sagas, and ballads. He wrote verse dramas and deeply personal and descriptive poems. *Fiskerne* (1779; "The Fishermen") was the first serious Danish drama in which ordinary people were treated heroically. His memoirs, *Levnet og meninger* ("Life and Opinions"), were influenced by Laurence Sterne and Jean-Jacques Rousseau. Jens Baggesen at first imitated the satires of Holberg and Wessel but gradually developed as a poet of distinction, although the quality of his poetry varies greatly. In *Labyrinten* (1792–93; "The Labyrinth"), he described his travels in Europe in the manner of Sterne.

The end of the 18th century was marked by much literary dilettantism. P.A. Heiberg, a militant radical satirist, influenced by the ideas of the French Revolution, was expelled from Denmark and spent his last 40 years as a political refugee in France. Malte Conrad Bruun, the author of *Aristokraternes catekismus* ("The Aristocrats' Catechism"), had a similar fate.

Norwegian. Several of Denmark's leading writers of the 18th century were of Norwegian birth, pre-eminently Ludvig Holberg, and later in the century the members of Det Norske Selskab (the Norwegian Society). Established in Copenhagen in 1772 by a group of resident Norwegians, it looked to French rather than to German and English literature for models. Among its members were Johan Herman Wessel; Johan Nordahl Brun, whose tragedy *Zarine* won a literary prize in 1772; and the intellectual Claus Fasting. Within Norway itself there was little overt literary activity, though the establishment in 1760 of a Royal Norwegian Society of Learning in Trondheim was evidence that Norway was beginning to assert its cultural aspirations.

Icelandic. *House-postil* ("Sermons for the Home"), by Jón Vídalín, bishop of Skálholt, is the best example of early-18th-century prose. Among important writers of the later 18th century, Eggert Ólafsson carried out a comprehensive geographical field survey (published in Danish, 1772; partial Eng. trans., 1805) of Iceland's country and its people. In his poetry he expressed 18th-century Rationalism combined with Romantic patriotism. Jon Steingrimsson is remembered for his autobiography, in which he described a volcanic eruption of 1783 and the famine that followed. Jón Porlbksson, poet and scholar, translated Milton's *Paradise Lost* and Pope's *Essay on Man*.

Finnur Jónsson, bishop of Skalholt, wrote *Historia Ecclesiastica Islandiae* (1772–78), which covers the history of Christianity in Iceland, and Jón Espólín wrote *islands árbaekur* (1822–55; "Annals of Iceland"), a history of Iceland from 1262.

RUSSIAN LITERATURE IN THE 18TH CENTURY

Modern Russian literature dates from the first decade of the 18th century, when literary works, as distinct from religious and official books, began to be printed. Classicism was the dominant movement in 18th-century literature, but in the second half of the century it was displaced by the sentimental movement, which itself was yielding to Romanticism and Realism by 1800.

The rise of Russian classicism. The most prominent literary figure at the beginning of the century was Feofan Prokopovich, archbishop of Novgorod, one of Peter I the Great's close associates. He was the progenitor of two of the main themes in Russian literature: autocracy as a form of government and satire as a means of attack on his political adversaries.

In the early years of the century, there was some solemn panegyric verse celebrating Russian victories as well as examples of the new genre of love lyrics and elegiac poems. This period also saw the development of Russian secular drama, but, on the whole, merely prepared for later development.

The growth of Russian cultural institutions

The growth of cultural institutions—the creation of the first Academy of Sciences, in St. Petersburg (1755), the first university, in Moscow (1755), and the first theatre, in St. Petersburg (1756)—fostered the development of literary talent. The leading literary genres were the ode and tragedy, both propagating enlightened absolutism. As in western Europe, the cult of reason lay at the foundation of Neoclassical aesthetics.

The leading writers of the classical school were Prince Antiokh Dmitriyevich Kantemir. the first Russian secular poet; Vasily Kirillovich Trediakovsky, one of the most scholarly men of his time; Mikhail Vasilyevich Lomonosov, poet, grammarian. scientist, and literary critic; and Aleksandr Petrovich Sumarokov, poet and dramatist. Kantemir is known mainly for his love lyrics and his nine satires, and is regarded as the founder of Russian satire. Trediakovsky began by translating Paul Tallemant's *Voyage de l'isle d'amour* ("Voyage to the Isle of Love") the first erotic work to be published in Russia, and he helped reform Russian prosody. Lomonosov created the famous "three styles" of poetic diction characteristic of Russian Neoclassicism: the "high" (or grand) style for heroic poems, odes, etc.; the "middle" style for dramatic works demanding colloquial speech; and the "low" style for comedies, epigrams, songs, letters in prose, and precise descriptions. Lomonosov also advanced the theoretical study of the Russian language, which he maintained was no whit inferior to any European language in natural richness, beauty, and strength.

Sumarokov, who wrote the first Russian classical tragedy, *Khorev* (1747), was adept in a variety of genres, and opposed Lomonosov's "florid" style. He owed his popularity to his numerous love lyrics, elegies, eclogues, and idylls. He also wrote six tragedies, including a free adaptation of *Hamlet*, and four comedies. His tragedies, strongly influenced by Racine, were intended as a school of noblemen's moral values, and even in his comedies, he sought to improve the moral standards of the Russian aristocracy. In his periodical *Trudolyubivaya pchela* ("The Industrious Bee") he exposed corruption among officials and attacked landowners for maltreating their serfs but defended social inequality as natural and lawful. His satiric articles and fables laid the foundation of the satire of the next decade.

The first breach in classicism was made by Mikhail Matveyevich Kheraskov, famous for two epic poems modelled on Voltaire's *Henriade–Rossiyada* (written 1771–79, published 1799) on the capture of Kazan by Ivan the Terrible; and *Vladimir Vozrozhdyonny* (1785), on St. Vladimir's introduction of Christianity to Russia.

Political and sentimental themes. Influenced by a Cossack and peasant rebellion of 1773–75, writers of the period chose as their most important theme that of serfdom. The social influence of literature greatly increased, leading to a widening circle of readers and to active participation in literature of all classes. Sumarokov, in his last three tragedies, attacked the idea of a tyrannical ruler and pleaded for an enlightened emperor. In *Tilemakhida* (1766) a free rendering of Fénelon's *Télémaque*, Trediakovsky declared that while the tsar wielded power over the whole people, the laws had power over the tsar too. The empress Catherine II herself edited a journal, modelled on the English *Spectator*, in which she poured scorn on Trediakovsky.

The theme of serfdom

The two most prominent writers of the period were a playwright, Denis Fonvizin, and a writer and publisher, Nikolay Novikov. Beginning by translating fables, Fonvizin later wrote original satirical fables, such as *The Fox and the Preacher* (1762), written shortly after the death of the old empress Elizabeth (Yelizaveta Petrovna), in which he attacked her hypocritical courtiers. But it was with two prose comedies, *Brigadir* and *Nedorosl*, that Fonvizin triumphed as a playwright. Novikov, like Fonvizin, directed his satire not against serfdom itself but against the landowners' misuse of their powers. His first periodical, *Truten* (1769–70; "The Drone") had the significant epigraph: "They labour and you feed upon their labour." Catherine II suspended *Truten* for a month in 1769, after which Novikov moderated its satire. At the end of 1770 it had to suspend publication, and Novikov's second journal, *Pustomelya* ("The Windbag"), was suspended after only two issues. In his third journal, *Zhivopisets* ("The Painter") he published in 1772 two of his most famous satires: "A Fragment of a Journey" and "Letter to Fallaley." The first gives a shattering picture of the poverty and slavery of the peasants, and the second provides insight into the serf owners' mentality. The fact that he never condemned serfdom saved Novikov from Catherine's wrath but robbed his satire of efficacy as a revolutionary instrument. The most important novelist of the period was Fyodor Aleksandrovich Emin, whose best novel, *Letters of Ernest and Doravra* (1776), a free adaptation of Rousseau's *La Nouvelle Héloïse*, is interesting as the first attempt in Russian fiction at psychological analysis of the thoughts and feelings of ordinary people. In it Emin exposed the evils of serfdom but did not attack serfdom as an institution. His son, Nikolay Emin, also a popular novelist, was less interested in the social inequities of his time. His novels show the growing influence of the sentimental school. A popular novelist to emerge from the lower classes, Mikhail Dmitriyevich Chulkov, was concerned with entertaining his readers: his novels lacked the lofty moral admonitions that abound in the works of classical writers.

Comic operas

Between 1770 and 1780 the sentimental movement gained ground, becoming noticeable in adaptations of French comic operas. These were followed by native comic operas, such as *Rozana* i *Lyubim* (1778) by Nikolay Petrovich Nikolev, the main theme of which is the superiority of moral equality over social inequality. The anti-serfdom note can be detected in other comic operas of the period—such as *Neschastye ot Karety* (1779; "An Accident with a Carriage"), by Yakov Borisovich Knyazhnin; *Kofeynitsa* ("The Coffee Fortune Teller"), by Ivan Krylov, the greatest Russian fabulist; and *Melnik, koldun, obmanshchik i svat* (1779; "The Miller, the Wizard, the Quack, and the Matchmaker") by Aleksandr Onisimovich Ablesimov.

The American Revolution, fully reported by Novikov in his *Moskovskie Vedomosti* ("Moscow News"), raised again the problem of an autocratic ruler's duties to his subjects. Fonvizin maintained that the tsar should be as completely subject to the laws of the land as his lowest subjects. In his satires, and, even more, in his popular fables, Ivan Ivanovich Khemnitser touched on the same theme, while Knyazhnin, in his tragedy *Roslav* (1784), demanded that the emperor should be subject to his own laws, a sentiment that led Catherine II to order the destruction of all copies of the work. Even Nikolev declared, in his tragedy *Sorena i Zamir* (1784), that "to destroy a tyrant is a duty not a crime".

The first indication of the declining power of classicism came in the popular narrative poems of Ippolit Fyodorovich Bogdanovich, especially his *Dushenka* (1775), a free adaptation of La Fontaine's *Les Amours de Psiché et de Cupidon*. Bogdanovich was regarded by the sentimentalist writers as their predecessor.

The lyrics and odes of Gavrila Derzhavin

Gavrila Derzhavin, the greatest Russian poet of the 18th century, gave the most vigorous expression to the change from classicism to sentiment. His first works—odes as well as lyrics—showed the influence of Lomonosov and Sumarokov, but he soon took up an independent attitude toward social evils. His ode on the death of Prince Meshchersky (1779) is full of reflections on the transience of life and the inevitability of death but ended on a note of cheerful resignation characteristic of the Latin poet Horace. He reached his greatest heights during the next decade with such odes as "On the Capture of Ismail" and "To the Nobleman." His finest poems—"The Waterfall" (1794) and "The Peacock" and his poems in the tradition of the ancient Greek poet Anacreon (collected 1804) such as "Invitation to Dinner" and "Life in Zvanka" (the poet's small estate)—belong to this period. Derzhavin accepted serfdom as natural and lawful, and his poetry expressed the ideology of the ruling classes; yet his realistic representation of everyday life and his simplification of poetic diction by introducing colloquial speech tended to emphasize the democratization of poetry.

Russian literature of the 1790s, influenced by the French Revolution, raised the themes of the rights of man and the role of the nation as a whole. Aleksandr Radishchev in his "Ode to Liberty" (1781–83) hailed the American Revolution and attacked serfdom, but it was his denunciation of autocracy that made Catherine II describe the ode as "a rebellious poem," in which the tsar was threatened with execution.

Sentimentalism

Apart from violently satiric works, among them the famous comedy *Chicane* (1798) by Vasily Vasilyevich Kapnist. the main literary movement was sentimentalism, led by Nikolay Karamzin. In Russian sentimentalism subjective perception is combined with denial of classical abstractions and idealization of man's natural condition. Karamzin opposed to the classical emphasis on reason a doctrine of poetry as an expression of feeling. The sentimentalists, moreover, put forward the claims of sensibility as a precondition of aesthetic impressions, emphasizing art's emotional foundation. Unlike Derzhavin, Karamzin was interested less in reality than in feelings and moods it arouses in the poet. According to him the greatest poetic creation is "an effusion of a languorous and grieving heart." This elegiac mood, so characteristic of Karamzin's latter poetry, is expressed in his famous novel *Poor Liza* (1792), in which for the first time in Russian fiction descriptive passages, used to emphasize the hero's feelings, are an important component. In his novel *Julia* he idealized country life and withdrawal into "the embraces of nature." His other novels—The *Island* of *Bornholm* and *Sierra Morena* (both 1793)—were precursors of the Russian Romantic novel.

Georgian. Belles lettres revived in Georgia with the lexicographer Sulkhan-Saba Orbeliani (1658–1725) who wrote a book of fables, *The Book of Wisdom and Lies.* The main poets of the period were David Guramishvili and Bissarion Gabashvili.

Latvian. The loss of political independence in the 13th century prevented a natural evolution of literature out of folk poetry, and much of Latvian literature is an attempt to re-establish this connection. Written literature came late, fostered by German clergymen. Latvian secular literature began in the 18th century with G.F. Stender who, in the spirit of the Enlightenment, produced didactic tales or idyllic portrayals of country life, and vainly attempted to supplant the folk songs by ditties of his own—thus, in his own way, verifying the fact that the great wealth of folk songs (some 400,000 published, and about a million recorded but unpublished) has been in all ages a pervasive presence in Latvian literature. Already in the 17th century, Cr. Fuereccerus, a sensitive poet who introduced new metrical conventions and rhymes, at times also made use of stylistic elements from Latvian folk songs, and G. Mancelius, founder of Latvian prose, battles against folklore more in a spirit of affection than hostility.

OTHER LITERATURES OF EASTERN EUROPE IN THE 18TH CENTURY

The literary developments of the Polish Enlightenment

Polish. Close contact with western Europe, especially France and England, characterized literature of the Enlightenment period in Poland, whose writers were imbued with a desire to save the national culture from effects of partition and foreign rule. Literary developments included the rise of drama; introduction of the periodical and the novel; publication of the first Polish dictionary; and, in poetry, the introduction of *dumy* (ballads).

Drama was established late in Poland. The earliest significant event was the inauguration of a national theatre in Warsaw in 1765. There were three principal dramatists: Franciszek Bohomolec, who satirized the aristocracy in adaptations of Molikre; Wojciech Bogusławski, who wrote a popular national comic opera *Krakowiacy* i *Górale* (1794; "Cracovians and Mountaineers"); and Franciszek Zabłocki, important for *Fircyk w Zalotach* (1781; "The Dandy's Courtship") and *Sarmatyzm* (1785). Aleksander Fredro's comedies appeared when the Romantic movement was underway, and in them the influences of Molikre and Carlo Goldoni were assimilated, as *Zemsta* (1834; "The Revenge") illustrated. They were remarkable for brilliant "type" characterization, ingenious construction, and metrical facility.

Didacticism permeated most of the period's prose writing. Modern periodicals appeared at this time (*e.g.*, *Monitor,* 1765–85), and a Polish dictionary was published between 1807 and 1814. Bishop Adam Naruszewicz wrote early in the Enlightenment. His poetic works, considered chronologically, reflected the transition from Baroque to Classical, and he also wrote a history of Poland in which modern methods of scholarship were used. The most important poet, Bishop Ignacy Krasicki, of European outlook and skeptical intellect, wrote two mock-heroic poems, *Myszeis* (1775) and *Monachomachia* (1778), as well as *Satyry* (1779) and *Bajki* i *przypowieści* (1779; "Fables and Moral Tales"), and was remarkable for concise expression, formal elegance, and wit. Krasicki also introduced the novel *Mikołaja Doświadczyńskiego przypadki* (1776; "The Adventures of Mikołaj Doświadczyński"), showing the influence of Swift and Rousseau. Two other outstanding poets were Stanisław Trembecki, whose works had an important place in Polish classicism as models of stylistic fluency, and Tomasz Kajetan Węgierski, a freethinker and admirer of Voltaire, who expressed a rationalistic outlook in a mock-heroic poem *Organy* (1784).

Lyrical poetry continued to develop. Franciszek Karpiński developed features of the Baroque style in popular pastorals and religious songs, while Franciszek Dyonizy Kniaźnin, a conscious experimenter, rewrote much of his earlier work to achieve stylistic uniformity; his verse, cool and intellectual in quality, anticipated Romantic themes of folk poetry, popular superstition, and gypsy life.

Julian Ursyn Niemcewicz's writings were inspired by patriotism and concern for reform. He knew English literature thoroughly and made early translations of English Romantic ballads, his original *dumy* being the first in Poland; he introduced the historical novel to Poland with *Jan z Tęczyna* (1825), which showed Sir Walter Scott's influence. His comedy *Powrdt posła* (1790; "The Envoys' Return") was one of the best dramatic works of the period, and *Śpiewy historyczne* (1816; "Historical Songs") was widely read.

After loss of national independence, with the third partition of the country between Russia, Austria, and Prussia in 1795–96, the tradition of patriotic poetry was continued by émigré soldier-poets in the Polish legions of Napoleon's army, among them Józef Wybicki, whose popular patriotic song "Mazurek Dąbrowskiego" (1797) was adopted as the national anthem in 1918.

Hungarian. The period between 1711 and about 1770 was a time of decadence in Hungarian literature, producing notable works only in the fields of memoirs, history, and history of literature. Among historians, Mátyás Bél, Gyorgy Pray, and Istvbn Katona were most important.

The period between about 1772 and 1825, the Enlightenment, though immensely important in the development of the Hungarian spirit, produced few writers of the first rank. The Hungarian Enlightenment was more receptive to French and English ideas than it was productive of original developments.

With the publication in 1772 of the first literary work by Gyorgy Bessenyei, a translation (from the French) of Alexander Pope's *Essay on Man,* the new era began. All his works served a didactic purpose. His drama *Agis tragédiája* (1772; "The Tragedy of Agis") served as a somewhat creaking vehicle for his antidespotic ideas. His best work, *Tarimenes' Journey* (1802–04), the first real novel in Hungarian, was a bitter attack on everything that conflicts with the views of Enlightenment. With destructive irony, Bessenyei examines the shortcomings of human society. His personal influence induced several of his fellow officers—for example, Sándor Báróczi and Ábrahám Barcsay—to try to convey the ideas of the Enlightenment in Hungarian to a Hungarian public.

Spurred on by new ideas, but basically traditionalists, József Gvadanyi and András Dugonics achieved works of some literary merit and amusing enough to become popular. Gvadányi's best work, *Egy falusi nótáriusnak budai utazdsa* (1790; "The Journey to Buda of a Village Notary"), is an apology for national and traditional values, directed against encroaching foreign ideas. The novel *Etelka* (1788), by Dugonics, a sentimental love story in a historical setting, was the first Hungarian best seller. Both Gvadanyi and Dugonics used a popular language, free from foreign influence, and this was perhaps their greatest merit. Ádám Pálóczi Horváth left a collection of 450 poems, a treasure-house of popular poetry and music.

The end of the 18th century was a period of discovery, and of experiments with language. The pioneers of the use of classical metre in Hungarian verse were followed by Benedek Virág, who imbued with poetic inspiration verse forms which for his predecessors were merely formal exercises. It fell to Dániel Berzsenyi, who published a single volume of poetry, in 1813, to show what use a really great poet could make of classical metre. Berzsenyi is a giant of expression. It is the terseness and vigour of the expression, the power of conviction, that make his lines memorable. His ode "Magyarokhoz" ("To The Hungarians"), his *Fohász* ("Prayer"), and his elegy *A közelitő tél* ("On the Nearing Winter") express the transitoriness of power, friendship, of everything but God.

The ideas of the Enlightenment were not universally welcomed in Hungary. Several writers went to prison for the crime of sympathy with these ideas. The most talented among them, Jbnos Batsbnyi, secured his place in the history of Hungarian literature by his poem *A franciaorszagi változásokra* ("On the Changes in France"), a vigorous warning to all tyrants "to cast their watchful eyes on Paris."

The only work of importance by József Kármán is a sentimental novel, *Fanni hagyományai* ("The Papers of Fanny"), that marked an important step in the history of the Hungarian novel.

The first really important lyric poet since the Renaissance poet Bálint Balassi was Mihály Csokonai Vitéz, who continued the purely Hungarian poetical tradition. His many songs to "Lilla" are a happy blend of rococo grace and thoughts less superficial than they appear. The influence of Rousseau is very noticeable in some of his longer philosophical poems. Alexander Pope's *The Rape of the Lock* served as a source of inspiration for Csokonai's comic epic *Dorottya* (1804; "Dorothy") but Csokonai's poem is original and very much Hungarian. The language of the poem is vigorous, even vulgar, and the comic situations are coarse but amusing.

The place of Sándor Kisfaludy in Hungarian literature is secured by his first work, *Kesergő szerelem* ("Plaintive Love"), a song cycle depending on a very thin narrative thread. Writing in a very elaborate verse form of 12 lines, called the Himfy verse, which he devised himself, Kisfaludy displayed great ingenuity in finding new variations on the theme of unhappy love. Among his better works must also be reckoned three tales published together in *1807—Csobdnc, Tdtika,* and *Somló*—written in the mood of chivalric romances.

The contribution of Ferenc Kazinczy

Ferenc Kazinczy, a mediocre poet but an influential man of letters, was the pivot of literary life for about 40 years. His political conceptions were progressive, a luxury for which he paid with six years' imprisonment. He wanted a literature refined and limpid, neither baroque nor popular, and his interest was focussed on style. He became the head of the *neologi,* or linguistic innovators, who, opposed by the *orthologi,* or purists, tried to renew and enrich the Hungarian language to make it suitable to express the most elaborate concepts.

Romanian. Most of the 18th century presents a picture of social oppression and decadence. A rich secular and apocryphal literature circulated in manuscript (*Erotocritul, Fiziologul, Istoria lui Archir, Viaţa lui Esop, Halirnanaua);* but there was no progress in comparison with that of the past. In Moldavia a new cultural centre arose at Rădăuţi. The achievements of the century were the *Minei* ("Lives of the Saints") of 1776–80 and 1807–15 (each in 12 volumes published in Rîmnicu Vilcea and in the monastery of Neamf, respectively), whose rich and lucid language put them alongside the Bible of 1688.

Lyric poetry was cultivated toward the end of the century in love songs (1769–99), in the tradition of the ancient Greek poet Anacreon, by Alecu Văcărescu. His father Ienăchiţă, a moralist poet, also wrote the first grammar of Romanian; his son Iancu, the father of Romanian poetry, overshadowed his predecessors by his poems. The fourth Văcărescu poet was Nicolae. The lyric tradition was carried on in Walachia by B.P. Mumuleanu.

Slovene. In about 1750 there was a revival of literature in Slovene, initiated by the monk Marko Pohlin, an opponent of Germanization, who wrote educational, recreational, and religious works. On his initiative the first poetic almanac, *Pisanice* (1779–81; "Exercises in Writing"), began to be published. Anton Linhart compiled a critical history and adapted two comedies, one based on Beaumarchais's *Mariage de Figaro*. Valentin Vodnik, a rationalist didactic poet, was editor of the first periodical in Slovene *Lublanske novice* (1797–1800; "The Ljubljana News"), as well as a grammarian, lexicographer, and Francophile, since in Napoleon's province of Illyria (1809–14) the Slovene language was recognized. Literature had become secularized and was to be an important vehicle for awakening national consciousness.

CELTIC LITERATURES IN THE 18TH CENTURY

Owen's poetic reforms

Welsh. The middle of the 18th century was, after the 14th, the most fruitful period of Welsh literature. After an intervening period of stagnation, Welsh writing revived. Goronwy Owen, inspired by English Augustanism, reintroduced and improved the strict metres of the *cywydd* (verse in couplets of seven syllables) and *awdl* (ode), old verse forms which made use of *cynghanedd* ("harmony"), a complicated system of alliteration and internal rhyme. He also introduced a new and wide range of subject content, and thus founded a new classical school of Welsh poetry. The more important poets of this school were William Wynn of Llangynhafal, Edward Richard, and Evan Evans. Much of their activity was associated with the Welsh community in London and the Cymmrodorion society and led to the establishment of local eisteddfods in Wales, which perpetuated the classical forms of Welsh poetry.

Chief among Owen's successors was David Thomas (Dafydd Ddu Eryri), who, however, like other eisteddfodic bards of this period, soon departed from classical strictness.

The classicists of the 18th century stood aloof from the Methodist revival, but the intense religious fervour brought a new articulateness and greatly inspired poets in free metre, especially hymn writers like William Williams of Pant-y-celyn, almost the first poet to use the free metres for a serious purpose; the mystical Ann Griffiths, and many others. The hymn is important by virtue of its influence on later secular poetry.

For a long time after 1750, Welsh prose was narrow in range. The results of the French Revolution saw much activity in political thought. The most important political writer was John Jones (Jac Glan-y-gors). After the establishment of the periodical press, political writing became an important part of Welsh literature, extending into the 19th century.

Breton. Modern Breton is said to begin in 1659, when Julien Maunoir introduced a more phonetic orthography, but works of the Middle Breton type appeared until the 19th century. The bulk of Breton literature in this period consisted of mystery and miracle plays treating subjects from the Old and New Testaments, saints' lives, and stories of chivalry derived from French or Latin. Even plays depicting Breton saints evinced little originality. In the 18th century, many Breton dictionaries were published but little of literary significance was produced. One name survives: Claude-Marie Le Lae, who wrote satirical poems—Ar *C'hy* ("The Dog") and the sermon of *Mikel Morin*.

Scottish Gaelic. Practically no secular poetry in Gaelic was printed before 1751, and the bulk of earlier verse was recovered from oral tradition after that date. Much of the inspiration of Gaelic printing in the 18th century can be traced to Alexander Macdonald (Alasdair Mac Mhaighstir Alasdair), who published a Gaelic vocabulary in 1741 and the first Scottish Gaelic book of secular poetry, *Aish-eiridh na Sean Chánoin Albannaich* ("Resurrection of the Ancient Scottish Tongue"), in 1751. He rallied his fellow Highlanders to Prince Charles Edward's cause in the '45 rising with *Brosnachudh nam Fineachan Gaidhealach* ("Incitement to the Highland Clans"), and *Hi ri rì tha e tighinn*, a song of welcome to the Prince. His masterpiece, "The Birlinn of Clanranald," is an extravaganza that is ostensibly a description of a voyage from South Uist in the Hebrides Isles to Carrickfergus in County Antrim, Northern Ireland. He also composed nature poems, love poems, drinking songs, and bitter satires.

Duncan Macintyre (Donnchadh Bàn), who was influenced in various ways by Macdonald, published his poems in 1768, but the two men were very different in temperament and in training. Macdonald had received a formal education; Macintyre could neither read nor write. Macdonald was ambitious, independent, and restless; Macintyre was not. Macintyre fought on the Hanoverian side at the Battle of Falkirk and later praised George III in *Oran do'n Rìgh*, but he had been a forester on the Perthshire–Argyllshire borders in early manhood, and this is the setting of his greatest poems, *Moladh Beinn Dóbhrain* (The *Praise of Ben Dorain*) and *Oran Coire a' Cheathaich* ("Song to Misty Corrie"), remarkable for their emotional closeness to nature, their minute and objective detail, and their personal and lyrical quality. His most famous love song is addressed to his wife, Màiri.

Other poets of note in the 18th century include John MacCodrum, author of an elegy for Sir James Macdonald of Sleat and of much humorous and satirical poetry; also Robert (called Rob Donn) Mackay, whose gifts of observation and satire in commenting on the life of his district produce much social satire in his verse and a wealth of shrewd and humorous understanding of human nature; and William Ross, the Romantic poet of the group, several of whose best poems, such as *Feasgar Luairt* and *Oran Eile*, were occasioned by an unhappy love affair.

The greatest composer of Gaelic religious verse in the 18th century was Dugald Buchanan, who assisted Rev. James Stewart of Killin in preparing his Gaelic translation of the New Testament (1767). His *The Day of Judgement* and *The Skull* are impressive and sombre and show considerable imaginative power.

Irish Gaelic. The 18th century is a low point in Irish Gaelic literature. The last great flowering of the poetic tradition in Munster was *Cúirt an Mheánoíche* (The *Midnight Court)* by Brian Merriman, a Clare schoolmaster. After it, Irish poetry became a matter of folk songs.

During the 18th and early 19th centuries the only books in Irish prose were catechisms and devotional tracts. The manuscript tradition was carried on by a few scribes into the first half of the 19th century, when it all but died out. By the middle of the 19th century there was no literary activity in Ireland and all but a handful of the speakers were illiterate.

Manx. There is little evidence for any former existence of a rich oral literature in the Isle of Man. The first written text in the language is the translation of *The Book of Common Prayer* by a Welshman, John Phillips, bishop of Sodor and Man, which survives in a unique manuscript of about 1630.

The traditionary (or Manannan) ballad, purporting to give a digest of the history of the island, is known in manuscripts only from about 1770, in print certainly only from 1802, but was probably composed early in the 16th century. *Bause Illiam Dhone*, a ballad on the execution of William Christian in 1663, written a generation later since it refers to the fate of his accusers' families, is first known from its revival, with additional verses, in 1781. The heroic tradition survives in the *Fin as Osshin* fragment, a ballad on an Ossianic theme, recovered from oral tradition. Most Manx verse is in the form of carvals, or carols, religious songs, not all connected with Christmas (the fall and redemption of man being a favourite theme) but composed to be sung at the *Oie'l Verree*, the Christmas Eve service.

VI. The 19th century

CHARACTERISTICS OF THE AGE

The 19th century in Western literature—one of the most vital and interesting periods of all—has special interest as the formative era from which many modern literary conditions and tendencies derived. Influences that had their origins or were in development in this period—Romanticism, Symbolism, Realism—are reflected in the current of modern literature, and many social and economic characteristics of the 20th century were determined in the 19th. This is seen particularly in the economic and social influences of the increase in industrialization, beginning in England in the mid-18th century and generally termed the Industrial Revolution; but it is also discernible in many other developments of the age, particularly in the growth of what might be termed a "social conscience" toward the middle and later parts of the century.

Romanticism

The predominant literary movement of the early part of the 19th century was Romanticism, which in literature had its origins in the *Sturm und Drang* (Storm and Stress) period in Germany (see above *German literature of the 18th century).* An awareness of this first phase of Romanticism is an important correction to the usual idea of Romantic literature as something that began in English poetry with William Wordsworth and Samuel Taylor Coleridge and the publication of *Lyrical Ballads* in 1798. Moreover, although it is true that the French Revolution of 1789 and the Industrial Revolution already spoken of were two main political and social factors affecting the Romantic poets of early-19th-century England, many characteristics of Romanticism in literature sprang from literary or philosophical sources. A philosophical background was provided in the 18th century chiefly by Jean-Jacques Rousseau, whose emphasis on the individual and the power of inspiration influenced Wordsworth and also such first-phase Romantic writers in Germany as Friedrich Holderlin and Ludwig Tieck and in France Bernardin de Saint-Pierre, whose *Paul et Virginie* (1787) anticipated some of the sentimental excesses of 19th-century Romantic literature. Positive as it was, the influence of Rousseau must also be seen as a partly negative reaction against 18th-century Rationalism with its emphasis on intellect. A similar influence existed in the philosophy of Emanuel Swedenborg, who allied himself with those who sought a hidden key to life's secrets in intuitions and in sight-giving experience and thus continued a thread in German thought dating from Spinoza and emphasizing the individual and self-knowledge.

Belief in self-knowledge was, indeed, a principal article of Romantic faith. Late-18th-century French writers such as Fabre d'Olivet sought to explain the physical world by an idea of a "breath of life" similar to the "inspiration" of Wordsworth and Coleridge. The Romantics believed that the real truth of things could be explained only through examination of their own emotions in the context of nature and the primitive. Because of this emphasis on inspiration, the poet came to assume a central role—that of seer and visionary. Simultaneously, such formal conventions as imitation of the classics were rejected as binding rules. A new directness of the poet's role emphasized the language of the heart and of ordinary men, and Wordsworth even tried to invent a new simplified diction. Poetry became divorced from its 18th-century social context, and a poet was answerable only to ultimate truth and himself. Two classic poses of the Romantic poet were the mystic visionary of John Keats and the superman of Lord Byron (indeed, satirization of the Byronic hero was to become a theme of later novelists such as Fyodor Dostoyevsky, even though he himself had Romantic antecedents).

The fact that Dostoyevsky was a Russian showed how the Romantic stream flowed across Europe. In Spain and Italy, Hungary, Poland, and the Balkans, it took the form of drama, which in England failed to produce great works. The early and middle 19th century was a time of poetry and prose rather than of drama. The Romantic style in poetry was seen everywhere in Europe—in José de Espronceda in Spain; Ugo Foscolo and Giacomo Leopardi in Italy, where it became identified with nationalist sentiments; Aleksandr Pushkin and Mikhail Lermontov in Russia; Adam Mickiewicz in Poland. In America, a Romantic thread also allied with the emergence of national feeling could be seen in the adventurous stories of James Fenimore Cooper; in the supernatural and mystic element in Edgar Allan Poe; in the poetry of Walt Whitman and Henry Wadsworth Longfellow; and in the Transcendentalist theories of Ralph Waldo Emerson and Henry David Thoreau, which, as Wordsworth's pronouncements had done, affirmed the power of "insight" to transcend ordinary logic and experience.

The impetus of Romantic poetry began to slacken after about 1830 and gave way to more objective styles. although, as J.M. Cohen says, " . . . the superfluous man, the artist misunderstood, the unhappy lover, the Hamlet figure paralyzed by his own sensitiveness, continued to be the forms in which the artist saw himself." *(A History of Western Literature,* 1956)

Arguably the first post-Romantic poet was a German, Heinrich Heine, but German poetry in the mid-19th century mostly followed Wordsworth, though new tendencies were to be found in August von Platen Hallermünde and an Austrian, Nikolaus Lenau. The principal development was to be seen in France in the growth of a movement known as Parnassianism. Originating with Théophile Gautier, Parnassianism in some ways was an offshoot of Romanticism rather than a reaction against it. In concentrating on the purely formal elements of poetry, on aesthetics, and on "art for art's sake," it changed the direction of French poetry and had much influence abroad. Its most illustrious representative was Charles Baudelaire, who believed that "everything that is not art is ugly and useless." Another branch of new development was the growth of Impressionism and Symbolism, a result of "borrowing" from movements in painting, sculpture, and music. Paul Verlaine, foremost of the Impressionists, used suggestion, atmosphere, and fleeting rhythms to achieve his effects. Symbolism, a selective use of words and images to evoke tenuous moods and meanings, is conveyed in the work of Stéphane Mallarmé and Arthur Rimbaud. The advance of French poetry in the middle and latter part of the century was an achievement of individuals, based on invention of a personal idiom.

Impressionism and Symbolism

The spread of education and, in England, of circulating libraries increased a demand for novels. At the beginning of the 19th century Jane Austen had already satirized the excesses of the "Gothic" novel, a harbinger of medievalizing Romanticism in the latter part of the 18th century, in *Northanger Abbey* and the conflict of sense and Romantic sensibility in *Sense and Sensibility.* In France the conflict of intelligence and emotion appeared in the work of Benjamin Constant (*Adolphe*, 1816) and most notably in *Le Rouge et le noir* (1830) of Stendhal and later in Gustave Flaubert's *Madame Bovary* (1857). The detailed verbal scrupulousness and Realism exhibited in the work of Flaubert and of Honor6 de Balzac was carried forward by Guy de Maupassant in France and Giovanni Verga in Italy; they culminated in the extreme Naturalism of Émile Zola, who described his prose in novels such as *Thérèse Raquin* (1867) as "literary surgical autopsy."

But Realism and nationalism seem irrelevant as descriptions of the great writers of the period—for example, George Eliot, Charles Dickens, and Thomas Hardy in England and Nikolay Gogol, Ivan Turgenev, Leo Tolstoy, Fyodor Dostoyevsky, and Anton Chekhov in Russia. In such writers there was a distinct bias toward literature with a social purpose, stimulated by awakening forces of liberalism, humanism, and Socialism in many Western countries.

A decline of the Romantic theatre into melodrama was fairly general in Europe, and it was slower than the novel to take up problems of contemporary life. When revival came, through the work of a Norwegian, Henrik Ibsen, Romantic conflicts of visionary and realistic, individual and society were restated, and this was true also of the plays of August Strindberg in Sweden. In Russia a modern theatre became a vital influence that could trace its beginnings back to Gogol's *Government Inspector* (1836) but was to be felt later in the century in Turgenev's *Month in the Country* (1850) and, above all, in the work of Anton Chekhov, who was a great dramatist of the period.

ENGLISH LITERATURE IN THE 19TH CENTURY

The Romantic period. *The nature of Romanticism.* The term Romantic movement is somewhat misleading: it was hardly a movement, and the word Romantic is so vague and general as to be almost meaningless. The writers of the period differed widely in the nature of their work and in their critical approach. They did not apply the word Romantic to themselves, and recognition of their achievements by both the public and critics was slow in coming.

The features of English Romanticism

With these reservations in mind, it may be possible to isolate the distinguishing features of English Romanticism. These had obvious correspondences with political and social upheavals of the time: the American and the French revolutions, emphasizing natural rights and the importance of the individual, were reflected in attitudes of writers such as William Blake and were implicit in their statements about poetry. Where the main trend of 18th-century poetics had been to prove the general, to see the poet as a spokesman of society, addressing a cultivated and homogeneous audience and having as his end the conveyance of "Truth," the Romantics found the source of poetry in the particular, unique experience and saw the poet as an individual distinguished from his fellows by the intensity of his perceptions, taking as his basic subject matter the workings of his own mind. The implied attitude to an audience varied accordingly: Keats, for instance, declared, "I never wrote one single line of Poetry with the least Shadow of public thought." Poetry was to be regarded as conveying its own truth, sincerity the criterion by which it was to be judged.

Emphasis on feeling—seen perhaps at its finest in the poems of Burns—was in some ways a continuation of an earlier "cult of sensibility," but it now received special stress and made an appearance in most Romantic definitions of poetry. Wordsworth spoke of poetry as "the spontaneous overflow of powerful feelings." It followed that the best poetry was that in which greatest intensity of feeling was expressed. The degree of intensity was affected by the extent to which a poet's imagination had been at work; as Coleridge saw it, imagination was the supreme poetic quality, a force that made the poet a godlike being. Romantic theory thus differed from the Neoclassical in assigning the imagination a role of supreme importance. Samuel Johnson had seen the components of poetry as "invention, imagination, and judgment," but Blake wrote, "One Power alone makes a Poet: Imagination, the Divine Vision." Judgment, or conscious control, was felt to be secondary; Romantic poets emphasized the workings of the unconscious mind, dreams and reveries, the supernatural, and a childlike or primitive view of the world, valuable because it had not been overlaid by restrictions of civilized "reason." A further sign of the diminished stress placed on judgment is the Romantic attitude to form: if poetry must be spontaneous, sincere, intense, it should be fashioned primarily according to the dictates of the creative imagination. Wordsworth advised a young poet, "You feel strongly, trust to those feelings, and your poem will take its shape and proportions as a tree does from the vital principle that actuates it." This organic view of poetry is opposed to the Classical doctrine of "genres," each with its own linguistic decorum; and it led to the feeling that poetic sublimity was unattainable except in short passages.

Changes in poetic diction

With the new conception of poetry went a demand for a new diction. Wordsworth and his successors, particularly Keats, found the prevailing poetic diction of the later 18th century stale and stilted and totally unsuited to the expression of their perceptions. Wordsworth accordingly sought to bring the language of poetry back to that of common speech. When he published his views in his "Preface" to the second edition of *Lyrical Ballads* in 1800, the time was ripe for a change: the flexible diction of earlier 18th-century poetry had hardened into a conventional language, and, with the notable exception of Blake and Bums, little first-rate poetry had been produced in Britain since the 1740s.

Insistence on the importance of the individual led to an extension of literary sympathies. Most prominent and characteristic was a feeling for external nature, not unconnected with the social changes being brought about by the Industrial Revolution—especially with a shift of population from rural areas into rapidly expanding, ugly cities. In the presence of nature, man considered himself to be closer to God; in such an environment, spontaneous feeling was still possible; communion with and understanding of nature led a poet toward an understanding of his own soul. The supernatural and marvellous were a further area for an exploration of the workings of the human mind and were a prime source of sublimity; and the remote, whether in time or space, formed the subject or the setting of much Romantic writing.

Neither the suddenness nor the novelty of Romanticism should be exaggerated. The critical theories put forward had been anticipated in the 18th century and earlier, and the main difference lay in a shift of emphasis. Moreover, not all writers of this period—Jane Austen, for example, or George Crabbe or Thomas Love Peacock—could be called Romantic; and much of what seems most enduring in the novels of such a Romantic as Scott was non-Romantic. Again, the great Romantics differed among themselves: Byron was eloquent in his praise of 18th-century poetry and vehement in his attacks on Wordsworth and Keats; Shelley found Wordsworth lacking in imagination; and Blake disagreed sharply with many of Wordsworth's critical theories.

Wordsworth and Coleridge and the *Lyrical Ballads*

Poetry. The meeting in 1795 of William Wordsworth and Samuel Taylor Coleridge was the beginning of one of the most fruitful of all literary friendships. The anonymous appearance, in 1798, of their *Lyrical Ballads* marked a new departure in English poetry, and Wordsworth's "Preface" to an enlarged edition was a manifesto of a new outlook. Wordsworth's contribution to the volume was mainly a group of poems "giving the charm of novelty to things of every day," and it was these that aroused most hostility. Certainly, in the earliest versions of these poems, Wordsworth was not always sufficiently sure of himself: his extreme simplicity and matter-of-factness sometimes led him into bathos, and he did not always succeed in raising them above the level of anecdote; but at their best the poems have an extraordinary immediacy and power.

Coleridge said, "Wordsworth added two or three poems written in his own character, in the impassioned, lofty, and sustained diction which is characteristic of his genius"; foremost among these is "Tintern Abbey," a poem in which Wordsworth gave superb expression to his feeling for nature and the mystical "presence" that guided, sustained, and consoled him. He had a remarkable gift for conveying the inner significance of a scene or of an apparently trivial event. As he explains in a long autobiographical poem, *The Prelude,* there are in our existence "spots of time"—moments when, with sudden clarity, it is possible to "see into the heart of things." His ability to present these moments was his greatest strength. Poetry, he wrote, "takes its origin in emotion recollected in tranquillity"; and the quiet meditative gravity with which he is able to recall and re-create his moments of luminous perception perfectly illustrated this statement. Equally notable are the solemn dignified pathos of "Michael" (1800), the moving simplicity of the "Lucy" poems, the excitement of many passages of *The Prelude,* and the eloquence of the "Ode: Intimations of Immortality" (1807). Wordsworth is an uneven poet: when his imagination fails he can be banal or silly, or indulge in empty moral rhetoric and inflated diction; but of the greatness of his achievement there can be no doubt.

A meditative quality also informs some of Coleridge's best work; in "Frost at Midnight" (1798), he relates his state of mind to a particular time and place, moving easily and conversationally through an association of ideas. The power of a less consciously controlled association is seen in his great "magical" poems—"The Rime of the Ancient Mariner" (1798), "Kubla Khan," and "Christabel" (both published 1816). "The Ancient Mariner" is his finest achievement, in its manifestation of great narrative skill, a nightmarish atmosphere, richness of image and symbol, and a complex and all-pervading moral tone. Coleridge was a man of immense potentialities, few of which were realized; yet his achievement remains great and influential. His *Specimens of Table Talk* (1835) give an idea of his gifts and range of interests, as do his lectures and essays, especially those on Shakespeare. and collections of notes. *Biographia Literaria* (1817) is a rambling but stimulating discussion of poetry and criticism, of seminal importance: one of the most intellectually formative writers of his day, he has had a profound influence on later criticism.

Of lesser poets of this generation, Thomas Moore, whose *Irish Melodies* began to appear in 1807, was one of the most popular. Robert Southey was closely associated with Wordsworth and Coleridge and was a prominent member of the Lake poets, who sought inspiration in the Lake District of Cumberland and Westmorland; though Southey's grandiose epic poems scarcely repay the reading, some shorter poems as well as prose works, *The Life of Nelson* (1813), the *History of the Peninsular War* (1823–32), and a classic formulation of the children's tale "The Three Bears," have lived on.

A reminder of how various was the literary achievement of this period is provided by George Crabbe. He has been called the last of the Augustans, and his roots—his sensibility, his values, much of his diction, his heroic couplet verse form—are very firmly in the 18th century. He differs from the earlier Augustans, however, in his subject matter, concentrating on realistic, unsentimental accounts of the life of the poor and the middle class. In his verse tales he displays considerable narrative gifts and power of description, put to atmospheric and psychological use: *The Village* (1783), *The Borough* (1810), *Tales in Verse* (1812), and *Tales of the Hall* (1819) won him popularity, and after a long period of neglect he is widely recognized once more as a major poet.

The later Romantics: Shelley, Keats, and Byron

When *Lyrical Ballads* appeared, Byron was 10 years old, Shelley six, and Keats three; they grew up in the shadow of the Napoleonic Wars, and the overthrow of Napoleon in 1815 was an event as stirring for them as the storming of the Bastille in 1789 had been for the older poets. Shelley in particular was passionately interested in politics, coming early under the spell of the anarchistic views of William Godwin, whose *Political Justice* had appeared in 1793. This revolutionary ardour, a somewhat vague zeal for the liberation of mankind, is the basis of Shelley's critical essay "A Defence of Poetry" (written 1821; published 1840), in which poets are hailed as "the unacknowledged legislators of the world." This fervour burns throughout the early *Queen Mab* (written 1812–13), the long *Revolt of Islam* (1818), and the noble lyrical drama *Prometheus Unbound* (1820). Shelley is the poet as prophet, as the fine "Ode to the West Wind" (written 1819) makes clear; but with his prophetic spirit goes a vagueness that too often results in a blurring of poetic effect. He is an emotional poet, and critics have complained that he frequently seems simply to strike an attitude and let poetic clichés come pouring out. This is true of his weaker work: but Shelley should not be judged as if he were trying to write like Donne or Keats. His material is transcendental and cosmic, and his expression is appropriate to it; though elements of self-pity and immature posturing have caused a decline in his reputation, at his best (as in short lyrics, much of "Adonais" [1821], "Ozymandias," and *The Triumph of Life)* he is a poet of compelling excitement and power.

The reputation of John Keats, supported as it is by his superb letters, has fluctuated less. He is a richly sensuous poet whose early work, such as *Endymion* (1818), produces an overluxuriant, cloying effect. But Keats was able to discipline himself: he must have known that he had not long to live, and he devoted himself to the perfection of his art with feverish intensity. He experimented with many kinds of poem: "Isabella" (1820) is a deliberate attempt to reproduce a medieval atmosphere; his epic fragment *Hyperion* (1820) has graveness and sonority, but Keats found the style too Miltonic—"I wish to give myself up to other sensations," he wrote. Some of these are found in the poems of Keats's *annus mirabilis* —1819—"The Eve of St. Agnes" and the great odes, "To a Nightingale," "On a Grecian Urn," and "To Autumn." These, with the revised *Hyperion,* represent the summit of Keats's achievement, showing what has been called "the disciplining of sensation into symbolic meaning," the complex themes being handled with a concrete richness of detail.

Of the "great five" Romantic poets, Byron presents major differences from the others. In *Don Juan* he wrote, without irony:

> Thou shalt believe in Milton, Dryden, Pope;
> Thou shalt not set up Wordsworth, Coleridge, Southey.

There were, moreover, striking contrasts within his own work: in *Childe Harold* (1812–18) he appears as an archetypal Romantic, and an element of melodrama appears again in *Manfred* (1817) and *Cain* (1821). Very different is the detached, ironic Byron, a master of witty, almost impudent, satire. *Beppo* (1818), *Don Juan* (1819–24), a kind of gay picaresque novel in verse, and *The Vision of Judgement* (1822) represent, with a handful of lyrics, his lasting achievement.

Of minor poets of the second Romantic generation the best is undoubtedly a Northamptonshire peasant, John Clare, who led a wretched life of poverty and eventual madness, marked by a noble dedication to his poetic gifts. He has natural simplicity and lucidity of diction, intent observation, and almost classical poise, and the unassuming dignity of his attitude to life makes him one of the most quietly moving of English poets. Thomas Lovell Beddoes, whose violent imagery and obsession with death and the macabre recall Jacobean dramatists, represents a pole opposite to that of Clare. He had considerable metrical virtuosity, seen at its best in the songs and lyrical passages from his shapeless tragedy *Death's Jest-Book* (begun 1825; published 1850), but his sensationalism becomes tiring. A comic writer, Thomas Hood, once enjoyed great vogue, though he is now little read. Some of his poems of social protest, such as *The Song of the Shirt* (1843), and the graceful *Plea of the Midsummer Fairies* (1827), are by no means negligible.

Jane Austen's and Sir Walter Scott's different treatments of the novel

The novel. At the turn of the century the cult of sensibility, manifested in the novel of feeling and of terror, dominated prose fiction. The Gothic novel lingered on in such writers as Mary Shelley, whose *Frankenstein* (1818) deals, among its scientific horrors, with themes of social injustice and the "noble savage"; and Charles Maturin, whose *Melmoth the Wanderer* (1820) has, with all its absurdity, a striking intensity. But novelists dealt with the supernatural far less adequately than did poets, and their works were ripe for deflation. The spirit of parody formed a starting point for Jane Austen, who perceived the falsity of the novel based on a carefully cultivated emotional response. *Northanger Abbey* (begun *c.* 1798; published 1817, dated 1818) satirizes the Gothic novel with complex irony, and *Sense and Sensibility* (begun *c.* 1795; published 1811) examines the qualities indicated by its title with sympathy and understanding. As her novels grew in depth, so did Jane Austen's moral perceptions; her art is at its finest in *Emma* (1815). She is the spokesman for sanity and intelligence and builds up positive values against which the objects of her attack can be judged. She is by no means a simple novelist: working within chosen limits, she observes and describes closely the subtleties of relationships between people. She looks continually to discover the principles of conduct that animated them, but her analysis is sympathetic as a rule and her vision basically comic. She is a master of dialogue and writes with great economy, hardly ever wasting a word.

The same cannot be said of the sprawling talent of Sir Walter Scott. His earlier literary career was as a successful poet, with such historical romances as *The Lady of the Lake* (1810). Turning to prose with *Waverley* (1814), he wrote more than 20 novels in the next 15 years. His novels are a great achievement, to be judged by their cumulative effect. He is best when dealing with recent Scottish history, as in *Guy Mannering* (1815) or in his masterpiece, *The Heart of Midlothian* (1818). In adopting the manner and speech of "the lower orders," he was conscious of an affinity with his friend Wordsworth.

His great dramatic gifts and power of characterization often found vivid expression in dialogue but were offset by a deficient sense of form.

Thomas Love Peacock, a satirist for whom plot meant little, approached the novel differently. His novels are conversation pieces in which many pretensions of the day are laid bare. *Nightmare Abbey* (1818) humorously exposes the trappings of Romanticism, and, by including as characters, under thin disguises, Coleridge, Byron, and his friend Shelley, Peacock is able to satirize the more extravagant elements of Romantic poetry. Among lesser novelists are Maria Edgeworth, whose novels of Ireland inspired Scott; Susan Ferrier, a Scot with her own vein of racy humour; and another Scot, John Galt, whose *Annals of the Parish* (1821) is a minor classic, as was James Hogg's *Confessions of a Justified Sinner* (1824), a powerful story of Calvinism and the supernatural.

Miscellaneous prose. The Romantic emphasis on individualism is reflected in prose. William Hazlitt is a vigorous and forthright writer and an energetic and subjective critic of wide range, though lacking in sympathy with 18th-century poetry. His most characteristic work is to be seen in his *Lectures on the English Poets* (1818), *Lectures on the English Comic Writers* (1819), and in *The Spirit of the Age* (1825), especially valuable for its portraits of Hazlitt's contemporaries. Charles Lamb is an even more personal essayist, a zealous but undiscriminating critic. In the collection of essays *Elia* (1823) and *The Last Essays of Elia* (1833), he projects a carefully managed portrait of himself—charming, whimsical, witty, sentimental, warmhearted, nostalgic, sociable. Confession of a different kind is provided by Thomas De Quincey, whose addiction to opium resulted in the eloquent *Confessions of an English Opium-Eater* (1821); his *Reminiscences of the English Lake Poets* is still of interest. A critic and essayist of lighter weight is Leigh Hunt, an intimate and loyal friend of Keats. His outspoken journalism, particularly during his editorship of the *Examiner,* was influential.

Anti-Romantic criticism

Walter Savage Landor is a classicist whose detached style is best seen in brief lyrics and in a series of *Imaginary Conversations*, which began to appear in 1824. The anti-Romantic point of view received pungent expression in the quarterlies: the Whig *Edinburgh Review* (begun 1802), edited by Francis Jeffrey, was followed by its Tory rivals, *The Quarterly Review* (1809) and *Blackwood's Edinburgh Magazine* (1817). All three express trenchantly, and often savagely, adverse views of Romantic poets. These journals were not confined to literature, and in their attacks on prejudices and abuses they set a standard of fearless and independent journalism.

Drama. The great Romantic poets essayed tragedies or "lyrical dramas," and one or two of these, such as Coleridge's *Remorse* (first performed 1813) and Byron's *Marino Faliero* (published 1821), made brief appearances on the stage, but most of them were unacted and often virtually unactable; their authors had little dramatic gift or knowledge of stagecraft, and much of their work seems like a pastiche of Jacobean drama. A partial exception was Byron, who was interested in the theatre and had some talent for it, but even his dramas lack vitality. Shelley's *Cenci* (1819; first performed 1886) has some power and passion but is crudely melodramatic and has so many echoes of Shakespeare as to read almost like a burlesque.

As for the "acting theatre," performances at the theatres of Covent Garden and Drury Lane and elsewhere were of melodramas, farces, pantomimes, and extravaganzas, staged before rowdy and sensation-hungry audiences. Writers of more serious plays showed little talent; and, although some of the farces of the day are lively enough, the "regular" comedies are solemn and dreary. The early 19th century in fact failed to produce worthwhile tragedy or comedy. Against this might be set the introspective and often illuminating dramatic criticism of Coleridge, Hazlitt, and Lamb.

The aftermath of Romanticism and the Victorian age. *Tennyson.* The 19th century has usually been divided into two periods called, respectively, Romantic and Victorian, of which the first, beginning in the 18th century, was taken to have ended about 1830–32; and, as a rule of thumb, this was justifiable: Keats had died in 1821, Shelley in 1822, Byron in 1824, and Scott in 1832; Coleridge had done his best work before 1832, and the same was true of Wordsworth, although he lived until 1850. Yet there was no real break; in 1830–32 Alfred, Lord Tennyson published his first volumes of verses, and these years were not a turning point in cultural history like 1660 or 1798 or like 1914, when the 19th century came to its true end. The story was rather one of continuous development—or "evolution," a key word of 19th-century thought. The impress of the first-generation Romantics—Wordsworth, Coleridge, and Scott—was on the work of their Victorian successors; and it was, above all, Wordsworth and Coleridge who fixed the notions about poetry that were accepted for the rest of the century. Wordsworth's description of poetry as "the spontaneous overflow of powerful feelings," his avowal of the purpose of his poetry as being "to teach the young and the gracious of every age to see, to think, and feel"—these were central to later 19th-century poets and their readers. Poetry was to reveal truth, and the poet was revered as prophet and priest "Of the wonder and bloom of the world," in the words of Matthew Arnold. Never before had it been so generally accepted that nature—the outward world—should be a poet's main source of inspiration. Hence the extraordinary success attained by 19th-century writers in rendering nature with fidelity and insight—a success seen to advantage in Tennyson, Matthew Arnold, Gerard Manley Hopkins, and George Meredith but found also in such prose writers as Emily Bronte, John Ruskin, George Eliot, Charles Kingsley, Thomas Hardy, Robert Louis Stevenson, and others. From Tennyson's "Laburnums, dropping-wells of fire" to Hopkins' "Fresh-firecoal chestnut falls," from Ruskin's description of his first sight of the Alps to Hardy's Egdon Heath—19th-century literature surpassed in its command of "natural magic" any preceding century.

The great influence of Wordsworth on the 19th century

Behind this lay the "nature" religion of Wordsworth; nature was holy and morally uplifting, and the more successful a writer was in "disimprisoning the soul of fact," as Thomas Carlyle put it, the more good he was doing to mankind. Moreover, in spite of the Oxford Movement and other revivals of religious activity, the century witnessed an immense falling away from traditional religious certainties, and Wordsworth furnished many doubters with an interim faith. Increasing urbanization created a longing for escape and compensation, and readers expected poets to restore "the freshness of the early world" to them. Thus, much Victorian literature was agnostic at heart, yet nature-loving, high-minded, and morally serious. Tennyson was the representative poet of the age because he expressed most completely its misgivings as well as its underlying assumptions. *In Memoriam* (1850) represented the 19th-century mind, just as Milton's *Paradise Lost,* Pope's *Essay on Man,* and Wordsworth's *Prelude* represented their respective periods. Immortality, progress, the providential scheme, and the beneficence of nature were questioned; yet Tennyson preserved a faith in human dignity and a passionate joy in landscape and the seasons; he did not doubt that "through the ages one increasing purpose runs," and he looked forward to "one far-off divine event." Tennyson was no aesthete or escapist; he kept abreast of scientific thought and flinched from none of the implications of the nebular theory, of geology, of embryology, and of the evolutionary theory (which he had versified several years before Charles Darwin's *Origin of Species* appeared in 1859). A devout agnostic, Henry Sidgwick considered that Tennyson had given beautiful and moving expression to "the indestructible and inalienable minimum of faith which humanity cannot give up because it is necessary to life." Tennyson has emerged in reputation from a temporary eclipse, not merely as a typical Victorian but for the fidelity of his renderings of nature and for the skill with which his descriptions symbolize states of feeling.

Tennyson as the representative poet of his age

The effect of the French and Industrial revolutions. The 19th century, in one respect, was an aftermath of

The emergence of a social conscience in Victorian England

the French Revolution. English poetry of that century took its character from the Romantic age—from a period of upheaval and excitement that, originally sympathetic toward French aspirations, later swung away into conservative reaction. In England, radicals and liberals attempted to salvage from the tidal wave of reaction whatever of permanent value the French Revolution had bequeathed. Enduring social injustice and inequality lay heavily on the Victorian conscience. The French Revolution had originally fought against these, and, though England had been forced in its 20-year struggle with Napoleon to reaffirm its immemorial way of life, yet "the condition-of-England question" asserted itself with ever-increasing urgency. For the 19th century witnessed not only aftermaths of the French and the Romantic revolutions but also of the Industrial Revolution. Thus, indignation at the state of the underprivileged and a sense that something must be done before it was too late were preoccupations of Victorian writers as various as Jeremy Bentham, Carlyle, Ruskin, Dickens, Disraeli, Mrs. Gaskell, Charles Kingsley, Matthew Arnold, William Morris, and others. Naturally, they did not all diagnose the same complaint or prescribe the same cure. Bentham urged reform of the legal code to ensure the triumph of Utilitarianism—the "greatest-happiness principle"; Carlyle urged faith, sincerity, and leadership; Ruskin and Morris, love of nature and art and pride in craftsmanship; Kingsley, Christian Socialism; Arnold, the spread of culture and education of the populace; and novelists depicted or satirized abuses and brought them home unforgettably to readers' imagination.

Considering the changes going on throughout the 19th century, the tenacity with which the old social hierarchy persisted in England and the completeness with which its underlying assumptions and valuations were taken for granted by writers were remarkable. Novelists, poets, and critics presupposed a world resting on the foundation of a working class. In Dickens' *Bleak House* (serialized 1852–53), the old aristocracy represented by Dedlocks might have been on the way out, but the "new rich" Rouncewells were replacing them, and society—however little Dickens might like it—was still ascendant over the multitude of mankind. The Victorian age was uncomfortably aware that England, in the process of becoming the world's workshop, had lost much that had given an ideal character to past times and particularly to the Middle Ages. For the very reason that the age of faith and chivalry had gone forever, Scott's novels were read with avidity.

The cult of the medieval

Indeed, the cult of the medieval was significant. It appeared in Tennyson, in the Rossettis and other Pre-Raphaelites, in Carlyle, Ruskin, and Morris, and in the architecture of A.W.N. Pugin, Sir Charles Barry, Alfred Waterhouse, and Gilbert Scott. Carlyle's *Past and Present* (1843) contrasted the present—disfigured by Materialism, irreligion, Utilitarianism, dilettantism, and the "cash nexus"—with the past, typified by the harmonious life of the monks of St. Edmundsbury. Ruskin proclaimed the Gothic to an age of machinery, while Morris dreamed of a London small and white and clean and of a Nowhere where men might perhaps recapture the lost glamour of living.

Seminal influences on Victorian thought. The predominance of Thomas Carlyle in the first half of the century had wide and deep meaning. His prophetic mission was to recall a doubting and godless generation to faith in the God of the Old Testament and of Calvin. In his *French Revolution* (1837), he dramatized history as a working out of judgments upon sin and corruption; and in *Sartor Resartus* (serialized 1833–34), *Past and Present* (1843), and *On Heroes, Hero-Worship, and the Heroic in History* (1841), he summoned readers to hear "the voice of old Eternities" and to revere great men who had heard that voice more clearly than others. Carlyle's influence dwindled as people tired of his hysterical style and excessive admiration of strong leaders; but he inspired and invigorated a whole generation, and his prose at its best was moving and expressive—the embodiment of a highly individual vision.

Though Carlyle subscribed to no particular creed, he made continual use of religious language, and his message associated him with the believing side in the 19th-century struggle. John Stuart Mill once called Bentham and Coleridge the two "seminal minds" of the century. Bentham was father to philosophical radicals, Utilitarians, and freethinkers—men such as James and John Mill, Herbert Spencer, George Henry Lewes, Leslie Stephen, John Morley, Frederic Harrison—to all who believed that man could be schooled in the direction of orderly progress by education, free discussion, and the enlightened application of Utilitarian standards. Coleridge, in later prose works, *Aids to Reflection* (1825) and *On the Constitution of the Church and State* (1830), showed that old meanings in religion and politics might still be valid though outward forms had changed. The influence of Coleridge's philosophical rehabilitation of Christianity could be seen down the century in such writers as John Sterling, Julius Hare, Thomas and Matthew Arnold, and Frederick Denison Maurice: Carlyle conspicuously carried on his work, and even J.S. Mill freely acknowledged that Coleridge had deepened and enriched his understanding of the forces that hold men together in society.

J.A. Froude, historian and disciple and biographer of Carlyle, placed Thomas Carlyle and John Henry Newman where Mill had placed Bentham and Coleridge, at the head of the two currents of thought that interested him most. Though both have come to seem men of God in their own ways, to Froude they seemed to face opposite directions. Yet both belonged to the Coleridgean stream, and Newman himself counted Coleridge among influences making for spiritual reawakening. But neither the so-called Tractarian movement of High Church revival nor Newman's secession from the Church of England was much reflected in the literature of the time, except in Froude's *Nemesis of Faith* (1849) and "The Oxford Counter-Reformation" (1881), Charlotte M. Yonge's *Heir of Redclyffe* (1853), J.H. Shorthouse's *John Inglesant* (1880), a few passages in Mark Pattison's *Memoirs* (1885), and the opening of Matthew Arnold's *Discourses in America* (1885) on Emerson. But in the *Apologia pro Vita Sua* (1864), Newman produced not merely a masterpiece of prose style but one of the two or three most significant books of the century.

Darwin and the theory of evolution

Another one of the significant books of the century was Charles Darwin's *Origin of Species* (1859). Works of science and of philosophy and history did still often possess literary value, and the *Origin* was perhaps the last major scientific work written to be understood and enjoyed by a "general reader." Darwin did not invent the theory of evolution, but he familiarized his age with the concepts of natural selection and of continuous development. Powerfully aided by his disciple and champion T.H. Huxley, he compelled men to readjust many of their cherished assumptions about God, nature, and themselves. After Darwin there came a gradual ebbing of the old religious certainties and a growing suspicion that life was caught up in workings of impersonal forces moving inscrutably to an unknown end. This did not come about immediately; but, both in life and in literature, the old unthinking exuberance and confidence gave place in the latter half of the century to "doubts, disputes, distractions, fears." If Dickens' *Pickwick Papers* (serialized 1836–37) and Thackeray's *Vanity Fair* (1848) might be taken to represent the first half of the century, George Eliot's *Middlemarch* (1871–72) and Thomas Hardy's *Tess of the D'Urbervilles* (1891) or *Jude the Obscure* (1895) might stand for the second half.

The novel. Victorian literature reached its highest level of achievement in the novel. A good deal of its poetry has now worn rather thin, and some reputations—notably that of Robert Browning, so highly regarded up to the turn of the century as a subtle psychologist, deep thinker, and invigorating lay-preacher—have been somewhat eclipsed. In drama its contribution was inferior; in criticism, with a conspicuous exception in Matthew Arnold, it was uncertain of its direction. But in Charles Dickens, Emily Bronte, George Eliot, Thomas Hardy, and Henry James it produced novelists of the first order, while it brought forth also a large company of others who, though sometimes unsurpassed in their own way, were mainly of a rank below the very highest—Anthony Trollope, Charlotte Bronte, Wilkie Collins, Mark Rutherford, Robert Louis Stevenson, George Moore, and George Gissing, besides others. Thackeray and Dickens were once classed as the two best Victorian novelists. Later, Dickens was decried as melodramatic, sentimental, and chaotic, and Thackeray was preferred as the more civilized and self-conscious artist. But, seen from a modern vantage point, Dickens has once again begun to appear the supreme Victorian novelist. He began in *Pickwick* as the arch-entertainer in the comic-picaresque style of the 18th century; he ended with a group of far more subtle, intricate, and sombre novels on which his reputation came to rest: *Bleak House* (serialized 1852–53), *Little Dorrit* (1855–57), *Great Expectations* (1860–61), and *Our Mutual Friend* (1864–65). He had a unique relationship with his public, sometimes altering plots to suit what he knew it wanted or to avoid breaking its heart. Sophisticated readers have come to know about Dickens' defects: he drew caricatures rather than portraits; many of his characters were stage types who repeat catchphrases ad nauseam; his plots often seemed fantastic and contrived; and his sense of artistic form was crude. In spite of this and in spite of his manner of siding with or against his own characters, he was without an equal among English novelists for sheer vitality, inventiveness, and imaginative force combined with power of observation and a flair for significant detail; he felt his way imaginatively into scenes and situations and, by charging them with feeling, made them expressive emanations of the Dickens vision.

The great Victorian novelists—Charles Dickens, George Eliot, and Thomas Hardy

It has been said that the English novel came of age with George Eliot, and her work certainly had an intellectually adult quality that distinguished her from her predecessors and contemporaries. She was familiar with the advanced thought of her time and was the first translator of David Friedrich Strauss's *Leben Jesu* (1835–36), a work that pained the orthodox by its relentless "demythologizing" of the Gospels. Brought up in the evangelical tradition, she had been shocked out of orthodoxy by an early encounter with emancipated thinking and became an agnostic. In this she was typical of her age, and she was no less typical in retaining a firm hold upon the ethical core of religion and a lifelong sense of mission to mankind. She also retained an intense affection for the well-remembered scenes and people of her Warwickshire childhood and an imaginative sympathy with their beliefs. These qualities, combined with a powerful grasp of psychological and sociological realities, enabled her to produce a series of admirable novels, including *Adam Bede* (1859), *The Mill on the Floss* (1860), and, most notably, *Middlemarch* (1871–72), generally felt to be the greatest English novel of the period.

Both Thomas Hardy and George Eliot were at their best in dealing with rustic life, scenes, and character. But Hardy was essentially a poet; his real subject matter was states of feeling, rendered against a landscape background coloured by them. Hardy's sense of the strange disease of modern life, of the withdrawal of God and the indifference of nature, expressed itself in a vision of man caught up in a web woven by an inscrutable destiny—a vision implicit in all his work but expressly stated in a remarkable epic drama, *The Dynasts* (1903–08). Yet he was keenly alert to every aspect of nature and depicted it with imaginative faithfulness and intensity: there is nothing in English prose to equal his rendering of the night sky or the thunderstorm in *Far from the Madding Crowd* (1874), Egdon Heath in *The Return of the Native* (1878), and winter at Flintcomb Ash or early mornings at Talbothays in *Tess of the D'Urbervilles* (1891). The brooding intensity of his mind, which stamped his individuality on everything he touched, raised Hardy to a high place among novelists of the later 19th century, a position hardly threatened by his far more brilliant, witty, and sophisticated rival, George Meredith, and challenged only by Henry James, whose work fell mainly in the next century (see below *English literature in the 20th century*). The same qualities of intensity and authenticity gave Hardy as poet a rank among the later poets of the century shared perhaps by Gerard Manley Hopkins and not attained by Algernon Charles Swinburne, once considered the leading poet of the time but who, despite his sound and fury, was later felt to signify very little.

Critics. Of eminent Victorian critics Matthew Arnold has worn best. Only Leslie Stephen and Walter Pater approached a similar order of importance, with critics such as Walter Bagehot, R.H. Hutton, W.E. Henley, Robert Louis Stevenson, John Addington Symonds, Sir Edmund Gosse, and others well in the rear.

Leslie Stephen, in his *History of English Thought in the Eighteenth Century* (1876), set a high standard in what was then a new venture: the "history of ideas." Throughout numerous essays collected in *Studies of a Biographer* (1898–1902) and *Hours in a Library* (1874, 1876, 1879) and in many biographies in the *Dictionary of National Biography*, he showed unusual knowledge and skill in relating writers to their historical, social, and intellectual backgrounds and a sure instinct in discerning their moral core. Stephen was also interesting as one of a band—including T.H. Huxley, W.K. Clifford, and Henry Sidgwick—who did much to make agnosticism respectable.

Walter Pater, high priest of aestheticism, was of a quite opposite cast of mind. In him evaluation was subordinate to "appreciation." Whether he wrote of Wordsworth, Charles Lamb, or Sir Thomas Browne, his aim was to divine their uniqueness and then distill and present it "flask'd and fine." Pater did this supremely well; yet criticism that treated all subjects alike became satiating. It was Matthew Arnold who gave criticism a firm basis of principle and a sense of direction, and the best subsequent criticism took its cue from him.

The importance of Matthew Arnold

Arnold combined a poet's sensibility with a keen intellect and a flair for diagnosing the cultural and spiritual condition of the modern world. He lifted English criticism out of a rut of provinciality and brought it into line with contemporary European thought. At a time when Romanticism was in its heyday, Arnold drew attention to defects of much Romantic poetry—lack of sanity, substance, and form—and pointed to classic virtues of sobriety, weightiness, and unity. He believed that, with the advent of a new and undisciplined democracy, literature might have to play a more important part than before in maintaining civilized standards. He therefore tried to provide criteria whereby the best could be distinguished from the inferior or counterfeit.

Arnold interpreted "criticism" widely, extending it to include the whole interest of an informed intelligence. In *Culture and Anarchy* (1869), he proposed liberal education as the best remedy for the smugness and narrowness of the "Philistines," or uncultured middle class. In spite of his intellectual emancipation, Arnold recognized in religion the highest form of culture; he felt that, although men could not do without Christianity, they could not do with it as it was and set himself—in a series of remarkable works (*St. Paul and Protestantism*, 1870; *Literature and Dogma*, 1873; *God and the Bible*, 1875; and *Last Essays on Church and Religion*, 1877)—to find for religion a sure foothold in spiritual experience. Opinions have differed about the permanent value of these books but not about the sincerity of Arnold's effort to restore life and conviction to religion at a time when it was threatened, on the one side, by a too easy infidelity and, on the other, by a too easy acceptance of sacred clichés.

The end of the age. In the last two decades of the 19th century there were unmistakable signs that the original impulses that had launched the century on its course—Romanticism, evangelicalism, humanitarianism, meliorism—were losing their momentum; poets were becoming aesthetes instead of legislators of mankind, and novelists were turning more and more inward for their subject matter. In Oscar Wilde there was the iridescence of decay; in Samuel Butler the overthrow of many Victorian sanctities—the home, parental and filial affection, the church; in Rudyard Kipling the bugle notes of the new imperialism; in George Bernard Shaw the conversion of drama into an instrument of propaganda and discussion. The 19th century lingered precariously on until World War I swept away its Edwardian aftermath.

Anglo-Irish. With the 19th century there came a change in Anglo-Irish literature. Nationalism, liberalism, and revolution were felt in the Anglo-Irish colony, and Romanticism was beginning to affect the arts. Moreover, antiquarianism had begun to uncover the Gaelic past, which had never been wholly forgotten, for even Swift had translated a poem from the Irish. But Charlotte Brooke, daughter of a dramatist and novelist, was the first to make more extensive verse translations. Irish nationality was born, and thenceforth books about Ireland predominated and an enormous number were produced.

Irish Melodies and *Lalla Rookh*

Poetry. Anglo-Irish verse was established by Thomas Moore, a versatile poet and singer of his own songs. In his *Irish Melodies* (1808–34) he attempted to solve the problem of setting English words into Irish airs. Through these often vehement songs the wrongs of Ireland were warbled in English drawing rooms with great advantage to the Irish cause. Apart from his songs, his Oriental epic *Lalla Rookh* (1817) brought him wealth and fame. Moore was a national hero as no other Irish poet has been, even though he considered it unnecessary to write in dialect, or the style of folk poetry, in order to emphasize Irish nationality. George Darley, a contemporary of Moore, wrote in an exquisite style reminiscent of an Elizabethan or 17th-century poet.

In 1842 a patriotic organization named Young Ireland and led by Thomas Osborne Davis, an eloquent and sincere writer, founded a new paper, *The Nation,* to which a large number of writers attached themselves. Another journal was the *Dublin University Magazine,* which lasted about 40 years and was probably the finest magazine ever produced in Ireland. Most of the best Irish writers contributed to it, notably James Clarence Mangan, a prolific and uneven writer of every kind of verse, who, at his best, was one of the greatest poets of Ireland. He was much influenced by the German Romantics and in turn influenced Edgar Allan Poe. Other notable poets were Sir Samuel Ferguson, who wrote on Irish themes in a strikingly original way, inspired to some extent by Gaelic examples, and William Allingham, who wrote a long and interesting narrative in verse, *Laurence Bloomfield in Ireland* (1864). He settled in England and became an associate of Dante Gabriel Rossetti, adopting the Pre-Raphaelite manner, which linked him with William Butler Yeats and a succeeding period of Irish writing.

Prose. Among novelists was Charles Maturin, whose *Melmoth the Wanderer* (1820) had a wide influence in Europe. Even better known was Maria Edgeworth, who produced many novels, always with some edifying tendency. She knew Ireland well and depicted it with insight and humour in *Castle Rackrent* (1800) and in a tale, *The Absentee* (1812). A landlord's daughter, she believed firmly that the solution of Ireland's troubles lay in an improvement of the outlook of its landlords.

Joseph Sheridan Le Fanu was a successful writer of a different kind. Owner and editor of the *Dublin University Magazine* in the 1860s, he wrote many novels and short stories, chiefly dealing with mystery, crime, and the supernatural. He was the Irish master of the ghost story. He was also a poet, and there is a poetic quality about his work that raises it above the mere thriller.

Scottish literature in English. The re-emergence of vernacular prose, mainly within the novel and the short story, was a distinguishing feature of the 19th century in Scottish literature written in English. The writers fell into two groups: those using Scots for dialogue and English for the narrative, including Sir Walter Scott, James Hogg, Susan Ferrier, George MacDonald, Margaret Oliphant, William Black, and Robert Louis Stevenson; and those such as John Galt, David Moir, and (in the 20th century) Lewis Grassic Gibbon who employed a form of Scots or Scotticized English throughout. The advantage of Galt's method, in *Annals of the Parish* (1821), of casting the book as reminiscences of a Scots-speaking person, was that it secured a homogeneous tone, and the exact Scots idiom was admirable. Scott, on the other hand, had a wider range that came from contrast between English and Scots (as in *Redgauntlet,* 1824), though his English writing and the restriction of his brilliant Scots dialogue to minor characters sometimes made the result patchy and unsatisfactory.

The Kailyard school

The so-called Kailyard school of fiction, characterized by sentimental descriptions of Scottish life and the use of Scots dialect, appeared toward the end of the century and included Ian Maclaren (John Watson), S.R. Crockett, and Sir James Barrie. The sentimental viewpoint of Maclaren's *Beside the Bonnie Brier Bush* (1894) and Barrie's *Window in Thrums* (1889), the hypocrisies and idealization of village life, were pitilessly exposed in George Douglas Brown's *House with the Green Shutters* (1901). Brown's brutal tale was no more than a temporary blow against the Kailyarders.

Though much was written, the poetry of the period was disappointing. Two poems of the supernatural kept up an ancient Scottish tradition: James Hogg's "Kilmeny" (1813) and William Bell Scott's "Witch's Ballad" (1875); there were good vernacular lyrics by Scott, Allan Cunningham, and George MacDonald, but the century after Burns mostly saw a proliferation of the maudlin and jocose in well-worn verse forms. Widely read anthologies of verse called *Whistle-Binkie* (1832–53) were the poetic equivalent of Kailyard, and their popularity was a comment on the poetic taste of the age. More interesting poetry was found in James Thomson's "City of Dreadful Night" (1874), Alexander Smith's *Glasgow* (1857), and John Davidson's *Testaments* (1901–08), which were written in English and, unlike Kailyard and *Whistle-Binkie,* shpwed the impact of the contemporary world and its ideas.

CELTIC LITERATURE IN THE 19TH CENTURY

Welsh. *Poetry.* Strict metre poetry declined in the 19th century. Although the volume produced was enormous, the quality was poor. Eben Fardd was probably the last of the eisteddfodic poets to make any real contribution to Welsh literature. The influence of the hymn writers of the 18th century was seen in the development of the lyric. In fact, all the poetry of the 19th century betrays its religious origin. The influence of contemporary English songs was also seen, as in the work of John Blackwell (Alun), the father of the modern secular lyric. More originality was shown by Ieuan Glan Geirionydd (Evan Evans), who founded the Eryri school of poetry, inspired by the natural scenery of Snowdonia. The earlier lyricists were followed by a more bohemian group—Talhaiarn (John Jones), Mynyddog (Richard Davies), and Ceiriog (John Hughes), the latter the greatest lyrical writer of the century. Only one poet, Islwyn (William Thomas), made a success of the long poem: his Y *Storm* is a series of meditations on life and art.

Prose. This was the most prolific period of Welsh prose, though much of it was of poor quality, partly because it was produced by a people who had had little formal education in their own language and who had lost touch with their own literary past. Much of it was marred also by the pretentious style of the followers of William Owen Pughe, who tried to "restore" literary standards. A tremendous volume of prose was produced—periodicals, religious books and tracts, biographies, sermons, letters, and monumental works such as Y *Gwyddoniadur* ("The Encyclopaedia") and *Hanes y Brytaniaid a'r Cymry* ("History of the Britons and the Welsh"). Political writings became an important part of Welsh literature, the two great political writers of the century being Samuel Roberts and Gwilym Hiraethog (William Rees). Lewis Edwards, founder and editor of Y *Traethodydd,* tried to introduce a wider, European standard of literary criticism. There were some interesting attempts at creative writing, but the only great novelist was Daniel Owen, whose work portrays the extraordinary influence of religion on society during this period in Wales.

Breton. *The revival of Breton literature.* Interest in Breton revived at a time when France's central government was trying to impose French on Brittany and de-

Barzas-Breiz

stroy the regional language and was particularly stimulated with the publication of the celebrated ***Barzas-Breiz*** (1839; "Breton Bardic Poems"). This was a collection made in the villages by Theodore Hersart de La Villemarqué, who declared that they had survived unchanged as part of Breton folklore, though Breton-speaking scholars doubted the collection's authenticity. Attacks on the book reached their height about 1870, when R.-F. Le Men, in a reprinting of ***Catholicon,*** and François-Marie Luzel, in a paper delivered in 1872, showed that *Barzas-Breiz* was divided into three classes: (1) old poems rearranged by the editor or others, chiefly love songs and ballads; (2) modern poems made to look medieval; and (3) spurious poems on such personages as the wizard Merlin. But ***Barzas-Breiz*** was nonetheless important: the historical poems (which exalted the Breton's traditional struggle against oppression) had an especially strong influence. ***Barzas-Breiz*** led to a reawakening of Breton writers and stimulated Luzel himself to collect authentic folk songs and publish ***Gwersiou*** *Breiz-Izel* (2 vol., 1868–74; "Ballads of Lower Brittany") and, in collaboration with Anatole Le Braz, ***Soniou*** *Breiz-Izel* (2 vol., 1890; "Folksongs of Lower Brittany").

Prose. Luzel also collected folktales and legends, publishing many in Breton as well as in French translation. His collaborator, Le Braz, published stories concerning ***an*** *ankou* ("death"), as ***La Legende de la mort*** (1893; ***Dealings with the Dead,*** 1898). Traditional and literary elements combined indistinguishably in many stories. When Breton writers did not depend on folk legends for material, they fictionalized their own life stories. The many improving religious works published were not at all original; yet many Bretons who have read only one book in their own language have read ***Buez*** *ar Zent* ("Lives of the Saints").

Most playwrights were concerned to teach moral and religious lessons, such as Toussaint Le Garrec and Abbé J. Le Bayon, who revived several great mystery plays—*Nicolazig,* ***Boeh er goed*** ("The Voice of the Blood"), ***Ar*** *hent* ***en*** *Hadour* ("In the Steps of the Sower"), and ***Ar en*** *hent* ***de Vethleem*** ("On the Way to Bethlehem").

Poetry. For 200 years Bretons expressed their feelings in poems published as pamphlets--either as ***soniou*** (love songs, satires, carols, marriage lays) or ***gwersiou*** (ballads or broadsides describing recent events in Brittany and elsewhere). Their authors were people of every social class, very few of whom read ***Barzas-Breiz,*** and the poems were hawked around from fair to fair. Dozens of poets published collections after the appearance of *Barzas-Breiz;* the outstanding figure was undoubtedly Jean-Pierre Calloc'h, killed in action in 1917, whose poems were published as ***Ar en*** *Deulin* (1921; "Kneeling").

AMERICAN LITERATURE IN THE 19TH CENTURY

Early 19th century. After the American Revolution, and increasingly after the War of 1812, American writers were exhorted to produce a literature that was truly native. As if in response, four authors of very respectable stature appeared. William Cullen Bryant, Washington Irving, James Fenimore Cooper, and Edgar Allan Poe initiated a great half century of literary development.

Bryant, a New Englander by birth, attracted attention in his 23rd year when the first version of his poem "Thanatopsis" (1817) appeared. This, as well as some later poems, was written under the influence of English 18th-century poets. Still later, however, under the influence of Wordsworth and other Romantics, he wrote nature lyrics that vividly represented the New England scene. Turning to journalism, he had a long career as a fighting liberal editor of ***The Evening Post.*** He himself was overshadowed, in renown at least, by a native-born New Yorker, Washington Irving.

Irving and Cooper

Irving, youngest member of a prosperous merchant family, joined with ebullient young men of the town in producing the ***Salmagundi*** papers (1807–08), which took off the foibles of Manhattan's citizenry. This was followed by A ***History of New York*** (1809), by "Diedrich Knickerbocker," a burlesque history that mocked pedantic scholarship and sniped at the old Dutch families. Irving's models in these works were obviously Neoclassical English satirists, from whom he had learned to write in a polished, bright style. Later, having met Sir Walter Scott and having become acquainted with imaginative German literature, he introduced a new Romantic note in ***The Sketch Book*** (1819–20), ***Bracebridge Hall*** (1822), and other works. He was the first American writer to win the ungrudging (if somewhat surprised) respect of British critics.

James Fenimore Cooper won even wider fame. Following the pattern of Sir Walter Scott's "Waverley" novels, he did his best work in the "Leatherstocking" tales (1823–41), a five-volume series celebrating the career of a great frontiersman named Natty Bumppo. His skill in weaving history into inventive plots and in characterizing his compatriots brought him acclaim not only in America and England but on the continent of Europe as well.

Poe's Gothic tales

Edgar Allan Poe, reared in the South, lived and worked as an author and editor in Baltimore, Philadelphia, Richmond, and New York City. His work was shaped largely by analytical skill that showed clearly in his role as an editor: time after time he gauged the taste of readers so accurately that circulation figures of magazines under his direction soared impressively. It showed itself in his critical essays, wherein he lucidly explained and logically applied his criteria. His gothic tales of terror were written in accordance with his findings when he studied the most popular magazines of the day. His masterpieces of terror—"The Fall of the House of Usher" (1839), "The Masque of the Red Death" (1842), "The Cask of Amontillado" (1846), and others—were written according to a carefully worked out psychological method. So were his detective stories, such as "The Murders in the Rue Morgue" (1841), which historians credited as the first of the genre. As a poet, he achieved fame with "The Raven" (1845). His work, especially his critical writings and carefully crafted poems, had perhaps a greater influence in France, where they were translated by Charles Baudelaire, than in his own country.

Two Southern novelists were also outstanding in the earlier part of the century: John Pendleton Kennedy and William Gilmore Simms. In ***Swallow*** *Barn* (1832), Kennedy wrote delightfully of life on the plantations. Simms's forte was the writing of historical novels like those of Scott and Cooper, which treated the history of the frontier and his native South Carolina. ***The*** *Yemassee* (1835) and Revolutionary romances show him at his best.

American Renaissance. The authors who began to come to prominence in the 1830s and were active until about the end of the Civil War—the humorists, the classic New Englanders, Herman Melville, Walt Whitman, and others—did their work in a new spirit, and their achievements were of a new sort. In part, this was because they were in some way influenced by the broadening democratic concepts that in 1829 triumphed in Andrew Jackson's inauguration as president. In part, it was because, in this Romantic period of emphasis upon native scenes and characters in many literatures, they put much of America into their books.

Jacksonian democracy reflected in humorous writing

Particularly full of vivid touches were the writings of two groups of American humorists whose works appeared between 1830 and 1867. One group created several down-east Yankee characters who used commonsense arguments to comment upon the political and social scene. The most important of this group were Seba Smith, James Russell Lowell, and Benjamin P. Shillaber. These authors caught the talk and character of New England at that time as no one else had done. In the old Southwest, meanwhile, such writers as Davy Crockett, Augustus Baldwin Longstreet, Johnson J. Hooper, Thomas Bangs Thorpe, Joseph G. Baldwin, and George Washington Harris drew lively pictures of the people of the ebullient frontier. All showed the kind of interest in the common man that was a part of Jacksonian democracy.

New England Brahmins. Although Lowell for a time was one of these writers of rather earthy humour, his lifelong ties were to a group of New England writers associated with Harvard and Cambridge, Massachusetts—

the Brahmins, as they came to be called—at an opposite extreme. Henry Wadsworth Longfellow, Oliver Wendell Holmes, and Lowell were all aristocrats, all steeped in foreign culture, all professors at Harvard. Longfellow adapted European methods of storytelling and versifying to narrative poems dealing with American history, and a few of his less didactic lyrics perfectly married technique and subject matter. Holmes, in occasional poems and his "Breakfast Table" series (1858–91), brought touches of urbanity and jocosity to a perhaps oversober polite literature. Lowell, in poems descriptive of the out-of-doors in America, put much of his homeland into verse. His odes—particularly the "Harvard Commemoration Ode" (1865)—gave fine expression to noble sentiments.

The Transcendentalists. Concord, Massachusetts, a village not far from Cambridge, was the home of leaders of another important New England group. The way for this group had been prepared by the rise of a theological system, Unitarianism, which early in the 19th century had replaced Calvinism as the faith of a large share of the New Englanders. Ralph Waldo Emerson, most famous of the Concord philosophers, started as a Unitarian minister but found even that liberal doctrine too confining for his broad beliefs. He became a Transcendentalist who, like other ancient and modern Platonists, trusted to insights transcending logic and experience for revelations of the deepest truths. His scheme of things ranged from the lowest objects and most practical chores to soaring flights of imagination and inspired beliefs. His *Essays* (1841–44), *Representative Men* (1850), and *English Traits* (1856) were thoughtful and poetic explanations of his beliefs; and his roughhewn lyrics, packed with thought and feeling, were as close to 17th-century Metaphysical poems as any produced in his own time.

Thoreau as the great exponent of American individualism

An associate of Emerson with a salty personality of his own and an individual way of thinking, Henry David Thoreau, a sometime surveyor, labourer, and naturalist, was closer to the earthy and the practical than even Emerson was. He also was more of a humorist—a dry Yankee commentator with a flair for paradoxical phrases and sentences. Finally, he was a learned man, widely read in Western classics and books of the Orient. These qualities gave distinction to *A Week on the Concord and Merrimack Rivers* (1849) and to *Walden* (1854). The latter was a record of his experiences and ponderings during the time he lived in a hut by Walden Pond—a defense of his belief that modern man should simplify his demands if need be to "suck out all the marrow of life." In his essay "Civil Disobedience" (1849), Thoreau expounded his anarchistic views of government, insisting that if an injustice of government is "of such a nature that it requires injustice to another [you should] break the law [and] let your life be a counter friction to stop the machine."

Associated with these two major figures were such minor Transcendentalists as Bronson Alcott, George Ripley, Orestes Brownson, Margaret Fuller, and Jones Very. Fuller edited *The Dial,* the chief Transcendental magazine, and was important in the feminist movement.

New England reformers and historians. A worldwide movement for change that exploded in the revolutions of 1848 naturally attracted numerous Americans. Reform was in the air, particularly in New England. At times even Brahmins and Transcendentalists took part. William Lloyd Garrison, ascetic and fanatical, was a moving spirit in the fight against slavery; his weekly newspaper, *The Liberator* (1831–65), despite a small circulation, was its most influential organ. A contributor to the newspaper—probably the greatest writer associated with the movement—was John Greenleaf Whittier. His simple but emotional poems on behalf of abolition were collected in such volumes as *Poems Written During the Progress of the Abolition Question . . .* (1837), *Voices of Freedom* (1846), and *Songs of Labor, and Other Poems* (1850). The outstanding novelist of the movement—so far as effect was concerned—was Harriet Beecher Stowe. Her *Uncle Tom's Cabin* (1852) combined the elements of contemporary humour and sentimental fiction to dramatize the plight of the Negro.

One other group of writers—and a great novelist—contributed to the literature of New England in this period of its greatest glory. The group consisted of several historians who combined scholarly methods learned abroad with vivid and dramatic narration. These included George Bancroft, author of *History of the United States* (completed in 12 volumes in 1882), and John Lothrop Motley, who traced the history of the Dutch Republic and the United Netherlands in nine fascinating volumes (1856–74). The leading member of the group was Francis Parkman, who, in a series of books (1851–92), wrote as a historian of the fierce contests between France and England that marked the advance of the American frontier and vividly recorded his own Western travels in *The Oregon Trail* (1849).

Hawthorne, Melville, and Whitman. History also figured in tales and romances of Nathaniel Hawthorne, the leading New England fictionist of the period. Many tales and longer works—for example, his masterpiece, *The Scarlet Letter* (1850)—were set against a background of colonial America with emphasis upon its distance in time from 19th-century New England. Others, such as *The House of the Seven Gables* (1851), dealt with the past as well as the present. Still others, such as *The Marble Faun* (1860), were set in distant countries. Remote though they were at times from what Hawthorne called "the light of common day," they showed deep psychological insight and probed into complex ethical problems.

Another great American fiction writer, for a time a neighbour and associate of Hawthorne, was Herman Melville. After relatively little schooling, Melville went to sea; a whaling ship, as he put it, was his "Yale College and his Harvard." His first books were fiction in the guise of factual writing based upon experiences as a sailor—*Typee* (1846) and *Omoo* (1847); so were such later works as *Redburn* (1849) and *White-Jacket* (1850). Between 1846 and 1851, however, Melville's reading in philosophy and literary classics, as well as in Hawthorne's allegorical and symbolic writings, gave him new interests and aims. The first sign of this interest was *Mardi* (1849), an uneven and disjointed transitional book that used allegory after the model of Rabelais to comment upon ideas afloat in the period—about nations, politics, institutions, literature, and religion. The new techniques came to fruition in *Moby Dick; or, The Whale* (1851), a richly symbolical work, complex but brilliantly integrated. Only in short stories, "Benito Cereno"—a masterpiece of its genre—and others, in the psychological novel *Pierre* (1852), and in the novelette *Billy Budd* (written 1890?) was Melville later to show sporadic flashes of the genius that created *Moby Dick.*

An ardent singer of the praise of Manhattan, Walt Whitman saw less of the dark side of life than Melville did. He was a believer in Jacksonian democracy, in the splendour of the common man. Inspired by the Romantic concept of a poet as prophet and also by the Transcendental philosophy of Emerson, Whitman in 1855 published the first edition of *Leaves of Grass.* As years passed, nine revised and expanded editions of this work were published. This autobiography in verse was intended to show the ideas, beliefs, emotions, and experiences of the common man in a great period of American individualism. Whitman had a hard time winning a following because he was frank and unconventional in his Transcendental thinking, because he used free verse rather than rhymed or regularly metred verse, and because his poems were not conventionally organized. Nevertheless, he steadily gained the approval of critics and in time came to be recognized as one of the great poets of America.

The slow growth of Whitman's reputation

From the Civil War to 1914. Like the Revolution and the election of Andrew Jackson, the Civil War was a turning point in U.S. history and a beginning of new ways of living. Industry became increasingly important, factories rose and cities grew, and agrarian pre-eminence declined. The frontier, which before had always been an important factor in the economic scheme, moved steadily westward and toward the end of the 19th century vanished. The rise of modern America was accompanied, naturally, by important mutations in literature.

Literary comedians. Although they continued to employ some devices of the older American humorists, a group of comic writers that rose to prominence was different in important ways from the older group. Charles Farrar Browne, David Ross Locke, Charles Henry Smith, Henry Wheeler Shaw, and Edgar Wilson Nye wrote, respectively, as Artemus Ward, Petroleum V. (for Vesuvius) Nasby, Bill Arp, Josh Billings, and Bill Nye. Appealing to a national audience, these authors forsook the sectional characterizations of earlier humorists and assumed the roles of less individualized literary comedians. The nature of the humour thus shifted from character portrayal to verbal devices such as poor grammar, bad spelling, and slang, incongruously combined with Latinate words and learned allusions. Most that they wrote wore badly, but thousands of Americans in their time and some in later times found these authors vastly amusing.

Fiction and local colorists. The first group of fiction writers to become popular—the local colorists—took over to some extent the task of portraying sectional groups that had been abandoned by writers of the new humour. Bret Harte, first of these writers to achieve wide success, admitted an indebtedness to prewar sectional humorists, as did some others; and all showed resemblances to the earlier group. Within a brief period, books by pioneers in the movement appeared—Harriet Beecher Stowe's *Oldtown Folks* (1869) and *Sam Lawson's Oldtown Fireside Stories* (1871), delightful vignettes of New England; Bret Harte's *Luck of Roaring Camp, and Other Sketches* (1870), humorous and sentimental tales of California mining camp life; and Edward Eggleston's *Hoosier Schoolmaster* (1871), a novel of the early days of the settlement of Indiana. Down into the 20th century, short stories (and a relatively small number of novels) in patterns set by these three continued to appear. In time, practically every corner of the country had been portrayed in local-colour fiction. Additional writings were the depictions of Louisiana Creoles by George W. Cable, of Virginia Negroes by Thomas Nelson Page, of Georgia Negroes by Joel Chandler Harris, of Tennessee mountaineers by Mary Noailles Murfree (Charles Egbert Craddock), of tight-lipped folk of New England by Sarah Orne Jewett and Mary E. Wilkins Freeman, of people of New York City by Henry Cuyler Bunner and William Sydney Porter ("O. Henry"). The avowed aim of some of these writers was to portray realistically the lives of various sections and thus to promote understanding in a united nation. The stories as a rule were only partially realistic, however, since the authors tended nostalgically to revisit the past instead of portraying their own time, to winnow out less glamorous aspects of life, or to develop their stories with sentiment or humour. Touched by romance though they were, these fictional works were transitional to Realism, for they did portray common folk sympathetically; they did concern themselves with dialect and mores; and some at least avoided older sentimental or romantic formulas.

The humour of Mark Twain

Samuel Langhorne Clemens (Mark Twain) was allied with literary comedians and local colorists. As a printer's apprentice, he knew and emulated the prewar sectional humorists. He rose to prominence in days when Artemus Ward, Bret Harte, and their followers were idols of the public. His first books, *The Innocents Abroad* (1869) and *Roughing It* (1872), like several of later periods, were travel books in which affiliations with postwar professional humorists were clearest. *The Adventures of Tonz Sawyer* (1876), *Life on the Mississippi* (1883), and *The Adventures of Huckleberry Finn* (1884), his best works, which re-created the life of the Mississippi Valley in the past, were closest to the work of older humorists and local colorists. Even in his best work, however, he succumbed now and then to the temptation to play the buffoon or sink into burlesque. Despite his flaws, he was one of America's greatest writers. He was a very funny man. He had more skill than his teachers in selecting evocative details, and he had a genius for characterization.

Born and raised in Ohio, William Dean Howells was an effective advocate of a new realistic mode of fiction writing. At the start, Howells conceived of Realism as truthful portrayal of ordinary facets of life—with some limitations; he preferred comedy to tragedy, and he tended to be reticent to the point of prudishness. The formula was displayed at its best in *Their Wedding Journey* (1872), *A Modern Instance* (1882), and *The Rise of Silas Lapham* (1885). Howells preferred novels he wrote after he encountered Tolstoy's writings and was persuaded by them, as he said, to "set art forever below humanity." In such later novels as *Annie Kilburn* (1888) and *A Hazard of New Fortunes* (1890), he chose characters not only because they were commonplace but also because the stories he told about them were commentaries upon society, government, and economics.

The Naturalists. Other American writers toward the close of the 19th century moved toward Naturalism, a more advanced stage of Realism. Hamlin Garland's writings exemplified some aspects of this development when he made short stories and novels vehicles for philosophical and social preachments and was franker than Howells in stressing the harsher details of the farmer's struggles and in treating the subject of sex. His *Main-Travelled Roads* (1891) and *Rose of Dutcher's Coolly* (1895) displayed Garland's particular talents. These and a critical manifesto for the new fiction, *Crumbling Idols* (1894), were influential contributions to a developing movement.

The influence of Zola on Dreiser

Other U.S. authors of the same period or slightly later were avowed followers of French Naturalists led by Émile Zola. Theodore Dreiser, for instance, treated subjects that had seemed too daring to earlier Realists and, like other Naturalists, illustrated his own beliefs by his depictions of characters and unfolding of plots. Holding that men's deeds were "chemical compulsions," he showed characters unable to direct their actions. Holding also that "the race was to the swift and the battle to the strong," he showed characters defeated by stronger and more ruthless opponents. His major books included *Sister Carrie* (1900), *Jennie Gerhardt* (1911), *The Financier* (1912), *The Titan* (1914), and—much later—*An American Tragedy* (1925).

Dreiser did not bother with—or did not care for—niceties of style or elaborate symbolism such as were found in French Naturalistic works; but Stephen Crane and Frank Norris were attentive to such matters. In short novels, *Maggie: A Girl of the Streets* (1893) and *The Red Badge of Courage* (1895), and in some of his short stories, Crane was an impressionist who made his details and his setting forth of them embody a conception of man overwhelmed by circumstance and environment. Frank Norris, who admired Crane's "aptitude for making phrases—sparks that cast a momentary gleam upon whole phases of life," himself tried to make phrases, scenes, and whole narratives cast such gleams in *McTeague* (1899), *The Octopus* (1901), and *The Pit* (1903). Both Crane and Norris died young, their full abilities undeveloped but their experiments foreshadowing later achievements in the 20th-century novel.

Formal excellence and psychological insight in Henry James

Henry James. In the books of Henry James, born in New York but later an expatriate in England, fiction took a different pathway. Like Realists and Naturalists of his time, he thought that fiction should reproduce reality. He conceived of reality, however, as twice translated—first, through the author's peculiar experiencing of it, and, second, through his unique depicting of it. Deep insight and thorough experience were no more important, therefore, than the complicated and delicate task of the artist. *The Art of Fiction* (1884), essays on novelists, and brilliant prefaces to his collected works showed him struggling thoroughly and consciously with the problems of his craft. Together, they formed an important body of discussion of fictional artistry.

An excellent short-story writer, James nevertheless was chiefly important for novels in which his doctrines found concrete embodiment. Outstanding were *The American* (1877), *The Portrait of a Lady* (1881), *The Spoils of Poynton* (1897), *What Maisie Knew* (1897), *The Wings of the Dove* (1902), *The Ambassadors* (1903), and *The Golden Bowl* (1904). The earliest of these were international novels wherein conflicts arose from relationships between Americans and Europeans—each group with its own characteristics and morals. As time passed, he became increasingly interested in the psychological processes of his characters and in a subtle rendering of their limited insights, their perceptions, and their emotions.

Critics of the gilded age. Writers of many types of works contributed to a great body of literature that flourished between the Civil War and 1914—literature of social revolt. Novels attacked the growing power of business and the growing corruption of government, and some novelists outlined utopias. Political corruption and inefficiency figured in Henry Adams' novel *Democracy* (1880). Edward Bellamy's *Looking Backward* (1888) was both an indictment of the capitalistic system and an imaginative picturing of a utopia achieved by a collectivist society in the year 2000. Howells' *Traveler from Altruria* (1894) pleaded for an equalitarian state in which the government regimented men's lives. The year 1906 saw the publication of Upton Sinclair's *Jungle,* first of many works by him that criticized U.S. economic and political life and urged Socialism as the remedy.

Two poets embodied criticisms in songs. Edwin Markham's "Man with the Hoe" (1899) was a protest against the exploitation of labour and vaguely threatened revolution; it immediately stimulated nationwide interest. A year later William Vaughn Moody's "Ode in Time of Hesitation" denounced growing U.S. imperialism as a desertion of earlier principles; his "On a Soldier Fallen in the Philippines" (1901) developed the same theme even more effectively.

With the rise of journalistic magazines, a group of journalists became notable as critics of America—the group dubbed "the muckrakers" by Theodore Roosevelt. Ida M. Tarbell's *History of the Standard Oil Company* (1904) and Lincoln Steffens' *Shame of the Cities* (1904) were typical contributions by two members of a large group of journalistic crusaders.

Henry Adams. One of the most devastating and most literate attacks on modern life was an autobiography of a scion of an ancient New England family, the Adamses. Educated at Harvard and abroad, Henry Adams was a great teacher and historian *(History of the United States* [1889–91] and *Mont-Saint-Michel and Chartres* [1904]). *The Education of Henry Adams* (1907), however, complained that a lifelong hunt for some sort of order in the world, some sort of faith for man, left him completely baffled. The quiet, urbane style served well to underline, in an ironic way, the message of this pessimistic book.

Poetry. The latter 19th century and early years of the 20th century were a poor period for American poetry; yet (in addition to William Vaughn Moody) two poets of distinction wrote songs that survived long after scores of minor poets had been forgotten. One was Southern-born Sidney Lanier, a talented musician who utilized the rhythms of music and the thematic developments of symphonies in such fine songs as "Corn" (1875), "The Symphony" (1875), and "The Marshes of Glynn" (1878). Distressed, like many of his contemporaries, by changes in American life, he wove his doubts, fears, and suggestions into his richest poems.

The poetic techniques of Emily Dickinson

The other poet was a New Englander, Emily Dickinson. A shy, playful, odd personality, she allowed practically none of her writings to be published during her lifetime. Not until 1890, four years after her death, was the first book of her poems published, to be followed at intervals by other collections. Later poets were to be influenced by her individual techniques—use of imperfect, or eye, rhymes, avoidance of regular rhythms, and a tendency to pack brief stanzas with cryptic meanings. Like Lanier, she rediscovered the value of conceits for setting forth her thought and feeling. Such poems as "The Snake," "I Like to See It Lap the Miles," "The Chariot," "Farther in Summer than the Birds," and "There's a Certain Slant of Light" represented her unusual talent at its best.

AUSTRALIAN LITERATURE IN THE 19TH CENTURY

The literatures of Australia and New Zealand developed, from beginnings in the late 18th and early 19th centuries, their own characteristic themes, styles, and idioms. They developed at different rates and were affected by different historical and environmental circumstances, such as the fact that the first settlers in Australia included convicts; in New Zealand they were traders and organized colonizers. Differences in geography, strength of native opposition, pace of settlement, and degree of contact with Great Britain and other countries affected development of individual and indigenous literatures. Writers in 19th-century New Zealand achieved relatively little and are considered with New Zealand writing as a whole in the section below on *Australian and New Zealand literature in the 20th century.*

Three main periods may be distinguished in the history of Australian literature. In the first (1788–1880) descriptive and documentary literature predominated. The second (1880–1940) was a time of expansion and consolidation and growing responsibility, and a diversification of Australian society was reflected in literature's greater variety. In the third, from 1940 onward, an increase in literary activity matched and reflected the increase in immigration, in industrialization, and in growth of large suburban areas.

The life of the convicts, administrators, and soldiers who arrived in New South Wales in 1788 and of the free settlers who followed them was a struggle, allowing little time for the arts. Most of those with literary talent employed it in describing their new world. Memoirs and eyewitness accounts of convict life and, later, of conditions on the goldfields abounded and provided inspiration and material for later creative writers.

Novels of life in the colonies

Novelists were also primarily concerned with recording facts about life in the colonies. Often using the basis of a romantic plot, they were preoccupied with convict life, problems of pioneers and new settlers, and conditions on the goldfields, and they dwelt on details of life strikingly different from those of the Old World—landscape, drought, bush fires, bushrangers, the vastness and loneliness of the bush, and the strange flora and fauna.

Two novels by an Englishman, Henry Kingsley, reflected a change in attitude toward Australia. In *The Recollections of Geoffry Hamlyn* (1859), he wrote of an English family whose successful life as pastoralists in New South Wales enabled them to return to a life of ease in Devon. In *The Hillyars and the Burtons* (1865), his immigrant family of Chelsea blacksmiths settled in Australia and rose to a position of some eminence. Outstanding among novels of convict life was *For the Term of His Natural Life* (1874), by Marcus Clarke, an indictment of the transportation system and of conditions in colonial prisons. Rolf Boldrewood (pseudonym of Thomas Alexander Browne) in *Robbery Under Arms* (1888) and *The Miner's Right* (1890) combined excitements of the gold rushes with bushranging adventures. In most novels of this period emphasis was on colourful atmosphere and description and complicated, exciting plot.

Poetry in the first 100 years developed less confidently than did prose, with poets struggling to adapt the English Romantic tradition of landscape and reflective poetry to Australian subjects. Adam Lindsay Gordon won popularity with *Bush Ballads and Galloping Rhymes* (1870).

CANADIAN LITERATURE IN ENGLISH IN THE 19TH CENTURY

The earliest Canadian literature in English was written at about the time of the American Revolution (1775–83) and was largely a result of that event. The 40,000 American Loyalists who took refuge in the northern colonies that had not joined in the revolt were to determine the English-speaking character of Nova Scotia, New Brunswick, and Upper Canada (Ontario) and to give them the slight beginnings of a literature. Joseph Howe was a remarkable personality in the political life of Nova Scotia in his time, editor of the *Nova Scotian* (1828–41) and author of patriotic and narrative poems and several volumes of travel sketches. In the columns of the *Nova Scotian* in 1835–36 appeared the first Canadian literary work to gain international notice, *The Clockmaker; or, The Sayings and Doings of Samuel Slick of Slickville.* Its author, Thomas Chandler Haliburton, was motivated in his public life by the pro-British, anti-American, and anti-democratic prejudices of Tory Loyalist families. In ***The Clockmaker,*** sayings and doings of Sam Slick and vivid little pictures of frontier life made this book a minor classic, in spite of its formless and sometimes repetitious arrangement.

The Maritime writers

These earliest writers lived in the Maritime Provinces, which had attracted better educated Loyalists from the northern Atlantic Seaboard; those who settled in Quebec and along the St. Lawrence and Niagara frontiers were of humbler stock, mostly farmers, and literary activity began later than down east. The first name in this region was that of John Richardson, whose background and military adventures were almost as romantic as his novels. His best book was ***Wacousta*** (1832), a story of the days of the Ottawa Indian chief Pontiac's descent in 1763 on Michilimackinac and Detroit. Of early immigrants from Britain the most literary were two sisters, Catherine Parr Traill and Susanna Moodie. Although they published novels, poems, and stories for children, they have been remembered mainly for autobiographical volumes: ***The Backwoods of Canada*** (1836), by Mrs. Traill, and ***Roughing It in the Bush*** (1852), by Mrs. Moodie, accurate and spirited social records of pioneer life. About contemporary with these two gentlewomen were two immigrant poets of the working class: Alexander McLachlan, whose verses were compounded of memories of poverty and social inequality in Scotland and love for the new country, and Charles Heavysege, whose dramatic poems ***Saul*** (1857), ***Count Filippo*** (1860), and ***Jephthah's Daughter*** (1865), though often commonplace or pompous in language, were bold in design and in implied moral and religious skepticism. (For an account of literature in French in Canada, see below ***Canadian literature in the 20th century: French.)***

FRENCH LITERATURE IN THE 19TH CENTURY

The Revolutionary and Napoleonic period, 1789–1815. After the French Revolution in 1789 the Republic was forced to protect itself from threatening dangers at home and abroad, so that there was little scope for writers save as political journalists and party hacks. Of these, the republican Camille Desmoulins and the royalist Antoine de Rivarol had the force and bite that made them masters of invective. One poet, André de Chénier (see above ***French literature in the 18th century),*** was moved by the violence of the Revolution to compose ***Les Iambes,*** a savage outcry written while he awaited execution.

The other literature that survived the first Revolutionary years was the literature of such eccentrics as monarchist exiles and the work of fanatical and convinced individualists. An autobiographical novel, ***Monsieur Nicolas*** (1796–97), by Restif de La Bretonne, was a vast panorama of the social transformation of Revolutionary Paris as well as a repetitive chronicle of amorous adventure. A notorious work of the Marquis de Sade (1740–1814), ***Justine, ou les malheurs de la vertu*** (1791), with its extreme form of hedonism, has been an acknowledged influence on eroticism. Sébastien-Roch-Nicolas Chamfort left a collection of maxims and anecdotes (1795), which brought him fame. Only Joseph Joubert, a philosophical moralist, possessed the writer's traditional capacity for detachment with his subtle meditations.

The works of Chateaubriand

Napoleon, though carried to power by the Revolution, soon whittled away the liberties he had sworn to defend, and bold and original writers had to work secretly, watched by the police. The greatest of these was François-René de Chateaubriand, whose literary career spanned the first 15 years of the century. His return to belief in the Christian ideal as a principle of social cohesion, precipitated by exile and suffering, gave him a vocation as a writer, and ***Le Génie du Christianisme*** (1802) was a result. Two short novels, ***Atala*** (1801) and ***Rene',*** and his prose epic, ***Lcs Martyrs*** (1809), were illustrations to this apologetic. Chateaubriand's influence was profound; his hero René, seduced from prosaic reality by longings for the infinite that carry him into dreamworlds of the imagination, imposed the emotion of Romantic melancholy on the sensibility of the coming age. Another Romantic impulse, exoticism, was inspired by Chateaubriand's travels in America and was shown in ***Les Natchez.*** But it was in the ***Mémoires d'outre-tombe*** (written 1811–41, published 1849–50; ***The Memoirs of . . . Chateaubriand,*** 1902) that he left his most enduring work.

Influence of German Romanticism

The contemporary fashion for the introspective, self-analytical hero was stimulated by Étienne Pivert de Sénancour's influential ***Oberman*** (1804; later ***Obermann).*** Madame de Stäel asserted her tempestuous personality as a critic in essays, ***De la litte'rature*** (1800) and ***De l'Allemagne*** (1810), in which the "Romantic" genius of German civilization was first revealed to the French and played a vital role in forming the taste of the period. Gothic horror stories, Goethe's early writings, and Schiller's plays opened the way for a literary revolution that coincided with the change of political climate.

Restoration of the monarchy, 1815–48. The result of comparative peace and order under Louis-Philippe after the turmoil under Louis XVIII and Charles X was the astonishing literary achievement of the Romantic generation. Romanticism is the term used to define a new approach to human experience, a transformation of thought and taste that at this time all Europe shared. Poets, novelists, painters, sculptors, and musicians came together for discussion and the hammering out of new formulas to embody the new ideas. In 1827 Victor Hugo and Charles-Augustin de Sainte-Beuve founded the Cénacle, a group that included Alfred de Vigny, Alfred de Musset, Prosper Mérimée, Théophile Gautier, Gérard de Nerval, and Alexandre Dumas; it was here that the new forces of Romanticism worked out their strategy before a performance of Hugo's ***Hernani*** at the Théâtre Français—a clamorous evening that ended in a rout of the outdated representatives of classicism.

This literary revolution had already been prepared by vigorous manifestos. Stendhal (the pseudonym of Henri Beyle), in an essay with the significant title ***Racine and Shakespeare,*** proved that the contemporary audience was more attuned to the turbulence of Shakespearean drama than to the rigid theatrical formulas of Racine. He identified Romanticism with a new direction of taste. Hugo defined Romanticism as "liberalism in literature." However generalized this definition might seem, it summarized the spirit of the movement. The French Romantics claimed the right of an individual to place the fulfillment of his own nature above ethical imperatives. Romanticism presented diverse and even contradictory aspects: spiritual dejection and sensual delirium, the cults of the picturesque and the fantastic, humanitarianism and mysticism—these could all be discerned in major works of the time. It was a literature that recognized no law, save that of liberty.

The poetry of the French Romantics. Many Romantic poets, although free to write of their personal suffering and ecstasy, believed that the social conscience of the century would find its voice in poetry. This conviction became accentuated as the period advanced. The poems of Alphonse de Lamartine were particularly characteristic of this development. Such personal themes as an unhappy love affair ***(Les Me'ditations,*** 1820) began to be coloured by religious emotion in ***Les Harmonies poétiques et religieuses*** (1830), and in ***Les Recueillements*** (1839) he became passionately concerned with social problems, expressing remorse for his self-pitying egoism, with compassion for humanity and faith in its future.

After poetry such as ***Les Chants du crépuscule*** (1835; "Songs of Evening") and ***Les Voix inte'rieures*** (1837; "Voices from Within"), which were outlets for personal melancholy and heartbreak, Victor Hugo also gave voice to contemporary disquiet. In ***Les Rayons et les ombres*** (1840; "The Lights and the Shadows"), he had reached the conviction that he was the anointed prophet of a better age.

The poems of Alfred de Vigny appeared to be self-communings far removed from Hugo's abundant public verse. His ***Poèmes antiques et modernes*** (1826) celebrated significant moments in universal legend and history from the biblical epoch up to the 19th century. ***Les Destinies*** transcribed in symbols a long journey from agonies of doubt to a serene wisdom. The despair of the earlier poems in this collection gave way to peace and a humanist optimism.

Among great poets of this period, only Alfred de Musset retained his literary and political independence and stubbornly refused to serve a public cause. His best known work, the four "Nuits" (1835–37; "Nights"), traced the course of a heartbreaking love affair with a lyricism marred, in places, by a fatal capacity for declamation.

Of lesser poetic talents, an actress named Marceline Desbordes-Valmore wrote poems of charm and ardour, and Sainte-Beuve in *Joseph Delorme* (1829) and Auguste Brizeux in *Marie* (1831) were Romantic Intimistes—poets of emotional reticence who only suggested the deeper regions of the spirit. Such discretion contrasted with the uninhibited Petrus Borel and Philothte O'Neddy, the satiric violence of Auguste Barbier, and the wit and verve of Pierre-Jean de Beranger. Aloysius Bertrand in *Gaspard de la nuit* (1842) and Maurice de Guérin in *Le Centaure* (1840) shared a preoccupation with the effects of the prose poem.

The Romantic theatre. In the preface to *Cromwell* (1827), Hugo proposed that the unities of time and place be abandoned and that the tragic and comic be permitted to coexist in the modern poetic play, in violation of classical rules governing dramatic construction. On the stage as in poetry, Hugo, an original genius, made his own rules for his own purposes.

Alexandre Dumas *père* was the first of his generation to achieve success in the theatre in *Henri III et sa cour* (performed 1829). Hugo's triumph in *Hernani* (1830) and *Ruy Blas* (1838) enhanced the prestige of poetic drama. Vigny's *Chatterton* (1835) was closer, in its construction and dense language, to classical tragedy. Musset's *Lorenzaccio* (1834) was a victory for the Shakespearean manner.

Musset never overindulged current taste for local colour and the historical picturesque, as did Hugo and Dumas. Something of his own obsessive nature belonged to the debauched hero of *Lorenzaccio*, and it was his own wit that graced his sophisticated comedies. His plays were written only to satisfy his own needs, but they alone among the plays of the period retained their freshness and brilliance.

The Romantic novel. It was to Romanticism that the modern French novel owed its overwhelming prestige; Romanticism produced the novel of self-analysis, the historical novel. and, as in the works of Balzac and Stendhal, the novel of contemporary society.

Adolphe (1816), by Benjamin Constant, and *Volupté* (1834), by Sainte-Beuve, were disguised autobiographies in which the central character was subjected to the searchlight of a pitiless self-knowledge. Musset's *Confession d'un enfant du siècle* (1836; *The Confession of a Child of the Century,* 1892), Lamartine's *Raphael* (1849), and Eugène Fromentin's *Dominique* (1863) were further examples of self-portraiture, direct or indirect.

Both Constant in *Journal intime* and *Le Cahier rouge* (1907; *The Red Notebook,* 1948) and Stendhal in *Journal* (published posthumously) followed an impulse toward self-knowledge by writing intimate diaries in which their characters were ruthlessly analyzed. The historical novel, like the historical play, satisfied a reading public in love with the colour and movement that the past provided, and the romances of Sir Walter Scott were slavishly imitated. Vigny, in *Cinq-Mars* (1826; *The Conspirators,* 1873), related the story of a conspiracy in Richelieu's time, an apologia for his own class, the nobility. In *Notre-Dame de Paris* (1831; *The Hunchback of Notre Dame,* 1831), Hugo brought medieval Paris to life, but gave the plot certain pessimistic philosophical implications when all his characters died or were murdered.

Balzac and *La Comédie humaine*

After surrendering to the prevailing mode for historical and autobiographical novels, Honoré de Balzac gradually fitted each of his novels and novel cycles into a vast fresco of 19th-century French society, *La Comédie humaine.* Some described secret dramas of provincial life (*Eugénie Grandet*) and others the violent and complicated passions of Parisian life, a world over which modern tyrants—stock exchange, politics, and press–exercised unlimited power. Balzac was also a master of the novel of character; he understood the whole mechanism of the human heart—avarice in *Gobseck* (1830), paternal love in *Le Père Goriot* (1834–35), and envy in *La Cousine Bette* (1846). But these novels of contemporary life were, in Balzac's eyes, to be crowned by such philosophical studies as La *Recherche de l'absolu* (1834; "In Search of the Absolute"). in which man, with his limitations and ambition, confronted, in a desperate struggle, the forces of destiny.

Stendhal wrote novels whose subtlety and verve made them a major influence; his young heroes reflected his own temperament and quick, lucid intellect. But his novels, like those of Balzac, were social and political documents. *Lo Chartreuse de Parme* (1839; *The Charterhouse of Parma,* 1925) was set in the Italy to which he gave his heart and by which, in some sense, he was formed; *Le Rouge et la noir* (1830; *Scarlet and Black,* 1927) transcribed the moral climate of French society at the Restoration and mirrored all the capacity for revolt in his nonconforming nature. *De l'amour* (1822), in which he elaborated a theory of the passions, was an invaluable appendix to the novels; his travel books were a fascinating commentary on them.

George Sand displayed generosity of feeling and mastery of her craft in a love story such as *Lélia* (1833) and a regional novel such as *La Mare au diable* (1846; "The Pool of the Devil"). Dumas abandoned the theatre for inventive adventure novels, especially *Les Trois Mousquetaires* (*The Three Musketeers*) and *Le Comfe de Monte Cristo* (1845). Eugène Sue developed the peculiar techniques of the serial story in *Les Mystères de Paris* (1842; *The Mysteries of Paris,* 1843).

Shapelessness and overwriting were indigenous faults of Romanticism; yet the period was the golden age of the short novel and short story. Charles Nodier with a seeming artlessness that concealed art conducted readers into regions of dream, as in *Trilby* (1822); Prosper Mérimée, finest technician of them all, gave body to Romantic mystery and an almost unbearable verisimilitude to the violence of Romantic passion (*Colomba* [1840; *Carmen.* 1845]).

Historical and critical writers of the Romantic movement. Romanticism affected the disciplines of historical and critical writing to the point at which they became accepted literary genres in their own right. Augustin Thierry, for example, transformed the early chronicles by his narrative skill. Other historians such as François-Pierre-Guillaume Guizot in *Histoire de la révolution d'Angleterre* (1826–27) and Alexis de Tocqueville in *De la de'mocratie en Ame'rique* (1835–40) set out to verify their theories by an examination of the facts. Jules Michelet, greatest of the Romantic historians, regarded historical writing as an integral re-creation of life; his monumental *Histoire de France* evoked successive advances to the attainment of liberty.

The only literary criticism to have survived from this period was the work of Sainte-Beuve. Sainte-Beuve possessed so lucid a comprehension of the human character behind the written word that *Portraits litte'raires* and his weekly *Causeries de lundi* (1851–62; "Monday Conversations") were often models of perspicacity.

Comte and Positivism

The movement of ideas. Continuity with 18th-century thought was sustained by the Idéologues, a group who carried the propositions of the Encyclopédistes to their logical conclusion and who were opposed by the Transcendentalists, whose philosophy emphasized the intuitive and spiritual over the empirical. The Positivism of Auguste Comte, a mystique of science and humanity, was more attuned to the century of progress. Positivism excluded speculation about the metaphysical, concerning itself only with facts. A disciple of Comte, Émile Littrt, compiled a monumental *Dictionnaire de la langue française.* His precise definitions and historical grasp of the growth of the French language made this dictionary an indispensable instrument in French literature.

The social structures of the period were scrutinized by

Henri de Saint-Simon, Charles Fourier, Pierre-Joseph Proudhon, and Félicité de Lamennais, and their criticism foreshadowed modern Socialism.

The Second Republic and Second Empire, 1848–70. In February 1848 the people of Paris rose against the intolerant bourgeois regime of Louis-Philippe, and from this democratic revolution the Second Republic was born. But from 1852 under Napoleon III, censorship was reintroduced.

Positivist thought, more reassuring to the bourgeois determination to consolidate itself, grew in power; scientific method dominated intellectual life. Ernest Renan and Hippolyte Taine analyzed historical fact and literature with the sole purpose of arriving at an objective truth. Romantic idealism survived in the work of a few poets, but many writers reacted against the previous generation. This reaction was known in poetry as the Parnassian movement and in the novel and drama as Realism.

The aftermath of the Romantic movement. Three poets, Hugo in his later work, Gérard de Nerval, and Charles Baudelaire, formed a bridge between the first and second phases of Romanticism.

Gérard's life was a search for the paradise of which his childhood had been an intimation—a paradise from which he was constantly expelled by the pains and deceptions of existence. The essential Gérard was distilled in two works of prose, *Sylvie* (1854) and *Aurélia* (1855), and in the 12 sonnets called *Les Chimdres* (1854). GCrard was a pure incarnation of the Romantic spirit; the bold innovations of his art looked forward to the experiments of modern poetry.

Hugo (who lived in exile from the Second Empire on Jersey and Guernsey in the Channel Islands), in his finest lyrical verse *(Les Contemplations,* 1856), wrote the memoirs of his spirit—the life of a man who had endured, without defeat, 25 years of struggle and suffering. He composed an epic of humanity, *La Légende des siècles* (1859), which he set within the vaster epic of creation; he wrote the novel of human society *Les Misérables* (1862), in which he gave free rein to all the longings and hopes of his generous heart.

Influence of Baudelaire

Charles Baudelaire profoundly influenced the course poetry was to take in the years after his death. In controlled and rigorous verse, he combined melancholia and the pursuit of the ideal. His poems were collected under the title of *Les Fleurs du mal* (1857; *The Flowers of Evil,* 1926). Hugo spoke of a new excitement in French verse, and certainly these emotionally tense poems explored forbidden regions of human existence as never before. *Petits Poèmes en prose,* experimenting with a language in which metrical freedom was demanded by inner necessity, discovered the emotional tone of a life beginning to be known as "modern." Baudelaire's notebook, *Mon Coeur mis à nu* ("My Heart Laid Bare"), survived as an intimate and pathetic reflection of a tortured spirit.

The Parnassian reaction. The Parnassian poets were determined to rescue French verse from the emotional and verbal imprecision of the Romantics. The movement was heralded by Théophile Gautier, whose poems proposed a belief in formal perfection without which, he asserted, no work of art, however sincerely felt, could hope for immortality.

Charles-Marie-RenC Leconte de Lisle was the first leader of the Parnassians. His reserve and deliberate discipline inhibited movement of life within his verse; his poems were magnificent but sometimes curiously dead. *Poèmes antiques* (1852), and *Podmes barbares* (1862) voiced a longing to escape into the savage grandeur of the past or untouched regions of the natural world, but the rigorously controlled language of his verse paralyzed his inspiration.

Gautier, Baudelaire, and Leconte de Lisle figured in the magazine of the Parnassian movement, as did Theodore de Banville, Sully Prudhomme, François Coppée, and José Maria de Heredia—all proclaiming a belief in formal perfection and flattering themselves that they had brought poetry back to the sublime purity of its nature.

The Realist novel and the drama of social manners. A development of scientific studies, after 1850, impelled novelists to base their work on accurate observation of facts. Champfleury (Jules Husson), who wrote a Realist manifesto in 1857, demanded that novelists choose subjects from the most ordinary aspects of the human condition.

The impersonal, exact writing of Flaubert

Gustave Flaubert, master of the Realists, was a "lost" Romantic who devoted himself to an elaboration of an impersonal, classical art. Whether, as in the historical novels *La Tentation de Saint Antoine* (1874) and *Salammbô* (1862), he chose a Romantic subject or whether, as in novels of modern life, *Madame Bovary* (1857) and *L'Éducation sentimentale* (1869), a subject more in accord with Realist theory, his work was always based on microscopic research and observation. He subjected each novel to an exact articulation of plot and demands of an impersonal style. This made *Madame Bovary* and *L'Éducation sentimentale* two of the great novels of the 19th century. Flaubert's clarity and Realism did much to exorcise the century's sentimental bourgeois complacencies and emotional self-indulgence. Flaubert's *Correspondence* was a moving witness to the devotion with which he served his art.

Jules de Goncourt and his brother Edmond collected documents, took notes in the suburbs and slums of Paris, made clinical studies of pathological cases, and translated this into their novels. Like Flaubert, they were conscious prose stylists, and the same gifts of observation and style were applied to their famous *Journal.*

In the theatre, the failure of Hugo's *Burgraves* in 1843 marked the end of the Romantic dream. Émile Augier took the rich bourgeoisie for his subject, and Alexandre Dumas *fils* portrayed the social and moral problems of his time in beautifully constructed plays, such as La *Dame aux came'lias* (performed 1852). Eugène Labiche used his gift for farce to explore the deeper strata of human character.

The Third Republic, from 1870. The Franco–German War of 1870 marked a new point in French history, but the literary world seemed unaffected. Novelists, with Émile Zola at their head, carried Realism a stage further and formed a Naturalist school. By 1885, however, sustained attacks on the reigning ideology by a critic, Ferdinand Brunetikre, and a philosopher, Henri Bergson, incited a new generation to recover idealism for the novel and the poem.

The Naturalist school. Influenced by Taine, a literary historian, and Claude Bernard, a scientist, Zola maintained that the novel should study "the human temperament and the profound modifications of the human organism under the pressures of environment and events."

Zola's cycle of 20 novels

He set out to compose a cycle of 20 novels, *Les Rougon-Macquart,* that would become a "natural and social history of a single family during the Second Empire." Two of these novels stand out for their savage depiction of working class life: *L'Assomoir* (1877; *The Drunkard,* 1958) and *Germinal* (1885).

A collection of short stories about the Franco–German War, *Les Soirées de Médan,* signalled in 1880 the birth of the Naturalist school; Zola was among the contributors, and Guy de Maupassant made his first public appearance with a masterpiece, "Boule de suif." In addition to 300 short stories, he completed six novels, the best known being *Bel-Ami* (1885), in which he painted the Parisian newspaper world with ruthless realism.

Several writers adhered to Naturalism: Edmond de Goncourt, writing after his brother's death; Alphonse Daudet, a novelist *(Les Aventures prodigieuses de Tartarin de Tarascon,* 1872) and a writer of lively and touching short stories *(Lettres de mon moulin* [1869; "Letters from My Mill"], *Les Contes du lundi* [1873; "Monday Tales"]); and, though on the fringe of the school, Jules Vallès, with a bitter semi-autobiographical trilogy, *Jacques Vingtras* (1879–86). In the theatre, Henry Becque displayed in *Les Corbeaux* (published 1882; *The Vultures,* 1913) many Naturalist traits. André Antoine founded the widely influential Théâtre-Libre for Naturalist drama. Jules Renard had all the Naturalist observation, but used it only to serve a narration and prose style reduced to barest essentials.

The reaction against Naturalism. Some writers scorned this literature of exact description and opposed a materialist philosophy of the democratic age. Barbey d'Aurevilly's best known work, *Les Diaboliques* (1874; *Weird Women*, 1900), was a collection of six short stories written by one "who believes in the devil and his power over the world." In *Les Pleiades* (1874; *The Pleiads*, 1928), the Comte de Gobineau related the travels of three young men who thought of themselves as exceptional beings, with an exclusive scornful pride of race. Villiers de l'Isle-Adam *(Contes Cruels* [1883; *Cruel Tales,* 19631) arraigned the pride of scientists, the tyranny of finance, and insolent triumphs of mediocrity.

Joris-Karl Huysmans was a disciple of Zola in the first stages of his literary career, but despair at the limitations of Naturalist "reality" drove him toward religious faith. Between Naturalism and religion, Huysmans paused to explore the ivory tower of aestheticism. This provoked a most extraordinary and best known novel, *A rebours* (1884: *Against the Grain,* 1922). His last novels described the stages of this journey toward a full, mystical experience of the Christian religion. Lion Bloy, a fanatical Catholic, wrote two autobiographical novels, *Le Désespéré* (1836) and *La Femme pauvre* (1897), in which he thundered imprecations against the impious century.

Novelists who reacted profoundly but less violently were Paul Bourget and Maurice Barrès. Barrès' early work was complex—a series of novels published under the collective title of *Le Culte de moi* (1888–91); here he transcribed his philosophy of egoism—a systematic cult of rare, even violent, sense experiences. Pierre Loti, a naval officer, wrote exotic novels analyzing the sensibility of those who sought relief from the perplexities of their nature in travel and yet could not disperse innate melancholy and despair.

The Dreyfus affair

Anatole France began his writer's career as an escapist into a dream of pagan beauty and wisdom, but the impact of the Dreyfus affair (a bitter dispute over a Jewish army officer wrongly condemned for spying that divided even the most detached men of letters) drew him into the struggle against the right wing. The hero of his novel series *Histoire contemporaine* (1897–1900), first encountered as a convinced skeptic, was also drawn into the political struggle and compelled to fight for justice and humane government.

The Symbolist movement. The Parnassian doctrines of impassiveness and objectivity were opposed by those who still took it for granted that the writing of poetry was a metamorphosis of inner experience. Baudelaire himself had shown the path that Symbolism was to follow. Natural forms, this new movement asserted, are the multiple symbols of a single reality, and beneath their diversity the poet rediscovers a profound unity, mysterious and intangible.

Arthur Rimbaud "studied to make himself a visionary," and, as a way of access to obscure regions of consciousness, he cultivated delirium in all its forms. This experimental initiation into the sources of poetic consciousness was recounted and condemned in *Une Saison en enfer* (1873; "A Season in Hell"); his prose poems *(Illuminations,* published 1886) witnessed the urgency with which his whole being strained toward the hidden mystery of existence and a new language with which to utter it.

Others foreshadowed this new poetic consciousness. The prose poems of Lautréamont (pseudonym of Isidore Ducasse), *Les Chants de Muldoror,* which appeared to celebrate the apotheosis of evil, were composed with a haphazard juxtaposition of images that made them a source book of Surrealism. Tristan Corbière's poems seethed with explosive, savage images, while those of Charles Cros were composed with a metropolitan bitterness that reduced everything to nothing.

Paul Verlaine liberated himself rapidly from the precepts of the Parnassians, which only constrained his voluptuous sensibility. A dangerous friendship with Rimbaud culminated in an emotional crisis echoed in *Romances sans paroles* (1874; "Songs Without Words") and above all in *Sagesse* (published 1880, dated 1881; "Wisdom"), in which the verse was infused with Christian repentance. Verlaine had great sincerity and charm; his verbal music prefigured the more elaborate orchestrations of Symbolism.

The Decadents

To emancipate the self from tradition, to live within the claustrophobia of ennui, as did the poets between 1880 and 1885 known as the Decadents, produced either vague or contorted verse. But decadence did produce one true poet, Jules Laforgue, whose dislocated verse rhythms perfectly transmitted the diffidence and the impudence of his paradoxical nature.

Symbolism was a manifestation of the climate of Hegelianism, the philosophy of Idealism. Symbolist doctrine was based on a belief that the world transmitted by the senses was a reflection of the spiritual universe. The poets thought of a poem as an instrument of metaphysical knowledge. Several of them experimented with a free verse liberated from rhyme and measure.

Stéphane Mallarmé was a central figure of this movement: the simplicity of his character, his poverty, and selfless devotion to his aesthetic made him, in the eyes of disciples, a saint of literature. With *Hérodiade* and *L'Après-midi d'un faune* ("The Afternoon of a Faun") he achieved his particular and profound originality: words brought into relationship not only with other words but with the pauses between them. Each of his poems was an outcome of protracted meditation and required an equal patience of the reader to allow the poetic meaning to be disclosed.

Mallarmé transcended the Symbolist movement. Symbolism failed as a poetic doctrine because it asked more of poetry than it could give. Jean Moréas, one of the movement's founders, broke with it in 1891 and called his countermovement the *école romane* ("Roman school"). This reaction bore little but dead fruit, though Paul Valéry, Mallarmé's close friend but not his disciple as a poet, might have been touched by it, as was Charles Maurras.

The year 1900 did not, on the surface, mark any change in literary taste, but literature, like other arts, was secretly preparing, in a few minds in advance of their time, a revolution as radical as were coming changes that transformed the old Europe and undermined accepted conventions of society (see below *Belgian literature in the 19th century: French).*

Provençal. After the French Revolution, scholars of Provensal literature such as F.-J. Raynouard occupied themselves with the brilliant literary traditions of the Middle Ages; newspapers sprang up, and poets banded together and collected their pieces in volume form; *e.g.*, the nine *troubaire* ("troubadours") who published *Lou Bouquet Prouvençaou* ("The Provençal Garland") in 1823. The "forerunners of the Félibrige" were all more or less academic and appealed to the cultured few; addressing a far wider public were four poets of the people: Jean-Antoine Verdié of Bordeaux, who wrote comic and satirical pieces; Jean Reboul, the baker of Nîmes, who never surpassed his first effort, *L'Ange et l'enfant* (1828; "The Angel and the Child"); Victor Gelu of Marseille, relentless but undeniably powerful of his kind; and, greatest of them all, the true and acknowledged forerunner of the Félibres, Jacques Jasmin. In Languedoc the Marquis de la Fare-Alais is noteworthy.

Mistral and the Félibrige

Joseph Roumanille and Frédéric Mistral, by writing in native dialect, showed a desire to stir the Provensal nation to renewed awareness of its glory. Roumanille's secular verse was moving in the sincerity of its poetry, and his prose works sparkled with delightful humour, but there was no doubt that Mistral's finest work (the long narrative poems *Mirèio* [1859] and *Calendau* [1867], among others, towel-ed above that of his fellows. It was he who in 1852 collected and published an anthology in which all the names yet to become well-known and most of those known already (such as Jasmin) were represented. In 1854 Roumanille was one of seven poets who, on May 21, foregathered at the castle of Font-Ségugne, near Avignon, and founded the Félibrige, a society of writers desirous of promoting Provensal literature. The other six were Mistral, Théodore Aubanel, Anselm Mathieu, Jean Brunet, Alphonse Tavan, and Paul Giéra. Of these, Théodore Aubanel of Avignon, a printer, alone proved himself worthy to rank with Mistral and Roumanille. He was, without a doubt, the deepest nature and temperament among the Félibres, and his lyrics were the most poignant. The first Félibres were followed by Louis Roumieux, Felix Gras (a vapid imitator of Mistral), the Irish-born W.C. Bonaparte-Wyse, and the popular song-writer Charles Rieu (called Charloun). Mistral's doctrine spread from province to province and gave impetus to poetic works throughout the entire oc-speaking region, such as those of Joseph Roux of Limoges, the Auvergnat Arsène Vermenouze, and the Rouergue J. Bessou. Mistral's poetic doctrine, however, did not receive universal acceptance among Provençal writers. Among those who most strongly dissented was A. Foures of Languedoc (Les *Grilhs*, 1887). Many of these poets whose careers were so brilliant at their outset continued to develop in the first decades of the 20th century (Mistral, for example, received the Nobel Prize for Literature in 1904).

GERMAN LITERATURE IN THE 19TH CENTURY

The second Romantic school. The first Romantic school had dispersed by 1804. Two years later, however, another phase of Romanticism was initiated in Heidelberg by Clemens Brentano, Achim von Amim, and J.J. von Gorres, the most characteristic production of which was the collection of folk songs published under the title Des *Knaben Wunderhorn* in 1805–08. Brentano's and Joseph von Eichendorff's lyrical poetry was also striking on account of its melodious quality. Unlike the earlier school, the Heidelberg writers wrote historical works and also collected folk songs and popular prose romances. Their immediate influence on German intellectual life was consequently greater; from that period dates the study of German philology and medieval literature and the nationalism that prepared for the rising against Napoleon.

The plays of Kleist

Around 1809, when the Heidelberg school broke up, the Romantic movement followed two lines of development, one north German, the other associated with Wiirttemberg. In the north, Heinrich von Kleist, Prussia's greatest dramatic poet, was closely allied to the Romantic movement. In his plays, such as *Amphitryon* (published 1807), *Penthesilea* (published 1808), and Prinz Friedrich *von* Homburg (posthumously published 1821), he depicted the confusion of mind resulting from the conflict between the intellect and feeling. Zacharias Werner was popular because of his fate tragedies and martyr dramas. During the same period E.T.A. Hoffmann, a novelist of genius, created a world of fantasy, often of a morbid character, and gave European currency to German Romanticism. Wilhelm Muller, following Byron's example, stirred up German sympathy for oppressed Greeks and Poles.

The Swabian school represented a last phase of Romanticism. The ballads of its leader, Ludwig Uhland, were held second only to Schiller's in popular esteem. Uhland, Justinus Kerner, Gustav Schwab, and others carried on the Romantic tradition but without the impetus of its original force.

The death of Goethe in 1832 marked the end of cosmopolitan humanism, typical of the 18th century. Although some leading Romantics outlived Goethe by a decade, the movement had lost its impact. In conservative, nonliterary fields, Romanticism was more tenacious, and in politics its alliance with rising nationalism coloured German thinking for more than a century. In literature, Goethe himself was of more lasting significance; few were unaffected by his work, though the effect sometimes took the form of rebellion against his olympian predominance.

Rule by conservative governments repressed liberty of thought, and writers' efforts to prescribe solutions for social ills were foiled by severe censorship. Literature was dominated by disillusionment with man's capacity to achieve lofty ends, and pessimistic appraisal of man's role replaced once optimistic or solidly constructive attitudes. In keeping with this change in attitude, writers sought to free themselves from the bondage of Neoclassical and Romantic thought, not always by rejection but often by adaptation.

Grill-parzer's tragedies

The greatest dramatist of this post-Napoleonic era, Franz Grillparzer consciously cast his dramas in the tradition of Neoclassicism, yet they lacked self-confident vigour and assurance. His tragedies had weakness of will as their theme; an individual's effort was of no avail against the overwhelming power of circumstance and the world could not give contentment to man, for only cultivation of inner resources and self-abnegation were able to grant inner peace. In his first play, Die Ahnfrau (performed 1817; "The Ancestress"), fate was an external force; but in a trilogy, Das goldene *Vliess* (1820; The Golden Fleece, 1942), it was the combination of character and circumstance. In Medea both partners in a marriage stand in isolation, incapable of reconciliation because of their burden of guilt.

This element pervaded Grillparzer's plays: *Sappho* (1818), modelled on Goethe's *Torquato Tasso*, depicted the tragedy of a poetess seeking in vain to hold her younger lover; Der Traum *ein* Leben (1834; *Dream* Is Life, 1946) shows the folly of ambition. Konig Ottokars *Glück* und Ende (1823; King Ottokar, His Rise *and* Fall, 1938) treated a ruler's downfall through overweening ambition, while in Ein Bruderzwist in Habsburg (c. 1848; Family Strife in Hapsburg, 1940) untimely action was the source of evil.

The sombre mood of Grillparzer prevailed in the period, notably in the work of C.D. Grabbe and Georg Biichner; it invaded even the popular Viennese comedies by F. Raimund and J.N. Nestroy. The heritage of Neoclassicism and Romanticism appeared discredited, but no new faith had yet grown out of the resulting disillusionment. In the new drama, therefore, established values were questioned and disparaged. Grillparzer's doubts of his creative capacity and his conflicting aspirations gave rise to contradictions in his work, held in check by an impulse to create an almost classical form. Grabbe did not aim at formal perfection. The tragic error of his heroes sprang from a mistaken belief in their ability to control the course of history; the chaos of a meaningless world was stronger than the efforts of individuals. For Biichner, too, the world appeared meaningless; but he was a much more incisive dramatist than Grabbe, for his was a more radical vision. He had been disappointed by the political ineffectiveness of would-be revolutionaries, and his writings waged war against unrealizable ideals and sham rhetoric. His comedy Leortce und Lena (published 1850) satirized Romantic drama and the nebulousness of Romantic ideas; Danrons Tod (published 1835; *Danton's* Death, 1939) was a tragedy of heroic pessimism; and in Woyzeck (posthumously published 1879) the individual was caught in a net of hostile social forces. Buchner's work was thus an indictment of the social and cosmic order.

Lyric poetry. Melancholy and morbid subjectivity characterized the lyric verse of Nikolaus Lenau. The great tradition of Neoclassical and Romantic poetry made it possible to achieve formal excellence but difficult to be original. Friedrich Riickert and August von Platen-Hallermiinde, two most consummate formal lyricists, illustrated this amply. Ruckert was a scholar and poet of no mean importance whose real poetic achievement was a portrayal of the conflict between reason and will. In Platen-Hallermunde's *Sonnette aus* Venedig (1925; "Venetian Sonnets") the German language was skillfully adapted to what was essentially an alien verse form.

For Eduard Morike, too, classical poetry was a model; Morike's formal excellence was matched by an idyllic and melodious portrayal of nature and country life. In Mozart *auf* der Reise nach Prag (1856; "Mozart's Journey to Prague"), he humorously examined the problems of artists in a world uncongenial to art. Nature was also a source of inspiration of Annette von Droste-Hulshoff, whose powerful rhythm and sombre language expressed apprehension of the irrational forces of life, as in Das geistliche Juhr (1851; "The Spiritual Year"). Religious feeling helped balance her vision and gave her poetry greater maturity.

No one attacked Romanticism more ruthlessly than Heinrich Heine. In Germany, Heine was, and still is, a con-

Heine's attack on Romanticism

troversial figure, mainly because he subjected German national susceptibilities and Romantic nationalism to scathing criticism, but his *Buch der Lieder* (1827; "Book of Songs") became one of the best known anthologies of love poetry. Heine described dreams and yearnings, and his realism showed that they were only make-believe. In *Romanzero* (1851) and the posthumously published poems, his poetry conveyed the hopes and anguish that were so real during his last long, drawn-out illness, and his early Saint-Simonian belief in the "rehabilitation of the senses" had given way to a belief in God. His less well-known prose, *Reisebilder* (1826–31; "Travel Sketches"); *Lutezia* (1854), a collection of reports on life in France; his analysis of German intellectual life and history in *Zur Geschichte der Philosophie und Religion in Deutschland* (1834; "On the History of Religion and Philosophy in Germany"), reveal him as a master of ironic prose, dissatisfied with solemnity and pretension. His most effective political satire is a verse epic, *Deutschland: Ein Wintermärchen* (1844; "Germany: A Winter's Tale"), a savage attack upon personal enemies and upon political conditions of his time.

In 1835 an edict of the federal Diet banned Heine's writings, together with those of Ludolf Wienbarg, Karl Gutzkow, Heinrich Laube, and Theodor Mundt. Wienbarg's *Ästhetische Feldzüge* (1834; "Aesthetic Campaigns") had been dedicated to "Young Germany," and this name was then given to the writers who were in tune with the radicalism of the Young Hegelians and political liberals, frustrated by severe censorship and authoritarian government. Wienbarg proclaimed a need for literature to deal with political and social problems. Karl Gutzkow criticized conventional morality and orthodoxy in a novel, *Wally, die Zweiflerin* (1835; "Wally the Doubter"), and a drama, *Uriel Acosta* (performed 1846). Exile was often the fate of those who dared to criticize the established political and social order. Ludwig Borne, a highly talented prose writer, went into self-imposed exile in Paris, and his *Briefe aus Paris* (1830–33; "Letters from Paris") were valuable social documents. Two important lyric poets, Georg Henvegh and Ferdinand Freiligrath, had to flee, one to Switzerland, the other to London.

More conservative was Emanuel Geibel, whose collections *Zeitstimmen* (1841; "Voices of the Age"), *Juniuslieder* (1848), and *Heroldsrufe* (1871; "Herald Calls") contain patriotic verse. He was the leader of the popular Munich school of poetry, whose patron was Maximilian II of Bavaria. Of these poets only Heinrich Leuthold struck a deeper note. Paul von Heyse's novellas rarely roused the reader, and Victor von Scheffel's verse tale *Der Trompeter von Sackingen* (1854) and a novel *Ekkehard* (1857), although popular at the time, came to sound unconvincing.

Realism and regionalism. Realism, often of regional inspiration, was a source of real originality at this time. Poetic Realism, a term coined by Otto Ludwig, aimed at portraying life but only insofar as life was artistically significant and appeared to possess intrinsic value. Attention focussed on social reality but not, as in later Naturalism, on its ugly, pathological side. The main object of a realist writer was to discover positive values in everyday life without reference to transcendental ideas. Changes in the social order had made a host of social critics to question developments that accompanied the beginning of urbanization. Of them Karl Marx is now the best known, but Arthur Schopenhauer's pessimistic philosophy and Ludwig Feuerbach's materialistic thought also amounted to a more sober appraisal of man's capacity. In the same period there developed a positivism that, by way of analogy, sought to apply to the study of literature and society methods that they mistakenly believed to be those of natural science. This, in turn, led to the study of sources and texts, formalized by the first important organized school of literary history in Germany, that of Wilhelm Scherer. Together with his successors, Erich Schmidt and Jakob Minor, Scherer established criticism of modern literature as an academic discipline; Jacob and Wilhelm Grimm and Karl Lachmann had already given academic respectability to German medieval studies.

In fiction, writers concentrated on subjects that they could, through familiarity, accurately describe. Karl Immermann, whose work was still greatly influenced by classicism, in *Der Oberhof* (1839; "The Manor") portrayed peasants rooted in their work and their countryside. The Low German novels *Ut de Franzosentid* (1859) and *Ut mine Stromtid* (1862–64), by Fritz Reuter, contained a wealth of individual character made more convincing by a lively dialect style. With *Quickborn* (1853), a collection of lyrical poetry, Klaus Groth became a prototype of the regional poet; his dialect clearly linked his work to colloquial speech and recalled the folk song.

The gentle art of Stifter

Adalbert Stifter, too, drew much strength from his native Bohemian forest; some of his tales, collected in *Studien* (1844–50) and *Bunte Steine* (1853; "Bright Stones"), were set there. For Stifter, the world of everyday events was a symbol of emotional significance; he therefore portrayed it carefully in his novel *Der Nach Sommer* (1857; "Indian Summer"). Influenced by Goethe's *Wilhelm Meister*, Stifter stressed the power of art to educate; he sought to show how the "law of gentleness"—that is, of humane action, based on justice, simplicity, self-control, restricted activity, and admiration of the beautiful—was effective in bringing about an exemplary life true to nature.

The Realism of Otto Ludwig had a psychological flavour; in *Zwischen Himmel und Erde* (1856; "Between Heaven and Earth"), a conflict within an artisan family was explored with striking objectivity and careful characterization. Another important Realist was Theodor Storm, whose work was stamped by the atmosphere of his native Schleswig-Holstein. Romantic elements in his work were subordinated to realistic description, though both his prose tales and lyric poetry were permeated by a sense of the ephemerality of life. Romantic preoccupation with the past had stimulated historical thought and writing. Some of Storm's novellas had dealt with the past, but other writers, such as Willibald Alexis (W. Häring), Wilhelm Hauff, Gustav Freytag, and W.H. Riehl, made history a main theme. The stories of Alexis—of which *Die Hosen des Herrn von Bredow* (1846; "The Trousers of Squire Bredow") was the best known—were imbued by a delicate sense of humour and a feeling for the landscape of Brandenburg. Freytag's best work is his portrayal of social and economic change in *Soll und Haben* (1855; *Debit and Credit*, 1855) and his comedy *Die Journalisten* (performed 1852; *The Journalists*, 1888).

Wilhelm Raabe's analysis of social life was more profound. He anticipated 20th-century methods of storytelling in focussing attention both on the story and the way in which it was told. He attacked the narrowness of the bourgeois philistinism and the nationalism of Bismarck's empire. In his later work—*Stopfkuchen* (1891) and *Die Akten des Vogelsangs* (1895; "The Vogelsang Documents")—he depicted eccentric characters with a rich inner life who achieved spiritual freedom. His pessimism and humour were paralleled by Wilhelm Busch, a satirical poet most widely known for his comic-strip verse-story *Max und Moritz* (1865). His down-to-earth laughter over human imperfection savagely exposed hypocrisy and illusion.

The plays of Friedrich Hebbel revealed poetic Realism at its most powerful. His work was a synthesis of psychological analysis and metaphysical beliefs. Deep inner impulses drove his characters to doom: his dramas, *Judith*, *Herodes und Mariamne*, and *Gyges und sein Ring* (all between 1840 and 1856), depicted the tragedy of those who suffered defeat because their outraged individuality did not allow them to compromise. In his last play, *Die Nibelungen* (performed 1861), he interpreted an old legend in terms of his own psychological and metaphysical ideas. His lyrical poetry depended on close identification with the growth and decay of nature. Theodor Fontane's Realism was subtle and impressive for its humour and irony. His novels about life in Brandenburg were characterized by psychological insight and an understanding of social problems in *L'adultera* (1882), *Irrungen Wirrungen* (1888), *Frau Jenny Triebel* (1892), and *Effi Briest* (1895), human relationships clashed with society and survived or broke down according to their innate strength.

Nietzsche's theory of art

Friedrich Nietzsche was a harbinger of 20th-century literature. His distinction, in *Die Geburt der Tragodie aus dem Geiste der Musik* (1872; *The Birth of Tragedy,* 1909), between the Apollonian and Dionysian elements of art was of considerable consequence. The view spread that classical art could not only be serene but also be ecstatic, and that the origins of Greek drama sprang from the orgiastic intoxication of Dionysian religious mysteries. Nietzsche's emphasis on a need to liberate personality from shackles of conventional Christian morality—he denounced Richard Wagner after the composer had turned to Christianity—skepticism as to the validity of the artist's statements and his place in society, and prophecy of nihilism to come provided an arsenal of ideas and intellectual ferment for the next generation of writers.

The keynote of Naturalism in Germany was scientific objectivity, and the principal model was the work of Émile Zola in France. An anthology of lyric verse, *Dichtercharaktere,* appeared in 1884, in which urban life was the theme, but the real revolution was made by Arno Holz, who, in *Buch der Zeit* (1886; "Book of the Times"), revealed himself as the first important poet of Naturalism. Together with Johannes Schlaf, he wrote three tales published as *Papa Hamlet* (1889), in which they attempted faithfully to depict the minutiae of life, even its pathological and sordid aspects. Many of his poems dealt with the life of the poor. Gerhart Hauptmann was the chief naturalist playwright. His play *Vor Sonnenaufgang* (1889; "Before Dawn," 1912) was memorable for its novel technique, for it was a drama without hero or proper plot. *Die Weber* (1892; *The Weavers,* 1962), also without a plot, was an indictment of dire poverty caused by industrialization, while *Der Biberpelz* (1893; *The Beaver Coat,* 1912), one of the few successful German comedies, was a satire on Prussian officialdom outwitted by the common sense of a clever washerwoman. In *Hanneles Himmelfahrt* (1893; "The Assumption of Hannele"), Hauptmann began to experiment with symbolist drama, and *Der Nurr in Christo, Emanuel Quint* (1910; *The Fool in Christ,* 1911) revealed his force as a prose narrator.

In Hauptmann's wake several writers wrote in a straightforward Naturalist manner. The best known among them were Herman Sudermann, notable for *Ehre* (1889; translated as *What Money Cannot Buy)* and *Heimat* (1893; translated as *Magda,* 1896), plays criticizing middle class morality; and Max Halbe, whose *Jugend* (1893; "Adolescence") was a drama of adolescent love.

In the course of the 19th century, German literature had increasingly abandoned an idealistic conception of man and turned to a more down-to-earth and deprecating appraisal of reality, reflecting the rise of positivist and materialist thought in science. This proved too narrow; and in consonance with the new relativist scientific cosmology of the 20th century, artistic imagination began to portray a more complex vision of the world.

The revival of drama in Vienna

Austrian literature. The reforms of Maria Theresa and her son Joseph II encouraged a revival of Austria's German language and culture and in particular of German theatre. Vienna became once more the centre of drama, with dramatists such as Josef Schreyvogel, Heinrich Laube, Eduard von Bauernfeld, and Franz Grillparzer (see above *The second Romantic school)* writing for the court theatre, or *Burgtheater.* The popular state theatre, or *Volksbühnen,* produced the fairy-tale plays of Ferdinand Raimund, the peasant drama of Ludwig Anzengruber (see below), and the popular pieces of Johann Nestroy. Dramatists such as Joseph von Hammer-Purgstall and Jakob Fallmerayer dealt with far-off places, while Franz Stelzhamer, one of several regional dramatists, wrote in an Upper Austrian dialect. Other playwrights active at this time included Charles Sealsfield, Friedrich von Schwarzenberg, Adalbert Stifter (see above *Realism and regionalism),* and Franz Kranewitter. Toward the end of the century Ferdinand von Saar and Marie von Ebner-Eschenback provided realistic accounts of both bourgeois and peasant society. A novelist, Peter Rosegger, and a dramatist, Ludwig Anzengruber, wrote about peasant life. Anzengruber's humour, as seen in his plays *Der Pfarrer von Kirchfeld* (1870; "The Minister from Kirchfeld") and *Das vierte Gebot* (1877; "The Fourth Offer"), softened his polemical didacticism.

SWISS LITERATURE IN THE 19TH CENTURY

German Swiss. In the 19th century, international fame and critical estimate at home did not always occur in German Swiss literature. Thus, *Der schweizerische Robinson* (1812–27; *Swiss Family Robinson,* 1818), by Johann David Wyss, and *Heidi* (1881), by Johanna Spyri, were examples of worldwide success by works little considered at home. Meanwhile, Bern produced its greatest novelist in Albert Bitzius, who, as Jeremias Gotthelf, combined epic power with a profound knowledge of human nature in a series of great novels accurately depicting the life of Swiss peasant communities. It was in fiction and poetry that the Ziirich writers Gottfried Keller and Conrad Ferdinand Meyer achieved fame. Keller first reached the height of his creative powers with *Der grune Heinrich* (1854–55; revised 1879–80), and Meyer with his verse epic *Huttens letzte Tage* ("Hutten's Last Days") in 1871. Meyer drew upon the mountains and upon the princely courts of the past and, as a writer of fiction, immersed himself in the life and culture of the Renaissance.

Keller's prose and poetry were full of genial humour and exuberance, matching his fundamentally human attitude, and his love for his country took different forms, from hymns of praise to pungent social criticism. The importance of this period was further emphasized by the work of a Basel historian, Jacob Burckhardt, and his disciple Heinrich Wölfflin, who continued and completed that part of his master's work that was interrelated with the history of fine arts.

French Swiss. At the beginning of the 19th century, French Swiss literature was largely connected with the influential circle of Madame de Staël, who, in her house on Lake Geneva, often entertained leading intellectuals of western Europe. She and Benjamin Constant were both of Swiss extraction, and much of their work was inspired by their background. Another member of Madame de Stael's circle was a Genevan, Simonde de Sismondi, who wrote the *Histoire des rhpubliques italiennes du moyen âge* (1807–18).

Rodolphe Toepffer depicted a more homely humorous world in *La Bibliothèque de mon oncle* (1832; "My Uncle's Bookshop"), while the poems of Juste Olivier testified to a pronounced patriotism. A powerful international influence was exercised by the fragments of H.F. Amiel's *Journal intime* (1883–84).

Italian Swiss. About 9 percent of Switzerland's population use Italian as their native language and for their literature. The Swiss Italians included Francesco Soave of Lugano, who translated John Locke and Salomon Gessner into Italian and, following the example of the latter, wrote his own *Novelle morali,* which appeared in many editions and made the story of William Tell popular in Italy; and Stefano Franscini, who helped to bring about the unity of the Ticino and connect it with the spirit of the Swiss Confederation. His main work, *La Svizzera italiana* (1837–38), bore as a Latin motto: "The Alps looking toward Italy are my greatest hope." His *Nuova statistics della Svizzera* (1847) was a particularly effective description of Switzerland.

DUTCH LITERATURE IN THE 19TH CENTURY

The growth of nationalistic Romanticism

Although Jacob Geel's essays in *Onderzoek en phantasie* (1838; "Inquiry and Fantasy") set a new standard in philological and philosophical criticism in Dutch literature, he, like the poet Antony Staring, was almost swept aside by the growing wave of Romanticism. Simultaneously, the reactionary freethinking of the Enlightenment roused the militancy of the Calvinists, who realized that their entrenched position was being threatened. Willem Bilderdijk and his disciple Isaac da Costa reminded the nation of its divine mission, and foreign historical novels (particularly the work of Chateaubriand

and Scott) provided models for historical national Romanticism. In 1826 David van Lennep published a paper calling for novels modelled on Sir Walter Scott; his son Jacob responded with *De pleegzoon* (1833; *The Adopted Son,* 1847). Although now little read, Jacob was a prolific writer of poetry, novels, drama, librettos, translations (of Byron, Scott, Shakespeare), history, and literary criticism. More important was *Hermingard van de Eikenterpen* (1832; "Hermingard of the Oak Burial Mounds"), by Aernout Drost, with the makings of a modern novel. Drost also started a new literary journal, *De muzen* (1834), which, like his novel, was true to the spirit of the "Réveil." Two men on its staff, a historian, R.C. Bakhuizen van den Brink, and a future leader of the literary revival, Everardus Johannes Potgieter, continued the campaign to improve critical standards in *De gids* ("The Guide"), known as the "Blue Butcher" because of its merciless treatment of complacency. Potgieter defined the historical novel, and Anna Bosboom-Toussaint put his ideas into effect, transposing the universal Christian idealism of Drost to the national Protestant faith of the Golden Age. Her best known book, *Majoor Frans* (1874; "Major Francis"), was not historical, belonging rather to an era of liberal politics and female emancipationists. One historical novel had an effect far beyond its literary value. Hendrik Conscience's *Leeuw van Vlaanderen* (1838; *The Lion of Flanders,* 1853–57) aroused a national consciousness in Flanders that matured in the Flemish revival (see below *Belgian literature in the 19th century: Flemish).*

Nicolaas Beets was the most popular poet of his period, but, although he was feted as a national Protestant poet, his claim to fame rests on his sketches in *Camera obscura* (1839), which is still overrated for its so-called Dickensian observation of detail. The more subtle humour of Potgieter never had the appeal of Beets or of Johannes Kneppelhout, who wrote *Studententypen* (1839–41), and his quest for originality tended to deprive his style of simplicity and clarity. The sober, personal, and merciless standards of the critic Conrad Busken Huet, a progressive who left the church, placed Dutch writing in a truer perspective with western European writing. His essays were collected in *Litterarische fantasien en kritieken* (1868–88, "Literary Fantasies and Criticisms"), and his later work was best represented by *Het land van Rembrandt* (1882–84). Meanwhile, a furor had been caused by an entirely unknown writer, Multatuli, pseudonym of Eduard Douwes Dekker, whose *Maw Havelaar* (1860), *a* masterly satire of Dutch exploitation of the Dutch East Indies, suddenly revealed the full poignancy of the language. Dekker's writing, in *Wouterje Pieterse* (1865–77) and *Minnebrieven* (1861; "Love Letters"), vibrated between extremes of sentimentality and anarchy, iconoclasm and utopianism. Although poetry as a convention was anathema to him, Dekker was nevertheless rather greatly admired by the young men of the new generation; and the first of the 1880s poets, Jacques Perk, wrote sketches in Dekker's humorous style before writing a sonnet cycle, *Mathilde* (published posthumously in 1882), which opened a new epoch in Dutch literature.

The appearance of the periodical *De nieuwe gids* ("The New Guide") in 1885 marked the beginning of an important renaissance of literature in the northern Netherlands. It differed from the earlier periodical *De gids* in that it pursued an exclusively aesthetic ideal. Leaders of the movement were the poets Willem Kloos and Albert Verwey and the violent and lyrical critic Lodewijk van Deyssel. Among others involved in the movement was the dramatist, poet, and prose writer Frederik van Eeden, who occupied a special position. Herman Gorter, who became the foremost poet after *Mei* appeared in 1899, and the poets Hélène Lapidoth-Swarth, Pieter Cornelis Boutens, and Jan Hendrik Leopold also stood close to the movement. Also belonging to this generation were the writers Jacobus van Looy, who wrote pictorial prose, and Louis Couperus, who described the social activities of The Hague. (For literature in Flemish, see the following.)

BELGIAN LITERATURE IN THE 19TH CENTURY

Flemish. Before the end of the 18th century, Willem Verhoeven and Jan Baptist Verlooy started a reaction in Flanders against French influence, returning to the work of 16th-century Humanists but neglecting medieval masterpieces. Revival was helped by the *rederijkers,* who continued to use Flemish, not French. Karel Broeckaert wrote dialogues in a spirit of rational liberalism modelled on Joseph Addison's *Spectator* essays and also wrote the first Flemish prose story, *Jellen en Mietje* (1811). A poet, Peter Joost de Borchgrave, embodied the transition from classicism to Romanticism, and Jan Baptist Hofman wrote "bourgeois" dramas.

Romanticism made its influence felt in the 19th century and was linked to a revival of nationalist consciousness. The older generation—Jan Frans Willems, Jan Baptist David, Philip Blommaert, and Ferdinand Snellaert—while remaining rationalists, rediscovered the rich medieval inheritance. To their group belonged two important poets of the new age, Karel Lodewijk Ledeganck and Prudens van Duyse. The younger generation was more spontaneously Romantic, as was illustrated by the work of Hendrik Conscience, creator of the Flemish novel. Theodoor van Rijswijck and Johan Alfried de Laet freed poetry from classical concepts and forms, and the ultra-Romantic stories of Eugeen Zetternam and Petrus Frans van Kerckhoven denounced social evils.

Led by a Realist, Jan Lambrecht Domien Sleeckx, a reaction against Romanticism set in about 1860. Writing became characterized by acute observation, description of local scenery, humour, and, not infrequently, a basic pessimism, as could be seen in novels such as Anton Bergmann's *Ernest Staes* (1874) and Virginie Loveling's *Een dure eed* (1892; "*A* Dear Oath"). The poets Johan Michiel Dautzenberg, Jan van Beers, and Rosalie Loveling, together with the first important Flemish critic, Max Rooses, also reflected a new Realistic approach.

The reaction of Flemish Realism

Parallel to this Realism was a remarkable revival in West Flanders, headed by a lyrical poet, Guido Gezelle, and a nationalist agitator, Hugo Verriest, who revitalized prose. Albrecht Rodenbach, who died before his talents had matured, wrote militant songs, thoughtful lyrics. monumental epics, and a verse tragedy, *Gudrun* (1882).

The review *Van nu en straks* ("Of Today and Tomorrow"), which was to make Flemish literature of European importance, was influenced more by Gezelle, Verriest, and Rodenbach than by the generation of the 1880s. Led by Pol de Mont, an already complex modern poet, the writers of the 1880s had, however, widened horizons and, by emphasis on individualism and "art for art's sake," prepared the ground for their successors.

French. Impetus for the long-awaited Belgian literary renaissance came from Max Waller, founder in 1881 of an influential review, *La Jeune Belgique* ("Young Belgium"), which gave its name to a movement aiming for literary expression of a genuinely Belgian "consciousness." It was a group of writers of highly individual talent pursuing similar aims in different ways.

Of novelists early associated with the movement, Camille Lemonnier, Eugène Demolder, and Georges Eekhoud were the most influential. Later *Jeune Belgique* novelists were Georges Virrès, who lyrically depicted peasant life in the Kempenland (Campine), and Maurice des Ombiaux, who portrayed his compatriots with sly humour.

Stimulated by the *Jeune Belgique* movement was a group of poets much concerned with style and language; Grégoire Le Roy, a gifted lyrical Symbolist poet, and a poet and critic, Albert Mockel, founder of an influential Symbolist review, La *Wallonie,* were in this group.

They were overshadowed, however, by three poets of international stature: Émile Verhaeren, Maurice Maeterlinck, and Max Elskamp. Verhaeren extolled humanity's struggle toward social justice; Maeterlinck, creator of the Symbolist poetic drama, was concerned to illuminate life's inner meaning; and Elskamp treated themes from folklore and legend.

Outstanding dramatists were Maeterlinck (*L'Oiseau bleu* [performed 1908; *The Blue Bird,* 1909]), Verhaeren, and Georges Rodenbach. A playwright, novelist, and critic, Edmond Picard propounded Socialism, Symbolism, and Impressionism.

The period also saw a beginning, in the work of Godefroid Kurth, of modern historiography and of modern criticism. An outstanding historian was Henri Pirenne. Art and literary criticism flourished, and an atmosphere for a flowering of scholarship culminated in the foundation (1920) of the Belgian Académie Royale de Langue et de Littérature Françaises.

Walloon. The number of Walloon poets and other dialect writers increased during the 19th century. Charles-Nicolas Simonon wrote the moving stanzas of "Li Côpareye" (the name of the clock of the cathedral of Saint-Lambert), François Bailleux his charming "Mareye," and the first great Walloon lyric poet, Nicolas Defrêcheux, his famous "Leyiz-m'plorer" (1854; "Let Me Weep"). The establishment at Liège, in 1856, of the Société Litgeoise de Littérature Wallonne had considerable influence on both language and literature. The number of poems, songs, plays, and even translations into Walloon of such authors as La Fontaine, Ovid, and Horace increased.

Other parts of Belgium, apart from prolific Liège, still remained active centres of dialect writing. In the 19th century, Namur could boast especially of Charles Wérotte and Nicolas Bosret, poet of the touching song "Bia Bouquet." The works of Jean-Baptiste Descamps and others originated in Hainaut. Walloon Brabant was the home of a truculent Abbe Michel Renard.

By the end of the 19th century many writers working in Walloon dialects chose a rather doctrinaire Realism to depict workaday existence and remained somewhat hidebound by social conventions. Poets included Joseph Vrindts and, above all, Henri Simon, who sang of working peasantry. Successful playwrights included André Delchef and Édouard Remouchamps, whose vaudeville comedy in verse, *Tâtî l'pèriquî* (performed 1885; "Tati the Hairdresser"), married observation and technical dexterity.

ITALIAN LITERATURE IN THE 19TH CENTURY

The 19th century was a period of political ferment in Italy, and many outstanding writers were involved in public affairs. Much of the literature written with a political aim, even when not of intrinsic value, became part of Italy's national heritage and inspired not only those for whom it was written but all who valued freedom.

Early Romanticism. Foremost among writers in early struggles for his country's unity and freedom from foreign domination was Ugo Foscolo, who reconciled passionate feeling with a formal perfection inspired by classical models. His *Le Ultime lettere di Jacopo Ortis* (1802; "Jacopo Ortis' Last Letters") was an epistolary story of a young man forced to suicide by frustrated love for both a woman and his fatherland. It was extremely moving and popular, as was a poem, "Dei sepolcri" (1807; "Of the Sepulchres"), where, in fewer than 300 lines, he wrote lyrically on the theme of inspiration to be found at the tombs of the great, exhorting Italians to be worthy of their heritage. This poem influenced the Italian Risorgimento, or national revival, and a passage in which Florence was praised because it kept in Santa Croce the ashes of Michelangelo, Machiavelli, and Galileo is still very popular in Italy. Two odes celebrating the divine quality of beauty, 12 sonnets ranking with the best of Petrarch's and Tasso's, and an unfinished poem, "Le Grazie" ("The Graces"), also testified to Foscolo's outstanding poetic merit. As an exile in England from 1816 until his death (1827), he wrote for English readers remarkable critical essays on Italian literature.

In Foscolo patriotism and classicism united to form almost one passion, but Vincenzo Monti was outstanding for mobility of feeling. He saw danger to his country in the French Revolution and wrote "Il pellegrino apostolic~'(1782; "The Apostolic Pilgrim") and *La Bassvilliana* (1793; *The Penance of Hugon,* 1805); Napoleon's victories aroused his praise in "Prometeo" ("Prometheus"), "Il bardo della selva nera" ("The Bard of the Dark Wood"), and "La spada di Federico 11" (1806; "The Sword of Frederick II"); in "Il fanatismo" and "La superstizione" (1797) he attacked the papacy; later he extolled the Austrians. Thus every great event made him change his mind, through lack of political conviction, yet he achieved greatness in *La bellezza dell'universo* (1781; "The Beauty of the Universe"), lyrics inspired by domestic affections, and in a translation of the *Iliad,* a masterpiece of Neoclassical beauty.

Classicism, purism, and the reaction of Romanticism

Melchiorre Cesarotti occupied a prominent position in the world of learning at the end of the 18th century, and his *Poesie di Ossian* (1763–72) influenced Foscolo, Leopardi, and others by their mysterious and gloomy fantasy, so alien from classical inspiration; *Saggio sulla filosofia delle lingue* (1785) was an important essay in the dispute on the Italian language. The trend was toward pedantic classicism as a reaction against an excessive Gallicism favoured by some 18th-century writers. Among the purists was Antonio Cesari, who brought out a new enlarged edition of the *Vocabolario della Crusca* (the first Italian dictionary, published by the Accademia della Crusca in 1612). He wrote *Sopra lo stato presente della lingua italiana* ("On the Present State of the Italian Language") and endeavoured to establish the supremacy of Tuscan and of Dante, Petrarch, and Boccaccio as models. But a Lombard school opposed this Tuscan supremacy. Vincenzo Monti, its leader. issued *Proposta di alcune correzioni ed aggiunte al vocabolario della Crusca* ("Proposal for Some Corrections and Additions to the Crusca Dictionary"), which attacked the Tuscanism of the Crusca. All Italy took part in the disputes about language, literature, and politics.

A patriot, a classicist, and a purist at one and the same time was Pietro Giordani; he was almost a compendium of literary movements of the time; his works were few and comparatively unimportant, but his position among contemporaries singled him out as the last great exponent of *purismo.* French domination in Italy made people realize that traditional aspirations toward political unity and independence were possible, for the separate states and rulers had been obliterated by Napoleon; and Italians were convinced that they could not rely on foreign help, for the French, who had entered Italy as liberators, had proved oppressive masters. An artificial form of classicism was associated with the Napoleonic domination, so that when Napoleon fell, forces antagonistic to classicism arose. Literary Romanticism had already won favour with the French, who erroneously thought themselves akin to German Romantics. Between 1816 and 1818 a battle was fought for Romanticism, particularly in Milan, where a Romantic periodical, *Il Conciliatore.* was published. G. Berchet (patriotic poet and author of *La lettera semiseria di Grisostomo,* a manifesto of Romanticism), Silvio Pellico, L. di Breme, Giovita Scalvini, and E. Visconti were among its contributors. Their efforts were silenced in 1820 when several were arrested by the Austrian police because of their liberal opinions; among them was Pellico, who later wrote a famous account of his experiences, *Le mie prigioni* (1832; *My Prisons,* 1853). It appears that the new school, though advocating the study of modern works in different languages and a certain independence from classical imitation and conventions, was on the whole consistent with Italian tradition. The chief exponent of Italian Romanticism was Alessandro Manzoni, whose major work, *I promessi sposi* (1825–27; *The Betrothed,* 1889), was a novel about two peasant lovers whose marriage is opposed by a wicked nobleman and who are finally reunited after many adventures through war, revolution, and plague. This was a great masterpiece of modern Italian fiction and has ranked with the greatest novels of any literature. Manzoni's fluency, elegance, and humour pervaded the work, which had a vivid 17th-century background integrated with a complicated plot. Manzoni's genius as a poet showed in the odes "Il cinque maggio" ("The Napoleonic Code"), written on the death of Napoleon, and "Marzo 1821" and in passages of *Inni sacri* ("Sacred Hymns"; five poems in celebration of church festivals) describing human affections. His tragedies, *Il conte di Carmagnola* (performed

The publication of *Il Conciliatore*

1820) and *Adelchi* (1822), marked a victory of Romanticism over classicism; they contained passages of great lyrical beauty but lacked strong dramatic power.

Giovan Battista Niccolini was another notable dramatist of the Romantic period who gradually evolved from classical to Romantic in style but never achieved more than topical significance. although his eloquence stiired his compatriots to love of liberty.

Leopardi's pessimism

The foremost Italian poet of the age was Giacomo Leopardi, an outstanding scholar and thinker whose philological works together with his philosophical writings, *Operette morali*, would alone place him among the great writers of the 19th century. Embittered by solitude, sickness, and near penury, from the age of 20 he realized the vanity of his hopes. Though he developed a doctrine of universal pessimism, seeing life as evil and death as the only comfort, the poetry based on these bitter, despairing premises was far from depressing. Leopardi's poems were all contained in one book, *I canti* ("Songs"), first published in 1831. Some were patriotic and were once very popular; but the best came from deeper lyrical inspiration. Among them were a meditation on infinity; "A Silvia," on the memory of a girl who died when he was 20; "Le ricordanze," an evocation of his childhood; "Il passero solitario," comparing the lonely poet and a sparrow that sings by itself; and "La quiete dopo la tempesta" and "Il sabato del villaggio," two pictures of village life. They balance depth of meaning and formal beauty, simplicity of diction, intensity, and verbal music.

The Risorgimento and after. After 1821 the literature of Italy was mainly concerned with political events tending toward the Risorgimento. Romantics and classicists were both actuated by patriotism. Manzoni's novel created so deep an impression that several writers followed his example. Massimo Taparelli d'Azeglio, painter, statesman, and author, had a political object in writing *Ettore Fieramosca*, a heroic episode of the Renaissance. Though overcrowded with incidents, it was full of zest. D'Azeglio, a Piedmontese monarchist, was several times prime minister and during his leisure composed excellent memoirs, *I miei ricordi.* Francesco Guerrazzi, Republican follower of Mazzini, wrote several historical novels, notably *L'assedio di Firenze* ("The Siege of Florence"). Writing was, to him, a means of fighting oppression. He led the Tuscan revolution of 1848 and wrote in the intervals of his political activity. His vigorous rhetoric impressed his readers, but he was not always historically accurate. Garibaldi knew Foscolo's "Dei Sepolcri" by heart, and his followers called each other by the names of Guerrazzi's characters. It was among Garibaldians that the last historical novelists were to be found. G.C. Abba wrote *Da Quarto al Volturno*, a moving account of Garibaldi's campaign in 1860; and Ippolito Nievo wrote *Le confessioni di un italiano* (1858), a cyclic novel that just fell short of being a masterpiece through lack of revision because of his premature death. Giuseppe Mazzini, the greatest political leader of the Risorgimento and advocate of an Italian republic, wrote profusely on literature and politics; at first championing Romanticism, he later opposed it as laying too great stress on the individual, but at all periods his style was vigorous and his convictions sincere. His political works, mainly written during his exile in London, included *Fede ed avvenire* (1835; "Faith and the Future"), *Dei doveri degli uomini* (1844; "The Duties of Men") and *Ai giovani d'Italia* (1860; "To the Youth of Italy"). Vincenzo Gioberti had to leave his country because of his love of liberty. In 1843 he published *Del prirnato morale e civile degli italiani* ("The Moral and Civil Superiority of the Italians"), in which he supported the moral and historical right of Italians to independence and advocated an Italian confederation under the presidency of the pope. This book formed a basis of the political creed of those Italians, other than followers of Mazzini, who took part in the revolution of 184849; the failure of that revolution caused Gioberti to revise his opinions and to advocate the institution of a monarchy under the House of Savoy in *Rinnovamento civile d'Italia* (1851; "The Civil Renovation of Italy"). Patriotic literature was common throughout the period. Luigi Settembrini's *Ricordanze della mia vita* ("Memoirs of My Life") was one of the best examples. Others were written by Manzoni, Leopardi, Berchet, and Gabriele Rossetti; by a satirist, Carlo Porta, who made French and Austrians a target of his invective; and by Giuseppe Gioacchino Belli, who used extraordinary gifts of observation to depict, in 2,000 sonnets, the life of the people in papal Rome. Giuseppe Giusti's satires were also avidly read. Francesco Dall'Ongaro, Aleardo Aleardi, and Giovanni Prati were sentimental Romantics and patriots. Prati was standard-bearer of the "second Romanticism," a movement that thrived between 1850 and 1870, characterized by sentimentality and manneiism. Prati's *Ermengarda* (1841) was acclaimed as a poem of originality, and Aleardi was highly praised; but they and the mediocre imitators of Manzoni brought Romanticism into disrepute and caused Carducci's reaction. Niccolò Tommaseo was also a patriot and a Romantic and, after Manzoni, the greatest Roman Catholic poet and essayist of his age; his personality and work had many conflicting characteristics, but some of his poems are outstanding.

Guerrazzi's novels

The works of Carducci

Giosuè Carducci was an outstanding figure whose enthusiastic support for the national cause during the struggle of 1859–61 was changed to disillusionment by the difficulties in which the new kingdom was involved. The bitterness of some of his poetry revealed frustration and rebelliousness. *Rime nuove* ("New Rhymes") and *Odi barbare* ("Barbarous Odes"), both of which appeared in the 1880s, contained the best of his poetry: memories of childhood, evocations of landscape, laments for domestic sorrows, an inspired representation of historical events, an ambitious effort to resuscitate the glory of Roman history, and an anachronistic but sincere cult of pagan civilization. He tried to adapt Latin prosody to Italian verse, which sometimes produced good poems, but his opposition to Romanticism and his rhetorical tirades provoked a strong reaction, and his metrical reform was short-lived. He was also a scholarly historian of literature, and his literary essays had permanent value, although philosophical criticism such as that of De Sanctis was uncongenial to him. Francesco De Sanctis, exiled by the Bourbons of Naples, considered literature to be an expression of social and moral conditions; and on the basis of a sound philosophical training, he inaugurated aesthetic criticism. *Saggi critici* ("Critical Essays") and particularly his *Storia della letteratura italiana* ("History of Italian Literature") were not fully appreciated in his day but later received recognition and started the philosophical revival of the later 19th century.

While Carducci was still alive, Giovanni Pascoli acquired a reputation and succeeded him in the chair of Italian literature at the University of Bologna. His art was often impressionistic and fragmentary, his language occasionally laborious: but his lyricism. at first timid in inspiration (*Myricae,* 1891), rose to fuller tones when he attempted the loftier themes of antiquity: Roman heritage and greater Italy. His original vein still found expression in *Canti di Castelvecchio* (1903; Songs of Castelvecchio") and in the classicism of *Poemi conviviali* (1904; "Convivial Poems"). In later years he produced—both in humanistic Latin and in self-consciously elaborate Italian—heroic hymns in honour of two sacred cities of Italy, Rome and Turin. But what Pascoli wrote in imitation of Carducci and D'Annunzio was inferior to poems derived from humbler inspirations.

The realist novel

Giovanni Verga stands out as by far the greatest Italian novelist of his time; he was the master of Italian Realism, and his two best novels, *I malavoglia* (1881; *The House by the Medlar Tree,* 1953) and *Mastro-don Gesualdo* (1889; "Mister-Sir Gesualdo"), which describes the dismal conditions in Sicily during the first part of the century, achieved a poignant intensity. Verga was also an exceptionally gifted writer of short stories (such as those in *Novelle rusticane*). Although his success was not immediate, it was lasting, and his influence on the development of Italian literature was paramount. Followers of his were Luigi Capuana and Federico De Roberto, who wrote a masterly novel, *I vicerè* (1844; "The Viceroys"). In order to secure a realistic reproduction of life, these writers drew their subjects from the life of their district, thus creating a tradition of "regionalist" novels. The same was true of Matilde Serao and of Renato Fucini and to some extent of Antonio Fogazzaro, too, although his characters moved in a wider circle. Fogazzaro was a deeply religious man, much influenced by Manzoni and the German Romantics. His later novels—*Il santo* (1906; "The Saint"), well known because of the criticism it provoked from the ecclesiastical authorities, and ***Leila*** (1911)—did not equal the mellowness and sentimental seductiveness of such previous works as ***Piccolo** mondo **antico*** (1895; ***The Patriot,*** 1906), generally acknowledged as his masterpiece, and ***Piccolo rnondo** moderno* (1900; ***The Man of the World,*** 1907). Fogazzaro tried to contrast the Realism of his times with a personal idealism and was more interested than the Realists in psychological problems, yet he never rose to the power of Verga. A lasting though less resounding fame was won by Emilio De Marchi, whose novels (particularly *Demetrio **Pianelli*** [1890]) revealed a thoughtful and kindhearted nature. A very different writer was Edmondo De Amicis, whose *Cuore* (1886; first English translation, 1887; ***The Heart of a Boy,*** 1960) became a classic of children's literature and whose short stories and travel books were truly representative of the mood of the masses in his time.

Finally, writers of the scapigliatura milanese (Milanese libertinism) created a movement that was strongly imbued with real Romanticism—not the "second Romanticism" (against which it rebelled)—and that also disliked bourgeois orderly life, taking its cue from the French Bohémiens. The novelist Giuseppe Rovani (*I cento **anni*** [1859–60; "The Hundred Years"]), Emilio Praga, and a poet and musician, Arrigo Boito (Giuseppe Verdi's librettist), were foremost among the scapigliati.

In literary criticism the historical method prevailed. Under the inspiration of Alessandro D'Ancona, A. Bartoli, C. de Leva, Pasquale Villari, D. Comparetti, and G.I. Ascoli much research was carried out that aimed at clarifying political and literary history.

SPANISH LITERATURE IN THE 19TH CENTURY

Spanish Romanticism

Literature in Spain in the first third of the 19th century was still affected by the Napoleonic Wars and their long aftermath. Many liberals driven into exile by Ferdinand VII after 1823 sought refuge in France; and, when they returned to Spain after his death in 1833, they had been so influenced by French Romanticism that this date has been taken as the beginning of the Romantic movement in Spain. The ground had been prepared in Cádiz from 1814 onward in a debate on literary values initiated by a German, Johann Niklaus Bohl von Faber; in Barcelona with the founding in 1823 of a review, ***El europeo;*** and in Madrid with Agustin Durán's essay on the drama of the Siglo de Oro (the Golden Age of the Spanish Renaissance) in 1828 and his ***Coleccidn de romances** antiguos* (1828–32; "Collection of Ancient Ballads"). Romanticism in Spain was, in many respects, a return to the spirit of its own earlier classics. The formal characteristics of Spanish Romantic drama—mingling of genres, rejection of the unities, metrical variety—had characterized the drama of Lope de Vega and his contemporaries, who had, moreover, treated many of its themes.

The movement arrived in Spain a generation later than elsewhere and had a short life. It never became a school or had a particular leader. José de Espronceda was the one Romantic who lived his Romanticism. His ***Estudiante de** Salamanca* ("Student of Salamanca"), ***Canciones*** ("Songs"), and an unfinished work, ***El diablo** mundo* ("The Devilish World"), were the only subjective lyrics of value that the period produced, and they marked a milestone in the development of poetic form. A play, ***Don Álvaro o la** fuerza **del sino*** ("Don Alvaro; or, The Force of Destiny"), by Angel de Saavedra, duque de Rivas, and the preface, by a critic, Antonio Alcalá Galiano, to Saavedra's narrative poem ***El** moro expósito* (1834; "The Foundling Moor") came nearest to expressing a philosophy of Romanticism.

Three poets revealed how one of Romanticism's concerns was liberation of the individual personality. Gustavo Adolfo Bécquer, in 76 *Rimas,* expressed his own tortured emotions; Rambn de Campoamor y Campoosorio wrote *Doloras, Pequeños poemas,* and ***Humoradas*** (new poetic forms of his invention), attempting to bring poetry back into the realm of ideas; and Gaspar Núñez de Arce wrote ***Gritos del** combate* (1875; "Combat Cries"), patriotic, declamatory exhortations defending democracy. A later poet, Salvador Rueda, anticipated Modernism with his innovations and influenced Juan Ramón Jiménez. He was an exuberant local colorist.

Costumbrismo was a movement that started earlier than Romanticism and flourished at the same time. It concerned realistic prose writing, often within a narrative framework, and resembled the Coverley papers of Joseph Addison and Richard Steele. Both the *cuadro **de** costumbres* and the ***articulo de costumbres*** were short literary sketches on customs, manners, or character, but the ***cuadro*** inclined to description for its own sake, whereas the ***articulo*** was more critical and satirical. ***Cartas de un pobrecito** holgazán* (1820; "Letters from a Poor Idler"), by Sebastián de Miiiano, was probably the first work of this kind, but the most important were by José de Mariano Larra, outstanding prose writer and most critical mind of his age, who dissected society pitilessly in ***Articulos*** (1835–37); by Ramón de Mesonero Romanos, whose ***Escenas** matritenses* (1836–42; "Scenes of Madrid") gave a vivid picture of contemporary life; and by Serafín Estebanez Calderón, who portrayed the manners, folklore, and history of Andalusia in ***Escenas andaluzas*** (1847; "Andalusian Sketches"). These writings, and others similar, with their realistic and regional elements helped to prepare for a revival of the novel.

Revival of the Spanish novel

For more than two centuries the novel, with which Spain had made its greatest contribution to literature, had been almost extinct. The first novels of the revival were more interesting for powers of observation and description (a continuation of *costumbrismo*) than for imaginative or narrative quality. A woman novelist, Fernán Caballero, determined the technique of observation that was to rehabilitate the novel in ***La gaviota*** (1849; ***The Seagull,*** 1867). In 1874 the great period of the regional novel began with the masterpiece ***El sombrero de** tres picos **(The Three-Cornered Hat,*** 1918), a sparkling tale of peasant malice by Pedro Antonio de Alarcbn. Although local Realism prevailed too in Juan Valera's novels, they were also remarkable for their psychological insight and notes of cultured detachment. The greatest regional writer was José Maria de Pereda, whose Realism was a powerful re-creation of nature as the abiding reality, more important than the individual. ***Sotileza*** (1884; "Subtlety") and ***Peñas arriba*** (1893; "Up the Mountains") revealed his support for traditional values of religion, family, and country life. An attempt by Emilia, condesa de Pardo Bazán in her novels of Galicia, ***Los** pazos **de** Ulloa* (1886; ***The Son of a Bondwoman,*** 1908) and ***La** madre **naturaleza*** (1887; "Mother Nature"), to combine a Spanish Christian outlook with French Naturalism made clear their incompatibility, and in later novels she returned to a genuinely Spanish Realism. Armando Palacio Valdés was the novelist of Asturias.

Besides this cult of regionalism, the fecundity in the novel of Benito Pérez Galdbs created a world in itself. After living through one of the most turbulent chapters in Spanish history, he imaginatively re-created its antecedents, beginning with the war against Napoleon. The 46 novels of his ***Episodios nacionales*** (1873–79 and 1898–1912) embraced 70 years of the country's story and taught generations of Spaniards much of what history they knew.

Post-Romantic drama

The drama, disoriented after a brief Romantic efflorescence, produced few outstanding works. Manuel Tamayo y Baus achieved fame by an isolated work, *Un **drama nuevo*** (1867; ***A New Drama,*** 1915), in which the characters are members of Shakespeare's company of actors (including Shakespeare himself). Adelardo Ldpez de Ayala pilloried bourgeois vices in ***El tejado de vidrio*** (1857; "The Glass Roof") and *Consuelo* (1870). The 1904 Nobel Prize for Literature set a seal on José Echegaray y Eizaguirre, whose 63 plays fall into two main groups. In the first, drama became melodrama with a constant striving after effect and a basic falsity of character, passion, and situation alike. The second comprised a serious, often tragic, drama of social problems. Joaquín Dicenta brought the drama nearer to earth with an unpleasantly realistic study of working class conditions in *Juan José* (performed 1895). Failure to master the problems involved in the change from novel to drama robbed Pérez Galdós of full success in the theatre, to which he turned increasingly in his desire to stimulate the social conscience: *Realidad* (1892; "Reality"), *La loca de la casa* (1893; "The Madwoman in the House"), *Electra* (1901).

Catalan. In 1814 appeared the *Gramdtica y apologia de la llengua cathalana* ("Grammar and Apology of the Catalan Language") of Josep Pau Ballot i Torres, a forerunner of the literary and linguistic renaissance (Renaixensa) that marked the Romantic period in Catalonia. The pioneers, however. saw the inadequacies of the ancient language for the expression of spiritual and intellectual ideas. The Institut d'Estudis Catalans, founded in Barcelona in 1907, has played a notable part in the deliberate enrichment and purifying of Catalan as a vehicle for contemporary thought.

Bonaventura Carles Aribau's patriotic *Oda a la pátria* (1832; "Ode to the Fatherland") and the poems of Joaquim Rubió i Ors and Victor Balaguer prepared the way for the mysticism of Jacintó Verdaguer Santaló, a great epic poet (*L'Atlántida* [1877], *Canigó* [1886]). Miguel Costa i Llobera cultivated a classical perfection of form. In Joan Maragall i Gorina, Catalonia found its first great modern poet who, in spiritual quality (as also, if less happily, in his theory that inspiration absolved the artist from the need for formal perfection), exerted a powerful influence on later poets.

The foundations of modern Catalan prose were laid by the critical writings of Rubió i Ors, Francisco Pi i Margall, one of the four presidents of the Spanish Republic of 1873, and Josep Torras i Bages (*La tradicid catalana,* 1892). One of the best and most influential writers in prose was the essayist Eugeni d'Ors (pseudonym "Xenius"), whose philosophical novel *La ben plantada* (1911; "Firmly Rooted") was one of the most notable works in modern Catalan literature.

Catalan dramatists have produced plays of considerable originality. Angel Guimerb achieved a European reputation with *Terra baixa* (1896; *Martha of the Lowlands,* 1914). The many social dramas of Ignasi Iglésias, inspired by Gerhart Hauptmann, a 19th-century German dramatist, included one near-masterpiece, *Els vells* (performed 1903; "The Old Men").

The suppression of languages other than Castilian by the dictator (1923–29) Miguel Primo de Rivera cast responsibility for the literary survival of Catalan largely onto expatriate intellectuals in Mexico City and Santiago, Chile.

The Galician revival

Galician. The Romantic movement, like the Peninsular War, revived local feeling and interest in things Galician, but not in the language. The *Xogos Froraes* (Floral Games, or poetry congresses; an equivalent of Catalan and Provençal *Jocs Florals*) of 1861, with the first dictionary (1863) and first grammar (1864) of Galician, marked a change. Francisco Añón y Paz was the first notable poet in the resurrected idiom, his most stirring notes being love of country and of freedom. Rosalia de Castro, the greatest name in Galician literature, identified herself with the spirit and people of the Galician countryside in *Cantares gallegos* (1863; "Galician Songs"); her *Follas novas* (1880; "New Leaves"), introspective to the verge of despair, reflected deep personal sorrows. Eduardo Pondal y Abente, a bard of a dimly sensed heroic past, was concerned with nature and Celtic mythology. Valentin Lamas Carvajal has been remembered as the voice of the peasant.

Prose showed no comparable achievement. Aurelio Ribalta, Manuel Lugris Freire, and Heraclio Pérez Placer wrote short stories but were overshadowed by novelists of stature—Emilia Pardo Brazbn and Rosalia de Castro—who chose to write for a larger public in Castilian.

PORTUGUESE LITERATURE IN THE 19TH CENTURY

The 19th century witnessed a general revival of Portuguese letters. The chief exponents of Romanticism were, in poetry and drama, João Baptista de Almeida Garrett and, in prose, Alexandre Herculano; both lived for some years in exile, the price of their political liberalism. Almeida Garrett read literature in English and French and introduced Portugal to nationalistic Romanticism through two epics, *Camões* (1825) and *Dona Branca* (1826). Antonio Feliciano de Castilho, half-Romantic, half-Classicist, exercised much influence over a younger generation of poets; João de Lemos, Soares de Passos, Tomás Ribeiro (who won fame with an ardently patriotic *Dom Jaime,* 1862). In 1865 Antero de Quental, a student of German philosophy and poetry, and Teófilo Braga, disciple of Auguste Comte, led a revolt against the primacy of Castilho, much to the benefit of literature, and of poetry in particular. The *Campo de Flores* (1893; "Field of Flowers") of João de Deus contained some of the finest short poems in the language, of a spontaneous simplicity. Abilio Manuel Guerra Junqueiro, heir to Victor Hugo, was a would-be social revolutionary overprone to grandiloquence. In *Os Simples* (1892) he turned to the portrayal of peasant life, and this work constituted his finest poetry. Akin to him was António Duarte Gomes Leal (*Claridadesdo Sul* [1875] and *O Anti-Cristo* [1886]), who could likewise achieve quiet sincerity on humble themes. Antonio Cândido Gonçalves Crespo stood out as the first of his country's Parnassians. By contrast Cesbrio Verde addressed himself to the poetic essence of common realities. The *Só* (1892; "Alone") of António Nobre was intensely Portuguese in themes, mood. and rhythms; he and Teixeira de Pascoais developed a cult of *saudosismo* ("yearning," "nostalgia") that inspired a whole school of poets. French Symbolism found an enthusiastic adept in Eugénio de Castro.

Portuguese drama

Almeida Garrett, seeking to reinvigorate drama. found he had to create alike theatre, plays, actors, and audience. In *Urn Auto de Gil Vicente* (1838), *O Alfageme de Santarkm* (1841; "The Swordsmith of Santarém), and especially in *Frei Luis de Sousa* (1843; *Brother Luiz de Sousa,* 1909), he proved himself, after Vicente, his country's most notable dramatist. António José Enes dramatized topical questions in a spirit of combative liberalism; Ernesto Biester wrote social drama; and Fernando Caldeira produced comedy. João da Câmara was the outstanding dramatist of his day, and his works included *Alfonso VI* (1890), *Rosa Enjeitada,* and *Os Velhos* (1893). Other historical playwrights included Henrique Lopes de Mendonça, Marcelino Mesquita, and the gifted Júlio Dantas (*A Severa* [performed 1901], *Santa Inquisição* [1910], *A Ceia dos Cardeais* [1902], *Rosas de Todo o Ano*). Herculano, returning from exile with an enthusiasm for Sir Walter Scott, launched the historical romance with *O Monasticon* (1844) and *Lendas e Narrativas* (1851). Many followed suit, including Oliveira Marreca, Arnaldo da Gama, and Pinheiro Chagas, popular successes being *A Mocidade de D. João V* (1852), by Rebelo da Silva, and João de Andrade Corvo's *Urn Ano na Côrte.* This was the great age of the novel: Camilo Castelo Branco, J.G. Gomes Coelho (better known as Júlio Dinis), and especially José Maria Eça de Queirós were names that would stand high in any country. The first was a master of the language and of dramatic, or melodramatic, plot; Julio Dinis depicted country life, as in *As Pupilas do Senhor Reitor* (1867); while Eça de Queirós introduced Realism with a powerful novel, *O Crime do Padre Amaro* (1876). Naturalism claimed Júlio Lourenço Pinto, Luis de Magalhães, and the much superior Francisco Teixeira de Queirós, who sought to expose contemporary society in his two series, *Comédia do Campo* and *Comédia Burguesa.*

With his magnum opus the *Histdria de Portugal* (1846–53) and the *Da Origem e Estabelecimento da Inquisição em Portugal* (1854–59), Herculano established himself as a leader of modern Peninsular historians. Historiography flourished with the Visconde de Santarém, historian of the Cortes, José Simão da Luz Soriano of constitutionalism, Luis António Rebelo da Silva of the period of Spanish rule under the Philips, and José Maria Latino Coelho of the dictatorship of Pombal. Henrique da Gama Barros and António da Costa Lôbo followed in the footstep of Herculano. The works of Joaquim Pedro de Oliveira Martins gave proof of psychological imagination, a notable capacity for general ideas, and a gift of picturesque narration. He left in his numerous writings a vast portrait gallery of great figures of his country. In the 20th century the trend toward scientific documentation and objectivity was accentuated. The monumental ***Histdria de Portugal*** edited by Damião Peres provides an exhaustive treatment of the entire field.

LATIN-AMERICAN LITERATURE IN THE 19TH CENTURY

Literature of rebellion. Political unrest spread in Latin America as the 18th century advanced, and French ideas broke through the relaxed controls held by Spain and Portugal over New World thought. Early stirrings became more purposeful when French Revolutionary doctrines were tested by the action of Britain's colonies to the north. Printing presses and periodicals sprang up everywhere, and ideals quickened in literary societies founded by Latin America's young liberals returning from abroad.

One of the earliest fruits of these contacts with foreign thought was an abortive Brazilian Inconfidência Mineira of 1789, a "conspiracy of poets" headed by Joaquim José da Silva Xavier and supported by a number of exceptional writers who were members of the Minas school of epic and Neoclassical poets, which had no equal in the Spanish colonies of that day. José Basilio da Gama's *Uraguai* (1769) and José de Santa Rita Durão's ***Caramuru*** (1781) were two great native epics of Brazil. Love of country and an appearance of the Indian as a literary character stamped both works as forerunners of Brazilian intellectual independence. Tomás António Gonzaga, author of love songs to ***Marília de Dirceu*** (1792), has remained the most popular love poet in the Portuguese language. When, after a bloodless victory in 1822, Brazil finally emerged as an empire, only one literary figure, José Bonifácio de Andrada e Silva, stood out as a patriarch of Brazil's struggle for independence. As author of such vigorous, passionate verse as ***Poesias*** (1825), he revealed his affinity to Byron and has been acclaimed Brazil's first Romantic poet.

A Venezuelan, Francisco de Miranda, left a remarkable journal that revealed how he profited from contacts in the United States with the "great American experiment." His compatriot Simón Bolivar was later christened "the thinker of the Revolution." Through his prophetic analyses of the sociopolitical scene filtered some of the best of French thought, particularly that of Montesquieu and Rousseau. Bolivar's dream of a confederation of Latin-American states received support from a fiery Argentine pamphleteer, Bernardo Monteagudo. But it was the Mexican José Joaquin Fernández de Lizardi, referred to as ***el pensador mexicano*** ("the Mexican thinker"), after a revolutionary journal founded by him in 1812, who was the only liberator remembered as a man of letters. His fame has rested largely on a picaresque tale, ***El periquillo sarniento*** (1816; ***The Itching Parrot,*** 1942), conceded to be the first Latin-American novel.

Patriotic poetry

The Revolution found popular expression in balladry and heroic verse. More enduring patriotic poetry came with victory and represented but a phase in the work of three outstanding poets whose significance transcended the struggle for independence. Of the three, only an Ecuadorean, José Joaquin Olmedo, limited his work almost exclusively to the themes and spirit of Revolutionary years; his best known poem, "La victoria de Junín, canto a Bolivar" (1825), has been generally considered to be the finest example of heroic poetry in the classical style written in Latin America. In his Virgilian ***Silva a la agricultura de la zona tórrida*** (1826), Andrés Bello of Venezuela exhorted his fellow Latin Americans to turn their swords into plowshares and live the life that rich, tropical America offered freemen; in later years Bello distinguished himself as a grammarian, critic, translator, lawgiver, and educator and as the father of Chile's first intellectual generation.

José Maria de Heredia of Cuba, Latin America's first great lyric poet and Romanticist, lived most of his life in exile (Venezuela, New York, Mexico), where nature's grander moods inspired his widely acclaimed poems ***En el teocalli de Cholula*** (1820 and ***Oda al Niágara*** (1824). He participated in the new literary movement of Romanticism with which the young Latin-American nations were born to political independence.

The Romanticists. Political independence from Spain and Portugal did not bring freedom from the despotism of political anarchy in the early formative years. Economic and political stability for most new nations came in the closing years of the century. American themes had fired the imagination of the "liberators," but Neoclassic forms were still held sacred and untouchable. European Romanticism pointed the way to cultural independence also, even though that way lay largely along a route marked out by French, English, and Spanish writers. Neoclassic form and restraint yielded to Romantic freedom, individualism, and emotional intensity, tenets suited to Latin-American temperaments and conditions. The most illustrious early Romanticists were Argentine political refugees who fled from Juan Manuel de Rosas. Their leader was Esteban Echeverria, who, after a stay in France (1826–30) when Romanticism was at its height, indicated the way by writing "La cautiva" (1837), his best poem and the earliest fusion of native themes and scenes with new, more appropriate verse forms. It remained for Domingo Faustino Sarmiento to present, in *Facundo* (1845), written in passionate denunciation of Rosas, a first serious study of the great plain, or Pampas, and of gaucho (cowboy) lore. This emphasis on the national scene gave birth to an indigenous literary genre without European prototype, the gaucho literature of Argentina and Uruguay. The gaucho had long been the subject of folktale and ballad and became a subject of some of the best verse, as in Rafael Obligado's poem (1887) on a legendary minstrel, Santos Vega, and a humorous gem, *Fausto* (1866; ***Faust,*** 1943), by Estanislao del Campo, until finally he received epic treatment in ***Martin Fierro*** (1872–79; ***The Gaucho, Martin Fierro,*** 1936), by José Hernández.

The search for national roots in Latin-American writing

These "primitive" poems in imitation of gaucho minstrels' ballads and speech were one of two of Latin America's original contributions to Western letters; the other sprang from Romanticists' interest in a search for national roots. This romantic evocation reached its poetic climax in the elegiac *Tabaré* (1886; Eng. trans., 1956), by an Uruguayan, Juan Zorrilla de San Martin, which related the fate of the aboriginal Charrúas, vanquished by Spanish invaders. In prose, this same past produced the *tradición*, the other unique Latin-American genre patterned after the historical anecdote and perfected by a Peruvian master of humorous prose, Ricardo Palma, whose ***Tradiciones peruanas*** appeared between 1872 and 1910 ***(The Knights of the Cape,*** 1945). The Brazilian Romantics had no great past and therefore extolled the beauties of their tropical homeland and the simple living of idealized Indians with languid nostalgia. Domingos José Gonçalves de Magalhães' poems, *Suspiros* ***Pokticos e Saudades*** (1836; "Poetic Sighs and Longings"), have been held to have launched the Romantic movement, earlier phases of which found their best and most representative expression, however, in inspired and richly variegated writings by Antônio Gonçalvez Dias, one of Latin America's truly outstanding poets of the Romantic period. Later phases were best exemplified in a poetry of doubt and despair by Manuel Antônio Alvares de Azevedo of the Satanic school and author of ***A Noite na Taverna*** (c. 1851) and in the sociopolitical verse of Antônio de Castro Alves, author of ***Os Escravos*** (1876).

The Realists and the Naturalists. The Romanticist's interest in the picturesque and unusual helped him discover evidence of a budding national way of life. The sketch of contemporary manners developed into a realistic novel of manners shortly after midcentury. From that date, the novel assumed a more commanding role in Latin-American letters but appeared almost concurrently in the several types representative of successive literary trends in

Europe whose masters provided the molds into which Latin-American themes were poured. José Marmol gave the outside world a dramatic depiction of life in Argentina under the tyranny of Rosas in a Romantic novel, *Amalia* (1851–55; Eng. trans., 1919). Across the Andes, a Realist, Alberto Blest Gana, began producing a series of ***costumbrista*** novels on Chilean life, of which ***Martin Rivas*** (1862; Eng. trans., 1918) was considered his best, while the Colombian Jorge Isaacs wrote the tragic idyll ***Maria*** (1867) and Juan León Mera contributed *Cumandá* (1879) to a growing number of highly Romantic fictional portrayals of idealized Indian life.

The true novel appeared first in Brazil in 1844 when ***A Moreninha*** ("The Little Brunette"), by Joaquim Manuel de Macedo, was published. After that, the form enjoyed a more orderly and continuously progressive growth in Brazil. Still one of the most widely read of his country's novelists, José Martiniano de Alencar initiated a vogue of the Brazilian *Indianista* novel with ***O Guarani*** (1857; "The Guarani Indian") and ***lracema*** (1865; Eng. trans., 1886). But these romantic tales of love between Indian and white represented only one aspect of Alencar's varied literary activity; he also turned to the hinterland to depict life and customs of Brazil's backlands, and *O Gaúcho* (1870) and **O *Sertanejo*** (1876; "The Man of the Backlands"), although still markedly Romantic in spirit, were among the forerunners of a flourishing regional genre that foreshadowed the truly national novel. Two other contributors to this transitional genre were Alfredo d'Escragnolle Taunay, whose *Inocência* (1872; Eng. trans., 1945) became a universal favourite, and Bernardo Guimarães, whose abolitionist ***Escrava Isaura*** (1875) was a decisive step forward in the direction of the novel of social protest.

True Realism

True Realism—with a definite leaning toward Naturalism—was initiated by ***Memdrias de um Sargento de Milícias*** (1854), by Manuel Antônio de Almeida. But it was not until the mid-1870s that the novel began to expose cankers of social and psychological maladjustments to a rapidly changing economic scene. Aluizio Azevedo, an early example of social protest in the manner of 20th-century novelists, wrote such favourites as O *Mulato* (1881) and ***O Cortiço*** (1890; ***A Brazilian Tenement,*** 1926). Less occupied with external aspects of Brazilian life, Joaquim Maria Machado de Assís pried into the psychological complex of the Brazilian and distinguished himself as his country's most original and gifted writer. His trilogy, ***Bras Cubas*** (1881; ***Epitaph of a Small Winner,*** 1952), ***Quincas Borba*** (1891; ***Philosopher or Dog?,*** 1954), and ***Dom Casmurro*** (1900; Eng. trans., 1953) was a landmark in Latin-American letters. Two other novelists, Júlio Ribeiro and Raúl de Avila Pompéia, also helped set the Brazilian novel on a course not followed elsewhere until almost a generation later.

After midcentury, several late Romantic political writers distinguished themselves in essay form. Among these were Juan Montalvo, Eugenio Maria de Hostos, Joaquim Nabuco, and Rui Barbosa. An ironic experimental poet and essayist, Manuel González Prada was the chief figure and his verse paved the way for the new poetry of a coming generation of rebels.

SCANDINAVIAN LITERATURE IN THE 19TH CENTURY

Swedish. Political changes in Sweden up to 1804 meant that ardent nationalism emerged as a characteristic of Swedish Romanticism. The idealism at the core of this movement was laid by the Kantian teaching of Benjamin Hoijer and the impact of Schiller, Goethe, and the German Romantics on Swedish literature. Student societies and their periodicals, such as ***Polyfem*** (1809–12) and ***Phosphorus*** (1810–13), led the attack on the traditional school. Most gifted of the Forforister, or Phosphorists, Per Daniel Atterbom wrote a verse "Prolog" (1810) to ***Phosphorus*** revealing both talent and commitment to Romanticism. Vilhelm Palmblad, publisher and prose writer, led the polemics at Uppsala; Lorenzo Hammarskold, with Johan Askelöf and Clas Livijn, advanced the same views at Stockholm; while Johan Valerius, P.A. Wallmark, and Johan Wallin championed the traditionalists.

Meanwhile, another society, Gotiska Forbundet (Gothic Society), advocated, from its start in 1811, that study of the "Gothic" past could morally improve society. One of its members, Esaias Tegnér, wrote a most popular poem, ***Frithiofs saga*** (1825), based on an Old Norse theme.

The return to the literary past

Tegnér, like E.G. Geijer, valued old Northern mythology for the patterns he discerned in it—patterns also found in Greek mythology and Romantic metaphysics, in which religion, philosophy, and poetry appeared to be one and the same. Nevertheless, Tegnér's ideals of clarity of thought and formal perfection led him sometimes to side with traditionalists in their struggle against obscurities and formal innovations.

Several leading Romantics were learned men whose poetry strove to embody a philosophical system or an interpretation of history. The most ambitious attempt of this kind was Atterbom's ***Lycksalighetens*** o (1824–27: "The Isle of Bliss"), an allegory dealing with adventures of a legendary king, Astolf, and a history of poetry as an illustration of man's alienation from the divine. The greatest poet was perhaps Erik Johan Stagnelius, who held aloof from schools and coteries. The recurrent theme in his *Liljor i Saron* (1821; "Lilies of Sharon") was the lament of the human soul, imprisoned in a world of darkness and sin. Among noteworthy minor Romantic writers were Adolph Torneros, Per Elgstrom, Samuel Hedborn, and Arvid August Afzelius, collector of folk songs.

In prose the most complex personality among the later Romantics was a novelist, Carl Jonas Love Almqvist, who combined an extravagant imagination with realism. A master of prose style, he was at his best in the long short story, in which he foreshadowed Strindberg's method of raising problems for debate. The novel was really established by Fredrika Bremer, author of *Grannarna* (1837; "The Neighbours"), whose "sketches from ordinary life" appeared from 1828. Sophie von Knorring wrote principally about aristocratic families, and popular Emilie Flygare-Carlén produced many stories dealing with west-coast life, including ***Rosen på*** *Tistelön* (1842; ***The Rose of Tistelon,*** 1844–50).

Realism made only slow headway, in spite of the example of a great Finnish–Swedish poet, Johan Ludvig Runeberg. Literature of the 1840s and 1850s was mainly an aftermath of Romanticism: though a critic, Bernhard Elis Malmstrom, was ostensibly an opponent of the movement, even his work showed Romantic influence. His elegy "Angelika" (1840) had affinities with the poetry of a contemporary, Carl Vilhelm Bottiger, and older Karl August Nicander. A movement known as Scandinavism produced a good deal of verse: Carl Vilhelm August Strandberg (pseudonym "Talis Qualis"), fieriest poet of this type, later made excellent translations from Byron. Popular reading was provided by August Blanche in ***Bilder ur verkligheten*** ("Pictures of Real Life"), successful short stories depicting Stockholm life with humour and vivacity, while Frans Hedberg wrote pompous historical plays.

Poetic Realism became an official program of the "pseudonym poets" of the 1860s, including Carl David of Wirsén, Edvard Backstrom, Pontus Wikner, and Carl Snoilsky. Only Snoilsky had the temperament and poetic gift needed to carry out the program. Wirsén, on the other hand, as secretary of the Swedish Academy, launched formidable opposition against innovators; and Viktor Rydberg fell between idealism and Naturalism, for, as novelist, poet, and critic, he began as a radical journalist and ended as a professor and author of philosophical poems. His important early work consisted of an ideological novel, ***Den siste athenaren*** (1859; ***The Last Athenian,*** 1869), and a treatise, ***Bibelns lära om Kristus*** (1862; "The Teaching of the Bible About Christ"), which prepared the way for scientific Rationalism.

The sources of modern Swedish literature

Four influences combined to free Swedish literature from petrifying conventions: the English writings of Charles Darwin, Herbert Spencer, and J.S. Mill; the French Naturalism of Émile Zola; the drama of the Norwegians Henrik Ibsen and Bjørnstjerne Bjemson; and the criticism of Georg Brandes. The modern literature growing out of this was first and best represented in the work of August Strindberg, Sweden's greatest writer. Modern drama has dated from his play Muster Olof (published 1872), and the modem novel from Roda *rummet* (1879; The Red Room, 1913). Strindberg overshadowed all the writers of the 1880s, including Gustaf af Geijerstam, author of Erik *Grane* (1885), Anne Charlotte Edgren-Leffler, and the gifted Victoria Benedictsson, who both wrote about the adverse position of women in society. Benedictsson's stories, such as *Från Skåne* (1884; "From Skåne"), revealed the regional character of new prose literature. Regional poetry was written by Albert Bååth and Ola Hansson, both of Skåne.

In 1888 Verner von Heidenstam began the reaction against Utilitarianism and Naturalism with a volume of verse, *Vallfart* och *vandringsår* ("Pilgrimage and Wander Years"). His later poetry and historical tales won him the Nobel Prize for Literature in 1916. Oscar Levertin, stimulated by Heidenstam's example, wrote poetry full of colour and lore of the past and as a critic was influential in molding contemporary taste. Gustaf Fröding was also influenced by Heidenstam, and his verse constantly mingles the melancholy and gay. Despite the threat of madness, he published five collections of poems before his reason gave way in 1898, by which time he had established himself as one of the greatest Swedish lyric poets. Regionalism entered Neoromantic poetry with Fröding, who was from Varmland, and with the work of Erik Axel Karlfeldt the province of Dalarna came into its own. Karlfeldt's mature poetry won him the Nobel Prize in 1931.

Meanwhile, Selma Lagerlof, the first Swede to win a Nobel Prize for Literature (1909), had developed the prose tale; her long series of novels and short stories, beginning with Gosta Berlings saga (1891), reached an international public through translation. Per Hallstrom was a more skillful writer of short stories than of novels. Romantic, too, in his love for the skerries (rocky isles) was Albert Engstrom, a great humorist and one of the most beloved of Swedish writers.

Finnish literature in Swedish. Only in the 19th century did a strong literature in Swedish develop in Finland. Previously it had been somewhat sporadic, although there had been several excellent poets, notably Jacob Frese, Gustaf Philip Creutz, and Frans Mikael Franzén. In the work of Johan Ludvig Runeberg, the Finnish people and landscape first came to life in literature, and he became the national poet. Zacharias Topelius wrote historical novels in Scott's manner, as *Fältskärns* berattelser (1853–67; The Surgeon's Stories, 1872), poems, and children's stories. Johan Vilhelm Snellman, a disciple of the German philosopher Hegel, developed ideas that emphasized the importance of a local and national culture: he decisively influenced the status of Finnish, which was given parity with Swedish as an official national language in 1863.

Toward the end of the 19th century, Swedo-Finnish literature began to draw away from literature in Finnish. Important writers of the transition were Josef Julius Wecksell and Karl August Tavaststjerna. Early in the 20th century a school of prose writers known as Dagdrivarna (Idlers or Saunterers) emerged with a crisp, skeptical, analytical tone. Important among them was Runar Schildt, whose stories and plays dealt with ethical and artistic problems. Among poets, Arvid Morne and Bertel Gripenberg may be mentioned.

Norwegian. After 1814 a new, exciting, and difficult age began for Norway: an opportunity seemed to be offered to develop an independent Norwegian culture and way of life, but there were deep differences of opinion as to how this could best be achieved. A poet and critic, Johan Sebastien Welhaven was chief representative of those who insisted that the existing Danish element in the culture should not be neglected. Henrik Wergeland was a spokesman for those whose nationalistic pride led them, on the other hand, to demand a complete break with Denmark. Welhaven stood for a coolly intellectual approach, for restraint and control, and for conscious artistry, as his own sonnet cycle Norges daemring (1834; "The Dawn of Norway") exemplifies. Wergeland was more passionate and revolutionary, and his enormous epic, *Skabelsen*, mennesket og messias (1830; "Creation, Humanity and Messiah"), was a youthful but typical example of the spirit he admired.

Wergeland dominated the age as poet, orator, and social reformer, and the clash between him and Welhaven and between the two factions associated with them—the "patriots" and the "intelligentsia"—began an ideological conflict that has continued to persist in modified forms.

The ideological conflict between Wergeland and Welhaven

The literature of the mid-19th century, known as Norway's "national Romanticism," continued to reflect the country's larger aspirations. The compilation and publication, between 1841 and 1844, of Norske folkeeventyr ("Norwegian Folk Tales"), by Peter Christen Asbjørnsen and Jørgen Engebretsen Moe, and the 1853 collection by Magnus Brostrup Landstad, Norske folkeviser ("Norwegian Folk Ballads"), indicated a lively interest in the past, as did Peter Andreas Munch's eight-volume history of the Norwegian people (1857–63). Ivar Aasen was the creative spirit behind the Landsmål movement to establish a literary language based on rural dialects linked with Old Norse. Many publications of these years—including earlier works of Ibsen and Bjørnson—turned consciously to Norway's heroic past and its peasants. To these years belonged also the lyric poetry of Aasmund Olafsson Vinje, founder of a periodical *Døien*, who adopted Nynorsk (New Norwegian) as his literary language.

In 1855 Camilla Collett, Wergeland's sister, published Amtmandens *døttre* ("The Governor's Daughters"), which, by considering the place of women in society, marked a beginning of a trend that, encouraged by the immensely influential Danish critic, Georg Brandes, culminated in the 1870s and the 1880s in the realistic "problem" literature of Ibsen, Bjnmson, and their contemporaries. *Samfundets støtter* (Pillars of Society), in 1877, was first of a succession of problem dramas by Ibsen to win him worldwide fame. By then he had already written two verse dramas, Brand (published 1866) and Peer Gynt (1867), and his long "double drama" *Kejser* og Galilaeer (1873; The Emperor and the Galilean, 1876). The first substantial drama of this type, by Bjørnstjerne Bjørnson, En *fallit* (The Bankrupt, 1914), appeared in 1875. Although never the world figure that Ibsen became, Bjørnson was a leading personality of his age in Norway, as novelist, dramatist, and lyric poet and in public affairs.

The novelists Jonas Lie and Alexander Kielland, together with Ibsen and Bjørnson, were the major figures of modern Norwegian literature and were responsible for a remarkably large body of important work between 1870 and 1884, as the following translated titles illustrate: Ibsen's works Et *dukkehjem* (A Doll's House), Gengangere (Ghosts), En *folkefiende* (An Enemy of the People), and Vildanden (The Wild Duck); Bjørnson's dramas Det ny system (The New System), En handske (*A* Gauntlet) and Over aeve (Beyond Our Power) and his novel Det *flager* i *byen* og *på* havnen (The Heritage of the *Kurts*); Lie's novels Gaa Paa! (Go Ahead!), Livsslaven (One of Life's Slaves), and *Familjen* paa Gilje (The Family at Gilje); and Kielland's Skipper Worse, Gift ("Poison"), and *Fortuna.* The foremost stylist of his age, Kielland was an elegant, witty novelist with a strong social conscience and an active reforming zeal stemming from an admiration for John Stuart Mill.

The literature of the 1870s emphasized individual development and expression in keeping with the optimistic attitude of the times to social change and improvement; in the following decade, growing skepticism and disillusionment made writers more bitter in their attacks on "established social institutions. The publication of Fra *Kristiania-Bohêmen* ("From the Christiania Bohemia") in 1885 by Hans Henrik Jaeger created, by its seeming advocacy of sexual license, a public scandal. The most extreme exponent of Naturalism was Amalie Skram, especially in a four-volume novel, *Hellemyrsfolket* (1887–98; "The People of Hellemyr"). Arne Garborg, poet, novelist, dramatist, and critic, was a much superior writer whose work reflected successive movements of Romanticism, Realism, Naturalism, and Neoromanticism. His wider reputation was first established with a novel, *Bondestudentar* ("Peasant Students"), in 1883, but perhaps his greatest achievement was the poem cycle *Haugtussa* (1895).

Danish. *The Romantic period.* The Romantic movement came to Denmark from Germany, inspired partly by the German Jena Romantics, partly by the Neoclassicism of Goethe and Schiller. F.W. Schelling's philosophy was interpreted in Denmark by the Norwegian Henrik Steffens, but the leading Danish Romantics gave it a form very different from the original. A.W. Schack von Staffeldt was hardly recognized in his lifetime, and his metaphysical poetry lacked popular appeal. The leader of the Romantic movement in Denmark was Adam Oehlenschlager, whose unparalleled versatility in poetry, drama, and prose showed the influence of German Romanticism, especially of the poets Goethe and Schiller. His plays *Sanct Hansaften-Spil* ("Play for Midsummer Eve") and *Aladdin; Hakon Jarl*, one of his many Northern tragedies; and a cycle of dramatic poems, *Helge* (1814), were outstanding. The popular and historical songs and hymns of the poet N.F.S. Grundtvig, as well as his personal poetry, have given him a lasting place in Danish literature. Sharing the Romantic enthusiasm for antiquities of Scandinavia, he translated the 13th-century historians Saxo Grammaticus and Snorri Sturluson and translated *Beowulf* even before it had appeared in English. His *Håndbog i verdens-historien* ("Handbook of World History") was a mixture of scholarship, prophetic visions, and insanity. Bernhard Severin Ingemann wrote historical novels and a poetic cycle, *Holger Danske*, around the themes of chivalry and nationalism as well as his unsophisticated *Morgen og aftensange* ("Morning and Evening Songs"). Johannes Carsten Hauch wrote tragic and philosophic dramas, novels, and contemplative poetry.

Romantic realism. New elements of reason and realism appeared after the first quarter of the century in the works of Poul Møller, who wrote the first Danish novel on contemporary events, *En dansk students eventyr* (1824; "The Adventures of a Danish Student"), and dramatic poems and fables, sometimes showing personal disillusionment, and Steen Steensen Blicher, who, in *Traekfuglene* ("The Birds of Passage"), interpreted human nature with sad resignation. Some of his best poems were in the Jutland dialect. His many *noveller*, or short stories. beginning in 1824 with the masterly "En landsbydegns dagbog" ("The Journal of a Parish Clerk"), struck notes varying from sorrow and resignation to humour and irony.

Minor writers of the same period were Thomasine Gyllembourg-Ehrensvard, whose novel *En hverdagshistorie* (1828; "A Story of Everyday Life") was much admired; Andreas de Saint-Aubin, who wrote novels under the nom de plume of "Carl Bernhard"; and Carl Bagger, whose novel *Min broders levned* (1835; "My Brother's Life") shocked the literary world by its bold realism.

Poetic realism. About 1830, early Romanticism gave way to a less naive poetic realism, more contemplative and more concerned with form than with content. Johan Ludvig Heiberg, who led this movement, attempted to revivify Danish drama by importing French vaudeville, and in his serious romantic plays *Elverhøj* ("The Elfinhill") and *Syvsoverdag* ("Day of the Seven Sleepers") he juxtaposed poetic and pedestrian reality. His finest achievement was a verse comedy, *En sjael efter døden* (1841; "A Soul After Death"). He was the leading literary critic of his time, profoundly influenced by the philosophy of Hegel. Henrik Hertz also regarded the perfection of poetic form as more important than its content, as was clearly expressed in *Gjenganger-breve* (1830; "Letters of a Ghost"). He also wrote comedies and serious Romantic plays, including *Kong Renés datter* (1845; *King Rene's Daughter*, 1850).

The revival of lyrical poetry

A revival of lyrical poetry took place in the 1830s and 1840s, led by poets concerned with the aesthetic treatment of love and nature. Christian Winther, most famous for a long verse novel, *Hjortens flugt* (1885; "The Flight of the Stag"), sang the praises of his native island, Zealand, and of woman. Ludvig Bødtcher wrote delicate and sensitive poetry, some of which was inspired by the Italian scene. Emil Aarestrup is Denmark's erotic poet par excellence. Frederik Paludan-Miiller became an uncompromising moralist; *Adarn Homo* (1841–48), a poetic epic, was a bitter contemporary satire. Hans Christian Andersen was most important for his fairy tales, most of whose plots were his own invention, though he also wrote novels, plays, travel books, and poems. His own story is told in *Mit livs eventyr* (1855; *The Fairy Tale of My Life*, 1954).

Søren Kierkegaard holds a position entirely isolated in Danish literature. His highly personal religious philosophy was expressed in such works as *Enten Eller* (1843; *Either/Or: A Fragment of Life*, 1944) and *Stadier paa livets vei* (1845; *Stages on Life's Way*, 1940). He spent his last years in a violent and passionate attack on "official Christianity."

Meïr Aron Goldschmidt edited a rebellious, anti-royalist weekly, *Corsaren* ("The Corsair"), while many of his novels and short stories were concerned with Jewish life in the Danish community. The 1850s and 1860s produced hardly any new Danish writers of importance: the most original was Hans Egede Schack, whose novel *Phantasterne* (1857; "The Daydreamers") revealed great psychological gifts.

Icelandic. The literary and linguistic renaissance in Iceland at the start of the 19th century was fostered by three men in particular: a philologist, Hallgrímur Scheving; a poet and lexicographer, Sveinbjörn Egilsson; and a philosopher and mathematician, Bjorn Gunnlaugsson. The principal movement in this renaissance was Romanticism, introduced to Scandinavia by a German philosopher, Henrik Steffens, in his Copenhagen lectures of 1802–04. Inspired by Steffens, Bjarni Thorarensen produced nationalistic poetry that became a model for 19th-century lyrical poetry. Jónas Hallgrímsson, however. surpassed Thorarensen as a metrist. He was one of four involved in the periodical *Fjölnir* ("The Many-Sided"), which aimed to revolutionize literary theory and practice. The Fjolnismenn were anti-traditional and rejected the use of rhymes. Among those they criticized were Sigurdur Breidfjord and a satirist, Bólu-Hjálmar, both working class poets.

The group was replaced in the 1840s by another group of poets, of whom the most outstanding were Benedikt Grondal, Steingrimur Thorsteinsson, and Matthías Jochumsson. Grondal wrote powerful lyric poetry, two prose fantasies, and an autobiography, *Daegradvol* (1923; "Day-Spending"). Thorsteinsson wrote nature poetry and satirical epigrams but is best remembered as translator of *King Lear* (1878) and *A Thousand* and *One Nights* (1857–64). Jochumsson's *Hallgrímur Pétursson* (1874) and hymn *Fadir andanna* ("Father of Spirits") established him as the greatest lyric poet of the three. He, too, translated Shakespeare in addition to Ibsen's *Brand*. A poet, Grimur Thomsen, was contemporary with but distinct from this group; his poetry was less lyrical, more austere and rugged, as *Hemings flokkur Áslákssonar* (1885; "The Story of Heming Aslakssonar") exemplified.

The latter part of the century produced three talented poets: Thorsteinn Erlingsson, author of *Aldaslagur* (1911; "Sound of the Ages"); Einar Benediktsson, a Neoromantic; and Stephan G. Stephansson, an embittered expatriate whose irony passed in Iceland for Realism.

The 19th century also saw a renaissance in imaginative prose. Jón Thoroddsen wrote two novels that have acquired a position not incommensurate with that of the medieval sagas: *Piltur og Stúlka* (1850; *Lad and Lass*, 1890) and the incomplete *Madur og kona* (1876; "Man and Woman"), distinguished in prose style, narrative skill, and witty and perceptive observation of peasant and small-town life.

RUSSIAN LITERATURE IN THE 19TH CENTURY

Poetry. The greatest Russian poet of the early 19th century was Aleksandr Pushkin. Although his early poems displayed surpassing mastery of diction and verse, The simplicity and profundity of Pushkin's language

it was not until his great narrative poem, ***Yevgeny Onegin*** (written 1823–31), that he achieved what no other Russian poet had achieved: integration of idea and character; warm, humane humour; really deep understanding of the human heart; and mastery of language astonishing in its simplicity and profundity. His other narrative poems written at this time, ***Count Nulin*** (1825) and ***Domik v Kolomne*** (1830; "The Small House in Kolomna"), revealed a playful satiric vein, a blend of realism and irony with good-humoured sympathy for human foibles. The ***Tsygane (The Gypsies)*** and ***Poltava*** were masterpieces of two quite different types, the first a tragedy of frustrated passion and the second the apotheosis of a hero-king in the person of Peter I the Great. During the same period Pushkin wrote his greatest lyrics and the often-quoted rhetorical ***Prorok*** ("Prophet"). At the beginning of the 1830s he wrote fairy tales in verse and the magnificent "King Saltan." In 1833 he wrote ***Medny Vsadnik*** ("The Bronze Horseman"), in which Peter the Great personified the elemental forces that sweep puny man out of their path. Pushkin never surpassed this poem, with its onomatopoetic undertow of horror. His poetic dramas included a historical play, ***Boris Godunov*** (1831).

The period's other major poet, Mikhail Lermontov, sprang to fame in 1837 with a poem on the death of Pushkin that resulted in his exile. Lermontov's most Romantic poems, such as ***Mtsyri*** (1840; "The Novice") and the celebrated ***Demon*** (1839), dealt with Caucasian themes.

Less important poets of the Romantic period were Ivan Ivanovich Dmitriev, a follower of the sentimentalist Karamzin, and Krylov, whose simple and profound fables are among the great treasures of Russian literature. Vasily Zhukovsky, most important as a translator, created a new poetic diction on Karamzinian principles. Many poets of this golden age, such as Yevgeny Baratynsky, wrote elegaic poetry, while many others, such as Kondraty Fyodorovich Ryleyev, gave expression to their abhorrence of tsarist oppression and glorified death in the struggle against it.

Prose. With Pushkin and Lermontov the golden age of poetry ended, and the great age of creative prose began. Pushkin turned increasingly to prose in the last years of his life. Lermontov's novel ***Geroy nashevo vremeni*** (1839–40; ***A Hero of Our Time,*** 1886) was immediately successful. Its hero was one of the typical misfits of Lermontov's generation, a man of great gifts but with an insatiable and self-destroying desire for novelty.

The first widely popular 19th-century novelist was Mikhail Nikolayevich Zagoskin, whose ***Yury Miloslavsky*** (1829), on the expulsion of the Poles from Russia in 1612, appealed to the public by its crude nationalistic spirit, while a most popular Romantic novelist was Aleksandr Aleksandrovich Bestuzhev (pseudonym Marlinsky). An outstanding writer was Nikolay Gogol, who was a great influence on Russian literature and on the Russian revolutionary movement; partly due to the fact that he was a Ukrainian by birth and saw the Russians from the standpoint of an outsider, he revealed the Russians to themselves and raised turbulent ideas in their minds. The revolutionary impact of Gogol's writings became evident in 1836 with the performance of his comedy ***Revizor (The Government Inspector,*** 1968). It dealt with the officials of an obscure provincial town, but it presented a microcosm of the Russian state. It was saved from being banned by its laughter, which Gogol considered the only positive character in it. Protests at the play forced Gogol to go to Italy, where he finished the first part of his famous novel ***Myortvye dushi*** (1842–52; ***Dead Souls,*** 1877). Gogol was a conservative and an upholder of autocracy and serfdom who never thought that his play and his novel were destroying the things he stood for.

The "natural" school

One of Gogol's last stories, "Shinel" (1842; "The Overcoat," 1949), led to the creation of a whole school of writers, the "natural" school, of which Fyodor Dostoyevsky was the most brilliant follower. The first part of Dostoyevsky's literary career was notable mainly for his stories of St. Petersburg slums and the life of poor degraded civil servants, such as ***Bednye lyudi*** (1845; ***Poor Folk,*** 1894). In 1849 he was imprisoned in Siberia for his membership in a revolutionary group, and on his return—faced with the impending liberation of the serfs and the new relationship that would inevitably ensue between landowners and peasants—published a magazine to help solve this problem. In ***Epokha*** he took up an attitude midway between the Slavophiles and conservatives, on the one hand, and, on the other, the westerners and revolutionaries grouped around the magazine ***Sovremennik*** ("The Contemporary"). Dostoyevsky's attempt to bridge the gulf between the mass of illiterate peasants and the educated classes, by advocating that the latter should "return to the soil," ended in failure. His four greatest novels, ***Prestupleniye i nakazaniye*** (1866; best translation, ***Crime and Punishment,*** 1955), ***Idiot*** (1868–69; ***The Idiot,*** 1955), ***Besy*** (1871–72; ***The Devils,*** 1953), and ***Bratya Karamazovy*** (1879–80; ***The Brothers Karamazov,*** 1958), all showed his intuitive understanding of the human heart and of the tragic aspects of life, together with unsurpassed moments of illumination, that makes them immortal.

Although Ivan Turgenev lacked Dostoyevsky's moments of illumination, his stories and novels, too, transcended topical problems and laid bare the eternal. ***Zapiski okhotnika*** (1852; ***A Sportsman's Notebook,*** 1950), in which serfs were shown to be superior to their masters in intelligence, decency, and humanity, foreshadowed the abolition of serfdom. With his first novels he enhanced his reputation as a liberal-minded thinker and as one of the finest prose writers of the day. His greatest novel, ***Otsy i deti*** (1862; ***Fathers and Sons),*** dealing with the generation gap, set left-wing writers (who took Bazarov, its nihilist hero, for a caricature of themselves) against him, and he never regained popularity with young progressives. *Dym* (1867; ***Smoke,*** 1949), in which he had bitter truths to say about all classes of Russian society, and ***Nov*** (1877; ***Virgin Soil,*** 1877), in which he analyzed the Russian revolutionary movement and forecast the rising power of the managerial class, deepened the enmity of the radicals. It was only on his last visit to Russia that he was again popularly acclaimed.

Another great creative writer of the century, Leo Tolstoy, mostly stood aloof from the literary scene. Two great novels, ***Voyna i mir*** (1865–69; ***War and Peace,*** 1925) and ***Anna Karenina*** (1875–76), raised him to a pinnacle; and even his denial of his art, following his conversion to Christianity in 1876, failed to affect his supremacy. Tolstoy's distinguishing mark as a creative artist was his genius for analytical dissection of character. In "Kreytserova sonata" (1891; "The Kreutzer Sonata"), "Smert Ivana Ilyicha" (1886; "The Death of Ivan Ilich"). and ***Voskreseniye*** (1899; ***Resurrection,*** 1900), his creative genius asserted itself over the philosophic and religious convictions that marred many of his last stories.

Ivan Goncharov achieved shattering results in his finest novel, *Oblomov* (1859), by an accumulation of seemingly unimportant details. Aleksey Pisemsky was another major novelist, but his play ***Gorkaya sudbina*** (1859; "A Hard Lot"), though popular, showed the artistic dangers of too realistic a representation of life.

Late-19th-century drama, satire, and short stories. The most prolific professional playwright of the century, Aleksandr Ostrovsky, in such plays as ***Bankrut*** (1850; "The Bankrupt") and ***Groza*** (1860; "The Storm"), exposed and protested against the low business morality, ignorance, and brutality of the Moscow merchant class.

The great satirist of the century, Mikhail Saltykov, was a pillar of the radical movement as editor of ***Otechestvennye zapiski*** ("Fatherland Annals"). In ***Gospoda Golovlyovy*** (1876; ***The Golovlyov Family,*** 1955), Saltykov wrote one of the century's most brilliant novels; its hero, Iudushka (Little Judas), surpassed even Gogol's most villainous characters in idleness, uselessness, and drunkenness.

Chekhov, master of the Russian short story

Although the short story was developed by many writers, such as Nikolay Leskov, author of ***Ocharovanny strannik*** (1873; ***The Enchanted Wanderer,*** 1924) and "Zayachy remiz" (1894; "The March Hare," 1949), it was

Anton Chekhov who became its acknowledged master, as well as a brilliant innovator in drama. Chekhov was the first great Russian writer to adopt a neutral attitude to politics. Most of his short stories were written while he was a medical student and later as a young doctor. In his greatest short stories, "Step" ("The Steppe") and "Skuchnaya istoriya" ("A Dreary Story"), as well as in four famous plays, *Chayka* (1896; *The Seagull*), *Dyadya Vanya* (1897; *Uncle Vanya), Tri sestry* (1901; *The Three Sisters),* and *Vishnyovy sad* (1903–04; *The Cherry Orchard),* his training can be seen both in the medical men he introduces and in his attitude toward his characters.

Gorky's social themes

Maksim Gorky, in contrast, overflowed with pity and compassion, though only for the working classes. Self-educated, he early threw himself into revolutionary work. A romantic poem in prose, "Pesnya o burevestnike" (1901; "The Song of the Stormy Petrel")—with its refrain, "The Storm! The Storm is about to break!"—became a powerful rallying cry of the revolutionary movement. In his first and most popular play, *Na dne* (1902; *The Lower Depths),* Gorky introduced philosophizing down-and-outs onto the Russian stage. Apart from his early novels—especially *Mat* (1906; *Mother)—his* most impressive work is an autobiographical trilogy: *Detstvo* (1913; *Childhood,* 1950), *V lyudyakh* (1915–16; *In the World,* 1917), and *Moi universitety* (1923; *My Universities,* 1952).

Ukrainian. Ukrainian literature in the 19th century reflects the rapid development of Ukrainian national consciousness. Ukrainian writers at first were primarily concerned with reawakening that consciousness and the sense of historical continuity and establishing the vernacular as a literary language. Virtually the entire Ukrainian literary process in the 19th century occurred under official and unofficial Russian disfavour, and in 1863 and 1871 all Ukrainian publications were prohibited. Not until 1905 did the Russian Academy of Sciences concede that Ukrainian was indeed a separate language.

Ivan Kotlyarevsky, classicist poet and playwright, inaugurated modern Ukrainian literature with his *Eneida* (1798), a travesty of Virgil's *Aeneid.* Kotlyarevsky's work had enormous (at times undue) influence on later Ukrainian writers. Classicist prose appeared only with Hryhoriy Kvitka Osnovyanenko's novel *Marusya* (1834). His *Konotopska vidma* (1837; "The Witch of Konotop") is a first-rate novella that is reminiscent of Gogol.

Around 1830 Kharkov became the centre of Ukrainian Romanticism (Izmail Sreznevsky, Levko Borovykovsky, A. Metlynsky, and Mykola Kostomarov). In the western Ukraine Romanticism was represented by the "Ruthenian Triad": Markiian Shashkevych, Yakov Holovatsky, and Ivan Vahylevych. The Romantic movement reached its peak in the work of the Kiev Romantics and found its highest expression in the Brotherhood of SS. Cyril and Methodius (1846). Its ideology was reflected in Kostomarov's biblical *Knyhy bytiia ukrainskoho narodu* ("Books of Genesis of the Ukrainian People").

The early poetry of Taras Shevchenko, the outstanding Ukrainian poet of the 19th century, expressed the interests of the Romantics, but it soon moved to a more sombre portrayal of Ukrainian history, especially in the long poem *Haidamaky* (1841; "The Haidamaks"), and to works satirizing Russia's oppression of the Ukraine—*e.g.*, *Son* ("The Dream"), *Kavkaz* ("The Caucasus"), and *Poslaniie* ("The Epistle"). His later poetry, written after his release (1857) from exile, treats broader themes.

After Shevchenko, the most important Romantic was Panteleymon Kulish, poet, prose writer *(Chorna rada;* "The Black Council"), translator, and historian.

Ukrainian Realism, which begins with Marko Vovchok *(Narodni opovidannia,* 1857; "Tales of the People"), was long confined to populist themes and the portrayal of village life. Anatoli Svydnytsky's novel *Lyuboratski* was exceptional for its artistry but had little influence on the development of Ukrainian Realism since, though written in 1862, it was not published till 1898. Ivan Nechuy-Levytsky's literary oeuvre was larger and thematically broader, ranging from the portrayal of village life in *Kaydasheva simya* (1879; "The Kaydash Family") to that of the Ukrainian intelligentsia in *Khmary* (1908; "The Clouds"). Panas Myrny (pseudonym of Panas Rudchenko) was the major representative of Ukrainian Realism. His depiction of social injustice and the birth of social protest—in *Khiba revut voly, yak yasla povni?* (1880; "Do the Oxen Low When the Manger Is Full?"), written with his brother Ivan Rudchenko (pseudonym Ivan Bilyk), and in *Poviya* ("The Whore")—has a new psychological dimension. The novels of the influential Ivan Franko describing the Boryslav oil industries of Galicia were written in the naturalistic manner of Zola. The long narrative poems *Moysey* ("Moses"), *Panski zharty* ("Nobleman's Jests"), and *Ivan Vyshensky* are the heights of Franko's poetic achievement.

Writing at the turn of the century were such outstanding figures as the Neoromantic poet Lesya Ukrainka, Mikhaylo Kotsiubynsky, and Vasyl Stefanyk.

POLISH LITERATURE IN THE 19TH CENTURY

A second distinct period of Polish classicism, called pseudoclassicism, occurred in the early 19th century. In general, pseudoclassicist writing lacked freshness. During the Enlightenment period, literature had re-established contact with the West and became the voice of national consciousness. Although it was the literature of a community undergoing a severe political crisis, it exercised an influence on neighbouring countries.

The Romantic period began later in Poland than in England or Germany, and it lasted longer. It has been regarded as the greatest period in Polish literature. The rise of Romanticism coincided with the loss of independence, and great writers found in it an expression of their own mood. A need to interpret their country's destiny gave the work of the three great Romantic poets—Adam Mickiewicz, Juliusz Siowacki, and Zygmunt Krasiński—visionary power and moral authority. Writing in exile, they kept faith in the restoration of Polish independence alive, and their concern gave the literature of the Polish Romantic movement its strength and passion. Mickiewicz was the greatest Polish poet and leader of the Romantic period. His *Poezye* (1822–23; "Poetry") was the first major literary event of the period. In its second volume were included parts ii and iv of *Dziady,* in which he combined folklore and mystic atmosphere to create a new kind of Romantic drama. Mickiewicz' greatest works were written after 1824, when he was deported to Russia for revolutionary activities as a student; they included *Sonety Krymskie* (1826; "Crimean Sonnets"); a visionary third part of *Dziady* (1833); a messianic interpretation of Poland's past and future destiny, *Księgi narodu polskiego i pielgrzymstwa polskiego* (1832; "Books of the Polish Nation and Its Pilgrimage"), written in biblical prose; and a great epic, *Pan Tadeusz . . .* (1834; "Master Thaddeus . . .").

The poets in exile

The suppression of the insurrection of 1830–31 drove the cultural elite into exile in France; among poets whom Mickiewicz joined there were Słowacki, Krasinski, and Cyprian Norwid. Słowacki, a Romantic in the fullest sense, who in all his work showed genius, wrote verse narratives in the style of Byron and accomplished lyric poetry. He was inspired by patriotic themes: *Kordian* (1834) was a drama of conspiracy and problems of commitment. His subtle W *Szwajcarii* (1839; "In Switzerland") is probably the finest lyrical work in Polish. Much of Slowacki's work was in dramatic form, and although it was not intended for production, it laid the foundations of Polish tragic drama. His plays showed the influence of French Romantic drama, Shakespeare, classical tragedy, and Calderon. The last years of Słowacki's life were devoted to writing *Król-Duch* (1847; "The Spirit King"), an unfinished lyrical and symbolic epic describing the history of a people as a series of incarnations of the essential spirit of the nation.

Zygmunt Krasinski, when 23, published (anonymously, as with all his works) *Nie-Boskq komediq* (1835; *The Undivine Comedy,* 1875), which presented, for the first time in Europe, a struggle between opposed worlds of aristocracy and disinherited masses. *Irydion* (1836), his second play, was an allegory of Poland's fate. In *Przed-Swir* (1843; "The Moment Before Dawn") he developed a messianic interpretation of Polish history, and this conception of Poland as "the Christ among the nations" was also expounded in ***Psalmy przyszłości*** (1845; "Psalms of the Future"). The introduction of fantastic or supernatural elements into a realistic setting was characteristic of many Polish Romantic works.

The genius of Cyprian Kamil Norwid was not fully recognized until the 20th century. During his lifetime he was misjudged and remained obscure, partly because he accepted some ideas of Romanticism while criticizing others but even more because of his ironic intellectual reserve. Among the most important works published in his lifetime was a verse dialogue on aesthetics, "Promethidion" (1851), which expounded a theory of the social and moral function of art anticipating that of John Ruskin. An authentic text of his most important lyrical collection, the ***Vade-mecum,*** was first published in 1947. Norwid experimented with free verse and with the rhythms of speech, and, furthermore, he foreshadowed the French Symbolists in his analogical method of presenting the poetic concept.

The lesser talents of early Romanticism formed the Polish Ukrainian school, of whom Antoni Malczewski was outstanding as the author of a single poem, the Romantic verse narrative ***Maria . . .*** (1825), a tale of love and treachery remarkable for original diction, dramatic tension, and unity of mood.

There were fewer prose writers than poets among the exiles. Zygmunt Miłkowski (pseudonym Teodor Tomasz Jeż) wrote on a wide range of subjects, including folklore and the history of the Balkan countries. The literary criticism of Maurycy Mochnacki, a passionate advocate of Romanticism and the first Polish critic to link literature with Poland's political progress, exercised a strong and not wholly beneficial influence on literary theory. The historical works of Joachim Lelewel, a great, many-sided scholar, were an impressive example of the prose of the period.

As a result of partition, Romantic poetry in Poland was limited to closed provincial circles. In Warsaw a group of young poets was formed, but its activities were restricted by political pressure. Its most fully developed talent was that of Teofil Lenartowicz. Ryszard Wincenty Berwiński, a poet of social radicalism, wrote *Poezje* (1844) and *Studia o literaturze ludowej* (1854; "Studies on Folk Literature"), which marked a step away from Romantic nationalist interpretations and stressed the international community of folk tradition.

Prose was more popular with writers in Poland than with those in exile. Henryk Rzewuski belonged spiritually to the 18th century: *Pamiątki Seweryna Soplicy* ("Memoirs of Seweryn Soplica") evoked the atmosphere of the Baroque tradition. As the century progressed, signs of a Realistic tendency were discernible in Józef Korzeniowski's novels *Spekulant* (1846) and ***Kollokacja*** (1847). A woman novelist, Narcyza Zmichowska (pseudonym Gabryella), produced ***Poganka*** (1846; "The Pagan"), a psychological allegory anticipating 20th-century sensibility in its subtle analysis of feeling. The dominant figure among prose writers was Józef Ignacy Kraszewski, whose output ran into hundreds of volumes of fiction, history, ethnography, criticism, and so on. His imaginative writings reflected a change of literary styles during his long career. Banished in 1863, he continued to influence Polish writers at home and in exile, maintaining the Polish cause by his manifold activities.

The influence of Polish Romanticism

Polish Romanticism, conscious of its role as the torch of national spirit, retained its force as a mode of thinking beyond the period of the political circumstances that fostered it. It produced works of highest artistic value, which excited the interest of foreign writers. Mickiewicz influenced Slavonic literatures and was compared by George Sand with Goethe and Byron. Slowacki's poetic technique proved of fundamental importance to writers at the end of the 19th century, whereas Norwid's poetic technique was increasingly felt in the mid-20th century. The political implications of the Romantic movement led to the insurrection of 1863, which ended in Poland's becoming a province of Russia.

OTHER LITERATURES OF EASTERN EUROPE AND THE EASTERN MEDITERRANEAN IN THE 19TH CENTURY

Lithuanian. After the death of creative secular writings in Lithuania in the 18th century—only the poem *Metai* ("The Four Seasons," 1818), by Kristijonas Donelaitis, depicting village life, stood out from the grammars and folk song collections—the first half of the 19th century produced a new movement attempting to create a Lithuanian literary language and fostering a new Romantic interest in the early history of the country. In the literature of the period, notably in the poetry of Simanas Stanevičia and Dionyzas Poška, there appeared a surge of Western influence, in the wake of the French Revolution. Despite a Russian prohibition of the printing of Lithuanian writings in Latin letters, this renaissance was continued by Bishop M. Valančius, noted for religious and educational works, and by Bishop A. Baranauskas, a poet whose greatest work was *Anykščiu šilelis* (1858–59; ***The Forest of Anykščiai***, 1956). The literature of this era sought to rally Lithuanians against the political control of Russia and the cultural influence of Poland.

Influence of *Aušra* and of Maironis

The first modern Lithuanian periodical, *Aušra* ("Dawn"), founded in 1883 by Jonas Basanavičius and printed in Lithuanian Minor, gave its name to the literature of the ensuing generation. One of the poems of Vincas Kudirka, a leading publicist and short-story writer, became the national anthem of independent Lithuania. The most famous Lithuanian poet, J. Mačiulis (pseudonym Maironis), was noted for both dramatic and lyric poetry and has been called "the poet-prophet of the Lithuanian renaissance." Other distinguished names were V. Storasta (pseudonym Vydūnas), philosopher, poet, and dramatist; J. Biliūnas, a sensitive short-story writer; and J. Tumas (called Vaižgantas), a literary critic.

Latvian. During the "national awakening" of the mid-19th century, the Latvians established their literary independence. J. Alunāns' book of verse *Dziesminas* (1856; "Little Songs") founded the modern Latvian lyric. Folk poetry became a source of literary inspiration, as in the lyrics of Auseklis (M. Krogzems) and in A. Pumpurs' epic poem *Lāčplēsis* (1888; "Bearslayer"). The first major novel, ***Mērnieku laiki*** (1879; "The Times of the Land-Surveyors"), by R. and M. Kaudzites, portrayed Latvian peasant life realistically. Modern Latvian plays and short stories began with R. Blaumanis.

In the 1890s the "new movement" demanded Realism, but the major poet of that time, Rainis (J. Pliekšāns), wrote in a Symbolic manner, using the imagery of folk poetry in his depictions of contemporary problems. His wife, Aspazija (E. Pliekšāna, *née* Rozenberga), took up the struggle for women's rights, but displayed rather Romantic tendencies in her later work. J. Poruks introduced New Romanticism, whereas in the following decade "Decadents" or "Symbolists" propounded art for art's sake.

Estonian. Written literature began in the Estophile period (*c.* 1750–1840) with moral tales and manuals written by Balto-German enthusiasts for the native language and culture. The philological journal ***Beiträge zur Genauern Kenntniss der Ehstnischen Sprache*** ("Contributions to a Better Understanding of the Estonian Language") contained examples of folk poetry and essays, including work by the first native Estonian poet, Kristjan Jaak Peterson. More significant for literature was an epic, ***Kalevipoeg*** (1857–61, part translated in ***The Hero of Estonia,*** 1895), part authentic tradition and part a creation of Fr.R. (F. Reinhold) Kreutzwald, for this inspired the Romantic nationalistic movement soon to emerge. Popular patriotic Romantics were the poets Lydia Koidula and Anna Haava, and the first novelist was Juhan Sommer, whose book ***Luige Laus*** appeared in 1843. The historical novel first appeared with Eduard Bornhohe's *Tasuja* (1880; "The Avenger"), while Jakob Pam's ***Oma tuba, oma luba*** ("Own House, Own Master") approached a realistic style fully developed by the later work of Juhan Liiv.

Czechoslovak. ***Czech.*** The historicism and antiquarianism of the 18th century led many Czech scholars to investigate the earlier literature and history of their country; a revival of Bohemian patriotism was, moreover, a natural reaction to the centralizing tendencies of the Habsburg government under Maria Theresa and was encouraged by the local nobility in the interests of their own power. Josef **Dobrovský** became a codifier of a revived Czech literary language, and in his history of older Czech literature he brought to light neglected models that Czech writers might follow. He himself wrote in Latin and German; but several of his contemporaries restored Czech to literary currency, notably **Antonín** Jaroslav Puchmajer with his poetical almanacs. At the same time, social and political developments of the late 18th century created a public for Czech literature. Vernacular plays acted in Prague from 1786 and the beginnings of modern Czech journalism represented by the newspapers of Václav Mattj Kramerius were directed at a new middle class of growing Czech towns.

The establishment of a modern Czech literary language

Dobrovsky had contented himself with codifying the Czech language: Josef Jungmann set out to extend its possibilities so that it could become a modern literary language and achieved this in translations (including that of Milton's ***Paradise Lost,*** 1811) and above all in a monumental Czech–German dictionary (1835–39). The revival of Czech culture was also greatly furthered by **František Palacký,** whose history of Bohemia and Moravia was the last masterpiece of classical Czech.

Some Slovaks were being drawn into the Czech literary revival; foremost was **Ján Kollár,** whose allegorical sonnet cycle *Slávy **dcera*** ("The Daughter of Slava") was the first significant work in the revived language.

A special position in this period belonged to the ***Rukopis*** *Královédvorský* ("Manuscript of Králové Dvůr") and ***Rukopis*** *Zelenohorský* ("Manuscript of Zelená Hora"), ostensibly poems from the early Middle Ages but in fact forgeries executed by a brilliant and unscrupulous poet, Václav Hanka, and by others. Though their spurious character was finally proved toward the end of the century, they have held their own as examples of Romantic poetry, with echoes of popular poetry of southern Slavs.

The greatest poet of Czech Romanticism, perhaps of all Czech poets, was Karel Hynek **Mácha,** whose lyrics, prose fragments, and a lyrical epic, ***Maj*** (1836; ***May,*** 1932) showed the influence of Byron, Sir Walter Scott, and the Polish Romantics, but it was an influence transcended by its intensity of poetic vision and perfection of language.

In the 1840s a reaction against Romanticism became evident in a number of authors, notably **Karel Havlíček Borovský** and **Božena Němcová.** Both gave attention to practical issues and were masters of prose style who did much to bring Czech prose nearer to the everyday language. **Havlíček** was a political journalist whose achievement lay in critical articles in which he stood out for Czech rights against Habsburg absolutism, and in brilliant satirical poems, especially those written in exile just before his death: *Král Lávra* ("King Lavra"), ***Tyrolskd elegie*** ("Tyrolese Elegies"), and *Křest **svatdho** Vladimíra* ("The Baptism of St. Vladimir"). **Božena Němcová,** the first woman to make a significant contribution to Czech literature, became best known for ***Babička*** ("The Grandmother"), a portrayal of country life in a series of sketches held together by the central figure. Descriptions are precise and realistic; and the language has a firmness and individuality new in Czech prose.

The work of **Havlíček,** Erben, and **Němcová,** all at their peak in the 1850s, formed a bridge from a first, Romantic phase of revived Czech literature to the second half of the century, in which authors, writing for an expanding public, tried to establish a literature that might occupy a worthy place among other literatures of Europe. In 1858 an almanac, *Máj,* appeared, dedicated to the memory of **Mácha** and containing the work of young authors, among whom Jan Neruda and **Vítězslav Hálek** were pre-eminent. A significant novelist of the *Máj* group was **Karolina Světlá** (Johanna **Mužáková**); her novels of early-19th-century Prague society and of the north Bohemian countryside contained Romantic elements of theme and plot but showed considerable skill in psychological analysis. Moral and social problems and, in particular, the position of women in 19th-century society were dominant themes of her work. It was under the auspices of the *Máj* group that Adolf Heyduk began his literary career. His patriotic poetry best stood the test of time, notably the poems in which he was inspired by the kinship between Czechs and Slovaks.

Slovak. Until the 18th century there was no systematic attempt to establish a literary language from the Slovak dialects, which, though closely related to Czech, developed a separate identity from the early Middle Ages. The decline of literary Czech in the early 18th century caused an increase of local colouring in devotional texts produced by both Catholics and Calvinists. With Anton **Bernolák,** these tendencies were consolidated in a grammar (1790) and a dictionary (6 vol., 1825–27), which codified a literary language based mainly on western Slovak usage. In an era of reviving national consciousness, this language was taken up by a number of writers. Preeminent was **Ján Hollý,** who wrote lyrics, idylls, and national epics. The didactic novel ***Rend*** (1783–85) was written in a strongly Slovakized Czech by Jozef Ignác Bajza.

Attempts to establish a literary Slovak language

Bernolák's language was not accepted by the Protestants of Slovakia. who used Czech as their liturgical language. By the 1840s, however, Slovak national feeling among the Catholic majority was so strong that there was little possibility of their accepting Czech as their written language. The western Slovak of Bernolhk was inadequate; but L'udovit **Štúr** codified a new form of literary Slovak based on the central dialects that was immediately taken up by a group of talented poets. Andrej **Sládkovič** (Andrej Braxatoris) produced, in ***Marina*** (1846), a national epic that had individuality and freshness. The most significant figure was Janko **Král',** whose exploits in the revolution and war of 1848–49 made him a legend. His ballads, epics, and lyrics are among the most original products of Slavonic Romanticism.

The first Slovak dramatist of note was **Ján** Chalupka, whose works, including a lively satire, *Kocúrkovo* (1830), were written in Czech. **Ján** Palhrik used the new literary language: his comedies, produced in the 1850s and 1860s, portrayed Slovak society with sympathetic irony.

Yugoslavian. ***Serbian.*** The most important Serbian representative of the Enlightenment period was Dositej **Obradović,** whose writings (autobiography 1783, and others) greatly influenced Serbian literary development. Many characteristics of European Romanticism could be observed in the literature of the period 1820–70, especially the cult of folklore and national self-assertion. A central figure was Vuk **Stefanović Karadžić,** a reformer of literary language who did much to forward the national movement. Petar II **Petrović Njegoš,** a Montenegrin ruler, was a poet whose gifts are best seen in his dramatic poem ***Gorski vijenac*** (1847; "The Mountain Wreath"). The lyrical verses of Branko **Radičević** contributed to the break with earlier didactic-objective poetry. Among younger Romantic writers were the lyrical poets **Jovan Jovanović** (known as **Zmaj**), **Đura Jakšić,** and Laza **Kostić.**

From 1870 to 1900 there was a tendency toward Realism, and its outstanding propagator was Svetozar **Marković,** founder of Socialism in Serbia. The most significant narrative writing was by Laza **Lazarević,** a master of the short story; Simo Matavulj, a keenly observant novelist and short-story writer with a strong sense of humour; and Stevan **Sremac,** satirist and humorist. Vojislav **Ilić** was a fine descriptive poet, resembling the French Parnassians.

Toward the end of the 19th century Serbian literature was influenced by European currents, particularly the French Symbolistr: outstanding figures were Jovan **Dučić** and Milan **Rakić,** a patriotic poet of a melancholy nature. Vladislav **Petković** (called Dis), a subjective poet, chose themes halfway between reality and the irrational. Prose changed from objective description to psychological narrative, often with a lyrical quality, as in the work of Petar **Kočić,** Ivo Cipiko, and especially Borisav **Stan-**

ković. A literary historian and critic, Jovan Skerlić asserted concepts of aesthetics based on belief in the social and humanitarian functions of art.

The popularity of patriotic verse

Croatian. Romanticism in Croatian literature originated in a cultural and national reformation brought about by the Illyrian movement (1835–48), which aimed at a union of all south Slavs within the Habsburg federation. Ljudevit Gaj introduced the *Btokavski* dialect and *ijekavski* speech as the literary language of Croatia and also a unified orthography. Personal, patriotic, and reflective lyrics were popular and were best represented by the sensitive, moving poems of Stanko Vraz, the patriotic songs and poetic drama of Petar Preradović, and the dramatic works of Dimitrije Demeter. Some of the best poetry includes *Smrt Smail–Age Čengića* (1846; *The Death of Smail–Aga Čengić*, 1925) by Ivan Mažuranić.

Many writers collected Croatian folk poetry, which continued to inspire writers long after the Illyrian movement was over. In the development of national characteristics of Croatian Romanticism an outstanding figure was August Senoa, poet, dramatist, critic, journalist, and creator of the Croat historical novel. Šenoa was a subtle stylist and a champion of Realism, which was at its height between 1881 and 1895. Writers were concerned with contemporary problems, particularly with conditions among the lower classes. Representatives of this movement were Evgenij Kumičić, a naturalist and poet; Ante Kovačić, satirist and author of a lively novel, *U registraturi* (1888; "In the Registry Office"); and Ksaver Šandor Gjalski, a short-story writer and novelist concerned with political and cultural problems. A poet, Silvije Strahimir Kranjčević, was a notable social rebel whose work was rich in imagery and rhythmic variety.

Slovene. The Romantic movement purified both language and literature in Slovenia. Its initiator was Jernej Kopitar, who established standards for the literary language. Matija Cop supported the poetic miscellany *Kranjska Cbelica* (1830–34, 1848; "The Carniola Bee"), which included work by France Preieren, an outstanding poet of the Slovene Romantics. He created some of the greatest poems in Slovene and gave new life to his country's literature. Preieren published a tale in verse, *Krst pri Savici* (1836; "The Baptism at the Savica"), and only one collection of poems, *Poezije* (1847; "Poems"), in which he expressed his love for a woman, for his people, and for mankind. With his works Slovene literature reached an unexpected summit in European poetry. The Romantics produced the first popular narrative and were enthusiastic about folk poetry and the newly established literary language. A battle for the national alphabet was won by the progressive Cop-Preieren group, which defeated attempts to replace the literary language by Illyrian, an amalgam of Serbo-Croatian dialects. The conservative national leader J. Bleiweis established the newspaper *Novice* (1843–1902; "News"), of which the leading poet was the bombastic, emotional J. Vesel (called Koseski), a champion of Slovene nationalism at the time of the March revolution of 1848. The revolution and the constitutional period after it induced the young intelligentsia to begin to organize politically and culturally the awakening peasant masses and native bourgeoisie, in spite of the opposition of the German administration. Poets and novelists who shared in this national revival were Janez Trdina, Fran Erjavec, and Janez Mencinger, best known for short stories and novellas, and Simon Jenko, a significant poet. The most dynamic writer was a critic, Fran Levstik, founder of a program for popular literary prose. His program was completed by Josip Jurčič, author of the first Slovene novel, *Deseti brat* (1866; "The Tenth Son"). Josip Stritar, a poet, novelist, playwright, essayist, and critic, directed Slovene writers toward Western literatures; and Fran Levec achieved distinction as a literary historian. Simon Gregorčič, a melodious lyrical poet, was celebrated for his patriotic verses, and Anton Aškerc wrote some of the best Slovene ballads. Neoclassical Realism was represented by Fran Detela, Janko Kersnik, and the novelist Ivan Tavčar. Drama developed in a parallel manner and is represented by Fran Levstik, Josip Jurčič, Jože Ogrinec, and Josip Voinjak. In the second half of the 19th century several literary reviews were established in Slovenia: *Slovenski glasnik* (1858–68; "The Slovene Herald"), *Zvon* (1870,1876–80; "The Bell"), *Zora* (1872–78; "The Dawn"), *Kres* (1881–86; "The Bonfire"), *Ljubljanski zvon* (1881–1941; "The Ljubljana Bell"), and *Dom in svet* (1888–1945; "The Home and the World"). Later, two associations which were also publishing houses were established, Mohorjeva Družba (1852; "St. Mohor's Society") and Slovenska Matica (1864; "The Slovene Literary Society"), as well as Dramatično Društvo (1872; "The Dramatists' Association"), and Pisateljsko Društvo (1872; "The Writers' Association"). Celovec and Maribor joined Ljubljana as Slovene cultural centres.

Macedonian. Early-19th-century literature in Macedonia echoed the medieval religious enlightenment of the school of Kliment, and the only original contributions were from folk literature. Later, original lyrical poetry was written by Konstantin Miladinov, who, with his brother Dimitrije, compiled a notable collection of legends and folk songs contributing to the development of a national Macedonian literature.

Greek. After the capture of Constantinople by the Turks in 1453, the destruction of Greek national life and Byzantine civilization naturally involved a cessation of Greek literary production in the subjected regions. Learned Greeks in exile sometimes retained their own language when they wrote, but they often used foreign languages. Modern Greek literature can nevertheless be traced to distant native origins, such as the 10th-century epic cycle of Digenis Akritas; verse romances of the 13th and 14th centuries; a chronicle of 15th-century Cyprus by Leontios Makhairás, who used the Greek vernacular; and writings inspired by the Franks, who introduced rhyming verse when they ruled Crete, Rhodes, and Cyprus. Crete was captured by the Turks in 1669 and until then had a vigorous and remarkable literature, influenced by Italian during its Venetian occupation. It showed development in versification and in drama, including comedies and a mystery play that have some extraordinarily modern aspects. There were also many interesting popular songs. Above all, the language of Cretan literature, though incorporating some Venetian words, was vigorously native. Those parts of Greece under Turkish domination only produced folk songs and klephtic ballads (a klepht was an armed Greek living as a freeman and outlaw). The roots of these songs, some reaching far into antiquity, were a source of inspiration to modern Greek poetry.

The literary styles of modern Greek

Modern Greek has inherited two literary styles—the consciously archaic, the Katharevusa, and the living popular, the Demotiki. Both were promoted by the invigorating influence of Italian and French literature. The Demotic movement of the 1880s ended with a decisive victory of the popular language for all writings of an imaginative nature. The purist language for its part was unsuited for production of a really living drama, but with the use of Demotic and a choice of contemporary themes, plays showed a fresh vitality, and a national drama began to emerge, inaugurated mainly by G. Xenopoulos.

The Greek Romantics. The liberation of Greece from the Turks in 1828 made the capital of the new kingdom a centre of Greek political and intellectual life. The Phanariotes (Greeks who had gathered around the ecumenical patriarch in Constantinople and who endeavoured to continue the purist Byzantine tradition in the 18th century and link it with the great literatures of the West) moved finally to Athens. In this mixed and unsettled society the Romantic school of Athens flourished, founded and led by Aléxandros Soútsos, who had studied in Paris and was influenced by French Romanticism but never captured its spirit. The influence he exerted upon Greek poetry was considerable. All poets in the early days of the Romantic school were painstakingly patriotic and often excessively Romantic; they mainly used the Katharevusa. The most striking figure was Aléxandros Rizós Rankavis, a man of extraordinary fertility of mind; his works covered many genres and were considerable achievements in the archaic style.

Akhilléfs Paráskhos was a leading poet in the last period of the school. His contemporaries Angelos Vláchos, Aléxandros Vyzántios, Dhimitrios Paparrigópoulos, Geórgios Viziïnós, and Geórgios Paráskhos were overshadowed by his rhetorical profuseness, but often showed greater sincerity and finer technique.

The Ionian school of poetry. Another school of poetry, parallel to the Romantics of Athens, flourished in the Ionian islands, under British rule until 1864. Its founder and greatest representative was Dhionísios Solomós, who wrote at first in Italian, following his education in Italy, but soon developed a preference for Greek. His work showed a gradually deepening approach to life, and, although temperamental instability prevented his completing any major works, his verses possessed a delicacy and balance unsurpassed in modern Greek. Solomós marked a turning point in the struggle between Katharevusa and Demotiki; his choice of the latter foreshadowed the course of Greek poetry after the Demotic movement of the 1880s. He also introduced some Western metrical forms, thus freeing Greek poetry from the monotony of the 15-syllable political verse mainly used previously. Two other major poets of the Ionian school were Andréas Kálvos, who was inspired by Greek classics and used a classicized form of language; and Aristotelís Valaorites, a deeply Romantic poet, greatly admired by his contemporaries, who influenced Kostís Palamás in adopting the spoken tongue for poetry and thus linked the Ionian school with the new school of Athens.

The new school of Athens. About 1880 some young poets formed a group in reaction to the stilted Katharevusa and the weaknesses of Romanticism. They aspired to a restrained and objective art, drawing inspiration from contemporary Greece and using the living idiom. A climax in the so-called Demotic movement came with Ioinnis Psicharis' *Tó taxídi mou* (1888), a prose work intended to awaken Greek linguistic consciousness.

Prose. Before the 19th century, prose works were mainly theological or educational and were fostered by the clergy, the great Phanariote families of Constantinople, and the patronage of wealthy merchants. The greatest single forerunner of the revival of prose was Adamántios Koraïs, who exercised an enormous influence on his Greek contemporaries by issuing many editions of classical authors, accompanied by stirring patriotic introductions and by efforts to reform the written language to bring it closer to the living idiom.

In the first decades that followed the liberation of Greece, prose was largely confined to journalism and scholarship. The few writers of creative literature were attracted by the works of Sir Walter Scott and Alexandre Dumas *père*, and the historical novel was cultivated between 1821 and 1888, notably *Authéntis tou Móreos* ("Lord of the Morea") by Aléxandros Rizos Rangavis; Emmanouil Roi'dis' vivid historical satirical novel about Pope Joan (1865); and *Loukis Láras* (1879) by Dhimitrios Vikelás. The short story was also developed in this period, particularly by Georgiós Viziïnos and Ioánnis Kondylákis. There also occurred the development of a remarkable classical style by certain distinguished scholars. Two works of major importance were a history of the Greek revolution by Spyridon Trikoupis and a history of the Greek nation by Konstantinos Paparrigópoulos, both written in a balanced and flowing style.

Bulgarian. Modern Bulgarian literature dates from the mid-19th-century awakening of national consciousness. Consonant with this was the formation of *novobulgarski*, the new (or modem) literary Bulgarian language based on the vernacular of its eastern dialects, as opposed to the medieval Church Slavonic, which until then had always been used for literary purposes. Pioneers in this were Bishop Sophrony, whose *Nedelnik* (1806; “Sunday-Book”) is the first modern Bulgarian printed book; Neophyt Rilski, grammarian and founder of the first modern Bulgarian school in 1835; V. Aprilov; N. Gerov, compiler of the first major dictionary of Bulgarian; I. Bogorov; and the Russian antiquary Y. Venelin. Harbinger of this whole awakening of Bulgarian national consciousness (known as the *Vuzrazhdane)* was Father Paisy of Chilandari, whose single work, *Zstoria slavyano-bulgarska* (1762; "Slavo-Bulgarian History"), by its romantic evocation of Bulgaria's past and appeal to national self-respect inspired Bulgaria's renascence, including its first able modern writers. These, who often combined capacities of poet, scholar, publicist, and revolutionary, shaped through works of unequal literary merit an effective image of the resurgent nation. Conditions of the time—lack of freedom, the strength of Greek cultural domination, and strong Russian utilitarian influences—taught these writers, many of whom were educated in Odessa or Moscow, that literature should serve social and national needs. Thus inspired, D. Voynikov, I. Bluskov, and especially L. Karavelov and V. Drumev founded modern Bulgarian Realism with their narrative prose and drama taken from rural and small-town life; H. Botev, in his single-minded devotion to ideals of liberty and fatherland, wrote impassioned revolutionary poetry, dying (like his fellow martyr-poet Bacho Kiro) in 1876 a victim of the Turks; Petko Slaveykov, an irrepressible journalist, Bible translator, and agitator for the Bulgarian independent exarchate, worked all his life in Bulgarian and Macedonian lands and in Stambul itself (never in emigration like Karavelov and Botev), drawing for his verse on folklore and Greek popular songs: and G. Rakovski, a typical *vuzrozhdenets* ("Renaissance figure") in his versatility and vitality, exploited often with mole zeal than discretion the two main indigenous resources for Bulgarian writers then and since, an illustrious medieval past and a richly surviving folklore.

The liberation of Bulgaria in 1878 created a climate far more favourable to literary development than that of the preceding five centuries of Turkish rule. Ivan Vazov almost alone links as a writer the epochs before and after liberation. His immense output from the early 1870s to 1921, reflected in all main genres every facet of his people's life, past and present, has earned him the title of "national poet." An epic cycle, *Epopeya na zabravenite* (1881–84: "Epic of the Forgotten"), evoked with visionary power his pantheon of heroes from the struggle for independence; a novella, *Chichovtsi* (1895; "Uncles"), was a realistic portrait gallery of Bulgarian provincial "notables" in Turkish times. Vazov's narrative gifts were at their highest in Bulgaria's "national novel" *Pod igoto* (1893; translated as *Under the Yoke,* 1894), which vividly described the Bulgarian struggle against the Turks; his short stories entertained and his travelogues of rural and historical Bulgaria informed his readers; his most popular play, *Hushové* (1894), depicting these pre-liberation expatriates' ordeals in Romania, together with his dramas of medieval Bulgaria, dominated the repertoire of the Sofia National Theatre (founded 1907).

Without equalling Vazov's powers of imagination and synthesis, Konstantin Velichkov shared his ideals. His unusual poetic temperament was best expressed in sonnets inspired by travels to Constantinople and Italy. An exponent of Italianate influence, he contributed to the then fashionable literature of memoirs. Most notable here was Z. Stoyanov, whose *Zapiski po bulgarskite vuzstaniya* (1883–85; translated as *Notes on the Bulgarian Uprisings)* recorded eyewitness experiences of then recent history with a directness rarely equalled since in Bulgarian prose.

Writers of the new independent state, not preoccupied with celebrating the recent or distant past, eyed critically contemporary society's more negative aspects. In satire, fable, and epigram, S. Mihaylovski with unrelenting bitterness castigated corruption in public life. His most ambitious satire, *Kniga za bulgarskia narod* (1897; "Book on the Bulgarian People"), took the form of a moral-philosophical allegory. In a lighter vein, Aleko Konstantinov created in *Bay Ganyu* (1895; subtitled "Incredible Tales of a Contemporary Bulgarian [on his European Travels and at Home]") a tragi-comic prototype of the Bulgarian peasant turned *parvenu* and demagogue. In his travelogue *Do Chicago* i *nazad* (1894; "To Chicago and Back”) he measured Bulgaria against cultures of Europe and the United States, not always to the latters' advantage.

Romanian. The first landmark of the 19th century in Romania was a national popular rising of Tudor Vladimirescu (1821) in Walachia and the return of the national rulers. Romanticism carried forward the falling wave of the Latinist movement. In the second half of the 19th century a serious literary criticism, which originated in German philosophy and French culture, inaugurated modern literature.

Transylvanian Latinism crossed the Carpathians and had beneficial effects on the Greek-inspired culture of Walachia. Eliade Rădulescu, who came under this influence, founded the first Romanian newspaper in Walachia and the Societatea Filarmonică (1833), which later treated a national theatre in Bucharest. He was a pioneer of Italian influence, which was taken up in Moldavia by Gheorghe Asachi, who created the historical short story, wrote verses in Romanian and Italian, and founded a periodical, Albina *Românească.* The outstanding literary personality among a galaxy of minor poets and translators who enriched the Romantic heritage was Grigore Alexandrescu. Alexandrescu wrote Poezii (1832, 1838, 1839) and *Meditații* (1863), fables and satires influenced mostly by French writers. A literary magazine, Dacia *Litterară*, edited by Mihail Kogălniceanu, a leading statesman and father of modern Romanian historiography (1840), marked a beginning of the traditionalist trend in literature. Alecu Russo, another leader of 1848, enriched literature with a biblical prose poem, *Cântarea României.*

Leading writers of the second half of the century were Vasile Alecsandri and Mihail Eminescu. Alecsandri's rich output comprised poetry (Doine *şi lăcrimīoare* [1853], *Suvenire si Mărgăritărele* [1856]), prose (*Buchetiera* din *Florența* ["A Bouquet from Florence"], *Călătorii* in Africa), and plays (*Fîntîna* blanduziei, Ovidiu, Despot *Vodă*). He also revealed treasures of Romanian folklore in *Balade* (1852–53) and Poezii populare (1866). Eminescu, a philosophical lyric poet, created modern Romanian poetry. He was influenced by Hindu thought and German philosophy but remained rooted in tradition. He raised Romanian poetry to new heights and was the guiding star in every aspect of cultural life. His writings include short stories and political and philosophical essays.

Hungarian. Literary leadership of Hungary at the beginning of the 19th century was assumed by Károly Kisfaludy when, in 1822, he founded a literary magazine, Aurora, to which all the important writers of the period contributed. He was also the first representative of Romanticism and the first playwright to achieve popular success.

While Kisfaludy's tragedies were applauded all over the country, Bdnk *bán* (the bdn was a high Hungarian dignitary), one of Hungary's best tragedies, by József Katona, was published in 1821 but was overlooked. Set in the 13th century and written in vigorous prose, the play was a masterful combination of national and individual conflicts, and one of its characters, Tiborc, a poor peasant, has remained ever since a symbol of the oppressed.

Ferenc Kolcsey was a politician of standing and a brilliant orator; his literary criticism was of a high standard, though unduly severe. His later poems, grave, vigorous in thought and expression, often dealt with problems of his country's situation; the impressive "Hymnus" (1823) became the Hungarian national anthem. After Kisfaludy's death, Mihály Vorosmarty became a central figure in literary life, producing works of value in every literary genre. In particular he succeeded with a long epic poem *Zalán futása* (1825; "The Flight of Zalan"), written in a Romantic vein but with an eye to contemporary problems, which appeared also in many of his best lyric poems and in his symbolic fairy play Csongor *és* Tiinde (1830).

Hungarian novels

In Hungarian literature, poetry was far ahead of drama, and the novel seemed slow in taking root. Miklós Jósika, a disciple of Sir Walter Scott, was the first successful novelist. His first and best work, a historical novel, *Abafi* (1836), marked a turning point in the history of the Hungarian novel. József Eotvos, who after the 1848 revolution became a political theorist, produced two of the best novels in Hungarian literature—A *falu jegyzője* (1845; "The Village Notary"), a portrait of feudal life in his own time, and *Magyarország 1514-ben* (1847; "Hungary in 1514"), about Gyorgy Dózsa's peasants' revolt. They possessed exceptional qualities of characterization, both of individuals and of periods, and were political manifestos in support of the oppressed and against the appalling injustices that led to revolutions—of which Eotvos disapproved as a political means.

The folk song and ballad collections of János Erdélyi and Janos Kriza exerted an influence on the further development of Hungarian poetry. "Popular poetry is the only real poetry" was the opinion of Sándor Petőfi, one of the greatest Hungarian poets, whose best poems ranked among masterpieces of world literature. He was an innovator and made a break with conventional subjects and poetic language. His poems are striking in immediacy of perception and directness of language and could treat almost any subject. The revolutionary violence of his patriotic poems was an inspiration during the revolution of 1848. Petofi's many songs were enchanting in their simplicity, and in this genre he remained unsurpassed. His death on the battlefield in 1849 at 26 was a tragic loss to Hungarian literature.

János Arany shared Petőfi's conviction of the value of popular poetry, but his approach was different, for his subjects were often taken from history and showed deep understanding of the human mind. He had the assurance of one who knew that what he wrote was the language of the people, lifted to a degree never surpassed in Hungarian. His ballads, often Romantic, had vigour, conciseness, and uncommon evocative power. His great narrative poems, the Toldi trilogy (1847–79) and Buda *halála* (1864; "Death of Buda"), reflected eternal human problems; Arany's philosophy appeared through his characters and not in lengthy digressions and was accompanied by subtle humour.

The peaks of poetry reached by Petofi and Arany remained inaccessible to other poets during the rest of the 19th century. Hungary, prostrated by the unsuccessful revolution of 1848–49, remained under Austrian rule until 1867. Defeat was followed by half-hearted acceptance of the compromise and by a self-deceiving optimism that produced complacency and uninspired traditionalism. The strongest talent in this period of decadence, János Vajda, beset with gloomy visions, was little recognized by contemporaries but influenced coming generations.

The national theatre

In 1837 a national theatre was formed to produce works of merit, but the level of plays was low. Ede Szigligeti's comedies were amusing, and he created a special genre, the *népszinmü*, plays giving an idealized picture of village life. Szigligeti catered for a public delighted to watch plays presenting no problems; but problems—social, political, and religious—constituted a principal preoccupation of Imre Madách, whose Az ember *tragédiája* (published 1861; "The Tragedy of Man") was one of the glories of Hungarian literature. This dramatic poem followed man's destiny from creation through stages of history into a future of a phalanstery and the ultimate extinction of life; the play not only displayed original thought incisively expressed but was also effective on the stage. It remains a favourite with the Hungarian public.

The first really good novelist, Zsigmond Kemtny displayed, in such novels as Zord id6 (1862; "Grim Times"), A *rajongók* (1858–59; "The Fanatics"), and *Férj és nő* (1852; "Husband and Wife"), a masterly skill in psychological analysis. His characters were pushed toward their gloomy fate by a host of circumstances determined by their own deeds. Analysis often took the place of action in Kemény's novels, which were therefore difficult to read and not popular. On the other hand, Mór Jókai was undoubtedly a popular Hungarian novelist, an exceptional storyteller able to evoke any epoch, any milieu; characters were idealized and descriptions inaccurate, but the dream world so created was real. In his works (more than 100 volumes), historical novels alternated with others centred on problems of contemporary society, of which almost all strata interested him. Kálmán Mikszáth was also popular; he recorded with keen observation and sly humour the shortcomings of society but, although a politician, was little concerned with improvement. Though his principal works were published early in the 20th century, Géza Gárdonyi belonged to the 19th century. ***Egri csillagok*** (1901; "The Stars of Eger") and ***A láthatatlan ember*** (1902; "The Invisible Man") were well constructed.

During the 19th century, literary life in Hungary became organized to some extent: Kisfaludy and Petofi societies, founded in 1836 and 1876, respectively, were particularly influential, though the authority of the Hungarian Academy, founded in 1825, remained unchallenged. The principal critic of the second half of the century was Pál Gyulai, himself a poet and writer. Literary criticism, the history of Hungarian literature, attracted some of the best minds, including Jeno Peterffy and Frigyes Riedl.

Finnish. Although a number of talented poets wrote in Finnish in the 17th and 18th centuries, it was only with Aleksis Kivi that a genuine Finnish literature came into being. His *Seitsemän veljestä* (1870; ***Seven Brothers,*** 1929) was the first Finnish novel. It endowed Finnish with a style (realism spiced with humour) and a theme (the Finnish people) that were to become traditional. Kivi was also a poet, and among his fellow poets were August Ahlqvist-Oksanen: Suonio (Julius Krohn); an austere and powerful poet, Kaarlo Kramsu; and J.H. Erkko, whose style was based on folk song.

In 1872 Kaarlo Bergbom founded the Finnish National Theatre. The 1880s saw the formation of a group of liberal writers known as Nuori Suomi (Young Finland), who founded a paper, ***Yaivalehti*** (from 1904, ***Helsingin Sanomat).*** Influenced by Norwegian and French writers, they introduced Realism and social criticism to Finland. Similar views were already being put forward by a formidable dramatist, Minna Canth. Among the group's members were Juhani Aho, a master of the lyrical nature novel; and Arvid Jarneflet, who attracted attention with *Isänmaa* (1893; "The Fatherland"), a novel of student life, and who tried to apply Tolstoy's teachings to his novels and his life. In *Vanhempieni romaani* (1928–30; "The Novel of My Parents"), he produced a classic portrait of his parents, who had played a part in Finland's cultural life. A younger writer was Eino Leino, one of the major Finnish poets, the scope of whose talent ranged from the visionary and mystical ***Helkavirsia*** (1903–16; "Sacred Hymns") to topical novels, pamphlets, and critical journalism. (For literature in Swedish, see above ***Scandinavian literature in the 19th century: Finnish literature in Swedish.)***

Hebrew. In the 18th century the conservative mystical movement of Ḥasidism spread rapidly over all eastern Europe except Lithuania. There, Elijah ben Solomon of Vilna, a writer of unusually wide scope, advocated a better graded course of Talmudic training. Shneur Zalman of Ladi created the highly systematized Ḥabad Hasidism, which was widely accepted in Lithuania. The Musar movement of Israel Salanter encouraged the study of medieval ethical writers.

The Haskala movement

In the Berlin of Frederick II the Great, young intellectuals from Poland and elsewhere, brought in as teachers by the wealthy, met representatives of the European Enlightenment and came under the influence of Moses Mendelssohn and also met some representatives of Italian–Dutch Hebrew culture. One was a Dane, N.H. Wessely, who wrote several works on the Hebrew language, and another, an Italian, S.A. Romanelli, who wrote and translated plays. Out of these contacts grew Haskala ("Enlightenment"), a moderate tendency toward Westernization that venerated Hebrew and medieval western Jewish literature. Among German Jews, then already in rapid process of Germanization, this Hebrew movement had no place. The Enlightenment was somewhat brusquely introduced in Galicia (Austrian Poland), a centre of Hasidism, by the Edict of Toleration (1781) of the emperor Joseph II. By supporting some of its aims, Hebrew writers incurred hatred and persecution. Their chief weapon was satire, and the imitation by J. Perl of the ***Epistolae obscurorum virorum*** of 1515 of Crotus Rubianus and the essays of I. Erter were classics of the genre. One poet, M. Letteris, and one dramatist, N.I. Fischman, wrote interesting biblical plays.

Galicia's chief contribution was to the Jiidische Wissenschaft, a school of historical research with Romanticist leanings. The impact of Haskala ideas upon the humanistic Italo-Hebrew tradition produced a short literary renaissance. Its main connections were with the Jiidische Wissenschaft, to which I.S. Reggio contributed. S.D. Luzzatto, a prolific essayist, philologist, poet, and letter writer, became prominent by his philosophy of Judaism, while a poet, Rachel Morpurgo, struck some remarkably modern chords. For the Jews of the Russian Empire. the Enlightenment proper began with I.B. Levinsohn in the Ukraine and with M.A. Ginzberg (Günzburg), in Lithuania. In the 1820s an orthodox reaction set in, coinciding with the rise of a Romanticist Hebrew school of writers. A.D. Lebensohn wrote fervent love songs to the Hebrew language, and his son Micah Joseph (Mikhal). the most gifted poet of the Haskala period, wrote biblical romances and pantheistic nature lyrics. The first Hebrew novel, ***Ahavat Ziyyon*** (1853; "The Love of Zion"), by A. Mapu, was a Romantic idyll, in which Mapu, like all Haskala writers, employed phrases culled from the Bible, more or less ingeniously adapted to the thought the writer wished to express.

Mapu's third novel, ***Ayit Tsavu^{c}a*** (1857–69; "The Hypocrite"), marked a departure. It dealt with contemporary life and attacked its social evils and portrayed a new type, the ***maskil*** (possessor of Haskala), in a fight against orthodox obscurantism. The new, aggressive Haskala soon came under the influence of Russian left-wing writers, such as Nikolay Gavrilovich Chernyshevsky and Dmitry Pisarev. Judah Leib Gordon, like Mapu, had started as a Romantic writer on biblical subjects. From 1871 onward he produced a series of ballads exposing the injustices of traditional Jewish life. M.L. Lilienblum began as a moderate religious reformer but later became absorbed by social problems, and in "Mishnat Elisha ben Abuyah" (1878) he preached Jewish socialism. P. Smolenskin created in six novels a kaleidoscope of Jewish life in which he rejected the Westernized Jew as much as orthodox reactionaries did.

Armenian. The 18th century witnessed an Armenian cultural and intellectual renaissance, and by the middle of the 19th century, the time was ripe for the development of a modern Armenian literature. The Armenian language, however, was in a chaotic state, and the question of which form should serve as the vehicle for new ideas led to controversies, both in Turkish and Russian Armenia, between champions of the old classical language and those of the modern spoken languages. Eventually the latter prevailed, with the result that the eastern literature became written in a modified form of the Erevan dialect ***(rusahayeren)*** and that of the west in a similarly modified form of the dialect of Istanbul (***dachgahayeren).*** For their models, and for many of their ideals, Armenian writers looked to Europe. Among western authors, Hakob Paronian and Ervand Otian were outstanding satirical novelists, and Grigor Zohrab wrote realistic short stories; the theatre was best represented by Paronian, whose comedies (as ***The Dowry, Master Balthazar, The Oriental Dentist)*** still remain popular.

Russian Armenian novels

The novel, weak in western Armenian literature, was strongly represented in Russian Armenia, where it became a vehicle for Armenian moral, social, and political aspirations. Khachatur Abovean, "father of modern Armenian literature," wrote ***Wounds of Armenia*** in ***1841.*** The most celebrated Armenian novelist was Hakob Meliq-Hakobian, or Raffi. Among eastern poets, Hovhannes Thumanian wrote lyric and narrative poems; and his masterpiece, a short epic, ***Anush,*** full of songs that have become traditional, was early adapted as an opera. The most outstanding Armenian dramatist was Gabriel Sundukiantz, whose comedies ***(Hullabaloo, Pepo, The Broken Hearth)*** portrayed the contemporary Armenian society of Tbilisi, in whose dialect most of them were written.

The rapid decline of Istanbul as the principal western Armenian literary centre (after massacres in the first quarter of the 20th century) brought about a new period of decadence in Armenian literature, although Armenians scattered abroad continued to write in Paris, Beirut, and Boston. Some Turkish Armenians fled to the east, where they enjoyed a certain degree of autonomy and where, after the foundation of the Armenian Soviet Socialist Republic in 1936, national literature was encouraged, and controlled, by the state.

VII. The 20th century

CHARACTERISTICS OF THE PERIOD

When the 20th century began, social and cultural conditions that prevailed in Europe and America were not too different from those of the middle and late 19th century. Continuity could be seen, for example, in the work of four novelists writing in English at the turn of the century and after. Joseph Conrad, Thomas Hardy, Henry James, and D.H. Lawrence all demonstrated in the progress of their work the transition from a relatively stable world at the end of the 19th century to a new age that began with World War I (1914–18). The awakening of a new consciousness in literature was also to be traced in such works of fiction as the first volume of Marcel Proust's ***Remembrance of Things Past*** (*Swann's Way*, 1913), André Gide's ***Vatican Cellars*** (1914), James Joyce's *Ulysses* (1922), Franz Kafka's ***Trial*** (published posthumously in 1925), and Thomas Mann's ***Magic Mountain*** (1924).

The influence of Nietzsche and Freud

Various influences that characterized much of 20th-century writing from the 1920s were at work in these writers. An interest in the unconscious and the irrational was reflected in their work and that of others of about this time. Two important sources of this influence were Friedrich Nietzsche, a German philosopher to whom both Gide and Mann, for example, were much indebted, and Freud, whose psychoanalytical works, by the 1920s, had had a telling influence on Western intellectuals. A shift away from 19th-century assumptions and styles was not limited to writers of fiction. André Breton's first *Manifeste du surréalisme* (1924; "Manifesto of Surrealism") was the first formal statement of a movement that called for spontaneity and a complete rupture with tradition. Surrealism showed the influence of Freud in its emphasis on dreams, automatic writing, and other antilogical methods and, although short-lived as a formal movement, had a lasting effect on much 20th-century art and poetry. The uncertainty of the new age and the variety of attempts to deal with it and give it some artistic coherence can be seen also in Rainer Maria Rilke's ***Duino Elegies*** and ***Sonnets to Orpheus*** (1923); in T.S. Eliot's ***Waste Land*** (1922); and in Luigi Pirandello's play about the instability of identity, *Henry IV* (1922).

The international and experimental period of Western literature in the 1910s and 1920s was important not only for the great works it produced but also because it set a pattern for the future. What was clearly revealed in the major works of the period was an increasing sense of crisis and urgency, doubts as to the 19th century's faith in the psychological stability of the individual personality, and a deep questioning of all philosophical or religious solutions to human problems. In the 1930s these qualities of 20th-century thought were not abandoned but, rather, were expanded into a political context, as writers divided into those supporting political commitment in their writing and those reacting conservatively against such a domination of art by politics. Nor did World War II resolve the debate concerning political commitment—issues similar to those that exercised major creative imaginations of the 1930s were still very much alive during the 1960s and the early 1970s.

The scarcity of great writers after World War II

It would be tempting to explain what seemed to be a relative scarcity of great writers in the period after World War II as an inevitable result of the cumulative pressure of disturbing social and technological developments accelerated by that war. Under such fluctuating and doubtful circumstances, it would not seem altogether strange if writing and reading, as traditionally understood, should cease. Indeed, in certain technologically highly developed countries, such as the United States, the printed word itself seemed to some critics to have lost its central position, having been displaced in the popular mind by a visual and aural electronic culture that did not need the active intellectual participation of its audience. Thus the communications media that helped to create something resembling an international popular culture in many Western countries did nothing to make the question of literary value easier to answer. Given the extraordinary conditions in which a modern writer works, it was not surprising, as the last quarter of the century was about to open, that reputations were difficult to judge, that radical experimentation characterized many fields of literature, and that traditional forms of writing were losing their definition and were tending to dissolve into one another. Novels might acquire many features of poetry or be transformed into a kind of heightened nonfictional reportage, while experimentation with typography gave poems an appearance of verbal paintings, and dramatic works, shorn of anything resembling a traditional plot, became a series of carefully orchestrated gestures or events. But formal experimentation was only part of the picture, and to say that modern writing since World War II has been primarily experimental would be to ignore other characteristics that writing acquired earlier in the century and that still continued to be issues. Most good critics felt that there was no lack of good literature being written, despite the lack of major reputations and despite the possibly transitional nature of much of the period's work in its variety of styles and subjects.

ENGLISH LITERATURE IN THE 20TH CENTURY

The turn of the century was a period of complex change, and combinations of social forces not at first apparent left their mark on literature. Rudyard Kipling's verse, for example, expressed pride in Britain's overseas expansion; but it also looked back in admiration to mid-Victorian industriousness and technical skill, upon which that expansion had been based, and registered with recurrent disquiet a sense that they were being replaced by an age in which a financier stood for more than an industrialist or pioneer. In his short stories, too, Kipling was often critical not of the imperial idea but of a failure to live up to its ideals. He was no vulgar imperialist, and his writings reflected the anxieties as well as the buoyancy of his period. Yet as the 20th century opened it was a very different poet, Thomas Hardy, who, in pieces about the South African War, brought out the realities of empire building and war in their effects on ordinary people, so anticipating and providing an example for many later 20th-century "war poets."

Early-20th-century novelists. Joseph Conrad also showed a sense of the less attractive side of overseas expansion. His novel ***Lord Jim*** (1900) closed with a memorable picture of the lowest kind of overseas adventurer, petty yet ruthless, half trader and half bandit. The story ***Heart of Darkness*** (1902) struck a balance between what was dark and bestial in primitive black Africa and the greed and aimless vindictiveness of its white exploiters. Conrad's most outstanding novel, ***Nostromo*** (1904), recorded how finance imperialism operated in a Central American country to replace colourful barbarism with nothing better than a soulless, sterile materialism. The deepest note running through this and his other works was that of disillusionment with a society that, for all its range and power, was losing its values and often preferred elaborate sham to genuine human worth. In the end, Conrad's conclusion seemed to be that only at sea could human integrity both maintain itself and achieve anything meaningful. This was made explicit in ***Chance*** (1913), the only one of Conrad's major novels to be set in roughly equal proportions in normal English society and at sea. The extraordinary atmosphere of constriction and gloom so memorable in ***The Secret Agent*** (1907) and ***Under Western Eyes*** (1911) came partly from their subject matter—the ruthless and far-reaching power of the Russian police state and, in the latter, the terrorism this created in its opponents. But the taut, dark atmosphere of the two novels was due also to Conrad's tight-lipped recognition that the claims of devotion and integ-

Conrad's disillusionment with society

rity, though as real as ever, were, in a modem society, either pathetic and ineffective or ruthlessly overriden.

If this note of frustration, almost of despair, at the fate of human ideals in a modern world was Polish-born Conrad's response to the society of his time, it was significant that American expatriate Henry James showed much the same feeling. The world James depicted—in a series of novels that were an outstanding literary product of the turn of the century—was the world of Edwardian plutocracy (the great country manor, the great town house); and repeatedly his novels revealed the sordid reality beneath the elegant surface of contemporary life: greedy connoisseurship in *The Spoils of Poynton* (1897); calculating promiscuity in *What Maisie Knew* (1897) and *The Awkward Age* (1899); materialism and selfishness in *The Wings of the Dove* (1902) and *The Golden Bowl* (1904). One value not shown explicitly in Conrad's work was conspicuous in James's: a conviction of the importance in life of art in its highest sense. This was a reminder of something lying behind his whole effort as a writer. In his deep and discriminating study of the great 19th-century French novelists, in his attention to a range of other European writers, and in his intent, sustained reflection on the task and art of the novelist, James marked a departure from the general character of English literature in the mid-19th century.

The influence of the continental novel in England

At that period, English literature had proceeded mainly along its own lines, independent of trends elsewhere; but by 1900 a steady tide of influence was beginning to flow from the mainland of Europe. The desire of James and Conrad to excel as artists was a sign of the influence of a self-conscious and sophisticated writer such as Gustave Flaubert. All in all, the influence of the Continent was pervasive at this time. Ford Madox Ford, especially in *The Good Soldier* (1915), displayed an economy of narrative and intricacy of structure that must be related to French originals. Somerset Maugham, especially in *Of Human Bondage* (1915), showed an affinity with Émile Zola and Flaubert; and John Galsworthy, in *Villa Rubein* (1900), for example, was influenced by Ivan Turgenev. Arnold Bennett also had an outstanding affinity with Zola, as his posthumously published *Journals* (1932–33) made explicit.

Other strands were interwoven with these continental affiliations. The influence of Charles Dickens was marked in Conrad, both in idiosyncracy of characterization and in the sinister and macabre quality of some of his most remarkable scenes. More surprisingly, in the novels of George Moore, Ford, and Bennett there was often a warmth of character or inclination to sentimentalize that undoubtedly recalled Dickens. Interest in continental writing, moreover, did not lead to mere slavish imitation: James studied Flaubert and learned from him but on balance condemned him; Arnold Bennett studied Zola while resolving to avoid what he saw as Zola's lack of sympathy and humanity. Nor, of course, was there a break with earlier English tradition and continuity. James saluted George Eliot as the great master of English fiction, and Bennett acknowledged how much he owed to Herbert Spencer, the Victorian sociologist. Bennett's achievement, though minor compared with that of James, was a genuine one. More than any other novelist of the early 1900s, he revealed the other side of Edwardian opulence: the drab and deprived life of the lower classes, whose emergence into political and social power during the next 50 years was to have such an effect on writing itself. In this context it has been convincingly argued that it was to Bennett—and to H.G. Wells, who, in his realistic fiction, much resembled him—that many novelists writing of everyday lower middle class life from the 1950s onward would look back.

Continental influence affected the manner of two other novelists whose own work had international repercussions. James Joyce (see below *World War I's impact and the years to World War II*) in his early writings—the sketches and stories in *Dubliners* (1914)—showed a link with the aesthetic movement of the 1890s in his occasional melancholy, spare preciosity, and sense of form, while these stories and *A Portrait of an Artist as a Young Man* (1916) also show a link with French Naturalism. Another early and lasting continental influence was that of Ibsen's realism. All these, combined with the influence of French Symbolism and the experimental poetic techniques developed along with Ezra Pound and T.S. Eliot, were among the strands from which *Ulysses* (1922) and *Finnegans Wake* (1939) were woven. Like that of Joyce, the main work of D.H. Lawrence belonged to a somewhat later period, and his intense individuality was always conspicuous in it; but admiration for late-19th-century Russian fiction, then becoming available in English for the first time, was visible in the humane sensitiveness and fluid organization of his work.

The early development of modem poetry. How "modern" poetry emerged in the early years of the century is not wholly clear; and it was certainly more than a swift and drastic substitution, in the first decades of the century, by two American-born poets, Ezra Pound and T.S. Eliot, of realism and intelligence for escapist romanticism. Throughout these years there was a clear tradition of verse that dealt with everyday life and used everyday language—characteristics of much modern verse—and there was no lack of vitality in poems written about this time by Hardy, Edward Thomas, and D.H. Lawrence. The poetry that appeared in Georgian anthologies, however, does offer a useful contrast to what was to become a dominant 20th-century poetic idiom. These anthologies arose out of a feeling among poets who about 1910–11 were beginning to complain that their poetry was neglected in comparison with that of established poets—Robert Bridges, John Masefield, and Lascelles Abercrombie, for example. Rupert Brooke and Edward Marsh decided there was a need to make new poetry more accessible to the public and, with Harold Munro, editor of *The Poetry Review*, John Drinkwater, and Wilfrid Wilson Gibson, they planned the anthologies. They aimed to make people aware that poetry was being written and could be bought, read, and enjoyed. Brooke and Marsh applied the name "Georgian" to suggest that a new poetic age had opened with the accession of George V (1910).

The Georgian poets

Though their work remains readable, the poets represented in the anthologies did not wholly bear out the promise of a new age. The real gifts of Rupert Brooke, W.H. Davies, Walter de la Mare, Edmund Blunden, and Ralph Hodgson should not be overlooked; but, taken as a whole, too much of the Georgians' work was lifeless or repetitive. As a result, "Georgian" came to be used in a sense not intended by its progenitors: rooted in its period and looking backward rather than forward. Even the work of Hardy and Edward Thomas hinted at weaknesses that later proved decisive: both were inspired by nature and the countryside, but it was already to some extent a nostalgic inspiration, for to most young English poets nature could no longer be at this time a source of deep inspiration. For this reason, the manner and themes of these poets easily became, in the hands of others less gifted, diluted and middlebrow; and it was against this that the avant-garde authors of the period reacted.

The work of D.H. Lawrence was not in total contrast with that of the Georgian group, but from the start his insistent originality and responsiveness to experimentation outside England showed in his verse as in his prose. His earliest poems were written in traditional forms; but from about 1915 his original and cosmopolitan outlook led him to reject conventional lyric forms for the sake of a blunt yet sometimes delicate spontaneity, and it was this that made him one of the first major English poets to use free verse. As developed in France, *vers libre* (free verse) meant a defiance of the rigid exigencies of French metre, which was determined by the number of syllables. According to *vers libre* theory, what mattered was musical cadence rather than the number of syllables, and consequently the prosodic unit became the phrase rather than the foot or the line. Lawrence responded to this continental influence but in his own distinctive way: for him free verse was a means of embodying the unconstrained and vital immediacy of experience.

Although embracing more than versification, the movement called Imagism also had as one of its principles "to

The Imagist movement

compose in sequence of the musical phrase, not in sequence of the metronome." The most important writers associated with the movement were Pound and Eliot; T.E. Hulme, a philosopher, aesthetician, and poet whose emphasis in his essays on the precise use of words and the psychological effect of juxtaposing concrete images provided the movement's metaphysical background; F.S. Flint, a poet; Richard Aldington, a poet and novelist who contributed to all four Imagist anthologies and who was on the staff of *The Egoist,* unofficial organ of the group; and his wife, the poet Hilda Doolittle ("H.D."). The first "Imagist manifesto" (in *Poetry,* Chicago, 1913) was based on ideas of brevity, rejection of rhetoric, and truth to perception. The movement itself was short-lived, though its effects were considerable. It showed one more aspect of a varied and self-conscious reaction, about 1910, against rhetorical diffuseness and dilution.

William Butler Yeats had, before 1900, recognized something of this in 19th-century poetry and had declared that true poetry could be written for scholars or for peasants but for no one in between. In so saying he was responding to the indigenous peasant life of his own country, Ireland, on the one hand, and to France (as a source of literary ideals), on the other. He turned from English Victorian poetry to the uncompromising work of the French Symbolists. During the 1900s Yeats, both in poetry and in plays written for the Dublin Abbey Theatre, was breaking with literary mannerisms such as he had owed to the Pre-Raphaelites. He was turning, however, not to the "ordinary life" or "ordinary speech of the middle class but to a diction he found among the peasantry or the landed Ascendancy of Ireland and to an austere ideal of poetic drama remote from the everyday.

From about 1910 onward, Pound and Eliot constituted a sophisticated minority movement that looked to the Symbolists and to the French poet Jules Laforgue as models; and their poetry must be seen as a deliberate reaction against more conventional work accepted by a large middlebrow audience. Moreover, it turned emphatically away from nature and the countryside to represent attitude and interests of a metropolitan intellectual elite.

World War I's impact and the years to World War II. Even as early as in Eliot's *Waste Land* (1922) something was to be observed in literature that was fundamentally different in kind from what had gone before. What this poem attempted lay quite outside the interests and range of the Symbolists. It sought to depict the plight, indeed, the breakdown, of a whole civilization. This fundamental change of direction could be seen in the sharp break between early war poets such as Julian Grenfell and Rupert Brooke and later ones such as Siegfried Sassoon, Wilfred Owen, and Isaac Rosenberg. The early poets of World War I inherited their attitude from literature about wars in the past; what dominated the work of the later poets was a tragic sense of the sufferings that this war had brought, or angry satire directed against those who endorsed and prolonged it. In their poems written after 1920, Pound and Eliot shared the concern that mankind had reached a time of crisis and that the urgent call on the poet was to confront it. The poet's utterance rose from social satire almost to prophecy. Yeats, who had a long personal association with Pound at this time, was moving in the same direction, as was plain in poems such as "The Second Coming."

World War I had a decisive effect on fiction as well as on verse, though its impact showed itself in rather different ways. The early years of the century saw a resurgence of political liberalism, which enjoyed a great victory in the election of 1906 and which in the following years was responsible for the Britain of social welfare and material advance that was to become a pattern for the future. This liberalism was reflected in the intellectual life in the great houses of leading aristocratic families, and it had a certain affinity with more radical groups such as those of the Fabian Society. In general, the writers and intellectuals who formed this circle—Beatrice and Sidney Webb, George Bernard Shaw, Virginia Woolf, and E.M. Forster—were characterized by the term Bloomsbury group, in reference to the university area of London in which many of them lived and worked. In culture the word liberal during these years pointed to a whole movement of emancipation, humanity, and concern for the higher and finer values of life.

This intellectual liberalism was reflected in the novels of E.M. Forster and Virginia Woolf, whose values were those of the true liberal intellectual. Nonetheless, their work leaves an impression—clear even in a novel such as Forster's *Where Angels Fear to Tread* (1905) from before World War I—that there was a weakness in their position that might make it untenable in the postwar world. In Forster, as in Virginia Woolf's first postwar novel, *Jacob's Room* (1922), a concern for freedom, individuality, and the development of the personality was combined with a fear that these qualities lacked strength to survive in the violent modern world. Even in these authors' best work some readers discerned a lack of vitality or conviction.

It would be doctrinaire, however, to see Virginia Woolf as primarily a representative of liberalism. *Mrs. Dalloway* (1925) might show a consciousness of tyranny over the individual; *To the Lighthouse* (1927) might show the self-doubts and tensions of the intellectual; *Between the Acts* (1941) might hint at how the life of a nation is affected by its environment and history. But, in each case, what gave these books their distinction and power was their compassionate awareness and a rare delicacy of response to the world of intuitive consciousness and spontaneous feelings.

The novels of Aldous Huxley signalled a new stage in the anxieties of a liberal intellectual confronted by the modern world. Huxley seemed to doubt not only the ability of liberal culture to survive but the reality of that culture itself: his portrayals seemed like the work of one who had lost faith in what he depicted and who was preoccupied with its destruction at the hands of the violent and irrational, especially in his early novel *Crome Yellow* (1921). His brilliance and lively, witty display of ironic intelligence only emphasized the emptiness that he found at the centre of a culture to which he still belonged. In comparison with those of Forster and Virginia Woolf, his novels seemed to many to lack the sense of values, the humane responsiveness to life, and (in the case of Woolf) the sensuous poetry that made their work positive in its ultimate quality.

The sometimes almost hysterical satire of Huxley's later novels, such as *Eyeless in Gaza* (1936), had a counterpart in the cynical attitude to liberal culture of Evelyn Waugh, particularly in such satirical novels as *Decline and Fall* (1928), *A Handful of Dust* (1934), and *Brideshead Revisited* (1945). It was only in the context of this developing attitude that feelings conveyed by the novels of Graham Greene (*Brighton Rock* [1938], *The Heart of the Matter* [1948], *The End of the Affair* [1951], for example)—that man's life, if lacking in a sense of religion and, more particularly, of sin and a need for grace, was essentially drab, futile, and horrifying—could be rightly understood.

A very different writer, T.E. Lawrence, the famous "Lawrence of Arabia," is remembered in the literature of the age for *Seven Pillars of Wisdom* (1926), a dryly mannered but powerful and authentic autobiographical account of the Arabian struggle for independence from the Turks, in which he played a leading role.

Some of the earlier novels of Wyndham Lewis, such as *The Apes of God* (1930), with their disgusted sense of the triviality underlying much cultivated or "intellectual" life, were reactions to social change in something of Huxley's manner. But Lewis' work registered a more deeply felt and pondered awareness of the realities of a modern, machine-age society than did Huxley's, as may be seen in *Tarr* (1918) and more fully developed in *The Childermass* (1928), *The Human Age* (1955–56), and *Self-Condemned* (1954). Lewis saw the machine and city as menacing individual personality because something in man himself accepts and responds to mechanical control. His insight into fundamentals of modern life is at once intellectualized and humane, and it constituted a notable positive achievement.

Influences on Joyce

James Joyce. Joyce's first affiliations were with Dublin and with the 1890s; and something of the conviction that art was and should be a self-contained world of its own remained through all his work. Some of his later realism he might have owed to Ibsen or to such French Realist fiction as that of Zola. But his unique style seemed to have emerged mainly from contact with Pound and Eliot and the French writers who had influenced them. In his later prose ***(Ulysses*** [1922], ***Finnegans Wake*** [1939]) Joyce crystallized the reaction from middlebrow writing toward a style in which art made no compromise with the reader. Ideas come one after another in apparently unpremeditated but highly organized juxtaposition. The effect was to present what seemed like the disorganized thinking of a character who was bringing his thought only partially into conscious focus. In developing this style Joyce created a dense texture of associations that purported to represent the mind at work. Yet ***Ulysses*** was not only a work of stylistic virtuosity: Joyce's constant experimentation with language created a total impression of daily life in a large city (Dublin) that had few if any parallels in literature and that was also outstanding for its interpenetrating humour and humanity.

D.H. Lawrence. Coming from England's north Midlands, where rural life was fast giving place to industrialism, D.H. Lawrence was influenced by Thomas Hardy, who shared something of his experience of the passing of an old way of life. His earlier novels frequently rehearsed his own development: the central character outgrows provincial origins and acquires a modern, urbanized, or cosmopolitan consciousness. This was clearest in ***Sons and Lovers*** (1913) and ***The Rainbow*** (1915).

Lawrence's hostility toward modernity

As his acquaintance with modernity extended, Lawrence seemed to become more and more aware of its dangers and to set himself more and more urgently to find some solution for them. At the core of his novels lay a conviction that men were being deprived of traditional sources of strength, balance, genuineness, and dignity and that they could replace these only by rediscovering the source of life-giving spontaneity that they all possessed in their own innermost selves. Lawrence's treatment of sex was subordinate to this; for him, it was in their sexual lives that men could be most genuinely themselves and least the puppets of a machine age. This was revealed most clearly in short stories such as "The Captain's Doll" and "The Fox" and a short novel such as ***St. Mawr.*** From this conviction—that the truest, most unassailable source of vitality resides in the psyche—Lawrence was naturally drawn toward technical experiments not altogether unlike those practiced by Pound, Eliot, and Joyce. In the fluid, episodic construction of his later novels (notably ***Women in Love*** [1920]), with their seemingly disjointed characters who yet have an intense reality and individuality, he too displays something of the trends of the time.

But Lawrence, as he himself recognized, sought the deepest values of life, though he did not always master them. His successes came out of the intensity of his effort, but his work often displayed a bullying insistence that, when truest to himself, he rejected. Yet it is easy to forget his faults and to remember instead his astonishing vitality, often sharply perceptive intelligence, immensely real and tender sense of life's potentialities for good, and passionate stand for the real against the sham.

W.B. Yeats. Like Lawrence, Yeats too was forced to a reappraisal of a local and traditional culture by the threat of modernity. His earliest work was a product of Celtic legend, Irish peasant life, and the aesthetic movement of the 1890s. But more and more he was drawn into the modern world: first, by the part he played in the Irish dramatic movement (see below ***Anglo-Irish);*** then by the "troubles" in Ireland before and after 1920; and, more generally, by an awareness that the values that he most cared for were being threatened by "new commonness" on every hand.

Yeats's interest in the occult

Troubled more and more deeply after 1920 by a sense of living in a hostile world, Yeats turned again, but with a disciplined intensity, to the occultism and esoteric philosophies that had interested him as a young man. It was out of this material that he developed his later views, expressed in ***A Vision*** (1925), asserting that human vitality was in itself an answer to what was dehumanizing in modern life and looking back to the ordered society of the 18th-century Irish Ascendancy, based on a way of life rooted in the land but essentially aristocratic, rhetorical, and stylized.

Other writers. Other authors between 1920 and 1950 responded to what they sensed as a period of crisis in human affairs. L.H. Myers, especially in ***The Root and the Flower*** (1935), showed Lawrence's concern for what was real and what was sham in life, though he lacked Lawrence's gift for embodying a philosophy in narrative form. Joyce Cary, in such novels as ***The Horse's Mouth*** (1944) and ***A Prisoner of Grace*** (1952), attempted to deal with the disintegrating impact of war and modernity but reasserted the power of the simple human emotions. and especially of social and family affection, to overcome it. George Orwell, despite a conventional background of Eton and service in Burma in the Anglo-Indian police, showed perceptiveness and vigour in semi-autobiographical writings about the life of the underdog ***(Down and Out in Paris and London*** [1933], ***The Road to Wigan Pier*** [1937]), works remarkable for simple directness of style, free from all "literariness" and formality. By a repudiation of the upper class, empire-building ethos of the "English gentleman," he prepared the way for much of interest in later English writing. His postwar novels, ***Animal Farm*** (1945) and ***Nineteen Eighty-four*** (1949), rendered unforgettable by a deep general pessimism about the future of mankind, reflected more particularly a disillusionment with Stalinist Russia as the embodiment of Socialism. The Hungarian-born Arthur Koestler, who migrated to England in 1940, was another notable writer of fiction and essays with marked political interests. ***Darkness at Noon*** (1940) is a powerful novel of the Stalinist purges, and in his autobiography ***(Scum of the Earth*** [1941]) and essays (*e.g.*, ***Reflections on Hanging*** [1956], ***The Act of Creation*** [1964]) Koestler shows greater affinities with continental traditions than most English writing of the period does.

The poets of the 1930s

Although the best known poets of the 1930s followed Pound and Eliot in their satire and terse colloquialism, for the most part they did not continue the Symbolist side of their work. This partial lack of continuity was an indication of the new social and political conditions that were being reflected in the writing of the period before World War II. From the ***New Signatures*** anthology (1932) onward, W.H. Auden, Stephen Spender, Louis MacNeice, and C. Day Lewis were writing verse with a markedly left-wing political involvement—a reflection of the period of the Spanish Civil War, idealism about the Soviet Union before the "purges," and the political Popular Front in France. More diffuse than T.S. Eliot, and more traditional than his work up to that time, their verse revealed the poetry of Gerard Manley Hopkins (written 1884–89; published 1918) as an important influence in technique and that of Thomas Hardy as influential for its plainness of diction and lyricism. But Hopkins' obscurity, compression, and bold linguistic experimentation were not followed, so that his influence was seen mainly in a rhythmic fluency derived from a use of irregular metrical patterns called "sprung rhythm." While these poets of the 1930s used plain language to reach a wider audience rather than as a sophisticated revolt against poetic orthodoxy, much of their verse sacrificed depth of vision and particularity of language for a too journalistic or too doctrinaire engagement with politics. MacNeice, after World War II, finally found a new medium in radio drama. Spender, in some ways a more personal poet than the others, increasingly turned his gaze from the external, topical situation to subjective experience and, after 1939, was better known for his perceptive criticism and editorial association with the influential reviews ***Horizon*** and ***Encounter*** than as a poet. Day Lewis, the least adventurous of the poets of the 1930s, reverted in later work to a quiet, meditative, and discursive style, more "Georgian" than contemporary. Auden—who, like Christopher Isherwood (see below ***Drama in the first half of the 20th century***), later became a United States citizen—continued to develop significantly as a poet (see below *Poetry after* 1945).

The decline in technical experimentation

The changing scene after 1930. Broadly speaking, the avant-garde movement represented by Joyce, Pound, the early Eliot, Virginia Woolf, and D.H. Lawrence was only briefly dominant. L.H. Myers and Orwell made no original contribution to technique, and Cary was, in the main, a traditional novelist, writing in the chronicle form and owing much to Dickens. But since the political poets of the 1930s were more interested in content and wide readership than in form, after 1930 both fiction and verse began to make a significant break with the immediate past and to regain some continuity with 19th-century and earlier trends in English writing. The period of the Continent's strongest influence was over. Almost imperceptibly, new writing came to be coloured by something more popular in quality and to read as if written for an audience both larger and at the same time more limited and insular in outlook.

T.S. Eliot's conversion to the Church of England in 1927, and his profound study during this period of Dante, marked something of a turning point in both his prose and his poetry. Emphasis on literature as art and on the poet's need to break with the past (expressed in an essay, "Tradition and the Individual Talent" [1917], and in *The Sacred Wood* [1920]) was replaced by concern for the interrelation of literature, society, religion, and culture (*The Idea of a Christian Society* [1939], *Notes Towards the Definition of Culture* [1948]). And in the poetry from "Ash Wednesday" (1930) to *Four Quartets* (1943), Eliot's reappraisal of the crisis of contemporary civilization in terms of his own religious experience led to a widening of philosophic outlook as well as to a new feeling for English writing of the 17th and 18th centuries. Many people who had acknowledged Eliot's earlier greatness, but who did not accept his later religious and ecclesiastical opinions, all the same found in his later poetry a fundamental spiritual experience that had not been present in the earlier, more experimental work.

Pound and the earlier Eliot had been part of a small elite group writing in reaction to an effete literary "Establishment." The same ends were being served by such critical reviews of the time as *The New Age* (1908–21), which published much of Pound's early criticism. The literary movement of the first 30 years of the century comprised a comprehensive set of new principles about writing expressed by such philosophic critics as T.E. Hulme and a new evaluation of English literature based on these principles.

In time, these minority views, in becoming those of the majority, tended to be changed, partly because of an expansion of higher education and, in consequence, the growth of a sizable reading public of a new kind. This educational change had been brought about by social change: the advance of the lower middle and working classes to positions of much greater prominence and influence in the life of the country. Literature after 1930 was coming to be written and read by those with a new outlook and new interests that were more earnest and more straightforward than what had gone before. The reaction, led by Pound and Eliot, against the "ivory tower" of the aesthetic movement became more taken for granted. That literature should be intelligent and "common-sensical" also became an accepted view, as did the concept of fiction as mainly interesting for the light it shed on moral values and on how men ought to live. These changes were powerfully advanced by the critical writings of F.R. Leavis, an acute, uncompromising, passionately engaged critic whose influence was diffused, from the 1930s onward, through his teaching at Cambridge and through *New Bearings in English Poetry* (1932), the magazine *Scrutiny*, and *The Great Tradition* (1948). A somewhat distinct critical movement, begun in the 1920s by I.A. Richards with *The Principles of Literary Criticism* (1924) and *Practical Criticism* (1929), was equally directed toward the view that literature and its study were social disciplines, capable of close, quasi-scientific analysis.

The new criticism

Partly because the changes were already underway, World War II had no effect on writing comparable to that of World War I. Only three war poets (all of whom died in the war) achieved even minor distinction: Alun Lewis, with a few poems that showed promise of an assurance he did not live to develop; Sidney Keyes, whose *Collected Poems* (1945) made an impression greater than their achievement warranted; and Keith Douglas, who, of the three, was the only one to show an original poetic response to the fact of war and a potential greatness.

But none of these poets made more than a passing impact. The pervasive literary transformation was already taking place as a reflection of a social transformation. The political poets of the 1930s were lucid, even diluted, by comparison with Pound and Eliot. William Empson, George Barker, and Dylan Thomas were the most important poets of that decade to write verse that was in any way "difficult." Of the three, Barker and Thomas were the most visionary and apocalyptical and also the most uninfluenced by the mainstream of English poetry in the 1930s.

Drama in the first half of the 20th century. Developments in English drama in the early years of the 20th century showed a complex interaction of indigenous forces and continental influence. A vogue for Henrik Ibsen's drama of social comment came to dominate the English theatre in the 1890s and strongly influenced the early plays of George Bernard Shaw. As he went on, Shaw's material increasingly diverged from that of Ibsen: the incisive, if hilarious, political involvement and topicality of the early plays (such as *Man and Superman* [first performed 1905] and *Major Barbara* [1905]) changing into the much more timeless and speculative interests of the later ones (such as *Back to Methuselah* [1922], *Saint Joan* [1923], and *Geneva* [1938]). James Joyce's *Exiles* (1918) was another play to show Ibsen's influence. John Galsworthy, in *The Silver Box* (1906), *Strife* (1909), and *Justice* (1910), at least succeeded in showing that a didactic aim and a serious theme—that of social justice—could be good theatre. Harley Granville-Barker, with some notable works, especially *The Voysey Inheritance* (1905), treated the conflict between public and personal moral responsibility with intellectual subtlety and feeling. The "Manchester school" of playwrights wrote plays that at their best were both realistic and good theatre—Stanley Houghton's *Hindle Wakes* (1912), for example. But the most important development of the period was in poetic drama; and the greatest contribution came from Ireland (see below *Anglo-Irish*).

The revival of verse drama

The revival of verse drama was continued in the 1930s by T.S. Eliot (*Murder in the Cathedral* [1935], *The Family Reunion* [1939]). His lead was followed by other writers, including Auden and Isherwood, who collaborated in political verse plays, notably *The Dog Beneath the Skin* (1935) and *The Ascent of F 6* (1936). Eliot inspired a group of religious poets and verse dramatists, including Ronald Duncan (*This Way Is the Tomb* [1945]), Norman Nicholson (*The Old Man of the Mountains* [1946]), and Christopher Fry. Fry, influenced by Charles Williams, a Christian apologist with unusual power to present theological ideas symbolically in an everyday setting (such as *The Place of the Lion* [1931]), developed a colourful if somewhat precious style of his own in his best plays, notably *The Lady's Not for Burning* (1948).

Directions of writing after World War II. *Poetry after 1945.* Empson and Thomas represented a recession rather than a continuance of the early Pound–Eliot line. Later poets were influenced by Empson's criticism (*Seven Types of Ambiguity* [1930], *The Structure of Complex Words* [1951]) as well as by his poetry, but they adopted his laconic wit and nonchalant tone rather than his cramped intense feeling and intellectual ingenuity. Many who seemed to have learned something from Empson, such as John Wain, Donald Davie, and D.J. Enright, drew as much or more from the poet, novelist, and critic Robert Graves. Graves, especially in poetry, preserved a continuity with an earlier tradition of English writing. In his novels the creative use of myth and history sprang from idiosyncratic erudite interests (as he outlined in *The White Goddess* [1948]); in criticism he was a pioneer of close analysis. Like W.H. Auden, however, he to some extent withdrew from the battle.

Auden's later poetry, like that of T.S. Eliot, was partly religious in inspiration and showed a highly individual interest in historical learning and linguistic virtuosity (*About the House* [1965], *City Without Walls* [1969]). It maintained a continuity with his earlier poetry by its development of a certain lyrical quality and by use of a vocabulary and syntax reminiscent of Thomas Hardy rather than Pound or Eliot. Philip Larkin stated his belief that Hardy was the great and authentic poet of the 20th century; and Larkin's own work, especially in *The Less Deceived* (1955) and *The Whitsun Weddings* (1964), showed the influence of Hardy and Edward Thomas as well as a restrained but often lyrical quality of "Englishness." Roy Fuller (*Collected Poems* [1962], *New Poems* [1968]) illustrated, especially in his later verse, the terse and fluid elegance of this trend at its best.

Characteristics of the "new poetry"

By the 1960s shrewd common sense, carefully calculated tone, disciplined craftsmanship, and sharp intelligence had become dominant in new English verse, particularly that included by A. Alvarez in a collection, *The New Poetry* (1957), which contained work of important British poets of the period after World War II. Three of these, Thom Gunn (*Fighting Terms* [1954], *My Sad Captains* [1961], *Touch* [1967], among others), Ted Hughes (*The Hawk in the Rain* [1957], *Wodwo* [1967], *Crow* [1971]), and Davie (*Essex Poems* [1969]), were generally ranked with Larkin as being outstanding poets of this period, although writing in very different styles. Hughes showed the influence of D.H. Lawrence's early verse in much of his poetry, while Gunn showed the influence of continental and American writing. Later judgments rated American-born Sylvia Plath no less highly as an outstanding poet writing in England during this period. The wife of Ted Hughes, she achieved in her early delicate work, *The Colossus* (1960), distinction that foreshadowed the achievements of the posthumously published *Ariel* (1965) and *Crossing the Water* (1971), in which she confronted the most painful and terrifying possibilities of death and oblivion with skill and intelligence.

The work of Charles Tomlinson (*A Peopled Landscape* [1963], *The Way of a World* [1969]) showed the influence of the U.S. poet Wallace Stevens, but without the latter's flamboyance and philosophizing. Tomlinson's best work was notable for its scrupulous precision of workmanship and delicate integrity of vision. Elizabeth Jennings shared with other poets of the period a quality of plainness, clarity, and directness in such collections as *A Way of Looking* (1955) and *Collected Poems* (1967). Another widely admired poet of the 1950s and 1960s was a Welsh clergyman, R.S. Thomas (*Song at the Year's Turning* [1955], *Pietà* [1966]), who resembled Wordsworth in technique but whose abrupt and tight-lipped utterance placed him in the mainstream of the poetry of the time.

Postwar fiction. It became clear, after 1945, that a second literary revolution was in progress, though one less spectacular and on the whole less interesting than that of the 1910s. The change may perhaps be seen by a comparison of Virginia Woolf with Elizabeth Bowen (*The Death of the Heart* [1938], *The Heat of the Day* [1949], *Look at All Those Roses* [1941]). The latter's feeling and subject matter were not unlike Virginia Woolf's, but her framework of ideas was slighter and her technique much more conventional. Only one earlier novelist of high distinction continued into the 1950s and 1960s something of the originality and the technical innovation of an earlier generation. This was Ivy Compton-Burnett (*Pastors and Masters* [1925], *A House and Its Head* [1935], *Parents and Children* [1941], *The Present and the Past* [1953]). Ostensibly her narrow but deeply worked achievement is to deal closely with upper middle class family life in the countryside of late Victorian England. But character and incident are intensely stylized, and the dry wit of a ruthlessly sustained dialogue suggests an elaborate hidden world of aggression, vanity, deprivation, and tangled family affection and hatred. As a result, her work is both timeless and intensely dramatic.

Ivy Compton-Burnett has a limited link with the stylishness and wit of such early-20th-century novelists as Frederick Rolfe (*Hadrian the Seventh* [1904] or Ronald Firbank (*Concerning the Eccentricities of Cardinal Pirelli* [1926]) and ultimately with a 19th-century novelist such as Meredith. But this, in suggesting certain continuities for her work, also shows her isolation. Postwar, the movement away from avant-garde and also from upper middle class fiction became clear. Angus Wilson (*The Wrong Set* [1949], *Hemlock and After* [1952], *Anglo-Saxon Attitudes* [1956], *No Laughing Matter* [1967]) dealt with current middle class conditions and predicaments with mingled irony and compassion, but through loosely episodic plots, characters reminiscent of Dickens, and a general adherence to traditional modes. C.P. Snow (*Strangers and Brothers* [1940], *The Masters* [1951], *Corridors of Power* [1964]) and William Cooper (*Scenes front Married Life* [1961]) also wrote fiction that was traditional in form, dealing with the postwar middle class world of bureaucracy and social life, though Snow did not achieve Cooper's lightness and colour. The latter's *Scenes from Provincial Life* (1950) broke new ground in its relaxed but witty and frank portrayal of the life of young and obscure people in the provinces, though it cannot be seen merely as a forerunner of others. Cooper's relaxed satire came out of an attitude of general acceptance, but several later novelists, such as Kingsley Amis (*Lucky Jim* [1954], *Take a Girl Like You* [1960], *The Anti-Death League* [1966]) and John Wain (*Hurry on Down* [1953], *Living in the Present* [1955], *The Smaller Sky* [1967]), who emerged in the 1950s seemed to be in deliberate revolt against earlier avant-garde ambitions, hostile to anything that smacked of the "highbrow" or "phoney." As *a* result, they and others came collectively to be known as the "Angry Young Men." Forerunners of these attitudes can be found in the lower class provincial setting and in the rejection of "highbrow" values found in such early-20th-century writers as Bennett and Wells.

The "Angry Young Men"

A striking development of the later 1950s and early 1960s was the emergence of an authentic working class or near-working class fiction. It was remarkable that this took so long to happen, but with the arrival of John Braine (*Room at the Top* [1957], *Life at the Top* [1962]), Alan Sillitoe (*Saturday Night and Sunday Morning* [1958], *The Loneliness of the Long Distance Runner* [1959]), Keith Waterhouse (*Billy Liar* [1959]), Sid Chaplin (*The Day of the Sardine* [1961]), Stan Barstow (*A Kind of Loving* [1960]), and above all David Storey (*This Sporting Life* [1960]) a vigorous fiction dealing with working class life from something like a working class point of view came into being. There may have been little or no innovation in technique, but this far from negligible development should be seen alongside the assertion of a north-of-England cultural distinctiveness, the increased opportunities for working class children to take part in higher education at all levels, and the impact of a book like Richard Hoggart's picture of present-day English working class culture, *The Uses of Literacy* (1957). These novelists may have developed from Wain, Amis, and the rest in what concerns their attitudes and technique, but whereas the earlier group largely dealt with "opting out" of middle class situations, the later one concerned itself with the process of moving upward in working class life or with moving over into the middle class.

Certain other novelists may be loosely linked—sometimes even against their own professions—with this traditional and realist mode of writing. Thus Lawrence Durrell, author of *The Alexandria Quartet* (four novels, 1957–60), claimed that his fiction was based on the scientific principle of relativity, though little in his superficially scintillating work seemed to bear this out. Durrell's scintillations result chiefly from setting his fiction in an exotic foreign city, partial relic of the imperialist phase of British history. In almost the same years Anthony Burgess was writing his best work, *A Malayan Trilogy* (1956–59), in which satire, wit, vivid portraiture, and marked descriptive power embody a deep sense of the passing of the British "raj." These works, however (like Waugh's African novels or Graham Greene's *The Heart of the Matter* [1948] or *The Quiet American* [1955], set in Southeast Asia), also belong to a realist tradition in fiction. Malcolm Lowry's opulent and complex Mexican novel *Under the Volcano* (1947) is a notable work that also indirectly reflects the decline of the "raj." Burgess' varied output includes more experimental work, like the savagely violent near-farce *A Clockwork Orange* (1962).

The link with Iris Murdoch's work is more tenuous. An academic philosopher by early profession, her first novel (*Under the Net* [1954]) showed the influence of French Existentialist thought, while later works, such as *The Flight from the Enchanter* (1956), *The Bell* (1958), and *An Unofficial Rose* (1962), seemed less cosmopolitan. Her attempts to deal with the movements of deep human feeling (*e.g.*, *Bruno's Dream* [1969]), her poetic suggestiveness, idiosyncratic fertility of character and incident, and sometimes memorable use of archaic myth (*A Severed Head* [1961], *The Unicorn* [1963]) make her probably the most interesting and complex of English novelists to appear since the war.

With Iris Murdoch, however, the trend moved toward another continuity in fiction, one more romantic, philosophical, or indeed fantastic, which was less conspicuous because in the nature of the case it was more diverse—yet one that came to stand recognizably over against the "realist" continuity. Here, the Powys brothers, early in the century, were undoubtedly key figures. The most important novels of J.C. Powys (*Wolf Solent* [1929], *A Glastonbury Romance* [1932], *Weymouth Sands* [1934]) were set largely in "Wessex" and to some extent recalled the work of Thomas Hardy; but they showed originality in their variety and profusion, eloquent if sometimes artless power and depth, and intricate development of an almost transcendental awareness. Powys also had a certain kinship with Lawrence (who was in fact younger than he, though so much less long-lived). T.F. Powys, his brother, was part of the same development (*Mr. Weston's Good Wine* [1927]), as was L.H. Myers, with his Indian trilogy *The Root and the Flower.*

As the avant-garde movement receded, J.C. Powys came to seem less isolated and more important. Mervyn Peake's *Titus Groan* (1946), *Gormenghast* (1950), and the sketchier but no less remarkable *Titus Alone* (1959), written during his last illness, all displayed powers of rich description and fantastic but intense characterization in what can now be seen as an ambitious allegory of decline and modernity. Andrew Sinclair's erudite, bawdy rhetorical fantasy *Gog* (1967) seems to stem from Powys, though other novels (*My Friend Judas* [1959], *The Breaking of Bumbo* [1970]) are more conventional; a similar distinction shows in the fiction of John Fowles, as between his ambitious myth-novel *The Magus* (1966) and *The Collector* (1965) or *The French Lieutenant's Woman* (1969).

In this general context J.R.R. Tolkien's elaborately topographical "fairy tale," *The Lord of the Rings* (1954–56), may also be mentioned. Much of William Golding's work (*Free Fall* [1959], *The Spire* [1964], *The Pyramid* [1967]) has been notable for its imaginative and poetic qualities, though his most assured success is *The Lord of the Flies* (1954), which converts the children's desert-island adventure story into a horrifying moral fable of human evil nature and degeneration.

Certain writers stood outside the general picture. The fiction of the Irish-born, French-writing Samuel Beckett (see below *French literature in the 20th century*), in its compassion, anxiety, and daring stylistic experiments, looked back to the work of his friend James Joyce and to the innovators of the earlier part of the century. Another distinctive postwar novelist was Anthony Powell, whose saga *The Music of Time* (1951–) and earlier groups, including *Afternoon Men* (1931), showed the two aspects of his development. *Afternoon Men* had affinities with the satire of Evelyn Waugh and was concerned with bohemian London in the 1930s, while *The Music of Time* sequence recalled Marcel Proust and *The Alexandria Quartet* of Durrell. Powell's characteristically uppercrust, eccentric, or seedy world was unique in the fiction of the period.

Postwar drama. After World War II a significant change in English drama set in. It became Eliot's ambition to reintroduce a kind of verse drama into the commercial theatre. His position was thus already remote from that which lay behind his earlier verse; and later plays (*The Cocktail Party* [1949], *The Confidential Clerk* [1953]) were to be regarded as a distinctive kind of work for the commercial theatre rather than as verse drama in a more ambitious or poetic sense. Thus, even he, in his later drama, illustrated a movement away from avant-garde ideas of the 1920s toward a style more traditional in kind and general in appeal.

T.S. Eliot's later plays

From the late 1950s on, however, the most interesting theatrical developments were in prose, and to some extent went parallel with those in the novel. A number of young dramatists, for example, encouraged by the English Stage Company at the Royal Court in West London, Joan Littlewood's Theatre Workshop in East London, and several provincial theatres, rejected the middle-class interests and values of drawing-room comedy and depicted everyday attitudes and values in the postwar life of the common people. John Osborne's *Look Back in Anger* (1956)—followed by *The Entertainer* and other plays down to *West of Suez* (1971)—was a landmark at the beginning of this change. Other playwrights were Arnold Wesker (*Chicken Soup with Barley* [1958], *Roots* [1959]), whose loosely organized, panoramic plays often depended on explicitly left-wing political attitudes; John Arden (*Live Like Pigs* [1958], *Serjeant Musgrave's Dance* [1959]); Shelagh Delaney (*A Taste of Honey* [1958]); Charles Wood (*Cockade* [1965]); and Harold Pinter (*The Caretaker* [1960], *The Homecoming* [1965]), whose often highly stylized "absurdist" dialogue and action suggested a connection with Eugene Ionesco. Something similar may be said of Anne Jellicoe's richly inventive *The Sport of My Mad Mother* (1956) and *The Knack* (1961), where singing, games, and nonsense are woven into a complex of psychological perception. Freer methods of stage production, such as multiple simultaneous scenes and other innovatory techniques (*e.g.*, Wesker's *Their Very Own and Golden City* [1966], Donald Howarth's *A Lily in Little India* [1966], or Henry Living's *Eh?* [1965] and *The Little Mrs. Foster Show* [1969]) were also cause, as well as effect, of freer dramatic writing.

By the middle 1960s, direct social reporting and protest were in part giving way to plays that (though mostly in prose) showed more poetry, fantasy, and even "absurdist" stylization. Giles Cooper (*Happy Family* [1967]) and Peter Terson (*The Mighty Reservoy* [1970]) may be noted among many such writers, and others of interest were Tom Stoppard (*Rosencrantz and Guildenstern are Dead* [1968]), Peter Shaffer (*Five Finger Exercise* [1958], *The Royal Hunt of the Sun* [1964]), David Storey (*Home* [1970], see also above *Postwar fiction*), Peter Nichols (*A Day in the Death of Joe Egg* [1968], *The National Health* [1969]), and Joe Orton (*Entertaining Mr. Sloane* [1965], *Loot* [1968]). In this respect the influence of writing for radio drama was important. One of the earlier outstanding radio plays was Dylan Thomas' *Under Milk Wood* (1953). In later years one may note Barry Bermange's crisp but nightmarish *No Quarter* (1968) and Pinter's intensely dramatic interior-monologue piece, *Landscape* (1968). Robert Bolt's popular stage success *A Man for All Seasons* (1960) was one of many plays to succeed as films. Television also produced dramas of interest in the work of Dennis Potter (*Stand Up Nigel Barton* [1968], *Vote Vote Vote for Nigel Barton* [1968]) and John Hopkins (*Talking to a Stranger* [1967]), as well as popular successes like Jeremy Sandford's *Cathy Come Home* (1971). In all these interrelations between drama and the mass media, and with the increasing dominance of the visual dimension in much dramatic art, lie possibilities of change that may profoundly affect future literature—and perhaps increase its transient appeal while reducing its lasting value.

Television drama and film

Conclusion. A general view of the literary and cultural scene in Great Britain in the early 1970s revealed, in general, limited achievement and reason for disquiet. In all kinds of creative writing in the 1950s and 1960s it had seemed easy enough to find young writers of interest; but hopes of their maturing and consolidating their work were often disappointed, and an emergence of any genuinely major talent was lacking. This situation was perhaps associated in part with absence of literary continuity; older writers of outstanding achievement had fallen silent or, like Auden and Graves, had for many years been expatriates. Related perhaps to this limited literary achievement was the comparative poverty of nonliterary writing of a kind that provides an atmosphere in which creative writing itself may flourish. In the first half of the century there had been many prose writers whose work in one way or another bore strongly and directly on society and culture as a whole. The philosopher G.E. Moore, the psychologist Havelock Ellis, the critic and aesthetician John Middleton Murry, the philosopher and political theorist Bertrand Russell, the economist J.M. Keynes, the economic historian R.H. Tawney, the historian G.M. Trevelyan were all outstanding in a broad spectrum of intellectual and cultural life. T.S. Eliot was a major critical and cultural as well as poetic influence; F.R. Leavis' writings had marked significance in the field of social thought. But, in the second half of the century, philosophy, economics, and criticism all became more academic or technical; sociology seemed to replace social philosophy; and good political writing had long been rare. Thus, despite much good writing, the cultural climate as a whole was fragmented, specialized, lacking in the authority of profound nd widely meaningful achievement and tending to be indifferent or inimical t [illegible] ti life. The relative lack of major literary talent or achievement has to be seen in this perturbing context.

Scottish literature in English and Scots. Scottish prose fiction continued its traditional emphasis on physical description and reliance on action rather than on psychological subtleties, as was seen in the stories of John Buchan. More original were the witty and often fantastic narratives of Eric Linklater; the passionately written ***A Scots Quair*** (1932–34) of Lewis Grassic Gibbon; the Celtic visionary novels of Neil Gunn; and the sharp character studies of Robin Jenkins. The drama, revived to some extent by James Barrie (as in ***Dear Brutus*** [1917]), discovered a distinctively native voice in James Bridie, whose entertaining plays combined the humorous, ethical, and supernatural in a very Scottish manner.

Hugh MacDiarmid's poetry

It was in poetry that the greatest changes occurred. In the second decade of the 20th century the explosive personality of Hugh MacDiarmid became a centre and motive force of what has been called the Scottish renaissance. This movement, by re-expanding the Scots vocabulary after its stagnation following the great lyric poet Robert Burns, aimed to restore the intellectual prestige of Scots and break through the barrier created by the domination of the English language. MacDiarmid, in his encyclopaedic, polemical, metaphysical verse, himself wrote the best lyrics since Burns. He was followed by others, including Sydney Goodsir Smith and Douglas Young.

Of poets using English, Edwin Muir, with his meditative, myth-haunted verse, was the most distinguished, while Norman MacCaig, W.S. Graham, Edwin Morgan, George Mackay Brown, and Iain Crichton Smith wrote with craftsmanship and force. In a class by itself was the delicate experimental poetry of Ian Hamilton Finlay.

Although the Scottish sense of separateness was too real to be swamped, English was dominant in prose and educated speech, and the modern Scots poet needed to try many different forms in order to find his characteristic mode.

Anglo-Irish. At the end of the 19th century a new movement became apparent. In the 1890s two Irish dramatists appeared: Oscar Wilde and George Bernard Shaw. Although they were outstanding dramatists in the Anglo-Irish tradition, neither wrote of or for Ireland. A new movement, closely allied with a strong political nationalism, was growing quickly. This movement brought about a literary renaissance in both Irish and English. The latter, led by the poet William Butler Yeats, was deeply influenced by the work of Douglas Hyde, whose translations from the Irish were the model for the stylized peasant dialect used by Lady Gregory. Yeats and Lady Gregory were the founders of the first national Irish theatre, the Abbey Theatre, which soon made its name through the magnificent dramas of John Millington Synge, notably ***Riders to the Sea*** (1904) and ***The Playboy of the Western World*** (1907), which used the dialect evolved by Hyde and Lady Gregory with great beauty and power. Later, the theatre became absorbed in realism, mostly rural, apart from Sean O'Casey's three great dramas of the Dublin slums: ***The Shadow of a Gunman*** (1923), ***Juno and the Paycock*** (1924), and ***The Plough and the Stars*** (1926).

The plays of J.M. Synge

In poetry, besides Yeats there was George Russell, a mystic and patriot. Notable among their younger contemporaries were Padraic Colum, author of the beautiful "Drover," one of the finest poems in the language, and Seamus O'Sullivan, founder and editor of ***The Dublin Magazine***. The Republican movement also had its poets: P.H. Pearse, Thomas MacDonagh, and Joseph Mary Plunkett, all executed in 1916 after the Easter Rising.

In the novel there were historical tales by Emily Lawless and Standish James O'Grady and imaginative stories by James Stephens. By contrast there was also George Moore, who attached himself for a time to the Irish cultural movement; his irreverent account of its leading figures in ***Hail and Farewell*** (1911–14) was on the whole more readable than his novels.

By far the greatest of modern Irish writers was James Joyce, whose work, although it was complex and cosmopolitan in inspiration (see above ***English literature in the 20th century***), was firmly rooted in the daily life of Dublin. Like his friend Samuel Beckett (see below ***French literature in the 20th century***), who wrote mainly in French, Joyce left Ireland but never lost the essential "Irishness" of his character.

Writers such as Sean O'Faolain, who remained in Ireland after the achievement of independence in 1921, were most successful when treating the waning of the nationalist struggle or the failings of Irish Catholicism, as in O'Faolain's ***Bird Alone*** (1936) and ***Come Back to Erin*** (1940). In general, the short story, as written by Frank O'Connor and Liam O'Flaherty, was more successful. One exception, a writer who showed the direct influence of James Joyce, was Flann O'Brien (pseudonym of Brian Ó'Nualláin), who in a novel, ***At Swim-Two-Birds*** (1939), created a brilliant and under-rated experimental work.

Dramatists, while continuing to write on Irish themes, became more cosmopolitan in outlook and technique. At the Dublin Gate Theatre, founded in 1928, Micheál MacLiammdir appeared in and designed nearly 300 productions, including his own ***Ill Met by Moonlight*** (1946). Donagh MacDonagh broke new ground with ballad comedies in the style of the German dramatist Bertolt Brecht, but the most outstanding playwright was Brendan Behan, with a tragicomedy, ***The Quare Fellow*** (1954), and with ***The Hostage*** (1957).

Among poets, though no successor to Yeats emerged, Patrick Kavanagh showed originality and realism in ***A Soul for Sale*** (1947) and ***Come Dance with Kitty Stobling*** (1960); and Thomas Kinsella, in ***Another September*** (1958) and ***Nightwalker*** (1967), showed unusual mastery of subject and style. (See above ***English literature of the 20th century*** for separate mentions of Yeats and Joyce and other Irish-born writers.)

CELTIC LITERATURE IN THE 20TH CENTURY

Welsh. The establishment of the University of Wales (1872–93) widened literary horizons. Men like Sir Owen M. Edwards, Sir John Morris-Jones, and Emrys ap Iwan (Robert Ambrose Jones) made the Welsh conscious of their literary identity and set new standards for correctness of language and sincerity of thought. The great literary revival that followed was marked by T. Gwynn Jones's masterly use of the old strict metres to express modern thought and W.J. Gruffydd's lyrical use of the free metres to express his rebellion against society and his love for the countryside of his youth. R. Williams Parry showed a superb gift of poetic observation, while Sir Thomas Parry-Williams combined a mystical love for his native Gwynedd with an almost scientific analysis of his own instincts and emotions in relation to man's place in the universe. Older poets, such as Cynan (A. Evans-Jones), William Morris, and Wil Ifan (William Evans), clung to earlier lyrical models, although many others, like D. Gwenallt Jones and Saunders Lewis, drew increasingly on the rhythms and vocabulary of colloquial speech. Waldo Williams, Gwilym R. Jones, the younger Bobi Jones, and particularly Euros Bowen experimented with form and subject. Their work has been followed and developed by writers of the younger generation, the most distinctive and prolific being Gwyn Thomas. Most poets, old and young, reflect a varying involvement in contemporary Welsh political activity.

The high standard of the periodical Y *Llerzor* (1922–51) indicated the advances made in prose. Contributors were generally involved in a wide range of activities: its editor, W.J. Gruffydd, was both poet and essayist; Saunders Lewis was a poet, dramatist, and politician; Sir Thomas Parry-Williams a poet and essayist; and R.T. Jenkins an essayist and historian. Together with novelists and short-story writers like Tegla Davies, T. Rowland Hughes, Kate Roberts, and D.J. Williams, they effectively mirrored the contemporary Wales of which they were part. John Gwilym Jones and Islwyn Ffowc Ellis were innovators in form and subject matter, and they are being followed by an enthusiastic younger generation of writers of which none is, as yet, outstanding. As in other literatures, there has been an increasing preoccupation with, and an improvement in, literary criticism.

Drama in Wales began in the 20th century. At first realistic, it developed into poetic, symbolic drama, often based on historical and mythological themes but dealing with moral, social, and psychological contemporary problems. The outstanding names are Saunders Lewis, John Gwilym Jones, and, of the younger generation, Gwenlyn Parry.

Scottish Gaelic. A considerable amount of prose appeared in 19th- and 20th-century periodicals in the form of short stories and essays. Alongside these were numerous religious translations from the 17th century onward, including Calvin's catechism of 1631, Gaelic translations of the Old and New Testaments, Kirk's Psalter and his Irish version of the Bible, and the 1807 Gaelic Bible. Other translations included works by John Bunyan, Richard Baxter, Thomas Boston, and Philip Doddridge. Among original prose writers in the earlier part of the century were the Rev. Donald Lamont, Donald Mackechnie, and Angus Robertson. The most notable modern short stories have appeared from Colin Mackenzie, John Murray, and Iain Crichton Smith.

Little vital poetry appeared in the 19th century, and a 20th-century movement to free Gaelic poetry from its traditional shackles began with the work of Sorley Maclean, George Campbell Hay, and Derick Thomson. Later work in this vein came from Donald MacAulay and Iain Crichton Smith.

Valuable collections of poetry date from the mid-18th century. One of the earliest was that of the Rev. Alexander Pope. Jerome Stone collected Ossianic ballads, while James Macpherson's ***Fragments of Antient Poetry*** (1760) also stemmed from this collecting zeal. The work was continued in the 19th century by later scholars and clerics—for example, the Rev. Alexander Cameron's ***Reliquiae Celticae*** (1892–94), which printed the Fernaig manuscript, parts of the ***Books of*** *Clanranald*, and some of the Edinburgh manuscripts for the first time. Gaelic proverbs were published with an English translation by Donald Macintosh (1785), a new edition by M. MacInnes appearing in 1951. Frances Tolmie's collection of folk songs (1911), Margaret Shaw's *Folksongs and* ***Folklore of South*** *Uist* (1955), and J.L. Campbell and F. Collinson's *Hebridean Folksongs* (1969) continued the work in the 20th century, while the ***Transactions of the Gaelic Society of*** *Inverness* and ***Scottish Gaelic Studies*** have published much material from manuscript and oral sources.

Irish Gaelic. An antiquarian interest in the Irish language had begun early in the 19th century, especially among the comparatively small educated classes who spoke English. The movement suffered because speakers of Irish were a minority, and the language of Irish nationalist agitation had been English. As a result, the revival was led by antiquarians and nationalists rather than by the linguistic minority itself. Irish today is a minority language in the republic, although it has a firm place in the educational system.

The revivalists

The revivalists were faced with the problem of writing a language that had split up into dialects. The result was considerable linguistic diversity that continued until the mid-20th century, when a governmental standard was introduced. Patrick Pearse, a leader of the 1916 Easter Rising, and Pádraic Ó Conaire, who introduced the short story into Irish. were the first writers who took their craft seriously. Tomás Ó Criomhthain's *tOileánach* (1929; *Islandman*, 1934), the life story of a Munster fisherman, was a unique document. The short story had been handled in masterly fashion by Liam O'Flaherty, who also wrote in English (see above ***Anglo-Irish),*** and Máirtín Ó Cadhain. Generally, however, both the novel and the drama were undistinguished, excepting Brendan Behan's *Giall* (1957; *The* ***Hostage,*** 1958). While some lyric poetry was produced. no poet of Yeats's stature emerged.

Breton. The 20th century saw the publication of Jabez Riou's short stories in ***Geotenrz ar Werc'hez*** (1934; "The Virgin's Herb"), which were remarkably concise and unexpectedly combined sensitivity with profound skepticism. Youenn Drezen wrote one of the best modern Breton novels, *Itron* ***Varia Garmez*** (1942; "Our Lady of the Carmelites"). In drama the work of Tanguy Malmanche (d.1953) dominated the first half of the century, and it was compared with that of Paul Claudel and J.M. Synge. His work was carried on by Pierre Hélias, a talented younger writer who had written hundreds of radio plays and had had stage plays produced and whose writing was both popular and extremely polished. In poetry an outstanding figure was Jean-Pierre Calloc'h, killed in action in 1917, whose poems were published with a French translation in 1921 as *Ar en Deulin* ("Kneeling").

The struggle to resist the encroachment of French words and to make Breton self-sufficient continued, with the encouragement of many literary reviews and the work of scholars such as François Vallée, a lexicographer. In 1941 a new standardized spelling was introduced, not wholly successfully, and in 1951 Breton was given a place in state schools.

AMERICAN LITERATURE IN THE 20TH CENTURY

Writing from 1914 to 1945. Important movements in drama, poetry, fiction, and criticism took form in the years before, during, and after World War I. The eventful period that followed that war left its imprint upon books of all kinds, for it was a time when writers were much involved with interpreting life about them. Literary forms of the period were extraordinarily varied, and in drama, poetry, and fiction leading authors tended to experiment with radical innovations in technique.

Experiments in drama. Although drama in the 19th century had not been a pre-eminent form, no type of writing embodied wider experimentation than a new drama that arose as a result of rebellion against the glib commercial stage. In the early years of the 20th century, Americans travelling abroad found a vital theatre flourishing in Europe; returning home, some of them became active in founding a Little Theatre movement in every corner of their country. Freed from commercial limitations, playwrights experimented with dramatic forms and methods of production and in time producers, actors, and dramatists appeared who had been trained in college classrooms and community playhouses. Some Little Theatre groups became commercial producers; for example, the Washington Square Players, founded in 1915, which became the Theatre Guild (first production in 1919). The drama that resulted was marked by a spirit of innovation and by a new seriousness and maturity.

The plays of Eugene O'Neill

Eugene O'Neill, the most admired dramatist of the period, was a product of this movement. He worked with the Provincetown Players before his plays were commercially produced. His dramas are remarkable for their range. *Beyond the Horizon* (first performed 1920), *Anna Christie* (1921), *Desire Under the Elms* (1924), and *The Iceman Cometh* (1946) were Naturalistic works, while *The Emperor Jones* (1920) and *The Hairy Ape* (1922) made use of the Expressionistic techniques developed in German drama in the period 1914–24. He also employed a stream-of-consciousness form in *Strange Interlude* (1928) and produced a work of subtle psychological analysis in *Mourning Becomes Electra* (1931).

No other dramatist was as generally praised as O'Neill, but many others wrote plays of a high order that reflected the growth of a serious and varied drama. Marc Connelly wrote touching fantasy in a Negro folk biblical play, *The Green Pastures* (1930). Like O'Neill, Elmer Rice made use of both Expressionistic techniques *(The Adding Machine* [1923]) and Naturalism *(Street Scene* [1929]). Beginning as a Realist, Maxwell Anderson turned to verse drama in plays such as *Elizabeth the Queen* (1930) and *Winterset* (1935) and then to musical comedy satire in *Knickerbocker Holiday* (1938). Robert Sherwood produced a distinguished body of work, writing comedy *(Reunion in Vienna* [1931]) and tragedy *(There Shall Be No Night* [1940]). Clifford Odets, in *Waiting for Lefty* (1935), a plea for labour unionism, utilized auditorium as well as stage for action and in *Awake and Sing* (1935) wrote in the vein of Naturalism. Thornton Wilder used stylized settings and poetic dialogue in *Our Town* (1938) and turned to fantasy in *The Skin of Our Teeth* (1942).

Robinson and Frost

The new poetry. Poetry ranged between traditional types of verse and experimental writing that departed radically from the established forms of the 19th century. Two New England poets, Edwin Arlington Robinson and Robert Frost, who were not noted for technical experimentation, both won critical as well as popular acclaim in this period. Robinson, whose first book appeared in 1896, found sonnets, ballad stanzas, and blank verse satisfactory to his thought. In the 1920s he won three Pulitzer Prizes—for his *Collected Poems* (published 1921), *The Man Who Died Twice* (1925), and *Tristram* (1927). Like Robinson, Frost used traditional stanzas and blank verse in volumes such as *A Boy's Will* (1913), his first book, and *North of Boston* (1914), *New Hampshire* (1923), *A Further Range* (1936), and *A Masque of Reason* (1945). The best known poet of his generation, Frost, like Robinson, saw and commented upon the tragic aspects of life and the complexities of human existence and was skeptical of pat solutions.

Just as modern U.S. drama had its beginnings in little theatres, modern U.S. poetry took form in little magazines. Particularly important was *Poetry: A Magazine of Verse,* founded by Harriet Monroe in Chicago in 1912. The surrounding region soon became prominent as the home of three poets: Vachel Lindsay, Carl Sandburg, and Edgar Lee Masters. Lindsay's blend of legendary lore and native oratory in irregular odelike forms was well adapted to oral presentation, and his lively readings from his works contributed to the success of such books as *General William Booth Enters into Heaven, and Other Poems* (1913) and *The Congo, and Other Poems* (1914). Sandburg wrote of life on the prairies and in Middle Western cities in Whitmanesque free verse in such volumes as *Chicago Poems* (1916) and *The People, Yes* (1936). Masters' very popular *Spoon River Anthology* (1915) consisted of free-verse monologues by village men and women, most of whom spoke bitterly of their frustrated lives.

Writing traditional sonnets and brief, personal lyrics, Edna St. Vincent Millay and Sara Teasdale were innovative in being unusually frank (according to old standards) for women poets. Three fine Negro poets—James Weldon Johnson, Langston Hughes, and Countee Cullen—also found old molds satisfactory for dealing with new subjects, specifically the problems of their race. In general, however, the range of experimentation was great. While Conrad Aiken experimented with poetical imitations of symphonic forms often mingled with stream-of-consciousness techniques, e.e. cummings used typographical novelties to produce poems that had surprisingly fresh impact. Marianne Moore invented and brilliantly employed a kind of free verse that was to make her one of the most distinguished voices in modern U.S. poetry. Stephen Vincent Benét, in *John Brown's Body* (1928), produced a stirring novel in verse. Robinson Jeffers used violent imagery and modified free or blank verse to express perhaps the most bitter views voiced by a major poet in this period.

Pound, Eliot, and the influence of the 17th-century Metaphysical poets

Except for a period after World War II when he was confined in St. Elizabeth's Hospital, Washington, D.C., Ezra Pound had lived outside the United States since 1908. He had had, nevertheless, a profound influence on 20th-century writing in English, both as a practitioner of verse and as a patron and impresario of other writers (see above *English literature in the 20th century).* His most controversial work, which he was said to be revising in the early 1970s, remained *The Cantos,* the first installment of which appeared in 1925 and the latest in 1959 *(Thrones: 96–109 de los cantares).*

Like Pound, to whom he was much indebted, T.S. Eliot lived abroad most of his life, becoming a British citizen in 1927. His first volume, *Prufrock and Other Observations,* was published in 1917. In 1922 appeared *The Waste Land,* the poem by which he first became famous. As a poet and critic, Eliot exercised a strong influence, especially in the period between World Wars I and II. In what some critics regard as his finest work, *Four Quartets* (1943), Eliot explored through images of great beauty and haunting power his own past, the past of the human race, and the meaning of human history.

Eliot was the acknowledged master of many members of a varied group of poets whose work was indebted to 17th-century English Metaphysical poets, especially to John Donne. Eliot's influence was clear in the writings of Archibald MacLeish, whose earlier poems were similar both in manner and thought to *The Waste Land.* In later poems MacLeish voiced a positive belief in social advance that contrasted with the religious attitude advocated by Eliot. A number of Southern poets showed a loose affiliation and metaphysical influence; among them were John Crowe Ransom, Donald Davidson, and Allen Tate. Hart Crane had a similar metaphysical manner but a subject matter of his own. Other American metaphysicals having individual qualities of thought and method were Louise Bogan, Léonie Adams, Muriel Rukeyser, Delmore Schwartz, and Karl Shapiro.

The influence of the little magazines

Fiction. The little magazines that helped the growth of the poetry also contributed to a development of the fiction of the era by printing material that diverged from older patterns and by attacking conventional writing and established writers. The most powerful of the little magazines were two edited by the journalist-critic H.L. Mencken—The *Smart Set* (editorship 1914–23) and *American Mercury* (which he co-edited between 1924 and 1933). One of Mencken's favourites, James Branch Cabell, sprang to fame with *Jurgen* (1919), a novel that attacked America's orthodoxies and institutions. Other authors whom Mencken favoured launched "a revolt against the village," an attack on the narrow, provincial quality of much rural American life. The most distinguished of these was Sherwood Anderson, who dealt with the subject in two collections of short stories, *Winesburg, Ohio* (1919) and *Triumph of the Egg* (1921).

In 1920 a new school of fiction rose to prominence with the success of books such as F. Scott Fitzgerald's *This Side of Paradise* and Sinclair Lewis' *Main Street.* Thereafter, writers tended toward Realism and Naturalism—frank portrayals of contemporary life. Portrayal of character and motive was much influenced by the psychology of Sigmund Freud and others. In the decades that followed, fiction voiced reactions to changing times:

novels of the 1920s expressed disillusionment and protest against established institutions and ideologies. Some of those of the 1930s protested against the economic and political system. World War II led many novelists to see qualities of excellence in American life not before realized.

Critics of society. F. Scott Fitzgerald's ***This Side of Paradise*** (1920) showed the disillusionment and moral disintegration of post-World War I America. His masterpiece, ***The Great Gatsby*** (1925), was a more poignant and unified development of the same theme. Like Fitzgerald, Sinclair Lewis was best as social critic. His onslaught against the "village virus" (***Main Street*** [1920]); against average businessmen (***Babbitt*** [1922]); against materialistic scientists (***Arrowsmith*** [1925]); and against the racially prejudiced (***Kingsblood Royal*** [1947]) were satirically sharp and thoroughly documented. Similar careful documentation characterized James T. Farrell's Naturalistic "Studs Lonigan" trilogy (1932–35). Richard Wright protested against the plight of the Negro in ***Uncle Tom's Children*** (1938) and ***Native Son*** (1940). Particularly admired as a novelist of protest was John Dos Passos, who first attracted attention with an anti-World War I novel, ***Three Soldiers*** (1921). His ***Manhattan Transfer*** (1925) and the "U.S.A." trilogy (***The 42nd Parallel, Nineteen Nineteen,*** and ***The Big Money*** [1930–36]) employed various narrative innovations to attack society from the left. His later books, attacks on leftists, had less merit. A bitter vision of an inhuman and brutal world and a black-comedy style distinguish Nathanael West's novels, ***The Dream Life of Balso Snell*** (1931), ***Miss Lonelyhearts*** (1933), and ***The Day of the Locust*** (1939).

Hemingway, Faulkner, Steinbeck. Three Nobel laureates whose writings showed a shift from disillusionment were Ernest Hemingway, William Faulkner, and John Steinbeck. Hemingway's early short stories and first novels, ***The Sun Also Rises*** (1926) and ***A Farewell to Arms*** (1929), were full of the disillusionments of the postwar years, but the Spanish Civil War led him to believe in the possibility of collective action to solve social problems, and his novels ***To Have and Have Not*** (1937), ***For Whom the Bell Tolls*** (1940), and ***The Old Man and the Sea*** (1952) embodied the new belief.

William Faulkner brilliantly handled point-of-view, stream-of-consciousness techniques, and complex plots in a body of work concerned chiefly with a mythical Mississippi county, Yoknapatawpha. Such novels as ***The Sound and The Fury*** (1929), ***As I Lay Dying*** (1930), ***Light in August*** (1932), and ***The Hamlet*** (1940) presented a generally grim picture of the human condition, though more optimistic convictions emerged in ***Intruder in the Dust*** (1948) and ***The Reivers*** (1962).

Steinbeck's career, marked by uneven achievements, began with a historical novel, ***Cup of Gold*** (1929), wherein he voiced the distrust of society, the glorification of the anarchistic individualist typical of the rebellious 1920s. Later, however, a belief in the possibilities of collectivist action was implied in ***In Dubious Battle*** (1936) and ***The Grapes of Wrath*** (1939).

Lyric fictionists. An interesting development in fiction was a movement toward poetry. The tendency to select details and endow them with symbolic meaning, to stress thoughts and emotions, and to use rhythmical prose gave fiction more of a lyrical quality. In varied ways, Hemingway, Steinbeck, and Faulkner all showed the trend. Lyricism was prominent in such writings of Willa Cather as ***My Ántonia*** (1918) and ***Death Comes for the Archbishop*** (1927). Katherine Anne Porter, writing more in the style of the Metaphysical poets, used the stream-of-consciousness method in ***Flowering Judas*** (1930) and ***Pale Horse, Pale Rider*** (1939) with the complexity and the symbolic sophistication of poetry. Another leading poetic fictionist was Thomas Wolfe, the author of four large novels that in effect were one long lyrical recording of the author's life: ***Look Homeward, Angel*** (1929), ***Of Time and the River*** (1935), ***The Web and the Rock*** (1939), and You ***Can't Go Home Again*** (1940).

Criticism. The first half of the 20th century was noteworthy for its achievements in literary criticism. The period began with a battle between the New Humanists—a group supporting the older values in judging literature—and a group who urged that new standards be adopted. The Humanists were led by Irving Babbitt, who in books and vigorous essays attacked the modern tendency toward Naturalism as a vicious influence. The leader of the opposition was the pugnacious H.L. Mencken, who, notably in ***Prejudices*** (1919–27), claimed that the duty of writers was to present "the unvarnished truth" about life. In the end, the progress of Naturalism was assured, and literature was liberated from a number of ancient restrictions.

The New
Humanists
and their
opponents

In this period of social change, it was natural for a number of critics to consider literature's relationships to society and politics. They consistently judged books as reflections of society or as expressions of social truth. Van Wyck Brooks and Vernon Parrington wrote greatly admired studies that embodied such an approach. Two outstanding critics, Kenneth Burke and Edmund Wilson, stressed social influences less and illuminated literary works by analyzing them and relating them to their creators' sensibility.

After World War II. The United States emerged from World War II as a world power, and its literature correspondingly took on a new worldwide interest. Three of the nation's leading novelists received Nobel Prizes—Faulkner in 1949, Hemingway in 1954, and Steinbeck in 1962—but in each instance the award was presumed to have been made on the strength of work done in earlier decades. Other distinguished writers were also still on the scene, notably the poets Robert Frost, Wallace Stevens, Marianne Moore, e.e. cummings, William Carlos Williams, and Ezra Pound. But the most interesting work of these writers seemed to lie behind them. The period 1955–72 was marked by the deaths of Frost, Stevens, Faulkner, Hemingway, Cummings, Williams, and Pound. Impending for postwar writing, then, was a changing of the guard, but there was little agreement as to who were the most worthy successors. The literature produced between 1945 and the 1970s was characterized by a great diversity of style, goals, and accomplishments.

Fiction. The multiplicity and variety of postwar writing was nowhere more evident than in the novel and short story. Many writers who became prominent in the United States after World War 11—Henry Miller, Vladimir Nabokov, Eudora Welty, Mary McCarthy, John Cheever, Bernard Malamud, Ralph Ellison, William Burroughs, and Saul Bellow, for example—had very little in common except their ages: they all had been born before 1920. What was striking about these authors was the variety of their achievements. Miller came into his own as something of an American classic in the 1960s after a Supreme Court decision allowing the publication of his works in the United States. His ***Tropic of Cancer*** (1934) and ***Tropic of Capricorn*** (1939) contained uninhibited portrayals of sexual experiences that could, in the 1960s, be seen as characteristic of the general vitality and candour of Miller's prose. Nabokov, who became a U.S. citizen in 1945, had long been a master of high style and intricate literary effects before he won recognition with the publication of ***Lolita*** (1955) and ***Pale Fire*** (1962). His other novels written in English—The ***Real Life of Sebastian Knight*** (1941), ***Bend Sinister*** (1947), ***Ada or Ardor: A Family Chronicle*** (1969), and ***Pnin*** (1957)—together with those originally written in Russian—The ***Defense*** (1930), ***Camera Obscura*** (1933; Eng. trans., ***Laughter in the Dark,*** 1938), ***Invitation to a Beheading*** (1935), and ***The Gift*** (1937), for example—secured Nabokov's reputation as a writer of first importance. Eudora Welty, usually grouped with Southern writers such as Faulkner, Flannery O'Connor, and Carson McCullers, achieved immediate recognition with her first collection of stories, ***A Curtain of Green*** (1941), and went on to produce a distinguished body of work, both short stories and novels, chiefly in the postwar period. For all her brilliance as a stylist, her work was neither mannered nor precious. Mary McCarthy was perhaps better known as a critic, but ***The Groves of Academe*** (1952), ***The Group*** (1963), and ***Birds of America*** (1971) were novels

Nabokov's
novels
in
English

that often reflected an acute satirical intelligence. John Cheever, a writer long associated with *The New Yorker* magazine, was the author of five books of short stories and three novels, the last of which, *Bullet Park* (1969), showed a distinct turning to a highly satirical point of view. Like Saul Bellow, Bruce Jay Friedman, Philip Roth, and Herbert Gold, Bernard Malamud wrote of specifically Jewish subject matter in such novels as *The Assistant* (1957) and *The Fixer* (1966) and in his collections of short stories, such as *Pictures of Fidelman* (1969). Ellison's subject was the travail of the Negro in America, searching for "his place in history." He had thus far written only one novel, *Invisible Man* (1952), but it attained the standing of a contemporary American classic. Burroughs' first book, *The Naked Lunch* (1959), was made up of fragments, many of them considered obscene, from the life of a drug addict. His experimental techniques in prose as well as his unique vision had a great influence on younger writers. Bellow's subject—most notably in *The Adventures of Augie March* (1953), *Herzog* (1964), and *Mr. Sarnrnler's Planet* (1970)—is modern man in urban America. His novels are marked by wit, intelligence, a high comic sense, and extraordinary craftsmanship.

There had been a general awareness among these and other American novelists that the categories, styles, and modes of thought traditional to American literature no longer applied with the old force. Novelists whose work had not been touched by this awareness had little or no effect on U.S. readers in the postwar period. That most American novelists appeared to be perceiving the world in radical flux was illustrated well in the work of Norman Mailer. Although regarded as one of the nation's most talented novelists, Mailer had been called a genius who had not yet found his subject. There would seem to be some truth in this view since he had written four novels —*The Naked and the Dead* (1948), *Barbary Shore* (1951), *The Deer Park* (1955), and *An American Dream* (1965)—on four different subjects in four utterly different styles. Two other important writers of Mailer's generation were James Jones and William Styron. Jones's *From Here to Eternity* (1951) and Styron's *Lie Down in Darkness* (1951) were remarkable first novels, but their succeeding efforts did not maintain such a high mark. In *The Confessions of Nat Turner* (1967), a controversial novel about an antebellum slave revolt, Styron reminded readers of his unusual imaginative powers.

Irony, satire, and "black humour" in fiction

If the postwar period in American fiction had a dominating style, that style was irony. Joseph Heller, in *Catch-22* (1961), attacked military bureaucracy and the inhumanity of war with irony as perhaps sole weapon. In *Goodbye, Columbus* (1959) Philip Roth, a writer of admirable comic talent, used irony in criticizing those of his fellow American Jews who had grown indifferent to the suffering of others. Later, in *Portnoy's Complaint* (1969), he created a brilliantly sustained comic performance. In short stories and a novel, *Snow White* (1967), Donald Barthelme demolished cliché in all aspects of modern life. J.P. Donleavy, in *The Ginger Man* (1955), presented a hero who, from all appearances, was totally irrational; but then the novel gradually revealed an entire world that was itself more than a little mad.

There arose among American novelists a group of writers—prominent among them were Terry Southern, Kurt Vonnegut, Jr., and Thomas Pynchon—whom critics labelled "black humorists." Essentially satirists, they were able to wring comedy out of the bleakest of situations.

John Updike, William Gass, John Barth, and Flannery O'Connor were novelists who fitted conveniently into no group or category. In *Rabbit, Run* (1960), *The Centaur* (1963), *Of the Farm* (1965), and *Rabbit Redux* (1971), Updike dealt with such traditional themes as adolescence, marriage, and the family, but his lyrical treatment of these themes set him apart from his contemporaries. In a single novel, *Omensetter's Luck* (1966), and a collection of short stories, *In the Heart of the Heart of the Country* (1968), Gass showed himself to be a unique stylist. Barth, in *The Floating Opera* (1956), *The End of the Road* (1958), *Giles Goat-Boy* (1966), and *Chimera* (1972), established a reputation as something of an American Nabokov. His *Sot-Weed Factor* (1960) was an outstandingly great imaginative tour de force. Flannery O'Connor (died 1964) demonstrated in her last book. a collection of stories, *Everything That Rises Must Converge* (1965), her continued growth as a wholly original talent. A Roman Catholic, she combined immense comic gifts with an essentially religious concern with corruption in the human heart.

In the midst of this profusion of talent, an insistent literary question of the period was whether the novel was a dying form. Those who believed that it was argued that sociologists had taken over much of what had once been an exclusive domain of the novelist—namely, the description of manners and milieu and the topical investigation of values. There was no doubt that nonfiction such as Truman Capote's *In Cold Blood* (1966), a chronicle of the murder of a Kansas family, and later works by James Baldwin and Norman Mailer aroused a great deal of interest (see below *Literary and social criticism).* Though there might be a paucity of fictional masterpieces during the period—the work of Saul Bellow comprised perhaps the only major fictional *oeuvre* of these years—novelists continued to produce work of high quality, and, so long as they did, the question concerning the vitality of the novel as a form came to seem increasingly academic.

Poetry. Poets who reached literary maturity after World War II moved in different directions. One group tended to forsake the obscurantism, .the Surrealism, the free forms of previous American poetry for dramatic or dialectical organization. Stanley Kunitz, little appreciated heretofore, won a Pulitzer Prize in 1959 for *Selected Poems 1928–1958*. Karl Shapiro, who was later to change his style decisively, was a Pulitzer Prize winner for *V-Letter and Other Poems* in 1945; Robert Lowell for *Lord Weary's Castle* in 1947; Richard Wilbur for *Things of This World* in 1957; W.D. Snodgrass for *Heart's Needle* in 1960; Alan Dugan for *Poems* in 1962; Louis Simpson for *At the End of the Open Road* in 1964; John Berryman for *77 Dream Songs* in 1965; and Anne Sexton for *Live or Die* in 1967. Two other distinguished poets in this group were Randall Jarrell and Theodore Roethke.

All the above-named poets could be said to represent the poetry establishment in postwar American literature. But there were other forces at work in American poetry. There was, for example, something of a Midwest renaissance, evidence for which was supplied by the appearance in 1967 of an anthology entitled *Heartland: Poets of the Midwest.* Allied with this trend was a rather loosely organized movement, led by the poet Robert Bly, that disdained English verse models and called for an image-driven poetry written in a wholly American idiom. The late William Carlos Williams proved an influence on a group known as the Black Mountain school (from a short-lived college of that name in North Carolina); its reigning doyen was Charles Olson and its leading younger light was Robert Creeley. On the West Coast, mostly in and around San Francisco, a group known as the Beats began to be heard from in the mid-1950s. Among a number of poets more or less associated with the Beats, the best known were Allen Ginsberg, Lawrence Ferlinghetti, and Gregory Corso.

Drama. Perhaps because of ever-increasing costs of production, which permitted only "smash hits" to prosper, most dramatic writing in the postwar period was unexperimental and unexceptional. The best young literary minds showed a decided lack of interest in the theatre, many preferring to write for films or television. So marked was this apathy that the Ford Foundation, in the early 1960s, began to offergrants to novelists and poets to study with theatre companies. The only significant theatre to come out of the project was Robert Lowell's anthology piece *The Old Glory* (performed 1964). In the main, these were not rich years for the American theatre.

Over the postwar period two playwrights predominated: Tennessee Williams and Arthur Miller. Williams' experimentation in *The Glass Menagerie* (1944), which used a narrator, unorthodox settings, and poetic dialogue, continued in *A Streetcar Named Desire* (1947), *Cat on a*

Hot Tin Roof (1955), *Orpheus Descending* (1957), *Suddenly Last Summer* (1958), and *The Night of the Iguana* (1961). Miller was experimental in a variety of ways in *All My Sons* (1947), *Death of a Salesman* (1949), *The Crucible* (1953), and *A View from the Bridge* (1955). By the 1960s, however, there were signs that the talents of both playwrights were wearing rather thin.

The situation among younger American playwrights was more fluid. One of the most promising, Lorraine Hansberry, whose *Raisin in the Sun* (1959) centred on Negro family life in Chicago, died young. Several younger dramatists seemed likely to have noteworthy careers —among them, Jack Gelber and Frank Gilroy—but then appeared to fade out rather quickly. Edward Albee, after early critical successes off-Broadway, established his reputation firmly with *Who's Afraid of Virginia Woolf?* (1962).

The rise of off-Broadway theatre

From a literary point of view, the greatest share of the excitement of American dramatic writing after the war shifted from Broadway to off-Broadway and, indeed, in many cases, from off-Broadway to "off-off-Broadway." Much avant-garde theatre in the 1960s was produced in lofts and cabarets. Toward the end of the 1960s, nudity became a theatrical issue, and everywhere improvisation, shock, and the Absurd were features of a good deal of theatrical writing. The inspiration for it came less from American than from older European playwrights—Samuel Beckett, Eugène Ionesco, and Bertolt Brecht—whose plays were much in vogue in the U.S after 1945.

Literary and social criticism. The poet Randall Jarrell once described the postwar era in American literature as the "age of criticism." At no other time in American literature, indeed, had so much criticism, both literary and social, been written. Yet not much changed in criticism itself. Yvor Winters, John Crowe Ransom, Cleanth Brooks, and others who had first made their marks in an earlier era still predominated.

In literary scholarship three American critics turned out biographies that were acknowledged masterworks. In his five-volume study of Henry James, *Henry James: The Untried Years, 1843–1870, The Conquest of London 1870–1881, The Middle Years, 1882–1895, The Treacherous Years, 1895–1901,* and *The Master, 1901–1916* (1953–72), Leon Edel produced a work that was at once subtle, masterly, and provocative. Ernest Samuels' three-volume biography of Henry Adams, *The Young Henry Adams*, *The Middle Years,* and *The Major Phase* (1948–64), demonstrated a cultivated and refined literary craftsmanship rare in any era. Richard Ellmann's biography of James Joyce (1959) was properly regarded as definitive.

The broadening concerns of the critics

Alongside more traditional critics in the United States after World War II arose another kind who tended to eschew the highly theoretical and preferred to deal with each new work or movement in a direct, topical, and often personal way. They did not restrict themselves to the exclusively literary. Lionel Trilling completed a major body of work whose concern was the relation between life and literature. History, social theory, and politics, as many critics saw it, also fell within their purview. Irving Howe established a reputation with *Politics and the Novel* (1957); Alfred Kazin, after producing a history of American literature, *On Native Grounds* (1942), turned to autobiography; Norman Podhoretz, who became editor of an intellectual journal, *Commentary*, in 1960, flatly announced in *Doings and Undoings* (1964) that issues brought to the surface by authors sometimes interested him more than their books.

Bridging the two critical traditions—the scholarly and the intellectually committed—was Edmund Wilson, critic, historian, playwright, novelist, social reporter, travel writer, chronicler. Wilson was the complete man of letters, and his death (in 1972) left a gap that did not seem soon likely to be filled.

Among others who turned away from an exclusive interest in literature was James Baldwin, a Negro novelist, whose *Notes of a Native Son* (1955) and *The Fire Next Time* (1963) combined autobiography and radical social criticism in elegant and powerful essays. Originally a novelist and poet, Paul Goodman became best known for a study of the young in America, *Growing Up Absurd* (1960), and for other polemical and utopian writings. Norman Mailer, in *The Presidential Papers* (1963), *The Armies of the Night* (1968), and *Miami and the Siege of Chicago* (1968), wrote some of the most stunning personal-political reportage in that genre's history. A novelist and poet, Robert Penn Warren took time out from literary work to compose *Who Speaks for the Negro?* (1965), a particularly forceful and intelligent book on the civil rights movement. Indeed, many problems and issues to arise in postwar America seemed so urgent that literary men often found themselves dealing with them directly in social criticism.

CANADIAN LITERATURE IN THE 20TH CENTURY

French-Canadian. The cultural history of Canada has been conditioned by the country's dual origin, so that a certain historical tension is a constant of Canadian civilization. Founded as New France in 1608, conquered by Britain in 1763, and exposed to the overflowing vitality of the United States since 1850, Canada, in its search for a national identity, has been variously the beneficiary and victim of these three cultural forces.

Within French Canada itself, two other internal pressures complicate the situation: the claustrophobic and the agoraphobic complexes. The former dominated the 17th, 18th, and 20th centuries, the latter holding sway in the 19th, when a strong urge to hold to the past animated official thought and literature. In terms of literary themes, these opposing tendencies are seen as the patriotic pride in the feats of the early adventurers and of 20th-century separatists on the one hand, and the regionalist praise of an ordered and settled rural society on the other.

History and related fields. François-Xavier Garneau laid the foundation for a later blossoming of both historical studies and creative literature; his *Histoire du Canada* (1845–52) reawakened a dormant pride of nation and inspired poets, novelists, and other historians of the day. Among his successors, Robert Rumilly wrote an ambitious chronicle, *Histoire de la province de Québec* (41 vol., 1940–69).

Various aspects of French-Canadian society were examined in J.-C. Falardeau's *Essais sur le Québec contemporain* (1953), Father P. Angers' *Problèmes du culture au Canada français* (1960), and M. Rioux and Y. Martin's *French-Canadian Society* (1964). Among many theologians and philosophers who contributed to religious thought was Louis-Adolphe Paquet, who developed the theme of the providential mission of the French in America. This theory cast strong reflections on regional literature earlier in the 20th century. Two comprehensive views of French Canada were to be found in I.F. Fraser's *Spirit of French Canada* (1939) and Mason Wade's *French Canadians: 1760–1967* (1968).

Poetry. The first literary movement of French Canada, the Patriotic school of 1860, had been imbued with a strong nationalism to which religious fervour was a natural adjunct. Literary inspiration was found principally in Victor Hugo and Alphonse de Lamartine. Later in the 19th century, Charles Baudelaire and the Symbolists gradually replaced Romantic models, and literary activity was oriented more around Montreal. In the 1930s, Surrealist influences began to predominate; after World War I1 the impact of Existentialism was felt, and poets gave an impression that they sensed and wrote with more independence than they had formerly.

Joseph-Octave Crémazie was the first important poet of French Canada. His patriotic poems were still popular early in the 20th century; Louis Fréchette won success with a patriotic epic entitled *La Légende d'un peuple* (1887), while other followers of Crémazie celebrated Canadian life, its picturesque customs, and religious faith. These poets were precursors of Le Terroir, or regionalist school of Quebec, who recorded humble aspects of French-Canadian life. Blanche Lamontagne-Beauregard, best known of the group, published *Par nos champs et nos rives* (1917) and *La Vieille Maison* (1920).

In 1895 Jean Charbonneau and Paul de Martigny founded the Montreal literary school. Canadian life, Canadian landscape, and patriotism were no longer the principal inspiration for these poets. Symbolists and aesthetes, they wished to live in the presence of beauty and liked to picture their souls as beautiful things, Émile Nelligan picturing his as a transparent ship sculptured in gold and laden with treasures, "Le Vaisseau d'or."

Paul Morin reflected European experience in the exotic poems of *Le Paon d'émail* (1911; "The Enamel Peacock"). Louis Dantin (real name Eugène Seers), the critical conscience of the group, contributed *Le Coffret de Crusoé* (1932; "Crusoe's Casket"), and Alfred DesRochers, author of *L'Offrande aux vierges folles* (1928; "The Offering to the Foolish Virgins"), expressed the gusty spirit of the north in his "Hymne au vent du nord" ("Song to the North Wind").

In 1934 Robert Charbonneau, François Hertel, and Saint-Denys Garneau founded a literary journal, *La Relève*. Charbonneau subsequently made a name for himself as a novelist and editor. For Garneau, author of *Regards et jeux dans d'espace* (1937), poetry was a means of probing despair; the importance of his *Journal* was only realized in the 1960s, when his intense feeling and suggestive technique began to exert a strong influence on many poets who followed him. Hertel, as seen in such titles as *Strophes et catastrophes* (1943), was a humorous man with a double vision, torn between sensuous delights and a consciousness of sin; the full spectrum of his poetry is found in *Poèmes d'hier et d'aujourd'hui* (1967; "Poems of Yesterday and Today").

Along with Saint-Denys Garneau, the respected poets of the older generations are Alain Grandbois, Anne Hébert, and Rina Lasnier. Alain Grandbois had a powerful grasp of cosmic images; his mastery was clearly maintained from his first collection in 1944 to his collected works, *Poèmes* (1963). Anne Hébert shows conscious poetic progress from *Les Songes en équilibre* (1942) to the surer and more positive *Poèmes* (1960) and *The Tomb of the Kings* (1967); the same Symbolist and Surrealist elements are to be found in her poetic prose volumes *Le Torrent* (1950) and *Kamouraska* (1970). One of the best poems of Rina Lasnier, a Christian poet looking for perfection, was "Malemer," in *Présence de l'absence* (1956); a later collection is *L'Arbre blanc* (1966; "The White Tree").

The Hexagone

The most important contemporary poetic movement, the Hexagone, was founded in Montreal in 1954, principally by Gaston Miron and Jean-Guy Pilon. Perhaps the best way to describe this dynamic group of poets and publishers is to say, at the risk of oversimplification, that they rediscovered the value of eroticism and combined it with a fierce love of Quebec; sometimes the loved one is indistinguishably the woman-country; tenderness and violence are inextricably bound together. A few of the principal names follow with titles of their representative works: Jacques Brault, *Mémoire* (1965); Gaston Miron, *La Vie agonique* (1964) and *L'Homme rapaillé* (1970); Paul-Marie Lapointe, *Choix de poèmes: Arbres* (1960) and *Le Réel absolu* (1971); Gatien Lapointe, *Ode au Saint-Laurent*, *J'appartiens à la terre*, and *Le Chevalier de neige* (1963); Roland Giguère, *L'Âge de la parole* (1965); Yves Prefontaine, *Pays sans parole* (1967); and Fernand Ouellette, *Poésie* (*poèmes 1953–1971*), (1972).

A comprehensive view of French-Canadian poetry can be found in a number of anthologies: *The Oxford Book of Canadian Verse in English and French* (1960), Guy Sylvestre's *Anthologie de la poésie canadienne française* (4th ed., 1963), J. Cotnam's *Poètes du Québec* (1969), and J. Glassco's anthology, *The Poetry of French Canada in Translation* (1970).

The novel. The history of fiction followed a course parallel to that of poetry. Romantic in mid-19th century, it lapsed into a long period of regionalism before the social novel developed later under Naturalist influences, providing an authentic picture of urban French-Canadian society.

According to its author, Philippe-Ignace Aubert de Gaspé, *Le Chercheur de trésor* (1837; "The Treasure Seeker") was the first Canadian novel, telling a story of adventure and black magic. The best-known 19th-century novel, by Philippe-Joseph Aubert de Gaspé, was *Les Anciens Canadiens* (1863; *Canadians of Old*, 1864), describing seignorial life and the tragedy of divided loyalties caused by the country's conquest. *Jean Rivard* (1862), by Antoine Gérin-Lajoie, depicted pioneer life, forerunning *Maria Chapdelaine* (1915), by Louis Hémon, and novels of pioneering. This theme was the mainspring of "deserter" novels of writers such as Claude-Henri Grignon, author of *Le Déserteur* (1934), in which a farmer who moves to the city is called a deserter.

Germaine Guèvremont dramatized the progressive decadence of a pioneer family in novels of peasant life (*Le Survenant* [1945] and *Marie Didace* [1947]; published together in English as *The Outlander*, 1950). Ringuet (Philippe Panneton) brought a clinical talent into fictional art and in *Trente arpents* (1938; *Thirty Acres*, 1940) viewed migration from the farm with disarming frankness, while in *Fausse monnaie* (1947) he photographed the frustration of an insignificant life in the city.

Works of historical fiction exploited the natural interest in past glories: *Les Habits rouges* (1923; "The Redcoats"), by Robert de Roquebrune, revived memories of the rebellion of 1837; Léo-Paul Desrosiers went back to the early days of the colony for *Les Opiniâtres* (1941) and to the fur trade of 1800 for *Les Engagés du Grand Portage* (1938), works on historical themes that contrasted with his later style as found in *Vous qui passez* (3 vol., 1958–60).

Gabrielle Roy and Roger Lemelin

Gabrielle Roy recorded her observations of life in a working class district of Montreal in a widely acclaimed novel, *Bonheur d'occasion* (1945; *The Tin Flute*, 1947), and continued her skillful revelation of the frustrating insignificance of modern living in *Alexandre Chenevert* (1954; *The Cashier*, 1955). While Gabrielle Roy was portraying Montreal, Roger Lemelin was depicting life in Quebec: the hero of his trilogy, including *Au pied de la pente douce* (1944; *The Town Below*, 1948), *Les Plouffe* (1948; *The Plouffe Family*, 1950), and *Pierre le magnifique* (1952; *In Quest of Splendour*, 1955), was torn between a desire for grandeur and a paralyzing sense of impotence.

Yves Thériault, a prolific novelist, reaches beyond his own milieu for subjects: *Aaron* (1954) was concerned with the strain on a Jewish family in a gentile world; *Agaguk* (1958) powerfully depicted an Eskimo family faced with the white man's code of law; and *Ashini* (1960) gave a lyrical picture of the Indian way of life. Gérard Bessette is another keen observer of French-Canadian society—*La Bagarre* (1958; "The Brawl") dealt with antagonistic social forces in a big city, *Le Libraire* (1960; *Not for Every Eye*, 1962) treated small-town hypocrisy, and *L'Incubation* (1965) and *Le Cycle* (1971) examined the tragedy of human solitude.

Certain novelists, feeling the influence of Mauriac, Gide, Camus, and others, probed the depths of the individual soul. Robert Charbonneau located his psychological studies in a small fictional town that also provided the name of his novel *Fontile* (1945). André Giroux chose two unique situations for his penetrating studies, a crime of passion in *Au delà des visages* (1948; "Behind the Faces") and a man near death from cancer in *Le Gouffre a toujours soif* (1953; "The Abyss Is Always Thirsty"). Solitude and despair were the main themes of André Langevin in *Évadé de la nuit* (1951; "Night Fugitive") and in *Poussière sur la ville* (1953; *Dust over the City*, 1955); primitivism and ennui are delicately orchestrated in *L'Élan d'Amérique* (1972).

The novels of the 1960s demonstrate a new anguish, stimulated by political and spiritual turmoil. Representative names include Réal Benoît, *Quelqu'un pour m'écouter* (1964; "Someone to Listen to Me"); Hubert Aquin with his intriguing baroque novels, *Prochain Épisode* (1965), *Trou de mémoire* (1968), *L'Antiphonaire* (1969); Jacques Godbout and his novels of revolt, *Le Couteau sur la table* (1965) and *Salut Galarneau* (1967); V.-L. Beaulieu presenting the saga of the Beauchemin family in *Jos Connaissant* (1970) and *Les Grands-Pères* (1971); the prolific and whimsical Jacques Ferron, among whose best titles are *Cotnoir* (1962) and *Le Salut de l'Irelande* (1970). The adolescent occupies centre stage in the work of Marie-Claire Blais, beginning with *La Belle Bête* (1959; *Mad Shadows,* 1960) and continuing through to *Une Saison dans la vie d'Émmanuel* (1965) and *Le Loup* (1972); the same subject matter occupies Réjean Ducharme in *L'Avalée des avalés* (1966) and *Le Nez qui voque* (1967).

Drama. The theatre is the poor relation of French-Canadian literature. Excellent theatrical companies were nonetheless founded, such as Les Compagnons du Saint-Laurent (1937–52), Le Théâtre du Nouveau Monde (1951), and Théâtre de la Comédie Canadienne (1956). Gratien Gélinas won great popular acclaim as author and principal actor of *Tit-coq* (published 1950) and *Bousille et les justes* (1960; *Bousille and the Just,* 1961). Robert Elie dealt in Symbolist form with an anguish for lost purity (*L'Etrangère*, 1954), and his contemporary Jacques Languirand confirmed the atmosphere in *Les Insolites* (1956) and *Les Grands Départs* (1957). Marcel Dubé won a wider audience with social themes in *Un Simple Soldat* (1958), *Florence* (1960), and *Pauvre Amour* (1969). His post has since been occupied by Michel Tremblay, best known for *Les Belles-Soeurs* (1971). Robert Gurik introduced science fiction to the stage with such plays as *Api 2967* and *La Palissade* (1971). Radio and television, indeed, offered much scope to dramatists, and a number were engaged in writing specifically for that medium. Examples of their art were to be found in the series *Écrits du Canada français*, published from 1954 onward.

Criticism. Literary criticism appeared in 1903 with a study of the poet Émile Nelligan by Louis Dantin. Camille Roy, however, made one of the first systematic studies; most important among the many works he published was *Manuel d'histoire de la littkrature canadienne-française* (1918). Previous work was rendered obsolete by Gérard Tougas' *Histoire de la littérature canadienne-française* (1960), which inspired other good studies, such as Bessette-Geslin-Parent's *Histoire de la littérature canadienne-française* (1968), Pierre de Grandpré's *Histoire de la littkrature française du Québec* (4 vol., 1967–69), and Guy Sylvestre's *Literatute in French Canada* (1967). Jean Béraud wrote a good account of the theatre in *350 Ans de théâtre an Canada français* (1958), and Séraphin Marion's 10-volume chronicle of the 19th century is entitled *Les Lettres canadiennes d'autrefois* (1939–59).

The *University of Toronto Quarterly* published an excellent annual review of French-Canadian letters, from 1936 onward. Adrien Thério provided a complementary source of information with an annual *Livres et auteurs canadiens* from 1961, and Paul Wyczynski published his scholarly *Archives des lettres canadiennes* from 1961. A number of other serial publications remain active.

English. *From federation to the 1920s.* A growing sense of national identity had preceded the union of the colonies of British North America in the Confederation of Canada in 1867 and was strengthened by its accomplishment. The most national-minded poet in the decade before federation was Charles Sangster, once unofficial Canadian laureate but scarcely remembered since. Charles Mair found themes for poetry on the new frontier and in Canadian history, as used in a verse drama *Tecumseh* (published 1886). Historical romance, always a popular form in Canada, was represented in this period by a costume romance *The Golden Dog* (1877), by William Kirby, about honesty and corruption in New France.

Meanwhile, semiliterary periodicals such as *The Literary Garland*, *Canadian Monthly, Nation* (organ of the Canada First group), and *The Week,* the best of them, appeared.

The Confederation group

The Week's first editor was Sir Charles G.D. Roberts, who, with Bliss Carman, Archibald Lampman, and Duncan Campbell Scott, wrote the best poetry composed in Canada before the 1920s. Of these, Roberts and Carman had much in common; they were first cousins, were educated at the same school and university, and were steeped in English Romanticism and in the Transcendentalism of the 19th-century American writer Ralph Waldo Emerson. Roberts was a memorable regional poet but also expressed the nationalistic optimism of the end of the century. His religious and philosophic poetry seemed less authentic than his rural *Songs of the Common Day* (1893), a pale reflection of Romantic pantheism and Transcendentalism. Carman was best in the romantic or transcendentalist manner in only a few stanzas and brief poems; more often his pseudo-Keatsian beauties were over-sentimental and cloying. The other two poets of the Confederation group, as these nationalistic writers were called, Lampman and Scott, were friends living in Ottawa as members of the civil service. Lampman's poetry of natural description of Ottawa and of social comment were expressions of a lonely and sensitive mind; Scott was also an isolated and slightly austere figure, but more vigorous. Like the others he was a regionalist, but of the remote and vast northern Indian wilderness; Scott's narrative and descriptive poetry depicted man against man or the charged energies of nature against man, but the potentially realistic violence of the themes was subdued and often suggested strangeness and fantasy.

This was the first age of the best seller—romances of Ralph Connor and Yukon ballads of Robert W. Service. Tom MacInnes for 40 years chanted the joys of bohemian vagabondage more plausibly than did Carman; Marjorie Pickthall, a finer artist, combined religious feeling with end-of-the-century aestheticism in beautiful, but often cloying, historical idylls; comic-sentimental dialect poems by William H. Drummond and feminine romances by Lucy M. Montgomery, author of *Anne of Green Gables* (1908), were popular. The best book of the period, *Sunshine Sketches of a Little Town* (1912), by Stephen Leacock, was a regional idyll, though sentiment was laced with ironic satire on the pettiness of life in an Ontario town.

Literature after 1920. The founding of *Canadian Forum* (1920), which championed painters, the Little Theatre movement, and new poets, was a sign of a growing nationalism and interest in cultural arts after World War I. The first of the new poets was E.J. Pratt, whose impulse toward sheer fantasy was evident in *The Witches' Brew* (1925) and *The Titans* (1926); later, most of his longer poems, *The Titanic* (1935), *Brébeuf and His Brethren* (1940), and *Behind the Log* (1947), were narratives of heroism displaying exact historical and technical knowledge and an Elizabethan delight in the vigorous splendour of words. Pratt was an isolated figure, but his break from the traditions of the Confederation poets encouraged younger men, usually influenced by T.S. Eliot. Five of these, with Pratt, in 1936 produced a volume of verse, *New Provinces:* A.J.M. Smith, critic of the group, and Leo Kennedy showed most clearly the influence of Eliot; Robert Finch owed more to Eliot's French masters; F.R. Scott was most effective in brief satirical poems; Abraham Moses Klein was a learned, sensitive Jew, steeped in the history of his people. Later, Raymond Souster, an Imagist poet, and Leonard Cohen, writing morbidly introspective verse, were influential. During the depression of the 1930s and World War II, Earle Birney composed social comment and satire, war poetry (and a comic novel of the war, *Turvey)*, and narrative and regional description. The work of P.K. Page was concerned with economics and politics. *East of the City* (1946), by a critic, Louis Dudek, was occasionally Marxist in social comment but also sometimes lyrically joyful at the industrial landscape of his native Montreal. Irving Layton, also of Montreal, was more aggressively proletarian, Naturalistic, and egocentric, the castigator of Canadian puritanism and intellectualism. James Reaney was also a satirist of small-town life beneath his poetry's complex allusiveness. A preoccupation with symbol and myth, with the English 19th-century poet William Blake, and with the Swiss psychologist Carl Jung informed the poetry of Jay Macpherson.

Rise of the novel

The early novels of Frederick Philip Grove from *Settlers of the Marsh* (1925) to *Fruits of the Earth* (1933) were powerful and sombre studies of pioneering on the prairies, though stiff in form. Two previous volumes of western sketches, *Over Prairie Trails* (1922) and *The Turn of the Year* (1923), were the best of his writings. From *Jalna* (1927) to *Morning at Jalna* (1960), Mazo de la Roche published 16 novels about the turbulent Whiteoak family—the most massive achievement in Canadian fiction. Ethel Wilson wrote with sensitivity and skill about private emotion and conflict; Philip Child, who began with historical romance, turned later to contemporary Realism as in *Ray of Wrath* (1945); Morley Callaghan was a humanitarian Realist. describing with compassion the lives of misfits and the morally bewildered in urban society. Hugh MacLennan was a Realist of Nova Scotia life in *Barometer Rising* (1941) and *Each Man's Son* (1951) and interpreted Canadian national character in *Two Solitudes* (1945). Canadian mores in small cities of southern Ontario provided comic themes for Robertson Davies. In Mordecai Richler's best novel, *The Apprenticeship of Duddy Kravitz* (1959), a juvenile antihero and Jewish Montreal were compounded of the farcical, the realistic, and the pathetic.

Two transient novelists were an Englishman, Malcolm Lowry, who left Mexico to spend 15 years in Canada, chiefly in British Columbia, where he completed his novel *Under the Volcano* (1947); and Brian Moore, who lived briefly in Montreal, the setting of *The Luck of Ginger Coffey* (1960).

AUSTRALIAN AND NEW ZEALAND LITERATURE IN THE 20TH CENTURY

Australian. *Nationalism and expansion.* The last 20 years of the 19th century saw a growth of nationalism and moves toward federation of the separate states. National pride, the values of country life, and sympathy for the struggles of small landholders were common literary themes, particularly in stories by Henry Lawson and Steele Rudd (Arthur Hoey Davis). Another theme was that of early convict days, when prisoners were transported from England to penal servitude in Australia: four volumes of tales by Price Warung (William Astley) exemplify this. Joseph Furphy, in a large novel, *Such Is Life* (1903), described the rural world of the 1880s. It was full of detail of station life, conversations of bullock drivers, nationalistic sentiments, and philosophizings about chance and determinism.

The flourishing tradition of ballad verse was kept alive in the 1890s by Lawson and "Banjo" Paterson.

Federation (1901) was greeted by patriotic fervour in prose and in verse, but generally, in the first 30 years of the 20th century, nationalistic themes diminished in the face of a growing awareness of the complexity of Australian life, and attention was drawn to the plight of ordinary people and need for social reform. Prominent among writers about the life of the city and its workers were Katherine Susannah Prichard, whose novels spanned over 40 years; Louis Stone; Edward Dyson; and Kylie Tennant (Mrs. L.C. Rodd). The life of the Aboriginal and his relationship with the white man were explored by Mrs. Aeneas Gunn, Xavier Herbert, and Katherine Susannah Prichard. Two writers more interested in history and earlier colonial days were Miles Franklin and Eleanor Dark. Notable novels, short stories, and criticism were produced by Vance Palmer. Henry Handel Richardson (Ethel Florence Lindesay Robertson) wrote about her schooldays in Melbourne (*The Getting of Wisdom*, 1910), student days in Leipzig (*Maurice Guest*, 1908), and her father's life (in the trilogy *The Fortunes of Richard Mahony*, 1917–29), in the last of which she combined description of an immigrant's life and conditions on the gold fields with a powerful character study.

The success of poets was slighter but showed diversity of aims and interests. John Shaw Neilson wrote fine, delicate lyrics; Victor Daley created romantic poems and some sharp satires; C.J. Dennis continued the ballad tradition with popular verse; Christopher Brennan, in his Symbolist poems, owed much to European tradition; and Kenneth Slessor wrote powerful dramatic lyrics.

The modern period. During and after World War II, literary magazines proliferated and the reading public grew. Though factual and descriptive writing remained prominent, from the 1950s onward Australian writers became increasingly speculative and searching. The most influential of mid-20th-century novelists was Patrick White, whose major novels were distinctively Australian but whose treatment had a largeness of vision surpassing nationalistic limitations; the Australia reflected in *The Tree of Man* (1955), *Voss* (1957), *Riders in the Chariot* (1961), *The Solid Mandala* (1966), and *The Vivisector* (1970) and in short stories was the product of an individual, critical, poetic imagination. Other novelists included Martin Boyd, who offered a penetrating analysis of English and Australian life; Randolph Stow, who set his symbolic novels in a finely evoked Australian landscape; and Thomas Keneally. The short story continued but retained a strong rural bias—a strange disparity between life as most Australians knew it and as literature represented it. Of particular interest was the autobiographical writing of Hal Porter, which showed the changes in Australian society from the 1930s to the 1960s.

The novels of Patrick White

A tradition of descriptive poetry remained, but mid-20th-century poets ranged more widely than their predecessors. Robert D. FitzGerald was noted for strenuously argued lyrics; A.D. Hope for searching, allusive, witty poetry; Douglas Stewart for forthright, vigorous verse; Judith Wright for sensitive lyrics; and James McAuley for meditative lyrical poetry.

Australian literature had always been deficient in drama: only after the late 1950s and 1960s did any plays achieve real success. Best known were Douglas Stewart's *Ned Kelly* (published 1943) and *Fire on the Snow* (performed 1941); Ray Lawler's *Summer of the Seventeenth Doll* (1955); Alan Seymour's *One Day of the Year* (1961); and Patrick White's *Four Plays* (published 1965). Recently several young playwrights have come into prominence.

The rapid expansion of Australian society in the 20th century made it more difficult for writers to keep pace with their world. A spirit of self-criticism that became pronounced in the 1950s and '60s was exemplified by searching studies of Australian history and society and by reinterpretations of Australian literature.

New Zealand. In organized settlement, Australia had a 50-year start over New Zealand, and for most of the century from 1840 to 1940 a similar gap in national consciousness seemed to prevail. Yet from about 1930 there was a flowering of literature that made it possible for the Anglo-Australian novelist Colin MacInnes to argue that New Zealand writers had made a "sharper, deeper revelation" of their country than had the Australians.

Nineteenth-century writers left future generations little real New Zealand literature: even up to the 1920s most writers aimed at English readers and often exploited and distorted exotic and indigenous elements of their surroundings. There were some worthwhile chronicles and autobiographical narratives, such as F.E. Maning's *Old New Zealand* (1863), Samuel Butler's *First Year in Canterbury Settlement* (1863), and Lady Mary Anne Barker's *Station Life in New Zealand* (1870). Among colonist versifiers, the most notable were Alfred Domett and a Scots dialect poet, John Barr.

Katherine Mansfield in New Zealand literature

Katherine Mansfield was one of the great names of this period, though she did not expect to find a readership in her own country. In her most admired stories, "At the Bay" and "The Garden Party" (1922), her debt to New Zealand pioneer society was, however, clear. Two other writers achieved works of distinction in this same period: Jane Mander, in *The Story of a New Zealand River* (1920), and William Satchell, in *The Land of the Lost* (1902).

A few poets and two or three prose writers first weathered the uncongenial literary climate of the 1920s and 1930s. Outstanding were a short-story writer, Frank Sargeson, and the poets A.R.D. Fairburn, R.A.K. Mason, Allen Curnow, and Denis Glover, and what distinguished their work was that they assumed a readership of fellow countrymen. The yarn spinner had always been characteristic of New World writing, and Sargeson used this to great effect in tales of the Depression years. Two novelists to emerge during this time were John Mulgan, whose *Man Alone* (1939) remained a significant New Zealand novel in title and theme, and John A. Lee, with his harrowing *Children of the Poor* (1934).

The years from 1940 saw a flowering in most literary genres and especially in the short story, whose best writers included Roderick Finlayson, Maurice Duggan, O.E. Middleton, and Phillip Wilson. A poet and playwright, James K. Baxter, and a historian-poet, Keith Sinclair, were perhaps the most considerable figures of the postwar period. Among best known novelists were Dan Davin (*No Remittance* [1959]); David Ballantyne (*The Cunninghams* [1949]). Sylvia Ashton-Warner (*Spinster* [1958], *Greenstone* [1966]); Ian Cross (*The God Boy* [1957], *After Anzac Day* [1961]); Janet Frame (*Faces in the Water* [1961], *A State of Siege* [1966], *The Rainbirds* [1968]); Maurice Shadbolt (*Among the Cinders* [1965], *Strangers and Journeys* [1972]); and Maurice Gee (*A Special Flower* [1965], *In My Father's Den* [1972]). The growth in quantity and quality of New Zealand writing and a rapid expansion of theme reflected accelerating national consciousness.

AFRICAN LITERATURE

South African. *English.* Olive Schreiner, a liberal and a powerful writer on local and international affairs, wrote the first great South African novel, *The Story of an African Farm* (1883). William Plomer pioneered race relations as material for fiction in a novel, *Turbott Wolfe* (1925). Pauline Smith's stories, *The Little Karoo* (1925), dealt sympathetically with rural Afrikaners. Laurens van der Post, in a novel, *In a Province* (1934), dealt with the African-coming-to-town theme.

Cry, the Beloved Country (1948) established Alan Paton's international reputation, which later writing, such as the stories in *Debbie, Go Home* (1961), enhanced. Nadine Gordimer made an impact abroad with her first novel, *The Lying Days* (1953); her talent was at its best perhaps in the short story, such as those in *Not for Publication* (1965). Her novel *A Guest of Honour* (1971) is set outside South Africa. Dan Jacobson wrote with restraint and wry humour, as in *The Beginners* (1966) and in his collected short stories, *Beggar My Neighbour* (1964); *The Rape of Tamar* (1970) is a fictional treatment of a biblical theme. Peter Abrahams (*Tell Freedom: Memories of Africa* [1954]) was a prolific expatriate Coloured novelist. In his short stories and novellas (*e.g.*, *A Walk in the Night* [1962]), Alex La Guma uses the racy Coloured English vernacular that owes much to Afrikaans. His other writings include *And a Threefold Cord* (1964), *The Stone-Country* (1965), and *In the Fog of a Season's End* (1972). Other writers of protest include Lewis Nkosi, author of a collection of essays, *Home and Exile* (1965), and Ezekiel Mphahlele, whose autobiographical *Down Second Avenue* (1959) has become a South African classic. Nkosi and Mphahlele, both Africans, worked for *Drum* magazine, which provided an important forum for their ideas; they are now in exile. Among younger novelists, Jillian Becker has written two powerful works, *The Keep* (1967) and *The Union* (1971).

Warm humour, rare in South African writing, is abundant in the work of H.C. Bosman, who deals affectionately with Afrikaners of the old school in *Mafeking Road* (1947) and *A Cask of Jerepigo* (1957). The only drama of note in English is that of Athol Fugard, particularly *The Blood-Knot* (1965) and *People Are Living There* (1970).

Many South African English poets expressed their consciousness of the difficulty of finding language and rhythm appropriate to uniquely South African material; some, too, expressed a sense of being aliens as people as well as poets. Guy Butler expressed much of this in his fine poem "Home Thoughts" (1956). F.C. Slater often evoked uniquely South African experience, as in "Lament for a Dead Cow" (*Collected Poems* [1957]). In the 1920s came the work of major poets Roy Campbell and William Plomer. Campbell, whose adventurous life was reflected in his powerful poetry, often sounded a note of menace. His most famous work was his long symbolic poem *The Flaming Terrapin* (1924). The acutely observant William Plomer wrote with restraint and experimented with rhythm and diction (*Notes for Poems* [1927], *Visiting the Caves* [1936]). Other poets of merit include Mazisi Kunene, Sidney Clouts, Dennis Brutus, F.T. Prince, Roy Fuller, and the young O.M. Mtshali, whose *Sounds of a Cowhide Drum* (1971) is especially noteworthy.

Afrikaans. By 1750 Afrikaans was sufficiently distinct from its parent Dutch to be called a separate language. The first Afrikaans texts were, however, not published until more than a century later. The Association of True Afrikaners, which published the first newspaper, magazine, and books in Afrikaans, was founded in 1875. From defeat in the South African War came a new upsurge to establish Afrikaans as a national language. The second Afrikaans language movement spread north from Cape Province, and Afrikaans gradually won ascendancy over Dutch, replacing Dutch as the official language of the (then) Union of South Africa in 1925.

Outstanding writers of the "second movement" were primarily poets: Eugène Marais; Jan François Elias Celliers, a pastoral poet; Jakob D. Du Toit (Totius), who wrote some of the best elegiacs in Afrikaans; and C. Louis Leipoldt, foremost war poet. In Realism two novelists achieved success—Jochem van Bruggen and Jan Van Melle—while the two foremost romantic novelists were D.F. Malherbe and C.M. van den Heever. In the 1920s, problems of religion and personal relationships came to the fore. F.P. van den Heever was the outstanding poet at this time. His anti-conformism foreshadowed the great upsurge of "new" poetry in the 1930s.

The Dertigers

The supreme event in Afrikaans literature was the appearance of a group of talented poets, the Dertigers (Men of the '30s), begun by W.E.G. Louw with *Die ryke dwaas* (1934; "The Rich Fool"). This sensitive poet, with his searing conflicts between God and Eros, exemplified qualities soon to become the new generation's hallmark. He was followed by his elder brother, N.P. van Wyk Louw, principal creative artist and theoretician of the new movement. Each of Van Wyk Louw's books was a milestone: in every form he achieved mastery; he wrote the best odes, sonnets, modern ballads, and love lyrics in Afrikaans; his dramatic monologue "Die Hond van God" (1942; "The Hound of God") was unsurpassed in the Dutch literatures, and his epic poem *Raka* (1941) became a timeless and matchless symbol.

The poet D.J. Opperman emerged in 1945. His technique superimposes different historical levels, intermingled with a fascinating mosaic of themes, images, and allusions from a common Western heritage. Of the poets writing in the vernacular of the Cape Coloureds, Adam Small is the most talented.

Afrikaans moved from being an essentially pastoral language to being an urban one, expressing the frustrations and stresses of the city dweller. From the 1950s onward young writers came to the fore in the novel, short story, prose poem, experimental drama, and poetry. Generally, the avant-garde novels of "men of the '60s" caused indignation among the more conservative. Young writers such as Breyton Breytonbach and Ingrid Jonker, both poets, and Etienne Leroux and André Brink, both novelists, revolted against more than mere externals of religious or sexual orthodoxy; their revolt was part of a new way of life. Leroux explored the dilemma of man in search of a myth, the inexhaustible fantasy and satire of his work making it unique in Afrikaans.

Afrikaans drama lagged behind. The two most important dramas—N.P. van Wyk Louw's *Germanicus* (1956) and Opperman's *Periandros van Korinthe* (1954)—were both traditional in form and theme. Of the younger school, P.G. du Plessis is the most promising.

Ethiopian. In the Muslim incursion of 1527–43 Ethiopian literary activity ceased and many manuscripts perished; Islāmicization was widespread, and, even after the repulsion of the invaders, the country never fully recovered. A Muslim merchant who had been converted to Christianity and, as Enbaqom (Habakkuk), became prior of a monastery, Dabra Libanos wrote

Anqas'a amin ("Gate of Faith") to justify his conversion and to persuade apostates to recant. Other similar works were produced, and several were written to defend the Monophysite branch of the Christian faith; meanwhile the arrival of Roman Catholic missionaries constituted a further danger to the Ethiopian Church.

The ancient language of Ge'ez had by now lost its vigour and became a liturgical language with which few people were thoroughly conversant. During the 16th century, Amharic, the principal spoken language, was beginning to be used for literary purposes, and Amharic expressions even appeared in royal chronicles. About 1600, nevertheless, a few substantial works in Ge'ez appeared, including ***Hawi,*** an enormous theological encyclopaedia translated by Salik of Dabra Libanos, a ***History*** of Johannes Madabbar, bishop of Nikiu, containing an account of the Arab conquest of Egypt, valuable since the Arab original has been lost, and ***Fetha Negast*** ("Justice of the Kings"), a compilation of canon and civil law. Ge'ez poetry (*qene*) flourished, at Gonder particularly, in the 18th century and has since continued to be practiced at many monasteries. Some poems of Alaqa Tayya were printed in Asmera in 1921, and an important anthology compiled by Heruy Walda Sellāsē was published at Addis Ababa in 1926.

A Jewish population, known as Falashas, who live mostly in regions north of Lake Tana, still use Ge'ez as their sacred language. Besides the Old Testament (including the ***Book of Jubilees),*** they have a few books peculiar to themselves, notably ***Te'ezaza Sanbat*** ("Ordinance of the Sabbath"), of uncertain date and perhaps mostly translation from Arabic of the 14th century. A ***Falasha Anthology*** was published by Wolf Leslau in 1951.

Works in Amharic

The earliest known Amharic compositions are songs celebrating the victory of Amda Tseyon I (1314–44). From the 16th century onward theological works were produced. A translation of the Bible was made in Cairo early in the 19th century (though probably not by a true Ethiopian, to judge by the quality of the Amharic) and from this version missionary societies composed their editions and revisions by foreigners with an inadequate knowledge of Amharic. A more scholarly version of the New Testament was printed in Addis Ababa in 1955, followed by the Old Testament in 1961. The first official chronicles wholly in Amharic were those of Tewodros (Theodore) II (1855–68). A translation of John Bunyan's ***Pilgrim's Progress*** made in 1892 pointed the way to a new popular form—the allegorical novel, often partly in verse, with a religious bias, of which the first was ***Libb wallad tarik*** (1908; "Imaginative Story") by Afawarq Gabra-Syasus. During the regency of Ras Tafari (1916–20; afterward Emperor Haile Selassie), Blatengeta Heruy Walda-Selase (died 1938) became the leading Amharic writer, especially notable for allegorical compositions such as ***Wadaje lebbe*** ("My Heart as My Friend").

With the restoration of Ethiopian independence after the Italian occupation of 1936–41, a great impetus was given to Amharic literature, the Emperor encouraging authors to produce many types of books, especially on moral and patriotic themes. Writers of merit were Bitwadded Makonnen Endalkachaw (allegorical novels and plays), Kabbada Mika'el (verse dramas, some history and biography), and Takla-S'adeq Makurya (histories).

CARIBBEAN LITERATURE IN ENGLISH, FRENCH. AND SPANISH

Unlike the literatures of Africa, that of the Caribbean has no indigenous tradition. The pre-Columbian American Indians left few rock carvings or inscriptions (petroglyphs), and their oral traditions did not survive 16th-century Spanish colonization. The West Africans who replaced them were also without a written tradition, so that for 400 years Caribbean literature was an offshoot and imitation of the models of the colonial powers—Spain, France, Britain, and The Netherlands. Caribbean writers, however, were not unaware of their environment. The letters and speeches of Toussaint-Louverture, Haitian general and liberator, indicated that from at least the end of the 18th century the Caribbean was conscious of its cultural identity. But it was not until the 1920s that the challenge of a distinctive literary form was accepted. Then, as part of a Latin-American *modernismo* movement, Spanish and French Caribbean writers began to break away from European ideals and to identify themselves with their mainly Negro masses.

The *modernismo* movement

The leaders of this movement, mainly poets, were Luis Palés Matos (Puerto Rico), Jacques Roumain (Haiti), Nicolás Guillén (Cuba), Léon Damas (French Guinea), and Aimé Césaire (Martinique). Jean Price-Mars, a Haitian ethnologist, in ***Ainsi parla l'oncle*** (1928), declared that his purpose was to "restore to the Haitian people the dignity of their folklore." The achievement of this Négritude, finely expressed in Césaire's poem ***Cahier d'un retour au pays natal*** (1939; ***Return to My Native Land,*** 1968), was the construction into poetic forms of the rhythmic and tonal elements of the islands' rituals and speech patterns, using Symbolist and Surrealist techniques.

The British Caribbean, developing its national literature after 1945, made its own contribution in the folk dialect novel: Vic Reid's ***New Day*** (1949), Samuel Selvon's ***A Brighter Sun*** (1952) and ***The Lonely Londoners*** (1956), George Lamming's ***In the Castle of My Skin*** (1953), V.S. Naipaul's ***Mystic Masseur*** (1957) and ***House for Mr. Biswas*** (1961), among others; and the poetry of Louise Bennett ***(Jamaica Labrish,*** 1966). But paradoxically, anglophone Caribbean development was formally conservative, working toward an "open" rather than an autochthonous, or indigenous, expression in the work of C.L.R. James (Trinidad) and the poetry of Derek Walcott (St. Lucia). In the novels of Wilson Harris (Guyana), the Symbolist and Surrealist techniques of the *modernismo* movement reappear; and the poetry of Edward Brathwaite ***(Rights*** of ***Passage*** [1967], ***Masks*** [1968], ***Islands*** [1969]) attempt to reassert the place of Africa in the Caribbean.

FKENCH LITERATURE IN THE 20TH CENTURY

War and political and social change broadened the gap between the literature of the 19th and 20th centuries in France, but more particular influences included the reform of the university system, with its emphasis on modern studies (1502); the arrival of the cinema; the emergence of strong publishing houses and the invention of the ***livre de poche*** ("pocket," or paperback, edition); the creation of such important reviews as ***La Nouvelle Revue Française***, ***Les Temps Moderrzes, Le Mercure de France,*** the ***Cahiers du Sud, Esprit, La Table Ronde, Les Lettres Modernes, Tel Quel***; and the new conceptions of man suggested by Freud and his successors.

Although change in French literature in the 20th century proceeded by phases of revolt, destruction, innovation, and revaluation, the French genius for continuity remained unimpaired, with the same respect for the French language, moral preoccupation, and care for form that has always characterized French literature. Though Paris remained the crucible and experimental centre, literature preserved its personal, often pastoral qualities; the provinces were still a main setting for comedy, tragedy, fiction, poetry. Literature continued to be impeccably French in essence, but because of a concentration on universal problems it was also so successfully outward looking as to integrate itself into the world picture and to share, with English and American literature, leadership of Europe.

Fiction. Of writers whose reputation was made before 1900, Pierre Loti, Henry Bordeaux, Paul Bourget, Léon Bloy, Pierre Louys, Marcel Prévost, Henri de Régnier, and Anatole France suffered some eclipse. A few significant novels appeared before 1914. Romain Rolland, in a great novel cycle ***Jean-Ckristophe*** (1904–12), synthesized the outlook of his time through a central character. Valery Larbaud, after ***Fermina Marquez*** (1911) and ***A.O.*** *Barnabooth* (1913), was a pioneer and theorist of the internal monologue, which, based on Édouard Dujardin's ***Lauriers sont coupks*** (1887), influenced his friend James Joyce. Jules Romains invented what he called the ***cink-roman*** ("cinematic novel") with ***Mort de quelqu'un*** (1911; ***The Death of a Nobody,*** 1914), and the idea (not the book) later influenced the *nouveau roman* ("new novel"; see below). He developed this technique on a vast scale in *Lcs Hommes de bonne volonté* (27 vol., 1932–47; "Men of Goodwill" series, 1933–46), which influenced Jean-Paul Sartre's manner.

Romains's generation was obsessed by the Balzac–Zola–Rolland example of "monumental" structures, variously adapted, even in works so diverse as Sidonie-Gabrielle Colette's "Claudine" saga (1900–03) and Georges Duhamel's domestic *Chronique des Pasquicr* (10 vol., 1933–44; *The Pasquicr Chronicles*, 1937). A more personal adaptation of the monumental structure was Marcel Jouhandeau's caricatural "Monsieur Godeau" series (1926--50). Other domestic cycles were Roger Martin du Gard's work *Les Thibault* (8 vol., 1922–40) and Maurice Druon's *Grandes Familles* (1948; translated as *The Rise of Simon Lachaume*, 1952, and, as part of the trilogy *La Fin des hommes*, 1951, as *The Curtain Falls*, 1952–59). François Mauriac explored problems of conscience in his "Thérèse Desqueyroux" series (1927–35), and the application became political and polemical with Sartre's *Chemins de la liberté* (1945; "Roads to Freedom").

Proust and Gide

None of these writers, however, created as monumental a work of beauty and complexity as Marcel Proust's *A la recherche du temps perdu* (1913–27; *Remembrance of Things Past*, 1922–31j, the basis of which, *Jean Santeuil*, remained unpublished until 1952. The seven novels making up the work represent an allegorical search for truth, in that the narrator recalls the experiences of his past in an attempt to recapture time lost. Proust and André Gide were leading figures of the period up to 1940. Gide distrusted himself as a "novelist," but already, in *Lcs Caves du Vatican* (1914; *The Vatican Swindle*, 1925), he had advanced the concept of the "gratuitous act," which contributed something to Surrealism, to the "philosophy of the Absurd," and (negatively) to Existentialist literature. At the same time the book focussed attention on the amoral adolescent, more carefully portrayed in *Les Faux-Monnayeurs* (1926; *The Counterfeiters*, 1927), which, in its composition, together with the *Journal des Faux-Monnayeurs* (1926; *The Logbook of the Coiners*, 19-52), prepared the way for the "antinovel," although Gide himself thought in terms of a "pure" novel (see below).

The disillusioned adolescent was over-exploited by modern French writers, but Alain-Fournier's *Grand Meaulnes* (1913; *The Wanderer*, 1928), Raymond Radiguet's *Diable au corps* (1923; *Devil in the Flesh*, 1932), Jacques de Lacretelle's *Silbermann* (1922), Jean Giraudoux's *Simon le pathétique* (1918), and Hervé Bazin's *Vipère au poing* (1948; *Viper in the Fist*, 1951) and Françoise Sagan's blasé *Bonjour tristesse* (1954) remained interesting variations on the theme.

Among the few novels about World War J to have survived were Henri Barbussé's *Feu* (1916; *Under Fire*, 1917); Duhamel's *Vie des martyrs* (1917; *The New Book of Martyrs*, 1918) and *Civilisation* (1918); André Maurois's *Silences du Colonel Bramble* (1918; *The Silence of Colonel Bramble*, 1919); and Maurice Genevoix's documentary *Sous Verdun* (1916; *'Neath Verdun*, 1916). A realist–revolutionary crisis in the novel was seen in the work of Louis Aragon, from *Les Cloches de Bâle* (1934; *The Bells of Basel*, 1936) to *Les Communistes* (1949), and in the novels of Louis-Ferdinand Céline (who was later to turn violently anti-Semitic)—notably in *Voyuge au bout de la nuit* (1932; *Journey to the End of the Night*, 1934), *Mort à credit* (1936; *Death on the Installment Plan*, 1938), *Guignol's Band* (1943), and *D'un château à l'autre* (1957; "Castle to Castle"). Observation and fantasy combined in the work of regionalist novelists of this period such as Marcel Aymé; but the best of them, Jean Giono, adopted a dryer, Stendhalian style in *Le Hussard sur le toit* (1952; *The Hussar on the Roof*, 1953) and subsequent works.

Novels exploring the psyche

Meanwhile, other important novelists preferred to explore the psyche—the most important being Mauriac, whose stress on ineffectual guilt and spiritual gloom was also found in Julien Green and Georges Bernanos and in Henri Bosco's *Mas Théotime* (1946; *The Farm Théotime*, 1946). Henry de Montherlant analyzed humanity with contempt in *Les Célibataires* (1934; *Perish in Their Pride*, 1936). Pierre-Jean Jouve, strongly influenced by psychiatry, wrote "poetic" novels that could stand beside Raymond Queneau's *Chiendent* (1933; "The Snag"), *Pierrot, mon ami* (1942), and *Zazie duns le métro* (1959); or those of Cocteau, from *Le Potomak* (1919) to *Les Enfants terribles* (1929); or Andre Breton's *Nadja* (1928) and Aragon's *Le Paysart de Paris* (1926; "The Peasant of Paris"); or the slightly faded preciosity of Giraudoux.

Of many novelists of adventure, Andre Malraux, especially in *La Condition humaine* (1933; *Mart's Fate*, 1934), was the only one to give this form philosophical significance.

The pre-1940 novel seemed less original by the 1970s than it did in its day, despite the formal innovations of Rolland, Proust, and Gide; the linguistic experiments of Céline, Giraudoux, and Queneau; and the monologue techniques of Valery Larbaud, Pierre-Jean Jouve, Jean Schlumberger, and Léon-Paul Fargue. 'The real "explosion" came only after 1940.

Sartre and Existentialism

On the one hand, the traditional novel had been threatened by Gide's concept of the "pure" novel, in which motivation and probability (*vraisemblance*) were questioned: on the other, with Malraux and Aragon it had come so close to documentary as to resemble propagandist journalism, so that Sartre could even argue that literature must become journalism. Fiction practically disappeared in the heroic reportage of Antoine de Saint-Exupéry's *Vol de nuit* (1931; *Night Flight*, 1932). During and after World War II, fiction was at first a *témoignage*, or "inspired newsreel," as in the work of Vercors (pseudonym of Jean Bruller; *Le Silence dc la nzcr* [1942]; *Put Out the Light* [1944]), Jean-Louis Curtis, Pierre Gascar, Roger Vailland (*Drôle de jeu* [1945], *Playing with Fire* [1948]), Romain Gary, André Schwartz-Bart, and Jules Roy. The margin between fiction and documentary also narrowed in Sartre and Simone de Beauvoir. Albert Camus, in his enigmatic book *L'Étranger* (1942; *The Stranger*, 1946), in an allegorical novel, *La Peste* (1947; *The Plague*, 1948), and in *La Chute* (1956; *The Fall*, 1957), was, however, primarily a moralist in the great French tradition. Sartre, a novelist despite himself, used every trick of the trade, but sometimes clumsily. His brilliant *Nausée* (1938; *Nausea*, 1949) was a philosophical tract sublimated by insight and style. *Les Chemins de la liberté* might be laborious propaganda but showed a flair for situation, arrangement, and significant detail: its weakness was that the reader was expected also to know Sartre's philosophical work *L'Être et le néant* (1943; *Being and Nothingness*, 1956), his contribution to Existentialist thought. (Sartre's Existentialism, with its emphasis on man "condemned to be free" and on man's life as "an ineffective passion," was based on the distinction between unconscious beings who exist only in themselves and conscious beings who exist for themselves and are therefore necessarily free. Sartrian Existentialism had a profound influence on many French writers.) Sartre, like Proust, showed, however, that fiction could be philosophy in action; and this was true, too, of Maurice Blanchot, Jean Cayrol, and other of his contemporaries. Simone de Beauvoir, obsessed with ambiguity, mortality, and feminism, began well with *L'Invitée* (1943; *She Came to Stay*, 1954) but barely maintained her reputation with the didactic *Mandarins* (1954; *The Mandarins*, 1956) and the somewhat unscientific *Le Deuxième Sexe* (1949; *The Second Sex*, 1953) before finding her proper medium in autobiography. As a novelist she achieved a lighter touch in *Les Belles Images* (1966). These writers were not concerned to experiment with the novel as a form; for political reasons they regarded it primarily as a means of communication. Alongside their earnestness went the more experimental work of Queneau and of Julien Gracq (*Le Rivage des Syrtes* [1951; "The Banks of the Syrtes"]), André Pieyre de Mandiargues (*Le Lis de mer* [1956; *The Girl Beneath the Lion*, 1959]), Boris Vian (*L'Automne à Pekin* [1947; "Autumn in Peking"]), Serge Groussard, and Maurice Blanchot *(Thonzas l'obscur* [1941, new version 1950; "Thomas the Obscure"]).

The beginning of the "new novel," or "anti-novel"

The postwar novel was strongly influenced by Franz Kafka, Virginia Woolf, William Faulkner, Ernest Hemingway, Erskine Caldwell, and John Dos Passos. Despite this influence there emerged the French blow to the established—or traditional—novel, variously called the "anti-novel" and the *nouveau roman* ("new novel"). It might be said to have begun in 1951 with the Irish-born Samuel Beckett's *Molloy* and *Malone meurt* (*Malone Dies)*, written in French and translated by Beckett in 1955 and 1956, though Nathalie Sarraute's *Tropismes (Tropisms,* 1963) had appeared in 1938 and her *Martereau* followed in 1953. The "new novelists" attacked story, plot, character, form, style, meaning, chronology, analysis of thought and feeling—decomposing reality, flouting time. What was left was a "do-it-yourself" novel, in which elite readers worked from data: direct communication between novelist and reader was taboo. Thus the "hero" was opaque in Michel Butor's *Modification* (1957: *Second Thoughts*, 1958); chronology was fuddled in Claude Simon's *Routes des Flandres* (1960; *The Flanders Road*, 1961); necessary facts and interpretations were withheld in Alain Robbe-Grillet's novels *Le Voyeur* (1955) and *La Jalousie* (1957); time was transposed in Claude Mauriac's *Dîner en ville* (1959; *The Dinner Party*, 1960); psychological "authenticity" was disregarded in Nathalie Sarraute's *Portrait d'un inconnu* (1947; *Portrait of a Man Unknown*, 1958). The term *école du regard* ("school of the glance"), applied to Robbe-Grillet, Jean Ricardou, and Claude Ollier, meant that they showed only the flat surfaces of things; but if the "new novel" had been merely a film script and its masterpiece the film called *L'Année dernière à Marienbad (Last Year at Marienbad),* there would have been no future in it. Jean Cayrol, Robert Pinget, and Marguerite Duras were sometimes associated—the latter wrongly—with the movement.

The general public, meanwhile, continued to encourage writers who were in many respects not so experimental. Among these were Henri Thomas; Jean Cau; a Belgian, Françoise Mallet-Joris; Marguerite Yourcenar; José Cabanis; Bernard Pingaud; Edmonde Charles-Roux; and Roger Peyrefitte.

The theatre. At the turn of the century the French theatre was torn between neo-Symbolism and Social Realism and broke free only 30 years later. Of the lighter comic writers, Georges Feydeau revived (and translated) well. The drawing-room (parlour) "problem" playwrights had also dated, but the form persisted-even in Sartre's *Huis-clos* (performed 1944; *No Exit*, 1946)—and seemed likely to persist so long as people had problems and parlours. The sentimental Symbolism of Maurice Maeterlinck (*Monna Vanna* [1902], *L'Oiseau bleu* [1908; *The Blue Bird,* 1909]) retained a period charm, but the only lastingly great dramatist in the Symbolist tradition was Paul Claudel. The historical theatre of Romain Rolland and the verse drama of Edmond Rostand had no successors.

Alfred Jarry and modern French theatre

The 20th-century theatre began with a time bomb under it, one that exploded only 50 years later: Alfred Jarry's *Ubu Roi* (1896), which could later be seen as a forerunner of Surrealism and the Theatre of the Absurd. Otherwise the period was notable mainly for reforms by great manager-producers: Jacques Copeau, Louis Jouvet, Charles Dullin, Gaston Baty, and Georges Pitoëff. After them came Jean-Louis Barrault, André Barsacq, Jean Vilar, Jean Dasté, Georges Vitaly, and Roger Blin. After 1944 the state theatres—the Comédie-Française, the Théâtre de l'Odéon (also known as the Salle Luxembourg), the Théâtre Nationale Populaire, and the Théâtre des Nations (Sarah Bernhardt)—were reorganized; the state grants were made to provincial troupes.

Claudel's religious plays, deeply rooted in Shakespeare and in classical Greek and later Spanish theatre, tended to be chronicles or panoramic works overflowing with theatrical conventions, so that they long seemed unactable. *L'Annonce faite à Marie (Tidings Brought to Mary)* and *L'Otage (The Hostage)* were staged in Paris in 1912 and 1914, respectively, and soon after in the United States and London, but others were not staged until the 1940s. Claudel, with his grotesque sense of pageantry and hierarchy, buffoonery, brutal psychology, creative imagination, cruel fantasy, and gusts of rhetoric spiced with gross peasant humour, approached the Elizabethen synthesis. He had no apparent heirs, but writers such as Michel de Ghelderode and Gide *(Oedipe* [published 1931: *Oedipus and Theseus*, 19501) could not escape his influence.

Generally speaking, the stage play was less experimental from 1920 to 1940 than sircumstances permitted. Guillaume Apollinaire's *Mamelles de Tirésias* (1917; "The Breasts of Tiresias") was neo-Jarry, but Dada and Surrealism failed to mark the theatre. Giraudoux's witty plays lacked depth and density: his comedies—*Amphitryon 38* (1929), *Intermezzo* (1933; *The Enchanted*, 1950), *La Folle de Chaillot* (1945; *The Madwoman of Chaillot*, 1947)—like his more serious *Guerre de Troie n'aura pas lieu* (1935; *Tiger at the Gates*, 1955), soon lost their topical savour, though they remained actable. This also applied to Cocteau, whose poetic plays, remarkably exploiting every scenic device, came to seem too clever and abstract. Armand Salacrou's nihilistic, cinematographic plays, ranging from almost neo-Surrealistic works to commercial theatre, were ignored. He reached his best with *Les Nuits de la colère* (1946; adapted as *Men of Darkness*, 1948) and *L'Archipel Lenoir* (1947). Jean Anouilh began as an extremely serious dramatist who entertained and shocked the public just enough to remain popular. Though his genius for traditional theatre sometimes made him appear facile, his reputation rested solidly on *Antigone* (1942), *L'Alouette* (1953; *The Lark*, 1955), and *Becket ou l'honneur de Dieu* (1959; *Becket; or, The Honour of God*, 1962).

The "theatre of cruelty"

Meanwhile, Antonin Artaud and Roger Vitrac's Théâtre Alfred Jarry (1927) passed almost unnoticed, though it produced the *théâtre de cruauté* ("theatre of cruelty"), in which Artaud theorized on "events" and "happenings." This was responsible for the production of plays by Artaud, Vitrac, and Raymond Aron, all neo-Surrealist works.

The commercial theatres at this period were dominated by Marcel Achard, Stève Passeur, Henri Lenormand, Édouard Rourdet (*Les Temps difficiles*, 1934), Sacha Guitry (author and often director of and star actor in innumerable minor comedies), and the delightful Marcel Pagnol (*Topaze*, 1928; *Marius*, 1929). Jules Romains was a brilliant humorist whose later devotion to the novel was a loss to the theatre. Other novelist-playwrights, such as Mauriac, Giono, and Gide, lacked this stage sense. The greatest dramatist of that generation, and in some ways Claudel's successor, was Henry de Monthcrlant, last survivor of the classical Symbolist tradition. His postwar plays—La *Reine morte* (1942; *Queen After Death*, 1951), *Le Maître de Santiago* (1947; *The Master of Santiago*, 1951), *Port-Royal* (1954), *Le Cardinal d'Espagne* (1960)—gained a worldwide reputation.

The post-1940 theatre presented a confused picture. At first the Existentialist left wing produced ardent political and philosophical allegories: Sartre with *Les Mouches* (1943; *The Flies*, 1946), *Les Mains sales* (1948; *Dirty Hands*, 1949), *Les Séquestrés d'Altona* (1959; *Loser Wins*, 1960), and *Nekrassov* (1955); Simone de Beauvoir with *Les Bouches inutiles* (1945; "Useless Mouths"); and Camus with *Caligula* (1945), *Le Malentendu* (1944; *Cross Purpose*, 1948), and *Les Justes* (1949). But for all these, the stage was a propagandist platform, so that, with all their talent, they looked back to the problem plays of the turn of the century. More original was Jean Genet, who, in *Haute Surveillance* (1949; *Deathwatch*, 1954) and *Les Bonnes* (1947; *The Maids*, 1954) to *Les Paravents* (1961; *The Screens*, 1962), created a complex anti-Naturalist and antisocial theatre, aggressively poetic but less tied to theatrical convention. More traditional was the poetic theatre of (among others) Jacques Audiberti (*Quoat-quoat* [1946]); Michel de Ghelderode, whose 30 plays (written 1918–37) only began to reach the stage in 1947; Henri Pichette (*Les Epiphanies*, 1947); Jean Vauthier (*Le Capitaine Bada*, 1952); Georges Chéhad6 (*Le Voyage,* 1961); and François Billetdoux (*Va donc chez Torpe,* 1961), though many of them had experimental qualities.

The year 1950 was to prove a turning point, with the production of Eugène Ionesco's ***Cantatrice chauve (The Bald Soprano,*** 1958) and Arthur Adamov's ***Grande et la petite manoeuvre*** and ***Invasion.*** The "antitheatre" thus initiated was really a "pure" theatre, stripped of convention, naked and abstract, crudely poetic, arbitrary, and imaginative. Ionesco, influenced by Kafka and Jarry, caricatured the real and the "absurd" together, exteriorized secret fantasies, often achieved profound social relevance, and was a chief creator of the Theatre of the Absurd. Adamov, an Expressionist, did likewise in ***Le Ping-pong*** (1955). Beckett, in ***En attendant Godot*** (1953; ***Waiting for Godot,*** 1954), ***Happy Days*** (1961; performed in French as *Oh! les beaux jours,* 1963), and ***Play*** (1963; performed in French as ***Come'die,*** 1964), perhaps achieved a greater universality, although he refused tragic catharsis. Other successful dramatists in this new stream were Marguerite Duras (***Le Square,*** 1955), Robert Pinget (***Lettre morte,*** 1960; ***No Answer,*** 1961), and Roland Dubillard, with his baroque tragedy La *Maison d'os* (1962; "The House of Bone"). French experimentalism, in the theatrical vanguard since perhaps 1950, seemed by the early 1970s to be losing touch with the "common" audience.

Poetry. Late-19th-century poetry was already split between a Neoclassical "pure" poetry, written in traditional forms, and a poetry of common speech, usually in *vers libre* ("free verse"). These tendencies persisted in the 20th century, with an occasional call to order. The best poets distrusted rhetoric or eloquence, although the leading poets of the early part of the century—Gmile Verhaeren, Claudel, Francis Jammes, Paul Fort, and Charles Péguy—not only failed to give a lead but themselves suffered from a Hugoesque verbosity. Influenced initially by Arthur Rimbaud, Claudel used a form that became known as the *verset claudélien*—a long, unscanned and usually unrhymed line—which he perfected but which few later poets adopted. The more restrained José Maria de Heredia, Henri de Régnier, Jean Moréas, Albert Samain, and Fernand Gregh all wrote into the 20th century, but classical Symbolism (as opposed to the Romantic Symbolism of Jules Laforgue, Rimbaud, etc.) found its last great representatives in Paul Valéry (***La Jeune Parque,*** 1917; *Charmes,* 1922), who purged poetry of rhetoric and social contingency while using it as a field of research into the creative act; and in Saint-John Perse. Influenced by Homer and Lucretius, Saint-John Perse tightened Claudel's versicle and used it to produce profound, metaphysically inclined poetry.

Reconciliation of conflicting styles in the poetry of Apollinaire

Guillaume Apollinaire synthesized contemporary tendencies while pointing in new directions with *Alcools* (1913) and ***Calligrammes*** (1918), and his posthumous collections added to his reputation. His formula reconciled classical intellectuality and form with Romantic enthusiasm, intuition, Expressionism, and experimentalism of every kind. Alongside him, Max Jacob, André Salmon, Pierre Reverdy, and others, under the influence of Cubism, gave new forms to personal utterance. Apollinaire also helped to unleash the forces of Dadaism and Surrealism by exalting the Marquis de Sade, Jarry, and Rimbaud.

Although the Surrealists numbered among them some readable poets—such as André Breton, Louis Aragon, Philippe Soupault, and Benjamin Péret—Paul Éluard became the movement's leader when, in 1931, he established the difference between the "Surrealist text," or document, and the "Surrealist poem," the text elaborated and formalized. His own work was intensely personal, interior, restrained, yet universal in its deceptive simplicity. Whereas Breton and Robert Desnos never overcame rhetorical extravagance, Aragon unexpectedly did so, with *Le Crève-coeur* (1941; "Heartbreak"). So also did Pierre Reverdy and Pierre-Jean Jouve, in his collections ***Sueur de sang*** (1933; "Bloody Sweat") and ***Gloire.*** Nonetheless, the liberating movement of Surrealism proved disappointing, showing that manifestos, a philosophy of the irrational, even a new imagery could not produce poems if form, style, intention, communication were despised. Thus Surrealist prose poetry is often more satisfying. Here, the marginal Surrealist Henry Michaux made an interesting Expressionist contribution with La *Nuit remue* (1934; "The Night Stirs"), while René Char developed a more classical style in his verse (***Les Matinaux,*** 1950; "The Early Risers"), prose poems, and aphorisms. Of others standing somewhat apart from the current, Jean Cocteau, despite his great gifts, was too much of an opportunist to mature properly and did not surpass his ***Plain-Chant*** (1923); while Jules Supervielle cultivated a certain malaise with wit and feeling but failed to produce really satisfactory verse.

The period after 1940 produced no French poet of international stature, although Jacques Prévert, Francis Ponge, and Raymond Queneau were all interesting. If the French poetic muse has seemed to be in the doldrums, more traditionalist work of high quality continued to be written by Maurice Fombeure, Yves Bonnefoy, Alexandre Toursky, Jean Tardieu, André Frénaud, Jean Follain, Henri Thomas, Georges Clancier, Alain Bosquet, and Marc Alyn. Contemporary French poets show little of the adventurousness that is to be seen in the novel and the theatre, and in the early 1970s there was little sign of their becoming more European or world minded. The unfortunate truth was that ever since Apollinaire, anti-intellectualism had undermined French poetry, and what was lacking was "the shaping spirit of imagination."

Literary criticism. French criticism had a strong historical bias. The "scientific" history of literature formulated by Gustave Lanson and backed by his useful bibliographies was continued by numerous scholars. A major achievement in this regard was the Pléiade *Histoire des littératures* (1955–58; "History of Literatures"), a world survey edited by Raymond Queneau. Against the historical approach stood the impressionistic, beginning with Rémy de Gourmont and Jules Lemaître, and related to it was the amateur criticism that had been an important part of the work of creative writers such as Proust, Gide, Valéry Larbaud, Paul Valéry, Paul Léautaud, Maurice Blanchot, Alain Robbe-Grillet, and Sartre. In the 1960s the opposition between experimental and academic criticism came to a head in the dispute between the "new" critics—Roland Barthes, Georges Poulet, Jean-Pierre Richard, Jean-Paul Weber, and others who had been influenced by the psychological stylistics and structuralist approaches of Leo Spitzer and Gaston Bachelard—and Raymond Picard, a leading representative of traditional academic criticism. Although the dispute remained unresolved, it was clear that some of the younger critics, such as those associated with the review ***Tel Quel,*** were already making important contributions to literary discussion in France. Unfortunately, no modern critical school in France was able to establish, as was done in Britain and the United States, a proper critical terminology. The most accessible new technique was that of the critical "Panorama," which combined criticism with texts; it was created by Gaetan Picon and followed by Georges Clancier, J. Rousselot, and Jeanine Moulin. See above ***Canadian literature in the 20th century: French*** and, below, ***Belgian literature in the 20th century: French.***

Provencal. Among the Provençal writers who became famous during the first half of the 20th century, although many of them had published a good portion of their work before 1900, should be mentioned Valère Bernard of Marseilles (*La Legenda d'Esclarmonda,* 1936), Marius André, Prosper Estieu, Antonin Perbosc, the Languedocian poet of ***Lo Got Occitan*** (1903), and Philadelphe de Gerde, a Pyrenean, and Miqeu Camelat, also a Pyrenean, whose pastoral poem ***Beline*** (1899) was a Gascon counterpart to Mistral's ***Mirkio.*** Contemporary with them were the Provencal writers of the Camargue region of the Rhône Delta: Joseph d'Arbaud, notable author of such stories as ***La Bestio dóu Vaccarès (The Beast of the Vaccarks),*** written in an epic vein, and such verse as ***Lou Lausié d'Arles*** (1913); Folco de Baroncelli-Jaron; and Marius Jouveau. A curious case was that of Sully-André Peyre, writing in Provencal, in French, and in English. Had Paul Froment (1875–98) not died young, he might well have become the great poet of Quercy; his place was taken by a bucolic and religious poet Jules Cubaynes, author of *L'Ome **de Dieu,*** a masterpiece of sacerdotal poetry. P.-L. Grenier was a notable artist who revived the classical language of Limousin. J.B. Chèze, in the same region, wrote the delicate *Una princessa dins **la Tor*** (1932). Albert Pestour of Limousin was the inspired poet of *Rebats sur l'autura* and *L'Autura **enviblada.*** Among other noteworthy Provençal writers born toward the end of the 19th century are P. Eyssavel, R. Rouquette, and their feminine compatriot Marcelle Drutel, as well as J.S. Pons of Rousillon. Contemporary writers are divided between those who remained faithful to the Mistral tradition—the "Provençals"—and those who have been won over to more modern ideas—the "Occitans." Yet such poets as J. Mouzat, C. Campreux, C. Galtier, L. Cordes, M.-P. Delavouet, R. Méjean, R. Nelli, R. Lafont, B. Manciet, and many others less well known, bear witness to the permanent vitality, throughout every langue d'oc-speaking province, of Occitanian poetry.

ITALIAN LITERATURE IN THE 20TH CENTURY

Gabriele D'Annunzio's nationalism. In Italy at the beginning of the 20th century, aggressive nationalism superseded peaceful internationalism; the attempt at the unification of Italy, the Risorgimento, was replaced by the selfishness of the middle classes; and primacy of society was replaced by glorification of the individual. The chief representative of this reaction to the 19th-century thinking was Gabriele D'Annunzio, whose life and art were a blend of Jacob Burckhardt's idea of the Renaissance "complete man" and the superman created by Friedrich Nietzsche, but his literary work was characterized by an inability to distinguish between life and art; he was at his best when writing about himself, as in an autobiographical novel, ***Il piacere*** (1889; ***The Child of Pleasure,*** 1898), in his mature poetry, and his late memoirs and confessions; it was worst when projecting his superhuman ideals as characters. D'Annunzio's "erotic-heroic" ideology (as he defined it) fired younger contemporaries, who identified it with the Fascist mystique.

Benedetto Croce's 'criticism. Although D'Annunzio's fame was worldwide, the function of organizing Italian culture and modernizing intellectual life fell mainly to Benedetto Croce in almost 70 books and in a bimonthly review ***La Critica*** (1903–44). Perhaps his most influential work was literary criticism, which he expounded and continually revised in articles and books spanning nearly half a century. He created a method of aesthetic appreciation independent of social and economic background and practical implications, which became so self-contained as to be insensitive and lend itself to misinterpretation by believers in "pure art" and critics who indulged in unsubstantiated accounts of their aesthetic impressions. Crocean criticism succeeded perhaps beyond Croce's intentions, stifled an earlier school of "historical criticism," and suppressed attempts to evolve stylistic or sociological theories.

Croce's beliefs implied condemnation of Fascist ideology, and he parted with a lifelong friend, Giovanni Gentile, whose theory of "absolute idealism" in his political development justified the "absolute state" and, by extension, the Fascist regime. Nevertheless, Croce was never seriously molested by Fascism, perhaps because the dictator Benito Mussolini wanted a showpiece of toleration of opponents and because Croce's enlightened conservatism did not seriously antagonize the ambitions of the Italian upper middle class, which Fascism manipulated. After the fall of Fascism, Croce's ideology proved unsuited to changed conditions, and he lost much of his authority. But his monumental corpus of philosophical, critical, and historical works, of great scholarship, humour, and common sense, remains the greatest intellectual feat in the history of modern Italian culture.

Literary trends before World War I. While Croce was starting his arduous task, literary life revolved mainly around reviews such as ***Leonardo*** (1903), *Hermes* (1904), ***La Voce*** (1908), and ***Lacerba*** (1913), founded and edited by relatively small groups. The two main literary trends were: *crepuscolarismo*, which favoured a colloquial style to express memories of sweet things past, as in the work of Guido Gozzano and Sergio Corazzini; and *futurismo*, loathing of traditional art and demanding complete freedom of expression, whose leader was Filippo Tommaso Marinetti, editor of ***Poesia,*** a fashionable cosmopolitan review. Both *crepuscolari* and *futuristi* were part of a complex European tradition of disillusionment and revolt, the former inheriting the sophisticated pessimism of French and Flemish "decadents," the latter taking part in an episode in the history of western European avant-garde developed from the French poets Stéphane Mallarmé and Guillaume Apollinaire to the Cubist, Surrealist, and Dada movements. In spite of being apparently at opposite extremes, both shared a feeling of revulsion against D'Annunzian flamboyance and rhetoric, from which they attempted to free themselves and, paradoxically, from which they derived elements of their style (the "crepuscular" mood of D'Annunzio's *Poema paradisiaco* [1893] and most Futuristic "new theories"—identification of art with action, heroism, and speed, free use of words—being implied in his *Laus **Vitae).***

Crepuscolarismo
and
futurismo

The "return to order." The wish for a "return to order" after World War I made it easier for the Fascist regime to impose its own form of "order." The review ***La Ronda***, founded in 1919 by Vincenzo Cardarelli and others, advocated a return from chaotic eclecticism to the saner aspects of Italian tradition; its Neoclassicism started a new literary genre, variously labelled "artistic prose," *elzeviro*, and ***capitolo*** and consisting in stylistic exercises to which considerations of content were almost irrelevant. As Fascist dictatorship thwarted the free expression of ideas, how to write became more important than what to write. Apart from the works of a few good storytellers, such as Riccardo Bacchelli, and the award of the 1926 Nobel Prize to the Sardinian novelist Grazia Deledda, the most notable event of the late 1920s was the "discovery" of Italo Svevo, whose talents would have won earlier recognition had he not been operating outside the literary establishment. His best known novel, a masterpiece of psychological insight, Jewish humour, and pessimism, was ***La coscienza di Zeno*** (1923; ***The Confessions of Zeno,*** 1930). By the time new promising novelists, such as Alberto Moravia, Corrado Alvaro, and Carlo Bernari, appeared in the 1930s, Italy was intellectually isolated, and interest in modern Italian literature was kept alive only by an anti-Fascist expatriate Ignazio Silone. But when his novels ***Fontamara*** (1930; Eng. trans., 1934) and ***Pane e vino*** (1937; ***Bread and Wine,*** 1937) appeared in Italy after the war, the public was unreceptive to their style and mood.

Luigi Pirandello. Drama, which a few playwrights and producers were trying to extricate from old-fashioned realistic formulas and more recent superhuman theories, was increasingly dominated by Luigi Pirandello. His own experience of the "unreal," through his calamitous family life and his wife's insanity, enabled him to see the limitations of realism. From initial short-story writing, in which he explored the incoherence of personality, the lack of communication between individuals, the uncertain boundaries between sanity and insanity or reality and appearance, and the relativity of truth, he turned to drama when—as he said—his characters urged him to give them life on the stage. He realized that life's absurdity could be better expressed by moving from the immediacy of narrative prose to drama, a literary genre already removed from reality, in which the ambiguous relationship between actors and the characters they represent, characters and real people, fact and fiction provided a metaphor of the contradictions of human existence.

To multiply the fragmentation of the levels of reality, Pirandello tried to destroy conventional dramatic structures and to adopt new ones: a play within a play in ***Sei personaggi in cerca d'autore*** (1921; ***Six Characters in Search of an Author,*** 1952) and a scripted improvisation in ***Questa sera si recita a soggetto*** (1930; ***Tonight We***

Pirandello's
play
within
a play

Improvise, 1932). This was a way of transferring the dissociation of reality from the plane of content to that of form, thereby achieving an almost perfect unity between ideas and dramatic structure. Pirandello's plays, including perhaps his best, *Enrico IV* (1922; *Henry IV*, 1960), often contain logical arguments: several, including Croce, were misled into thinking that he intended to express in this way a coherent philosophy, whereas he used logic as a dramatic symbol, a fixed landmark in the flux of human existence.

The Hermetic movement. Poetry in the Fascist period underwent a process of involution, partly influenced by French Symbolism, with its faith in the mystical power of words, and partly under the stress of changed political conditions after World War I, during which literature had declined. Many poets of the wartime generation, weary of tradition and rhetoric, had been seeking new expression: some, like the *futuristi*, had tried to work rhetoric out of their system by letting it run amok; others, such as Camillo Sbarbaro (*Pianissimo* [1914], *Trucioli* [1920; "Shavings"]), cultivated a style purified of unessential elements. Out of those efforts grew a poetry combining the acoustic potentialities of words with emotional restraint and consisting mainly of fragmentary utterances in which words were enhanced by contextual isolation and disruption of syntactic and semantic links. The resultant obscurity compensated poets for loss of influence in a society subservient to dictatorship by turning them into an elite and allowed some, notably Eugenio Montale, to express their pessimism covertly. The name of this movement, *ermetismo* ("Hermeticism"), hinted at both its aristocratic ambitions and its esoteric theory and practice. Its leader, Giuseppe Ungaretti, tried to charge each word of his early poems with such intensity of meaning that concern with technical problems often overshadowed emotion, thus producing supremely stylized forms. Thus, what in the 1920s had appeared revolutionary proved later to be only another facet of the formalistic tradition. Against this background of refinement, obscurity, and unreality, only the simple and moving poems of Umberto Saba preserved an immediate appeal.

The Neorealist movement and after. During World War II the walls of the hermetic ivory tower began to crumble. Ungaretti's style became so articulate as to be almost unrecognizable. Salvatore Quasimodo adopted a new *engagé*, or committed, style, which won critical admiration, and others followed suit in a drift toward social realism.

Social realism

This development had been foreshadowed by some writers under Fascism. In 1929 Alberto Moravia had written a scathing indictment of middle class moral indifference, *Gli indifferenti* (*The Indifferent Ones,* 1932). Carlo Bernari wrote a novel about the working classes, *Tre operai* (1934; "Three Workmen"); Cesare Pavese produced *Paesi tuoi* (1941; *The Harvesters,* 1961); and Elio Vittorini wrote *Conversazione in Sicilia* (1941; *Conversation in Sicily,* 1948); all definitely promised a new literary development. From these and from certain aspscts of U.S. literature (William Faulkner, Erskine Caldwell, John Steinbeck, John Dos Passos, Ernest Hemingway, translated mainly by Vittorini and Pavese), postwar Neorealism took its cue. Writers were confronted with a wealth of unused material. There were the social and economic problems of the south, described in all their magnitude by Carlo Levi in his social, moral, and poetic portrait of the people of the primitive southern Italian province of Lucania, *Cristo si è fermato a Eboli* (1945; *Christ Stopped at Eboli,* 1947) and by Rocco Scotellaro (*Contadini del sud,* 1954) and Francesco Jovine (*Le terre del Sacramento,* 1950). The problems of the urban proletariat were touched by Vasco Pratolini in his portraits of the Florentine working classes (*Cronache di poveri amanti* [1947; *A Tale of Poor Lovers,* 19491, *Metello* [1955]) and exposed by P.P. Pasolini in his tales of the Roman underworld (*Una vita violenta* [1959]). There were memories of the industrial north's struggle against Fascist and Nazi domination, which excited Vittorini, Pavese, and Beppe Fenoglio; and there were sad tales of a lost war recounted by Giuseppe Berto and Mario Rigoni Stern. No longer needing to invent a plot, many became preoccupied with technical details.

Carlo Cassola, in many ways a forerunner of the French *nouveau roman,* or "new novel," emptied his stories of action in a quest for narrative objectivity exemplified in *Il taglio del bosco* (1959; "The Felling of the Forest"); and he was often unimaginative in recording every minute event. A similar tendency was apparent in Moravia's later work, although curiosity about human psychology prevented him from drawing uninteresting characters. Pavese began to use recurrent images (misty hills, winding country roads, empty town streets, sterile seashore) as symbols of a writer's struggle to come to terms with his world; they were used later by film director Michelangelo Antonioni as symbols of man's alienation. Italo Calvino turned to writing fantastic tales such as *I nostri antenati* (1960; three tales translated as *The Baron in the Trees,* 1959, and *The Nonexistent Knight* and *The Cloven Viscount,* 1962) and, later, moralizing science fiction such as *Le Cosmicomiche* (1965; *Cosmicomics,* 1968) and *Ti con zero* (1967; *T Zero,* 1969). Vittorini, paralyzed by stylistic anxiety, turned to criticism and the encouragement of younger writers. Thus "engaged" literature became inward looking and lost its grip on reality. This tendency also affected drama; from practical issues of moral justice and responsibility with which he had dealt earlier, Ugo Betti was drawn to representation of his characters' hidden metaphysical problems, which gave his later plays their ambiguous fascination.

The influx of foreign ideas

As a result of the return to normality after intellectual poverty, Italy was flooded with foreign ideas; intellectual debates gained so much in breadth and subtlety that artists found it more rewarding to feed on them rather than on real-life problems, and writers increasingly interpreted in the light of new critical ideas. Dino Buzzati's charming tales *Il deserto dei tartari* (1940; *The Tartar Steppe,* 1952) and *Sessanta racconti* (1958; "Sixty Stories") were seen as reminiscent of Kafka. Carlo Emilio Gadda's language, full of subtle and unsubtle puns, and rare, vulgar. and invented words, was seen as the influence of the Irish author James Joyce. The need for a return to native sources was shown by the relish with which readers turned in the late 1950s to old-fashioned historical novels, among which perhaps only *Il gattopardo* (1958; *The Leopard,* 1960), written earlier by a Sicilian nobleman, Giuseppe Tomasi di Lampedusa, and *Cinque storie ferraresi* (1956; *A Prospect of Ferrara,* 1962), edited by Giorgio Bassani, were considered of lasting value. Trends in the 1960s confirmed literature's preoccupation with itself, symbolized by Moravia's *Attenzione* (1966; "The Lie"), about a writer writing about the writing of his novel.

Such literary narcissism does not seem to have produced many new ideas. In the same way as Neorealism failed to overcome the ideological and aesthetic limitations of 19th-century realism, the Neo-avant-garde and Neo-experimentalist movements of the 1960s and early 1970s appeared unable to say much that had not already been said by Surrealism and Dada over half a century before. Such poetry as that of Edoardo Sanguineti, Elio Pagliarani, Alfredo Giuliani, and Georgio Manganelli proved to be just as inaccessible to the public of the early 1970s as was the Hermetic poetry of the 1930s.

These movements are caught in a painful contradiction. On the one hand, their members reject class-bound "establishment" literature in the name of democratic and revolutionary ideals. On the other, their attempts to reject the standard language, seen as the incarnation and the instrument of bourgeois cultural and political hegemony, cut them off from the vast majority of the reading public and turn them into a literary caste even more exclusive than the establishment they wish to destroy.

Some novelists, however, less given to introspection and to extreme ideological stances, have been on the whole more successful than the avant-gardes in expressing the crisis of industrial capitalism; among them such novelists are Ottiero Ottieri (*Donnarumma all'assalto,* 1959), Paolo Volponi (*Il memoriale,* 1962), Giovanni Testori (*Il fabbricone,* 1963), and Lucio Mastronardi (*A casa tua ridono,* 1971).

SPANISH LITERATURE IN THE 20TH CENTURY

The generation of 1898. For over two decades before 1900, a mood of seething political and social analysis developed in Spain that gave in Ángel Ganivet's *Idearium español* (1897; *Spain, an Interpretation*, 1946) one of the most searching analyses of the Spanish character ever written. The imperial cycle begun in 1492 ended in ignominy with the Spanish–American War of 1898, and thinking Spaniards embarked on a diagnosis of their country's ills and an attempt to shock the national mentality out of its *aboulia,* or "lack of will." The novel was injected with a new seriousness of purpose, and the critical, psychological, and philosophical essay rose to new importance. Novelists and essayists constituted what Azorin (pen name of José Martinez Ruiz) called the "generation of 1898," a group that regained respect for Spanish letters abroad.

Unamuno's analyses of the national problem

Miguel de Unamuno, who dominated the literary scene for a generation, studied the national problem acutely in the five essays in *En torno al casticismo* (1895; "On Spanish Purism") and in the *Vida de Don Quijote y Sancho* (1905; *The Life of Don Quixote and Sancho,* 1927). He examined the problem of immortality in his most important work, *Del sentimiento trágico de la vida* (1913; *The Tragic Sense of Life in Men and Peoples,* 1921). A provocative rather than a systematic thinker, he aimed at sowing spiritual disquiet. The novel was to him a medium for discussion of the fundamentals of personality; his own include *Niebla* (1914; *Mist,* 1929), *Abel Sanchez* (1917), and *Tres novelas ejemplares y un prólogo* (1920; "Three Cautionary Tales and a Prologue").

Azorin concerned himself with the reinterpretation of earlier literary values and of the Spanish countryside in, for example, *El alma castellana* (1900; "The Castilian Soul"), *La ruta de Don Quijote* (1905; "Don Quixote's Route"), and *Clásicos y modernos* (1913). An artist in criticism and a finely sensitive miniaturist, he contributed powerfully to the deflation of the rhetoric that had vitiated much 19th-century writing. A philosopher, José Ortega y Gasset, developed from criticism and psychology (*Meditaciones del Quijote* [1914; "Meditations on Quixote"]) to national problems (*La España invertebrada* [1921; *Invertebrate Spain,* 1937]), then to international (*El tema de nuestro tiempo* [1923; *The Modern Theme,* 1931] and *La rebelión de las masas* [1929; *The Revolt of the Musses,* 19321).

Pio Baroja repudiated tradition, religion, and the cult of the individual and advocated social action. *La raza* ("The Race"), *La lucha por la vida* (1904; "The Struggle for Life"), and *Agonías de nuestro tiempo* (1926; "Agonies of Our Time") were fiercely vigorous attempts to arouse discontent with material conditions. As vigorous, but possessing greater narrative skill, was Vicente Blasco Ibáñez, who wrote on contemporary social problems from the standpoint of an anarchist, as in *La bodega* (1905; *The Wine Vault,* 1923) and *La horda* (1905; *The Mob,* 1927). He won international renown with *Los cuatro jinetes del apocalipsis* (1916; *The Four Horsemen of the Apocalypse,* 1918), a novel of World War I. Ricardo León, a conscious stylist, sought to recapture the traditional Christian values of a society threatened with materialism.

*No*ecentistas*

'The term *novecentistas* is applied to writers of the early 20th century who sought to renew intellectual and aesthetic standards after the passionate involvement of their immediate predecessors.

The novel. In Ramón Pérez de Ayala, the novel was at once a polished art form and a forum for philosophical discussion. *Belarmino y Apolonio,* a projection of the old debate between faith and reason, made its characters almost symbolic, as did *Tigre Juan,* on the traditional theme of honour. Gabriel Miró's perfect descriptive prose retarded the action of his novels, but he remained a supreme artist in words. The novel as a literary form fell under the influence of Ortega y Gasset, who in *La deshumanización del arte* (1925; *The Dehumanization of Art,* 1948) propounded principles of a pure, depersonalized art. Analyzing the novel as an art form, he predicted its decline. In the following decade Benjamin Jarnés and others attempted, without complete success, to apply a technique of pure art to the novel; Jarnés' works were outstanding examples of the Surrealist novel in Spain. The publication in 1929 of Ramón José Sender's *Imán* (*Earmarked for Hell,* 1934), based on military experiences in Morocco, indicated a return to realism and social criticism. It was attentive to the human situation in all its horror and to a search for a satisfying philosophical and ethical system.

Novels after the Spanish Civil War of 1936–39 often showed emptiness and disillusionment. Camilo José Cela created a realistic style depicting rural violence in horrific detail in *La familia de Pascual Duarte* (1942; *Pascual Duarte's Family,* 1946): this early style was named *tremendismo. La colmena* (1951; *The Hive,* 1953), much more mundane, described the post-Civil War poverty and misery of Madrid.

Drama. With the new century, drama achieved new vigour under the stimulus of Jacinto Benavente y Martinez, winner of the Nobel Prize for Literature in 1922, whose plays were skillful and witty. After a period of effervescence and irony, Benavente showed a preoccupation with aesthetics and later with ethics. By contrast, Gregorio Martinez Sierra remained true to a more traditional Spanish atmosphere, in which idyllic sentiment, though always deep-rooted in Spanish realities, breathed a sensuous joy in nature and life (*Tearro de ensueño,* 1905; "Dream Theatre"; and *El reino de Dios,* 1916; *God's Kingdom*). If the brothers Serafín and Joaquín Alvarez Quintero contributed nothing new to dramatic art, the vivacity of their many Andalusian comedies never failed to entertain. Federico Garcia Lorca stood far above his contemporaries. His drama was poetic in more than the usual sense, presenting elemental passions with an intensity that made the characters poetic symbols of man's tragic impotence to arrest his fate. His dramatic poetry was modern yet traditional, personal yet universal, surrealist yet childlike. His plays *Bodas de sangre* (1933; *Blood Wedding,* 1939), *Yerma* (1934; translated 1941), and *La casa de Bernarda Alba* (1936; *The House of Bernarda Alba,* 1941) depicted extremes of passion involving the traditional Spanish theme of honour.

Garcia Lorca's drama

An impulse of renovation visible in the novel after the Civil War failed to reach the theatre, although Antonio Buero Vallejo attempted to revitalize the drama by using social criticism and Miguel Mihura by introducing the Theatre of the Absurd. The *género chico,* or "little genre" (the short sketch, lively and often with music), continued to charm ordinary people, whose way of life supplied it with setting and theme. Ricardo de la Vega and Carlos Arniches were outstanding in this form.

Poetry. Rubén Dario, Latin America's greatest poet, took *modernismo* to Spain in 1892. In general, modernism was a reaction against 19th-century bourgeois materialism and a search for other and more specifically aesthetic values of life. Dario's Modernism greatly enriched the musical resources of Spanish verse, notably by a daring use of new rhythms and metres; and under his influence poetry in Spain underwent a renaissance.

Modernism had scarcely any contact with the generation of 1898. The Modernists, apart from the novelist Ramón Maria del Valle-Inclán, whose four *Sonatas* (1902–05) typified the four seasons of his hero's life, were almost all Andalusian poets in pursuit of self-realization, esoteric beauty, and refinement of style; the generation of 1898 were mostly northerners and chiefly concerned with content.

Juan Ramón Jiménez, another Nobel Prize winner (1956), soon discovered poetry to be for him not a withdrawal but reality itself; and, as he strove to capture the poetic essence of each passing moment, his style, initially ornate, became more and more bare. Using and gradually winnowing all the resources of Modernism, he became a powerful influence on the younger generation. The brothers Machado well exemplified the Andalusian–Castilian dichotomy: Manuel, always loyal to his native Seville, was the Modernist; Antonio lost his heart to Soria, in Old Castile, and wrote of the recesses of the poet's soul or of the unchanging soul of Castile.

The poetic reputation of Garcia Lorca grew steadily after his death. He was a poet, as he was a dramatist, of fundamentals and showed of what starkness of feeling and effect the traditional song and ballad forms were still capable. His mature poems revealed the potency of the inspiration that he drew from Andalusian ways and folklore.

The Civil War drove many notable poets into exile, Luis Cernuda one of the greatest. In later verse the tone of most major poetry was political or tending toward "social realism," as in the works of Angel González, José Angel Valente, and Blas de Otero.

PORTUGUESE LITERATURE IN THE 20TH CENTURY

The "Integralist" school

The passage from monarchy to republic in Portugal in 1910 saw a revisionary urge in literature associated chiefly with Oporto and the *Renascença Portuguesn* ("Portuguese Renaissance"). Leonardo Coimbra was its philosopher, and Antbnio Sérgio its critic and historian. Its poets—Mário Beirão, Augusto Casimiro, and João de Barros—adopted the *saudosismo* of Teixeira de Pascoais as the key to the nation's recovery of greatness, though the inadequacy of this nostalgia was soon realized. The "Integralist" school reacted from 1913 onward in favour of Catholic monarchist tradition, led by António Sardinha, a historian and poet. Fernando Pessoa, author of *Mensagem* (1934), was posthumously regarded as the most inspired poet of his generation, and his influence enriched poetry without imposing a movement. Another prominent writer was José Régio, an outstanding dramatist and a powerful religious poet. Miguel Torga's verse, like his stories and volumes of autobiography, revealed a faith in the primitive virtues of mankind.

Among novelists, Aquilino Ribeiro was a prolific writer whose themes often centred on his native Beira; his delight in life stood close to awareness of decay and death. J.M. Ferreira de Castro, author of *A Selva* (1930; Jungle, 1934), a brilliant evocation of his time as a worker in an Amazonian rubber plantation, was deeply concerned with social problems. J. Paço de Arcos, a widely travelled and penetrating observer, wrote *Ana Paula* (1938), *Ansiedade* (1940), and *Tons Verdes em Fundo Escuro* (1946). Social and psychological trends were united in J. Rodrigues Miguéis' *Pdscoa Feliz* (1932) and *Onde a Noite se Acaba* (1946). Novelists who treated African colonial questions included Castro Soromenho, and an important woman novelist of the postwar period was Agustina Bessa Luis, whose *Sibila* (1955) was a complex psychological study.

Notable work came out in history and literary criticism, and through this work Portugal's history and literature at last became more adequately known.

LATIN-AMERICAN LITERATURE IN THE 20TH CENTURY

Rubén Dario and the Modernists (1888–1910). A measure of political and economic security vouchsafed the emergence of a cosmopolitan awareness of life and letters that resulted in the revolt against the sentimental romantic versifiers filling the bulging pages of national anthologies. The revolt began when young writers, independently and across the Americas, withdrew temporarily from the local whirlpool to revitalize themselves in the mainstream of world thought and writing. The young despondents and pessimists attempting to shut themselves out from their immediate environment in artificial worlds of their own making were the transition group disparagingly labelled *modernistas* (Modernists) by the older generation. They wrote on exotic themes—the ancient past, the distant Orient, lands of childhood fancy and opiate creation. Beauty was their goddess, "art for art's sake" their creed.

Foremost among the early Modernists were a Mexican, Manuel Gutiérrez Nájera, whose elegiac verse and restrained rhythmical prose sketches and tales best represented the trend from Romanticism to Modernism; a Colombian, José Asuncibn Silva, who wrote a small but influential body of poems; the morbid Julián del Casal and his compatriot José Martí, martyr and symbol of Cuba's struggle for freedom from Spain, whose inspired prose style and deceptively simple, sincere verse set his work above and apart from all schools and movements.

But the full flowering of Modernism came under the leadership of Rubén Dario (died 1916) of Nicaragua, whose collection of verse and prose, *Azul*, published in Chile in 1888, was the cornerstone of Latin-American Modernism. *Prosas profanas* (1896; "Profane Prose") represented the high point of the escapist, cosmopolitan phase of the movement. When Spain's empire crumbled in 1898 and mutual sympathy allayed the centuries-old distrust between Spain and its former colonies, Dario created new songs of life and hope for Spanish-speaking peoples. His *Cantos de vida* y *esperanza* (1905; "Cantos of Life and Hope") were a blending of the best of Modernist form with the more enduring themes of Hispanic lands. Dario's imitators, particularly of his early experimental, escapist phase, were responsible for the emergence of a cult that bore his name, *rubendarismo.* But many of Dario's contemporaries were individuals of exceptional merit: Mexico's Amado Nervo, whose mysticism was reflected in *Serenidad* (1914) and *Elevación* (1917); Peru's José Santos Chocano (1875–1934), whose exalted Americanism gave birth to *Alma América* (1906); Bolivia's Ricardo Jaimes Freyre (1872–1933), who drew upon Scandinavian mythology for *Castalia bárbara* (1899); Colombia's Guillermo Valencia, whose classic bent was manifest in *Ritos* (1898); and Uruguay's philosopher and essayist José Enrique Rodb, whose *Ariel* (1900; Eng. trans., 1921) distinguished him as the leading critic and exponent of Modernist ideals.

After Dario's death, Leopoldo Lugones of Argentina was a leader from early Modernist days to the later phases of an arbitrary nationalism; Enrique Gonzalez Martinez was a sensitive pacesetter of later poetic trends in his native Mexico; and Julio Herrera y Reissig of Uruguay was the outstanding Symbolist of Modernism. But the vast majority of Spanish-American Modernists continued to be spellbound by the verbal magic and brilliance of Dario's *Prosas profanas.*

Brazilian works

In Portuguese-speaking Brazil, reaction against Romantic verse never produced the rich mosaic of Spanish-American Modernism. The Brazilian Parnassians with their formalistic, detached poetry were challenged by poets attracted to French Symbolism, but a Symbolist movement as such never materialized in Brazil. Parnassianism, as epitomized in the poetry of Raimundo Corréia, Alberto de Oliveira, and Olavo Bilac, was unchanged until the "stirring 1920s" of Brazilian Modernism.

Vanguard literature (1918–30). The horror and bloodshed of the Mexican Revolution (1911–17) shocked a complacent intellectual minority into a realization of the plight of their country's submerged masses: the Indian and mestizo (or person of European and Indian parentage) found able champions of their cause. Youthful liberals rejected Modernist tenets and wordy descriptions of local scenes and types, largely in imitation of European Realist and Naturalist techniques, to create the themes, form, spirit, and language that were unequivocal testimony that Latin-American literature had at last come of age. The Spanish Civil War and World Wars I and II gave continental and international perspective to America's attempt to define its place in the world. Worldwide depression and dollar diplomacy fostered radical economic philosophies offering deliverance from imperialism. Latin-American literature was a dramatic tribute to this ferment of self-discovery and self-assertion.

Women lyricists

Shortly after 1900 the Modernist leaders Dario, Nervo, and Lugones initiated a return from their more formal and exotic innovations to traditional forms and sincerity and simplicity. Their followers, however, never wholly rejected the enriched versification and language and countless new thematic sources of Modernism. Of these, an extraordinary band of women stood out whose lyrics were more widely enjoyed than most of the work of male poets in the first half of the 20th century. Love in its impassioned and transcendental manifestations, maternal longing, and social protest were the themes of Delmira Agustini, Alfonsina Storni, Juana de Ibarbourou, and

Gabriela Mistral, winner of the 1945 Nobel Prize for Literature. Stemming directly from the Modernist tradition were the unpretentious lyrics of Enrique Banchs; the experimental verse of a subjective Mexican, Ramón López Velarde; the mystical expression of a Guatemalan, Rafael Arévalo Martinez: the brilliant sonnet sequence of the tropical scene in *Tierra de promisión* (1921; "Land of Promise"), by a Colombian, José Eustasio Rivera; and the intensely racial rhythms of Cuba's nativist mulatto poet Nicolás Guillén. With the post-Modernist return to more traditional forms and themes, other groups, following the nihilistic waves of post-World War I "isms," experimented with free verse, often daring to use obscure imagery that gave a mistaken impression of a coldly intellectual mood. Many *ultraistas,* as these vanguard experimenters were labelled, wrote with socio-political overtones.

Borges and the *ultraísta* movement

Vicente Huidobro of Chile launched one of these ephemeral movements, *creacionismo,* in Spain in 1918. His denial of the poetic past was offset somewhat by the classical leanings and love of the national past that rendered the novel imagery of Argentina's Jorge Luis Borges less vulnerable to the charges of obscurity leveled at vanguard groups, including those of the *ultraísta* movement launched by Borges in Buenos Aires in 1921. César Vallejo of Peru represented a shift from Modernism to the Marxist emphasis of the *ultraístas* of the 1930s. An intensely subjective Chilean, Pablo Neruda, winner of the 1971 Nobel Prize for Literature, also adopted Marxism. His influence bade fair to equal that of Dario and of the 17th-century poet Luis de Góngora in their time. At a Modern Art Week program in São Paulo in 1922, the vanguard revolt in Brazil, usually referred to as Modernism, broke away noisily from academicism and colonial cultural bondage, until the world depression of 1929 and a new political order (1930) under Getúlio Vargas sobered its aggressive unconventionality. Although incited by European iconoclasts, the Brazilian Modernists' primary aim was to modernize national thought and life. This high-pitched, often theatrical, self-searching period of aesthetic re-evaluation and of analysis of the immediate Brazilian present served as a sorely needed purge and produced men of importance in Brazilian literature, such as the movement's high priest, a gifted poet and musicologist, Mario de Andrade; his lieutenant, Oswald de Andrade; a critic and bard, Ronald de Carvalho; and Manuel Bandeira, who has been acclaimed the country's greatest modern lyric poet. Preoccupation with social and metaphysical problems and an imperative urge toward untrammelled self-expression characterized the poetry of Modernist contemporaries or followers—Jorge de Lima, Cecilia Meireles, and Augusto Frederico Schmidt.

Literature of social protest. Contrary to its exceptional development in Brazil, the Spanish-American novel had been left largely to inspired followers of the 19th-century French Realist Émile Zola. Federico Gamboa of Mexico, who wrote *Santa* (1903), about a provincial prostitute reminiscent of Zola's *Nana,* and Baldomero Lillo of Chile gave artistic balance to their social-protest fiction. Later novelists, essayists, and short-story writers developed new and more effective techniques from such stylistic innovators as the Irish novelist James Joyce and the Austrian Franz Kafka.

Martí and González Prada were hailed as the intellectual progenitors of men aware of their responsibilities in guiding the Americas in a rapidly changing world. Rufino Blanco Fombona of Venezuela assailed his country's tyrants with more passion than poise as in *El hombre de hierro* (1907; "The Man of Iron") and *El hombre de oro* (1916; *The Man of Gold,* 1920). He was also among the first to attack "Yankee imperialism," abetted by a militant Argentine, Manuel Ugarte, whose *Porvenir de América latina* (1911; "The Future of Latin America") and *Destino de un continente* (1923; *The Destiny of a Continent,* 1925), together with the writings of a Peruvian, Francisco Garcia Calderón, envisioned Latin America as the future guardian of the Latin tradition. Ricardo Rojas, Argentinian literary historian and critic, and José Vasconcelos, controversial Mexican philosopher and educator, were more concerned with racial and cultural aspects within the American family of nations. Alfonso Reyes, Mexican poet, scholar, and literary critic, made the essay a vital, intimate force.

It was in the short story and the novel that the panoramic grandeur of the American scene in all its drama was best described. The disheartening years following the abolition of slavery in 1888 and the establishment of a republic in 1889 made serious-minded Brazilians analyze their troubled homeland as an extraordinary amalgam of man, land, and climate. An army engineer and journalist, Euclides da Cunha, revealed the bedrock of Brazilian life in an unclassifiable epic *Os Sertões* (1902; *Rebellion in the Backlands,* 1944), which was the first written protest on behalf of Brazil's forgotten man, the emerging Brazilian of the backlands. In *Canaã* (1902; *The Canaan,* 1920), a novel of ideas, José Pereira da Graça Aranha focussed on the effects of recent European immigration upon this evolving Brazilian type. A remarkable collection of short stories, *Urupês* (1918), by José Bento Morteiro Lobato, showed that intellectuals were still probing for native traits in a search that gave direction to the Modernist outburst of the 1920s.

Regionalist Brazilian literature

A new cultural regionalism of Brazil's "northeastern school" that flowered after 1930 produced gifted and dedicated prose writers, including a sociologist, Gilberto Freyre, whose *Casa Grande e Senzala* (1933; *The Masters and the Slaves,* 1946) was fundamental to an understanding of the region. José Lins do Rêgo, in a highly personal, evocative style, depicted the clash of the old and new way of life in his classic "sugarcane" cycle and in *Pedra Bonita* (1938); Jorge Amado gave Brazil some of America's best "proletarian" literature in *Cacau* (1933), *Jubiabá* (1935) and *Terras do Sem-Fim* (1942; *The Violent Land,* 1945). *Angústia* (1936), by Graciliano Ramos, attested to the fact that the individual inner struggle had also been adroitly plumbed by these new "regionalists." Érico Veríssimo was one of Latin America's few cosmopolitan writers of distinction, as demonstrated in *Olhai os Lirios do Carnpo* (1938; *Corzsider the Lilies of the Field,* 1947) and *O Tempo e o Vento* (1950; *Tinze and the Wind,* 1951). The most widely acclaimed work resulting from the Mexican Revolution was *Los de abajo* (1915; *The Under Dogs,* 1929), a novel conceived over the campfire by Mariano Azuela, an army doctor of one of the bands of the revolutionary Pancho Villa. Azuela alone chronicled the revolution from its preliminary rumblings to its later social implications. From the late 1920s on, Martin Luis Guzmán, Gregorio López y Fuentes, and José Rubén Romero gave breadth and scope to Azuela's treatment.

The 20th-century Indian was not the uncompromising hero of the epic *La araucana,* nor the symbol of colonial revolt against tyrannical Spain, and much less the "noble savage" of America's untamed romantic wilderness: he was the victim of centuries-old political and economic forces that kept the masses in abject bondage to colonial institutions. This new *Indianista* literature had already found favour in fiction in the novel *Aves sin nido* (1889; *Birds Without a Nest,* 1904) by a Peruvian, Clorinda Matto de Turner; and the Indian's cause had been advanced by Gonzalez Prada, a precursor of the militant pro-Indian, social reform party APRA (Alianza Popular Revolucionaria Americana) in 1923. A spokesman of the brutally realistic school of Ecuadorean writers, Jorge Icaza, skirted dangerously close to aesthetic suicide in mass-minded, vernacular-ridden novels, *Huasipungo* (1934; *The Villagers,* 1964) and *En las calles* (1935).

The effects of the tensions between the pampa and the city

The clash between the forces of nature and powerful economic forces, the pampa and the city, had by no means died with the passing of 19th-century local chiefs. Land and nature's gifts were more zealously sought than ever before: cattle on the pampas, tin and copper and nitrates in the mountains and deserts, rubber and bananas in the tropics. And the struggle between the two became more violent as man fought against man, selfishly, to possess nature alone. In the growing urban centres, modern industrial economy exerted an even more insidious control over the destiny of the masses. The clash between the old and the new on the pampas of Argentina and Uruguay created the sombre descriptive pages of Uruguay's short-story writer Javier de Viana, the psychological portrayal of rural types in *El terrufio (1916;* "The Native Country"), by Carlos Reyles, also of Uruguay; a simple, humorous narrative of gaucho life in *El inglés de los giiesos* (1924), by Argentina's Benito Lynch, and an image-studded prose epic of the gaucho, *Don Segundo Sombra (1926;* Eng. trans., 1935), also by an Argentine, Ricardo Giiiraldes. In *Doña Barbara (1929;* Eng. trans., *1931*) Rómulo Gallegos gave a dramatic poetic depiction of similar forces at work on the Venezuelan *llanos,* or "plains."

From the tropics appeared two artists who spoke for a growing number of younger writers who had discovered the *selva,* or "jungle": Horacio Quiroga of Uruguay, consummate short-story artist, who excelled in dramatic descriptions of the Chaco and the jungle of Misiones, Argentina; and a Colombian poet, José Eustasio Rivera, whose sole prose work, *La vorágine (1924; The Vortex,* 1935), was a powerful denunciation of exploitation in the upper Amazon during the rubber boom of the early *1900s.*

In *La maestra normal (1914)* an Argentinian novelist, Manuel Galvez, captured forever the universal pettiness and monotony of smaller provincial centres before modern mechanized manners shattered old colonial ways. Chile's underprivileged had two champions in a novelist, Joaquín Edwards Bello, and a short-story writer, Manuel Rojas. Man's struggle with the deeper forces within and beyond himself was re-created in the psychological novels of a Chilean, Eduardo Barrios, and in the "clinical" tales of the Cuban Alfonso Hernandez Catá.

In their analysis of individual and collective existence in the Americas, writers often turned to the past: *La gloria de Don Ramiro (1908; The Glory of Don Ramiro,* 1924), by Enrique Rodriguez Larreta of Argentina, a stylist, was generally considered the best historical novel in Spanish.

Recent trends. The literature of the third quarter of the 20th century was characterized by an increased preoccupation with the problem of man as the victim of alienating forces, of solitude, identity, anguish, and evil and by a marked determination to create new forms and new techniques. Above all, it displayed a new language more responsive to the demands imposed by increasingly complex spiritual, social, and ideological concerns. These concerns found a more direct expression in the essay, a form that has been cultivated with signal distinction by writers equally competent in other literary genres. Individual and collective preoccupation with analysis ran the gamut from the ruthless dissection of his country's ills by the Argentine Ezequiel Martinez Estrada (*Radiografia de la pampa, 1933; X-Ray of the Pampa, 1971)* to the more varied, deeper soundings of the Mexican Octavio Paz *(El laberinto de la soledad, 1950; The Labyrinth of Solitude, 1961*). Poetry veered from experimental and hermetic emphasis to seek answers to the same concerns in a more limpid and more personalized style. But it was the revitalized manner of the older poets that still held captive a younger generation not yet prepared to share fully in the honours bestowed on masters such as Neruda *(Selected Poems, 1970)* and Paz *(Selected Poems, 1963).*

The drama—hitherto the least significant genre in spite of its success in calling international attenion to the Uruguayan Florencio Sánchez *(Representative Plays, 1961)*—emerged from the traditional nativist theatre of local customs and types to embrace new approaches and techniques. These resulted in a mad ensemble of experimental thrusts reflecting and appropriating innovations as diverse as those of the American playwrights Edward Albee and Tennessee Williams, a theatre indulging in Surrealist vagaries, social and political satire, "angry" protest, and "dead pan" portrayal of the "Absurd." The first of the moderns were the Brazilian Joracy Camargo *(Deus lhe Pague, 1932)* and the Mexican Rodolfo Usigli (El *gesticulador, 1937,* and *Corona de sombra, 1943 [Crown of Shadows, 19461).* Of the younger generation, Sebastián Salazar Bondy of Peru, Emilio Carballido of Mexico, Osvaldo Dragún of Argentina, Jorge Díaz of Chile, and José Triana of Cuba were rapidly winning international recognition. Ariano Suassuna of Brazil stood out above all with his *Auto da compadecida (1955; The Rogue's Trial, 1963*), a highly sophisticated adaptation of Brazil's northeast folk theatre.

Prose fiction occupied the centre of the Latin-American literary scene. This "new" fiction gave full voice to the concerns of the generation through a disconcerting maze of techniques that launched an unremitting attack on both the form of the novel and the structure of the language. This "new" narrative prose was already in evidence in the work of a small band of earlier writers who had distinguished themselves in other genres, exemplified especially in the intellectual and "extraordinary" tales of the Argentine Jorge Luis Borges *(Labyrinths, 1962; The Aleph and Other Stories, 1933–1969, 1970);* in the Surrealist, terrifying novel *El señor presidente (1948; The President,* 1963), of the Guatemalan Miguel Angel Asturias, winner of the *1967* Nobel Prize for Literature; in the Joycean fiction of the Mexican Agustin Yáñez (*Al filo del agua, 1947; The Edge of the Storm, 1963);* in the ideological and philosophical novels of the Argentine Eduardo Mallea *(La bahía de silencio, 1940* [*The Bay of Silence,* 1944], and *Todo verdor perecerá, 1941 [All Green Shall Perish, 19661);* in the "magic realism" of the Cuban Alejo Carpentier *(Los pasos perdidos, 1953; The Lost Steps, 1956);* in the earthy, enigmatic prose of the Brazilian João Guimarães Rosa *(Grande Sertão: Veredas, 1956; The Devil to Pay in the Backlands, 1963);* and in the Rabelaisian romances of Brazil's Jorge Amado *(Gubriela, Cravo e Canela, 1958; Gabriela, Clove and Cinnamon, 1962).* It was on the bedrock of these pioneers of the new fiction that the younger generation planted the invigorating and challenging novel of the *1960s.* They include Argentina's Ernesto Sábato (*Sobre héroes y tumbas, 1961)* and Julio Cortázar *(Rayuela, 1963; Hopscotch, 1966);* the Mexican Carlos Fuentes *(La muerte de Artemio Cruz, 1962; The Death of Artemio Cruz, 1964);* the Colombian Gabriel Garcia Márquez *(Cien años de soledad, 1967; One Hundred Years of Solitude, 1970);* and the Peruvian Mario Vargas Llosa *(La ciudad y los perros, 1963 [The Time of the Hero, 19661,* and *La casa verde, 1965 [The Green House, 19681).*

GERMAN LITERATURE IN THE 20TH CENTURY

Through the 20th century, German literature has reflected the social, political, and spiritual uncertainty of its surroundings. Early dissatisfaction with conventional literary forms led to experiments with new forms in an attempt to avoid sterility and revitalize the language aims that have emerged as dominant forces in modern literature. Much early 20th-century writing developed out of the 19th-century style of Naturalism, which made the smallest details of life a subject of literature.

Impressionism. Impressionism had beginnings closely allied to Naturalism, and writers at the turn of the century reflected the influence of Naturalism on their development. Impressionism evokes a mood or state of mind by emphasizing the impression made by an object on its observer. The poet Detlev von Liliencron provided an early example of this, as did Richard Dehmel, who, despite a Naturalistic subject matter, evoked mood through sound patterns. Writers influenced by Symbolism also had elements of Impressionism in their work. A successor of French Symbolism who had considerable effect on other writers was Stefan George, whose solemn, carefully composed verse aimed at asserting the lofty stature of poetry, which, for him, had a religious character. Because of their obscurity, George's poems can only be understood in terms of the framework to which they belong. He founded the journal *Blatter fur die Kunst (1892;* "Journal for Art") to publish his followers' poetry. Among those attracted by his work were the critics Friedrich Gundolf and Ernst Bertram and a poet, Karl Wolfskehl.

Hugo von Hofmannsthal, an Austrian whose Impressionistic elements had their roots in Romanticism, declined to join George's circle. In his melodious poetry he delicately analyzed his sensibilities and was haunted by his obsession with the inadequacy of language completely to convey feeling. An essay, the "Chandos-Brief" (1902; "Letter by Lord Chandos," 1952), records this sense of the inadequacy of words. The plays of the 1890s concerned the aesthete faced with the reality of this inadequacy. Later dramas, such as *Jedermann* (published 1911), an adaptation of ***Everyman,*** and ***Das Saliburger grosse Welttheater*** (1922; "The Great Salzburg Theatre of the World"), were religious in tone and borrowed from Baroque and medieval drama; a comedy, ***Der Schwierige*** (1921; "The Awkward Man"), analyzed a sophisticated mind inhibited by the weight of social tradition. His greatest public successes were his librettos, such as ***Der Rosenkavalier*** (1911), which Richard Strauss set to music. Conscious of the heritage of European culture and of ethical responsibility, Hofmannsthal conveyed a strong awareness of moral issues in his work.

The end-of-the-century analyses of decadence

Arthur Schnitzler, another Austrian writer of note, depicted the decadence of pre-1914 Vienna while giving a penetrating analysis of man's inner life. A searching analyst of Austrian culture was Robert Musil, whose monumental novel *Der Mann ohne Eigenschaften* (1930–43; ***The Man Without Qualities,*** 1953) examined modern incertitude and exposed sham values in society; stories such as ***Drei Frauen*** (1924; "Three Women") and ***Die Verwirrungen des Zöglings Törless*** (1906; ***Young Törless,*** 1955) dealt with the inner decay of man in face of cultural collapse. Musil's rise to fame was slow. More than a decade after his death elapsed before he was recognized as a major figure in German literature. Hermann Broch's novels, too, were appreciated only after his death (1951); his trilogy ***Die Schlafwandler*** (1931–32; ***The Sleepwalkers,*** 1932) is an account of the decline of values in modern society. Elias Canetti's *Die Blendung* (1935; ***Auto da Fé,*** 1946) continued the Symbolist tradition and analyzed the impact of mass society on the individual.

Prague was another centre of writing: Franz Kafka, Rainer Maria Rilke, Franz Werfel, Kafka's friend Max Brod, and Gustav Meyrink wrote and lived in Prague. Their work inclined toward the esoteric and was strongly influenced by Symbolism.

Rilke's view of God

Symbolism. Like most great lyric poets of the time, Rilke was indebted to Symbolism. His melodious verse, which made him one of Germany's great lyric poets, gave his poetic vision of reality compelling power. This was clearly evident in ***Das Stunden-Buch*** (1905; "The Book of Hours"), which described a search for spiritual health in a hostile urban civilization. Rilke's conception of the universe, God, and death was determined by a quest for artistic fulfillment. In ***Neue Gedichte*** (1907–08; "New Poems") he no longer sought to depict the poet's subjective response to spiritual isolation but wanted to convey an objective appraisal of reality by recreating the "things" that he encountered in art and nature. In ***Die Aufzeicknungen des Malte Laurids Brigge*** (1910; ***The Notebooks of Malte Laurids Brigge,*** 1930) he studied artistic sensitivity by analyzing a neurotic personality. The ten poems contained in the volume ***Duineser Elegien*** (1923; ***Duino Elegies,*** 1939) summed up his spiritual struggles in complicated severe verse. In ***Die Sonette an Orpheus*** (1923), Orpheus was symbolic of poetry's power to transmute problems of existence, and of its attempt to justify reality.

Mann's analyses of his age

Symbolism also influenced prose writers, not least Thomas Mann, who attempted to use symbol and myth in narratives that started from a clinical analysis of modern man's mental and physical state. Mann's characterization was Impressionist, but impressions became leitmotivs conveying the power of the subconscious. His work was influenced by the philosophers Schopenhauer and Nietzsche; yet his portrayal of social change, of the impact of ideology, was an organic part of the story and he was occupied, as always, with the status of the artist in society. In his early works art was symbolic of decadence, an over-refinement no longer acceptable; but with ***Der Zauberberg*** (1924; ***The Magic Mountain,*** 1927), Mann, like Rilke, emphasized the constructive qualities of art. His great novels examined different facets of his age: *Buddenbrooks* (1900), bourgeois society; ***Der Zauberberg,*** intellectual corruption; ***Doktor Faustus*** (1947), the German mind and character during the Third Reich. His novellas—*e.g.*, ***Tonio Kroger*** and ***Tristan*** (both 1903) and ***Der Tod in Venedig*** (1912; ***Death in Venice,*** 1925)—depicted the same themes.

Irony and resultant ambiguity were characteristic of Mann. His increasingly complex style reflected the complexity of his mind and his study of the history of ideas. Mann's last work, ***The Confessions of Felix Krull*** (1954), humorously stated the doubt that ran through all his work—whether the pursuit of beauty and, hence, pursuit of culture and art were not in the end a great deception.

Hermann Hesae was influenced by Neoromanticism and concentrated upon man's spiritual conflict. His novels, from his first success, ***Peter Camenzind*** (1904), portrayed the struggle of individuals in a world hostile to sensitivity or explored the subconscious and the balance between sensuality and the spirit. In ***Der Steppenwolf*** (1927), he examined the conflict between the bourgeois world and the sensitive outsider, here resolved by self-abandonment to fantasy; in ***Das Glasperlenspiel*** (1943; ***Magister Ludi,*** 1949) he questions the whole purpose of civilization. Hesse wrote poetry and also short stories, of which the best known was "Knulp" (1915).

Ricarda Huch's novels, like those of Thomas Mann and his brother Heinrich Mann, emphasized the individual's independence and dignity. Heinrich Mann savagely attacked social and political abuses in novels such as ***Professor Unrat*** (1905) and ***Der Untertan*** (1918; ***The Patrioteer,*** 1921).

Expressionism. The often ecstatic style of Heinrich Mann anticipated Expressionism, the key movement in German literature during and immediately after World War I. Expressionism emphasized the inner significance of things and not their external forms and therefore did not depict life in action but evoked states of mind.

Frank Wedekind's dramas, in which bourgeois morality was pilloried, were forerunners of this style, but the first fully Expressionist drama was Johannes Reinhard Sorge's ***Bettler*** (1912; "The Beggar"), in which characters appeared as abstract functions in each other's lives. This play, like those of Walter Hasenclever, Paul Kornfeld, Fritz von Unruh, Ernst Barlach the sculptor, and Oskar Kokoschka the painter, was characterized by a quest for the essence of things, for the ideas behind personality and spiritual meaning in life. Ernst Toller wrote political plays employing an Expressionist technique in *Die Maschinenstürmer* (published 1922; ***The Machine-Wreckers,*** 1923). Georg Kaiser, the leading Expressionist playwright, moved from Naturalism through Expressionism to a mature traditional style, while Carl Sternheim unmasked bourgeois pretensions by means of a shrill satire of contemporary language.

Expressionist poetry was equally non-referential, attaining coherence through its associative power. The chief poets were Ernst Stadler, Georg Heym, Georg Trakl, Franz Werfel, Johannes Becher, August Stramm, Theodor Daubler, Gottfried Benn, and Else Lasker-Schiiler. The leaders, Heym, Trakl, and Stadler, died young. Trakl's poetry expressed disgust with modern civilization; Heym, Stadler, and Stramm were dominated by fears erupting from man's urban existence and often expressed their vision of doom in grotesque, concentrated verse. Benn's macabre early verse clinically described human suffering; the nihilism of his later poetry took the form of obscurity in language. Like Jean (Hans) Arp and Yvan Goll, Benn later abandoned Expressionism, as did many major figures within its orbit.

The nightmare vision of Franz Kafka

Kafka, famous only after his death, depicted the individual in a world of anxiety, crushed by unfathomable forces. His work, such as the posthumously published novels *Der Prozess* (1925; ***The Trial,*** 1937) and ***Das*** *Schloss* (1926; ***The Castle,*** 1930), exposed the incongruities of aspiration and the weakness of reason with grotesque humour. He was deliberately ambiguous about the characters' sense of guilt and their protests against the established order.

Post-Expressionism and Social Realism. After 1918 Expressionism gave way to Social Realism through which writers hoped to gain objectivity. The first subjects chosen were World War I and its aftermath: Arnold Zweig's ***Streit um den Sergeanten Grischa*** (1927; ***The Case of Sergeant Grischa,* 1927**), Erich Maria Remarque's ***Im Westen Nichts Neues*** (1929; ***All Quiet on the Western Front,* 1929**), and Hans Fallada's (Rudolf Ditzen's) and Erich Kästner's works documented the war and postwar society.

This new objectivity continued in the work of Anna Seghers and in Carl Zuckmayer's ***Hauptmann von Köpenick*** (1931; ***The Captain of Kopenick,*** 1932) and ***Des Teufels General*** (produced 1946; "The Devil's General"). Alfred Döblin combined documentation with psychological analysis, whereas Ernst Jünger explored the philosophical implications of technology and modem civilization. Junger's ***Auf den Marmorklippen*** (1939; ***On the Marble Cliffs,* 1947**), a criticism of the Third Reich, revealed his inability imaginatively to conceive individual character; the poetry and prose of his brother Friedrich exhibited greater lyrical and narrative skill.

The Third Reich. The Third Reich disrupted the continuity of literary life in Germany. Under the Nazis, good writers either left Germany, were driven out, were forced into silence, or were exterminated, and good writing did not come to the surface until after World War II. Of the vaunted school of blood and soil, the talent of E.G. Kolbenheyer, Friedrich Blunck, and Hans Grimm was limited. Hans Carossa's autobiographical novels were significant for their emphasis on the individual's needs to develop inner resources by following tradition.

Literature after World War II. After World War II, established writers continued to publish, reputations such as those of Kafka and Musil were definitely established, and the poetry of Gertrud Kolmar, Jesse Thoor, and Lasker-Schüler came to light. Attempts to free lyric language from customary forms encouraged unconventionality of expression, and Ingeborg Bachmann, Giinter Eich, Walter Hollerer, Karl Krolow, and Heinz Piontek expressed the chaos of the age through experimental forms. Paul Celan was an important poet who emerged after 1945; his poetry owed much to Trakl and Expressionism and delineated reality in a deliberately complex and obscure manner.

The plays of Bertolt Brecht

The giant of European theatre was the poet, playwright, theatrical producer, and theoretician Bertolt Brecht, much of whose work surprisingly had been completed almost 30 years before he received international acclaim. His first successful play, ***Trommeln in der Nacht*** (performed 1922; "Drums in the Night"), the poems and songs in ***Hauspostille*** (1927; ***A Manual of Piety*),** and the satirical opera ***Die Dreigroschenoper*** (1928, music by Kurt Weill; ***The Three-penny Opera,*** 1949) all dated from the 1920s, when he was developing his theory of "epic theatre" and his social criticism which led him to Marxism. During the Third Reich he lived first in Scandinavia and then in the United States, and in those countries he wrote such famous works as ***Mutter Courage und ihre Kinder*** (1941; ***Mother Courage and Her Children,*** performed 1949), ***Leben des Galilei*** (1943; ***The Life of Galileo,* 1947**), and ***Der kaukasische Kreidekreis*** (first performed in English as ***The Caucasian Chalk Circle;*** performed in Berlin, 1954). As a poet he was characterized by simplicity of diction and suggestive power, as a dramatist by acute visual perception and sardonic wit, while as a theoretician he sought to blend didacticism with entertainment.

The German political dramatists who followed Brecht received international attention: Rolf Hochhuth ***(Der Stellvertreter* [1963; *The Deputy,* 1964]);** Heinar Kipphardt ***(Joel Brand* [1965]),** and the two best known, Peter Weiss and Gunter Grass. ***Die Ermittlung*** (1965; ***The Investigation,* 1966),** by Weiss, dealt with the Auschwitz trial of 1964–65. In ***Die Verfolgung und Ermordung des Jean-Paul Marats . . .*** (1964; often known as ***Marat/Sade***) Weiss portrayed the conflict between individualism and socialism simultaneously on several levels of reality. A left-wing intellectual, increasingly extreme, Weiss embraced political beliefs that several (though by no means all) members of the so-called Group 47 shared. This group included many well-known writers, such as Grass, Hans Magnus Enzenberger, Ingeborg Bachmann, Heinrich Böll, and Alfred Andersch. Boll analyzed postwar psychological problems in ***Haus ohne Hiiter*** (1954; ***The Unguarded House,*** 1957) and ***Und sagte kein einziges Wort*** (1953; ***Acquainted with the Night,*** 1954) and satirized bourgeois life in ***Doktor Murkes gesammeltes Schweigen*** (1958; "The Collected Silences of Dr. Murke") and ***Ansichten eines Clowns*** (1963; ***The Clown,*** 1965). In 1972 he was awarded the Nobel Prize for Literature. Grass's plays, poems, and novels, in particular ***Die Blechtrommel*** (1959; ***The Tin Drum,*** 1962) and ***Hundejahre*** (1963; ***Dog Years,* 1965),** focussed attention on the grotesque and absurd elements in life. Other talented writers were Hans Nossak, Rudolf Hagelstange, Siegfried Lenz, Peter Handke, and Johannes Bobrowski.

Group 47

SWISS LITERATURE IN THE 20TH CENTURY

German Swiss. Many 20th-century authors in German, guided by the Swiss distrust of one-sided attitudes, believed that the values of tradition and emancipation were not irreconcilable; and novelists such as H.A. Moser, Robert Faesi, and Heinrich Federer, among others, sought to have their native country reflect the world at large.

A similar universal humanism was at work in history and letters—in Carl J. Burckhardt, Fritz Ernst, and others. Although Carl Spitteler, with an epic, ***Der Olympische Friihling*** (1900–06; "Olympian Spring"), gained recognition early in the century and won the Nobel Prize in 1919, Robert Walser (who in his stories and novels explored the feelings of the underdog and of minds out of tune with reality) and Albin Zollinger were appreciated at large only after World War II. Curt Gotz's comedies were keenly witty, but the outstanding experiments in dramatic form were made by Max Frisch and Friedrich Dürrenmatt. Their work had a profound influence on the German theatre and German writing.

Frisch's ***Nun singen sie wieder*** (1946; ***Now Sing Again)*** and ***Andorra*** (1961) and Dürrenmatt's ***Besuch der alten Dame*** (1956; ***The Visit,*** 1960) and ***Physiker*** (1962; ***The Physicists,*** 1963) were modern morality plays. Like Eich and Bachmann, Diirrenmatt experimented with radio plays, criticizing, in the manner of Frisch's novels ***Stiller*** (1954) and ***Homo Faber* (1957),** the sterility of modem life. His inventive power, genuine sense of comedy, and grotesque vision of life's absurdities reflected awareness of a world out of joint.

French Swiss. In the 20th century the leading Swiss author in French was C.-F. Ramuz, who wrote strongly imaginative novels about life among vinegrowers and Alpine herdsmen. Gonzague de Reynold demonstrated the inward connection between German- and French-speaking Switzerland in the 18th century and depicted the whole of his country in his ***Cités et pays suisses*** (1914–20).

As much 20th-century literary activity was carried on in the canton of Geneva, contemporary French Swiss literature had a cosmopolitan air, to distinguish what was peculiarly Swiss—as, for example, the prose of Henry Vallotion and the poetry of Gilbert Trolliet. A typically European outlook was to be found in the essays of Denis de Rougemont. The prose of Ramuz and Léon Savary made use of more particularly Swiss themes.

DUTCH LITERATURE IN THE 20TH CENTURY

The writers of the Dutch revival of the 1880s were essentially individualistic, but in the next generation a new concern for philosophical and social problems became apparent.

The poetry of a foremost socialist writer named Henriëtte Roland Holst-van der Schalk was characterized by a desire for justice and charity. The socialist dramas of Herman Heijermans were internationally successful; he and Israel Querido described life in Amsterdam in novels concise in narrative style. A group of Naturalist-Realist novelists, including **Marcellus Emants,** P.A. Daum, and Augusta de Wit, was also writing at this time. Two great novelists were the Neoromantic Arthur van Schendel and Louise Marie Anne Couperus.

Significant early poets were Adriaan Holst, J.C. Bloem, and P.N. van Eyck, a philosophical poet and essayist. Immediately after World War I two poets emerged: Hendrik Marsman, an advocate of free verse and representative of the Vitalist movement; and the pessimistic J.J. Slauerhoff, who roamed the world in search of the unattainable.

The literary periodical ***Forum*** was founded in 1932 by Menno ter Braak and Edgar du Perron, leaders of a movement that aimed to replace superficial elegance with greater sincerity and warned against the German threat before the war.

The most important mid-20th-century Dutch writer, Simon Vestdijk, was originally associated with the ***Forum*** group, and other noteworthy authors were Ferdinand Bordewijk and Albert Helman. The most original poet was Gerrit Achterberg, whose poems explored the boundary between life and death.

During the Nazi occupation, free literature either stopped or was published secretly. The new generation that arose after 1945 adopted an experimental and irrational style verging on the absurd: typical of these were the poets Leo Vroman, Hans Lodeizen, Remeo Campert, and Ellen Warmond—whose experimentation was in turn rejected by the poets of the 1960s.

Postwar novelists

Postwar novelists showed the influence of the Nazi occupation in various ways. Anna Blaman treated existential solitude, while Adriaan van der Veen showed concern for human relationships. The novels and short stories of Maria Dermout and H.J. Friedericy were based on memories of life in the former Dutch East Indies, and the work of Simon Carmiggelt and Anton Koolhaas revealed bitter humour. The influence of Existentialism was seen in the prose of the "angry young men" Willem Frederik Hermans and Gerard Kornelis van het Reve, whose works of the 1960s expressed despairing self-revelation. (For Dutch literature in Flemish, see below.)

BELGIAN LITERATURE IN THE 20TH CENTURY

Flemish. At the turn of the century a group of writers strove through Neoromanticism for an art in which individual feelings would be given universal significance. In masterly essays and a symbolical novel, ***De wandelende Jood*** (1906; "The Wandering Jew"), their leader, August Vermeylen, advocated rationalism infused with idealism. Emmanuel de Bom published the ***fin de siècle*** novel ***Wrakken*** (1898; "Wrecks"), and Alfred Hegenscheidt produced the Wagnerian drama ***Starkadd*** (1898).

The poetry and prose of Karel van de Woestijne formed a symbolical autobiography of a sophisticated, world-weary sensualist striving after spiritual detachment. His work, a passionate confession of human frailty, represents one of the achievements of European Symbolism. Stijn Streuvels made the West Flemish landscape his microcosm, while the polished work of Herman Teirlinck, novelist, dramatist, and essayist, was characterized by imagination, sensuality, and a sonorous vocabulary.

Naturalism reached its height in the robust tales and pithy plays of Cyriel Buysse. The regional novel attained its summit in the charming Bruges stories by Maurits Sabbe, and in the vivid treatment of Antwerp life by Lode Baekelmans. But the writer who, apart from Vermeylen, represented the strongest intellectual force of his time was the priest Cyriel Verschaeve: his poems, plays, and essays were passionate expressions of his intensely Augustinian outlook.

The Boomgaard ("Orchard") group, which included André de Ridder and Paul Gustave van Hecke, introduced a new, individual note, strove to be cosmopolitan, and defended a more dilettante attitude to culture. To this generation belongs the amiable stoic Jan van Nijlen.

After World War I. During World War I there was a new flowering of the picturesque regional tale: ***Pallieter*** (1916), by Felix Timmermans, and the roguish ***De witte*** (1920; "Whitey"), by Ernest Claes, became known outside Flanders. From the poetry of August van Cauwelaert and the prose of Franz de Backer it could be seen that the generation that fought in the war stressed life rather than literature. But a trend first revealed during the German occupation found its most direct outlet in revolutionary Expressionism, and a review, ***Ruimte*** (1920–21; "Space"), published its manifesto: ethics must take priority over aesthetics, and the art of the community over that of the individual. Expressionism was most apparent in lyrical poetry and drama. Wies Moens' poetry is representative of this trend. The outstanding lyricist of the movement was Paul van Ostaijen, who expressed faith in humanity in ***Het sienjaal*** (1918; "The Signal") but soon went through a crisis of Dadaism, adopted rhythmical typography (***Bezette stad***, 1921), wrote pure poetry concentrated on word and sound, and grotesque verse and prose. His principal opponent, Urbain van de Voorde, wrote and advocated traditional "eternal poetry." Poets of a review ***'t Fonteintje*** (1921–24; "The Little Fountain"), including Richard Minne and Maurice Roelants, reacted against Expressionism, proclaiming love of life in traditional forms. Expressionism gave new life to drama. In the 1920s the Flemish Popular Theatre became one of the foremost avant-garde theatres in Europe. The standard of drama was raised by Herman Teirlinck with ***De man zonder lijf*** (1925; "The Bodiless Man") and Anton van de Velde with ***Tijl*** (1925).

Flemish Expressionism

By 1930 the tide of Expressionism had run out and the novel came into its own. The regional novel was replaced by the psychological novel, introduced by Roelants with ***Komen en gaan*** (1927; "To Come and Go"). Gerard Walschap wrote dynamically about man's social, religious, and moral problems, and Lode Zielens about the lives of the poor.

The New Realism movement included Marcel Matthijs, Norbert Edgard Fonteyne, and André Demedts. Since 1930 the focal point of the literature has been man. Refined stylists such as Filip de Pillecijn and Maurice Gilliams (the latter also a poet of value) are literary psychologists as well. The caustic Willem Elsschot, the skeptical Raymond Brulez, and the disenchanted humanist Marnix Gijsen are all more or less detached observers of human weaknesses.

Poetry also changed in character around 1930. The new tone was set by the "personalistic" poets of the Vormen ("Forms") group, of whom Pieter Geert Buckinx and René Verbeeck were representative: they had read Rimbaud and expressed their vitalism in a new imagery. There were also such independent writers as the religious poet Albe (Renaat A. Joostens), the dynamic Bert Decorte, and the "noble pagans" Karel Jonckheere and Herwig Hensen. All of them restored syntax and even the regular verse.

After World War II. The outstanding writers of World War II and the postwar period were novelists. The range of subjects and styles in the novel was remarkable. The Catholic novels by Paul Lebeau and Gaston Duribreux, the "magic-realist" work of Johan Daisne and Hubert Lampo, the Social Realism of Louis-Paul Boon (***De kapellekensbaan,*** 1953; "Chapel Road"), the Existentialism of Jan Walravens, and Hugo Claus's experimental novels are but a sample. The last three writers belonged to a review group called ***Tijd en mens*** (1949–55; "Time and Man"), which was marked by postwar chaos, rebellion, and Experimentalism. From the 1950s, Experimentalism has had a great influence on literary production. Poetry developed, on the one hand, first into post-Surrealism and linguistic experiment (Hugo Claus and Albert Bontridder), then into "concrete" poetry (Paul de Vree and his avant-garde review ***De tafelronde*** ["The Round Table"]); on the other hand, the development was toward engaged poetry and toward New Realism. The experimental trend in the novel, already anticipated by Daisne and Boon, led to new prose either based on splitting and stream-of-consciousness association (Hugo Raes and Ivo Michiels) or consisting of introverted "texts" dwelling largely on the act of writing itself (Willy Roggeman and Daniel Robberechts). Nevertheless, the tradition—invigorated by new techniques—proved to be fertile; ***e.g.***, in the

The avant-garde reviews

poetry of Jos de Haes and Paul Snoek, in the humanistic, satiric novels by Ward Ruyslinck, and in Jef Geeraerts' violent colonial novels inspired by his experiences in what was then the Belgian Congo.

In drama three developments were notable: the staging of the literary plays of Johan Daisne and Herwig Hensen; the popularity of such massive productions as ***Het heiligbloedspel*** (1938; "The Play of the Holy Blood"), by Jozef Boon; and the success of small, avant-garde theatres and of new plays, some of them experimental, by Claus, Pie Sterckx, and Tone Brulin.

French. ***Between World Wars I and II.*** A new generation of Belgians who wrote in French arose between World Wars I and II. The novels of André Baillon showed keen yet compassionate observation of life. Jean Tousseul was concerned with human suffering, whereas Charles Plisnier wrote powerfully analytical novels (***Mariages***, 1936; ***Nothing to Chance***, 1938). Other talented novelists were Marie Gevers and the visionary Franz Hellens. Somewhat later, Georges Simenon imbued the detective story with exceptional psychological penetration.

The poetry of this period was characterized by increased stylistic experiment and the development of a neoclassical poetry of great fluency. Henri Michaux, who, influenced by Surrealism, revolutionized the poetic language; Marcel Thiry, whose lyrical style harmonized traditional and modern; and Géo Norge were chief exponents of an experimental use of words. To another group, headed by Odilon-Jean Périer, an original poet of unusual clarity who aimed to convey his awareness of the interpenetration of daily life by the divine message, a poet must free himself from personal involvements and achieve a transparent medium through which what lies behind life's apparent confusions may be clearly seen.

In drama Fernand Crommelynck wrote savage farces laced with poetry. Michel de Ghelderode astonished audiences by a love of anachronistic character and situation and puppetlike characters, and Herman Closson reinterpreted historical events and characters.

Developments after World War II. After World War II the novel became less regional than formerly, often set in foreign surroundings; generally it subordinated action to detailed psychological analysis of characters' reactions in somewhat contrived situations. Albert Ayguesparse, Pierre Demeuse, Hubert Juin, Maud Frere, and Marie Nicolaï were all ultimately concerned with the theme of man. Françoise Mallet-Joris won instant success with ***Lc Rempart des beguines*** (1951; ***Into the Labyrinth***, 1953); ***Les Personnages*** (1961; ***The Favourite***, 1964), about France in the reign of Louis XIII, showed her bare economical style and widening of range.

Postwar poetry reverted to regular metrical forms in poems on the eternal themes of life, love, birth, and death and topical subjects, including that of contemporary Europe. Outstanding dramatists were Georges Sion, who wrote comedy, religious and historical plays, and translations from Shakespeare; Charles Bertin, whose ***Prétendants*** (1947), a modern version of the Ulysses story, was played abroad as ***Love in a Labyrinth;*** Jean Mogin, whose plays, successful in both Paris and Brussels, explored "being" and "nonbeing"; José-André Lacour; and Romain Sanvic (1883–1957), who adapted English and American plays for the Brussels theatre.

Literary periodicals, which were usually organs for political or literary groups of writers, were influential, especially ***Le Journal des Poètes***, which in 1952 founded a biennial international conference of poets and critics at Knocke-le-Zoute.

Walloon. Walloon literature explored new paths in the 20th century. Dialect studies were undertaken by a whole army of scholars, and the literary possibilities of the dialect were extended as a result of a standardizing of rules of spelling and grammar, as well as of attempts by Émile Lempereur and some other writers to renew the sources of inspiration. Alongside several veteran authors, such as a talented prose writer Joseph Calozet of Namur, the younger generations sought to achieve a strict unity of thought and technique. Among poets the following were to be noted: Frans Dewandelaer, Robert Grafe, Willy Bal, Henri Collette, Émile Gilliard, Jean Guillaume, Marcel Hicter, Albert Maquet, Georges Smal, and Jenny d'Invérno. Widely praised storytellers and novelists were Léon Mahy, Dieudonné Boverie, and Léon Maret, among many others. The dramatists included François Roland, Jules Evrard, Georges Charles, Charles-Henri Derache, François Masset, and J. Rathmès.

The work of dialect writers continued to be assisted by the Société de Littérature Wallonne, with its associations and publishing centres at Liège, Namur, Mons, La Louvière, Nivelles, and Brussels.

SCANDINAVIAN LITERATURE IN THE 20TH CENTURY

Norwegian. In the 1890s established Norwegian writers came under fire from the new generation. The manifesto of new ideas was an essay published in 1890 in the periodical *Samtiden* ("The Present Age") by Knut Hamsun, "Fra det ubevidste Sjaeleliv" ("From the Unconscious Life of the Mind"), which demanded attention to what was individual and idiosyncratic rather than typical. Hamsun was impatient with contemporary emphasis on social problems, and his early novels exemplified these ideas; *Sult* (1890; ***Hunger***, 1899), ***Mysterier*** (1892; ***Mysteries***, 1927), and ***Pan*** (1894); his later novels, such as *Markens grøde* (1917; ***Growth of the Soil***, 1920), were less extreme but still showed a strong, sometimes savage irony. Hamsun won the Nobel Prize for Literature in 1920.

Knut Hamsun's emphasis on the individual

Lyric poetry at this time flourished with Sigbjørn Obstfelder, who had a close affinity with the Symbolist movement, and Nils Collett Vogt, who produced some of the best lyrics of the 1890s. In drama Gunnar Heiberg, who combined a sharply satirical wit with a lyric deftness, expressed the new spirit in ***Kong Midas*** (1890), ***Gerts have*** (1894; "Gert's Garden"), *Balkonen* (1894; "The Balcony"), and ***Kjaerlighetens tragedie*** (1904; "The Tragedy of Love"). Sharing Hamsun's preoccupation with the irrational side of human conduct was Hans Kinck, a writer of power and penetration. His verse drama ***Driftekaren*** (1908; "The Drover") and long novel *Sneskavlen brast* (1918–19; "The Avalanche Broke") showed him to be a more reflective and analytical writer than Hamsun.

The real achievements of Norwegian literature in the first half of the 20th century were in the novel and lyric poetry. Drama was not conspicuous, except for the plays of Gunnar Heiberg and Nordahl Grieg. In the early decades of the century, regionalism was a strong element, particularly in the novel; and authors adopted language coloured by dialect, thus becoming identified with their region. Kristofer Uppdal, of the midnorth region of Trøndelag, wrote a remarkable work—a 10-volume novel cycle, ***Dansen gjenom skuggeheimen*** ("The Dance Through the Shadow World"). The novel also treated of conflicts arising from the spread of industrialism, which Norway underwent later than did other European countries. The most proletarian writer was Oskar Braaten, but superior as an artist was Johan Falkberget, who wrote with understanding and historical insight about the miners in Røros in *Christianus Sextus* (1927–35) and in *Nattens brød* (1940; "Bread of Night"). Sigrid Undset, who won the Nobel Prize for Literature in 1928, set her novels in many different ages, and their concern was to examine women's loyalties within the framework of their role in society. A long historical novel, ***Kristin Lavransdatter*** (1920–22), was a masterpiece of Norwegian literature. Her later novels, ***Gymnadenia*** (1929; ***The Wild Orchid***, 1929) and ***Detz braendende busk*** (1930; ***The Burning Bush***, 1932), were greatly influenced by her conversion to Roman Catholicism. Olav Duun, again of the midnorth region, revealed his insight into life as endless conflict in a six-volume novel cycle about the development of a peasant family through four generations—***Juvikfolke*** (1918–23; ***The People of Juvik***, 1930–35).

Shortly before World War I, there were several good lyric poets: Herman Wildenvey, Olaf Bull, Tore Ørjasaeter, and Olav Aukrust. Between World Wars I and II, there were many socially committed writers: the poet

Arnulf Øverland; a novelist and critic, Sigurd Hoel; a dramatist and critic, Helge Krog: and Nordahl Grieg. After World War II, Tarjei Vesaas wrote a remarkable series of novels, including a symbolic *Huset i mørkret* (1945; "The House in the Darkness") and *Bruene* (1966; "The Bridges"). Cora Sandel, who had made a major contribution to literature with her "Alberte" trilogy (1926–39), continued to write, as did Aksel Sandemose, an experimental writer, and Johan Borgen, who was noted for his early short stories, his *Lillelord* trilogy (1955–57), and the autobiographical *Barndommens rike* (1965; "Childhood's Realm").

Swedish. The early years of the 20th century were a period of decadence and pessimism in Swedish literature. Representative of this mood were Hjalmar Soderberg and Bo Bergman. Soderberg's forte was the short story (*Historietter* [1898]), in which psychological subtlety and irony were happily combined and in which, as in his novels *Martin Bircks ungdom* (1901; "Martin Birck's Youth") and *Doktor Glas* (1905), he appeared as a master of Swedish prose. Bergman also produced memorable short stories, but his real medium was the lyric; he developed his talent in a series of collections from *Marionetterna* (1903; "The Marionettes") to *Riket* (1944; "The Kingdom").

The development of the novel was associated with Gustaf Hellstrom, Ludvig Nordstrom, Elin Wagner, and Sigfrid Siwertz. Hellstrom's work as journalist in Europe, the United States, and England greatly influenced him. Irony and careful detail emerged in his best known novel, *Snormakare Lekholm får en idé* (1927; *Lacemaker Lekholm Has an Idea,* 1930). Siwertz was a more elegant stylist—he began as a lyricist—and a decisive influence upon him was the philosophy of Henri Bergson, reflected in *En flanör* (1914; "An Idler"); but his weightiest work was a family saga, *Selambs* (1920; *Downstream,* 1922), a novel of Stockholm during World War I. Nordstrom, overflowing with vitality and keen but grotesque humour, accomplished some of his best work in *Landsorts-bohème* (1911; "Small-Town Bohemia") and in his short stories, as in *Fiskare* (1907; "Fishermen") and *Öbacka-bor* (1921). Elin Wagner was an ardent pacifist and feminist; her most powerful work was a peasant novel, *Åsa-Hanna* (1918). The outstanding novelist of the 1920s was Hjalmar Bergman: with vivid imagination and restless energy, Bergman wrote a long series of stories, many set in "Wadkoping" (his native Örebro), others in Italy. In *Loewenhistorier* (1913) he depicted an irrational, impulsive, unsuccessful hero; in *Farmor och vår Herre* (1921; *Thy Rod and Thy Staff,* 1937) he portrayed one of the dominating female personalities that fascinated him: The satire *Markurells i Wadkoping* (1919; *God's Orchid,* 1924) and *Swedenhielms* (performed 1925), one of the few Swedish comedies, were his most widely known works.

Meanwhile, the "proletarian" novel had been developed by writers concerned with the miseries of the working class, particularly Martin Koch and Ivar Lo-Johansson. There was particularly harsh criticism of working class conditions in stories by Jan Fridegård. Vilhelm Moberg wrote novels of peasant life but achieved his greatest success with the four-part prose epic about a group of Swedish emigrants to North America, *Utvandrarna* (1949–59; *The Emigrants,* 1951–61). The development of the Swedish autobiographical novel was helped by Eyvind Johnson, with the series "Romanen om Olof" (1934–37); Harry Martinson, with *Nässlorna blomma* (1935; *Flowering Nettle,* 1936) and *Vägen ut* (1936; "The Way Out"); and Agnes von Krusenstjerna. In her novel cycles, the "Tony" trilogy (1922–26) and the "Froknarna von Pahlen" series (1930–35), she described her own aristocratic environment and analyzed a degenerate psychology. Harry Martinson was one of a group, formed *c.* 1930, of five primitivist writers. He later developed into one of the finest lyricists of the century. Sensuous imagery and a feeling for nature characterized his work. He attempted to revive the verse epic in his *Aniara* (1956), a symbolical story of a voyage of a spaceship.

Par Lagerkvist's work

The internationally best known Swedish writer of the 20th century was Par Lagerkvist, who won the Nobel Prize for Literature in 1951. In his youth a bold innovator, he later developed an admirably pure prose style, as in the allegorical novel *Dvärgen* (1944; *The Dwarf,* 1953); Expressionistic in style were collections of poems, *Ångest* (1916; "Anguish") and early plays—for instance, *Himlens hemlighet* (1919; "The Secret of Heaven")—reflecting the years of World War I. Lagerkvist wrote an autobiographical novel and love poetry, but the dominant theme throughout his work was a search for vital, often outspokenly religious values.

Several of the best Swedish writers were connected with the development of lyric poetry, notably Vilhelm Ekelund, in his youth the chief exponent of Symbolism in Sweden, and later, as an author of aphorisms, a weighty influence on the development of literary modernism. Among the most popular poets were Dan Andersson, Birger Sjoberg (who set many of his songs to his own music), and Hjalmar Gullberg. In Gullberg's poetry religious commitment and classical learning are balanced by irony and wit. A more esoteric style in modernism was introduced by Bertil Malmberg and developed by the group of poets called the generation of the 1940s, which included Erik Lindegren and Karl Vennberg. Stylistically influenced by T.S. Eliot, they often expressed an anguish and disbelief close to French Existentialism. Lindegren's *Mannen utan väg* (1942; *The Man Without a Wuy,* 1969) was typical of this generation's search for meaning in life. The most distinguished novelist of the 1940s was Lars Ahlin; who was concerned with man's search for grace through love and humiliation in works such as *Min dod ar min* (1945; "My Death Is Mine").

The greatest lyric poet of the century was Gunnar Ekelof. His first collection of poems, *Sent på jorden* (1932; "Late on Earth"), was heralded as the first specimen of Surrealism in Swedish literature. Ekelof's later development passed through successive phases of romanticism and anti-poetic skepticism resolved in a trilogy of books blending autobiography and Eastern mysticism. The first part was called *Diwan over Fursten av Emgion* (1965; "Diwan of the Prince of Emgion").

In reaction to the literature of the 1940s and 1950s, which was much concerned with artistic form and the individual approach to life, the 1960s was a period of political and social commitment in poetry and fiction alike. Recurrent topics were the war in Vietnam and bitter onslaughts on the Swedish welfare state. Independent lyric poetry, however, continued to be written by Östen Sjostrand and Thomas Transtromer, and a tortured experience of life, coloured by Roman Catholicism, was forcefully expressed in the novels of Birgitta Trotzig.

Finnish literature in Swedish. The second flowering of Swedo-Finnish literature was in the 1920s, with the development of modernism in poetry, initiated by Edith Sodergran, who wrote visionary, dreamlike poems. After her came Elmer Diktonius, whose deliberately rough-edged lyrics had a revolutionary political accent; Gunnar Bjorling, with a technique of broken-off sentences; Rabbe Enckell, who wrote impressionistic nature poetry; and Hagar Olsson, writer of poetical novels and essays supporting modernism. Poetry became characterized by free rhythms, unrhymed lines, and powerful images. A similar style was adopted by a second generation of modernists: Solveig von Schoultz, Ralf Parland, Eva Wichman, and Bo Carpelan. During the 1960s there was a reaction against modernism, notably by the FBT review and the group that formed around it, who disliked the modernists' aestheticism and individualism and introduced more critical and social discussion. The most prominent FBT poets were Lars Huldén and Claes Andersson.

Among 20th-century prose writers, Tito Colliander and Göran Stenius wrote from a religious standpoint. Drama was presented by Walentin Chorell, and the psychological novel by Oscar Parland, while Tove Jansson was internationally known as a children's writer. Among younger authors Christer Kihlman and Anders Cleve stood out. Essayists included the critic and literary historian Yrjo Hirn and Göran Schildt.

Georg Brandes' radical ideas

Danish. About 1870 in Denmark, a new movement began, led by Georg Brandes, from which a modern (that is, a naturalistic or realistic) literature emerged. His *Hovedstrømninger **i** det 19de aarhundredes litteratur* (1872–90; ***Main Currents in 19th Century Literature,*** 1901–05), describing the growth and defeat of reaction, caused a great sensation. He influenced Henrik Ibsen and August Strindberg and wrote many scholarly and critical works illustrating radical ideas, while later biographies of Shakespeare, Goethe, Voltaire, Julius Caesar, and Michelangelo revealed how he was influenced by Nietzsche into developing a philosophy of aristocratic radicalism. Among his followers were Jens Peter Jacobsen, whose short story "Mogens" and novel ***Fru Marie** Grubbe* are the supreme examples of Danish Naturalism, while his other novel ***Niels** Lyhne* (1880) and some of his short stories dealt with dream as against reality; and Holger Drachmann, greatest lyric poet of the period, who later reacted strongly against Brandes and whose poetry and prose was often about the sea.

Henrik Pontoppidan, one of Denmark's greatest novelists, dealt at first with social injustices and contemporary political, moral and religious problems in his short stories. The Denmark of his day was also the subject of his greatest work, three long novel cycles, ***Det** forjaettede **land*** (1891–95; ***The Promised** Land*, 1896), ***Lykke-Per*** (1898–1904; "Lucky Peter") and ***De** døcles **rige*** (1912–16; "The Realm of the Dead"); and in these he makes penetrating, if unflattering, analyses of Danish national character. Herman Bang was another novelist interested in the outsiders of life and in insignificant people. His skillful. mainly impressionistic technique was displayed in his best novels, *Ved vejen* (1886; "By the Way-Side"), ***Tine*** (1889), and ***Det** hvide **hus*** (1898; "The White House"). Karl Gjellerup was another of Brandes' followers who later opposed him and one of whose best novels, *Møllen* (1896; "The Mill"), had a poetic beauty; but a metaphysical idealism made his later stories unreadable.

Other notable writers at the end of the century were Gustav Wied, whose "satyr plays" and whose novels *Livsens Ondskab* (1899; "Life's Malice") and ***Knagsted*** (1902) were full of malicious humour; Vilhelm Topsøe, a conservative realist; Peter Nansen. who wrote stories reminiscent of those of Guy de Maupassant; Carl Ewald, whose nature stories were based on Darwinian philosophy; Karl Larsen, who caught the atmosphere of Copenhagen and its inhabitants with fine precision; and several playwrights, including Edvard Brandes, Otto Benzon, Gustav Esmann, Sven Lange, Einar Christiansen, and Henri Nathansen.

In the 1890s a Neo-Romantic poetic revival occurred, reinstating the value of emotion and fantasy. The leader of these Symbolist poets was Johannes Jørgensen, since 1896 a convert to Roman Catholicism, whose prose works were also widely read. They included *Lignelser* (1898; "Parables"), books of travels, saints' lives, and an autobiography. Other poets at this time were Viggo Stuckenberg, who expressed sad resignation; Sophus Claussen, whose poems, often obscure, show sensuality, pantheistic love of nature, and sophisticated aestheticism; Helge Rode, a mystic who also wrote plays and criticism attacking intellectualism; and Ludvig Holstein, who was more akin to the classical tradition of Romantic poetry.

Several women contributed to literature at the turn of the century: Gyrithe Lemche, who wrote a novel cycle. ***Edwardsgave*** (1900–12); Agnes Henningsen, a brilliant writer who was often concerned with experiences of the emancipated woman; and Karin Michaelis, a fine psychologist, best known for her novel ***Den** farlige **alder*** (1910; ***The Dangerous Age,*** 1911).

Nexø and Jensen

The two greatest early 20th-century novelists were Martin Andersen Nexø and Johannes Vilhelm Jensen. Nexø's works described the lives of poor people; ***Pelle Erobreren*** (4 vol., 1906–10; ***Pelle the Conqueror,*** 1913–16) and ***Ditte Menneskebarn*** (3 vol., 1917–21; ***Ditte: Daughter of Man,*** 1920–23) were great epics of proletarian life, and his reminiscences were among the finest in the language. Jensen, who was also a great and original lyric poet and prolific essayist, wrote ***Den** lange rejse* (6 vol., 1908–22; ***The Long Journey,*** 1922–24), an ambitious epic of man from the baboon stage to the discovery of America; he was also noted for ***Himmerlandshistorier*** ("Tales from Himmerland"), based on his childhood memories of North Jutland; ***Kongens fald*** (1900–01; ***The Fall of the King,*** 1933); and nine volumes of ***Myter*** (1907–44; "Myths"). Other novelists of this period included Jakob Knudsen, whose interest, taking account of the inequality of man and the need for authority, was with Christian and moral problems; Harald Kidde, an introspective and melancholy writer; and Knud Hjortø, a keen and intelligent writer of psychological novels.

Three important poets, all with a Jutland background, were Jeppe Aakjaer, whose popularity and appeal recall that of Robert Burns in Scotland; Johan Skjoldborg; and Thøger Larsen. Also the novels of Marie Bregendahl and Harry Søiberg draw upon Jutland settings. Other prominent novelists were J. Anker Larsen, Otto Rung, Johannes Buchholtz, Thit Jensen, and Astrid Ehrencron-Kidde.

Significant poets were Tom Kristensen, whose novels *Livets* ***arabesk*** (1921; "Life's Arabesque") and ***Haervaerk*** (1930; ***Havoc,*** 1968) were also important; Ottc Gelsted; Emil Bønnelycke; Hans Hartvig Seedorff; Harald Bergstedt; Kai Friis Møller; and Per Lange. Among interesting novelists after World War I, Jacob Paludan wrote some very good novels—Fugle ***omkring fyret*** (1925; ***Birds Around** the **Light,*** 1928) and *Jørgen Stein* (1932–33; Eng. trans., 1966)—as also did Hans Kirk, whose ***Fiskerne*** (1928; "The Fishermen") was social realism at its best. Harald Herdal, a disciple of Nexø, exposed society's hypocrisy in his proletarian novels. Jørgen Nielsen's themes were suppressed hatred, sin, and fear among Jutland peasants. H.C. Branner, an important writer of novels, plays, and short stories, spoke of the loneliness of men and the danger of power. Another writer of these three genres was Knud Sønderby, who had a brilliant style and deep understanding. Nis Petersen, poet and novelist, was famous for ***Sandalmagernes gade*** (1931; ***The Street of the** Sandalmakers,* 1933) and ***Spildt** maelk* (1934; ***Spilt Milk,*** 1935). Karen Blixen (Isak Dinesen), an aristocratic writer with subtle irony and unusual sensitivity, wrote ***Seven Gothic Tales*** (1934) in English, ***Out of Africa*** (1937), ***Winter's Tales*** (1942), and ***Last Tales*** (1957). Two other notable novels by Faeroese writers were ***Barbara*** (1939; Eng. trans., 1948), by Jørgen-Frantz Jacobsen, and ***De** fortabte spillemaend* (1950; ***The Lost Musicians,*** 1972), William Heinesen's masterpiece. Among the distinguished novelists of the 1930s were also Mogens Klitgaard, whose first novel was about the "white-collar proletariat"; Hans Scherfig, a great humorist and social satirist; Martin Alfred Hansen, a psychological novelist, whose best known novel is *Løgneren* (1950; ***The Liar,*** 1954); Knuth Becker; Aage Dons; Leck Fischer; and Peter Freuchen, most of whose novels are about his Arctic experiences.

Danish playwrights of the post-World War I generation such as Sven Clausen and Svend Borberg were influenced by German Expressionism, Symbolism, Luigi Pirandello, and Sigmund Freud. Kaj Munk, who revived the heroic drama of Shakespeare and Schiller, showed unusual qualities in his best plays—En ***idealist*** (1928; ***Herod the King,*** 1953), and ***Ordet*** (1932; ***The Word,*** 1953)—which were concerned with problems of God and man. The work of Kjeld Abell marked a severance from Naturalist drama, and a radical perspective underlay his witty dialogue. His most important plays were ***Melodien, der blev vaek*** (1935; ***The Melody that Got Lost,*** 1939), ***Anna Sophie Hedvig*** (1939; Eng. trans., 1944), ***Dage på en sky*** (1947; ***Days on a Cloud,*** 1964), and ***Skriget*** (1961; "The Scream"). C.E. Soya is the third important playwright of the period, and also a novelist and fine short-story writer; some of his daring experiments with the theatre have been very successful.

Many postwar poets found an aesthetic manifesto in ***Fragmenter af en dagbog*** (1948; "Fragments of a Diary"), by Paul la Cour, who was influenced by contemporary French poetry. Jens August Schade, a sophisticated naivist, also had an important influence, as did the prematurely deceased poets Gustaf Munch-Petersen and Morten Nielsen. A revival of poetry followed the liberation (1945), and an Existential periodical *Heretica* (1948–53) became the voice of a group of young writers who regarded a Christian philosopher, Vilhelm Grønbech, as their spiritual progenitor. Two outstanding poets apart from the *Heretica* group were Halfdan Rasmussen, who also wrote excellent nonsense verse, and Erik Knudsen, also a brilliant satirical playwright. Both studied contemporary problems and reacted against the anti-rationalism and anti-intellectualism of the *Heretica* movement. Tove Ditlevsen was another important poet, as well as novelist and short-story writer, unattached to any group. Though belonging to a previous generation. Albert Dam published his best prose work in the 1950s and 1960s. Among the young modernist writers of those two decades, the best known was Klaus Rifbjerg, both as a poet and a novelist. Other important prose writers of the same period were Hans Lyngby Jepsen, Leif Panduro, Poul Ørum, Villy Sørensen, Cecil Bødker, Peter Seeberg, Erik Aalbaek Jensen, Thorkild Hansen, Ulla Ryum, Sven Holm, Tage Skou-Hansen, Peter Ronild, Svend Age Madsen, Per Højholt, Christian Kampmann, Anders Bodelsen, Hans Jørgen Nielsen, Vagn Lundbye, and Henrik Stangerup.

Poetry also flourished in those decades, and the moat noteworthy poets were Frank Jaeger, Thorkild Bjørnvig, Ole Sarvig, Ole Wivel, Jørgen Gustava Brandt, Ove Abildgaard, Robert Corydon, Ivan Malinovski, Lise Sørensen, Jørgen Sonne, Benny Andersen, Poul Borum, and Inger Christensen.

The best playwrights of the 1950s and 1960s were Ernst Bruun Olsen, Finn Methling, Erik Knudsen, Leif Panduro, and Klaus Rifbjerg.

Icelandic. Modern Icelandic prose writing did not really develop until the late 1870s, when a group of young men, influenced by the theories of the Danish critic Georg Brandes, began their literary careers. Unfortunately, they had absorbed Brandes' ideas uncritically, which resulted in introspective, self-pitying works believed by their authors to be realistically written. The early works of Einar Kvaran were like this, but he later proved to be a novelist of skill and power.

Several writers of this time showed a keen eye for character and an understanding of human feelings and of the stark life of rural Iceland: Jón Trausti (Gudmundur Magnússon), who wrote the cycle *Heidarbýlid* (4 vol., 1908–11; "The Mountain Cot"); Gunnar Gunnarsson, whose *Kirken på bjerget* (1923–28; "The Church on the Mountain") was written in Danish; and Gudmundur Hagalín. The outstanding modem prose writer was Halldór Laxness, who was awarded the Nobel Prize for Literature in 1955. His mature works, written after several years' travelling abroad, were influenced by his conversion to Roman Catholicism and his identification with the basic ideas of Communism. His major works were *Salka Valka* (1936), *Sjálfstaet fdlk* (1935; *Independent People,* 1945), *Íslandsklukkan* (1943; "The Bell of Iceland"), and *Gerpla* (1952). He helped restore his native language as a sensitive medium for storytelling.

The works of Halldór Laxness

A writer of independence—egocentric, individualistic, acidly satirical—was Thórbergur Thórdarson, who wrote essays, *Bréf til Láru* (1924; "Letters to Laura"), and an autobiographical fragment, *Ofvitinn* (1940–41; "The All-Too-Wise"). Other novelists included Ólafur Jóhann Sigurdsson, whose first hook, *Skuggarnir áf baenum* (1936; "The Shadows of the Farm"), was immediately well received, and Agnar Thórdarson, who also made an impressive debut with *Haninn galar tvisvar* (1949; "The Cock Crows Twice"). During the 1960s a new writer of force emerged in Svava Jakobsddltir, whose *Leigjandinn* (1969; "The Lodger") revealed a stylist of vigour and a writer of great insight into the murkier side of the human psyche.

At the beginning of the 20th century, poetry had lyricists in Thorsteinn Erlingsson, whose early delicacy later developed into a more powerful note in "Aldaslagur" (1911; "Sound of the Ages") and in an incomplete epic, "Eidurinn" (1913; "The Oath"); in Einar Benediktsson, who wrote in an ornate style sometimes capable of greatness, as "I dísarhöll" ("In the Hall of the Muses") shows; and in Stephan G. Stephansson, an expatriate farmer in Canada, who was a more bitter poet, influenced by the "realism" that passed for Georg Brandes' ideas in Icelandic literature—but *Andvokur* (1909–38; "Sleepless Nights") revealed a sensitive spirit and a consummate control of words.

David Stefánsson was a major Icelandic poet, a traditionalist who wrote with feeling and simplicity in *Kirkja fyrirfinnst engin* ("No Church To Be Found") and *Svarti daudi* ("Black Death"). His approach was shared by Tómas Gudmundsson and Jón Helgason, whose book *Úr landsudri* (1939, revised 1948; "From the South") was outstanding. Steinn Steinarr (Adalsteinn Kristmundsson) made innovations: he introduced the techniques of free verse in *Raudur loginn brann* (1934; "Red Burned the Flame") and was deeply influenced by Surrealism, and his nihilistic outlook was reflected in *Ferd án fyrirheits* (1942; "Journey Without Promise"). Om Arnarson (Magnús Stefánsson) possessed a rare humour, as *Rimur af Oddi sterka* (1938; "The Rhyme of Oddi the Strong") shows. Sigurdur Ivarsson also had a similar quality, and *Vjer brosum* (1929; "We Smile") and *Verkin tala* (1930; "Works Speak") became classics. Two young poets, Hannes Pétursson and Einar Bragi (Fridriksson), published work in the 1960s that showed great sensitivity and skill in adapting Icelandic to new, European metres.

Icelandic drama really started to develop through Jóhann Sigurjónsson, whose first success was *Fjalla-Eyvindur* (1911; *Eyvind of the Hills,* 1916), followed by *Galdra-Loftur* (1915; "Loftur the Sorcerer"); both plays were based on powerful folktales. Gudmundur Kamban's *Hadda-Padda* (1914) was highly praised by Georg Brandes, and he remained important in Scandinavian drama for the next quarter of a century. After Kamban, there were few plays of tasting value, though David Stefánsson's *Gullna hlidid* (1941; "The Golden Gate"), Jakob Jónsson's *Tyrkja-Gudda* (published 1948), and Agnar Thórdarson's satirical comedy of modern Reykjavik life, *Kjarnorka og kvenhylli* (1957; "Nuclear Force and Female Popularity"), had considerable merit. In *Ganksklukkan* (1962; *The Cuckoo Clock,* 1972) the latter produced a powerful play on the dehumanizing effect of modem life.

RUSSIAN AND SOVIET LITERATURE IN THE 20TH CENTURY

Soviet literature in the first years of the 20th century was dominated by the attempts of writers and politicians to come to terms with a new ideology. Early writers, reared in the literary traditions of the 19th century, were opposed, before and after the 1917 Revolution, by writers concerned to support the new social and political ideas. With the installation of the Communist Party, a left-wing, party-backed movement in literature was established whose aim was to produce literature in support of Communist theories. At the same time, anxiety about freedom of expression increased, and these two seemingly opposed interests remained central issues, earning any given writer either official approval or disapproval of his work in the Soviet Union.

The early 20th century in Russia. *Symbolism.* The revival of poetry in Russia stemming from the 19th-century Symbolist movement had as its leader Vladimir Solovyov. His poetry expressed a belief that the world was a system of symbols expressing metaphysical realities. Konstantin Balmont and Valery Bryusov were more talented poets, and the greatest poet of the movement was Aleksandr Blok, who in *Dvenadtsat* (1918; *The Twelve,* 1920) united the Revolution and God in an apocalyptic vision in which 12 Red Army men became apostles of the New World, headed by Christ. Other important Symbolist poets were Vyacheslav Ivanovich Ivanov, Fyodor Sologub, and Andrey Bely. Each brought his particular field of knowledge to his conception of reality: Ivanov, a Greek scholar, proclaimed the identity of Christ and Dionysus, and Bely, outstanding theoretician of the movement, worked out his philosophy in novels strongly reminiscent of Gogol and Dostoyevsky.

Futurism. Viktor Khlebnikov founded a most revolutionary poetic movement in 1910. A manifesto announcing the establishment of Futurism, also signed by Vladimir Mayakovsky, the future "poet laureate," appeared under the title of *Poshchochina obshchestvennomu vkusu* (1912; "A Slap in the Face of Public Taste"). Futurists wanted to wake everyone up by shock tactics. Mayakovsky rallied at first to the Soviet regime. His later satires, *Klop* (1929; *The Bedbug,* 1960), and *Banya* (1930; "The Bathhouse"), showed disillusion with Soviet bureaucracy. His suicide in 1930 was ascribed to this political disillusionment. Boris Pasternak also began as a Futurist poet and by 1917 had published most of the poems included in *Sestra moya zhizn* (1922; *Sister: My Life,* 1967).

Post-Revolutionary literature. The impetus of the Revolution led to brilliant experimentation, and contending literary groups sprang up, in particular, over rejection of the 19th-century literary heritage in favour of a proletarian culture. Styles and themes became increasingly realistic violent stories of the Civil War; Isaac Babel's Cossack tales *Konarmiya* (1926; *Red Cavalry,* 1929) and Aleksandr Fadeyev's *Razgrom* (1927; translated as *The Nineteen,* 1929) shared an emphasis on realism.

Among authors concerned with the struggle between old and new—whom Trotsky called mere "fellow travellers of the Revolution"—were Konstantin Fedin, Leonid Leonov, Yury Olesha, and the satirist Valentin Katayev.

The abolishment of RAPP

Five-Year-Plan literature and Socialist Realism. The struggle between "fellow travellers," who demanded creative self-determination, and the left-wing writers, arguing for proletarian literature subservient to the Communist Party, became so bitter that the Central Committee refused to endorse any one group. When the First Five-Year Plan was launched, however, the party backed the Russian Association of Proletarian Writers (RAPP) and other left-wing groups, thereby supporting themes of construction and collectivization. RAPP was abolished by the Central Committee in 1932, and it was suggested that all literary groups form a single union. A national Union of Soviet Writers was thereupon organized in 1934, and a new doctrine of "Socialist Realism" propounded to guide creative efforts. Literature was expected to show reality in its "revolutionary development," which in practice meant it was supposed to propagate the party's ideological objectives. Some tolerance was permitted during this period of economic success and Popular Front agitation. The ablest writers, such as Mikhail Sholokhov and Leonov, took advantage of this. Melekhov, for example, hero of Sholokhov's *Tikky Don* (1928–40; vol. I and II translated as *And Quiet Flows the Don,* 1934, and continued in *The Don, Flows Home to the Sea,* 1940), remains a tragic "White" Cossack throughout. It remained for Nikolay Ostrovsky to create the "new Soviet man" in *Kak zakalyalas stal* (1932–34; *How the Steel Was Tempered,* 1952), and most writers took up this model. The party required "positive heroes" and optimistic themes that romanticized heroic efforts to achieve Communism. Literary critics imitated one another in insistence on the party's version of Socialist Realism. Some authors were "liquidated" in Stalinist purges, and others, among them Anna Akhmatova, a major poet of exquisite skill, and Pasternak, perhaps the most celebrated Soviet poet, fell virtually silent.

War literature, 1943–45. During World War II many writers shared fervent national patriotism and were assigned to the front as correspondents. Party control relaxed and authors felt free to concentrate on emotions evoked by the tragedy of war. The most popular novels were *Nepokorcnnye (Semya Tarasa)* (1943; "The Taras Family"), by Boris Gorbatov; *Dni i nochi* (1943–44; *Days and Nights,* 1945), by Konstantin Simonov; and Fadeyev's *Molodaya gvardiya* (1946; *The Young Guard,* 1959), about the underground activities of Young Communist League members under German occupation. The best plays were Leonov's *Nashestviye* (1942; "Invasion") and *Lyonushka* (1943), and the most popular were sensational exposures of Red Army weaknesses in *Front* (1942), by Aleksandr Korneychuk, and Simonov's *Russkiye lyudi* (1942; *The Russians,* 1944). War was most sincerely expressed in poetry. The finest lyrics were by Pasternak, Olga Bergolts, Margarita Aliger, and Simonov, and the best long poems by Aleksandr Tvardovsky, Nikolay Tikhonov, and Vera Inber.

Zhdanovism, 1945–53. Any hope that the party would extend the creative freedom of the war was squelched by the Central Committee's 1946 decree that all art must be politically inspired and understood. The edict was the work of Andrey Zhdanov, heir apparent to Stalin and unofficial commissar of culture. The works of Akhmatova and Mikhail Zoshchenko were singled out for savage attack. Although Socialist Realism was not to be rejected, the principal tenet of literature became party spirit. The word Zhdanovism (Zhdanovshchina) was given to both this policy and the sterile writing it generated. Some authors took refuge in war themes, on which many novels were based, notably *Povest o nastoyashchem cheloveke* (1946; "A Story About a Real Man"), by Boris Polevoy (Kampov); Ilya Erenburg's *Burya* (1947; *The Storm*); *Za vlast sovetov* (1949; "For the Power of the Soviets"), by Valentin Katayev; and Mikhail Bubennov's *Belaya brryoza* (1947; "The White Birch"). Novels such as Pyotr Pavlenko's *Schastye* (1947; "Happiness") and Semyon Babayevsky's *Kavaler zolotoy zvezdy* (1947; "Cavalier of the Golden Star") complied with the official demand for literature dealing with peaceful reconstruction. Fedin's trilogy *Pervye radosti* (1945–46; *Early Joys,* 1960), *Neobyknov ennoye leto* (1948; *No Ordinary Summer,* 1950), and *Kostyor* (1962; "The Bonfire") was far superior and perhaps the best postwar novel.

Protesters against party control

Literature after Stalin. The number and directness of articles critical of literature's stagnation increased considerably after Stalin's death in 1953, and writers were quick to take up the protest. Leonid Zorin's play *Gosti* (1954; "The Guests") challenged the claim that class structure had vanished. Poets such as Bergolts and Inber attacked the "steam shovel" school of verse, and Pasternak, in 1954, brought out his first original verse since the war, namely, ten poems later included in his novel *Doctor Zhivago* (1957). Erenburg, however, gave name and focus to the dissent in a play, *Ottepel* (1954; *The Thaw,* 1955), which highlighted the tragedy of the artist under Stalin. The same year, at the Second Writer's Congress, offending authors and critics were reprimanded. Premier Nikita Khrusbchev's exposure of Stalin's crimes in 1956 revived the protest against literary control, and some of the best writing of 1956 and 1957 was an indictment of Stalinism and hypocrisy in Soviet life. Soviet reaction to the 1956 Hungarian Revolution made these works seem part of an organized attack on authority, and administrators of the Writers' Union demanded recantations from authors. Publication of Pasternak's *Doctor Zhivago* in western Europe in 1957 provoked another outburst of denunciation, but writers continued to press for greater freedom. These "angry young men," including the poet Yevgeny Yevtushenko, were strongly opposed by the "conservatives," who forced several leaders to recant at a 1963 meeting of the Board of the Writers' Union. When Khrushchev left office in 1964, the party stated it would insist on an identification of literature and party ideology, although freedom would be allowed in matters of form and content. Under these guidelines a new liberal generation strove for an individuality of expression alien to Socialist Realism.

The most talented prose writers were Aleksandr Solzhenitsyn, Viktor Nekrasov, Yury Kazakov, Vasily Aksyonov, Yury Nagibin, and Vladimir Tendryakov. Solzhenitsyn became internationally known for an authentic description of prison camps under Stalin in *One Day in the Life of Ivan Denisovitch* (1962), and later works, such as *The First Circle* (1968) and *Cancer Ward* (1968), established him as a mature and talented author and resulted in his winning the Nobel Prize for Literature in 1970. He was not permitted to receive the Nobel Prize, however, and the work he considered to be his greatest, *August 1914,* was also not permitted to be published. The novel was published in the West in the early 1970s in both Russian and English. In 1971 his *August 1914* was published in Paris (Eng. trans., 1972), the first of a projected series of novels about World War I. Aksyonov published his first story, *Kollegi* ("Colleagues"), in 1960. His work was marked by an ability to write pithy colloquial Russian and unusual powers of description. Among many good poets, Andrey Voznesensky and Yevtushenko were perhaps best known. The brilliant concentration of verbal experiments in Voznesensky's poetry gave it a deceptively witty appearance. He was, in fact, centrally concerned with problems of modern society. Yevtushenko was a more erratic and less talented poet, but his verse, like Voznesensky's, showed involvement with social and personal problems. He travelled widely after 1960 and was perhaps the best known of the modern Russian poets. Among less well-known but talented poets were Yevgeny Vinokurov and Bella Akhmadulina. But the degree of nonconformity allowed writers hung in the balance after two minor writers, Andrey Sinyavsky and Yuly Daniel, were imprisoned (1966) for publishing work abroad that criticized the Soviet Union. The pattern of periods of partial relaxation of control followed by periods of severe ideological disciplining established itself as a regular feature of Soviet literary life and gave every indication of continuing.

Ukrainian. In the first three decades of the 20th century Ukrainian literature experienced a renascence, characterized by a variety of quickly succeeding and often strongly competing literary movements. Realism, with a distinctly decadent strain, was the most notable characteristic of Volodymyr Vynnychenko's prose. Pavlo Tychyna was the leading Symbolist poet; others included D. Zahul, P. Tereshchenko, and O. Slisarenko. Neoclassicism produced outstanding poets in Mykola Zerov, Maksym Rylsky, and Mikhaylo Dray-Khmara. Futurism was initiated by M. Semenko and produced one of the Ukraine's greatest 20th-century poets, Mykola Bazhan.

After the Russian Revolution, during a period of relative freedom between 1917 and 1932, a host of talented writers emerged: Mykola Khvylovy's prose was imbued with revolutionary and national Romanticism, Hryhoriy Kosynka's prose was Impressionistic, while Y. Yanovsky's stories and novels were unabashedly romantic, and V. Pidmohylny adhered to the principles of realism. Other writers of note include the novelist and film maker Aleksandr Dovzhenko as well as the novelists Borys Antonenko-Davydovych, Volodymyr Gzhytsky, Mikhaylo Ivchenko, Oles Dosvitny, the poet Mike Yohansen, and the humorist Ostap Vyshnia. The outstanding dramatist was Mykola Kulish.

In 1932 the Communist Party enforced Socialist Realism as the required literary style. Typical representatives of this official literature were the dramatist Oleksandr Korniychuk and the novelist Mikhaylo Stelmakh.

The post-Stalinist period saw the emergence of a new generation that rejected drab Socialist Realism. Known as the "Writers of the Sixties," they included Lina Kostenko, Vasyl Symonenko, V. Korotych, Ivan Drach, M. Vinhranovsky, V. Holoborodko, and I. Kalynets. Repressive measures taken in the early 1970s silenced many of them or else turned them back to Socialist Realism.

Lithuanian. In 1918 Lithuania regained independence. Writers began to concentrate on developing national culture and a greater degree of sophistication in literature.

V. Kreve-Mickevitius, novelist and dramatist, was regarded by some as the greatest Lithuanian writer, and J. Baltrušaitis achieved distinction as a lyrical poet. Other prominent names were those of V. Mykolaitis-Putinas, who pioneered the modern Lithuanian romance; B. Sruoga and K. Binkis, both poets and dramatists; J. Savickis, novelist and short-story writer; a poet, F. Kirša; P. Vaičiūnas, dramatist; I. Šeinius, novelist and short-story writer; and S. Čiurlionienė, novelist and dramatist. B. Brazdžionis was a leading poet of the younger generation.

When Lithuania was occupied by the Soviet Union, writers were compelled to follow the Communist line. Those working in the West (about 100) tried to further the development of the national literature. New modes of expression were successfully attempted in the philosophical poetry of A. Nyka-Niliiinas, in the idylls of J. Mekas, and in the novels of M. Katiliškis. The genres most favoured have been the short story and the lyric.

Latvian. A great emotional experience was the revolution of 1905 when the Latvians tried to break away from imperialistic Russian and local German tutelage. Lyricism then began to predominate. In the verse and fairy tales of a great poet, Kārlis Skalbe, the ethical world of folk poetry was reborn. A new generation of authors arose when Latvia became independent in 1918. J. Akuraters portrayed himself or romantic heroes with aesthetic ideals in the spirit of Nietzsche, and his lyrics were powerful but improvised. A. Upītis, inspired by French and Russian Naturalism, idealized working class heroes. E. Virza (E. Lieknis) created lyrics in strict classical forms; his prose poem *Straumēni* (1933) praised the patriarchal farmstead. Lyrical emotionalism was disciplined in J. Jaunsudrabiņš, whose best novel was a trilogy, *Aija*, *Atbalss*, and *Ziema*. World War I provided many themes for works such as K. Štrāls' *Kari* (1922–27), Anna Brigadere's *Kvēlošā loka* (1922), and A. Grins's *Dvēseļu putenis* (1932–34); the postwar atmosphere found expression in well-composed short stories by J. Ezeriņš and K. Zarinš. J. Veselis tried to harmonize the spirit of the age with that of Latvian folk poetry; this is successfully realized in the poetry of Zinaida Lazda and Andrejs Eglitis and also in that of Veronika Strēlerte.

Latvians found it difficult to achieve a unified view of the world in the 20th century, however, and so turned to psychological detail. The stories of M. Bendrupe show Freudian influence, and E. Ādamsons depicted the neuroses of modern man. Anšlavs Eglitis delighted in caricaturing and intensifying one particular human quality at a time. M. Ziverts, the best modern Latvian dramatist, evolved a long, one-act play culminating in a great monologue, as in his historical tragedy *Vara* (1944).

Several poets were still influenced or inspired by folk songs, but A. Čaks (A. Čadarainis) created a new tradition, describing in free verse, with exaggerated images, the atmosphere of the suburbs. His outstanding work was a ballad cycle, *Mūžības skārtie* (1938; "Marked by Eternity"), about the Latvian fusiliers of World War I. His influence was felt in a new generation of poets who migrated to the West after World War II.

The poetry of Velta Sniķere contains certain elements of Surrealism in verse reminiscent of ancient Latvian magic formulas. A fusion of A. Čaks's imaginist poetry and the experience of big American cities led to the poetry of L. Tauns and G. Saliņš. Caks's verse may have appeared too avant-garde to find an echo in the work of poets in present-day Latvia; but three gifted poets there, Vizma Belševica, O. Vācietis, and I. Ziedonis, gave individual expression to their inner worlds of experience, constrained by external pressures. In the West, new vistas were opening up in the poetry of Astride Ivaska, Aina Kraujiete, and Raiba Bičole. In the field of prose, A. Bels, a noteworthy writer in Latvia, portrays a many-facetted reality; in the West, Ilze Sķipsna has moved from Existentialism to profound Symbolism working at various levels, as in her novel *Neapsolitas zemes* (1971).

The Siuru and Arbujad groups

Estonian. During the russification of 1890–1906 the style of Realism introduced was best represented in Estonian literature by Juhan Liiv. It was superseded by the Neoromantic Young Estonia group, whose leader, a poet, Gustav Suits, devised the slogan "More European culture! Be Estonians but remain Europeans!" For Suits and his followers this meant greater attention to form. With the 1917 Revolution emerged the Siuru group (named after a bird in Finno-Ugrian mythology). These Neoromantic poets reacted against Suits's emphasis on formalism. Their emotional intensity was well illustrated by Henrik Visnapuu, who, with Marie Under, developed the lyrical potential of Estonian to the full. By the 1930s a renewal of Realism brought poetry closer to life, but the only outstanding poetry of this revival was descriptions of modern urban life in the work of Juhan Siitiste (Schiitz). The Arbujad group (which also took its name from a word with origins in mythology) of the mid-1930s, on the other hand, stressed intellectual and aesthetic aspects of literature. Leading poets were Betti Alver, whose skillful use of symbolic imagery was shown in ***Tolm ja tuli*** (1936; "Dust and Fire"); Heiti Talvik, who in ***Kohtupäev*** (1937; "Doomsday") predicted the coming holocaust; Uku Masing, a religious mystical poet; and Bernard Kangro, later the leading lyrical poet in exile.

After World War II more than half of Estonia's writers went into exile, and their poetry reflected either pessimism, like Kangro, or longing for Estonia, as in Visnapuu's exile poetry. Gradually a new generation of ironic poets emerged, best exemplified by Kalju Lepik, experimental author of ***Kollased nõmmed*** (1965; "Yellow Heaths"); a skeptical poet, Arno Vihalemm, whose work was spiced with self-irony; and the author of the epic ***Peetri kiriku kellad*** ("The Bells of St. Peter's"), Ivar Grunthal. In Estonia little poetry appeared under Stalin's Socialist Realism, but new poets, adopting Western styles, appeared in the 1960s. Among these were Jaan Kross, Ellen Niit, Ain Kaalep, and Mats Traat.

Prose writing was equally influenced by movements current in Europe. The Realism of the beginning of the century was exemplified in the social criticism of Liiv's *Kümme lugu* (1893; "Ten Tales") and in Ernst Peterson's criticism of social injustice, ***Boils*** (1899–1901). An outstanding Realist novelist was Eduard Vilde, who wrote a historical trilogy attacking the Balto-Germanic feudal system and in *Mäeküla piimamees* (1916; "The Dairyman of Maekula") again treated the relationship between landowner and serf. Friedebert Tuglas, who introduced Impressionism and Symbolism, belonged to Young Estonia, while August Gailit was a leading ***Siuru*** prose writer. Among the Neoromantics who became Realists were Anton Tammsaare, who wrote an ethico-psychological chronicle, ***Tdde ja õigus*** (1926–33; "Truth and Right"); Albert Kivikas, whose ***Nimed marmortahvlil*** (1936; "Names on the Marble Tablet") was about the war of liberation; August Malk, who concentrated on nautical subjects; and August Jakobson.

Estonian novelists in exile

Novelists in exile found inspiration in the very fact of their exile. Two principal themes were wartime experiences and the problem of adapting to new environments. Among writers in exile were Gailit, Malk, Kivikas, Ristikivi, Pedro Krusten, Karl Rumor, Juhan Jaik, Evald Mand, and Valev Uibopuu. New writers included a critic, essayist, and dramatist, Arvo Magi, and the novelists Ilmar Talve, Ilmar Jaks, Helga Nõu, and Elin Toona. Of these, the last three showed an increasing internationalism in their work. In Estonia postwar fiction decayed in the way poetry did. The deadening effect of Socialist Realism gradually gave way to greater subtlety, and younger novelists, such as Arvo Valton, Enn Vetemaa, and Mati Unt, were able to examine some of the problems of Communism and begin stylistic experimentation.

Dramatic works were few, but two early playwrights stood out: August Kitzberg, author of both comedies and serious plays, and Hugo Raudsepp, whose realistic and symbolical plays were social satires.

OTHER LITERATURES EASTERN EUROPE AND THE N MEDITERRANEAN IN 20TH CENTURY

Polish. The literary trend of the period following the 1863 uprising was called positivism and reflected a practical mood and reaction against Romanticism, the rise in Russian and Austrian Poland of an urban intelligentsia acting as a leaven in this ferment. Periodicals were of particular importance in disseminating new ideas, especially the ***Tygodnik Ilustrowany*** ("Illustrated Weekly"), founded in 1859. The natural consequence of a positivist outlook was a predominance of prose. With other writers of the Warsaw school, Aleksander Świętochowski voiced anticlerical and anti-aristocratic views in his weekly ***Prawda.*** Bolesław Prus (Aleksander Głowacki), a journalist, ranked high among Polish novelists: ***Lalka*** (1890; "The Doll") gave a complex picture of bourgeois life in Warsaw, and ***Faraon*** (1897; "The Pharaoh and the Priest") was an ambitious evocation of ancient Egypt, masking political problems that could not be published in the form of a modern novel.

Eliza Orzeszkowa, a campaigner for social reform. wrote about women's emancipation, the ignorance of the peasants, and the Jewish problem. Her books showed psychological penetration and a fine sense of style.

In 1905 Henryk Sienkiewicz was a winner of the Nobel Prize for Literature; his early critical works propounded positivist aesthetic theories, and his early short stories showed an acute awareness of the contemporary situation and a stark Realism. His famous ***Quo Vadis*** (1896; Eng. trans., 1898), a historical novel of Rome under Nero, has been widely translated.

A more flexible Naturalism gained ground toward the end of the period, as seen in the stories of Adolf Dygasiński, famous for portrayals of animal life—such as *Zając* (1900; "The Hare")—which could be compared with those of Rudyard Kipling. Gabriela Zapolska, a critic of social hypocrisy in Naturalistic novels and lively comedies, excelled in dialogue and dramatic situations, in such plays as ***Moralność Pani Dulskiej*** (1906; "The Morals of Mrs. Dulska").

The period produced two important poets: Adam Asnyk, a reflective lyricist of formal dexterity; and Maria Konopnicka, writer of sentimental verses on the underprivileged.

The "Young Poland" movement

The "Young Poland" movement describes several different groups and tendencies united by opposition to positivism, and a desire to return to imagination in literature; hence its other name, Neoromanticism. Among its pioneers were Antoni Lange, a poet, and Zenon Przesmycki (Miriam), editor of a Symbolist review, ***Chimera.*** Both made translations from a number,of other languages and expressed aesthetic theories in critical essays. Przesmycki's most influential contribution to a development of modern literature was his discovery of Cyprian Norwid, the chief innovator of Polish poetic diction in the previous century, whose experiments and originality could be compared with those of Ezra Pound and, more particularly, with Gerard Manley Hopkins.

Kazimierz Tetmajer achieved popularity with his nostalgic *Poezje*, but his prose had greater vigour and precision of observation, ***Na skalnym Podhalu*** (1903–10; "Tales of the Tatras") containing some effectively stylized folk material. An interesting poet, Jan Kasprowicz, was of peasant origin. His principal contribution to Polish literature lay in the structure of his longer lyrical poems; those in the volume ***Ginqcemu światu*** ("To the Dying World") employed a technique of association, quotation, musical repetition, and free metre that anticipated the early style of such poets as T.S. Eliot. Tadeusz Micinski, a forerunner of Expressionism and Surrealism, wrote philosophical and mystical poems and plays, notably a collection of poems, ***W mroku gwiazd*** (1902; "In the Twilight of the Stars"), and a play, ***Kniaź Patiomkin*** (1906). The lyrical poet Leopold Staff, whose work shows great variety and technical dexterity, was at this period associated with the "Young Poland" movement, although some of his finest work was written later.

Stanislaw Przybyszewski was a leading exponent of the movement's new aesthetic theories and edited a literary magazine, *Życie* ("Life"). Stephen (Stefan) Żeromski expressed passionate concern for social justice and national freedom in widely read works, but an excess of Realist documentation frequently vitiated the power of his later work. Władysław Stanisław Reymont, of peasant stock, adapted the Naturalistic technique to create a vision of peasant life in an epic novel cycle, *Chłopi* (4 vol., 1902–09; "The Peasants"), for which he received the Nobel Prize in 1924. One of the most effective novels of the period, ***Żywot i myśli Zygmunta Podfilipskiego*** (1898; "The Life and Thoughts of Zygmunt Podfilipski"), by Józef Weyssenhoff, presented an ironical portrait of the egoist in society. Wacław Berent's *Próchno* (1903; "Rotten Wood") portrayed with biting irony the late-19th-century decadence of life and art. His ***Ozimina*** (1911; "Autumn Sowing"), a Symbolist novel foreshadowed the associative structure and narrative technique of James Joyce's *Ulysses* (1922). His ***Zywe kamienie*** (1918; "The Living Stones") stressed the unity of medieval culture and Poland's place within it. A bold experiment antedating by several years the psychoanalytical novel in western Europe was *Pałuba* (1903) by Karol

Irzykowski. In it, motivation and behaviour were presented from different viewpoints; ingeniously cemented by the author's own analyses, as in a scientific study. Irzykowski was also a critic and, in Dziesiqta muza (1924; "The Tenth Muse"), the first to give attention to the cinema as an art form.

Stanislaw Brzozowski, an outstanding critic, insisted that a critic must represent the moral consciousness of his age; in *Legenda Młodej Polski* (1909; "The Legend of Young Poland") he analyzed the weakness of the period's literature and expounded his view of the unity of all work — physical, technical, intellectual, and artistic.

Stanisław Wyspianski was an artist and dramatist of genius. In his plays he reforged elements from classical tragedy and mythology, Polish Romantic drama, and national history in a complex whole. *Wesele* (1901; "The Wedding") was a visionary parable of Poland's past, present, and problematical future, cast in the form of the traditional puppet-theatre play. It was a masterpiece of evocative allusion, tragedy, and humour.

The literature of the period was characterized by close contact with western European literatures, but writers such as Wyspianski turned back to the Polish Romantics in a search for new poetic language.

The Skamander poets

Literature *in* restored Poland. The restoration of independence in 1918 decisively affected Polish literature. The period between 1918 and 1939 was characterized by richness and variety and increasing contact with other European literatures, especially through publication of many translations. For nearly a decade after 1918 lyrical poetry predominated. A periodical, *Zdrój* ("The Fountainhead"), showed affinities with German Expressionism. In Warsaw several poets formed a group called Skamander, from the name of their monthly publication; it was united by a desire to forge a poetic language, attuned to modern life. Julian Tuwim, a poet of emotional power and linguistic sensitivity, headed the group, and during World War II, in Brazil and the United States, wrote a long, discursive, autobiographical poem, *Kwiaty* polskie (1949; "Polish Flowers"). Among Skamander members were Jan Lechoń, Kazimierz Wierzyński (both died abroad after World War 11), Antoni Slonimski, and Jaroslaw Iwaszkiewicz, who was also a prolific prose writer; among sympathizers of the group were two eminent woman poets, Maria Sasnorzewska-Pawlikowska and Kazimiera Iłłakowiczówna, and Władysław Broniewski, a poet with strong left-wing sympathies, who became a master of the revolutionary lyric, expressing involvement in current social and ideological problems.

A writer of importance was Bolesław Leśmian, whose symbolic, Expressionist poetry was remarkable for the inventiveness of its vocabulary, sensuous imagery, and philosophic content, all anticipating Existentialism. He published only three notable collections—*Łąka* (1920; "The Meadow"), Napdj *cienisty* (1936; "The Shadowy Drink"), and *Dziejba leśna* (posthumous, 1938; "Woodland Tale") — but has been recognized by his admirers as the most outstanding 20th-century Polish lyrical poet.

Other experimental movements (*e.g.*, Futurism) followed revolutionary trends in poetry — particularly in Italy and Russia. More original was a group called Awangarda Krakowska (of Cracow). Led by Tadeusz Peiper, it produced few works but had widespread influence in the regeneration of poetic technique. Two of its adherents, Julian Przyboś and Adam Wazyk, who was loosely connected with the movement, ranked among the outstanding poets of the post-World War II period. Also noteworthy was Józef Czechowicz, who assimilated traditional and regional elements to the new style.

Prose writing reached its ascendancy in the second decade of independence. Early stories by Zofia Nalkowska belonged to the "Young Poland" movement and aimed to expose the feminine psyche; later she turned to other themes, striving for narrative objectivity and technical simplicity. Two other women writers of distinction were Zofia Kossak-Szczucka, noted for historical novels, and Maria Kuncewiczowa, who wrote psychological novels. Juliusz Kaden-Bandrowski used experimental Realism in Czarne skrzydta (1928–29; "Black Wings") and Mateusz *Bigda* (1933), which treated social and political themes. Michał Choromański's *Zazdrość i medycyna* (1933; Jealousy and Medicine, 1946) used experimental methods of narrative sequence and was remarkable for its clinical analysis of character. A writer skilled in reflecting subtleties of perception was Bruno Schulz, author of Sklepy *cynamonowe* (1934; Cinnamon Shops, 1963), whose prose was reminiscent of that of Kafka.

Tadeusz Żeleński Boy was a literary critic who showed interest in biographical and psychological rather than literary considerations and provided revaluations of most of the great figures of the past. The essay form was represented by Jan Parandowski, whose main theme was the classical culture of Greece and Rome. He was also known for a novel about Oscar Wilde, Krdl zycia (1930; "King of Life"). A subversive attack on intellectual and social conventions was launched in Ferdydurke (1937; Eng. trans., 1961) by Witold Gombrowicz, who displayed in it a satirical talent reminiscent of Alfred Jarry. The taste for the cyclic novel was satisfied by Maria Dąbrowska with *Noce* i *dnie* (4 vol., 1932–34; "Nights and Days"), an outstanding modern Polish example of a chronicle novel in epic style, about the development of the Polish intelligentsia of upper-middle class origin.

Stanislaw Witkiewicz and "catastrophism"

The drama was the weakest of the literary forms during this period and returned to the Young Poland's especially symbolic form (Karol Hubert Rostworowski, Jerzy Szaniawski). The experimental dramas of Stanisław Ignacy Witkiewicz were of interest chiefly for their expression of anti-Realist aesthetic theories; he developed many ideas of the Awangarda, applied the principles of "pure form" to painting and drama, and was the main exponent of a movement in Polish literature known as "catastrophism." Obsessed with the idea of a disintegration of European culture, endangered by totalitarian ideologies, and an attempt to impose the uniformity of a "mass society," he developed his ideas in plays combining elements of Surrealism, grotesque misrepresentation, and what later became known (in the plays of Eugène Ionesco, for example, whose work Witkiewicz to some extent foreshadowed) as the Theatre of the Absurd. His novels Pozegnanie *jesieni* (1927; "Farewell to Autumn") and Nienasycenie (1930; "Insatiability") expressed the same philosophy. After World War II his work attracted interest abroad and appeared in translation (*e.g.*, The *Madman* and the Nun and *Other* Plays, 1968).

Literature after 1945. The impact of World War II, the experience of occupation, and the establishment in 1945 of the People's Republic decisively affected the character of literature in Poland and also produced a number of émigré writers who had become famous between World Wars I and II: lyrical poets of the Skamander group and former associates of the Awangarda movement, among them Czesław Milosz, who won the Prix Littéraire Européen for Zdobycie wtadzy (1953 in French, 1955 in Polish; "The Usurpers"). Many émigrés wrote of experiences in German or Soviet prisons and forced-labour camps. The most accomplished as literature were *Inny świat* (1953; A World Apart, 1951) by Gustaw Herling-Grudzinski and Sprawa *Józefa* Mosta (1953) by Herminia Naglerowa. Jerzy Pietrkiewicz, whose early work was published in Poland during World War II, later wrote mainly in English (the novels The Knotted Cord, 1953; Isolation, 1959). Witold Gombrowicz also published his postwar work abroad and became famous with the novels Trans-Atlantyk (1953), *Pornografia* (1960; Eng. trans., 1966), and *Kosmos* (1965; Cosmos, 1967), which won him the 1967 International Prize for Literature. He also published abroad a play, *Ślub* (1953; The Marriage, 1970), and three volumes of diaries (*Dziennik*, 1957–66). In all these works, especially the novels, Gombrowicz treated philosophical and psychological themes in a satirical narrative style in which, by emphasizing the grotesque and irrational elements in human nature, he presented an expos6 of the conventions of modern life and culture.

In Poland the years immediately after the war saw publication of works written during the occupation or by writers who had been in concentration camp or prison. A frequent theme was the attempt to come to terms with Fascism and war. This was exemplified in the short stories of Tadeusz Borowski, a prisoner at Auschwitz, who, in collections published in 1948, *Pozegnanie z Mariq,* ("Farewell to Mary") and *Kamienny Swiat* ("The World of Stone," published in *This Way for the Gas, Ladies and Gentlemen, and Other Stories,* 1967), explored human depravity and degradation; and in those of Adolf Rudnicki, who treated moral and philosophical themes in lyrical prose and described, in *Szekspir* (1948; "Shakespeare") and *Ucieczka z Jasnej Polany* (1949; "Flight from Jasna Polana"), the wartime fate of the Jewish community in Poland. Another theme, shown, for example, by a novel *Popidt i diament* (1948; *Ashes and Diamonds)* by Jerzy Andrzejewski, was the examination of the moral controversies that accompanied political and social changes of the postwar period, especially the tragic situation of young conspirators involved in the struggle against the new regime.

The literature of Social Realism and the reaction against it

During 1949–54 the literature of Social Realism gained ground, and writers attempted to emulate the great 19th-century Realists. A new type of hero was created—the ordinary man or woman actively engaged in "productive" work, and those elements in the social scene that served to present an idea of revolutionary progress were accentuated. The main writer was Leon Kruczkowski, a prewar exponent of the Marxist novel whose outstanding plays *Niemcy* (1949; "The Germans") and *Pierwszy dzieli wolnosci* (1960; "The First Day of Freedom") were successfully performed abroad. Kazimierz Brandys, whose development typified postwar tendencies in Polish literature, published an epic novel cycle, *Między wojnami* (1947–51; "Between the Wars"), and a Social-Realist novel, *Obywatele* (1954; "Citizens").

Among writers of the Social-Realist period who stood aside from political involvement were Konstanty Ildefons Gałczyński, who combined lyricism with grotesque fantasy, and the reflective Mieczyslaw Jastrun, who in later work—for example, the essay collection *Mit Śródziemnomorski* (1962; "The Mediterranean Myth")—moved toward Existentialism. A group of Catholic writers opposed to Social Realism included Antoni Gołubiew, author of an epic novel cycle, *Bolesław Chrobry* (1947–54), a prose writer and dramatist Jerzy Zawieyski, and a historical novelist, Hanna Malewska. Teodor Parnicki used a background of conflict between cultures for an analysis of contemporary problems in historical novels set mainly in the early Christian period: *Koniec "Zgody Naroddw"* (1955; "End of the Agreement Between the Nations"), *Nowa baśń* (6 vol., 1962–70; "A New Fairytale"), and *Tylko Beatrycze* (1962; "Only Beatrice").

The weakness of the Social-Realist movement—its attempt to impose a political pattern on creative writing, its avoidance of themes arising from contemporary conflicts—resulted partly from the stranglehold of the Stalinist regime. In the period beginning in 1954–55, writers began to criticize these weaknesses and to oppose them. Andrzejewski, for example, presented contemporary ideas and problems in two novels combining historical and metaphorical treatment, *Ciemności kryją ziemie* (1957; *The Inquisitors,* 1960) and *Bramy raju* (1960; *The Gates of Paradise,* 1962), and Brandys criticized Stalinism in the novel *Matka Królów* (1957; *Sons and Comrades,* 1961).

The political "thaw" after 1956 made it possible for writers to renew contacts with the West. As a result, a period of development and experiment began in which the essay was a vehicle for philosophical and intellectual discussion and comment, and there was an increase of satire. Tadeusz Breza analyzed contemporary life and ideas in a prose of Proustian subtlety in, for example, *Spiżowa brama* (1959; "The Bronze Gate"), a keen description of life in the Vatican. Writers continued to be concerned with World War II, as shown by such novels as *Czarny potok* (1954; *Black Torrent,* 1969) by Leopold Buczkowski, *Kolumbowie-rocznik* 20 (1957; "The Columbuses-Generation of 1920") by Roman Bratny, and *Tren* (1961; "Threnody") by Bohdan Czeszko. Many chose as their theme consequences of wartime experience, as, for example, Tadeusz Konwicki in *Sennik współczesny* (1963; *A Dreambook for Our Time,* 1969). His new novels, *Wniebowstqpienie* (1967; "Ascension") and *Nic albo nic* (1971; "Nothing or Nothing") project those themes on contemporary problems. In *Gtosy W ciemności* (1956; "Voices in the Dark") and *Austeria* (1966; "An Inn"), Julian Stryykowski restated the feeling of the Orthodox Jewish Polish community that the world has already ended and gave it universal application.

Several prewar writers continued to publish: the poets Leopold Staff and Kazimiera Iłłakowiczówna; Maria Dąbrowska, who enhanced her reputation with a collection of short stories, *Gwiazda zaranna* (1955; "Morning Star") and a series of critical essays on Joseph Conrad; the novelist Maria Kuncewiczowa; and the novelist, poet, and dramatist Jarosław Iwaszkiewicz, who published the epic novel *Slawa* i *chwała* (1956–62; "Fame and Praise").

The works of Mrożek

Many writers of the 1950s and 1960s wrote prose works ranging from the political novels of Jerzy Putrament to the psychological novels of manners of Stanislaw Dygat, while the novels of Stanislaw Lem, leading Polish representative of serious science fiction, looked to the future. Young writers such as Marek Nowakowski, in their search for a moral basis for life, often looked into the worlds of those on the fringes of society—outcasts and misfits. An interesting younger writer was Sławomir Mrożek, who went into exile after the political·crisis of 1968; both in his plays—Policja (1958; "The Police"), *Na pełnym morzu* (1961; *Out at Sea,* 1967), *Karol* (1962; *Charlie,* 1967), *Striptease* (1962), and above all in *Tango* (1965), his most widely known work—as well as in stories collected in *Słoń* (1957; *The Elephant,* 1962), he displayed an acute sense of satire and the grotesque, which he used to express a philosophy of life both topical and timeless. His comedy belonged to the Theatre of the Absurd and was distinguished by a subtlety of parody and highly stylized language.

Poetry of the "second" postwar period was notable for expression of philosophical thought. Stanislaw Jerzy Lec was a satirical poet noted for skeptical philosophical aphorisms in *Myśli nieuczesane* (published in series from 1957, collected posthumously 1968; *Unkempt Thoughts,* 1967). Zbigniew Herbert, whose most notable collection was *Studium przedmiotu* (1961; "Study of a Subject"), was a representative of intellectual poetry. Perhaps the most interesting, however, was Tadeusz Różewicz, who had a profound influence on younger lyrical poets; from *Niepokdj* (1947; "Trouble"), his first collection, to *Głos Anonima* (1961; "The Nameless Voice"), his work was occupied with moral themes. He also wrote plays resembling those of Ionesco: *Swiadkowie albo nasza mała stabilizacja* (1962; *Faces of Anxiety,* 1969), and one published with poems in *Kartoteka* (1961; *The Card Index and Other Plays,* 1969). Modem problems also dominated the intellectual, ironic poetry of Wisława Szymborska, collected in *Sól* (1962; "Salt") and *Sto pociech* (1967; "The Hundred Amusements").

The lyrical poetry of the generation of poets born about 1930 was characterized by a variety of aims and styles. On the one hand, the controversial work of such poets as Miron Bialoszewski showed extreme experimentalism; on the other hand, a poet such as Ernest Bryll reasserted traditional poetic forms. Some poets—Tadeusz Nowak and Jerzy Harasymowicz—turned for inspiration to the peasant culture; others, among them Jarosław M. Rymkiewicz, an outstanding translator of English and American poetry, based their poetic program upon the example of T.S. Eliot, in a return to Baroque and Neoclassical forms, and developed an erudite, allusive poetry. Most representative of the poets of this new generation was perhaps Stanislaw Grochowiak, who created an expressive poetic style based on sudden contrasts and deliberate emphasis on grotesque aspects of life.

Critics and essayists included Artur Sandauer; Jan Kott (now in the U.S.), whose *Szkice o Szekspirze* (1961; *Shakespeare, Our Contemporary,* 1964) was widely translated and discussed; Kazimierz Wyka; and Jan Błoński.

Political events in 1968 forced several Polish writers to emigrate and publish abroad, thus joining those who had left Poland previously, like Czesław Milosz (now in the U.S.) and Witold Gombrowicz (who died in Switzerland). Some writers, such as Jerzy Andrzejewski, who published his novel *Apelacja* (1970; *The Appeal,* 1971) in Paris, defied the increasing control; others, like Paweł Jasienica and Stefan Kisielewski, were banned from publishing their works. Although the change in political and cultural life occurring after December 1970 promised more creative freedom, the basic pattern of limited freedom of expression, experimentation, and search for new literary forms established in 1956 continued throughout the period.

The *Lumir* and *Ruch* groups

Czechoslovak. *Czech.* By the 1870s Czech literature had fully established itself in poetry and the novel but not yet in the drama. Literary life crystallized around two groups associated with the periodicals *Lumir* and *Ruch* ("Stir"). The former stressed the necessity to Europeanize Czech literature, the latter looked to the strength of native traditions and themes. The leading representative of the cosmopolitan tendency was Jaroslav Vrchlický (Emil Frida), probably the most prolific of all Czech writers. His lyrics showed an amazing mastery of language, with a vast cycle of historical epics containing his best work. Perhaps his greatest influence was exercised by numerous translations of major European writers, and he was also instrumental in forming a modern Czech poetical language. Cosmopolitanism found expression, too, in the poetry of Vrchlický's Neoromantic lyrics and epics, though his novels and stories, particularly the semi-autobiographical *Jan Maria Plojhar*, were more original.

The principal figure of the "Stir" group was Svatopluk Cech, whose work was inspired by love of his nation and its traditions and by a liberal humanism. One of his most popular works, *Ve stínu lípy* ("In the Shade of the Lime Tree), gave an idyllic picture of Czech country life; in his prose satires he created Mr. Brouček, who satirized the Czech middle classes' philistinism.

The Czech novel of the last quarter of the century exhibited a trend toward realism of description, which was apparent in two major historical novelists, Alois Jirásek and Zikmund Winter (whose novels, such as *Mistr Kampanus*, were by-products of his work as a historian). Both men presented a romanticized version of Czech history, but the details of reconstruction were based, in both instances, on scholarly research. The novels of Jirásek presented an entire history of the Czechs up to his own time, and his mature craftsmanship was seen at its best in a novel of the period of national decline, *Temno* ("Darkness").

In the last decade of the century new trends shaped poetry. Lyrics of more subtle content and more complex form were written by Antonín Sova, and the turn of the century saw the best work of two remarkable Czech poets: Otakar Biezina (Václav Jebavý) and Petr Bezruč (Vladimir Vašek). Biezina expressed a personal religion in a language of subtlety and originality; his metrical structure (including free rhythms) influenced later poets. Bezruč was a regional poet, obsessed by the oppression of the Czechs of Silesia.

In the 1890s, critical reaction to the romantic idealism of the national revival had inspired the historical and sociological writings of T.G. Masaryk. A more sophisticated approach to literary criticism showed itself in the work of František Xaver Šalda, whose sensitive interpretations of his country's greatest writers have not been surpassed.

The satire of Karel Capek

With the establishment of an independent Czechoslovak state in 1918, new possibilities lay before Czech writers. Some of the best achievements of Czech literature sprang from this period, especially in lyrical poetry of the utmost variety. The Czech drama came into its own, notably, in the idealistic and satirical plays of Karel Capek and in the versatile talent of František Langer. The realistic novel of Prague life had been successfully cultivated by Karel Matěj Capek-Chod and in the lighter vein by Ignát Herrmann, but Czech narrative prose reached a peak in the work of three very different writers: Karel Capek, Ivan Olbracht (Kamil Zeman), and Vladislav Vančura. Capek wrote Wellsian fantasies, subtle psychological studies, and stories, such as a trilogy *Hordubal, Povětroň,* and *Obyčejný život* (1933–34), *Krakatit* (1924), and *Válka s mloky* (1936). His best plays exposed the problems of a centralized, machine society of the 20th century: *R.U.R.* (1920), from which the word robot was introduced into English, and *Ze života hmyzu* (1921; *The Insect Play).* In his later plays, pacifism gave way to an acceptance of patriotic duty. Olbracht's most successful works had a Ruthenian background. Vančura cultivated a complex, mannered style with success. The novels of Jan Otčenášek stand out as the most effective from a mass of fiction dealing with World War II and the establishment of a Communist government. The highest achievement of Czech 20th-century literature was the lyrical poetry of the period 1918–45. Outstanding was the work of Josef Hora, František Halas, Vítězslav Nezval, and Jaroslav Seifert.

Slovak. The chief strength of Slovak literature continued to be in the lyric, and the pre-eminent prewar poet was Hviezdoslav (Pavol Országh). He enriched Slovak poetic language by original work and by translations, especially from English, Russian, German, and Hungarian. Other notable poets were the Russophile Svetozár Hurban Vajanský and Ivan Krasko (real name, Jan Botto), whose volumes of verse, *Nox et solitudo* (1909) and *Verše* (1912), were among the finest achievements of Slovak literature.

After World War I leading lyric poets were Martin Rázus, Janko Jesenský, Emil Boleslav Lukáč, Jan Smrek (real name, Ján Cietek), Ján Poničan, and Laco Novomeský. In the novel, country tales by Timrava (real name, Božena Slančíkova), a vast chronicle of 20th-century Slovakia by Milo Urban, and the lyrical prose of Margita Figuli were outstanding. The problems of World War II and its aftermath of Communist government found vivid, personal expression in the work of Ladislav Mňačko and Alfonz Bednár.

Yugoslavian. *Serbian.* Serbian writers between the wars, like Miloš Crnjanski, followed major European literary movements (Expressionism and others); the union of the realistic tradition and modernism was reached in the work of Nobel Prize winner Ivo Andrić. Other writers who gained reputations as exponents of the realistic and psychological orientation included Isak Samokovlija and Veljko Petrović. In the 1930s, when political and social problems intensified, formal experiment and introspective writing met with strong opposition.

Serbian literature during and after World War II dealt predominantly with war themes, particularly in the immediate postwar period. As far as its procedural and ideological orientation went, the literature continued the trends of the 1930s.

In the 1950s and 1960s, however, new writers emerged with a range of themes and styles that reflected the tendencies of western European literature. A poet and novelist, Oskar Davičo, wrote about the individual in Communist society and the problems involved in creating a Socialist state. Branko Ćopić was one of the most popular writers of adults' and children's books to emerge after 1945, and the novels *Prolom* (1952; *The Break,* 1952) and *Gluvi barut* (1957; *The Deaf Gunpowder,* 1957) were important works. Other noteworthy writers were Mihailo Lalić, Dobrica Ćosić, highly original Miodrag Bulatović, together with the poets Vasko Popa, nature poet Stevan Raićković, Miodrag Pavlović, and Dušan Kostić.

Croatian. In the first part of the 20th century, poetry was the chief form of Croatian literature. It dealt with re-creation of natural beauty, spiritual struggle, and a search for deeper meaning, to be seen in the work of Vladimir Vidrić and Vladimir Nazor and of prose writers such as Milutin Cihlar, Dinko Šimunović, and the dramatist Ivo Vojnović. By the middle of the century, the influence of Expressionism was reflected in a frequent adoption by writers of inner monologue, psychoanalytical exploration, and stream-of-consciousness technique. Socialist Realism grew up among the Partisans of the national liberation struggle in World War II; and after 1948 a reaction against uniformity of expression and literature strengthened, and literature became less restricted. Chief representatives of the modern movement in Croatian poetry were Miroslav Krleža, Tin (Augustin) Ujević, and Antun Branko Šimić, a poet of deep contrasts and social awareness. Modern prose was represented by Slavko Kolar, a short-story writer of peasant life and the Partisan struggle, and August Cesarec, who describes working class life. The eminent lyricists are D. Cesarić, D. Tadijanović, and satirist and dramatist Ranko Marinković.

The Slovene modernist movement

Slovene. The emergence of a Slovene modernist movement in the early 20th century resulted in a second peak in Slovene literature (the first being in the time of Prešeren, 1800–49). With rich metaphor and lively rhythm the moderns gave fresh life to poetry, while in prose they replaced Naturalistic description by greater sensitivity and a more subjective attitude toward the world. In addition to the young poets Dragotin Kette and Josip Mum, the two main founders of this movement were Oton Župančič, a vigorous poet of luxuriant diction and native sentiments, and Ivan Cankar, a masterful prose stylist who combined themes of human suffering and longing with severe social criticism. Naturalistic and Realistic elements developed in the prose works and plays of Ksaver Meško, Alojz Kraigher, Zofka Kvedrova, and Fran S. Finžgar. Župančič's verbal enthusiasm was counterbalanced by the less colourful but expressive and reflective lyrical poetry of Alojz Gradnik, especially his love poems.

After World War I social and spiritual tension was evident in the predominantly Expressionistic poetry of Tone Seliškar, Miran Jarc, and Anton Vodnik, as well as in the plays of Slavko Grum. Expressionism was less clearly manifest in fiction: the historical novels of Ivan Pregelj had essentially a Romantic basis in spite of their Baroque stylization, while the prolific story writer France Bevk showed psychological, realistic vision. The most remarkable representative of this period was a young poet, Srečko Kosovel, who in direct, simple language described the horrors of being and of dying and the eternal division of modern man, crucified between two historical eras.

With the development of Social Realism (*c.* 1930), the novel and short story revived, especially with the works of Juš Kozak, Miško Kranjec, Prežihov Voranc, and Ciril Kosmač, who turned to the everyday life of simple country people. Socio-historical conflicts provided plots and themes for the dramatic works of Bratko Kreft and the poetry of Igo Gruden and Mile Klopčič; and if some poetry (*e.g.*, that of Edvard Kocbek) pointed the way to a more inward-looking subjective attitude, other verse (*e.g.*, the caustic sonnets of Božo Vodušek) manifested a sober disillusionment. Between World Wars I and II, moral and psychological criteria were introduced into criticism by Josip Vidmar and socio-ideological criteria by I. Brnčič.

During and after World War II, writers who had been active before it remained rooted in the realistic tradition, although many deepened, or at least broadened, the scope of their themes. This is particularly true of the poet Karl Destovnik-Kajuh, who was killed in the war, and of poet and dramatist Matej Bor, as well as of Ivan Potrč and Mira Mihelič, both prose writers and dramatists. The prose of Danilo Lokar and Boris Pahor does not differ essentially from this movement in spite of its innovations. A more subjective, metaphorical trend has developed in the poetry of Cene Vipotnik, France Balantič, and especially Jože Udovič, to whom the postwar generations look in their new endeavours.

Macedonian. The Macedonian republic established after 1944 in the Yugoslav federation charged such scholars as B. Koneski with standardizing Macedonian as the official literary language, and a national culture began to develop freely. Writers who became prominent in the 1950s and 1960s include the poets G. Todorovski, S. Ivanovski, M. Mateski, and P. Popovski, and the playwrights M. Čašule and T. Arsovski.

Bulgarian. By the 1890s the school of older writers began to be challenged by a younger group, the "Europeans," intent on freeing art from parochialism and socio-political militancy. Leading this was the review *Misŭl* ("Thought," 1892–1908), founded by Krŭst'o Krŭstev, the first Bulgarian critic to stress the importance of the aesthetic conscience. A member of the *Misŭl* group, Pencho Slaveykov, broadened the Romantic tradition of Bulgarian poetry and helped to create a complex poetic language. Influenced by Nietzsche, he glorified the heroism of spiritual achievement and wrote his ***Epicheski pesni*** (1896–98; "Epic Songs") on the giants of the human spirit he revered—Dante, Beethoven, Shelley, and Giacomo Leopardi. His ideas were expressed in his essays and in his autobiographical anthology of "apocryphal" verse by fictitious poets, ***Na ostrova na blazhenite*** (1910; "On the Isle of the Blessed"). His narrative poems ***Boyko*** (1897) and ***Ralitsa*** (1893) interpreted folk themes psychologically, and his greatest, though unfinished, work, *Kŭrvava pesen* (1913; "Song of Blood"), was an epic on Bulgaria's history and destiny. Even more than Slaveykov, Petko Todorov, originator of the Bulgarian Romantic short story, believed that literature was sufficient unto itself; both in his *Idilii* (1908), prose poems inspired by folklore, and in several dramas based on Balkan mythology, notably ***Zidari*** (1906; "Masons"), he displayed a delicate poetic talent.

Symbolist poetry in Bulgaria

With the beginning of the 20th century, avant-garde literary currents encouraged a "modernist" phase related to the Symbolist movement in Western poetry. An anacreontic permissiveness and lyrical power distinguished the poetry of Kiril Khristov, as in ***Himni na zorata*** (1911; "Hymns to the Dawn"). P. Yavorov, a member of the ***Misiil*** group, did most at this time to develop the musical and evocative potentialities of Bulgarian in poetry. His work closely reflected his restless spiritual development, and although his plays showed great promise, lyric poetry was his real achievement. Echoes of Yavorov are found in the melodious, sensuous stanzas of Dimcho Debelyanov, whose death in World War I made him a symbol of tragic frustration for intellectuals. Symbolism inspired the postwar poetry of Nikolay Liliev and Teodor Trayanov.

Meanwhile, the Realist tradition continued in the work of such writers as Anton Strashimirov and G. Stamatov, whose cynical stories denigrated Sofia's society. Strashimirov was an acute observer of the contemporary social scene; one of his best stories of peasant life was "Kochalovskata kramola" (1895; "The Kochalovo Quarrel"), and he also wrote the novels ***Yesenni dni*** (1902; "Autumn Days"), ***Krŭstopŭt*** (1904; "Crossroad"), and ***Sreshta*** (1908; "Meeting") and the dramas ***Vampir*** (1902) and *Svekŭrva* (1906; "Mother-in-Law"). His contemporary Elin Pelin portrayed his native rural province with wit and humanity in ***Razkazi*** (1904 and 1911; "Stories") and in the tragic novellas ***Geratsite*** (1911; "The Gerak Family") and ***Zemya*** (1928; "Land"). Yordan Yovkov, novelist and playwright, excelled at describing the effects of war, the subject of his early masterpiece, ***Zemlyatsi*** (1915); his short stories "Staroplaninski legendi" (1927) and "Vecheri v Antimovskiya khan" (1928; "Evenings in the Antimovo Inn") display deep insight into the Bulgarian mind and a classical mastery of narrative prose.

In the aftermath of World War I the literary left was represented by a number of poets who died tragically young: Geo Milev, a convert to revolutionary Marxism; Khristo Smirnenski; and later, the young, gifted Nikola Vaptsarov, who died a martyr in the anti-Nazi resistance, but not before he had hailed the dawn of Socialism and the machine age in his poems ***Motorni pesni*** (1940; "Motor Songs") and ***Izbrani stihotvoreniya*** (1946; "Selected Verses").

Pre-eminent as the prose of Elin Pelin and Yovkov was between the World Wars, the younger generation brought artistic refinement to realistic portrayal of Bulgarian life, and high literary standards were maintained in such authoritative reviews as the Symbolist

Hypcrion (1920–31) and *Zlatorog* (1920–44). The mystical-fantastic evocations of medieval Bulgaria by the art historian Nikolay Raynov represented Bulgarian Neo-romanticism at its best. A satisfying fusion of traditional and experimental poetry was to be found in the work of Elisaveta Bagryana.

The Communist regime set up in 1944 encouraged only writing of "Socialist Realism" as defined by Soviet "aesthetic" theory. The resulting uniformity of purpose made it difficult to evaluate the work of many writers, though the novels of D. Dimov and D. Talev received universal acclaim, especially Talev's work on 19th-century Macedonia. By the 1960s literary critics were still engaged in a Marxist re-evaluation of the past, but this, with the demise of the *kult* (Stalinist "personality cult"), seemed decreasingly mandatory amid a wealth of young talent. The originality of Blaga Dimitrova, Lyubomir Levchev, Asen Khristoforov, Nikolay Khaytov, and Yordan Radichkov augured well for the future.

Greek. The great social and economic changes that Greece underwent at the end of the 19th century soon found reflection in its literature with publication in 3838 of *To taxidi mou*, by Ioannis Psicharis, and development of the Demotic movement, through which modern Greek prose and poetry changed momentously. The outcome of a long linguistic and literary battle was victory for the vernacular.

Prose. Writers now turned to the life of the Greek village for inspiration; as in the 1880s, there were no large towns apart from Athens, so this new prose became predominantly pastoral—a tendency that continued till the turn of the century, when urban life developed. Although there was an early pastoral novel in *Thanos Vlekas* (1855), by Pavlos Kalligas, it was not until after the 1880s that Alexandros Papadiamadis and Andréas Karkavitsas wrote tales of villages and fisherfolk. Papadiamadis was the greatest modern Greek short-story writer, and his short novel I *Fonissa* ("The Murderess") was outstanding; in a slightly archaic idiom he examined the psychology of island people and moving incidents in their lives. The short stories of Karkavítsas were of an almost equal emotional power, but his greatest achievement was a realistic novel, I *zitiános* ("The Beggar"). Another important work at this time was an autobiographical novel, I *Zoï kai o thanatos tou Karabela*, by Konstantinos Theotokis, notable for its realism and insight.

The urban novel

The development of the urban novel was aided by translations of French novels, particularly those of Émile Zola, and was fostered by Psicharis and Gregorios Xenopoulos. Psicharis' novels (the most successful of which was *To Oneiro tou Yianniri* [1897]) had a great influence in spite of faults in construction and characterization. Xenopoulos serialized many works in Athenian newspapers and often had to compromise his art in order to earn a living. His best sellers were *Foteini Sandri* (*O kokkinos Vrakhos*) and *Stella Violanti*. There followed Konstantinos Christomanos, who wrote *Kerenia koukla*, and Konstantinos Chatzopoulos, who produced the first Greek Symbolist novel, *Fthinoporo* (1917; "Autumn").

After World War I, when vernacular prose was reaching maturity, Stratis Mirivilis took the literary scene by storm with the first of his "war trilogy" novels, I *zoï en tapho* ("Life in the Tomb"). The second was I *daskala me ta khrisa matia* ("The Schoolmistress with the Golden Eyes"), and finally came I *Panagia i Gorgona* (1955). He also wrote shorter stories of power and originality. His style was a lively demotic with dialectal and lyrical elements. Elias Venezis also had a striking first success, with *To Noumero* 31328, about life as a prisoner of war; his major writings include a long novel, *Aeolia*, full of childhood memories.

A most gifted author of the 1930s was Kosmas Politis (P. Taveloudis), who in his *Eroica* (1938), about a gang of children, *Lemonodassos*, and *Gyri*, proved himself a master of long narrative. Georgios Theotokas' writings covered many genres in a flowing and simple demotic, and included a long novel, *Argo* (1936).

After World War II the earlier generation still strongly influenced younger writers, of whom Nikos Kazantzakis was pre-eminent. He turned to the novel after a long career writing poetry, travel books, dramas, and essays and showed full mastery of the medium in *Zorba the Greek*, *Christ Recrucified*, and *Freedom and Death*. His autobiographical novel *Report to Greco* was published posthumously.

Real literary merit was often achieved by the *Chronografema*, a column in certain Athens newspapers treating some daily event in a humorous or lyrical manner. In the hands of such writers as P. Nirvanas (Petros Apostolides) or Spiros Melas, it transcended journalism.

In the 1960s some writers stood out for their use of prose and imaginative powers, among them Vasilis Vassilikos, Rodis Provellengios, Nikos Kazdaglis, and Kostas Takhtsis.

Poetry. Kostis Palamás was a central figure of the Demotic movement; his many important works portrayed modern Greek life, the continuity of Greek history, and the social and spiritual convulsions of the late 19th and early 20th centuries. The long philosophic poem *Dodecalógos tou Giftou* (1907; "Twelve Lays of the Gypsy") was perhaps his greatest achievement; a powerful lyric epic, *Í flógera tou Vasiliá* (1910; "The King's Flute"), and the collection of lyrics *Asalefte Zoé* (1904; *Life Immovable*, 1904) established his reputation throughout the Western world, and his influence on all subsequent Greek literature was profound. The poets of this school explored the expressive and metrical possibilities of the spoken idiom and introduced Symbolism and free verse.

After Palamás, a leading figure in modern Greek poetry was Angelos Sikelianós. His vigorous verse was rooted in the new school of Athens, but his thought followed a more obscure course. Greek nature and history were seen in the light of a Dionysian mysticism.

Modern tendencies reflected in Cavafy's verse

One great Greek poet who remained untouched by the influence of the new school of Athens was Constantine Cavafy (Konstantínos Kaváfis), who dealt with the tragic glory of Hellenistic Greece and its decadence. In his work, historical memories and personal experiences were inextricably blended. His tragic outlook, sensuality, and irony reflected modern tendencies in Western culture, so that his writings have been widely acknowledged.

The many poets who wrote in Greece after the end of World War I include Nikos Kazantzakis, better known as a novelist, whose philosophical epic poem *Odyssey* stretches to 33,333 lines; George Seferis, whose poems were awarded the Nobel Prize for Literature in 1963; and other contemporaries Odysseus Elytis and John Ritsos, who compose in Greek.

Romanian. Romanian literature of the 20th century was rooted in the traditions of the 19th. Important figures spanned both centuries and established genres, literary groups, and methods of criticism that continued into the 20th century. Thus Titu Maiorescu, founder of a literary circle Junimea in 1863, which reacted against interest in form at the expense of content, pointed toward a later reassessment of the uses of literature. Ion Luca Caragiale died in 1912 but was relevant to the 20th century as the creator of Romanian social comedy. Similarly Barbu Ştefănescu established the historical national drama and Moses Gaster was important as a pioneer of research into Romanian folklore.

Literary movements of eastern and western Europe at the beginning of the century were reflected in Romania. The periodical *Viaţa Românească* (1901), based on the Russian model of "populism," had a social and political ideology. A critic Constantin Dobrogeanu Gherea's theories followed Karl Marx, although western modernism also influenced Romanian writers. Ovid Denuşianu clearly followed Symbolism, as did the poets Ion Minulescu and Georghe Bacovia, while Impressionism was taken up by E. Lovinescu and Niculae Davidescu, whose epic *Cântecul omului* (1928–37; "The Song of Man") aimed at re-creating world history.

After World War I. In the period of national unity in Romania following World War I, the novel began to compete with lyric poetry. Writers took inspiration from society or recent events, principally the war. Liviu Rebreanu wrote of the peasants' need for land and independence and in *Răscoala* (1932; ***The Uprising,*** 1934) described the 1784 peasant uprising in Transylvania. His best work, inspired by Romanian participation in World War I, was the *Pădurea spînzuraţilov* (1922; ***The Forest of the Hanged,*** 1967).

Cezar Petrescu and the poet Minulescu also dealt with the war, while other writers examined different areas of society: Ionel Teodoreanu described the disappearance of patriarchal life, Victor Popa wrote about rural subjects, G.M. Zamfirescu depicted the Bucharest suburbs, and D.D. Pătrăşcanu wittily described political life. A leading realist writer early in the century was Mihail Sadoveanu, who together with I.A. Brătescu-Voineşti represented a link with the older generation and was extremely influential for the development of prose. He concentrated on the place of the peasant in society and in 1924 was awarded the Golden Peace Medal for a description of the peasants' part in the war in ***Mitren Cocor.***

Nonfiction writers of the period

Scholars, philosophers, critics, and translators also made contributions to literature of the period. An archaeologist, Vasile Pârvan, commemorated the sacrificed war generation in ***Parentalia;*** a historian, Nicolae Iorga, founded literary periodicals and wrote plays, poetry, and criticism; a geographer, S. Mehedinţi (Soveja), edited a periodical and wrote village stories; Lucian Blaga was a philosophic essayist and poet, while Gala Galaction translated the Bible and wrote mystical poems and novels on biblical subjects. Lyric poetry was the most cultivated genre in modern Romanian literature. The diversity of styles was illustrated by Nichifor Crainic's religious traditionalist tendency, the mathematical form of I. Barbu's poems, and the influence of French and German lyric in Ion Pillat's verse. Tudor Arghezi was noteworthy for the expression he instilled into lyric poetry. Both his prose essays of 1935–36 and his verse, ***Cuvinte potrivite*** (1927; "Suitable Words"), ***Flori de mucegai*** (1931; "Mold Flowers"), ***Versuri de seară*** (1935; "Evening Verses"), were landmarks in Romanian letters.

Developments after World War II. Several famous writers continued to write after World War II. Arghezi reached new lyrical heights in *1907* and in a hymn praising mankind's will to live and struggle for freedom. Geo Bogza joined the Social Realist movement. Mihail Beniuc became (as he said) "the drummer of the new age" and, in stirring lyrics, celebrated achievements of the postwar period. Demostene Botez, whose prewar poetry described the sadness of provincial life, later revealed a vigorous optimism, and a poet Eugen Jebeleanu protested on contemporary events and themes. Among those who came to the fore during and after World War II were the poets Maria Banuş, who expressed the struggle for peace, Miron Paraschivescu, a lyrical poet taking themes from folklore, and Marcel Breslaşu, a complex writer on a wide range of themes.

Dramatists included Aurel Baranga, who dealt with the problems of contemporary life; Horia Lovinescu, whose plays depicted changing intellectual attitudes; and M. Davidoglu, author of plays set in mines and factories.

The postwar novel also dealt with topical themes. Zaharia Stancu wrote novels evoking Romanian village life in a vanished age. Eusebiu Camilar, in his novel ***Mist,*** bitterly indicted Fascism.

Essays and criticism were written by Călinescu, by Mihai Ralea, who also published travel books and philosophical and psychological works, and by Tudor Vianu, who revealed a materialistic and methodological approach after first adhering to the aesthetic school. Among critics becoming known in the 1950s were Paul Georgescu, Ovid Crohmălniceanu, Silvian Iosifescu, author of a study of the Romanian novel, and Dumitru Micu, who wrote a book on the modern novel in Romania (1959). In England, Miron Grindea was editor of the international literary review ***Adam.***

Hungarian. The last third of the 19th century in Hungary was an era of literary decline in which writers based their work on social and political ideals which were becoming sterile. The great majority of Hungarian writers came from the nobility and were part of the middle class: only at the end of the century did lower middle class writers come to the fore. The periodical ***A Hkt*** ("The Week"), founded in 1890 by József Kiss, became the organ of a number of gifted writers, including Zoltán Ambrus, a disciple of Maupassant and a theatrical expert.

The influence of the periodical ***Nyugat***

The year 1906, when Endre Ady burst into Hungarian life "with the new songs of a new epoch," marked a turning point. Ady's revolutionary political ideas made it difficult for sections of society to accept that he was a poet of unusual genius. In form and content Ady was an original lyrical poet who rejuvenated Hungarian language and poetical thought. In 1908 the left-wing periodical ***Nyugat*** ("The West") began to appear, under the editorship of Hugo Ignotus and Ern6 Osvát. The influence of this was not to be overestimated: it brought together vigorous talents and lifted the level of Hungarian letters. Among writers associated with ***Nyugat*** was Mihály Babits, who became editor in 1929; others were Dezső Kosztolányi, foremost impressionist in Hungarian poetry and an accomplished short-story writer, and Árpád Tóth and Gyula Juhász, who voiced the distress of the solitary and oppressed in society. Zsigmond Móricz was a great novelist whose descriptions of provincial life were masterly portrayals of peasants and gentry. His powerful works present a troubled society full of human conflicts and dramatic passions. Margit Kaffka, a first major woman writer in Hungary, was another significant novelist. From 1908 three main streams were discernible in Hungarian literature: the ***Nyugat*** group already mentioned; an official literature written by conservative-nationalist writers; and a superficial "boulevard" literature to entertain. The principal writer of the second group was Ferenc Herczeg, author of novels and plays of theatrical skill. The third type included several playwrights: an impressionist, Dezso Szomory; Menyhért Lengyel, whose *Tájfun* (1907; "Typhoon") had worldwide success; and the exceptionally gifted Ferenc Molnár. The importance of the ***Nyugat*** diminished considerably after World War I, and leading writers and poets of the group gained official recognition, and the conflict that opposed them to the traditionalist men of letters became less violent. A solitary writer, Dezso Szabó, author of powerful and bewildering novels and stories, alienated sympathy with venomous, though often pertinent, attacks on almost everything. Lajos Kassák was the first notable working class writer whose novels and autobiography accurately depicted working class life. He was, at the same time, the father of Hungarian avant-garde poetry.

The period between World Wars I and II saw a flowering in Hungarian letters. In poetry the chief figure was that of Attila József, whose great intellectual poems voice the anguish of modern man in a technological era and his passionate, socialistic ideas. Lőrincz Szabó was a master of fine observation and a gifted translator of foreign poets. The poetry of Miklós Radnóti (died 1944) reached a tragic climax in splendid poems written in a German camp and during a death march in which he himself perished. Gyula Illyés, considered by many as the leading Hungarian poet of the mid-20th century, found inspiration in the life of the peasantry.

In Hungary, as elsewhere, the novel became the principal form of literary expression. Between World Wars I and II Lajos Zilahy, Ferenc Kormendi, and Sándor Marai vividly described the Hungarian bourgeoisie, and Áron Tamási wrote on Transylvanian life. The realistic novels of Pál Szabó, János Kodolányi, and József Darvas and firsthand accounts of peasant life by Péter Veres were probably among the better works laden with a social "message." Problems of Socialism influenced some writers even before World War II; later, social and political considerations became overwhelming, and they constituted the materials of literature for some years. Almost all major novelists and poets tried writing drama, but the most satisfying achievements in this field were the historical plays of Lászlo Németh.

During the 20th century, literary criticism and the history of literature kept pace with growing production and an increased interest in letters. The two most outstanding personalities were János Horváth, a dignified scholar who brought Hungarian literary research to a summit, and

Gyorgy Lukács, a great Marxist literary theorist whose critical and aesthetic works assure him an international reputation.

Finnish. Finnish writers at about the turn of the century included Teuvo Pakkala, whose stories of childhood became classics; and Johannes Linnankoski, who wrote the best seller *Laulu tulipunaisesta kukasta* (1905; *The Song of the Blood-Red Flower,* 1920), describing the amatory adventures of a Finnish Don Juan, and a well-knit novel of peasant life; Aino Kallas's works had an Estonian setting, and her best were prose ballads, written in an archaic style, about illicit love: *Barbara von Tisenhusen* (1923), *Reigin pappi* (1926; *Eros the Slayer,* 1927), and *Sudenmorsian* (1928; *The Wolf's Bride,* 1930).

Many writers continued the tradition of "folk portrayal" but in a more critical spirit; after the civil war of 1918 an attitude of self-criticism became general. A leading Finnish prose writer was Joel Lehtonen, whose *Putkinotko* (1919–20) was a colourful, humorous, bitterly critical study of the lives of rural poor. His last novel, *Henkien taistelu* (1933; "Struggle of Souls"), bitterly satirized contemporary conditions. Volter Kilpi, in an important novel, *Alastalon salissa* (1933; "In the Parlour at Alastalo"), used interior monologue, long "flashback" episodes, and exact detailed description, spreading events of six hours over more than 900 pages. Kilpi was an exponent of the experimental novel; his interest in problem of time and in re-creation of the past linked him with Marcel Proust and James Joyce. The stories of Heikki Toppila set people's lives against a background of superstition, and his writing was grimly effective. F.E. Sillanpaa viewed his characters from a biologist's standpoint, as an integral part of their surroundings; for example, in his most important novels, *Hurskas kurjuus* (1919; *Meek Heritage,* 1938) and *Nuorena nukkunut* (1931; *The Maid Silja,* 1933). He received the Nobel Prize in 1939. Notable poets of the period include Veikko Antero Koskenniemi, contemplative, pessimistic, and academic; and Otto Manninen, a master of laconic compression and a brilliant translator.

Tulenkantajat—the Torchbearers

In the mid-1920s a group of young writers emerged called Tulenkantajat (Torchbearers), who took as their slogan "Open the windows to Europe!" Through them, free verse, exotic themes, and a new urban romanticism became acclimatized. Their original ideals were realized in the early verse of Katri Vala; at first a prophetess of sensual joys, she later turned to social criticism and socialism. One of the Torchbearers' leaders was an essayist, Olavi Paavolainen, a brilliant travel writer and analyst of the times, who in books published in the 1930s criticized Hitler's Germany and whose last published work was a war diary, *Synkkä yksinpuhelu* (1946; "Sad Soliloquy"). Mika Waltari's achievements were short stories and a novel, *Sinuhe, egyptiläinen* (1945; *Sinhue, the Egyptian,* 1949), set in ancient Egypt but reflecting postwar disillusionment.

Among the chief poets of the years between World Wars I and II were Uuno Kailas and Kaarlo Sarkia, both of whom returned to classical ideals of poetry and traditional metres. The former wrote *Sleep and Death* and upheld a rigid moral code; the latter was a fastidious stylist and sensitive seeker after beauty. Aaro Hellaakoski and P. Mustapaa were recognized as major poets only after World War II; both broadened the traditional style, especially in rhythm.

Leading prose writers included Pentti Haanpaa and Toivo Pekkanen. In his short stories Haanpaa observed the life of the pool, revealing himself as a skillful stylist possessing an individual vein of irony. Pekkanen portrayed the industrial worker; many regarded his account of his own childhood in a working class family, *Lapsuuteni* (1953; "My Childhood"), as a masterpiece.

In the years immediately before World War II many literary trends were discernible: colourful romanticism, depth psychology, bitter social criticism. In 1936 a group of left-wing writers known as Kiila (The Wedge) was formed, most of their important work appearing after the war (*e.g.,* Elvi Sinervo's novel *Viljami Vaihdokas* [1946]). Left-wing ideas were also expressed in the work of Haanpaa and in that of the period's most notable dramatist, Hella Wuolijoki, who collaborated in 1940 and 1941 with Bertolt Brecht in writing a play, *Herr Puntila und sein Knecht Matti* (performed 1948).

World War II marked a period of transition. The generation that began writing before or during the war suffered a crisis survived by few, among them the poets Aaro Hellaakoski, P. Mustapaa (pseudonym of Martti Haavio), Aale Tynni, Viljo Kajava, and Arvo Turtiainen. A school of younger poets soon emerged whose work partook of the free rhythms, lack of rhyme, symbolic imagery, and unpoetical themes of modernism. Its leaders (who included Paavo Haavikko *[Selected Poems,* 1968], also a prose writer and author of experimental and eccentric plays) shared an avoidance of political or religious commitment, an often skeptical outlook, and an interest in problems of lyrical expression. In lyrical poetry the 1950s were a rich and creative period, thanks to such poets as Helvi Juvonen, Eeva-Liisa Manner, Tuomas Anhava *(In the Dark Move Slowly,* 1969), Pentti Holappa, and Lassi Nummi.

A similar development took place, more slowly, in prose. In fiction a restrained, objective style became customary; for example. that of Eila Pennanen and Eeva Joenpelto. Occasionally, as in Antti Hyry's *Kevatta ja syksyä* (1958; "Spring and Autumn") and *Alakoulu* (1965; "Primary School"), this technique resulted in effective prose. (Hyry's characters were depicted behavioristically.) Other writers explored new paths, notably Veijo Meri in his grotesque, Chaplinesque war novels, as *Manillakoysi* (1957; *Manila Rope,* 1967); and Marja-Liisa Vartio, who blended realism and fantasy. A more traditional narrative style was retained by Vaino Linna, author of a war novel, *Tuntematon sotilas* (1954; *The Unknown Soldier,* 1957), and of *Täällä Pohjantähden alla* (1959–62; "Here Beneath the Pole-star"), a long novel of social criticism.

Poets of the 1960s mainly adopted a frank, urbane, conversational style and took a firm stand on social and political questions. The most notable were Pentti Saarikoski and Matti Rossi. In the poems of Anselm Hollo and Vaino Kirstina, emphasis was on linguistic experiment. The most outstanding theatrical work of the 1960s was the *Lapualaisoopera* (1966; "Lapua Opera"), a political musical about the Finnish Fascist movement of the 1930s, by Arvo Salo. In prose, intellectual experiment, sexual romanticism, documentary fiction, traditional narrative styles, and naturalistic treatment of everyday life were obvious features. The most important new writers were Hannu Salama and Alpo Ruuth. (For Finnish literature in Swedish, see above *Scandinavian literature in the 20th century: Finnish literature in Swedish.)*

Modern literature in Hebrew. *Formative influences.* The first formative influences on 20th-century Hebrew literature belong to the late 19th century. The middle classes of eastern European Jewry that read Hebrew books turned to Jewish nationalisms and Zionist activity, coupled with the movement for speaking Hebrew, widened the circle of Hebrew readers. Hebrew daily papers began to appear in 1886. Writers borrowed extensively from medieval translators and European languages, and the Hebrew language assumed a new character. A key figure in the transition to modern writing was S.J. Abramovich, who wrote under the pseudonym of Mendele Mokher Sefarim; after his first novel he became convinced that biblical Hebrew was unsuitable for modern subjects and turned to Yiddish. From 1886 onward he turned first to Yiddish, then later returned to Hebrew and by using Hebrew and Aramaic phrases from the Talmud was able to capture the homeliness he prized in Yiddish. His stories depicted life as it really was, and his style and positive attitude to traditional values attracted a wide readership. The popularity he brought to stories of ghetto life ensured that they would remain the most read and written genre of Hebrew literature until the mid-20th century. A group of talented writers adopted "grandfather Mendele" as their model. One of these, Asher Ginsberg (Aḥad Haʿam), wrote, from 1889 onward, a series of articles evolving a philosophy of secular Jewish nationalism and postulating a "cultural centre" in Palestine. His periodical *ha-Shiloaḥ* attained editorial standards previously unknown in Hebrew. In Tel Aviv from 1921, he devoted his last years to the edition of his correspondence, a valuable documentary of a vital period.

The conflict between Judaism and the natural instincts of the Jews

H.N. Bialik, an important poet, essayist, editor, and anthologist of medieval literature, was, for a time, literary editor of *ha-Shiloaḥ* and was much influenced by Aḥad Ha'am. His poetry expressed the inner struggles of a generation concerned about its attitude to Jewish tradition. Saul Tchernichowsky, on the other hand, was untroubled by tradition, and his poetry dealt with love, beauty, and the three places where he had lived, the Crimea, Germany, and Palestine. I.L. Peretz, who wrote both in Hebrew and in Yiddish, introduced the Ḥasidic, or pietistic devotional, element into literature. The emotionalism and simple joy of life of that milieu thereafter strongly influenced writers, and the language absorbed many Ḥasidic terms. A literary historian, R. Brainin, discerned the presence of a "new trend" in literature and foresaw a concentration on human problems. Bialik had already pointed to a conflict between Judaism and the natural instincts of Jews. This psychological interest dominated the work of a group of short-story writers and, in particular, that of the writer and critic D. Frischmann, who, more than anyone else, imposed European standards on Hebrew literature. European literary tendencies thus became absorbed into Hebrew. Uprooted by the pogroms of 1881 and the two Russian revolutions of 1905 and 1917, Jews had emigrated to western Europe and America, and Hebrew literary activity in eastern Europe was disrupted. The Soviet Union eventually banned Hebrew culture, and it also decayed in other eastern European countries and in Germany as the position of Jews deteriorated.

Émigré and Palestinian literature. The writers of this generation were known as the émigré writers. Their work was pessimistic, as the rootlessness without hope of U.N. Gnessin and Y.Ḥ. Brenner exemplified. The majority of writers active in Palestine before 1939 were born in the Diaspora (Jewish communities outside Palestine) and were nostalgically concerned with the past. An exception was Y. Burla, an Oriental Jew who wrote about Oriental Jewry. The transition from ghetto to Palestine was achieved by only a few writers, among them A. Barash, who described the early struggles of Palestinian Jewry. S.J. Agnon, the outstanding prose writer of this generation (and later a joint winner of the 1966 Nobel Prize for Literature), developed an original narrative style that borrowed from the Midrash (homiletical commentaries on the Hebrew Scriptures), popular stories, and ethical writings of earlier centuries. Whereas his earlier stories were set in Galicia, he began in the 1940s to write about Palestine.

In contrast with prose, poetry immediately began to treat of Palestinian life. Among outstanding writers were Rachel (R. Blovstein), who wrote intensely personal poems, many of which have been set to music; U.Z. Greenberg, a political poet and exponent of free verse; and A. Shlonsky, who led the Symbolist school.

Israeli literature. World War II and the Arab-Israeli War of 1948–49 brought to the fore Palestinian-born writers who dealt with the problems of their generation in colloquially flavoured Hebrew. In the State of Israel literature developed on a large scale, mainly along contemporary western European and American lines. The extreme diversity in culture of parts of the population, and the problems of new immigrants, provided the main theme for fiction. Poetry flourished, but original drama was slow to develop. Greenberg's *Rehoboth HaNahar* (1951) traced the process by which the humiliation of the massacred is transmuted by the pride of martyrdom into the historical impulse of messianic redemption. In a long dramatic poem (*Between the Fire and Salvation*, 1957) Aaron Zeitlin envisioned the annihilation of European Jewry in mystical terms, examining the relationship of catastrophe and redemption.

Native Israeli prose writers wrote of their life in the kibbutz, the underground, and the war of 1948–49. S. Yizhar and Moshe Shamir emerged as the outstanding representatives of this generation, probing the sensibility of the individual in a group-oriented society. But the establishment of the State of Israel could not allay the anxieties of the individual. The dominant themes of writers who had no access to collective ideals were personal ones—frustration, confusion, and alienation. The later works of Yizhar and Shamir emphasize the dissolution of social coherence and portray people without a sense of historical mission. Aharon Meged's Surrealist novel *The Case of the Simpleton* (1960) traces a picaresque progress through a dehumanized society. In *Living on the Dead* (1965) a hero of the pioneer generation is cast in an ironic light.

Memories of the holocaust haunt the lyrical work of Aaron Applefeld. Flight and hiding are the characteristic situations of his stories. His novel *The Skin and the Gown* (1971) portrays survivors of European prison camps who are unable to exorcise the past. In the stark stories of Abraham B. Yehoshua the tone of the narrator is remote, the people are isolated and drained of emotion. Only occasionally in a solitary forest, desert, or village does an act of feeling or meaning break the mood of boredom and light up the humanity of a character. Personal frustration and religious vision are the subjects of Pinḥas Sadeh's work. In his novel *Notes on the Conditions of Man* (1967) the misery of social failure and spiritual beauty alternate. *My Michael* (1968) by Amos Oz is a study of a young housewife who narrates her own story of psychological disintegration. Amalia Kahane-Carmon explored the subjective impressions of experience and the complexities of time and memory. She used stream of consciousness techniques to reveal the intricate inner life of quite ordinary people.

BIBLIOGRAPHY

General introductory works: FERNAND BALDENSPERGER and WERNER P. FRIEDERICH, *Bibliography of Comparative Literature* (1950, reprinted 1960), comprehensive coverage of literatures, classified by author, country, and according to genre, theme, etc.; ANTONY BRETT-JAMES, *The Triple Stream: Four Centuries of English, French, and German Literature, 1531–1930* (1953), contains useful comparative tables arranged chronologically; JOHN M. COHEN, *A History of Western Literature*, rev. ed. (1963), a useful factual and critical account; HORATIO SMITH (gen. ed.), *Columbia Dictionary of Modern European Literature* (1947), contains over 1,000 articles, including surveys, critical essays, and biographies, with bibliographies; WILLIAM F. THRALL and ADDISON HIBBARD, *A Handbook to Literature*, rev. by C. HUGH HOLMAN (1960), good coverage of literary terms and movements; RENE WELLEK, *A History of Modern Criticism: 1750–1950*, 4 vol. (1955–), surveys theory in the major European nations since the Renaissance.

English and Anglo-Irish literature: F.W. BATESON (ed.), *The Cambridge Bibliography of English Literature*, 4 vol. (1941), *Supplement*, ed. by GEORGE WATSON (1957); *New Cambridge Bibliography of English Literature*, vol. 3 (1969) and vol. 2 (1971) ed. by GEORGE WATSON, vol. 4 (1972) ed. by I.R. WILLISON; ALBERT C. BAUGH (ed.), *A Literary History of England*, 2nd rev. ed. (1967; paperback 4-vol. ed., 1967), a standard work; DAVID DAICHES, *A Critical History of English Literature*, 2 vol. (1960; paperback 4-vol. ed., 1968); BORIS FORD (ed.), *The Pelican Guide to English Literature*, rev. ed., 7 vol. (1961–64), stimulating, with a critical rather than historical emphasis, containing helpful bibliographies; SIR PAUL

HARVEY (ed.), *The Oxford Companion to English Literature,* 4th rev. ed. (1967), a basic reference work; GEORGE SAMPSON (ed.), *The Concise Cambridge History of English Literature,* 3rd rev. ed. (1970), to some extent correcting and supplementing *The Cambridge History of English Literature,* 15 vol. (1907–16, 1932), the most important general history of the literature, largely superseded but still useful for some periods; F.P. WILSON and BONAMY DOBREE (eds.), *The Oxford History of English Literature,* projected 15 vol. (1947–); STEPHEN L. GWYNN, *Irish Literature and Drama in the English Language* (1936).

Celtic literatures: DOUGLAS HYDE, *A Literary History of Ireland from Earliest Times to the Present Day,* new ed., introd. by BRIAN O. CUIV (1967), a pioneer work; KURT WITTIG, *The Scottish Tradition in Literature* (1958), perhaps the best general guide; THOMAS PARRY, *Hanes Llenyddiaeth Gymraeg hyd 1900,* 3rd ed. (1953; Eng. trans., *A History of Welsh Literature,* 1955), the only modern and authoritative history; H.M. and N.K. CHADWICK, *The Ancient Literatures of Europe,* vol. 1 (1932), includes a comprehensive treatment of Celtic literature.

English literature in the United States, Canada, Australia, and New Zealand: ROBERT E. SPILLER *et al.* (eds.), *Literary History of the United States,* 3rd ed., 2 vol. (1963), a standard general work; MARCUS CUNLIFFE, *The Literature of the United States,* 3rd ed. (1967); VERNON L. PARRINGTON, *Main Currents in American Thought,* 3 vol. (1927–30; reprinted in 1 vol., 1958), essential background reading; ARTHUR H. QUINN (ed.), *The Literature of the American People* (1951); WALTER BLAIR, THEODORE HORNBERGER, and RANDALL STEWART (eds.), *The Literature of the United States,* 3rd ed., 2 vol. (1966); CARL F. KLINCK (ed.), *Literary History of Canada: Canadian Literature in English* (1965); HENRY M. GREEN, *A History of Australian Literature, Pure and Applied, 2* vol. (1961); ERIC H. MCCORMICK, *New Zealand Literature* (1959).

French and Provencal literature: GEOFFREY BRERETON, *A Short History of French Literature* (1954), a good brief survey with basic bibliography; LOUIS F. CAZAMIAN, *A History of French Literature* (1955), a well-written history containing independent and discriminating evaluations and short biographies; PATRICK E. CHARVET (gen. ed.), *A Literary History of France, 6* vol. (1967–70); and JOHN CRUIKSHANK (ed.), *French Literature and Its Background,* 6 vol. (1968–70), two thorough historical works; W.G. MOORE, *The French Achievement in Literature* (1969); DANIEL C. HASKELL, *Provencal Literature and Language, Including the Local History of Southern France* (1925), with bibliographies.

Italian literature: JOHN H. WHITFIELD, *A Short Hzstory of Italian Literature* (1960), useful, reliable, and readable; FRANCESCO DE SANCTIS, *Storia della letteratura italiana a cura di Benedetto Croce,* 4th ed., 2 vol. (1959; Eng. trans., *History of Italian Literature,* 2 vol., 1960); ROBERT ANDERSON HALL, *A Short History of Italian Literature* (1951); ERNEST HATCH WILKINS, *A History of Italian Literature* (1954).

Spanish, Portuguese, and Ibero-American literature: RICHARD E. CHANDLER and KESSEL SCHWARTZ, *A New History of Spanish Literature* (1961); R.O. JONES (gen. ed.), *A Literary History of Spain,* 8 vol. (1971–72), rapidly becoming a standard work—very readable; GEORGE T. NORTHUP, *An Introduction to Spanish Literature,* 3rd ed. rev. by NICHOLSON B. ADAMS (1960), a good readable history; AUBREY F. BELL, *Portuguese Literature* (1922, reprinted 1970), a standard work, with extensive bibliography; ARTHUR TERRY, *Catalan Literature* (1972); H.V. LIVERMORE and W.J. ENTWISTLE (eds.), *Portugal and Brazil: An Introduction* (1953), contains a literary bibliography of studies and of translations from Portuguese to English; ALFRED COESTER, *The Literary History of Spanish America,* 2nd ed. (1928, reprinted 1971); JEAN FRANCO, *An Introduction to Spanish-American Literature* (1969), a substantial guide to writings, from colonial times to the present.

German, Swiss, Dutch, and Afrikaans literature: JETHRO BITHELL, *Germany: A Companion to German Studies,* rev. 5th ed. (1955), a collection of articles by various authors—good background reading; JOHN G. ROBERTSON, *A History of German Lzterature,* 6th ed. (1970), an essential reference work providing easy access to dates and facts; GILBERT WATERHOUSE, continued by H.M. WAIDSON, *A Short Hrstory of German Literature,* 3rd ed. rev. (1959), the best brief outline; ALEX NATAN (ed.), *Swiss Men of Letters* (1970), 12 essays covering all facets of the literary scene; THEODOOR WEEVERS, *Poetry of the Netherlands in Its European Context, 1170–1930* (1960); C.M. VAN DEN HEEVER and THEODORE J. HAARHOFF, *The Achievement of Afrikaans* (1934); THEODORE J. HAARHOFF, *Afrikaans: Its Origin and Development* (1936).

Scandinavian literature: ELIAS L. BREDSDORFF, BRITA MORTENSEN, and RONALD POPPERWELL, *An Introduction to Scandinavian Literature, from the Earliest Times to Our Day* (1951), a useful short survey; HARALD BEYER, *Norsk litteratur historie* (1952; Eng. trans., *A History of Norwegian Literature,* 1956), probably the best survey in English; ALRIK GUSTAFSON, *A History of Swedish Literature* (1961), the best critical history in English, with bibliographical appendix; PHILLIP M. MITCHELL, A *History of Danish Literature* (1957); STEFAN EINARSSON, *A History of Islandic Literature* (1957).

Slavic and Eastern European literatures: MAURICE B. LINE, *A Bibliography of Russian Literature in English Translation to 1900 (Excluding Periodicals)* (1963); WILLIAM EDWARD HARKINS, *Dictionary of Russian Literature* (1956, reprinted 1971); HELEN MUCHNIC, *An Irztroduction to Russian Literature,* rev. ed. (1964); D.P. MIRSKY, *A History of Russian Literature, Comprising a History of Russian Literature and Contemporary Russian Literature,* ed. by FRANCIS J. WHITFIELD (1949), annotated and updated—thorough and readable, but the author's critical judgments are often highly personal; MARK L. SLONIM, *An Outline of Russian Literature* (1958), a good introduction, with bibliographical notes; JANIS ANDRUPS and VITAUTS KALVE, *Latvian Literature* (1954); ANTANAS VAICIULAITIS, *Outline History of Lithuanian Literature* (1942); GREGORY LUZNYCKY, *Ukrainian Literature Within the Framework of World Literature: A Short Outline of Ukrainian Literature from Renaissance to Romanticism* (1961); ARVO MAGI, *Estonian Literature* (1968); CZESLAW MILOSZ, *The History of Polish Literature* (1969), an excellent work by an outstanding Polish poet and literary historian; ELEANOR EDWARDS LEDBETTER, *Polish Literature in English Translation* (1932); MANFRED KRIDL, *A Survey of Polish Literature and Culture* (1956); FRANTISEK CHUDOBA, *A Short Survey of Czech Literature* (1924, reprinted 1969); PAUL SELVER (ed.), *An Anthology of Czechoslovak Literature* (1929, reprinted 1969); D. SHISHMANOV, *A Survey of Bulgarian Literature* (1932); ANTUN BARAC, *Jugoslavenska književnost* (1954; Eng. trans., A *History of Yugoslav Literature,* 1955); HORACE G. LUNT, *A Survey of Macedonian Literature* (1953); PAVLE POPOVIC, *The Literature of the Southern Slavs* (1917); JANKO LAVRIN and ANTON SLODNJAK, *The Parnassus of a Small Nation: An Anthology of Slovene Lyrics,* 2nd ed. (1965), English translations, with introduction; JACOB STEINBERG (ed.), *Introduction to Rumanian Literature* (1966), selections from representative prose writings by 24 authors; TIBOR KLANICZAY, JOSEPH SZAUDER, and MIKLOS SZABOLCSI, *History of Hungarian Literature* (1964); ILMARI HAVU (ed.), *An Introduction to Finnish Literature: A Book of Readings* (1952), translations, with introduction and notes.

Armenian, Syriac, and Hebrew literature: E. ARCH. DOURIAN, *The History of Armenian Literature* (1933); WILLIAM WRIGHT, *A Short History of Syriac Literature* (1894); MEYER WAXMAN, *A History of Jewish Literature,* 2nd ed., 5 vol. (1960), excellent coverage of Yiddish writing as well as Hebrew.

Ancient Hebrew, Greek, and Latin literature: JULIUS A. BEWER, *The Literature of the Old Testament in Its Historical Development,* 3rd ed. (1962); SANFORD C. YODER, *Poetry of the Old Testament* (1948), a useful introduction and representative collection of biblical poetry; M.J. ANDERSON (ed.), *Classical Drama and Its Influence* (1965), a collection of essays by leading scholars, covering aspects of classical drama and European theatre; J.W.H. ATKINS, *Literary Criticism* in *Antiquity,* vol. 2, *Graeco-Roman* (1934, reprinted 1961), perhaps somewhat out of date, but a worthwhile comprehensive study; MARGARETE BIEBER, *The History of the Greek and Romatt Theatre,* 2nd rev. ed. (1961); GILBERT HIGHET, *The Classical Tradition* (1949); and R.R. BOLGAR, *The Classical Heritage and Its Beneficiaries* (1954), two standard works that trace the posthumous influence of classical authors; SIR PAUL HARVEY (ed.), *The Oxford Companion to Classical Literature* (1937), a basic reference work; MAURICE PLATNAUER (ed.), *Fifty Years of Classical Scholarship* (1954), contains valuable bibliographies; C.M. BOWRA, *Greek Lyric Poetry from Alcman to Simonides,* 2nd ed. (1961), controversial but perceptive; see also his *Landmarks in Greek Literature* (1966); ROBERT FLACELIERE, *Histoire littéraire de la Grèce* (1962; Eng. trans., *A Literary History of Greece,* 1964), a systematic, readable survey of ancient literature; ROBERT GRAVES, *The Greek Myths,* 2 vol. (1957), a learned work, notable for the author's speculative theories; MOSES HADAS, *A History of Greek Literature* (1950), a useful account; GILBERT MURRAY, A *History of Ancient Greek Literature* (1897, reprinted 1966), a valuable general guide in spite of its date; HERBERT J. ROSE, *A Handbook of Greek Literature from Homer to the Age of Lucian,* 4th ed. (1950); and A *Handbook of Latin Literature from the Earliest Times to the Death of St. Augustine,* 3rd ed. (1954), two standard works; WILLIAM BEARE, *The Roman Stage,* 3rd rev. ed. (1964), an authoritative work on drama during the Republic; MICHAEL GRANT, *Roman Literature*

(1954), a good short account; William A Laidlaw, *Latin Literature* (1951), a useful introduction; John Wight Duff, *A Literary History of Rome,* 2nd–3rd ed., 2 vol., ed. by A.M. Duff (1960–64), standard introduction containing comprehensive and scholarly surveys, with supplementary bibliographies.

The Middle Ages: H.M. Chadwick, *The Heroic Age* (1912, reprinted 1967), a comparative study covering Greek, Teutonic, Slavonic, and Celtic literatures and cultures; E.K. Chambers, *The Mediaeval Stage,* 2 vol. (1903), a standard reference work; W.T.H. Jackson, *The Literature of the Middle Ages* (1960), includes a useful bibliography; Charles W. Jones (ed.), *Medieval Literature in Translation* (1950), a good, readable anthology; C.S. Lewis, *The Allegory of Love* (1936, reprinted 1958), a critical study of courtly love in medieval literature; Roger S. Loomis (ed.), *Arthurian Literature in the Middle Ages* (1959), an excellent survey.

Medieval Latin literature: Ernst R. Curtius, *Europäische Literatur und lateinisches Mittelalter* (1948; Eng. trans., *European Literature and the Latin Middle Ages,* 1953), an important study; Charles H. Haskins, *The Renaissance of the Twelfth Century* (1957), a standard work; Maurice Helin, *Littérature d'Occident: histoire des lettres latines du moyen âge* (1943; Eng. trans., *A History of Medieval Latin Literature,* rev. ed., 1949); M.L.W. Laistner, *Thought and Letters in Western Europe, A.D. 500 to 900,* new ed. (1957); Frederick A. Wright and T.A. Sinclair, *A History of Later Latin Literature from the Middle of the Fourth to the End of the Seventeenth Century* (1931), a very useful survey.

French literature: Jessie Crosland, *Medieval French Literature* (1956); Mary D. Legge, *Anglo-Norman Literature and Its Background* (1963).

English literature: Stanley B. Greenfield, *A Critical History of Old English Literature* (1965); William P. Ker, *Medieval English Literature* (1912, reprinted 1962), an established useful introduction; William L. Renwick and H. Orton, *Introductions to English Literature,* vol. 1, *The Beginnings of English Literature to Skelton, 1509,* 2nd rev. ed. (1952), a standard work; Margaret Schlauch, *English Medieval Literature and Its Social Foundations* (1956, reprinted 1971), an excellent critical introduction; Kenneth Sisam, *Studies in the History of Old English Literature* (1953), a good basic critical work; John E. Wells, *A Manual of the Writings in Middle English, 1050–1400* (1916; nine suppl., 1919–52), a basic work of reference, with comprehensive lists, summaries, and descriptions; Dorothy Whitelock, *The Beginnings of English Society,* ch. 9–10 (1952), very useful background reading; Richard M. Wilson, *Early Middle English Literature,* 3rd ed. (1968), a thorough work, and *Lost Literature of Medieval England,* 2nd ed. (1970), a classic in its field; Charles L. Wrenn, *A Study of Old English Literature* (1967), an excellent survey; David M. Zesmer, *Guide to English Literature from Beowulf Through Chaucer and Medieval Drama* (1961); St. John D. Seymour, *Anglo-Irish Literature, 1200–1582* (1929).

Celtic literature: Eleanor Knott and Gerard Murphy, *Early Irish Literature* (1966).

German literature: John Knight Bostock, *A Handbook on Old High German Literature* (1955), an essential reference work; Maurice O'Connell Walshe, *Medieval German Literature* (1962), a very useful reference work; Paul Salmon, *Literature in Medieval Germany* (1967), the best English introduction to the subject.

Scandinavian literature: Gabriel Turville-Petre, *The Heroic Age of Scandinavia* (1951) and *Origins of Icelandic Literature* (1953).

Italian literature: Adolf R. Gaspary, *Geschichte der italienischen Literatur* (1885; Eng. trans. of part of vol. 1, *The History of Early Italian Literature to the Death of Dante,* 1901).

Spanish literature: Otis H. Green, *The Literary Mind of Medieval and Renaissance Spain* (1970), 12 essays by an eminent scholar; A.D. Deyermond, *A Literary History of Spain,* vol. 1, *The Middle Ages* (1971), a very good introduction, with bibliography.

Greek literature: F.H. Marshall and John Mavrogordatol, "Byzantine Literature," in N.H. Baynes and H. St. L.B. Moss, *Byzantium* (1948).

Hebrew literature: Abraham E. Millgram (ed.), *An Anthology of Medieval Hebrew Literature* (1961).

Russian literature: Dmitri Chizhevsky, *History of Russian Literature, from the Eleventh Century to the End of the Baroque* (1960); N.K. Gudzii, *History of Early Russian Literature* (Eng. trans. of 2nd Russian ed., 1949, reprinted 1970).

The Renaissance: Ernst Cassirer, Paul O. Kristeller, and John H. Randall (eds.), *The Renaissance Philosophy of Man* (1948), a collection of excerpts from the writings of Renaissance philosophers; Joseph A. Mazzeo, *Renaissance and Revolution: The Remaking of European Thought* (1966), useful background reading; Henry O. Taylor, *Thought and Expression in the Sixteenth Century, 2* vol. (1920, reprinted 1959), a good standard work.

Latin literature: Roberto Weiss, *The Dawn of Humanism in Italy* (1947) and *Humanism in England During the Fifteenth Century* (1941), among the best scholarly works on the subject.

Italian literature: Bernard Weinberg, *A History of Literary Criticism in the Italian Renaissance,* 2 vol. (1961), an indispensable work; Jefferson B. Fletcher, *Literature of the Italian Renaissance* (1934); John A. Symonds, *Renaissance in Italy,* 7 vol. (1875–86), later reprints worthwhile and interesting, but should be supplemented by more recent historical works.

French literature: Kathleen Butler, *A History of French Literature,* 2 vol. (1923, reprinted 1966); Arthur A. Tilley, *The Literature of the French Renaissance,* 2 vol. (1904) and *Studies in the French Renaissance* (1922); Bernard Weinberg (ed.), *French Poetry of the Renaissance* (1954), good background reading.

Spanish literature: Otis H. Green, *Spain and the Western Tradition: The Castilian Mind in Literature from El Cid to Calderon,* 4 vol. (1963–66), readable and authoritative; R.O. Jones, *A Literary History of Spain,* vol. 3, *The Golden Age: Prose and Poetry* (1971), an excellent introduction; Edward M. Wilson and Duncan Moir, *The Golden Age: Drama* (1971), essential reading.

English and Anglo-Irish literature: Muriel C. Bradbrook, *The Growth and Structure of Elizabethan Comedy* (1955) and *Themes and Conventions of Elizabethan Tragedy* (1935, reprinted 1957), two of the best critical works on the drama of the period; Douglas Bush, *Mythology and the Renaissance Tradition in English Poetry,* 2nd ed. (1963), an important study; Patrick Cruttwell, *The Shakespearian Moment and Its Place in the Poetry of the 17th Century* (1954), a study of thought and expression at the turn of the 16th century—not limited to Shakespeare; Madeleine Doran, *Endeavours of Art: A Study of Form in Elizabethan Drama* (1954), a major critical work on the drama; Una M. Ellis-Fermor, *The Jacobean Drama,* 4th ed. (1961), an excellent critical work; C.S. Lewis, *English Literature in the Sixteenth Century, Excluding Drama* (1954), probably the best volume in the "Oxford History of English Literature" series and an excellent survey; Frank P. Wilson, *Elizabethan and Jacobean* (1946), treats various literary topics; St. John D. Seymour, *Anglo-Irish Literature, 1200–1582* (1929).

German literature: Archer Taylor, *Problems in German Literary History of the Fifteenth and Sixteenth Centuries* (1939).

The seventeenth century: Mario Praz, *Studi sul concettismo,* 2 vol. (1934–46; Eng. trans., *Studies in Seventeenth Century Imagery,* 2 vol., 1939–48), a standard and readable work; Joel E. Spingarn (ed.), *Critical Essays of the Seventeenth Century,* 3 vol. (1909, reprinted 1957), a valuable collection with a long critical introduction.

English and American literature: Cleanth Brooks, *The Well-Wrought Urn* (1947, reprinted 1963), close studies of works by several writers by a leading critic; Douglas Bush, *English Literature in the Earlier Seventeenth Century, 1600–1660,* 2nd rev. ed. (1962), a standard work with an excellent bibliography; H.V.D. Dyson and J.E. Butt, *Augustans and Romantics, 1689–1830,* 3rd rev. ed. (1961), a standard work with introductions with annotated bibliography; T.S. Eliot, *Selected Essays,* 3rd ed. (1951), essential for Renaissance and 17th-century studies; H.J.C. Grierson, *Cross Currents in English Literature of the XVIIth Century* (1929; reprinted as *Cross-currents in 17th Century English Literature,* 1958), essential reading; Victor I. Harris, *All Coherence Gone* (1949, reprinted 1966), on the philosophical background; Richard P. Jones *et al., The Seventeenth Century: Studies in the History of English Thought and Literature from Bacon to Pope* (1965), a good study of the philosophical background and of attitudes to style; Louis L. Martz, *The Poetry of Meditation* (1954), an interesting critical work on metaphysical and Baroque poetry; Marjorie H. Nicolson, *Science and Imagination* (1956); James R. Sutherland, *English Literature of the Late Seventeenth Century* (1969), contains a good bibliography; E.M.W. Tillyard, *The Elizabethan World Picture* (1943, reprinted 1966), somewhat old-fashioned in approach, but good background reading; Rosemond Tuve, *Elizabethan and Metaphysi-*

cal Imagery (1947), the best work on the subject; CICELY V. WEDGWOOD, *Seventeenth-Century English Literature,* rev. ed. (1970), a short survey; BASIL WILLEY, *The Seventeenth Century Background* (1934), an excellent study of the philosophical background; PERRY G. MILLER, *The New England Mind: From Colony to Province* (1953) and *The New England Mind: The Seventeenth Century* (1939, reprinted 1961), authoritative.

French literature: ANTOINE ADAM, *Grandeur and Illusion: French Literature and Society, 1600–1715* (Eng. trans. 1972), a comprehensive and penetrating history of the literature of the period; NATHAN EDELMAN (ed.), *A Critical Bibliography of French Literature,* vol. 3, *The Seventeenth Century* (1961); JEAN JACQUES DEMOREST (ed.), *Studies in Seventeenth-Century French Literature* (1962); WILLIAM D. HOWARTH, *Life and Letters in France,* vol. 1, *The Seventeenth Century* (1965); HENRY C. LANCASTER, *A History of French Dramatic Literature in the Seventeenth Century,* 9 vol. (1929–42, reprinted 1966); PHILIP J. YARROW, *A Literary History of France,* vol. 2, *The Seventeenth Century, 1600–1715* (1967), very good background reading.

German literature: ROY PASCAL, *German Literature in the Sixteenth and Seventeenth Centuries* (1968), the best English introduction to this period.

The eighteenth century: LILIAN R. FURST, *Romanticism in Perspective* (1969), on the Romantic movement in France, England, and Germany; JOHN B. HALSTED (ed.), *Romanticism* (1969), a collection of extracts and key essays by the leading figures of Western European Romanticism, with a long introduction and chronological table; PAUL HAZARD, *La Pensée européenne au XVIIIème siècle* (1963; Eng. trans., *European Thought in the Eighteenth Century,* 1963); DANIEL MORNET, *The Development of Literature and Culture in the XVIIIth Century* (1954), an extensive survey; MARIO PRAZ, *La carne, la morte e il diavolo nella letteratura romantica* (1930; Eng. trans., *The Romantic Agony,* 2nd ed., 1970), a remarkable work, now a classic in this field; JOHN G. ROBERTSON,, *Studies in the Genesis of Romantic Theory in the Eighteenth Century* (1923, reprinted 1962).

English, Scottish, and American literature: JAMES L. CLIFFORD (ed.), *Eighteenth-Century English Literature: Modern Essays in Criticism* (1959), 21 recent articles; H.V. DYSON and J.E. BUTT, *Augustans and Romantics, 1689–1830,* 3rd rev. ed. (1961), introductions with annotated bibliographies; ARTHUR R. HUMPHREYS, *The Augustan World: Life and Letters in Eighteenth-Century England* (1954); SAMUEL JOHNSON, *Lives of the English Poets,* 4 vol. (1781; standard ed. by GEORGE BIRKBECK HILL, 3 vol., 1905, reprinted 1968), still one of the best critical works on the period; MARJORIE H. NICOLSON, *Newton Demands the Muse* (1946), on the effects of science on literature; BONAMY DOBREE, *English Literature in the Early Eighteenth Century, 1700–1740* (1959), contains full bibliography; GEORGE SHERBURN and D.F. BOND, *The Restoration and Eighteenth Century, 1660–1789,* rev. ed. (1967), a very good handbook; IAN P. WATT, *The Rise of the Novel* (1957), a good introduction, mainly on Defoe, Richardson, and Fielding; BASIL WILLEY, *The Eighteenth-Century Background* (1941), an essential background work; DAVID CRAIG, *Scottish Literature and the Scottish People, 1680–1830* (1961), a good, useful survey; MOSES C. TYLER, *A History of American Literature, 1607–1765,* 2 vol. (1879), and *The Literary History of the American Revolution, 1763–1783,* 2 vol. (1897, both reprinted 1966), useful histories of the Colonial Period and early Republic.

French literature: ERNST CASSIRER, *Die Philosophie der Aufklärung* (1932; Eng. trans., *The Philosophy of the Enlightenment,* 1951); LESTER G. CROCKER, *An Age of Crisis* (1959); GEORGE R. HAVENS, *The Age of Ideas* (1955), an interesting account of the period, studied through biography; ROBERT NIKLAUS, *A Literary History of France,* vol. 3, *The Eighteenth Century, 1715–1789* (1970), a good general work.

German literature: WALTER H. BRUFORD, *Germany in the Eighteenth Century: The Social Background of the Literary Revival* (1935, reprinted 1959), a thorough, commendable work; HENRY B. GARLAND, *Storm and Stress* (1952), an adequate introduction; WILLIAM D. ROBSON-SCOTT, *The Literary Background of the Gothic Revival in Germany: A Chapter in the History of Taste* (1965), on the history of art as well as of literature; ERNST L. STAHL and W.E. YUILL, *German Literature of the Eighteenth and Nineteenth Centuries* (1970), the best introduction in English.

Italian literature: VIOLET PAGET, *Studies of the Eighteenth Century in Italy,* 2nd ed. (1907).

Spanish Literature: ROBERT E. PELLISSIER, *The Neo-Classic Movement in Spain During the XVIIIth Century* (1918); NIGEL GLENDINNING, *A Literary History of Spain,* vol. 4, *The Eighteenth Century* (1972), a very good survey.

The nineteenth century: GEORG BRANDES, *Creative Spirits of the Nineteenth Century* (1923, reprinted 1967); BENEDETTO CROCE, *Poesia e non poesia,* 7th ed. (1964; Eng. trans., *European Literature in the Nineteenth Century,* 1924, reprinted 1967); JANKO LAVRIN, *Aspects of Modernism: From Wilde to Pirandello* (1935, reprinted 1968); JOHN LUCAS (ed.), *Literature and Politics in the Nineteenth Century* (1971).

English and American literature: MEYER H. ABRAMS, *The Mirror and the Lamp: Romantic Theory and the Critical Tradition* (1953), a study of English Romantic critical theory with attention to its Germanic roots; RICHARD D. ALTICK, *Victorian People and Ideas* (1972); O. ELTON, *A Survey of English Literature 1780–1830,* 2 vol. (1912), and *. . . 1830–1880,* 2 vol. (1920), deals with writers separately, rather than in a general survey; WALTER E. HOUGHTON, *The Victorian Frame of Mind, 1830–1870* (1957), a useful survey; FRANK R LEAVIS, *Revaluation: Tradition and Development in English Poetry* (1936, reprinted 1963), a major work of criticism; *The Oxford History of English Literature* devotes three volumes to the period: vol. 9, *1789–1815* (1963); vol. 10, *1815–1832* (1964); vol. 11, on the Victorians (in press), helpful as surveys but of little critical interest; G. WILSON KNIGHT, *The Starlit Dome* (1941), an excellent critical work on the Romantics; GEORGE M. YOUNG, *Victorian England: Portrait of an Age,* 2nd ed. (1960), a standard work; FRANCIS O. MATTHIESSEN, *American Renaissance* (1941, reprinted 1968), an essential work on the major writers of the period; JAY MARTIN, *Harvests of Change: American Literature, 1865–1914* (1967), a useful study; ARTHUR H. QUINN, *A History of the American Drama from the Beginning to the Civil War* (1923) and *. . . From the Civil War to the Present Day,* rev. ed. (1936, reprinted 1964), the most thorough treatment; MARIO PRAZ, *La crisi dell'eroe nel romanzo vittoriano* (1952; Eng. trans., *The Hero in Eclipse in Victorian Fiction,* 1956).

French literature: PATRICK E. CHARVET, *A Literary History of France,* vol. 4, *The Nineteenth Century, 1789–1870* (1967), a good and readable introduction; MARCEL RAYMOND, *De Baudelaire au Surréalisme,* rev. ed. (1947; Eng. trans., *From Baudelaire to Surrealism,* rev. ed., 1957), the best critical treatment of this period available in English; ALBERT THIBAUDET, *Histoire de la littérature française de 1789 à nos jours* (1938), the best critical history.

German literature: GEORG BRANDES, *Hovedstrømninger i det 19de aarhundredes Litteratur,* vol. 6, *Det unge Tyskland* (1872–90; Eng. trans., *Main Currents in 19th-Century Literature,* vol. 6, *The Young Germany,* 1901–05), a thorough and basic work on European comparative literature; RONALD D. GRAY, *The German Tradition in Literature, 1871–1945* (1965), an interesting study with particular reference to the more recent authors, Thomas Mann and Rainer Maria Rilke.

Italian literature: ANTONIO CIPPICO, *The Romantic Age in Italian Literature* (1918).

Spanish literature: DONALD L. SHAW, *A Literary History of Spain,* vol. 5, *The Nineteenth Century* (1972), a very good survey; EDGAR A. PEERS, *A History of the Romantic Movement in Spain,* 2 vol. (1940; abridged ed., 1950), a comprehensive account.

Scandinavian literature: BRIAN W. DOWNS, *Modern Norwegian Literature, 1860–1918* (1966), the first book in English about the "classic" period—an excellent survey, with bibliography; RICHARD BECK. *History of Icelandic Poets, 1800–1940* (1950); STEFAN EINARSSON, *History of Icelandic Prose Writers, 1800–1940* (1948).

Russian and Polish literature: M.I. OLGIN, *A Guide to Russian Literature, 1820–1917* (1920, reprinted 1971); JULIAN KRZYZANOWSKI, *Polish Romantic Literature* (1930).

Hebrew literature: JOSEPH KLAUSNER, *A History of Modern Hebrew Literature, 1788–1930* (1932; orig. pub. in Hebrew, 1920); JACOB S. RAISIN, *The Haskalah Movement in Russia* (1913).

The twentieth century: ERICH AUERBACH, *Mimesis* (1946; Eng. trans., 1953), traces the development of Realism from ancient to modern times; CLEANTH BROOKS and ROBERT PENN WARREN (eds.), *Understanding Poetry.* 3rd ed. (1960), and *Understanding Fiction,* 2nd ed. (1959); and CLEANTH BROOKS and ROBERT B. HEILMAN, *Understanding Drama,* rev. ed. (1948), detailed anthologies, with explications of texts—invaluable introductions, especially to the study of modern writing, though not limited to 20th-century literature; GYORGY LUKACS, *Studies in European Realism* (1950), an important work by a major Marxist critic; RENE WELLEK and AUSTIN WARREN, *Theory of Literature,* 3rd ed. (1963), a general and theoretical work, especially useful as a guide to modern literature; CLAUDE MAURIAC, *L'Alittérature contemporaine* (1958; Eng. trans., *The New Literature,* 1959); STEPHEN SPENDER, *The Struggle of the Modern* (1963); EDMUND WILSON, *Axel's Castle* (1931), and *The Triple Thinkers,* rev. ed. (1948).

English, Australian, South African, and American literature: WALTER E. ALLEN, *Tradition and Dream* (1964), covers post-1920 fiction; JEROME H. BUCKLEY, *The Victorian Temper* (1951), a thorough critical survey; see also its sequel, *The Triumph of Time* (1966); DAVID DAICHES, *The Present Age After 1920,* rev. ed. (1958), a useful handbook; RICHARD ELLMANN and CHARLES FEIDELSON (eds.), *The Modern Tradition: Backgrounds of Modern Literature* (1965), discussions of the principal literary figures; GEORGE S. FRASER, *The Modern Writer and His World,* rev. ed. (1964), an extremely good critical guide; FRANK R. LEAVIS, *New Bearings in English Poetry,* rev. ed. (1950), a stimulating introduction; JOHN R. TAYLOR, *Anger and After,* rev. ed. (1963), deals with contemporary British drama; ALEC D. HOPE, *Australian Literature, 1950–1962* (1963), a good survey by a leading Australian poet; NADINE GORDIMER and LIONEL ABRAHAMS (eds.), *South African Writing Today* (1967); ALFRED KAZIN, *On Native Grounds: An Interpretation of Modern American Prose Literature,* rev. ed. (1956), a readable, useful critical history; HEINRICH STRAUMANN, *American Literature in the Twentieth Century,* 3rd ed. (1965); WILLARD THORP, *American Writing in the Twentieth Century* (1960); PAUL WEST, *The Modern Novel,* 2nd ed., 2 vol. (1965), a survey of both European and American writing since 1900; MORTON D. ZABEL (ed.), *Literary Opinion in America,* rev. ed. (1951).

French literature: JOHN FLETCHER (ed.), *Forces in Modern French Drama* (1972); MAURICE NADEAU, *Histoire du Surréalisme* (1945; Eng. trans., *The History of Surrealism,* 1965), with bibliography and extracts from Surrealist authors, reviews, and manifestos; JUSTIN O'BRIEN, *Contemporary French Literature* (1971), essays on various topics; WALLACE FOWLIE, *A Guide to Contemporary French Literature from Valéry to Sartre* (1965); JOHN SIMON, *Modern French Criticism* (1972).

Italian literature: LANDER MacCLINTOCK, *The Age of Pirandello* (1951); SERGIO PACIFICI, *A Guide to Contemporary Italian Literature: From Futurism to Neorealism* (1962).

Spanish and Ibero-American literature: PAUL ILIE, *The Surrealist Mode in Spanish Literature* (1968), a useful account, and the first examination of Spanish Surrealism; G.G. BROWN, *A Literary History of Spain,* vol. 6, *The Twentieth Century* (1972), one of the most thorough surveys; JOHN M. COHEN (ed.), *Latin American Writing Today* (1967), translations of prose and poetry in Spanish and Portuguese, from Argentina, Brazil, Chile, Colombia, Cuba, Mexico, Peru, and Uruguay; JOHN A. NIST, *The Modernist Movement in Brazil: A Literature Study* (1967), a very good survey.

German literature: JETHRO BITHELL, *Modern German Literature, 1880–1950,* 3rd ed. (1959), a useful reference work, from Naturalism to Surrealism—includes postwar Austrian writers; AUGUST CLOSS (ed.), *Introductions to German Literature,* vol. 4, *Twentieth Century German Literature* (1969), the best English introduction; WALTER H. SOKEL, *The Writer in Extremis: Expressionism in Twentieth-Century German Literature* (1959).

Belgian literature: VERNON MALLINSON, *Modern Belgian Literature, 1830–1960* (1966).

Scandinavian literature: HELGE G. TOPSOE-JENSEN, *Den skandinaviske litteratur fra 1870 til vore dage* (1928; Eng. trans., *Scandinavian Literature from Brandes to Our Day,* 1929).

Slavic and eastern European literature: MAX HAYWARD and LEOPOLD LABEDZ (eds.), *Literature and Revolution in Soviet Russia, 1917–1962* (1963), based on contributions of a symposium held in Oxford, 1962—includes an important introduction that is a general survey of the period; VLADIMIR MARKOV, *Russian Futurism* (1969), the first study of its kind and well worth reading; MARK L. SLONIM, *Soviet Russian Literature: Writers and Problems, 1917–1967,* 2nd rev. ed. (1977), a comprehensive work with critical evaluations and bibliographical notes; GLEB STRUVE, *Russian Literature Under Lenin and Stalin, 1917–1953* (1971), the definitive analysis of revolutionary and post-revolutionary Russian literature; *Soviet Russian Literature, 1917–50* (1951), excellent bibliography of works in English translation to 1950—a detailed and comprehensive survey—see also his many studies on individual writers and works; ADAM GILLON and LUDWIK KRZYZANOWSKI (eds.), *Introduction to Modern Polish Literature: An Anthology of Fiction and Poetry* (1964), includes a short historical introduction on Polish literature and brief biographical notes; EWALD OSERS and J.K. MONTGOMERY (eds. and trans.), *Modern Czech Poetry* (1945); CLARENCE A. MANNING and ROMAN SMAL-STOCKI, *The History of Modern Bulgarian Literature* (1960); ANTE KADIC, *Contemporary Serbian Literature* (1964) and *Contemporary Croatian Literature* (1960); C.A. TRYPANIS (comp.), *Medieval and Modern Greek Poetry* (1951), includes extensive bibliography on many modern Greek poets; BASIL MUNTEANO, *Panorama de la littérature roumaine contemporaine* (1938; Eng. trans., *Modern Rumanian Literature,* 1939); RIMVYDAS SILBAJORIS, *Perfection of Exile: Fourteen Contemporary Lithuanian Writers* (1970), includes a brief survey of Lithuanian literature.

Hebrew literature: SIMON HALKIN, *Modern Hebrew Literature: Trends and Values* (1950).

Lithuanian Soviet Socialist Republic

One of the 15 union republics of the Soviet Union, the Lithuanian Soviet Socialist Republic is more popularly known as Lithuania (Lithuanian Lietuva, Russian Litva). It is one of the three Baltic republics, lying on the shores of the Baltic Sea, and is one of the westernmost portions of Soviet territory. Lithuania is relatively small in size, with an area of 25,200 square miles (65,200 square kilometres), and in population, with about 3,398,000 people according to the 1979 census, 80 percent of them Lithuanian. In spite of its small size, an ancient culture and an often wooded landscape largely molded by Ice Age glaciers lend character and variety to the republic.

Since World War II there has been considerable diversification and industrialization of the Lithuanian economy; the national income has risen dramatically, and about two-thirds of the population has become urban, with 14 percent concentrated in the capital, Vilnius. As a result, less than one-fourth of the economically active population of Lithuania still works in the traditionally dominant sphere of agriculture.

Lithuania is bounded on the north by the Latvian S.S.R., on the east and south by the Belorussian S.S.R., and on the southwest by the Kaliningrad oblast (region) of the Russian S.F.S.R. and by Poland. The waters of the Baltic Sea to the west add an important maritime element to the natural environment and economy of the republic. (For related information, see BALTIC STATES, HISTORY OF THE; RUSSIA AND THE SOVIET UNION, HISTORY OF; and BALTIC LANGUAGES.)

THE LAND

Topography and soil types. Underlying rock structures are of little significance for the contemporary terrain of Lithuania, which, basically, is a low-lying plain that is scraped by Ice Age glaciers, which left behind thick, ridgelike terminal deposits known as moraines. The Baltic coast area is fringed by a region that is characterized by geographers as the maritime depression, which rises gradually eastward. Sand dunes line the attractive coast, and the Kuršių Marios (Kurisches Haff), a lagoon almost cut off from the sea by a thin, 60-mile (100-kilometre) sandspit, forms a distinctive feature. The lagoon is bounded on the east by the Žemaičių (Samogitian) Hills, which give way to the flat expanses of the central Lithuanian lowland.

The central lowland

The lowland area of Lithuania consists of glacial lake clays and boulder-studded loams. It stretches in a wide band across the republic from north to south; some portions of it are heavily waterlogged. The lowland is bordered in the southeast by the narrow Žiežmariai Plain, which was formed from an ancient glacial valley filled with sandy, gravelly, and pebbly deposits. The sandy portions have often been whipped up into dunes, which have become overgrown with pine trees. The elevated Baltic Ridge thrusts between these two lowland areas into the eastern and southeastern portions of the republic; its rumpled glacial relief includes a host of small hills and numerous small lakes. The Švenčionių-Naročiaus and the Ašmenos hills—the latter containing Juozapinė, at 958 feet (292 metres) above sea level the highest point in Lithuania—are located in the extreme east and southeast of the republic.

Lithuanian soils range from sands to heavy clays. In the northwest the soil is either loamy or sandy (and sometimes marshy) and is quite heavily podzolized, or leached. In the central region weakly podzolized, loamy peats predominate, and it is there that the most fertile, and hence most cultivated, soils are found. In the southeast there are sandy soils, somewhat loamy and moderately podzolized. Sandy soils, in fact, cover a quarter of Lithuania, and most of these regions are blanketed by woodlands.

Climate and drainage. The climate of the republic is transitional between the maritime type of western Europe and the continental type found farther east. As a result, damp air masses of Atlantic origin predominate, alternating with continental Eurasian and, more rarely, colder Arctic air or air of a southern, tropical origin, Baltic Sea influences dominate only a comparatively narrow coastal zone. The mean temperature for January, the coldest month, is 23.4° F (−4.8° C), while July, the warmest month, has an average temperature of 63° F (17.2° C). The average annual rainfall is 25 inches (630 millimetres), with the heaviest amounts occurring along the coast and the total diminishing inland. Rainfall reaches a peak in August, except in the maritime strip, where the maximum is reached two to three months later.

Lithuanian rivers drain to the Baltic and generally have the slow, meandering characteristics of lowland rivers. The Neman (Nemunas), cutting north and then west through the heart of the country, is the largest. Its main tributaries are the Merkys, Neris, Nevėžís, Dubysa, Jūra, Minija, and Šešupė. The rivers have a total length of some 1,700 miles, nearly a fifth of which is navigable. Most of them can be used for floating timber rafts and for electric-power generation. A distinctive feature of the Lithuanian landscape is the presence of about 3,000 lakes, mostly in the east and southeast. The boggy regions produce large quantities of peat that, dried by air, is used in both industry and agriculture.

Plant and animal life. The natural vegetation cover of Lithuania falls into three separate regions. In the maritime regions, pine forests predominate, and wild rye and various bushy plants grow on the sand dunes. Spruce trees add their colour to the hilly eastern portion. The central region is characterized by large tracts of oak trees, with elegant birch forests in the northern portions, as well as distinctive black alder and aspen groves. Pine forests again prevail in the south; indeed, about a quarter of the whole republic is forested, with a further quarter taken up by meadowlands. Swamps and marshlands account for about 7 percent of the total area.

Three distinctive vegetation zones

Wildlife is very diverse, with about 60 mammalian species. There are wolves, foxes, otters, badgers, ermines, wild boars, and many rodents. The deep forests harbour elk, stag, deer, beaver, mink, and water rats. Common birds include delicate white storks, a variety of ducks, geese, and swans, cormorants, herons, hawks, and even an occasional bald eagle. There are many types of grouse and partridge, and the total number of bird species recorded approaches 300. The more than 50 species of fish found in Lithuanian rivers include include salmon, eel, bream, carp, and trout, with cod, plaice, and herring common off the coast.

THE PEOPLE

Composition and distribution. The 1979 census reported some 3,398,000 people in the republic. Ethnically, about 80 percent of the people are Lithuanians, but there are also Russians (almost 9 percent), Poles (about 7 percent), and lesser numbers of Belorussians, Ukrainians, Jews, Latvians, Tatars, Gypsies, and others. The Lithuanians belong to the Baltic group and have very ancient roots. Linguistic and archaeological evidence indicates that their ancestral populations moved northward from steppe regions centred in the Upper Dnepr Basin and by about 2,500 years ago had differentiated into the modern language groups.

The average density of population in the republic is more than 135 persons per square mile (52 persons per square kilometre), with a concentration in the southeastern region, notably around Vilnius, the capital. Urban dwellers make up almost two-thirds of the total population. Lithuania has more than 90 settlements classified as cities and a further two dozen towns. The largest centres are Vilnius (503,000 population, 1981), a modern city that has spread from a historic old quarter with narrow streets onto the wooded hills around the Vilija and Vilnia River junction; Kaunas (377,000); Klaipeda (178,000); Šiauliai (121,000); and Panevėžys (104,000).

Demographic trends. Natural increase, rather than any inward migration, has accounted for almost 90 percent of recent population growth. Internally, however, there has been rapid movement of people to the cities, accentuated in the case of the new, planned regional centres of Alytus, Kapsukas, Utena, Plunge, and Mažeikiai.

THE ECONOMY

Resources and their development. Lithuania possesses a good range of useful mineral resources, including sulfates, notably gypsum; chalk and chalky marl; limestones; dolomites; various clays, sands, and gravels; peat; some iron ore and phosphorites; and mineral waters. Oil deposits have been detected in the offshore regions. The power potential of the many rivers and the traditional resources of the great forests and the rich agricultural areas have added to the basic wealth of the republic, which is well placed geographically for trade.

During the Soviet period, economic policy has emphasized industrialization, and, since the end of World War II, the machinery, shipbuilding, electronic, electrical- and radio-engineering, chemical, cement, and fish-processing industries have expanded rapidly, partly to meet Soviet goals and partly to satisfy local needs. Traditional industries such as food processing, especially of meat, milk, and fish products, and various branches of light industry such as the manufacture of clothing, footwear, and durable consumer goods have also expanded. The building materials and construction industries have expanded to meet the demands of the growing and increasingly urban population. Gross industrial output in the republic increased more than 3 times during the 1960s and nearly doubled during the 1970s. Worsening labour shortages, however, have made it increasingly difficult to sustain such high growth rates.

Planning goals

Expansion in energy production in Lithuania has been particularly notable. Electrical output expanded from 81,000,000 kilowatt-hours in 1940 to 11,664,000,000 kilowatt-hours in 1980. A 1,800,000-kilowatt thermal station is located at the town of Elektrėnai. Other major plants include a hydroelectric station at Kaunas and a thermal station at Vilnius. A 1,600,000-kilowatt hydroelectric plant near Kaišiadorys was begun in 1979, and construction began near Ignalina on the republic's first nuclear-power station, with a 6,000,000-kilowatt capacity, in 1975. Since 1961 the Lithuanian power system has been part of the network covering the northwestern Soviet Union.

To facilitate the expansion of the basic Lithuanian industries, there has been a marked emphasis on the training of engineers and technicians. Industrial expansion has added such towns as Siauliai and Panevėžys to the major existing industrial centres of Vilnius, Kaunas, and Klaipėda. A number of small towns, notably Kapsukas, Alytus, and Utena, are becoming the focus of the metalworking, mechanical-engineering, and textile industries, while the modest centres of Kedainiai and Jonava now specialize in the chemical industry. The rapidly growing town of Mažeikiai has a major oil refinery, with accompanying fuel and petrochemical production. Lithuanian industrial products are exchanged with other union republics and exported to more than 85 countries, while imports, mostly from the other union republics, include machinery and other equipment, some raw materials, fuels, and the products of light industry.

Agriculture. Lithuanian agriculture still maintains something of its traditional importance, with almost one-fourth of the economically active population engaged in farming. There are some 775 collective and 325 state farms, which occupy 11,508,000 acres (4,656,000 hectares); two-thirds of this land is used for agriculture, about 70 percent being arable, and most of the rest is given over to meadows and pastures, with a small amount to gardens. The development of agriculture has been closely linked to land reclamation and swamp-drainage schemes. The chief agricultural trend is toward the production of meat and milk, together with the cultivation of such crops as flax, sugar beets, potatoes, and vegetables. Half the total production is made up of fodder crops; about 40

Emphasis on livestock breeding

percent is grain and leguminous crops; and most of the rest is potatoes and vegetables. Livestock breeding is still the single most important branch of agriculture, however, with emphasis on dairy cattle and pigs. There are smaller numbers of sheep, goats, horses, and poultry on Lithuanian farms. One feature of the Soviet period has been the introduction of technology in agriculture; most crop cultivation is mechanized, although at fall harvest time large amounts of manual labour are still required.

Economic regions. Lithuanian planners, using as criteria environmental, economic, and transportational indexes, have divided the republic into four economic regions.

Eastern Lithuania. Occupying almost 30 percent of the total area, Eastern Lithuania, including the capital, Vilnius, is characterized by diversified and rapidly growing industry (primarily metalworking and mechanical engineering, woodworking, branches of light industry, and, more recently, energy production from nuclear sources); industry is centred on the main cities, but there is also a substantial rural economy. The region also has a number of health resorts, including Trakai and Ignalina, and is crisscrossed by highways linking it with major Soviet cities.

Southern Lithuania. Occupying slightly more than one-fourth of the republic's territory, the southern portion of central Lithuania contains more than half of the republic's developed waterpower resources. Metalworking, mechanical-engineering, food-processing, and chemical industries predominate; farming is intensive, with a concentration on stock raising and the growing of sugar beets. Kaunas, Alytus, and Kapsukas are the main centres.

Northern Lithuania. Sprawling over the northern portion of the middle Lithuanian lowland and the eastern slopes of the Žemaičių Hills, Northern Lithuania occupies almost 30 percent of the republic. The region is noted for its fertile soils and for its dolomite, gypsum, and limestone reserves. Farming is intensive, with almost half the winter-wheat sowing and most of the sugar-beet and flax crops located there. Industry is not well developed. The main centres are Šiauliai, Panevėžys, and Rokiškis.

Western Lithuania. Occupying the remaining 15 percent of the republic, Western Lithuania lies along the Baltic Sea, which lends a distinctive maritime quality to the region. Shipbuilding, ship repairing, fish processing, and oil refining are the main industries, with Klaipeda, Telšiai, Plunge, and Mažeikiai the main centres. There are many pastures, and horse breeding and the raising of dairy cattle and pigs, together with poultry farming and fishing, are well developed.

Transportation. Railways continue to be the main means of transport in Lithuania. About 1,300 miles of track are in use, and freight and passenger haulage is almost three times greater than it was in 1960. Motor transportation has nevertheless increased sharply, and cars and buses account for about 95 percent of the total passenger traffic. The hard-surfaced road network covers some 13,400 miles, about two-thirds of the total. Sea transport is important, with freight transportation having shown a rapid increase since World War II. River transport is also significant.

Vilnius is the main air-transportation centre, with links to other important Soviet cities and to resort areas. The transportation network also includes a natural-gas pipeline that carries gas from the Ukraine and an oil pipeline that carries crude from western Siberian oil fields to the refinery at Mažeikiai.

ADMINISTRATION AND SOCIAL CONDITIONS

The constitutional and political framework. The constitution of the Lithuanian Soviet Socialist Republic, originally adopted on August 25, 1949, has been modified several times since, always in close accordance with executive, legislative, and judicial patterns prevailing throughout the Soviet Union. The constitution states that political power resides in the workers and peasants of the republic, acting through the local soviets, or councils of workers' deputies. This political foundation rests on a socialist economic system, with communal ownership of the means of production.

The Supreme Soviet, elected for four years and acting through a Council of Ministers, is the highest legislative body of the republic. Its Presidium exercises executive power between sessions. Locally, power is vested in various levels of soviets, down to the smallest village unit; all are elected for two-year periods.

Justice is administered through the Supreme Court and a local network of people's courts, with members elected for five and two years, respectively. Law enforcement is in the hands of the Lithuanian S.S.R. procurator, who is appointed for five years.

The executive, legislative, and judicial bodies established within the Lithuanian Soviet Socialist Republic are substantially administered by, and are accountable to, the authorities of the Soviet Union. In accordance with long-standing practice, control is exercised through central directives and agencies established for that purpose.

The Lithuanian Communist Party

The Lithuanian Communist Party is a constituent of the Communist Party of the Soviet Union and is closely subordinated to its control; it is the sole political organization of the republic. Its 170,000 members and candidates for membership, of whom about 70 percent are of Lithuanian nationality, are supported by the activities of the Komsomol youth movement, which has some 450,000 young men and women in its ranks. As elsewhere in the Soviet Union, trade unions, which have about 1,750,000 members, play roles in formulating and implementing social and economic policy in accordance with party directives.

Social services. Lithuanian society has benefitted from emphasis on the production of consumer goods and the improvement of social services, as well as on the expansion of heavy industry. Both average monthly income and the proportion of the national income set aside for social purposes have shown a steady expansion. The standard of living is augmented by free education and medical services, as well as a range of ancillary services. The latter include the upkeep of kindergartens and day nurseries, sick leave, pension payments, and help in providing vacation and sanatorium accommodations. Pensions and related allowances, for example, covered more than 670,000 people, one-third of them farmers, by the early 1980s. Urbanization has meant a constant, and still unresolved, struggle to keep up with housing needs, and new techniques, including prefabrication, have been introduced.

A typical state budget for the 1970s showed 92.5 percent of the state income coming from the socialist economy. Some two-thirds of budget expenditures went for reinvestment in the economy, about 10 percent went to finance education and culture, and the remainder was spent on various social services. There has been a considerable expansion of health facilities in Lithuania, including increases in the numbers of doctors and hospital beds, since World War II.

The schools of the republic serve more than 1,300,000 students. More than half of these are enrolled in general education schools of all types, and a transition to a compulsory 10-year education was begun in the early 1970s. Some 70 specialized secondary schools enroll about 70,000 students, and universities and other post-secondary institutions in Lithuania have about the same total enrollment. The Lithuanian Academy of Sciences, which was created in 1941, directs the work of 12 research centres and is the main agency of research in the republic.

Cultural life. As elsewhere in the Soviet Union, there is a high level of public interest in various forms of cultural life. The republic has well over 2,000 public libraries and a large number of museums, amateur cultural centres, theatres, and cinemas. A year's output of books amounts to some 16,400,000 copies, all but 3,000,000 or so in Lithuanian, and readership is at a high level. The works of contemporary Lithuanian writers, poets, and playwrights are evolving in a milieu that blends a very old cultural tradition with the relatively new social factors introduced during the Soviet period. Many Lithuanian critics have praised the poetry of Eduardas Mieielaitis, especially his collection *Žmogus* (1962; "Man"), for its deep and optimistic human, as well as social, vision. Related concerns animate much modern historical writing, as in ***Parduotos vasaros*** (1957; "Bartered Summers"), a novel by Juozas

Baltušis, and *Sodybų tuštėjimo metas* (1970; "The Time of Emptying Homesteads"), a novel by Jonas Avyžius. Writings about the bitter conflicts of the World War II invasion include the heroic poem Kraujas ir pelenai (1960; "Blood and Ashes"), by Justinas Marcinkevičius, who also treats national and historical themes in the drama trilogy Mindaugas, *Mažvydas* (both biographical), and Katedra (1968, "Mindaugas"; 1976, "Mažvydas"; 1970, "The Cathedral").

The great majority of Lithuania's newspapers and magazines, which enjoy high circulations, are published in Lithuanian, and there are a number of broadcasting services, including a television service that is part of the East European Intervision network. In spite of such modern incursions, however, Lithuanian folklore continues to hand down a rich and original heritage from generation to generation. Lithuanian songs and a remarkable collection of fairy tales, legends, proverbs, and aphorisms have their roots deep in a language and culture that are among the oldest in Europe. The folk songs (*dainos*) are melodious and lyrical, while the communal folk dances, often related to everyday activities, are characterized by an elegant symmetry of design and motion. Lithuanian folk art is mainly embodied in ceramics, leatherwork, wood carving, and textiles; its colouring, which tends to avoid gaudiness, and its original geometric or floral patterns are characteristic features.

The country's folk heritage

The Vilnius drawing school, founded in 1866, has had a strong influence on the republic's fine-arts traditions, while the composer and painter M.K. Čiurlionis, who died in 1911, also had a considerable influence on contemporary forms. During the Soviet period, a realistic note has been introduced into sculpture and painting, and Lithuanian contemporary drawing, noted for the use of natural colour and a highly refined technique, has won international acclaim. The republic's architecture has been affected by a rich heritage in monuments and old buildings and by styles, ranging from the Gothic to the Neo-classical, that have acquired a distinctive local character. While much attention is given to preservation of historical monuments, much of the energy of modern Lithuanian architects has gone into the designing of new buildings, both industrial and domestic, and especially of cultural and educational centres.

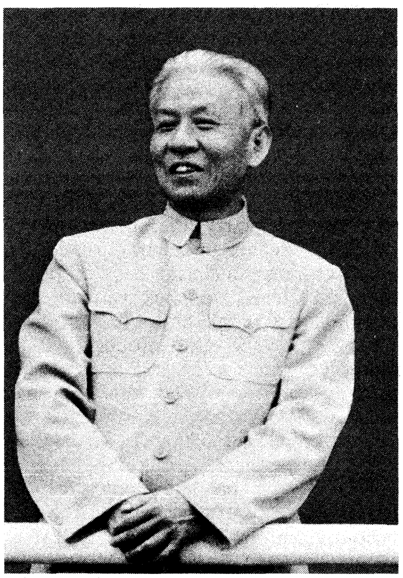
Music, too, has a strong tradition in the republic, a special feature being the dances and singing festivals held in the towns and villages every summer. These build to a climax every five years in national singing festivals during which as many as 40,000 persons may compete.

The outlook. Published data indicate that the rapid economic growth that characterized the previous two decades of development in Lithuania had decelerated by the early 1980s. The decline in demographic growth, exhaustion of labour surpluses, diminishing returns on capital investments in industry and agriculture, rigidities in managerial controls, and decline in rates of labour productivity—all are indicators that point not only to more severe difficulties in increasing production but also to problems in maintaining the living standards that have been achieved.

(K.A.M./B.V.M.)

Liu Shao-ch'i

Liu Shao-ch'i (Pinyin romanization, Liu Shao-qi) was head of state of the People's Republic of China, chief theoretician for the Chinese Communist Party (CCP), and considered the heir apparent of Mao Tse-tung (Mao Zedong) before being purged in the late 1960s. One of the early Chinese Communists, Liu was active in the Chinese labour movement and influential in formulating party and, later, governmental strategy. He played an important role in Chinese foreign affairs after the Communists had gained control of the country.



Liu Shao-ch'i.
Eastfoto

Liu was born in 1898 in Ning-hsiang (Ning-xiang) district, Hunan Province, the youngest son of a rich peasant landowner. He attended middle school, went to normal school in Ch'ang-sha (Chang-sha), and by 1918 was studying French in North China. Two years later, Liu joined the Socialist Youth League and subsequently journeyed to Moscow, where he enrolled in the University for Toilers of the East and became a member of the newly formed CCP. Liu's education and his extensive experience abroad later made him one of the most cosmopolitan of the Chinese leaders.

Investment in China's labour movement

In 1922 Liu returned to China, where he helped organize the First National Labour Congress in May. Soon after this he was assigned to the Hunan Secretariat as an aid to Mao Tse-tung. Late that year Liu went to the An-yiian (An-yuan) colliery to organize miners for what was to become a successful strike. From this time onward he became increasingly more involved in the labour movement—as leader of a sympathy strike in February 1923, as vice chairman of the All-China Federation of Labour in May 1925, and as secretary general of the Third National Labour Congress in 1926.

The year 1926 marked the high point of the Chinese labour movement. When the Nationalist Party (Kuomintang) and the CCP split in April 1927, Liu and his comrades found the urban component of the Chinese Communist movement decimated; they fled underground. In late April, Liu was elected to the Fifth Central Committee of the CCP.

After the turbulence of 1927, Liu's ascendancy in the party was rapid; he was named director of the workers' department in mid-1928, and in the following year he assumed the post of secretary of the Manchurian Provincial Party Committee, a post he later relinquished (early 1931) in order to go to Shanghai. By 1931 the centre of gravity of the Chinese Communist movement had shifted away from the cities to rural areas, but Liu remained in Shanghai, underground, taking part in movements in opposition to the Japanese invasion of Manchuria and encroachment in North China.

In late 1932 Liu joined Mao Tse-tung's forces in Kiangsi (Jiang-xi) Province and was named head of the All-China Federation of Labour; by 1934 he had gained a seat on the Politburo (Political Bureau) of the Sixth Central Committee. Shortly after his elevation to the Politburo, he left Mao's forces, who were in the midst of their Long March, and went to Peking (Bei-jing) to agitate further against the Japanese. In early 1936 Liu was designated secretary of the party's North China Bureau. When the war with Japan had spread to most of China, he was put in charge of the Central Plain Bureau of the CCP, and in this position he worked closely with the Communist New Fourth Army operating in Central China.

Liu's lectures of 1939

In mid-1939 in Yen-an (Yan-an; the Communist headquarters), Liu delivered a famous series of lectures called "How To Be a Good Communist." In these talks he drew upon all his organizational experience as a labour leader and underground figure to define the demands to be made upon all party members; at this point Liu began to assume the role of chief theoretician for the party. He delivered another important talk in July 1941, entitled "On Intraparty Struggle," which further enhanced his position as the party's theoretical spokesman.

In 1943 Liu was named secretary of the Central Secretariat and vice chairman of the People's Revolutionary Military Council, making him one of the most powerful men in the Chinese Communist hierarchy. By June 1945 he was clearly spokesman for party affairs, and at the Seventh Party Congress he delivered the major address, entitled "On the Party." During the closing days of World War II, Mao Tse-tung and Chiang Kai-shek were engaged in talks at Chungking (Chong-qing), and Liu served as acting chairman in Mao's absence. By October 1, 1949, the Communists controlled much of China, the People's Republic of China had been established, and Liu had been named vice chairman of the new government.

Experience with Soviet leadership

Once the Chinese Communists had achieved power, Liu's cosmopolitan outlook and experience with the Soviet leadership enabled him to act as initial spokesman for Peking's new hard-line foreign policy, and it also gave him a central role in the formation of China's industrialization plans; both endeavours were dependent on Moscow in 1949. For these reasons Liu headed the Sino-Soviet Friendship Association in 1949–54 and led the Chinese delegation to the Soviet 19th Party Congress in October 1952. In August 1954, at the First National People's Congress, Liu was elected chairman of the Standing Committee. His influence was not confined to state organs, however, but extended also into the party, where late in 1953 and early 1954 he led a purge of regional power holders. Subsequently his position in the party grew, and by 1956 he was clearly Mao Tse-tung's heir apparent.

The Great Leap Forward

During the second session of the Eighth Party Congress in May 1958, Liu outlined the strategy for the second five-year economic plan (called the Great Leap Forward), which was to lay the foundation for the rapid industrialization of China. Shortly after the initiation of the Great Leap Forward, however, it became apparent that industrialization could not be achieved as rapidly as hoped, and a policy of retrenchment was called for. Partly as a result of the failures of the Great Leap, Mao relinquished his position as chairman of the People's Republic of China, though he remained party chairman, and Liu assumed the chairmanship in April 1959. During this period, Liu tried to revitalize agriculture by initiating policies that permitted peasants to cultivate private plots and spurred them on with monetary incentives; both were policies to which Mao later strongly objected.

Liu's fall from power

In his new post as head of state, Liu began to play a more prominent role in foreign affairs, receiving state visitors from Indonesia, the Soviet Union, Pakistan, Ghana, Cuba, North Vietnam, Cambodia, and North Korea. In addition, he travelled abroad rather extensively during 1959–66. Upon reaching this pinnacle, however, Liu became one of the most important figures to be purged in the Great Proletarian Cultural Revolution (1966–69). Many persons associated with him, such as P'eng Chen (Peng Zhen), mayor of Peking, and Teng Hsiao-p'ing (Deng Xiao-ping), a member of the Politburo, were also purged, decimating what had been viewed as a highly cohesive Chinese leadership. In October 1968 Liu was stripped of party positions and labelled China's Khrushchev, and, by April 1969, a new constitutionally designated successor to Mao had been chosen—Lin Piao (Lin Biao), head of the armed forces. In the autumn of 1971, however, Lin Piao disappeared, and it was announced that he had died in an airplane crash while fleeing from an attempt to assassinate Mao.

During 1974 rumours of Liu's death gained wide circulation, and on October 31, a Communist newspaper in Hong Kong confirmed the fact. No details of date or place of death were revealed, however, until May 1980, when the *Beijing Review* reported that Liu had died on November 12, 1969, in K'ai-feng (Kai-feng), northern Honan Province.

The causes of Liu's fall (and events leading to Lin's death) are not clear. For several years the names of Liu, Teng, and Lin were linked, and the three were condemned in the party press as "capitalist roaders" intent on defeating the revolution. After Mao's death on September 9, 1976, however, his widow, Chiang Ch'ing (Jiang Qing), and the other members of her so-called "Gang of Four" undertook a coup that was quickly aborted. Hua Kuo-feng (Hua Guo-feng), a relatively junior member of the hierarchy, achieved party leadership, and Teng Hsiao-p'ing was rehabilitated. Then, in February 1980, the 11th Central Committee of the CCP decided "to completely rehabilitate" Liu, calling him a "great Marxist and proletarian revolutionary," and to remove the labels of "renegade, traitor, and scab" formerly attached to him. Lin was then identified with the Gang of Four and charged with "concocting false evidence" and subjecting Liu to "political frame-up and physical persecution" while overthrowing other leaders as being Liu's agents.

While little is known of Liu's first four spouses, his fifth wife, Wang Kuang-mei (Wang Guang-mei), achieved great notoriety during the Cultural Revolution for her "bourgeois" life-style. Liu had at least eight children, none of whom achieved political prominence.

CLARK, ***Biographic Dictionary of Chinese Communism, 1921–1965*** (1971), a monumental, two-volume set that is well written and gives an excellent discussion of Liu's life; LIU SHAO-CH'I, ***The Collected Works of Liu Shao-ch'i***, 3 vol. (1968–69), an anthology of Liu's major statements; "Fifth Plenary Session of 11th C.C.P. Central Committee," ***Beijing Review***, No. 10 (March 10, 1980), pp. 3–10, which documents official rehabilitation measures.

(R.C.N.)

Liver, Human

A pyramid-shaped structure located in the upper right region of the abdomen, with its upper border at about the level of the nipples, the liver is the largest organ in the human body, accounting for about one-eighteenth of the body weight in an infant and one-fiftieth in an adult. It is divided into two parts, or lobes, of which the right is about six times the size of the left.

Functions

The liver serves many functions, including the regulation of blood volume and manufacture of certain blood clotting factors; the storage of several substances, including glycogen, copper, iron, and vitamin B_{12}; the metabolism of proteins, carbohydrates, and fats; the production of heat; the detoxication (removing the poisonous effect) of certain foreign substances in the blood; the destruction of old red blood cells; and the formation of bile.

In the undersurface of the right lobe of the liver is a fissure, known as the porta hepatis—"the door of the liver"—so called because it is the point of entrance for arterial and venous blood and of exit for bile. Venous blood is brought by the portal vein from the intestines and spleen; arterial blood, by the hepatic (liver) artery from the aorta by way of the celiac artery. The hepatic artery and the portal vein both divide into branches to the right and left lobes of the liver within the porta hepatis. There, also, bile ducts from the two lobes unite in the common hepatic duct. The hepatic duct in turn joins with the duct from the gallbladder (the cystic duct) to form the common bile duct, which leads toward the small intestine.

Usually, within the wall of the duodenum, the first portion of the small intestine, the common bile duct and the main channel for pancreatic juice come together to form a channel called the ampulla of Vater, which then empties into the duodenum. The portion of the common duct within the duodenal wall is encircled by muscle fibres called the sphincter of Oddi.

Bile is stored in the gallbladder, a pear-shaped structure resting in a shallow furrow in the right lobe of the liver and extending from the lower edge of the liver to the porta hepatis. The narrow lower end of the gallbladder, called its neck, joins with the cystic duct.

Hepatic network of nerves

The cystic artery, a large, twisting branch of the hepatic artery, brings blood to the gallbladder. The ganglia beside the spine at the level of the chest, the right and left vagus nerves, and the right phrenic nerve contribute fibres to the hepatic network of nerves. (The vagus nerves are the pair of tenth cranial nerves; the phrenic nerves serve chiefly the diaphragm—the muscular partition between the chest and the abdomen—and the pericardium, the sac that encloses the heart.) Branches of the hepatic network of nerves accompany all the branchings of the hepatic artery and of the bile ducts, even into the hepatic parenchyma, or functioning liver tissue.

The hepatic veins carry venous blood from the liver into the inferior vena cava, the large vessel that brings venous blood from the lower half of the body to the right atrium of the heart. There is a deep groove in the back of the liver where the inferior vena cava presses against it.

Most lymph channels from the liver lead to a small group of lymph nodes in the vicinity of the porta hepatis; some superficial lymphatic vessels penetrate the diaphragm and terminate in nodes in the chest. Lymph from the gallbladder flows by way of the node at the gallbladder neck to nodes near the common bile duct; there is a connection at this point with lymphatic vessels near the right end of the pancreas.

Ligaments and pressures exerted by the muscles of the abdominal wall hold the liver in position.

***Origin** and development.* The liver originates as a ventral, or forward, outgrowth from the embryo's innermost germ layer, called its endoderm. The bud divides into two portions, one forming the main body of functioning liver tissue and the hepatic duct and its branches; the other portion forming both the gallbladder and the bile ducts.

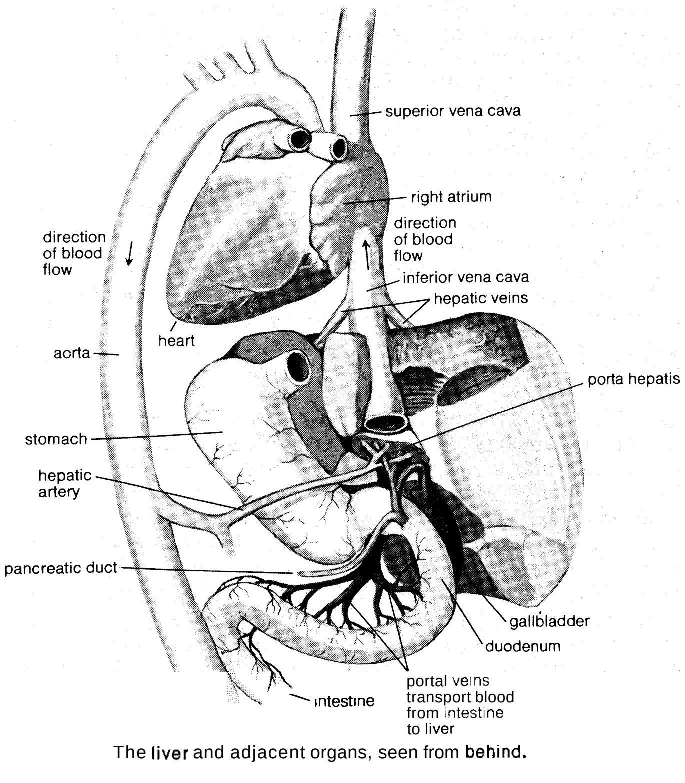
Normal structure and functions

STRUCTURE

The lobules

Grossstructure. The liver has been described as a collection of units called lobules, each of which contains, in its centre, a branch of the hepatic vein and, in its outer areas, a complex known as a portal tract. The portal tract includes a bile duct, a small branch of the portal vein, and a branch of the hepatic artery. Between the tributary of the hepatic vein and the portal tract are columns of hepatic cells and blood channels called sinusoids.

It is more precise to think of the liver as sheets of hepatic cells, the sheets pierced by two types of tunnels, one made up of the portal tracts and the other of the central tributaries of the hepatic vein. The two types of tunnels tend to run in planes perpendicular to each other; they never touch, although their smallest branches may be only about 0.5 millimetre (0.02 inch) apart. The sinusoids are not in any regular order, but tend to run perpendicular to the central veins.



The liver and adjacent organs, seen from behind.

Blood flows from the terminal branches of the portal vein into the sinusoids and thence, by way of hepatic vein branches, into the hepatic vein. This direction of flow, from portal vein to hepatic vein rather than the reverse, is brought about by the greater pressure in the portal vein.

The hepatic cells, the functioning cells that make up about 60 percent of the liver, are polyhedral and about 25 to 35 microns (one micron = 0.001 millimetre or 0.00004 inch) in diameter. Each cell usually has one nucleus, and the cells multiply by mitosis, the cell division that is the usual form of reproduction of body cells.

The walls of the sinusoids are made up of two types of cells, endothelial, or lining, cells and Kupffer cells. The Kupffer cells are capable of phagocytosis—the ingestion of other cells and of foreign particles. They also have important functions in the production of antibodies and in blood formation.

Between the hepatic cells and the walls of the sinusoids there is tissue fluid, which flows outward into the lymphatic vessels. The lymph channels are located in connective tissue around the portal vein.

Arterial blood is supplied to the portal tracts by a network of arterioles (minute arteries) around the bile ducts; the blood then empties into the sinusoids and hence into the central hepatic veins.

In grooves on the surfaces of the hepatic cells are the bile canaliculi, or capillaries, the smallest of the series of bile channels that terminate in the right and left main hepatic ducts. These emerge from the liver at the porta hepatis and carry the bile into the duodenum.

Intracellular structure. The hepatic cell, also called the hepatocyte or liver cell, has more metabolic functions than any other cell of the body and is the producer of bile. In its cytoplasm (substance outside the nucleus) the netlike structure known as the smooth endoplasmic reticulum is the site at which the bile pigment bilirubin is metabolized and many enzymes, such as those necessary to make glucose available to the blood, are synthesized. The bile acids, needed in the digestion of fats, are formed at this point, and drugs are detoxicated.

The rough endoplasmic reticulum produces certain proteins, such as the albumin and clotting factors of the blood. The mitochondria (membranous structures in the cytoplasm) have many functions, including the production of enzymes that play a role in the synthesis of glycogen and enzymes involved in the metabolism of fats.

Other structures of the hepatic cell cytoplasm—the network of fine tubes known as the Golgi apparatus and the minute bodies and channels known, respectively, as the lysosomes and canaliculi—act as the cell's excretory apparatus. The canaliculi and the nearby tissues are especially involved in bile excretion.

FUNCTIONS

Contents of bile

Production and storage of bile. The liver secretes about 800 to 1,000 millilitres (about one quart) of bile each day at a pressure of 15 to 25 centimetres (six to ten inches) of water. In the bile are bile salts and bile products of metabolism, such as cholesterol and phospholipid. Cholesterol, ordinarily insoluble, is in large-molecule compounds that permit it to be carried in solution. Bile salts are needed for the digestion of fats in the diet (see DIGESTION, HUMAN), and bile is the chief vehicle for the excretion of cholesterol and the bile pigment bilirubin. Some drugs and poisons, such as the salts of heavy metals, atropine, strychnine, and salicylates, are also excreted principally in the bile.

The sphincter of Oddi, the ring of muscle fibres that encircles the common bile duct within the wall of the duodenum, cuts off the flow of bile into the small intestine and diverts it to the gallbladder, where it is concentrated and stored. Through the mucous membrane lining the gallbladder, water and salts (a solution of sodium chloride and bicarbonate) are absorbed in such quantities that the bile is reduced to one-tenth of its former volume. At the same time the membrane secretes a thick mucus into the bile.

The principal function of bile is in the digestion of fats. Fat in the duodenum causes the sphincter of Oddi to relax and the gallbladder to contract, so that bile is discharged into the duodenum.

Functional disorders of the biliary tract, particularly spasm of the sphincter of Oddi, sometimes occur after surgical removal of gallbladder (cholecystectomy). These disorders are called biliary dyskinesia.

Bilirubin metabolism. Bilirubin, or bile pigment, which gives bile its characteristic green-orange colour, is formed chiefly in the spleen, the bone marrow, and the phagocytic—cell ingesting—cells of the liver called Kupffer cells, during the destruction of worn out red blood cells (erythrocytes) and the attendant breakdown of the pigment heme from the hemoglobin of these cells. A little bilirubin results from the breakdown of heme-containing enzymes and of young red cells in the bone marrow.

After the bilirubin has been carried in the bloodstream to the hepatic cells, the endoplasmic reticulum of these cells forms the compound bilirubin glucuronide. This compound is excreted into the bile channels and eventually reaches the small intestine. From the duodenum, the compound passes into the colon, where bacteria break some of it down into fat-soluble bilirubin. Limited amounts of the bilirubin are reabsorbed from the colon into the portal-vein system and carried to the liver, where they are re-excreted by the hepatic cells. The intestinal bacteria convert some bilirubin glucuronide into stercobilinogen, and about 100 to 200 milligrams (0.004 to 0.008 ounce) of this is eliminated each day in the feces, giving them their characteristic colour.

Formation of blood clotting factors. Most of the proteins that make up the clotting factors in the blood are produced by the liver. So-called clotting factor VIII (the antihemophilic factor) is made elsewhere, and for the production of certain other factors—factors II (prothrombin), VII, and X—sufficient quantities of fat soluble vitamin K must be absorbed from the intestine. Vitamin K absorption is inadequate if insufficient fat is absorbed—*e.g.*, when obstruction of the bile duct causes the supply of bile in the intestine to be inadequate.

Bleeding and liver disease

A number of elements may be involved, therefore, in the tendency of persons with liver disease to bleed. The liver may fail to produce clotting factors; insufficient fat-soluble K may be absorbed; or excessive destruction of blood platelets in a large spleen may lead to their being in short supply (platelets both produce a clotting factor—platelet factor 3—and themselves form the first plug to fill a gap in a vessel wall).

Metabolism of nutritive substances. Cholesterol, the precursor of the primary bile acids cholic and chenodeoxycholic acid, is synthesized by the liver. The liver also processes cholesterol that is absorbed into the portal-vein system from the intestine and not re-excreted into the bile. (Cholesterol is also the precursor of adrenal cortical hormones and of estrogens.) The liver combines the primary bile acids with glycine and taurine in the production of bile salts. Most of the bile salts are absorbed through the terminal part of the small intestine, called the ileum, and returned to the liver. The bile salts that are not absorbed pass through into the colon—the section of large intestine that is next to the rectum—and there are broken down by bacteria and converted into secondary bile acids—deoxycholic and lithocholic acid. About 0.7 gram (0.025 ounce) of bile acid is eliminated each day in the feces.

Fat that reaches the liver may be converted by it into fatty acids and converted in turn into carbohydrates or ketone bodies. The ketone bodies—acetoacetic acid, acetone, and beta-hydroxybutyric acid—are transported in the bloodstream to the tissues, where they are metabolized, with carbon dioxide and water as the end products.

Much of the fat that is transported is in the form of lipoproteins (fat–protein compounds). In combination with bile salts and cholesterol, lipoproteins form large protein compounds that are excreted in the bile.

Monosaccharide sugars (*e.g.*, glucose, fructose, and galactose), absorbed through the intestine, are stored in the liver. Fructose is converted directly to glucose and galactose, either directly or indirectly through glycogen. Glucose that is not converted to glycogen and stored or used in formation of amino acids is changed into fatty acids, carbon dioxide, and water. When the levels of glucose in the blood are low, glucose is supplied by the liver by conversion of stored glycogen, amino acids, or fatty acids. Lactic, ketoglutaric, and pyruvic acids are removed by the liver and metabolized (see also METABOLISM).

The synthesis by the hepatic cells of blood-serum proteins, including albumin and several clotting factors, has already been touched upon. Disease of these cells results in a lowering of the blood levels of the proteins, especially of albumin. At the same time amino acids, which the liver normally uses in the production of proteins, are excreted in the urine. Disease of the hepatic cells also lowers the blood levels of urea, normally produced by the cells from amino acids.

Ammonia, which is produced (1) by bacteria in the colon, (2) by the action of the enzyme urease in the stomach and small intestine, and (3) in the kidneys, is converted by the liver to urea. A high level of ammonia in the blood from abnormal liver function is believed to be partially responsible for the coma and the aftereffects on the brain that may be complications of hepatic-cell disease.

Drug metabolism and detoxication. In the liver, enzymes oxidize, reduce, hydrolyze, or combine many substances, metabolizing them and making them more soluble in water for elimination in the feces or the urine. The enzymes, which are usually bound to microsomes (structures that are part of the smooth endoplasmic reticulum of the hepatic cell), develop gradually in the fetus, attaining adult levels after birth. These enzymes detoxicate many compounds from outside the body and also work on various substances that are produced in the body—*e.g.*, bilirubin and thyroxin; they have a limited effect on the steroid hormones. Some drugs are detoxicated in the mitochondria of the hepatic cell. Detoxication, which is usually thought of as removal of the poisonous properties of a substance, also includes the modification of a drug to make it less active and more easily eliminated.

Drug tolerance

The effect of certain drugs, particularly barbiturates, is decreased and of shorter duration if the drugs are used repeatedly. This is due in part to a decrease in the sensitivity of the brain but also to metabolic processes in the hepatic cells. The barbiturates, and many other drugs soluble in fats, alter the microsomal enzymes and make them active; the effect is not confined to the particular enzymes that are involved in the detoxication of the drugs. This is called enzyme induction.

Among the substances that activate enzymes are alcohol, coffee, food additives—such as butylated hydroxytoluene (BHT), an antioxidant used to preserve fats—and DDT (dichlorodiphenyltrichloroethane), which may contaminate food that is eaten.

Because diseased livers metabolize drugs more slowly than normal, caution is exercised in the administration of sedatives to persons with liver disease, especially if they have shown any tendency to develop hepatic coma.

Malfunction and diseases

JAUNDICE

Jaundice, the yellowness of the eyes and skin that comes from excess amounts of bile pigment—bilirubin—in the blood, may arise in any of a number of ways. (1) The hepatic cells may form more bilirubin than usual because of an abnormally high level of red blood cell destruction. This type is called hemolytic jaundice. (2) Impaired uptake or transport of bilirubin by the hepatic cells may occur (this congenital disorder is known as Gilbert's syndrome). (3) A defect within the hepatic cell itself or an obstruction in the bile duct system may prevent the excretion of bilirubin glucuronide into the bile. (4) A number of these defects may occur at one time. In hepatocellular jaundice, for example, there may be abnormalities in the transport of bilirubin, in its combining with glucuronic acid to form bilirubin glucuronide, and in its excretion in the bile.

In hemolytic jaundice the skin has a characteristic lemon-yellow colouring, and there is usually anemia. In the urine there are excess quantities of urobilinogen, a product of the reduction (removal of oxygen) of bilirubin. The urine contains little or no bilirubin. The feces are dark brown because of the presence of excess quantities of urobilinogen, also called stercobilinogen. There are signs in the peripheral blood—*e.g.,* blood from the fingertips or ear lobes—that red blood cells are being destroyed and regenerated in abnormal numbers. Hemolytic jaundice and its varieties are covered in detail in BLOOD DISEASES.

In hepatocellular, or liver-cell, jaundice the hepatic cells are unable to function as a result of hepatitis (inflammation of the liver) or cirrhosis (see below) or because drugs that damage the liver have been taken. The feces are ordinarily pale, and the urine contains both urobilinogen and bilirubin.

Obstructive jaundice

Obstructive jaundice, also called cholestatic (bile-stopping) jaundice, results from interference with the flow of bile from the liver into the duodenum. The causes include gallstones, cancer of the head of the pancreas, and cancer of the main bile ducts. The jaundice may come from the reaction of the liver to a drug such as chlorpromazine or to the hepatitis virus.

Obstructive jaundice causes the skin to itch. If the jaundice continues for some time, cholesterol may be deposited in the skin, particularly the skin of the eyelids. If the obstruction is a gallstone, the affected person may be feverish or may feel pain in the abdomen. If cancer is the cause there may be loss of weight. The feces are pale because they lack normal amounts of bile pigment and contain abnormal quantities of fat (steatorrhea). The steatorrhea occurs because inadequate amounts of bile salts have reached the intestines, so that fats in the diet are not digested.

TESTS OF LIVER FUNCTION

Tests of liver function help in identifying liver disease, in estimating the damage to the liver and the chances of recovery, and in evaluating the treatment.

The levels of bilirubin in the blood are determined to confirm the presence of jaundice and to follow progress. Increased quantities of the enzyme alkaline phosphatase are found in the blood serum when the bile ducts are obstructed or when the liver is cirrhotic or contains tumours or abscesses. Because high serum levels of the enzyme may be caused by bone disease, further tests may be necessary; levels of the serum 5-nucleotidase enzyme are normal when there is disease of bone and elevated in the presence of liver or bile duct disease.

Obstruction of bile ducts may elevate blood cholesterol levels. If the obstruction continues for some time, cholesterol may be deposited in the skin. These deposits, called xanthomas, are found especially in the upper eyelid.

When the hepatic cells are damaged by disease, various enzymes, including glutamic oxalacetic transaminase (GOT, also called aspartate aminotransferase) and glutamic pyruvic transaminase (GPT, also called alanine aminotransferase), leak into the blood. Determination of transaminase levels in the blood serum helps in early identification of acute virus hepatitis, especially during epidemics, and in uncovering cases not made evident by the presence of jaundice.

Levels of glutamic pyruvic transaminase are especially high in active chronic hepatitis and are elevated in liver disease due to alcoholism.

Low serum levels of albumin suggest the presence of chronic liver disease such as cirrhosis, and abnormally high serum levels of the protein globulin are suggestive of chronic liver disease such as active chronic hepatitis and cirrhosis of the alcoholic when in relapse. The type of globulin that is present in abnormally large amounts also is significant as a clue to the type of abnormality: increase of gamma globulin, for example, suggests hepatic-cell disease, while an increase of alpha and beta globulin is indicative of bile-duct obstruction.

Bromsulfalein test

A bromsulfalein (BSP) test is of value in evaluating liver function in the absence of jaundice. The dye bromsulfalein is injected into a vein, and blood samples taken from veins 30 to 45 minutes later. After 45 minutes persons whose livers function normally retain in their blood 4 percent or less of the dye administered. Retention of greater amounts of the dye is observed in a person whose liver is fatty but not cirrhotic. The test may suggest that a drug that is being administered is injuring the liver.

Needle biopsy, a method of obtaining a sliver of liver tissue for examination, is performed in a hospital and is carried out only on persons whose blood clots normally. A small hollow needle is inserted into the liver after administration of a local anesthetic, and a core of tissue is obtained. The fragment of tissue is examined under a microscope, and further investigations may be made into whether disease organisms are present. Diagnosis of cirrhosis, tumours, infections, and jaundice may be reached by this method. A series of such biopsies is sometimes carried out to follow the results of treatment.

In scintiscanning, a small amount of radioactive substance is introduced into the body and the scintillations, or flashes, on a screen sensitive to the radiation are recorded by an automated process. The apparatus required for scintiscanning requires a heavy investment, but the method does not tax the patient. The positions of tumours, cysts, and abscesses can be determined in this way, and liver deformities can be indicated. If the liver as a whole shows a patchy uptake, cirrhosis may be suggested.

LIVER DISEASE

Symptoms and signs of liver cell failure. The hepatic, or liver, cell may fail to function because of hepatitis or cirrhosis, less commonly, because tumour cells have spread through the liver or because blood flow through liver arteries or veins is obstructed. The hepatic cells may be poisoned by such substances as carbon tetrachloride, phosphorus, or certain drugs.

The most common symptoms are weakness and a tendency to become fatigued. Jaundice is another indication. The skin is usually warm, and the blood pressure low. There is often a slight fever. The breath has a characteristic sweetish, slightly fecal odour, known as fetor hepaticus. Inability of the hepatic cell to synthesize blood-clotting factors may lead to easy bruising and nose bleeds. In the skin of the face, shoulders, arms, and hands, lesions can be seen that are called vascular spiders because of their resemblance in shape to spiders. Each lesion is made up of a central arteriole (minute artery), which forms the spider body, and numerous small vessels radiating from the arteriole like spider's legs. The larger vascular spiders may pulsate. The palms of the hands may be bright red, an appearance that may also be present in rheumatoid arthritis, in pregnancy, and when the thyroid gland is overactive.

Mental and neurologic changes

Liver disease of almost every type may be complicated by mental changes. The affected person may be apathetic, slow to respond, and then sleepy and finally may go into a coma. Mental capacity may decrease in the chronic case. Speech may be slow and slurred. The so-called flapping tremor is the most characteristic neurologic symptom. This is seen when the person affected stretches his arms out in front of him. A person with this tremor may tend to drop things and may experience difficulty in handwriting.

The brain waves, as recorded in the electroencephalogram, are symmetrical, large, and slow—changes similar to those found in other metabolic disturbances of the brain.

The mental disturbances in liver disease have not been completely explained. A meal heavy in proteins may precipitate the symptoms, and they may be decreased by oral antibiotics. These characteristics suggest that some toxic substance formed in the intestines by the action of bacteria on proteins may be responsible, at least in part, for the mental disturbances. The toxic substance, which may be ammonia, may reach the brain because the liver has failed to remove the substance from the bloodstream. Other possible causes include low levels of electrolytes (*e.g.,* sodium, chloride, bicarbonate, in solution) in the blood as a result of efforts to remove excess fluids from the tissues or of bleeding into the gastrointestinal tract.

Treatment directed toward relief of the mental disturbances includes restriction of dietary protein, maintenance of calorie intake, oral administration of antibiotics, and measures to maintain free bowel action.

Ascites, the accumulation of fluid in the peritoneal cavity (between the membrane lining the abdominal cavity and that covering the organs and structures in the abdomen), is usually preceded, in persons with liver disease, by accumulation of fluid in the ankles. Ascites causes the abdomen to feel unpleasantly distended and may interfere with breathing. With the increased body weight there may be abdominal hernias. The muscles become extremely wasted. The fluid is examined by taking a sample through a puncture in the abdominal wall (paracentesis), and the affected person is placed on a low-sodium diet and given diuretics—drugs that increase urine production.

Acute hepatitis. Acute virus hepatitis (inflammation of the liver), which includes the varieties known as infectious hepatitis (IH) and serum hepatitis (SH), is believed to be caused by more than one virus, although the viruses have not been conclusively identified. In the 1960s an antigen (a substance, most often a protein or a polysaccharide, that causes the formation of antibodies) was found in 20 to 40 percent of persons who were in the acute stage of virus hepatitis. The antigen, known as Australia antigen, or hepatitis-associated antigen, is identified in persons with serum hepatitis and may actually be part of a virus that causes hepatitis, for persons given transfusions of blood containing the antigen often develop recognizable virus hepatitis.

The only proven sources of infection with virus hepatitis are human blood, urine, and feces. That the virus is present in high concentration is suggested by the fact that as little as 0.0005 millilitre (0.00002 ounce) of whole blood is infectious. Immunity probably develops with age, since the disease is less common in older persons than in children and young adults, but susceptibility to serum hepatitis does not decline in the same manner.

Spread of infectious hepatitis

Infectious hepatitis is usually spread by fecal contamination of food or drink, although it can be transmitted by infection of blood. The disease may occur as sporadic cases after person-to-person contact or in large epidemics after widespread contamination of water or food. At least three epidemics have been caused by the consumption of raw clams or oysters from polluted waters. The disease becomes manifest about 15 to 40 days after exposure.

Serum hepatitis, which causes symptoms about 50 to 160 days after exposure, is usually transmitted by injection. The virus may be in whole blood, plasma, fibrinogen, or the globulin used to treat hemophiliacs, or infections may come from the use of instruments such as syringes, needles, or lancets that have been contaminated with human blood containing the virus.

A person is usually immune for the rest of his life after an attack of infectious hepatitis and probably always gains immunity from an attack of serum hepatitis. Neither form of virus hepatitis brings immunity to the other form, however.

Serum and infectious hepatitis cause the same abnormalities in the liver tissue. These are essentially inflammation and destruction of hepatic cells. The framework of the liver is not affected, and, with recovery from attack, the liver tissues usually return to normal.

Attacks of virus hepatitis vary from slight distress to a serious illness that culminates in coma and death. Usually there is jaundice after three days to two weeks of ill health marked by failure of appetite, nausea, aversion to smoking, and a dull pain in the right upper part of the abdomen. There is moderate fever. Just before the appearance of jaundice, the liver is tender and perceptibly larger. The urine takes on an orange-brown colour, the feces lighten, and jaundice shows in the whites of the eyes. When jaundice spreads to the skin some of the physical distress disappears and the appetite improves. For a few days the skin may itch. During the illness there may be a loss in weight of about ten pounds (five kilograms).

About three to ten days after the onset of jaundice the convalescence begins. Feces regain their usual colour, and the jaundice disappears.

An adult may be ill for two to six weeks and may experience lassitude and a tendency toward fatigue for as long as six months.

From 2 to 15 percent of persons who recover from virus hepatitis have relapses. Some of the relapses are like mild recurrences of the original attack, but most are manifested merely by chemical abnormalities in the blood. Usually when a relapse occurs it is because of a too early return to activity or to drinking alcohol. After relapses, as after the original attack, there is usually complete recovery.

Children sometimes have acute attacks of hepatitis without showing jaundice. The symptoms are like those of gastroenteritis; that is, like the effects of inflammation of the stomach and intestinal lining. Tenderness and enlargement of the liver may be noted. Identification of the disease may be based upon a number of factors, including a history of association with a person who had the disease, the finding of bilirubin in the urine, evidence that the liver is not functioning normally, or, occasionally, the results of a needle biopsy of the liver. Cases of hepatitis not accompanied by jaundice may account for the way in which immunity to the disease spreads in a community.

Fulminant hepatitis

Rarely, a hepatitis attack is of a severe type, sometimes called acute fulminant hepatitis, that makes the patient gravely ill usually within ten days of the onset of the disease.

In the cholestatic form of jaundice the decrease in the flow of bile is similar to that which occurs in obstructive jaundice after surgery. The skin itches, and jaundice is persistent. Recovery is usually complete after an illness of eight to 20 weeks.

In major outbreaks of hepatitis, the death rate is about one to two persons per 1,000. Infectious hepatitis causes fewer deaths than serum hepatitis. An average young adult usually is ill for about six weeks and rarely is ill longer than three months. In children the attacks tend to be milder. Cirrhosis as a result of hepatitis is extremely rare, and, to judge from follow-up investigations of epidemics in the Middle East in World War II, in the Korean War, and in Delhi, an attack of hepatitis does not increase the likelihood of chronic liver disease.

To prevent the spread of infectious hepatitis, great care must be exercised in the practice of sanitation, especially with respect to the disposal of feces. The feces of an infected person contain virus for as much as two weeks before jaundice appears, so that the disease may be widespread before a diagnosis is made. Consequently, isolation of ill persons and of contacts is unlikely to have much effect on the spread of the hepatitis.

Persons (and particularly pregnant women) who are in close association with one who is ill with hepatitis are sometimes given an injection of gamma globulin to prevent spread of the disease.

The spread of serum hepatitis is prevented by avoiding unnecessary use of blood products and by taking care that any injections that are made are sterile. Blood to be transfused must be screened for Australia antigen. Whole blood that is contaminated with hepatitis virus cannot be sterilized. Blood donors who have previously given blood a number of times without infecting recipients with hepatitis are the safest donors. It has not been definitely proved that gamma globulin is effective in preventing serum hepatitis.

Current forms of treatment do not hasten recovery from virus hepatitis. A person with the disease should stay in bed as long as he has jaundice; his convalescence lasts about twice as long as the period of bed rest. Early in the disease, when there is a tendency toward nausea, a diet low in fat is recommended. A patient is advised to increase his exercise gradually after recovery and to abstain from alcohol for at least six months and preferably for a year.

In newborn infants a number of organisms can cause hepatitis, including German measles (rubella), Coxsackie and ECHO (enteric cytopathogenic human orphan—

which means that the virus attacks the cells of the human intestine but was once thought not to cause disease) viruses, and the organisms that cause toxoplasmosis and syphilis.

Drug-associated liver injury. Jaundice may result from injury to the liver by such substances as carbon tetrachloride, cytotoxic (cell-destroying) drugs used in treatment of psoriasis or leukemia, phosphorus, or the tetracycline antibiotics, if extremely large doses are given by injection into a vein.

Drugs such as the newer drugs used in treatment of tuberculosis or the anesthetic halothane may, in very rare instances, have effects almost indistinguishable from those of virus hepatitis. The illness is not affected by the size of the dose and seems to be caused by individual sensitivity to the drug. Treatment is similar to that for virus hepatitis.

An obstructive type of jaundice can result from taking certain steroid compounds, including some that are contained in some of the oral contraceptives. The jaundice is more severe if the affected person already has some form of liver disease, such as cirrhosis or hepatitis. The jaundice tends to disappear as soon as taking of the drug is stopped.

Causes of cirrhosis

Cirrhosis of the liver. Cirrhosis, a chronic liver disease that is irreversible, is characterized by widespread fibrosis and nodule formation (replacement of functioning liver tissue with bands and small lumps of scar tissue). It has a number of possible causes, including virus hepatitis, alcoholism, obstruction of bile channels, heart failure, obstruction of the hepatic vein, deposition of iron (hemochromatosis) or copper (Wilson's disease), and some forms of metabolic disease. In many instances the cause is not known.

Cirrhosis causes hepatic-cell failure and abnormally high pressure in the portal vein—portal-venous hypertension. The effects of hepatic-cell failure have already been touched upon. They include fatigue, jaundice, easy bruising and bleeding, mental changes, ascites, and the appearance of vascular spiders.

The portal-venous hypertension is the result of fibrosis and formation of nodules; these interfere with portal blood flow through the liver. The portal vein brings venous blood to the liver from the intestines and the spleen. Obstruction to the portal-venous system and resultant hypertension in the portal vein cause back-pressure enlargement of the spleen, and this, in turn, causes the spleen to be overactive in destruction of red and white blood cells and platelets. Blood in the portal vein, being prevented from flowing through the liver, is diverted to important veins in the area of the stomach and the esophagus (gullet). Rupture of these swollen veins leads to hematemesis and melena—vomiting of blood and passing blood in the stools. This loss of blood is a common cause of death in persons with cirrhosis. The swollen veins in the esophagus and the state of the portal system can be detected by X-rays. The blood pressure in the portal system can also be measured directly.

Enlargement of the spleen or liver, jaundice, gastrointestinal bleeding, and ascites are among the early effects of cirrhosis. In treatment, the cause of the cirrhosis is eliminated if possible. For example, heart failure is controlled and obstruction of bile ducts is removed. Avoidance of alcohol, restriction of salt (sodium) in the diet, and administration of diuretics are other measures taken. If coma threatens, the amount of protein eaten is reduced and oral antibiotics (*e.g.*, neomycin) may be given. If there is bleeding, blood volume may be restored by transfusion and measures may be taken to reduce the hypertension and stop the bleeding.

Alcoholism is clearly associated with cirrhosis of the liver. There is a direct relationship, in Western countries, between the amount of alcohol consumed and the prevalence of cirrhosis. Daily ingestion of at least a pint of spirits (hard liquor) for more than ten years seems necessary for severe liver damage to occur. It is the quantity of alcohol that is important, whether it is in beer, spirits, or wine. The incidence of cirrhosis is, however, only about one in 12, even among severe alcoholics.

The injurious effect of alcoholism on the liver is principally from its interference with the metabolic processes of the liver. The tendency of the alcoholic to eat inadequate amounts of protein probably contributes to the damage. In the liver are gross fatty changes, and inflammation surrounds areas in which hepatic cells are destroyed (alcoholic hepatitis). Later, genuine cirrhosis develops.

Effects of alcoholism

In early stages of the disease, the alcoholic shows no loss of weight and may even be obese. Abnormalities present may include anemia, vitamin deficiencies, inflammation of the pancreas, and inflammation of the peripheral nerves. Chronic gastritis (inflammation of the stomach lining) results from loss of appetite, early morning nausea, and retching. The affected person has difficulty in concentrating and exhibits a tremor. The ankles are swollen and there may be nosebleeds. Enlargement of the liver and vascular spiders on the skin are other features.

The cirrhosis resembles that resulting from other causes but the prospects for survival in alcoholic cirrhosis are better than in other types. If the alcoholic abstains, he has two chances in three of surviving five years. He has two chances in five of surviving this long even if he continues to drink.

An alcoholic with cirrhosis shows striking improvement in condition when he has rested in bed and stopped consumption of alcohol. If coma does not threaten, a diet high in protein hastens recovery. Such people must avoid all forms of alcohol for the rest of their lives.

Active chronic hepatitis. Active chronic hepatitis, sometimes called lupoid hepatitis, is a form of cirrhosis that attacks primarily young persons, usually girls and young women between the ages of ten and 30. Most cases have no obvious cause, although some seem to progress from an acute virus hepatitis. There is persistent jaundice and usually there is failure to menstruate. About 50 percent of persons with the disease also have other abnormal conditions that seem to have no relation to the liver; these may include pain in the joints, ulcerative colitis, diabetes, and thyroiditis and nephritis (inflammation of the thyroid and the kidney).

In the liver there is inflammation and formation of scar tissue, resulting finally in true cirrhosis. There is substantial evidence that there is an immunological disturbance involved (a reaction against a foreign protein or against a protein in the body's own tissue). For this reason corticosteroid drugs are given. They do not prevent the progression to cirrhosis but do prolong life, bringing relief from fatigue and decrease in jaundice.

The mean survival from this type of cirrhosis is about five years, but some affected persons survive as long as 16 years.

Miscellaneous forms of cirrhosis. Hemochromatosis, a type of cirrhosis in which there are abnormal deposits of iron in the liver and other organs, causes diabetes because of the iron deposits in the pancreas, and sexual incapacity because of deposits in the endocrine glands. In treating persons afflicted with hemochromatosis, iron is removed from the body by multiple bloodlettings (venesections). This is very successful.

Wilson's disease

Copper deposits in the liver and in other tissues are characteristic of a rare form of cirrhosis known as Wilson's disease, or hereditary hepatolenticular degeneration. Deposits of copper in the brain may cause tremor and other abnormalities related to the nervous system. A brownish-green coloration of the cornea of the eye, called Kayser–Fleischer rings, is also caused by the copper deposits. Wilson's disease is treated by administration of penicillamine. This drug removes copper from the tissues and causes its excretion in the urine.

Obstruction of the bile ducts, with pigmentation and itching of the skin, may lead to biliary cirrhosis. There are two types, called respectively primary and secondary biliary cirrhosis. The primary type, a rare disease that occurs chiefly in middle-aged women, begins with inflammation of the small bile ducts in the liver, which are finally destroyed. Secondary biliary cirrhosis may occur after a chronic obstruction of the bile ducts, as from gallstones or the constriction of bile ducts after surgery.

Tumours of the liver. Both benign and malignant growths affect the liver, but the benign growths are of little significance. Cancers of the liver are common. Of these, secondary cancers (growths that originate outside the liver) are 25 times more common than primary cancers.

Primary carcinoma of the liver cells (malignant hepatoma). Malignant hepatoma usually follows upon cirrhosis, although about one case in three occurs spontaneously. This type of cancer occurs most frequently in tropical areas. The prevalent theory of its causation is that it is due to ingestion of food contaminated with carcinogens from fungi. It may also be related to Australia antigen-positive virus hepatitis.

Among the early manifestations of the cancer are pain in the area of the liver and enlargement of the organ. There may be ascites and some of the features of cirrhosis.

No cure is currently available. On the average, the terminal illness lasts about seven months.

Secondary tumours of the liver. Metastases—secondary tumours spreading through the bloodstream—occur more frequently in the liver than in any other organ. One-half of the cancers of the stomach, breast, lung, pancreas, and colon—and about one-third of all metastasizing cancers—metastasize to the liver. The liver may contain only one or two microscopic growths, or the secondary tumour may involve the whole liver, which becomes enormously enlarged. Treatment is only palliative, there being no cure available.

Infections of the liver. *Pyogenic liver abscess.* Pus-forming abscesses of the liver are less common than formerly, as a result of the development of antibiotic treatment of infection and the earlier diagnosis of acute appendicitis, which is the most frequent cause of liver abscess.

Effects of the presence of the abscess include shivering, sweating, a high temperature, and weakness. Tenderness and enlargement of the liver are noted. The location of the abscess is determined by X-rays and scintiscanning, antibiotics are administered, and the abscess may need to be drained by surgery.

Abscesses, of a type called cholangitic, develop when pus forms in the bile ducts inside the liver above a mechanical obstruction in the main bile ducts. Gallstones and narrowing of the duct after surgery are the principal causes. Symptoms include pain in the liver, jaundice, and fever. The person affected is given antibiotics and the common bile duct is drained by surgery.

Amebic liver abscesses

Amebic liver abscesses are caused, as the name indicates, by an amoeba *(Entamoebn histolytica)*, a parasite which lives in the wall of the large intestine and is brought to the liver in the portal vein. An enzyme produced by the amoeba destroys liver tissue and causes formation of an abscess. Amebic liver abscess is ordinarily a disease of the tropics and subtropics.

About one-fourth of the persons with amebic liver abscess have had amebic dysentery previously. Sufferers are ill, but their fever is moderate (their temperature rarely is higher than 103" F, or 39° C). There is pain over the liver, and the liver itself is tender and enlarged. If the abscess ruptures and contaminates the lungs or the abdominal cavity, there may be a secondary pyogenic (pus-forming) infection that causes the patient to be gravely ill, with a high fever.

The abscess is located by use of X-rays and scintiscanning, and the pus may need to be aspirated (drawn out with a syringe and needle). Amebic dysentery can be diagnosed by the appearance of the pus, which is characteristically thick and brown. The response to drainage of the pus and treatment with anti-amebic drugs is often striking.

Tuberculosis of the liver. Generalized tuberculosis usually affects the liver, but ordinarily this aspect of the disease is not important and is not even discovered during the patient's lifetime. The diagnosis of tuberculosis of the liver may be made by needle biopsy of the liver. Jaundice may be present, not as the result of tuberculosis but because of the effect of antituberculosis drugs or as a result of a simultaneous attack of virus hepatitis.

Syphilis of the liver. Syphilis of the liver is now rare. When it occurs it may be as a result of heavy involvement in congenital syphilis, with the ultimate result of scars around the hepatic cells. Jaundice in newborn infants may be one result of this involvement. The liver may also be infected in the secondary stage of syphilis, and in tertiary syphilis there may he liver abscesses or gummas (rubbery, tumourlike formations). Treatment is by antibiotics.

Weil's disease. Weil's disease is a form of hepatitis caused by infection with *Leptospira icterohaemorrhagiae* from the urine of infected rats. It occurs most often in men engaged in such pursuits as farm work or coal mining. The disease results in deep jaundice; but death, when it occurs, is usually from heart and kidney involvement.

Schistosorniasis (bilharziasis). Schistosomiasis, infestation with the parasite *Schistosoma mansoni* or, more rarely, with *Schistosonza japonicum,* is found in Africa, the Far East, and areas of South America and the Caribbean. The organisms penetrate the liver by way of the portal vein and cause inflammation within the liver in the terminal branches of the portal vein. The inflammation results in obstruction of these small veins and a rise in blood pressure within the portal vein. The portal hypertension in turn causes enlargement of the spleen and development of varicose veins in the esophagus (gullet). If the veins rupture, there is vomiting of blood. Treatment is with preparations of antimony (tartar emetic).

Hydatid (echinococcal) disease. Hydatid disease, also called echinococcal disease and echinococcosis, is infestation with a small tapeworm, *Echinococcus granulosus,* the larvae of which form cysts (hydatids) in the liver and lungs. The disease is important in sheep-raising areas, especially Australia, New Zealand, Africa, South America, and southern Europe, where the infestation spreads to man from the excreta of dogs that have eaten the entrails of infected sheep. The fluid of the hydatids contains a foreign protein that sensitizes the host. The sensitization may develop into severe anaphylactic shock but more often causes recurrent itching wheals on the skin. The cysts are dealt with surgically.

Effects of hydatid fluid

Liver flukes. Flukes that invade the liver include the Chinese liver fluke *(Clonorchis sinensis)* and the common sheep fluke *(Fasciola hepatica). Clonorchis sinensis* is found in the inhabitants of East Asia and in immigrant Chinese elsewhere. It enters the body in raw or partially cooked fish and causes inflammation of the bile ducts (cholangitis). Of the instances of primary cancer of the liver observed in Hong Kong about one case in six occurs after infestation with liver flukes.

Fasciola hepatica is most common in middle and western Europe and in the Caribbean. Infestation in man comes principally from sheep by way of an intermediate host, a snail that contaminates watercress and other greens, particularly in wet summers.

Glycogen-storage disease. The glycogen-storage diseases, resulting from the excessive retention of glycogen in the tissues, are inherited and of several types, which have differing enzymatic and structural defects in the glycogen and vary in the severity and course of the disease. In all types there is failure to maintain glucose at normal levels in the blood by the liver's production of glucose and the influx of glucose from the intestines.

The first sign of glycogen-storage disease in the infant is usually an enlarged liver. The spleen is not enlarged as it is in the lipid-storage diseases.

The diagnosis is confirmed by noting the failure of glucose levels in the blood to rise sufficiently in response to stimulation of liver breakdown of glycogen.

Liverpool

A city of barely 520,000 inhabitants and the core of Merseyside, a metropolitan area containing some 1,500,000 people, the Liverpool of the early 1980s remains an enigma in modern Britain, a unique blend of cosmopolitanism and parochialism. Three centuries of far-flung maritime trade may have dominated the life of Liverpool and broadened the horizons of its citizenry, but a fierce loyalty and pride, far in excess of the normal "hometown" feeling, remain interwoven with these outgoing attitudes. A visitor may find this local affection for a grimy commercial centre, from which some of the worst British examples of overcrowding and poverty are only gradually being eradicated, difficult to understand. The feelings in question may stem, in part, from the city's long-standing social isolation from adjoining Lancashire, but they are primarily derived from the warmth and vibrance of a folk culture second to none in Britain. There is little modern significance in the distinction between the Liverpool man of commerce and the Manchester industrialist expressed in the 18th-century aphorism "Liverpool gentleman, Manchester man." The separate character of Merseyside stems from a 19th-century immigration whereby impoverished Celtic (and particularly Irish) migrants contributed a distinctive accent and cultural style to the area. A paradox was thus created: the confirmation of the social isolation of Merseyside at a time when the economic integration of the port with its industrial hinterland was proceeding apace.

The special character of the city

Although the flat catarrhal accents, blunt aggressive style, and deadpan expression of the typical "scouse" or "wacka" (informal variants of the more official "Liverpudlian") are restricted to a few miles around the docks, the continued popularity of the seemingly endless stream of local comedians and other entertainers who have won national acclaim has made these attributes familiar to the rest of Britain. Such national fame may also be attributed to the success of two of the premier soccer teams in the country, Liverpool ("the Reds") and Everton ("the Blues"), who are urged on each week during the football season by regular local crowds of more than 45,000 enthusiastic—and often choral—supporters. It was during the 1960s, however, that local characteristics received their widest exposure: under the leadership of the Beatles, the vibrant sounds of the "Mersey Beat," a rhythm-and-blues derivative with marked local features, made Liverpool, for a few hectic years, the Mecca of the international world of popular music. By the early 1980s, the peak of such adulation had passed, but folk culture, in music and in verse, remains very much alive in Liverpool public houses and clubs.

In more formal terms, Liverpool is an urban centre of northwest England with most of the economic and cultural attributes of a large city: two daily newspapers, the larger of which, the ***Liverpool Daily Post,*** has an extensive circulation outside the city in North and Mid Wales; one of the largest provincial universities and medical schools in the United Kingdom, with an enrollment exceeding 7,000 students; a professional symphony orchestra (the Royal Liverpool Philharmonic), two large choirs (Philharmonic and Welsh Choral), and many other smaller orchestral and choral groups. Liverpool entered the 1980s with generally well-supported theatres, and the city is one of the few in Britain that does not depend on massive infusions of government aid for the arts. Strong circulation for a local monthly magazine in this field reflects this interest.

Architecture

Such commitment to the arts is not, however, reflected in the physical fabric of the city. Liverpool does possess small features of architectural work, notably the restored Georgian elegance of Abercromby Square and other precincts around the university, together with the solid porticoed magnificence of the Albert Dock and other early 19th-century granite quays and wharves. Apart from these individual buildings and the extensive parks that occupy almost one-twelfth of the city, Liverpool lacks any architectural or environmental areas of distinction. Even the Neoclassical buildings comprising the central cultural precinct of St. George's Hall, the Merseyside County Museum and Library, and the Walker Art Gallery present a confused, rather than a dramatic, perspective due to an orientation along rather than across their sloping site. The visual effect of this area is further lessened by the litter of traffic signs and parking lots lying close to the Mersey Tunnel, which is the major routeway under the Mersey to the Wirral Peninsula, nearby Cheshire, and beyond. Only in the two cathedrals is any sense of civic drama restored, and even these are of recent origin. The red sandstone Anglican Cathedral, the largest church of its denomination in England, was begun in 1904 by King Edward VII. Built in a massive neo-Gothic style, the cathedral was completed in 1978. Its nearby Roman Catholic counterpart, the Metropolitan Cathedral of Christ the King (1962–67), is constructed in contrasting materials of concrete, glass, and aluminum. It has an ultramodern design: the central altar is surrounded by a cone-shaped building topped with a pillared cylindrical core representing a crown of thorns.

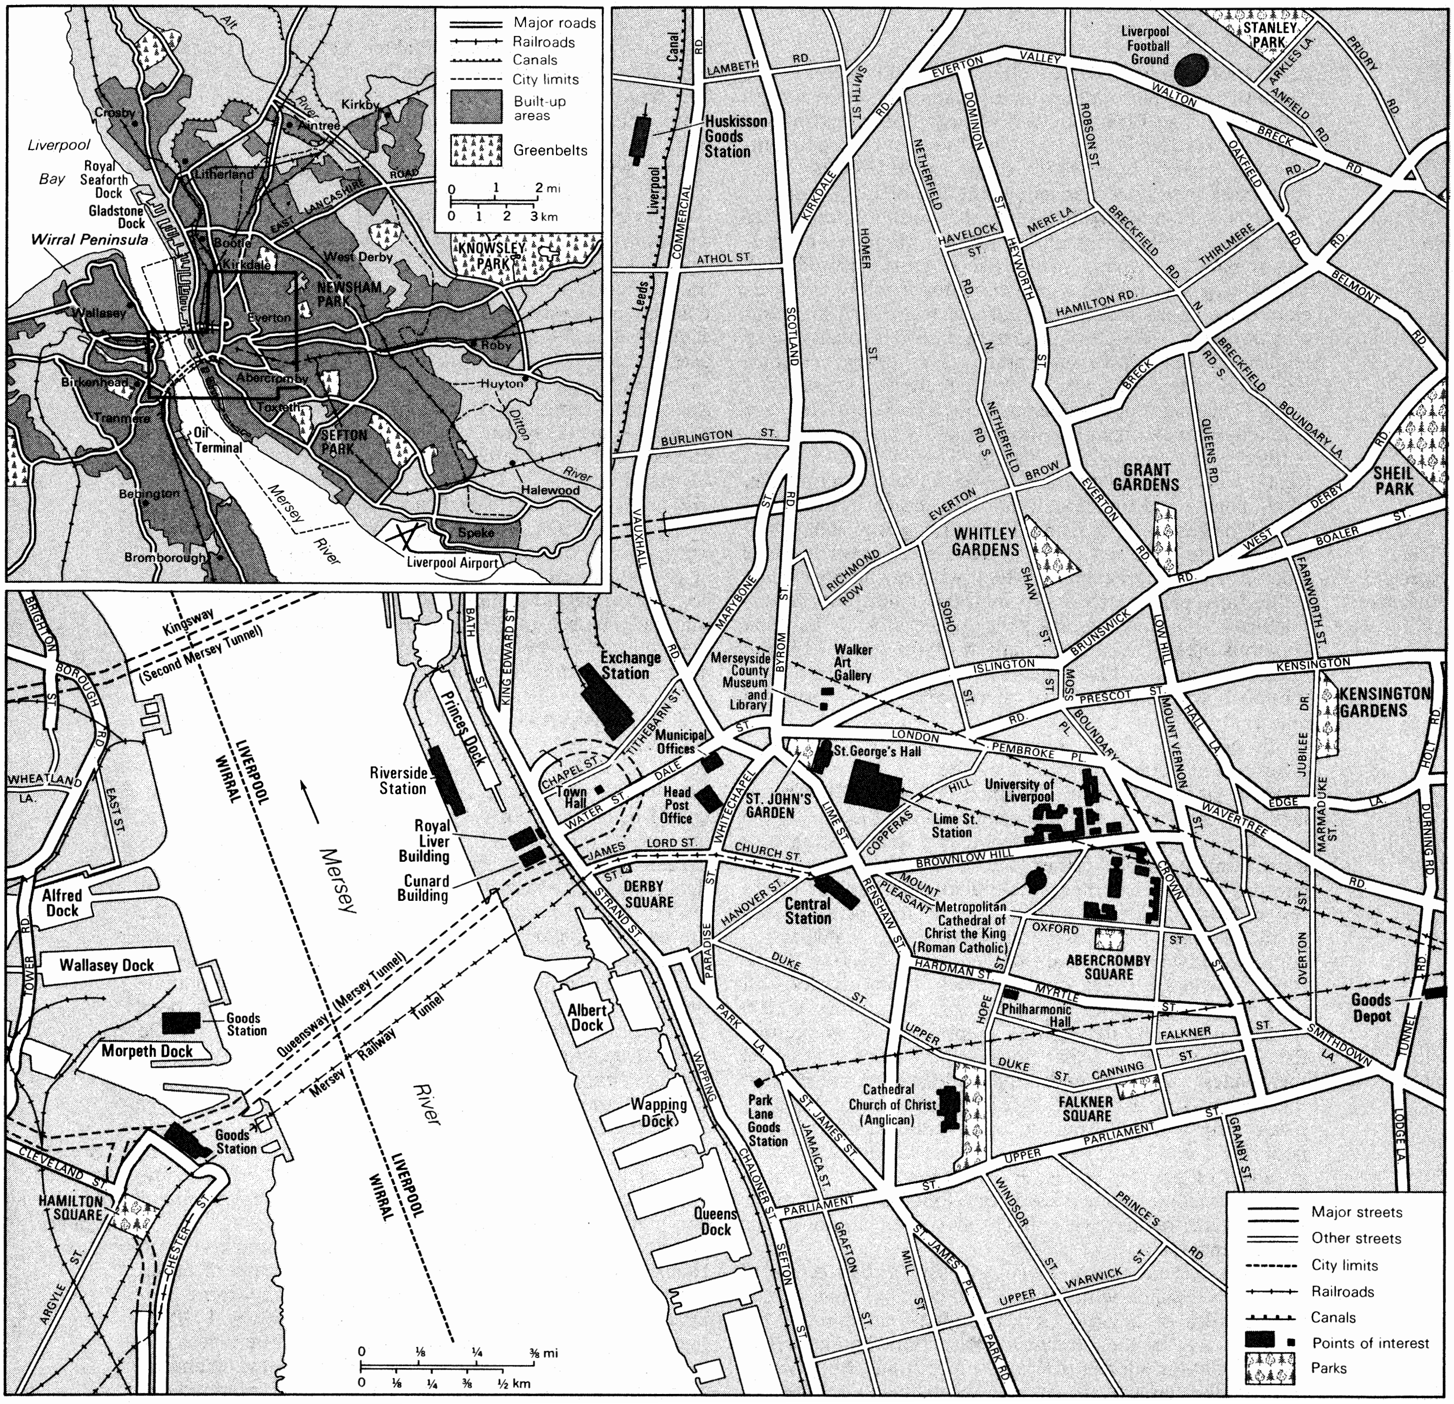
History. The first significant date in the history of Liverpool is 1207, when King John of England granted a charter for a planned new town. Although it was located at the narrowest part of the funnel-shaped Mersey Estuary, the initial advantage the town derived from its site was the presence of a short but widemouthed tidal creek, draining one of the sandstone ridges that rise 200 feet (60 metres) on both sides of the river above a gently undulating plain. Only in the last two centuries, with the technological development of ships with a deeper draft, has the tidal scour created by the shape of the estuary and the depth of water (28 feet at low spring tide) become an asset to development. In all probability, the town acquired its name from a hamlet lying on the other side of the "pool" created in the creek at high tide, but this partial continuity of settlement was of little economic significance. The stimulus to the growth of a small coastal trading centre came from the physical protection of the site and the legal privileges provided by royal charters.

Medieval growth was slow and halting. Not only was the town located in what was a remote and sparsely populated corner of England but also the area had long been dominated by the fortress and port of Chester on the River Dee. As a result, the young settlement did not reach a population of 2,000 until 1660. By then, the silting of the Dee, allied with the development of larger ships, tilted the balance of the Irish and coastal trade from Chester to Liverpool. It was the profitable return in 1667 of the ship "Antelope" from a trading journey to the West Indies that may be taken to signify the first major boom in the importance of Liverpool.

Development of the city as a port

During the next 70 years, the growth of commerce with North America, combined with the illegal spoils of privateering, made Liverpool the second most important port in Britain, with a population reaching 15,000 by 1730. A significant element in the general trading pattern was the famous, or infamous, Liverpool Triangle—the exchange of manufactured goods from the Mersey hinterland for slaves in West Africa who were in turn traded for sugar, molasses, spices, and other plantation crops in the West Indies. Although modern research has called into question the continuity implied by the threefold links, these activities were still of considerable economic importance. Not only were three sets of profits possible but the trade provided a stimulus to the manufacturers of an economically poor region, and it is the gradual industrialization of its hinterland that provided the key to Liverpool's progress.

Such developments placed additional demands upon the initial site of the town, which proved inadequate. The pool was filled in by 1715, creating the first dock, and by the end of the century four other docks were established along the Mersey, enclosing 30 acres (12 hectares) of water and forming two miles (three kilometres) of quays, so that the port outranked even London in dock space. Yet capitalization upon the advantages of the estuary rather than the pool was only one of the preconditions for the city's growth. A more important one was the construction of an economic transport network to the hinter-



Central Liverpool and (inset) its metropolitan area.

land, especially to the Lancashire coalfield and the Cheshire saltfields. Local improvements in river navigation and canals were at the forefront of world development and culminated, in 1830, in the Liverpool and Manchester Railway, the first in England to link two major cities. By the mid-19th century, a rail network providing easy and cheap access to all major British industrial centres had been created. The establishment of steam ferry links between Liverpool and the expanding centres of the Wirral was a parallel local development.

Nineteenth-century expansion

These changes were reflected in the growth of population. In 1801 Liverpool had 78,000 inhabitants and was the only town of any size in the area. During the next 50 years the city's population increased fourfold, but the extension of the docks system along the estuary, and later on the Wirral shore, enabled the Merseyside region as a whole to attain a population of 500,000. This growth was characterized by persistently high levels of immigration from surrounding areas and from Ireland, especially during and after the Irish famine (1845–48). Indeed, a measure of the effect of this disaster is the fact that no fewer than 300,000 Irish emigrants disembarked at Liverpool in 1847, many to settle permanently in the area.

Accommodation of such a rapid population increase proved difficult and led to overcrowding and squalor. An 1846 survey, for example, revealed that 40,000 people were living in 8,000 cellars in Liverpool. Expansion of the built-up area beyond the city—at Everton, Kirkdale, and West Derby, for example—did occur, with monotonous rows of terraced houses springing up behind the docks. In the second half of the 19th century many of these small townships were annexed by the city, but subsequent extension of the city limits took place to the south and east, leaving the contiguous built-up areas of Bootle, Litherland, and Crosby to the north as independent administrative entities.

Although immigration continued at high levels, the growth of population until the beginning of the 20th century was dominated by the natural increase of a fertile and youthful people. By 1901 Liverpool had reached a population of 147,000, with more than 1,000,000 in Merseyside as a whole. Clearly dominating its surroundings—and doing so in a much more extensive way than is the case in the six other major British metropolitan regions—Liverpool had become the centre of seven miles of docks extending along the Mersey from Hornby (1884) in the north to Herculaneum (1866) in the south, with additional developments at Birkenhead on the Wirral shore. It was also the principal exporting port in the country, handling no less than one-quarter of Britain's foreign trade, as well as a major part of the extensive overseas emigrant movement.

The 20th century has seen the continuation of many of these trends, particularly after the addition of the Gladstone Dock (1927) at the seaward edge of Merseyside. A more decisive theme, however, has been the internal readjustment of the city, with an intensive effort being applied to the eradication of the problems caused by the rapidity of earlier development. All this has been set against a stagnating local economy, which since 1918 has been reflected in a new demographic trend, namely net emigration. Although 81,000 people left the metropolitan area between 1921 and 1939, 55,000 between 1951 and 1961, and 170,000 during 1966–76, levels of natural increase sufficient to offset these losses continued until the early 1970s. Thus, population gains, combined with decreasing household sizes through the early 1970s, served only to aggravate urban sprawl along both sides of the Mersey. During the decade of the 1970s, however, accelerating emigration and a declining rate of natural increase were estimated to have caused in Merseyside a loss of more than 150,000 persons.

Internal population movements. Within Merseyside, considerable population relocation has occurred. Some has been the product of spontaneous growth, as in the case of the development of largely middle-class suburbs outside Liverpool, on the west of Wirral Peninsula, and to the north of the city, in Crosby and Southport. Other trends—notably the decline of population in the central city—have resulted from the deliberate policy of the city's government. Although most of the inner wards of Liverpool were experiencing population loss by 1871, it was not until after World War II that major changes took place. In 1966 the city council drastically upgraded the scale of its previous attempts at housing improvements by the adoption of a seven-year program for the demolition of 33,000 slum dwellings in the inner city, a policy involving the relocation of 100,000 people. Although, by 1970, about 2,000 houses per year were being modernized with the help of government improvement grants, this process, together with the redevelopment of cleared sites at only half their previous residential densities, did not immediately offset the effects of wholesale demolition. By 1980, however, the city and Merseyside as a whole had a housing surplus. By the early 1980s, the city's population had been declining at the rate of almost 10,000 per year for nearly a decade. The most significant decline was in the four inner wards of Kirkdale, Everton, Toxteth, and Abercromby, which lost 25 percent of their population during the 1960s; it was estimated that they would decline by another 30 percent by 1981.

Slum clearance

Clearance of substandard housing has ensured that Liverpool Corporation plays a major role in the city's housing program. Although this trend is not new—Liverpool constructed the first municipally owned housing block in Britain in 1869—the scale of building by the public sector is important: between 1945 and 1970, 85 percent of new housing was publicly owned, and by the early 1980s, the corporation owned about a third of the total existing housing stock. This proportion is even higher if all those areas of council housing on Merseyside that are the products of Liverpool's earlier housing needs are considered. The housing surplus of the late 1970s, however, reduced the public sector to less than 50 percent of new housing constructed during 1976–78. In the late 19th and early 20th centuries, shortage of land for housing drove the council to seek new territory in districts beyond its boundaries, some of which were subsequently incorporated into the city. Most of the more recent large council housing developments remained outside the political control of Liverpool, for example the former Huyton-with-Roby and Kirkby. The latter was created an urban district in 1958 when its population was already about 30,000. Even these peripheral expansions proved inadequate, and, in the 1960s, more than 7,000 families were moved even farther afield, to such "new towns" as Skelmersdale (in Lancashire) and Runcorn (in Cheshire), specifically designated to receive Liverpool "overspill," and to town-development schemes in Cheshire at Winsford, Ellesmere Port, and Widnes and in Lancashire at Burnley.

George's Landing Stage and the Pierhead, Liverpool. The large office blocks are the Royal Liver Building, the Cunard Building, and the Mersev Docks and Harbour Board.

The economy. These decentralization trends have not been reflected in any comparable major shift in the location of commercial activity. Liverpool, and particularly its central business district, exercises a greater degree of dominance over the surrounding metropolitan county than is found in other British cities.

The traditional employment categories of transport, communication, distribution, and shipping are still important in the economic life of the city, representing in the early 1970s about 30 percent of the labour force. This, however, was considerably below the 50 percent level of 1929. The change was mainly because of the decreasing local influence of the port, a feature paralleled by national trends. The trend continued during the 1970s, and by 1978 Liverpool was only fourth among the principal exporting ports in the country: by the early 1980s exports were less than a third of London's, and imports were running at four times the level of exports. Because of this national trend, Liverpool had become the sixth largest port in the country by the late 1970s, with a correspondingly smaller percent of the national dock labour force. It controls only about 5 percent of Britain's foreign trade, and only 1.5 percent of the coastwise trade. In addition, the halcyon days of its role as a major passenger port have passed: by the 1970s it was a poor third to Southampton and London, handling only one-seventh of the passengers travelling to centres outside Europe. Such changes could be attributed mainly to the decreasing significance, in the economic life of Britain, of Liverpool's industrial hinterland and its traditional trading partners, the United States and West Africa. Low capital investment and labour strife in the docks intensified the situation.

Economic significance within the nation

Within the port, the long-established dependence on dry cargo has been maintained, with exports dominated by chemicals, iron, and steel; and imports by cereals, ores, scrap, sugar, wood, and pulp. With the completion in

1969 of a new oil terminal at Tranmere, on the Wirral shore south of Birkenhead, capable by 1980 of handling tankers of 275,000 dead weight tons, crude oil became by far the most important commodity imported. About 13,000,000 tons were imported during the terminal's first year of operations, making the Mersey at the time the third largest oil port in Britain; by the late 1970s imports had declined to only about 3,500,000 tons a year, however. Further improvements included the Royal Seaforth Docks, opened in 1971, and extension of the dock system northward beyond the Gladstone Docks into the town of Crosby.

Manufacturing changes

The economic difficulties of the port have been compounded by major structural changes in the manufacturing base of the area. There was a brief spurt of post-World War II prosperity, followed, toward the end of the 1940s, by a drastic decline in the indigenous manufacturing industries, particularly those associated with the processing of imported goods. A total of 18,000 jobs were lost in the process. Merseyside was designated a development area in 1949, and the government assistance that followed resulted in the provision of about 29,000 new jobs, making a net overall gain of about 11,000 jobs. A persistently high rate of population increase combined with these circumstances to give the region an unemployment rate that approached two and a half times the national average during the course of the 1950s. In the 1960s increased powers given to the government in the matter of industrial location stimulated the establishment of new motor-vehicle plants on Merseyside. These were situated at Ellesmere Port (Vauxhall), Halewood (Ford), and Kirkby (British Leyland Motor Corporation) and involved an investment of £65,000,000 generating 33,000 new jobs. Unfortunately, this did not result in the eradication of local unemployment, which remained above the national average, but it did act as a catalyst in the restructuring of the local economy. No less than 17 percent of the insured workers in the area changed their employment categories in the 1960s, compared with 12 percent in the previous decades. Manufacturing industry, which formerly provided over 40 percent of the employment in Merseyside County as a whole, is no longer dependent on the port but rather upon more modern growth industries.

Locational changes followed in the wake of such structural changes, and a general decentralization of manufacturing industry took place. As in the case of population movement, it was the inner areas of the city that experienced the greatest loss; the dock areas saw both a change in industrial type and an absolute loss. So extensive was the inner city's landscape of empty factories, abandoned buildings, and derelict land that, by the early 1980s, planners could contemplate the use of miles of land adjoining the Mersey for development projects. The moribund national economy could not provide investment capital, however, and local economic managers undertook a campaign to attract foreign, particularly U.S., capital.

Most of the new industry attracted during the 1960s was located on the periphery of the Liverpool district, in the new industrial estates at Kirkby, Aintree, Huyton-with-Roby, Speke, and Halewood, as well as over the Mersey at Bromborough and Ellesmere Port, in Cheshire. It was also possible to recognize the creation of a major industrial axis running from Kirkby along the East Lancashire Road to the Mersey Tunnel and down the east Wirral to Ellesmere Port.

Transportation and administration. The creation of this industrial axis, together with the overall decentralization trends in industry and housing, has placed additional strains upon the communication systems of the area. Despite the series of transportation improvements designed to ease movement across the Mersey—ranging from the early ferries to rail tunnels and culminating in the opening of the Queensway Road Tunnel in 1934—the decreasing significance of the port has meant that the estuary is regarded increasingly as the major barrier to movement in the city, rather than its sole artery. A survey made in the 1960s revealed that 130,000 trips were made across the river on an average weekday, 34 percent by road, 40 percent by rail, and 26 percent by ferry. Even with the relief provided by low car ownership levels in Liverpool (72 percent of households are without cars, compared with 40 percent for the rest of England and Wales), congestion necessitated the opening of a new road tunnel, the Kingsway, in 1971.

Transport in the central city

The historical dominance of the central city within the economy of the region as a whole represented an allied problem. In the early 1970s an inner motorway was being constructed to encircle the commercial heart of the city, but public transportation continued to account for more than 70 percent of trips made to the central area. The Merseyside Passenger Transport Executive, set up in 1969, has as its function overall integration of the existing transportation services, but vital physical links are still missing in the central area: the suburban rail services that enter it terminate at separate stations, Liverpool Central and Exchange, neither of which connects with the major national rail terminal at Liverpool Lime Street. In regional terms, the electrification of the main line to London has eased one problem; but the standard major road links to the rest of the country are still considered inappropriate for a city of Liverpool's size, whereas the airport at Speke remains a subsidiary to the regional airport at Manchester Ringway.

The attention paid by the transportation authorities to Merseyside as a whole, rather than to the city of Liverpool alone, represents the continuation of a trend that began with the creation, in 1857, of an overall ports authority, the Mersey Docks and Harbour Board. A more formal expression of these tendencies may be seen in the work of the Maud Commission on Local Government in England (1969), which recommended the creation of a Greater Merseyside administrative entity. Successive governments modified the original proposals, but, effective April 1974, the metropolitan county of Merseyside came into existence, with a series of distinct authorities exercising wide powers within the overall unit.

Problems and prospects. It remains a matter of conjecture as to whether the land-use changes associated with the creation of a major metropolitan county around Liverpool would alter the distinctive character of the city. The economic problems of the post-World War II era have, however, ensured that Liverpool has not experienced the major influx of Commonwealth citizens, a trend that has altered, in some cases drastically, the ethnic balance in more prosperous British cities. On the contrary, in social terms, the heritage of past immigration streams can still be seen in one of the highest concentrations of Roman Catholics in Britain, whereas the influence of the port may be responsible for the high proportion of unskilled and semiskilled workers (particularly among the unemployed) in the makeup of the city. In spite of these changes, the continuity with its past is still expressed in the attachment to the mythical stone liver birds at Pierhead and the folk song exploits of Maggie May, symbolic features which still characterize the city in the minds of residents and visitors alike.

BIBLIOGRAPHY. Although dated, W. SMITH (ed.), *A Scientific Survey of Merseyside* (1953), remains a classic work on all aspects of the city, containing a valuable historical summary of the town, which has been complemented in recent years by a portrayal of the development of the area through the medium of maps by J.A. PATMORE and A.G. HODGKISS (eds.), *Merseyside in Maps* (1970). More specific historical studies have been usefully collected together by J.R. HARRIS, *Liverpool and Merseyside: Essays in the Economic and Social History of the Ports and its Hinterland* (1969). R. LAWTON and C.M. CUNNINGHAM (eds.), *Merseyside: Social and Economic Studies* (1970); and the DEPARTMENT OF ECONOMIC AFFAIRS, *Problems of Merseyside* (1965), are useful accounts of the socioeconomic conditions of Liverpool and the Merseyside conurbation; D.M. SMITH, *Industrial Britain: The Great North West* (1969), puts these issues in a wider regional context. The port of Liverpool is carefully documented in J. BIRD, *The Major Seaports of the United Kingdom* (1963); the architectural character of the city is vividly portrayed by J.Q. HUGHES in *Seaport: Architecture and Townscape of Liverpool* (1964); whereas D.M. MUCHNICK provides an intriguing account of the process of urban renewal in *Urban Renewal in Liverpool* (1970). More recent works, concentrating on the analysis and solution of

the social and economic problems of the city, include the DEPT. OF THE ENVIRONMENT, ***Change or Decay, Final Report of the Liverpool Inner Area Study*** (1977); a report of Oxford University's DEPT. OF SOCIAL AND ADMINISTRATIVE STUDIES, ***Government Against Poverty***, a report on the 1970–75 Liverpool Community Development Project (1977); and PLANNING RESEARCH APPLICATIONS, ***Liverpool Social Area Study***, 2 vol. (1975).

(W.K.D.D.)

Livestock and Poultry Farming

Livestock is a general term that refers to all animals kept on a farm for use or for pleasure. Poultry includes birds raised on a farm for meat or eggs, In this article, the discussion of livestock includes both beef and dairy cattle, pigs, sheep, goats, horses, mules, asses, buffalo, and camels, while the discussion of poultry comprises chickens, turkeys, ducks, geese, guinea fowl, and squabs. Fur farming is treated in the article FURS. For further information on dairy-cattle breeds, feeding and management, as well as on milk and other dairy foods, see DAIRYING AND DAIRY PRODUCTS. For a further discussion of thoroughbred horses, see HORSE RACING and HORSES. Draft-horse breeds are discussed in DRAFT ANIMALS. Poultry eggs are covered in EGG PRODUCTION, COMMERCIAL. For other general information, see also ANIMAL FEED and DISEASES OF ANIMALS.

An efficient and prosperous animal agriculture historically has been the mark of a strong, well-developed nation. Such an agriculture permits a nation to store large quantities of grains and other foodstuffs in concentrated form to be utilized to raise animals for human consumption during such emergencies as war or natural calamity. Furthermore, meat has long been known for its high nutritive value, producing stronger, healthier people.

Ruminant (cud-chewing) animals such as cattle, sheep, and goats convert large quantities of pasture forage, harvested roughage, or by-product feeds, as well as nonprotein nitrogen such as urea, into meat, milk, and wool. Ruminants are therefore extremely important; more than 68 percent of the world's farmland is in meadows and pasture. Poultry also converts feed efficiently into protein; chickens, especially, are unexcelled in meat and egg production. Milk is one of the most complete and oldest known animal foods. Cows were milked as early as 9000 BC. Hippocrates, the Greek physician, recommended milk as a medicine in the 5th century BC. Sanskrit writings from ancient India refer to milk as one of the most essential human foods.

Significantly, peoples of the developed countries today consume six times as much animal protein per person per day as do those in underdeveloped countries. The United States leads the world in total per capita meat consumption (including poultry and fish) at 304 grams (10.7 ounces) per day (1979), and Lebanon is lowest at 15 grams (0.5 ounce) per day (1979). U.S. per capita daily milk consumption amounts to 405 grams (14.3 ounces; 1979), compared with 772 grams (27.2 ounces) for Finland (1979) and 16 grams (0.6 ounce) for Peru (1979). Israel and Hungary lead the world in per capita egg consumption with 1.1 eggs per day (1979). Of the world's red-meat supply (*i.e.*, excluding poultry and fish), 51 percent is beef and veal, 42 percent is pork, 6 percent is mutton, goat, and lamb, and less than 1 percent is horsemeat. Argentina leads the world in per capita red-meat consumption with 227 pounds (103 kilograms) consumed in 1979.

Farm technology, especially in the U.S. and other developed countries, has steadily improved the rate and efficiency of food production, permitting the average consumer to spend less of his disposable income for foods than he once did. In 1870 the average American spent 58 percent of his disposable income for food. Today he spends 21.7 percent, including 4.4 percent for red meat. In the Soviet Union the average citizen spends 32 to 36 percent of his disposable income for food. Italians spend 20 percent, Frenchmen 26 percent, and Englishmen 30 percent. Less than 4 percent of the U.S. population produces food for the other 96 percent, whereas in colonial times practically all able-bodied people spent the major part of their time in the production of food and fibre.

World livestock numbers. The Food and Agriculture Organization of the United Nations in 1979–80 reported a world population of 61,800,000 horses, 42,800,000 asses or donkeys, 11,600,000 mules, 1,212,000,000 cattle, 763,500,000 pigs, 1,084,000,000 sheep, 445,900,000 goats, 130,500,000 buffalo, and 16,800,000 camels. The United States leads the world in horse population. Brazil has the largest mule population, and China owns more than one-fourth of the world's asses. China also leads the world in hog and goat numbers. India has the most cattle and buffalo and Somalia the most camels. Australia is the leading sheep producer of the world. During the period 1947 to 1979 world horse numbers declined 19 percent, while world mule numbers increased 21 percent, asses increased 17 percent, cattle 59 percent, sheep 40 percent, goats 54 percent, buffalo 62 percent, camels 77 percent, and hogs 160 percent. Mere numbers, of course, do not indicate animal quality. Thus, while India possesses more cattle than any other nation, many of its animals are poorly nourished, sick, or of substandard breeding stock.

World poultry numbers. China was the leading country in number of chickens in 1979 with 1,410,000,000. Vietnam led the world in number of ducks with over 30,300,000, while Poland had the most geese at 8,450,000 and Mexico the most turkeys with 13,000,000. Worldwide egg production that year totalled 335,126,000,000 with North America accounting for one-fourth of this number and Europe slightly more than a fifth.

Fears that increased population pressures will cause human beings to compete with livestock for the world's grains and other edible plant production appear unfounded because modern technology has proved that it is possible to increase plant production manyfold while simultaneously developing types and strains of animals that will produce food for people with ever-greater efficiency. Problems of world-food supply, however, are political, economic, and social, as well as simply technological. Because almost 70 percent of the world's farmland and ranchland is in pasture and forage crops that are valuable only as animal feeds, and because ruminant animals can utilize easily synthesized nonprotein nitrogen for the production of high-quality animal proteins, it appears that, as a country develops economically, animal numbers and quality increase (see also ANIMAL BREEDING).

LIVESTOCK

Cattle. Cattle were probably first domesticated during the New Stone Age (*c.* 10,000 BC) from the aurochs (now extinct), which stood six to seven feet (1.8–2.1 metres) high at the withers (the ridge between the shoulder bones). Modern cattle are of the family Bovidae and the genus ***Bos***. The European breeds are of the species B. ***taurus***, whereas the humped cattle of the tropics, including the Brahman, or zebu, of India, and the Africander of Africa, belong to the species ***B. indicus***. Identifiable breeds throughout the world number 277, with 33 generally classified as beef breeds, 18 as draft breeds, 39 as meat-draft, 54 as meat-dairy, 21 as dairy-draft, 61 as meat-dairy-draft, and 51 as dairy breeds. Most of these are quite limited in distribution and importance. No cattle are native to the North American continent, only bison, or buffalo. Cattle used for draft purposes are usually oxen—that is, castrated males at least two or three years old. Though long supplanted by the horse and the tractor in the developed countries, oxen are still used in Africa and tropical Asia.

The cattle that Christopher Columbus and others brought to the New World were valued mainly for their milk, butter, hides, and work. Because of the plentiful supply of wild game, it was then thought wasteful to slaughter cattle at less than seven to nine years of age. This view was in accord with the practice in many Continental European countries, where few cattle have ever been kept solely for beef production.

Early cattle breeding in America

Cattle raising expanded rapidly in the New World. The need for fresh and larger grazing areas drew cattle farming west into Ohio and Kentucky, where corn for fattening purposes could be raised at low cost. Cattle were driven overland to seaboard markets by 1805. The first shipment of cattle marketed by rail originated in Lexington, Kentucky, in 1852. These cattle were driven to Cincinnati, Ohio, freighted to Cleveland on Lake Erie, boated to Buffalo, N.Y., freighted to Albany, and then boated down the Hudson River to New York City. By 1860 railroads had extended beyond the Mississippi River, opening the Southwest to range production and the Midwest to cattle feeding.

In the U.S. today there are four times as many beef cattle as dairy cattle. Production of milk per dairy cow in the U.S. more than doubled after 1930 and reached 11,194 pounds (5,078 kilograms) in 1977. Elsewhere in the New World, the vast pampas of Argentina—an area as large as France—provide excellent conditions for grazing of cattle throughout the year without need for shelter. In Australia, cattle have always ranked second in importance among livestock after sheep. Today's Australian beef cattle are raised mostly in the east and northeast portions of the continent, where feed and climate are unsuitable for sheep.

British breeds

Beef cattle breeds. The British Isles led the world in the development of the principal beef breeds; Herefords, Angus, beef Shorthorns, and Galloways all originated in either England or Scotland. Other breeds of greatest prominence today originated in India (Brahman), France (Charolais; Limousin; Normandy), Switzerland (Simmental), and Africa (Africander). The Hereford breed, considered to be the first to be developed in England, probably descended from white-faced, red-bodied cattle of Holland crossed with the smaller black Celtics that were native to England and especially to Herefordshire. By the middle of the 18th century the slow process of selective breeding that resulted in the smooth, meaty, and prolific Herefords had begun. The United States statesman Henry Clay of Kentucky imported the first purebred Herefords to America in 1817.

The Hereford, which became the most popular beef breed of the United States, is distinguished by its white face, white flanks and underline, white stockings and tail, and white crest on the neck. Its body colour ranges from cherry to mahogany red. It is of medium size, with present-day breeders making successful efforts to increase both its rate of weight gain and mature size, in keeping with the demand for cheaper, leaner beef.

The Polled Hereford is a separate breed of cattle originating from hornless mutations in 1901. It has the same general characteristics as the horned Hereford and has gained substantial favour because of its hornlessness and often faster rate of weight gain.

The Aberdeen Angus breed originated in Scotland from naturally hornless aboriginal cattle native to the counties of Aberdeen and Angus. Solid black, occasionally with a spot of white underneath the rear flanks, the breed is noted for its smoothness, freedom from waste, and high quality of meat.

Although the native home of the Galloway breed is the ancient region of Galloway in southwestern Scotland, it probably had a common origin with the Angus. The Galloway is distinguished by its coat of curly black hair. Though the breed has never attained the prominence of other beef breeds, it has been used extensively in producing blue-gray crossbred cattle, obtained by breeding white Shorthorn bulls to Galloway cows.

The beef, or Scotch, Shorthorn breed developed from early cattle of England and northern Europe, selected for heavy milk production and generally known as Durham cattle. These were later selected for the compact, beefy type by the Scottish breeders. Emphasis on leaner, high-quality carcasses in the second half of the 20th century has diminished the popularity of this breed. The Polled Shorthorn originated in 1888 from purebred, hornless mutations of the Shorthorn breed. The milking, or dual-purpose, Shorthorn, representing another segment of the parent Shorthorn breed, was also developed in England to produce an excellent flow of milk as well as an acceptable carcass, therefore resembling the original English type of Shorthorn. Shorthorns range in colour from red through roan, to white- or red-and-white-spotted.

The Brahman breed originated in India, where 30 or more separate varieties exist. Preference is given to the Guzerat, Nellore, Gir, and Krishna Valley strains, which are characterized by a pronounced hump over the shoulders and neck; excessive skin on the dewlap and underline; large, droopy ears; and horns that tend to curve upward and rearward. Their colour ranges from near white through brown and brownish red to near black. Their popularity in other areas such as South America and Europe, into which they have been imported, is attributable mainly to their heat tolerance, drought resistance, and resistance to fever ticks and other insects. The Santa Gertrudis was developed by the King Ranch of Texas by crossing Brahman and Shorthorn cattle to obtain large, hearty, tick-resistant, red cattle that have proved to be popular not only in Texas but in many regions along the semitropical Gulf Coast. Until the tick was eradicated in the southern and southwestern U.S., Brahman crosses were raised almost exclusively there.

Cross-breeds

Several lesser breeds have been developed from crosses of the Brahman on other beef breeds such as: the Charbray (Charolais), Braford (Hereford), Brangus (Angus), Brahom (Shorthorn), and Beefmaster (Brahman-Shorthorn-Hereford).

The Charolais breed, which originated in the Charolais region of France, has become quite popular in the United States for crossing on the British breeds for production of market cattle. The superior size, rate of gain, and heavy muscling of the pure French Charolais and the hybrid vigour accruing from the crossing of nonrelated breeds promise an increased popularity of this breed. Many American Charolais, however, carry significant amounts of Brahman blood, with a corresponding reduction in size, rate of gain, and muscling. Important in France, the Charolais is the foremost meat-cattle breed in Europe.

The Limousin breed, which originated in west central France, is second in importance to the Charolais as a European meat breed. Limousin cattle, often longer, finer boned, and slightly smaller than the Charolais, are also heavily muscled and relatively free from excessive deposits of fat.

The most prevalent breed of France, the Normandy, is smaller than the Charolais or Limousin and has been developed as a dual-purpose breed useful for both milk and meat production. A fourth important breed is the Maine-Anjou, which is the largest of the French breeds.

The Simmental accounts for nearly half of the present-day cattle of Switzerland, Austria, and West Germany. Smaller than the Charolais and Limousin, the Simmental was developed for milk, meat, and draft. It is yellowish-brown or red combined with characteristic white markings.

Beef cattle feed. Beef cattle can utilize roughages of both low and high quality, including pasture forage, hay, silage, corn fodder, straw, and grain by-products. Cattle also utilize nonprotein nitrogen in the form of urea and biuret feed supplements, which can supply from one-third to one-half of all the protein needs of beef animals. Nonprotein nitrogen is relatively cheap and abundant and is usually fed in a grain ration or in liquid supplements with molasses and phosphoric acid, or is mixed with silage at ensiling time; it may also be used in supplement blocks for range cattle or as part of range pellets. Other additions to diet include corn (maize), sorghum, milo, wheat, barley, or oats. Fattening cattle are usually fed from 2.2 to 3.0 percent of their live weight per day, depending on the amount of concentrates in the ration and the rate at which they are being fattened. Such cattle gain from 2.2 to 3.0 pounds (1,000–1,350 grams) per day and require from 1.3 to 3.0 pounds (600–1,350 grams) of crude protein, according to their weight and stage of fattening. Up until the early 1970s, when the practice was prohibited, fattening cattle were given the synthetic hormone diethylstilbestrol as a supplement in their feed or in ear implants. The use of this synthetic hormone results in a 10 to 20 percent increase in daily gain with less feed required per pound of gain. Synthetic vitamin A sources have become so cheap as to permit the use of 10,000 to 30,000 International Units per day for cattle being fattened for market (finished) in enclosures bare of vegeta-

Hormones for cattle

tion (drylots) used for this purpose. The economics of modern cattle finishing encourages the use of all-concentrate rations or a minimum of roughage, roughage substitutes including oyster shells, sand, and rough plastic pellets. Corn silage produces heavy yields per acre at a low cost and makes excellent roughage for beef-cattle finishing.

Beef cows kept for the production of feeder calves are usually maintained on pasture and roughages with required amounts of protein supplement and some grain being fed only to first-calf heifers or very heavy milking cows. Most beef cows tend to be overnourished and may become excessively fat and slow to conceive unless they happen to be exceptionally heavy milkers. Most pregnant cows go into the winter in satisfactory condition and need to gain only enough to offset the weight of the fetus and related membranes. They can therefore utilize coarser roughages, having a total daily crude protein requirement of from 1.3 to 1.7 pounds (585–765 grams). Daily vitamin A supplement at the rate of 18,000 to 22,000 International Units per cow is advisable unless the roughages are of a green, leafy kind and the fall pasture has been of excellent quality. Feed requirements for bulls vary with age, condition, and activity, from 2.0 to 2.4 pounds (900–1,080 grams) of crude protein per day; from 25,000 to 40,000 International Units of vitamin A; and during breeding periods nearly the same energy intake as calves or short yearlings being finished for market, the main feeding requirement being to prevent their becoming excessively fat.

All cattle require salt (sodium chloride) and a palatable source of both calcium and phosphorus, such as limestone and steamed bone meal. Most commercial salts carry trace minerals as relatively cheap insurance against deficiencies that occasionally exist in scattered locations.

Beef cattle management. Beef production has become highly scientific and efficient because of the high cost of labour, land, feed, and money. Most brood-cow herds, which require a minimum of housing and equipment, are managed so as to reduce costs through pasture improvement, and are typically found in relatively large areas and herds. Other aspects of management include performance testing for regular production of offspring that will gain rapidly and produce acceptable carcasses, and the use of preventive medicine, feed additives, pregnancy checks, fertility testing of sires, artificial insemination of some purebred and commercial herds, protection against insects and parasites, both internal and external, adequate but not excessive feed intakes, and a minimum of handling.

Calving

Calving of beef cows is arranged to occur in the spring months to take advantage of the large supplies of cheap and high-quality pasture forages. Fall calving is less common and occurs generally in regions where winters ale moderate and supplies of pasture forage are available throughout the year. Calves ale normally weaned at eight to ten months of age because beef cows produce very little milk past that stage and also because they need to be rested before dropping their next calf. Feeder calves sell by the pound, so that weight for age is even more important than conformation or shape. Consequently, crossbred cattle are used; their hybrid vigour results in greater breeding efficiency and milk production on the part of the dam, as well as greater birth weight, vigour, and gaining ability on the part of the offspring.

Beef cows are normally first bred at 15 to 18 months. The gestation period is 283 days, and the interval between estrus, or periods in which the dam is in heat, is 21 days. Cows should produce a living calf every 12 months. Pasture breeding, in which nature is allowed to take its course, calls for one mature bull for every 25 cows, whereas hand breeding, in which control is exercised by the breeder, requires half as many bulls. Artificial insemination permits one outstanding sire to produce thousands of calves annually.

Diseases of beef and dairy cattle. Dairy cattle are susceptible to the same diseases as beef cattle. Many diseases and pests plague the cattle industries of the world, the more serious ones being prevalent in the humid and less developed countries. One of the more common diseases to be found in the developed countries is brucellosis, which has been controlled quite successfully through vaccination and testing. This disease produces undulant fever in man through milk from infected cows. Leptospirosis, prevalent in warm-blooded animals and man, is caused by a spirochete and results in fever, loss of weight, and abortion. Bovine tuberculosis has been largely eliminated; where it has not, it can infect other warm-blooded animals, including man. Test and slaughter programs have proven effective. Rabies, caused by a specific virus that also can infect most warm-blooded animals, is usually transmitted through the bite of infected animals, either wild or domestic. Foot-and-mouth disease has been eliminated from most of North America, some Central American countries, Australia, and New Zealand. The rest of the world is still plagued by the disease, which attacks all cloven-footed animals. Man is mildly susceptible to this organism. Successful vaccinations have been developed for blackleg, malignant edema, infectious bovine rhinotracheitis (or red nose), and several other diseases. Anaplasmosis, common to most tropical and semitropical regions, is spread by the bite of mosquitoes and flies. Anthrax, caused by a generally fatal bacterial infection, has been largely eliminated in the U.S. and western Europe. Rinderpest, still common to Asia, the U.S.S.R., and Europe, is caused by a specific virus that produces high fever and diarrhea. An infectious fever sometimes called nagana, caused by the tsetse fly, attacks both cattle and horses and is prevalent in central and southern Africa, as well as in the Philippines. Grass tetany and milk fever both result from metabolic disturbances. Bloat, caused by rapid gas formation in the rumen, or first compartment of the stomach, is sometimes fatal unless relieved. Pinkeye is an infectious inflammation of the eyes spread by flies or dust and is most serious in cattle having white pigmentation around one or both eyes. Mastitis, an inflammation of the udder, is caused by rough handling or by infection. Vibriosis, a venereal disease that causes abortion; pneumonia, an inflammation of the lungs; and shipping fever all cause serious losses and are difficult to control except through good management. Broad-spectrum antibiotics (effective against various micro-organisms), as well as powerful and specific pharmaceuticals, are effective and profitable means of keeping cattle herds healthy. Vermifuges, which destroy or expel parasitic worms, and insecticides, which kill harmful insects, are also highly effective and much used.

Pigs. Pigs are believed to have been domesticated in eastern Asia as early as 2900 BC. The early Egyptians, Greeks, and Romans all raised pigs for their meat. Popular in medieval Europe, pigs were brought to the New World by Columbus on his second voyage in 1493; from Haiti they were taken to Cuba and Florida. Throughout ancient and medieval times pigs were scavengers and foragers. Scientific breeding did not begin until the 18th century. China has always favoured pork production. Hogs are excellent scavengers, are relatively easy to raise in confinement and can be slaughtered with a minimum of equipment because of their size and the many ways in which their carcasses can be processed into food and fat. Hogs are also quite efficient in converting feed to food.

Breeds. Pigs have a gestation period of 114 days with a 21-day interval between periods of estrus. A boar can mate with 15 to 45 sows per year. The average litter consists of seven pigs, each with a birth weight of 2.5 pounds (1,135 grams). Sows should each produce 1.5 litters or more per year. Most market pigs are produced from crossbred sows by a boar of a third breed. There are over 300 breeds or local varieties of pigs throughout the world. A brief description follows of the better-known commercial breeds that have figured prominently in improving and upgrading domestic breeds and crosses throughout the world.

The Hampshire pig, which originated from the Norfolk thin-rind breed of England, is black with a white belt completely encircling its body and both front legs and feet. There should be no white on the head or the ham.

The Yorkshire pig, which originated early in the 19th century in England, where it was considered a bacon type, is long, lean, and trim with white hair and skin. Found in most countries, this breed is probably the most widely-distributed in the world.

The Duroc-Jersey breed originated in the eastern U.S. from red pigs brought by Columbus and de Soto. The modern Duroc, originated from crosses of the Jersey Red of New Jersey and the Duroc of New York in the late 19th century, ranges from golden-red to mahogany-red in colour, with no black allowed. This breed proved particularly suitable for feeding in the U.S. Corn Belt (parts of Ohio, Indiana, Illinois, Wisconsin, Minnesota, South Dakota, Nebraska, Missouri, and Oklahoma; all of Iowa) and has been extensively used in Argentina, Canada, Chile, and Uruguay. The Poland China originated about 1860 in southern Ohio from a number of different breeds common to that area. The Spotted Poland China originated in Indiana about 1915 from crosses of the Poland China and the native spotted pigs. The Chester White, which originated in Chester County, Pennsylvania, after 1818, is restricted to the U.S. and Canada. The Berkshire, which originated in Berkshire, England, about 1770, is used for fresh pork production in England and Japan; a larger bacon type has been evolved in Australia and New Zealand. The Landrace is a white, lop-eared pig found in most countries in central and eastern Europe, with local varieties in Denmark, Germany, The Netherlands, and Sweden. World attention was first drawn to the Landrace by Denmark where, since 1890, by progeny testing (the selection of boars for breeding on the basis of the scientific assessment of their progeny), a superior pig, designed for Denmark's export trade in Wiltshire bacon to England, has been produced. Denmark no longer permits the export of Landrace for breeding. Sweden also has progeny tested from Landrace stock but for a shorter period. Pigs from Sweden were first exported to England in 1953 when prices of up to $1,000 were paid. This resulted in a worldwide Landrace explosion, and most major pig-producing countries have since taken stock.

The Landrace hog

The importance of the Asian pig breeds was recognized in the use of Chinese and "Siamese" pigs from southeastern Asia in the improvement of early European and North American breeds and is reflected in the name of the world-famous Poland China. China leads the world in pig numbers, and pork is traditional in the Chinese diet. Exports from China are substantial.

Feeding. Corn is a favourite feed for pigs, but wheat, sorghum, milo, barley, and oats are also used if the price is favourable. Wherever abundant and reasonable in price, soybean-oil meal is a favourite source of protein, and other oil meals and high-protein by-products are used in some countries. Antibiotics to control disease have become a standard ingredient in most pig rations. Improvements in breeding, disease control, management, and feed formulation have all contributed to faster gains and lower feed requirements per pound of weight gain. The use of antibiotics after World War II, especially in regions of less favourable sanitation, increased gain by as much as 20 percent.

Management. Pork production lends itself to mechanization and a minimum use of high-priced labour. The use of self-feeders and concentrated rations and construction of slotted floors and lagoons for waste disposal have become almost universal among large commerical producers in developed countries. Most commercial producers try to farrow pigs every two to three months of the year. Sows should have an 80 percent conception rate on first mating, eight or more pigs per litter, and average 1.6 litters per year. Most pigs are raised in confinement with various means of environmental control. Air-conditioned farrowing barns for excessively hot summers and heated floors and space heating or heat lamps for cold winters have become widespread.

Diseuses. Pigs are subject to many infectious and parasitic diseases. Among the more common of these is transmissible gastroenteritis, an infectious disease often fatal to young pigs. Cholera, formerly controlled by vaccination, is now controlled by slaughter of infected animals. Leptospirosis, common to pigs as well as man and most warm-blooded animals, can be controlled by vaccination. Necrotic enteritis and other infections of the intestinal tract are largely controlled by antibiotics. Atrophic rhinitis produces sneezing, crooked snouts, and little or no weight gain even with proper feeding (unthriftiness). Erysipelas, a bacterial infection of pigs, turkeys, and man, causes in pigs inflammation of the skin, a swelling and stiffness of joints, and unthriftiness; it can be controlled through a vaccination program. Parasitic diseases are controlled mainly through effective sanitation programs and are less of a problem under confinement raising than when pigs are raised in the open. Effective vermifuges, which kill or expel parasitic worms, have been developed for further control. Production in the United States, the Scandinavian countries, and Western Europe has been developed to a high state of efficiency, largely through effective control of infectious and parasitic diseases.

Sheep. Sheep were probably first domesticated in western Asia, perhaps as early as 10,000 BC. There is ample evidence of domesticated sheep in prehistoric Europe, where their skins were used for clothing and shelter, their meat and milk for food. Sheepherding is frequently mentioned in the Old Testament.

Sheep in the Middle Ages

In the Middle Ages England became known as the home of most medium and long-wooled mutton breeds, while Spain achieved worldwide recognition as the origin of the fine-wool Merino. These two countries became leaders in the production of both mutton and wool. In the 16th and 17th centuries, such New World countries as Argentina, with suitable climate and grazing land, and later such countries as Australia and New Zealand introduced sheep with the object of exporting wool, which is light in relation to its value and is relatively imperishable. The same considerations, plus the ability of sheep to subsist on sparse forage and limited water, made the western U.S. a natural sheep-raising region, especially in the early years of the 20th century when public lands provided vast ranges for flocks as large as 4,000 head. Later, sheep in the U.S. declined in favour of more profitable cattle, from over 56,000,000 in 1942 to fewer than 20,500,000 in 1970.

The gestation period for sheep is 147 days with 16.7 days between periods of estrus, which last 29 hours. The average number of lambs raised per hundred ewes is 91 and the average fleece weight per shearing is 8.34 pounds (3,783 grams).

Breeds. Of mole than 200 breeds of sheep in existence in the world, the majority are of limited interest except in the localities where they are raised. Sheep breeds are generally classified as medium wool, long wool, and fine wool. Of the medium wool breeds the Hampshire, Shropshire, Southdown, Suffolk, Oxford, and Dorset all originated in England. The Cheviot and Black Faced Highland originated in Scotland. The Panama, Columbia, and Targhee were developed in the U.S., and the Corriedale in New Zealand. After World War II, such larger breeds as the Suffolk and Hampshire increased in popularity at the expense of the smaller breeds.

The long wool breeds, including the Cotswold, Lincoln, Leicester, and Romney, were all developed in England and, in addition to mutton, produce wool of unusually long fiber length that is suitable for rugs and coarse fabrics.

The original fine-wool breed was the Merino, developed in Spain from parent stock native to that country before the Christian era. Though medieval Spain sought to preserve a monopoly on the Merino, the sheep gradually spread to France, Italy, and the rest of Europe. Today the Merino is prominent in Australia, the U.S., the U.S.S.R., South Africa, Argentina, France, and Germany; the breed is designated by various names such as Australian Merino in Australia, Merino Transhumante in Spain, and others. The Merino was the principal ancestor of the French Rambouillet, somewhat larger in size and less wrinkled than the Merino. This breed prospers in the Western ranges of the U.S., where two-thirds of that country's sheep are raised. The Corriedale breed, adapted to both farms and ranges, is especially valued in New

Zealand and Australia. Most commercial sheep today represent two-breed or three-breed crosses, with white-faced crossbred ewes preferred in the range areas and a black-faced sire, such as Suffolk or Hampshire, preferred for market lambs, which are either finished for slaughter or sold as breeding ewes.

Feeding. Sheep are excellent foragers and, being ruminants, can effectively utilize both pasture forage and harvested roughage. Selective in their grazing habits, they prefer short grass when available. Pregnant ewes can run on late pasture as long as it is available and abundant, but in winter subsist satisfactorily on well-cured legume hay or mixed hay carrying a high percentage of legume. Corn silage is relatively inexpensive and relished by sheep; lactating ewes and lambs being finished for market usually require some concentrate, with corn (maize) favoured because of its high energy content and reasonable cost.

Range sheep grazing selectively on native plants frequently develop mild deficiencies of protein, energy, phosphorus, and vitamin A, especially when plants are mature or dormant or are eaten by ewes in the later stages of pregnancy or lactation. Broad spectrum antibiotics at the rate of five to ten milligrams per pound of feed are normally used in all lamb finishing rations to prevent digestive disturbances and infections.

Management. Range sheep are normally white-faced crosses carrying both long-wool and Rambouillet breeding and are consequently very hardy and thrifty. They are wintered in bands, or flocks, of from 1,000 to 4,000 head at lower altitudes, and are moved in bands ranging from 1,000 to 1,500 head to summer range at much higher altitude, sometimes 300 miles (480 kilometres) from their winter quarters. Each flock is tended by a sheepherder and his dogs who move systematically from one grazing area to another. The herder often lives in a covered wagon or truck and may spend weeks at a time in complete solitude. The most famous sheepherders are the Basques, who emigrated widely from their home in Spain. The breeding ewes are mated to Suffolk or Hampshire rams and produce lambs during the late winter or early spring so that the lambs will be old enough to move to summer grazing without difficulty.

Shepherds

In many parts of the world small flocks are kept partly as scavengers to clean up fence rows, weeds, brush, and other undesirable forage, but this is a diminishing role. Large flocks are maintained partly for wool and partly for market lambs. Lambs are usually dropped in the spring and are sold at ages of from three to eight months and weights of around 40 pounds (18 kilograms) for Easter lambs, and 100 pounds (45 kilograms) for the usual market lambs. Sheep are sheared in the spring after the worst winter weather has passed. Some breeds are noted for producing a high percentage of twins, and others, such as the Dorset, for both high frequency of twins and heavy milk production. Shepherds frequently switch a newly born twin lamb to a ewe that has just lost a single lamb, thereby utilizing the extra milk. This practice requires skill and experience since mother ewes recognize their own lamb by both its smell and the sound of its call.

Diseases. Such internal parasites as the tapeworm and several species of roundworms that infest the gastrointestinal tract are perhaps the greatest scourge of sheep, but modern vermifuges are quite effective against these. Dips are used to combat such external parasites as ticks, lice, and mites. Foot rot, caused by an infection of the soft tissue between the toes, results in extreme lameness and even loss of the hoof. The more persistent type is caused by a specific organism that is difficult to treat. The pain and the restricted movement of infected sheep result in rapid loss of weight. Enterotoxemia, or pulpy kidney, affects lambs at two to six weeks of age, especially those starting on unusually lush or rich feeds. A vaccination is quite effective in preventing this otherwise costly ailment.

Goats. Probably first domesticated in the East, perhaps during prehistoric times, the goat has long been used as a source of milk, cheese, mohair, and meat. Its skin has been valued as a source for leather. In China, Great Britain, Europe, and North America, the goat is primarily a milk producer. By good management its limited (six months per year) breeding season and the consequent difficulty of maintaining a level supply of milk throughout the year, can be overcome. The goat is especially adapted to small-scale production of milk for the family table; one or two goats supply sufficient milk for a family throughout the year and can be maintained economically in quarters where it would not be practical to keep a cow.

Goat's milk

Pure-white goat's milk compares favourably with cow's milk in favour and keeping qualities under sanitary conditions. It has certain characteristics differing from cow's milk that make it more easily digested by infants, invalids, and persons with allergies. Goat flesh is edible, that from young kids being quite tender and more delicate in flavour than lamb, which it resembles. Goat flesh is much prized in the Mediterranean countries, particularly in Spain, Italy, the south of France, and Greece. The Angora and Cashmere breeds are famous for their fine wool or mohair.

The many breeds may be roughly grouped: the prick-eared—*e.g.*, Swiss goats; the eastern, or Nubian, with long, drooping ears; and the wool goat—*e.g.*, Angora. While it is usually easy to distinguish goats from sheep, certain hair breeds of the latter are, to the layman, only distinguishable from goats by the direction of the tail, upward in goats, downward in sheep.

Of the Swiss goats, from which many of the best modern breeds are derived, the Toggenburg and Saanen are most important. The French breeds have much Swiss blood. In Germany the many varieties trace to Swiss breeds, which are also popular throughout Scandinavia and the Netherlands.

The Maltese goat, an important source of milk on the island of Malta, probably contains eastern blood. Many goats are found in Spain, northern Africa, and Italy, among them the Murcian, Granada, and La Mancha.

Nubians are African goats, chiefly Egyptian. They are usually large, short-haired goats with large lop ears and Roman noses. They may be of solid colour, parti-coloured, or spotted. The goats in Israel and Syria have long hair and large lop ears and most commonly are solid black or with white spots. Most Indian varieties, the best of which come from the Yamuna River area, have lop ears.

In Britain, the native goat was small, with short legs, long hair—usually gray but of no fixed colour—and with no definite markings. The widespread use of pedigree males, mostly of Swiss extraction, to improve the milk yield, has resulted in the almost total disappearance of the native types.

Horses. Horses were among the last species of livestock to be domesticated. Domestication took place at least as early as 3000 BC, probably in the Near East. The wild ass, which when domesticated is usually called a donkey, was first domesticated in Egypt about 3400 BC.

Breeds. The Arabian, the oldest recognized breed of horse in the world, is thought to have originated in Arabia before AD 600. Though its history is lost in the past, the breed probably descended from the Libyan horse, which, in turn, was probably preceded by horses of similar characteristics in Assyria, Greece, and Egypt as early as 1000 BC. The Arabian may be bay, gray, chestnut, brown, black, or white in hair colour, but always has a black skin. It ranges from 14.1 to 15.1 hands (56–60 inches, or 1.4 to 1.5 metres) in height. The Arabian horse has one lumbar vertebra less than other breeds of horse and is characterized by the high carriage of its head, long neck, and spirited action.

The Thoroughbred racing horse is descended from three desert stallions brought to England between 1689 and 1724; all of the Thoroughbreds of the world today trace their ancestry to one of these stallions.

The American Saddle Horse, originating in the U.S., was formed by crossing Thoroughbreds, Morgans, and Standardbreds on native mares possessing an easy gait. The American Saddle Horse is 15 to 16 hands (60–64 inches, or 1.5–1.6 metres) in height. Its colours are bay, brown, black, gray, and chestnut. There are two distinct types of the American Saddle Horse: three-gaited and five-gaited. The three natural gaits are walk, trot, and

Horse gaits

canter. Three-gaited saddle horses are shown with a short tail and cropped mane. They often have slightly less style and finish than the five-gaited horse. The five-gaited saddle horse has the three natural gaits plus two man-trained gaits—the rock and slow gait, or running walk. The American Saddle Horse is also used as a fine harness horse mainly for show.

The American Quarter Horse traces to the Thoroughbred, and includes the blood of other breeds, such as the Morgan, the American Saddle Horse, and several strains of native horses. This fast, muscular horse has been raced, ridden in rodeos, and used for herding cattle.

The typical Quarter Horse is 15 to 16 hands tall and is of powerful build, suitable for both racing and the rough life of a cow pony. This horse is noted for its intelligence, easy disposition, and cow sense.

The Tennessee Walking Horse, or plantation horse, traces mainly to the Standardbred but also includes Thoroughbred and American Saddle Horse blood. The Tennessee Walking Horse is noted for its running walk, a slow-gliding gait in which the hind foot oversteps the print of the front foot by as much as 24 inches (600 millimetres). This breed is 15.2 to 16 hands high and is bay, black, chestnut, roan, or gray in colour.

The Morgan traces directly to "the Justin Morgan horse", foaled in 1793, of unknown breeding but no doubt tracing to Arabian stock. A dark bay in colour, Morgan stood 14 hands high and weighed 950 pounds (430 kilograms). He was a heavily muscled, short-legged horse of great style, quality, and endurance. He is the world's best example of prepotency, since he alone founded the Morgan breed. The Morgan is used for both riding and driving. It ranges from 14 to 16 hands in height and resembles the Arabian in size, conformation, quality, and endurance.

The American Standardbred originated around New York City during the first half of the 19th century from Thoroughbred, Morgan, Norfolk Trotter, Arabian, Barb, and pacers of mixed breeding. The modern Standardbred is smaller than the Thoroughbred, ranging from 15 to 16 hands in height and averaging about 15.2 hands. In racing condition it weighs from 900 to 1,000 pounds (410–450 kilograms). Stallions in stud condition average from 1.100 to 1,200 pounds (500–545 kilograms). Compared with the Thoroughbred, the Standardbred is longer-bodied, shorter-legged, heavier-boned, and stockier in build. Prevailing colours are bay, brown, and chestnut.

Draft horses

Draft horses have largely been supplanted by trucks and tractors in the developed countries of the world. Major draft breeds include the Percheron, developed in France; the Clydesdale of Scotland; the Shire of England; the Suffolk of England; and the Belgian of Belgium. These breeds range from 15% to 17 hands in height at the withers; at maturity the mares weigh from 1,600 to 2,000 pounds (720–900 kilograms) and the stallions from 1,900 to 2,200 pounds (860–1000 kilograms).

The more popular pony breeds are the Shetland, which originated in the Shetland Islands, and the Hackney, of English origin. Ponies must be under 14.2 hands in height at the withers and are used both for show and for children's pleasure.

Feeding. The specific and exact nutrient requirements of horses are poorly understood. Usually, these may be supplied economically from pasture forage, harvested roughages, and concentrates. Good quality grass-legume pastures, in addition to iodized or trace-mineralized salt, will supply adequate nutrients to maintain an adult horse at light work (such as pulling a small cart) or mares during pregnancy. Lush, early spring pasture is very high in water and protein contents and may need to be supplemented with a high-energy source, such as grain, to meet the needs of horses performing medium to heavy work (such as plowing). Conversely, late fall- and winter-pasture forage is low in water and protein and may require protein and vitamin A supplementation. High-quality legume hays, such as early bloom alfalfa, are preferred for horses, especially those that are growing or lactating. Moldy or dusty feeds should be avoided because horses are extremely susceptible to forage poisoning and respiratory complications. Grass hays, such as timothy, prairie grass, orchard grass, and bluegrass, were preferred by early horsemen, especially for race horses, because they were usually free from mold and dust and tended to slow down the rate of passage through the intestinal tract. These hays are low in digestible energy and protein, however, and must be adequately supplemented. Silages of all sorts should be avoided since horses and mules are extremely susceptible to botulism and digestive upsets.

Oats are the preferred grain for horses because of their bulk. Corn, barley, wheat, and milo can be used, however, whenever they are less expensive. Weanling foals require three pounds of feed per hundred pounds of live weight per day; as they approach maturity, this requirement drops to one pound of feed per hundred pounds of live weight daily. Horses normally reach mature weight at less than four years of age and 80 percent of their mature weight at less than two years of age.

A large and ever-growing number of horses stabled in cities and suburbs where sufficient roughages cannot be grown provide a large market for complete horse rations, including roughage, which are tailored to the total needs of specific animals according to their particular function at a given time, such as growth, pregnancy, lactation, or maintenance.

Horses will vary from the normal requirement in terms of weight, temperament, and previous nutrition. Foals will eat some pasture grass, forage, or hay when they are three days old and grain when they are three weeks old.

Management. Highly bred light horses are notoriously poor reproducers. Many horse farms consider a 60 percent foaling rate for a large band of mares to be average. Most large horse farms employ resident veterinarians to check for abnormalities or disease before breeding and to check mares for pregnancy 40 to 45 days after breeding. Because many mares conceive only every other year, expert assistance at foaling time is an absolute necessity, especially if the foal is sired by an expensive stallion out of a valuable mare.

Foaling mares

The gestation period of horses is 340 days. The period between estrus ranges from 18 to 28 days with an average of 22 days. Mature stallions can safely mate with from 50 to 100 mares per season, although the practice with expensive Thoroughbreds is to book no more than 35 to 40 mares.

The feet and legs of horses demand unusual attention. The old adage "no foot no horse" remains apt. Hooves should be trimmed regularly, beginning when the horse is a foal or only a few months old. Otherwise they may grow long and uneven, causing improper action, undue stress on joints, and broken or cracked hooves. Horses that are worked regularly, especially on hard and stony ground, as well as show horses and race horses in service, must be shod. Shod horses should have their hooves trimmed and their shoes refitted every four to six weeks. Tendency toward unsoundness is probably inherited but may be aggravated by poor hoof care and excessive stresses.

Diseases. Horses are especially susceptible to tetanus or lockjaw but can be given two-year protection through the use of a commonly accepted toxoid. There are two common types of abortion in horses: virus abortion, specifically viral rhinopneumonitis, and the *Salmonella* type. The former, which produces an influenza with pinkeye, catarrh, general illness, and abortion, affects both mares and foals, but all surviving horses develop natural resistance soon after infection. Pregnant mares thought to be subjected to infection may be given some protection by available vaccines the success of which was not fully proved in the early 1970s. The *Salmonella* type of abortion can be prevented completely by vaccination. Encephalomyelitis, or sleeping sickness, is prevented by vaccination. A specific vaccine is available for anthrax, which is prevalent in Asia. Hemolytic anemia of foals has become a problem. Foals so afflicted are born normal but soon become sluggish and progressively weaker; the membranes of their eyes, mouth, and lips become very pale and the heartbeat becomes rapid. This condition is caused by antibodies in the mare's milk that destroy the foal's red blood cells. These antibodies are caused by the difference in blood type between the foal and the mother. Newborn foals can be muzzled to avoid nursing while their blood is checked for reaction against the serum and milk of its mother. Where reactions are noted, the mare is hand-milked at hourly intervals for 12 to 24 hours, and the foal is fed milk from another suitable mare or a milk substitute. Horses are quite susceptible to various infections, but rotation of pastures, strict sanitation, and the use of suitable vermifuges are quite effective.

Asses and mules. The words donkey and ass are generally used interchangeably to denote the same animal, though ass is more often employed when the animal is wild and donkey is used for a domesticated beast. Wild asses inhabit arid, semidesert plains where the vegetation is sparse and coarse; the domestic donkey does well on coarse food and is hardy under rough conditions, hence its usefulness to man as a beast of burden in places where horses cannot flourish, such as the mountains of Ethiopia and other parts of northeast Africa. the high plains of Tibet, and the arid regions of Mongolia.

The donkey's occasional obstinacy in refusing work too heavy for it has become proverbial, but its equally proverbial stupidity has probably become legendary through its reaction to brutal treatment and neglect. It is naturally patient and persevering, responding to gentle treatment with affection and attachment to its master.

Mining mules

Mules are still used in some of the subtropical and tropical countries because of their ability to withstand most types of stress including heat, irregular feeding, and abuse. The mule is produced by crossing a jackass (Equus *asinus*) with a mare. The so-called Mammoth Jack was developed in America from European imports dating back to the late 18th century. It stands 15 to 16 hands (1.5 to 1.6 metres) in height and weighs from 900 to 1,150 pounds (410–520 kilograms) at maturity. The reverse cross of a stallion on a jenny, or female ass, is called a hinny but theoretically has the same characteristics as a mule. At one time many different types of mules were recognized, such as draft mules, farm mules, sugar mules, cotton mules, and mining mules in declining order of size. The mining mule, a small, rugged individual weighing as little as 600 pounds (270 kilograms), was used in pit mines. These small mules are usually produced by pony dams.

Mules are surer-footed than horses and also more intelligent. For this reason they are still used as saddle and pack mounts in precarious terrain. Unlike horses, they also refuse to damage themselves by overeating or by thrashing around when tangled up or in cramped quarters.

Buffalo and camels. Buffalo. The name buffalo is applied to several different cud-chewing (ruminant) mammals of the ox family (Bovidae). The true, or Indian, buffalo (*Bubalus bubalis*), also known as water buffalo, or arna, exists both as a wild and domestic animal; it has been domesticated in Asia from very early times and was introduced into Italy about the year 600. A large oxlike animal of massive and rather clumsy build with large horns that are triangular in cross section, the Indian buffalo, standing five feet (1.5 metres) at the shoulder, has a dull black body, often very sparsely covered with hair. The horns, which may be over six feet (1.8 metres) long, spread outward and upward, approaching each other toward the tips; they meet more or less in one plane above the rounded forehead and elongated face. Used for draft purposes, and also for milk and butter. the domesticated Indian buffalo is found throughout the warmer parts of the Old World from China to Egypt, and in Hungary, France, and Italy. Its cousin, the Cape, or African. buffalo (*Syncerus caffer*), a black animal of similarly massive build, has never been domesticated.

Camels. The term camel is applied to two species of the genus *Camelus*. The Arabian camel, *Camelus dromedarius*, has one hump, the Bactrian camel, *Camelus bactrianus*, has two. The limbs are long and the feet have no traces of the second or fifth toes; the wide-spreading soft feet are well adapted for walking upon sand or snow. Horny pads on the chest and knees support the camel's weight when kneeling.

Camels are known only as domestic animals and are not found in a truly wild state. The Bactrian camel occurs throughout the highlands of Central Asia from Turkistan to Mongolia and is an important beast of burden throughout that region. The Arabian camel, characteristic of India, the Near East, and North Africa, is likewise primarily important as a beast of burden, though it also provides wool, milk, hides. and meat. It is longer-legged, shorter coated, and more lightly built than the Bactrian camel, standing about seven feet (2.1 metres) tall at the shoulder.

Camel diets

Camels can flourish on the coarsest of sparse vegetation, feeding on thorny plants, the leaves and twigs of shrubs, and dried grasses that other animals would refuse, though camels ale not averse to more attractive food if it is available. When the feeding is good they accumulate stores of fat in their humps, upon which they are able to draw when conditions are adverse not only for sustenance but also for the manufacture of water by the oxidation of the fat; but they do not store water in the miscalled water cells. They are thus able to fast and go without drinking for several days; they have been known to go without water for 17 days and survive. Other adaptations that enable them to survive in deserts and other unfavourable environments include double rows of heavy protective eyelashes, haired ear openings, the ability to close their nostrils, and keen senses of sight and smell. The female produces one young at a birth after a gestation of 11 months and suckles it for a year; maturity is reached at the age of 10 to 12 years, and the life span is 30 to 40 years.

POULTRY

Chickens. Man first domesticated chickens of Indian origin for the purpose of cockfighting in Asia, Africa, and Europe. Very little attention was given to egg or meat production. Cockfighting was outlawed in England in 1849 and in most other countries thereafter. Exotic breeds and new standard breeds proliferated in the years to follow, and poultry shows became very popular. From 1890 to 1920 chicken raisers stressed egg and meat production, and commercial hatcheries became important after 1920.

Breeds. The breeds of chickens are generally classified as American, Mediterranean, English, and Asiatic. The American breeds of importance today are the Plymouth Rock, the Wyandotte, the Rhode Island Red, and the New Hampshire. The Barred Plymouth Rock, developed in 1865 by crossing the Dominique with the Black Cochin, has grayish-white plumage crossed with dark bars. It has good size and meat quality and is a good layer. The White Plymouth Rock, a variety of the Barred Plymouth Rock, has white plumage and is raised for its meat. Both varieties lay brown eggs. The Wyandotte, developed in 1870 from five or more strains and breeds, has eight varieties and is characterized by a plump body, excellent meat, and good egg production. Only the white strain is of any significance today because it is used in broiler crosses where its white plumage, quality of flesh, and rapid growth are highly desirable. Popular in England, this breed also lays a brown egg.

An American breed, the Rhode Island Red, developed in 1857 from Red Malay game fowl crossed with reddish-coloured Shanghais—with some brown Leghorn, Cornish, Wyandotte, and Brahma blood—is good for meat production and is one of the top meat breeds for the production of eggs. It has brilliant red feathers and lays brown eggs.

The New Hampshire, developed in the U.S. in 1930 from Rhode Island Red stock, is a meaty, early maturing breed with light-red feathers and lays large brown eggs. The only Mediterranean breed of importance today is the Leghorn. This breed, originated in Italy, has 12 varieties, the single-comb White Leghorn being more popular than all of the other types combined. This breed, the leading egg producer of the world, lays white eggs and is kept in large numbers in England, Canada, Australia, and the U.S. The White Minorca, a second Mediterranean breed, is often used in crossbreeding for egg production.

The only English breed of modern significance is the Cornish, a compact and heavily meated bird used in crossbreeding programs for broiler production. It is a poor producer of eggs, however.

The only Asiatic breed of significance today, the Brahma, which originated in India, has three varieties, the light Brahma being preferred because of its size.

Chicken breeding is an outstanding example of the application of basic genetic principles of inbreeding, linebreeding, and crossbreeding, as well as of intensive mass selection to effect faster and cheaper gains in broilers and maximum egg production for the egg-laying strains. Maximum use of heterosis, or hybrid vigour, through incrosses and crossbreeding has been made. Crossbreeding for egg production has used the single-comb White Leghorn, the Rhode Island Red, the New Hampshire, the Barred Plymouth Rock, the White Plymouth Rock, the Black Australorp, and the White Minorca. Crossbreeding for broiler production has used the White Plymouth Rock or New Hampshire crossed with White or Silver Cornish or incrosses utilizing widely diverse inbred strains within a single breed. Rapid and efficient weight gains, and high quality, plump, meaty carcasses have been achieved thereby.

Development of the **egg**

The male sperm lives in the hen's oviduct for two to three weeks. Eggs are fertilized within 24 hours after mating. Yolks originate in the ovary and grow to about 40 millimetres (1.6 inches) in diameter, after which they are released into the oviduct, where the thick white and two shell membranes are added. The egg then moves into the uterus where the thin white and the shell are added. This process requires a total of 24 hours per egg. The hatching of fertilized eggs requires 21 days, with the heavy breeds requiring a few more hours and the lighter breeds slightly fewer. Ideal hatching temperature approximates 100" F (38" C) with control of air flow, humidity, oxygen, and carbon dioxide being essential. Standardized egg-laying tests and official random sample tests have been used for many years to measure actual productivity.

Feeding. Chicken feeding is a highly perfected science that ensures a maximum intake of energy for growth and fat production. High quality and well-balanced protein sources produce a maximum amount of muscle, organ, skin, and feather growth. The essential minerals produce bones and eggs; 3 to 4 percent of the live bird being composed of minerals and 10 percent of the egg. Calcium, phosphorus, sodium, chlorine, potassium, sulfur, manganese, iron, copper, cobalt, magnesium, and zinc are all required. Vitamins A, C, D, E and K and all 12 of the B vitamins are also required. Water is essential, and antibiotics are almost universally used to stimulate appetite, control harmful bacteria, and prevent disease. Modern rations produce a pound of broiler on about two pounds (900 grams) of feed and a dozen eggs from 4½ pounds (2,025 grams) of feed.

Management. Among the world's agricultural industries, meat chicken breeding in the U.S. is one of the most advanced. It is presently considered the model for other animal industries, the broiler industry leading the way in advanced agricultural technology and efficiency. Intensive nutritional research and application, highly improved breeding stock, intelligent management, and scientific disease control have gone into the effort to give a modern broiler of uniformly high quality produced at ever-lower cost. Today, one man can care for 25,000 to 50,000 broilers that reach market weight in three months' time, giving him an annual output of from 100,000 to 200,000 broilers. A modern broiler chick gains over 43 times its initial weight in an eight-week period. Aggressive marketing methods increased the per capita consumption of broilers fourfold in the two decades beginning in 1950, with further substantial increases predicted for the future. Less than half as much feed is now required to produce a pound of broiler meat as was needed in 1940. While per capita consumption of eggs has declined, the feed requirement per dozen eggs is only slightly more than half as high as it was in the early 1900s. Annual egg production per hen has increased from 104 to 218 since 1910.

A carefully controlled environment that avoids crowding, chilling, overheating, or frightening is almost universal in chicken raising. Cannibalism, which expresses itself as toe picking, feather picking, and tail picking, is controlled by debeaking at one day of age and by other management practices. The feeding, watering, egg gathering, and cleaning operations are highly mechanized. Four-fifths of the 3,800,000,000 chicks hatched per year in the early 1970s were used for broiler production and one-fifth for egg production. In egg production feed and labour represent 75 percent of the cost. Pullet (immature hen) flocks predominate. Hens are usually housed in wire cages with two or three hens per cage and three or four tiers of cages superposed to save space. Cages for laying hens have been found to increase production, lower mortality, reduce cannibalism, lower feeding requirements, reduce diseases and parasites, improve culling, and reduce both space and labour requirements.

Other poultry. These include turkeys, ducks, geese, guinea fowl, and squabs.

***Turkey** production.* After World War II turkey production became highly specialized, with larger flocks predominating. Turkeys are raised in great numbers in Canada where their ancestors still live wild, as also in some parts of the U.S. Broad Breasted Bronze, Broad Breasted White, and White Holland are the most popular of the larger breeds, representing nearly three-fourths of the total production. The Beltsville Small White is the most popular of the smaller bleeds and composes the bulk of the remaining 25 percent. At 24 weeks of age the toms are 50 percent heavier than the hens. In breeding flocks, one tom is required per 8 or 10 hens. Tremendous improvements both in breeding and nutrition have been made in this century. Since 1910, the amount of feed required to produce a pound of turkey meat has fallen 40 percent, while the time required has been reduced 25 percent. Ninety to 100 pounds (40–45 kilograms) of feed will produce a turkey for market weight with from three to five pounds required per pound of gain on full-size turkeys, and 2½ to 2% pounds (1,125–1,250 grams) of feed per pound (450 grams) of gain for turkey broilers, which are marketed at from 12 to 15 weeks of age. Turkey poults are hard to start on feed. One method is to dip their beaks in water and then in feed. Another is to light the feed troughs very brightly and to use oatmeal or ground yellow corn sprinkled on top of the feed. Turkeys are given range, or open land, and automatic waterers, self-feeders, range shelters, heavy fencing, and rotated pastures are used. Successful marketing techniques have increased turkey consumption; *e.g.*, in the U.S., per capita consumption from 1950 to 1970 rose 250 percent.

Duck and goose production. Duck raising is practiced on a limited scale in nearly all countries, for the most part as a small-farm enterprise. The flocks once kept in England are much reduced, the demand for eggs being greatly lessened, though a limited market still exists. Khaki Campbell and Indian Runner ducks are prolific layers, each averaging 300 eggs per year. In Indonesia, where the labour supply is large, duck herders take a flock of ducks to the high country during the warmer seasons and work their way down the mountainsides to the lowlands. Ducks are easily transported, can be raised in close confinement, and convert some waste products and scattered grain (*e.g.*, by gleaning rice fields) to nutritious and very desirable eggs and meat. In developed countries, commercial plants have been built exclusively for duck meat production; an example is the large duckling industry of Long Island, N.Y. There are also local industries in The Netherlands and England, the favourite breed in England being the Aylesbury. This breed has white flesh and can reach eight pounds (3.6 kilograms) in eight weeks. The U.S. favourite is the Pekin duck, which is slightly smaller than the Aylesbury and yellow-fleshed.

Geese

Goose raising is a minor farm enterprise in practically all countries, but in Germany, Austria, some eastern European countries (notably Poland), parts of France, and locally elsewhere, there is important commercial goose production. The two outstanding meat breeds are the Toulouse, predominantly gray in colour, and the Embden (or Emden), which is white. Geese do not appear to have attracted the attention of geneticists on the same scale as the meat chicken and the turkey, and no change in the goose industry comparable to that in the others has occurred or seems to be in prospect. In some commercial plants, geese are fattened by a special process resulting in a considerable enlargement of their livers, which are sold as a delicacy, pâté de foie gras.

Guinea fowl and squabs. Guinea fowl are raised as a sideline on a few farms in many countries, and eaten as gourmet items. In Italy there is a fairly extensive industry. There the birds are raised in yards with open-fronted shelters. In England, guinea fowl are marketed at 16–18 weeks of age and in the U.S. at about 10–12 weeks. The market weight is usually about 2½–3½ pounds, but food conversion is poor.

Pigeons are raised not only as messengers and for sport but also for the meat of their squabs (nestlings), also a gourmet item. Squab production, carried on locally, is rare in most countries with established poultry industries.

Poultry diseases. Poultry are quite susceptible to a number of diseases; some of the more common are fowl typhoid, pullorum, fowl cholera, chronic respiratory disease, infectious sinusitis, infectious coryza, avian infectious hepatitis, infectious synovitis, bluecomb, Newcastle disease, fowl pox, avian leukosis complex, coccidiosis, blackhead, infectious laryngotracheitis, infectious bronchitis, and erysipelas. Strict sanitary precautions, the intelligent use of antibiotics and vaccines, and the widespread use of cages for layers and confinement rearing for broilers have made it possible to effect satisfactory disease control.

Parasitic diseases of poultry, including hexamitiasis of turkeys, are caused by roundworms, tapeworms, lice, and mites. Again, modern methods of sanitation, prevention, and treatment provide excellent control.

BIBLIOGRAPHY. The UNITED STATES DEPARTMENT OF AGRICULTURE, *Agricultural Statistics* (annual), provides reliable agricultural information for the United States and includes basic worldwide statistics. The UNITED NATIONS FOOD AND AGRICULTURE ORGANIZATION (FAO), *Production Yearbook* (annual), is the most authoritative source for worldwide agricultural statistics. See also the proceedings of the first world conference on animal production, *Efficiency in Animal Production* (1963); and *Dairying Throughout the World: Monographs on Dairying in a Number of Countries Throughout the World* (1966), published on the occasion of the 17th International Dairy Congress. Other works on this subject include: CHARLES S. PLUMB, *Types and Breeds of Farm Animals*, rev. ed. (1920), a classic history of breeds; FAO, *European Breeds of Cattle*, 2 vol. (1966), an excellent history and description of European dairy, dual-purpose, and beef breeds; *Stud Managers Handbook* (1958), authoritative, selected articles from early stud manager's courses at the University of Kentucky; *Swine Feed Additives* (1970), proceedings of a symposium by the College of Agriculture at the University of Kentucky that is an excellent summation of the physiological and economic effects of antibiotics on swine production and pork prices; and standard textbooks, such as A.L. NEUMANN and R.R. SNAPP, *Beef Cattle*, 6th ed. (1969); W.E. CARROLL and J.L. KRIDER, *Swine Production*, 4th ed. (1971); W.E. PETERSEN and A.M. FIELD, *Dairy Farming* (1953); A.R. WINTER and E.M.
