Unusual forms of emphysema also occur. In one form the disease appears to be unilateral, involving one lung only and causing few symptoms. Unilateral emphysema is believed to result from a severe bronchiolitis in childhood that prevented normal maturation of the lung on that side. "Congenital lobar emphysema" of infants is usually a misnomer, since there is no alveolar destruction. It is most commonly caused by overinflation of a lung lobe due to developmental malformation of cartilage in the wall of the major bronchus. Such lobes may have to be surgically removed to relieve the condition.

Bronchiectasis. Bronchiectasis is believed usually to begin in childhood, possibly after a severe attack of whooping cough or pneumonia. It consists of a dilatation of major bronchi. The bronchi become chronically infected, and excess sputum production and episodes of chest infection are common. The disease may develop as a consequence of airway obstruction or of undetected (and therefore untreated) aspiration into the airway of small foreign bodies such as plastic toys.

Bronchiectasis may also develop as a consequence of inherited conditions, of which the most important is the familial disease of cystic fibrosis. The essential defect in this condition probably has to do with the transport of sodium and other ions across the wall of membranes, but it is not yet completely understood. The most important consequence of cystic fibrosis, apart from the malnutrition it causes, is the development of chronic pulmonary changes, with repetitive infections and bronchiectasis as characteristic features. This condition does not progress to pulmonary emphysema but rather causes obliteration and fibrosis of small airways and dilation and infection of the larger bronchi. Thick, viscid secretions in the bronchial tree are difficult to expectorate. However, the modern management of the condition, with the control of pulmonary infections, has markedly improved survival in affected persons, many of whom, who would formerly have died in childhood, now reach adult life.

OCCUPATIONAL LUNG DISEASE

Silica dust produces a distinctive reaction in the lung that eventually leads to the development of masses of fibrous tissue and distinctive nodules of dense fibrosis, which, by contracting, distort and damage the lung. Silicosis is a hazard in any occupation in which workers are exposed to silica dust, particularly rock drilling above or below ground, quarrying, or grinding with a wheel containing silica. Cases have also been reported in dental technicians, who use the material ground into a fine powder. Silicosis is usually fairly easy to detect on radiographs, and in its later stages it causes considerable shortness of breath and reduction of the vital capacity (a maximal breath). Sandblasting without respiratory protection is exceedingly dangerous, and fatal cases of acute silicosis caused by unprotected sandblasting have been reported. The dangers of silica are generally well recognized, and better protection has reduced the incidence of this condition. The disease may advance, with increasing disability, for years after the person has stopped inhaling the dust.

Coal dust alone, even if its silica content is very low, causes a distinctive pattern of change in the lung known as coalworker's pneumoconiosis (also called black lung). Initially the dust is deposited in the terminal bronchioles, where it causes a fibrotic reaction. At this stage there is little disability, but later the disease may progress to a more generalized form, and in some instances large masses of fibrotic tissue form in the lung. This condition, known as progressive massive fibrosis, is usually associated with severe disability and the risk of a secondary heart failure. It is not clear whether this stage is more likely to develop if pulmonary tuberculosis is superimposed on the respiratory damage caused by coal dust inhalation.

The widespread use of asbestos as an insulating material during World War II, and later in flooring, ceiling tiles,

Theories concerning smoking and emphysema

Cystic fibrosis

Signs and symptoms

Silicosis

Asbestosis

brake linings, and as a fire protectant sprayed inside buildings, led to a virtual epidemic of asbestos-related disease 20 years later. At first only the form of disease known as asbestosis, with radiographic changes and impaired function at an early stage, was recognized. Then it became apparent that exposure to much less asbestos than was needed to cause asbestosis led to thickening of the pleura, and, when both cigarette smoking and asbestos exposure occurred, there was a major increase in the risk for lung cancer. It is currently believed that the risks from smoking and from significant asbestos exposure are multiplicative in the case of lung cancer. Finally, a malignant tumour of the pleura known as mesothelioma was found to be caused almost exclusively by inhaled asbestos. Often a period of 20 years or more elapsed between exposure to asbestos and the development of the tumour.

As far as is known, all the respiratory changes associated with asbestos exposure are irreversible. Malignant mesothelioma is rare and unrelated to cigarette smoking, but survival after diagnosis is less than two years. Usually the pleural thickenings are not associated with disturbance of function or symptoms, although in occasional cases the pleuritis is more aggressive, in which case both may occur. It is not yet understood why asbestos causes such devastating changes. Furthermore, not all types of asbestos are equally dangerous; the risk of mesothelioma in particular appears to be much higher if crocidolite, a blue asbestos that comes from South Africa, is inhaled than if chrysotile is inhaled. But exposure to any type of asbestos is believed to increase the risk of lung cancer when associated with cigarette smoking. There has been much discussion of the advisability of removing asbestos from all buildings. It has been argued on the one hand that this is the only responsible policy, and on the other that more exposure might follow the careless removal of the material than would occur if it were left in place. All industrialized countries have imposed strict regulations for handling asbestos, and the work force is generally aware of the material's dangers.

The increasing use of man-made mineral fibres (as in fibreglass and rock wool) has led to concern that these may also be dangerous when inhaled; present evidence suggests that they do increase the risk of lung cancer in persons occupationally exposed to them. Standards for maximal exposure have been proposed.

The toxicity of beryllium was first discovered when it was widely used in the manufacture of fluorescent light tubes shortly after World War II. Beryllium causes the formation of granulomas in the lung and alveolar wall thickening, often with considerable disability as a result. Although beryllium is no longer used in the fluorescent light industry, it is still important in the manufacture of special steels and ceramics, and new cases of beryllium poisoning are occasionally reported.

Byssinosis

It is not only inorganic minerals and dusts that may affect the lung. The dust produced in the processing of raw cotton may cause chronic obstructive lung disease. This does not have a characteristic pathology, however, and it does not give rise to emphysema. It is unclear whether cotton dust alone or the combination of cigarette smoke and cotton dust is particularly dangerous. The disease that results is known as byssinosis, or "brown lung." Workers in cotton plants in England used to complain of "Monday morning fever" and were found to suffer an easily measurable decrement in ventilatory function when they returned to work after spending a weekend away from the plant. The active particle or contaminant in the cotton dust that is responsible for the syndrome has not yet been identified.

The dust from western red cedar may cause occupational asthma, and dust from the redwood and other trees may cause an acute hypersensitivity pneumonitis. Workers in the sugarcane industry may be affected by a similar syndrome, known as bagassosis; sisal workers also develop airflow obstruction.

Toluene diisocyanate, used in the manufacture of polyurethane foam, may cause occupational asthma at very low concentrations; in higher concentrations, such as may occur with accidental spillage, it causes a transient flulike illness associated with airflow obstruction. Prompt

recognition of this syndrome has led to modifications in the industrial process involved.

Although the acute effects of exposure to many of these gases and vapours are well-documented, there is less certainty about the long-term effects of repeated low-level exposures over a long period of time. This is particularly the case when the question of whether work in a generally dusty environment has contributed to the development of chronic bronchitis or later emphysema—in other words, whether such nonspecific exposures increase the risk of these diseases in cigarette smokers. There is little unanimity on this question, but it is generally recognized that the differentiation is difficult.

Many chemicals can damage the lung in high concentration: these include oxides of nitrogen, ammonia, chlorine, oxides of sulfur, ozone, gasoline vapour, and benzene. In industrial accidents, such as occurred in 1985 in Bhopal, India, and in 1976 in Seveso, near Milan, people in the neighbourhood of chemical plants were acutely exposed to lethal concentrations of these or other chemicals. The custom of transporting dangerous chemicals by rail or road has led to the occasional exposure of bystanders to toxic concentrations of gases and fumes. Although in many cases recovery may be complete, it seems clear that long-term damage may occur.

The assessment of disability and the writing of opinions on attributability have become important tasks for many respiratory specialists. Disability consequent upon a specific lung disease can be assessed by pulmonary function testing and in some cases by tests of exercise capability; these measures provide a good indication of the impact of the disease on the physical ability of the patient. It is much more difficult to decide how much of the disability is attributable to occupational exposure. If the exposure is historically known to cause a specific lesion in a significant percentage of exposed persons, such as mesothelioma in workers exposed to asbestos, attribution may be fairly straightforward. In many cases, however, the exposure may cause only generalized pulmonary changes leading to airflow obstruction or may cause lung lesions of multifactorial etiology, the precise cause of which cannot be determined by histological examination of the tissue. The question of attributability in these instances, already diffuse, may be complicated by a history of cigarette smoking, which may be mild or moderate, or of short or long duration. Physicians asked to give opinions on attributability in multifactorial disease processes before a legal body frequently must rely on the application of probability statistics to the individual case, a not wholly satisfactory procedure to those who must assign compensation and disability benefits.

of
disability

LUNG CANCER

Up to the time of World War II, cancer of the lung was a relatively rare condition. The increase in its incidence in Europe after World War II was at first ascribed to better diagnostic methods, but by 1956 it had become clear that the rate of increase was too great to be accounted for in this way. At that time the first epidemiological studies began to indicate that a long history of cigarette smoking was associated with a great increase in risk of death from lung cancer. By 1965 cancer of the lung and bronchus accounted for 43 percent of all cancers in the United States in men, an incidence nearly three times greater than that of the second most common cancer (of the prostate gland) in men, which accounted for 16.7 percent of cancers. The 1964 *Report of the Advisory Committee to the Surgeon General of the Public Health Service* (United States) concluded categorically that cigarette smoking was causally related to lung cancer in men. Since then, many further studies in diverse countries have confirmed this conclusion.

The incidence of lung cancer in women began to rise in 1960 and continued rising through the mid-1980s. This is believed to be explained by the later development of heavy cigarette smoking in women compared with men, who greatly increased their cigarette consumption during World War II. By 1988 there was evidence suggesting that the peak incidence of lung cancer due to cigarette smok-

Cigarette
smoking
and lung
cancer

ing in men may have been passed. The incidence of lung cancer mortality in women, however, is increasing.

The reason for the carcinogenicity of tobacco smoke is not known. Tobacco smoke contains many carcinogenic materials, and although it is assumed that the "tars" in tobacco smoke probably contain a substantial fraction of the cancer-causing condensate, it is not yet established which of these is responsible. In addition to its single-agent effects, cigarette smoking greatly potentiates the cancer-causing proclivity of asbestos fibres, increases the risk of lung cancer due to inhalation of radon daughters (products of the radioactive decay of radon gas), and possibly also increases the risk of lung cancer due to arsenic exposure. Cigarette smoke may be a promoter rather than an initiator of lung cancer, but this question cannot be resolved until the process of cancer formation is better understood. Recent data suggest that those who do not smoke but who live or work with smokers and who therefore are exposed to environmental tobacco smoke may be at increased risk for lung cancer, eloquent testimony to the power of cigarettes to induce or promote the disease.

Because lung cancer is caused by different types of tumour, because it may be located in different parts of the lung, and because it may spread beyond the lungs at an early stage, the first symptoms noted by the patient vary from blood staining of the sputum, to a pneumonia that does not resolve fully with antibiotics, to shortness of breath due to a pleural effusion; the physician may discover distant metastases to the skeleton, or in the brain that cause symptoms unrelated to the lung. Lymph nodes may be involved early, and enlargement of the lymph nodes in the neck may lead to a chest examination and the discovery of a tumour. In some cases a small tumour metastasis in the skin may be the first sign of the disease. Lung cancer may develop in an individual who already has chronic bronchitis and who therefore has had a cough for many years. The diagnosis depends on securing tissue for histological examination, although in some cases this entails removal of the entire neoplasm before a definitive diagnosis can be made.

Survival from lung cancer has improved very little in the past 40 years. Early detection with routine chest radiographs has been attempted, and large-scale trials of routine sputum examination for the detection of malignant cells have been conducted, but neither screening method appears to have a major impact on mortality. Therefore, attention has been turned to prevention by every means possible. Foremost among them are efforts to inform the public of the risk and to limit the advertising of cigarettes. Steps have been taken to reduce asbestos exposure, both in the workplace and in public and private buildings, and to control air pollution. The contribution of air pollution to the incidence of lung cancer is not known with certainty, though there is clearly an "urban" factor involved.

Persons exposed to radon daughters are at risk for lung cancer. The hazard from exposure was formerly thought to be confined to uranium miners, who, by virtue of their work underground, encounter high levels of these radioactive materials. However, significant levels of radon daughters have been detected in houses built over natural sources, and with increasingly efficient insulation of houses, radon daughters may reach concentrations high enough to place the occupants at risk for lung cancer. A recent survey of houses in the United States indicated that about 2 percent of all houses had a level of radon daughters that posed some risk to the occupants. Major regional variations in the natural distribution of radon occur, and it is not yet possible to quantify precisely the actual magnitude of the risk. In some regions of the world (such as the Salzburg region of Austria) levels are high enough that radon daughters are believed to account for the majority of cases of lung cancer in nonsmokers.

Workers exposed to arsenic in metal smelting operations, and the community around the factories from which arsenic is emitted, have an increased risk for lung cancer. Arsenic is widely used in the electronics industry in the manufacture of microchips, and careful surveillance of this industry may be needed to prevent future disease.

Some types of lung cancer are unrelated to cigarette

smoking. Alveolar cell cancer is a slowly spreading condition that affects men and women in equal proportion and is not related to cigarette smoking. Pulmonary adenocarcinoma of the lung also has a more equal sex incidence than other types, and although its incidence is increased in smokers, it may also be caused by other factors.

It is common to feel intuitively that one should be able to apportion cases of lung cancer among discrete causes, on a percentage basis. But in multifactorial disease, this is not possible. Although the incidence of lung cancer would probably be far lower without cigarette smoking, the contribution of neither this factor nor any of the other factors mentioned can be precisely quantified.

MISCELLANEOUS PULMONARY CONDITIONS

Nonoccupational diffuse interstitial fibrosis. This condition has many names, including cryptogenic fibrosing alveolitis. It is a diffuse disease characterized by thickening of the alveolar walls, which may become so severe as to interfere with gas transport, and hypoxemia (reduced oxygen supply to tissues) results. Hypoxemia particularly occurs with exercise, since exercise reduces the time the blood spends in the alveolar capillary; and when the wall is thickened, there is insufficient time for oxygen to pass into the blood and achieve full saturation. Thus an early indication of abnormality in this condition is a significant fall in the pressure of oxygen in the arterial blood during exercise. The pulmonary diffusing capacity is usually reduced when this occurs. The cause of diffuse interstitial fibrosis is not known, although it sometimes appears after a viral infection; it also occurs in some diseases of the collagen system. It may run a relatively short course, but often it is slowly progressive over several years and leads eventually to secondary heart failure. The radiographic appearances are characteristic, although in some instances a lung biopsy may be necessary to establish the diagnosis. In a few patients the course of the disease seems to be improved by steroid treatment, but in many cases the downhill course of the disease is uninfluenced by it.

Sarcoidosis. Sarcoidosis is a disease characterized by the development of small aggregations of cells, or granulomas, in different organs; the lung is commonly involved. Other common changes are enlargement of the lymph glands at the root of the lung, skin changes, inflammation in the eye, and liver dysfunction; occasionally there is inflammation of nerve sheaths, leading to signs of involvement in the affected area. The kidney is not commonly involved, but some changes in blood calcium levels occur in a small percentage of cases. The disease seems to affect the Scandinavian population more often than other Caucasians; and in the North American population it is more severe in blacks than in whites. In most cases the disease is first detected on chest radiographs. Evidence of granulomas in the lung may be visible, but often there is little interference with lung function. The disease usually remits without treatment within the next year or so, but in a small proportion of cases it progresses, leading finally to lung fibrosis and retraction.

Eosinophilic granuloma. This disease causes granulomas associated with masses of eosinophil cells, a subgroup of the white blood cells. It also causes lesions in bone. Eosinophilic granuloma is a lung condition that may spontaneously "burn out," leaving the lung with some permanent cystic changes. Its cause is not known.

Alveolar proteinosis. Alveolar proteinosis is characterized by accumulation of protein-rich material in the alveolar spaces of the lung. It is not usually associated with irreversible changes in the lung but runs a remittent course and finally may resolve completely. Its cause is unknown. It is often treated by lavage (washing out) of the lung with saline during bronchoscopy. The disease produces a characteristic radiographic picture and is not associated with changes in any other organ.

Immunologic conditions. The lung is often affected by generalized diseases of the blood vessels. Periarthritis nodosa, an acute inflammatory disease of the blood vessels believed to be of immunologic origin, is an important cause of pulmonary blood vessel inflammation. Acute hemorrhagic pneumonitis occurring in the lung in associa-

Varied
symptoms
of lung
cancer

Early
indications

Exposure
to radon

tion with changes in the kidney is known as Goodpasture's syndrome. The condition has been successfully treated by exchange blood transfusion, but its cause is not fully understood. Pulmonary hemorrhage also occurs as part of a condition known as pulmonary hemosiderosis, which results in the accumulation of the iron-containing substance hemosiderin in the lung tissues. The lung may also be involved in a variety of ways by the disease known as systemic lupus erythematosus, which is also believed to have an immunologic basis. Pleural effusions may occur, and the lung parenchyma may be involved. These conditions have only recently been recognized and differentiated; accurate diagnosis has been much improved by refinements in radiological methods, by the use of pulmonary function tests, and especially by improvement in thoracic surgical techniques and anesthesia that have made lung biopsy much less dangerous than it formerly was.

The common condition of rheumatoid arthritis may be associated with scattered zones of interstitial fibrosis in the lung or with solitary isolated fibrotic lesions. More rarely, a slowly obliterative disease of small airways (bronchiolitis) occurs, leading finally to respiratory failure.

Radiation damage. The lung may be damaged by irradiation of the chest wall in the treatment of cancer of the breast and other conditions. About three weeks or so after the end of the treatment, a pneumonitis may develop in the underlying lung, signaled by an irritant and unproductive cough. The condition may resolve, but in a few cases the lung becomes fibrotic and contracts to a small fraction of its normal volume. There is considerable individual variation in the response to the same dose of radiation.

Circulatory disorders. The lung is commonly involved in disorders of the circulation. The most important and common of these is blockage of a branch of the pulmonary artery by blood clot, which has usually formed in the veins of the legs or the pelvis. The resulting pulmonary embolus leads to changes in the lung supplied by the affected artery. These changes are known as a pulmonary infarction. The consequences of embolism range from sudden death, when the infarction is massive, to an increased respiratory rate, slight fever, and occasionally some pleuritic pain over the site of the infarction. People are at increased risk for pulmonary embolism whenever they are immobilized in bed and the circulation is sluggish, and particularly during the postoperative period. Early mobilization after surgery or childbirth is considered an important preventive measure. Repetitive small emboli may lead to pulmonary thromboembolic disease, in which the pressure in the main pulmonary artery is permanently increased. This disease is believed to be more common in women who have regularly used birth-control pills, but it is not confined to them.

In primary pulmonary hypertension, a condition of unknown origin, a marked increase in pulmonary arterial pressure occurs, with changes in the small radicles of the pulmonary artery that may not be clearly embolic in nature. Both repetitive thromboembolic disease and primary pulmonary hypertension eventually lead to failure of the right ventricle of the heart, usually after increasing disability with severe shortness of breath.

Congestion of the lungs and the development of fluid in the pleural cavity, with consequent shortness of breath, follows left ventricular failure, usually as a consequence of coronary arterial disease. When the valve between the left atrium of the heart and the left ventricle is thickened and deformed by rheumatic fever (mitral stenosis), chronic changes develop in the lung as a result of the increased pressure in the pulmonary circulation. These changes contribute to the shortness of breath in that condition and account for the not-infrequent blood staining of the sputum.

Diseases of the pleura. The pleura lining the lung may become perforated and spontaneously rupture, usually over a small collection of congenital blebs or cysts at the apex of the lung. This causes spontaneous pneumothorax, a partial or occasionally complete collapse of the lung. In the majority of cases a pneumothorax resolves slowly of its own accord, although pleural suction may be needed to expedite recovery. If repetitive attacks occur, the blebs

may be removed surgically, and the pleura lining the lung may be sealed to the pleura lining the inner wall of the thorax to prevent a recurrence.

The most common disease of the pleura is inflammatory. A pleurisy with an effusion may be the presenting symptom of pulmonary tuberculosis, and pleurisy may accompany any kind of pneumonia, though it is rare in viral infections. When a pleural effusion in a person with bacterial pneumonia becomes infected, pus accumulates in the pleural cavity (empyema). This complication, dreaded before the antibiotic era, required drainage of the pleural space. Such episodes are now rarely seen as a result of acute infections, but draining sinuses may still occur in pulmonary tuberculosis or fungal infections. Infection of the lung and later the pleural cavity by the moldlike bacteria *Actinomyces* and *Nocardia* is particularly likely to lead to this complication.

Diseases of the mediastinum and diaphragm. The mediastinum comprises the fibrous membrane in the centre of the thoracic cavity, together with the many important structures situated within it. Enlargement of lymph glands in this region is common, particularly in the presence of lung tumours or as part of a generalized enlargement of lymphatic tissue in disease. Primary tumours of mediastinal structures may arise from the thymus gland or the lower part of the thyroid gland; noninvasive cysts of different kinds are also found in the mediastinum.

The diaphragm may be incompletely formed, leading to herniation of abdominal viscera through it. In adult life the important disease involving the diaphragm is bilateral diaphragmatic paralysis. This leads to a severe reduction in the vital capacity when the subject is recumbent, although exercise capability may be relatively well preserved. In many cases the cause of the paralysis cannot be determined. The function of the diaphragm may be compromised when the lung is highly overinflated, as occurs in emphysema; diaphragmatic fatigue may limit the exercise capability of affected persons.

Acute respiratory distress syndrome of adults. Bacterial or viral pneumonia, exposure of the lung to gases, aspiration of material into the lung (including water in near-drowning episodes), or any generalized septicemia (blood poisoning) or severe lung injury may lead to capillary leakage throughout the lung, a syndrome known as the acute respiratory distress syndrome of adults. It was first recognized when cases occurred following septicemia induced by intrauterine birth control devices; however, this is only one pathway to a generalized lung injury that has many causes. Acute respiratory distress syndrome carries about a 50 percent mortality, later infection by certain types of bacteria being particularly serious. Life-support treatment with assisted ventilation rescues some patients, but there has been little improvement in survival during the 1970s and '80s. Recovery and repair of the lung may take months after clinical recovery from the acute event.

Effects of air pollution on health. The disastrous fog and attendant high levels of sulfur dioxide and particulate pollution (and probably also sulfuric acid) that occurred in London in the second week of December 1952 led to the deaths of more than 4,000 people during that week and the subsequent three weeks. Many, but not all, of the victims already had chronic heart or lung disease. Prize cattle at an agricultural show also died in the same period as a result of the air pollution. This episode spurred renewed attention to this problem, which had been intermittently considered since the 14th century in England, and finally the passage of legislation banning open coal burning, the factor most responsible for the pollution. This form of pollution, common in many cities using coal as heating fuel, was associated with excess mortality and increased prevalences of chronic bronchitis, respiratory tract infections in the young and old, and possibly lung cancer. Many industrial cities in Western countries now have legislation restricting the use of specific fuels and mandating emission-control systems in factories.

In 1952 a different kind of air pollution was characterized for the first time in Los Angeles. The large number of automobiles in that city, together with the bright sunlight and frequently stagnant air, leads to the formation

Pulmonary
embolism

Spon-
taneous
pneumo-
thorax

The 1952
London
epidemic

Smog

of photochemical smog. This begins with the emission of nitrogen oxide during the morning commuting hour, followed by the formation of nitrogen dioxide by oxygenation, and finally, through a complex series of reactions in the presence of hydrocarbons and sunlight, to the formation of ozone and peroxyacetyl nitrite and other irritant compounds. Eye irritation, chest irritation with cough, and possibly the exacerbation of asthma occur as a result. It is now recognized that ozone is formed in many large cities of the world. Modern air pollution consists of some combination of the reducing form consequent upon sulfur dioxide emissions, and the oxidant form, which begins as emissions of nitrogen oxides. Ozone is the most irritant gas known. In controlled exposure studies it reduces the ventilatory capability of healthy people in concentrations as low as 0.12 parts per million. These levels are commonly exceeded in many places, including Mexico City, Bangkok, and São Paulo, where there is a high automobile density and the meteorologic conditions favour the formation of photochemical oxidants. Although acute episodes of communal air exposure leading to demonstrable mortality are unlikely, there is much concern over the possible long-term consequences of brief but repetitive exposures to oxidants and acidic aerosols; such exposures are now common in the lives of millions of people. Their impact has not yet been precisely defined.

The indoor environment can be important in the genesis of respiratory disease. In developing countries, disease may be caused by inhalation of fungi from roof thatch materials or by the inhalation of smoke when the home contains no chimney. In developed countries, exposure to oxides of nitrogen from space heaters or gas ovens may promote respiratory tract infections in children. Inhalation of tobacco smoke in the indoor environment by nonsmokers impairs respiration and may cause lung cancer. A tightly sealed house may act as a reservoir for radon seeping in from natural sources.

Acute carbon monoxide poisoning. Acute carbon monoxide poisoning is a common and dangerous hazard. The British physiologist J.S. Haldane pioneered the study of the effects of carbon monoxide at the end of the 19th century, as part of his detailed analysis of atmospheres in underground mines. Carbon monoxide is produced by incomplete combustion, including combustion of gas in automobile engines, and for a long period it was a major constituent of domestic gas made from coal (its concentration in natural gas is much lower). When the carbon monoxide concentration in the blood reaches 40 percent (that is, when the hemoglobin is 40 percent saturated with carbon monoxide, leaving only 60 percent available to bind to oxygen), the subject feels dizzy and is unable to perform simple tasks; judgment is also impaired. Hemoglobin's affinity for carbon monoxide is 200 times greater than for oxygen, and in a mixture of these gases hemoglobin will preferentially bind to carbon monoxide; for this reason, carbon monoxide concentrations of less than 1 percent in inspired air seriously impair oxygen-hemoglobin binding capacity. The partial pressure of oxygen in the tissues in carbon monoxide poisoning is much lower than when the oxygen-carrying capacity of the blood has been reduced an equivalent amount by anemia, a condition in which hemoglobin is deficient. The immediate treatment for acute carbon monoxide poisoning is assisted ventilation with 100 percent oxygen.

The carbon monoxide inhaled by smokers who smoke more than two packs of cigarettes a day may cause up to 10 percent hemoglobin saturation with carbon monoxide. A 4 percent increase in the blood carbon monoxide level in patients with coronary artery disease is believed to shorten the exercise that may be taken before chest pain is felt, in those who have that symptom on exercise.

LUNG TRANSPLANTATION

Early attempts at transplanting a single lung in patients with severe bilateral lung disease were not successful, but from the late 1970s bilateral lung transplantation had some striking results. Persons severely disabled by cystic fibrosis, emphysema, sarcoidosis, pulmonary fibrosis, or severe primary pulmonary hypertension reportedly

achieved nearly normal lung function several months after the procedure. Combined heart-lung transplantation has been attempted, with some good long-term results. One study of seven cases showed that ventilatory capacity after bilateral lung transplantation was about 75 percent of the normal value for that individual. Because transplantation offers the only hope for persons with severe lung disease, who may be relatively young, the techniques are being pursued aggressively in specialized centres. (D.V.B.)

Respiration in humans: The design of the human respiratory system is covered by PETER H. BURRI, JOAN GIL, and EWALD R. WEIBEL, "Ultrastructure and Morphometry of the Human Lung," in THOMAS W. SHIELDS (ed.), *General Thoracic Surgery*, 2nd ed. (1983), pp. 18-42; and two essays in *Handbook of Physiology*, sect. 3, *The Respiratory System*, vol. 1, *Circulation and Nonrespiratory Functions*, ed. by ALFRED P. FISHMAN and ARON B. FISHER (1985); PETER H. BURRI, "Development and Growth of the Human Lung," pp. 1-46; and EWALD R. WEIBEL, "Lung Cell Biology," pp. 47-91.

(P.H.B.)

Control of breathing is described in *Handbook of Physiology*, sect. 3, *The Respiratory System*, vol. 2, *Control of Breathing*, 2 vol., ed. by NEIL S. CHERNIACK and JOHN G. WIDDICOMBE (1986); JACK L. FELDMAN, "Neurophysiology of Breathing in Mammals," in *Handbook of Physiology*, sect. 1, *The Nervous System*, vol. 4, *Intrinsic Regulatory Systems of the Brain*, ed. by FLOYD E. BLOOM (1986), pp. 463-524, an overview of the control of breathing; and the following journal articles: EUGENE N. BRUCE and NEIL S. CHERNIACK, "Central Chemoreceptors," *Journal of Applied Physiology*, 62(2):389-402 (Feb. 1987), a short review of advances in understanding the physiological mechanisms that account for the effect of carbon dioxide on breathing; NEIL S. CHERNIACK and MURRAY D. ALTOSE, "Mechanisms of Dyspnea," *Clinics in Chest Medicine*,

Mechanism
of action

8(2):207-214 (June 1987), a brief description of the physiological basis of shortness of breath; HUGO LAGERCRANTZ and THEODORE A. SLOTKIN, "The 'Stress' of Being Born," *Scientific American*, 254(4):100-107 (April 1986), an article on breathing in the infant; MICHAEL E. LONG, "What Is This Thing Called Sleep?" *National Geographic*, 172(6):787-821 (Dec. 1987), an update on sleep physiology and apnea and on the kinds of research being conducted; and KINGMAN P. STROHL, NEIL S. CHERNIACK, and BARBARA GOTHE, "Physiologic Basis of Therapy for Sleep Apnea," *American Review of Respiratory Disease*, 134(6):791-802 (June 1986), on abnormal breathing during sleep and how it can be treated. (N.S.C.)

The principles of gas exchange in animals and humans are discussed in MALCOLM S. GORDON, *Animal Physiology: Principles and Adaptation*, 4th ed. (1982), a consideration of the mechanisms of gas exchange among animals; "Gas Exchange and Circulation," in R. MCNEILL ALEXANDER (ed.), *The Encyclopedia of Animal Biology* (1987), pp. 50-65; and *Handbook of Physiology*, sect. 3, *The Respiratory System*, vol. 4, *Gas Exchange*, ed. by LEON E. FARHI and S. MARSH TENNEY (1987), a critical, comprehensive presentation of physiological knowledge and concepts. (A.P.F./R.A.Kl.)

The interplay between respiration, circulation, and metabolism is outlined by EWALD R. WEIBEL, *The Pathway for Oxygen: Structure and Function in the Mammalian Respiratory System* (1984); R. GILLES (ed.), *Circulation, Respiration, and Metabolism: Current Comparative Approaches* (1985), essays on oxygen transport and utilization in animals; and C.R. TAYLOR et al., "Adaptive Variation in the Mammalian Respiratory System in Relation to Energetic Demand," *Respiration Physiology*, 69(1):1-127 (July 1987), an entire issue devoted to the subject. (E.R.W.)

Adaptations of the respiratory system to high altitude are described in a comprehensive but readable manner in DONALD

HEATH and DAVID REID WILLIAMS, *High-Altitude Medicine and Pathology* (1989). (Do.A.H.)

The effects of swimming and diving on respiration are detailed in PETER B. BENNETT and DAVID H. ELLIOTT (eds.), *The Physiology and Medicine of Diving*, 3rd ed. (1982); and N.R. ANTHONISEN, "Respiration," in CHARLES W. SHILLING, CATHERINE B. CARLSTON, and ROSEMARY A. MATHIAS (eds.), *The Physician's Guide to Diving Medicine* (1984), pp. 71-85, part of a chapter on the physiology of diving. (D.H.E.)

Diseases and disorders of respiration: The respiratory system is described in DAVID V. BATES, PETER T. MACKLEM, and RONALD V. CHRISTIE, *Respiratory Function in Disease: An Introduction to the Integrated Study of the Lung*, 2nd ed. (1971), a detailed text on impairment of lung function caused by disease; and ROBERT G. FRASER et al., *Diagnosis of Diseases of the Chest*, 2nd ed., 4 vol. (1977-79), with vol. 1 also available in a 3rd ed. (1988). H. CORWIN HINSHAW and JOHN F. MURRAY, *Diseases of the Chest*, 4th ed. (1980), is a general textbook covering diagnosis and treatment of chest diseases; see also J.G. SCADDING and GORDON CUMMING (eds.), *Scientific Foundations of Respiratory Medicine* (1981). STEVEN E. WEINBERGER, *Principles of Pulmonary Medicine* (1986), is an introductory text in which respiratory pathophysiology is considered from the clinical vantage. Comprehensive texts include GORDON CUMMING and STEPHEN J. SEMPLE, *Disorders of the Respiratory System*, 2nd ed. (1980); JOHN CROFTON and ANDREW DOUGLAS, *Respiratory Diseases*, 3rd ed. (1981); and IAN R. CAMERON and NIGEL T. BATEMAN, *Respiratory Disorders* (1983). ALFRED P. FISHMAN (ed.), *Pulmonary Diseases and Disorders*, 2nd ed., 3 vol. (1988), provides a comprehensive overview of pathophysiology as related to clinical syndromes. See also JOHN F. MURRAY and JAY A. NADEL (eds.), *Textbook of Respiratory Medicine* (1988); and WILLIAM M. THURLBECK (ed.), *Pathology of the Lung* (1988). (D.V.B./A.P.F.)

Rhetoric

The term rhetoric has traditionally applied to the principles of training communicators—those seeking to persuade or inform; in the 20th century it has undergone a shift of emphasis from the speaker or writer to the auditor or reader. This article deals with rhetoric in both its traditional and its modern forms. For information on applications of rhetoric, see the articles BROADCASTING, COMMUNICATION, and PROPAGANDA. For coverage of related topics in the *Macropedia* and the *Micropedia*, see the *Propedia*, sections 621 and 10/12, and the *Index*. The article is divided into the following sections:

Rhetoric in literature

THE NATURE AND SCOPE OF RHETORIC

Traditional and modern rhetoric. The traditional rhetoric is limited to the insights and terms developed by rhetors, or rhetoricians, in the Classical period of ancient Greece, about the 5th century BC, to teach the art of public speaking to their fellow citizens in the Greek republics and, later, to the children of the wealthy under the Roman Empire. Public performance was regarded as the highest reach of education proper, and rhetoric was at the centre of the educational process in western Europe for some 2,000 years. *Institutio oratoria* (before AD 96; “The Training of an Orator”), by the Roman rhetorician Quintilian, perhaps the most influential textbook on education ever written, was in fact a book about rhetoric. Inevitably, there were minor shifts of emphasis in so long a tradition, and for a long time even letter writing fell within the purview of rhetoric; but it has consistently maintained its emphasis upon creation, upon instructing those wishing to initiate communication with other people.

Modern rhetoric has shifted its focus to the auditor or reader. Literary criticism always borrowed from rhetoric—stylistic terms such as antithesis and metaphor were invented by Classical rhetoricians. When language became a subject of sustained scholarly concern, it was inevitable that scholars would turn back to Classical theories of rhetoric for help. But modern rhetoric is far more than a collection of terms. The perspective from which it views a text is different from that of other disciplines. History, philosophy, literary criticism, and the social sciences are apt to view a text as though it were a kind of map of the author’s mind on a particular subject. Rhetoricians, accustomed by their traditional discipline to look at communication from the communicator’s point of view, regard the text as the embodiment of an intention, not as a map. They know that that intention in its formulation is affected by its audience. They know also that the structure of a piece of discourse is a result of its intention. A concern for audience, for intention, and for structure is, then, the mark of modern rhetoric. It is as involved with the process of interpretation, or analysis, as it is with the process of creation, or genesis.

Rhetorical analysis is actually an analogue of traditional rhetorical genesis: both view a message through the situation of the auditor or reader as well as the situation

of the speaker or writer. Both view the message as compounded of elements of time and place, motivation and response. An emphasis on the context automatically makes a rhetorician of the literary critic or interpreter and distinguishes that approach from the other kinds of verbal analysis. Critics who have insisted upon isolating, or abstracting, the literary text from the mind of its creator and from the milieu of its creation have found themselves unable to abstract it from the situation of its reader. Certain modern critics have joined with rhetoricians in denouncing the folly of all such attempts at abstraction. In interpreting any text—say a speech by Elizabeth I of England at Tilbury, Essex, or a play by the great Hindu poet of the 5th century, Kālidāsa—the rhetorician must imaginatively re-create the original situation of that text as well as endeavour to understand those factors that condition a present understanding.

All discourse now falls within the rhetorician’s purview. Modern rhetoricians identify rhetoric more with critical perspective than with artistic product. They justify expanding their concerns into other literary provinces on the basis of a change in thinking about the nature of human reason. Modern philosophers of the Existentialist and Phenomenologist schools have strongly challenged the assumptions whereby such dualities as knowledge and opinion, persuasion and conviction, reason and emotion, rhetoric and poetry, and even rhetoric and philosophy have in the past been distinguished. The old line between the demonstrable and the probable has become blurred. According to these modern philosophers, a person’s basic method of judgment is argumentation, whether in dialogue with others or with a text, and the results are necessarily relative and temporal. Such modern philosophers use legal battles in a courtroom as basic models of the process every person goes through in acquiring knowledge or opinion. For some, philosophy and rhetoric have become conflated, with rhetoric itself being a further conflation of the subject matter Aristotle discusses not only in his *Rhetoric* but also in his *Topics*, which he had designed for dialectics, for disputation among experts. According to this view, philosophers engage in a rhetorical transaction that seeks to persuade through a dialogic process first themselves and then, by means of their utterances, others. It is in this “argumentative” light that a rhetorically trained reader or auditor interprets all texts and justifies their inclusion within the province of rhetoric.

Rhetoric has come to be understood less as a body of theory or as certain types of artificial techniques and more as an integral component of all human discourse. As a body of discursive theory, rhetoric has traditionally offered rules that are merely articulations of contemporary attitudes toward certain kinds of prose and has tended to be identified with orations in which the specific intent to persuade is most obvious. But modern rhetoric is limited neither to the offering of rules nor to studying topical and transient products of controversy. Rather, having linked its traditional focus upon creation with a focus upon interpretation, modern rhetoric offers a perspective for discovering the suffusion of text and content inhering within any discourse. And for its twin tasks, analysis and genesis, it offers a methodology as well: the uncovering of those strategies whereby the interest, values, or emotions of an audience are engaged by any speaker or writer through his discourse. The perspective has been denoted with the term situation; the methodology, after the manner of certain modern philosophers, may be denoted by the term argumentation. It should be noted at the outset that one may study not only the intent, audience, and structure of a discursive act but also the shaping effects of the medium itself on both the communicator and the communicant. Those rhetorical instruments that potentially work upon

courtroom
model

The situa-
tions of a
message

an audience in a certain way, it must be assumed, produce somewhat analogous effects within the writer or speaker as well, directing and shaping his discourse.

Figures of
speech

Elements of rhetoric. For the tasks imposed by the rhetorical approach some of the most important tools inherited from antiquity are the figures of speech: for example, the metaphor, or comparison between two ostensibly dissimilar phenomena, as in the famous comparison by the 17th-century English poet John Donne of his soul and his mistress's to the legs on a geometer's compass in his "A Valediction: Forbidding Mourning"; another is the allegory, the extended metaphor, as in John Bunyan's classic of English prose *Pilgrim's Progress* (1678, 1684), wherein man's method of earning Christian salvation is compared to a road on which he journeys, and the comparison is maintained to such an extent that it becomes the central structural principle of the entire work. Such figures may be said to pertain either to the texture of the discourse, the local colour or details, or to the structure, the shape of the total argument. Ancient rhetoricians made a functional distinction between trope (like metaphor, a textural effect) and scheme (like allegory, a structural principle). To the former category belong such figures as metaphor, simile (a comparison announced by "like" or "as"), personification (attributing human qualities to a nonhuman being or object), irony (a discrepancy between a speaker's literal statement and his attitude or intent), hyperbole (overstatement or exaggeration) or understatement, and metonymy (substituting one word for another which it suggests or to which it is in some way related—as part to whole, sometimes known as synecdoche). To the latter category belonged such figures as allegory, parallelism (constructing sentences or phrases that resemble one another syntactically), antithesis (combining opposites into one statement—"To be or not to be, that is the question"), congeries (an accumulation of statements or phrases that say essentially the same thing), apostrophe (a turning from one's immediate audience to address another, who may be present only in the imagination), enthymeme (a loosely syllogistic form of reasoning in which the speaker assumes that any missing premises will be supplied by the audience), *interrogatio* (the "rhetorical" question, which is posed for argumentative effect and requires no answer), and *gradatio* (a progressive advance from one statement to another until a climax is achieved). However, a certain slippage in the categories trope and scheme became inevitable, not simply because rhetoricians were inconsistent in their use of terms but because well-constructed discourse reflects a fusion of structure and texture. One is virtually indistinguishable from the other. Donne's compass comparison, for example, creates a texture that is not isolable from other effects in the poem; rather, it is consonant with a structural principle that makes the comparison both appropriate and coherent. Above all, a modern rhetorician would insist that the figures, like all elements of rhetoric, reflect and determine not only the conceptualizing processes of the speaker's mind but also an audience's potential response. For all these reasons figures of speech are crucial means of examining the transactional nature of discourse.

Rhetoric of or in a discourse. In making a rhetorical approach to various discursive acts, one may speak of the rhetoric *of* a discourse—say, Robert Browning's poem "My Last Duchess" (1842)—and mean by that the strategies whereby the poet communicated with his contemporaries, in this case the Victorians, or with modern man, his present readers; or one may speak of the rhetoric *in* a discourse and mean by that the strategies whereby the persona, the Duke of Ferrara who speaks Browning's poem in dramatic-monologue fashion, communicates with his audience in the poem, in this case an emissary from the father of Ferrara's next duchess. The two kinds of rhetoric are not necessarily discrete: in oratory or in lyric poetry, for example, the creator and his persona are assumed to be identical. To a degree Aristotle's distinction between the three voices of discourse still holds. A poet, according to Aristotle, speaks in his own voice in lyric poetry, in his own voice and through the voices of his characters in epic (or narrative), and only through the voices of his charac-

The three
voices of
discourse

ters in drama. Thus, the speaker of oratory or of most nonfictional prose is similar to the lyric speaker, with less freedom than the latter either to universalize or to create imaginatively his own audience.

RHETORICAL TRADITIONS

Although knowledge of rhetorical traditions is essential to the modern student's work, it must be borne in mind that he is nonetheless divorced from those traditions in two important ways. First, there is an almost exclusive emphasis upon the speaker or writer in traditional rhetoric; and, second, there is an implicit belief that the truth can be detached from the forms of discourse and can be divided into the demonstrable and the probable. In both of these respects, modern rhetorical practice differs.

Ancient Greece and Rome. Since the time of Plato it has been conventional to posit a correlative if not causal relationship between rhetoric and democracy. Plato located the wellsprings of rhetoric in the founding of democracy at Syracuse in the 5th century BC. Exiles returning to Syracuse entered into litigation for the return of their lands from which they had been dispossessed by the overthrown despotic government. In the absence of written records, claims were settled in a newly founded democratic legal system. To help litigants improve their persuasiveness, certain teachers began to offer something like systematic instruction in rhetoric.

In this experience at Syracuse, certain identifiable characteristics become prototypal: the rhetor, or speaker, is a pleader; his discourse is argumentative; and members of his audience are participants in and judges of a controversy. Later, in Athens, these characteristics began to aggregate to themselves some serious intellectual issues.

In Athens early teachers of rhetoric were known as Sophists. These men did not simply teach methods of argumentation; rather, they offered rhetoric as a central educational discipline and, like modern rhetoricians, insisted upon its usefulness in both analysis and genesis. With the growth of Athenian democracy and higher systematized education, the Sophists became very powerful and influential. Today the word sophistic refers to a shabby display of learning or to specious reasoning; it refers, consequently, to an image of the Sophists that resulted from the attacks upon them led by such reformers as Plato. The ideal rhetoric proposed by Socrates in Plato's dialogue the *Phaedrus*, however, is itself not unlike the ideal sought by the Sophists in general, Isocrates in particular. Though the Platonic-Socratic ideal is more specialized in its focus on creating discourse, nonetheless, like the Sophistic ideal, it sought a union of verbal skills with learning and wisdom. Specifically, Platonic-Socratic rhetoric became a means of putting into practice the wisdom one acquires in philosophy. In this way Plato and Socrates resolved one of the most serious intellectual issues surrounding the subject: the relationship between truth and rhetorical effectiveness. The resolution, of course, presupposes and maintains a bifurcation between the two.

Aristotle, too, presupposed and maintained the same division between truth, which was knowable to varying degrees of certainty, and verbal skills, which for Aristotle were primarily useful in assisting truth to prevail in a controversy. But Aristotle lived in a world different from Plato's, one that was closer to the present in the premium it placed upon literacy and upon those patterns of thought that literacy encourages. The literate function of Aristotle's brilliance at recording and categorizing is well captured in Donne's phrase, "Nature's Secretary." Aristotle's *Rhetoric* both recorded contemporary practice and sought its reform through fitting it into its proper category among the arts. One of the masterstrokes of Aristotle's thought on the subject is his teaching that rhetoric itself is not a productive art of making but is an art of doing, embodying a power which is employed in certain kinds of speaking. Further evidence of his brilliance on the subject is his division of speaking into the forensic, the deliberative, and the epideictic and of persuasive appeals into the ethical, the emotional, and the logical. His division of speaking into three kinds reflects his efforts to distinguish rhetoric and its counterpart, dialectics, from philosophy

Role
of the
Sophists
in Athens

Aristotle's
contributions
to rhetoric

and science. Rhetoric and dialectics, he felt, are concerned with probable matters, in which there are several roads to truth; philosophy and science, on the other hand, are concerned with demonstrable matters, in which the roads are fewer but the truth more certain. In dividing persuasive appeals into three kinds, Aristotle indicated an unmistakable preference for the logical. This preference has been interpreted variously as a result of Aristotle's naïve assumption about the rationality of most audiences and as an attempt to reform the emotionally charged rhetoric of his contemporaries. In discussing elements of style, Aristotle treated metaphor, perhaps the major figure of speech, in a way that was to plague rhetoricians and poets for centuries. He describes it not as an instrument of thought but as an ornamentation, an adornment that at best serves the functions of clarity and vividness. The effect is further reflection of the principle noted earlier: for Aristotle the truth with which rhetoric is concerned is not demonstrable. It is, moreover, detachable from the forms of argument, and it can be tested by such analytical means as dialectics, which is the counterpart of rhetoric but which does not have what Aristotle viewed as rhetoric's cloying concerns with that beast of many heads, the heterogeneous audience composed of experts and laymen alike.

The Sophistic doctrine that rhetoric should be the central discipline in the educational scheme had a long history, rising to its fullest statement in the writings of Quintilian in Rome of the 1st century AD. By the age of Quintilian three intellectual issues had become firmly fixed within the orbit of rhetoric. Two of these were consciously faced: (1) the relationship between truth and verbal expression and (2) the difficulties of achieving intellectual or artistic integrity while communicating with a heterogeneous audience. In a sense, both of these issues were not faced at all but dodged, as they had been in the past, with the implicit assumption that wisdom and eloquence were not necessarily synonymous and that truth and integrity were ultimately dependent upon the character of the speaker. The orator, according to Cato the Elder, must be a good man skilled in speaking. Through the writings of Cicero, the ancient Roman orator of the 1st century BC whom later ages were to admire both for his statesmanship and for his prose style, Cato's doctrine was spread in the Western world for centuries. Quintilian's tediously prescriptive *Institutio oratoria* is built on Cato's thesis: it offers an educational program for producing generations of Ciceronian statesmen. But for all its importance and influence, the work never found its time so far as being used as a text for political leaders to follow. Quintilian's program was impossible to achieve in the age of tyranny in which he lived, and it was impracticable in the Renaissance. Nevertheless, it was in the Renaissance that the *Institutio oratoria* began to be revered as the greatest educational treatise ever written.

A third issue arose in part as a consequence of literacy and in part as a consequence of social change: rhetoric became a productive art, but one whose role and status were unclear. The audience was no longer quite the full partner in the creative event that it had been in older days of freer public discussion; subsequently, from the classical period through the Middle Ages rhetoricians began to conceive of their art as a kind of methodical, solitary progress toward literary creation. Rhetoric was thought of less in terms of a power and more in terms of certain products of that power—orations; elaborate rules were given for distinguishing the kinds of orations and for arranging the material in them. Accompanying this shift, the entire creative process taught by the rhetoricians became linear and sequential in concept, with some activities located at further and further removes from the serious operations of the mind. A certain linearity, or step-by-step procedure, is evident in Aristotle's *Rhetoric*, but the attendant dangers of compartmentalization and fragmentation into increasingly trivial matters did not make themselves felt for centuries. By the time of Cicero, rhetoric was considered to be a discipline that encompassed five "offices": invention, analyzing the speech topic and collecting the materials for it; disposition, arranging the material into an oration; elocution, fitting words to the topic, the speaker,

the audience, and the occasion; pronunciation or action, delivering the speech orally; and memory, lodging ideas within the mind's storehouse. Not only orations but also poems, plays, and almost every kind of linguistic product except those belonging peculiarly to logic (or dialectics) fell within the rhetoricians' creative art. Thus, the function of rhetoric appeared to be the systematic production of certain kinds of discourse, but the significance of this now clearly productive art became increasingly dubious in ages when governments did not allow public deliberation on social or political issues or when the most significant speaking was done by church authorities whose training had been capped by logic and theology.

The Middle Ages. The early Church Father St. Augustine made one of the earliest efforts to write a rhetoric for the Christian orator. Book IV of *On Christian Doctrine* is usually considered the first rhetorical theory specifically designed for the minister. Of course, the kind of truth to which Augustine sought to give verbal effectiveness was the "revealed" truth as contained in the Scriptures. The first three books of *On Christian Doctrine*, which describe procedures for a proper interpretation of the Bible, actually set forth the invention part of Augustine's rhetoric. There is no basis here for replacing either logic or theology with rhetoric as the capstone of professional training. The work does represent, however, one of the first theoretical efforts to bring together interpretation—that is, interpreting a text, as opposed to interpreting the facts of a case—and rhetoric.

Late in the 13th century, two students of the German philosopher Albertus Magnus produced a great impact upon the thought—particularly the educational thought—of succeeding generations. Thomas Aquinas, who became in effect the preceptor of the theological curriculum, and Peter of Spain (later Pope John XXI), the preceptor of the general or "arts" curriculum, gave articulate force to the current educational practice of making logic the specialty toward which the professional student advanced beyond rhetoric. Thomas wrote on the logic of abstract, symbolic thought, and Peter wrote on the logic of dialectics, disputation among experts.

The Renaissance and after. In the 16th century, at a time marked by a tremendous growth of interest in creating vernacular rhetorics to satisfy a new self-consciousness in the use of native tongues, the French philosopher Petrus Ramus and his followers merely completed the incipient fragmentation of rhetorical theory by affirming the offices as discrete specialties. Invention and disposition were assigned to dialectics, by now largely a silent art of disputation which in the Ramist system placed a premium upon self-evident, axiomatic statements. Memory was considered not a matter of creating sound effects to enhance the memorization of the orator's ideas but a matter of effective disposition, so that separate attention to memory disappeared. Elocution and pronunciation were considered the only two offices proper to rhetoric, and these fell under peculiar opprobrium.

Elocution, or style, became the centre of rhetorical theory, and in Ramist hands it was almost solely concerned with figures of speech. Actually, a strong emphasis upon the figures of speech had been evolving since the late Middle Ages. When responsibly taught, as linguistic postures, stances, gestures of the mind in confrontation with external reality, the figures served a useful purpose; and in Renaissance education they were widely employed, as in the modern manner, in the interpretation or analysis of discourse. Less responsibly taught, the figures became merely an ornamentation, like the metaphor in Aristotle. In the Ramistic system, the figures ranged between serving as arguments and serving as extrinsic decorations. The figures of speech fell into greater disrepute in the new culture of the Renaissance, which was marked not only by an enthusiasm for printed vernacular discourse in a "plain" style but also by an increasing perplexity over doctrines of the passions. For centuries rhetoricians had taught figures of speech as means of "amplifying" ideas so that they would appeal to the passions in an audience. With Ramus, rhetoric discarded its principles of amplification, leaving the passions to be discussed primarily by "moral

system

The five
"offices"
of rhetoric

philosophers," who battled heatedly over which were ordinate and which were inordinate passions. Ultimately, the passions themselves became subjects, or objects, of the new scientists, who divorced them from moral or religious dogma. It was the end of the 18th century before doctrines of the passions fell once more within the rhetorician's purview; however, at that time the figures were regarded less as appeals to an audience's passions and more as manifestations of the author's or speaker's psychology—or, to use the metaphor employed earlier, as places on the map of his mind.

The other part of the fragmented Ramist rhetoric, pronunciation or action, was rarely mentioned in the Renaissance; it hath not yet been perfected, was the excuse the Ramists gave. The first real impetus for a scientizing of English oral delivery came at the beginning of the 17th century from Francis Bacon, who, in touching on rhetoric in his writings, called for a scientific approach to the study of gesture. The Ramists had created a context within which Bacon's call would have peculiar force and meaning. John Bulwer's *Chirologia* (1644) was the first work to respond, and in its wake came a host of studies of the physical, nonverbal expression of ideas and passions, including works by Charles Darwin and Alexander Melville Bell in the 19th century and modern writings on "silent language" by the American linguist Edward T. Hall.

The elocutionary movement

But, so far as rhetorical theory is concerned, even more significant attempts to specialize in the study of pronunciation or action came in the elocutionary movement of the 18th century, which was the first large-scale, systematic effort to teach reading aloud (oral interpretation). The elocutionists named their study for the third office of rhetoric partly because "pronunciation" was coming to refer solely to correct English phonation and partly because "elocution" had traditionally referred to the decorous expression of previously composed material. The most important elocutionists were actors or lexicographers, such as Thomas Sheridan and John Walker, both of whom acted in London and went on to write dictionaries in the late 18th century. At first glance, their efforts to describe or prescribe the oral delivery of written or printed discourse (poems, plays, as well as speeches) appear to operate on extremely inadequate theory: exactly how one discovered the meaning on the page seems mysterious, almost divinatory. Some of their efforts produced such absurdities as statelike posing or a contempt for the verbal later associated in America with the 19th-century French teacher of dramatic and musical expression François Delsarte. Yet, their efforts may also be seen as attempts to restore the voice to that entire language process which the page abstracted—as attempts to bridge the gap left in concepts of "natural" meaning by the decay of the oral traditions. Moreover, it is most significant that of all theorists within the history of rhetoric, the elocutionists were the first to place an exclusive concern upon interpreting discourse. Indeed, it was through the elocutionary emphasis upon interpretation that something like a meaningful restoration of pronunciation occurred within the rhetorical tradition.

Sheridan had found within the teachings of the 17th-century English philosopher John Locke a foundation on which the study of elocution could be built: words are the signs of ideas, tones the signs of passions. A new, virtually irrevocable split had apparently occurred between spoken language and printed or written discourse. But the split did not produce in other rhetoricians quite the anxiety it produced in the elocutionists. Other rhetoricians began to discover faculty psychology (*i.e.*, the obsolete notion that supposed faculties of the mind such as will and reason account for all human behaviour) and associationism (*i.e.*, the philosophy expostulated by the 18th-century Scot David Hume and others that most mental activity is based on the association of ideas). In these concepts they found a fragmented, compartmentalized means whereby a fragmented, compartmentalized rhetorical theory could recover part of its earlier vast province, as, for example, doctrines of the passions. Pathetic appeals could simply become, as in Hugh Blair's *Lectures on Rhetoric and Belles Lettres* (1783), something like the sixth office of rhetoric. Besides Blair's, the most important rhetorical

Dis-solution of rhetoric

treatises of the period were George Campbell's *Philosophy of Rhetoric* (1776) and Richard Whately's *Elements of Rhetoric* (1828). All three books were written by Protestant clerics, and all reveal the pervasive assumptions of the Age of Reason. Though rhetoric may involve the whole man—indeed, that is the very reason Campbell believed rhetoric properly seen is naturally allied with a science of the mind—nonetheless, man was viewed as an animal with higher and lower faculties, whose intellect was susceptible to being disordered by his passions and whose noble achievement was the creation of rational, preferably written, discourse.

Theories of rhetorical invention of the 18th and 19th centuries seldom treated the exigencies of oral composition before live audiences or even involved an imaginative projection of oneself into a public situation. Rather, they posited an inventive process that was silent, solitary, meditative—a process of conducting solitary, or inward, dialogues. Imagination, that faculty by which man may potentially synthesize what faculty psychology termed his rational and sensory experiences, was not vindicated philosophically until the Romantic movement of the 19th century (and perhaps never effectively). By that time, rhetoric had fallen into discredit. Printed matter had proliferated to such an extent that traditional principles of invention had become antiquated. Eventually all traditional techniques of style and all organized rhetorical study were devalued by interest in experiments; in Switzerland, cultural historian Jacob Burckhardt described antiquity's interest in rhetoric as a "monstrous aberration." In America, the Delsartians, who stressed gesture rather than words, spread an anti-rhetorical approach to imagination, the passions, sensory experience, and delivery. Thus, well into the 20th century, "elocution" in popular speech meant florid delivery and "rhetoric" because of its principal concern with oratory, meant purple prose. In academic circles, "rhetoric" referred largely to principles of "belles lettres" until "belletristic" became a pejorative; then "rhetoric" in a host of college "composition" courses referred to less philosophically troublesome principles of paragraph development and thematic arrangement. More than the medieval logicians, more than Ramus, more than all Rationalist philosophers, and more than even the new philosophies of science, it was probably the very momentum of the revolution begun by Johannes Gutenberg's invention of the printing press that caused traditional rhetoric, both as an educational principle and as a theory, to go under.

TOWARD A NEW RHETORIC

These extremely negative views toward rhetoric prevailed until the 1930s, when attention to the importance of studying how language is used was stimulated by Logical Positivism, the philosophical movement that insists that all statements be verifiable by observation or experiment, and that movement had ironically been stimulated in turn by the very scientism that had earlier disparaged rhetoric. Substantial attempts were made, particularly in the United States, to develop an art of discourse suitable for teaching in schools and universities.

In the opening decades of the 20th century, an attempt was made in American universities to restore rhetoric to the serious study of communication (that is, of creating discourse). Teachers of public speaking were the first to turn to rhetorical traditions for help, followed by teachers of writing. (The teaching of speaking had been divorced from the teaching of writing in America since the third quarter of the 19th century—a divorce that has been recognized by modern universities but challenged by the temper of modern life.) Appropriately, considering the impetus of Logical Positivism, the restored rhetoric was largely Aristotelian, an Aristotelianism that was filtered through centuries of faculty psychology, that was becoming part of a doctrinaire stance against the Romantics and the elocutionists, and that was interpreted in terms of lingering presuppositions of a typographical age. Nonetheless, the rhetoric offered through the tenets of a restored Aristotelianism was potentially more comprehensive—more inclusive of all the offices of rhetoric—than any in Western education since the Renaissance. The political facts of

Restored Aristotelianism

modern life, however, made the Rationalist proclivity of this rhetoric appear naïve. The new media—films, radio, and television—and the new orality of modern life was felt by those interested in rhetoric as a challenge to older linguistic notions, not simply those of the print-oriented teachers of written or spoken composition but those of the Aristotelian Positivists as well.

Moreover, the restoration of traditional rhetoric was at first—within speech departments and then later within English departments—an attempt to serve as an emphasis upon training students in how to communicate. When modern rhetoricians shifted their emphasis to interpretation and shifted their concerns from the speaker or writer to the auditor or reader, traditional rhetoric was seen in a new perspective and the subject itself was given its strongest modern impetus and relevance. As noted earlier, the latter effect was the combined result of the work of modern philosophers and literary critics as well as educators.

The 20th century witnessed the publication of some highly provocative works on rhetoric, which potentially carry the subject beyond its Aristotelian confines and give it new relevance to an age dissatisfied with older epistemologies (or theories of knowledge) and their curious, divisive assumptions about truth and verbal expression or about oral and written discourse. Particular attention must be called to the work of the American critic and philosopher Kenneth Burke. A controversial writer, partly because of his extension of rhetoric into the study of non-verbal transactions and sensations, he has perhaps done more than anyone else to create a theoretical basis for the use of rhetoric in interpretation.

As noted at the opening of this article, modern literary critics have helped to free rhetoric from its traditional emphasis by proving its instrumentality in literary analysis—"practical criticism," as the English critic I.A. Richards called his 1929 book on the subject. But in turn the practical critic has helped preserve traditional rhetoric for the analyses of traditional literature, and through his work on modern literature, he has stimulated the demand for a new rhetoric.

THE RHETORIC OF NON-WESTERN CULTURES

Freed, too, of the parochialism engendered by its Western traditions, rhetoric could undertake a variety of analytical endeavour, even "cross-cultural" studies—for example, the mingling of Malaysian and Western cultures in the political oratory of the Philippines, structure and intention in the oral literatures of Africa, or the communicative strategy of the Japanese verse form haiku.

Indeed, the search for the rhetoric of non-Western cultures has become a crucial scholarly and political endeavour, as people seek bases for understanding the politics as well as the poetry of other lands—and, hopefully, bases for dialogue across tribal and national boundaries. The avenues this search has taken thus far reveal a significant fact both about rhetoric and about the nature of its Western tradition: the true rhetoric of any age and of any people is to be found deep within what might be called attitudinizing conventions, precepts that condition one's stance toward experience, knowledge, tradition, language, and other people. Searching for those precepts, the scholar realizes the extent to which Western culture has become secularized and compartmentalized. In Western culture one may seek out a body of writing under such special rubrics as "rhetoric," "religion," "ethics." But in some Oriental or Middle Eastern cultures, the search may begin and end with religious thought and practices. The Talmudic rabbis, with their disputatious hermeneutics and their attitudes toward Oral Law, gave centuries of Jews a pattern of reasoning and communication. No less so did the *Tao-te Ching*—the basic text of the Chinese religious system of Taoism—shape a mentality that is as inherent in certain Chinese poetry as in the oratory, dance, painting, architecture, and government of that ancient culture. And for all the Western studies one might encourage into the haiku, surely only one thoroughly grounded in the mysterious doctrines of Zen Buddhism can fully understand how that imagistic poetry itself "works." Moreover, as

rhetorical doctrine, the form and function of the "sayings" of a modern, secular Oriental revolutionary may not be so far distant from the form and function of the ancient analects of the sage Confucius. Though rhetoric is to be found in every use of language, only Westerners have attempted to divide its precepts discretely from the great body of ethical, moral, or religious precepts that condition the very nature of a culture.

In sum, the basic rhetorical perspective is simply this: all utterance, except perhaps the mathematical formula, is aimed at influencing a particular audience at a particular time and place, even if the only audience is the speaker or writer himself; any utterance may be interpreted rhetorically by being studied in terms of its situation—within its original milieu or even within its relationship to any reader or hearer—as if it were an argument. (T.O.S.)

Rhetoric in philosophy: the new rhetoric

There is nothing of philosophical interest in a rhetoric that is understood as an art of expression, whether literary or verbal. Rhetoric, for the proponents of the new rhetoric, is a practical discipline that aims not at producing a work of art but at exerting through speech a persuasive action on an audience.

NATURE OF THE NEW RHETORIC

The new rhetoric is defined as a theory of argumentation that has as its object the study of discursive techniques that aim to provoke or to increase the adherence of men's minds to the theses that are presented for their assent. It also examines the conditions that allow argumentation to begin and to be developed, as well as the effects produced by this development.

This definition indicates in what way the new rhetoric continues classical rhetoric and in what way it differs from it. The new rhetoric continues the rhetoric of Aristotle insofar as it is aimed at all types of hearers. It embraces what the ancients termed dialectics (the technique of discussion and debate by means of questions and answers, dealing especially with matters of opinion), which Aristotle analyzed in his *Topics*; it includes the reasoning that Aristotle qualified as dialectical, which he distinguished from the analytical reasoning of formal logic. This theory of argumentation is termed new rhetoric because Aristotle, although he recognized the relationship between rhetoric and dialectic, developed only the former in terms of the hearers.

It should be noted, moreover, that the new rhetoric is opposed to the tradition of modern, purely literary rhetoric, better called stylistic, which reduces rhetoric to a study of figures of style, because it is not concerned with the forms of discourse for their ornamental or aesthetic value but solely insofar as they are means of persuasion and, more especially, means of creating "presence" (*i.e.*, bringing to the mind of the hearer things that are not immediately present) through the techniques of presentation.

The elaboration of a rhetoric thus conceived has an undeniable philosophical interest because it constitutes a response to the challenge of Logical Empiricism. The Logical Empiricists proclaim the irrationality of all judgments of value—*i.e.*, those judgments that relate to the ends of men's actions—because such judgments can be grounded neither in experience nor in calculation, neither in deduction nor in induction. But it is not clearly necessary, after discarding the recourse to intuition as an insufficient basis for a judgment of value, to declare all such judgments equally arbitrary. This amounts to considering as futile the hopes of philosophers to elaborate a wisdom that would guide men in their public as well as their private lives. The alternative offered by the new rhetoric would furnish a complementary tool to traditional logic, which is limited to the technique of demonstration, or necessary proof according to the rules of deduction and induction; it would add the technique of argumentation. This would allow men not only to verify and to prove their beliefs but also to justify their decisions and their choices. Thus, the new rhetoric, elaborating a logic for judgments of value, is indispensable for the analysis of practical reasoning.

Theory of argumentation

The search for the rhetoric of non-Western cultures

SYSTEMATIC PRESENTATION OF THE NEW RHETORIC

Adaptation
to the
audience

Personal relations with the audience. Argumentation, whether it be called rhetorical or dialectical, always aims at persuading or convincing the audience to whom it is addressed of the value of the theses for which it seeks assent. Because the purpose of all argumentation is to gain or reinforce the adherence of an audience, it must be prepared with this audience in mind. Unlike demonstration, it cannot be conceived in an impersonal manner. On the contrary, it is essential that it be adapted to the audience if it is to have any effectiveness. Consequently, the orator—the person who presents an argument either by speech or in writing to an audience of listeners or readers—must seek to build his argumentative discourse on theses already accepted by his audience. The principal fallacy in argumentation is the *petitio principii* (“begging of the question”), in which the speaker presupposes that the audience accepts a thesis that actually is contested by them, even implicitly.

Taken in a broad sense, the new rhetoric can treat the most varied questions and be addressed to the most diverse audiences. The audience may involve only the individual deliberating within himself or it may involve another person in a dialogue. The discourse may be addressed to various particular audiences or to the whole of mankind—to what may be called the universal audience—in which case the orator appeals directly to reason.

Classical rhetoric was traditionally addressed to an audience made up of a crowd of generally incompetent hearers gathered in a public place; argumentation, however, can be addressed to highly qualified audiences, such as the members of an academy or some learned society. As a result, effectiveness is not the only means of testing the value of an argument, for this value also depends on the quality and competence of the minds whose adherence is sought. An argument may persuade an audience of less informed persons and remain without effect on a more critical audience. For Plato, the argumentation worthy of a philosopher should convince the gods themselves.

Basis of agreement and types of argumentation. The orator, in order to succeed in his undertaking, must start from theses accepted by his audience and eventually reinforce this adherence by techniques of presentation that render the facts and values on which his argument rests present to the listener. Thus, the orator can have recourse to literary devices, using figures of rhetoric and other techniques of style and composition that are well known to writers.

If the discourse is addressed to a nonspecialized audience, its appeal will be to common sense and common principles, common values, and common *loci*, or “places.” Agreement about common values is general, but their object is vague and ill-defined. Thus, the appeal to universal values, such as the good and the beautiful, truth and justice, reason and experience, liberty and humanity, will leave no one indifferent, but the consequences to be drawn from these notions will vary with the meaning attached to them by the different individuals. Therefore, an agreement about common values must be accompanied by an attempt to interpret and define them, so that the orator can direct the agreement to make it tally with his purposes. If the discourse is addressed to a specialized group—such as a group of philosophers or jurists or theologians—the basis of agreement will be more specific.

Types of
arguments

To pass from the premises accepted by the audience to the conclusions he wishes to establish, the orator can use arguments of various types of association and dissociation. A detailed analysis of such arguments would require a whole treatise; the best known, however, are arguments by example, by analogy, by the consequences, *a pari* (arguing from similar propositions), *a fortiori* (arguing from an accepted conclusion to an even more evident one), *a contrario* (arguing from an accepted conclusion to the rejection of its contrary), and the argument of authority. The traditional figures of rhetoric are usually only abridged arguments, as, for instance, a metaphor is an abbreviated analogy.

Associative arguments transfer the adherence from the premises to the conclusion; for example, the act-person

association enables one to pass from the fact that an act is courageous to the consequence that the agent is a courageous person. Argumentation leads to the dissociation of concepts if appearance is opposed to reality. Normally, reality is perceived through appearances that are taken as signs referring to it. When, however, appearances are incompatible—an oar in water looks broken but feels straight to the touch—it must be admitted, if one is to have a coherent picture of reality, that some appearances are illusory and may lead to error regarding the real. Because the status of appearance is equivocal, one is forced to distinguish between those appearances that correspond with reality and those that are only illusory. The distinction will depend on a conception of reality that can serve as a criterion for judging appearances. Whatever is conformable to this conception of the real will be given value; whatever is opposed to it will be denied value.

Every concept can be subjected to a similar dissociation of appearance and reality. Real justice, democracy, and happiness can be opposed to apparent justice, democracy, and happiness. The former, being in conformity with the criteria of what justice, democracy, and happiness really are, will keep the value normally attached to these notions. The apparent—what is taken for real by common sense or unenlightened opinion—will be depreciated because it does not correspond to what actually deserves the name of justice, democracy, or happiness. By means of this technique of dissociating concepts, philosophers can direct men's actions toward what they hold to be true values and can reject those values that are only apparent. Every ontology, or theory about the nature of being, makes use of this philosophical process that gives value to certain aspects of reality and denies it to others according to dissociations that it justifies by developing a particular conception of reality.

Scope and organization of argumentation. A discourse that seeks to persuade or convince is not made up of an accumulation of disorderly arguments, indefinite in number; on the contrary, it requires an organization of selected arguments presented in the order that will give them the greatest force. After its analysis of the various types of arguments, the new rhetoric naturally deals with the study of the problems raised by the scope of the argumentation, the choice of the arguments, and their order in the discourse.

Although formal demonstrative proof is most admired when it is simple and brief, it would seem theoretically that there would be no limit to the number of arguments that could be usefully accumulated; in fact, because argumentation is concerned not with the transfer from the truth of premises to a conclusion but with the reinforcement of the adherence to a thesis, it would appear to be effective to add more and more arguments and to enlarge the audience. Because the argumentation that has persuaded some may fail to have any effect on others, it would appear to be necessary to continue the search for arguments better adapted to the enlarged audience or to the fraction of the audience that has been hitherto ignored.

In practice, however, three different reasons point to the need to set bounds to the scope of an argumentation. First, there are limits to the capacity and the will of an audience to pay attention. It is not enough for an orator to speak or write; he must be listened to or read. Few people are prepared to listen to a 10-hour speech or read a book of 1,000 pages. Either the subject must be worth the trouble or the hearer must feel some obligation to the subject or orator. Normally, when a custom or an obligation exists, it binds not the hearer but the orator, setting limits to the space or time allotted to the presentation of a thesis. Second, it is considered impolite for an orator to draw out a speech beyond the normally allotted time. Third, by the mere fact that he occupies the platform, an orator prevents other people from expressing their point of view. Consequently, in almost all circumstances in which argumentation can be developed, there are limits that are not to be overstepped.

It thus becomes necessary to make a choice between the available arguments, taking into account the following considerations: first, arguments do not have equal strength

Limits to
argumen-
tation

nor do they act in the same manner on an audience. They must be considered relevant for the thesis the speaker upholds and must provide valuable support for it. It is essential that they do not—instead of reinforcing adhesion—call the thesis into question again by raising doubts that would not have occurred to the audience had they not been mentioned. Thus, proofs of the existence of God have shaken believers who would never have thought of questioning their faith had such proofs not been submitted to them. Second, there is constant interaction between the orator and his discourse; thus, the speaker's prestige intensifies the effect of his discourse, but, inversely, if his arguments are weak, the audience's opinion of his intelligence, competence, or sincerity is influenced. Therefore, it is best to avoid using weak arguments; they may induce the belief that the speaker has no better arguments to support his thesis. Third, certain arguments, especially in the case of a mixed audience whose beliefs and aspirations are greatly varied, may be persuasive for only one part of an audience. Therefore, arguments should be chosen that will not be opposed to the beliefs and aspirations of some part of the audience. Thus, by stressing the revolutionary effect of a particular measure, for example, one stiffens the opposition to that measure on the part of those who wish to prevent the revolution, but one draws to the measure the favour of those who wait for the revolution to break out. For this reason arguments that have value for all men are superior to those that have more limited appeal; they are capable of convincing all the members of what could be called the universal audience, which is composed of all normally reasonable and competent men. An argumentation that aims at convincing a universal audience is considered philosophically superior to one that aims only at persuading a particular audience without bothering about the effect it might have on another audience in some other context or circumstances.

The need
for order
in argu-
mentation

Further, for a discourse to be persuasive, the arguments presented must be organized in a particular order. If they are not, they lose their effectiveness, because an argument is neither strong nor weak in an absolute sense and for every audience but only in relation to a particular audience that is prepared to accept it or not. In the first place, the orator must have a certain amount of prestige, and the problem in question must raise some interest. Should the orator be a small child, a man of ill-repute, or one supposed to be hostile to the audience or should the question be devoid of interest for the audience, there is little chance that the orator will be allowed to speak or that he will be listened to. Thus, an orator is normally introduced by someone who has the public ear, and the orator then uses the exordium, or beginning portion of his discourse, not to speak about his subject but to gain the audience's sympathy.

Effective arguments can modify the opinions or the dispositions of an audience. An argument that is weak because it is ill-adapted to the audience can become strong and effective when the audience has been modified by a previous argument. Similarly, an argument that is ineffective because it is not understood can become relevant once the audience is better informed. Research into the effectiveness of discourse can determine the order in which arguments should be presented. The best order, however, will often be whatever is expected, whether it be a chronological order, a conventional order, or the order followed by an opponent whose argumentation has to be refuted point by point.

In all these considerations—concerning the techniques of presentation and argumentation and the arrangement of a discourse—form is subordinated to content, to the action on the mind, to the effort to persuade and to convince. Consequently, the new rhetoric is not part of literature; it is concerned with the effective use of informal reasoning in all fields.

It has been seen that common principles and notions and common *loci* play a part in all nonspecialized discourses. When the matter that is debated belongs to a specialized field, the discussion will normally be limited to the

initiated—i.e., those who, because of their more or less extensive training, have become familiar with the theses and methods that are currently accepted and regarded as valid in the field in question. In such instances, the basis of the argumentation will not be limited to common *loci* but to specific *loci*. The introduction in some field of a new thesis or new methods is always accompanied by criticism of the theses or methods that are being replaced; thus, criticism must be convincing to the specialists if the new thesis or method is to be accepted. Similarly, the rejection of a precedent in law has to be justified by argumentation giving sufficient reasons for not applying the precedent to the case in question.

SIGNIFICANCE OF THE NEW RHETORIC

The new rhetoric introduces a fundamental change in the philosophical outlook. Insofar as it aims at directing and guiding human action in all of the fields in which value judgments occur, philosophy is no longer conceived as the search for self-evident, necessary, universally and eternally valid principles but, rather, as the structuring of common principles, values, and *loci*, accepted by what the philosopher sees as the universal audience. The way the philosopher sees this universal audience, which is the incarnation of his idea of reason, depends on his situation in his cultural environment. The facts a philosopher recognizes, the values he accepts, and the problems he attends to are not self-evident; they cannot be determined *a priori*. The dialectical interaction between an orator and his audience is imposed also on the philosopher who wishes to influence his audience. Therefore, each philosophy reflects its own time and the social and cultural conditions in which it is developed. This is the fundamental truth in the thought of G.W.F. Hegel, a German Idealist: the history of philosophy is not regarded as an abstract and timeless dialectic that proceeds in a predetermined direction but as an argumentation that aims at universality at a concrete moment in history.

To the extent that the new rhetoric views all informal discourse and all philosophical discourse from the viewpoint of its action on the minds of the hearers, it integrates into the analysis of thought valuable elements from both Pragmatism and Existentialism. In stressing the effects of discourse it allows Analytical philosophy to be given the dynamic dimension that some scholars believe it has heretofore lacked. The new rhetoric can thus contribute to the development of a theory of knowledge and to a better understanding of the history of philosophy. (C.Pe.)

BIBLIOGRAPHY. The following works may be regarded as fundamental to the points made in the preceding article: EDWIN BLACK, *Rhetorical Criticism* (1965); WAYNE C. BOOTH, *The Rhetoric of Fiction* (1960); WILLIAM J. BRANDT, *The Rhetoric of Argumentation* (1970); KENNETH BURKE, *The Philosophy of Literary Form* (1941), *A Grammar of Motives* (1945), and *A Rhetoric of Motives* (1950); CHAIM PERELMAN and LUCIE OLBRECHTS-TYTECA, *La Nouvelle Rhétorique: traité de l'argumentation*, 2 vol. (1958; Eng. trans., *The New Rhetoric: A Treatise on Argumentation*, 1969); JOHN CROWE RANSOM, *The New Criticism* (1941); and STEPHEN E. TOULMIN, *The Uses of Argument* (1958). See also CHAIM PERELMAN, "The New Rhetoric: A Theory of Practical Reasoning," in *The Great Ideas Today* (1970).

In addition, the following is helpful in understanding the modern critique of rhetorical traditions: LLOYD F. BITZER and EDWIN BLACK (eds.), *The Prospect of Rhetoric: Report of the National Developmental Project* (1971); RAYMOND F. HOWES (ed.), *Historical Studies of Rhetoric and Rhetoricians* (1961); and R.S. CRANE (ed.), *Critics and Criticism, Ancient and Modern* (1952), are particularly useful in understanding respectively the critics and rhetoricians of Cornell and Chicago, the universities at which modern rhetoric received especially strong impetus. Other works useful in a study of the history of rhetoric include WILBUR SAMUEL HOWELL, *Logic and Rhetoric in England, 1500–1700* (1956); GEORGE KENNEDY, *The Art of Persuasion in Greece* (1963); and WALTER J. ONG, *Ramus: Method, and the Decay of Dialogue* (1958). In addition to Ransom's book, I.A. RICHARDS, *The Philosophy of Rhetoric* (1936), helped illuminate the early stages of the modern relationship between rhetoric and literary criticism. A book-length treatment of non-Western rhetoric is ROBERT T. OLIVER, *Communication and Culture in Ancient India and China* (1971).

Rio de Janeiro

Rio de Janeiro, a major port city of Brazil and the capital of Rio de Janeiro state, is located on the Atlantic Ocean, in the southeastern part of the tropical zone in South America. The name was given to the city's original site by Portuguese navigators who arrived at the port on Jan. 1, 1502, and mistook the entrance of the bay for the mouth of a river (*rio* is the Portuguese word for "river" and *janeiro*, the word for "January"). When the foundations of the future town were laid in 1565, it was named Cidade de São Sebastião do Rio de Janeiro ("City of Saint Sebastian of Rio de Janeiro"), for both St. Sebastian and Dom Sebastian, king of Portugal. It is officially and commonly called Rio de Janeiro but is often referred to, in a shortened form, as Rio.

Rio was the capital of Brazil from 1822 until 1960, when the national capital was moved to Brasília and the territory belonging to the former Federal District was converted into Guanabara state, which formed an enclave in Rio de Janeiro state. In March 1975 the two states were fused as the state of Rio de Janeiro; the former Guanabara state, including the city of Rio de Janeiro, became one of the 14 municipalities of the Metropolitan Region of Rio de Janeiro, or Greater Rio. The city of Rio de Janeiro then became the capital of the reorganized state of Rio de Janeiro.

Physical and human geography

CHARACTER OF THE CITY

Rio de Janeiro is well known for the beauty of its beaches and of its peaks, ridges, and hills—all partly covered by tropical forests. The city is a centre of leisure for national and foreign tourists, and people wearing bathing suits can be seen walking in the streets and along the beaches or traveling on the city's buses. Perhaps at no time is the city's festive reputation better displayed than during the annual pre-Lenten Carnival, which enlivens the city night and day with music, singing, parties, balls, and street parades of brilliantly-costumed dancers performing to samba rhythms. Rio is also an important economic centre, however, with activities ranging from industry and national and international trade to administration, banking, education, culture, and research.

The city's economic and social prominence grew in the 18th century after it became the main trade centre for the gold- and diamond-mining areas of Minas Gerais. Later, its status as a national capital and as the royal residence

of the Portuguese monarch influenced Rio's continued growth and helped it acquire a cosmopolitan atmosphere and a national character, free of regional conflict. After the city reverted to being a state capital in the mid-20th century, however, a new regional consciousness began to develop.

THE LANDSCAPE

The city site. Rio de Janeiro lies on a strip of Brazil's Atlantic coast, close to the Tropic of Capricorn, where the shoreline is oriented east-west, the city facing south. It was founded on an inlet of this stretch of the coast, Guanabara Bay (Baía de Guanabara), the entrance to which is marked by a point of land called Sugar Loaf (Pão de Açúcar), a "calling card" of the city.

The core, or Centre, of Rio lies on the plains of the western shore of Guanabara Bay. The greater portion of the city—commonly referred to as the North Zone—extends to the northwest on plains composed of marine and continental sediments and on hills and several rocky mountains. The South Zone of the city, reaching the beaches fringing the open sea, is cut off from the Centre and from the North Zone by coastal mountains. These mountains and hills are offshoots of the Serra do Mar, an ancient gneiss-granite mountain chain that forms the slopes of the Brazilian Highlands.

Climate. Although the region's climate is generally tropical, hot, and humid, the climate of Greater Rio is strongly affected by its topography, its proximity to the ocean, and the shape of the southern cone of South America. Along the coast, the breeze, blowing alternately onshore and offshore, modifies the temperature. Because of its geographic situation, the city is reached often, especially during autumn and winter, by cold fronts advancing from the Antarctic, which cause frequent weather changes. But it is mostly in summer that strong showers may provoke catastrophic floods and landslides. The mountainous areas register greater rainfall since they constitute a barrier to the humid wind that comes from the Atlantic. The highest rainfall rate is found in the urban district of Jardim Botânico (more than 63 inches [1,600 millimetres]), where nearby coastal mountains trap humid winds from the Atlantic.

The temperature varies according to altitude, distance from the coast, and type of vegetation. Winter (from June 21 to September 23) is particularly pleasant, both because of its mild temperatures and because it is, in general, less rainy than the summer (December 21 to March 21), which is hotter as well. The annual average temperature at Rio is about 73° F (23° C).

The city layout. The core of the city of Rio de Janeiro (452 square miles [1,171 square kilometres]) and of its large metropolitan area are the sectors called the Centre and the South Zone, respectively.

The Centre corresponds approximately to the old city and is referred to as Cidade (Portuguese: "City," "Downtown"). There are few colonial buildings or monuments because of a series of remodeling and modernizing efforts. Included in these changes were the demolition of old buildings and their substitution with larger and higher constructions; the destruction of hills and the filling of lagoons, swamps, and stretches of the sea; the enlarging of streets and avenues for automobile traffic; and the construction of new infrastructure, such as the port, rebuilt in 1907.

The Centre also contains a number of public buildings with styles that reflect these historical remodeling phases. The Municipal Theatre, still the main national theatre, was built at the beginning of the 20th century and is almost a replica of the Paris Opera House. The Ministry of Education (1936), conceived by Le Corbusier and Brazilian architects, represents the modernismo movement in

Four By Five Inc.

Brazilian architecture of the 1930s, while the headquarters of the Bank of Brazil is an example of a modern skyscraper. Two- or three-storied houses, built at the turn of the century and resembling those of some areas of Lisbon, compete for space with historical monuments, 8- to 12-storied buildings constructed before the 1940s, 20- to 30-storied buildings of the post-World War II era, and 40- to 60-storied skyscrapers of the 1970s. The Avenida Rio Branco is the main street of the Centre, which is also noted as a shopping and entertainment district.

The South Zone

The South Zone grew primarily as a residential area for Rio's wealthy population, which moved from the Centre and North Zone, attracted by the amenities of the shore and the social status that became associated with the area. Settlement along the sea and in valleys of the coastal mountains was made possible, from the 20th century's first decades, by the construction of tunnels and the establishment of a streetcar system. In the shore areas, generally the first street parallel to the shore avenue became the main commercial street. In Copacabana, for example, Avenida Atlântica lies along the shore, and the main commercial artery, Avenida N.S. Copacabana, is the first parallel street inland. Each neighbourhood was named for a bay—such as Flamengo, Botafogo, Copacabana, Ipanema-Leblon—or a valley—such as Laranjeiras or Gávea.

The South Zone was once dominated by individual houses but today is mainly an area of apartment buildings. Despite high rents, the middle class has increasingly moved to the apartments of the South Zone, while the very poor occupy *favelas* (slums) on the slopes of the mountains.

West of the historical South Zone, along the sandy coast, is another urban ring, the development of which began in the 1970s and was based on the growth of automotive transport. Streetcars had disappeared from Rio de Janeiro and all other Brazilian cities by the 1960s and buses had become the main form of public transportation. The opening of more tunnels and the construction of highways sustained urban expansion in the newer southern areas of São Conrado and Barra da Tijuca.

Barra da Tijuca is a planned, upper-class community that looks like a mixture of a British New Town and an af-

fluent U.S. residential suburb. There are areas where only individual houses may be built, apartment buildings are scattered, and commercial and service areas are segregated.

Railways and streetcar lines influenced the North Zone's tentacular form, which prevailed until the mid-20th century. As bus service became the main urban mass transportation, the empty areas between the tentacles were settled, and the North Zone became a large mass of streets, houses, and other buildings. Commercial and service activities were established along the streets or avenues served by streetcar lines and on squares where traffic was concentrated. Neighbourhoods such as Tijuca, Méier, and Madureira emerged as local centres for large portions of the North Zone. In the late 1970s the subway was introduced, linking Tijuca in the North Zone to Botafogo in the South Zone, passing through the Centre. A branch of this line continues to the northern suburban area.

The North Zone

Areas of the North Zone are socially differentiated by the average level of income of the inhabitants, which is reflected in the urban infrastructure and the commercial and service activities that are available. Tijuca and Grajaú are wealthy neighbourhoods, while Engenho Novo and Lins de Vasconcelos are poor. Moving outward from the Centre, the first ring, corresponding to older settlement, is a deteriorated area. A second ring contains varying affluent neighbourhoods. Outwardly from there, in general, as distance from the Centre increases, poverty also increases. As in the South Zone, but more so, *favelas* have been established on the slopes of mountains and hills, but there are also many such areas in the swampy lands along Guanabara Bay and the river plains.

The suburban zone inside the municipality of Rio de Janeiro extends 12 miles (20 kilometres) north and more than 30 miles west from the Centre. Suburbs also lie in neighbouring municipalities. These areas have experienced the most rapid growth of the metropolitan region since the 1950s. This growth has been due to natural reproduction and migrations from the interior of the state, other states of Brazil, and other areas of the metropolitan region.

The suburbs

With the exception of the South Zone, most of the suburbs are poor; the streets are largely unpaved and most of

The
Baixada

the areas are without a sewer system. Individual houses dominate, although the number of apartment buildings is growing. Government housing programs of the 1960s attempted to relocate inhabitants of the *favelas* of the Centre and North Zone to the suburbs, but the population resisted such removal from proximity to their places of work. More recent programs concentrate on rebuilding the *favelas* proper. For example, the huts of the Favela da Maré, close to the Federal University of Rio de Janeiro on the shoreline of Guanabara Bay, were replaced with low-income three-story apartment buildings.

Among the suburbs that extend into the municipalities of Greater Rio are Nova Iguaçu, Nilópolis, São João do Meriti, Duque de Caxias, and Paracambi to the north. These five towns, known as the Baixada (Portuguese: "Lowland"), were once small rural centres that grew tremendously after being linked by rail to Rio proper. Along the road to São Paulo, in Nova Iguaçu, and to Belo Horizonte, in Duque de Caxias, are large industrial plants, such as the Petrobras oil refinery in the latter.

Farther to the north of Rio proper is the satellite city of Petrópolis, once the summer residence of the Brazilian royal family and former capital of Rio de Janeiro state (1894–1903). Located in the highlands at an altitude of 2,667 feet (813 metres), it is a summer tourist resort as well as an industrial centre.

To the west are the smaller localities of Itaguaí and Mangaratiba, where truck farming and tourism prevail. A branch line of the railway that links Rio to Minas Gerais passes through the two towns to the port that was built at Mangaratiba especially for iron-ore exports.

On the east shore of Guanabara Bay, a major urban agglomeration includes Niterói, a former capital of the state of Rio de Janeiro; São Gonçalo; and the suburbs of Itaboraí, Maricá, and others. There also is a large, poor, suburban settlement. Voluminous commuting to Rio de Janeiro is made via the Rio-Niterói bridge (built in the 1970s) and by ferries, motorboats, and hydrofoils. Motorboat service also links Rio to the resort island of Paqueta, which lies near the middle of the bay. Industries in Niterói-São Gonçalo include shipyards and textile, food-processing, and metallurgy plants.

THE PEOPLE

Historically, Rio's population grew primarily as a result of internal migration, which in some years accounted for two-thirds of the city's increase. From the 1930s, governmental economic policies included restrictions on foreign immigration and incentives for internal migration to Brazil's large urban areas. The proportion of foreigners in the former Federal District decreased from 30 to 7 percent between 1890 and 1960. By the 1960s almost half of the city's population were Brazilian migrants, most of them born in the states of Rio de Janeiro, Minas Gerais, and Espírito Santo. Among the largest groups of foreign-born in Greater Rio are the Portuguese, Italians, and Spaniards.

With the transfer of the national capital to Brasília in 1960, the rhythm of population growth in Rio declined. Most national migrants were directed to other municipalities of the metropolitan region, leaving Rio to rely more upon the birth rate within its own boundaries for further growth; persons born in Rio are called *cariocas*.

Rio's inhabitants are primarily Roman Catholic, although many simultaneously follow the religious folk cult called Umbanda. The population is composed of whites, blacks, and people of mixed race, the whites largely predominant in the wealthy neighbourhoods of Flamengo, Copacabana, Ipanema-Leblon, Jardim Botânico, and Tijuca-Grajaú.

THE ECONOMY

Industry. Greater Rio is the second most important industrial area of Brazil after São Paulo. Large shipyards and an electronics-computer sector have been added to the older industries of metallurgy, engineering, wearing apparel and footwear, textiles, nonmetallic mineral products, food and beverages, chemicals, pharmaceuticals, and printing and publishing.

To attract industry, the state government has designated six areas as industrial districts (Fazenda Botafogo,

Palmares, Paciência, Santa Cruz, Campo Grande, and Jacarepaguá) where infrastructure is provided and the sale of land is made under special conditions. The discovery and exploitation of oil and natural gas fields off the coast of the state of Rio de Janeiro also has opened new possibilities for the development of industrial activities in Rio's metropolitan region.

Rio's attraction for tourists and seasonal residents is an important stimulus for trade. The establishment of second residences in Rio by many wealthy people from other Brazilian cities and from abroad has been a factor in the city's active building industry, which is a significant source of employment for large numbers of unskilled labourers.

Management, finance, and trade. Because it was once the national capital, Rio de Janeiro was chosen as the site for the headquarters of many large private, national, multinational, and state corporations, even when their factories were located in other cities or states. Despite the transfer of the capital to Brasília, many of these headquarters remained within the Rio metropolitan area, as did, for instance, those of Petrobrás, the state oil company; Rio Doce Valley Company, a state mining enterprise; the National Economic and Social Development Bank, a federal investment bank; and Esso and Shell, multinational oil corporations.

Rio is an important financial centre, second only to São Paulo in volume of business in the stock market or in banking. Its securities market is also of major importance. The port of Rio has a large market area, exporting automobiles produced in Belo Horizonte, for example, and is among the nation's leading ports by tons moved.

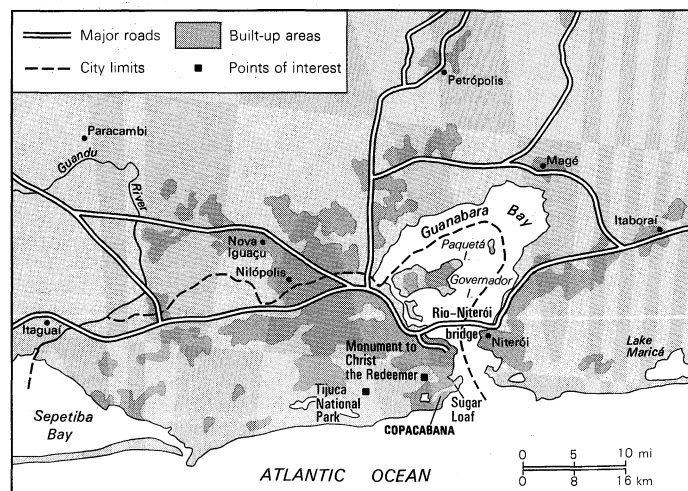

In Greater Rio, which has one of the highest per capita incomes in Brazil, the retail trade is substantial. Many of the most important retail stores are located in the Centre, but others are scattered throughout the commercial areas of the other districts, where shopping centres, supermarkets, and other retail businesses handle a large volume of consumer trade.

Transportation. Rio de Janeiro is still the primary centre for air services in Brazil, with flights to major cities of North America and Europe. There are two modern airports—Galeão for domestic and international services and Santos Dumont for domestic lines only.

Most surface transport with other places is negotiated by bus, truck, and automobile; there are railway links to São Paulo and Belo Horizonte, but their daily service is somewhat limited. Privately owned bus services are the main means of public transportation inside the urban agglomeration. The city began building its subway in 1972, and by 1979 the first station was opened, initiating the first step in the development of an underground system marked to alleviate Rio's serious traffic congestion.

ADMINISTRATION AND SOCIAL CONDITIONS

Government. The city and municipality of Rio de Janeiro are governed by a *prefeito* (Portuguese: "mayor")

Rio de Janeiro and surrounding area.

with the assistance of secretaries who head administrative departments. Since 1984 the *prefeito* has been elected to a four-year term. Legislative power is held by the members of the Municipal Chamber, who are elected proportionally from Rio de Janeiro's 24 administrative regions.

Services. As frequently happens in rapidly developing metropolitan areas, Rio faces serious difficulties in providing urban services and facilities, especially in the growing suburban areas. The water supply and sewer system belong to a state company, and a state company also supplies domestic gas. The water supply system was modernized during the 1960s, but the extension of the water supply and the sewage system to new urbanized areas and to the *favelas* has been a continuing problem.

Telephone service is operated by two public enterprises, one for the central area and another for the suburbs. The demand for home telephone equipment is greater than the system's capacity, and, consequently, the trunk lines are frequently overloaded. Electricity is distributed by a former Canadian-owned private enterprise bought by the federal government during the 1970s. Rio is connected to an electrical system that extends throughout south-central Brazil.

The city has a healthful climate. Although pollution is a growing concern, there are no serious health problems, except within the *favelas*, where diseases related to lack of sanitation, poor diet, and inadequate health facilities prevail. The Rio de Janeiro area as a whole has one of the nation's better ratios of population to hospital beds and doctors.

Education. The literate population of the city makes up approximately 90 percent of those 10 years or older, a proportion that is higher than the national average. The city's two most important universities, the Federal University of Rio de Janeiro and the Pontifical Catholic University of Rio de Janeiro, offer graduate courses. The state also administers the State University of Rio de Janeiro and a large network of secondary schools. A number of governmental national research centres in Rio de Janeiro conduct studies in such fields as physics, atomic energy, geology, geography, and statistics.

CULTURAL LIFE

As the country's cultural capital, Rio de Janeiro has many prestigious artistic, literary, and scientific institutions. These include the Brazilian Academy of Letters, the Brazilian Academy of Sciences, and numerous museums. Among the museums are the National Museum of Fine Arts, founded in 1818; the National Museum, rich in anthropological objects and located in the former Imperial Palace of the Quinta da Boa Vista; the National Historical Museum; the Museum of Modern Art; and the Indian Museum.

The most important of the city's many libraries is the National Library; it was founded in 1810 with the remains of the Royal Library of Ajuda, which were brought to Brazil from Portugal after the 1755 earthquake in Lisbon. Rio has a large number of cinemas and theatres, many radio broadcasting stations, and several television stations. Many periodicals are published there, and the variety of daily newspapers includes two of national range, the *Jornal do Brasil* and *O Globo*.

Among the picturesque places frequently toured are Mount Corcovado, 2,310 feet high, on top of which is found the monument to Christ the Redeemer; Sugar Loaf mountain, 1,296 feet high, which is reached by a funicular railway; the Quinta da Boa Vista, a park in which the Zoological Garden, as well as the National Museum, is located; the Botanical Gardens, which date from 1808 and display a huge variety of species; and the Tijuca National Park, located in the Forest of Tijuca.

Rio's well-known Carnival, the highlight of which is the samba schools parade, lasts for four days each year and attracts many tourists. It is a traditional festival in which the people of the city actively participate. The most popular sport in Rio de Janeiro, as in Brazil as a whole, is association football (soccer); the most important football matches take place in the Municipal Stadium, which can seat 200,000 spectators.

History

THE COLONIAL PERIOD

Several years after the Portuguese first explored Brazil, French traders in search of *pau-brasil* (a type of brazil-wood) explored the rich area extending from the Cape Frio coast to the beaches and islands of Guanabara Bay—the economic and, above all, strategic importance of which was already well-known. On one of these islands, the French founded a colony that was called La France Antarctique (Antarctic France).

The Portuguese wanted to expel the French from Brazil, and the task was given to Estácio de Sá, a nephew of Governor Mem de Sá of Brazil, who in 1565 occupied the plain between Dog Face Hill (Morro Cara de Cão) and the Sugar Loaf and Urca mounts, thus laying the foundations of the future town of Rio de Janeiro. After two years (1565–67) of bloody battles, in which Estácio de Sá was killed and the French expelled, Mem de Sá chose a new site for the town, farther inland on the coast of the bay, at the top of the Hill of Rest (Morro do Descanso), or St. Januarius Hill (São Januário), later called the Castle Hill (Morro do Castelo). In 1568 the settlement was laid out in the form of a medieval citadel, protected by a bulwark and cannons.

The surrounding fertile land, allotted to Portuguese settlers by the Portuguese king in enormous plots called *sesmarias*, was planted with sugarcane, which was to provide the colony with its main source of income. In 1660 the community became the seat of the government of the southern captaincies (Portuguese administrative units) of Brazil. In the second half of the 17th century, the captaincy population grew to 8,000 inhabitants, two-thirds of whom were probably Indian and black slaves.

At the beginning of the 18th century, Brazil began to engage in gold and diamond mining, which brought about remarkable changes in the colony's economy and stimulated a great migration from Europe, thereby increasing the white population. The former village became a town of 24,000 in 1749. When the colonial capital was transferred from Bahia to Rio de Janeiro in 1763, the town expanded farther, far beyond its walls. The remains of the monumental Roman-style aqueduct Arcos ("Arches") built at this time still stand in the city.

At the end of the 18th century, the town's economy, as well as that of the colony as a whole, was in a crisis because of the decline of the mines and competition from Central America for the world sugar market. In 1796 the value of exports from Rio's port was less than half of what it had been in 1760.

Coffee production and the resettlement of the Portuguese royal family in Brazil in 1808 again brought prosperity to the colony. By 1815, when Brazil became a kingdom, Rio de Janeiro was large enough to accommodate a foreign population. At about this time the city's initial features were being transformed; from 1808 to 1818, 600 houses and 100 country houses were built, and many older buildings were restored. Many streets were lighted and paved, more land was reclaimed, new roads opened, and new public fountains installed. Among new institutions established were the Royal Press, the Royal Library, the Theatre of Saint John, the Academy of Fine Arts, the Botanical Gardens, and the Bank of Brazil. When King John VI returned to Portugal in 1821, Rio had almost 113,000 inhabitants and 13,500 buildings, and the town had extended both northward and southward. A year later Brazil was independent.

THE CITY AFTER INDEPENDENCE

Expansion of coffee plantations in the state of Rio de Janeiro gave a new impulse to the city's development. Nobles and bourgeois moved their residences north to the São Cristóvão district. Merchants and English bankers chose to live around the Outeiro da Glória and Praia do Flamengo areas in the south, or they established their residences in the nearby Botafogo and Laranjeiras districts. The French, on the other hand, lived in country houses scattered in the Tijuca area farther westward.

In this era, as Brazil expanded its world export trade in

Early
settlement

Tourism

such products as coffee, cotton, sugar, and rubber, the city changed its appearance, and the traces of its colonial past were effaced. In 1829 oxcart traffic was banned from the Rua do Ouvidor, then the city's most elegant street. In 1838 the first public transportation—horse-drawn buses—began to run to the districts of São Cristóvão, Engenho Velho, and Botafogo. In 1868 the first tramcars, also drawn by animals, were introduced. A steamboat service to Niterói began to operate in 1835. The first railroad was built in 1852 to Petrópolis, and a line reached Queimados in the Nova Iguaçu area in 1858. In 1854 gas replaced oil for street-lighting, and wireless telegraphy was inaugurated. Sewerage was installed in 1864, and telephone service began in 1877.

THE REPUBLICAN PERIOD

When Rio de Janeiro, which had formerly been the capital of the empire, became capital of the Republic of Brazil in 1889, it was already a considerable community. At the time of the 1890 census, it had more than 520,000 inhabitants on 61 square miles, ranking it as the largest city in Brazil and one of the larger cities in the world. The 1891 constitution made it the Federal District.

During the federal administration of President Francisco de Paula Rodrigues Alves, from 1902 to 1906, Rio de Janeiro was transformed into a modern city. Through the efforts of a team of administrators and technicians, endemic yellow fever and smallpox were subdued, other health conditions were improved, huge swamps were drained, slums were cleared, and more streets were paved and widened. The central avenue (called Avenida Rio Branco from 1912), still the most important of the Centre, was opened during this period; Avenida Beira-Mar, running parallel to part of the south shore, was built on reclaimed land; and several other important avenues were opened.

The population of the Federal District exceeded 1,000,000 by 1920 and increased to 1,750,000 by 1940. During this period the number of industrial establishments in the Federal District nearly trebled. Castle Hill was demolished,

land reclamation increased the area in the Centre, and the first skyscrapers appeared. Streetcar lines, now moved by electrical power, multiplied. While settlement spread on the east coast, some areas to the north lost status—such as São Cristóvão, which became an industrial and lower-class residential neighbourhood.

After World War II the confluence of interests of the landowners, the industrial sector, and the financial sector in real estate speculation and the dominance of automobile transportation precipitated a series of changes to the city. These included still higher skyscrapers in the Centre; extension of the highway system; and the substitution of houses and small apartment buildings with larger residential buildings. The advent of such changes brought an intense pressure on the poor to move from the central city to the periphery.

BIBLIOGRAPHY. Descriptions of the city can be found in AARON COHEN, *Rio de Janeiro* (1978); and DOUGLAS BOTTING, *Rio de Janeiro* (1977), which includes discussions of the city's history, the favelas, and Afro-Brazilian cult religions. For a general comprehensive approach to the city's geography and development, see JÚLIA ADÃO BERNARDES (ed.), *Rio de Janeiro, Pánel de um Espaço em Crise* (1986); and PEDRO PINCHAS GEIGER, *Evolução da Rede Urbana Brasileira* (1963), and "A Área Metropolitana Rio de Janeiro," in *Enciclopédia dos Municípios Brasileiros*, vol. 6 (1950), pp. 290–354. ALBERTO RIBEIRO LAMEGO, *O Homem e a Guanabara*, 2nd ed. (1964); and ANTONIO TEIXEIRA GUERRA, "Paisagens Físicas da Guanabara," *Revista Brasileira de Geografia*, 27:539–568 (1965), study the physical environment and geography. The problems of slums and the urban poor are treated by JANICE E. PERLMAN, *The Myth of Marginality: Urban Poverty and Politics in Rio de Janeiro* (1976, reprinted 1979). City planning is the subject of NORMA EVENSON, *Two Brazilian Capitals: Architecture and Urbanism in Rio de Janeiro and Brasília* (1973). Good accounts of the historical development of Rio de Janeiro include VIVALDO COARACY, *O Rio de Janeiro no Século 17.*, 2nd ed. rev. and expanded (1965); and GASTÃO CRULS, *Aparência do Rio de Janeiro: Notícia Histórica e Descritiva da Cidade*, 3rd ed. rev., 2 vol. (1965). See also MARY C. KARASCH, *Slave Life in Rio de Janeiro, 1801–1850* (1987).

Sacred Rites and Ceremonies

The sacred (or holy) is the power, being, or realm understood by religious persons to be at the core of existence and to have a transformative effect on their lives and destinies. Other terms, such as divine, transcendent, ultimate being (or reality), mystery, and perfection (or purity) have been used for this domain. "Sacred" is also an important technical term in the scholarly study and interpretation of religions.

Broadly defined, worship is man's response to the sacred.

Characteristic modes of response (other than spontaneous, ecstatic behaviour) include primarily cultic and private acts of ritual, the performance of which is prescribed by tradition or sacerdotal decree.

This article will treat various ritualistic, behavioral responses to the sacred. For a discussion of dogmatic interpretations of the Divine as a being or force, see RELIGIOUS AND SPIRITUAL BELIEF AND DOCTRINES AND DOGMAS. This article is divided into the following sections:

THE SACRED OR HOLY

The emergence of the concept of the sacred. It was during the first quarter of the 20th century that the concept of the sacred (or holy) became dominant in the comparative study of religions. Nathan Söderblom, an eminent Swedish churchman and historian of religions, asserted in 1913 that the central notion of religion was "holiness" and that the distinction between sacred and profane was basic to all "real" religious life. In 1917 Rudolf Otto's *Heilige* (Eng. trans., *The Idea of the Holy*, 1923) appeared and exercised a great influence on the study of religion through its description of religious man's experience of the "numinous" (a mysterious, majestic presence inspiring dread and fascination), which Otto, a German theologian and historian of religions, claimed, could not be derived from anything other than an a priori sacred reality. Other scholars who used the notion of sacred as an important interpretive term during this period included the sociologist Émile Durkheim in France, and the psychologist-philosopher Max Scheler in Germany. For Durkheim, sacredness

referred to those things in society that were forbidden or set apart; and since these sacred things were set apart by society, the sacred force, he concluded, was society itself. In contrast to this understanding of the nature of the sacred, Scheler argued that the sacred (or infinite) was not limited to the experience of a finite object. While Scheler did not agree with Otto's claim that the holy is experienced through a radically different kind of awareness, he did agree with Otto that the awareness of the sacred is not simply the result of conditioning social and psychological forces. Though he criticized Friedrich Schleiermacher, an early 19th-century Protestant theologian, for being too subjective in his definition of religion as "the consciousness of being absolutely dependent on God," Otto was indebted to him in working out the idea of the holy. Söderblom recorded his dependence on the scholarship of the history of religions (*Religionswissenschaft*), which had been a growing discipline in European universities for about half a century; Durkheim had access to two decades

of scholarship on nonliterate peoples, some of which was an account of actual fieldwork. Scheler combined the interests of an empirical scientist with a philosophical effort that followed in the tradition of 19th-century attempts to relate human experiences to the concept of a reality (essence) that underlies human thoughts and activities.

Since the first quarter of the 20th century many historians of religions have accepted the notion of the sacred and of sacred events, places, people, and acts as being central in religious life if not indeed the essential reality in religious life. For example, phenomenologists of religion such as Gerardus van der Leeuw and W. Brede Kristensen have considered the sacred (holy) as central and have organized the material in their systematic works around the (transcendent) object and (human) subject of sacred (cultic) activity, together with a consideration of the forms and symbols of the sacred. Such historians of religions as Friedrich Heiler and Gustav Mensching organized their material according to the nature of the sacred, its forms and structural types. Significant contributions to the analysis and elaboration of the sacred have been made by Roger Caillois, a sociologist, and by Mircea Eliade, an eminent historian of religions.

Basic characteristics of the sacred. *Sacred-profane and other dichotomies.* The term sacred has been used from a wide variety of perspectives and given varying descriptive and evaluative connotations by scholars seeking to interpret the materials provided by anthropology and the history of religions. In these different interpretations, however, common characteristics were recognized in the sacred, as it is understood by participant individuals and groups: it is separated from the common (profane) world; it expresses the ultimate total value and meaning of life; and it is the eternal reality, which is recognized to have been before it was known and to be known in a way different from that through which common things are known.

The term sacred comes from Latin *sacer* ("set off, restricted"). A person or thing was designated as sacred when it was unique or extraordinary. Closely related to *sacer* is *numen* ("mysterious power, god"). The term numinous is used at present as a description of the sacred to indicate its power, before which man trembles. Various terms from different traditions have been recognized as correlates of *sacer*: Greek *hagios*, Hebrew *qadosh*, Polynesian *tapu*, Arabic *haram*; correlates of *numen* include the Melanesian *mana*, the Sioux *wakanda*, the old German *haminja* (luck), and Sanskrit *Brahman*.

Besides the dichotomy of sacred-profane the sacred includes basic dichotomies of pure-unpure and pollutant-free. In ancient Rome the word *sacer* could mean that which would pollute someone or something that came into contact with it, as well as that which was restricted for divine use. Similarly, the Polynesian *tapu* ("tabu") designated something as not "free" for common use. It might be someone or something specially blessed because it was full of power, or it might be something accursed, as a corpse. Whatever was tabu had special restrictions around it, for it was full of extraordinary energy that could destroy anyone unprotected with special power himself. In this case the sacred is whatever is uncommon and may include both generating and polluting forces. On the other hand there is the pure-impure dichotomy, in which the sacred is identified with the pure and the profane is identified with the impure. The pure state is that which produces health, vigour, luck, fortune, and long life. The impure state is that characterized by weakness, illness, misfortune, and death. To acquire purity means to enter the sacred realm, which could be done through purification rituals or through the fasting, continence, and meditation of ascetic life. When a person became pure he entered the realm of the divine and left the profane, impure, decaying world. Such a transition was often marked by a ritual act of rebirth.

Ambivalence in man's response to the sacred. Because the sacred contains notions both of a positive, creative power and a danger that requires stringent prohibitions, the common human reaction is both fear and fascination. Otto elaborated his understanding of the holy from this basic ambiguity. Only the sacred can fulfill man's deepest needs and hopes; thus, the reverence that man shows to

the sacred is composed both of trust and terror. On the one hand, the sacred is the limit of human effort both in the sense of that which meets human frailty and that which prohibits human activity; on the other hand, it is the unlimited possibility that draws mankind beyond the limiting temporal-spatial structures that are constituents of human existence.

Not only is there an ambivalence in the individual's reaction to the numinous quality of the sacred but the restrictions, the tabus, can be expressive of the creative power of the sacred. Caillois has described at length the social mechanism of nonliterate societies, in which the group is divided into two complementary subgroups (moieties), and has interpreted the tabus and the necessary interrelationship of the moieties as expressions of sacredness. Whatever is sacred and restricted for one group is "free" for the other group. In a number of respects—e.g., in supplying certain goods, food, and wives—each group is dependent on the other for elemental needs. Here the sacred is seen to be manifested in the order of the social-physical universe, in which these tribal members live. To disrupt this order, this natural harmony, would be sacrilege, and the culprit would be severely punished. In this understanding of the sacred, a person is, by nature, one of a pair; he is never complete as a single unit. Reality is experienced as one of prescribed relationships, some of these being vertical, hierarchical relationships and others being horizontal, corresponding relationships.

Another significant ambiguity is that the sacred manifests itself in concrete forms that are also profane. The transcendent mystery is recognized in a specific concrete symbol, act, idea, image, person, or community. The unconditioned reality is manifested in conditioned form. Eliade has elucidated this "dialectic of the sacred," in which the sacred may be seen in virtually any sort of form in religious history: a stone, an animal, or the sea. The ambiguity of the sacred taking on profane forms also means that even though every system of sacred thought and action differentiates between those things it regards as sacred or as profane, not all people find the sacred manifested in the same form; and what is profane for some is sacred for others.

Manifestations of the sacred. The sacred appears in myths, sounds, ritual activity, people, and natural objects. Through retelling the myth the divine action that was done "in the beginning" is repeated. The repetition of the sacred action symbolically duplicates the structure and power that established the world originally. Thus, it is important to know and preserve the eternal structure through which man has life, for it is the model and source of power in the present.

The recognition of sacred power in the myth is related to the notion that sound itself has creative power—in particular special, sacred sounds. Sometimes these sounds are words, such as the name of god, divine myth, a prayer, or hymn; but sometimes the most sacred sounds are those that do not have a common meaning, for example, the Hindu *om*, the Buddhist *om mani padme hum*, or the Jewish and Christian "Hallelujah."

Closely connected with verbal expressions of sacred power are activities done in worship, in sacraments, sacrifices, and festivals. Part of the importance of religious ritual is that in the realm of the sacred all things have their place. In order for human existence to prosper (or even continue) it must correspond as closely as possible to the divine pattern (destiny, or will). Different religious traditions have different theological and philosophical formulations of the meaning of sacraments. In Roman Catholic Christianity, a sacrament is "an outward and visible sign of an inward and invisible grace." In Brahmanic Hinduism a *samskāra* (sacrament) is a sacred act that perfects a person and that culminates at the end of a series of *samskāras* in a spiritual rebirth, a symbolic "second birth." In both of these cases, the sacred action establishes the relation between the divine and human worlds.

Other sacred activity includes initiation, sacrifice, and festival. Initiation rites among nonliterate societies both expose and establish the world view of the participants. The initiate learns the eternal order of life as proclaimed

Sacred
sounds

*Sacer
and
numen*

The
elements
of fear and
fascination

Initiation,
sacrifice, and
festival

in the myth. Life is viewed essentially as the work of supernatural beings, and the initiate in this ritual is taught this secret of life and how to gain access to divine benefits. The initiate learns the tabus and is often given a sacred mark—e.g., circumcision, tattoo, or incisions—to express physically that he is part of the sacred (original) community. In other religions, such as Christianity, Buddhism, and Hinduism, an initiate to a special holy (often monastic) community within the larger religious community is designated by a change in name and wearing apparel, denoting his special relation to the sacred.

In festivals and sacrifices two religious functions are often combined: (1) to provide new power (energy, life) for the world, and (2) to purify the corrupted, defiled existence. Religious festivals are a return to sacred time, that time prior to the structured existence that most people commonly experience (profane time). Sacred calendars provide the opportunity for the profane time to be rejuvenated periodically in the festivals. These occasions symbolically repeat the primordial chaos before the beginning of the world; and just as the world was created “in the beginning,” so in the repetition of that time the present world is regenerated (see also *Dimensions of the sacred*, below). The use of masks and the suspension of normal tabus express the unstructured, unconditioned nature of the sacred. Dancing, running, singing, and processions are all techniques for re-creation, for stimulating the original power of life. Ritual activity moves power in two directions: (1) it concentrates it in one place, time, and occasion, and (2) it releases power into the everyday stream of events through its self-abundance—the primal vibration reverberates throughout existence. The new energy dispels the old, depleted, polluted energy; it cleanses the constricted, clogged, hardened channels of life.

One of the most important forms in which man has access to the sacred is in the sacrifice. The central procedure in all sacrifices is the use of a victim or substitute to serve as a mediator between the sacred and profane worlds. The sacrifice (Latin *sacri-ficium*, “making sacred”) is a consecration of an offering through which the profane world has access to the sacred without being destroyed by the sacred. Instead, the sacrificial object (victim) is destroyed in serving as a unique, extraordinary channel between these two realms. In sacrificial rites it is important to duplicate the original (divine) act; and because creation is variously conceived in different religious traditions, different forms are preserved: the burning or crushing of the “corn mother,” the crushing of the *soma* stalks, the slaughter of the lamb without blemish, the blood spilling of a sacred person, such as the firstborn.

Sacredness is manifested in sacred officials, such as priests and kings; in specially designated sacred places, such as temples and images; and in natural objects, such as rivers, the sun, mountains, or trees. The priest is a special agent in the religious cult, his ritual actions represent the divine action. Similarly, the king or emperor is a special mediator between heaven and earth and has been called by such names as the “son of heaven,” or an “arm of god.”

Just as certain persons are consecrated, so specific places are designated as the “gate of heaven.” Temples and shrines are recognized by devotees as places where special attitudes and restrictions prevail because they are the abode of the sacred. Likewise, certain images of God (and sacred books) are held to be uniquely powerful and true (pure) expressions of divine reality. The image and the temple are, in traditional societies, not simply productions by individual artists and architects; they are reflections of the sacred essence of life, and their measurements and forms are specified through sacred communication from the divine sphere. In this same context, natural objects can be imbued with sacred power. The sun, for example, is the embodiment of the power of life, the source of all human consciousness, the central pivot for the eternal rhythm and order of existence. Or, a river, such as the Nile for the ancient Egyptians and the Ganges for the Hindu, gave witness to the power of life incarnated in geography. Sacred mountains (e.g., Sinai for Jews, Kailasa for Hindus, Fujiyama for Japanese) were particular loci of divine power, law, and truth.

Dimensions of the sacred. The sacred, by definition, pervades all dimensions of life. Within the kind of religious apprehension that is expressed in sacred myth and ritual, however, there is a special focus on time, place (cosmos), and active agents (heroes, ancestors, divinities). When existence is seen in terms of the dichotomy of sacred and profane—which assumes that the sacred is wholly other than, yet necessary for, everyday existence—it is very important to know and to get in contact with the sacred. In periodic festivals men celebrate sacred time; a sacred calendar marks off the intervals of man's life, and these sacred festivals provide the pattern for productive and joyous living.

Seasonal sacred calendars are especially important in predominantly agricultural societies. In the very order of nature, people see that different seasons have their distinct values. These differences are celebrated with spring festivals (when the world is re-created through ritual expressions of generation) and harvest festivals (of thanksgiving and of protecting the life force in seeds for the next spring). Here time is regarded as cyclical, and one's life is marked by those rituals in which one continually returns to the divine source.

Similarly, the myths and rituals mark off the world (cosmos) into places that have special sacred significance. The territory in which one lives is real insofar as it is in contact with the divine reality. Within this territory is life; outside it is chaos, danger, and demons. Throughout most of history the “sacred world” was coextensive with a certain territory, and one could speak literally of Christian lands, the Jewish homeland, the Muslim world, the place of the noble people (*Āryāvarta*, Hindu), or the central kingdom (China). Consecrating one's possession of land with certain rituals was equal to establishing an order with divine sanction. In Vedic ritual, for example, the erection of a fire altar (in which the god Agni—fire—was present) was the establishment of a cosmos on a microcosmic scale. Once a cosmos is established, there are certain places that are especially sacred. Certain rivers, mountains, groves of trees, caves, or human constructions such as temples, shrines, or cities provide the “gate,” “ladder,” “navel,” or “pole” between heaven and earth. This sacred place is that which both allows the sacred power to flow into existence and gives order and stability to life.

Another dimension of the sacred is divine or heroic activity: the decisive action done by creative or protective agents. One's spiritual ancestors need not be biologically defined ancestors; they may not even be human. They are the essential forces on which survival depends and can be embodied in animal skills (longevity, rebirth, magical skills), in the “ways of the ancients,” or through a special hero who has provided present existence with material and spiritual benefits. If the notion of sacred manifestation is extended to include the social relationships (especially tabus) in a community, then communal relations can be viewed as a dimension through which the sacred is manifested. Here human values are sacralized by social restraints that prescribe—e.g., with whom one can eat or whom one can marry or kill. The establishment of a community requires forming certain relationships; and these relationships are sacred when they bear the power of ultimate, eternal, cosmic force. For example, the consecration of a king or emperor in traditional agricultural societies was the establishment of a system of allegiance and order for society.

By extending the notion of “sacralization” to include human reorganization of experience within the context of any absolute norm, the sacred can be seen in such dimensions of life as history, self-consciousness, aesthetics, and philosophical reflection (conceptualization). Each of these modes of human experience can become the creative force whereby some people have “become real” and gained the most profound understanding of themselves.

Critical problems. Phenomenologists of religion who use the concept “sacred” as a universal term for the basis of religion differ in their estimation of the nature of the sacred manifestation. Otto and van der Leeuw hold (in different formulations) that the sacred is a reality that transcends the apprehension of the sacred in symbols or

Sacred
time and
place

Divine
or heroic
activity
and social
relations

Nonuni-
versalist
views of
the sacred

rituals. The forms (ideograms) through which the sacred is expressed are secondary and are simply reactions to the "wholly other." Kristensen and Eliade, on the other hand, regard the sacred reality to be available through the particular symbols or ways of apprehending the sacred. Thus, Kristensen places emphasis on how the sacred is apprehended, and Eliade describes different modalities of the sacred, while Otto looks beyond the forms toward a meta-empirical source.

A second problem is the continuing question of whether or not the sacred is a universal category. There are religious expressions from various parts of the world that clearly manifest the kind of structure of religious awareness characterized above. It is especially apropos of some aspects in the religion of nonliterate societies, the ancient Near East, and some popular devotional aspects of Hinduism. There is, however, a serious question regarding the usefulness of this structure in interpreting a large part of Chinese religion, the social relationships (*dharma*) in Hinduism, the effort to achieve superconscious awareness in Hinduism (Yoga), Jainism, Buddhism (Zen), some forms of Taoism, and some contemporary (modern) options of total commitment that, nevertheless, reject the notion of an absolute source and goal essentially different from human existence. If one takes the notion of sacred as something above (beyond, different from) the religious structure dominated by divine or transcendent activity (described above), then this suggests that the notion of sacredness should not be limited to that structure. Thus, some scholars have found it confusing to use the notion of sacred as a universal religious quality, for it has been accepted by many religious people and by scholars of religion as referring to only one (though important) type of religious consciousness.

The 20th-century discussion of the nature and manifestation of the sacred includes other approaches than those of scholars in the comparative study of religions. For example, Sri Aurobindo, a Hindu mystic-philosopher, speaks of the supreme reality as the "Consciousness-Force"; and Nishida Kitaro, a Japanese philosopher, expresses his apprehension of universal reality as that of "absolute Nothingness." Martin Heidegger, a German philosopher, speaks of "the holy" as that dimension of existence through which there is the illumination of the things that are, though it is no absolute Being prior to existence; rather it is a creative act at the point of engaging the Nothing (*Nichts*). In contrast, the Protestant theologian Karl Barth rejects philosophical reflection or mystical insight for apprehending the sacred, and insists that personal acceptance of God's self-revelation in a particular historical form, Jesus Christ, is the place to begin any awareness of what philosophers call "ultimate."

Sociologists who study religion have, since Durkheim, usually identified the sacred with social values that claim a supernatural basis. Nevertheless, the sacred has been identified predominantly as found in the social occasions (festivals) that disrupt the common social order (by Caillouis), or as the reinforcing of social activities that secure a given social structure (by Howard Becker). During the 1960s, however, the usual definition of religion as those sacred activities which claimed a transcendent source was ques-

tioned by some empirical scholars. For example, Thomas Luckmann, a German-American sociologist, described the sacred in modern society as that "strata of significance to which everyday life is ultimately referred"; and this definition includes such themes as "the autonomous individual" and "the mobility ethos."

The sacred today. The problems of defining and investigating religion mentioned above are already expressive of the shifts in modern consciousness regarding the sacred. Both the physical and social sciences have given modern man a new image of himself and techniques for improving his present life. The acceptance of rational and critical perspectives for judging the claims of religious authorities in Europe since the 18th century, plus the development of historical criticism and a sense of historical relativism, has contributed to the affirmation of man as basically a secular person. The once absolute authorities in the West (the Bible, priest, rabbi) are no longer the prime sources for one's self-identity. To a growing extent the cultures in the East are also experiencing a loss of their traditional authorities. Some attempts have been made to resacralize contemporary cosmology, history, and personal experience by (1) extending the scope of religious concerns to "secular" areas such as politics, economics, personality development, and art; and (2) modifying theological positions, ethical norms, and liturgical forms to incorporate new modes of expression and to experiment with new styles of living.

An important 20th-century development in religious life has been the easy flow of information between religious communities on different continents. This has provided an opportunity for experimenting with religious forms from outside the traditionally acceptable forms in a culture. During the 1950s and 1960s, for example, Yoga and Zen meditation were serious religious options for some Westerners and a form of experimentation for large numbers. The concern to experiment with personal experience and with styles of living during the 1960s in the West has itself been considered an important religious expression by some commentators. These years saw considerable exploration in exotic experience with psychedelic drugs, many attempts to set up new communities for group living (communes)—though few lasted more than a year—and a shift in the values of middle class youth from a concern for personal economic security to social and experiential concerns. These recent activities may be viewed as attempts to recapture the experience of the sacred.

Throughout the past hundred years a number of philosophers and social scientists have asserted the disappearance of the sacred and predicted the demise of religion. A study of the history of religions shows that religious forms change and that there has never been unanimity on the nature and expression of religion. Whether or not man is now in a new situation for developing structures of ultimate values radically different from those provided in the traditionally affirmed awareness of the sacred is a vital question. The suggestion that a radically different kind of reality is possible is, of course, nonsense for those to whom the sacred already has been manifested once and for all in a particular form.

Assertions
of the
end of the
sacred

WORSHIP

Broadly defined, worship is man's response to the appearance of that which is accepted as the holy—that is, to the sacred, transcendent power or being. Characteristic modes of response to the holy include cultic acts of all kinds: ritual drama, prayers of many sorts, dancing, ecstatic speech, veneration of various persons and objects, sermons, silent meditation, and sacred music and song. Also included in worship are acts of private response: spoken or unspoken prayers, silence, the assumption of particular postures, ritual acts and gestures, and individual acts of veneration of persons or objects.

Nature and significance. The performance of acts of worship rests upon the assumption that there is a realm

of being that transcends the ordinary (*i.e.*, secular or profane) "world" of the worshipper. Acts of worship serve to unite, temporarily at least, the ordinary and the transcendent realms through one or more of a variety of possible means. According to the imagery of this assumption, the heavenly world is above and apart from the earthly, and the reality and powers of the heavenly realm are made to be effectively present on earth through acts of worship. The worshipper may thus find himself transported from the earthly to the heavenly world or may perceive the heavenly to descend to the earthly through the movement of worship.

The act of uniting the sacred and profane realms, in

effect, transforms the situation of the worshipper into one that means health, fresh understanding, renewal of life, or salvation. The situation that prompts worship thus calls for change or for the acknowledgment of change. Frequently, life is recognized to be in need of renewal, and worship is viewed as offering the path to such renewal. Some acts of worship arise from the need of the worshipper to exult in praise of the holy and to express his joy or gratitude that his situation, in fact, has changed for the better.

In both instances, the change is widely believed to take place through the worshipper's return, by means of the acts of worship, to primordial time (as in primitive religions), to the realm in which unity and blessedness obtain. Public acts of ritual often include the recitation of myths of creation or of origin; such recitation transports the worshipper from ordinary time and circumstance back to the beginnings of things. The result is the reconstitution of the world itself and of the worshipper within the world.

Worship, especially in ancient societies, was no matter of indifference to the society at large, for the very continuation of life demanded it. In hunting and food-gathering societies, the continuance of sources of food depended upon the performance of ritual acts through which the means of sustaining life were preserved or secured. In agricultural societies, the fructification of the soil took place in relation to acts of worship focussed upon fertility (e.g., in Syrian and Palestinian religions). In the religion of the state (e.g., ancient Rome), the preservation of the society in times of danger depended upon appropriate acts of worship through which the power of the holy was focussed upon the community's particular need.

In ancient societies (and in some contemporary communities) worship was viewed as affecting all aspects of the life of the community, since it was recognized to provide the means for preserving and renewing life itself. Most of the arts developed in relation to worship and to statecraft and law, and the practical (technical) arts generally gained legitimacy and continuing force through their place in the ritual and liturgical acts of the community. In many ancient societies, the chief institutions (e.g., monarchies) and customs of the society were understood to be derivative from their prototypes or archetypes in the realm of the gods. Kingship was patterned upon divine kingship; worship itself had its heavenly archetype; and the representations of the gods and goddesses were modelled upon the divine beings themselves or upon replicas of them in the heavenly place of worship.

Functions of worship. *Primary functions.* The basic function of worship—the establishment and maintenance of the relation between man and the holy—includes many facets. The relation between the holy and the earthly has, however, a noteworthy ambivalence. On the one hand, man's life is enriched and renewed through ever closer relations with the divine. On the other hand, the holy represents threatening, potentially damaging power, for the force of the holy so greatly transcends that of man that its coming is recognized as a grave danger. This double relationship to the gods has been summed up in various ways. The Latin expression *do ut des*, "I give, that you may give," voices some of the dimensions. The worshipper turns to the gods with his gifts (e.g., sacrifices, prayers, words of praise and adoration, and petitions), and the gods receive these and bestow the gifts on which human life depends. The other dimension of the relationship is signalled by the Latin *do ut abeas*, "I give, that you may go (and stay) away." The divine power must be averted in order to preserve human life. The gods can become the enemies of man, and worship can function to keep the gods at a safe distance.

The rites of worship well document this double attitude of worshippers toward the holy. The sacred precincts are most holy because at them the holy once appeared and continues to appear. Thus, the precincts must be guarded, worship must be performed in the right manner, and the sanctity of the site identified and maintained.

Acts of sacrifice include gifts to the gods in exchange for gifts received or anticipated. They also include offerings entirely devoted to the gods, none of which is touched again by the worshipper; these are sacrifices intended to

avert the wrath of the gods or to express the worshipper's complete dependence upon them. The most characteristic sacrifice, however, is one in which both the beneficence and the danger of the holy are affirmed: sacrifices that relate the divine and the human, that express and create communion between God and man. These communion sacrifices generally take the form of a meal (e.g., in Mithraism) that worshipper and deity share. Care must still be taken not to infringe upon the deity's rights or desires, but the mood of such sacrificial meals is one of sacramental participation in the life and beneficence and power of the god.

Secondary functions. Secondary functions of worship—highly significant for the social and personal life of the community—are distinguishable, although their interrelationship is evident. An important function of worship is the creation and maintenance of social concord in societies dominated by one religion. The understandings expressed in worship bind the members of the society together. The acts of worship celebrate and symbolize this unity when the majority of the members of the society regularly engage in common worship. In Muslim lands, for example, the regular division of the day into five parts through the call of the muezzin (official proclaimer) to prayer and the daily gatherings in the mosque unite the society and express its common commitments and character.

A second function of worship is the creation and maintenance of views and attitudinal stances that identify the members of the society to each other and in relation to other groups. Worship thus involves social learning: the members of the community, through their common worship, learn how to plant, to cultivate the soil, to hunt game, to engage in warfare, to settle disputes, to relate to the various strata of the society. Worship displays and reinforces the character of the society; the traditions are passed along through the worship of the community. In this way, acts of worship sum up and reinforce the moral and cultural commitments and understandings of the community. In a situation in which one religion predominates, such social learning pervades the entire society. This situation formerly pertained, for example, in Ethiopia, where the Ethiopian Orthodox Church was closely identified with the character and objectives of the state, and in Buddhist Tibet before the Chinese invasion in 1950.

The worship of a particular group within a society performs the same purposes for that group. Group concord is effected and maintained through the rites and formal acts of group worship. The celebration of fundamental understandings and values through worship bestows solidity and substance on them so that they become a part of the divinely ordained system of laws, customs, and social practices. Doctrines or dogmas are significantly strengthened and reinforced through worship, and religious truths become a part of the very existence of a group as they are embodied in the art, music, drama, and public rites of the worshipping community. Group learning also is effected, since occasions for worship offer opportunity for the group to reflect upon the significance of its history, rites, and traditions and to celebrate the import of these. The remembrance of deliverance from Egypt (i.e., the Exodus, 13th century BC) became a regular part of the celebration of Passover for the Jews.

A third function of worship is that of providing personal support to individual members of a group or of a society. Because life is marked by anxiety, disasters, and dangers from natural and historical happenings, the individual is provided with a sense of well-being through acts of worship. Worship is viewed as relating the disparate elements of life to the life, purposes, and plans of the divine; and in this way the worshipper is enabled to believe that the burden has been shared, or taken over, by the gods.

Since acts of worship need to be performed in the "right" way in order to be efficacious, there is a strong tendency toward conservatism regarding the forms and understandings of worship. The desire for release of personal or group anxiety also makes it likely that the practice of worship may support conservatism within the group, since the tendency is to rely upon past solutions to personal or group problems long after the time when such solutions appear

Significance in maintaining life and order

Worship as societal reinforcement

The ambivalent nature of the holy

Tendency toward conservatism in worship

to be entirely satisfactory. This conservatism belongs to the nature of religion, inasmuch as religion deals precisely with those issues of life that yield no easy resolution or solution: the mystery of life itself, the travails of birth, initiation into the community of adults, marriage, sickness, public disasters, and death. It is of great social importance that worship brings to the group and its members a sense of the enduring qualities of life, hope for a doubtful future, and a sense of well-being and health in the midst of trials and illness and danger. The result, however, can also be that the forward movement of the society is inhibited by the religious traditions and claims of a past age that are regularly reinforced through acts of worship.

Types of worship. The forms and types of worship are extraordinarily rich and varied. Three types may be distinguished: corporate exclusive worship; corporate inclusive worship; and personal worship.

Corporate exclusive worship. Exclusive corporate worship is worship that belongs to the group alone. Such exclusive groups may understand their distinct status over against other groups on the basis of a divine mission in the world (e.g., Judaism, Christianity, and Islām), of clan, social, or initiatory distinctions (e.g., totemic societies, Gnostic groups), or by reference to certain ritual or ethical commitments and practices (e.g., Seventh-day Adventists) characteristic of the group. Study of contemporary religious groups discloses many similarities of belief among these exclusive communities, and distinctions considered unique by the group may not be unique at all—but they are perceived to be unique.

Among the exclusive types, the mystery religions (e.g., Eleusinian) of the Mediterranean world are particularly well-known. The worship of such communities (also including Gnostic sects—i.e., Christian dualistic heretical groups) centred in the sharing of secret knowledge concerning the origin of the world, the true nature of mankind, and man's proper vocation and destiny. An elaborate system of initiation brought the new member into the community. The community maintained its exclusiveness through the passing on of the secret lore to new members through rites designed to free the devotee from the hold of the material world and thus prepare the way for his ascent to the realm of the divine, from which he had been separated.

Totemic societies are drawn and held together by the recognition of the significance of the animal or object that embodies and displays the holy in their midst. Signs worn or placed on the body identify the adherents of the society. Groups otherwise quite similar in language, customs, religious rites, social behaviour, and culture are held distinct from one another through the power of the totem, and worship underscores and helps to maintain this exclusivism.

Certain social or ethical commitments operate to single out the exclusiveness of religious communities and to define their form of worship. The commitment of Mennonites (a Christian group originating during the 16th century) to refuse participation in acts of war, for example, affects the character of their worship as well as of their general religious life. The worship is conducted over against the larger society, especially the power and commitments of the state. It centres upon peace and reconciliation, upon the moral demands laid upon each worshipper, underscoring the need for worship that issues in the service of fellowmen caught up in the evil of warfare.

The worship of the "gathered church" has a similar character: Baptists, Congregationalists, and many of the free churches—i.e., those not connected with the state (including Mennonites)—engage in a form of worship that stresses the need for each member to make his own confession of faith and to identify personally the character of his religious commitment. The new member must enter such a community on the basis of personal testimony and commitment. Those who do not share these commitments are, in principle (if not in actual fact), not to be accepted into membership.

Racial, ethnic, and language distinctions also can operate to create and maintain exclusive communities. The Negro churches of the United States, though open to members

who are not Negroes, have become, in many sections of the United States, exclusive communities, largely through the exclusion of Negroes from white churches. The worship of Negro communities has incorporated elements from African religions and has focussed upon forms of worship appropriate to a people oppressed by the larger society and excluded from many of its benefits. The service generally is "freer" than that of the white churches, including a more significant place for congregational singing and responses and more active participation by the congregation than has become customary in most white churches.

Many other exclusive communities could be mentioned: new religious groups in Japan and African countries (e.g., nativistic religious movements), in the United States and Canada (e.g., the Churches of Christ, the Nazarenes, the Black Muslims), and in western European countries. These communities give prominence in worship to those features that called them into existence: sectarian religious concerns, nationalism, dissatisfaction with the worship and ideas of the dominant religious communities, or other distinctive commitments.

Women have been excluded from full participation in acts of worship by several religious communities, though this exclusivism, or discrimination, is being challenged in the 20th century, and changes have begun to occur.

Corporate inclusive worship. The second type is corporate inclusive worship, which probably has been numerically the largest throughout human history. Members of a society are, in virtue of birth, included as members of the worshipping community (e.g., the Lutheran churches of Scandinavia) or at least potential members. Though there may be rites of entrance that are to be observed, these frequently become no more than conventional acts, placing few demands upon the initiate. The ancient Greek and Roman city-states observed acts of worship that were open to the entire populace, since they were a fixed part of the ceremonial and political life of the state. The sanctuaries and ceremonies often were cared for at state expense, and the leaders of worship were officials of the state.

In American Christianity, many churches engage in such corporate inclusive worship, even though they may have their fixed doctrines and requirements for membership. The Holy Communion (Lord's Supper) often is open to all who wish to communicate. Some congregations have been organized as community churches; i.e., not belonging to any of the recognized denominations; in these, worship is, of course, inclusive. Participation in worship is generally open to those who wish to take part, irrespective of creed or religious commitment. Members of one church may become members of another and take active part in the life of the new congregation, including its sacramental life, at will. Many of the distinctions marking off the large number of denominations or churches from one another have lost most of their significance.

Participation in worship also is much less restricted than formerly in the Roman Catholic Church, especially as a result of the "opening to the world" that followed the second Vatican Council (1962–65). The same inclusiveness is evident in other religions, especially with regard to participation in worship. Non-Jews in many areas are welcome to participate in Jewish worship even though they may not wish to become converts to Judaism. Worship in the temples and shrines of Hinduism or Buddhism or in Shintō shrines in Japan is not restricted to adherents of the religion. In general, the major religions of the world welcome nonmembers to their public acts of worship; special rites or ceremonies, however, may be reserved to members or initiates.

Personal worship. The third type of worship is that of the individual. The individual's worship may centre in public events and ceremonies, but there is ample place in most religious communities for the devotions, prayers, and religious exercises of the individual, either lay or religious. In corporate acts of worship, fixed prayers, confessions, ritual acts, processions, and participation by empathy in the acts of the leader of worship all enrich the individual's own worship. Some persons are best able to worship in the company of fellow-worshippers, finding little meaning in acts of devotion done in solitude or even in the family

Openness
of U.S.
Christi-
anity

Social or
ethical
exclusive-
ness

circle. Some individuals may well find that special times and places, special rubrics and ceremonies, and a properly enclosed and framed setting for the appearance of the holy are necessary for their worship. Other individuals find the opposite to be the case; for them, the public and fixed occasions for worship lack meaning and intimacy, and they thus need to frame their own prayers, engage in their own devotions, and anticipate the appearance of the holy to themselves alone. In most religious communities and for most persons, a combination of public and private worship appears to be desirable. In the public acts of worship, the range and depth of the religious tradition are represented and affirmed; the power of the holy is made the more palpable. Especially in the modern Western world—in which erosion of traditional religion has occurred to a great extent—individuals are aided in acts of worship by the gathering of members of the community for public worship. They affirm together the faith that becomes increasingly difficult for the individual believer himself to affirm as genuinely his own faith.

Disciplines
and
techniques

Personal worship, whether public or private, is often aided by the observance of disciplines and techniques that focus the attention of the worshipper upon the sacred or holy. Silence, devotional readings, set prayers, the rosary (beads used as a devotional aid in Roman Catholicism), bodily postures and attitudes, music, and works of art, including the icons (images) of Eastern Christian churches, all serve to help the worshipper to concentrate his apprehension of the power of the holy and to intensify his sense of the presence of the holy. The act of worship may aim at a temporary leaving behind of the ordinary concerns and activities of the individual, so that meditation on the divine may occur. It may have as its aim the union of the self with fellowmen and with the divine, as an act that brings the divine powers effectively into the life of the worshipper for that time and for coming days. Or it may be a part of an act of religious devotion aimed at continuing union with the divine (as in mysticism), the sloughing off of natural existence, or a move toward "divinization" (becoming divine).

Variations or distinctions within the act of worship. Worship may be distinguished with regard to the kind of devotion extended to the holy. Worship (Greek *latreia*) in the narrow sense is considered by many religions to be directed to the divine alone: to God in Judaism, Christianity, and Islam and to Amitābha (Buddha) in Mahāyāna (the Greater Vehicle) Buddhism. To worship any being or object other than God alone is thus understood to be an engagement in idolatry, though other beings, persons, or objects may be shown lesser forms of veneration because of their special relationship to the divine.

Certain persons are viewed as being entitled to major veneration (Greek *hyperdoulia*). Among these, the best known are the Virgin Mary in Christianity, especially Roman Catholic Christianity, the *bodhisattvas* (Buddhas-to-be) in Mahāyāna Buddhism, the prophet Muḥammad in Islam, and Jesus in Christian churches that do not emphasize Jesus as the divine Son of God in their worship.

Lesser, or minor, veneration (Greek *doulia*) is extended to the saints of the church in many Christian groups, but especially in the Roman Catholic Church and in Eastern Orthodox churches. The saints are understood to participate in the power of God in virtue of their holy lives and (often) their martyrdom. The saints make intercession in behalf of the worshipper before God and, joining their voices with his, bring about the blessing sought. The relics of the saints are shown veneration as well and are sometimes believed to effect cures or to perform miracles. The forefathers (patriarchs) Abraham, Isaac, and Jacob were venerated in ancient Israel and were named frequently in prayers to God. Veneration of saints also occurs in Buddhism, Jainism, and Islam.

Worship that places emphasis upon the Virgin Mary or upon the lives or relics of the saints has been called idolatry by reforming groups. The danger of idolatry is held to be its tendency to disperse the commitment of the worshipper, to detract from the glory and honour due to God alone. No person or object in the world of God's creation, according to ancient Israel, was entitled

to worship; images of the deity were dangerous because of this fact. According to reforming critics the tendency is to slip from religion into magic whenever worship is not centred upon God alone. Magic and religion are difficult to distinguish, but the operational difference in worship is recognizable: worship is response to the holy, the divine, the powers of which are not controllable. Magic represents an act designed precisely to control the power of the holy and to direct it to one's own ends.

But devotion to the Virgin Mary, to the *bodhisattvas*, to the saints or their relics in various religions, to the icons of the saints in Eastern Christianity should not be considered idolatry. Rather, such devotion is intended to acknowledge the power of the divine and the beauty, nobility, and moral excellence of those who stand in an intimate relationship to God or the sacred realm. Thus, worship of God is accomplished by way of devotion to those whose lives have been touched by the sacred or holy in special ways.

Times and places of worship. *Sacred seasons.* Worship takes place at appointed seasons and places. The religious calendar is thus of great importance for the worshipping community, since communities associate worship with critical times in the life of the society. The hunting, planting, and harvesting seasons are of special importance. The beginning of the year (at the time of the spring or fall equinox or of the summer or winter solstice, normally), of the new moon (occasionally, the full moon), or of the week is viewed as an especially auspicious time for acts of worship. Special festivities peculiar to the community's geographical or historical existence also provide fixed occasions for worship.

In communities with an elaborate structure for worship, the day frequently is divided into appointed periods for worship (e.g., in Christianity among monastic communities and in Islam). Days commemorating the birth (e.g., December 25 in Christianity) or death of the founder of the religion may be of special significance for worship. Commemoration of the lives of the saints also involves special prayers and acts of devotion for certain communities.

In the ordering of time for worship, the recognition that the holy appears most powerfully on fixed occasions is important. On New Year's Day in many ancient societies (and in some contemporary communities), the act of worship is viewed as actually recreating the cosmos itself. Through the recitation of the myth of the world's creation, the worshippers are drawn back into primordial time, to the fount of natural and historical existence, and participate in the renewal of the world order. In the ancient Near East, such celebrations were of fundamental significance for the society. The Akitu festival of the Babylonians occurred in the spring, marking the rebirth of nature, the reestablishment of the kingship by divine authority, and the securing of the life and destiny of the people for the coming year. The agricultural rhythm of preparing the soil, planting, watering, harvesting, and waiting for the earth to become ready for planting again was the decisive natural factor in many of these seasonal festivals. The world grew old, its fertility languished, but, at the appointed time, new life began to stir and nature was ready once again to produce its bounty.

Ancient Israelite festivities were, for the most part, nature festivals originally, but they came to be associated with historical events in the life of the community. The barley harvest in the early spring was related to the deliverance (the Passover) of the Israelites from slavery in Egypt. The wheat harvest (Pentecost, or the Feast of the Weeks), about seven weeks later, commemorated the giving of the divine Law (the Ten Commandments) at Mt. Sinai. The celebration of the harvest of the summer fruits and the olives in the early fall (Sukkot, or Feast of Tabernacles) was associated with the period of wanderings in the wilderness, prior to the entrance of the Israelites into the Promised Land (Canaan, or Palestine). In this way, the worship of the community was tied to events in its early history, the powerful attraction of worship connected with natural fertility was held in check, and the community's worship was thereby enabled to focus upon the moral and social demands of the deity. A similar "historicizing" of

Importance
of the
religious
calendar

seasonal festivals occurred in other religious communities (e.g., Iranian religion, Christianity, Islām).

Sacred places. Worship has its appointed places. A place of worship became sacred and suitable by virtue of the holy's appearing at that place. Sacred places were also sites of natural and historical significance for the community: springs, river crossings, threshing places, trees or groves where the community gathered for public business, hills or mountains where there was safety from enemies, and other such areas. Mountains were of particular importance, since they were understood to bring the worshipper into closer relationship with the heavenly realm.

Signifi-
cance of
sacred
sites

A centre for worship takes on a special character, once it has come to be recognized as the place where the holy regularly appears. In some religions it represents the centre of the earth, often called the "navel" of the earth, the place that constitutes the meeting place of God and man, heaven and earth. The sanctity of such a place must be preserved. Thus, the need arises for officials to guard the holy place and to instruct worshippers regarding the kind of acts of worship suitable to the gods at that place. Also, the site must be marked off and its sacred precincts identified. A holy place that once was marked by no more than a sacred stone on which gifts were placed and sacrifices made would thus become the location of a house for the god, a temple.

Places are selected for worship for other reasons. Shrines, temples, and mosques have been built to commemorate a particular experience of an individual leader of the community. Places also become holy because of the association of a holy man with the locality. The home of the shaman (a medicine man with psychic and healing powers), for example, is viewed as holy simply because he, a spirit-filled person, resides there. The place of retreat of a hermit may become a place of pilgrimage and of worship, and the site of a miracle is often commemorated because miracles continue to occur there.

Established places of worship came to be characteristic of the major religions. Temples, mosques, and churches were erected at state expense or through the beneficence of kings, merchants, bankers, or religious leaders. Architectural patterns became established, with the result that mosques, churches, or temples would normally be built in a set style, with a fixed orientation. Many temples and churches were oriented toward the rising sun so that its rays at sunrise would enter the door of the building from the east.

Sacred time and space provide the structure within which worshippers respond to the holy in orderly ways. The danger exists, of course, that such acts of worship at precisely the right time and place may make of worship a routine thing, debilitating the spontaneity of the act or the openness to fresh perspectives and experiences. Orderly and timely worship places bounds upon the fear with which worshippers approach the holy. It provides an established mode of approaching God that can evoke from worshippers genuine spontaneity while offering a setting that is rich in aesthetic and intellectual, as well as spiritual, powers.

Importance
of altars

Focuses of worship. *Objects.* Religious communities are aided in worship through a variety of objects and activities. The power of the holy is focussed not only in sacred spots and on special occasions but also in animate and inanimate objects. Altars of earth, stone, or metal are extremely common. Some altars are quite simple, formed of beaten earth or consisting of natural stone unshaped by tools. Others are formed of clay or metal or carved from stone, with grain, animals, incense, plants, and flowers the most common offerings at the altar. The altar and the sacrifice both participate in the sacredness of the act of worship and thus are removed from the ordinary realm. The ashes of sacrificed victims must be disposed of with care, just as the altar and the victims must be prepared carefully before the offering occurs. One of the chief duties of the leader of worship is to assist the worshipper in making a proper sacrifice: inspecting the offering, guiding the worshipper as he makes the offering, or performing the act in the worshipper's behalf.

The sacred scriptures of the religious community, the

pulpit or stand from which readings and preaching take place, beads or other objects used by the worshipper as he performs his devotions also focus attention upon the holy and participate in its powers. Images of the gods, totems, or other religious objects—in a variety of forms and materials—also have been employed in worship. Such objects must be understood to represent, not to be identical with, the divine being or power that they portray. Some religious communities (Judaism and Islām in particular) have placed severe limits on the making and use of such representations of the deity. For many religious communities, however, worship without objects representing the gods is impoverished (as in Hinduism); worshippers apparently need such portrayals of the presence of the divine among them. The plastic arts (e.g., sculpture) have flourished as a result of such religious usage, despite the danger that the representation can indeed become identified with the holy and worshippers come to believe that they are enabled to exercise control over the gods.

Activities. Activities likewise have had a significant import in focussing attention on the holy. The divine liturgy of Eastern Orthodox churches provides a dramatic portrayal of the view that God works for the salvation of mankind. Incense, vestments, icons, music, and the processional and ritual movements of the liturgy are united into a re-enactment of Christian deliverance from the powers of sin and death and move the congregation toward active participation in the divine life.

The sacred dance also has occupied a large place in worship, including dances in connection with hunting, marriage, fertility rites, Islāmic mysticism (dervishes), and the Christian liturgy. Dancing serves in particular to open the way for religious ecstasy, a phenomenon known in many religions. The shaman of Central Asia, the medicine men among the American Indians and Australian Aborigines, and many other leaders in worship are susceptible to ecstatic seizure. Ecstatic utterance was characteristic of the priestesses at Delphi in ancient Greece and of the sibyls (prophetesses) at a number of Greek and Roman cult sites, as well as of participants of Pentecostal worship services in Christianity in the 20th century. Evidence of a person's being overwhelmed and overpowered by the Spirit has been highly valued in many religions and continues to be honoured among some.

Sacred
dances

Other activities include prayers (public and private, which are a part of almost all acts of worship), the preaching or teaching that accompanies many services of worship, and the active silence of worship (e.g., the Quakers of Christianity). Music is another of the most widespread activities of worship. Certain forms of music are considered unsuitable for worship—the group of free churches known as Churches of Christ, for example, prohibit instrumental music in worship.

Other focuses. Other means for focussing attention on the presence of the holy have a long and significant place in worship. The veneration of ancestors is known in many religious communities (e.g., Confucianism, Shintō); shrines in honour of the ancestors were maintained in Greek and Roman homes in antiquity. Heroes of the tribe, the region, or the city were also focuses for acts of devotion in many religions.

The most noteworthy focus of worship in a vast number of religious communities, however, was the king or the emperor. The king was viewed in ancient Egypt as the incarnate deity, entitled to be worshipped along with the other gods. In early Mesopotamian religion, the king was viewed as the adopted son of God and was venerated along with the high god. Kingship was believed to be a gift of the gods; the king represented the god on earth and partook of his divine powers.

The desire of worshippers to have an example of strength, beauty, wisdom, and riches appears to be the motive behind the great honour lavished upon kings and emperors. Impoverished persons apparently took pleasure in the rich dress, the many wives, the corpulence, and the lavish expenditures of their kings, even as they resented their own deprivation. Worship was believed to be enriched by the indications of excess, the overabundance of vitality and riches. These were pointers to the heavenly world, to

Motiva-
tions
behind
opulent
forms of
worship

the richness of life for which the worshipper longed and prayed. Thus, much of the trappings of worship and the lavishness of temples, churches, and shrines is accounted for by this longing for opulence on the part of those denied it.

Priests and ministers of religion also serve as focuses for worship. The leader may wish not to be associated too closely with the power of the holy, but, even so, worshippers tend to attach to such persons a special quality of holiness, or a special capacity to mediate the divine powers through acts of worship and through their counsel. The leader's primary function is, in fact, to enable the worshipper to participate more actively in the act that

is designed to produce communion between the divine and the human.

Conclusion. It is not necessary to believe in a personal God or a transcendent heavenly power in order to worship. Essential to an act of worship is the belief that there are powers outside of one's present experience that can be brought to bear upon that experience through prayer, meditation, or some other act of worship. A full human life may often require acts and modes of celebration—activities that bring into focus the heights and depths of man's being and experience—that offer a way to transcend and understand ordinary existence and provide renewal of life for man and for the world itself. (W.Ha.)

THE CONCEPT AND FORMS OF RITUAL

The performance of ceremonial acts, or rituals, prescribed by tradition or by sacerdotal decree is a specific, observable mode of behaviour exhibited by all known societies. It is thus possible to view ritual as a way of defining or describing man.

Nature and significance. Man is sometimes described or defined as a basically rational, economic, political, or playing species. Man may, however, also be viewed as a ritual being, who exhibits a striking parallel between his ritual and verbal behaviour. Just as language is a system of symbols that is based upon arbitrary rules, ritual may be viewed as a system of symbolic acts that is based upon arbitrary rules.

The intricate, yet complex, relation between ritual and language can be seen in the history of various attempts to explain ritual behaviour. In most explanations, language becomes a necessary factor in the theory concerning the nature of ritual, and the specific form of language that is tied to explanations of ritual is the language of myth. Both myth and ritual remain fundamental to any analysis of religions.

Three general approaches to a theory about the nature and origin of ritual prevail.

The origin approach. The earliest approach was an attempt to explain ritual, as well as religion, by means of a theory concerned with historical origin. In most cases, this theory also assumed an evolutionary hypothesis that would explain the development of ritual behaviour through history. The basic premise, or law, for this approach is that ontogeny (development of an individual organism) recapitulates phylogeny (evolution of a related group of organisms), just as the human embryo recapitulates the stages of human evolutionary history in the womb—e.g., the gill stage. The solution to explaining the apparently universal scope of ritual depended upon the success in locating the oldest cultures and cults. Scholars believed that if they could discover this origin, they would be able to explain the contemporary rituals of man.

There are almost as many solutions as authors in this approach. In the search for an origin of ritual, research turned from the well-known literate cultures to those that appeared to be less complex and preliterate. The use of the terms primitive religion and primitive cultures comes from this approach in seeking an answer to the meaning of ritual, myth, and religion. Various cultures and rituals were singled out, sacrifice of either men or animals becoming one of the main topics for speculation, though the exact motivation or cause of sacrificial ritual was disputed among the leading authors of the theory. For W. Robertson Smith, a British biblical scholar who first published his theory in the ninth edition of *Encyclopædia Britannica* (1875–89), sacrifice was motivated by the desire for communion between members of a primitive group and their god. The origin of ritual, therefore, was believed to be found in totemic (animal symbolic clan) cults; and totemism, for many authors, was thus believed to be the earliest stage of religion and ritual. The various stages of ritual development and evolution, however, were never agreed upon. Given this origin hypothesis, rituals of purification, gift giving, piacular (expiatory) rites, and worship were viewed as developments, or secondary stages,

of the original sacrificial ritual. The Christian Eucharist (Holy Communion), along with contemporary banquets and table etiquette, were explained as late developments or traits that had their origin and meaning in the totemic sacrifice.

The influence of Robertson Smith's theory on the origin of ritual can be seen in the works of the British anthropologist Sir James Frazer, the French sociologist Émile Durkheim, and Sigmund Freud, the father of psychoanalysis. Although they were not in complete agreement with Smith, sacrifice and totemism remained primary concerns in their search for the origin of religion. For Frazer, the search led to magic, a stage preceding religion. Both Smith and Frazer led Durkheim to seek the origin of ritual and religion in totemism as exemplified in Australia. Durkheim believed that in totemism scholars would find the original form of ritual and the division of experience into the sacred and the profane. Ritual behaviour, they held, entails an attitude that is concerned with the sacred; and sacred acts and things, therefore, are nothing more than symbolic representations of society. In his last major work, *Moses and Monotheism*, Freud also remained convinced that the origin of religion and ritual is to be found in sacrifice.

The functional approach. The second approach to explaining ritual behaviour is certainly indebted to the work of such men as Smith, Freud, and Durkheim. Yet very few, if any, of the leading contemporary scholars working on the problems of religion, ritual, and myth begin with a quest for origins. The origin-evolutionary hypothesis of ritual behaviour has been rejected as quite inadequate for explaining human behaviour because no one can verify any of these bold ideas; they remain creative speculations that cannot be confirmed or denied.

Turning from origin hypotheses, scholars next emphasized empirical data gathered by actual observation. Contemporary literature is rich in descriptions of rituals observed throughout the world. If the term origin can be used as central to the first approach, the term function can be used as indicative of the primary focus of the second approach. The nature of ritual, in other words, is to be defined in terms of its function in a society.

The aim of functionalism is to explain ritual behaviour in terms of individual needs and social equilibrium. Ritual is thus viewed as an adaptive and adjustive response to the social and physical environment. Many leading authorities on religion and ritual have taken this approach as the most adequate way to explain rituals. Bronisław Malinowski, A.R. Radcliffe-Brown, E.E. Evans-Pritchard, Clyde Kluckhohn, Talcott Parsons, and Edmund Leach, all English or American anthropologists, adopted a functional approach to explain ritual, religion, and myth.

Most functional explanations of ritual attempt to explain this behaviour in relation to the needs and maintenance of a society. The strengths of this approach are dependent upon a claim that it is both logical and empirical. It is a claim, however, that is open to serious criticism. If the aim of functionalism is to explain why rituals are present in a society, it will be necessary to clarify such terms as need, maintenance, and a society functioning adequately, and this becomes crucial if they are to be

Individual
needs
and social
equilibrium

Early
emphasis
on sacrifice

taken as empirical terms. From a logical point of view, functionalism remains a heuristic device, or indicator, for describing the role of ritual in society. If it is asserted that a society functions adequately only if necessary needs are satisfied; and if it is further asserted that ritual does satisfy that need, scholars cannot conclude that, therefore, ritual is present in that society without committing the logical fallacy of affirming the consequent. To assert that the need is satisfied "if and only if" ritual is present is a tautology and a reversal of the claim to be empirical.

The history of religions approach. A third approach to the study of ritual is centred on the studies of historians of religion. The distinction between this approach and the first two is that though many historians of religions agree with functionalists that the origin-evolutionary theories are useless as hypotheses, they also reject functionalism as an adequate explanation of ritual. Most historians of religions, such as Gerardus van der Leeuw in The Netherlands, Rudolf Otto in Germany, Joachim Wach and Mircea Eliade in the United States, and E.O. James in England, have held the view that ritual behaviour signifies or expresses the sacred (the realm of transcendent or ultimate reality). This approach, however, has never been represented as an explanation of ritual. The basic problem with it remains that it cannot be confirmed unless scholars agree beforehand that such a transcendent reality exists (see also RELIGIONS).

Functions of ritual. Ritual behaviour, established or fixed by traditional rules, has been observed the world over and throughout history. In the study of this behaviour, the terms sacred (the transcendent realm) and profane (the realm of time, space, and cause and effect) have remained useful in distinguishing ritual behaviour from other types of action.

The sacred
and the
profane

Although there is no consensus on a definition of the sacred and the profane, there is common agreement on the characteristics of these two realms by those who use the terms to describe religions, myth, and ritual. For Durkheim and others who use these terms, ritual is a determined mode of action. According to Durkheim, the reference, or object, of ritual is the belief system of a society, which is constituted by a classification of everything into the two realms of the sacred and the profane. This classification is taken as a universal feature of religion. Belief systems, myths, and the like, are viewed as expressions of the nature of the sacred realm in which ritual becomes the determined conduct of the individual in a society expressing a relation to the sacred and the profane. The sacred is that aspect of a community's beliefs, myths, and sacred objects that is set apart and forbidden. The function of ritual in the community is that of providing the proper rules for action in the realm of the sacred as well as supplying a bridge for passing into the realm of the profane.

Although the distinction between the sacred and profane is taken as absolute and universal, there is an almost infinite variation on how this dichotomy is represented—not only between cultures but also within a culture. What is profane for one culture may be sacred to another. This may also be true, however, within a culture. The relative nature of things sacred and the proper ritual conducted in relation to the sacred as well as the profane varies according to the status of the participants. What is set apart, or holy, for a sacred king, priest, or shaman (a religious personage having healing and psychic transformation powers), for example, will differ from the proper ritual of others in the community who are related to them, even though they share the same belief systems. The crucial feature that both sustains these relations and sets their limits is the ritual of initiation.

Three further characteristics are generally used to specify ritual action beyond that of the dichotomy of sacred and profane thought and action. The first characteristic is a feeling or emotion of respect, awe, fascination, or dread in relation to the sacred. The second characteristic of ritual involves its dependence upon a belief system that is usually expressed in the language of myth. The third characteristic of ritual action is that it is symbolic in relation

to its reference. Agreement on these characteristics can be found in most descriptions of the functions of ritual.

The scholarly disputes that have arisen over the functions of ritual centre around the exact relation between ritual and belief or the reference of ritual action. There is little agreement, for example, on the priority of ritual or myth. In some cases, the distinction between ritual, myth, and belief systems is so blurred that ritual is taken to include myth or belief (see also MYTH AND MYTHOLOGY).

The function of ritual depends upon its reference. Once again, although there is common agreement about the symbolic nature of ritual, there is little agreement with respect to the reference of ritual as symbolic. Ritual is often described as a symbolic expression of actual social relations, status, or the role of individuals in a society. Ritual is also described as referring to a transcendent, numinous (spiritual) reality and to the ultimate values of a community.

Whatever the referent, ritual as symbolic behaviour presupposes that the action is nonrational. That is to say, the means-end relation of ritual to its referent is not intrinsic or necessary. Such terms as latent, unintended, or symbolic are often used to specify the nonrational function of ritual. The fundamental problem in all of this is that ritual is described from an observer's point of view. Whether ritual man is basically nonrational or rational, as far as his behaviour and his belief system are concerned, is largely dependent upon whether he also understands both his behaviour and belief to be symbolic of social, psychological, or numinous realities. It is difficult to imagine a Buddhist, a Christian, or an Australian aborigine agreeing that his ritual action and beliefs are nothing but symbols for social, psychological, or ultimate realities. The notion of the sacred as a transcendent reality may, however, come closest to the participant's own experience. The universal nature of the sacred-profane dichotomy, however, remains a disputed issue.

What is needed is a new theory that will overcome the basic weaknesses of functional descriptions of ritual and belief. Until such a time, ritual will remain a mystery. The progress made in the study of language may be of help in devising a more adequate explanation of nonverbal behaviour in general and of ritual in particular.

Types of ritual. Because of the complexities inherent in any discussion of ritual, it is often useful to make distinctions by means of typology. Although typologies do not explain anything, they do help to identify rituals that resemble each other within and across cultures.

Imitative. All rituals are dependent upon some belief system for their complete meaning. A great many rituals are patterned after myths. Such rituals can be typed as imitative rituals in that the ritual repeats the myth or an aspect of the myth. Some of the best examples of this type of ritual include rituals of the New Year, which very often repeat the story of creation. In a passage from an Indian *Brāhmaṇa* (a Hindu scripture) the answer to the question of why the ritual is performed is that the gods did it this way "in the beginning." Rituals of this imitative type can be seen as a repetition of the creative act of the gods, a return to the beginning.

This type of myth has led to a theory that all rituals repeat myths or basic motifs in myths. A version of this line of thought, often called "the myth-ritual" school, is that myth is the thing said over ritual. In other words, myths are the librettos for ritual. The works of such scholars as Jane Harrison and S.H. Hooke are examples of this theory. Although it cannot be denied that some rituals explicitly imitate or repeat a myth (e.g., a myth of creation), it cannot be maintained that all rituals do so. The ritual pattern of the ancient Near East, which Hooke considers basic to the festival celebrating the creation, is itself a typological construction. In any case, although there is a combat and killing narrated in the festival myth, no known evidence exists of ritual killing or of king-sacrifice in the ancient Near East. Nevertheless, some rituals do repeat the story of a myth and represent an important type of ritual behaviour, even though the type cannot be universalized as a description of all ritual action.

Positive and negative. Rituals may also be classified as

The variety
of ritual
references

The
"myth-
ritual"
school

positive or negative. Most positive rituals are concerned with consecrating or renewing an object or an individual, and negative rituals are always in relation to positive ritual behaviour. Avoidance is a term that better describes the negative ritual; the Polynesian word *tabu* (English, taboo) also has become popular as a descriptive term for this kind of ritual. The word taboo has been applied to those rituals that concern something to be avoided or forbidden. Thus, negative rituals focus on rules of prohibition, which cover an almost infinite variety of rites and behaviour. The one characteristic they all share, however, is that breaking the ritual rule results in a dramatic change in ritual man, usually bringing him some misfortune.

Variation in this type of ritual can be seen from within a culture as well as cross-culturally. What is prohibited for a subject, for example, may not be prohibited for a king, chief, or shaman. Rituals of avoidance also depend upon the belief system of a community and the ritual status of the individuals in their relation to each other. Contact with the forbidden or transgression of the ritual rules is often offset by rituals of purification.

Negative ritual, as noted above, is always in polarity with positive ritual. The birth of a child, the consecration of a king, a marriage, or a death are ritualized both positively and negatively. The ritual of birth or death involves the child or corpse in a ritual that, in turn, places the child or the corpse in a prohibitive status and thus to be avoided by others. The ritual itself, therefore, determines the positive or negative characteristic of ritual behaviour.

Sacrificial. Another type of ritual is classified as sacrificial. Its importance can be seen in the assessment of sacrificial ritual as the earliest or elementary form of religion. See below under *Sacrifice*.

The significance of sacrifice in the history of religions is well documented. One of the best descriptions of the nature and structure of sacrifice is to be found in *Essai sur la nature et le fonction du sacrifice*, by the French sociologists Henri Hubert and Marcel Mauss, who differentiated between sacrifice and rituals of oblation, offering, and consecration. This does not mean that sacrificial rituals do not at times have elements of consecration, offering, or oblation but these are not the distinctive characteristics of sacrificial ritual. Its distinctive feature is to be found in the destruction, either partly or totally, of the victim. The victim need not be human or animal; vegetables, cakes, milk, and the like are also "victims" in this type of ritual. The total or partial destruction of the victim may take place through burning, dismembering or cutting into pieces, eating, or burying.

Hubert and Mauss have provided a very useful structure for dividing this type of ritual into subtypes. Though sacrificial rituals are very complex and diverse throughout the world, nevertheless, they can be divided into two classes: those in which the participant or participants receive the benefit of the sacrificial act and those in which an object is the direct recipient of the action. This division highlights the fact that it is not just individuals who are affected by sacrificial ritual but in many instances objects such as a house, a particular place, a thing, an action (such as a hunt or war), a family or community, or spirits or gods that become the intended recipients of the sacrifice. The variety of such rituals is very extensive, but the unity in this type of ritual is maintained in the "victim" that is sacrificed.

Life crisis. Any typology of rituals would not be complete without including a number of very important rites that can be found in practically all religious traditions and mark the passage from one domain, stage of life, or vocation into another. Such rituals have often been classified as rites of passage, and the French anthropologist Arnold van Gennep's study of these rituals remains the classic book on the subject. See below under *Rites of passage; Death rites and customs*.

The basic characteristic of the life-crisis ritual is the transition from one mode of life to another. Rites of passage have often been described as rituals that mark a crisis in individual or communal life. These rituals often define the life of an individual. They include rituals of birth, puberty (entrance into the full social life of a community),

marriage, conception, and death. Many of these rituals mark a separation from an old situation or mode of life, a transition rite celebrating the new situation, and a ritual of incorporation. Rituals of passage do not always manifest these three divisions; many such rites stress only one or two of these characteristics.

Rituals of initiation into a secret society or a religious vocation (viz., priesthood, ascetic life, medicine man) are often included among rites of passage as characteristic rituals of transition. The great New Year's rituals known throughout the world also represent the characteristic passage from old to new on a larger scale, that includes the whole society or community.

One of the dominant motifs of the life-crisis ritual is the emphasis on separation, as either a death or a return to infancy or the womb. In India, a striking example is the Hindu rite of being "twice born." The young boy who receives the sacred thread in the *upanayana* ritual, a ceremony of initiation, goes through an elaborate ritual that is viewed as a second birth. Rituals such as Baptism in early Christianity, Yoga in India, and the complex puberty rituals among North American Indian cultures exemplify this motif of death and rebirth in rites of passage.

Rituals of crisis and passage are often classified as types of initiation. An excellent description of such rites is found in *Birth and Rebirth* by Mircea Eliade. From Eliade's point of view, rituals, especially initiation rituals, are to be interpreted both historically and existentially. They are related to the history and structure of a particular society and to an experience of the sacred that is both transhistorical and transcendent of a particular social or cultural context. Culture, from this perspective, can be viewed as a series of cults, or rituals, that transform natural experiences into cultural modes of life. This transformation involves both the transmission of social structures and the disclosure of the sacred and spiritual life of man.

Initiation rituals can be classified in many ways. The patterns emphasized by Eliade all include a separation or symbolic death, followed by a rebirth. They include rites all the way from separation from the mother to the more complex and dramatic rituals of circumcision, ordeals of suffering, or a descent into hell, all of which are symbolic of a death followed by a rebirth. Rites of withdrawal and quest, as well as rituals characteristic of shamans and religious specialists, are typically initiatory in theme and structure. Some of the most dramatic rituals of this type express a death and return to a new period of gestation and birth and often in terms that are specifically embryological or gynecological. Finally, there are the actual rituals of physical death itself, a rite of passage and transition into a spiritual or immortal existence.

The various typologies of ritual that can be found in texts on religion and culture often overlap or reveal a common agreement in the way in which ritual behaviour can be classified. There is a striking contrast in the use of these typologies to interpret the meaning of ritual. In general, this contrast can be described in terms of two positions: the first emphasizes the sociopsychological function of ritual; the second, although not denying the first, asserts the religious value of ritual as a specific expression of a transcendental reality.

Conclusion. Ritual behaviour is obviously a means of nonverbal communication and meaning. This aspect of ritual is often overlooked in the stress on the relation of ritual to myth. Thus, the meaning of ritual is often looked for in the verbal, spoken, or belief system that is taken as its semantic correlate. The spoken elements in a ritual setting do often reveal the meaning of a ritual by reference to a belief system or mythology, but not always. Such a connection has led to an overemphasis on the importance of the belief system or myth over ritual. To assert that myths disclose more than ritual ever can is an oversimplification of the complex correlation of these two important aspects of religion. A partial explanation of this emphasis is undoubtedly the fact that a vast amount of data, both primary and secondary, is literary in form. Theories about ritual are either deduced from the primary literature of a religious tradition or are translated into written language as a result of observation.

Rituals of initiation

Differentiation between sacrifice and other ritual acts

Nonverbal communication and meaning

Ritual can be studied as nonverbal communication disclosing its own structure and semantics. Scholars have only recently turned to a systematic analysis of this important aspect of human behaviour; and progress in kinesics, the study of nonverbal communication, may provide new approaches to the analysis of ritual. This development may well parallel the progress in linguistics and the analysis of myth as an aspect of language.

A complete analysis of ritual would also include its relation to art, architecture, and the specific objects used in ritual such as specific forms of ritual dress. All of these components are found in ritual contexts, and all of them are nonverbal in structure and meaning.

Most rituals mark off a particular time of the day, month, year, stage in life, or commencement of a new event or vocation. This temporal characteristic of ritual is often called "sacred time." What must not be forgotten in the study of ritual is a special aspect of ritual that is often described as "sacred space." Time and place are essential features of ritual action, and both mark a specific orientation or setting for ritual. Time and space, whether a plot of ground or a magnificent temple, are ritually created and become, in turn, the context for other rituals. Examples of ritual time and ritual space orientation can be found in the rituals for building the sacrifice in Brahmanic Indian ritual texts; for the building of a Hindu temple or a Christian cathedral; and for consecrating those structures that symbolize a definite space-time orientation in which rituals are enacted. The shape, spatial orientation, and location of the ritual setting are essential features of the semantics of ritual action.

When particular ritual objects, dances, gestures, music, and dress are included in the study of ritual, the total structure and meaning of ritual behaviour far exceed any one description or explanation of ritual man. Most descriptions are selective and are dependent upon the theory and intent with which rituals are to be studied.

In recent years there has been little consensus among scholars on an adequate theory, or framework, for explaining or describing ritual. Though the term has often been used to describe the determined, or fixed, behaviour of both animals and men, the future study of ritual may disclose that this behaviour, found throughout history and cultures, is as unique to man as his capacity for speaking a language and that change in ritual behaviour is parallel to, or correlated with, change in language. Although great progress has been made in the analysis of man as the species who speaks, the syntax and semantics of ritual man are yet to be discovered.

(Ha.P.)

Prayer

Prayer is an act of communication by man with the sacred or holy—God, the gods, the transcendent realm, or supernatural powers. Found in all religions in all times, prayer may be a corporate or personal act utilizing various forms and techniques. Prayer has been described in its sublimity as "an intimate friendship, a frequent conversation held alone with the Beloved" by St. Teresa of Ávila, a 16th-century Spanish mystic.

NATURE AND SIGNIFICANCE

Prayer is a significant and universal aspect of religion, whether of primitive peoples or of modern mystics, that expresses the broad range of religious feelings and attitudes that command man's relations with the sacred or holy. Described by some scholars as religion's primary mode of expression, prayer is said to be to religion what rational thought is to philosophy; it is the very expression of living religion. Prayer distinguishes the phenomenon of religion from those phenomena that approach it or resemble it, such as religious and aesthetic feelings.

Historians of religions, theologians, and believers of all faiths agree in recognizing the central position that prayer occupies in religion. According to the American philosopher William James, without prayer there can be no question of religion. An Islamic proverb states that to pray and to be Muslim are synonymous, and Sadhu Sundar Singh,

a modern Christian mystic of India, stated that praying is as important as breathing.

Of the various forms of religious literature, prayer is considered by many to be the purest in expressing the essential elements of a religion. The Islamic Qur'an is regarded as a book of prayers, and the book of Psalms of the Bible is viewed as a meditation on biblical history turned into prayer. The *Confessions* of the great Christian thinker St. Augustine (354–430) are, in the final analysis, a long prayer with the Creator. Thus, because religion is culturally and historically ubiquitous, if prayer were removed from the literary heritage of a culture, that culture would be deprived of a particularly rich and uplifting aspect.

From its primitive to its mystical expression, prayer expresses a desire on the part of men to enter into contact with the sacred or holy. As a part of that desire, prayer is linked to a feeling of presence (of the sacred or holy), which is neither an abstract conviction nor an instinctive intuition but rather a volitional movement conscious of realizing its higher end. Thus, prayer is described not only as meditation about God but as a step, a "going out of one's self," a pilgrimage of the spirit "in the presence of God." It has, therefore, a personal and experiential character that goes beyond critical analysis.

Prayer is also linked to sacrifice, which seems to support prayer as a cultic—as well as a personal—act and as a supplement to the bare word of man in his attempts to relate to the sacred or holy. In any case, the sacrificial act generally precedes the verbal act of prayer. Thus, the presentation of an offering often prolongs prayer and is viewed as a recognition of the sovereignty and beneficence of the deity or supernatural powers. The word of man (in prayer), however, apart from a concomitant sacrificial act, is itself viewed as the embodiment of sacred action and power.

When prayer becomes dominating and manipulative in its intent, it becomes magic. With words and songs, man thus believes that he can ask, conjure, and threaten the sacred or supernatural powers. Imprecation and incantation become, in effect, "oral talismans" (charms). The effectiveness of such magical prayer is believed to depend on the recitation of a precise formula, or rhythm, or on the saying and repeating of the divine name. Manipulation by magic, however, is neither the explanation nor the essence of prayer but rather its deviation and exploitation, a tendency that is to be noticed whenever prayer departs from its basic and essential meaning—i.e., the expression of a desire to enter into contact with the sacred or holy.

ORIGIN AND DEVELOPMENT

During the 19th century, when various evolutionary theories were in vogue, prayer was viewed as a stage in the development of religion from a magical to a "higher" stage. Such theories, which saw in prayer no more than a development of magic or incantation, failed to recognize the strictly personal characteristics of prayer. Even if a scholar could prove the chronological precedence of magical incantations to prayer—which has thus far not been done—he would be derelict in his scholarly duty if he saw in such a precedence the only explanation of prayer. The origin of prayer is to be found—essentially and existentially—in the recognition and invocation of the creator-god, the god of heaven.

Though some scholars, such as Costa Guimaraens, a French psychologist in the early 20th century, have attempted to trace prayer back to a biological need, the attempt, on the whole, has been unsuccessful. If sometimes—especially with exceptional subjects or subjects with fragile nervous systems—the act of prayer is accompanied by corporal phenomena (e.g., bleeding, shaking), such phenomena can accompany it without having provoked it and without explaining its deep inspiration. In order to analyze normal prayer psychologically it is especially important to choose normal subjects. Affective sources such as fear, joy, and sadness doubtless play a role in prayer. Such affectations are expressed in prayers recorded in various religions and particularly in the Psalms of the Bible; but they do not explain the recourse to prayer itself, which is explained by a motivation deeper than affective

Significance of "sacred time" and "sacred space"

Theories of the origin of prayer

Prayer as the primary mode of expression in religion

elements. The cause and occasion of prayer must not be confused.

Moral sentiments also are integrating elements, but they are accidental to the development of prayer; virtue is not necessarily expressed in the act of praying because there exist atheists of incontestable morality. Morality is more a consequence than a cause of prayer; and it follows more than it prepares for the development of the religious man.

William James and psychologists such as Joseph Segond describe prayer as a "subconscious" and "emotional effusion," an outburst of the mind that desires to enter into communication with the invisible. Experiences of prayer very often, in fact, do include "cries from the heart," "inexpressible laments," and "spiritual outbursts." The psychological explanation has the advantage of probing the subconscious, of describing the various forces that act within men's psyches; but the emergence of the subconscious in the act of prayer is not the essence of prayer since it minimizes the role of intelligence and the will. Among what are called the higher religions (e.g., Judaism, Christianity, Islām, Hinduism, Buddhism), divine action, which is the object of the human action of prayer, violates neither man's consciousness nor his freedom.

Sociologists often explain prayer in terms of the religious environment, which plays an indubitable role in spiritual behaviour. Though prayer supposes a personal belief, that belief is, to a great extent, provided by society. Society creates and regulates social and religious rites and liturgies to express its beliefs, but to explain the origin of prayer solely in terms of an environmental context would be to neglect the inner, personal origins of prayer. That belief is transmitted by society is incontestable, but the channel is not to be viewed as the source. Society itself is, so to speak, a tributary of beliefs that are both received from and given to the collective whole and also from and to each of its members. The collective forms may influence personal prayer, but they do not explain it.

The vertical (divine-human) as well as horizontal (social) dimension of prayer is also expressed in the alternation between speech and silence. Whereas magical formulas are used to coerce the supernatural, liturgical language, even when incomprehensible to the congregation, seeks to lead the participants into an apprehension of the mystery of the divine. In the presence of the mystery of the divine, man often discovers that he can only stammer or that his speech often falters. When this occurs, he frequently expresses his "fear and love" (Luther) or "*tremendum et fascinans*"—i.e., fear and attraction (according to Rudolf Otto, a modern German historian of religion), in apophatic (negative) formulas. Speech with the divine is, in such cases, followed by silence before men, as one apprehends the inexpressible (i.e., the sacred or holy). Religious language, like silence, thus expresses the distance and inadequacy of man in relation to the divine mystery.

TYPES OF PRAYER

Because the various types of prayer are connected and permit a flow from one type to another, it is difficult to conceive of them in terms of rigid classifications. They are enumerated here more on the basis of psychology than on history.

Petition. The role of the request in religion has played such a central part that by metonymy (using a word for another expected word) it has given its name to prayer. However contestable this may sometimes be, it is impossible to refuse to recognize the importance of request, whether it be for a material or spiritual gift or accomplishment. The requests that occur most often are for preservation of or return to health, the healing of the sick, long life, material goods, prosperity, or success in one's undertakings. Request for such goals may be tied to a magical invocation; it may also be a deviation from prayer when it takes the form of a bargain or of a request for payment due: "In payment of our praise, give to the head of the family who is imploring you glory and riches" (from the Rigveda (Rgveda), a sacred scripture of Hinduism). Christianity has never condemned material requests but rather has integrated them into a single providential order while at the same time subordinating them to spiritual values.

Thus, in essence though not always in practice, requests are only on the fringe of prayer. As a religion adopts more spiritual goals, the requests become more spiritual: in the *Choephoroi*, a play written by Aeschylus (a Greek tragic poet of the 6th–5th centuries BC), Electra, the daughter of King Agamemnon, prays, "Grant that I may be a more temperate and a more pious wife than was my mother." Other examples of the transformation to spiritual goals may be seen in the prayers of the ancient Babylonian and Assyrian kings who asked for the fear of God, rather than material benefits, and that of a priest of the Ewe (a West African people) who even asks of his god "That I remain near you and that you remain near me."

Confession. The term confession expresses at the same time an affirmation of faith and a recognition of the state of sin. In Mazdaism (Zoroastrianism and Parsism), as in ancient Christianity, the confession of faith accompanies the renunciation of demons. The *Confessions* of St. Augustine also illustrate this dual theme. In a similar fashion, ancient and primitive men recognize that their sins unleash the anger of the gods. To counter the divine wrath, a Ewe, for example, throws a little bundle of twigs—which symbolizes the confessor's sins—into the air and he says words symbolizing the deity's response, "All your sins are forgiven you."

The admission of sin cannot be explained only by anguish or by the feeling of guilt; it is also related to what is deepest in man—i.e., to what constitutes his being and his action (as noted by Karl Jaspers, a 20th-century philosopher). The awareness of sin is one of the salient features of religion, as, for example, in Hinduism: "Varuṇa is merciful even to him who has committed sin" (Rigveda). Confession is viewed as the first step toward salvation in both Judaism and Christianity; in Buddhism, monks confess their sins publicly before the Buddha and the congregation two times every month.

Situated at the most personal level of man, sin places him directly before God, who alone is able to grant pardon and salvation. The Miserere ("Lord, have mercy," Psalm 51) of the ancient Israelite king David expresses repentance for sin with an intensity and depth that has a universal value. One of the results of such a dialogue with God is the discovery of the dark depths of sin.

Intercession. Members of primitive societies have a clear sense of their solidarity in the framework of the family, the clan, and the tribe. This solidarity is often expressed in intercessory prayer, in which the needs of others are expressed. In such societies, the head of the family prays for the other members of the family, but his prayers also are extended to the whole tribe, especially to its chief; the primitive may pray even for those who are not members of his tribe (e.g., strangers or Europeans).

Intercessory prayers are also significant in Eastern and ancient religions. In the hymns of the Rigveda the father implores the god Agni (god of fire) for all of those who "owe him their lives and are his family." In the Greek play *Alceste* by Euripides (5th century BC), the mother, on her death, entrusts the orphans she is about to leave to Hestia, the goddess of the home. Among the Babylonians and the Assyrians, a priesthood was established primarily to say prayers of intercession.

Prayers of intercession to the divine are supported by mediatory minor gods or human protectors (alive or dead), marabouts (dervishes, or mystics, believed to have special powers) in Islām, or saints in Christianity, whose mediation ensures that the prayer will be efficacious.

In biblical religion, intercession is spiritualized in view of a consciousness of the messianic (salvatory) mission. Moses views himself as one with his people even when they fail in their duty: "Pardon your people," he prays, "or remove me from the Book of Life." Such solidarity finds its supreme form in the prayer of Christ on the cross—"Father, forgive them, for they know not what they do"—which St. Stephen (the first recorded Christian martyr) and other martyrs repeated in the course of their sufferings.

Praise and thanksgiving. Praise, in the prayer of primitive peoples, can be traced to salutations, such as in the prayer of the Hottentots (of South Africa) to the New Moon—"Welcome." Praise among most of the ancient

The purposes of prayer

The central position of request in religion

peoples was expressed in the hymn, which was primarily a prayer of praise (whether ritual or personal) for the gift of the created world. Israel praises its Creator for "his handiwork," as does the Qur'an. Contemplation of the majesty of the universe thus often gives rise to a prayer that is not always completely free from pantheism (the divine in all things) and that can be found all the way from the nature hymns of Oriental religions to the effusions of J.-J. Rousseau, the 18th-century French moralist, embracing the trees and contemplating the sunrise.

Praise—in addition to concerns for the created world—plays an important role in the prayer of mystics, for whom it is a form of adoration. Praise in this instance constitutes an essential element of the mystic experience and celebrates God, no longer for his works, but for himself, his greatness, and his mystery.

When the great deeds of God are the theme of praise, it becomes benediction and thanksgiving. Even when words denoting thanksgiving are not present, the substance of thanksgiving is manifest, even, for example, for the Pygmy of Central Africa, who says to his god, "Waka [meaning God], you gave me this buffalo, this honey, this wine." Mealtime prayers, frequently enunciated in both ancient and modern religions, give thanks for the goods of the earth and are linked to the giving of an offering.

In Christianity, Christ is discovered as the gift of God and in his mission the economy (or mode of operation) of salvation. Thus, the giving of thanks is viewed as man's response, as a spiritual reaction to the benefit received—*i.e.*, the mediatory work of Christ. Because of the cultivation of this expected response, praise and thanksgiving occupy a central position in Christian prayer and in the liturgy, so much so that its name is given to the Eucharistic Prayer (*i.e.*, the Prayer of Thanksgiving).

Adoration. Adoration is generally considered the most noble form of prayer, a kind of prostration of the whole being before God. Even if the prayer of request is predominant among primitives, they are seized with the feeling of fear and trembling before the numen (spiritual power) of all that is mana (endowed with the power of the sacred or holy) or taboo (forbidden because of association with the sacred). Names given to the divinity in prayers of adoration express dependency and submission, as, for example, in the prayer of the Kekchí Indians of Central America: "O God, you are my lord, you are my mother, you are my father, the lord of the mountains and the valleys." To express his adoration man often falls to the ground and prostrates himself. The feeling of submissive reverence also is expressed by body movements: raising the hands, touching or kissing a sacred object, deep bowing of the body, kneeling with the right hand on the mouth, prostration, or touching the forehead to the ground. The gesture often is accompanied by cries of fear, amazement, or joy; *e.g.*, *has* (Hebrew), *hū* (Islām), or *svāhā* (Hindu).

Adoration takes on its fullest meaning in the presence of the transcendental God who reveals himself to man in the religions of revelation (Judaism, Christianity, and Islām). In the Old Testament prophet Isaiah's vision of the holy (Isa. 6:3), the seraphim (winged creatures) chant to Yahweh: "Holy, holy, holy is the Lord of hosts; the whole earth is full of his glory." This hymn of adoration became a part of the Christian liturgy. The supreme form of adoration, however, is generally considered to be holy silence, which can be found in primitive religion and in ancient religions, as well as in the "higher" religions, and among mystics it expresses the most adequate attitude toward the immeasurable mystery of God: "I am in a dark sanctuary, I pray in silence; O silence full of reverence" (Gerhard Tersteegen, an 18th-century Protestant mystic). Silent adoration is often viewed as the introduction or the response to an encounter with the sacred or holy.

Unitative: mystical union or ecstasy. Ecstasy is literally a departure from, a tearing away from, or a surpassing of human limitations and also a meeting with and embracing of the divine. It is a fusion of being with being, in which the mystic experiences a union that he characterizes as a nuptial union: "God is in me and I am in him." The mystic experiences God himself in an inexpressible encounter because it is beyond the ordinary experiences of man. The

mystical union may be a lucid and conscious progression of contemplative prayer, or it may take a more passive form of a "seizing" by God of the one who is praying.

The mystic, by his goals and actions, is removed from both the world and himself. He discovers in the light and majesty of the divine his own poverty and nothingness and is thus torn between the contemplation of the greatness of God and his own meagreness. St. Francis of Assisi exemplified this dichotomy in his prayer: "Who are you, O God of sweetness, and who am I, worm of the earth and your lowly servant?" Ecstatic prayer goes beyond the frame of ordinary prayer and becomes an experience in which words fail. Mystics speak in turn of unity (*e.g.*, the 3rd-century-AD Greek philosopher Plotinus), of great pleasure (Augustine), or of intoxication (Philo). It is found in the accounts of Hindu, Persian, Hellenistic, and Christian mystics. "You are me, supreme divinity, I am you," says Nimbāditya. The Sūfī (mystic) of Islām Jalāl ad-Dīn ar-Rūmī sighs in the same words as a Christian mystic, Angela da Foligno: "I am you and you are me." Mechthild von Magdeburg develops the same kind of reciprocity: "I am in you and you are me. We cannot be closer. We are two united, poured into a single form by an eternal fusion." Such reciprocity that is so complete that it becomes identity is the supreme expression of ecstatic prayer. It is found in all of the mystic writings, from the Orient to the West.

FORMS OF PRAYER IN THE RELIGIONS OF THE WORLD

The forms that prayer takes in the religions of the world, though varied, generally follow certain fixed patterns. These include: benedictions (blessings), litanies (alternate statements, titles of the deity or deities, or petitions and responses), ceremonial and ritualistic prayers, free prayers (in intent following no fixed form), repetition or formula prayers (*e.g.*, the repetition of the name of Jesus in Eastern Christian Hesychasm, a quietistic monastic movement, or the repetition of the name of Amitābha Buddha in Japanese Buddhism), hymns, doxologies (statements of praise or glory), and other forms.

Religions of nonliterate peoples. Prayer is one of the most ancient expressions of religion. Practically the only evidence of early forms left, however, is that to be noted among the most primitive peoples of today. Together with his dependency in relation to his tribe, the primitive man is aware of his dependency in relation to the Supreme Being. He often addresses his prayers, however, to various numina (spiritual powers): the dead, the divinities of nature, protective gods or actor gods, the Supreme Being localized somewhere in heaven, or a feminine divinity linked to the earth (*i.e.*, the great mother). It is impossible to determine the historical precedence of one over the others, and it is difficult to describe the most primitive prayer because certain forms escape modern scholars, so much so that it has been assumed by some that prayer was absent in earliest religion. The first form may have been a cry, then brief formulas repeated as incantations, such as "Come . . . hear me . . . have pity." (*e.g.*, Algonkin Indians of North America).

Internalized prayer is found among the Eskimos of North America, the Algonkin tribes, the Semangs (of the Andaman Islands in the Indian Ocean), and the Aborigines of Australia. Prayer in gestures is also found among the Semangs. Another form is spontaneous prayer, without any precise formulation, which is found, for example, among the Negritos of the Philippines and the Alacaluf (Halakwulups) of Tierra del Fuego. More developed liturgies and prayer vigils are found among the Negritos and the Pygmies of Gabon.

The prayers of peoples of a nonliterate society generally are concerned with the self (egoistic) and concerned with well-being (eudaemonic) at the same time; they are clearly pragmatic, concerned above all with food, protection, and posterity. But the higher forms of adoration and recognition of obligations, of confidence, and self-abandonment are to be noted. Among the Australian Aborigines are prayers on tombs for the dead, so they may be received in heaven, and prayers are also addressed to the spirits of ancestors. Request and pardon accompany sacrifices in

the propitiatory rites of the Semangs. Of special interest is the fact that the Wiradjuri-Kamilaroi of Australia practice public prayer on only two occasions: the burial of a man and the consecration of puberty. They believe that excessive prayer serves no purpose.

Ancient civilizations. From the 3rd millennium BC to the beginning of the Christian Era, forms of prayer changed little among the Assyrians and Babylonians and their descendants. The oldest forms are composed of hymns and litanies to the moon goddess Sin and to the god Tammuz. Though some songs of joy have been found, most are adjurations. Some hymns of thanksgiving tell of gratitude to the divinity for victory over an enemy. One such hymn, addressed to Marduk (the Babylonian sun god), apparently goes back to the 12th century BC. A number of hymns of later date celebrate the king, but their intent is to request divine protection first for him and his country. Preserved in the library of Ashurbanipal (7th-century-BC Assyrian king) at Nineveh is a rather long hymn to the goddess Nana (queen of the world and giver of life), the consort of the god Nabu, son of Marduk and a god of wisdom and science. There also is a long acrostic poem in praise of the god Marduk, creator of heaven and earth, and hymns that the Babylonians recited at the new year, at the beginning of spring, and at the celebration of Marduk.

Other hymns accompany sacrifices, such as in the offering of a young gazelle in place of humans. A most important form of prayer, however, is found in the conjurations and exorcisms of a priest or believer and in lamentations, which are particularly numerous and which often end in a refrain similar to a litany.

Ancient Egyptian piety is preserved in numerous precepts engraved on the backs of scarabs. These engravings sometimes include praises of the divinity ("All good fates are in the hand of God"), statements of confidence, or requests for protection for the one praying and for his whole family ("God is the protector of my life; the house of one favoured by God fears nothing"). Hymns of thanksgiving, such as that of the artist Nebre, who obtained from the god Amon the healing of his son who had been struck with illness because of Nebre's fault, are numerous in ancient Egyptian religion. Protective magic, widely practiced, also utilized formulas of incantation, recited or written, and amulets (charms). Some of the incantation formulas (anonymously written) come from the earliest times, and others, more recent but no less efficient, were composed by magicians. In order to increase their authority and efficacy, several, such as those composed by pharaoh Ramses III (12th century BC) and preserved in Cairo, were attributed in origin to the gods themselves.

Collections of formulas, such as the Egyptian Pyramid Texts and the Book of the Dead, were compilations of magical prayers that allowed the dead to forestall all the dangers and meet all the eventualities. In particular, they contain negative confessions in which the dead man justifies himself before the court of Osiris (god of the dead). The funeral liturgies of the ancient Egyptians have preserved lamentations that echo the family in mourning. Hymns written on papyrus that are compositions in honour of a divinity and that were recited during sacred ceremonies have also been preserved. Such are the hymns of the pharaoh Akhenaton (Amenophis IV, 14th century BC) to the god Aton and the hymns in honour of the god Amon-Re that boast of divine benefits and sometimes confess misery and sin.

In Greece, poetic prayer can be distinguished from ceremonial prayer. The first, like all of the liturgical prayers, contains three essential parts: the invocation of the god, a justification for fulfillment (e.g., sacrifices offered, favours given and received), and a conclusion that formulates the request, such as in the prayer of Diomedes to the goddess Athena in the *Iliad* (written by the Greek poet Homer in the 8th century BC). Generally, the ceremonial prayer followed a ritual pattern: washing of the hands, the prayer proper, then sacrifice and libations. The prayer initiated the liturgical action; without it there could be no ceremony. Prayers often were transformed into hymns, a characteristic of Greek religion. One of the oldest known Greek hymns is that of women devotees of Dionysus,

the god of wine and fertility. That such hymns were not always sublime in character is attested to by the comment of a 6th-century-BC Greek philosopher in regard to a Dionysiac festival.

If they did not hold a procession and sing a hymn to the genitals, it would be an outrageous performance. Hades and Dionysus, in whose honour they rage and celebrate the Bacchus rites, are one and the same.

Another ancient hymn is a morning hymn to Asclepius, the god of healing. All the hymns begin with invocations of the names of the gods to whom they are addressed. The invocation was believed to have an almost magic value. Though there are many individual Greek hymns in existence, the only official collection remaining contains the Orphic Hymns (addressed to the ancient hero Orpheus); it dates from the Greco-Roman period (c. 3rd century BC–c. 4th century AD).

Roman prayers begin with an invocation to the divinity. Addressing the god is of capital importance and one must be careful not to address the wrong god. In order to avoid this error, there were litanies of 15 gods and goddesses. The prayer itself generally takes two forms, depending on whether it implies a request or is simply limited to praise. The prayer of request has a juridical pattern in which the offering, as a contractual element, dominates. The offering is what jurists call bail bond, a guarantee. The prayer of request's effectiveness depends on a precise formulation, with parallelisms, solemn repetition, and accumulation of synonyms. The verb *precor* ("I pray") is reinforced by many synonyms. Prayers of praise developed out of meditation or experiences of religious elevation and utilized various patterns in both public and private ceremonies. An example of collections of prayers of praise is preserved in the *Verba pontificalia* ("Priestly Words").

Another form of prayer is the *votum* ("vow"), in which a person undertakes to offer to the divinity, in exchange for divine favour, a sacrifice, the building of a temple, or other such offerings. It is a kind of bargain in which is still felt the prudence of the peasant who has experienced failure. These *vota* ("vows") become more numerous than other prayers the farther one goes from the historical origins of Rome. The most solemn form of the vow is the *devotio* ("act of devotion"), by which a chief offers himself to the divinity in order to obtain victory.

Religions of the East. Although the religion of the Vedas contains private prayers, it gives importance and hieratic stature to liturgical prayer, which may or may not include sacrifice. There exists a whole series of hymns, such as the morning hymn addressed to Agni (the god of fire), who brings light, and to the two Aśvin (twin gods of light). There is also an evening prayer, the *sāvītū*, more precisely a prayer for dusk, which the disciple of the Brahmins (priestly teachers) says at nightfall until the stars appear, and a benediction formula. The gestures of adoration (*upasthāna*) in effect give more intensity to the prayer. The prayers that accompany sacrifices and the numerous hymns of the Rgveda (Rgveda; a collection of sacred ritualistic lyrics), which were composed by the members of the priestly caste according to a stereotyped and schematic form, are addressed to the greatness of the divinity in exaltation of his great deeds.

In Hinduism there is an elementary form of prayer—i.e., an affirmation of homage and refuge with the divinity. More frequent is a more elaborate prayer in two forms: *dhyāna* ("meditation") and the *stotra* ("praise"). The *stotra* occurs in a variety of subforms and generally opens with an invocation. It is often characterized by a sort of litany of the titles given, for example, to Vishnu (Viṣṇu; the preserver god) or Śiva (the destroyer god). The *Śivasahasranāman* ("The Thousand Names of Śiva") lists 1,008 titles. In this hymn, each strophe ends with the same refrain. When recited with concentration and pure heart, these prayers are believed to achieve remission of sins.

Hindu mysticism gives great importance to spoken prayer, which, by progressive absorption, leads to ecstasy. The scale of the prayer of Hindu mystics is exemplified in the five stages of *bhakti* ("devotion") as taught by the Hindu mystic Caitanya (15th–16th century AD), who uses

Hindu
mystical
prayer

the metaphor of love in social relationships: *śānta* (peaceful love), *dāśya* (servant of God love), *sakhya* (friendship with God), *vātsalya* (filial attitude toward God), and *mādhurya* (love of God as one's lover). "When I was no longer capable of recognizing, I said me and mine. I am you and you are mine" (*Nalayiram*).

In Chinese Buddhism and Taoism, in addition to prayer that accompanies sacrifice, there is the monastic prayer (*mu-yu*), which is practiced morning, noon, and night to the sound of a small bell. There is also a prayer for the dead, related to the transmigration of souls, which is recited at funerals, the 30th day, the anniversary of the death, and the celebration of the deceased's day of birth. Taoism gave increased importance to this latter form.

Private prayer prepares the way for liberation and illumination. The *tsai-fei* is a prayer—to accompany abstinence—that monks will recite for a believer on payment of alms. Other prayers accompany vows and pilgrimages. Both Buddhist monks and laymen use a string with 108 beads, which monks always carry in their hands.

Religions of the West. In Judaism is one of the best known collections of prayers, the 150 psalms in the Bible. In these psalms, which always presuppose a collective witness, though they may be used by an individual privately, praise is descriptive (God is . . .) or narrative (God does . . .) in nature. Also included are hymns, exhortations to praise God, and supplications. The psalms of request include lamentations and songs of confidence or gratitude. Whether individual or collective, the psalms have a rather similar structure: a cry to God, a confession of sins, a protestation of innocence, and imprecations against one's enemies.

To the prayers of the Bible, the rabbis (religious teachers and leaders) added the Shema ("Hear"), which is a confession composed of three quotes from the Bible (Deut. 6:4–9, 11:13–21, Num. 15:37–41) with attendant blessings and which the Israelite recites daily. At the time of Christ, there appears the prayer par excellence, the *tefilla* or '*amida* (standing prayer), also called *shemone 'esre* ("18 Benedictions"), which every Israelite recites two or three times a day. To these must be added the benediction before eating that raises the meal to the level of the dignity of a religious act.

Christianity preserves the doxologies and benedictions from its Jewish heritage. It adds to them the Lord's Prayer, psalms, hymns, and canticles, the first specimens of which are furnished by the New Testament (e.g., the *Nunc dimittis*, "Now let your servant depart"). Christian prayer, like that of other religions, includes liturgical prayer and personal prayer. Liturgical prayer frames and explains more especially the sacraments of Baptism and the Eucharist (Lord's Supper).

The liturgical collection, for Sundays as well as other days, includes readings from the Bible, collects (brief prayers including an invocation, petition, and conclusion in which the name of Jesus is called upon), and a litany (general prayer) for the intentions of the universal church. During the Eucharist, there is a consecration of the bread and wine to be used in the sacred meal. This consecration prayer is called the Eucharistic (Thanksgiving) Prayer, a long prayer in which the element of thanksgiving is dominant. Addressed to the Father, through the mediation of the Son, and in the Holy Spirit, this prayer develops, like the Jewish liturgies, from praise, to thanksgiving, to the memorial (or anamnesis), and finally to an invocation of the Spirit (epiclesis). Originally improvised and spontaneous, this liturgical prayer became fixed in stereotyped forms, first in the West, then—though with more flexibility—in the East.

The first Christians retained the custom of praying three times a day, reciting the "Our Father" (Lord's Prayer). Special times for prayer are morning and evening. Christ's custom of praying at meals (as a devout Jew) is also maintained. This framework can and does favour the life and spirit of prayer that make a Christian existence, according to the words of Clement of Alexandria, a 2nd–3rd-century theologian, "an uninterrupted celebration." Bible readings, silent prayer (in the West especially), brief, fervent invocations, and the repetition of formulas like the Kyrie eleison

("Lord, have mercy") in the East have enriched spiritual life and have led monks and laymen to contemplative prayer, as is shown by the growth of mysticism in both the West and East.

From its beginning in the 7th century AD, the most important part of Islamic liturgy has been the ritual prayer called the *ṣalāt* (daily prayer), in which both Christian and Jewish influences can be seen. This minutely detailed prayer is recited while the suppliant turns toward Mecca (in Saudi Arabia) five times a day. On Friday, the *ṣalāt al-jum'ah* (Friday prayer) replaces the noon prayer. It is celebrated by the community in the principal mosque and includes preaching and a *ṣalāt* of two ritual bowings. Twice a year, at the end of Ramaḍān and the 10th month, a solemn *ṣalāt* is celebrated, similar to Friday's.

Islamic prayer is an act of adoration of Allāh (God) and thus it would not be suitable to add a request. Before adoring God the believer must purify himself by means of ablutions in pure water or, failing this, in sand. The prayer is accompanied by a meticulous ceremonial with prostration of the body (*rak'ah*). The sense of adoration and conversation with Allāh has led many spiritual Muslims to the heights of mysticism (Sūfism).

In Mazdaism, Avestan (scriptural) prayer, sacerdotal prayer, and the prayer common to priests and laymen alike can be distinguished. In the very first poem of the Avesta, Zoroaster (Zarathushtra) presents himself to Ahura Mazdā (the Good Lord) in a prayer that ends with these words: "I will sing for you again praises of great value." What is characteristic of these hymns is that man proceeds almost exclusively by questions and answers. Only priests can understand the ceremony of the *Yasna* (the sacrifice), during which they recite verses from the Avesta, adding to it the *Visp-rat* (shorter liturgy), with or without the *Vidēvdāt* ("Law against the Demons"), which is concerned with ritual purity. Songs (involving light symbolism) accompany the five fire ceremonies that are celebrated daily. There are also ceremonies in which both priests and laymen participate. The great Bāj, a ritual offering of consecrated bread, grain, and butter, begins with a long preface: "In the name of God, Lord Ormazd, may your power and glory increase." The Satum, in praise of the dead, is recited at the beginning of a meal prepared in their honour every month for the first year after a death and then on each anniversary. Other prayers accompany benedictions, especially those used at the consecration of fire, initiation, and marriage. To these must be added the prayers of great purification.

CONCLUSION

Though historians of religion, psychologists, and anthropologists debate various theories concerned with the origin of prayer, the act of prayer itself is of great significance to the believers of all religions, whatever their inspiration, revealed or otherwise. Ludwig Feuerbach, a 19th-century German philosopher, summed up the significance of prayer when he stated, "The most intimate essence of religion is revealed by the most simple religious act: prayer."

As a religious phenomenon, prayer—in terms of its evolution—appears to be neither universally progressive nor progressively regressive. Its great moments and the appearance of men of prayer at various times, whether simple men or men of genius, are found throughout its long history, which thus marks it as a significant and characteristic element of most, if not all, religions. Whether halting or mystical, ceremonial or personal, prayer expresses the experience of a mystery that envelopes and surpasses man. In the presence of that mystery, prayer seeks and establishes dialogue.

(A.G.Ha.)

Creed and confession

CreeDs and confessions of faith are authoritative formulations of the beliefs of religious communities (or, by transference, of individuals). The two terms are sometimes used interchangeably, but when distinguished a "creed" refers to a brief affirmation of faith employed in public worship or initiation rites, while a "confession" is generally a longer,

Role of belief

more detailed, and systematic doctrinal declaration; the latter term is usually restricted to such declarations within the Christian faith. Both creeds and confessions were historically called symbols, and the teachings they contain are termed articles of faith or, sometimes, dogmas.

The role of belief within religion is interpreted differently in the various empirical disciplines and by the proponents of particular theological or philosophical positions. Traditionally, it has been considered the primary factor in religion, but some modern scholars often regard beliefs as rationales for ritual, that is to say, as secondary expressions of religious experience or as a posteriori ideological sanctions for social and cultural patterns. The present article follows a current anthropological and sociological tendency to define religion as a symbolic system in which ideas and their concomitant attitudinal aspects and actions provide to an individual or group a model of itself and its world. From this perspective, every religion involves distinctive views or beliefs regarding the nature of ultimate reality.

CREEDS IN THE MAJOR RELIGIONS

Origins and functions of creeds. These beliefs, however, need not be explicitly articulated but may be wholly embedded and transmitted in rituals, myths, and social structures and practices. This is especially true in primitive religions. Even when differentiated from other factors, beliefs are frequently not stated in creedal form but are diffusely expressed in sacred writings, legal codes, liturgical formulas, and theological and philosophical reflection. This was true in the ancient cultural religions of Egypt, Mesopotamia, Greece, and Rome, and in traditional Hinduism, Confucianism, and Taoism. When, however, a religion is transmitted from one culture to another (as from Semitic to Hellenistic; *i.e.*, Palestine to Rome) or claims some degree of universal or exclusive truth, formal creeds often develop as aids in maintaining continuity and identity. They serve this purpose because the relative abstractness, comprehensiveness, and concentration of the verbal expressions of beliefs enable them to serve better than most other forms of religious symbolism as stable identifying marks in pluralistic, changing, proselytizing, and missionary situations.

Purpose of creeds

Creeds in the full sense are therefore found only in so-called universal religions, such as Zoroastrianism, Buddhism, Judaism, Christianity, Islām, and certain modern Hindu movements (*e.g.*, Brahmo Samaj). Even here they are of variable importance, with some groups rejecting all formal creeds. Confessions are less common. They function to define the distinctive beliefs of opposing or uniting groups within a given religion or to formulate doctrines appropriate to new circumstances, and are chiefly a Christian phenomenon during the period from the Reformation to the present.

Religions of the East. Related to creeds in the full sense are certain words and phrases which have partially creedal functions. Terms like *tao* (literally, the "way") in Taoism or *li* (rules of propriety) and *hsiao* (filial piety) in Confucianism summarize fundamental emphases of the religious systems of which they are a part. The endlessly repeated *mantra* (evocative sacred syllables) of magic invocation, *Oṃ mani padme hūṃ* ("O, the jewel in the lotus"), especially popular in Tibetan Buddhism, is in one sense a profession of belief in the Avalokiteśvara (jewel's) presence in the world (lotus). Various Hindu *mantras*, most notably the Gāyatrī prayer from the R̥gveda (R̥gveda) (3.62.10) that is learned as part of the initiation rites of Brahmin youth, also serve in part as professions of faith. Indeed, it is primarily through liturgical utterances (*e.g.*, the Lord's Prayer in Christianity), that religious identity is signaled and faith confessed in most religions.

More specifically creedal is the early thrice-repeated *triratna* of Hinayāna Buddhism: "I take my refuge in the Buddha. I take my refuge in the *dharma* (doctrine). I take my refuge in the *saṅgha* (monastic community)."

Religions of the West. Even earlier perhaps are such Zoroastrian formulations as "I profess myself a Mazdāh-worshipper, a Zarathustrian, enemy of the demons, servant of the Lord" (*Yasna* 12.1), whereby the believer declared

himself a monotheist, a member of a specific community, and a dualist.

Islām. The intensely anti-polytheistic faith of Islām is summed up in the *shahādah*: "there is no God but God; Muḥammad is the Prophet of God." This is proclaimed in the daily calls to prayer from every mosque, and every Muslim must recite it aloud with full comprehension and assent at least once in his life, and profess it without hesitation until his death. Doctrinal disputes have contributed to the development of additional creedal formulations called '*aqā'id*' (singular, '*aqidah*'), but these do not divide Islām into clearly marked confessional groupings or denominations such as exist in Christianity.

Judaism. In Judaism, the central affirmations of belief are parts of worship; *e.g.*, the confessions of the oneness of God in the Shema (Deut. 6:4 "Hear, O Israel: The Lord our God is one Lord") and of the resurrection of the dead in the *amidah* (standing prayer). Of the various medieval attempts to formulate creeds, the most enduring has been Maimonides' Thirteen Principles of Faith, but these have never become formally binding. The Reform movement's doctrinal declarations, such as the Pittsburgh Platform (1885), have been without lasting influence. The reason for this paucity of creeds is that Jewish identity has been chiefly defined in terms of the observance of the commandments and of the Oral Law, not the acceptance of doctrines.

Christianity. In Christianity, in contrast, there are over 150 officially recognized creeds and confessions. In part this is because the church was from the beginning doctrinally oriented, making the acceptance of a specific kerygma (proclamation) a condition for membership. The faith of the community was expressed in acclamations such as "Jesus is Lord" (*e.g.*, Rom. 10:9, I Cor. 12:3) and in longer, partly stereotyped summaries of essential beliefs (*e.g.*, I Cor. 15:3 ff.) For the New Testament community, in contrast to some Christian groups in later times, a creedless Christianity was inconceivable.

Fully formed creeds first developed for use in baptismal rites and catechetical instruction. They generally had three sections concerned with God the Father, Jesus Christ, and the Holy Spirit, but were variable in wording and content and only gradually became standardized.

This process culminated in the West in the Apostles' Creed, which is now almost universally recognized by Western churches, and is still used in baptismal rites as well as public worship by Catholics and most Protestants. This creed is wholly derived from New Testament affirmations, but the 5th-century legend that the Twelve Apostles were its authors is without foundation. Not until the 8th century is it quoted in its present wording. Its sources, however, are to be found in earlier baptismal creeds, most probably in the Old Roman Symbol, which appears to go back in its essentials to the 2nd century. As is true of other creeds, it is in part intended to exclude heretical views. For example, against Gnosticism and Marcionism (dualistic heresies), it emphasizes that God, not an evil demiurge, is the creator of the world, and against docetic views that Jesus was a heavenly being with a phantom body, it insists that he was born of the Virgin Mary and actually suffered and died and was buried.

The Nicene Creed exists in two versions and represents a new type of doctrinal statement. It was first formulated at Nicaea in 325 by the first of the universal, or ecumenical, councils, after Christianity became the official religion of the Roman Empire, and was designed not as a baptismal confession but as a binding standard of orthodox teachings. Its second version has become the most fully ecumenical of Christian creeds, accepted in East and West alike, including the major Protestant bodies. In Eastern churches, it is regularly employed in both Baptism and eucharistic worship; in the West, only in the Eucharist, and chiefly by Roman Catholics, Anglicans, and Lutherans.

The first version of this formulary is that promulgated at the Council of Nicaea in 325, but the second version, the "Niceno-Constantinopolitan Creed," which has everywhere become standard and is generally referred to as the Nicene Creed, was affirmed at the Council of Chalcedon (451) as the Nicene "faith of the 150 fathers" (*i.e.*, the

The Ecumenical Creeds: Apostles', Nicene, and Athanasian

Council of Constantinople of AD 381). In 4th- and 5th-century usage, "the Nicene faith" did not refer to the creed of Nicaea as such, but rather to its teaching.

Both versions make the same fundamental affirmations against the Arian heresy that denied the equality of the Father and the Son, asserting that Jesus Christ, the Son of God, is *homoousios* ("of one substance") with the Father. They are also both derived from Eastern baptismal formulas, though which ones is in dispute.

The *filioque* clause, affirming that the Spirit proceeds "from the Son" as well as the Father, was inserted into the text in Spain during the 6th century and gradually spread to all Western churches, but was probably not used in Rome itself until 1014. Eastern Christians continue to reject this addition, though now they do not generally regard it as heretical, especially if it is understood in the sense of "through the Son."

The Athanasian Creed, also called the *Quicumque vult* from its initial words, is the last of what in the West are regarded as the three catholic or ecumenical creeds. It has received some slight recognition in the East, but only since the 16th century. While officially accepted in the Roman Catholic, Anglican, and Lutheran communions, its liturgical use has greatly declined in recent centuries. In part this is because it is in form more a theological exposition than a creed, and in part because of the damnatory clauses that exclude from salvation all those who do not accept every detail of its teaching. The main themes are the nature of Christ and the Trinity, and these are developed in opposition not only to Arianism but also apparently to later heresies such as Nestorianism and Eutychianism. While its doctrine can in general be attributed to the 4th-century Church Father Athanasius, he was not its author. It probably originated in southern France about 450–500, although there is no scholarly consensus on this point.

CONFESSIONS OF THE CHRISTIAN FAITH

Origins and functions of confessions. Official doctrine has chiefly developed during later periods of church history by the formulation of confessions of faith, rather than new creeds. This process did not begin, however, until the 16th-century Reformation. During the Middle Ages, dogmas evolved slowly, almost unconsciously, and then were ratified from time to time by decisions of the church councils, such as the decision on the seven sacraments at the Council of Ferrara-Florence in 1439. The Protestant Reformers, however, were confronted with the need to define and make legitimate their views over against the established system, and thus issued comprehensive manifestos that, much more than the early creeds, were not only catalogues of beliefs but also interpretations and apologies for them. The Roman Catholic and Eastern Orthodox churches responded with their own confessional statements.

Lutheran confessions. The Augsburg Confession (1530) was the first of these statements, and still remains the most authoritative standard in Lutheran churches. It (as well as the Apology of the Augsburg Confession of 1531) was written by Philipp Melancthon and approved by Martin Luther, and presents an irenic statement aiming to show that the pope and his allies, not the Reformers, had departed from Scripture and the tradition of the early Fathers. Luther's Small Catechism also enjoys official status in all Lutheran churches and has been determinative for most Lutheran preaching and instruction. The Formula of Concord (1577) further defined the Lutheran position in reference to controversies both within and outside the ranks. These four writings, together with the Large Catechism (1529), the Schmalkald Articles, and the Treatise were assembled into the *Book of Concord* (1580), which has official status in many Lutheran churches.

Reformed churches confessions. In the Reformed tradition stemming from John Calvin (1509–64) and Huldrych Zwingli (1484–1531), each national church produced its own confessional documents. No one of these is authoritative for all, though some (e.g., the Heidelberg Catechism; 1563) are widely esteemed and used. In Switzerland, the First (1536) Helvetic Confession and the Second (1566) Helvetic Confession are the most generally accepted. The

French Gallican Confession of 1559 is much admired, and in the Low Countries, the Belgic Confession of 1561 is important. The Netherlands was also the site of the international Synod of Dort (1619) that presented an especially rigid statement of Calvinism against Arminianism (a view that asserted the compatibility of God's sovereignty and man's free will). This same emphasis, combined with Puritan covenantal theology, is reflected in the English Westminster Confession of 1646 that in Scotland replaced the Scots Confession in 1560, was adopted with modifications by Congregationalists and many Baptists, and still remains standard for American Presbyterian churches, though with some revisions.

The Anglican Communion. The Thirty-nine Articles (1563) is the only doctrinal formulation other than the early creeds recognized in the Church of England and its offshoots, but its authority is not great. In the Anglican Communion, *The Book of Common Prayer* plays the identity-sustaining role served by confessions in Lutheran and Reformed churches. The Thirty-nine Articles, abbreviated to 25, are also the chief doctrinal standard in the Methodist churches, but their authority is uncertain.

Confessions of other Protestant groups. Confessional documents are of little significance for most of the radical groups (e.g., Anabaptists) coming out of the Reformation. To be sure, the Anabaptist Schleithem Confession (1527) was historically important, the Dordrecht Confession (1632) still has some standing in Mennonite churches, and various Baptist and Congregationalist statements could also be mentioned. The general tendency in these churches, however, has been to oppose formal creeds and confessions for fear of stifling the workings of the Holy Spirit or imperilling the sole authority of the Bible or, in theologically liberal circles, endangering freedom of thought and conscience.

Roman Catholic doctrinal statements. Roman Catholic doctrinal statements are not usually called confessions, but the presentation of the distinctive points of Catholic dogma in the Decrees and Canons of the Council of Trent (1564) is as fully elaborated as are Protestant confessional writings. The dogmatic constitutions of the first Vatican Council (1869–70) and papal definitions of the dogmas of the Immaculate Conception (1854) and of the Assumption (1950) also have some of the character of confessions.

Eastern Orthodox doctrinal statements. Eastern Orthodoxy responded to Protestant and Roman Catholic challenges with the confessions of Peter Mogila, Metropolitan of Kiev, in 1643 and of Dositheos, the Patriarch of Jerusalem, in 1672, both adopted by the Synod of Jerusalem (1672), as well as with the Catechism of Philaret, Metropolitan of Moscow, revised and approved by the Holy Synod in 1839. The Orthodox, however, place little emphasis on these documents, for they regard only the Nicene Creed with its Chalcedonian additions as fully authoritative, and in practice also treat their historic liturgies as doctrinally more important than later statements.

Creeds and confessions today. Recently new types of confessions have begun to emerge. With the decline of state churches, confessions are no longer legally established norms and can once again regain their original function of witnessing to basic convictions. Especially notable in this respect is the Barmen Declaration, formulated in 1934 by a group of Reformed and Lutheran churchmen in opposition to the Nazi-influenced "German Christians." Because of the advance of the ecumenical movement, recent confessional statements have usually been unitive rather than divisive. The doctrinal basis of the World Council of Churches is limited to the affirmation that it is "a fellowship of churches which accept our Lord Jesus Christ as God and Savior" (1961). Preparation of joint Protestant and Roman Catholic official translations into English of the Apostles and Nicene Creeds commenced in 1969. Another characteristic of contemporary doctrinal statements, such as those of the Roman Catholic second Vatican Council (1962–64) and the Presbyterian (U.S.A.) Confession of 1967, is the attempt to reformulate traditional beliefs in ways appropriate to modern circumstances.

Despite these developments, creeds and confessions are losing influence in both Christian and non-Christian

groups. They are, among other things, often attacked as obstacles to the individual's freedom of thought. This objection applies with special force against a fideistic attitude, such as is illustrated in extreme form by the well-known saying attributed traditionally, though not altogether correctly, to the 2nd-century North African Church Father Tertullian, *credo quia absurdum est*, "I believe because it is absurd." It is less applicable to another ancient and theologically more common approach summed up in the 11th- and 12th-century theologian Anselm's (and, in a somewhat different wording, Augustine's) classic phrase, *credo ut intelligam*, "I believe in order that I may understand." The latter view claims that true faith promotes rather than suppresses inquiry and intellectual liberty.

Yet, whatever the merits of such views, doctrinal convictions are clearly weakening, even in traditionally creedal and confessional bodies. The search for creedless religion is widespread. There is the possibility, however, that this trend may be eventually reversed because the quest for religious community is also strong, and may require the formation or re-affirmation of community-identifying beliefs; i.e., of creeds or confessions. (G.A.L.)

Sacrament

The Latin word *sacramentum*, which etymologically is an ambiguous theological term, was used in Roman law to describe a legal sanction in which a man placed his life or property in the hands of the supernatural powers that upheld justice and honoured solemn contracts. It later became an oath of allegiance taken by soldiers to their commander when embarking on a new campaign, sworn in a sacred place and using a formula having a religious connotation.

NATURE AND SIGNIFICANCE

When *sacramentum* was adopted as an ordinance by the early Christian Church in the 3rd century, the Latin word *sacer* ("holy") was brought into conjunction with the Greek word *mysterion* ("secret rite"). *Sacramentum* was thus given a sacred mysterious significance that indicated a spiritual potency. The power was transmitted through material instruments and vehicles viewed as channels of divine grace and as benefits in ritual observances instituted by Christ. St. Augustine defined sacrament as "the visible form of an invisible grace" or "a sign of a sacred thing." Similarly, St. Thomas Aquinas wrote that anything that is called sacred may be called *sacramentum*. It is made efficacious by virtue of its divine institution by Christ in order to establish a bond of union between God and man. In the Anglican catechism it is defined as "an outward and visible sign of an inward and spiritual grace."

The term sacrament has become a convenient expression for a sign or symbol of a sacred thing, occasion, or event imparting spiritual benefits to participants; and such signs or symbols have been associated with eating, drinking, lustration (ceremonial purification), nuptial intercourse, or ritual techniques regarded as "means of grace" and pledges of a covenant relationship with the sacred order. In this way the material aspects have become the forms of the embodied spiritual reality.

TYPES AND VARIATIONS

Types. The several types of sacraments (i.e., initiatory, purificatory, renewal, communion, healing, cultic elevation) are well exemplified in Christianity, though they also may be found in other Western religions, the Eastern religions, and preliterate religions. In the 12th century the several sacraments of the Western Christian Church were narrowed by Peter Lombard (12th-century theologian and bishop) to seven rites, viz., Baptism, confirmation, the Eucharist (the Lord's Supper), penance, holy orders, matrimony, and extreme unction. This enumeration was accepted by St. Thomas Aquinas, the Council of Florence in 1439, and subsequently by the Council of Trent (1545–63). All these rites were thus affirmed by the Roman Catholic Church as being sacraments instituted by Christ. The number, however, has been modified by modern theologians since the precise origins of some of the seven

sacraments are uncertain. Protestant Reformers of the 16th century accepted two or three sacraments as valid: Baptism, the Lord's Supper, and, in some fashion, penance. Both Roman Catholicism and Eastern Orthodoxy accept the sevenfold enumeration. In addition to these, any ceremonial actions and objects related to sacraments that endow a person or thing with a sacred character have been designated "sacramental," though they are differentiated from those of dominical (i.e., Christ's) institution in conveying divine grace *ex opere operato* (it works by itself) or in conferring an indelible character on the recipient, such as Baptism, confirmation, and holy orders. Sacramentals include the use of holy water, incense, vestments, candles, exorcisms, anointing and making the sign of the cross, fasting, abstinence, and almsgiving.

The word sacrament, in its broadest sense as a sign or symbol conveying something "hidden," mysterious, and efficacious, has a wider application and cosmic significance than that used in Christianity. For example, the evolutionary process is viewed by some as a graded series in which the lower stratum provides a basis for the one next above it. The lower, indeed, seems to be necessary to the growth of the higher. This view has introduced concepts of new powers and potentialities in organic evolution culminating in the human synthesis of mind transcending the process. The entire universe, therefore, can be said to have a sacramental significance in which the "inward" (or spiritual) and the "outward" (or material) elements meet in a higher unity that guarantees for the latter its full validity. Thus, the sacred meal has been at once a sacramental communion and a sacrificial offering (e.g., wine, bread, or animal as a sign or symbol of a divine death and resurrection for the benefit of man) in which the two fundamental and complementary rites have been closely combined throughout their long and varied histories.

Variations. *Sacramental ideas and practices in preliterate societies.* In preliterate society everyday events have been given sacramental interpretations by being invested with supernatural meanings in relation to their ultimate sources in the unseen divine or sacred powers. The well-being of primitive society, in fact, demands the recognition of a hierarchy of values in which the lower is always dependent on the higher and in which the highest is regarded as the transcendental source of values outside and above mankind and the natural order. To partake of the flesh of a sacrificial victim or of the god himself or to consume the cereal image of a vegetation deity (as was done among the Aztecs in ancient Mexico), makes the eater a recipient of divine life and its qualities. Similarly, portions of the dead may be imbibed in mortuary sacramental rites to obtain the attributes of the deceased or to ensure their reincarnation. To give the dead new life beyond the grave, mourners may allow life-giving blood to fall upon the corpse sacramentally. In this cycle of sacramental ideas and practices, the giving, conservation, and promotion of life, together with the establishment of a bond of union with the sacred order, are fundamental. In Paleolithic hunting communities this sacramental idea appears to have been manifested in the sacramental rites performed to control the fortunes of the chase, to promote the propagation of the species on which the food supply depended, and to maintain right relations with the transcendental source of the means of subsistence, as exemplified in paintings—discovered in the caves at Altamira, Lascaux, Les Trois Frères, Font-de-Gaume and elsewhere in France and Spain—that show men with animal masks (illustrating a ritual or mystical communion of men and animals that were sources of food).

Sacramental ideas and practices in the ancient Near East. When agriculture and herding became the basic type of food production, sacramental concepts and techniques were centred mainly in the fertility of the soil, its products, and in the succession of the seasons. This centralization was most apparent in the ancient Near East in and after the 4th millennium BC. A death and resurrection sacred drama arose around the fertility motif, in which a perpetual dying and rebirth in nature and humanity was enacted. In this sequence birth, maturity, death, and rebirth were ritually repeated and renewed through sacramental tran-

"Sacramentals"

Mortuary sacramental rites

Fertility motifs

Christian sacraments

sitional acts, such as passage rites, ceremonies ensuring passage from one status to another. In passage rites the king often was the principal actor in the promotion of the growth of the crops and the propagation of man and beast and in the promotion of the reproductive forces in nature in general at the turn of the year.

Sacramental ideas and practices in the Greco-Roman world. In the Greco-Oriental mystery cults the sacramental ritual based on the fertility motif was less prominent than in the Egyptian and Mesopotamian religions. It did, nevertheless, occur in the Eleusinia, a Greek agricultural festival celebrated in honour of the goddess Demeter and her daughter Kore. The things spoken and done in this great event have remained undisclosed, though some light has been thrown upon them by the contents of the museum at Eleusis, such as the vase paintings, and by later untrustworthy references in the writings of the early Church Fathers (e.g., Clement of Alexandria) and some Gnostics (early Christian heretics who held that matter was evil and the spirit good). The drinking of the *kykeon*—a gruel of meal and water—can hardly be regarded as a sacramental beverage since it was consumed during the preparation for the initiation rather than at its climax. There is nothing to suggest that a ritual rebirth was effected by a sacramental lustration, or sacred meal, at any point in the Eleusinian ritual. What is indicated is that the neophytes (*mystae*) emerged from their profound experience with an assurance of having attained newness of life and the hope of a blessed immortality. From the character of the ritual, the mystery would seem to have been connected with the seasonal drama in which originally a sacred marriage may have been an important feature, centred in Demeter, the corn mother, and Kore (Persephone), the corn maiden.

In the 6th century BC, or perhaps very much earlier, the orgiastic religion of the god Dionysus, probably originating in Thrace and Phrygia, was established in Greece. In the Dionysiac rites the Maenads (female attendants) became possessed by the spirit of Dionysus by means of tumultuous music and dancing, the free use of wine, and an orgiastic meal (the tearing to pieces and devouring of animals embodying Dionysus Zagreus with their bare hands as the central act of the Bacchanalia). Though not necessarily sacramental, these rites enabled the Maenads to surmount the barrier that separated them from the supernatural world and to surrender themselves unconditionally to the mighty powers that transcended time and space, thus carrying them into the realm of the eternal. Ecstatic rites of this nature did not commend themselves to the Greeks of the unemotional nonsacramental Homeric tradition; such rites did appeal, however, to many, some of whom had come under the influences of the Orphic mysteries in which it was possible for them to rise to a higher level in its *thiasoi* (brotherhoods). The purpose of the Orphic ritual was to confer divine life sacramentally on its initiates so that they might attain immortality through regeneration and reincarnation, thereby freeing the soul from its fleshly bondage.

Sacramental ideas and practices in the Indo-Iranian world. To what extent, if at all, metempsychosis (the passing of the soul at death into another body) was introduced into Greece from India can be only conjectural in the absence of conclusive evidence. Though belief in rebirth and the transmigration of souls has been widespread, however, especially in preliterate religions, it was in India and Greece that the two concepts attained their highest development. In post-Vedic (the period after the formulation of the Hindu sacred scriptures, the Veda) India, belief in the transmigration of souls became a characteristic doctrine in Hinduism, and the priestly caste (*i.e.*, the Brahmins) reached their zenith as the sole immolators of the sacrificial offerings; but sacramentalism was not a feature in the *Brāhmaṇas*, the ritual texts compiled by the Brahmins. In the earlier Vedic conception of *soma*, the personification of the fermented juice of a plant, comparable to that of *ambros* in Greece, kava in Polynesia, and especially *haoma* in Iran, the sacramental view is most apparent (see HINDUISM).

In Zoroastrianism *haoma* (Sanskrit *soma*, from the root *su* or *bu*, “to squeeze” or “pound”) is the name given to

the yellow plant, from which a juice was extracted and consumed in the *Yasna* ceremony, the general sacrifice in honour of all the deities. The liturgy of the *Yasna* was a remarkable anticipation of the mass in Christianity. Haoma was regarded by Zoroaster as the son of the Wise Lord and Creator (Ahura Mazda) and the chief priest of the *Yasna* cult. He was believed to be incarnate in the sacred plant that was pounded to death in order to extract its life-giving juice so that those who consumed it might be given immortality. He was regarded as both victim and priest in a sacrificial-sacramental offering in worship. As the intermediary between God and man, Haoma acquired a place and sacramental significance in the worship of Mithra (an Indo-Iranian god of light) in his capacity as the immaculate priest of Ahura Mazda with whom he was coequal. The Mithraic sacramental banquet was derived from the *Yasna* ceremony, wine taking the place of the *haoma* and Mithra that of Ahura Mazda. In the Mithraic initiation rites, it was not until one attained the status of the initiatory degree known as “Lion” that the neophyte could partake of the oblation of bread, wine, and water, which was the earthly counterpart of the celestial mystical sacramental banquet. The sacred wine gave vigour to the body, prosperity, wisdom, and the power to combat malignant spirits and to obtain immortality.

The early Christian leaders noticed the resemblances between the Mithraic meal, the Zoroastrian *haoma* ceremony, and the Christian Eucharist; and between Mithraism and Christianity, to some extent, there was mutual influence and borrowing of respective beliefs and practices. But Mithraism’s antecedents were different, being Iranian and Mesopotamian with a Vedic background before it became part of the Hellenistic and Christian world (*c.* 67 BC to about AD 385).

Sacramental ideas and practices of pre-Columbian America. The recurrent and widespread practice of holding sacred meals in the sacramental system, in addition to being well documented in the Greco-Roman world, also occurred in the pre-Columbian Mexican calendrical ritual in association with human sacrifice on a grand scale. In the May Festival in honour of the war god Huitzilopochtli, an image of the deity was fashioned from a dough containing beet seed, maize, and honey; then the image was covered with a rich garment, placed on a litter; and carried in a procession to a pyramid-temple. There pieces of paste similarly compounded and in the form of large bones were transformed by rites of consecration into Huitzilopochtli’s flesh and bones. A number of human victims were then offered to him, and the image was broken into small fragments and consumed sacramentally by the worshippers with tears, fears, and reverence, a strict fast being observed until the ceremonies were over and the sick had been given their communion with the particles. This ceremony was repeated at the winter solstice when the dough was fortified with the blood of children, and similar images were venerated and eaten by families in their houses. The main purpose of the sacrament was to secure a good maize harvest and a renewal of the crops, as well as human health and strength. In Peru at the Festival of the Sun, after three days of fasting, llamas, the sacred animals, were sacrificed as a burnt offering, and the flesh was eaten sacramentally at a banquet by the lord of the Incas and his nobles. It was then distributed to the rest of the community with sacred maize cakes. Dogs, regarded as divine incarnations, also were slain and parts of their flesh solemnly eaten by the worshippers.

Similar rites were celebrated in North America by Indians at the Feast of Grain among the Natchez of Mississippi and Louisiana and among the Creeks in the Mississippi Valley when the corn was ripe. Among the Plains Indians sacrificial blood was employed sacramentally to make the earth fruitful by the fructifying power of the sun.

THEOLOGY AND PRACTICE OF SACRAMENTS IN CHRISTIANITY

Though the widespread conception of the sacramental principle is an ancient heritage, in all probability going back before the dawn of civilization, it acquired in Christianity a unique significance. There it became the fun-

rites

Rebirth

Significance of the sacramental principle in Christianity

damental system and institution for the perpetuation of the union of God and man in the person of Jesus Christ through the visible organization and constitution of the church, which was viewed as the mystical body of Christ.

Baptism. Baptism, as the initial rite, took the place of circumcision in Judaism in which this ancient and primitive custom was the covenant sign and a legal injunction rather than a sacramental ordinance. Baptismal immersion in water was practiced in Judaism for some time before the fall of Jerusalem in AD 70, and it was adopted by John the Baptist (a Jewish prophet and cousin of Jesus Christ) as the principal sacrament in his messianic movement.

The purificatory lustration of John the Baptist, however, was transformed into the prototype of the Christian sacrament by the baptism of Jesus in the river Jordan and by the imagery of this event combined with the imagery of his death and resurrection. A distinction was made, however, between the water baptism of John and the Christian Spirit Baptism in the apostolic church. Under the influence of the missionary Apostle St. Paul, the Christian rite was given an interpretation in the terms of the mystery religions, and the catechumen (initiate instructed in the secrets of the faith) was identified with the death and Resurrection of Christ (Rom. 6:3–5; Gal. 3:12). The bestowal of the new life constituted a sacramental rebirth in the church in union with the risen Lord as its divine head.

Confirmation. With the development of infant Baptism, the regenerative initial sacrament was coupled with the charismatic apostolic laying on of hands as the seal of the Spirit in the rite of confirmation (Acts 8:14–17). By the 4th century, confirmation became a separate “unction” (rite using oil) administered by a bishop or, earlier and in the Eastern Church, by a priest to complete the sacramental baptismal grace already bestowed at birth or on some other previous occasion. At first, especially in the East, a threefold rite was performed consisting of Baptism, confirmation, and first communion; but in the West, where the consecration of the oil and the laying on of hands were confined to the episcopate, confirmation tended to become a separate event with the growth in the size of dioceses. It was not, however, until the 16th century that Baptism and confirmation were permanently separated. In England Queen Elizabeth I was confirmed when she was only three days old; and infant confirmation is still sometimes practiced in Spain. But the normal custom in Western Christendom has been for confirmation to be administered at or after the age of reason and to be the occasion for instruction in the faith, as in the case of the *mystae* in the Mysteries of Eleusis. But whether or not confirmation conveys a new gift of the Spirit or is the sealing of the same grace bestowed in Baptism, which is still debated, it has come to be regarded in some churches as conferring an indelible quality on the soul. Therefore, it cannot be repeated when it has once been validly performed as a sacrament.

The Eucharist. Together with Baptism the greatest importance has been given to the Eucharist, both of which institutions are singled out in the Gospels as dominical (instituted by Christ) in origin, with a special status and rank. Under a variety of titles (Eucharist from the Greek *eucharistia*, “thanksgiving”; the Latin mass; the Holy Communion; the Lord’s Supper; and the breaking of the bread) it has been the central act of worship ever since the night of the betrayal of Christ on the Thursday preceding his crucifixion. It was then that the elements of bread and wine were identified with the body and blood of Christ in his institution of the Eucharist with his disciples and with the sacrifice he was about to offer in order to establish and seal the new covenant. This “real presence” has been variously interpreted in actual, figurative, or symbolical senses; but the sacramental sense, as the *anamnesis*, or memorial before God, of the sacrificial offering on the cross once and for all, has always been accepted.

Along these lines a eucharistic theology gradually took shape in the apostolic and early church without much controversy or formulation. In the New Testament, in addition to the three accounts of the institution of the Eucharist in the first three “books” of the New Testament known as Synoptic Gospels because they have a

common viewpoint and common sources (Matt. 26:26ff.; Mark 14:22ff.; Luke 22:17–20), St. Paul’s earliest record of the ordinance in I Cor. 11:17–29, written about AD 55, suggests that some abuses had arisen in conjunction with the common meal, or *agapē*, with which it was combined. Like the Iranian *haoma* ceremony, it had become an occasion of drunkenness and gluttony. To rectify this, St. Paul recalled and re-established the original institution and its purpose and interpretation as a sacrificial-sacramental rite. Fellowship meals continued in association with the postapostolic Eucharist, as is shown in the *Didachē* (a Christian document concerned with worship and church discipline written c. 100–c. 140) and in the doctrinal and liturgical development described in the writings of the Early Church Fathers little was changed. Not until the beginning of the Middle Ages did controversial issues arise that found expression in the definition of the doctrine of transubstantiation at the fourth Lateran Council in 1215. This definition opened the way for the scholastic interpretation of the eucharistic Presence of Christ and of the sacramental principle, in Aristotelian terms. Thus, St. Thomas Aquinas maintained that a complete change occurred in the “substance” of each of the species, while the “accidents,” or outward appearances, remained the same. During the Reformation, though the medieval doctrine was denied by the continental Reformers, it was reaffirmed by the Council of Trent in 1551. Holy Communion was retained as a sacrament by most of the Protestant groups, except the Society of Friends, the Salvation Army, and some of the Adventist groups, which abandoned the sacramental principle altogether.

Repentance. In its formulation, the Christian doctrine of conciliation, which, as St. Paul contended, required a change of status in the penitent, had to be made sacramentally effective in the individual and in redeemed humanity as a whole. In the Gospel According to Matthew (16:13–20, 18:18) the power to “bind and loose” was conferred on St. Peter and the other Apostles. Lapses into paganism and infidelity in the Roman world by the 3rd century had demanded penitential exercises. These included fasting, wearing sackcloth, lying in ashes and other forms of mortification, almsgiving, and the threat of temporary excommunication. Details of the sins committed were confessed in secret to a priest, who then pronounced absolution and imposed an appropriate penance. In 1215 the sacrament of penance received the authorization of the fourth Lateran Council and was made obligatory at least once a year at Easter on all mature Christians in Western Christendom. When pilgrimages to the Holy Land, to Santiago de Compostela in Spain, or going on a Crusade could be imposed as penitential exercises, commutation by means of payment of money led to abuses and traffic in indulgences and the treasury of merits, a superabundance of merits attributed to Christ and his saints that could be transferred to sinful believers. The abuses opened the way for the Lutheran revolt against the penitential system, before they were abolished by the Council of Trent. The power of absolution was retained in the Anglican ordinal and conferred upon priests at their ordination and in the Order of the Visitation of the Sick. The sacrament of penance, however, ceased to be of obligation in the Anglican Communion, though it was commended and practiced by John Whitgift, Richard Hooker, and, after the Restoration in 1660 by the Nonjurors (Anglican clergy who refused to take oaths of allegiance to William III and Mary II in 1689) and revived by the Tractarians (Anglo-Catholic advocates of High Church ideals) after 1833, who encountered some Protestant opposition notwithstanding its entrenchment in canon law and in *The Book of Common Prayer*.

Ordination. The church has claimed that the ministry of bishops, priests, and deacons derives its authority and sacramental efficacy from Christ through his Apostles. In the Roman Catholic Church it has been maintained that a special charismatic sacramental endowment conveying an indelible “character” has been conferred on those who receive valid ordination by the laying on of hands on their heads by bishops (who thus transfer to them the “power of orders”), prayer, and a right intention. In Protestant

Penitential exercises

The Eucharist as the central act of Christian worship

Roman Catholic and Protestant views

churches the ministry is interpreted as a function rather than as a status. Just as the sacramental power to ordain, confirm, absolve, bless, and consecrate the Eucharist can be given, so also it can be taken away or suspended for sufficient reason.

Marriage. In the Roman Catholic Church the institution of holy matrimony was raised to the level of a sacrament because it was assigned a divine origin and made an indissoluble union typifying the union of Christ with his church as his mystical body (Matt. 5:27-32; Mark 10:2-12; Luke 16:18; I Cor. 7:2, 10; Eph. 5:23ff.). The adherence of Jesus to a rigorist position in regard to divorce and remarriage (Matt. 19:9; *i.e.*, unchastity the only cause for divorce), similar to that adopted by the rabbinical school headed by the conservative teacher Shammai in Judaism, was made the basis of the nuptial union as taught by St. Paul, except in regard to the dissolution of a marriage contracted between a Christian and a pagan who refused to live with his or her partner (I Cor. 7:2ff., 15ff.).

Apart from this deviation, known as the "Pauline Privilege," which was recognized in canon law in the 13th century, a marriage validly contracted in the presence of a priest, blessed by him, and duly consummated has been regarded as a sacramental ordinance by virtue of the grace given to render the union indissoluble. In Protestant churches, marriage is regarded as a rite, not a sacrament; views on divorce, however, vary, and many traditional notions of marriage and divorce are now being debated.

Healing of the sick. The anointing of the sick, an initiatory rite, conforms to the general pattern of the sacramental principle and is comparable to the other rites of passage, such as those concerned with birth and death, seed time and harvest, and with the securing of supernatural power and spiritual grace against the forces of evil that are looked upon as rampant at these critical junctures.

In Christianity anointing of the sick was widely practiced from apostolic times as a sacramental rite in association with the ceremony of the imposition of hands to convey a blessing, recovery from illness, or with the last communion to fortify the believer safely on his new career in the fuller life of the eternal world. Not until the 8th and 9th centuries, however, did extreme unction, another term for the final anointing of the sick, become one of the seven sacraments. In Eastern Christendom, it has never been confined to those *in extremis* (near death) nor has the blessing of the oil by a bishop been required; the administration of the sacrament by seven, five, or three priests was for the recovery of health rather than administered exclusively as a mortuary rite. Extreme unction is also coupled with exorcism for the restraint of the powers of evil—a practice taken over from Judaism by the early church and still retained by the Orthodox Eastern Church for mental diseases.

CONCLUSION

The ecumenical movement in the 20th century has initiated reforms in liturgical worship and in private devotions within Christianity. Such reforms, involving the celebration of sacraments (primarily the Eucharist), have done much to promote the recovery of a unity among Christians that transcends differences in beliefs and ritual practices. The second Vatican Council (1962-65) has played a significant part in the process of recovery of unity and of renewal. (E.O.J.)

Sacrifice

Sacrifice is a religious rite in which an object is offered to a divinity in order to establish, maintain, or restore a right relationship of man to the sacred order. It is a complex phenomenon that has been found in the earliest known forms of worship and in all parts of the world. The present article will treat the nature of sacrifice and will survey the theories about its origin. It will then analyze sacrifice in terms of its constituent elements, such as the material of the offering, the time and place of the sacrifice, and the motive or intention of the rite. Finally, it will briefly consider sacrifice in the religions of the world.

NATURE AND ORIGINS

Nature of sacrifice. The term sacrifice derives from the Latin *sacrificium*, which is a combination of the words *sacer*, meaning something set apart from the secular or profane for the use of supernatural powers, and *facere*, meaning "to make." The term has acquired a popular and frequently secular use to describe some sort of renunciation or giving up of something valuable in order that something more valuable might be obtained; *e.g.*, parents make sacrifices for their children, one sacrifices a limb for one's country. But the original use of the term was peculiarly religious, referring to a cultic act in which objects were set apart or consecrated and offered to a god or some other supernatural power; thus, sacrifice should be understood within a religious, cultic context.

Religion is man's relation to that which he regards as sacred or holy. This relationship may be conceived in a variety of forms. Although moral conduct, right belief, and participation in religious institutions are commonly constituent elements of the religious life, cult or worship is generally accepted as the most basic and universal element. Worship is man's reaction to his experience of the sacred power; it is a response in action, a giving of self, especially by devotion and service, to the transcendent reality upon which man feels himself dependent. Sacrifice and prayer—man's personal attempt to communicate with the transcendent reality in word or in thought—are the fundamental acts of worship.

In a sense, what is always offered in sacrifice is, in one form or another, life itself. Sacrifice is a celebration of life, a recognition of its divine and imperishable nature. In the sacrifice the consecrated life of an offering is liberated as a sacred potency that establishes a bond between the sacrificer and the sacred power. Through sacrifice, life is returned to its divine source, regenerating the power or life of that source; life is fed by life. Thus, the word of the Roman sacrificer to his god: "Be thou increased (*macte*) by this offering." It is, however, an increase of sacred power that is ultimately beneficial to the sacrificer. In a sense, sacrifice is the impetus and guarantee of the reciprocal flow of the divine life-force between its source and its manifestations.

Often the act of sacrifice involves the destruction of the offering, but this destruction—whether by burning, slaughter, or whatever means—is not in itself the sacrifice. The killing of an animal is the means by which its consecrated life is "liberated" and thus made available to the deity, and the destruction of a food offering in an altar's fire is the means by which the deity receives the offering. Sacrifice as such, however, is the total act of offering and not merely the method in which it is performed.

Although the fundamental meaning of sacrificial rites is that of effecting a necessary and efficacious relationship with the sacred power and of establishing man and his world in the sacred order, the rites have assumed a multitude of forms and intentions. The basic forms of sacrifice, however, seem to be some type of either sacrificial gift or sacramental meal. Sacrifice as a gift may refer either to a gift that should be followed by a return gift (because of the intimate relationship that gift giving establishes) or to a gift that is offered in homage to a god without expectation of a return. Sacrifice as a sacramental communal meal may involve the idea of the god as a participant in the meal or as identical with the food consumed; it may also involve the idea of a ritual meal at which either some primordial event such as creation is repeated or the sanctification of the world is symbolically renewed.

Theories of the origin of sacrifice. Since the rise of the comparative or historical study of religions in the latter part of the 19th century, attempts have been made to discover the origins of sacrifice. These attempts, though helpful for a greater understanding of sacrifice, have not been conclusive.

In 1871 Sir Edward Burnett Tylor, a British anthropologist, proposed his theory that sacrifice was originally a gift to the gods to secure their favour or to minimize their hostility. In the course of time the primary motive for offering sacrificial gifts developed into homage, in which the sacrificer no longer expressed any hope for a return, and from

Theories of Tylor, Smith, and Frazer

homage into abnegation and renunciation, in which the sacrificer more fully offered himself. Even though Tylor's gift theory entered into later interpretations of sacrifice, it left unexplained such phenomena as sacrificial offerings wholly or partly eaten by worshippers.

William Robertson Smith, a Scottish Semitic scholar and encyclopaedist, marked a new departure with his theory that the original motive of sacrifice was an effort toward communion among the members of a group, on the one hand, and between them and their god, on the other. Communion was brought about through a sacrificial meal. Smith began with totemism, according to which an animal or plant is intimately associated in a "blood relationship" with a social group or clan as its sacred ally. In general, the totem animal is taboo for the members of its clan, but on certain sacred occasions the animal is eaten in a sacramental meal that ensures the unity of the clan and totem and thus the well-being of the clan. For Smith an animal sacrifice was essentially a communion through the flesh and blood of the sacred animal, which he called the "theanthropic animal"—an intermediary in which the sacred and the profane realms were joined. The later forms of sacrifice retained some sacramental character: people commune with the god through sacrifice, and this communion occurs because the people share food and drink in which the god is immanent. From the communion sacrifice Smith derived the expiatory or propitiatory forms of sacrifice, which he termed *piaculum*, and the gift sacrifice. There were great difficulties with this theory: it made the totem a sacrificial victim rather than a supernatural ally; it postulated the universality of totemism; and, further, it did not adequately account for holocaust sacrifices in which the offering is consumed by fire and there is no communal eating. Nevertheless, many of Smith's ideas concerning sacrifice as sacramental communion have exerted tremendous influence.

Sir James George Frazer, a British anthropologist and folklorist, author of *The Golden Bough*, saw sacrifice as originating from magical practices in which the ritual slaying of a god was performed as a means of rejuvenating the god. The king or chief of a tribe was held to be sacred because he possessed mana, or sacred power, which assured the tribe's well-being. When he became old and weak, his mana weakened, and the tribe was in danger of decline. The king was thus slain and replaced with a vigorous successor. In this way the god was slain to save him from decay and to facilitate his rejuvenation. The old god appeared to carry away with him various weaknesses and fulfilled the role of an expiatory victim and scapegoat.

Henri Hubert and Marcel Mauss, French sociologists, concentrated their investigations on Hindu and Hebrew sacrifice, arriving at the conclusion that "sacrifice is a religious act which, through the consecration of a victim, modifies the condition of the moral person who accomplishes it or that of certain objects with which he is concerned." Like Smith, they believed that a sacrifice establishes a relationship between the realms of the sacred and the profane. This occurs through the mediation of the ritually slain victim, which acts as a buffer between the two realms, and through participation in a sacred meal. The rituals chosen by Hubert and Mauss for analysis, however, are not those of preliterate societies.

Another study by Mauss helped to broaden the notion of sacrifice as gift. It was an old idea that man makes a gift to the god but expects a gift in return. The Latin formula *do ut des* ("I give that you may give") was formulated in classical times. In the Vedic religion, the oldest stratum of religion known to have existed in India, one of the *Brāhmaṇas* (commentaries on the Vedas, or sacred hymns, that were used in ritual sacrifices) expressed the same principle: "Here is the butter; where are your gifts?" But, according to Mauss, in giving it is not merely an object that is passed on but a part of the giver, so that a firm bond is forged. The owner's mana is conveyed to the object, and, when the object is given away, the new owner shares in this mana and is in the power of the giver. The gift thus creates a bond. Even more, however, it makes power flow both ways to connect the giver and the receiver; it invites a gift in return.

Gerardus van der Leeuw, a Dutch historian of religion, developed this notion of gift in the context of sacrifice. In sacrifice a gift is given to the god, and thus man releases a flow between himself and the god. For him sacrifice as gift is "no longer a mere matter of bartering with gods corresponding to that carried on with men, and no longer homage to the god such as is offered to princes: it is an opening of a blessed source of gifts." His interpretation thus melded the gift and communion theories, but it also involved a magical flavour, for he asserted that the central power of the sacrificial act is neither god nor giver but is always the gift itself.

German anthropologists have emphasized the idea of culture history, in which the entire history of mankind is seen as a system of coherent and articulated phases and strata, with certain cultural phenomena appearing at specific levels of culture. Leo Frobenius, the originator of the theory that later became known as the *Kulturkreislehre*, distinguished the creative or expressive phase of a culture, in which a new insight assumes its specific form, and the phase of application, in which the original significance of the new insight degenerates. Working within this context, Adolf E. Jensen attempted to explain why men have resorted to the incomprehensible act of killing other men or animals and eating them for the glorification of a god or many gods. Blood sacrifice is linked not with the cultures of the hunter-gatherers but with those of the cultivators; its origin is in the ritual killing of the archaic cultivator cultures, which, in turn, is grounded in myth. For Jensen the early cultivators all knew the idea of a mythic primal past in which not men but Dema lived on the Earth and prominent among them were the Dema-deities. The central element of the myth is the slaying of a Dema-deity, an event that inaugurated human history and gave shape to the human lot. The Dema became men, subject to birth and death, whose self-preservation depends upon the destruction of life. The deity became in some way associated with the realm of the dead; and, from the body of the slain deity, crop plants originated, so that the eating of the plants is an eating of the deity. Ritual killing, whether of animals or men, is a cultic re-enactment of the mythological event. Strictly speaking, the action is not a sacrifice because there is no offering to a god; rather, it is a way to keep alive the memory of primeval events. Blood sacrifice as found in the later higher cultures is a persistence of the ritual killing in a degenerated form. Because the victim is identified with the deity, later expiatory sacrifices also become intelligible: sin is an offense against the moral order established at the beginning of human history; the killing of the victim is an intensified act restoring that order.

Another interpretation of some historical interest is that of Sigmund Freud in his work *Totem und Tabu* (1913; Eng. trans., *Totem and Taboo*, 1918). Freud's theory was based on the assumption that the Oedipus complex is innate and universal. It is normal for a child to wish to have a sexual relationship with its mother and to will the death of its father; this is often achieved symbolically. In the primal horde, although the sons did slay their father, they never consummated a sexual union with their mother; in fact, they set up specific taboos against such sexual relations. According to Freud, the ritual slaughter of an animal was instituted to re-enact the primeval act of parricide. The rite, however, reflected an ambivalent attitude. After the primal father had been slain, the sons felt some remorse for their act, and, thus, the sacrificial ritual expressed the desire not only for the death of the father but also for reconciliation and communion with him through the substitute victim. Freud claimed that his reconstruction of the rise of sacrifice was historical, but this hardly seems probable.

In 1963 Raymond Firth, a New Zealand-born anthropologist, addressed himself to the question of the influence that a people's ideas about the control of their economic resources have on their ideology of sacrifice. He noted that the time and frequency of sacrifice and the type and quality of victim are affected by economic considerations; that the procedure of collective sacrifice involves not only the symbol of group unity but also a lightening of the economic burden or any one participant; that the use of

Theories of Jensen and Freud

Theories of Hubert and Mauss, and van der Leeuw

Mid-20th-century theories

surrogate victims and the reservation of the sacrificial food for consumption are possibly ways of meeting the problem of resources. Firth concluded that sacrifice is ultimately a personal act in which the self is symbolically given, but it is an act that is often conditioned by economic rationality and prudent calculation.

Most social anthropologists and historians of religion in the mid-20th century, however, concentrated less on worldwide typologies or evolutionary sequences and more on investigations of specific historically related societies. Consequently, since World War II there have been few formulations of general theories about the origin of sacrifice, but there have been important studies of sacrifice within particular cultures. For example, E.E. Evans-Pritchard, a social anthropologist at Oxford University, concluded after his study of the religion of the Nuer, a people in the southern Sudan, that for them sacrifice is a gift intended "to get rid of some danger of misfortune, usually sickness." They establish communication with the god not to create a fellowship with him but only to keep him away. Evans-Pritchard acknowledged, however, that the Nuer have many kinds of sacrifice and that no single formula adequately explains all types. Furthermore, he did not maintain that his interpretations of his materials were of universal applicability. Many scholars would agree that, though it is easy to make a long list of many kinds of sacrifice, it is difficult, if not impossible, to find a satisfactory system in which all forms of sacrifice may be assigned a suitable place.

ANALYSIS OF THE RITE OF SACRIFICE

It is possible to analyze the rite of sacrifice in terms of six different elements: the sacrificer, the material of the offering, the time and place of the rite, the method of sacrificing, the recipient of the sacrifice, and the motive or intention of the rite. These categories are not of equal importance and often overlap.

Sacrificer. In general, it may be said that the one who makes sacrifices is man, either an individual or a collective group—a family, a clan, a tribe, a nation, a secret society. Frequently, special acts must be performed by the sacrificer before and sometimes also after the sacrifice. In the Vedic cult, the sacrificer and his wife were required to undergo an initiation (*dīkṣā*) involving ritual bathing, seclusion, fasting, and prayer, the purpose of which was to remove them from the profane world and to purify them for contact with the sacred world. At the termination of the sacrifice came a rite of "desacralization" (*avabhṛta*) in which they bathed in order to remove any sacred potencies that might have attached themselves during the sacrifice.

There are sacrifices in which there are no participants other than the individual or collective sacrificer. Usually, however, one does not venture to approach sacred things directly and alone; they are too lofty and serious a matter. An intermediary—certain persons or groups who fulfill particular requirements or qualifications—is necessary. In many cases, sacrificing by unauthorized persons is expressly forbidden and may be severely punished; e.g., in the book of Leviticus, Korah and his followers, who revolted against Moses and his brother Aaron and arrogated the priestly office of offering incense, were consumed by fire. The qualified person—whether the head of a household, the old man of a tribe, the king, or the priest—acts as the appointed representative on behalf of a community.

The head of the household as sacrificer is a familiar figure in the Old Testament, particularly in the stories of the patriarchs; e.g., Abraham and Jacob. Generally, in cattle-keeping tribes with patriarchal organization, the *paterfamilias* long remained the person who carried out sacrifices, and it was only at a late date that a separate caste of priests developed among these peoples. In ancient China, too, sacrifices were not presided over by a professional priesthood but by the head of the family or, in the case of state sacrifices, by the ruler.

The old man or the elders of the tribe are in charge of sacrifices among several African peoples. Among the Ila, a people of Zambia, for instance, when hunters have no success, the oldest member of the band leads the others in praying for the god's aid; when the hunters are

successful in killing, the old man leads them in offering portions of the meat to the god. Similarly, among peoples in Australia the leading role in all sacrificial acts is filled by the old men as bearers of tradition and authority. In cases in which there is a matriarchal organization, as in some parts of West Africa, the oldest woman of the family acts as priestess.

The king has played an important role as the person active in sacrificing, particularly in those cultures in which he not only has temporal authority but also fulfills a religious function. The fact that the king is the primary sacrificer may stem from two roots. It may be that the most important gods of the state were originally family gods of the rulers, and, thus, the king is simply continuing the task of *paterfamilias*, only now on behalf of the whole community. The second root lies in the notion of sacred kingship, according to which the royal office is sacred and the king set apart from ordinary people is the intercessor with the supernatural world. These two concepts often go together. Thus, in ancient Egypt the pharaoh was divine because he descended from the sun god Re. The pharaoh stood for Horus, the son of Re. The concepts of the god as family ancestor and of sacred kingship were combined. Although worship in ancient Egypt was controlled by a powerful priesthood, officially all sacrifices were regarded as made by the pharaoh.

Most frequently, the intermediary between the community and the god, between the profane and the sacred realms, is the priest. As a rule, not everyone can become a priest; there are requirements of different kinds to be satisfied. Usually, the priest must follow some training, which may be long and severe. There is always some form of consecration he has to undergo. For communities in which a priest functions, he is the obvious person to make sacrifices.

The sacrificer is not always man, however; at times gods also make sacrifices. Examples of this are found chiefly in India and are set down particularly in the *Brāhmaṇa* texts; e.g., it is said in the *Taittirīya Brāhmaṇa*: "By sacrifice the gods obtained heaven." The idea of gods making sacrifice, however, is found in the older *Rgveda-Saṃhitā*, a collection of sacred Vedic hymns: "With offerings the gods offered up sacrifice." In this conception man makes sacrifices in imitation of a divine model inaugurated by the gods themselves. Another instance is the Iranian primordial god Zurvān (Time), who offered sacrifice for 1,000 years in order to obtain a son to create the world.

Material of the oblation. Any form under which life manifests itself in the world or in which life can be symbolized may be a sacrificial oblation. In fact, there are few things that have not, at some time or in some place, served as an offering. Any attempt to categorize the material of sacrifice will group together heterogeneous phenomena; thus, the category human sacrifice includes several fundamentally different sacrificial rites. Nevertheless, for convenience sake, the variety of sacrificial offerings will be treated as (1) blood offerings (animal and human), (2) bloodless offerings (libations and vegetation), and (3) a special category, divine offerings.

Blood offerings. Basic to both animal and human sacrifice is the recognition of blood as the sacred life-force in man and beast. Through the sacrifice—through the return of the sacred life revealed in the victim—the god lives, and, therefore, man and nature live. The great potency of blood has been utilized through sacrifice for a number of purposes; e.g., earth fertility, purification, and expiation. The letting of blood, however, was neither the only end nor the only mode of human and animal sacrifice.

A wide variety of animals have served as sacrificial offerings. In ancient Greece and India, for example, oblations included a number of important domestic animals, such as the goat, ram, bull, ox, and horse. Moreover, in Greek religion all edible birds, wild animals of the hunt, and fish were used. In ancient Judaism the kind and number of animals for the various sacrifices was carefully stipulated so that the offering might be acceptable and thus fully effective. This sort of regulation is generally found in sacrificial cults; the offering must be appropriate either to the deity to whom or to the intention for which it is to

Gods as
sacrificers

The role
of the
inter-
mediary

be presented. Very often the sacrificial species (animal or vegetable) was closely associated with the deity to whom it was offered as the deity's symbolic representation or even its incarnation. Thus, in the Vedic ritual the goddesses of night and morning received the milk of a black cow having a white calf; the "bull of heaven," Indra, was offered a bull, and Sūrya, the sun god, a white, male goat. Similarly, the ancient Greeks sacrificed black animals to the deities of the dark underworld; swift horses to the sun god Helios; pregnant sows to the earth mother Demeter; and the dog, guardian of the dead, to Hecate, goddess of darkness. The Syrians sacrificed fish, regarded as the lord of the sea and guardian of the realm of the dead, to the goddess Atargatis and ate the consecrated offering in a communion meal with the deity, sharing in the divine power. An especially prominent sacrificial animal was the bull (or its counterparts, the boar and the ram), which, as the representation and embodiment of the cosmic powers of fertility, was sacrificed to numerous fertility gods (e.g., the Norse god Freyr; the Greek "bull of the Earth," Zeus Chthonios; and the Indian "bull of heaven," Indra).

The occurrence of human sacrifice appears to have been widespread and its intentions various, ranging from communion with a god and participation in his divine life to expiation and the promotion of the earth's fertility. It seems to have been adopted by agricultural rather than by hunting or pastoral peoples. Of all the worldly manifestations of the life-force, the human undoubtedly impressed men as the most valuable and thus the most potent and efficacious as an oblation. Thus, in Mexico the belief that the sun needed human nourishment led to sacrifices in which as many as 20,000 victims perished annually in the Aztec and Nahua calendrical maize ritual in the 14th century AD. Bloodless human sacrifices also developed and assumed greatly different forms: e.g., a Celtic ritual involved the sacrifice of a woman by immersion, and

human beings, and even the gods. Because of its great potency, water, like blood, has been widely used in purificatory and expiatory rites to wash away defilements and restore spiritual life. It has also, along with wine, been an important offering to the dead as a revivifying force.

Vegetable offerings have included not only the edible herbaceous plants but also grains, fruits, and flowers. In both Hinduism and Jainism, flowers, fruits, and grains (cooked and uncooked) are included in the daily temple offerings. In some agricultural societies (e.g., those of West Africa) yams and other tuber plants have been important in planting and harvest sacrifices and in other rites concerned with the fertility and fecundity of the soil. These plants have been regarded as especially embodying the life-force of the deified earth and are frequently buried or plowed into the soil to replenish and reactivate its energies.

Divine offerings. One further conception must be briefly mentioned: a god himself may be sacrificed. This notion was elaborated in many mythologies; it is fundamental in some sacrificial rituals. In early sacrifice the victim has something of the god in itself, but in the sacrifice of a god the victim is identified with the god. At the festival of the ancient Mexican sun god Huitzilopochtli, the statue of the god, which was made from beetroot paste and kneaded in human blood and which was identified with the god, was divided into pieces, shared out among the devotees, and eaten. In the Hindu *soma* ritual (related to the *haoma* ritual of ancient Persia), the soma plant, which is identified with the god Soma, is pressed for its intoxicating juice, which is then ritually consumed. The Eucharist, as understood in many of the Christian churches, contains similar elements. In short, Jesus is really present in the bread and wine that are ritually offered and then consumed. According to the traditional eucharistic doctrine of Roman Catholicism, the elements of bread and wine are "transubstantiated" into the body and blood of Christ: i.e., their whole substance is converted into the whole substance of the body and blood, although the outward appearances of the elements, their "accidents," remain.

Time and place of sacrifice. In many cults, sacrifices are distinguished by frequency of performance into two types, regular and special. Regular sacrifices may be daily, weekly, monthly, or seasonal (as at planting, harvest, and New Year). Also often included are sacrifices made at specific times in each man's life—birth, puberty, marriage, and death. Offerings made on special occasions and for special intentions have included, for example, sacrifices in times of danger, sickness, or crop failure and those performed at the construction of a building, for success in battle, or in thanksgiving for a divine favour.

In the Vedic cult the regular sacrifices were daily, monthly, and seasonal. The daily rites included fire offerings to the gods and libations and food offerings to the ancestors and the earth divinities and spirits. The monthly sacrifices, conducted at the time of New and Full Moons, were of cakes or cooked oblations to sundry deities, especially the storm god Indra. Some daily and monthly sacrifices could be celebrated in the home by a householder, but only the official priesthood could perform the complex seasonal sacrifices, offered three times a year—at the beginning of spring, of the rainy season, and of the cool weather—for the purpose of expiation and of abundance. Of the occasional sacrifices, which could be celebrated at any time, especially important were those associated with kingship, such as the royal consecration and the great "horse sacrifice" performed for the increase of the king's power and domain.

In ancient Judaism the regular or periodic sacrifices included the twice daily burnt offerings, the weekly sabbath sacrifices, the monthly offering at the New Moon, and annual celebrations such as Pesah (Passover), Yom Kippur (Day of Atonement), and Sukkot (Feast of Tabernacles). Special sacrifices were usually of a personal nature, such as thank and votive offerings and "guilt offerings."

The common place of sacrifice in most cults is an altar. The table type of altar is uncommon; more often it is only a pillar, a mound of earth, a stone, or a pile of stones. Among the Hebrews in early times and other Semitic peoples the altar of the god was frequently an upright stone

Gods as victims

Human sacrifice

Celtic sacrifice by immersion, detail of the Gundestrup Caldron, c. 1st century BC. In the Nationalmuseum, Copenhagen.

among the Maya in Mexico young maidens were drowned in sacred wells; in Peru women were strangled; in ancient China the king's retinue was commonly buried with him, and such internments continued intermittently until the 17th century.

In many societies human victims gave place to animal substitutes or to effigies made of dough, wood, or other materials. Thus, in India, with the advent of British rule, human sacrifices to the Dravidian village goddesses (*grāma-devīs*) were replaced by animal sacrifices. In Tibet, under the influence of Buddhism, which prohibits all blood sacrifice, human sacrifice to the pre-Buddhist Bon deities was replaced by the offering of dough images or reduced to pantomime. Moreover, in some cults both human and animal oblations could be "ransomed"—i.e., replaced by offerings or money or other inanimate valuables.

Bloodless offerings. Among the many life-giving substances that have been used as libations are milk, honey, vegetable and animal oils, beer, wine, and water. Of these, the last two have been especially prominent. Wine is the "blood of the grape" and thus the "blood of the earth," a spiritual beverage that invigorates gods and men. Water is always the sacred "water of life," the primordial source of existence and the bearer of the life of plants, animals,

(*matztzeva*) established at a place in which the deity had manifested itself. It was *bet el*, the "house of God."

Frequently, the altar is regarded as the centre or the image of the universe. For the ancient Greeks the grave marker (a mound of earth or a stone) was the earth altar upon which sacrifices to the dead were made and, like other earth altars, it was called the *omphalos*, "the navel" of the Earth—*i.e.*, the central point from which terrestrial life originated. In Vedic India the altar was regarded as a microcosm, its parts representing the various parts of the universe and its construction being interpreted as a repetition of the creation of the cosmos.

Method of sacrifice. Along with libation and the sacrificial effusion of blood, one of the commonest means of making an oblation available to sacred beings is to burn it. In both ancient Judaism and Greek religion the major offering was the burnt or fire offering. Through the medium of the fire, the oblation was conveyed to the divine recipient. In ancient Greece the generic term for sacrifice (*thysia*) was derived from a root meaning to burn or to smoke. In Judaism the important sacrifices (*'ola* and *zevah*) involved the ritual burning, either entirely or in part, of the oblation, be it animal or vegetation. For the Babylonians, also, fire was essential to sacrifice, and all oblations were conveyed to the gods by the fire god *Girru-Nusku*, whose presence as intermediary between the gods and men was indispensable. In the Vedic cult the god of fire, *Agni*, received the offerings of men and brought them into the presence of the gods.

As burning is often the appropriate mode for sacrifice to celestial deities, so burial is often the appropriate mode for sacrifice of earth deities. In Greece, for example, sacrifices to the chthonic or underworld powers were frequently buried rather than burned or, if burned, burned near the ground or even in a trench. In Vedic India the blood and entrails of animals sacrificed on the fire altar to the sky gods were put upon the ground for the earth deities, including the ghosts and malevolent spirits. In West Africa yams and fowls sacrificed to promote the fertility of the earth are planted in the soil.

In sacrifice by burning and by burial, as also in the effusion of blood, the prior death of the human or animal victim, even if ritually performed, is in a sense incidental to the sacrificial action. There are, however, sacrifices (including live burial and burning) in which the ritual killing is itself the means by which the offering is effected. Illustrative of this method was the practice in ancient Greek and Indian cults of making sacrifices to water gods by drowning the oblations in sacred lakes or rivers. Similarly, the Norse cast human and animal victims over cliffs and into wells and waterfalls as offerings to the divinities dwelling therein. In the Aztec sacrifice of human beings to the creator god *Xipe Totec*, the victim was lashed to a scaffold and shot to death with bow and arrow.

There are also sacrifices that do not involve the death or destruction of the oblation. Such were the sacrifices in ancient Greece of fruits and vegetables at the "pure" (*katharos*) altar of *Apollo* at *Delos*, at the shrine of *Athena* at *Lindus*, and at the altar of *Zeus* in *Athens*. These "fireless oblations" (*apura hiera*) were especially appropriate for the deities of vegetation and fertility; *e.g.*, *Demeter* and *Dionysus*. In *Egypt* bloodless offerings of food and drink were simply laid before the god on mats or a table in a daily ceremony called "performing the presentation of the divine oblations." In both Greek and Egyptian cults such offerings were never to be eaten by the worshippers, but they were probably surreptitiously consumed by the priests or temple attendants. In ancient *Israel*, on the other hand, the food offerings of the "table of the shewbread" (the "bread of the presence" of God) were regarded as available to the priests and could be given by them to the laity. In *Hinduism* the daily offering of cooked rice and vegetable, after its consecration, is distributed by the priests to the worshippers as the deity's "grace" (*prasāda*). In some cases the sacrificial gifts are put out to be eaten by an animal representative of the deity. In *Dahomey* wandering dogs consume, on behalf of the trickster deity *Eshu* (*Elegba*), the consecrated food oblations presented to the god each morning at his shrines.

Recipient of the sacrifice. Sacrifices may be offered to beings who can be the object of religious veneration or worship. They will not be made to human beings unless they have first been deified in some way. In some cases sacrifice is made only to the god or gods; in others it is made to the deity, the spirits, and the departed; in others it is made only to the spirits and the departed, who are considered intermediaries between the deity and men. The *Nkole* people of *Uganda*, for example, are said to make no sacrifices to God, thinking he does not expect any. But, on the third day following the New Moon, they make offerings to the guardian spirits (*emandwa*), and they also make offerings at the shrines of ancestors (*emizimu*) of up to three generations back. Worship of spirits and of ancestors, often including the offering of sacrifices, occurs in widely distributed cultures; in fact, according to some scholars, probably the major recipients of sacrifice in non-Western traditions are the ancestors.

Intentions. Sacrifices have been offered for a multiplicity of intentions, and it is possible to list only some of the most prominent. In any one sacrificial rite a number of intentions may be expressed, and the ultimate goal of all sacrifice is to establish a beneficial relationship with the sacred order, to make the sacred power present and efficacious.

Propitiation and expiation. Serious illness, drought, pestilence, epidemic, famine, and other misfortune and calamity have universally been regarded as the workings of supernatural forces. Often they have been understood as the effects of offenses against the sacred order committed by individuals or communities, deliberately or unintentionally. Such offenses break the relationship with the sacred order or impede the flow of divine life. Thus, it has been considered necessary in times of crisis, individual or communal, to offer sacrifices to propitiate sacred powers and to wipe out offenses (or at least neutralize their effects) and restore the relationship.

Among the *Yoruba* of West Africa, blood sacrifice must be made to the gods, especially the earth deities, who, as elsewhere in Africa, are regarded as the divine punishers of sin. For the individual the oblation may be a fowl or a goat; for an entire community it may be hundreds of animals (in former days, the principal oblation was human). Once consecrated and ritually slain, the oblations are buried, burnt, or left exposed but never shared by the sacrificer.

In ancient Judaism the *ḥatṭa't*, or "sin offering," was an important ritual for the expiation of certain, especially unwittingly committed, defilements. The guilty laid their hands upon the head of the sacrificial animal (an unblemished bullock or goat), thereby identifying themselves with the victim, making it their representative (but not their substitute, for their sins were not transferred to the victim). After the priest killed the beast, blood was sprinkled upon the altar and elsewhere in the sacred precincts. The point of the ritual was to purify the guilty and to re-establish the holy bond with God through the blood of the consecrated victim. It was as such an expiatory sacrifice that early Christianity regarded the life and death of Christ. By the shedding of his blood, the sin of mankind was wiped out and a new relationship of life—eternal life—was effected between God and man. Like the innocent and "spotless" victim of the *ḥatṭa't*, Christ died for men—*i.e.*, on behalf of but not in place of them. Also, like the *ḥatṭa't*, the point of his death was not the appeasement of divine wrath but the shedding of his blood for the wiping out of sin. The major differences between the sacrifice of Christ and that of the *ḥatṭa't* animal are that (1) Christ's was regarded as a voluntary and effective sacrifice for all men and (2) his was considered the perfect sacrifice, made once in time and space but perpetuated in eternity by the risen Lord.

There are sacrifices, however, in which the victim does serve as a substitute for the guilty. In some West African cults a person believed to be under death penalty by the gods offers an animal substitute to which he transfers his sins. The animal, which is then ritually killed, is buried with complete funeral rites as though it were the human person. Thus the guilty person is dead, and it is an innocent man who is free to begin a new life.

"Fireless
oblations"

Finally, some propitiatory sacrifices are clearly prophylactic, intended to avert possible misfortune and calamity, and as such they are really bribes offered to the gods. Thus, in Dahomey libations and animal and food offerings are frequently made to a variety of Earth spirits to ensure their good favour in preventing any adversity from befalling the one making the offering.

Gift sacrifices. Although all sacrifice involves the giving of something, there are some sacrificial rites in which the oblation is regarded as a gift made to a deity either in expectation of a return gift or as the result of a promise upon the fulfillment of a requested divine favour. Gift sacrifices have been treated above. Here, it can be briefly noted that numerous instances of the votive offering are recorded. In ancient Greece sacrifices were vowed to Athena, Zeus, Artemis, and other gods in return for victory in battle. The solemnity and irrevocability of the votive offering is seen in the Old Testament account of the judge Jephthah's sacrifice of his only child in fulfillment of a vow to Yahweh.

Thank offerings. One form of thank offering is the offering of the first fruits in agricultural societies. Until the first fruits of the harvest have been presented with homage and thanks (and often with animal sacrifices) to the deity of the harvest (sometimes regarded as embodied in the crop), the whole crop is considered sacred and thus taboo and may not be used as food. The first-fruits sacrifice has the effect of "desacralizing" the crops and making them available for profane consumption. It is a recognition of the divine source and ownership of the harvest and the means by which man is reconciled with the vegetational, chthonic powers from whom he takes it.

Fertility. Another distinctive feature of the first-fruits offering is that it serves to replenish the sacred potencies of the earth depleted by the harvest and to ensure thereby the continued regeneration of the crop. Thus, it is one of many sacrificial rites that have as their intention the seasonal renewal and reactivation of the fertility of the earth. Fertility rites usually involve some form of blood sacrifice—in former days especially human sacrifice. In some human sacrifices the victim represented a deity who "in the beginning" allowed himself to be killed so that from his body edible vegetation might grow. The ritual slaying of the human victim amounted to a repetition of the primordial act of creation and thus a renewal of vegetational life. In other human sacrifices the victim was regarded as representing a vegetation spirit that annually died at harvest time so that it might be reborn in a new crop. In still other sacrifices at planting time or in time of famine, the blood of the victim—animal or human—was let upon the ground and its flesh buried in the soil to fertilize the earth and recharge its potencies.

Building sacrifices. Numerous instances are known of animal and human sacrifices made in the course of the construction of houses, shrines, and other buildings, and in the laying out of villages and towns. Their purpose has been to consecrate the ground by establishing the beneficent presence of the sacred order and by repelling or rendering harmless the demonical powers of the place. In some West African cults, for example, before the central pole of a shrine or a house is installed, an animal is ritually slain, its blood being poured around the foundations and its body being put into the posthole. On the one hand, this sacrifice is made to the earth deities and the supernatural powers of the place—the real owners—so that the human owner may take possession and be ensured against malevolent interferences with the construction of the building and its later occupation and use. On the other hand, the sacrifice is offered to the cult deity to establish its benevolent presence in the building.

Mortuary sacrifice. Throughout the history of man's religions, the dead have been the recipients of offerings from the living. In ancient Greece an entire group of offerings (*enagismata*) was consecrated to the dead; these were libations of milk, honey, water, wine, and oil poured onto the grave. In India water and balls of cooked rice were sacrificed to the spirits of the departed. In West Africa, offerings of cooked grain, yams, and animals are made to the ancestors residing in the Earth. The point of such offerings is not that the dead get hungry and thirsty, nor

are they merely propitiatory offerings. Their fundamental intention seems to be that of increasing the power of life of the departed. The dead partake of the life of the gods (usually the chthonic deities), and sacrifices to the dead are in effect sacrifices to the gods who bestow never-ending life. In Hittite funeral rites, for example, sacrifices were made to the sun god and other celestial deities—transcendent sources of life—as well as to the divinities of Earth.

Communion sacrifices. Communion in the sense of a bond between the worshipper and the sacred power is fundamental to all sacrifice. Certain sacrifices, however, promote this communion by means of a sacramental meal. The meal may be one in which the sacrificial oblation is simply shared by the deity and the worshippers. Of this sort were the Greek *thysia* and the Jewish *zevah* sacrifices in which one portion of the oblation was burned upon the altar and the remainder eaten by the worshippers. Among the African Yoruba special meals are offered to the deity; if the deity accepts the oblation (as divination will disclose), a portion of the food is placed before his shrine while the remainder is joyfully eaten as a sacred communion by the worshippers. The communion sacrifice may be one in which the deity somehow indwells the oblation so that the worshippers actually consume the divine; e.g., the Hindu *soma* ritual. The Aztecs twice yearly made dough images of the sun god Huitzilopochtli that were consecrated to the god and thereby transubstantiated into his flesh to be eaten with fear and reverence by the worshippers.

mental
meal

SACRIFICE IN THE RELIGIONS OF THE WORLD

The constituent elements of sacrifice have been incorporated into the particular religions and cultures of the world in various and often complex ways. A few brief observations that may illustrate this variety and complexity are given here.

Religions of India. Speculations regarding sacrifice and prescribed rituals seem to have been worked out more fully in the Vedic and later Hindu religion in India than anywhere else. These rites, laid down in a complicated system known mainly from the *Brāhmaṇa* texts, included obligatory sacrifices following the course of the year or the important moments in the life of an individual and optional sacrifices occasioned by the special wishes of a sacrificer. Yet cultic sacrifice has not developed in Buddhism, another religion that arose in India. Ritual sacrifice was judged to be ineffective and in some of its forms to involve cruelty and to run counter to the law of *ahiṃsā*, or non-injury. There are, however, in the *Jātaka* stories of the Buddha's previous births accounts of his self-sacrifices. Furthermore, Buddhism emphasizes the notion of ethical sacrifices, acts of self-discipline; and there are instances of devotional offerings, such as burnt incense, to the Buddha.

Religions of China. In China sacrifice, like other aspects of religion, has existed at a number of different levels. The essential feature of Imperial worship in ancient China was the elaborate sacrifices offered by the emperor himself to Heaven and Earth. There are also records of sacrifice, including human sacrifice, associated with the death of a ruler because it was thought proper for him to be accompanied in death with those who served him during life. But, because the common people were excluded from participation in Imperial sacrifices, they had lesser gods—some universal, some local—to whom sacrifices were made. Furthermore, ancestor worship has been the most universal form of religion throughout China's long history; it was the responsibility of the head of a household to see to it that sacrificial offerings to the dead were renewed constantly. The blending of these elements with such established religions as Buddhism and Taoism influenced the great diversification of sacrificial rites in China.

Religions of Japan. In ancient Japan offering occupied a particularly important place in religion because the relationship of the people to their gods seems frequently to have had the character of a bargain rather than of adoration. It is probable that the offerings were originally individual, but they gradually became collective, especially as all powers, including religious, were concentrated in the hands of the emperor, who officiated in the name of all his people. Human sacrifice to natural deities and at burials

was once common but seems generally to have been abandoned in the early Middle Ages. Besides human sacrifices and their more modern substitutes, the Japanese offered to the gods all the things that man regards as necessary (e.g., food, clothing, shelter) or merely useful and pleasing (e.g., means of transportation, tools, weapons, objects of entertainment) for life. These practices, which were found in the traditional religion known as Shintō, were modified when Confucianism and Buddhism were introduced into Japan during the 5th and 6th centuries AD.

Ancient Greece. The Homeric poems contain the most complete descriptions of sacrificial rites in ancient Greece. These rites, which were maintained almost without change for more than 10 centuries, were of two types: rites (*thysia*) addressed to the Olympian deities, which included burning part of a victim and then participating in a joyful meal offered to the gods during the daytime primarily to serve and establish communion with the gods; and rites (*sphagia*) addressed to the infernal or chthonic deities, which involved the total burning or burying of a victim in a sombre nocturnal ceremony to placate or avert the malevolent chthonic powers. Besides the official or quasi-official rites, the popular religion, already in Homer, comprised sacrifices of all kinds of animals and of vegetables, fruits, cheese, and honey offered as expiation, supplication, or thanksgiving by worshippers belonging to all classes of society. Furthermore, the secret worship of what are known as the mysteries—cults normally promising immortality or some form of personal relationship with a god—became widespread. This practice became especially prominent during the Hellenistic period.

Judaism. The destruction of the Second Temple in AD 70 marked a profound change in the worship of the Jewish people. Before that event, sacrifice was the central act of Israelite worship; and there were many categories of sacrificial rites that had evolved through the history of the Jews into a minutely detailed system found in that part of the Torah (Law; the first five books of the Hebrew Bible) that is ascribed by biblical scholars to the Priestly Code, which became established following the Babylonian Exile (586–538). The sacrificial system ceased, however, with the destruction of the Temple, and prayer took the place of sacrifices. In modern Judaism the Orthodox prayer books still contain prayers for the reinstitution of the sacrificial cult in the rebuilt Temple. Reform Judaism, however, has abolished or modified these prayers in keeping with the conception of sacrifice as a once adequate but now outmoded form of worship, and some Conservative congregations have also rephrased references to sacrifices so that they indicate solely past events without implying any hope for the future restoration of the rite.

Christianity. The notion of sacrifice emerged in the

early Christian communities in several different contexts. The death of Christ upon the cross preceded by the Last Supper was narrated in the Gospels in sacrificial terms; the life of Christ, culminating in his Passion and death, was seen as the perfect sacrifice, and his Resurrection and glorification were seen as God the Father's seal of approval on that life. The notion that members of the church are vitally linked to Christ and that their lives must be sacrificial was also elaborated, especially in the letters of St. Paul. Moreover, from the first decades of the church's existence, the celebration of the eucharistic meal was connected with the sacrifice of Jesus; it was a "memorial" (*anamnēsis*)—a term denoting some sort of identity between the thing so described and that to which it referred—of that sacrifice.

The interpretation of sacrifice and particularly of the Eucharist as sacrifice has varied greatly within the different Christian traditions, partly because the sacrificial terminology in which the Eucharist was originally described became foreign to Christian thinkers. In short, during the Middle Ages, the Eastern Church viewed the Eucharist principally as a life-giving encounter with Christ the Resurrected; the Roman Church, however, saw it primarily as a bloodless repetition of the bloody sacrifice of Christ on the cross. For the Protestant Reformers in the 16th century, the sacrifice of Christ was unique and all sufficing, so that the idea of repeating it in cult became unnecessary. Sacrifice was separated from liturgy and was associated, especially in Calvinist Protestantism, with the personal ethical acts that should be made by a Christian believer. The ecumenical movement of the 20th century, bolstered by modern biblical scholarship, has led some of the Christian churches—e.g., the Roman Catholic and Lutheran churches—to realize that they are not so far apart in their understanding of the Eucharist as sacrifice as was formerly thought and that they hold many elements of belief in common.

Islām. Sacrifice has little place in orthodox Islām. Faint shadows of sacrifice as it was practiced by the pre-Islāmic Arabs have influenced Muslims, so that they consider every slaughter of an animal an act of religion. They also celebrate feasts in fulfillment of a vow or in thanksgiving for good fortune, but there is no sacrificial ritual connected with these festive meals. On the last day of the annual pilgrimage to Mecca, animals are sacrificed; nevertheless, it is not the sacrificial rite that is important to the Muslims, but rather their visit to the sacred city.

Conclusion. The organization of sacrificial rites in the different cultures and religions has undoubtedly been influenced by a number of factors. Economic considerations, for example, certainly have had some impact upon primitive peoples in the selection of the victim and the time of

Thysia
and
sphagia
rites

The Eu-
charist as
sacrifice

sacrifice and in the determination of whether the victim is consumed or totally destroyed and whether the sacrificer is an individual or a collective group. The importance of such factors is an aspect of sacrifice that deserves increased investigation. Nevertheless, sacrifice is not a phenomenon that can be reduced to rational terms; it is fundamentally a religious act that has been of profound significance to individuals and social groups throughout history, a symbolic act that establishes a relationship between man and the sacred order. For many peoples of the world, throughout time, sacrifice has been the very heart of their religious life.

(R.F.)

Rites of passage

Rites of passage are ceremonial events, existing in all historically known societies, that mark the passage from one social or religious status to another. This section describes these rites among various societies throughout the world, giving greatest attention to the most common types of rites, and discusses their purposes from the viewpoints of the people observing the rites, and their social, cultural, and psychological significance as seen by scholars seeking to gain an understanding of human behaviour.

NATURE AND SIGNIFICANCE

Many of the most important and common rites of passage are connected with the biological crises of life—birth, maturity, reproduction, and death—all of which bring changes in social status and, therefore, in the social relations of the people concerned. Other rites of passage celebrate changes that are wholly cultural, such as initiation into societies composed of people with special interests—for example, fraternities. Rites of passage are universal, and presumptive evidence from archaeology in the form of burial finds strongly suggests that they go back to very early times. The worldwide distribution of these rites long ago attracted the attention of scholars, but the first substantial interpretation of them as a class of phenomena was presented in 1909 by the French anthropologist and folklorist Arnold van Gennep (1873–1957), who coined the name rites of passage. Van Gennep saw the rites as means by which individuals are eased, without social disruption, through the difficulties of transition from one social role to another. On the basis of an extensive survey of preliterate and literate societies, van Gennep held that the rites consist of three distinguishable, consecutive elements, called in French *séparation*, *marge*, and *agrégation*, which may be translated as separation, transition, and reincorporation, or as preliminal, liminal, and postliminal stages (before, at, and past the threshold). The person (or persons) on whom the rites centre is first symbolically severed from his old status, then undergoes adjustment to the new status during the period of transition, and is finally reincorporated in society in his new social status. Although the most commonly observed rites relate to crises in the life cycle, van Gennep saw the significance of the ceremonies as being social or cultural, celebrating important events that are primarily sociocultural or man-made rather than biological. The British anthropologist A.M. Hocart (1884–1939) held that the passage from one status to another was the result rather than the cause of these ceremonies; thus the rites both induced and allayed personal and social stress rather than merely allaying it. Basing his views on circumstances in a few ancient civilizations, Hocart thought that all rites of passage were based on the model of ritual of investiture of kings, in which symbolic killing and rebirth of the new ruler, and sometimes actual killing of the old, were required. Later scholarship has shown that symbolic death and rebirth into the new status are common forms of symbolism in rites of passage of various kinds and that the symbolic killing and rebirth of rulers is therefore not appropriately viewed as the prototype of all rites.

FUNCTIONS

Modern scholars in the social sciences characteristically accept the views of van Gennep about the social and psychological significance of rites of passage; that is, passage

rites are seen to have positive value for the individual in relieving stress at times when great rearrangements in his life occur, such as are brought by coming of age, entering marriage, becoming a parent, or at the death of a close relative, and in providing instruction in and approval of his new roles. The rites are seen also to be socially supporting in various ways. Such support includes roles of the rites in preventing social disruption by relieving the psychological stress of the individuals concerned; providing clear instruction to all members of societies to continue life in normal fashion with new social alignments; the affirmation they provide of social and moral values expressed and thus sanctioned as part of the ceremonies; and the social unity they foster by joint acts and joint expression of social values. During most of man's history, rites of passage have generally been religious events; that is, they have been conducted in a religious framework and regarded as religious acts and hence possessed special authority. From the viewpoint of modern social science, however, their nature is generally seen as being fundamentally secular. Mankind gives social attention to all events regarded as being socially important. Until recent times, religion was intimately connected with most aspects of life, and events of such social importance as the changes in society that the rites celebrate were most frequently incorporated in the system of religious belief and act. The tendency of recent decades toward secularization of rites of passage strongly suggests that the primary significance of most rites is social or secular rather than religious. In the modern, scientifically minded nations of the world many rites of passage, such as rites of initiation into fraternal and honorary societies are wholly secular; others have only small elements of religion, and even marriage may be a wholly secular rite.

One of the primary functions of rites of passage that is often overlooked by interpreters, perhaps because it appears obvious, is the role of the rites in providing entertainment. Passage rites and other religious events have in the past been the primary socially approved means of participating in pleasurable activities, and religion has been a primary vehicle for art, music, song, dance, and other forms of aesthetics.

From its beginning, the study of the significance of rites as a class of phenomena has attempted to account for similarities and differences in the rites among societies of the world. The similarities are striking and doubtless reflect the close similarity in ways of human thought. Modern attempts to account for similarities and differences have generally given little attention to and reached no consensus concerning the nature of the innate psychological factors involved in the genesis of the rites. Attempts to understand rites of passage have instead generally been sociocultural interpretations that view the rites as part of an integrated sociocultural system, the man-made part of human life. Religion and rites of passage are thus seen as elements in this system that affect and are affected by other elements in the system such as means of gaining a livelihood and the manner in which society is aligned in groups. Most modern analysts accordingly have interpreted both differences and similarities in rites of passage on the basis of their sociocultural context. The inventive and symbolic capabilities of mankind are treated as a constant factor, and analytic attention is given to differences and similarities in the sociocultural contexts in which rites are found. In attempting to understand why marriage is an extremely elaborate rite in one society and very simple in another society, for example, scholars have looked to the social order and to the manner of gaining a livelihood to judge the relative importance of the enduring unions of spouses. Following the view that culture, including the social order, composes a coherent, inclusive system, modern scholarship has, in short, most commonly interpreted rites of passage in terms of their functional significance in the social system.

The significance or stated goals of rites of passage as these exist in the minds of the actors are regarded as quite inadequate for gaining an understanding of the functional significance of the rites. Very often, rites of passage are said to have goals such as dispatching the spirit of a dead

Rites as
entertainment

Arnold van
Gennep's
theory

person to another world, protecting the newborn, the new adult, and the newlywed from evil influences. Often the explicit goals of the rites have been forgotten and their continuation is a matter of following tradition, so that means have become goals. Although scholars have noted the explicit goals of these rites, they have characteristically given greatest emphasis to inferring functional significances that are not obvious to the actors in the rites. In so doing they have broadened their investigations from observations of the symbolism of rites to include prominently all of the behaviour during the rites and their social contexts, learning the social identities of the performers, and their relationships to other performers and the entire society.

CLASSIFICATIONS OF RITES

No scheme of classification of passage rites has met with general acceptance, although many names have been given to distinguishable types of rites and to elements of rites. The name purification ceremonies, for example, refers to an element of ritual that is very common in rites of passage and also in other kinds of religious events. In most instances, the manifest goal of purification is to prepare the individual for communication with the supernatural, but purification in rites of passage may also be seen to have the symbolic significance of erasing an old status in preparation for a new one (see also *Purification rites and customs*, below).

Other names that have been given to passage rites often overlap. Life-cycle ceremonies and crisis rites are usually synonymous terms referring to rites connected with the biological crises of life, but some modern scholars have included among crisis rites ritual observances aimed at curing serious illnesses. Ceremonies of social transformation and of religious transformation (for both see this section, below) overlap and similarly overlap crisis rites. Religious transformations, such as baptism and rites of ordination, always involve social transformations; social transformations such as at coming-of-age and induction into office may also bring new religious statuses, and life-cycle ceremonies similarly may or may not involve changes in religious statuses. It is nevertheless sometimes useful to distinguish the various rites by these names.

Life-cycle ceremonies. Life-cycle ceremonies are found in all societies, although their relative importance varies. The ritual counterparts of the biological crises of the life cycle include numerous kinds of rites celebrating childbirth, ranging from baby "showers" to pregnancy rites to rites observed at the actual time of childbirth and, as exemplified by Baptism and the fading Christian rite of Churching of Women, a ceremony of thanksgiving for mothers soon after childbirth. These rites involve the parents as well as the child and in some societies include the couvade, which in its so-called classic form centres ritual attention at childbirth upon the father rather than the mother. At this time the father follows elaborate rules of ritual procedure that may include taking to bed, simulating labour pains, and symbolically enacting the successful birth of a child. In all societies some ritual observances surround childbirth, marriage, and death, although the degree of elaboration of the rites varies greatly even among societies of comparable levels of cultural development. Rites at coming-of-age are the most variable in time in the life span and may be present or absent. In some societies such rites are observed for only one sex, are elaborate for one sex and simple for the other, or are not observed for either sex. Characteristically, rites at coming-of-age are not generally observed in the modern industrial civilizations or, as in the Jewish Bar Mitzva and the Protestant confirmation of the United States, exist today more or less as vestiges of formerly important religious rites. Among the elaborate civilizations of Asia, rites at coming-of-age have similarly waned in recent times. The elaborate rites observed a century ago in Japan when young men and young women reached social maturity are only rarely observed today and are virtually unknown to the general population. Death is given social attention in all societies, and the observances are generally religious in intent and import. In societies that fear dead bodies the deceased may be abandoned, but they are nevertheless the focus of ritual

attention. Most commonly, rites at death are elaborate, and they include clearly all of the stages of separation, transition, and reincorporation first noted by van Gennep. See below under *Death rites and customs*.

Ceremonies of social transformation. Ceremonies of social transformation include all of the life-cycle ceremonies, since these involve social transitions for the subjects of the ritual and also for other persons. When a man or woman dies, for example, he assumes a new social role as a spirit that may be socially important to the living; the bereaved spouse becomes a widow or widower; and the children have an unnamed but changed status as lacking one parent. A vast number of rites of social transformation, such as rites of initiation into common-interest societies, have no direct or primary connection with biological changes. These are abundant in the United States and European nations, usually as secular ceremonies. In primitive societies, rites of this kind mark induction into age-graded societies, principally limited to males, and a variety of common-interest societies such as warrior societies, curing societies (special groups whose purpose is to cure illnesses), and graded men's societies that are hierarchically ranked in prestige. Whether hereditary or achieved by appointment or election, assumption of important office in various kinds of societies is often observed by elaborate ritual. Any other events involving changes in social status tend to become the subjects of institutionalized ritual, which is then a prerequisite for the new status. Common examples are initiation ceremonies of college fraternities, sororities, and honorary societies; adult fraternal societies, and social groups of other kinds centred on common interests. Other social changes of importance that apply to a substantial number of people but do not involve initiation into organized social groups are also given ritual attention. Common among these are graduation exercises, festivities marking retirement from work, and various kinds of award ceremonies.

Ceremonies of religious transformation. Religious-transformation ceremonies signal changes in religious statuses, which may be matters of the greatest importance to the people. Performing ritual such as making sacrifices and offerings may be required in the normal course of life, and these acts may be regarded as conferring a new religious status or state of grace. Sacrifices are a frequent feature of rites of passage, and for important ceremonies such as coronations and funerals of rulers, have sometimes required the sacrifice of many human beings (see also above *Sacrifice*). Among the laity, entry into a religious society or the assumption of any other new religious role is customarily an event celebrated by rites such as those

Sacrifices

The
couvade

Ordination of a Lutheran pastor by the laying on of hands.

of baptism and confirmation. Among professional religious personnel, the achievement of any distinct status of specialization is ordinarily observed by rites corresponding to the Christian rites of ordination—the rites through which religious functionaries become entitled to exercise their respective functions. As with other rites of passage, these rites may be simple or complex, and their degree of complexity may generally be easily seen as reflecting the religious and social importance of the newly acquired status. A single element of an elaborate rite in one society, such as circumcision or the dressing of the hair in a distinctive way, may in another society be the central or sole event of rites of either social or religious transformation. These ceremonies may, accordingly, be called rites of circumcision or be identified by the name of the style of hairdress.

Other ceremonies. The term rites of passage is occasionally applied to institutionalized rites for curing serious illness and, rarely, to cyclic ceremonies such as harvest festivals. No new social or religious status is ordinarily gained by recovery from illness or participation in harvest rites, however, and these ceremonies have probably been included among the rites of passage because of similarities in their ritual procedures. In some societies, recovery from a very critical illness is regarded as a divine sign that the erstwhile invalid should assume the role of a religious specialist, but rites of ordination are quite separate. Some elements of ceremonies pertaining to changes in the seasons may be seen as incorporating acts of separation and incorporation, symbolically saying goodbye to the old season and welcoming the new, but these are not customarily called rites of passage. Although clearly denoting a change in social status, divorce has rarely been regarded as a rite of passage. Festive observances at this time are perhaps common in some societies, but they are often informal practices of the individual or simple acts of local custom, such as discarding wedding rings, that are not institutionalized in the entire society. The absence of divorce from the conventional roster of rites of passage illustrates an outstanding characteristic of this class of rites: all celebrate events that are either socially approved or, like death and illness, unavoidable. Rites of passage that signal the assumption of social statuses disapproved by society are both out of keeping with the prevailing interpretation of the rites as being socially supportive and would broaden them to cover such events as trials by jury and commitment to prison for serious crimes.

Symbolic aspects of ceremonies. Whatever their sub-classification, elaborate rites of passage are commonly rich in symbolism that prominently includes representations of the states of separation and transition and, especially, insignia of the new status. Most common among these markers of new status are alterations and embellishments of visible or invisible parts of the body, distinctive garments and bodily decorations, and insignias corresponding to symbols of office. All parts of the body that may be altered or embellished without ordinarily causing serious disability have served as the symbols of social statuses and have been elements of rites of passage. Outstanding among these insignias are special styles of hairdress, clothing, and ornaments; the filing, staining, and removal of teeth; the wearing of ornaments in pierced ears, noses, or lips; tattoos and, among dark-skinned people upon whom tattoos would not be visible, their counterpart of scarification, which produces designs in relief; and circumcision or other genital operations (see also *Religious dress and vestments* below).

Several motifs or themes of symbolism commonly recur among societies widely separated from each other geographically and culturally. One such theme symbolizes death and rebirth into the new status. Initiates may be ceremonially killed and then made symbolically to act like infants who, during the rites, are made to mature into their new statuses. Another common form of symbolism makes use of doors or other portals that signify entry into the new social domain. Ordeals are a rather common feature of coming-of-age ceremonies for both males and females, and they are also used in rites of initiation into men's societies of various kinds. Success in passing the

ordeals is customary and signifies mastery of the roles that are to be assumed.

A universal feature of rites of passage is the proscription of certain kinds of ordinary behaviour. Sexual continence is a common rule, as is the prohibition of ordinary work such as farming, hunting, and fishing. Many rites prohibit certain behaviour or prescribe the reverse of ordinary behaviour. Among Indians of the western United States, for example, a taboo against scratching the body with the fingers was common during ritual periods. In other societies, ritual behaviour required that the subjects of ritual sit in a remarkable fashion, wear articles of clothing inside out or backward, or wear the clothing of the opposite sex. These acts all may be seen as dramatizations, by contrast, of the events that they celebrate, thereby making them memorable.

A representative example. Rites of passage marking very important events customarily include all of the three stages described by van Gennep. A representative example is afforded by the traditional rites surrounding childbirth as these were commonly observed in Japan until recent years. Observances began when a woman learned she was pregnant. Partly for stated reasons of promoting health and partly for supernaturalistic reasons, she thenceforth abstained from certain foods and ate others. During the fifth month of pregnancy she donned a special girdle, ordinarily procured from a Buddhist temple and supernaturally blessed. Relatives offered prayers for the well-being of the woman and her child. When birth seemed imminent, she was isolated from all other persons except the women who attended her and remained in isolation for a fixed number of days after parturition. This period was most commonly 33 days, which was divided into stages preceeding from severe restriction of her acts to final complete resumption of all normal activities. She had at first to follow a number of special rules of diet and could not perform normal household tasks. During the period of isolation, the mother was regarded as polluted from the flow of blood during childbirth and therefore dangerous to other people and dangerous or offensive to supernatural beings of the Shintō religious pantheon. She could not make the usual offerings or say prayers before the household shrines to Shintō gods or have any other kind of contact with them. To avoid offending the sun goddess, her clothing and that of her child when laundered could never be hung in direct sunlight to dry but instead were placed in the shadows of the eaves of the house. For the same reason, she covered her head with a cloth when she stepped outside the house near the end of the period of isolation. Water and cloths used in washing the mother after parturition were considered to be polluted and were buried in the ground beneath the floor of the room of confinement. After a fixed number of days passed, the mother was permitted to resume bathing and again perform some but not all of her ordinary work in the house. Other restrictions on behaviour were removed at fixed times, and when the full period passed, the mother and her female aides performed a ceremony of purification by sprinkling salt on the mother and on the floors of the dwelling. The beginning of a new, normal period free from pollution also was symbolized by kindling a new fire in the household cooking stove. Now ready to return to normal life, the mother ate a ceremonial meal with other members of the family and resumed ordinary relationships with supernatural beings and other human members of the community.

RITES OF PASSAGE IN THE CONTEXT OF THE SOCIAL SYSTEM

Most of the scholarly interpretations of rites of passage of the 20th century have considered their relation to the social system and have seen the functional significance of the rites as a contribution to the maintenance of society as a system of congruent parts. Explicit or implicit in this line of reasoning is the idea of equilibrium found in any scientific theory concerned with systems. For the system to operate effectively, its elements must be mutually supportive or congruous, and the system is then described as being in a state of equilibrium. Social systems

Insignia
and body
decorations

Changes of status and social equilibrium

embrace a fixed number of people and a fixed number of roles. Changes in either the number of the people or in the proportions of statuses disturb social equilibrium. When a child is born, a new member is added to society; the social behaviour and statuses of its parents change, and these changes also affect other members of society. Other social changes that are the subjects of passage rites similarly disrupt the state of social equilibrium. Rites of passage are seen to foster the development of a new state of equilibrium in adjustment to the social changes upon which the rites focus. By means of the rites, members of society are informed of the new social circumstances and at the same time give social approval to them. Individuals upon whom the rites focus are assured of success in their new roles by the ritual observances and are given psychological reassurance in a number of other ways. They and all other members of society are instructed by the ritual enactment of their new social relations to return to normal behaviour incorporating the added or lost personnel and the added, lost, or changed social statuses. The same general kind of reasoning is applied to various other religious ceremonies. The anthropologists Eliot D. Chapple and Carleton S. Coon interpret all rites of passage and other group rites as "rites of intensification." Calling special attention to the ritual depiction of habitual relationships for the statuses involved, Chapple and Coon state that this behaviour "has the effect of reinforcing or intensifying their habitual relations, and thus serves to maintain their conditioned response . . . In the technical (physiological) sense, the performance of these rites prevents the extinction of habits . . . to which the individual has been trained."

Closely related to the function of passage rites in restoring social equilibrium, in the anthropologists' interpretation, are a group of additional effects or functions, some of which apply first to the individuals whose statuses change and, through their behaviour, to the entire social group. Other functional effects apply directly to the entire society. By allaying the anxiety of individuals who are undergoing change, social disruption is avoided. Rites of passage characteristically give assurance of mastery of the new roles and often include instruction in the new roles. In the many societies in which statuses and roles are clearly distinguished by sex, the rites symbolically emphasize these differences, thereby instructing the initiates and aiding them in sexual identification. The anxiety and potential social disruption caused by death and the grief of the bereaved are similarly held in check. Funeral rites customarily point up grief and then firmly instruct the bereaved to resume normal behaviour that is not disruptive to others. The joint performance of rites and the joint expression of moral and other social values that are included among ritual acts may be seen as directly promoting group solidarity through communion with one's fellows and affirmation or reaffirmation of rules and ideals that foster social harmony.

Rites of passage and all other group rites are seen to be socially supporting in still another implicit way. The joint rites are customarily a rehearsal or dramatization, with supernatural sanction, of a part or all of the social order of the society. Relatives have special roles that are congruent with, or enactments of, their positions in normal social life, and the entire social hierarchy may be on display during the rites through the assignment of ritual roles. Thus statuses of kinship, caste, social equality, and hierarchy are all seen to be reinforced by dramatic presentation of them.

Accepting this group of interpretations of the social significance of rites of passage, anthropologists have also attempted to understand variations in the degree of elaboration of rites of passage among societies of the world. A fundamental assumption is the commonplace idea that the greater the importance of a social change the greater the ritual attention will be. The birth, marriage, and death of a ruler obviously are more important to the entire society than these events in the life of a commoner. The importance of such events is not always obvious, however, and their relative importance is often difficult to see when different societies are compared. Rites of marriage, for example, may be very simple or very elaborate in differ-

ent societies of the same economic base and comparable levels of cultural development. Recourse to consideration of features of the social order has allowed a reasonable explanation of the differences. Marriage rites in matrilineal societies, for example, which are organized into subgroups primarily upon a principle of descent through female lines only, tend to be simple, and divorce in these societies is also simple. Marriage rites in patrilineal societies (in which descent is through male lines), however, tend to be elaborate, and divorce initiated by females is difficult.

In matrilineal societies, the social core is composed of groups of male and female relatives united by female lines, which are economically distinct from other groups and self-sufficient. Where the matrilineal principle of organization is strong, the role of the husband and father, who belongs to a matrilineal group different from that of his wife, is not that of economic provider for his wife and children. Instead, he is the economic mainstay for his sister and her children, and his contact with his wife may be limited to spending nights with her. The brothers or other male relatives of a mother not only provide economically for her children but also assume what is elsewhere the role of the father in socializing children. Enduring unions of marriage are not vital to such matrilineal societies. If marriages end in divorce, the matrilineal ordering of society assures approved social identification, economic support, and affective ties for the children and their mother and also assures continuance of the society as long as males are available as procreators. In patrilineal societies, however, the role of the mother, who is the outsider in the group, is vital for the birth and rearing of the children, and she and her children are dependent upon her husband for economic support. Strong sanctions are placed upon marriages in these societies to help ensure lasting unions. Marriage ceremonies are correspondingly elaborate, often involving the transfer of property, which among some African societies is called marriage insurance for the reason that it must be returned if the marriage falls asunder.

In societies such as those of the United States and European nations, where the important unit of kinship is ordinarily limited to the nuclear family of parents and children and where important social affiliation does not depend upon descent through one sex of progenitors, enduring unions of marriage are also vitally important. Rites of passage at marriage traditionally have been required by law as well as by the church, and many other sanctions on lasting marriages are imposed by laws concerning divorce, communal property, and the care of children. The bride and groom who have undergone the whole series of traditional rites of passage from engagement parties to the religious ceremony may reasonably be seen as more firmly married than couples united by a simple civil ceremony (see also SOCIAL DIFFERENTIATION; FAMILY AND KINSHIP).

PSYCHOLOGICAL ASPECTS OF RITES OF PASSAGE

Less scholarly attention has been given to psychological than to social or cultural aspects of rites of passage, in large part because the scholars concerned with such rites in world societies have been principally anthropologists, who lean toward sociocultural interpretations. As the foregoing discussion of passage rites in social context illustrates, psychological aspects of rites nevertheless enter strongly if often implicitly into anthropological interpretations as fundamental matters in social solidarity and social disorder. Emotional ties to kin and other members of society, personal identification with social groups and religious statuses, and commitment to religious ideology and other values are reinforced and sometimes created by rites of passage. In a realistic sense, the rites serve as blueprints for social relations and religious behaviour that make clear the acceptable ways to act and at the same time point up and reinforce affective relations with other people and with the supernatural. Familial rites of ancestor worship, for example, are not only reinforcements of familial solidarity but also have psychological value in reinforcing emotional ties among relatives.

Psychological interpretations of passage rites have given greatest emphasis to their value in allaying personal anxiety. A recurrent feature of the rites are acts of magic that

Marriage rites in matrilineal and patrilineal societies

assure that the outcome of the endeavour will be successful. In the words of the anthropologist Bronislaw Malinowski these acts serve symbolically and psychologically "to bridge over the dangerous gaps in every important pursuit or critical situation" that exist because of man's lack of control of the universe. By such magical means as miniature boats floated in streams or carried away by the tide, the dead are shown symbolically to go successfully to the other world, and childbirth and successful maturation are similarly depicted magically. The subjects of rites of passage frequently act out their future roles to the approval of all others. Numerous acts of magic that are not essential to changes in social status may be incorporated in rites of passage and may be seen to give psychological assurance relating to the future life of the individual. Traditional Japanese practices at childbirth, for example, required that when a girl was born, the placenta be buried in the ground outside the entrance to the dwelling to insure that the girl, when mature, marry in normal fashion and leave the family. When a boy was born, the placenta was buried inside the house to ensure that he remain at home when mature. The ordeal that a young man or young woman must often undergo during rites of coming-of-age may similarly be seen to provide psychological assurance of success in the new status. Ordeals of this kind are characteristically uncomfortable or frightening, but they are events that any human being ordinarily can endure.

Psycho-
therapeutic
value of
rites

The psychotherapeutic value of passage rites surrounding events in which stress may be acute, such as childbirth, death, and serious illness, is clearly apparent and essentially follows the principles of modern secular psychotherapy. The subject is made the centre of concentrated attention by many people, is given reassuring evidence of their regard for him, and, by means of magic and the intervention of supernatural beings, is assured of a successful outcome. These events are carried out on a high emotional pitch, which gives them added force. When anxiety is induced by religious beliefs themselves, such as by ideas that if ritual acts are not performed calamitous results will follow, the rites of passage may be said both to create and to allay anxiety.

Where particular social statuses have special honour and prestige, the mere existence of these statuses offers opportunities for gaining psychological satisfaction, and the requirements for gaining these statuses serve to guide behaviour in socially approved channels that offer psychological satisfaction.

Other interpretations of psychological aspects of passage rites have relied upon ideas derived from or inspired by the psychoanalyst Sigmund Freud (1856–1939). These have sometimes concerned the symbolism involved in the rites and, in anthropological interpretations, have dealt with both Freudian ideas of symbols and the social order. The psychologist Bruno Bettelheim has interpreted cicatrization (inducement of scars) of males in rites at coming-of-age as symbolic wounds indicating subconscious male envy of the vagina, the counterpart of Freud's idea of penis envy. A psychologically oriented anthropologist J.M. Whiting, and others have combined sociological and psychoanalytic theories in attempting to explain why male initiation ceremonies are conducted in some societies and not in others. Harsh rites, sometimes including genital operations, are held to be correlated with societies in which infant males have long and intimate contact with their mothers, and husbands are prohibited from sexual intercourse with their wives for a period of two years or more. The long and exclusive relationship between mother and son is assumed to lead to strong emotional dependence upon the mother by the son, which becomes potentially disruptive at the time the son reaches puberty. The harsh rites are seen to break the bond of dependency and avoid potential social disruption that might otherwise result from discord between son and father at this time.

rites of passage in the context of the religious system

Certain passage rites represent first and foremost transformations in the religious statuses or circumstances of the people concerned. As already noted, rites of passage are

customary upon the assumption of a new status as a religious professional. During most of man's history, however, rites of passage have carried among their implications a change to a new religious state for the ordinary members of society as well as for the professional religious person. Among the culturally advanced societies of the world with orders of priests, ideas of the significance of symbolism in passage rites may be elaborate and sophisticated, representing the rites as different states of grace or, as in Hinduism, cyclic states involving death and rebirth. In many societies, one is not fully or properly a human being until he has undergone the rites of passage appropriate for his age and sex. In some societies, fully human status is not reached until the rite of Baptism has been performed, and children who die before that time may be interred with special rites in places separate from those of the dead who have been baptized. When passage rites are religious ceremonies, as has generally been the circumstance until modern times, some state of sacrament or divine blessing, vaguely or clearly defined, is entailed. At the time of death, rites of passage placing the deceased in the realm of the supernatural customarily have been required. Symbolism in many rites of passage denotes communion with the supernatural. In common with many other kinds of religious events, then, passage rites relate the individual and the society to the sacred world, conferring benefit upon him thereby (see also above *Sacred or holy*).

Rites of passage frequently have ethical import of value for the maintenance of social equilibrium. Where ethical or moral codes and religious beliefs are intimately connected or identified as one and the same, as in Christianity, Judaism, and Islām, the role of religious beliefs and acts may be seen to have strong value as social sanctions since the moral injunctions apply to human relations as well as to man's relations with the supernatural world. All societies have moral or ethical codes, rules of what is appropriate and inappropriate in human relations, and these are enforced by various means. Rites of passage, as noted above, commonly incorporate statements or dramatizations of moral values, and rites at coming-of-age often give moral instruction in highly explicit terms. No necessary or inherent connection exists, however, between morality and religious beliefs. Any serious breach of proper moral conduct results in the imposition of a network of sanctions, many of them secular. In some societies, religious beliefs have little bearing on morality in relations with one's fellow men, although violations of rules applying to relations with supernatural beings and supernatural forces may be regarded as bringing inevitable punishment or misfortune through the supernatural agency. Whenever morality is a part of religious precepts, the direct sanctioning force of passage rites stressing moral rules may be powerful and important to the maintenance of society. In other societies, the ethical import of passage rites and other features of religion may operate less directly. An example is provided by societies that revere but do not deify ancestors. Any breach of morality reflects unfavourably upon the ancestors, who may undertake no action of censure but nevertheless serve as a sanctioning force that is reinforced by death rites.

Morality
and
religious
beliefs

primary rites of passage

In simple, primitive societies dependent for subsistence upon hunting and gathering, in which social groups are small and specialization in labour is limited to distinctions by sex and age, no social statuses may exist except those of child, adult, male, female, and disembodied spirit. Among primitive societies somewhat more advanced technologically and culturally, however, specialized groups based upon common interests appear, and these customarily require rites of induction or initiation. In culturally sophisticated societies, with elaborate divisions of labour, social statuses of leadership and specialized occupation are multiple. If all societies of the world, preliterate and literate, are considered, the most commonly recurrent rites of passage are those connected with the normal but critical events in the human life span—birth, attainment of physical maturity, mating and reproduction, and death.

Birth rites. Rites surrounding the birth of a child are

Isolation of
expectant
mothers

often a complex of distinct rituals that prescribe different behaviour on the part of the mother, the father, other relatives, nonfamilial members of the society, and with respect to the newborn. Observances may begin when pregnancy is first noted and may continue until the time of delivery, when the full rite of passage is observed, and for a variable period of time afterward. In many simple societies and in European societies of the past, the expectant mother is isolated from other members of society at this time for the stated reason that the blood that flows during childbirth has inherently harmful qualities. Where this belief is strong, the classic couvade may be practiced. Regions of the world in which this practice was formerly common include the Amazon Basin of aboriginal South America, Corsica, Spain, among the Basques of France and Spain, and among various societies of Asia. Old ethnological writings have created the impression that ritual attention is limited entirely to the father. Later investigations have made it appear doubtful that the mother in any society is free from ritual requirements. In many societies, rites that have been called the couvade are observed by both parents. The anthropologist Alfred L. Kroeber (1876–1960) reported that among most of the many tribes of aboriginal California, rites at childbirth were much alike for both mother and father. To prevent harm to their child and to other people during the ritual period, the parents observed food taboos; ate in seclusion; avoided contact with other people; did as little work as possible; and refrained from various other acts of ordinary behaviour that included cooking, touching tools, and eating salt, meat, and fish. Women often were under injunctions to scratch themselves only with a stick or a bone for fear that their nails at this time would leave permanent scars on their bodies.

Practices of sympathetic and contagious magic relating to birth and the later well-being of both child and mother are abundant and diverse. Among Indians of aboriginal British Columbia, the mother inserted a smooth beachstone, an eel, or other slippery object under her garment at the neckline, permitting it to slide to the ground to symbolize and insure quick and successful childbirth. In societies of Southeast Asia and Indonesia, religious specialists dressed as women simulated successful delivery. Rites directed toward the newborn similarly symbolize or ensure health and well-being and, after some days, weeks, or months have passed, often include Baptism or other ritual acts that introduce the child to supernatural beings. Both child and mother are often regarded as being defenseless at this time, and many ritual acts have the purpose of protecting them from harmful supernatural beings and forces. In Southeast Asia and Indonesia, a practice called mother roasting, which requires that the mother be placed for some days over or near a fire, appears once to have had the goal of protecting the mother from such evil influences. This practice survives today in altered form in the rural Philippines, where it is regarded as having therapeutic value.

Mother
roasting

Native explanations of the ritual procedures at childbirth reflect beliefs of a mystic affinity between parent and child, and many of the prescriptions have the manifest goals of preventing harm to the infant until it is able to fend for itself. Among South American Indians practicing the classic couvade, this belief of affinity between father and child relates to the soul, which is not fully transmitted to the child until the end of the ritual period.

In addition to the social (communal) and psychological significances of birth rites already noted, scholars have offered interpretations of these ceremonies as reinforcing familial ties. The classic couvade has been seen by Malinowski as a sympathetic symbolic stressing of the relationship between the husband and the wife and her kin, which is instituted when the child is born. In addition to serving as a means of allaying husbandly anxiety over the welfare of the wife, the practices of the couvade establish social paternity, which, in turn, promotes familial and societal solidarity.

Initiation rites. The most prevalent of rites of initiation among societies of the world are those observed at coming-of-age. These have frequently been called puberty rites, but, as van Gennep argued long ago, this name is

inappropriate. Puberty among females is often defined as the time of onset of menses (the menstrual flow), but no such clearly identifiable point exists in the sexual maturation of males. Moreover, the age at which rites of attaining maturity are observed vary greatly from society to society, going far beyond the normal range of years at which sexual maturity is attained. The definition of maturation is thus seen to be largely social or cultural rather than solely biological.

The full range of stages of passage rites is often followed in rituals at coming-of-age. Ordeals or other tests of manhood and womanhood are also common. Some of these practices in preliterate societies seem incomprehensible or absurd until their nature as evidence of qualification for the new social statuses is understood. Among the Bemba tribe of Africa, for example, girls were required to catch water insects with their mouths and to kill a tethered chicken by sitting on its head. Circumcision or other genital operations are also a fairly common feature of rites celebrating the attainment of maturity. Although most commonly applying to males, genital operations are performed on females in a few societies. It seems quite clear that circumcision and other alterations of the sexual organs have not until modern times been regarded as therapeutic surgery. These operations may have psychological significance following Freudian lines of interpretation, but it seems clear that they are also significant as insignia of social status. Where circumcision is the practice for

male initiates, the uncircumcised male is not a full-fledged adult. It may be remembered that at this time other parts of the body are also modified, by incision, piercing, filing, tattooing, and by other kinds of practices that are not painful. Circumcision may in fact have no direct relation to the attainment of sexual maturity. In native Samoa, boys were circumcised at any age from three to 20.

An outstanding feature of rites at coming-of-age, which is generally less prominent or absent from other rites of passage, is their emphasis upon instruction in behaviour appropriate to the status of adults. Instruction in dress, speech, deportment, and morality may be given over a period of months. Very commonly, instruction is first given at this time in matters of religion that have heretofore been kept secret, and initiates may at this time be expected or required to commune with the supernatural, sometimes by means of revelatory trances induced by fasting, violent physical exertion, or the consumption of plant substances that produce hallucinations or otherwise alter the sensibilities.

Separation of male initiates from their mothers and all other females is also common, and ritual events may dramatize the transition from a world of women and children to one that is ideally male. Symbolism of these rites dra-

matizes the separation in such ways as by requiring the young men temporarily to wear the clothing of women and by rigid exclusion of all females from participation in the rites.

Among the technologically and scientifically advanced societies of the world, initiation rites have become increasingly secular. The great religions of the world all included rites at coming-of-age, but for much of the modern population of these nations, the rites are either not observed or are simpler vestiges of the old religious ceremonies. The most common rites of initiation are predominantly or wholly secular ceremonies conducted to celebrate such events as entry into a common-interest association or graduation from school. Rites of initiation such as into age-graded groups or common-interest societies follow essentially the same pattern as those at coming-of-age, and their simplicity or elaboration may be correlated with the importance of the new statuses.

As seen by social analysts, the significance of initiation rites of all kinds is the same as that of other rites of passage. Some emphasis is given to their didactic value and to their significance in sex-role identification. One question that has not been answered is why rites at coming-of-age are so poorly developed today among the technologically advanced societies of the world. Many factors, including changed views of the nature of the universe and changed social conditions, appear to have contributed to the decline of rites of passage. The supernaturalism traditionally present in the rites is no longer acceptable to many people, and in the United States and parts of Europe the association of adult status with sexual maturity as expressed in the term puberty rites has been unwelcome, a matter that should be excluded from notice rather than celebrated. Probably far more important in discouraging the rites has been the extreme variation in these nations in the age of social maturity. In the United States, the ages differ at which one may legally drive a car, enter marriage, own and control property, buy alcoholic drinks and tobacco, enter military service, and vote; and in some of these matters the ages differ from state to state. The demands of modern civilization have, moreover, lengthened the age of social maturity, the time at which one is an economically productive member of society, and, dependent upon the number of years of formal education, have produced great variation in the age of full social maturity. The social and psychological value of rites of coming-of-age in making the transition to adulthood seem substantial, but it seems certain that modern cultural circumstances are incompatible with the conduct of such rites.

Marriage rites. It is assumed by anthropologists that marriage is one of the earliest social institutions invented by man, and, as already noted, rites of marriage are observed in every historically known society. These rites vary from extremes of elaboration to utmost simplicity, and they may be secular events or religious ceremonies. Subclasses of rites of marriage, named and unnamed, exist in many societies, beginning with ceremonies of betrothal that require complex formalities of transfer and exchange of goods, which are often regarded as compensation to the bride's kin group for their loss of the bride. Ceremonies of dramatic, sham "capture" of the bride by the groom and his relatives and friends have been common in both preliterate and literate societies. Marriage in these societies is seen by social analysts as a cooperative liaison between two different groups of kin, between which some feelings of hostility exist. Ceremonies of token capture are conducted even when betrothal and all other arrangements for marriage have long been completed to the expressed satisfaction of both sides, and the sham captures are interpreted as socially sanctioned channels or the expression and relief of feelings of hostility between the two kin groups. In some historically known societies of Africa such sham battles between kin of brides and grooms may occur, with full societal approval, for years after a marriage during any kind of religious rite.

Like rites at coming-of-age, ceremonies at marriage have often included clearly visible insignia of the new social status, in such forms as wedding rings, distinctive hair dress and garments, and tattoos, ornaments, or other em-

Hindu wedding custom; the bride regards her reflection in a mirror.

Frank Horvat—Black Star

bellishments that are regarded also as being decorative. Traditionally, preliminary rites have often provided instruction in the wifely role. Such instruction might be informal or conducted as a part of ritual. Rites of marriage proper also often give instruction through mimicry, dancing, and other symbolic acts that dramatically depict the woman's proper role in society, expressing her economic and social obligations and privileges with reference to her children, husband, other relatives, and still other members of society. Tests of maturity and rites with the purpose of promoting fertility have also commonly been included.

In addition to sharing the functional significances of other passage rites, marriage ceremonies may be seen especially to stress social bonds between husband and wife and their kin groups. In most societies and during most of human history, romantic love has not been the means by which spouses are selected. Convention, often strongly sanctioned, has limited marriage to only certain classes of people. Mutual attraction between the spouses has been a matter of little or no importance. The importance of marriage with respect to spouses, children, other kin, and the orderly maintenance of society is readily inferable. Rites of marriage place a sanction on unions of marriage that may be very powerful and thus serve as both a means of conducting an orderly and satisfying human life and also as sanctions for the orderly maintenance of society. A general correlation may be seen between the degree of elaboration of marriage rites and the social importance of enduring marriages in the society in question. Where, as in some of the large, industrial nations of the world, marriage rites are simple and sometimes secular, a host of other sanctions operate similarly to foster lasting unions.

Death rites. All human societies have beliefs in souls or spirits and an afterlife, and all conduct rituals when people die. See below under *Death rites and customs*. (E.N.)

Death rites and customs

Man is the only creature known to bury his dead. The fact is of fundamental significance. For the practice was not originally motivated by hygienic considerations but by ideas entertained by primitive peoples concerning human nature and destiny. This conclusion is clearly evident from the fact that the disposal of the dead from the earliest

times was of a ritual kind. The Paleolithic peoples not only buried their dead but they provided them with food and other equipment, thereby implying a belief that the dead still needed such things in the grave. In such provision for the dead, Paleolithic man had been anticipated, inevitably in a cruder manner, by his predecessor, the so-called Neanderthal or Mousterian man, so that this very significant practice can be traced back to an even greater antiquity, possibly to about 50,000 BC.

The ritual burial of the dead, which is thus attested from the very dawn of human culture and which has been practiced in most parts of the world, stems from an instinctive inability or refusal on the part of man to accept death as the definitive end of human life. Despite the horrifying evidence of the physical decomposition caused by death, the belief has persisted that something of the individual person continues to survive the experience of dying. In contrast, the idea of personal extinction through death is a sophisticated concept that was unknown until the 6th century BC, when it appeared in the metaphysical thought of Indian Buddhism; it did not find expression in the ancient Mediterranean world before its exposition by the Greek philosopher Epicurus (341–270 BC).

The belief that human beings survive death in some form has profoundly influenced the thoughts, emotions, and actions of mankind. The belief occurs in all religions, past and present, and decisively conditions their evaluations of man and his place in the universe. Mortuary rituals and funerary customs reflect these evaluations; they represent also the practical measures taken to assist the dead to achieve their destiny and sometimes to save the living from the dreaded molestation of those whom death had transformed into a different state of being.

RELEVANT CONCEPTS AND DOCTRINES

Life and death. The evidence of Paleolithic burials shows that already, in that remote age, various ideas were held about death and the state of the dead. The provision of food, ornaments, and tools in the graves implies a general belief that the dead continued to exist, with the same needs as in this life. Other customs, however, indicate the currency of a variety of notions about the postmortem existence, particularly about the potentialities and destiny of the dead. Thus, the presence of red ochre in some burials suggests the practice of contagious magic: the corpse had possibly been stained with the colour of blood in order to revitalize it. The fact that, in Paleolithic burials, the skeleton has often been found lying on its side, in a crouched position, has been interpreted by some prehistorians as evidence of belief in rebirth, in that the posture of the corpse imitated the position of the child in the womb. In some crouched burials, however, there is reason for suspecting a more sinister motive; for the limbs are sometimes so tightly flexed that the bodies must have been bound in that position before rigor mortis set in. Such treatment of the corpse was doubtless prompted by fear of the dead, for similar customs have been found among later peoples. Preventive action of this kind has a further significance, for it implies a belief that the dead might be malevolent and had power to harm the living.

That death was sometimes regarded as transforming those who experienced it into a state of being balefully different from that of those living in this world is evident in later mortuary rites and customs. Indeed, the proper performance of funerary rites was deemed essential by many peoples, to enable the dead to depart to the place and condition to which they properly belonged. Failure to expedite their departure could have dangerous consequences. Many ancient Mesopotamian divinatory texts reveal a belief that disease and other misfortunes could be caused by dead persons deprived of proper burial. The fate of the unburied dead finds expression in Greek and Roman literature. The idea that the dead had to cross some barrier that divided the land of the living from that of the dead also occurs in many religions: the Greeks and Romans believed that the dead were ferried across an infernal river, the Acheron or Styx, by a demonic boatman called Charon, for whose payment a coin was placed in the mouth of the deceased; in Zoroastrianism, the dead cross

the Bridge of the Requirer (Činvato Paratu); bridges figure also in Muslim and Scandinavian eschatologies (speculations concerning the end of the world and the afterlife)—the Širāt bridge and the bridge over the Gjöll River (Gjallarbrú)—and Christian folklore knew of a Brig o' Dread, or Brig o' Death.

It is significant that in few religions has death been regarded as a natural event. Generally, it has been viewed as resulting from the attack of some demonic power or death god: in Etruscan sepulchral art a fearsome being called Charun strikes the deathblow, and medieval Christian art depicted the skeletal figure of Death with a dart. In many mythologies death is represented as resulting from some primordial mischance. According to Christian theology, death entered the world through the original sin committed by Adam and Eve, the progenitors of mankind.

Human substance and nature. The conception of death in most religions is closely related to the particular view held about the constitution of human nature. Two major traditions of interpretation have provided the basic assumptions of religious eschatologies and have often found expression in mortuary rituals and funerary practice. The more primitive of these interpretations has been based on an integralistic evaluation of human nature. Thus, the individual person has been conceived as a psychophysical organism, of which both the material and nonmaterial constituents are all essential for a properly integrated personal existence. From such an evaluation it has followed that death is the fatal shattering of personal existence. Although some constituent element of the living person has been deemed to survive this disintegration, it has not been regarded as conserving the essential self or personality. The consequences of this estimate of human nature can be seen in the eschatologies of many religions. The ancient Mesopotamians, Hebrews, and Greeks, for example, thought that after death only a shadowy wraith descended to the realm of the dead, where it existed miserably in dust and darkness. Such a conception of man, in turn, has meant that, where the possibility of an effective afterlife has been envisaged, as in ancient Egyptian religion, Judaism, Zoroastrianism, Christianity, and Islam, the idea of a reconstitution or resurrection of the body has also been involved; for it has been deemed essential to restore the psychophysical complex of personality. In Egypt, most notably, provision was made for the reconstitution in an elaborate mortuary ritual, which included the mummification of the corpse to preserve it from disintegration.

The alternative view of human nature may be termed dualistic. It conceives of the individual person as comprising an inner essential self or soul, which is nonmaterial, and a physical body. In many religions based on this view of human nature, the soul is regarded as being essentially immortal and as existing before the body was formed. Its incarnation in the body is interpreted as a penalty incurred for some primordial sin or error. At death, the soul leaves the body, and its subsequent fate is determined by the manner in which it has fulfilled what the particular religion concerned has prescribed for the achievement of salvation. This view of human nature and destiny finds most notable expression in Hinduism and, in a subtly qualified sense, in Buddhism; it was also taught in such mystical cults and philosophies of the Greco-Roman world as Orphism (an ancient Greek mystical movement with a significant emphasis on death), Gnosticism (an early system of thought that viewed spirit as good and matter as evil), Hermeticism (a Hellenistic esoteric, occultic movement), and Manichaeism (a system of thought founded by Mani in ancient Iran).

Forms of survival. The conception of human nature held in any religion has, accordingly, determined the manner or mode in which postmortem survival has been envisaged. Where the body has been regarded as an essential constituent of personal existence, belief in a significant afterlife has inevitably entailed the idea of the reconstitution of the decomposed corpse and its resurrection to life. In turn, a dualistic conception of human nature, which regards the soul as intrinsically nonmaterial and immortal, envisages postmortem life in terms of the disembodied existence of the soul. This dualistic conception,

Two dominant traditions concerning human nature

in many religions, has also involved the idea of rebirth or reincarnation. In Hinduism, Buddhism, and Orphism this idea has inspired a cyclical view of the time process and produced esoteric explanations of how the soul becomes reborn into a physical body, whether human or animal.

The ultimate destiny of the dead. Belief in postmortem survival has been productive also of a variety of images concerning the destiny of the dead. This imagery is closely related to the conception of man that is held in each religion. Thus, the magical resuscitation of the dead in ancient Egypt was designed to enable them to live forever in their well-furnished tombs; according to Christian and Islāmic belief, God will ultimately raise the dead with their physical bodies and assess their merits for eternal bliss in heaven or everlasting torment in hell; the Buddhist concept of Nirvāṇa (Enlightenment) is achieved only when the individual has eradicated all desire for existence in the empirical world.

PATTERNS OF MYTH AND SYMBOL

Geography of the afterlife. Inhumation naturally prompted the idea that the dead lived beneath the ground. The mortuary cults of many peoples indicate that the dead were imagined as actually residing in their tombs and able to receive the offerings of food and drink made to them; e.g., some graves in ancient Crete and Ugarit (Ras Shamra) were equipped with pottery conduits, from the surface, for libations. Often, however, the grave has been thought of as an entrance to a vast, subterranean abode of the dead. In some religions this underworld has been conceived as an immense pit or cavern, dark and grim (e.g., the Mesopotamian *kur-nu-gi-a* ["land of no return"], the Hebrew Sheol, the Greek Hades, and the Scandinavian Hel). Sometimes it is ruled by an awful monarch, such as the Mesopotamian god Nergal or the Greek god Hades, or Pluto, or the Yama of Hindu and Buddhist eschatology. According to the view of man's nature and destiny held in a particular religion, this underworld may be a gloomy, joyless place where the shades of all the dead merely survive, or it may be pictured as a place of awful torments where the damned suffer for their misdeeds. In those religions in which the underworld has been conceived as a place of postmortem retribution, the idea of a separate abode of the blessed dead became necessary. Such an abode has various locations. In most religions it is imagined as being in the sky or in a divine realm beyond the sky (e.g., in Christianity, Gnosticism, Hinduism, and Buddhism); sometimes it has been conceived as the "Isles of the Blessed" (e.g., in Greek and Celtic mythology) or as a beautiful garden or paradise, such as the *al-firdaws* of Islām. Christian eschatology, which came to conceive of both an immediate judgment and a final judgment, developed the idea of a purgatory, where the dead expiated their venial sins in readiness for the final judgment. Although the dead suffered there in a disembodied state, because their bodies would not be resurrected until the last day, the purifying flames of purgatory were usually regarded as burning in a physical sense, as Dante's *Purgatorio* vividly shows. The idea of a postmortem purgatory had been adumbrated in the 1st and 2nd centuries BC in Jewish apocalyptic literature (*I Enoch* 22:9–13). The ten hells of Chinese Buddhist eschatology may be considered as purgatories, for in them the dead expiated their sins before being incarnated once more in this world.

Means of approach to the afterworld. The idea that the dead had to make a journey to the otherworld, to which they belonged, finds expression in many religions. The oldest evidence occurs in the Egyptian Pyramid Texts (c. 2375–c. 2200 BC). The journey is conceived under various images. The dead pharaoh flies up to heaven to join the sun-god Re, in his solar boat, on his unceasing voyage across the sky, or he joins the circumpolar stars, known as the "Imperishable Ones," or he ascends a ladder to join the gods in heaven. Later Egyptian funerary texts depict the way to the next world as beset by awful perils: fearsome monsters, lakes of fire, gates that cannot be passed except by the use of magical formulas, and a sinister ferryman whose evil intent must be thwarted by magic. The idea of crossing water en route to the otherworld, which first ap-

pears in Egyptian eschatology, occurs in the eschatological topography of other religions, as was noted above. Many mythologies describe journeys to the underworld; they invariably reflect the fear felt for the grim experience that was believed to await the dead. Ancient Mesopotamian literature records the visit of the goddess Ishtar to the realm of the dead, the way to which was barred by gates. At each gate the goddess was deprived of some article of her attire, so that she was naked when she finally came before Ereshkigal, the queen of the underworld. It is possible that this successive stripping of the celestial goddess was meant to symbolize the stripping away of the attributes of life that the dead experienced as they descended into the "land of no return." An 8th-century Japanese text, the *Koji-ki*, tells of the first contact with death experienced by the primordial pair, Izanagi and Izanami. When his wife died, Izanagi descended to Yomi, the underworld of darkness, to bring her back. His request was granted by the gods of Yomi, on condition that he did not look at her in the underworld. Impatiently he struck a light and was horrified to see her as a decomposed corpse. He fled in terror and disgust. Blocking the entrance to Yomi with a great rock, he then sought desperately to purify himself from the contagion of death.

Such myths doubtless reflect an instinctive feeling that death works an awful change in those who experience it. The dead cease to belong to the world of the living and become uncanny and dangerous: hence, their departure to the world of the dead must be expedited. To assist that grim journey, various aids have been provided. Thus, on some Egyptian coffins of the 11th dynasty, a plan of the "Two Ways" to the underworld was painted, and from the New Kingdom period (c. 1567–1085 BC), copies of the Book of the Dead, containing spells for dealing with perils encountered en route, were placed in the tombs. Orphic communities in southern Italy and Crete provided their dead with directions about the next world by inscribing them on gold laminae deposited in the graves. Advice about dying was given to medieval Christians in a book entitled *Ars moriendi* ("The Art of Dying") and to Tibetan Buddhists in the *Bardo Thödol* ("Book of the Dead"). Chinese Buddhists were informed in popular prints of what to expect as they passed after death through the ten hells to their next incarnation. More practical equipment for the journey to the next world was provided for the Greek and Roman dead: in addition to the money to pay Charon for their passage across the Styx, they were provided with honey cakes for Cerberus, the fearsome dog that guarded the entrance to Hades.

Forms of final determination. Those religions that have taught the possibility of a happy afterlife have also devised forms of postmortem testing of merit for eternal bliss. Ancient Egypt has the distinction of conceiving of a judgment of the dead of an essentially moral kind. This conception finds graphic expression in the vignettes that illustrate the Book of the Dead. The heart of the deceased is represented as being weighed against the symbol of Maat (Truth) in the presence of Osiris, the god of the dead. A monster named Am-mut (Eater of the Dead) awaits an adverse verdict. The judgment of the dead as conceived in other religions (e.g., Christianity, Islām, Zoroastrianism, Orphism) is basically a test of orthodoxy or ritual status, although moral qualities were included to varying degrees. The Last Judgment, as presented in Jewish apocalyptic literature, was essentially a vindication of Israel against its Gentile oppressors. Religions that held no promise of a significant afterlife (e.g., those of ancient Mesopotamia and classical Greece) had no place for a judgment of the dead.

DEATH AND FUNERARY RITES AND CUSTOMS

Before and at death. The process of dying and the moment of death have been regarded as occasions of the gravest crisis in many religions. The dying must be especially prepared for the awful experience. In China, for example, the head of a dying person was shaved, his body was washed and his nails pared, and he was placed in a sitting position to facilitate the exit of the soul. After the death, relatives and friends called the soul to return, possibly to make certain whether its departure from the body

The under-
world and
heaven

The
journey
after death

Judgment
of the dead

was definitive. Muslim custom decrees that the dying be placed facing the holy city of Mecca. In Catholic Christianity, great care is devoted to preparing for a "good death." The dying person makes his last confession to a priest and receives absolution; then he is anointed with consecrated oil: the rite is known as "anointing of the sick" (formerly called extreme unction). According to medieval Christian belief, the last moments of life were the most critical, for demons lurked about the deathbed ready to seize the unprepared soul as it emerged with the last breath.

Modes of preparation of the corpse and attendant rites.

After death, it has been the universal custom to prepare the corpse for final disposal. Generally, this preparation has included its washing and dressing in special garments and sometimes its public exposure. In some religions this preparation is accompanied by rites designed to protect the deceased from demonic attack; sometimes the purpose of the rites has been to guard the living from the contagion of death or the malice of the dead; for it has often been believed that the soul continues to remain about the body until burial or cremation. The most elaborate known preparation of the dead took place in ancient Egypt. Because the Egyptians believed that the body was essential for a proper afterlife, a complex process of ritual embalmment was established. This process was intended not only to preserve the corpse from physical disintegration but also to reanimate it. The rites were based upon the belief that, because the dead body of the god Osiris had been preserved from decomposition and raised to life again by the gods, the magical assimilation of a dead person to Osiris and the ritual enacting of what the gods had done would achieve a similar miracle of resurrection. One of the most significant of these ritual transactions was the "opening of the mouth," which was designed to restore to the mummified body its ability to see, breathe, and take nourishment.

Mummification in cruder forms has been practiced elsewhere (notably in Peru), but not with the same complex motives as in Egypt. The preparation of the corpse has also frequently included the placing on or in it of magical amulets; these were variously intended to protect or vitalize the corpse. Evidence found in tombs of the Shang dynasty (c. 1766–c. 1122 BC) suggests that the Chinese placed life-prolonging substances, such as jade, in the orifices of the corpse. Crosses or crucifixes are frequently placed upon the Christian dead, and sometimes in the Middle Ages the consecrated bread of the Eucharist (the

Lord's Supper) was buried with the body. It has also been a Christian custom to furnish a dead priest with a chalice and paten, the instruments of his sacerdotal office.

Modes of disposal of the corpse and attendant rites. The form of the disposal of the dead most generally used throughout the world in both the past and present has been burial in the ground. The practice of inhumation (burial) started in the Paleolithic era, doubtless as the most natural and simplest way of disposal. Whether it was then prompted by any esoteric motive, such as the return to the womb of Mother Earth, as has been suggested, cannot be proved. Among some later peoples, who have believed that primordial man was formed out of earth, it may have been deemed appropriate that the dead should be buried—the idea found classical expression in the divine pronouncement to Adam, recorded in Genesis 3:19: "You are dust, and to dust you shall return." There is evidence that in ancient Crete the dead were believed to serve a great goddess, who was the source of fertility and life in the world above and who nourished and protected the dead in the earth beneath.

The mode of burial has varied greatly. Sometimes the body has been laid directly in the earth, with or without clothes and funerary equipment. It may be placed in either an extended or crouched position: the latter posture seems to have been more usual in prehistoric burials. Sometimes evidence of a traditional orientation of the corpse in the grave can be distinguished, which may relate to the direction in which the land of the dead was thought to lie. The use of coffins of various substances dates from the early 3rd millennium BC in Sumer and Egypt. Intended probably at first to protect and add dignity to the corpse, coffins became important adjuncts in the mortuary rituals of many religions. Their ritual use is most notable in ancient Egypt, where the mummies of important persons were often enclosed in several human-shaped coffins and then deposited in large, rectangular wooden coffins or stone sarcophagi. The interiors and exteriors of these coffins were used for the inscription of magical texts and symbols. Sarcophagi, elaborately carved with mythological scenes of mortuary significance, became fashionable among the wealthier classes of Greco-Roman society. Similar sarcophagi, carved with Christian scenes, came into use among Christians in the 4th and 5th centuries and afford rich iconographic evidence of the contemporary Christian attitude to death.

In the ancient Near East, the construction of stone tombs began in the 3rd millennium BC and inaugurated a tradition of funerary architecture that has produced such diverse monuments as the pyramids of Egypt, the Taj Mahal, and the mausoleum of Lenin in Red Square, Moscow. The tomb was originally intended to house and protect the dead. In Egypt it was furnished to meet the needs of its magically resuscitated inmate, sometimes even to the provision of toilet facilities. Among many peoples, the belief that the dead actually dwelt in their tombs has caused the tombs of certain holy persons to become shrines, which thousands visit to seek for miracles of healing or to earn religious merit; notable examples of such centres of pilgrimage are the tombs of St. Peter in Rome, of Muhammad at Medinah, and, in ancient times, the tomb of Imhotep at Saqqārah, in Egypt.

The disposal of the corpse has been, universally, a ritual occasion of varying degrees of complexity and religious concern. Basically, the funeral consists of conveying the deceased from his home to the place of burial or cremation. This act of transportation has generally been made into a procession of mourners who lament the deceased, and it has often afforded an opportunity of advertising his wealth, status, or achievements. Many depictions of ancient Egyptian funerary processions graphically portray the basic pattern: the embalmed body of the deceased is borne on an ornate sledge, on which sit two mourning women. A priest precedes the bier, pouring libations and burning incense. In the cortege are groups of male mourners and lamenting women, and servants carry the funerary furniture, which indicates the wealth of the dead man. Ancient Roman funerary processions were notable for the parade of ancestors' death masks. In Islāmic countries,

Ewing Krainin—Stockpile

friends carry the corpse on an open bier, generally followed by women relatives, lamenting with dishevelled hair, and hired mourners. After a service in the mosque, the body is interred with its right side toward Mecca. In Hinduism the funeral procession is made to the place of cremation. It is preceded by a man carrying a firebrand kindled at the domestic hearth; a goat is sometimes sacrificed en route, and the mourners circumambulate the corpse, which is carried on a bier. Cremation is a ritual act, governed by careful prescriptions. The widow crouches by the pyre, on which in ancient times she sometimes died. After cremation, the remains are gathered and often deposited in sacred rivers.

Christian funerary ritual reached its fullest development in medieval Catholicism and was closely related to doctrinal belief, especially that concerning purgatory. Hence, the funerary ceremonies were invested with a sombre character that found visible expression in the use of black vestments and candles of unbleached wax and the solemn tolling of the church bell. The rites consisted of five distinctive episodes. The corpse was carried to the church in a doleful cortege of clergy and mourners, with the intoning of psalms and the purificatory use of incense. The coffin was deposited in the church, covered with a black pall, and the Office of the Dead was recited or sung, with the constant repetition of the petition: "Eternal rest grant unto him, O Lord: and let perpetual light shine upon him." Next, requiem mass was said or sung, with the sacrifice especially offered for the repose of the soul of the deceased. After the mass followed the "Absolution" of the dead person, in which the coffin was solemnly perfumed with incense and sprinkled with holy water. The corpse was then carried to consecrated ground and buried, while appropriate prayers were recited by the officiating priest. Changes in these rites, including the use of white vestments and the recitation of prayers emphasizing the notions of hope and joy, began to be introduced into the Catholic liturgy only following the second Vatican Council (1962–65).

In some societies the burial of the dead has been accompanied by human sacrifice, with the intention either to propitiate the spirit of the deceased or to provide him with companions or servants in the next world. A classic instance of such propitiatory sacrifice occurs in Homer's *Iliad* (xxiii: 175–177): 12 young Trojans were slaughtered and burnt on the funeral pyre of the Greek hero Patroclus. The royal graves excavated at the Sumerian city of Ur, dating c. 2700 bc, revealed that retinues of servants and soldiers had been buried with their royal masters. Evidence of a similar Chinese practice has been found in Shang

dynasty graves (12th to 11th centuries bc), at An-yang. In ancient Egypt, models of servants, placed in tombs, were designed to be magically animated to serve their masters in the afterlife. A particular type of these models, known as an *ushabti* ("answerer"), was inscribed with chapter VI of the Book of the Dead, commanding it to answer for the deceased owner if he were required to do service in the next world.

The custom has also existed among some peoples of dismembering the body for burial or subsequently disinterring the bones for storage in some form. There is Paleolithic evidence of a cult of skulls, which suggests that the rest of the body was not ritually buried. The Egyptians removed the viscera, which were preserved separately in four canopic jars. The Romans observed the curious rite of the *os resectum*: after cremation a severed finger joint was buried, probably as a symbol of an earlier custom of inhumation. In medieval Europe, the heart and sometimes the intestines of important persons were buried in separate places: e.g., the body of William the Conqueror was buried in St. Étienne at Caen, but his heart was left to Rouen Cathedral and his entrails for interment in the church of Chalus. To be noted also is the Zoroastrian and Parsi custom of exposing corpses on dakhmas ("towers of silence") to be devoured by birds of prey, thus to avoid polluting earth or air by burial or cremation.

The alternative use of inhumation or cremation for the disposal of the corpse cannot be interpreted as generally denoting a difference of view about the fate of the dead. In India, cremation was indeed connected with the fire god Agni, but cremation does not necessarily indicate that the soul was thus freed to ascend to the sky. Burial has been the more general practice, whether the abode of the dead be located under the earth or in the heavens.

Post-funerary rites and customs. Funerary rites do not usually terminate with the disposal of the corpse either by burial or cremation. Post-funerary ceremonies and customs may continue for varying periods; they have generally had two not necessarily mutually exclusive motives: to mourn the dead or to purify the mourners. The mourning of the dead, especially by near relatives, has taken many forms. The wearing of old or colourless dress, either black or white, the shaving of the hair or letting it grow long and unkempt, and abstention from amusements have all been common practice. The meaning of such action seems evident: grief felt for the loss of a dear relative or friend naturally expresses itself in forms of self-denial. But the purpose may sometimes have been intended to divert the ill humour of the dead from those who still enjoyed life in this world.

The purification of the mourners has been the other powerful motive operative in much post-funerary action. Death being regarded as baleful, all who came in contact with the corpse were contaminated thereby. Consequently, among many peoples, various forms of purification have been prescribed, chiefly by bathing and fumigation. Parsis are especially intent also on cleansing the room in which the death occurred and all articles that had contact with the dead body.

In some post-funerary rituals, dancing and athletic contests have had a place. The dancing seems to have been inspired by various but generally obscure motives. There is some evidence that Egyptian mortuary dances were intended to generate a vitalizing potency that would benefit the dead. Dances among other peoples suggest the purpose of warding off the (evil) spirits of the dead. Funeral games would seem to have been, in essence, prophylactic assertions of vitalizing energy in the presence of death. It has been suggested that the funeral games of the Etruscans, which involved the shedding of blood, had also a sacrificial significance.

Another widespread funerary custom has been the funeral banquet, which might be held in the presence of the corpse before burial or in the tomb-chapel (in ancient Rome) or on the return of the mourners to the home of the deceased. The purpose behind these meals is not clear, but they seem originally to have been of a ritual character. Two curious instances of mortuary eating may be mentioned in this connection. There was an old Welsh

Dismemberment of the body

custom of "sin eating": food and drink were handed across the corpse to a man who undertook thereby to ingest the sins of the deceased. In Bavaria, *Leichennudeln*, or "corpse cakes," were placed upon the dead body before baking. By consuming these cakes, the kinsmen were supposed to absorb the virtues and abilities of their deceased relatives.

Chastise-
ment of
the Tomb

A remarkable post-funerary custom has been observed in Islām; it is known as the Chastisement of the Tomb. It is believed that, on the night following the burial, two angels, Munkar and Nakir, enter the tomb. They question the deceased about his faith. If his answers are correct, the angels open a door in the side of the tomb for him to pass to repose in paradise. If the deceased fails his grisly interrogation, he is terribly beaten by the angels, and his torment continues until the end of the world and the final judgment. In preparation for this awful examination the roof of the tomb is constructed to enable the deceased to sit up; and, immediately after burial, a man known as a *fiqī* (or *faqih*) is employed to instruct the dead in the right answers.

CULTS AND MEMORIALS OF THE DEAD

Commemorative rites and services. The attitude of the living toward the dead has also been conditioned by the particular belief held about the human nature and destiny. Where death is regarded as the virtual extinction of the personality, the dead should logically have no more importance beyond that which their memory might stir in those who knew them. Even in the negative eschatologies of ancient Mesopotamia and Greece, however, the dead were thought of as still existent and capable of malevolent action if food offerings were not made to them. In those religions that have envisaged a more positive afterlife, the tendence of the dead has been developed in varying ways. In Egypt, it led to the building and endowment of mortuary temples or chapels, in which portrait images preserved the memory of the dead and offerings of food and drink were regularly made. In China, an elaborate ancestor cult flourished. The ancestral shrine contained tablets, inscribed with the names of ancestors, which were revered and before which offerings were made. The number of tablets displayed in the shrine was determined by the social status of the family. When the tablet of a newly deceased member was added to the collection, the oldest tablet was deposited in a chest containing still older ones: offerings to the remoter ancestors were made collectively at longer intervals. In India, three generations of deceased ancestors are venerated at the monthly *śrāddha* festival, at which mortuary offerings were made.

The Christian cult of the dead found early expression in the catacombs, where mural paintings and inscriptions record the names of those buried there and the hopes of eternal peace and felicity that inspired them. Special chapels were made where the bodies of martyrs were entombed, and the anniversaries of their martyrdoms were commemorated by the celebration of the Eucharist (the Lord's Supper). The development of cults of martyrs and other saints in the medieval church centred on the veneration of their relics, which were often divided among several churches. The introduction of the doctrine of purgatory profoundly affected the postmortem care devoted to the ordinary dead. It was believed that the offering of the sacrifice of the mass could alleviate the sufferings of departed souls in purgatory. Consequently, the celebration of masses for the dead proliferated, and wealthy Christians endowed monasteries or chantry chapels where masses were said regularly for the repose of their own souls or those of their relatives. Prayers for the well-being of the dead have an important place in Mahāyāna Buddhism, and so-called "masses for the dead" were celebrated by Chinese Buddhists, influenced originally perhaps by the practice of the Nestorian Christians, who entered China in the 7th century AD.

Periodic
commemo-
rations

In many religions, in addition to private cults of the dead, periodic commemorations of the dead have been kept. The oldest of the Hindu sacred texts, the R̥gveda (R̥gveda), records the practice of the ancient Aryan invaders of India. The sacred beverage called *soma* was set out on "the sacred grass," and the ancestors were invited

to ascend from their subterranean abode to partake of it and to bless their pious descendants. A similar ceremony, called the Anthesteria, was held in ancient Athens. On the day concerned, the souls of the dead (*kēres*) were believed to leave their tombs and revisit their former homes, where food was prepared for them. At sundown they were solemnly dismissed to the underworld with the formula: "out, *kēres*, the Anthesteria is ended." Buddhist China kept a Feast of Wandering Souls each year, designed to help unfortunate souls suffering in the next world. The Christian All Souls Day, on November 2, which follows directly after All Saints Day, commemorates all the ordinary dead: requiem masses are celebrated for their repose, and in many Catholic countries relatives visit the graves and place lighted candles on them. After World War I the public commemoration of the fallen was instituted on November 11, the day of the armistice in 1918, in many of the countries concerned: the memory of the dead was solemnly recalled in a two-minute silence during the ceremony. The body of an unknown soldier, killed in the fighting, was also buried in the capital cities of many countries and has become the accepted focus of national reverence and devotion.

Cult of the dead. Among many peoples it has been the custom to preserve the memory of the dead by images of them placed upon their graves or tombs, usually with some accompanying inscription recording their names and often their achievements. This sepulchral iconography began in Egypt, the portrait statue of King Djoser (second king of the 3rd dynasty [c. 2686–c. 2613 BC]), found in the *serdab* (worship chamber; from the Arabic word for cellar) of the Step Pyramid being the oldest known example. The Egyptian images, however, had a magical purpose: they not only recorded the features of the deceased but also provided a locus for his *ka*, the mysterious entity that constituted an essential element of the personality. The sculptured gravestones of classical Athens deserve special notice, for they are among the noblest products of funerary art. They are expressive of a restrained grief for those who had departed to the virtual extinction of Hades. The deceased are often shown performing some familiar act for the last time. The inscriptions are very brief and usually record only the name and parentage; sometimes the word farewell is added. Etruscan mortuary art is characterized by the effigy of the deceased, sometimes with his wife, represented as reclining on the cover of the funerary casket. These images are obviously careful portraits, but whether they had some magical use as substitute bodies or are only commemorative is unknown. Roman funerary images seem to have been essentially commemorative, as were those of Palmyra.

Images of
the dead

Christianity has provided the richest legacy of funerary monuments. In the catacomb art of the 4th and 5th centuries, the deceased was sometimes depicted on the plaster covering of the niche in which his body was laid. From the early Middle Ages onward, the more affluent dead were represented in sculptured effigy or engraved in outline on stone or brass. In this tomb iconography, they are shown in a variety of postures: lying, kneeling, seated, standing, and sometimes on horseback. They are generally presented in the dress appropriate to their office or social standing: kings wear crowns, knights their armour; bishops are in copes and mitres and ladies in the fashionable attire of the day. This iconography is patently commemorative of the appearance in life, the achievements, and the status of the persons concerned. In the later Middle Ages, however, there was a remarkable innovation in this funerary art, which was designed to emphasize the horror and degradation of death. In what are known as memento mori tombs, below the effigies of the deceased as they were in life, there were placed effigies of their naked decaying corpses or skeletons. Such tomb sculpture reflected a contemporary obsession with the corruption of death.

PSYCHOLOGICAL AND SOCIOLOGICAL ASPECTS OF DEATH

The Paleolithic burials reveal that the pattern of man's reaction to the fact and phenomena of death has been set from the dawn of culture. Unlike the other animals, man has been unable to ignore the mysterious cessation

of activity and lapse of consciousness that cause his body to decay and befall members of his own kind. Death has, accordingly, constituted a problem for man, and he has felt impelled to take special action to cope with it. The pattern of his reaction has been twofold: confronted with the deaths of his companions, he has recognized an obligation to attend to their needs as he has conceived them, believing that they continued to exist in some form, either in the grave or in an underworld to which the grave gave access. But man's concern with death has not been confined to his tending of the dead; for in the deaths of his fellows he has seen a presage of his own demise. This anticipation on the part of the living of the experience of dying has been a factor of immense psychological and social import. It is essentially a human characteristic; it stems from a consciousness of time, of which the immense cultural significance is only now beginning to be properly evaluated.

Awareness
of time
and
anticipa-
tion of
death

Awareness of time in its three categories of past, present, and future has decisively contributed to man's success in the struggle for existence. For it has enabled him to draw upon past experience in the present to anticipate future needs. Thus, from the making of the first stone tools to the complex structure of his modern technological civilization, man has sought by planning to render himself economically secure and to improve the standard of his living. But his time consciousness, which has made this immense achievement possible, is an ambivalent endowment. For, although it has enabled man to win economic security, it has also made him acutely aware of his own mortality and the inevitability of his own demise. Hence, his anticipation of death presents him with a profound emotional challenge, unknown to other species. The repercussions of this challenge can be traced in almost every aspect of his social and cultural life; but it is in his religions that man's reaction to death finds its most significant expression. All religion is concerned with postmortem security—with linking mortal man to an eternal realm—whether it be achieved by ritual magic, divine assistance, or mystic enlightenment.

MODERN NOTIONS OF DEATH

Continuation of traditional responses. Religious rites and customs continue to be practiced, because of conservatism, long after the ideas and beliefs that originally inspired them may be forgotten or abandoned. This is particularly true with regard to rites and customs pertaining to death. It is difficult to assess to what extent in the more sophisticated societies of the modern world the traditional eschatologies are still effectively held. Although a general skepticism obviously manifests itself toward the medieval imagery of death and judgment, of purgatory, heaven, and hell, modern modes of thinking have not lessened the mystery of death and its impact on the emotions. Indeed, in modern society, where expectation of life has been prolonged and standards of living raised, the negation of death is probably felt more keenly and also more hopelessly than in any other age.

Avowed secular inattention and unconcern. The reaction to death most apparent today among those having no effective religious faith is that of seeking to treat it as a disagreeable happening that must be dealt with as quickly and unobtrusively as possible. Funerals are no longer elaborately organized, mourning attire is rarely worn, and graveyards are landscaped, thus discreetly removing the earlier memorials of death. The increasing use of cremation facilitates this disposition to reduce the social intrusion of death and banish the traditional grave as a reminder of human mortality.

Rites and customs among secular materialists. It is significant, however, that, even where secularist principles are consciously professed, the dead are rarely disposed of without some semblance of ceremony. A deeply rooted feeling prompts most people to treat a dead human body with a respect that is not felt for a dead animal. It is significant that Communists make pilgrimages to the graves of Lenin and Marx; and, in the modern State of Israel, great effort is being made to record in the shrine of Yad va-Shem the names of those who died in the persecution

of the Jews in Germany during the Nazi regime of Adolf Hitler in the 1930s and '40s and, if possible, to bring their ashes there. In America, morticians strive to preserve the features of the dead as did the embalmers of ancient Egypt, though for somewhat different motives. Finally, as further evidence of modern preoccupation with death, it may be noted that, in Western society, Spiritualism witnesses to a widespread desire to have communication with the dead, and recently, in England, there has even been a recrudescence of necromancy. (S.G.F.B.)

Purification rites and customs

Purification rites and customs, based on concepts of purity and pollution, are found in all known cultures and religions, both ancient and modern, preliterate and sophisticated. Assuming a wide variety of types and forms, these rites and customs attempt to re-establish lost purity or to create a higher degree of purity in relation to the Sacred or Holy (the transcendent realm) or the sociocultural realm.

CONCEPTS OF PURITY AND POLLUTION

General concepts. Every culture has an idea, in one form or another, that the inner essence of man can be either pure or defiled. This idea presupposes a general view of man in which his active or vitalizing forces, the energies that stimulate and regulate his optimum individual and social functioning, are distinguished from his body, on the one hand, and his mental or spiritual faculties, on the other. These energies are believed to be disturbed or "polluted" by certain contacts or experiences that have consequences for a person's entire system, including both the physical and the mental aspects. Furthermore, the natural elements, animals and plants, the supernatural, and even certain aspects of technology may be viewed as operating on similar energies of their own; they too may therefore be subject to the disturbing effects of pollution. Because lost purity can be re-established only by ritual and also because purity is often a precondition for the performance of rituals of many kinds, anthropologists refer to this general field of cultural phenomena as "ritual purity" and "ritual pollution."

The rituals for re-establishing lost purity, or for creating a higher degree of purity, take many different forms in the various contemporary and historical cultures for which information is available. Some purification rituals involve one or two simple gestures, such as washing the hands or body, changing the clothes, fumigating the person or object with incense, reciting a prayer or an incantation, anointing the person or object with some ritually pure substance. Some involve ordeals, including blood-letting, vomiting, and beating, which have a purgative effect. Some work on the scapegoat principle, in which the impurities are ritually transferred onto an animal, or even in some cases (as among the ancient Greeks) onto another human being; the animal or human scapegoat is then run out of town and/or killed, or at least killed symbolically. Many purification rites are very complex and incorporate several different types of purifying actions.

Ritual purity and pollution are matters of general social concern because pollution, it is believed, may spread from one individual or object to other members of society. Each culture defines what is pure and impure—and the consequences of purity and pollution—differently from every other culture, although there is considerable cross-cultural overlapping on certain beliefs. Cultures also vary greatly in the extent to which purity and pollution are pervasive concerns: Hinduism, Judaism, and certain tribal groups such as the Lovedu of the African Transvaal or the Yurok of northern California in the United States seem highly pollution-conscious, whereas among other peoples pollution concerns are relatively isolated and occasional. Even within the so-called pollution-conscious cultures, attitudes toward the cultural regulations may vary considerably: the Yurok, on the one hand, are said to consider their purification rituals to be rather a nuisance, albeit necessary for the success of their economic endeavours; but Hindus, on the other hand, seem to incorporate and embrace more

The
transmis-
sion and
symptoms
of
pollution

fully the many regulations and rituals concerning purity prescribed in their belief and social systems.

Pollution is most commonly transmitted by physical contact or proximity, although it may also spread by means of kinship ties or co-residence in an area in which pollution has occurred. Because purity and pollution are inner states (though there usually are outer or observable symptoms of pollution), the defiled man—or artifact, temple, or natural phenomenon—may at first show no outward features of his inner corruption. Eventually, however, the effects of pollution will make themselves known; the appearance of a symptom or disaster that is culturally defined as a consequence of pollution, for example, may be the first indication that a defiling contact has occurred. Common cross-cultural, human symptoms of pollution include: skin disease, physical deformity, insanity and feeble-mindedness, sterility, and barrenness. Nature also may become barren as a result of pollution; but, on the other hand, the natural elements and magical or supernatural forces may run amok as a result of pollution.

In general, the vital energies of man, nature, or the supernatural, as a consequence of pollution, may become either hypoactive or hyperactive. The vital energies may tend to operate in a manner that leads toward decline, loss of potencies and fertility, and death; they may also, however, tend to operate in an opposite manner that leads toward excess, increase and perversion of potencies, and chaos. Both of these tendencies presumably contrast with the tendencies of a state of purity, although the properties, symptoms, or consequences of purity rarely are explicitly defined in cultural ideologies, in contrast to the wealth of detail elaborated on the consequences of pollution.

On the whole, purity seems to be equated with whatever a culture considers to be the most advantageous mode of being and functioning for achieving the paramount ideals of that culture. Thus, throughout most Asian religions (e.g., Hinduism, Buddhism, Jainism, and Taoism), purity is equated with calmness (physical, mental, and emotional equilibrium) in keeping with the ideal goal—at least for religious adepts—of achieving spiritual transcendence or liberation. In contrast to such Asian religions, groups whose dominant cultural orientation is pragmatic and this-worldly, such as the Yurok, often equate the state of purity with vigour and quickness of mind and body.

Purity and pollution in relation to religious concepts. Concepts of purity and pollution may tend to merge with several concepts of religion: the sacred, sin, and the forces of evil.

Conse-
quences
of contact
with the
sacred
or the
polluted

Pollution and the sacred. The consequences of contact with both the sacred (the transcendent realm and objects infused with transcendent qualities) and the polluted may be identical, although the reasons for the consequences in the two cases are quite different. The dangers of contact with the sacred may arise from the belief that the gods are offended by pollution; they will punish a person who defiles a sacred precinct or object (for example, in Buddhism and many other religions, a menstruating woman who enters a temple or shrine). The gods may even punish an entire village or tribe for such an offense. To come into contact with the sacred is also viewed as dangerous because the sacred is highly powerful or “charged” with energy; thus, one must be properly strengthened (usually by purification) for the encounter. If one is not thus strengthened, he will be overwhelmed. Although contact with the sacred may have negative consequences for a person, this is not because the sacred is polluting. On the other hand, the dangers of encounter with a polluted person (e.g., an “untouchable” in India) or object (e.g., feces, in most cultures) arise directly from the pollution that passes from that person or object to oneself.

Pollution and sin. Purity and pollution beliefs may become incorporated into a religious morality system in which pollution becomes a type of sin and an offense against God or the moral order, and purity becomes a moral or spiritual virtue. Thus, for example, in the Old Testament, the pollution of birth must not only be cleansed by symbolic or ritual gestures; it must also be atoned for as a cultic sin that offends the sacred precincts of the Lord. In general, the more universalistic religions—

Christianity, Buddhism, and Islam—seem to de-emphasize true pollution concerns, and to subsume them within their frameworks of moral and religious beliefs. Both the Qurʾān of Islam and the New Testament of Christianity show a sharp decrease in rules of specific pollution avoidances (e.g., fewer food prohibitions) compared to the Old Testament. Similarly, the sacred texts of Buddhism stress the unimportance of specific avoidances and rituals (in implicit contrast to the multiple and detailed purity regulations of Hinduism) and the necessity for cultivating one's spiritual and moral development instead.

Pollution and the forces of evil. Ideas of pollution are often closely associated with beliefs in demons, sorcerers, and witches. All of the latter may be viewed, in part, as personifications of the powers of pollution. People in polluted states are believed to be dangerous not only to others because they may spread their pollution, but they themselves are often thought to be in danger of attack by demons, who are attracted by the defiled person's impurities (see also DOCTRINES AND DOGMAS; OCCULTISM).

CATEGORIES AND THEORIES OF POLLUTION AND IMPURITY

Categories of pollution and impurity. Four major categories of what various religions and societies have regarded as polluting or inherently impure phenomena may be distinguished. Virtually any type of impure person, object, or state (as defined in various cultures) may be assigned to one of these four categories, or may be shown to have symbolic associations with one (or sometimes with several) of these four sets.

Physiological processes. The functions of the human body are, for the most part, universally considered polluting, although all functions are not considered polluting in all cultures. The intensity with which the various processes are abhorred also varies from culture to culture. The list of polluting organic processes and things includes menstruation, sexual intercourse, birth, illness, death, and all bodily excretions and exuviae (urine, feces, saliva, sweat, vomit, blood, menstrual blood, semen, nasal and oral mucous, and hair and nail cuttings). Associated with this category symbolically may be various persons, animals, natural objects, sense-related objects, and professions: women in general (because they menstruate), pregnant women, prostitutes, and widows (the latter because of their additional association with death); pigs, dogs, and other scavengers because they eat or associate with excrement and garbage; carrion-eating animals because of their association with death; leftover food, because it has come in contact with saliva via the fingers or utensils that have touched the mouth, or because it may visually resemble vomit or the undigested contents of the stomach; pungent vegetables or spices (such as garlic, onions, and leeks) and strong-smelling meats or fish because they cause foul breath odours; food in general because of its ultimate state as excrement; certain professions because their members are required to handle corpses or bodily exuviae; and things associated with lowness—the entire body below the navel, the feet, the hem of the garment, the floor or ground—because most bodily excretions derive from the lower part of the body.

Violence and associated processes. A second major category of polluting phenomena involves violence and all associated aspects. This entire category may be reduced to beliefs in the polluting nature of blood and death, but the extensive development of various ideas connected with violence pollution merit its being classified as a separate category. Violence pollution involves a wide variety of activities: murder, hunting, warfare, physical fights, quarrelling, cursing or speech that is considered foul, aggressive language, lying, and various aggressive human passions (e.g., greed, anger, and hatred). Various phenomena considered polluting in one culture or another may be placed in this category because of their symbolic associations with violence: Satan, demons, witches, predatory ghosts, and the practice of black magic; alcohol because it stimulates aggressive impulses; carnivorous, predatory, and aggressive animals; meat because of the act of slaughtering the animal; certain professions because their members manufacture weapons or kill or fight for a living.

Universal
belief that
bodily
functions
involve
pollution

Anomalies. The third major category includes strange, unusual, or unclassifiable phenomena: (1) certain events of nature (*e.g.*, comets or lunar or solar eclipses); (2) unusual deaths (*e.g.*, death by lightning); (3) unusual births (*e.g.*, twins or other multiple births, breech deliveries, miscarriages, or stillbirths); (4) physical deformities, especially sexual deformities (*e.g.*, monorchids [men having one testicle], hermaphrodites, or eunuchs); (5) speech defects and voices appropriate to the opposite sex; (6) unusual developmental sequences (*e.g.*, children who cut their upper teeth before their lower); (7) anomalous animals or types of plants that have features of several species; (8) viscous substances that seem neither solid nor liquid; (9) persons in liminal (threshold or transitional) categories or states (*e.g.*, persons undergoing initiation rites, strangers, or captives); (10) persons not considered fully in control of their faculties (*e.g.*, children, drunken persons, the insane, or the mentally or physically handicapped, such as cretins); and (11) perversions of social relationships, especially sexual, that a culture generally considers to be normal (*e.g.*, adultery, homosexuality, bestiality, incest, births of children to unwed parents or as a result of adulterous relationships, or the breaking of vows of celibacy by monks or nuns). That pollution results from a confusion of classification rules may explain beliefs that certain objects must not be mixed lest pollution result. The Old Testament prohibition (also found in certain African groups) that meat and milk should not be mixed with one another or the prohibition in the Vedas (ancient Hindu scriptures) against carrying water and fire at the same time are examples of attempts to maintain classificatory purification rules (see below under *Dietary laws and food customs*).

Social classifications: classes and castes. The belief that the lower castes pollute the upper castes has been explicit in India, where a true caste system has existed. These lower castes, to some extent, are considered polluting because they engage in professions that have been or are associated with the physiological processes or with violence. Many lower caste occupations (*e.g.*, pottery making or basket weaving), however, do not have such associations, and thus the categorization of pollution attached to all lower castes cannot be so explained. Outside true caste systems, there are de facto systems of racial or ethnic hierarchy, in which certain races or ethnic groups are considered to be inherently lower than others. In most such systems, the notion that the lower groups pollute the higher is not stated explicitly in terms of pollution; the language of racial or ethnic prejudices in such systems, however, is often strongly reminiscent of pollution concepts—*e.g.*, that the lower groups are “dirty,” have peculiar bodily odours, engage in sexual promiscuity or perversions, are “animals,” or are violent and dangerous. Relations between the dominant race or ethnic group and the subordinate one often resemble the relations between upper and lower castes in India. In such social systems, eating together and intermarriage generally are not condoned, and segregated neighbourhoods and public facilities to maintain minimal physical contact are encouraged by law or custom (see also SOCIAL DIFFERENTIATION).

Theories of pollution and impurity. Though these four major categories indicate the great diversity of phenomena considered polluting cross-culturally, no one culture considers every item noted in these categories as polluting. Furthermore, within a single culture, not every item considered polluting is necessarily polluting to every member of the society, because the connotation of pollution often is dependent upon the occasion and on the status of a person. The pollution of death, for example, may be confined to those who have actual contact with the corpse, the immediate family of the deceased, certain categories of kinsmen, or all members of the village in which the death has occurred.

The rules dictating avoidance of certain groups or individuals because of the threat of pollution may be seen as means that a society has at its disposal for emphasizing its important social categories. Thus, in the case of death, if relatives on the father's side but not on the mother's side are considered polluted by the death, it may be theorized that this is one of the society's ways of emphasizing

the greater social significance of the patrilineal relatives in the kinship system. Sociologists and anthropologists, on the one hand, tend to stress such social implications of pollution rules. On the other hand, some psychologists, philosophers, and theologians are more interested in explaining what there is about polluting events and processes (*e.g.*, death and menstruation) in themselves that would result in their being considered polluting in so many cultures.

Two general theories have been proposed in relation to these emphases or questions. The first theory derives primarily from psychoanalytic theories developed by Sigmund Freud in which the quest for sexual, excretory, and aggressive pleasures are viewed as instinctual drives in man that are repressed or greatly limited in the socialization of the individual. Hence, because many of the phenomena viewed as polluting cross-culturally are related to these concerns, pollution fears are interpreted as projections or symbolizations of these repressed instincts. The second theory that attempts to explain the specific content of pollution-belief systems (as opposed to the social effects of those beliefs) maintains that, in a very broad sense, things are considered polluting by virtue of their relationship to cultural classification. This theory holds that everything considered polluting in any culture either is anomalous in relation to basic cultural categories or is positioned at the extremities—*i.e.*, the margins—of major conditions or situations of individual or social existence. Birth and death, for example, are at the margins of an individual's life, and the lower castes are at the margin of society.

Both of these theories, however, contain certain problems that may be resolved by subsuming them under a more general theory. The theory derived from psychological considerations is regarded by many scholars as being too narrow in scope because it ignores many types of pollution data; the theory based upon cultural classification, because it is capable of such broad interpretation, loses its coherence as a theory. A more general view incorporates these two theories within a single more fundamental one based on denial. Thus, pollution fears might be interpreted as symbolizations of any material that is denied full expression—psychologically, culturally, or socially. The Freudian theory, emphasizing the psychoanalytic notion of repression of instinctual drives, thus becomes significant in interpreting the first two categories—physiological processes and aggression (*i.e.*, violent emotional processes). The classification theory, which emphasizes cultural attempts to ignore or suppress phenomena that do not fit its cognitive-classification schemes, then becomes significant in interpreting the third category of polluting things—*anomalies, unusual occurrences or types of persons, and “mixings.”* To account for the fourth category, involving the fear of lower castes, classes, and ethnic groups as polluting, the sociopolitical notion of oppression may thus be introduced. All these concepts—repression, suppression, and oppression—are related to the notion of something or someone being forcibly prevented from expression; that is, of being under some sort of pressure. This idea suggests why polluting things are viewed as threatening and not simply as interesting peculiarities of the world, because things under pressure are volatile, liable to escape, or capable of erupting at any moment.

TYPES OF PURIFICATION RITES

Occasions and symbolism of purification rites. Purification rites are required whenever there has been some kind of polluting contact. In addition, cultures may institutionalize regular, periodic purification rituals on the general principle that pollution occurs all the time. Important changes of status or quests for special or sacred status may be viewed as progressions from lesser to greater states of purity, and such changes or quests thus entail rites that promote the anticipated progressions. Purification is invariably required before any contact with the sacred. Purification also is generally considered necessary after any kind of traffic with the demonic forces and black magic, because these contacts with the nether realm are viewed as polluting experiences. Purification rites also may be required before undertaking a major endeavour in order

Psycho-analytic and social classification theories

Rites before or after contact with the sacred

to ensure the participant's success and a right relationship with the special powers involved in the project.

Though every culture has rituals to rectify unavoidable pollution, prescriptions of avoidance, abstention, separation, and seclusion are utilized to minimize contacts with polluting persons, objects, or places. Seclusion devices, which confine the very pure or the very polluted within an enclosed area away from other members of society, include menstrual huts, nuptial huts, and birth huts. Initiates are generally confined to special houses or isolated from the community by living for certain required periods of time in the bush or forest. Priests often withdraw to the inner rooms of temples to prepare for or to participate in contacts with the sacred; monks and nuns confine themselves or are confined to monasteries in order to remain undefiled by the world, among other reasons. Seclusion or containment may also be symbolically effected by the use of veils or by the drawing of circles or other enclosures around the object in question. Under the general heading of segregation, groups of different grades of purity may retire to their respective parts of a town when their periods of contact with other members of their community are completed for the day. Men may have special houses for their esoteric activities from which women are excluded. Impure persons may be required to cook over a separate fire; persons of different grades of purity often are not permitted to eat together, to sleep under the same roof or in the same room, and, almost universally, to marry or have sexual relations with one another. Finally, complete abstention, for a fixed period of time, from such polluting activities as sex, eating, and other sensuous indulgences is a significant aspect of purification processes in many societies around the world.

Classification of purification rites. Various kinds of avoidances and abstentions represent the passive aspect of purification. The active aspect consists of the purification rites themselves. Such rites may be classified according to the principle on which they operate.

The removal of pollution. Based on the analogy of cleansing outer dirt or stains by means of bathing or washing in everyday life, purification of man's inner state of being is almost universally believed to be effected by rituals involving various forms of washing. The polluted individual might be required to swim or bathe in the sea, a river, a pond, or special tank. Bathing in swift-flowing streams is often considered especially effective because the rapidly flowing water not only removes the impurities but carries them away. A polluted person might wash his entire body with water or only certain parts of the body that represent the body or person as a whole—rinsing or cleaning the mouth by other means is common. Water may be poured, sprinkled, thrown, or blown upon a polluted person or object. Simply touching water is a purifying gesture in the Vedas; gazing at it is considered purificatory in Sri Lanka (Ceylon). In the absence of water various kinds of moist substances may be used—clay, mud, wet herbs, or plants. The Qur'an (the Islamic sacred scriptures) directs desert dwellers and travellers to rub themselves with high clean soil because of the scarcity of water. In cultures in which saliva is not considered polluting, expectorating or breathing on something may be viewed as purificatory gestures.

Other modes of purification based on the analogy of cleansing outer dirt include: the use of wind or aeration to blow or carry away the impurities; sweeping a house or certain area of the ground or brushing the polluted person or object, often with a brush made of fibres from a symbolically pure source; scraping the surface of a polluted object or utensil; shaving and cutting the hair and nails; removing clothing and washing it or destroying it; and putting on clean or new clothes.

The expulsion of pollution. Based on the analogy of expelling internal physical poisoning or corruption, a second category of purification rites involves the actions of expelling, ejecting, purging, or drawing out the pollution from the defiled person or object. The use of purgatives in purification rites to induce vomiting is not uncommon. Sweat baths and steam baths are believed to bring the impurities out of the person as symbolized by the emerging sweat. Some purification rites involve bloodletting in

order to drain out impurities. The use of salt in some rites may be based on the fact that salt has drawing or draining properties. In corporate acts of expelling pollution, an entire community may purge itself of a polluted individual in its midst by excommunicating him and forcing him to leave the religious group, caste, tribe, or area.

The transfer of pollution. Closely connected with the practice of drawing pollution from the defiled person or object is the notion that pollution may be transferred from a person or community to another object that is either immune to pollution itself or that can be discarded or destroyed. The most dramatic rites embodying this principle are scapegoat ceremonies in which pollution is transferred to an animal or person by either touching, bathing with, or simply pronouncing the pollution transferred to the scapegoat. The scapegoat is then run out of town or killed, actually or symbolically. The victim may further be made into an offering or sacrifice to the gods on the general ritual principle of keeping the gods satisfied. In the classic scapegoat ceremony of the Old Testament, as noted in Leviticus, chapter 16, the animal—called Azazel (a desert demon)—was simply released to wander the wilderness; in Bali (in Indonesia) birds act as scapegoats and are then released to fly away.

Less dramatically, pollution may be transferred to a relatively worthless talisman (charm). Some talismans are regarded as convenient because they are disposable and of little value; after they have served their purposes in specific situations they are thrown away. In Bali a three-month-old child is purified by transferring his impurities to a chicken; this chicken may then become his pet and continue to absorb the pollutions to which the child is exposed. It may never be killed or eaten, and when it dies it is buried with respect.

The destruction of pollution. Pollution is also believed to be eliminated by destroying the polluted object. The killing of the scapegoat belongs to this general category; more dramatically, a severely polluted person may himself be killed rather than being allowed the opportunity to transfer his impurities onto a more dispensable animal or object. The execution of a polluted person or a scapegoat animal often takes the form of drowning, choking, suffocating, or clubbing so that the pollution might not escape with a flow of blood. Polluted metal objects may be melted down; polluted fires are extinguished; polluted clothing, utensils, and other items are torn, broken, and often buried.

The most common means of destroying pollution is by burning the polluted objects. Fire is a most efficient destroyer; when the flame no longer exists there is virtually nothing left of the objects. Fire is generally conceived, however, as having more positive purifying properties, not only destroying pollution but creating purity.

The transformation of pollution into purity. Fire is perhaps one of the most symbolically complex phenomena in the history of human culture. It renders raw meats and vegetables into cooked and edible food, base minerals into useful and durable metals, and porous dirt and clay into watertight pottery. It destroys the forests and brushlands, but its ashes make the earth fertile and productive. Fire is thus viewed as a powerful transformer of the negative to the positive. Because of such properties, fire is commonly found in purification rites throughout the world. Polluted persons may be required to walk around, jump over, or jump through fire. Polluted items may be singed, fumigated, or smoked. The widespread use of incense smoke in purification rites is based on the transforming powers of fire, as well as on the additional purificatory powers of sweet smells. Polluted persons or things may be rubbed with ashes or soot, and polluted objects may be boiled, subject to the double purificatory powers of fire and water. Exposure to sun and to intense heat are also regarded as practices falling into this same general category. The extinguishing of old fires in temples and villages and the kindling of new ones are common practices after a death or as part of annual renewal and purification ceremonies. Alchemic experiments, which attempt to purify mineral substances and turn them into gold, involve boiling or melting down the solution or elements over pure and

and
objects of
pollution-
destroying
rites

Rites of
cleansing

Phenomena viewed as intrinsically pure

intense heat and then recrystallizing them in newer and higher forms (see also OCCULTISM; TAOISM).

The introduction of purity. In addition to the cleansing, purging, destruction, and transformation of pollution, most purification rites involve the positive introduction of purity. Many phenomena are considered inherently pure; ingestion of, or contact with, or simply exposure to such phenomena is believed to bring purity to the object of the ritual.

Objects, activities, or persons commonly considered to have intrinsic purity cross-culturally include: fire; water; sweet smells created by flowers, fragrant plants and herbs, perfumes, fragrant oils, or incense; milk, ghee, and other dairy products; white objects; earth in its natural form; sacred objects (e.g., relics) and sacred personages (e.g., priests); the recitation of spells, incantations, and names of gods; magical amulets and stones; gold and, in one culture or another, silver, bronze, jade, and crystal; virgins; the right as opposed to the left side of things in many cultures (e.g., the Abaluyia of Kenya); morning, sunshine, and daylight as opposed to darkness; whole or perfect objects, including circles and wheels and perfect numbers—e.g., the number nine (because the digits of any of its square products always add up to nine) or four (because quaternity is viewed as perfection); and physically perfect specimens of their species. In addition, cultures idiosyncratically define certain things as pure because of special cultural associations: cow dung and cow urine are pure in Hinduism because of the sacredness of the cow; dogs are considered to be pure in Zoroastrianism (a religion founded in the 6th century BC by the Iranian prophet Zoroaster) because as scavengers they purify the world for everyone else (most cultures view dogs as impure because of their scavenging habits); and all cool things are considered pure among the Lovedu of the Transvaal because pollution is associated with heat.

Use of pollution to achieve purity

Other purification rites. Purification practices in which pollution is introduced qua pollution in order to achieve purity are also found in various religions and cultures. These rather paradoxical practices work on several different principles. The use of garlic, sulfur, or an amulet made of impure materials apparently operates on the principle of like attracting like; the impure amulet draws the impurity encountered in some situation toward itself, thus preventing it from polluting the wearer of the charm. Another set of practices apparently works on an inoculation principle—a baby, a magical implement, or a special work area may be briefly exposed to menstrual blood, for example, to protect it against future pollution from the same kind of item. A third group of such paradoxical practices, found primarily in Asian religions, involves immersing oneself in what is viewed as utter pollution, either by meditating on foul things or by actually keeping oneself permanently unclean, in order to achieve transcendence over pollution. Ordeals, mutilations, and blood rituals in general may also be regarded as fitting the transcendence pattern.

In highly developed and elaborated systems of thought, purity and pollution meet and merge. Buddhist monks are considered to be extremely pure, yet they are directed to make their robes from cemetery cloths, and beds or litters used in funerals may be donated to their monasteries. Buddhist relics with great purifying power are often composed of bits of hair, nails, and bones (albeit of the Buddha or other great saints); in Sri Lanka the word (*dhātu*) for such relics is the same as the word for semen. Monks and nuns of Jainism (an Indian religion founded by Mahavira in the 6th century BC) are ordered not to bathe and under no circumstances to clean their teeth. In Hinduism, if a Brahmin (a member of the highest caste) enters a street of the untouchables (outcastes), he is polluted, but the whole street also falls prey to disease, famine, and sterility. In a Burmese folktale, an alchemist became discouraged with his experiments and threw his alchemic stone into a latrine pit; on contact with the excrement, the stone achieved purity—thus indicating that contacts with pollution may bring about purity.

Many rituals considered to effect purification do not utilize any of the specific purifying techniques outlined above. They simply make use of techniques believed

to have generalized ritual efficacy, no matter what the disorder. Thus, some purification rites involve reversals, especially reversals of roles between men and women, on the general principle that they represent a return to chaos and then a change back to order. Another widely practiced ritual principle involving the symbolism of reversal is that of death and rebirth; man and the world, with all their disorders, are symbolically put to death and then symbolically renewed in a purer and better state. Because blood is associated with both life and death, the use of blood in purification rites is often central to the symbolic renewal process. Nearly all rituals involve the reading or reciting of spells, texts, or prayers that have a generalized efficacy over negative forces, and in many cases purification may be accomplished by these means without any further symbolization of cleansing or a recreation of purity. When pollution becomes one of many possible offenses against the gods, purification may be accomplished simply by making sacrifices or offerings to the gods. Pollution often becomes identified with immoral or sinful behaviour and in such instances purification may be effected by punishment of the offender, by the offender's spiritual atonement, or by acts of penance and virtue, such as giving alms. Purity also may become identified with the struggle against the demonic forces, and in this transcendent dimension purification is effected in rites of exorcism or in rites that placate the demons. The use of weapons in purification rites is often based on a symbolic battle with the forces of evil; the use of firecrackers in some purification rites is viewed as a means of frightening away the demons; the use of curses, abuse, ridicule, and ribaldry in purification rites among the ancient Greeks, for example, was regarded as forms of protection against the demons. Some purification rites involving blood are structured in terms of giving demons what they want in order to turn away their polluting presences (see also *Sacrifice*, above).

Ritual renewal and sacrificial rites

EXAMPLES OF PURIFICATION RITES

Most full-scale purification rites combine several of the principles outlined above. A few of the immense number of complex purification rites in the religions and cultures of the world follow.

Rite for purifying a cured leper in ancient Judaism. In the Old Testament purification rites for a person who has been cured of leprosy, as described in Leviticus, the leper and the priest meet outside the camp, and the priest examines the man to ascertain that he is cured. The priest then calls for two live, clean birds, cedar wood, a scarlet item, and hyssop (an aromatic herb). One of the birds is killed in an earthen vessel over running water. The live bird and the other ingredients are then dipped in the blood of the dead bird and used to sprinkle blood seven times upon the leper while the priest pronounces him clean. The live bird is then allowed to fly away. The leper washes his clothes, shaves off all his hair, and washes himself, after which he is allowed to enter the camp, although he must remain outdoors for seven days. On the seventh day he once again shaves off his hair, including his eyebrows, and washes his clothes and body. On the eighth day he goes to the temple to make various offerings to the Lord. The priest then takes some of the blood of one of the offerings and places it on the man's right ear, thumb, and large toe of the right foot, after which he does the same with some oil that is being offered, also pouring some oil on the man's head. The sacrifices are then offered to the Lord upon the altar, thus completing the required ritual: "the priest shall make atonement for him, and he shall be clean."

The Navajo sweat-emetic rite. The Navajo sweat-emetic rite is part of most major Navajo ceremonials for curing illness or rectifying other ritual disturbances. It is specifically viewed as a rite of purification.

A ritual hut is prepared with sand paintings, and a fire is then built. A procession of patients, led by the chanter, enters the hut and circumambulates the fire, pausing at each of the four directions to sing an appropriate chant. In some cases there is fire jumping; the men are required to jump over the fire, and the women to walk as close to it as possible. The audience then enters, with men and

women sitting in segregated groups. The chanter heats wooden pokers in the fire and applies them to himself, mainly on the legs, and then to all the patients. Basins in front of each patient are filled with the emetic formula, the fire procession is repeated, and the emetic is then drunk. Everyone is expected to vomit; if they do not, it is regarded as inauspicious. Vomiting is done into receptacles containing sand, and the contents of these receptacles may then be sprinkled with ashes from the pokers. A bullroarer (a heavy stone on a string that produces a deep roaring sound when whirled) is sounded outside six times and then brought in and applied to the patients. The audience leaves the hogan (hut) in procession, this time led by assistants who carry out the basins with their contents. The contents of the basins are deposited neatly in a row outside the hogan and allowed to be dispersed by the natural elements. The patients, however, remain inside the hogan, perspiring in the heat. Later, the audience re-enters; the fire is broken up and extinguished, and all remnants of it are removed to a place near the basin area. The chanter sprinkles all present with a medicinal lotion and then fumigates everyone with incense. All then leave in procession and dress outside.

The Zoroastrian "Great Purification" rite. The "Great Purification" rite (*baresnum*) of Zoroastrianism originally was intended for purification from serious polluting contacts, especially for corpse bearers after contact with death. The rite was later pre-empted for initiation into the priesthood, or for attaining higher statuses within it.

In preparation for this rite a priest seeks a piece of ground regarded as clean (*i.e.*, dry and unfrequented by men or animals). He then cuts down any trees located on the area selected. Nine pits are dug in a certain arrangement; furrows are drawn around three, then around six, and finally around all nine pits. Thereafter, the whole area is covered with sand. After these activities have been completed, the priest stands outside the outer furrow, and the subject requiring purification advances to the first pit and is told to recite praises to the "Purity of Thought." The priest, holding a stick with nine knots and with a spoon fastened to the end, uses the spoon to pour consecrated cow's urine (*gomez*) upon the hands of the subject, who washes his hands with the urine three times. He then washes his entire body with *gomez*, progressing from the head down to the feet. The pollution is said to leave the toes in the form of a foul-smelling fly. After the one seeking purification has washed himself with *gomez*, the priest recites purifying formulas. This process is repeated at each of the first six pits; at a prescribed distance from the seventh pit, the subject sits down and rubs himself 15 times with sand, making sure that he is completely dry. At the seventh pit he washes his body once, from head to toe, with water; at the eighth pit he does this twice and at the ninth pit three times. His body is then fumigated with the smoke of fragrant wood, after which he dresses in clean clothes. In certain versions of the ceremony, a dog is presented to the candidate, who, after each washing at each pit, must touch the left ear of the dog with his left hand. At the end of the ceremony the candidate is required to recite the following formula: "The Evil Spirit of pollution is put down. The head and the body have become purified. The soul has been purified. The dog is holy, the priest is holy."

The candidate then retires to a house and is required to have no contact with fire, water, cultivated land, trees, cattle, men, or women. On the fourth, seventh, and tenth days he again bathes with *gomez* and then with water. After the final bath he is considered "perfectly purified."

POLLUTION BELIEFS IN MODERN SOCIETY

Pollution beliefs and fears occur in modern society as well as in any other, although they are not systematized and usually not understood as such. Racism and other forms of prejudice apparently play upon pollution fears. Of less serious consequence are such notions that warts result from masturbation (traditionally considered a polluting or impure practice in conventional Western societies), that there is something dangerous or polluting in intercourse with menstruating women, and that (as in a New York state law) men and women should not have their hair cut

or beauty services performed in the same room. Physiological processes (*e.g.*, urination and other forms of elimination) are often viewed with disgust, and as a result many modern notions of sanitation are based on not entirely rational principles. The highly developed mortuary profession (especially in Western countries) protects persons in contact with death not only from grief but probably from pollution fears as well. On the whole, however, there are fewer pollution beliefs in modern society than in traditional societies. This trend may be attributed in part to the assimilation of these beliefs into moral and religious concepts. (S.B.O.)

Dietary laws and food customs

Like all other biologically and physically necessary things and acts, food and eating are always surrounded by social regulations that prescribe what may or may not be ingested under particular social conditions. These prescriptions and proscriptions are sometimes religious; often they are secular; frequently, they are both. This section surveys the variety of laws and customs pertaining to food materials and the art of eating in human societies from earliest times to the present. It will be seen that behaviour in respect to food—whether religious, secular, or both—is institutionalized behaviour and is not separate or apart from organizations of social relations.

By an institution is meant here a stable grouping of persons whose activities are designed to meet specific challenges or problems, whose behaviour is governed by implicit or explicit rules and expectations of each other and who regularly use special paraphernalia and symbols in these activities. Social institutions are the frames within which man spends every living moment. This survey explores the institutional contexts in which dietary laws and food customs are cast in different societies; the attempt will also be made to show that customs surrounding food are among the principal means by which human groups maintain their distinctiveness and help provide their members with a sense of identity.

Other points of view about food customs cover a wide range. What may be labelled an ecological approach suggests that food taboos among a group's members prevent over-utilization of particular foods to maintain a stable equilibrium in the habitat. Recently, investigators of such customs have been exploring the hypothesis that they provide an adaptive distribution of protein and other nutrients so that these may be evenly distributed in a group over a long period instead of being consumed at one time of the year. The ecological approach also suggests that many food taboos are directed against women to maintain a low population level; this seems to be an adaptive necessity in groups at the lowest technological levels, in which there is a precarious balance between population and available resources.

There are also psychological approaches to food customs. Psychoanalytic writers speculate that food symbolizes sexuality or identity because it is the first mode of contact between an infant and its mother. This point of view is most clearly exemplified in ideas that attitudes toward food, established early in life, tend to shape attitudes toward money and other forms of wealth and retentiveness or generosity. According to Claude Lévi-Strauss, a French anthropologist, the categories represented in food taboos enable people to order their perceptions of the world in accordance with the principle of polarities that govern the structure of the mind. Thus, they aid in maintaining such dichotomies as those between nature and culture or between man and animal.

NATURE AND SIGNIFICANCE

There are no universal food customs or dietary laws. Nor are food customs and dietary laws confined to either preliterate ("primitive") or advanced cultures; such regulations are found at all stages of development. Nevertheless, different types of regulations in respect to food are characteristic of groups at different levels of cultural or socio-technological development.

Each society has attached symbolic value to different

Theoretical approaches to food customs

foods. These symbolizations define what may or may not be eaten and what is desirable to eat at different times and in different places. In most cases, such cultural values bear little relationship to nutritive factors. As a result, they often seem difficult to explain. Moreover, dietary customs and laws are resistant to rational argument and change. For example, experts from health and nutritional agencies find it difficult to persuade mothers to give cow's milk to children in societies in which it is looked upon as undesirable. Such customs and laws also prevent people from adopting alternative foods during periods of shortage. During and after World War II, some Indians refused to eat Western wheat and rioted and died rather than accept it.

Food as a material expression of social relationships. Cutting across dietary laws and customs is the more general association of food and drink with those social interactions that are considered important by the group. In many societies the phrase "We eat together" is used by a man to describe his friendly relationship with another from a distant village, suggesting that even though they are not neighbours or kinsmen they trust one another and refrain from practicing sorcery against each other. Among the Nyakyusa of Tanzania, "for conversation to flow merrily and discussion to be profound, there must be . . . 'the wherewithal for good fellowship,' that is, food and drink—and very great stress is laid on sharing these." In Old Testament times, almost every pact, or covenant, was sealed with a common meal; eating together made the parties as though members of the same family or clan. Conversely, refusal to eat with someone was a mark of anger and a symbol of ruptured fellowship. Eating salt with one's companions meant that one was bound to them in loyalty; references to this are found in the New Testament.

Such sentiments, however, are not confined to tribal or ancient cultures. In Israeli kibbutzim (communal settlements), the communal dining room is a keystone institution, and commensality is one of the hallmarks of kibbutz life. The decline of communal eating and the increasing frequency of refrigerators, cooking paraphernalia, and private dining in kibbutz homes is regarded by some observers as a sign of the imminent demise of kibbutzim. In many U.S. communes there is a single facility for cooking and dining. Dinners must be taken communally; private dining is taken as a signal that one is ready to leave the group.

The provision of food and drink, if not actual feasting, is characteristic of rites of passage—*i.e.*, rites marking events such as birth, initiation ceremonies, marriage, and death—in almost all traditional cultures and in some modern nontraditional groups as well. The reason for this is that these events are regarded as being of importance not only to the individual and his family but also to the group as a whole because each event bears in one way or other on the group's continuity.

Furthermore, food and drink are almost universally associated with hospitality. In most cultures, there are explicit or implicit rules that food or drink be offered to guests, and there are usually standards prescribing which foods and drinks are appropriate. Reciprocally, these sets of rules also assert that guests are obligated to accept proffered food and drink and that failure to do so is insulting. In many societies, there are prescribed ritual exchanges of food when friends meet. Food is thus one of the most widespread material expressions of social relationships in human society.

Regulations about the quantity of food and drink consumed. It is extraordinarily rare for cultures to condone gluttony, the conventional exaggerations of the eating behaviour of the ancient Roman elite notwithstanding. Most people cannot afford to be gluttons. There are more examples of the other extreme, asceticism, though these too are infrequent.

A clear-cut example of gastronomic asceticism is provided by Indians of the U.S. Northeast, such as the Micmac, Montagnais, and Ojibwa. It was an ideal among them to eat sparingly. Preparation for this attitude began in early childhood with short fasts of a day or two, culminating in the puberty fast; the latter lasted about 10 days, during which time the child was isolated in a tiny

wigwam without food or water. The puberty fast also had important religious significance. During the fast, the child had to supplicate the deities for a vision (easily induced under such conditions), which came in the form of a supernatural figure, usually in animal shape; this was to become his guardian spirit.

Rules pertaining to drink are even more varied. Tribal groups throughout the world (except in Oceania and most of North America) knew alcohol; in each case, this led to the adoption of rules concerning its use.

Although a high intake of alcohol always has physiological effects, people's comportment is determined more by what their society tells them is the way to behave when consuming alcohol than by its toxic effects. In many societies, drinking is an established part of the total round of social activities. Robert McC. Netting, a U.S. anthropologist, observed that the Kofyar of northern Nigeria "make, drink, talk, and think about beer." All social relations among them are accompanied by its consumption, and fines are levied in beer payments. Ostracism takes the form of exclusion from beer drinking; they "certainly believe that man's way to god is with beer in hand." Their beer, however, is weak in alcoholic content and is quite nutritious, and they rarely consume European beer and never distilled liquor. Among Central and South American peasants, men are allowed or required to drink themselves into a state of stupefaction during religious celebrations (fiestas); though this drinking is frequent and heavy, it does not appear to result in addiction. Representative of the other extreme are the Hopi and other Indian tribes of the U.S. Southwest who have banned all alcoholic beverages (and almost all narcotics), asserting that these substances threaten their way of life.

Most cultures, however, prescribe moderation in drinking. In ancient Mesopotamia, beer played an important role in temple services and in the economy; but the code of Hammurabi—the monument of law named after the king of Babylon—strictly regulated tavern keepers and servants (these places were supposed to be avoided by the social elite). Similar patterns obtained in ancient Egypt. The ancient Greeks sought to attribute their intellectual and material culture to the introduction of vine and olive growing. The use of wine was quite general in biblical times; it belonged to the category of indispensable provisions listed in the Old Testament in the Book of Judges (chapter 13) and the First Book of Samuel (chapters 16 and 25). Wine was no less important in New Testament times; in Revelation to John (chapter 6) it is said that only wine and oil are to be protected from the apocalyptic famine. Wine is also frequently used in biblical imagery. In both Testaments, however, wine is both praised and condemned.

Use of food in religion. The most widespread symbolic use of food is in connection with religious behaviour. In fact, eating and drinking are minimal elements in most religious behaviour and experience, whether in eating, sacrifice, or communion. According to many anthropologists, there are essentially two reasons for this. First, religion is one of the systems of thought and action by which the members of a group express their cohesiveness and identity. Implicitly or explicitly, the members of every cultural group assert that its unity and distinctiveness derive from the deity or deities associated with it. Religion is a tie that binds. But no symbolic activity in human society stands alone and without material representation. Like all other symbolizations of institutional relationships, those of religion must also have substantial form. Food and drink—and their ingestion—are among the most important substances of religion.

The second reason, closely related to the foregoing, is that one element of dogma in every religion is the definition of polluting, or supernaturally dangerous, objects or personal states. Just as there is no objective or scientific connection between the nutritive qualities of different foods and the symbolic values attached to them, there is no objective relationship between an object or a personal state and its definition as polluting. Cultures vary in the objects and states that are defined as defiling, such as saliva, sneezing, menstruation, killing an enemy in warfare, a corpse,

Alcoholic
beverages

Reasons
for
symbolic
use of food
in religious
behaviour

The
common
meal

parturition, but cutting across these is the belief held in every religion that there are foods and drinks that are polluting or defiling.

As Mary Douglas, a British anthropologist, has suggested in her analysis of the religiously sanctioned food taboos in Leviticus (chapter 11) and Deuteronomy (chapter 14), *Purity and Danger*, concepts of pollution and defilement are among the means used by preliterate or tribal societies to maintain their separateness, boundedness, and exclusivity; thus, these concepts and rules contribute strongly to the sense of identity—the social badges—that people derive from participation in the institutions of their firmly bounded or encapsulated groups. More concretely, when a person proclaims his affiliation with and allegiance to a particular group that he regards as his self-contained universe and beyond whose margins he sees danger, threat, and alienation, he simultaneously invokes—explicitly or implicitly—the many badges of his social identity; these include the totem (*i.e.*, the emblem of a family or clan) that he may not eat, the foods that are regarded as defiling, the drinks that he must avoid, the sacred meals in which he participates, and the other rituals associated with his exclusive group. He thereby asserts his separateness from people in all other groups—usually referred to in pejorative terms—and his identification with the members of his own group. Food customs are not always formalized, however; they are sometimes cast in terms of preference. Americans, for example, unless they are members of ethnic or religious groups that have their own dietary laws, often shun the “exotic” foods of alien cultures; but these avoidances are not phrased in religious or other institutional terms.

LAWS AND CUSTOMS AT DIFFERENT STAGES OF SOCIAL DEVELOPMENT

Although there are dietary laws and customs in all societies, groups differ in this regard in two important ways: in the range or extent of foods that are defined as polluting or tabooed and in conceptualizations of the consequences resulting from violations of these laws and customs. In comparing societies, however, it must be remembered that the range of variability among them is so great that it would be necessary to list hundreds of societies and their customs to get a complete and detailed picture of their food customs and laws. For purposes of both economy and conceptual coherence it is necessary to group societies into levels, or stages, of social and technological development and to compare these; in this approach, individual societies are regarded as special or particular exemplary cases of the general class of the level of development in which the groups are found or classed.

Hunter-gatherers. The earliest cultural level that anthropologists know about is generally referred to as hunting-gathering. Hunter-gatherers are always nomadic, and they live in a variety of environments. Some, as in sub-Saharan Africa and India, are beneficent environments; others, such as those of the Arctic or North American deserts, are harsh and dangerous. Encampments of hunter-gatherers are usually small (generally fewer than 60 persons) and are constantly splitting up and recombining. An important rule among almost all hunter-gatherers is that every person physically present in a camp is automatically entitled to an equal share of meat brought into the group whether or not he has participated in the hunt; this rule does not usually extend to vegetables or fruits and nuts.

It may be thought that hunter-gatherers who live in habitats of scarcity and in which hunting is dangerous would try to make maximum use of all potentially available food; they are, however, also characterized by customs and beliefs that proscribe certain foods or at least limit their consumption. Many Alaskan Eskimo groups, for instance, make a sharp distinction between land and sea products; the Eskimo believe that products of the two spheres should be kept separate, maintaining that land and sea animals are repulsive to each other and should not be brought together. Thus, for example, before hunting caribou (a spring activity), a man must clean his body of all the seal grease that has accumulated during the winter; similarly, before whaling in April, the individual's body must be

washed to get rid of the scent of caribou. Weapons used for hunting caribou should not be used at sea; implements used at sea, however, may be used to hunt caribou. If these rules are violated, the hunter or whaler will be unsuccessful in his food quest; the consequences of this, of course, can be dire.

In addition, the Eskimo observe food taboos in connection with critical periods of the individual's life and development. Among the most outstanding of these are the food taboos that a woman is subject to for four or five days after giving birth. She may not eat raw meat or blood and is restricted to those foods that are believed to have beneficial effects on the child. For example, it is felt that she should eat ducks' wings to make her child a good runner or paddler. Because the Eskimo are often beset by food shortages, they sometimes have to eat forbidden foods. In such cases, there are several things that a person can do to neutralize the taboo. He first rubs the forbidden food over his body and then hangs the meat outside and allows it to drain. Another act that is regarded as particularly efficacious is to stuff a mitten into the collar of his parka with the hand side facing outward; it is believed that the harmful effects of the taboo food go into the mitten and travel away from him.

There are, of course, other food avoidances observed by the Eskimo, but these examples will suffice to illustrate the basic principles of dietary customs and laws among hunter-gatherers. First, the taboos are always thought to have magical consequences for the individual; observing them will assure health and strength, violating them will result in illness and weakness for the person or, in the case of a parturient mother, for her child. Second, food taboos are generally associated with critical periods during the life cycle, as in pregnancy, menses, illness, or dangerous hunts. Third—and this is true of almost all societies, not only those of hunter-gatherers—in every group's system of thought there are categories or types of foods that are regarded as dangerous, defiling, or undesirable. At first glance, these rules and customs seem arbitrary and capricious, but evidence is accumulating that there are rational elements in them. Although it would be difficult in the present stage of knowledge to apply this principle to every dietary taboo or custom in every society, it seems that prohibitions are placed on those foods that are the most difficult and dangerous to procure. Sometimes, however, these foods are also highly prized.

Corporate kin groups. With the development of corporate kin groups in social history, largely (but not exclusively) as an accompaniment of horticultural cultivation, a significant change occurred in the role of food in institutional life. Underlying the development of corporate kin groups was the development of the notion of exclusive rights to territory claimed by a group of kinsmen. This exclusive territoriality was probably designed, in large measure, to protect investments of time and effort in particular plots. The solidarity and sense of kin-group exclusiveness implicit in a corporate kin group grew out of kin-group ownership of the land and the individual's reliance on interhousehold cooperation in his productive activities. Such groups quickly evolve insignia, rules, and symbols that represent their ideals of exclusivity and inalienability of social relations; food plays an important role in this. Hence, taboos are thought to have consequences for the group as a whole rather than for the individual alone.

Another significant accompaniment of the development of corporate kin groups is the elaboration of initiatory rites, which mark an individual's transition from childhood to full membership in his community or kin group; they confer citizenship in the fullest sense of the term. Such events are celebrated by feasts, reciprocal exchanges of food, and food taboos, in addition to the ceremonial rituals themselves. Preparations for these feasts sometimes occupy the group for several months, especially when it is necessary to acquire from relatives and friends the animals that will be slaughtered and eaten, because it is rare for one family, or even one village, to own enough animals for a proper feast. They lay the groundwork for one of the basic rules of the group into which the individual is being initiated, namely, that the distribution of food (and

Territorial rights and initiatory rites

interhousehold cooperation in its acquisition) is one of the most significant ways in which he and the members of the group are knit together.

Feasting is also an integral element of religious assemblages and ritual in these societies, as are offerings to deities, whether spirits or ancestors. Because one of the main purposes of religious activity is to symbolize the solidarity of the group, food is used as a material representation of this cohesiveness. Additionally, it is believed in almost all tribal societies, whether or not they are characterized by corporate groupings, that all plant and animal foodstuffs are made available to man through the beneficence of the gods. Man's relationship with the deities in tribal societies is always, in part, an economic one involving the deities' provision of food. A gift from the gods must be balanced by a reciprocal gift to them from their adherents. In prayer, men thank their deities for these gifts; in sacrifice and offerings, they offer gifts to their deities.

Chiefdoms. The next major social and political developments in human history are the appearance of institutions in which political and economic power is exercised by a single person (or group) over many communities. Often referred to as chiefdoms by anthropologists, this development signalled a process evident today throughout the world, namely, the steady growth of centralized power and authority at the expense of local and autonomous groupings.

Political authority in chiefdoms is inseparable from economic power, including the right by rulers to exact tribute and taxation. One of the principal economic activities of the heads of chiefdoms is to stimulate the production of economic surpluses, which they then redistribute among their subjects on different types of occasions, such as feasts in the celebration of religious ceremonies and rites of passage of members of chiefly families, and during periods of famine. The accumulation of these surpluses requires conservation policies. Because techniques of food preservation were poorly developed in preliterate chiefdoms, the heads of chiefdoms often adopted the policy of placing taboos—often phrased in religious terms—on different crops or areas where food could be gathered or hunted, forbidding the consumption of such foods until the prohibitions were lifted. These taboos, however, were not exclusively for the purpose of conservation; they were also occasionally designed to underwrite higher standards of living for the chiefs themselves. For instance, in some Polynesian societies, as in Samoa, fishermen were required to obey a taboo that a portion of their catch must be given to the chief. The penalties for violating such taboos were supernaturally produced illness or other misfortunes.

Complex societies. As societies became increasingly complex, heterogeneous, and divided along lines of caste, class, and ethnic affiliation, their dietary customs became correspondingly less uniform because they mirrored these divisions and inequalities. Although these distinctive customs are almost always placed in the context of religious belief and practice, according to many anthropologists, the dietary observances in everyday behaviour are primarily shaped by economic and social considerations; moreover, observances at the village level rarely correspond directly to formal prescriptions and proscriptions.

The dietary laws and customs of complex nations and of the world's major religions, which developed as institutional parts of complex nations, are always based on the prior assumption of social stratification, traditional privilege, and social, familial, and moral lines that cannot be crossed. Taboos and other regulations in connection with food are incompatible with the idea of an open society. Nevertheless, complex nations were characterized by caste organizations that, in almost all cases, religion helped to legitimate. Caste systems, in addition to their other characteristics, are supported by deeply felt fears of pollution or contamination as a result of unguarded contact of the more "pure" with those who are less "pure."

Although there is no doubt that the development of caste is linked to some form of occupational separation in a society, which, in turn, leads to the development of ideas concerning the separation of unclean persons from the

ordinary or of the ordinary from the superpure, there is considerable controversy over the origins of caste systems. Regardless of the origins, however, the separation of castes is always mirrored in rules for eating that, when breached, represent a threat to the social order and to the individual's sense of identity. There is also a question among scholars whether or not caste is unique to India. Nevertheless, in Japan as well as India, eating together implies social and ritual equality, as it does in the United States, where, unlike Japan and India, food-related caste behaviour has not been institutionalized in religion (largely because of the U.S. history of religious freedom, which has promoted religious diversity). In India and Japan a person who cooks for another and serves his food must be equal or superior in rank to the recipient of the food; only in this way can the latter avoid pollution. By contrast, in the caste system of the United States before the civil-rights movement, a black might cook and serve food to, but not eat with, whites. Violation of these eating taboos constitutes defiance of caste, and observance of the etiquette is evidence of the acceptance of caste.

RULES AND CUSTOMS IN WORLD RELIGIONS

Judaism. Perhaps the best known illustration of the idea that the dietary laws and customs of a complex nation and its religion are based on the prior assumption of social stratification or, at least, of a sense of separateness, is provided by Judaism as spelled out in the Mosaic Law in the Old Testament books of Leviticus (chapter 11) and Deuteronomy (chapter 14). Prohibited foods may not be consumed in any form: all animals—and the products of animals—that do not chew the cud and do not have cloven hoofs (*e.g.*, pigs, horses); fish without fins and scales; the blood of any animal; shellfish (*e.g.*, clams, oysters, shrimp, crabs) and all other living creatures that creep; and those fowl enumerated in the Bible (*e.g.*, vultures, hawks, owls, herons). All foods outside these categories may be eaten.

Interpretation of Jewish laws. Mary Douglas has offered probably the most cogent and widely accepted interpretation of these laws in her book *Purity and Danger*. She suggests that these notions of defilement are rules of separation; they symbolize and help maintain the biblical notion of the separateness of the Hebrews from other societies. A central element in her interpretation is that each of the injunctions is prefaced by the command to be holy and that it is the distinction between holiness and abomination that enables these restrictions to make sense. "Holiness means keeping distinct the categories of creation. It therefore involves correct definition, discrimination, and order." The Mosaic dietary laws exemplify holiness in this sense. The ancient Hebrews were pastoralists, and cloven-hoofed and cud-chewing hoofed animals are proper food for such people; hence, Douglas maintains, they became part of the social order and were domesticated as slaves. Pigs and camels do not meet the criteria of animals that are fit for pastoralists. As a result, they are excluded from the realm of propriety. Douglas notes that there is remarkable consistency in Mosaic dietary laws. The Bible "allots to each element its proper kind of animal life. In the firmament two-legged fowls fly with wings. In the water scaly fish swim with fins. On the earth four-legged animals hop, jump, or walk. Any class of creatures which is not equipped for the right kind of locomotion in its element is contrary to holiness." People who eat food that is "out of place," as it were, such as four-footed creatures that fly, are themselves unclean and are prohibited from approaching the Temple.

There is, however, another dimension to Old Testament food customs. In addition to expressing their separateness as a nation—membership in which was ascribed by birthright—Israelite food customs also mirrored their internal divisions, which were castelike and were inherited. Though the rules of separation referred primarily to the priests, they also affected the rest of the population. The priest's inherent separateness from ordinary men was symbolized by the prescription that he must avoid uncleanness more than anyone else. He must not drink wine or strong drink, and he must wash his hands and feet before the Temple service. Explicit in Old Testament prescriptions is

Economic powers of the chief

Prohibited foods

Social stratification as basis for food customs

that an offering sanctifies anyone who touches it; therefore, often the priests alone were permitted to consume it.

These rules symbolizing the priestly group's castelike separateness also validated a system of taxation benefiting them, couched in terms of offerings, sacrifice, first-fruit ceremonies, and tithes. The religious rationalization of taxation is illustrated in the Old Testament by the first-fruits ceremony. Fruit trees were said to live their own life, and they were to remain untrimmed for three years after they were planted. But their fruits could not be enjoyed immediately: God must be given his share in the first-fruit ceremonies. These first fruits represent the whole, and the entire power of the harvest—which is God's—is concentrated in them. Sacrifice is centred around the idea of the first-fruits offering. Its rationalization was that everything belonged to God; the central point in the sacrifice is the sanctification of the offering, surrendering it to God. Its most immediate purpose was to serve as a form of taxation to the priests; only they were considered holy enough to take possession of it.

Elaboration of the Jewish laws. After the exile of the Jews from Palestine following the conquest by Rome in the 1st century AD, a remarkable elaboration in their dietary laws occurred, probably as a result of the Jews' attempts to maintain their separateness from nations into whose midst they were thrust. Many customs evolved that have taken on the force of law for those Jews who have sought to maintain a traditional way of life. For example, the Bible does not prescribe ritual slaughter of animals, yet this practice has taken on the same compulsion as the taboo on pigs and camels; a permitted food (e.g., cattle, chicken) that has not been ritually slaughtered is now regarded to be as defiling as pork. Similarly, one of the hallmarks of the Passover holiday in Judaism is the eschewal of all foods containing leaven, the consumption only of foods that have been designated as "kosher for Passover," and the use of special sets of utensils that have not been used during the rest of the year. But these, too, are postbiblical customs that have been given the force of law; the Bible prescribes nothing more than eating unleavened bread during the Passover season.

Shtetl
commu-
nities

Further elaborations on the Mosaic Law in regard to food can be observed in the dietary customs of certain groups of modern Jews in their daily lives. In the pre-World War II eastern European Jewish community (or *shtetl*), behaviour in regard to food not only included the biblical prescriptions and proscriptions but, in many ways, resembled the behaviour of people in the corporate communities of tribal societies. The major life crises were celebrated by feasts or other uses of food. Wine and other foods were integral parts of circumcision ceremonies and of a boy's attainment of ritual majority (Bar Mitzwa). Weddings were also celebrated with huge feasts that required weeks, if not months, of preparation, and guests were seated at the wedding feast according to their social rank. Following the wedding celebration, grain was sprinkled on the couple's heads, apparently to promote fertility. Those who visited mourners were to eat hardboiled eggs or other circular food because roundness symbolizes mourning.

Aside from the daily requirements of following the Mosaic dietary laws, which apply to everyone, the heaviest burden for maintaining these observances falls on the women; their ritual and secular statuses are always inferior to the men's. It is the task of the housewife to be sure that meat and dairy foods are not mixed, that ritually slaughtered meat is not blemished, and that cooking equipment and dishes and utensils for meat and dairy are rigidly separated. The only personal states of ritual pollution relating to food in *shtetl* culture also refer only to women. For instance, a woman who has not been ritually cleansed after her menses must not make or touch pickles, wine, or beet soup. If she violates this customary rule, it is believed that these foods will spoil.

"Hasidic"
Jews

A further illustration of the idea that dietary rules and customs are inextricably associated with the maintenance of group separateness is provided by one sect of Jews in the United States, those who refer to themselves as Hasidim (Pious Ones). These people live in self-contained enclaves; most of them are immigrants from the *shtetl*. In

addition to preserving their distinctiveness from surrounding non-Jewish communities, they are equally devoted to preserving their distinctiveness vis-à-vis other Jews; no matter what their degrees of piety, the latter are regarded by Hasidim as nonreligious.

This is clearly reflected in their behaviour in regard to food. The Hasidim assert that the larger Jewish community (and its rabbis) do not meet Hasidic standards and qualifications in the manufacture, preparation, handling, and sale of food; even non-Hasidic ritual slaughterers are classed with assimilated Jews who do not observe dietary laws at all. Hence, their food products are regarded as forbidden, and Hasidim consider only their own products as permissible for consumption. Even neutral foods, such as vegetables, are defined as nonkosher if handled by a non-Hasid since there is always the suspicion that it may come into contact with nonkosher—and thus contaminating—matter. Thus, for instance, only milk that they designate as "Jewish" can be used; only noodles prepared by someone from the Hasidic community may be consumed because there is the suspicion that eggs with a drop of blood (which are forbidden) may have been used in the noodles' preparation; only approved sugar may be used; and even paper bags that hold food come under these restrictions because only a member of the community is above the suspicion that forbidden matter has been included in the glue that is used in manufacturing the bags.

The extremity of Hasidic strictures with regard to food has to be viewed in the context of their setting in the United States and not only in the light of their Jewish sources. The Hasidim regard the growing secularization of U.S. life as the greatest threat to the perpetuation of the ancient tradition of Judaism; their extremism is the wall they have erected to stave off this danger of threatened assimilation.

Black Muslim movement. Until relatively recently, the separatism of U.S. Negroes was underwritten by an intricate combination of law and custom. The attempt of the United States government to achieve an integration of blacks and whites in daily social, economic, and political life was viewed by some Negroes as a threat to their social identity. Ideologies designed to legitimate the maintenance of their social identity began to develop, especially after the desegregation decision of the Supreme Court in 1954, the most notable of which is known as the Nation of Islam (the Black Muslims). In their attempt to separate themselves from the larger aggregate of U.S. Negroes, as well as from the rest of U.S. society, the Black Muslims sought to develop a separate social identity by adopting a set of symbols to which they attached particular meanings. A person's membership in the group not only depended on assuming a Muslim name but also on eating certain foods and avoiding others, including alcohol and tobacco. Forbidden foods include meats and fish proscribed by the Bible and Qur'an and also more than a dozen vegetables that were staples in the slave diet.

Islām. Islāmic dietary laws—as spelled out in the Qur'an—also illustrate their relationship to the establishment of a sense of social identity and separateness. Muḥammad, the founder of Islām, was among other things a political leader who welded a nation out of the mutually warring tribes of Arabia. His religious ideology legitimated the unification of these autonomous tribes and his own paramount rule over them. The main religious tenets of Islām were derived from Judaism and early Christianity, and it is clear from the Qur'an that Islām was intended to encompass all aspects of life.

Muḥammad apparently knew more about Judaism than about Christianity, and many of his strictures in the Qur'an were explicit in establishing distinctions between Arabs and Jews. This is evident in his dietary regulations, which borrow heavily from Mosaic Law. Specifically, Muḥammad proscribed for Muslims the flesh of animals that are found dead, blood, swine's flesh, and food that had been offered or sacrificed to idols. The most radical departure of Qur'anic from Mosaic dietary laws was in connection with intoxicating beverages. Though Jews frown upon alcoholic beverages, they do not forbid them, and wine is

Relation-
ship with
Judaism
and Chris-
tianity

an important element in many rituals and feasts; Muḥammad, however, absolutely forbade any such beverages.

Specific departures from Mosaic and Christian dietary rules notwithstanding, Islām represents a more fundamental removal from all other major religions: what is polluting, forbidden, and enjoined for one person in Islām applies equally to all. Islām's sharpest contrast in this regard is to the religions of India. This difference is highlighted by the fact that Muslims of all social statuses in an Indian village eat freely with each other, worship in the same mosques, and participate in ceremonies together.

Christianity. Christianity did not develop elaborate dietary rules and customs. This probably grew out of the controversy between the Judaizing and Hellenizing branches of the church during the earliest years of Christianity over whether or not to observe Mosaic food laws. The Council of Jerusalem settled on the formula that meat offered to idols, blood, and things strangled must be abstained from, thus freeing the Gentiles in all other respects from the law. The apostle Paul's position on the matter, however, was that "nothing is unclean in itself"; and it was thus that the New Testament repudiated the entire body of laws of purity, especially those pertaining to food. Jesus is said to have declared that defilement could not be caused by any external agent. The apostle Peter's vision of the sheet lowered from heaven and containing all types of animals that the divine voice pronounced clean and fit for food provided the church with a mandate to abandon the Old Testament food laws.

Last
Supper and
Eucharist

Food, however, in terms of the Last Supper and the Eucharist, plays an important role in Christianity. As told by the early Christians, Jesus foresaw his death and performed a simple ceremony during a last meal to bring home the significance of his death to the Twelve: he broke a loaf into pieces and gave it to them saying, "Take this, it is my body." After they had eaten, he took the cup of wine and said, "This is my blood."

During the 1st century AD, Christian communities developed into self-contained units with an organized life of their own. When they were beginning to see themselves as a church, they held two separate kinds of services: (1) meetings on the model of the synagogue that were open to inquirers and believers and consisted of readings from the Jewish scriptures and (2) *agapē*, or "love feasts," for believers only. The latter was an evening meal in which the participants shared and during which a brief ceremony, recalling the Last Supper, commemorated the Crucifixion. This was also a thanksgiving ceremony; the Greek name for it was *eucharist*, meaning "the giving of thanks." This common meal gradually became impracticable as the Christian communities grew larger, and the Lord's Supper was thereafter observed at the conclusion of the public portion of the scripture service; the unbaptized withdrew so that the baptized could celebrate together.

Thus, from the very inception of Christianity, food and beverage has symbolized that religious experience is not purely personal but also communal. Moreover, differences in interpretation of the Lord's Supper have provided some of the contrasts among the major Christian churches. The opposing views of Roman Catholics and Protestants over whether the Eucharist bread is changed in substance or is a symbol of the flesh of Christ is an example of the role of food as a representation of religious differences within Christianity.

The rituals of the Eucharist provide the clearest examples in the Christian churches or confessions of the relationship between social stratification and food behaviour. Christianity, unlike Judaism or Hinduism and other Asian religions, was never tied to a caste system; correspondingly, it repudiated the entire body of purity-pollution laws of the Old Testament. Christianity was, however, part of the early European social system that was based on clear-cut separations of social classes. Religious food customs in Christianity, most notably in the Eucharist, reflect this.

The first Christian churches developed alongside the most rigid social stratification in European history, with elaborate notions of class authority and superiority and subordination. The separation of those in authority from the masses of ordinary people is mirrored in the Roman

eucharistic ritual in which the sacrament's celebrant—the officiating priest—partook of the bread and wine first and then served only the bread to those of the faithful who wished it.

With the Reformation during the 16th century, which was (among other things) an overthrow of the traditional social order, a slight but important change in the eucharistic ritual was introduced, reflecting the weakening—but not the abandonment—of stratification and its attendant hierarchies of authority. In many Protestant confessions the officiating minister also partook of the bread and wine first, then served it to the congregation. In the Presbyterian ritual, the minister partook first and then served it to the elders who then served the people. Although this continued to reflect a system of stratification, it was a radical departure from the Roman rule that only the officiating priest could serve everyone. These rules for both Roman Catholics and Protestants are gradually changing in the 20th century.

Until relatively recently, the most notable dietary law in Christianity was the Roman Catholic prescription to abstain from eating meat on Friday. This ban was lifted as part of the modernization of Roman Catholicism that was begun during the reign of Pope John XXIII. In Roman Catholic abstinence meat is forbidden, but there is no restriction on the amount of food eaten; fasting means that the quantity of food is also restricted. Historically, there have been several categories of fasts. The 40 days of Lent have traditionally been a period of mortification, including practices of fast and abstinence; the rules, however, have been greatly modified in recent years. Ember Days—a Wednesday, Friday, and Saturday at each of the four seasons—seem to be survivals of full weekly fasts formerly practiced four times a year. Vigils are single fast days that have been observed before certain feast days and other festivals. Rogation Days are the three days before Ascension Day and are marked by a fast preparatory to that festival; they seem to have been introduced after an earthquake about 470 as penitential rogations, or processions, for supplication.

Also important in the Christian complex of fasting is that associated with monastic life. Mortification is seen as essential to the practice of asceticism, and, in many rules of monastic life, fasting is regarded as one of the most efficient exercises of mortification.

Religions of India. It is in the religions of India that one can most clearly observe the principles outlined above concerning the relationship between dietary laws and customs and the existence of social stratification, traditional privilege, and social, familial, and moral lines that cannot be crossed. Hinduism provides the best example, although the same principles also obtain in the religions of Jainism and Sikhism.

Food observances help to define caste ranking: Brahmins are the highest caste because they eat only those foods prepared in the finest manner (*pakkā*); everyone else takes inferior (*kaccā*) food. *Pakkā* food is the only kind that can be offered in feasts to gods, to guests of high status, and to persons who provide honorific services. Food is regarded as *pakkā* if it contains ghee (clarified butter), which is a very costly fat and which is believed to promote health and virility. *Kaccā* is defined as inferior because it contains no ghee; it is used as ordinary family fare or as daily payment for servants and artisans. When food serves as payment for services (e.g., barbering), the quality of the food depends on the relative ranks of the parties to the transaction; the person making the payment gives inferior food, such as coarser bread, to a lower ranking person performing the service. Performance of a service denotes that a person is ready to accept some kind of food, and giving food denotes an expectation that a service will be performed. Members of subordinate castes pick up the dirty plates of members of superior castes, as at village feasts. Food left on plates after eating is defined as garbage (*jūṭhā*); it is felt to have been polluted by the eater's saliva. This garbage may be handled in the family by a person whose status is lower than the eater's, such as a wife. Such food may be fed to domestic animals; among humans outside the family it can only be given to members of the

Fast and
abstinence

Relation-
ship
between
dietary
customs
and caste
systems

lowest castes, such as sweepers. The highest Brahmins do not accept any cooked food from members of any other caste, but uncooked food may be received from or handled by members of any caste. Nor will such Brahmins accept water across caste lines. Cow's milk is ritually pure and cannot be defiled, but a Brahmin will not accept milk from an untouchable—a member of the lowest caste groups—lest it has been diluted with water.

Water is easily defiled, but, if it is running in a stream or standing in a reservoir, it is not polluted even by an untouchable in it. Water in a well or container, however, is defiled by direct or indirect contact with a person of low caste. Thus, a ritually observant Brahmin will not allow a low-caste person to draw water from his well, although this rule is lapsing, possibly because of the introduction of plumbing and the removal of water from the list of scarce resources.

In the general Hindu system of purity-pollution, meats are graded as to their relative amount of pollution. Eggs are the least and beef the most defiling; but the highest caste Brahmins avoid all meat products absolutely. Also, certain strong foods (e.g., onions and garlic) are thought to be inappropriate to Brahminical status. Alcohol too is prohibited; it is not considered polluting in itself, but the prohibition seems related to the Brahminical value of self-control. Alcohol's manufacture and trade is confined to members of lower castes.

People who eat at each other's feasts hold equal rank. People who eat at every house in a village occupy a very low status, and refusal to take food from another constitutes a claim to higher caste rank. More generally, givers of food outrank receivers. This, however, is a definition of collective, not of individual, rank. If a member of one caste gives food to a member of a second, all members of the first caste are regarded as higher than a third, even if there is no direct transaction between the first and third castes. Thus, the behaviour of every person in a village has consequences for the entire village.

Local
variability
of dietary
restrictions

In actual practice, however, there is not an automatic enactment of these formal rules in village life; instead, they vary considerably according to local conditions. For instance, one of the formal rules of Hindu religious caste organization is that vegetarians outrank meat eaters, because contact with killed animals is regarded as polluting. Nevertheless, McKim Marriott, a U.S. anthropologist who has investigated village caste relationships, has found instances in which meat eaters outrank vegetarians. He concludes from his observations that it is caste rank—mostly in terms of the kinds of work that people in different castes do—that determines purity and pollution. In daily social relations this sometimes means that a caste of sufficiently high status may not be demeaned by receiving food from a lower caste if the latter is not too far below and if the proper food and vessels are used.

Status is rarely immutable over long stretches of time. In most societies, people who occupy low status try to exploit every opportunity to improve their position, and, Marriott found, Indian villagers are no exception. Because food in this culture is one of the principal indices of rank, it is used as a pawn in manoeuvres for social mobility. Specifically, members of a low caste will try to gain dominance over persons in another by feeding them, although the latter cannot be too far above the upwardly mobile group. There is no direct way of forcing a higher group to accept food; one of the techniques most often used is for the lower caste to threaten to withhold services unless a heretofore slightly higher caste receives food from the former. Such mobility, as noted earlier, affects not only the two castes concerned but also all other groups in the village, and the manoeuvring involves everyone in the community.

Marriott's emphasis on occupation (and, therefore, rank) as the determinant of food customs has not been accepted by all students of Indian society. He continues to leave some aspects of caste behaviour unexplained, such as the extreme statuses of Brahmins and untouchables, to say nothing of the existence of the total caste system itself and the mechanisms by which it is maintained. These problems have yet to be worked out. In any case, there can be

no doubt that concepts of pollution and purity in regard to food in India, as everywhere else, are governed by a systematic set of rules analogous to a language's grammar and that applications of the rules are logical and consistent within the grammatical framework. Observations of daily village life do not contradict this concept of the codification of food rules; they only suggest that earlier "grammars" may have been too narrowly conceived.

Buddhism. Buddhism is, perhaps, the most difficult religion to discuss in terms of dietary laws and customs because it does not have any unity; its tradition has a complex history, and individual believers are characterized by varied faiths. Though Buddhism originated in India, it also diffused to—and had a great impact on—Ceylon, Tibet, China, and Japan. In each case, it was reshaped to conform with local conditions, especially those of social stratification. For example, most of the countries of Southeast Asia have caste systems in which there are outcastes or untouchables; Buddhism has been important in supporting such systems. Specifically, untouchability and the occupation of butchering animals tend to go together both in Buddhism and in many of the countries of Southeast Asia. But Burma, where Buddhism is the dominant religion, is an exception; having no caste system, Burmese society has not made butchering a basis of untouchability.

Lack of
unity in
Buddhism

Buddhism developed its own class distinctions, most notably between the monastic elite and the lay devotees. The social and political ethic of the laity was based on a merit-making ethic that was geared primarily to the urban mercantile and artisan classes. Thus, Buddhism claimed from its inception to be a Middle View (*Mādhymika*), opposed equally to the extremes of sensuousness and indulgence and of self-mortification. This Middle View was exemplified in the "five precepts": no killing, stealing, lying, adultery, or drinking of alcoholic beverages. These precepts were translated into an ethic of moderation in diet. A person must allay his hunger so that he may practice the religious life. Buddhism holds that man is weak and helpless by himself; thus it sees the purpose of religious action as bringing a return from the deities. Deriving from this is the practice of holding ritual vegetarian feasts for large numbers of monks, a noble patron, or for the benefit of a departed soul to promote health and longevity. Another Buddhist custom is the issuing of a prohibition against killing animals to end a drought or to speed the recovery of a sick emperor. According to the Vedic treatise the *Śatapatha Brāhmaṇa*, food, when enclosed in the body, is linked to the body by means of the vital airs. The essence of food is invisible. Food is the highest of all things that can be swallowed, and food and breath are both gods.

The prohibition of killing animals is more stringent in Buddhism than the injunction against eating them. Buddhism allows pure flesh to be eaten if it has not been procured for eating purposes or if the eater has not supposed it to be. The sin is upon the slayer, not the eater. This notion has been used in India and Japan to justify the outcasting or untouchability of butchers.

Religions of China. China is an example of the proposition offered above that religion alone does not give rise to eating rules; instead, religion serves to legitimate customary patterns of behaviour and social relations that emerge out of economic (especially occupational) and political relationships. Although China was under strong Buddhist influence, the Chinese never developed the institution of untouchability or outcaste. Indeed, Buddhism did not really penetrate China until after the beginning of the 2nd century AD; during the previous century, Buddhism was confined to foreigners in the northern commercial cities.

Before 200 BC (the approximate beginning of the Han dynasty), Chinese culture was based on a rather elaborate system of social stratification in which mobility was rare and difficult. It was, in other words, a relatively closed social system, if not feudal. During this time, there were restrictions on the consumption of food: beef, mutton, and pork were to be eaten by an emperor; beef by feudal lords; mutton by high-ranking state ministers; pork by lower ministers; fish by generals; and vegetables by commoners (who probably could not afford meat or fish anyway). Officials, in fact, were known as "meat eaters,"

Chinese
culture
before
the Han
dynasty

and it was generally only the aged commoners who were allowed to eat meat.

During this time, military affairs and sacrifices were considered the two most important things in the state. Sacrifice was inseparable from veneration of the ancestors, and almost no ceremonies were conducted without sacrifice and offerings. These ceremonies were integral features of daily life and, as a result, foodstuffs became associated with the moral code that was based on maintaining fixed social and political relationships. God and ancestors were often referred to as those "who are sacrificed to," and disobedience to them was believed to result automatically in catastrophe. Ceremonies marking important personal transitions (e.g., initiation to adulthood and marriage) were held in the ancestral temple and were accompanied by feasts and sacrifices to the ancestors.

Ancestral veneration and the ethos of religiously validated legitimate authority remained as integral features of Chinese culture until the most recent years. Religious belief and observance notwithstanding, however, Chinese culture underwent a drastic change with the establishment of the Han dynasty. Most notably, the social class system was opened up—at least ideally—by the adoption of the principle of recruitment for public office; in later dynasties, this was expanded into the well-known system of written examinations, of grading officeholders by merit, and other features of the famous Chinese civil service. Correlated with the removal of the barriers to social mobility and establishment of the principle of ideally open recruitment to the civil service, the pre-Han food restrictions disappeared. This was also the time of Buddhism's greatest thrusts into Chinese thought and life.

Food continued to occupy an important social and religious place in villages, at least until the establishment of the People's Republic of China. For instance, marriage ceremonies traditionally last four days; the highlight of each day's celebration is a feast or sacrifice to the ancestors, sometimes both. Feasts and sacrifices are also important features of funerals, some of which are marked by two feasts in one day. These ceremonial occasions often work considerable economic hardship on families, forcing many of them into debt. (Y.A.C.)

Religions of Japan and Korea. Japan and Korea exhibit many of the same characteristics with respect to food customs as India, though with much less elaboration, and thereby the same relationships to Buddhism, though in an opposite direction. These relationships to Buddhism are also highlighted by contrasting Japan and Korea with China. Whereas post-Han China placed emphasis on achieved status and on personal superiority rather than on considerations of race or blood as a basis of social position, Japan and Korea (and also Tibet) established and continued a system of hereditary status and outcasting. As in India, therefore, the Japanese and Koreans considered pollution to be a hereditary taint; Buddhism played a major role in the legitimation of this ideology.

Outcastes in Japan traditionally were referred to pejoratively as *eta* (literally, "pollution abundant"). The accepted usage now is *burakumin* (meaning "hamlet people"), although this term has also taken on pejorative connotations. They are discriminated against in employment and intermarriage, live rurally or in slum conditions, have the lowest educational levels in the nation, and often suffer from malnutrition. In the past they were required to wear special clothing, slippers, and hairstyles; to stay away from other households; to remain in their own hovels at night; and to prostrate themselves before higher-caste people.

The history of the Japanese caste system in respect to food customs gives important clues to its origin. Among the ancient Japanese, meat was included in the diet, and the flesh of animals, fishes, and birds was offered to the gods as sacrifice. The flesh of ox, horse, dog, monkey, and fowl was prohibited, but that of deer, rabbit, and pig was not. During the 8th century AD the Japanese began to depend mostly upon plant rather than animal foods. In Japan's limited territory, it is understandable that cattle were raised for plowing and other agricultural work rather than for meat and milk. In 741 a law was passed forbidding the killing of cattle and horses, the latter being

necessary for military as well as productive purposes. This provided a conducive atmosphere for Buddhist influences in the 6th and 7th centuries (primarily from China and Korea) that stressed the abhorrence and ritual impurity of blood and death.

Buddhism, however, was only one of several sources of outcasting slaughterers and butchers. During the 8th century, Shintō—the only indigenous religion of Japan—began to stress concepts of uncleanness as things that are displeasing to the gods: wounds, disease, death, menstruation, and childbirth; and this too contributed strongly to the development of *eta* status. It was apparently about this time that the belief developed in Japan that a person's association with blood and death changed his nature; this contamination not only carried over to a man's descendants but was thought to be communicable. It was apparently also at this time that Japanese cuisine began to favour fish (especially raw fish) as a staple source of protein.

Important in this connection is that occupational specialization began to flourish in Japan during the 9th and 10th centuries; by this time, Buddhism was widespread in Japan. Traditional occupational roles became spheres of monopoly; in the face of competition from economically specialized groups who forced them out, people dealing with slaughtering, butchering, and tanning began to form guilds. This was rationalized by Buddhist and Shintō ideas that occupations associated with animal slaughter and processing (confined to *eta*) should be separated from the general body of commoner and slave occupations.

During the Heian period (794–1185), communities whose members were engaged in occupations related to death and animal products were forced outside the normal society, and they thus came to form the main body of outcastes in Japan. Increasingly, the latter were outcasted and considered untouchable, a pattern that reached its heights in the Tokugawa period (1603–1867). By the 17th century, the idea developed—supported by Shintō and Buddhism—that eating the flesh of all animals caused pollution for 100 days. After the mid-19th century, though, largely because of the emerging influence of Western cultural habits, meat consumption began to be more widespread in Japan, and among some Japanese the consumption of beef became associated with progress and enlightenment.

Soon after the Meiji Restoration (1868) the caste system and the legal discrimination against the *eta* were abolished. Outcasting, however, dies slowly. Though the egalitarian ideologies of modern industrialization are incompatible with caste, outcasting tends to remain in Japan and, alongside it, some of the food customs associated with the caste system. As in India, eating together (along with marriage and social visiting) between untouchables and members of normal society is disdained. In many parts of Japan, especially in traditional villages, the diet remained largely vegetarian until after World War II, when the consumption of meat and other Western dietary practices rapidly increased. Even the consumption of milk, which had been considered unclean, became common. (Y.A.C./Ed.)

Ceremonial and ritualistic objects

Throughout the history of religions and cultures, objects used in cults, rituals, and sacred ceremonies have almost always been of both utilitarian and symbolic natures. Ceremonial and ritualistic objects have been utilized as a means for establishing or maintaining communication between the sacred (the transcendent, or supernatural, realm) and the profane (the realm of time, space, and cause and effect). On occasion, such objects have been used to compel the sacred (or divine) realm to act or react in a way that is favourable to the participants of the ceremonies or to the persons or activities with which such rituals are concerned, or to prevent the transcendent realm from harming or endangering them. These objects thus can be mediatory devices to contact the divine world, as, for example, the drums of shamans (religious personages with healing and psychic-transformation powers). Conversely, they can be mediatory devices used by a god or other supernatural being to relate to man in the profane realm.

Shintō

Outcaste
groups

They may also be used to ensure that a chief or sovereign of a tribe or nation achieves, and is recognized to have, the status of divinity in cultic or community ceremonies. Of such a nature may be phallic cult statues bearing the name of a king associated with that of the Hindu god Śiva, in areas under Indian influence (such as in ancient Vietnam, Cambodia, and Indonesia, where the lingam was worshipped under a double name: Indreśvara [Indra, king of the gods, plus Īśvara, Lord, a name of Śiva]), or the Buddhist "body of glory" statues in Cambodia dating from the end of the 7th century. The religious dance masks of many societies, including those used in ancient Tibet and in Buddhist sects of Japan, may, to some extent, also belong to this class.

VARIETIES

Because such objects vary as much in nature as they do in form and material, they are difficult to evaluate. If limited strictly to religious practices, an inventory of ceremonial and ritualistic objects remains incomplete, because these objects have played significant roles on solemn secular occasions, such as consecrations, enthronements, and coronations, which may be closely linked to the divine order, as in Hindu-, Buddhist-, and Christian-influenced cultures.

Icons and symbols. Constituting a most significant category of cult objects are representations of a deity. Though such representations are often depicted in the form of statues and images (icons) of divine or sacred beings, they may also be either figurative or symbolic, the meanings often being equivalent. In Tantrism (a Hindu and Buddhist esoteric, magical, and philosophical belief system centred on devotion to natural energy), for example, the sacred Sanskrit syllable Om—which is a transcendent word charged with cosmological (order-of-the-universe) symbolism—is identified with the feminine counterpart of the god. In its written form, particularly on Tibetan banners (tankas), the word Om (often corresponding with the feminine counterpart—Tārā—of the patron of Tibet) is considered to be eminently sacred, even more so, in some instances, than an anthropomorphic (human-form) divine effigy.

Religious
statues and
images

Statues and painted images occur most frequently in religious iconography, as noted above. These are often viewed as the permanent embodiments of the deities they represent, whether they are located in sacred places of religious communities, such as temples, shrines, or chapels, or on domestic altars, which contain statues or icons of the divinities of prosperity and fertility, mother goddesses, household gods, saints, relics, the tablet of the ancestors in ancient China, and other similar domestic cult objects. Many household cult objects are made from clay or terracotta and are sometimes multicoloured. The material of which major cult objects are composed is often explicitly defined and assumes a certain importance. If the statue is fashioned in wood, the choice of the wood (acacia, sandal, or any other) is symbolically important because it is considered auspicious. By the same token, the choice of stone is likewise important, depending on the region. If metal is chosen, it is one that is deemed precious (e.g., golden statues bring prosperity). In the case of bronze statues and other cult objects, the composition is carefully defined and often corresponds to alloys to which symbolic values are attached. In addition to a proper and distinct form and material, the technique of fabricating and the procedural patterns of composing such objects are controlled by traditional rules that have become established rituals in many religions—sophisticated, folk, and primitive. In the production of statues in human or animal form, the last procedure is often the "opening the eyes" (i.e., the painting of the eyes of a statue of a deity or inserting gold in them by an officiating priest during the installation of the statue [*pratiṣṭhā*] in the sanctuary, along with the reciting of appropriate prayers that make the statue "living" and "real"), particularly in Brahmanic India and Chinese-influenced areas (see also RELIGIOUS SYMBOLISM AND ICONOGRAPHY).

Religious dress and vestments. The practice of wearing special garments for conducting rites, participating in worship, or even witnessing such ceremonies is very unevenly distributed, and the conceptions associated with this prac-

tice are highly varied and complex (see below *Religious dress and vestments*).

Instruments for worship and religious ceremonies. The types and varieties of instruments used in worship and religious ceremonies are almost innumerable. The role they play in ritual occasions may be as containers and sacred furniture, as objects with properties necessary for worship, and as "mediatory" objects through which a magical or mystical connection is believed to be made between the human and divine worlds. There are also the materials used in bloody or nonbloody sacrifices.

Amulets and talismans. Amulets (charms) have been used for protection in all ages and in all types of human societies; they persist even today in industrial societies, in which they are mass-produced by the most modern methods (e.g., mustard seeds encased in plastic to be worn as necklaces reminding the wearer of Jesus' words about the growth of the Kingdom of Heaven). The purpose of most amulets is not so much religious as it is for protection against danger, sickness, and bad luck (e.g., the "mystical eye" of the ancient Egyptians or the "Hand of Fatima" of Muslims). The same is true of talismans, which offer the additional advantage of conferring supernatural power on other people, even on the deity, from a distance. Dancers' masks and jewels, such as earrings, bracelets, necklaces, and belts, may be classified with amulets. Such objects are individually worshipped in order to gain their goodwill among some Hindus in India and among the Pueblo and Navajo Indians of North America (see also OCCULTISM).

TYPES OF SACRED SETTINGS FOR CEREMONIAL AND RITUALISTIC OBJECTS

Places of worship and sacrifice. Throughout history there is evidence of worship at natural sites as well as at sites constructed for ritualistic purposes. In the proto-history and perhaps the prehistory of most ancient civilizations, people venerated trees, stones, bodies of water, and other natural objects, which gradually became the objects of established cults and which often were included, in some form, as aspects of later official ritual. Initially, the objects of this frequently occurring process were sacred trees considered to be the habitats of spirits or gods, such as in Vedic, Brahmanic, and Buddhist India or pre-Islamic Arabia; sacred stones, such as fragments of meteorites, menhirs (upright stones), and rocks—for example, the Black Stone of Mecca in the Ka'bah; flowing waters, natural lakes, and sacred and purifying rivers, such as the Ganges; crossroads and junctions, such as the *tirtha* (river fords and, by extension, sacred spots) in India; and other such objects or places of nature. According to Hesiod, an 8th-century-BC Greek writer, such objects of nature were venerated in the popular piety of the rustic people of Greece in his times.

The association on the same site of four natural elements (mountain, tree, stone, and water) is supposed to constitute a sacred whole (a quaternity of perfection), a sacred landscape or "geography" similar to the world of the gods. Such sites, in many civilizations, were the initial points of departure for pilgrimages or for the establishment of places of worship. In some instances the natural sacred places were gradually adapted for religious use (e.g., the oracle at Delphi, in Greece), but in others the earlier natural sites were artificially recreated by using man-made symbolic equivalents. An artificial or natural hill, such as a barrow, mound, or acropolis (elevated citadel), often served as a base for the temple, but in many instances the temple itself has been an architectural representation of the mountain, as were the *bamot* ("high places," usually constructed with stones) of the ancient Hebrews, the zigurats (tower temples) of the ancient Babylonians, and the pyramidal temples of Cambodia, Java, and pre-Columbian Mexico. A branchless tree has often been transformed into a cultic object: a sacrificial post, such as the Vedic *yūpa*; the central pole of a nomadic tent in Siberia and Central Asia, the *yurt*, or initiation hut; or a parasol shaft (*chat-travali*) in the Buddhist *stūpas* (reliquary buildings) and the Japanese and Chinese pagodas. If represented in stone, the tree evolved into a column gnomon (a perpendicular shaft), such as the Buddhist *lāṭ*, the sacred pillar (*matzeva*)

Importance of the natural elements

of the ancient Hebrews, or the obelisk of pre-Hellenistic Egypt (before the 4th century BC, especially from the 3rd millennium to the early 1st millennium BC). Stone, transformed into an altar, has been used either to support or seat the image or symbol of the deity, or to receive sacrifices, burnt offerings, plant offerings, or aromatic perfumes. Water, because to it is generally ascribed a power that is purifying or even curative or miraculous, almost always plays an important role in or near sacred places. The whole assemblage of actual or symbolic mountains, trees, stone, and water is usually arranged architecturally within an enclosed space. An example of this arrangement is the typical Christian church, with its raised chancel (the mountain), the cross or crucifix (the tree), the altar (usually stone, but sometimes wood), and the baptismal font or tank (water).

This widespread scheme is almost everywhere bound up with a cosmology (theory of the universe) that establishes a symbolic identity between the divine world and the temple. This identity holds true in all stages of culture; e.g., the sacred sites of the Algonquin, Sioux, and Blackfoot North American Indian tribes; the *templum* (temple) of the Etruscans in ancient Italy; the temple of Bel at Palmyra (in Syria); the Mithraic crypts centring on devotion to the Iranian god Mithra throughout the Roman Empire; the *kiva* (a circular, partly underground ceremonial room) of the Pueblo villages; the Temple of Heaven at Peking and that at Hue (Vietnam); the Buddhist *stūpa*; and Brahmanic, Buddhist, and Mexican mountain temples. The cosmic character of the Israelite king Solomon's Temple, of the 10th century BC, constructed on Mt. Moriah in Jerusalem, was not given such an interpretation, however, until hellenistic times (3rd century BC–3rd century AD), as in the writings of Philo of Alexandria and Josephus. That of the Muslim mosques is very subdued, although the Ka'bah of Mecca, which contains the black stone, is believed by Muslims to be the centre of the cosmos. The cosmological scheme has been applied to Christian basilicas and churches—with square floor plans, an overarching dome, and symbolic ornamentation—from as far back as the 6th and 7th centuries.

Sacred furniture and related objects. Whatever its size and form, a sacred area is usually delimited by an enclosure, such as a simple fence around sacred trees or Buddhist *stūpas* or high walls with immense gates around temples. The sacred space may comprise multiple enclosures, such as that of huge sacred structures—such as the temple of Śrīraṅgam in southeastern India, which has seven concentric enclosures. The dominant idea in delimiting the holy place is to protect the sacred element and its mystery. Access to the sanctuary is often hidden by grills or screens: the veil of the Jewish Temple in ancient Jerusalem, which separated the holy area (or *hekhal*) from the Holy of Holies (or *devir*); or the Eastern Orthodox *ikonostasis* (image screen), which hides the chancel from the view of the faithful except on certain ritual occasions when it is opened to them. Hindu sanctuaries also are concealed by hangings. In Roman Catholic, Lutheran, and Anglican churches, the chancel has usually been separated from the nave by a railing, before which the faithful kneel to receive the eucharistic (communion) meal.

In Indo-European civilizations the essential element of the sacred furniture is the altar, the site of which varies according to the cult and period under consideration. Tables for sacrifice, burnt offerings, and offerings of plants or perfume have sometimes been placed outside the temple, as at the Temple of Solomon in Jerusalem and in temples of ancient Egypt. In early Christian cults, a single altar was placed in the chancel. Later, about the 6th century, the number of altars was increased, with one in each chapel of the larger church building.

The most sacred furnishings of temples are those most closely related to altars, such as the Jewish ark of the Law, or *aron ha-qodesh*, in the synagogues, which is made in the image of Moses' ark of the Covenant, and the tabernacle (the receptacle containing the consecrated bread and wine) of Roman Catholic and Eastern Orthodox churches. The ark, which is portable, is a kind of chest (*aron*) with a cover (*kapporet*), and the tabernacle, made of wood,

metal, or stone, is a locked chest. On the fire altars of Zoroastrianism (a religion founded by the Iranian prophet Zoroaster in the 7th century BC) is a sacred metal urn (*ātaš-dān*), containing the eternal fire, ashes, and aromatic substances.

When temples or other major sanctuaries are also places for assembly and common prayer, as, for example, Muslim mosques and Catholic and Protestant churches, pulpits are provided. They may be integral parts of the masonry, of the anterior screen of the chancel—as are ambos (raised platforms), or wooden furnishings fixed to the walls, like the formerly mobile *minbar* (domed boxes in mosques). In Manichaeism (a dualistic religion founded by the Persian prophet Mani in the 3rd century AD), the Bēma Feast was centred on the exaltation of a reconstructed pulpit (Bēma), which symbolically represented the rostrum from which Mani spread his teachings. Another important element of sacred furniture is the lectern, on which is placed one or more sacred books (from which one of the officiants reads aloud) or a collection of hymns and religious chants intoned by a cantor in monasteries or other religious structures.

Permanent lighting is also required in certain cults. This has encouraged the creation of supports or vessels for inflammable materials, the most characteristic of which are the seven-branched candelabrum of the Jerusalem Temple, the Easter candle holder of Roman Catholicism, the sanctuary lights of Roman Catholicism that signal the presence of the Eucharist in the tabernacle, lights suspended before icons in Orthodox rituals, glass or perforated-metal lamps in mosques, and spherical lanterns adorned with an eye, which represents the universal monad (one), of Vietnamese Cao Daism (a syncretistic religion combining Confucianism, Taoism, Roman Catholicism, and Buddhism).

Protective devices and markers of sacredness. Other objects, such as fans, flyswatters, parasols, and standards—analogueous to the symbols of royalty—often complete the permanent furnishings of sacred places. In addition to their utilitarian role, they are endowed with a sacred character; fans used in Brahmanic and Buddhist cults may be compared to the *flabella* (“fans”) in the Roman Catholic and Orthodox churches. They are waved before the iconostasis during the Eucharist in the divine liturgy of the Eastern Orthodox Church, and they also are placed on either side of the papal chair in solemn processions. The parasol, or umbrella, is generally a symbol of the vault of heaven, as in India and China; the domes of *stūpas* are often surmounted by parasols (*chattras*). In its symbolic and protective role the umbrella can be compared to the baldachin (canopy) in many of its forms. Whether it covers the altar, the statue or symbol of a deity, or even the imperial throne—as in Zoroastrian Iran during the Sāsānian period (3rd–7th centuries) and Orthodox Byzantium (during the 4th–15th centuries)—the baldachin's celestial symbolic ornamentation is generally explicit, and its cosmic character is apparent. The standard (*dhvaja*), in the Brahmanic cults, takes on the appearance of a high column (*dhvaja-stambha*) erected in front of temples; it is surmounted by a divine effigy, most often that of the sacred steed, or *vāhana*, of the god. Simultaneously a signal (because of its height) and a protective device, it first receives the homage of pilgrims. The poles adorned with flags erected before the pylons of the temples of ancient Egypt may also have had such a double character.

FORMS OF CEREMONIAL AND RITUALISTIC OBJECTS
ACCORDING TO THEIR FUNCTIONS

Summoning, mediating, and expelling devices. In the form of magic or sacred words, singing, and music, sound plays or has played an important role in the worship of most religions. The same is true of light and of aromatic substances, such as oils, perfumes, and incense. The importance of these elements has brought about the creation or adoption of specific objects with functions that often serve converging purposes in worship. In most cases they are used to draw the attention of the deity, to establish a connection with it, and to exorcise forces that are evil or harmful to the god and to men. Because of the need to attract the deity's attention, the sound-producing

instruments are usually percussive or shrill, rather than melodic, and drums, gongs, cymbals, bells, conchs, and sistrums (timbrels, or rattles) are the most common forms.

Sound devices. Summoning devices are played either alone, as objects to accompany prayers or litanies, as in Tantric Buddhism, or as instruments in a temple orchestra. Their size and form and the materials used to make them vary according to locale. Generally viewed as sacred, they are often worshipped, as in West Africa, Malaysia, and Burma, and partake of divine attributes, as in Brahmanism, Mahāyāna (Greater Vehicle, or northern) Buddhism, and Tantrism. Drums vary greatly in both size and form. The two-skinned *damaru* (drum) of Śaivism (devotion to the Hindu god Śiva) and Tantrism, believed to be effective in communicating with the divine world, is shaped like an hourglass and fitted with two pellets that hang from cords and that strike the skins when the drum is twirled. Gongs usually are suspended metallic disks, with or without a central protuberance. The gongs of ancient and contemporary China, however, are of varied form, with cutout designs, and may be made of resonant stone or of jade. Cymbals are very widespread and were used in the Hellenistic mystery (salvatory) religions, such as those of Dionysus (a god of wine) and the Eleusinian mysteries (centred on devotion to Demeter, a seasonal-renewal goddess). They were the only instruments played in the Temple of Jerusalem, where they were known as *metziltayim* or *tzeltzelim*. The sistrum, used in pre-Hellenistic Egypt in the worship of the goddesses Isis and Hathor and in Rome and Phoenicia, as well as among the Hebrews, is composed of a handle and frame with transverse metal rods and mobile disks. Producing a sharp ringing sound, it was regarded as particularly sacred and was carried to the temple by women of high rank. There are countless types of bells; the Indian *ghaṇṭā*, or Tibetan *dril-bu*, a metal handbell with a handle shaken during prayers in order to attract beneficent spirits and to frighten away evil ones, is used particularly during Brahmanic and Mahāyāna Buddhist ceremonies.

In this category of objects, the shaman's drum of the Buryats, Yakuts, Altaic Turks, and Eskimos is composed of a skin stretched over a circular or oval frame provided with a handle; it is struck with a curved beater. It plays the same magical role as the *ghaṇṭā*, but it also serves as a mode of ascending to the realm of the sacred for the shaman. The bull-roarer—a flat, elongated piece of wood, ivory, reindeer antler, or other material—used in primitive religions of Australia, equatorial Africa, western North America, Colombia, Brazil, and Sumatra, and the similar *rhombos* of the Hellenistic mystery religions, was propelled and whirled by a thin strap. Its humming sound and trajectory gave it the dual character of a summons to the divine world and a link with the celestial regions.

Lighting devices. In comparison with sound, which in worship usually presents a coercive character, lighting and fire, whether permanent or occasional, generally signify a sacred or spiritual presence, an offering, prayer, intercession, or purification. They are often viewed as sacred or even of divine origin, if not directly identified with the deity, as in the Zoroastrian fire altars. Their supports and containers can be made of either durable or perishable materials, depending on the ritual or ceremonial requirements. Torches have been used throughout history: in ancient Assyria and Babylonia they were used to carry a newly consecrated fire from torch to torch throughout the city three times a month; in ancient Rome they were sometimes placed in a hollow clay or metal shaft; and in the ancient Hebraic religion a lamp (*ner*) filled with sacred oil was used in the worship of the god Yahweh. In the Roman Catholic Church, from about the 10th century on, wax candles have been used, with bronze or copper candle holders—the forms of which changed according to style. Two of them were placed on the altar for the mass, and two others were carried by acolytes (light bearers). The Easter (Paschal) candle, made of beeswax around a wood core, had a candle holder appropriate to its size. At Westminster, in England, during the 14th century, a *candela rotunda* ("round candle") was the centre of a "festival of lights" during the feast of the purification of

the Virgin Mary (February 2), also called Candlemas Day.

Festivals of lights have been and still are common throughout the world, especially among the Jews, who celebrate Hanukka, the Feast of Dedication of the Temple. In India and in Indian-influenced countries (particularly Thailand), the festival of lights (Dīpāvalī or Divālī) is celebrated by the Vaiṣṇava Hindus (devotees of the god Vishnu [Viṣṇu]) in October–November, at the end of the monsoon season. It is practiced on other religious occasions by the Jaina (followers of the Indian reformer Mahāvira, of the 6th century BC), Thais, and Tibetans, who celebrate it in December. The lamps, which are lit everywhere (e.g., in temples, in houses, and at crossroads), are also set afloat on streams, rivers, and lakes. Some lamps are made of glass—like the votive lights of Roman Catholicism—with a wick dipped in a vegetable oil, usually coconut; some are made of clay; and others are made of rice paste with a central hollow filled with ritual clarified butter, or ghee (*ghī*), or are cut out of a plant stalk in the shape of a bark or raft. The Jaina use earthen saucers containing either wicks immersed in coconut oil or pieces of lighted camphor. Another form of this festival was known in Thailand, where three earthen pots, containing rice, seeds, beans, and an oil-soaked wick, were placed at the top of three poles opposite the temple entrance, and the fire was kept burning for three days.

The "cordons of light" placed around the sacred places of Buddhism during great festivals, such as at Bodh Gayā, in India, for the Buddhajayantī (the commemoration of the Buddha's 2,500th birthday) in 1958, are composed of thousands of small brass lamps in the form of footed cups filled with ghee, in which a cotton wick is soaked.

Incense and other smoke devices. The use of incense or the fumes of aromatic substances is especially widespread in the great religions of the world and has many symbolic meanings. It may signify purification, symbolize prayer (as among the Hebrews), or be an offering that rises to the celestial or sacred realm. Bronze incense burners were cast very early, as exemplified by those from the Chou period (c. 1111–255 BC). Their forms were often inspired by cosmological themes. In early Taoist ritual the fumes and odours of incense burners produced a mystic exaltation and contributed to well-being. Under the T'ang dynasty (AD 618–907), perforated golden vessels with handles were carried in the hand to accompany a votive offering. In Japan the censer (*kōdan*)—a vessel with a perforated cover and carried by chains—was used in Buddhist and Shintō rituals. In pre-Hellenistic Egypt and among ancient Jews, incense was burned in golden bowls, which sometimes had handles, and in cauldrons placed on or beside the altar or outside the temple. In pre-Columbian Mexico and Peru, incense burners were made of terra-cotta and sometimes of gold. Censers of precious metal provided with chains for hanging have been used since the 4th century in Christian churches, and the rite of swinging the censer is practiced in many rituals, both Christian and others.

Expelling and other protective devices. Several of the objects already described serve as protection against evil or demonic spirits. Of such a nature are the *ghaṇṭā* and *dril-bu*, the shaman's drum, the lamps of the Indian Dīpāvalī, and the burning of incense, which has also been practiced in ancient Greece, pre-Columbian America, Morocco, and many other regions. The possession of a large number of the same form of a protective object often is believed to be effective; this is the reason for the large number of bells (*ghaṇṭāmālā*) suspended on lattices on the handrail of the balustrade (*vedikā*) around the *stūpas* of ancient India; even today, small bells are hung from the roofs of Buddhist pagodas in Sino-Japanese regions. Like the small bells seen on the roofs of Romanian country dwellings until the beginning of the 20th century, these bells have a clapper provided with a feather or plaque that enables the wind to ring them continually. Perhaps the most effective protective object, however, is the "diamond thunderbolt" (Sanskrit *vajra*; Tibetan *rdo-rje*) of Mahāyāna Buddhism, Tantrism, and Lamaism (a Tibetan form of Buddhism and folk religion). Well-known in early Buddhism as an instrument held in the hand, the *vajra* is handled in the middle and has, at one or both ends, four curved points

Symbolism of incense and other aromatic substances

The use of torches

that meet at the tips. Of varying size, they are usually made of gilded or ungilded bronze. The Tantric *vajra* is also associated with the *ghaṇṭā* (*vajra-ghaṇṭā*), for which it forms a handle. A symbol of the indestructible force of religion, it is believed to be able to drive away all manifestations of evil. Although they are perishable, gunshots and firecrackers are viewed as protective and expelling devices, as in China and Cambodia (where soldiers, in the early 1970s, fired ammunition at a lunar eclipse to drive away the dragon they believed was devouring the moon).

Representational objects. In many religions, the god or divine order is represented among men by objects, which may be regarded simply as the god's material form on earth or may be totally identified with the god and endowed with his powers. In pre-Hellenistic Egypt the god was believed to be present in his statue, and elsewhere the statue frequently was believed to contain the god.

Figures. Statues of human or animal figures are the most explicit of the objects representing the divine order. In most iconic (image-using) religions the gods are generally anthropomorphic, half man, half animal (as in Egypt and India) or often entirely animal. In most cases the statues conform to an ideal physical type that is symbolic and conventional. The formulation of the ideal is governed by precise aesthetic and iconometric (ritual image proportion) rules, as well as by iconographic (image-representation) requirements, as in Egypt, Greece, and India. All such standards and requirements guarantee conformity to the divine model and, therefore, the effective presence of the god in his statue. Typical in this regard are the sculptured animals of the Hindu pantheon, such as elephants, lions, horses, bulls, and birds, which—erected at sacred places in India and other Hindu-influenced countries—serve as ever-ready sacred mounts (*vāhana*) for the journeys of the corresponding gods.

The masks representing beneficent and maleficent sacred or holy forces in religious dances—particularly in Buddhist monasteries of Nepal, Tibet, and Japan and in the majority of primitive societies—constitute another category of sacred representational objects. They are usually worshipped just as statues are worshipped.

Certain customs incorporating representational figures have been widespread since prehistoric times and appear to be more related to magic than to religion. One example of this type of practice is a custom observed in primitive or prehistoric societies—the incorporation of a skull in an anthropomorphic statue in order to emphasize its divine, sacred, or magical character. To some extent, a similar use of a skull, human bones, a mummified corpse, or a skeleton appears in Christian churches in the veneration of relics.

Plants and plant representations. In all civilizations, plants and trees have been viewed as sacred. Generally, the tree is either a god's habitat or the god himself and is worshipped. Such was the case, for example, in early Indian Buddhism. Trees may also be associated with the divine order because of some incident and subsequently venerated, as was the bodhi tree, under which the Buddha received his Enlightenment. Fences or even open-air temples, the form adopted for the early Bodh Gayā Buddhist temples, are built around such trees. Innumerable cases of sacred or divine trees and their painted or sculptured representations are found throughout written religious tradition and in the ethnological data. The branches of trees such as the palm, olive, and laurel are often associated with the gods; such branches may crown the god or be included among his attributes. Many are used in worship, as are the branches of the *bilva* (wood-apple tree) among the adepts of Śiva, and the *tulasī* (basil), symbol of Lakṣmī (Hindu goddess of prosperity and Vishnu's wife) and sacred plant of the Vaiṣṇavites.

As symbols of life and immortality, plants such as the vine of the Greco-Roman and the Christian world and the *haoma* (a trance-inducing or intoxicating plant) of pre-Islāmic Iran are planted near tombs or represented on funerary steles, tombstones, and sarcophagi. Two similar and related rites involving plants, the *haoma*, noted in the Avesta (ancient Zoroastrian scriptures), and the *soma*, noted in the Vedas (ancient Hindu scriptures), pertain to

the ritual production of exalted beverages presumed to confer immortality. The ritualistic objects for this ceremony included a stone-slab altar, a basin for water, a small pot and a larger one for pouring the water, a mortar and pestle for grinding the plants, a cup into which the juice drips and a filter or strainer for decanting it, and cups for consuming the beverage obtained. In many sacrifices, branches or leaves of sacred plants, such as the *kuśa* plant (a sacred grass used as fodder) of the Vedic sacrifice and the Brahmanic *pūjā* (ritual), are used in rituals such as the Zoroastrian sprinkling (*bareshnum*), or Great Purification, rite, in which the notion of fertility and prosperity is combined with their sacred characters (see above under *Purification rites and customs*).

Other representational objects. The staves of martial banners or standards are often surmounted by the figure of a god, which is frequently in its animal form. Such effigies, used by the Indo-Iranians, the Romans, the Germanic tribes, the Celts, and other ancient peoples, were probably meant to ensure the presence of the god among the armies. From the 4th century on, Byzantine armies placed the *labarum* (a cross bearing the Greek letters XP, signifying Christ) on their standards. Shields, such as the Greek *gorgonōtos* ("gorgon-headed"), were also often decorated with sacred figures, emblems, and symbolic themes, particularly in post-Gupta (4th-century) India, as seen in the 6th-century findings from the frescoes of Ajantā. In the Mycenaean civilization (15th–12th centuries BC) of ancient Greece, shields were worshipped in front of the temple, and at Knossos (in Crete) votive offerings were made of clay and ivory in the form of shields. The famous *ancilia* ("figure of eight" shields) of Rome were kept by the *Fratres Arvales* (a college of priests) and used by the *Salii* (Leapers), or warrior-priests, for their semiannual dances (in March and October) honouring the god Mars.

Relics. Relics of saints, founders of religions, and other religious personages, which are often objects of worship or veneration, generally consist of all or part of the skeleton (such as the skull, hand, finger, foot, or tooth), a piece or lock of hair, a fingernail, or garments or fragments of clothing. Such veneration is nearly universal, as is the production of reliquaries, or shrines that contain relics. The size, form, and materials of reliquaries vary greatly and often depend on the nature of the relic being exhibited. They may be fixed but are generally portable so that they can be carried in processions or on pilgrimages. Wood, bone, ivory, quartz, glass, semiprecious stones, and metals such as gold, silver, bronze, and copper are frequently used materials, and chasing (embossing), enamelwork, and precious stones often ornament reliquaries. They vary considerably in form; like the Tibetan reliquaries, or *ga'u*, they may be constructed on a small scale to look like churches, chapels, towers, *stūpas*, or sarcophagi, but sometimes they assume the form of the relic, such as in the form of anthropomorphic statues, busts, hands, feet, and other forms. Occasionally, as in Tantrism and Tibetan Lamaism, the bones of holy persons are used to make ritual musical instruments—flutes, horns (*rkang-gling*), and drums (*ḍamaru*)—or objects such as the ritual scoop made of a skull cup (*thodkhrag*) and a long iron handle encrusted with silver.

In many Asiatic regions, however, human relics are replaced by copies of sacred texts introduced into statues of bronze, as in Tibet and Yunnan (China), or of stucco, as in Afghanistan (Haḍḍa, an archeological site near Jālālabād excavated since 1928) in about the 4th–6th centuries.

Other ritual objects. *Objects used in prayer and meditation.* In many religions the practice of prayer requires the use of certain objects, among which rosaries (strings of beads) and chaplets (circular strings of beads) occupy an important place in the popular piety of various religions. They are widespread in Hinduism, Buddhism, Islām, Roman Catholicism, Eastern Orthodoxy, and Judaism, although they are not found in Shintō. Brahmanic and Buddhist rosaries have 108 beads, made of *tulasī*, or basil (in Vaiṣṇavism), of lotus seeds or small bones (in Śaivism), or of small disks of human bone (in Lamaism). In China, rosaries are composed of coloured beads. Elsewhere, their number varies; the rosary of Japanese Buddhism has 112

wooden beads, that of Islām has 99 amber beads, and that of the Christian world—and of the well-to-do Jaina—has 150 beads made of various materials, such as wood, pearl, mother-of-pearl, precious or semiprecious stones, gold, and silver. The beads of Brahmanic and Buddhist rosaries are usually strung continuously, except in Japan, where cords—which may or may not have beads on them—are tied to the principal cord in several combinations. The Christian rosary is divided into “decades” (tens) with intercalations, and in many cases the rosary has a “head” composed of a larger bead, several other beads, and a Christian cross.

There are several other objects pertaining to prayer—in addition to the rosary, which is principally a mnemotechnic (memory-technique) device. One example is the Lamaist prayer wheel (*‘khor-lo*), which varies widely in size. It is a cylinder, generally of chased metal, rotating on an axis and containing prayers inscribed on strips of paper, fabric, or parchment. Weighted by two balls suspended externally on small cords, the prayer wheels are set in motion when a hand rotates a handle extending from the axis or when the prayer wheels are aligned along a common axis. Some are driven by hydraulic power and others even by electrical power. There is some evidence of the use of prayer wheels among other peoples, such as the Japanese, the ancient Celts and Bretons, the ancient Greeks, and the ancient Egyptians. The idea of permanent prayer through the agency of objects is found in the candles lit in churches, in the perpetually burning lamps (*chōmyōtō*) of Buddhist Japan, and in Tibetan prayer flags, with sacred formulas painted on them, which wave in the wind around temples, houses, and villages. The phylacteries (*tefillin*) worn by traditional Jews during weekday morning prayers consist of two leather cases bound by leather straps to the forehead and left forearm; they contain parchment citations from the Pentateuch enjoining this as a reminder of God’s commandments. An amuletic function has been attributed to them, but this is disputed. Among protective objects associated with prayer are Muslim prayer rugs, the rectangular shape of which symbolizes the sacred area of the mosque, and the fringe-trimmed prayer shawl (*tallit*) worn by devout Jews during synagogue services.

Related to prayer and meditation are sacred and magical diagrams. Typical examples are the *yantras* (two- or three-dimensional meditation apparatus, often geometrical or anthropomorphic in form) and *maṇḍalas* (symbols of the cosmos in the form of circles, squares, or rectangles) of Brahmanism, Tantric Buddhism, and Lamaism and found in India, Nepal, Tibet, China, Korea, and Japan. Derived from sacred syllables (*mantras*) or from geometric designs endowed with mystical and cosmological symbolism, they are executed on sand, on the ground with coloured powders, and on durable materials. They may be made on stones, engraved on plates of copper, silver, or some other metal, or drawn and painted on skins, linen, silk, or hempen cloth. Like statues, they are consecrated by the rite of “initiation of breath,” *prāṇapratīṣṭhā* (see also *Prayer*, above).

Objects used in purification rites. Large numbers of purification rites are performed universally on widely varying occasions, both in private life, from conception to death, and in religious ceremonies. Such rites employ materials that include water, dust, or dry sand (in Islām); water and henna, a reddish-brown dye (in Islām); oil, incense, balm, and natron, a salt (in ancient Egyptian religion); ale (*öl*) or wine (in post-15th-century Germanic religion); salt (in Shintō); bread, sugar, spices, and animal blood (in ancient Greek and Scandinavian religions); paper, used in the Shintō *gohei*, a white paper “whip” that is shaken; ashes, among the Brahmins; and other materials. Water, fire, and light play especially important roles in purification rites. Objects used in such rites include water vessels of various shapes and sizes used for ablutions; jugs and vats containing ale or wine; terra-cotta or glass containers used for balms and perfumes; incense burners, cauldrons, and censers for fumigation; containers used in Confucian rituals, which include a basin (*chin-lei*) for pure water, another small basin (*huan-po*), and seven goblets (*chio*) for the sacrificial wine; and ewers and basins of gold, silver,

or copper used in purifying the hands and feet, as in pre-Hellenistic Egypt, or for ritual sprinklings.

The wearing of new clothes that have not yet been washed is also a purification rite, practiced, for example, in the spring of the year (October–November) in Brahmanic India, where it is associated with the festival of lights, the *Dīpāvalī*.

Purification may also be attained through mortification and penance, practices that were especially common in medieval Christianity and in Judaism. Methods included the wearing of hair shirts or sackcloth, wearing haircloth undergarments and belts bristling with spikes next to the skin, and flagellating oneself with a scourge made of leather straps or lashing oneself with a whip, such as the *sraośhō-karana* of Persia (see also *Purification rites and customs*, above).

Objects used in rites of passage. Most of the objects noted above have played or still play a role in rites of passage. Such objects play a secondary role in all such rites, which include rites of initiation, marriage, and death.

Circumcision in pre-Hellenistic Egypt and among the Hebrews, Muslims, Ethiopians, and certain primitive peoples was and is performed with a flint-blade knife, with some other kind of sharp knife, perhaps of metal, with a razor, or (as in Africa) with a pair of scissors. Among the Zulus and other African tribes, bull-roarers were launched on such an occasion of initiation. In the Brahmanism, Zoroastrianism, and Parsiism of the Indo-Iranian world, a sacred cord (Pahlavi *kuṣṭī* Sanskrit *yajñopavīta*) is the mark of initiation; in Iran and among the Parsis (Zoroastrians in India), the *kuṣṭī* is wound around the torso, and in India the *yajñopavīta* is passed diagonally from shoulder to waist. Among the Parsis, including the women, the cord is made of strands of lamb’s wool or of goat’s or camel’s hair, and in India the material varies according to caste and may be cotton, hemp, or wool. In addition, the Zoroastrians and Parsis wear a sacred shirt (*sudra*) made of two pieces of white cambric stitched together. For ordination, a shawl, a cotton veil (*padām*) to cover the nose and mouth, and a mace are added; the Brahmanic (Vedic) initiate also receives a tall staff and a black antelope skin. In Sikhism (an Indian religion combining Hindu and Muslim elements, founded by Gurū Nanak in the 16th century), initiations of novices formerly included drinking water into which sugar had been mixed with the blade of a dagger (*khaṇḍā*).

In the initiation of Buddhist monks, the tonsure (cutting the hair of the head) is performed with a razor with a handle, and each initiate receives three red or yellow garments, a belt, a bowl for alms (*pātra*), a filter or ewer (*kuṇḍikā*), an alms-collector’s staff (*khakkara*), a needle, a toothpick, and a fan. Japanese Tantric monks are initiated when they are past 50 years of age, at which time they are baptized (*abhiṣeka*) by having water from five *kuṇḍikā* poured on their heads and receive, in addition to the objects listed above, a *vajra* (“thunderbolt”), a wheel (*cakra*), and a conch (*śaṅkha*). The principal objects involved in the initiation of Christian priests and monks are the tonsure and sacerdotal vestments. The Buryat shaman receives, in addition to his magical cloak and drum, a four-legged chest (*shirē*) decorated with lunar and solar symbols.

The religious character of marriage is not universal. Objects involved in the ceremonies of betrothal and marriage include jars (*loutrophoroi*) for the water of the prenuptial bath of ancient Greece; metal rings placed on the ring finger of the betrothed or married couple among Hebrews, Zoroastrians and Parsis, and persons in classical Rome and in both Eastern and Western Christianity; the bridal veil, orange (*flammeum*) in Rome and white in the Christian and Slavic worlds; the bride’s crown, made first of marjoram and verbena and later of myrtle and orange blossoms in Rome and of various materials in the Christian and Slavic worlds; and the crown held above the heads of the bridal couple in Eastern Orthodox marriage ceremonies. In Roman and Slavic marriage rites a tunic or shirt was used, and in Hindu rites a yellow wool bracelet (*kautu-kasūtra*) is tied around the wrist of the betrothed girl by her mother.

The marriage ceremony sometimes takes place under a

marriage pavilion or canopy, as among the ancient Etruscans of Italy. The Hebrews first used a closed tent (*huppa*) and later a silk or tapestry canopy to symbolize the nuptial chamber. Hindus and Parsis use a tent or pavilion (*pandāl*), in which the bridal couple are initially separated by a curtain. Among the Sikhs, a paper parasol (*agast*) is rotated continually over the head of the bridegroom.

In some areas, particularly in contemporary Hindu India, a swing (*dolā*) is set up under the *pandāl*, on which the couple seat themselves after the official ceremony. The seesaw here symbolizes prosperity, love, and the union between earth and sky. The *aiōra* ("swing") used in the ancient Athenian Dionysiac festival, the swings of the spring festivals at Puri (Orissa) and in Thailand, also have similar symbolic connotations. During the winter solstice, a Vedic sacrifice (*hotr*) is performed on the swing (*preñkha*).

Except for Brahmanic and Buddhist ritual suicides by drowning, which require neither ceremony nor funeral apparatus, there are three methods of disposing of dead human bodies: cremation, stripping of the flesh, and inhumation, performed with or without embalming. These methods have coexisted and still coexist throughout the world. The preparation of the corpse often depends on the method adopted, which, in turn, governs the objects and instruments used. In Japanese sects, particularly in the Shingon and other Buddhist sects, a razor (made of gold in the Jōdo sects) is used for an actual or simulated tonsure of the head of the deceased. A mirror, used in magic to detect evil spirits, figured in the judgment of souls in ancient China. A copper mirror was placed under the head of the dead of pre-Hellenistic Egypt; one of bronze was placed near the head in Buddhist Japan. In Vedic and Brahmanic India, thin pieces of gold were used to close the facial and bodily orifices, and pieces of jade served the same purpose in ancient China. Mortuary masks made of gold, bronze, hard stone, many-coloured terra-cotta, and other materials were used at Mycenae, in pre-Hellenistic and later in Coptic (early Christian) Egypt, in Peru, and other places to cover the face and sometimes the chest. Elsewhere, a cloth covering the face or a shroud, which often was red, was considered sufficient. Pieces of money to pay for the passage from this world to the next were placed in the mouth of corpses in ancient Mycenae, Greece, and Rome and in a pouch in Japan.

Corpses have been borne to funeral sites by various means. Among primitive peoples and in Tibet, they are carried on the back or in the arms, and among the Jews, Muslims, Parsis, Slavs, and Hindus they are carried on biers, which are sometimes richly decorated and are either put in a tomb or destroyed. In modern Western countries, the funeral chariots of Rome and elsewhere have been transformed into motor hearses, while the contemporary Chinese and Vietnamese use carts that have been specially fitted out. Funeral boats were used in pre-Hellenistic Egypt, in ancient Scandinavia, and in the Pacific islands; Venetians of Italy still use gondolas for funeral rites. The sledge was used in the Kurgans of southern Russia.

When cremated, the corpse is often burned with its bier. In the Buddhist world, as, for example, in Cambodia and Thailand, it is burned in a wood and paper coffin made in the form of a sacred animal, with a cloth canopy surmounting the pyre. If the ashes are dispersed after cremation, as in India, they are collected in a cinerary urn. The form and composition of such urns have varied considerably, being made of terra-cotta, stone, porphyry, alabaster, bronze, silver, gold, ceramic ware, and other materials. The urn is placed in the grave, as in ancient Assyria and elsewhere, on a bronze or terra-cotta support (usually an armchair) and lowered into a large jug, as among the Etruscans, or in the niches of the cineraria (places containing ashes of cremated bodies), columbaria (vaults containing urns of cremated bodies), or catacombs, as in Etruria (in Italy), Greece, and Rome. Among the Zapotec of Mexico, the ceramic urn was placed in the niches of cells, the *mogotes*, made beneath hills set aside for the purpose, a practice also observed by the Mosquito Indians of Nicaragua. In Buddhist countries the urn is often displayed on the domestic altar, and in Tibet the imperfectly calcined bones are ground up and mixed with

clay and the mixture is molded into the form of a votive offering (*tsha-tsha*), which is placed in the niches of the funeral *stūpa* (*mchod-rten*). In ancient southwestern India the terra-cotta "feminine" urns had a pair of "breasts" formed by two bowls stuck onto the bulge of the urn.

Stripping the flesh of the corpse generally does not require the use of specific objects, since it is the work of vultures or sometimes of pigs, dogs, or other animals. The Parsis, however, build "towers of silence" (*dakhma*) for the purpose, to which they accompany the deceased with a pot containing fire.

Bodies have been and still are sometimes buried without coffins, as in Rome, where they were put into pit tombs. Among primitive and prehistoric peoples, ancient Egyptians, and the people of the Harappā civilization (c. 2500–1700 BC) of the Indus, the corpse was wrapped in a mat made of plant fibres. Coffins are sometimes carved or painted, and the crudest ones—such as those used by ancient Romans and primitive peoples—are made from hollowed-out tree trunks. Some coffins are modelled according to the human form, such as the colourful wooden coffins of pre-Hellenistic Egypt or the Chinese coffins covered with jade mosaic of the 2nd-century-BC Han dynasty. The majority, however, are oblong and made of wood; in ancient Greece, coffins were made of cypress. Tibetan coffins (*ro-sgam*) and Japanese Buddhist and Shintō coffins, however, are cubical, with the corpse placed in a sitting or crouching position. Among certain coastal peoples—e.g., the Vikings—the deceased is either buried in his boat or put out to sea and cremated with it. Sarcophagi—used in many civilizations—were made of various materials; terra-cotta in Etruria, Greece, southern India prior to the 2nd century BC, and Japan; wood and stone in Japan; and marble in late Rome and in the Christian world. They are often richly decorated with symbolic or allegorical carvings and are frequently very colourful. In ancient Egypt the viscera were placed separately in canopic (burial) jars. The Etrurians also used such jars, the covers of which were decorated with the portrait of the deceased.

From prehistoric times, the deceased was accompanied by ordinary objects placed either in the coffin or in the grave itself, the most common of which were drinking cups, pitchers, cups or vessels for solid food, weapons, tools and ornaments, and jewelry. Ancient Chinese collections of funerary objects of high quality have been exhumed, but the most complete outfitting of the dead was that of the Egyptian tombs, which is completed by scenes painted or carved on the interior walls of the rooms of the tomb. Funeral models of houses, wells, farms, herds, and armies were used in the Han (206 BC–AD 220), T'ang (618–907), and Ming (1368–1644) periods of China as well as in ancient Egypt. Figurines representing the deceased were included among Egyptian funerary objects, along with figurines representing his retinue; in China the retinue figurines included dancers, musicians, and soldiers (*ming-ch'i*). The models were probably substitutes for the servants who formerly had been sacrificed in the royal tomb. For a long time the Chinese figurines were made of ceramic decorated in many colours, but in more recent periods (i.e., after the revolution of 1911 and during the 19th century) they were straw effigies.

Some of the individual objects used in funeral rites include situlae, Roman and Egyptian bronze libation jars with a handle on the tops; Indian Brahmanic terra-cotta jars with perforated bases, which are broken after their use in the aqueous purification of the pyre; and cages containing birds (Buddhist Japan), sometimes eagles (ancient Rome), released near the tomb after burial. There are also the objects used in postmortem rites, such as the tablet of the ancestors (Japanese *ihai*) in China, Japan, and Vietnam and the miniature straw boat, flat-bottomed and with a curved prow, which is set afloat with a bit of candle and food during the Japanese Shintō festival of lights (Bon Matsuri), returning the spirit of the ancestor to the land of souls after three days' visit (see also *Rites of Passage*, above).

simply a massive rock or a hilltop, with no accoutrements. Menhirs (e.g., the Hebrew *matzeva*, a conical stele rubbed with oil at the top), megaliths, and sacrificial posts (e.g., the Vedic *yūpa*)—which are widespread throughout the primitive world—are also quite rudimentary. Altars, properly speaking, are set up either on sacrificial sites or in temples and may be either hollowed out in the earth or raised or constructed. Both of these categories are unknown in Africa and South America, where sacrifices are made on the ground or on a bed of sand. The first category includes the *vedi* (“altar”) of Vedic rites, trenches, pits, and ditches dug in the earth. Some of the hollowed-out sites are used for a sacrificial fire and some for collecting victims’ blood, as in Greece, pre-Sāsānid Iran, and pre-Islāmic Arabia. The altar is most often a table with one, three, four, or more legs. The top may be smooth, or it may be provided with drains for blood and liquid libations or with dishes to hold solid offerings, such as the firstfruits—e.g., the *kernoi* (small sacrificial pots) of the pre-Hellenic Aegean civilization.

The altar may be round or oblong or may imitate other forms, such as the Indian Vedic altar, which was made in the form of a bird with spread wings. Altars are usually fixed in place and are made of various materials: clay (pre-Columbian religions of Central America); terra-cotta (*kernos*) and stucco-covered sun-baked bricks (religions of ancient Greece); fired bricks (Vedism in ancient India); wood (Buddhism and Shintō of Japan, primitive religions of Polynesia, and Christianity in Western and Nestorian—an Eastern independent church—churches until the 10th or 11th century); wood plated with metals, such as bronze and gold (the religions of the Hebrews and Byzantine Christians); and metals, such as iron (Germanic religion), bronze (ancient Near Eastern religions), and gold (5th- and 6th-century Byzantine Christianity). Most commonly, however, altars are made of stone slabs resting horizontally on legs, columns, or lateral supports, although the pre-Sāsānid Iranian slab altar (*ādōshi*) rested on a pedestal. The Christian altar is square or oblong; that used in Greek hero worship was rectangular, as was the altar of pre-Hellenistic Egypt, which was made of alabaster. Some altars, such as the marble Altar of the Earth at Peking, are cubical, and others, such as the Altar of Heaven at Peking and ancient Phoenician altars, are cylindrical. Occasionally, as in Greece, they are hollow and contain the ashes of burnt offerings. The Roman Catholic altar is required to contain a stone, no matter what the predominant material may be.

A throne may be a special form of altar and may be either a true piece of furniture fashioned in wood or metal or a seat carved out in rock. It also may surmount a stele, as in northern Vietnam and Bali.

Equip-
ment for
sacrifices

Sacrificial weapons, like the utensils, vary according to the nature of the sacrifice. The most common weapon is the knife, which is used to slit the throat of the human or animal victim, a practice observed, for example, by Semites, Muslims, and ancient Greeks. Sometimes the knife is cast into the sea after use. An ax involved in the Athenian Bouphonia (“Ox-Slaughtering Festival”) was carried to the tribunal of the Prytaneum (the town hall, containing a community altar or hearth), inspected, and then submerged in the same way. Sometimes a poniard or dagger was used, such as in the Mithraic sacrifice of a bull; a ritual knife (*khaḍga*) shaped like a sickle, with the outer edge forming the cutting edge, is used in the sacrifice of black goats to Kālī (a Hindu goddess who is the consort of Śiva) in Calcutta. In the great imperial sacrifice of the horse (*aśvamedha*) of Vedic India, a gold-ornamented knife was used to sacrifice the horse, but knives of copper and iron were used for other animals. In the sacrificial rites of contemporary primitive peoples, a sword, which varies in size and form, generally is used. In ancient Iran the victim was slaughtered with a log or pestle. In all sacrificial rites, it should be noted that a flow of blood is always necessary, even when the victim is clubbed.

Sacrificial victims are also very frequently burned or else are cooked for a communal meal. Vessels for holding and maintaining the sacrificial fire may be used in such situations. Two such vessels have been well described in

religious literature: the Vedic Indian vessel (*ukhā*) made of earth and fired in a pit on the sacrificial grounds and the urn (*ātash-dān*) of pre-Sāsānid Iranian fire altars. Sometimes the ashes were collected in cauldrons (the ancient Hebrews), and occasionally the viscera were placed separately in a gourd (Africa) or on a tray (pre-Hellenistic Egypt and contemporary Africa). When intoxicating beverages—such as the Avestan Iranian *haoma* and the Vedic Indian *soma*—are made at the same time as the sacrifice, the inventory of ritual objects necessarily includes the stones for pressing the plants, a wooden vat, a filter, and a libation cup at the fire.

Three types of objects used in ablation and libation rites may be distinguished. First are the containers for storing liquids, such as water, fermented liquor, wine, and blood. A second type includes utensils—e.g., spoons and ladles—used for drawing off liquids, which are fashioned out of pieces of wood of different, although ritualistically defined, varieties. The third type comprises the containers used directly for ablutions, libations, and oblations—e.g., the ewers of Sumer, Egypt, and Vedic India; gold, silver, copper, or iron *pātra* of the Vedic and Brahmanic world; Hebrew goblets; cups of various forms, such as the Vedic and Tantric skull cup; the phial (bowl) and patera (shallow libation dish) of the Roman and early Christian worlds, made of gold, chased and engraved metal, semiprecious stones, or glass; the Australian bark *pitchi*; and the ciborium (covered container for the consecrated bread) and chalice (cup containing the consecrated wine) of Roman Catholic, Anglican, and Lutheran worship. The cup of the chalice must be made of gold, silver, or vermeil (gilded silver, bronze, or copper).

The sickle for harvesting plants, a winnowing basket for preparing grain offerings, a reed broom for cleaning the sacrificial area, the scoop for collecting ashes used in Vedic India and by the Hebrews (who made it of gold or bronze), and baskets for presenting offerings of fruit or cakes are among the many other objects used in sacrificial rites. In order to consecrate such offerings, a priest of ancient Egypt touched them with a sceptre (*khreep*).

Ornaments used in sacrificial rites are of many different types. The adornment of the victim before sacrifice may take the form of gilding the horns, as in ancient Greece, or putting a necklace or garland of flowers on it. The priest may wear a breastplate, as in Egypt, Etruria, and Jerusalem, or a gold ornament—e.g., the Vedic Indian *nikṣa*—around his neck. Divine statues also may be adorned with jewels, diadems, tiaras, and garments consisting of goldworked covers, a practice still observed in southern India, or with ceremonial apparel, a Christian practice observed in the veneration of saints, particularly in Czechoslovakia (Prague), Poland, and France (Brittany). Altars are permanently or occasionally decorated with incense burners, candelabra, and vases of flowers. Artificial flowers have been used on altars in Japan since the 7th century.

Finally, many sacrifices are accompanied by music, which may be viewed either as a protective measure or as an offering of sound. The musical instruments used in worship do not necessarily assume any special form, but they are often played by the priests themselves, as among Hindus, Tibetan Tantrists, and Hebrews, or are reserved for the accompaniment of particular rites. The silver trumpets of the Hebrews and the conches of Indian-influenced countries are used in this way.

Objects used in temple, state, and private ceremonies. A large number of ordinary objects produced especially for the god have been used in the daily worship of divine statues. The most complete and best described rites were those practiced in ancient Assyria and Egypt and those still observed in the Vaiṣṇavite temples of southeastern India. Such objects are identical in form to those ordinarily used by men, although the materials may vary: earthenware jars for “pure” water; table service, which may include plates, trays, bowls, cups, and pitchers; clothing; pots and flasks for salves and perfumes; jewels, ornaments, flower garlands, and metal mirrors; thrones and platforms; a swing; palanquins (enclosed litters), processional chariots, and boats for the god’s journeys outside the temple; musi-

rites

Other
objects
pertaining
to sacrifice

cal instruments, such as drums of all sizes, lutes, clarinets, and conches; and parasols, fans, flyswatters, standards, and oriflammes (banners).

The principal ceremony that pertains to the state is the coronation of the king or emperor. In addition to the pomp displayed on such occasions, the most significant objects generally are the containers used in baptizing or anointing the king, such as the sacred conches or antelope horns used for the lustral water in Indian-influenced countries and the Holy Ampulla (flask) for consecration oil, used particularly in France; the throne, which is the essential object of the ceremony in almost all civilizations; and the crown, the sceptre, the hand of justice, and the globe of the Byzantine, Iranian, and Western worlds.

Domestic rites were observed daily in ancient Rome, Brahmanic India, the Buddhist world, China, Japan, and other areas, as they still are in many places. The objects involved in such ceremonies are the same as those used in temple worship. Permanent altars, which are often placed near the entrance, contain statues, the tablets of the ancestors, and offerings of flowers, incense, fruits, and lights.

CONCLUSION

Ceremonial and ritual objects in past times have held and still hold, in many cases, a very important place in the civilizations of the world. From prehistoric times, they have played an integral part in the evolution of the various civilizations on two levels: (1) on the level of rites and rituals practiced in everyday life and (2) on the level of the more solemn and rare cultic and communal rites. From a merely functional standpoint, such objects serve sacred or symbolic purposes; their construction, forms, dimensions, and styles have been, from earliest times, codified. Some have been so closely associated with the divine or the sacred that they have been considered either a symbolic manifestation of the deity or an actual manifestation of the deity itself. In general, however, they lose in the course of time this particularistic characteristic. In this process, they generally survive only in a formal sense, and thus henceforth are devoid of any sacred power. (J.Au.)

Religious dress and vestments

Religious dress and vestments, broadly understood, include a wide range of attire, accoutrements, and markings used in religious rituals that may be corporate, domestic, or personal in nature. They comprise types of coverings all the way from the highly symbolic and ornamented eucharistic (Holy Communion) vestments of Eastern Orthodox Christianity to tattooing, scarification, or body painting of members of primitive (preliterate) societies. Some types of religious dress may be used to distinguish the priestly from the lay members of a religious group, or they may also be used to signify various orders or ranks within a priesthood. Some religious communities may require that religious personages (*e.g.*, priests, monks, nuns, shamans, priestesses, and others) garb themselves with appropriate types of religious dress at all times, whereas other religious communities may only request that religious dress be worn during rituals.

In theocratic societies, such as Judaism and Islām, religious sanctions govern what may and may not be worn by members of the community; and religious dress embraces not only what is worn by a prayer leader but also what is worn by his congregation outside as well as inside a place of worship. In many traditions, habits serve to identify monastic groups. Indeed, in the latter case, the function of religious dress is more akin to heraldry as a form of symbolic identification than to liturgy, with its ritualistic symbolic motifs.

In a more restricted sense, religious vestments articulate a liturgical language as part of a figurative idiom shared with other religious symbols—*e.g.*, icons (images), statues, drama, music, and ritual. According to the richness of the liturgical or ritual vocabulary employed, the more feasibly can a symbology of vesture be attempted. This is especially the case with Eastern Orthodoxy, whose predilection for symbolical theology has spread from sacraments to sacramentals and everything associated with worship, including

dress. With allegory paramount in the Middle Ages, the Western Church could not escape attributing symbolical values to garments whose origin may have owed little to symbolism. From the liturgical writer Amalarius of Metz in the 9th century to the theologian Durandus of Saint-Pourçain in the 13th–14th century sacerdotal vestments, in particular the stole and the chasuble, were viewed as symbols and indeed operated as such in a way that still influences current usage. Thus, because the stole is a yoke around the neck of the priest and he should rejoice in his servitude, on donning or doffing it he kisses the emblem of his servile status.

The notion of dress as a substitute skin and, hence, as an acquired personality temporarily assumed has been widespread in primitive religion; such practices in shamanism have been widely observed in Arctic and Siberian regions. The use of a substitute skin in religious ritual is also explicit in the cultic actions of some advanced cultures, such as in the rite of the Aztec maize goddess Chicomecoātl. A virgin chosen to represent Chicomecoātl, after having danced for 24 hours, was then sacrificed and flayed; and the celebrant, dressed in her skin, re-enacted the same ritual dance to identify with the victim, who was viewed as the goddess.

Religious dress may also serve a memorial function, as in the case of the religious leaders (mullahs) of the Shī'ites (Muslim members of the party of 'Alī), whose black gowns allude to the sufferings of Husayn ('Alī's son by Fāṭimah, Muḥammad's only surviving daughter), who was martyred at Karbalā', in modern Iraq, in AD 680. In the Eucharist, which is both a thanksgiving and a reenactment of the sacrifice of Christ on Golgotha, the chasuble (outer garment) worn by the celebrant depicts scenes from the Passion on the orphrey, the name given to the elaborately embroidered strips stitched on the chasuble. The fringes on the Jewish prayer shawl witness to "the commandments of the Lord" in Numbers, chapter 15, and remind the worshipper that he has covenanted to observe them.

TYPES OF DRESS AND VESTMENTS IN WESTERN RELIGIONS

Judaism. *Early sacerdotal dress.* Jewish vesture is an amalgam of very ancient and extremely modern religious dress. Originally, sacerdotal dress was probably varied and complex, but, after the destruction of the Second Temple in AD 70 and the subsequent disappearance of the Temple offices, many garments associated with priestly functions passed into oblivion. Chief among these offices was that of the high priest. In addition to the usual Levitical garments (those of the priestly class), the high priest, while officiating, wore the *me'il* (mantle), the ephod (an upper garment), a breastplate, and a headdress. The *me'il* was a sleeveless robe of purple the lower hem of which had a fringe of small gold bells alternating with pomegranate tassels in red, scarlet, purple, and violet. The ephod—an object of much controversy—probably consisted of a wide band of material with a belt to secure it to the body, and it was worn over the other priestly garments. Most important was the breastplate (*hoshen*), which was square in outline and probably served as a pouch in which the divinatory devices of Urim and Thummim were kept. Exodus, chapter 28, verse 15, specifies that it was to be woven of golden and linen threads dyed blue, purple, and scarlet. Because of its oracular function, it was called the "breastpiece of judgment." On the face of the breastplate were set 12 gems in four rows, symbolizing the 12 tribes of Israel. These stones were a sardius, a topaz, and a carbuncle in the first row; an emerald, a sapphire, and a diamond in the second; a jacinth, an agate, and an amethyst in the third; and a beryl, an onyx, and a jasper in the fourth. The identity, sequence, and objects of representation of these stones are matters of controversy. Worn over the ephod, the breastplate was slung from the shoulders of the wearer by golden attachments. On his head the high priest usually wore a *mitzenfet* (either a tiara or a turban), except on Yom Kippur ("Day of Atonement"), when he wore nothing but white linen garments upon entering the Holy of Holies (the inner sanctuary).

Later religious dress. Later religious dress of Judaism after the fall of the Temple in AD 70 reflects usages

teries
and
fringes

that predate that event but were continued in Judaism at the synagogue. Included among such garments are *tefillin* (phylacteries) and *tzitzit* (fringes), which have certain features in common. The name phylacteries is sometimes thought to point to a prophylactic origin, but the term is actually a translation of the Hebrew word for "frontlets" (*totafot*). Phylacteries are worn in obedience to the commandment found in Deuteronomy, chapter 11, verse 18, and Exodus, chapter 13, verses 9 and 16: "And you shall bind them [*i.e.*, the words of God] as a sign upon your hand, and they shall be as frontlets between your eyes." This implies that there should be two phylacteries: one to be worn on the arm, the other on the head. Both kinds consist of a small black box of hide containing a manuscript and are secured to the respective parts of the body by leather thongs. On the sides of the head *tefilla* is the Hebrew letter *vav*, the first letter of Shaddai (Almighty). Both boxes are secured by leather thongs. The practice can be dated at least as far back as the 3rd century BC. The knotted thongs indicate a prophylactic purpose—*i.e.*, to protect the wearer against demons. Likewise, the wearer of these objects was, for the prayer's duration, under the protection of the Almighty, whose name he bore. The importance of knots in Semitic magic is also alluded to in the Qur'ān (the Islāmic scripture).

Something similar obtains in the case of the *tzitzit* (fringes), or "twisted cords." The wearing of fringes is in obedience to a commandment in Numbers, chapter 15, verses 38–40: "It shall be to you a tassel to look upon and remember all the commandments of the Lord, [and] to do them." The fringes were attached to the outer garment with no attempt at or reason for concealment. Later, because of persecution, they became an inner garment, enabling the wearer to observe the Law clandestinely. This garment, which is not entirely obsolete, is styled *arba'kanfot* ("four corners") in allusion to Deuteronomy, chapter 22, verse 12 ("you shall make yourself tassels on the four corners of your cloak with which you cover yourself"), although no literary reference to its use can be traced further back than the 14th century.

The tallith, or prayer shawl, has the four fringes also, but it is confined to synagogal use and, even there, is limited to the morning service, whereas the *arba'kanfot* is worn all day. Both silk and wool are used, but the woollen tallith is preferable, with white as its ground colour. In the 20th century the tallith is worn like a scarf and is sometimes pulled over the head to aid in concentrating during prayer. Formerly, however, it was always wrapped around the head. In orthodox Judaism, the head is invariably covered during worship, usually by a skullcap known as a *yarmulka* or *kappel*.

Because a Jewish male is not supposed to walk more than four cubits (six feet) with his head uncovered, a religious Jew will wear the skullcap clipped to his hair, and indeed he may wear it all day because he believes himself to be in the presence of God at all times.

The dress of rabbis never conformed to precise standards. Current practice approximates modern Genevan (Protestant) conventions (gown and bands). The Jewish Reform movement, which began in Germany, further emphasized the Protestant character of rabbinical dress, and Reform rabbis differ little in this respect from ministers of various Protestant churches. Both cantor (*hazzan*) and rabbi now use the black gown and round black hat, which came into use during the 19th century.

Garments
used on
Yom
Kippur

On Yom Kippur, it was the custom for participants to wear a *sargenes*, or white garment, emphasizing that Yom Kippur was an occasion not only of repentance but also of grace, for which festal wear was appropriate. Emphasis on the atoning aspect of the occasion, however, led to the *sargenes* being interpreted as *takhrikhim*, or graveclothes, which are worn to aid the worshipper toward a mood of repentance, a practice also adopted by the *hazzan* on two other occasions and by the host at the seder (meal) on Passover (a feast celebrating the Exodus of the Hebrews from Egypt in the 13th century BC). Officials at the Yom Kippur service still dress in white robes. Shrouds are normally of unadorned white linen, following the sumptuary ruling of the 1st-century-AD rabbi Gamaliel the Elder. To

the shroud may be added the tallith used by the deceased, but with the fringes removed or cut, because the prescription governing their use applies only to the living. Both liturgical vesture and everyday clothing must conform to the Mosaic requirement that forbids the combination of linen and wool in the same garment (see also JUDAISM).

Christianity. In the pre-Constantinian church (before the early 4th century), no distinctive liturgical dress was worn, and the Eucharist (Holy Communion) was celebrated by priests whose dress did not differ from that worn by lay members of their congregations. Present liturgical vestments in Roman Catholic and Orthodox churches derive from a common origin—*i.e.*, the garments that were fashionable in the late Roman Empire. After the Schism of 1054, however, they each followed separate courses (see also CHRISTIANITY).

Roman Catholic religious dress. A distinction is made between the insignia of ecclesiastical and sacerdotal office in the hierarchy and the functionally and symbolically significant liturgical robes. After the barbarian invasions of the Roman Empire from the 4th century on, fashions in secular dress changed, and thus the clergy became distinct in matters of dress from the laity. Certain robes indicate a position in the hierarchy; others correspond to function and may be worn by the same individual at different times. The most important vestment among the insignia is the stole, the emblem of sacerdotal status, the origin of which is the ancient *pallium*. The stole originally was a draped garment, then a folded one with the appearance of a scarf, and, finally, in the 4th century, a scarf. As a symbol of jurisdiction in the Roman Empire, the supreme pontiff (the pope, or bishop of Rome) conferred it upon archbishops and, later, upon bishops, as emblematic of their sharing in the papal authority.

The distinctive garb of the liturgical celebrant is the chasuble, a vestment that goes back to the Roman *paenula*. The *paenula* also was the Orthodox equivalent of the chasuble, the *phelonion*, and perhaps also the cope (a long mantle-like vestment). In its primitive form the *paenula* was a cone-shaped dress with an opening at the apex to admit the head. Because ancient looms were not wide enough to make the complete garment, it was made in several parts sewn together with strips covering the seams. These strips, of contrasting material, developed into the orphrey (embroidery), on which much attention was later lavished. Next in the hierarchical order after the priesthood were the diaconate and subdiaconate, whose characteristic vestments were, respectively, the dalmatic (*dalmatica*), a loose-fitting robe with open sides and wide sleeves, and the tunic (*tunica*), a loose gown. A priest wore all three, one over another. Under these he wore the alb (a long white vestment), held round the waist by a girdle, and around the neck the amice (a square or oblong, white linen cloth), with the maniple (originally a handkerchief) on the left arm. Although the deacon used a stole, the subdeacon did not. In the formative period of liturgical dress, these practices were in the process of becoming normative. During the 9th to the 13th century the norms now familiar were established. The chasuble became an exclusively eucharistic garment; the cope, excluded from the Eucharist, became an all-purpose festive garment.

Next in importance to the chasuble is the cope, a garment not worn during the celebration of the mass but rather a processional vestment. It is worn by the celebrant for rites of a non-eucharistic character, such as the Asperges, a rite of sprinkling water on the faithful preceding the mass. The origins of the cope are not known for certain by liturgical scholars. According to one theory, it derives from the open-fronted *paenula*, just as the chasuble derives from the closed version of the same garment. (The subsequent wide divergence between the two vestments need not preclude a common origin.) Unlike the chasuble, the form of which has never stopped changing, the evolution of the cope was complete before the end of the Middle Ages. Cope chests, based on the quadrant of a circle and designed to preserve the embroidered surfaces by keeping the copes flat, were a common feature of medieval cathedrals. When it is worn, the two sides of the garment are held together by a morse (a metal clasp). The cope occupied an intermediate

Liturgical
garb

position between liturgical and nonliturgical vestments, the most important of which was the cassock, the normal dress of the priesthood outside church ceremonies. When engaged in religious ceremonies, the officiant would wear the liturgical vestments over his cassock.

The tiara, the papal diadem or crown apostolic, emerged in the early medieval period; and the mitre (the liturgical headdress of bishops and abbots), the most conspicuous of the episcopal insignia, began as a mark of favour accorded to certain bishops by the supreme pontiff at a somewhat later date.

Like the cope, the surplice (a white outer robe) entered liturgical usage in the Middle Ages as a late modification of the alb. By the 14th century its present role as a choral or processional garment was established. With the passage of time, the length of the garment grew progressively shorter.

Monastic
garb

The surplice was also associated with the monastic orders, but vesture distinguished only the order and not the kind of order. Eremitical (hermitic) monasticism allowed no standard form of dress to develop, and only communal monasticism, beginning with the Rule of St. Benedict of Nursia in the 6th century, enabled standardization to become possible. Monastic dress included habit, girdle or belt, hood or cowl, and scapular (a long narrow cloth worn over the tunic). The salient characteristics of monastic dress have always been sobriety and conservatism. The orders proved even more retentive of archaic fashions than the hierarchy, and, in contrast to the deliberate splendour of ecclesiastical vestments, monastic dress was expressive of a renunciation of luxury. The contrast was functional in origin: the menial tasks of the monk related him sartorially to the peasant, whose humble avocations he often duplicated, rather than to the princes and prelates of the church, whose dress reflected the splendour of the ceremonies in which they engaged.

Because of the diversity of the monastic orders, only a summary account of their vesture may be given. The Benedictine mantle was black, fastened with a leather belt; but the Cistercians—reformed Benedictines—eschewed any dyed material and instead dressed in undyed woollen material, which was off-white in colour. In the course of time this became white, a tacit relaxation of the primitive austerity adopted as a protest against “luxury.” Carthusians, a contemplative order founded in the 11th century, likewise wore white. In the 13th century the mendicant orders (friars) emerged. The Franciscans, founded by St. Francis of Assisi, first used a gray habit, which in the 15th century was exchanged for a brown one; in spite of this change they continued to be known as the Grey Friars. The Carmelites, an order founded in the 12th century, became known as White Friars. Dominicans, founded by St. Dominic from Spain, adhered from the beginning to a black robe over a white gown. Canons regular (communal religious persons living under vows), although ordained, lived like the orders under a rule, and the Augustinians (several orders following the Rule of St. Augustine) are styled Black Canons in contradistinction to the Premonstratensians, or White Canons, an order founded by St. Norbert in the 12th century. Because the office (prescribed prayers) took up so much of a monk’s time, his choir robes were almost as important as his day clothes. Surplices were worn in choir with an almuce over; this last was a lined shoulder cape designed to help the wearer resist the cold of medieval churches.

Nuns’ costumes were similar to those of monks, the chief difference consisting in the replacement of the hood by a wimple (collar and bib) and head veil. Habits are white or black or mixed, and this remained unaltered until the 17th century, when the Sisters of St. Vincent de Paul introduced blue. This exception remained unique; nuns’ habits retained a markedly medieval aspect until reformed by the second Vatican Council (1962–65).

The cassock has its origin in the barbarian *caracalla*, a robe favoured by the Roman emperor Bassianus (reigned 211–217), who came to be known as Caracalla because of the garment he habitually wore. Worn by the clergy as early as the 5th century, it became in time the standard day wear for prelates and priests, hierarchical rank being indicated by colour: bishops, archbishops, and other

prelates wore purple; cardinals, red; the pope, white; and ordinary clergy, black (see also ROMAN CATHOLICISM).

Eastern Orthodox religious dress. The Middle Ages also witnessed the evolution of Eastern Orthodox vestments into approximately their present form. The eucharistic garment corresponding to the chasuble was the *phelonion*, with variant forms in the Greek and Russian churches. The *sticharion*, which is held by the *zōnē*, or girdle, corresponds to the alb. The cuffs, or *epimanikia*, which fit over the *sticharion*, bear little or no resemblance to the maniple. The *epitrachēlion* is the Orthodox equivalent of the stole, but it hangs straight instead of being crossed over the chest, as is the case with the stole in Western churches. On the deacon, the *epitrachēlion* is pinned to the left shoulder and hangs in front and behind; with this exception, the deacon’s vesture is identical with the priest’s. The bishop wears an *omophorion*, whose shape and manner of wearing are closer to the original *pallium* than either the stole or the *epitrachēlion*. In place of the *phelonion*, since the 16th century, the bishop uses a dalmatic known as the *sakkos*. The *epigonation*, or rhombus-shaped portion of silk hanging to below the right knee, is common both to bishops and archimandrites (head abbots).

The monastic habit of the monk differs according to which of the three grades he occupies. The fully professed monk wears the great, or angelical, habit, which consists of the inner and outer rhasons, girdle, cowl (with veil), *analvos*, and *mandyas* (mantle). The inner rhason corresponds to the cassock and, like it, is used by the secular clergy. The outer rhason, a wide-sleeved garment, is black in the Greek Church but variable in colour in the Russian Church among the secular clergy (*i.e.*, those who minister in parishes). The *analvos* (shaped like the Western scapular, although historically unconnected with it) differentiates the full, or perfect, monk from the other grades, and its substance must be of animal, nonvegetable origin to remind the wearer constantly of death. The *mandyas* is the bishop’s cloak (for non-eucharistic occasions), and in the Russian Church its use is granted to monks of the intermediate grade, although this license does not obtain in the Greek Church. In neither church may the *mandyas* or *analvos* be worn by monks of the lowest grade. Unlike Western orders, Orthodox monks dress only in black, but they share the same sartorial conservatism, their habits having remained unchanged in essentials from medieval times to the present (see also EASTERN ORTHODOXY).

Protestant religious dress. The Reformation of the 16th century varied in intensity from one country to another, and the fate of liturgical vesture suffered accordingly. With the rejection of the dogma of transubstantiation (the Roman Catholic teaching that in the Eucharist the substance of the bread and wine is changed into the body and blood of Christ, with the properties of the bread and wine remaining the same), the use of the mass garments might have been expected to be eliminated, but, wherever an altered eucharistic doctrine survived, an attenuated liturgical vesture contrived to survive with it. In the case of the Anglican and Lutheran churches, a paradoxical situation emerged whereby, in the latter, pre-Reformation practices (*e.g.*, use of crucifixes) survived alongside a Reformation theology, whereas, in Anglicanism, a Catholic theology survived along with a repudiation of Catholic rites. The Lutherans rejected the insignia of a celibate clergy but retained the chasuble for Communion services and the surplice and alb for other services.

Bishops in both Lutheran and Anglican communions retained the cope. The different editions of *The Book of Common Prayer* (the Anglican liturgical book) attest to 16th-century reforms and the rising power of Puritanism, a 17th-century reform movement; the use of vestments declined in consequence. The cathedrals, however, maintained liturgical vestment standards to a certain degree, even when the last vestiges of liturgical propriety had been extinguished in the parishes in the 18th century. The cope became the High Church (liturgically oriented) vestment *par excellence*, worn by bishops not only processionally but even during Communion. Many views about the ceremonial revival of the 19th century have not in all respects been accurate; and followers of Edward Pusey, a leader

and monks

Anglican
and
Lutheran
liturgical
vesture

of the Catholic revival known as the Oxford Movement, and ritualists sometimes blundered not from excess of archaeological zeal as has been commonly supposed but rather because they were inordinately influenced by their sociocultural environment. This may be less immediately obvious in the case of vesture than in architecture, but one result of overreacting was the loss, in the 19th century, of the customary dress of the clergy. The gown and cassock, as street attire, were allowed to fall into desuetude because in Puseyite views the gown was Genevan, whereas in reality it was the reverse. Another instance lay in the adoption of the (local) Roman biretta, introducing an Italian fashion even though adequate indigenous precedents were not lacking.

The gown, now inseparably associated in the popular mind with Genevan (Reformed) divines, was in fact opposed by these same divines in England and Scotland in the 17th century. In spite of this, standard vesture in Presbyterian churches is now the black gown and white linen bands over cassock and cincture, with the academic hood added for preaching services as a mark of learning appropriate to the pulpit, and a stole or scarf (see also PROTESTANTISM).

Modern changes in religious dress and vestments. With a change in emphasis, chiefly expressed in the episcopal use of the cope, Episcopalian usage in the first half of the 20th century differed little from Catholic rules except in Anglo-Catholicism, in which deliberate archaism imposed an adhesion to Baroque (17th to early 18th century) models, themselves superseded within Roman Catholicism. The Liturgical Movement of the 20th century has exercised an influence beyond the boundaries of the church in which it originated, and modern clerics of different denominations increasingly resemble one another sartorially because all have had recourse to the same sources of liturgical inspiration.

In Roman Catholicism, the formative period of religious dress was over before the Reformation, and Reformation influence was indirect—via the impetus supplied by the Counter-Reformation, which made Baroque its official art style. The emphasis on richness of material, excessive decoration, and preoccupation with surface set in motion a process of decline that was not arrested till the 20th century. The degeneration of the Gothic chasuble with its pointed folds into a stiff fiddle-backed, overembroidered vestment had begun as early as the 13th century with the practice of elevating the Host (sacrificial elements) in the mass. The elevation of the Host entailed the folding back on the celebrant's shoulders of the sides of the chasuble. The flexibility of the early chasuble permitted this, but, to facilitate the elevation, more and more material was removed from the sides until the garment became a caricature of its primitive form, distorted beyond recognition and its vestigial portions—dorsal (back) and pectoral (front)—came to be viewed simply as canvases for the display of virtuoso embroidery. Undergarments also became what is now viewed as effeminate with the addition of lace, and, although the Liturgical Movement began with a new theology of the Eucharist, its repercussions forced a decline of the Baroque style in dress.

From the late Middle Ages to the 20th century, the history of religious dress in the Roman Catholic Church has been the history of its rubrical evolution: the regional variants of patristic (early church) and early medieval times were eliminated in the interest of ultramontanist (a theory that advocated a greater authority for the papacy), until the second Vatican Council reversed the process of eight centuries, again sanctioning regional divergences. Council rulings also simplified the use of the mitre and suppressed the use of the maniple altogether. Increased lay participation in the liturgy has led to an extension of lay religious dress in more than one communion. To lay offices such as the vergers, who wear a gown over cassock, and chorister, who wears a surplice, Anglicans have added that of the lay reader, who vests in cassock and surplice, with a scarf as his ensign.

The upheavals of the 16th, 19th, and 20th centuries have not had much effect on Eastern Orthodox vesture, and the same canons (rules) prevail today in Orthodoxy as

obtained prior to the fall of Constantinople in the 15th century. To ascribe this condition in Eastern Orthodoxy solely to the effects of cultural isolation would be an oversimplification. Suppression of vestments or their alteration is less likely to occur in a church in which such vestments have higher symbolic value attributed to them than in other traditions.

Islām. Islām attaches less importance to liturgical vestments than do most religions, but the social emphasis of the Islāmic faith finds expression in the universal application of the regulations governing dress; e.g., all who enter the mosque remove their footwear, and all going on pilgrimage must wear the same habit, the *iḥrām*, and thus appear in the holy places in the guise of a beggar.

Because Islām recognizes no priesthood in a sense of a class sacramentally set apart, "clerical" functions are discharged by the '*ulamā*', or "the learned (in the Law)," whose insignia is the '*imāmāh*' (a scarf or turban). The garb of the '*ulamā*' exhibits geographical variations, but the '*imāmāh*' is found everywhere. Two broad regional distributions obtain, with Iraq as the area of confluence between the two. In the western part of the Muslim world, "clerical" dress has tended to become standardized according to the Azhar (Egyptian) pattern: a long, wide-sleeved gown (*jubbah*) reaching to the feet and buttoned halfway down its total length over a striped garment (caftan); and the headgear consists of a soft collapsible cap (*qalansūwah*) of red felt around which is wound a white muslin '*imāmāh*'. In Syria a hard *ṭarbūsh* of the same red shade replaces the *qalansūwah*. Both the *qalansūwah* and the *ṭarbūsh* are provided with a blue tassel. The *jubbah* is usually a sober shade of blue, gray, or brown, and seldom black. Among the Sunnites—from Iraq eastward—the *jubbah* is worn in association with an '*abā*' (a long, full garment), traditionally of camel's hair and brown or black in colour. This is sometimes secured by a *ḥijām*, or cummerbund. In this second regional variant, the '*imāmāh*' becomes a full turban replacing the cap, or fez. A green turban usually denotes a *sharīf*, or descendant of the Prophet Muḥammad; and among the Shī'ites (the party of 'Alī) the entire "clerical garb" is black, as a symbol of mourning for the death of Ḥusayn at Karbalā'.

The Ottoman Turks, as strict Sunnites, preferred turbans of other colours, which, elaborately wound, served to distinguish the wearer from a non-Muslim. On conquering Constantinople in 1453, they adopted the Byzantine cap and wound the turban around it in demonstration of conquest. The elaborately wound turbans of Persia and India also have a skullcap as a foundation for their folds. The art of winding a turban required no small degree of skill, the wearer fitting the cap over his knee and winding it in that position, whereafter the cap kept the folds in place. To the Prophet Muḥammad is attributed the saying "What differentiates us [in appearance] from the polytheists is the turban." In India the turban has also been worn by non-Muslims, but the Muslim turban has remained distinguishable from the Hindu by the use of the skullcap as its foundation.

For all Muslim males, whether Sunni or Shī'ite, clerical or lay, the wearing of gold or silk is forbidden in consequence of a prescription (Ḥadīth) of the Prophet, whereby the wearing of either was rendered "*ḥarām* [forbidden] for the males of my nation." Footwear must be removed on entering a mosque for fear of defiling the interior with ritually impure substances that may have adhered to the sole of the shoe. This rule applies also to entering a grave; thus, gravediggers and stonemasons must be unshod on such occasions. Because covering the head is a Near Eastern way of showing respect, a head covering should properly be worn in the mosque and even when praying outside the mosque.

When a Muslim purposes to visit the holy city of Mecca at the time of the major pilgrimage (*ḥajj*), he enters on a state of consecration and robes himself in two white seamless garments (*iḥrām*), which may not be exchanged for normal dress until he deconsecrates himself after the conclusion of the pilgrimage ceremonies. To these two garments women may add a veil.

Many of the mystical dervish orders (*ṭuruq*) wear dis-

of the
second
Vatican
Council

tinctive robes, frequently with hierarchical differences. In Turkey, headstones are carved in the shape of the headdress distinctive to the order to which the deceased belonged and are tintured in the appropriate colours. Particularly interesting are the ceremonial robes of the Mawlawiyah order (popularly known in the West as the Whirling or Dancing Dervishes), in which the symbolism of the robes is central to the mysteries of the order. The dervishes wear over all other garments a black robe (*khirqah*), which symbolizes the grave, and the tall camel's hair hat (*sikke*) represents the headstone. Underneath are the white "dancing" robes consisting of a very wide, pleated frock (*tannür*), over which fits a short jacket (*destegül*). On arising to participate in the ritual dance, the dervish casts off the blackness of the grave and appears radiant in the white shroud of resurrection. The head of the order wears a green scarf of office wound around the base of his *sikke*.

For all Muslims of whatever sect the standard grave-clothes are the threefold linen shroud, or *kafan*: the *izâr*, or lower garment; the *ridâ*, or upper garment; and the *lifâfah*, or overall shroud. Martyrs, however, are buried in the clothes in which they die, without their bodies or their garments being washed, because the blood and the dirt are viewed as evidences of their state of glory (see also ISLÂM).

TYPES OF DRESS AND VESTMENTS IN EASTERN RELIGIONS

Indian religions. The distinction between ordinary dress and religious dress is difficult to delineate in India because the ordinary members of the various socioreligious groups may often be distinguished by their costumes. For example, Parsi (Zoroastrian) women wear the *sârî* (robe) on the right shoulder, not the left.

Hindu men frequently wear short coats (*angarkhâ*), and the women wear a long scarf, or robe (*sârî*), whereas typical Muslim attire for men and women is a long white cotton shirt (*kurtah*) and trousers (*pa'ijamah*). Muslim women also wear a veil called the *burqah*, which not only hides the face but also envelops the entire body. Traditional Sikh (a religion combining Hindu and Muslim elements) dress is an ordinary *kurtah* and cotton trousers, covered by a long hanging coat (*choghah*). The male Sikh is recognized especially by his practice of wearing his hair and beard uncut, the former being covered by a particularly large turban and the latter often restrained by a net.

The Brahmin (Hindu priest) is distinguished primarily by the sacred thread '*upavîta*', which is bestowed on him during his boyhood investiture and worn diagonally across the body, over the left shoulder, at all times. During the water offering to saints, it is worn suspended around the neck and, during ancestor rites, over the right shoulder. Devotees may also wear a tonsure that leaves a tuft of hair longer than the rest (*śikhâ*). The *pravrajyâ* ("going forth") associated with some *Upaniṣads* (Hindu philosophical treatises) involved a ritual rejection not only of homelife but also of the *upavîta* and *śikhâ*. Ascetics usually wear the ordinary loincloth, or *dhotî*, for meditation or yoga (a physical and psychological meditation system), but there is also a tradition of naked asceticism. A teacher (*swâmî*) traditionally wears a yellow robe (see also HINDUISM; SIKHISM; ZOROASTRIANISM AND PARSIISM).

Buddhism. Buddhism became more widespread in Asia than other ascetic and meditational movements, partly because of the strong organization of its monastic communities (*saṅgha*). One of the main outward signs of the *saṅgha*, along with the tonsure and the begging bowl, has always been the monk's robe; "taking the robe" became a regular expression for entering the *saṅgha*. The *saṅgha* was organized in accordance with the traditional code of discipline (*vinaya*), which includes the basic rules regarding robes in all Buddhist countries. These rules are all linked to the authority of the Buddha himself, but at the same time they allow considerable flexibility to cater to changing circumstances.

The robe (*civara*) illustrates two main types of religious action, each symbolized by the character of the materials used. First, the wearing of "cast-off rags" was one of the "four resources" of a monk, being an exercise in ascetic humility similar to the other three, which are living on alms, dwelling at the foot of a tree, and using only cow's

urine as medicine. The use of rags was later formalized into making the robes out of separate strips or pieces of cloth, but the rough patchwork tradition was carried over into China, where hermit monks in modern times wore robes made of old rags. In Japan, robes have been preserved with designs imitating the effect of patchwork, and robes sewn from square pieces of cloth were nicknamed "paddy-field robe" (*densōe*). This latter term is reminiscent of an old Indian Buddhist tradition according to which the Buddha instructed his disciple Ānanda to provide robes for the monks made like a field in Magadha (in India), which was laid out in "strips, lines, embankments, and squares." In general, whatever the degree of formalization, the rag motif ensured that the robe was to be "suitable for recluses and not coveted by opponents." The second type of religious action associated with the robe stemmed from the permission granted to monks to receive robes or the materials for making them from the laity. This meant that the laity "became joyful, elated, thinking: 'Now we will give gifts, we will work merit . . .'" (*Mahāvagga* VIII, 1, 36). Thus, the presentation of materials for robes was thought to have the same beneficial karmic effects (toward a better birth in the future) as the offering of food. The practice meant that various good materials were offered as well as rags, and in due course six types were allowed on the authority of the Buddha, namely, linen, cotton, silk, wool, coarse hempen cloth, and canvas.

There are three types of *civara* (i.e., *trīcivara*): the inner robe (Pāli, *antaravāsaka*), made of five strips of cloth; the outer robe (*uttarāsaṅga*), made of seven strips; and the great robe, or cloak (*saṃghāṭī*), made of nine, 15, or 25 strips.

In order to avoid the primary colours, Buddhist robes are of mixed colours, such as orange or brown. Another common term for the robe, *kaśāya*, originally referred to the colour saffron, though this meaning is lost in the Chinese and Japanese derivatives, *chia-sa* and *kesa*. The robe is normally hung from the left shoulder, leaving the right shoulder bare, though some ancient texts speak of disciples arranging their robes on the right shoulder before approaching the Buddha with a question. In cooler climates, both shoulders may be covered with an inner robe, and the outer robe is hung from the left shoulder, as in China.

Sandals are allowed if they are simple and have one lining only, or they may have many linings if they are cast-off sandals. The rules for nuns' robes are similar, but they also wear a belt and skirt. Some special vestments are worn by Tibetan Buddhists, including various hats characteristic of the different sects (see also BUDDHISM).

Chinese religions. Court dress, sacrificial dress, and ordinary dress were all influenced in ancient China by the Confucian-inspired civil religion. The classical text for the Confucian ideal of deportment and dress is Book X of the *Analects*, in which the emphasis is on propriety in every detail, whether at home or in affairs of state or ceremony. The undergarment, for example, was normally cut wide at the bottom and narrow at the top to save cloth, but it had to be made full width throughout for court and sacrificial purposes.

Confucius was also said to have insisted on the primary, or "correct," colours—blue, yellow, red, white, and black—rather than "intermediate" colours, such as purple or puce, and to have avoided red for himself because it was more appropriate for women.

Garments used in sacrifices to former kings and dukes were prepared from silk grown in a special silkworm house. According to the "Doctrine of the Mean," the clothes used by ordinary people at sacrifices were "their richest dresses." The fully developed Imperial costume for sacrifices was a broad-sleeved jacket and a pleated apron around the waist. Decorative symbols represented the universe in microcosm and thus the universal sovereignty of the emperor.

Funeral dress was generally white, although the *Shu Ching* ("Classic of History") refers to a funeral at which those who officiated wore hempen caps and variously coloured skirts. According to the *I Li*, mourning dress consists of "an untrimmed sackcloth coat and skirt, fillets

of the female nettle hemp, a staff, a twisted girdle, a hat whose hat string is of cord, and rush shoes." For Mencius, a 4th–3rd-century-BC philosopher, the wearing of a coarse cloth mourning garment was an important aspect of traditional filial piety.

Buddhist robes in China followed Indian tradition fairly closely, though they were noted under the T'ang dynasty (AD 618–907) for being black in colour. Taoist robes, in contrast, were yellow. That this is an old tradition may be seen from the example of the 2nd-century-AD Yellow Turban movement, in which the missionaries and priests wore yellow robes and the followers yellow headresses.

Japanese religions. The priestly robes of Shintō are an example of the way in which rather normal garments of a formative age became the specialized religious vestments of later times.

Shintō
religious
garments

They consist of an ankle-length divided skirt (*hakama*) in white, light blue, or purple, depending on rank; a kimono in white, symbolizing purity, and of which there are various types; and a large-sleeved outer robe of various colours that is frequently a *kariginu*, or hunting garment, as used in the Heian period (794–1185). The headgear is a rounded black hat (*eboshi*). The more elaborate "crown" (*kammuri*) has a flat base, a protuberance rising forward from the back of the head, and a flat band curving down to the rear. Within a shrine, stiff white socks with a divided toe (*i.e.*, *tabi*) are worn, and, when proceeding to or from a shrine, officiants wear special black lacquered clogs (*asagutsu*) of paulownia wood. Shintō priests carry a flat, slightly tapered wooden mace (*shaku*), which symbolizes their office but otherwise has no precisely agreed upon significance. The dress of *miko* (girl attendants at shrines), whose main function is ceremonial dance, also typically consists of a divided skirt and a white kimono. They carry a fan of cypress wood. Young male parishioners bearing a portable shrine through the streets may wear a kimono marked with the crest of the shrine and a simple *eboshi*.

Buddhist robes continued the general Buddhist tradition, but of particular interest are the ornate ceremonial robes of high-ranking monks, especially in the Shingon and Nichiren sects; the white robes worn by devotees in the syncretistic Shugen-dō tradition (famous for its *yamabushi*, or mountain priests) during lustrations and similar rituals, symbolizing purity, as in Shintō; and the deep, inverted bowl-shaped hats of woven straw (*ajirogasa*) worn by Zen monks during begging tours.

Many new religions in Japan have carefully manufactured ceremonial vestments based on Shintō or Buddhist models or of mixed or original design. A common feature is the use of fairly simple uniform clothing for all believers during dedicated labour, mass rallies, or acts of worship. In Tenri-kyō, a religion founded in the 19th century by Nakayama Miki, the name of the religion figures prominently on the back of the garment, and, in Nichiren movements, the central symbol *namu Myōhō renge-kyō* ("Homage to the Lotus of the Good Law") may be displayed on a stole hanging from the left shoulder.

Feasts and festivals

Throughout the history of human culture, certain days or periods of time have been set aside to commemorate, ritually celebrate or re-enact, or anticipate events or seasons—agricultural, religious, or sociocultural—that give meaning and cohesiveness to an individual and to his religious, political, or socioeconomic community. Because such days or periods generally originated in religious celebrations or ritual commemorations that usually included sacred community meals, they are called feasts or festivals.

The terms feast and festival usually—though not always in modern times—involve eating or drinking or both in connection with a specific kind of rite: passage rites, death rites, sacrificial rites, seasonal observances, commemorative observances, and rites celebrating the ending of fasts or fast periods. Fasting, the opposite of feasting, has often been associated with purification rites or as a preparatory discipline for the celebration of feasts and associated rites. Festivals often include not only feasting but also dramatic

dancing and athletic events, as well as revelries and carnivals that at times border on the licentious. Depending upon the central purpose of a feast or festival, the celebration may be solemn or joyful, merry, festive, and ferial.

Another term associated with the events and activities of days of sacred significance is "holy day," from which is derived the word holiday. This term has come to mean a day or period of special significance not only in religious calendars (*e.g.*, the Christian Christmas and the Jewish Hanukka) but also in the secular (*e.g.*, May Day in the Soviet Union and Labor Day in the United States and Canada, both of which holidays celebrate especially the accomplishments of the working class).

This section, though it will concentrate on feasts and festivals in the history of religions, will also give attention to the holidays of what has been termed the secular (or profane) sphere. Most secular holidays, however, have some relationship—in terms of origin—with religious feasts and festivals. The modern practice of vacations—*i.e.*, periods in which persons are "renewed" or participate in activities of "recreation"—is derived from the ancient Roman religious calendar in a reverse fashion. More than 100 days of the year were feast days dedicated to various Roman gods and goddesses. On the days that were sacred festivals, and thus holy days, persons rested from their routine daily activities. Days that were not considered sacred were called *dies vacantes*, vacant days, during which people worked. In modern times, however, vacations (derived from the term *dies vacantes*) are periods of rest, renewal, or recreation that may be sacred or secular holidays—or simply periods of time away from everyday work allowed by modern business or labour practices.

Feasts and festivals, originating in the dim past of man's social, religious, and psychic history, are rich in symbols that have only begun to be investigated in the 19th and 20th centuries by anthropologists, comparative folklorists, psychoanalysts, sociologists, historians of religion, and theologians. Such investigations will not only elucidate mythological, ritualistic, doctrinal, aesthetic, and psychic motifs and themes but will also provide educative insights to modern man, who has been caught up in social and religious forces that he has found difficult to understand. Feasts and festivals in the past have been significant informational and cohesive devices for the continuity of societies and religious institutions. Even when the feasts or festivals have lost their original meanings in doctrinal or mythological explanations, the symbols preserved in the rites, ceremonies, and arts (*e.g.*, pictorial, dramatic, or choreographic) have enabled persons in periods of crisis or transition to preserve an equanimity despite apparent evidences of disintegration within their cultures or societies. Thus, the scholarly investigations of the many and various facets of feasts and festivals will provide different forms of information that will be of help to modern man in achieving an understanding of his origin, identity, and destiny.

of feasts
and
festivals

NATURE AND SIGNIFICANCE

Concepts of sacred times. By their very nature, feasts and festivals are special times, not just in the sense that they are extraordinary occasions but more so in the sense that they are separate from ordinary times. According to Mircea Eliade, a Romanian-American historian of religion, festival time is sacred; *i.e.*, it participates in the transcendent (or supernatural) realm in which the patterns of man's religious, social, or cultural institutions and activities were or are established. Through ritualistic re-enactment of the events that inform man about his origin, identity, and destiny, a participant in a festival identifies himself with the sacred time:

Religious man feels the need to plunge periodically into this sacred and indestructible time. For him it is sacred time that makes possible the other time, ordinary time, the profane duration in which every human life takes its course. It is the *eternal present* of the mythical event that makes possible the profane duration of historical events.

In religions and cultures that view time as cyclical—and this applies to most non-monotheistic religions and the cultures influenced by them—man understands his

Man's
view of
himself in
cultures
that see
time as
cyclical

status in the cosmos, in part, through special times (*e.g.*, New Year's festivals) celebrating the victory of order in nature over chaos. New Year's festivals have been celebrated in recorded history for more than five millennia. In ancient Mesopotamia, for example, Sumerians and Babylonians celebrated the renewal of the life-sustaining spring rains in the month of Nisan—although some cities of Mesopotamia retained an ancient custom of celebrating a second similar festival when the rains returned in the month of Tishri (autumn). Sacrifices of grain and other foods were dedicated to the gods Dumuzi (or Tammuz) or Marduk, major fertility deities, at a ziggurat (tower temple), after which the people participated in feasting, dancing, and other appropriate ritualistic activities.

In the 20th century, the view that New Year's Day is a time significant in the victory of order over disorder has been celebrated, for example, in areas influenced by Chinese religions. In order to frighten the *kuei* (evil or unpredictable spirits), which are believed to be dispersed by light and noise, participants in the New Year's festival light torches, lanterns, bonfires, and candles and explode firecrackers. In 1953, when the first day of the lunar New Year coincided with a solar eclipse, the government of the People's Republic of China (which has been anti-religious in its propaganda and official activities) expressed an anxiety that the repressed "religious popular superstitions" might encourage some form of anti-government activity. According to the views of Confucius (6th–5th centuries BC) and Mencius (4th–3rd centuries BC), two of China's great religious teachers, whose social and ethical influences have extended into the 20th century, a solar eclipse during the New Year's festival is a sign of a coming disaster and of a lack of favour by Shang Ti, the Heavenly Lord, who sends omens to indicate his disapproval of man's evil activities.

In religions and cultures that conceive of time as linear, progressing from a beginning toward an end time, when the whole cosmos will be renewed or changed, man understands his status (*i.e.*, his origin, identity, and destiny) in relationship to particular events in history that have a significance similar to those expressed in the myths of people who view time as cyclical. The Jew understands his status as a member of the "people of God," who were "chosen" during the Exodus of the Hebrews from Egypt in the 13th century BC to be witnesses to the liberating love of Yahweh (their God). His being one of the chosen "people of God" is celebrated especially during the Passover festival—in which the Exodus is ritually re-enacted and commemorated—in the month of Nisan (spring). Similarly, the Christian understands his status as a member of the "new people of God." He believes that he has been chosen by Christ, who was crucified and resurrected by God in the 1st century AD, to work for the Kingdom of God that was inaugurated in the first advent of Christ and will be consummated at the Parousia, the Second Coming of Christ as king and judge. The festival of the Resurrection, or Easter, is ritually re-enacted every year in order that the believer may participate in the present and future kingdom of peace. The eucharistic feast (the Holy Communion), though celebrated at many and various times during the year, originated in the event (namely, the Lord's Supper on Holy Thursday preceding Christ's Passion) that has been interpreted as a commemoration of the crucifixion and Resurrection. Just as the New Year's festivals of the religions that interpreted sacred time as cyclical incorporated both remorse and joy in their celebrations, so also the feasts of the Passover and the Resurrection include sorrow for the sins of the individual and of mankind and joy and hope for the salvation of man and the world (see also CALENDAR; JUDAISM; CHRISTIANITY).

Times of seasonal changes. *The significance of seasonal renewal in prehistoric times.* Before the development of agriculture, with its associations with solar and lunar calendars, ritual feasts were probably celebrated by hunters and gatherers of tubers and fruits. Paleolithic (Old Stone Age) peoples from about 30,000–10,000 BC and those living in what are called "Stone Age" cultures in the 20th century, such as the Aborigines in Australia and New Guinea, have celebrated various rites in which feasts have assumed positions of significance. Seasonal variations—

important in the maintenance of the food supply—were associated with the migrations and fertility of animals and the growth and decay of tubers and fruits upon which the clan or tribe depended for its very existence. Thus, out of an acknowledgment of seasonal change, rituals—often including ceremonial feasts—most likely developed in relationship to beliefs that the continuance of the food supply depended on the sacred or holy powers that controlled various aspects and facets of nature: *e.g.*, animals, vegetation, the change in climatic conditions, weather phenomena, mountains, and rivers.

Access to the sacred or holy powers was obtained and maintained by certain religious personages (*e.g.*, shamans, or persons having healing and psychic transformation powers, priests, clan or tribal leaders, and other persons having special learned or inherited powers). Though interpretations by scholars vary and the evidence is still subject to much speculating, Paleolithic cave paintings—such as that of the "sorcerer" (a bearded figure wearing a mask on the top of which were antlers of a deer) at Les Trois Frères in France—and rock paintings of the Aruntas of central Australia—such as totemic animals (symbolizing clan and animal relationships) or mythological nature heroes (*e.g.*, Katuru, the "lightning man")—may indicate that fertility of animals and vegetation has been a primary concern (though not the only concern) in the ritual control of the food supply. Rituals connected with controlling the food supply generally centre on a feast in which eating, drinking, dancing, and the chanting of efficacious formulas play important symbolic roles.

At some point in human history (about 8,000–6,000 BC in the ancient Near East), when calendrical seasons were associated with planting and harvesting, special days or periods most likely were set aside for fasting (because of a paucity in the food supply) or for feasting (because of an increase in the food supply). Thus some calendrical periods inspired feelings of discouragement and remorse (when the food supply was low) or feelings of encouragement or joy (when the food supply was sufficient to meet immediate and future needs). Certain days were set aside during these periods for special rituals (often including feasts) that celebrated seasonal renewal, later interpreted in terms of individual spiritual or social renewal. In Zoroastrianism and Parsiism, for example, the annual seasonal renewal festival of Nōrūz (New Year) in the spring, dedicated to Rapithwin (the time of the midday meal), is at the same time a solemn and joyful celebration of new life in nature and the anticipated resurrection of the body when the world will be restored to its original and intended goodness—after the defeat of Ahriman (the spirit of evil and chaos) and his demons.

The significance of seasonal renewal in ancient Egypt. Seasonal-renewal motifs in ancient Egypt were often incorporated into other aspects of sacred times—such as times of passage rites (*e.g.*, ascension of the pharaoh to the throne), of death rites (*e.g.*, the transformation of the dead person into a glorified person), and of commemorating certain historical events (*e.g.*, military victories in which the pharaoh preserved *ma'at*—*i.e.*, order, truth, and justice—which was active in the realms of nature and society).

In Egypt during the 5th millennium BC, astronomers in the Nile Delta region associated the annual inundation of the river—which covered wide areas with fertile soil—with celestial movements, especially that of the star Sirius (*i.e.*, Sothis) and the sun. From such observations the Egyptians developed a solar calendar of 365 days, with 12 months of 30 days each and five festival days at the end of the year. Though priests assumed important functions at the festivals centred about the fertility of the soil irrigated by the Nile and the life-giving warmth of the sun, the pharaoh, the sacred king, embodied the continuity between the realm of the sacred (*i.e.*, the transcendent sphere) and the realm of the profane (*i.e.*, the sphere of time, space, and cause and effect). The pharaoh was believed to be the son of the sun god Horus of the Horizon (Harakhte), symbolized by the falcon; the sun god was also known as Re, among other names. The eastern horizon was viewed as the meeting point of the underworld of the dead and the

himself in
cultures
that see
time as
linear

The
pharaoh in
Egyptian
feasts and
festivals

world of the living. The sun god also was known as Atum, which means "to be at the end," or the west. Osiris, the god of the afterlife (the world of the dead) was believed to be embodied in the recently deceased pharaoh, who passed on his sacred powers and position to the new pharaoh, his son. At the *šd* festival, the new pharaoh, as the son of Horus and of Re, as well as of Osiris, was invested with both kingly and priestly powers. At his coronation festival the pharaoh was believed to gain the power to restore *ma'at* after the death of the previous pharaoh, and also to restore economic prosperity.

During the royal festivals—*i.e.*, ascension to the throne, the coronation, and the *šd* festival—feasting presumably occurred. Festivals associated with seasonal renewal, however, involved sacrifices, eating, drinking, and sometimes dramatic or carnival-like events. Some scholars hold that the Egyptian terms for festival, however, contain concepts that became extremely significant in later Hellenistic (Greco-Roman) religions—*e.g.*, the mystery, or salvatory, religions, such as those of Mithra, Isis, and the Eleusinian mysteries—and Semitic-based religions—*e.g.*, Judaism, Christianity, and Islām. According to this view Egyptian terms for festival, such as *hb*, *h'*, and *pri.t*, all contain concepts of resurrection and epiphany (*i.e.*, the manifestation of a god). In Eastern Orthodox Christianity, for example, the festival of the Epiphany (January 6) celebrates Christ's manifestation to the Magi of the East (presumably followers of Zoroaster, a 6th-century BC Iranian prophet) and his Baptism in the Jordan River. The usual Greek designation for Epiphany is "the day of the light" (*hē hēmera tou phōtou*), in reference to the words in the Bible, in John 1:4, that Jesus is the "light of men." Under the influence of the Christian Catechetical school at Alexandria (led by Clement and Origen in the 2nd and 3rd centuries AD), the earlier religious speculations of the Egyptians concerning their festivals were enhanced by further mystical and spiritual interpretations that affected Christian worship, piety, doctrine, and iconography, especially in Eastern Christianity.

The Egyptians celebrated many festivals that were connected with seasonal renewal, some of which became elaborated into sacred times of cosmic significance. Among their more popular festivals were those dedicated to Osiris, Amon-Re (the sun god), Horus, and Hathor (the sky goddess, represented by a cow).

Of special interest is the festival dedicated to Min, celebrated during the harvest month of Shemou (April). A statue of Min, represented as an ithyphallic god of fertility in iconography, was placed on an inclined pedestal, which was the symbol of *ma'at*. This pedestal represented the primordial mountain, a symbol of resurrection, renewal, and rebirth. During the processional honoring Min, hymns were sung and ritual dances and perhaps other types of dances were performed. The pharaoh and his queen entered the shrine and presumably enacted a sacred marriage rite. After the pharaoh's enthronement at the harvest Festival of Min, four arrows were shot toward the north, east, south, and west; and birds also were released in the directions of the four cardinal points of the compass. The releasing of the birds and arrows announced the harmonious union of man—both as an individual and as a corporate being—with the divine powers of nature inherent in the pharaoh as "Horus son of Min and Osiris." Though the pharaoh was symbolically significant in the feasts and festivals of ancient Egypt, the priests of the various cults officiated in the rituals and sacrifices to the many gods and announced the proper times for the differing forms of celebrations (see also SACRED OFFICES AND ORDERS).

The significance of seasonal renewal in ancient Mesopotamia. In ancient Mesopotamia, in Babylon, where the king was viewed not as the son of a god but as a god's agent, or representative, on earth, the New Year's festival (Akitu), in the spring month of Nisan, contained not only seasonal renewal motifs but also themes centring on the renewal of man and his community. The *Enuma elish*, the epic of creation, was read at the festival in order to remind the participants that cosmos (order) arose out of chaos by means of a struggle between Marduk, the god of heaven, and Tiamat, the goddess of the deep and the

powers of chaos. The New Year's festival was sometimes celebrated over a period of 10 to 12 days in Babylon. On the fifth day, a sheep was beheaded; the body of the sheep was thrown into the river, and the head was taken into the wilderness. This ritual act, in which an exorcist (*mashmashu*)—one who casts out demonic powers—participated, symbolized the ridding of the community of the powers of chaos. (It was similar to the scapegoat ritual of the ancient Hebrews, in which the sins of the community were ceremonially transferred to a goat, which was later led to a wilderness area to wander about far from the community.)

Before sunrise of the third day following the scapegoat ceremony, the Babylonian king, as the representative of a sinful people as well as the agent of the god, had to submit to ritual acts of humiliation: his symbols of power were removed, and the priest (*urigallu*) hit him in the face and enjoined him to pray for the forgiveness of his sins and the sins of his people. After a profession of innocence, the priest absolved the king, restored his regal insignia, and performed ceremonies with the king to ensure the continuous support of the powers of order in nature. During the three days between the sacrifice of the sheep and the reinvestiture of the king, the populace of the city engaged in chaotic activities, perhaps of a carnival-like nature, to symbolize the presence of chaos in nature and society during this period of the apparent absence of the king and the god. When the king reappeared to his people, with his royal symbols of office and in the presence of the statue of Marduk, a procession of statues of the various gods together with their adoring devotees then took place, leading to a sanctuary (*bitakitu*) outside the city. On the 10th day, a banquet involving the king, priests, temple functionaries, and the gods was held to celebrate the renewal of nature, man, and society.

The significance of seasonal renewal in areas of other religions. Among the pre-Columbian Maya, the first month (*uinal*), Pop, of the New Year—which would be July in the presently used calendar—became a time for several renewal ceremonies. Old pottery and fibre mats were destroyed, and new clothes were put on. The temple was renovated to meet the needs of the god that was especially venerated during a particular year (the annual god changed from year to year). New wooden and clay idols were made, and the portals and implements of the temple were reconsecrated with blue paint, the sacred colour. The god of the year entered the sacred precincts according to the cardinal point of the compass that he represented (and thus there were only four New Year's gods). The purpose of the processional rite was to ward off the forces of evil that might prevail against the people of the area. Dances by old women and sacrifices of live dogs (by throwing them down from the temple pyramid) were some of the activities that occurred during the Maya New Year's festival.

In Japan, among those engaged in agriculture, the *ta-asobi* ("rice-field ritual") festival is celebrated at the beginning of the year to ensure a plentiful harvest. Dances, songs sung with a *sasara* (musical instrument), sowing of seeds, and feasting play important roles in securing the aid of the *kami* (gods or spirits). Divination by means of archery, in which the angle of the arrow on the target is significant, has been used in shrines to help determine the methods that should be used in securing a good crop. In Hinduism, the Makara-Samkrānti, a New Year's festival in the month of Māgha (January–February), is celebrated with a fair that continues for a month's duration, with much rejoicing. The Śrī Pañcamī, a festival (*utsava*) of seasonal renewal on the fifth day of Māgha, symbolizes the ripening of crops. Feasts and festivals centring on seasonal renewal can be found among all peoples of the world, both past and present. Rogation festivities (Days of Asking), originally held by the ancient Romans to counteract the effectiveness of the deity (Robigus) of red mildew on wheat, were reinterpreted by early medieval Christians of the West from the 5th century on as litanies for the blessing of the seed. Rogation Day, the fifth Sunday after Easter, is still practiced in the 20th century in rural Roman Catholic, Anglican, and Lutheran churches.

Other sacred times. *Crucial stages of life.* Birth, puberty, marriage, and death have been times of sacred significance for peoples of all races from time immemorial. They signify changes in the status of a person's being in terms of a person's relationship with fellow members of his or her society and the realm of the sacred or holy that informs the person of the practical and symbolic ramifications of the new status. These times of change, therefore, have become occasions for feasts and festivals. Some are very elaborate and of long duration; others, especially under the influence of modern secularization, have been abruptly shortened or eliminated.

Rites and
feasts
connected
with birth

Birth, a most sacred time in the religions of the world, is celebrated by rites and festivities that appear to be incongruous or inconsistent in many religions. Mothers of newborn children are considered both as participants of the sacred by having brought forth a new being into the world and as persons who are ritually unclean (*e.g.*, among the Israelites and Zoroastrians), probably because of the presence of blood at birth, the loss of which may symbolize the loss of some of the life-sustaining force. Among Brazilian Indians, however, both the father and the mother participate in a ceremony of seclusion for five days (eating only certain foods) in order to protect the sacredness and health of the new mother and child. Seclusion, thus, need not be interpreted negatively. Among the Kikuyu of eastern Africa, seclusion is a symbol of death and resurrection. The mother and child symbolically die and rise again during and after a ceremony of seclusion, after which a feast is held in which a goat is sacrificed and prayers are said. The whole community rejoices that a new child has become a part of the family of man.

The Christian celebration of birth culminates in the sacrament of Baptism, a symbol of the death of the old person and the rebirth of the new person in Christ. As such, it is a rite of purification, using water and the words of institution by Christ. After the sacrament has been solemnized, Christians in many areas have engaged in much feasting to emphasize the joy inherent in the "new birth."

Among the ancient pre-Christian Norsemen, baptism by means of water was believed to impart divine and eternal life to men and even to preserve men from death—so that they "will not perish in war" nor "fall before any sword." Thus, when St. Boniface baptized members of Germanic tribes in the 8th century, he was ordered by Pope Gregory III to do so only according to the formula "in the name of the Father, and of the Son, and of the Holy Spirit." Because whole tribes became Christian en masse during this period, the feasts celebrating the incorporation of the tribe into the church often lasted for several days and included folk customs of which the church did not especially approve, such as those connected with merrymaking (*e.g.*, the drinking of mead).

Rites and
feasts
connected
with
puberty

Puberty, the transition into adulthood, has been celebrated since ancient times by various rituals and festivals. In the secular sphere, it is celebrated in democratic countries by the granting of the right to vote to persons upon the attainment of a certain age. In ancient Greece, young men of the ages of 16 or 17 were admitted as full members of the city-state; but before they were granted voting privileges, they had to swear allegiance to the religion of the city; this made them religious citizens and subsequently adults. After he had attained adulthood, a young Greek could participate in military service and could marry. In the United States in the early 1970s, citizens having attained the age of 18 were granted the right to vote; but the ceremony commemorating this right has been a secularized de-emphasis of this important rite of passage: the mere signing of one's name on a registration certificate.

Puberty rites are celebrated in various ways according to the prevailing religious and social customs. Among the Masai of eastern Africa, youths pass from childhood to adulthood by the rite of circumcision. After various preliminary activities, the boys (12 to 16 years of age) are circumcised and the blood released from the operation is later placed on their heads. After four days of seclusion and a period during which they are dressed in female attire, their heads are shaved and they attain the status of adults and thus can become warriors. Girls attain adult-

hood by means of similar practices: the cutting or piercing of sexual organs. Among the Kamba of eastern Africa, who perform similar puberty rites of passage, those initiated into adulthood are given presents, and offerings are made to the ancestors. A significant aspect of the festival celebrating the rite of passing from childhood to adulthood is the return from seclusion; this return to their communities symbolizes a type of resurrection and renewal as new persons—adults.

Among the churches of the 16th-century Reformation, the rite of confirmation in the Anglican and Lutheran churches has been a type of puberty rite. The child, who had been a baptized member of the church, became, in effect, an adult, assuming personal responsibility and the privilege of participating in the Eucharist. In the early 1970s, however, the instructional aspect of confirmation—important in almost all pre-puberty practices—has been diminished, especially in some Lutheran churches in the United States, thus de-emphasizing the importance of confirmation as a rite of passage. As the church has become increasingly influenced by secularization processes in the 20th century, the customary feasting to celebrate the rite of confirmation has decreased in practice.

Marriage, the rite of passage from the single to the united state, has been celebrated with many forms of feasts and festivals. Connected with the *hieros gamos* ("sacred marriage") of the Mesopotamian Akitu (New Year's festival), and of the Israelite Sukkot (Feast of Tabernacles)—during the month of Tishri (the first month of the year)—which had both sexual and covenantal overtones, the rite of marriage developed into a legal and religious act in Judaism and into a sacrament in Roman Catholic and Eastern Christianity. In most religions the married state is considered superior to the single, though tensions between these two states of existence exist in most religions. Monks and nuns who vow to live in a celibate state often celebrate a symbolic marriage to the founder of their religion (*e.g.*, to Christ) or to a religious institution (*e.g.*, the church). In the Talmud, a compendium of Jewish law, lore, and commentary, the statement is made that "He who does not marry is like a murderer and he mutilates (violates) the image of God." In the Avesta, the sacred book of Zoroastrianism, a similar statement is made: "The man who is married stands above him who is not married." Thus, the wedding has become the most significant domestic festival in both the secular and religious realms, in spite of the ascetic tendencies that exist in certain sectors of Christianity, Buddhism, and other religions. The wedding ceremony has often been accompanied by feasting and gift-giving to express the concern of the community for a successful participation within the community and an extension of the community through the procreation of children. Among African religions, marriage as a rite of passage is incomplete if procreation is avoided or not accomplished. After a wedding among the Batoro of Uganda in Africa, dancing and feasting last until the following morning. Later on, gifts are given to the bride's family in order to show gratitude, to compensate for her absence, and to legalize the marriage agreement.

Rites and
feasts
connected
with
marriage

The final rite of passage, death, has brought about numerous festival customs, all the way from the ritual sacrifice of the widow in Hinduism (until the 19th century) to the commercialization of death rites in Western societies. Just as the early Hebrews believed that life passes on to death when the breath (*ruah*) leaves the body, so also do Eskimos in the 20th century believe that death occurs when breath (soul) leaves the body and that death may be a moment when one is translated into another form of life. Among the ancient Greeks, Thanatos (death) is the twin brother of Hypnos (sleep), and from this conceptional relationship may come the view that death is merely a sleeping state in the passage from this life to an afterlife. Festivities surrounding rites include the customs of playing mournful (and, sometimes, joyful) music, speaking eulogies, performing sacramental acts (*e.g.*, extreme unction in the Roman Catholic Church), performing elaborate or simple embalming practices (*e.g.*, the lengthy procedural techniques of the ancient Egyptians and the rapid techniques of modern morticians), utilizing appropriate and expected

Rites and
feasts
connected
with death

bodily gestures and vocal expressions, and feasts of varied elaborateness, depending on the economic or social circumstances of the deceased or his next of kin. Flowers often play important roles in the festivities connected with death rites. In the 20th century, a change from mourning to joyful expectation has occurred in the funeral rites of some Christian churches. Among some African tribes, such as the Ndebele of Zimbabwe, funeral processions, sacrifices, ceremonial washings, and protective medicine are included in the festivities that symbolically celebrate man's conquest over death (see also *Rites of passage* and *Death rites and customs*, above).

Times of commemoration and remembrance. Festivals of commemoration are among the most important of the sacred times. Some festivals commemorate important events in mythology or the birth, inauguration, or victory of a founder of a religion, a god, or a hero. In Hinduism, for example, the Vaikunṭha-ekādaśī festival in December-January commemorates the victory of the goddess Ekādaśī Devī in her killing of a demon; and the Gaṇeśaturthī commemorates the birthday of Gaṇeśa, the elephant-headed god of fortune. Another major Hindu festival, Navarātri, commemorates the victory of the goddess Durgā over the buffalo-headed demon Mahiṣa; and Rāma-navamī commemorates the birth of Rāma, the hero of the *Rāmāyana*, one of India's great epics. In Chinese Buddhism, the birthdays of Kuan-yin (or Avalokiteśvara), Amitābha, and Śākyamuni (the first two being *bodhisattvas*, or buddhas-to-be, and the last being the Buddha himself) were celebrated before the 1950s with much ceremony. The nativity of Christ (or Christmas) is the most widely celebrated "birthday" of a divine being, though in the 20th century Christmas has been subjected to a wide variety of secular influences.

TYPES AND KINDS OF FEASTS AND FESTIVALS

National and local festivals. Feasts and festivals vary greatly in type. Though most are religious in background and character, other types have flourished in both ancient and modern civilizations. Included among such types are social and cultural festivals: e.g., New Year's Day in the 20th century, sword-dance festivals in Scotland, the Olympic festivals in ancient Greece and the modern world, the Great Dionysia of ancient Greece during which dramatic contests took place, and May Day celebrations. National festivals in the United States include Thanksgiving Day (in November), which commemorates colonial celebrations following successful harvests; Independence Day (July 4), which commemorates the Declaration of Independence of the American colonies from the British crown; St. Patrick's Day (March 17), celebrated mainly in Chicago and New York City as a secular-religious feast; Mother's Day (in May); Memorial Day (in May), commemorating those who have died, especially in war; and Flag Day (June 14). National or local festivals in other countries include: Bastille Day (July 14), commemorating the beginning of the French Revolution in 1789; Dominion Day (July 1) in Canada; and independence days in many countries. Birthdays of national founders or heroes are also types of commemorative festivals. In some Protestant countries, Reformation Day has assumed the position of a holiday either nationally or locally. In Israel, Holocaust Day commemorates the systematic destruction of European Jews by Nazi Germany in the 1930s and '40s.

Secular modernist festivals. Secular modernist festivals are often mixed with previous religious festivals. May Day, once mainly a springtime fertility festival that can be traced back to the Magna Mater (Great Mother) festivals of Hellenistic (Greco-Roman) times, has become a festival of the labouring class in Socialist countries. Football games in the United States have all the external trappings of religious festivals. A person from a preliterate culture would see a large congregation witnessing a ritual combat, conducted according to precise ritualistic rules. The participants are dressed in appropriate identifiable costumes as they engage in their ritual combat—one side representing evil and the other good, depending upon the viewpoint of the audience. Leading the congregation are priestesses (cheerleaders) dressed in appropriate garb, participating in

ritualistic dances, and chanting supposedly efficacious formulas. Operating on the principle of sympathetic magic, the priestesses attempt to transfer the crowd's enthusiasm to the appropriate combatants. In Western countries, according to some critics, lay participation in congregational worship has for a long time been little more than a spectator sport, and this may well have contributed to the festival character of weekend sports activities.

Carnivals and saturnalias. Some feasts and festivals provide psychological, cathartic, and therapeutic outlets for persons during periods of seasonal depression. The Holi festival of Hinduism during February-March was once a fertility festival. Of early origin, the Holi festival incorporates a pole, similar to the Maypole of Europe, that may be a phallic symbol. Bonfires are lit; street dancing, accompanied by loud drums and horns, obscene gestures, and vocalized obscenities, is allowed; and various objects, such as coloured powders, are thrown at people.

One of the best-known festivals of ancient Rome was the Saturnalia, a winter festival celebrated on December 17-24. Because it was a time of wild merrymaking and domestic celebrations, businesses, schools, and law courts were closed so that the public could feast, dance, gamble, and generally enjoy itself to the fullest. December 25—the birthday of Mithra, the Iranian god of light, and a day devoted to the invincible sun, as well as the day after the Saturnalia—was adopted by the church as Christmas, the nativity of Christ, to counteract the effects of these festivals.

Carnival-like celebrations were held in England on Shrove Tuesday, the day before the Lenten fast began, until the 19th century. Originating as a seasonal renewal festival incorporating fertility motifs, the celebrations included ball games that often turned into riots between opposing villages. Feasts of pancakes and much drinking followed the contests. This tradition of merrymaking continues, for example, in the United States in the Mardi Gras festival on Shrove Tuesday in Louisiana.

CONCLUSION

Feasts and festivals, whether religious or secular, national or local, serve to meet specific social and psychological needs and provide cohesiveness to social institutions: e.g., church, state, and esoteric or socially nonaccepted groups. The cohesiveness engendered in the feasts and festivals of minority groups (e.g., Christians in the early Roman Empire) often provides these groups with the strength to influence the institutions of the society and the culture of the majority. When a particular religion triumphs over other religions, it often incorporates elements from the feasts and festivals of the previously predominant religions into its own religious calendar. This has been an important practice of all the world religions in their attempts to bring about social solidarity, order, and tranquility. Similarly, individuals can gain a sense of psychological cohesiveness through participation in feasts and festivals.

During periods of crisis in society, feasts and festivals may lose some of the impact of their interpretive and cohesive functions. The sacraments of the medieval Western Church lost some of their earlier interpretive values in the 16th century during the Reformation, and the month of fasting before the Feast of Bēma ("judge's seat")—a festival commemorating the death of Mani, a 3rd-century-AD Iranian prophet who founded the syncretistic Manichaean religion—probably became the prototype of the Muslim fast month of Ramaḍān after Islāmic invasions of the 7th century AD. So also can persons living in the 20th century expect reinterpretations of the feasts and festivals to which they have become accustomed. Reinterpretations of feasts and festivals may thus provide impulses for institutional changes, which generally occur in times of crisis and transition. (L.F.)

BIBLIOGRAPHY

Sacred or holy: The socio-anthropological analyses written near the beginning of the 20th century that are still useful for their interpretations of the sacred in preliterate societies include HENRI HUBERT and MARCEL MAUSS, *Essai sur la nature et le fonction du sacrifice* (1899; Eng. trans., *Sacrifice: Its Nature and Function*, 1964); and ÉMILE DURKHEIM, *Les Formes élé-*

mentaires de la vie religieuse, le système totémique en Australia (1912; Eng. trans., *The Elementary Forms of the Religious Life*, 1965). More recently, in the same vein, are E.O. JAMES, *Sacrifice and Sacrament* (1962), a comparative analysis of sacred ritual from many different religious traditions; and ROGER CAILLOIS, *L'Homme et le sacré* (1939; Eng. trans., *Man and the Sacred*, 1960), a general reflective interpretation of various social expressions of the sacred. The following combine philosophical and theological concerns: RUDOLF OTTO, *Das Heilige* (1917; Eng. trans., *The Idea of the Holy*, 1923), an appeal to an a priori preconceptual knowledge of the holy; MAX F. SCHERER, *Vom Ewigen im Menschen*, 2nd ed. (1923; Eng. trans., *On the Eternal in Man*, 1960), an intuitive philosopher's argument for the eternal reality of the sacred prior to man's awareness or social expression of it; NATHAN SODERBLOM, "Holiness," *Encyclopedia of Religion and Ethics*, 6:731-41 (1928, reprinted 1955), which stressed the quality of holiness in all religion four years prior to Otto's more famous statement, and his *Living God: Basal Forms of Personal Religion* (1933), a comparative study of religion organized according to various ways through which man encounters God; and JOACHIM WACH, *The Comparative Study of Religions*, ed. by J.M. KITAGAWA (1958), a systematic analysis of the modes (thought, action, fellowship) used to express the religious experience. Two Dutch phenomenologists of religion who have made notable contributions to the interpretation of forms that express man's relation to the sacred are GERARDUS VAN DER LEEUW, whose *Phänomenologie der Religion* (1933; Eng. trans., *Religion in Essence and Manifestation*, 1963) organizes a wide spectrum of data into three foci: the object of religion, the subject of religion, and their reciprocal relation; and W. BREDE KRISTENSEN, who wrote *The Meaning of Religion* (1960), a series of lectures given during the 1930s on the sacredness of man's cosmological, anthropological, and cultic awareness as expressed in the preliterate cultures and those of the ancient Mediterranean area. An extensive analysis of the forms and modes in which the sacred is recognized is found in the writings of MIRCEA ELIADE, for whom the apprehension of the sacred is a unique kind of experience in which the creative power(s) of life appear(s) in particular symbols, myths, and rites. Four of his works that deal with the nature and meaning of the sacred in different types of expression are: *Le Mythe de l'éternel retour* (1949; Eng. trans., *The Myth of the Eternal Return*, 1954, reissued 1989); *Myth and Reality* (1963); *Traité d'histoire des religions* (Eng. trans., *Patterns in Comparative Religion*, 1958); and *The Sacred and the Profane: The Nature of Religion* (1959).

Worship: MIRCEA ELIADE, *Traité d'histoire des religions* (1949; Eng. trans., *Patterns in Comparative Religion*, 1958), is a standard work with much information on worship. JAMES G. FRAZER, *The Worship of Nature* (1926), is a classic work but is now out of date. WALTER HARRELSON, *From Fertility Cult to Worship* (1969); and F.H. HILLIARD, *How Men Worship* (1965), are popular, brief treatments of worship in the major religions. JOHN S. MBITI, *Concepts of God in Africa* (1970), has valuable source materials but is difficult to use because of the variety of materials placed together. GEOFFREY PARRINDER, *Worship in the World's Religions* (1961), is a popular work, accurate and helpful, but brief. H.H. ROWLEY, *Worship in Ancient Israel* (1967), is a standard and comprehensive work. EVELYN UNDERHILL, *Worship* (1936), is a standard work, still valuable, but now out of date. GEOFFREY WAINWRIGHT, *Doxology: The Praise of God in Worship, Doctrine and Life* (1980), argues that all Christian themes come to a focus in worship.

Ritual: WILLIAM LESSA and EVON Z. VOGT, *Reader in Comparative Religion*, 3rd ed. (1971), is a good general anthology on classical and modern positions on religion, ritual, and myth (mainly concerned with nonliterate cultures), with an excellent bibliography. *Gods and Rituals*, ed. by JOHN MIDDLETON (1967), contains a good collection of essays on ritual practices in nonliterate cultures, also with a fine bibliography. Among the classic texts dealing with the origin of ritual and religion, there are three authors who have enduring influence: W. ROBERTSON SMITH, *Lectures on the Religion of the Semites* (1889); ÉMILE DURKHEIM, *Les Formes élémentaires de la vie religieuse* (1912; Eng. trans., *The Elementary Forms of the Religious Life*, 1965); and SIGMUND FREUD, *Totem und Tabu* (1913; Eng. trans., *Totem and Taboo*, 1918). Among the classic positions on a functional approach to ritual are those of BRONISŁAW MALINOWSKI, *Coral Gardens and Their Magic*, 2 vol. (1935); and A.R. RADCLIFFE-BROWN, *The Andaman Islanders* (1922). More recent examples of the functional approach are the anthropological texts of E.E. EVANS-PRITCHARD, *Nuer Religion* (1956); and EDMUND LEACH, *Political Systems of Highland Burma* (1954). MELFORD E. SPIRO, *Burmese Supernaturalism* (1967), is one of the best critical texts using data from Burmese Buddhism as support for a revised approach. VICTOR W. TURNER, *The Forest of Symbols* (1967), represents a novel analysis of dominant symbols in belief and ritual. Among valuable approaches by

theologians and historians of religion are RUDOLF OTTO, *Das Heilige* (1917; Eng. trans., *The Idea of the Holy*, 1923); and JOACHIM WACH, *The Comparative Study of Religions* (1958). JANE E. HARRISON, *Themis*, 2nd ed. rev. (1927); and S.H. HOOKE (ed.), *Myth, Ritual and Kingship* (1958), are good examples of the myth-ritual school. An excellent critique of this school may be found in JOSEPH E. FONTENROSE, *The Ritual Theory of Myth* (1966). HENRI HUBERT and MARCEL MAUSS, *Essai sur la nature et le fonction du sacrifice* (1899; Eng. trans., *Sacrifice: Its Nature and Function*, 1964), remains a standard analysis of sacrifice as ritual. ARNOLD VAN GENNEP, *Les Rites de passage* (Eng. trans., *The Rites of Passage*, 1960), although written in 1909, continues to be an important work on ritual as a marker of passage. MIRCEA ELIADE, *Birth and Rebirth* (1958), is an excellent historical study of ritual as initiation, with a good bibliography. See also BRUCE LINCOLN, *Emerging from the Chrysalis: Studies in Rituals of Women's Initiation* (1981).

Prayer: The classical work is still that of F. HEILER, *Das Gebet*, 5th ed. (1923), which includes a bibliography and defends the theory of religious syncretism. R. BOCCASSINO (ed.), *La preghiera*, 3 vol. (1967), is a historical and psychological study of prayer and includes a useful bibliography. G. VAN DER LEEUW, *Phänomenologie der Religion* (1933; Eng. trans., *Religion in Essence and Manifestation*, 1963), is an excellent overview and general introduction of the psychology of prayer. Also of a psychological bent are WILLIAM JAMES, *The Varieties of Religious Experience* (1902); and H.U. VON BALTHASAR, *Das betrachtende Gebet* (1955; Eng. trans., *Prayer*, 1961). For prayer in various religions, in addition to *La preghiera*, one should refer to M.P. NILSSON, *Geschichte der griechischen Religion*, 2 vol. (1941-50; Eng. trans., *A History of Greek Religion*, 2nd ed., 1963); A. FALKENSTEIN and W. VON SODEN, *Summerische und akkadische Hymnen und Gebete* (1953); G.C. LOUNSBURY, *La Méditation bouddhique* (1935; Eng. trans., *Buddhist Meditation in the Southern School*, 1950); E. CONZE, *Buddhist Meditation* (1956); and R.C. ZAEHNER, *The Teachings of the Magi* (1956) and *The Dawn and Twilight of Zoroastrianism* (1961). For a bibliography on biblical prayer, see "Prière," *Dictionnaire de la Bible*, suppl. 8, pp. 604-606 (1968). I. ELBOGEN, *Der jüdische Gottesdienst in seiner geschichtlichen Entwicklung*, 4th ed. (1962), is a classic on Jewish prayer. This can be supplemented by A.Z. IDELSOHN, *Jewish Liturgy and Its Development* (1967). On the origins of Christian prayer, see A. HAMMAN, *La Prière*, 2 vol. (1959-63). KENNETH LEECH, *True Prayer* (1980), is an Anglo-Catholic introduction to Christian spirituality.

Creed and confession: A comprehensive treatment of creeds in all religions is "Creeds and Articles," *Encyclopaedia of Religion and Ethics*, 4:231-248 (1912, reprinted 1955). For anthropological, sociological, and phenomenological considerations, see the *International Encyclopedia of the Social Sciences*, 13:398-414 (1968); G. VAN DER LEEUW, *Phänomenologie der Religion* (1933; Eng. trans., *Religion in Essence and Manifestation*, 1963); and J. WACH, *Sociology of Religion* (1944). Works devoted to creedal and confessional formulations are rare for most religions, but see S. SCHECHTER, "The Dogmas of Judaism," *Studies in Judaism*, pp. 147-181 (1896); and A.J. WENSINCK, *The Muslim Creed: Its Genesis and Historical Development* (1932). For Christianity, the fullest collection of texts remains P. SCHAFF, *The Creeds of Christendom*, 3 vol., 6th ed. (1919); for Roman Catholicism, H.J.D. DENZINGER and A. SCHONMETZER, *Enchiridion Symbolorum* (1963); and W.M. ABBOTT (ed.), *The Documents of Vatican II* (1966); for Protestantism, T.G. TAPPET (ed. and trans.), *The Book of Concord* (1959); and A.C. COCHRANE (ed.), *Reformed Confessions of the 16th Century* (1966). On the Ecumenical movement, see L. VISCHER (ed.), *A Documentary History of the Faith and Order Movement 1927-1963* (1963). Brief but representative collections are B.A. GERRISH, *The Faith of Christendom: A Source Book of Creeds and Confessions* (1963); and J.H. LEITH (ed.), *Creeds of the Churches* (1963). Secondary works on early creeds include O. CULLMANN, *Die ersten christlichen Glaubensbekenntnisse* (1943; Eng. trans., *The Earliest Christian Confessions*, 1949); J.N.D. KELLY, *Early Christian Doctrines*, 2nd ed. (1960); A.E. BURN, *The Athanasian Creed*, 3rd impression (1930); D.L. HOLLAND, "The Earliest Text of the Old Roman Symbol," *Church History*, 34:262-281 (1965), and "The Creeds of Nicaea and Constantinople Reexamined," *Church History*, 38:248-261 (1969). On later confessions, a full treatment with good bibliographies is E. MOLLAND, *Christendom* (1959). This is usually supplemented by W.A. CURTIS, *A History of Creeds and Confessions of Faith in Christendom and Beyond* (1911); and C.A. BRIGGS, *Theological Symbolics* (1914).

Sacrament: The standard pioneer work on the wider pre-Christian occurrence and interpretations is W.R. SMITH, *Lectures on the Religion of the Semites*, 3rd ed. (1927), stressing sacramental communion with the deity. A. GARDNER, *History of Sacrament in Relation to Thought and Progress* (1921), applied the sacramental principle to various aspects of life and belief;

and R.R. MARETT, *Sacraments of Simple Folk* (1933), wrote on sacraments in primitive culture. In his *Dawn and Twilight of Zoroastrianism* (1961), R.C. ZAEHNER discussed the anticipation of the Christian eucharistic sacramental rite in the *Yasna* ceremony in the Avestan liturgy. The basic sacramental beliefs and cults throughout the ages are examined anthropologically in E.O. JAMES, *Sacrifice and Sacrament* (1962).

A good general study of the Christian doctrine of sacraments is P.T. FORSYTH, *Lectures on the Church and the Sacraments* (1917). O.C. QUICK, *The Christian Sacraments* (1927, reprinted continually to 1952), is one of the most comprehensive surveys. The positions of various religious bodies are presented in the following: A.J. TAIT, *Nature and Functions of the Sacraments* (1917), the evangelical viewpoint; B. LEEMING, *The Principles of Sacramental Theology*, new ed. (1960), the Roman Catholic viewpoint; D.M. BAILLIE, *The Theology of the Sacraments and Other Papers* (1957), the Protestant viewpoint; and A. SCHMEMMANN, *Sacraments and Orthodoxy* (1965), the Orthodox viewpoint. J.H. SRAWLEY, *Liturgical Movement: Its Origin and Growth* (1954), examines the development of sacramental worship with special reference to lay participation. See also JOSEPH MARTOS, *Doors to the Sacred: A Historical Introduction to Sacraments in the Catholic Church* (1981).

Sacrifice: Classic theories of the origin and nature of sacrifice are found in the following: EDWARD B. TYLOR, *Primitive Culture*, 2 vol. (1871, reprinted 1958), a presentation of the gift theory of sacrifice; W. ROBERTSON SMITH, *Lectures on the Religion of the Semites*, 3rd ed. (1927), the clearest formulation of the author's theory of communion through a sacrificial meal; JAMES G. FRAZER, *The Golden Bough*, 3rd ed., 12 vol. (1907-15; abridged ed., *The New Golden Bough*, 1964), a famous and influential treatise on ancient religion that presents sacrifice as a means for rejuvenating a god; and HENRI HUBERT and MARCEL MAUSS, "Essai sur la nature et la fonction du sacrifice," *L'Année sociologique* (1899; Eng. trans., *Sacrifice: Its Nature and Function*, 1964), a sociological explanation of the sacrificial victim as a buffer between man and the god. More recent formulations include GERARDUS VAN DER LEEUW, *Phänomenologie der Religion* (1933; Eng. trans., *Religion in Essence and Manifestation*, 1963), an expansion of the notion of the sacrificial gift by a phenomenologist of religion; ADOLF E. JENSEN, *Mythos und Kult bei Naturvölkern*, rev. ed. (1960; Eng. trans., *Myth and Cult Among Primitive Peoples*, 1963), which correlates types of cultures and their sacrifice; RAYMOND FIRTH, "Offering and Sacrifice: Problems of Organization," in W.A. LESSA and E.Z. VOGT (eds.), *Reader in Comparative Religion*, 3rd ed., pp. 185-194 (1971), an economic interpretation of sacrifice; and E.O. JAMES, *Sacrifice and Sacrament* (1962), a good survey. FRANCES M. YOUNG, *Sacrifice and the Death of Christ* (1978), is an overview of the theology of sacrifice in the early Christian church.

Brief articles on several religions are found in "Sacrifice," *Encyclopaedia of Religion and Ethics*, 11:1-39 (1928, reprinted 1955). On Vedic religion, A.B. KEITH, *The Religion and Philosophy of the Veda and Upanishads*, 2 vol. (1925), is still a standard work; and LOUIS RENO, *Religions of Ancient India* (1953), offers a brief survey. On Chinese sacrificial rites, see C.K. YANG, *Religion in Chinese Society* (1961); on ancient Egypt, J.H. BREASTED, *The Elder Development of Religion and Thought in Ancient Egypt* (1912); and on ancient Greek and Roman religions, R.K. YERKES, *Sacrifice in Greek and Roman Religions and Early Judaism* (1952), a clearly written, well-documented work; and M.P. NILSSON, *Geschichte der griechischen Religion*, 2 vol. (1941-50; Eng. trans., *A History of Greek Religion*, 2nd ed., 1963), a good handbook on Greek religion. On sacrificial rites in Judaism there is extensive literature, including "Sacrifice," *Encyclopedia Judaica*, 14:599-615 (1971), a good survey with a bibliography; ROLAND DE VAUX, *Les Sacrifices de l'Ancien Testament* (1964; Eng. trans., *Studies in Old Testament Sacrifice*, 1964); and YERKES (above). On ancient Scandinavian rites, see E.O.G. TURVILLE-PETRIE, *Myth and Religion of the North* (1964). WALTER KRICKBERG et al., *Die Religionen des Alten Amerika* (1961; Eng. trans., *Pre-Columbian American Religions*, 1968), discusses the rites of the ancient civilizations of the American continents. On the religions of the peoples of Africa, JOHN S. MBITI, *Concepts of God in Africa* (1970), is an introduction with extensive bibliography. Important specific studies include MELVILLE HERSKOVITS, *Dahomey*, 2 vol. (1938); E.E. EVANS-PRITCHARD, *Nuer Religion* (1956); E.B. IDOWU, *Olódùmarè: God in Yoruba Belief* (1962); and GEOFFREY PARRINDER, *West African Religion*, 2nd ed. rev. (1961).

Rites of passage: ARNOLD VAN GENNEP, *Les Rites de passage* (1909; Eng. trans., *The Rites of Passage*, 1960), is a pioneering study and standard work on passage rites. D.M. SCHNEIDER and K. GOUGH (eds.), *Matrilineal Kinship* (1961), is also, in comparison, a discussion of patrilineal kinship. BRUNO BETTELHEIM, *Symbolic Wounds* (1954), is a Freudian-inspired work interpreting ritual acts of circumcision and other genital operations.

E.D. CHAPPLE and C.S. COON, *Principles of Anthropology* (1942), has useful information on social interaction, social equilibrium and disruption, and the role of rites of passage in restoring equilibrium. J.G. FRAZER, *The Golden Bough*, 3rd ed., 12 vol. (1907-15), is a classic work that discusses rites of passage and many other features of religion. A.M. HOCART, *Social Origins* (1954), is an interesting interpretive work although somewhat dated. FRANK W. YOUNG, *Initiation Ceremonies* (1965), concerns rites of coming-of-age, interpreting their significance in relation to the social roles of males and females and the organization of social groups.

Death rites and customs: E. BENDANN, *Death Customs: An Analytical Study of Burial Rites* (1930, reprinted 1974), is a useful account of relevant ethnological material. P.C. ROSENBLATT, *Grief and Mourning in Cross-Cultural Perspective* (1976); and R. HUNTINGTON, *Celebrations of Death: The Anthropology of Mortuary Rituals* (1979), are two more-recent anthropological studies. Four works by S.G.F. BRANDON are helpful: *Man and His Destiny in the Great Religions* (1962), with extensive bibliographies and documentation; *The Judgment of the Dead* (1967), a comprehensive study of the subject; *Man and God in Art and Ritual* (1972), a profusely illustrated study that deals with mortuary rituals, conceptions of burial, and funerary iconography; and "The Personification of Death in Some Ancient Religions," *Bull. John Rylands Library*, 43:317-385 (1961). J. MARINGER, *Vorgeschichtliche Religion* (1956; Eng. trans., *The Gods of Prehistoric Man*, 1960), discusses Paleolithic and Neolithic burial practices. E.A.W. BUDGE, *The Mummy*, 2nd ed. (1894, reprinted 1974), is a handbook on Egyptian funerary archaeology. J. ZANDEE, *Death As an Enemy, According to Ancient Egyptian Conceptions* (1960, reissued 1977), also includes Coptic evidence. M. LAMM, *The Jewish Way in Death and Mourning*, rev. ed. (1972); and J. JEREMIAS, *Heiligräber in Jesu Umwelt* (Mt. 23, 29; Lk. 11, 47) (1958), an account of Jewish mortuary beliefs, are valuable studies. Sources focusing on Greek and Roman civilizations include E. ROHDE, *Psyche: Seelenkult und Unsterblichkeitsglaube der Griechen*, 8th ed. (1921; Eng. trans., *Psyche: The Cult of Souls and Belief in Immortality Among the Greeks*, 1925, reprinted 1972); D.C. KURTZ, *Greek Burial Customs* (1971); F.V.A. CUMONT, *After Life in Roman Paganism* (1922); J.M.C. TOYNBEE, *Death and Burial in the Roman World* (1971); and A.K. FORTESCUE, *The Ceremonies of the Roman Rite Described*, 6th ed. rev. by J.B. O'CONNELL (1937). The following are also recommended: R. EKLUND, *Life Between Death and Resurrection According to Islam* (1941); J.D.C. PAVRY, *The Zoroastrian Doctrine of a Future Life: From Death to the Individual Judgment*, 2nd ed. (1929, reissued 1975); J.J. MODI, *The Religious Ceremonies and Customs of the Parsees* (1922, reprinted 1979; 2nd ed., 1937); J.A. DUBOIS, *Hindu Manners, Customs and Ceremonies*, 3rd ed. (1906, reissued 1968), invaluable for its descriptions; M. GRANET, *La Civilisation Chinoise* (1929; Eng. trans., *Chinese Civilization*, 1930, reprinted 1974); *La Religion des Chinois*, 2nd ed. (1951); P. ARIÈS, *Western Attitudes Toward Death: From the Middle Ages to the Present* (1974), as reflected in ceremonies, customs, literature, and art; W.K.L. CLARKE (ed.), *Liturgy and Worship: A Companion to the Prayer Books of the Anglican Communion* (1932); T.S.R. BOASE, *Death in the Middle Ages: Mortality, Judgment, Remembrance* (1972); and E. PANOFSKY, *Tomb Sculpture* (1964), an illustrated survey of funerary iconography from ancient Egypt to the Renaissance.

Purification rites and customs: Few works deal directly with purification rites. MARY DOUGLAS, *Purity and Danger* (1966), is a major work dealing with the problems of purity and impurity. HUTTON WEBSTER, *Taboo: A Sociological Study* (1942); and FRANZ STEINER, *Taboo* (1956), deal with pollution taboos as part of the general field of ritual prohibitions. In the *Encyclopaedia of Religion and Ethics*, 10:455-505 (1919, reprinted 1955), the article "Purification" has many examples. Religious texts are among the best available sources: the Old Testament; the Egyptian Book of the Dead; and FRIEDRICH MAX MÜLLER (ed.), *The Sacred Books of the East*, 51 vol. (1879-1904), available in many later editions. The latter includes texts of Hinduism, Buddhism, Islam, Zoroastrianism, and Taoism. For a good summary of Zoroastrian purification rites, see J.J. MODI, *The Religious Ceremonies and Customs of the Parsees* (1922, reprinted 1979; 2nd ed., 1937). For ancient Greece, see LOUIS MOULINIER, *Le Pur et l'impur dans la pensée des Grecs, d'Homère à Aristote* (1952); and JANE HARRISON, *Prolegomena to the Study of Greek Religion*, 3rd ed. (1922). For excellent synopses of African thought systems, see DARYLL FORDE (ed.), *African Worlds* (1963); and, for a North American tribe, see GLADYS REICHARD, *Navaho Religion*, 2nd ed. (1963). MARGARET MEAD, *Sex and Temperament in Three Primitive Societies* (1935; reprinted, 1968), brings together material on three Pacific Islands societies.

Dietary laws and food customs: General works include DON-

ALD E. CARR, *The Deadly Feast of Life* (1971), a popular account of food habits and nutritional behaviour; MARY DOUGLAS, *Purity and Danger: An Analysis of Concepts of Pollution and Taboo* (1966), a definitive source; and CRAIG MCANDREW and ROBERT B. EDGERTON, *Drunken Comportment: A Social Explanation* (1969), an exploration of the ways people are expected to behave under the influence of alcohol in different cultures.

The following discuss food customs and dietary laws in tribal societies: RAYMOND FIRTH, *We, the Tikopia: A Sociological Study of Kinship in Primitive Polynesia* (1936); MEYER FORTES, "Pietas in Ancestor Worship," *Jl. R. Anthropol. Inst.*, 91:166-191 (1961), reprinted in *Man in Adaptation*, vol. 3, *The Institutional Framework*, ed. by YEHUDI A. COHEN, pp. 207-226 (1971); and MARGARET MEAD, *The Mountain Arapesh*, vol. 2 (1970).

The basic sources for Judaism and Christianity are, of course, the Old Testament (especially Leviticus 11, Deuteronomy 14, and the prophets) and the New Testament (especially Acts, Luke, Mark, and Romans). See also JOHANNES PEDERSEN, *Israel: Its Life and Culture*, 4 vol. (1926-40); and MARK ZBOROWSKI and ELIZABETH HERZOG, *Life Is with People: The Jewish Little-Town of Eastern Europe* (1952; reprinted as *Life Is with People: The Culture of the Shtetl*, 1962).

The following Islāmic sources may be consulted: the Qu'ran; AMEER ALI, *Mohammedan Law*, 5th ed., 2 vol. (1929); and CHARLES C. TORREY, *The Jewish Foundation of Islam* (1933).

Sources on Indian systems include LOUIS DUMONT, *Homo hierarchicus, essai sur le système des castes* (1967; Eng. trans., *Homo Hierarchicus: The Caste System and Its Implications*, 1970); EDWARD B. HARPER (ed.), *Religion in South Asia* (1964), especially Harper's "Ritual Pollution As an Integrator of Caste and Religion," pp. 151-196; EDMUND R. LEACH (ed.), *Aspects of Caste in South India, Ceylon, and North-west Pakistan* (1960); DAVID G. MANDELBAUM, *Society in India*, 2 vol. (1970); MCKIM MARRIOTT, "Caste Ranking and Food Transactions: A Matrix Analysis," *Structure and Change in Indian Society*, ed. by MILTON B. SINGER and BERNARD S. COHN, pp. 133-171 (1968); KENNETH K.S. CH'EN, *Buddhism: The Light of Asia* (1968); and CHARLES NORTON ELIOT, *Hinduism and Buddhism: An Historical Sketch*, 3 vol. (1921).

For the dietary laws and customs of Japan and China, see ROBERT N. BELLAH, *Tokugawa Religion: The Values of Pre-Industrial Japan* (1957); GEORGE DE VOS and HIROSHI WAGATSUMA (eds.), *Japan's Invisible Race: Caste in Culture and Personality* (1966); KENNETH K.S. CH'EN, *Buddhism in China* (1964); and ARTHUR F. WRIGHT, *Buddhism in Chinese History* (1959).

Ceremonial and ritualistic objects: JAMES HASTINGS (ed.), *Encyclopaedia of Religion and Ethics*, 13 vol. (1908-26, reprinted 1955), although outdated, is a very complete general source. See also the *Histoire générale des religions*, 2nd ed., 2 vol. (1960); *Symbolisme cosmique et monuments religieux*, 2 vol. (1953), texts and illustrations from an exhibit at the Musée Guimet, Paris; and *Le Symbolisme cosmique des monuments religieux* (1957), the proceedings of an international conference of the Istituto per il Medio ed Estremo-Oriente, Rome. For the Ancient period, see CHARLES V. DAREMBERG and EDMOND SAGLIO (eds.), *Dictionnaire des antiquités grecques et romaines* . . . , 5 vol. (1877-1919); PIERRE LAVEDAN, *Dictionnaire illustré de la mythologie et des antiquités grecques et romaines* (1931); and MIRCEA ELIADE, *Le Mythe de l'éternel retour*, (1949; Eng. trans., *The Myth of the Eternal Return*, 1954, reissued 1989).

JEANNINE AUBOYER, *Introduction à l'étude de l'art de l'Inde* (1965), is a basic work on the Holy Place. For the principal components of the Holy Place, see JAMES FERGUSSON, *Tree and Serpent Worship*, 2nd ed. (1873), which uses Indian facts as a base but makes many comparisons with data from antiquity. This work is complemented by ODETTE VIENNOT, *Le Culte de l'arbre dans l'Inde ancienne* (1954). JEANNINE AUBOYER, *Le Trône et son symbolisme dans l'Inde ancienne* (1949), makes many references to the role and the morphology of the throne (royal and divine) in ancient and modern civilizations. D.R. SHASTRI, *Origin and Development of the Rituals of Ancestor Worship in India* (1963), is helpful. JEAN PRZYLUKI, "Le Symbolisme du pilier de Sarnath," in *Mélanges d'Orientalisme*, vol. 2 (1932), deals with the gnomon and the cosmic pivot. See also LEOPOLD M. CADIÈRE, *Croyances et pratiques religieuses des Annamites dans les environs de Hue*: vol. 1, *Le Culte des arbres* (1918), and vol. 2, *Le Culte des pierres* (1919).

For architectural symbolism, GEORGE COEDES, *Pour mieux comprendre Angkor*, rev. 2nd ed. (1947; Eng. trans., *Angkor: An Introduction*, 1963), contains pertinent information in the chapters on temples and tombs and on architectural symbolism. ROLF A. STEIN, "Architecture et pensée religieuse en Extrême-Orient," *Arts Asiatiques*, 4:163-186 (1957), deals with tents used in Central Asia, especially Siberia, and Rupestral temples.

Icons and ritual symbols are discussed in J.N. BANERJEA, *The Development of Hindu Iconography*, 2nd ed. (1956), particularly ch. 2, "The Antiquity of Image-Worship in India," ch.

5, "Deities and Their Emblems on Early Indian Seals," and 8, "Canons of Iconometry"; GEORGE COEDES (*op. cit.*), ch. 3; and PIERRE FRANCASTEL (ed.), *Emblèmes, totems, blasons* (1964), an exhibition catalog produced by the Musée Guimet, Paris.

Cultic and ritual objects are discussed in HENRIETTE DEMOULIN-BERNARD, *Masques . . . exposés dans l'annexe du Musée Guimet en décembre 1959* (1965); for Judaism, see JAMES HASTINGS, *A Dictionary of the Bible*, rev. ed. (1963); for Christianity, *Historia Religionum*, vol. 1, *Religions of the Past* (1969); and OSCAR CULLMANN, *Urchristentum und Gottesdienst*, 2nd ed. (1950; Eng. trans., *Early Christian Worship*, 1953); for Hinduism, *The Cultural Heritage of India*, vol. 1, *Vedic Rituals*, rev. ed. (1958); and PAUL E. DUMONT, *L'Āśvamedha: descriptions du sacrifice solennel du cheval dans le culte védique* (1927); for Buddhism, *Hōbōgirin: Dictionnaire encyclopédique du Bouddhisme* . . . , 4 vol. to date (1937-67); and GEORGE P. MALALASEKERA (ed.), *Encyclopaedia of Buddhism* (1961-), appearing in fascicles; for the Indian world, JAN GONDA, *Die Religionen Indiens*, 3 vol. (1960-64); for Indonesia, WALDEMAR STOEHR and PIET ZOETMULDER, *Die Religionen Indonesiens* (1965; French trans., 1968); for the Islāmic world, the *Encyclopaedia of Islam*, 5 vol. (1908-38; new ed., 1960-); for Tibet, ROBERT B. EKVALL, *Religious Observances in Tibet* (1964); HELMUT HOFFMANN, *Symbolik der tibetischen Religionen und des Schamanismus* (1967); ROLF A. STEIN, *La Civilisation tibétaine* (1962); and TURRELL WYLIE, "Apropos of Tibetan Religious Observances," *Journal of the American Oriental Society*, 86:39-45 (1966); and for Japan, WILLIAM G. ASHTON, *Shinto* (1905).

Religious dress and vestments: HILAIRE and MEYER HILER, *A Bibliography of Costume* (1939, reprinted 1967), furnishes the widest bibliographical account. For Christian dress, see HERBERT NORRIS, *Church Vestments: Their Origin and Development* (1949); and CYRIL E. POCKNEE, *Liturgical Vesture: Its Origins and Development* (1960), a succinct, well-illustrated account. All previous research was superseded by JOSEPH BRAUN, *Die liturgische Gewandung im Occident und Orient* . . . (1907), which marked a turning point in liturgical studies. JOHN B. O'CONNELL, *The Celebration of Mass*, new ed. (1956), a handbook for priests, is a study of the rubrics. This can be supplemented by ADRIAN FORTESCUE, *Ceremonies of the Roman Rite Described*, 12th rev. ed. (1962), which indicates the appropriate use of garments and is a standard work on Roman Catholic ritual. Concerning Orthodox vesture, N.F. ROBINSON, *Monasticism in the Orthodox Churches* (1916, reprinted 1971); and Алексей Николаевич Свириц, *Древнерусское шитье* (1963), are descriptive rather than historical or analytical in methodology. Protestant vesture has not attracted the attention of liturgists, but PERCY DEARMER, *The Parson's Handbook*, 13th rev. ed. (1965); and CHARLES WALKER, *The Ritual Reason Why*, new ed. (1931), treat the subject from a High Anglican standpoint. On religious dress in Judaism, *The Universal Jewish Encyclopaedia*, 10 vol. (1939-43); and WILLIAM OESTERLEY and G.H. BOX, *The Religion and Worship of the Synagogue* (1907), are useful. On Islāmic dress, there is MOHAMMAD BAQIR OLMAJLISI, *Helyet ol-motaqqin* (1952). On Far Eastern religions, JEAN HERBERT, *Shintō* (1967), is a standard study of the subject and incorporates drawings of priestly attire. S. ONO, *Shinto: The Kami Way* (1960), also illustrates priestly attire. On Buddhist religious dress and vestments, *The Book of the Discipline*, vol. 4, trans. by I.B. HORNER (1951), gives the early Buddhist traditions about "the robe." HOLMES WELCH, *The Practice of Chinese Buddhism*, vol. 1, 1900-1950 (1967), contains much incidental material about monastic vestments, with photographs.

Feasts and festivals: E.O. JAMES, *Seasonal Feasts and Festivals* (1961), is a classic work on feasts and festivals of seasonal renewal and on Western folk festivals and customs from pre-historic times to the early 20th century. MIRCEA ELIADE, *The Sacred and the Profane* (1959), is a classic treatment of the concept of sacred time. W. BREDE KRISTENSEN, *The Meaning of Religion* (1960), is a phenomenological treatment of feasts and festivals. C. JOUCO BLEEKER and GEO WIDENGREN (eds.), *Historia Religionum: Handbook for the History of Religions*, 2 vol. (1969-71), incorporates feasts and festivals into the general framework of particular religions. H.W. PARKE, *Festivals of the Athenians* (1977), describes these ancient celebrations. WALTER KRICKBERG et al., *Die Religionen des Alten Amerika* (1961; Eng. trans., *Pre-Columbian American Religions*, 1968), includes treatment of various feasts, festivals, and associated rites. JOHN S. MBITI, *African Religions and Philosophy*, pp. 110-165 (1969), covers feasts and festivals associated with African passage rites. DERK BODDE, *Festivals in Classical China* (1975), has important information on the Han dynasty. JEAN HERBERT, *Aux Sources du Japon: le Shintō* (1964; Eng. trans., *Shinto*, 1967), covers the feasts and festivals of Shintō in detail (pp. 147-224). JOHN B. NOSS, *Man's Religions*, 6th ed. (1980), provides the best single-volume coverage of the feasts and festivals of the various religions of the world. P. RAFAEL AVILA, *Worship and Politics* (1981), is a historical overview of religious feasts.

Rivers

By original usage, a river is flowing water in a channel with defined banks (ultimately from Latin *ripa*, "bank"). Modern usage includes rivers that are multichanneled, intermittent, or ephemeral in flow and channels that are practically bankless. The concept of channeled surface flow, however, remains central to the definition. The word stream (derived ultimately from the Indo-European root *srou-*) emphasizes the fact of flow; as a noun it is synonymous with river and is often preferred in technical writing. Small natural watercourses are sometimes called rivulets, but a variety of names—including branch, brook, burn, and creek—are more common, occurring regionally to nationally in place-names. Arroyo and (dry) wash connote ephemeral streams or their resultant channels. Tiny streams or channels are referred to as rills or runnels.

Rivers are nourished by precipitation, by direct overland runoff, through springs and seepages, or from meltwater at the edges of snowfields and glaciers. The contribution of direct precipitation on the water surface is usually minute, except where much of a catchment area is occupied by lakes. River water losses result from seepage and percolation into shallow or deep aquifers (permeable rock layers that readily transmit water) and particularly from evaporation. The difference between the water input and loss sustains surface discharge or streamflow. The amount of water in river systems at any time is but a tiny fraction of the Earth's total water; 97 percent of all water is contained in the oceans and about three-quarters of fresh water is stored as land ice; nearly all the remainder occurs as groundwater. Lakes hold less than 0.5 percent of all fresh water, soil moisture accounts for about 0.05 percent, and water in river channels for roughly half as much, 0.025 percent, which represents only about one four-thousandth of the Earth's total fresh water.

Water is constantly cycled through the systems of land ice, soil, lakes, groundwater (in part), and river channels, however. The discharge of rivers to the oceans delivers to these systems the equivalent of the water vapour that is blown overland and then consequently precipitated as rain or snow—i.e., some 7 percent of mean annual precipitation on the globe and 30 percent of precipitation on land areas.

Rivers are 100 times more effective than coastal erosion in delivering rock debris to the sea. Their rate of sediment delivery is equivalent to an average lowering of the lands by 30 centimetres (12 inches) in 9,000 years, a rate that is sufficient to remove all the existing continental relief in 25,000,000 years.

Rock debris enters fluvial systems either as fragments eroded from rocky channels or in dissolved form. During transit downstream, the solid particles undergo systematic changes in size and shape, traveling as bed load or suspension load. Generally speaking, except in high latitudes and on steep coasts, little or no coarse bed load

ever reaches the sea. Movement of the solid load down a river valley is irregular, both because the streamflow is irregular and because the transported material is liable to enter temporary storage, forming distinctive river-built features that range through riffles, midstream bars, point bars, floodplains, levees, alluvial fans, and river terraces. In one sense, such geomorphic features belong to the same series as deltas, estuary fills, and the terrestrial sediments of many inland basins.

Rates of erosion and transportation, and comparative amounts of solid and dissolved load, vary widely from river to river. Least is known about dissolved load, which at coastal outlets is added to oceanic salt. Its concentration in tropical rivers is not necessarily high, although very high discharges can move large amounts; the dissolved load of the lowermost Amazon averages about 40 parts per million, whereas the Elbe and the Rio Grande, by contrast, average more than 800 parts per million. Suspended load for the world in general perhaps equals two and one-half times dissolved load. Well over half of suspended load is deposited at river mouths as deltaic and estuarine sediment. About one-quarter of all suspended load is estimated to come down the Ganges–Brahmaputra and the Huang Ho (Yellow River), which together deliver some 4,500,000,000 tons a year; the Yangtze, Indus, Amazon, and Mississippi deliver quantities ranging from about 500,000,000 to approximately 350,000,000 tons a year. Suspended sediment transport on the Huang Ho equals a denudation rate of about 3,090 tons per square kilometre (8,000 tons per square mile) per year; the corresponding rate for the Ganges–Brahmaputra is almost half as great. Extraordinarily high rates have been recorded for some lesser rivers: for instance, 1,060 tons per square kilometre per year on the Ching and 1,080 tons per square kilometre per year on the Lo, both of which are loess-plateau tributaries of the Huang Ho.

This article concentrates on the distribution, drainage patterns, and geometry of river systems; its coverage of the latter includes a discussion of channel patterns and such related features as waterfalls. Considerable attention is also given to fluvial landforms and to the processes involved in their formation. Additional information about the action of flowing water on the Earth's surface is provided in the articles *GEOMORPHIC PROCESSES* and *CONTINENTAL LANDFORMS*. Certain aspects of the changes in rivers through time are described in *CLIMATE AND WEATHER*, and the general interrelationship of river systems to other components of the Earth's hydrosphere is treated in *HYDROSPHERE, THE*. For information concerning the plant and animal forms that inhabit the riverine environment, see *BIOSPHERE, THE*.

For coverage of other related topics in the *Macropædia* and *Micropædia*, see the *Propædia*, sections 222, 231, and 232, and the *Index*.

The article is divided into the following sections:

Importance of rivers	844
Significance in early human settlements	844
Significance to trade, agriculture, and industry	844
Environmental problems attendant on river use	845
Distribution of rivers in nature	846
World's largest rivers	846
Principles governing distribution and flow	847
Variation of stream regime	
Determining factors	
Drainage patterns	848
Horton's laws of drainage composition	849
Morphometry of drainage networks	849
Relation of morphometric parameters and river flow	
Evolution of drainage systems	
Geometry of river systems	850
Hydraulic geometry	850

River channel patterns	850
Straight channels	
Meandering channels	
Braided channels	
Waterfalls	852
World distribution of waterfalls	
Types of waterfalls	
Development of waterfalls	
Streamflow and sediment yield	856
Peak discharge and flooding	856
Sediment yield and sediment load	857
Sources of sediment and nature of deposition	
Factors that influence sediment yield	
Rivers as agents of landscape evolution	861
Valleys and canyons	861
Valley evolution	

Formation of canyons and gorges	Classification of deltas
Floodplains 863	Morphology of deltas
Floodplain deposits, origins, and features	Deposits and stratigraphy
Time and the floodplain system	Deltas and time
River terraces 864	Estuaries 873
Origin of river terraces	Origin and classification
Terraces and geomorphic history	Sedimentation in estuaries
Alluvial fans 866	The river system through time 874
Size, morphology, and surface characteristics	Drainage diversion by stream capture 875
Fan deposits and depositional processes	Non-fluvial invasion and deposition 875
Economic significance	Effects of climatic change 875
Deltas 870	Bibliography 876

Importance of rivers

SIGNIFICANCE IN EARLY HUMAN SETTLEMENTS

The inner valleys of some great alluvial rivers contain the sites of ancestral permanent settlements, including pioneer cities. Sedentary settlement in Hither Asia began about 10,000 years ago at the site of Aṛiḥā (ancient Jericho). Similar settlement in the Tigris–Euphrates and Nile valleys dates back to at least 6000 BP (years before present). The first settlers are thought to have practiced a hunting economy, supplemented by harvesting of wild grain. Conversion to the management of domesticated animals and the cultivation of food crops provided the surpluses that made possible the rise of towns, with parts of their populations freed from direct dependence on food getting. Civilization in the Indus Valley, prominently represented at Mohenjodaro, dates from about 4500 BP, while civilization in the Ganges Valley can be traced to approximately 3000 BP. Permanent settlement in the valley of the Huang Ho has a history some 4,000 years long, and the first large irrigation system in the Yangtze catchment dates to roughly the same time. Greek invaders of the Syrdarya, Amu Darya, and other valleys draining to the Aral Sea, east of the Caspian, encountered irrigating communities that had developed from about 2300 BP onward.

The influence of climatic shifts on these prehistoric communities has yet to be worked out satisfactorily. In wide areas, these shifts included episodic desiccation from 12,000 or 10,000 BP onward. In what are now desert environments, increased dependence on the rivers may have proved as much a matter of necessity as of choice. All of the rivers in question have broad floodplains subject to annual inundation by rivers carrying heavy sediment loads. Prehistoric works of flood defense and irrigation demanded firm community structures and required the development of engineering practice. Highly elaborate irrigation works are known from Mohenjodaro; the ziggurats (temple mounds) of the Euphrates Valley may well have originated in ancient Egypt in response to the complete annual inundation of the Nile floodplain, where holdings had to be redefined after each flood subsided. It is not surprising that the communities named have been styled hydraulic civilizations. Yet, it would be oversimplistic to claim that riparian sites held the monopoly of the developments described. Elaborate urban systems arising in Mexico, Peru, and the eastern Mediterranean from about 4000 BP onward were not immediately dependent on the resources of rivers.

Where riverine cities did develop, they commanded ready means of communication; the two lands of Upper and Lower Egypt, for instance, were unified by the Nile. At the same time, it can be argued that early riverine and river-dependent civilizations bore the seeds of their own destruction, independent of major climatic variations and natural evolutionary changes in the river systems. High-consuming cities downstream inevitably exploited the upstream catchments, especially for timber. Deforestation there may possibly have led to ruinous silting in downstream reaches, although the contribution of this process to the eventual decline of civilization on the Euphrates and the Indus remains largely a matter of guesswork. An alternative or conjoint possibility is that continued irrigation promoted progressive salinization of the soils of irrigated lands, eventually preventing effective cropping. Salinization is known to have damaged the irrigated lands

of Ur, progressively from about 4400 to 4000 BP, and may have ruined the Sumerian Empire of the time. The relative importance of environmental and social deterioration in prehistoric hydraulic civilizations, however, remains a matter of debate. Furthermore, defective design and maintenance of irrigation works promote the spread of malarial mosquitoes, which certainly afflicted the prehistoric hydraulic communities of the lower Tigris–Euphrates Valley. These same communities also may have been affected by bilharziasis, or schistosomiasis (blood fluke disease), which requires a species of freshwater snail for propagation and which even today follows many extensions of irrigation into arid lands.

At various intervals of history, rivers have provided the easiest, and in many areas the only, means of entry and circulation for explorers, traders, conquerors, and settlers. They assumed considerable importance in Europe after the fall of the Roman Empire and the dismemberment of its roads; regardless of political structures, control of crossing points was expressed in strongholds and the rise of bridge-towns. Rivers in medieval Europe supplied the water that sustained cities and the sewers that carried away city waste and were widely used, either directly or with off-takes, as power sources. Western European history records the rise of 13 national capitals on sizable rivers, exclusive of seawater inlets; three of them, Vienna, Budapest, and Belgrade, lie on the Danube, with two others, Sofia and Bucharest, on feeder streams above stem floodplain level. The location of provincial and corresponding capitals is even more strongly tied to riparian sites, as can be readily seen from the situation in the United Kingdom, France, and Germany. In modern history, in both North America and northern Asia, natural waterways directed the lines of exploration, conquest, and settlement. In these areas, passage from river system to river system was facilitated by portage along lines defined by temporary ice-marginal or ice-diverted channels. Many pioneer settlers of the North American interior entered by means of natural waterways, especially in Ohio.

SIGNIFICANCE TO TRADE, AGRICULTURE, AND INDUSTRY

The historical record includes marked shifts in the appreciation of rivers, numerous conflicts in use demand, and an intensification of use that has rapidly accelerated during the 20th century. External freight trade became concentrated in estuarine ports rather than in inland ports when ocean-going vessels increased in size. Even the port of London, though constrained by high capital investment, has displaced itself toward its estuary. The Amazon remains naturally navigable by ocean ships for 3,700 kilometres (2,300 miles), the Yangtze for 1,000 kilometres, and the partly artificial St. Lawrence Seaway for 2,100 kilometres. Internal freight traffic on the Rhine system and its associated canals amounts to one-quarter or more of the total traffic in the basin and to more than half in some parts. After a period of decline from the later 1800s to about the mid-1900s, water transport of freight has steadily increased. This trend can in large part be attributed to advances in river engineering. Large-scale channel improvement and stabilization projects have been undertaken on many of the major rivers of the world, notably in the northern plain lands of the Soviet Union and in the interior of the United States (e.g., various large tributaries of the Mississippi River).

Demand on open-channel water increases as population

prehistoric
communi-
ties

Use for
irrigation

and per capita water use increase and as underground water supplies fall short. Irrigation use constitutes a comparatively large percentage of the total supply. With a history of at least 5,000 years, controlled irrigation now affects roughly 2,000,000 square kilometres (770,000 square miles) of land, three-quarters of it in East and South Asia and two-fifths in mainland China alone. Most of this activity involves the use of natural floodwater, although reliance on artificially impounded storage has increased rapidly. Irrigation in the 1,300-kilometre length of the Indus Valley, for instance, depends almost exclusively on barrages (*i.e.*, distributor canals) running down alluvial fans and along floodplains.

Hydro-
electric
power
generation

Present-day demands on rivers as power sources range from the floating of timber, through the use of water for cooling, to hydroelectric generation. Logging in forests relies primarily on flotation during the season of melt-water high flow. Large power plants and other industrial facilities are often located along rivers, which supply the enormous quantities of water needed for cooling purposes (see below). Manufacturers of petrochemicals, steel, and woolen cloth also make large demands. Hydroelectric power generation was introduced more than 100 years ago, but the majority of the existing installations have been built since 1950. Many of the world's major industrial nations have developed their hydropower potential to the fullest, though a few like the United States still have some untapped resources. It has been estimated that 75 percent of the potential hydropower in the contiguous United States has been developed, and about 13 percent of the total annual electrical energy demands of the country are met by hydroelectric power plants. By contrast, there are some countries, such as Norway and Switzerland, that depend almost entirely on hydropower for their electrical energy needs. Potential supplies of hydropower are greatest in parts of the Soviet Union and in various developing countries in the region of the Himalayas, Africa, and South America.

Use demand of more immediate kinds are related to freshwater fisheries (including fish-farming), to dwelling in houseboats, and to recreational activities. Reliable data for these kinds of dependence on rivers do not exist; published estimates that freshwater and migratory fish provide up to about 15 percent of world catch may be too low. Certainly, millions of people are concerned with freshwater fishery and houseboat living, principally in the deltaic areas of East Asia, where dwelling, marketing, and travel can be located almost exclusively on the water. Furthermore, recreational use of rivers has increased over the years. In North America many waterways, particularly those with relatively light commercial traffic, support large numbers of recreational craft. In Europe pleasure cruisers transport multitudes of sightseers up and down the Rhine and Seine each year, while various derelict canals of such systems as the Thames have been restored for boating.

(G.H.D./Ed.)

ENVIRONMENTAL PROBLEMS ATTENDANT ON RIVER USE

The ever-increasing exploitation of rivers has given rise to a variety of problems. Extensive commercial navigation of rivers has resulted in much artificial improvement of natural channels, including increasing the depth of the channels to permit passage of larger vessels. In some cases, this lowering of the river bottom has caused the water table of the surrounding area to drop, which has adversely affected agriculture. Also, canalization, with its extensive system of locks and navigation dams, often seriously disrupts riverine ecosystems.

An even more far-reaching problem is that of water pollution. Pesticides and herbicides are now employed in large quantities throughout much of the world. The widespread use of such biocides and the universal nature of water makes it inevitable that the toxic chemicals would appear as stream pollutants. Biocides can contaminate water, especially of slow-flowing rivers, and are responsible for a number of fish kills each year.

In agricultural areas the extensive use of phosphates and nitrates as fertilizers may result in other problems. Entering rivers via rainwater runoff and groundwater seepage,

Figure 1: River polluted by untreated chemical wastes from a nearby industrial plant (right background).

Grant Heilman Photography

these chemicals can cause eutrophication. This process involves a sharp increase in the concentration of phosphorus, nitrogen, and other plant nutrients that promotes the rapid growth of algae (so-called algal blooms) in sluggish rivers and a consequent depletion of oxygen in the water. Under normal conditions, algae contribute to the oxygen balance in rivers and also serve as food for fish, but in excessive amounts they crowd out populations of other organisms, overgrow, and finally die due to the exhaustion of available nutrients and autointoxication. Various species of bacteria then begin to decay and putrefy the dead algal bodies, the oxidation of which sharply reduces the amount of oxygen in the river water. The water may develop a bad taste and is unfit for human consumption unless filtered and specially treated.

Urban centres located along rivers contribute significantly to the pollution problem as well. In spite of the availability of advanced waste-purification technology, a surprisingly large percentage of the sewage from cities and towns is released into waterways untreated. In effect, rivers are used as open sewers for municipal wastes, which results not only in the direct degradation of water quality but also in eutrophication.

Still another major source of pollutants is industry. Untreated industrial chemical wastes can alter the normal biological activity of rivers, and many of the chemicals react with water to raise the acidity of rivers to a point where the water becomes corrosive enough to destroy living organisms. An example of this is the formation of sulfuric acid from the sulfur-laden residue of coal-mining operations. Although upper limits for concentrations of unquestionably toxic chemicals such as arsenic, barium, cyanide, lead, and phenols have been established for drinking water, no general rules exist for the treatment of industrial wastes because of the wide variety of organic and inorganic compounds involved. Moreover, even in cases where a government-imposed ban checks the further discharge of certain dangerous substances into waterways, the chemicals may persist in the environment for years. Such is the case with polychlorinated biphenyls (PCBs), the chlorinated hydrocarbon by-products of various industrial processes that were routinely discharged into U.S. waterways until the late 1970s when the federal government not only prohibited the continued discharge of the chemicals

Municipal
and indus-
trial wastes

into the environment but their production as well. Since PCBs cannot be broken down by conventional waste-treatment methods and are degraded by natural processes very slowly, scientists fear that these compounds will continue to pose a serious hazard for decades to come. PCBs have been found in high concentrations in the fatty tissues of fish, which can be passed up the food chain to humans. An accumulation of PCBs in the human body is known to induce cancer and other severe disorders.

Thermal
pollution

As noted above, many industrial facilities, including nuclear power plants, steel mills, chemical-processing facilities, and oil refineries, use large quantities of water for cooling and return it at elevated temperatures. Such heated water can alter the existing ecology, sometimes sufficiently to drive out or kill desirable species of fish. It also may cause rapid depletion of the oxygen supply by promoting algal blooms.

(Ed.)

Distribution of rivers in nature

WORLD'S LARGEST RIVERS

Obvious bases by which to compare the world's great rivers include the size of the drainage area, the length of the main stem, and the mean discharge; however, reliable comparative data, even for the world's greatest rivers, do not exist. Some of the values listed in Table 1 are approximate. The Nile, the world's longest river, is about 250 kilometres longer than the Amazon. It is possible that well over 100 of the greatest rivers may exceed a 1,600-kilometre length on their main stems.

Drainage
area,
length,
and
discharge

Area-length-discharge combinations vary considerably, although length tends to increase with area and area and discharge to increase through their individual ranking series. On all counts except length, the Amazon is the world's principal river; the Congo and the Paraná are among the first five by area and discharge, but the Mississippi, fourth in length and fifth in area, is only seventh in discharge. The Ganges-Brahmaputra, third in discharge, is 13th (or lower) in area and well down the list of length for its two main stems taken separately.

Ranking in Table 1 is by drainage area. In combination, the rivers listed drain some 44,000,000 square kilometres, roughly 30 percent of the world's land area. If volume of discharge is taken to be the basis of comparison, then

certain other rivers not tabulated also must be mentioned. The most important of these is the Orinoco, with a mean discharge of 19,800 cubic metres (700,000 cubic feet) per second and a basin of 948,000 square kilometres. Others are the Irrawaddy, discharge 13,000 cubic metres per second, basin 411,000 square kilometres; and the Mekong, 11,000 cubic metres per second, basin 795,000 square kilometres. The 20 greatest of these rivers, draining about 30 percent of the world's land area, discharge nearly 40 percent of total runoff, reckoned from a mean equivalent of 29.2 centimetres of precipitation. They deliver to the sea about 92 cubic kilometres of water per day, or roughly 33,325 cubic kilometres annually. The Amazon, the Paraná, the Congo, and the Ganges-Brahmaputra, combined, discharge more than 54 cubic kilometres a day and nearly 20,800 cubic kilometres a year, one-third of the world's total runoff to the oceans, with the Amazon alone accounting for almost one-fifth.

Higher-
than-
average
discharges

World average external runoff is about 0.01 cubic metre per second per square kilometre (0.6 cubic foot per second per square mile). Great rivers with notably higher discharges are fed either by the convectional rains of equatorial regions or by monsoonal rains that are usually increased by altitudinal effects. The Huang Ho averages 0.046 cubic metre per second per square kilometre, the Irrawaddy 0.032 cubic metre per second per square kilometre, the Magdalena and the Amazon 0.026 cubic metre per second per square kilometre, the Orinoco 0.021 cubic metre per second per square kilometre, and the Ganges-Brahmaputra above 0.024 cubic metre per second per square kilometre. Very high mean discharges per unit area are also recorded for lesser basins in mountainous coastlands exposed to the zonal westerlies of mid-latitudes. Among great rivers with mean discharges near or not far below world averages per unit area are those of Siberia, the Mackenzie, and the Yukon (828,000 square kilometres, 5,900 cubic metres per second), all affected by low precipitation for which low evaporation rates barely compensate. The basins of the Mississippi, Niger, and Zambezi include some areas of dry climate. The Nelson illustrates the extreme effects of low precipitation in a cool climate, while the Nile, Murray-Darling, and Shatt al-Arab (Tigris-Euphrates) experience low precipitation combined with high evaporation losses.

Table 1: The World's Principal Rivers, Ranked According to Drainage Area							
river	drainage area		length (km)*	mean discharge			
	extent (000 sq km)	percent of world's land area		(000 cu m/sec)	rank order	percent of world total	cu m/sec/sq km

Rio Grande	445	0.4	1,360	0.08	—	0.01	.0001
Rhine	160	0.1	1,392	2	—	0.2	.0137
Rhône	96	—	800	2	—	0.2	.0177
Thames	10	—	340	0.08	—	0.01	.0082

*Some figures are rounded to the nearest hundred kilometres.

The lower end of Table 1 lists comparative data for selected rivers in highly inhabited or otherwise hydrographically interesting valleys. The Rhine, Rhône, and Danube record regimes that vary along the length of their courses in response to glacier melt in the headwaters and the entry of contrasting tributaries downstream. The Rio Grande, like the Orange and the Colorado, suffers progressive downstream losses, both natural and irrigational. The Thames is special, as it experiences a very high tidal range in its estuary; this makes flood control especially difficult.

PRINCIPLES GOVERNING DISTRIBUTION AND FLOW

Moisture supply sufficient to sustain channeled surface flow is governed primarily by climate, which regulates precipitation, temperature, and evapotranspiration water loss caused by vegetation. In rainy tropical and exposed mid-latitude areas, runoff commonly equals 38 centimetres or more of rain a year, rising to more than 102 centimetres. Negligible external runoff occurs in subtropical and rain-shadow deserts; perennial, intermittent, and ephemeral lakes, expanding in response to local runoff, prevent the drainage of desert basins from finding escape routes.

Principal
classes
of regime

Variation of stream regime. Seasonal variation in discharge defines river regime. Three broad classes of regime can be distinguished for perennial streams. In the megathermal class, related to hot equatorial and tropical climates, two main variants occur; discharge is powerfully sustained throughout the year, usually with a double maximum (two peak values), but in some areas with a strong single maximum. In the mesothermal class some regimes resemble those of tropical and equatorial areas, with single or double summer maxima corresponding to heavy seasonal rainfall, while others include sustained flow with slight warm-season minima. Where mid-latitude climates include dry summers, streamflow decreases markedly and may cease altogether in the warm half of the year. In areas affected by release of meltwater, winter minima and spring maxima of discharge are characteristic. Microthermal regimes, which are influenced by snow cover, include winter minima and summer maxima resulting from snowmelt and convectional rain; alternatively, spring meltwater maxima are accompanied by secondary fall maxima that are associated with late-season thunder rain, or spring snowmelt maxima can be followed by a summer glacier-melt maximum, as on the Amu Darya. Megathermal regimes, which are controlled by systematic fluctuations in seasonal rain, and microthermal regimes, which are controlled by seasonal release of meltwater, may be more reliable than mesothermal regimes.

The regime can vary considerably along the length of a single river in timing and in seasonal characteristics. Spring maxima in the Volga headwaters are not followed by peak flows in the delta until two months later. The October seasonal peak on the upper Niger becomes a December peak on the middle river; the swing from tropical-rainy through steppe climate reduces volume by 25 percent through a 483-kilometre stretch. The seasonal headwater flood wave travels at 0.09 metre per second, taking some four months over 2,011 kilometres, but earlier seasonal peaks are reestablished on the lower river by tributaries fed by hot-season rains. The great Siberian rivers, flowing northward into regions of increasingly deferred thaw, habitually cause extensive flooding in their lower reaches, which remain ice-covered when upstream reaches have already thawed and are receiving the meltwaters of late spring and summer.

Extremes of regime characteristics come into question when streams are classified as perennial, intermittent, or ephemeral. These terms are in common use but lack rigid definition. Whereas the middle and lower reaches of streams in humid regions rarely or never cease flowing and can properly be called perennial, almost every year many of their upstream feeders run dry where they are not fed by springs. In basins cut in impermeable bedrock, prolonged droughts can halt flow in most channel reaches. Karst (limestone country) that has some surface drainage often includes streams that are spatially intermittent; frequently it also contains temporally intermittent streams that flow only when heavy rain raises the groundwater table and

reactivates outlets above the usual level. Temporally intermittent streams also occur in dry areas where, at low stage, only some channel reaches contain flowing water.

There is a continuous progression from perennial streams through intermittent streams to ephemeral streams: the latter command much attention, especially because their effects in erosion, transportation, and deposition can be inordinately great and also because they relate closely to periods and cycles of gullying. Their channels generally have higher width-depth ratios than those of unbraided channels in humid areas; e.g., 150:1 or more on small streams. In extreme cases, ephemeral streamflow merges into sheetflood. Streambeds, usually sandy, are nearly flat in cross section but contain low bars where gravel is available. These behave in many ways like riffles or braid bars elsewhere. Although beds and banks are erodible, the fine-material fraction is usually enough to sustain very steep channel banks and gully walls. Rapid downcutting produces flat-floored trenches, called arroyos, in distinction from the often V-shaped gullies of humid areas.

Arroyos

Discontinuous vegetation cover, well-packed surface soil, and occasionally intense rainfall promote rapid surface runoff, conversion of overland to channeled flow, and the multiplication of channels. Although reliable comparative data are scarce, it seems likely that ephemeral channel systems develop higher order ranking, area for area, than do perennial streams: channels as high as 11th order are recorded for basins of about 1,300 square kilometres, whereas the Mississippi is usually placed only in the 10th order (see below *Horton's laws of drainage composition*). This apart, geometry of ephemeral nets obeys the laws of drainage composition that apply to perennial streams: stream length, stream number, channel width, and water discharge can be expressed as exponential functions of stream order, and drainage area and channel slope as power functions, whereas slope and discharge can be expressed as power functions of width and drainage area.

At-a-station (a particular cross section) variations in width, depth, and velocity with variation in discharge in ephemeral streams resemble the corresponding variations in perennial streams. Differences appear, however, when downstream variations are considered. For a given frequency of discharge, the rate of increase in width differs little between the two groups, but ephemeral streams increase the more slowly in depth, becoming increasingly shallow in proportion in the downstream direction. This effect is compensated by a more rapid downstream increase in velocity, which reflects high concentrations of suspended sediment and a resultant reduction of friction. Ultimately, however, the ephemeral flood may lose so much water by evaporation and percolation that the stream is dissipated in a terminal mudflow.

Trenching, the extension of gullies, and their conversion into arroyo systems, implies valley fills of erodible surficial material. Like streams of humid regions, ephemeral stream systems record complex histories of cut and fill: it is reasonable to expect comparable timing for climatically controlled events. Whatever the effect upon stream erosion of historical settlement in the western United States, inland eastern Australia, and New Zealand, the present episode of gullying seems merely to have been intensified by man's use of the land. Accelerated channeling frequently involves three processes not characteristic of humid regions: piping, headcutting, and the formation of channel profiles that are discontinuous over short distances.

In piping, water that has penetrated the topsoil washes out the subsoil where this is exposed in section, forming small tunnels that may attain lengths of many metres. Collapse of tunnel roofs initiates lateral gullying and lengthens existing cuts headward. Headcutting is commonly associated with piping, because headcuts frequently expose the subsoil. A headcut is an abrupt step in the channel profile, some centimetres to some metres high; it may originate merely as a bare or trampled patch in a vegetated channel bed but will increase in height (like some very large waterfalls) as it works upstream. At the foot of the headcut is a plunge pool, downstream of which occurs a depositional slope of low downstream gradient. Formation of successive headcuts, say at an average spacing of 150 metres, and

Piping and
discontin-
uous
gullies

the construction of depositional slopes below each, causes the profile to become stepped. Ephemeral streams with stepped profiles are called discontinuous gullies. Speed of headcut recession varies widely with the incidence and intensity of rainfall; but ultimately, when the whole profile has been worked along and the bed widened, the original even slope is restored, though at a lower level than before.

Determining factors. Long-term effects expressed in mean seasonal regimes and short-term effects expressed in individual peak flows are alike affected by soil-moisture conditions, groundwater balance, and channel storage. Channeled surface flow begins when overland flow becomes deep enough to be erosive; and depth of overland flow represents a balance between short-term precipitation and soil infiltration. Rate and capacity of infiltration depend partly on antecedent conditions and partly on permeability. Seasonal assessments are possible, however; numbers of commercial crops can take up and transpire the equivalent of 38 centimetres of precipitation during the growing season. In many mid-latitude climates the rising curves of insolation and plant growth during spring and early summer cause soil moisture depletion, leading eventually to a deficit that is often strong enough to reduce runoff and streamflow. Soil-moisture recharge during colder months promotes high values of runoff frequently in the spring quite independently of the influence of precipitation regime or snowmelt.

Ground-
water and
glacier
effects

Storage of water in groundwater tables, stream channels, on floodplains, and in lakes damps out variations in flow, whereas snow and ice storage exaggerate peaks. For the world as a whole, groundwater contributes perhaps 30 percent of total runoff, although the proportion varies widely from basin to basin, within basins, and through time. Shallow groundwater tables in contact with river channels absorb and release water, respectively at high and low stage. Percolation to greater depths and eventual discharge through springs delays the entry of water into channels; many groundwater reservoirs carry over some storage from one year to another. Similar carryover occurs with glaciers and to some extent also with permanent snowfields; water abstracted by the ice caps of high latitudes and by large mountain glaciers can be retained for many years, up to about 250,000 years in the central Antarctic cap. Temperate glaciers, however, with temperatures beneath the immediate subsurface constantly near the freezing (or the melting) point, can, like their associated snowfields, release large quantities of water during a given warm season. Their losses through evaporation are small.

Con-
straints of
rock type
and
vegetation

Meltwater contributions to streamflow, however, can range from well above half the total discharge to well below the level of the snow line. They are vital to irrigation on alluvial fans rimming many dry basins, as in the Central Valley of California and the Tarim Basin of the Takla Makan Desert of China: meltwater is released during the planting or growing seasons. Within the limiting constraints of precipitation or meltwater input or both, and the outputs of evapotranspiration and percolation, the actual distribution of rivers in nature is affected by available drainage area, lithology, and vegetation. Vegetation is obviously climate dependent to a large extent but might well be capable of reaching thresholds of detention ability that do not match recognized climatic boundaries. It is, moreover, liable to the influence of climatically independent factors where it has been disturbed by human activity. Runoff on the plain lands of northern Asia, expressed as a percentage of mean annual precipitation, ranges from about 75 in the tundra, through about 70 in the boreal forest and 50 through boreal forest with perennially frozen ground, down through less than 40 in mixed forest, to five in semidesert. Clear felling of forest increases runoff in the short and medium term because it reduces surface detention and transpiration. In areas of seasonal snow cover, forest influences seasonal regime considerably. However, though there may be a jump in short-term runoff characteristics between areas of continuous vegetation (forest and grass sward) on the one hand and discontinuous vegetation (bunchgrass and scrub) on the other, comprehensive general studies of precipitation-temperature runoff characteristics suggest that mean annual runoff decreases,

at a decreasing rate through the range that is involved, as temperature increases and as precipitation (weighted in respect of seasonal incidence) decreases.

Lithology is significant mainly in connection with permeability. The capacity of karst to swallow and to reissue water is well known, as is the role of permeable strata generally in absorbing water into groundwater tables. An extreme case of a special kind is represented by an artesian aquifer, which in favourable structural conditions can take water for a very long time from the surface and immediately connected circulations, returning it only if the artesian pressure becomes strong enough to promote the opening of flowing springs. Less directly, but with considerable effect on infiltration and short-term runoff, the mechanical grade of bedrock or of surficial deposits can considerably affect the response to individual storms.

Artesian
aquifer

Both the ultimate possible extent of drainage basins and the opening of individual headwater channels are influenced by available drainage area. A hypothetical limit for very large basins could probably be constructed from considerations of stem length, basin shape, computed area, and continental extent. The Amazon probably approaches the hypothetical maximum. At the other extreme, basin morphometry (geometric aspects of basins and their measurement) can be made to indicate the limiting average area necessary to sustain a given length of channel; in large areas of the mid-latitudes, the ratio is close to 2.25 square kilometres of drainage area for a channel 1.6 kilometres in length. Estimates for the conterminous United States, an area of about 7,770,000 square kilometres, give some 5,230,000 kilometres of channel length. These estimates include 1,500,000 unbranched fingertip tributaries—each having an average length of 1.6 to 2.4 kilometres.

Drainage patterns

Distinctive patterns are acquired by stream networks in consequence of adjustment to geologic structure. In the early history of a network, and also when erosion is reactivated by earth movement or a fall in sea level, downcutting by trunk streams and extension of tributaries are most rapid on weak rocks, especially if these are impermeable, and along master joints and faults. Tributaries from those streams that cut and grow the fastest encroach on adjacent basins, eventually capturing parts of the competing networks therein. In this way, the principal valleys with their main drainage lines come to reflect the structural pattern.

Flat-lying sedimentary rocks devoid of faults and strong joints and the flat glacial deposits of the Pleistocene Epoch (from 2,500,000 to 10,000 years ago) exert no structural control at all; this is reflected in branching networks (Figure 2). A variant pattern, in which trunk streams run sub-parallel, can occur on tilted strata. Rectangular patterns form where drainage lines are adjusted to sets of faults and marked joints that intersect at about right angles, as in some parts of ancient crustal blocks. The pattern is varied where the regional angle of structural intersection changes. Radial drainage is typical of volcanic cones, so long as they remain more or less intact. Erosion to the skeletal state often leaves the plug standing in high relief, ringed by concentric valleys developed in thick layers of ash.

Dendritic,
trellis, and
radial
patterns

Similarly, on structural domes where the rocks of the core vary in strength, valleys and master streams locate

Deranged patterns

on weak outcrops in annular patterns. Centripetal patterns are produced where drainage converges on a single outlet or sink, as in some craters, eroded structural domes with weak cores, parts of some limestone country, and enclosed desert depressions. Trellis (or espalier) drainage patterns result from adjustment to tight regional folding in which the folds plunge. Denudation produces a zigzag pattern of outcrops, and adjustment to this pattern produces a stream net in which the trunks are aligned on weak rocks exposed along fold axes and small feeder streams run down the sides of ridges cut on the stronger formations. Deranged patterns, in which channels are interrupted by lakes and swamps, characterize areas of modest relief from which continental ice has recently disappeared. These patterns may be developed either on the irregular surface of a till sheet (heterogeneous glacial deposit) or on the ice-scoured expanse of a planated crystalline block. Where a till sheet has been molded into drumlins (inverted-spoon-shaped forms that have been molded by moving ice), the postglacial drainage can approach a rectangular pattern. In glaciated highland, postglacial streams can pass anomalously through gaps if the divides have been breached by ice, and sheet glaciation of lowland country necessarily involves major derangement of river networks near the ice front. At the other climatic extreme, organized networks in dry climates can be deranged by desiccation, which breaks down the existing continuity of a net. The largely linear systems of ephemeral lakes in inland Western Australia have been referred to this process.

Adjustment to bedrock structure can be lost if earth movement raises folds or moves faults across drainage lines without actually diverting them; streams that maintain their courses across the new structures are called antecedent. Adjustment is lost on a regional scale when the drainage cuts down through an unconformity into an under-mass with structures differing greatly from those of the cover: the drainage then becomes superimposed. Where the cover is simple in structure and provides a regional slope for trunk drainage, remnants of the original pattern may persist long after superimposition and the total destruction of the cover, providing the means to reconstruct the earlier network.

HORTON'S LAWS OF DRAINAGE COMPOSITION

Orders of streams

Great advances in the analysis of drainage nets were made by Robert E. Horton, an American hydraulic engineer who developed the fundamental concept of stream order: An unbranched headstream is designated as a first-order stream. Two unbranched headstreams unite to form a second-order stream; two second-order streams unite to form a third-order stream, and so on. Regardless of the entry of first- and second-order tributaries, a third-order stream will not pass into the fourth order until it is joined by another third-order confluent. Stream number is the total number of streams of a given order for a given drainage basin. The bifurcation ratio is the ratio of the number of streams in a given order to the number in the next higher order. By definition, the value of this ratio cannot fall below 2.0, but it can rise higher, since streams greater than first order can receive low-order tributaries without being promoted up the hierarchy. Some estimates for large continental extents give bifurcation ratios of 4.0 or more (see below *Sediment yield and sediment load*).

Although the number system given here, and nowadays in common use, differs from Horton's original in the treatment of trunk streams, Horton's laws of drainage composition still hold, namely:

1. Law of stream numbers: the numbers of streams of different orders in a given drainage basin tend closely to approximate an inverse geometric series in which the first term is unity and the ratio is the bifurcation ratio.
2. Law of stream lengths: the average lengths of streams of each of the different orders in a drainage basin tend closely to approximate a direct geometric series in which the first term is the average length of streams of the first order.

These laws are readily illustrated by plots of number and average length (on logarithmic scales) against order (on an arithmetic scale). The plotted points lie on, or close to,

straight lines. The orderly relationships thus indicated are independent of network pattern. They demonstrate exponential relationships. Horton also concluded that stream slopes, expressed as tangents, decrease exponentially with increase in stream order. The systematic relationships identified by Horton are independent of network pattern: they greatly facilitate comparative studies, such as those of the influences of lithology and climate. Horton's successors have extended analysis through a wide range of basin geometry, showing that stream width, mean discharge, and length of main stem can also be expressed as exponential functions of order, and drainage area and channel slope as power functions. Slope and discharge can in turn be expressed as power functions of width and drainage area, respectively. The exponential relationships expressed by network morphometry are particular examples of the working of fundamental growth laws. In this respect, they relate drainage-net analysis to network analysis and topology in general.

MORPHOMETRY OF DRAINAGE NETWORKS

Relation of morphometric parameters and river flow. The functional relationships among various network characteristics, including the relationships between discharge on the one hand and drainage area, channel width, and length of main stem on the other, encourage the continued exploration of streamflow in relation to basin geometry. Attention has concentrated especially on peak flows, the forecasting of which is of practical importance; and since many basins are gaged either poorly or not at all, it would be advantageous to devise means of prediction that, while independent of gaging records, are yet accurate enough to be useful.

A general equation for discharge maxima states that peak discharges are (or tend to be) power functions of drainage area. Such a relationship holds good for maximum discharges of record, but conflicting results have been obtained by empirical studies of stream order, stream length, drainage density, basin size, basin shape, stream and basin slope, aspect, and relative and absolute height in relation to individual peak discharges in the shorter term. One reason is that not all these parameters have always been dealt with. In any event, peak discharge is also affected by channel characteristics, vegetation, land use, and lags induced by interception, detention, evaporation, infiltration, and storage. Although frequency-intensity-duration characteristics (and, in consequence, magnitude characteristics) of single storms have been determined for considerable land areas, the distribution of a given storm is unlikely to fit the location of a given drainage basin. In addition, the peak flow produced by a particular storm is much affected by antecedent conditions, seasonal and shorter term wetting and drying of the soil considerably influencing infiltration and overland flow. Nevertheless, one large study attained considerable success by considering rainfall intensity for a given duration and frequency, plus basin area, and main-channel slope expressed as the height-distance relationship of points 85 and 10 percent of stem length above the station for which predictions were made. For practical purposes, the telemetering of rainfall in a catchment, combined with the empirical determination of its response characteristics, appears effective in forecasting individual peak flows.

Evolution of drainage systems. To empirical analysis of the morphometry of drainage networks has been added theoretical inquiry. Network plan geometry is specifically a form of topological mathematics. Horton's two fundamental laws of drainage composition are instances of growth laws. They are witnessed in operation, especially when a new drainage network is developing; and, at the same time, probability statistics can be used to describe the array of events and forms produced.

Random-walk plotting, which involves the use of random numbers to lay out paths from a starting point, can produce networks that respond to analysis as do natural stream networks—i.e., length and number increase and decrease respectively, in exponential relationship to order, and length can be expressed as a power function of area. The exponential relationship between number and

Problem of predicting peak discharge

Random-walk analysis

order signifies a constant bifurcation ratio throughout the network. A greater constancy in this respect would be expected from a randomly predicted network than from a natural network containing adventitious streams that join trunks of higher than one additional order. The exponential relationship between length and order in a random network follows from the assumption that the total area considered is drained to, and by, channels; the power relationship of length to area then also follows. The implication of the random-walk prediction of networks that obey the empirically derived laws of drainage composition is that natural networks correspond to, or closely approximate, the most probable states.

Geometry of river systems

HYDRAULIC GEOMETRY

Hydraulic geometry deals with variation in channel characteristics in relation to variations in discharge. Two sets of variations take place: variations at a particular cross section (at-a-station) and variations along the length of the stream (downstream variations). Characteristics responsive to analysis by hydraulic geometry include width (water-surface width), depth (mean water depth), velocity (mean velocity through the cross section), sediment (usually concentration or transport, or both, of suspended sediment), downstream slope, and channel friction.

Graphs of the values of channel characteristics against values of discharge usually display some scatter or departure from lines of best fit. One main cause is that values on a rising flood often differ from those on a falling flood, partly because of the reduction of flow resistance, and hence the increase in velocity, as sediment-concentration increases on the rising flood. Bed scour and bed fill are also related. Nevertheless, the variations for a given cross section can be expressed as functions of discharge, Q . For instance, width, depth, and velocity are related to discharge by the expressions: $w \propto Q^b$, $d \propto Q^f$, and $v \propto Q^m$, where w , d , v and b , f , m are numerical constants. The sum of the exponents $b + f + m = 1$, because of the basic relation—namely that $Q = wdv$.

Similar functions can be derived for downstream variations, but, for downstream comparisons to be possible, the observed values of discharge and of channel characteristics must be referred to selected frequencies of discharge. When data are plotted on graphs with logarithmic scales for each of two discharge frequencies at an upstream and a downstream station, the four points for each channel characteristic define a parallelogram (Figure 3), whereby the hydraulic geometry of the stream is defined in respect of that characteristic. The values of exponents in the power equations differ considerably from one river to another: those shown here are theoretical optimum values. One common cause of difference is that many gaging stations are located where some channel characteristics are controlled, whether naturally as by rock outcrops or

artificially as by bridge abutments. Constraints on variation in width, for instance, are mainly offset by increased variation in depth.

Analyses of downstream variation in channel slope with discharge commonly reveal contrasts between field results and the theoretical optima. The discrepancy is probably due in considerable part to the fact that channel slope can vary in concert with channel efficiency, including channel habit, channel size, and channel form. Many past discussions of stream slope are invalidated by their restriction to the two dimensions of height and distance. In any event, the slopes of many natural channels are influenced by some combination of earth movement, change in base-level, glacial erosion, glacial deposition, and change of discharge and load characteristics that result from change of climate. Consequently, although natural profiles from stream source to stream mouth suggest a tendency toward a smooth concave-upward form, many actually are irregular. Even without a change of baselevel, degradational tendency, or discharge, a change in channel sinuosity can produce a significant change of channel slope.

A marked downstream lessening of slope does not imply a decrease in velocity at a given frequency of discharge; reduction of slope is accompanied, and offset, by an increase in channel efficiency due mainly to an increase in size. The lower Amazon, with a slope of less than 7.6 centimetres per 1.6 kilometres, flows faster at the bankfull stage than many mountain streams, at 2.4 metres per second. According to the assumptions made, an optimal velocity equation in hydraulic geometry can predict a slight increase, constancy, or a slight decrease in velocity downstream, for a given frequency of discharge. On the Mississippi, velocity at mean discharge (not a set frequency) increases downstream; velocity at the overbank stages of the five-year and 50-year floods is constant downstream. Constant downstream velocity may well be first attained at the bank-full stage. The fact that relationships are highly disturbed at and near waterfalls and other major breaks of slope (the Paraná just below the site of the former Guaíra Falls, for instance, ran at nine to 14 metres per second) has no bearing on the principles of hydraulic geometry, which apply essentially to streams in adjustable channels.

The interrelationships and adjustments among width, depth, width–depth ratio, suspended-sediment concentration, sediment transport, deposition, eddy viscosity, bed roughness, bank roughness, channel roughness, and channel slope in their relation to discharge, both at-a-station and in the downstream direction, plus the tendency at many sections on many streams for variation to occur about some modal value, all encourage the conception of rivers as equilibrium systems. The designation quasi-equilibrium systems is usually used, since not all variances can be simultaneously minimized, and minimization of some variances (*e.g.*, of water-surface slope) can only be secured at the expense of maximizing others (*e.g.*, channel depth).

Downstream changes of velocity

Width, depth, and velocity of flow

RIVER CHANNEL PATTERNS

Distinctive patterns in the plan geometry of streams correspond to distinctive combinations of cross-sectional form, calibre of bed load, downstream slope, and in some cases cross-valley slope, tendency to cut or fill, or position within the system. The full range of pattern has not been identified: it includes straight, meandering, braided, reticulate, anabranching, distributary, and irregular patterns (Figure 4). Although individual patterns are given separate names, the total range constitutes a continuum.

Straight channels. Straight channels, mainly unstable, develop along the lines of faults and master joints, on steep slopes where rills closely follow the surface gradient, and in some delta outlets. Flume experiments show that straight channels of uniform cross section rapidly develop pool-and-riffle sequences. Pools are spaced at about five bed widths. Lateral shift of alternate pools toward alternate sides produces sinuous channels, and spacing of pools on each side of the channel is thus five to seven bed widths. This relation holds in natural meandering streams.

Meandering channels. Meandering channels are single channels that are sinuous in plan (Figure 5, left), but there is no criterion, except an arbitrary one, of the degree of

Basic types

Figure 4: Common types of channel patterns.

sinuosity required before a channel is called meandering. The spacing of bends is controlled by flow resistance, which reaches a minimum when the radius of the bend is between two and three times the width of the bed. Accordingly, meander wavelength, the distance between two successive bends on the same side—or four-bend radii—tends to concentrate between eight and 12 bed widths, although variation both within and beyond this range seems to be related to variations in the cross-sectional form of the channel. Because bed width is related to discharge, meander wavelength also is related to discharge.

Meandering channels are equilibrium features that represent the most probable channel plan geometry, where single channels deviate from straightness. This deviation, and channel division in general, is related in part to the cohesiveness of channel banks and the abundance and bulk of midstream bars. When single channels are maintained, however, the meandering form is most efficient because it minimizes variance in water-surface slope, in angle of deflection of the current, and in the work done by the river

in turning. This least-work property of meander bends is readily illustrated by the trace, identical with that of stream meanders, adopted by a bent band of spring steel. Meander plan geometry is simply describable by a sine function of the relative distance along the channel bend. The least-work and minimum-variance properties of the plan geometry, however, are secured only at the expense of maximizing the variance in depth. The longitudinal profile of the bed of a meandering stream includes pools at (or slightly downstream of) the extremities of bends and riffles at the inflections between bends. Increased tightness of bend, expressed by reduction in radius and increase in total angle of deflection, is accompanied by increased depth of pool. Where riffles are built of fragments larger than sand size, they behave as kinematic waves—*i.e.*, the speed of transport of material through a given riffle decreases as the spacing of surface fragments decreases, and the total rate of transport attains a maximum where the spacing is about two particle lengths. Numerous sand-bed streams in dry regions, however, fail to develop pool-and-riffle sequences, maintaining approximately uniform cross sections even at channel bends.

Irregularities in meanders developed in alluvium relate primarily to uneven resistance, which is often a function of varying grain size. Variations in total sinuosity are probably due in the main to adjustments of channel slope. The process of cutoff (short-circuiting of individual meanders) is favoured not only by the erosion of outer channel banks and by the tendency of meander trains to sweep down the valley but also by the stacking of meanders upstream of obstacles and by increases of sinuosity that accompany slope reduction.

Meandering streams that cut deeply into bedrock form entrenched meanders, the terminology of which is highly confused. It seems probable that, in actuality, the sole existing type of entrenched meanders is the ingrown type, where undercut slopes (river cliffs) on the outsides of bends oppose slip-off slopes (meander lobes) on the insides. For reasons not yet understood, lateral enlargement of ingrown meanders seems habitually to outpace downstream sweep, although the trimming of the upstream sides of lobes, and occasional cutoff, are well known. Many existing trains of ingrown meanders belong to valleys rather than to streams, relating to the traces of former rivers of greater discharge. Reconstruction of the original traces indicates approximate straightness at plateau level, as opposed to the inheritance of the ingrown loops from some former high-level floodplain.

In a broader context, meander phenomena cannot be understood as requiring cohesive banks of the kind usual in rivers. Meanders, with geometry comparable to that of rivers, have been recognized in the oceanic Gulf Stream and in the jet streams of the upper atmosphere. In this way, stream meanders are classed with wave phenomena in general.

Braided channels. Braided channels are subdivided at low-water stages by multiple midstream bars of sand or gravel (Figure 4 and Figure 5, right). At high water, many or all bars are submerged, although continuous downcutting or fixation by plants, or both, plus the trapping of sediment may enable some bars to remain above water. A single meandering channel may convert to braiding where one or more bars are constructed, as downstream of a tight bend where coarse material is brought up from the pool bottom. Each of the subdivided channels is less efficient, being smaller than the original single channel. If its inefficiency is compensated by an increase in slope (*i.e.*, by downcutting), the bar dries out and becomes vegetated and stabilized. However, many rivers that are largely or wholly braided along their length owe their condition to something more than local accidents. The braided condition involves weak banks, a very high width–depth ratio, powerful shear on the streambed (implied by the width–depth ratio), and mobile bed material. Thus, braided streams are typically encountered near the edges of land ice, where valleys are being filled with incoherent coarse sediment, and also on outwash plains, as the Canterbury Plains of South Island, New Zealand; width–depth ratios can exceed 1,000:1. Studies on terraced outwash plains

demonstrate that braided streams can readily excavate their valley floors—in other words, they are by no means solely an inevitable response to valley filling.

Distributary patterns, whether on alluvial fans or deltas (Figure 4), pose few problems. A delta pass that lengthens is liable to lateral breaching, whereas continued deposition, on deltas and on fans, raises the channel bed and promotes sideways spill down the least gradient. The branching rivers of inland eastern Australia, flowing across basin fills that range from thin sedimentary plains to thick fluvial accumulations, have affinities with deltaic distributaries even though their patterns are only radial in part. A branch may run for tens of kilometres before joining a trunk stream, whether its own or another. (G.H.D./Ed.)

WATERFALLS

Waterfalls, sometimes called cataracts, arise from an abrupt steepening of a river channel that causes the flow of water to drop vertically, or nearly so. Waterfalls of small height and lesser steepness are called cascades; the term is often applied to a series of small falls along a river. Still gentler reaches of rivers that nonetheless exhibit turbulent flow and white water in response to a local increase in channel gradient are rapids.

Waterfalls are characterized by great erosive power. The rapidity of erosion depends on the height of a given waterfall, its volume of flow, the type and structure of the rocks involved, and other factors. In some cases the site of the waterfall migrates upstream by headward erosion of the cliff or scarp, whereas in others erosion tends to act downward to bevel the entire reach of river containing the falls. With the passage of time, by either or both of these means, the inescapable tendency of streams is to eliminate so gross a discordance of longitudinal profile as a waterfall. The energy of all rivers is directed toward the achievement of a relatively smooth, concave-upward, longitudinal profile; this is a common equilibrium, or adjusted condition, in nature.

Even in the absence of entrained rock debris that serves as an erosive tool of rivers, it is intuitively obvious that the energy available for erosion at the base of a waterfall is great. Indeed, one of the characteristic features associated with waterfalls of any great magnitude—with respect to volume of flow as well as to height—is the presence of a plunge pool, a basin that is scoured out of the river channel directly beneath the falling water. In some instances the depth of a plunge pool may nearly equal the height of the cliff causing the falls. Its depth depends not only on the erosive power of the falls, however, but also on the amount of time during which the falls remain at a particular place. The channel of the Niagara River below Horseshoe Falls, for example, contains a series of plunge pools, each of which represents a stillstand, or period of temporary stability, during the general upriver migration of the waterfall. The significance of this profile will be discussed below, but in general it may be said that the

fate of most waterfalls is their eventual transformation to rapids as a result of their own erosive energy.

The lack of permanence as a landscape feature is, in fact, the hallmark of all waterfalls. Many well-known occurrences such as the Niagara Falls came into existence as recently as 12,000 years ago, when the last of the great ice sheets retreated from middle latitudes. The oldest falls originated during the latter part of the Tertiary Period (65,000,000 to 2,500,000 years ago), when episodes of uplift raised the great plateaus and escarpments of Africa and South America. Examples of waterfalls attributable to such pre-Pleistocene uplift (that occurring more than 2,500,000 years ago) include Kalambo Falls, near Lake Tanganyika; Tugela Falls, in South Africa; Tisisat Falls, at the headwaters of the Blue Nile on the Ethiopian Plateau; and Angel Falls, in Venezuela.

Available data suggest that the falls of greatest height are seldom those of greatest water discharge. Many falls in excess of 300 metres exhibit but modest flow, and, in some cases, only a perpetual mist occurs near their bases. By way of contrast, the Khone Falls of the Mekong River in southern Laos, drop only 22 metres, but the average discharge of this cataract is about 11,330 cubic metres per second. In general, considering height and volume of flow jointly, it is understandable that Victoria, Niagara, and Paulo Afonso, among others, have each been proclaimed “the world’s greatest falls” by various explorers and authorities (see Table 2).

World distribution of waterfalls. The distribution of waterfalls is not uniform, and large parts of the world are free of any notable occurrence. This is not surprising in view of the relatively large proportion of the Earth’s land area that consists of deserts and semiarid areas; these are understandably devoid of modern falls on climatic grounds. Ice-covered polar regions and relatively unbroken, low-lying plains and plateaus also are unfavourable sites of development.

Considered on a global basis, waterfalls tend to occur in three principal kinds of areas: (1) along the margins of high plateaus or the great fractures that dissect them; (2) along fall lines, which mark a zone between resistant crystalline rocks of continental interiors and weaker sedimentary formations of coastal regions; and (3) in high mountain areas, particularly those that were subjected to glaciation in the recent past.

High plateaus. Notable falls along high plateaus include the world’s highest, Angel Falls of the Churún River, Venezuela, with a drop of 979 metres and overall relief of more than 1,100 metres (Figure 6, right); Tugela Falls, issuing from the Great Escarpment, South Africa, which is 948 metres in height; Victoria Falls (108 metres) on the Zimbabwe–Zambia border; and Kalambo Falls (427 metres) on the Tanzania–Zambia border. The volume of flow at Victoria Falls is relatively large, approximately 1,080 cubic metres per second, but Guaira Falls, a series of falls that until their submergence by the waters of

Distributary patterns

Cascades and rapids

The transience of waterfalls

Height versus water discharge

Itaipú Dam in 1982 totaled 114 metres along the Paraná River, Brazil–Paraguay, had the largest known average discharge—13,300 cubic metres per second. During flood stages, however, even this figure is exceeded at some falls along the Orange River and elsewhere. Angel Falls, Iguacu Falls (82 metres), in Brazil, and several others occur along the margins of high plateaus, east of the Andes, between Venezuela and Argentina.

Fall lines. Waterfalls that occur along fall lines are in some cases relatively indistinguishable from plateau examples—the Aughrabies Falls (146 metres), for instance, which occur where the Orange River leaves resistant crystalline rocks of the plateau in southern Africa. The typical fall-line example, however, occurs at the junction of the crystalline rocks of the Appalachian Mountains and the sedimentary coastal plain along the eastern United States. A number of major cities, including Philadelphia, Baltimore, and Washington, D.C., are a geographic consequence of the existence of falls along this line or zone because they present barriers to further inland navigation. In England there is an analogous example with respect to the line of towns including Cambridge that borders the Fens. The most spectacular fall-line waterfalls, however, include Churchill (formerly Grand) Falls, Labrador, Canada (75 metres); Jog Falls (Gersoppa Falls), Karnātaka, India (253 metres [Figure 6, left]); and Paulo Afonso Falls, Brazil (84 metres).

Glaciated mountains. The last category, mountainous and formerly glaciated regions, include such well-known waterfalls as Yosemite Falls, California (739 metres), with a three-section drop; Yellowstone Falls, Wyoming (94 metres [Figure 7, right]), with a two-section drop; Sutherland Falls, South Island, New Zealand (580 metres [Figure 7, left]); and Krimmler Waterfall, Austria (380 metres). Other falls of considerable height or volume of flow occur elsewhere in mountainous and formerly glaciated regions—namely, in the Alps, the Sierra Nevada and northern Rocky Mountains of North America, and South Island, New Zealand. The ice-free parts of Iceland and the fjord (drowned-valley) region of Norway also should be cited. Both areas contain numerous falls by reason of suitable topography and climate. Australia also has a few falls, notably the Wollomombi, in the Great Dividing Range, New South Wales (482 metres).

Types of waterfalls. The several types of waterfalls that occur in nature may be classified according to a variety of schemes. One of the simplest of these is based on prin-

cipal region of occurrence—high plateaus, fall lines, and formerly glaciated mountains, as discussed above. More meaningful, however, is an alternate, threefold classification system that places more emphasis on the specific ways in which geologic and physiographic conditions produce and affect waterfalls. Thus, falls can be categorized as: (1) those attributable to natural discordance of river profiles, whether caused by faulting (vertical movements of the Earth's crust), glaciation, or other processes; (2) those attributable to differential erosion, which occurs whenever weak and resistant rocks are juxtaposed in some way; and (3) those attributable to constructional processes that create barriers and dams, over which water must fall. These three basic types will be discussed in turn.

Falls attributable to discordance of river profile. In one sense, all falls must be attributable to a discordance of river profile by their very definition. This category is here arbitrarily restricted, however, to exclude profile breaks that are caused by differential erosion and constructional processes. Remaining are waterfalls along fault scarps, uplifted plateaus and cliffs, glacial features of several kinds, karst topography—the caves and cave systems produced by solution of carbonate rocks—and falls that result from the issuance of springs from canyon walls high above valley floors.

The enormous rigid plates that make up the outer shell of the Earth continually move relative to one another, resulting in seafloor spreading, continental drift, and mountain building (see PLATE TECTONICS). These large-scale motions cause a buildup of strain within the rocks of the crust at some depth below the surface. Ultimately, the rocks must yield or shift in order to release this strain, and, when they suddenly do so, an earthquake results. Commonly, there will be some visible evidence of this sudden release at the Earth's surface, perhaps manifested by the creation of a cliff or series of cliffs along a line or zone. The sloping surfaces that form the cliff fronts are called fault scarps. The vertical movements that produce fault scarps seldom amount to more than about three metres during an individual earthquake. Repeated faulting along the same line or zone, however, can produce scarps that are thousands of metres in height in relatively brief periods of geologic time. Waterfalls occur where the faults cross established drainage systems. The ultimate height of such falls depends not only on the total height of uplift but also on the rate of downcutting by the affected rivers. Rates of uplift tend to exceed rates of downcutting considerably in those

Relation
of falls
to glacial
features

parts of the world where uplift is ongoing today. Hence, it is normal for high waterfalls to exist due to uplift in many areas. In addition, some plateaus are produced by broader, regional uplifts that are relatively continuous and are not associated with earthquakes. The heights attained are nevertheless comparable after suitable time intervals. Major rift (fracture) systems of continental or subcontinental scale, some sea cliffs, and other features of this nature also are attributable to some form of faulting. All of them provide suitable sites for waterfall development.

The processes of glaciation have served this same end. Mountain ranges that formerly were glaciated contain falls at the outlets of cirques, bowl-shaped depressions in the headwaters of drainage areas that were formed by the accumulation of ice and its erosive action on the underlying bedrock. In addition, waterfalls are most common where hanging valleys occur. Such valleys generally form when glacier ice deeply erodes a main or trunk valley, leaving tributary valleys literally hanging far above the main valley floor. After the glaciers have melted and withdrawn, streams from such tributary valleys must fall in order to join the main valley drainage system below. Hanging valleys also can occur in response to faulting and in some other non-glacial situations: the chalk cliffs of England, for example, where small streams cannot cut downward with sufficient rapidity to keep pace with backwearing of the cliffs by marine erosion.

Other features that may result from glaciation include glacial potholes and glacial steps. The former are thought to originate principally as a result of the plastic flow of ice at the base of a glacier; this permits the gouging of semicylindrical holes in the bedrock beneath the path of flow. The holes or depressions are subsequently enlarged and deepened by meltwater runoff that is heavily laden with gravels, and they have become the sites of modern cascades in many instances.

The steps (or glacial stairway, as this feature is sometimes called) consist of treads and risers on a relatively giant scale that have been produced by the passage of ice over bedrock, particularly when alternating rock properties or joints offer differential resistance to the flow of ice. Again, the establishment of runoff after wastage of the ice has occurred will lead to a series of waterfalls or cascades at the site of each riser in the stairway.

Most spectacular among glacial features, however, are the overdeepened valleys along formerly glaciated coasts, as in Norway. These fjords are intimately associated with falls because the valley walls typically are both high and steep and because hanging valleys are ubiquitous.

Like the potholes mentioned above, the solution of limestones and other carbonate rocks leads to the formation of pits, sinks, caves, and interconnected systems of caverns, which together are termed karst topography. Terrain of this kind commonly contains water in many of the included passages in the form of standing pools, streams, and, where discontinuities of cavern levels occur, waterfalls. There are a few parts of the world where karst topography and its associated drainage are prominent features of the landscape, but, on the whole, falls attributable to cave-forming processes are not numerous (see CONTINENTAL LANDFORMS: *Caves and karst landscape*). Springs that issue from canyon walls high above main valley floors are in the same category. Most of these artesian (free-flowing) systems result from the same type of solution phenomenon along joints and fractures that produce caves in carbonate rocks.

Falls attributable to differential erosion. Rocks differ markedly with regard to their resistance to erosion by running water. Although no quantitative scales to express this difference have been developed, widespread agreement exists on certain generalities. Metamorphic rocks (those that are formed from preexisting rocks under the action of high temperatures and pressures), for example, are commonly more durable than are sedimentary rocks, and great differences can exist even among the latter because of a significant amount of variation in the degree of cementation and kinds of rock structure present in them. Thus, a quartz-rich sandstone whose constituent grains are cemented by silica tends to be much more resistant than a fissile shale, the clay-rich layers of which tend to split and separate. And the blocky character of some carbonate rocks (limestones and dolomites) and extrusive igneous rocks (formed by the cooling of lava flows) tends to enhance their resistance to fluvial erosion, notwithstanding their relatively low resistance to solution.

Regardless of the intrinsic toughness of any rock type, however, lengthy periods of weathering or the presence of intricate fracture patterns will render it easily erodible.

Resistance
of rocks
to erosion

There are, in fact, a veritable legion of factors that influence rock resistance to erosion, and it is for this reason that generalities must be invoked. Suffice it to say that some rocks are weak whereas others are strong and that waterfalls are promoted where these occur in certain geologic arrangements.

There are three such arrangements that are common in nature: (1) horizontal or nearly horizontal strata in which rocks of greater resistance overlie weaker rocks, forming a protective cap rock; (2) inclined strata involving beds or layers of alternating resistance; and (3) various kinds of non-sedimentary rock arrangements in which dikes or veins of hard crystalline rocks are juxtaposed with weaker rocks. In each of these cases the weaker rocks are eroded more readily and more rapidly by running water, and the harder, resistant rocks, as a consequence, stand higher and are "falls makers." In the special case of the cap-rock arrangement, waterfalls migrate upriver because the protective upper layers break off as the weaker supporting

strata are eroded from beneath. Niagara Falls is the most notable example involving sedimentary rocks (a blocky dolomite cap overlies a series of less-resistant shales and sandstones); more commonly, a lava flow caps erodible strata.

Falls attributable to constructional processes. There are four principal constructional processes that can lead to the creation of dams or barriers and, hence, to the formation of waterfalls. These processes are (1) precipitation of calcium carbonate from solution; (2) disruption of drainage by lava flows or the deposition of volcanic ash and other pyroclastic sediments; (3) ice damming and the construction of moraines, or ridgelike sedimentary deposits left at the sites of former glaciers; and (4) the deposition of landslide and avalanche debris.

The first of these, carbonate precipitation, can accumulate to considerable dimensions as spring deposits of travertine or calcareous tufa, often in a series of terraces. Where these ultimately block avenues of normal runoff,

Relation-
ship of
volcanic
activity to
waterfall
develop-
ment

waterfalls result. The water in limestone caves also is rich in calcium carbonate, and where ponds occur in the path of small subterranean streams there is preferential precipitation at the spillage rims. The barriers that are raised are self-perpetuating, can attain heights of about 15 metres under certain circumstances, and have been called rimstone dams and falls.

Volcanic activity, principally in the form of basaltic lava flows, is related to waterfall development in many parts of the world. The flows compose the bulk of such great plateau areas as the Columbia River region of the United States and the Deccan Plateau in India and often serve as cap rock. The association of falls with plateaus in general and with cap-rock arrangements was noted previously, but, in addition, some falls result from drainage diversion and the ponding of streams and rivers by lava dams. This has occurred in some parts of New Zealand, Iceland, and Hawaii and, in general, in regions where volcanic activity is a prominent aspect of the landscape.

Ice dams can produce similar effects. One of the most interesting examples is Dry Falls, a "fossil waterfall" in the Columbia River Plateau, Washington, which formed in late Pleistocene time. A large ice sheet blocked and diverted the then-westward-flowing Columbia River and formed a vast glacial lake. The lake drained to the south when permitted to do so by periodically occurring ice dams, and torrents of water were released during these breakouts. The water flowed through the Grand Coulee channel and eroded a canyon nearly 300 metres deep. Dry Falls occurs along this flow path; it is about 120 metres high and five kilometres wide. The Columbia River has reestablished its path to the sea since the disappearance of the ice sheet, and so the falls are dry today.

The magnitudes of flow that must have occurred during the Pleistocene, however, can be appreciated from data on some of the great glacier outburst floods (*jökulhlaups*) of modern history. The breaching of an ice dam at Grímsvötn, Ice., in 1922, for example, released about 7.1 cubic kilometres of water, and the discharge attained a value of 57,000 cubic metres per second.

There are other depositional features that may pond and dam streams, notably glacial moraines—which attain heights as great as 250 metres in the formerly glaciated valleys of the Alps—and landslides, avalanches, and other downslope movements of earth materials into valleys. The associated falls tend to be rather ephemeral, however, because all such unconsolidated material is cut through relatively swiftly, and smooth stream gradients are reestablished. The damming action of lava flows and glacier ice is far more important in nature; the lava flows consist of more durable material, and ice damming leads to outburst floods and great attendant erosion.

Development of waterfalls. With the passage of time a particular waterfall must either migrate upstream, as in the case of a cap-rock falls, or serve as the locus for general downcutting along the reach of river containing the falls. In either case, the process depends on the height of the falls, the volume of flow, and the nature and arrangement of the rocks involved. Any discussion of waterfall development requires knowledge of these three factors and, more importantly, knowledge of the former locations and configurations of any particular waterfall under consideration. If the changes of location through time are lacking, then rates of waterfall recession are basically indeterminate.

The available data on the recession of the Horseshoe Falls of the Niagara River are little short of astonishing in comparison to the general paucity of such information elsewhere. Instrumental surveys of the configuration and position of Horseshoe Falls were made in 1842, 1875, 1886, 1890, 1905, 1927, and 1950. Still earlier delineations of position were provided by visual observations as long ago as 1678. For this reason, general waterfall development must be considered in terms of the Horseshoe Falls example. It should be noted, however, that the recession rates pertaining to this cap-rock-type falls are not necessarily average rates for all falls of this kind; they certainly do not apply to non-cap-rock falls in crystalline rocks, for example, where much slower rates generally prevail.

The average rate of recession of any falls can be deter-

mined from knowledge of the total upstream distance of migration and the time period during which the migration occurred. In the case of Horseshoe Falls, the total distance involved is about 12 kilometres, and retreat of the falls has been accomplished in approximately 12,500 years, since the disappearance of the most recent ice sheet from the area. The average rate of recession is therefore about one metre per year. The several instrumental surveys, however, suggest that a rate of 1.2 metres per year occurred during the 1842–75 period and two metres per year during the 1875–1905 period.

By way of comparison, the average recession rate for the American Falls, which occur downstream and to one side of Horseshoe Falls because of branching by the Niagara River, is only 0.08 metre per year. And, in a comparable vein, upstream migration of the Gullfoss in Iceland during the last 10,000 years is estimated to have occurred at an average recession rate of 0.25 metre per year. This is, again, a far slower rate of falls recession than has occurred at Horseshoe Falls.

To some extent the various recession rates are related to differential resistance of the rocks to erosion. Indeed, the discrepancy between the 1842–75 and 1875–1905 rates for Horseshoe Falls have been attributed in the past not only to possible surveying errors but also to the relative abundance of joints (fractures) in different parts of the dolomite cap rock. One study of Horseshoe Falls suggests, however, that another factor is of still greater importance—namely, the configuration of the crest of the falls and the relative stability of differing kinds of configurations. (L.K.L./Ed.)

Streamflow and sediment yield

PEAK DISCHARGE AND FLOODING

Rapid variations of water-surface level in river channels through time, in combination with the occurrence from time to time of overbank flow in flat-bottomed valleys, have promoted intensive study of the discharge relationships and the probability characteristics of peak flow. Stage (depth or height of flow) measurements treat water level: discharge measurements require determinations of velocity through the cross section. Although records of stage respond to frequency analysis, the analysis of magnitude and frequency is preferable wherever stage is affected by progressive scour or fill, and also where channels have been artificially embanked or enlarged or both. The velocity determinations needed to calculate discharge range from those obtained with portable Venturi flumes on very small streams, through observations with gaging staff or fixed Venturi flumes on streams of modest size, to soundings with current meters at intervals of width and depth at cross sections of large rivers. Frequent velocity observations on large rivers are impracticable. It is standard practice to establish a rating formula, expressed graphically by a rating curve. Such a curve relates height of water surface to the area of and velocity through the cross section and thus to discharge. Secular changes in rating occur where a stream tends progressively to raise or lower its bed elevation. Short-term changes are common where the bed is mobile and especially where the bed elevation–discharge relation, and thus the stage–discharge relation, differs between the rising and the falling limb of a single peak discharge curve. In such cases the rating curve describes a hysteresis loop. Rating curves for sand-bed streams can include discontinuities, chiefly during rising discharge, that relate to behavioral jumps on the part of the bed.

Floods in hydrology are any peak discharges, regardless of whether or not the valley floor (if present) is inundated. The time–discharge or time–stage characteristics of a given flood peak are graphed in the hydrograph, which tends to assume a set form for a given station in response to a given input of water. The peak flow produced by a single storm is superimposed on the base flow, the water already in the channel and being supplied from the groundwater reservoir. Rise to peak discharge is relatively swift and is absolutely swift in small basins and on torrents where the duration of the momentary peak is also short. On very large streams, by contrast, peak discharge can be sustained

Stage-
discharge
relations

Rates of
waterfall
recession

for lengths of days. Recession from peak discharge is usually exponential. The form of the hydrograph for any one station is affected by characteristics of the channel and the drainage net, as well as by basin geometry, all of which can be taken as permanent in this context.

As noted above, flood-flow prediction that is based on permanent characteristics has hitherto achieved but partial success. Transient influences, also highly and at times overwhelmingly important, include the storage capacity of bedrock and soil, the interrelationships of infiltration, evaporation, and interception and detention (especially by vegetation), plus storm characteristics, which vary widely with respect to amount, duration, intensity, and location of rainfall with respect to the catchment.

Flood-frequency analysis

In the longer term, flood-frequency analysis based on recorded past events can nevertheless supply useful predictions of future probabilities and risks. Flood-frequency analysis deals with the incidence of peak discharges, whereas frequency analysis generally provides the statistical basis of hydraulic geometry. Percentage frequency analysis has been much used in engineering: here, the 1 percent and 90 percent discharges, for instance, are those that are equalled or exceeded 1 and 90 percent of time, respectively. General observations of the flashy character of floods in headwater streams, in contrast to the long durations of flood waves far downstream, combine with analytical studies to suggest, however, that percentage frequency is in some respects an unsuitable measure. Magnitude-frequency analysis, setting discharge against time, is directly applicable in studies of hydraulic geometry and flood-probability forecasting.

Regional graphs of magnitude-frequency can be developed, given adequate records, for floods of any desired frequency or magnitude. Predictions for great magnitudes and low frequencies, however, demand records longer than those usually available. Twelve years of record are needed to define the mean annual flood within 25 percent, with an expectation of correct results for 95 percent of time; and in general, a record should be at least twice as long as the greatest recurrence interval for which magnitude is desired.

Predictions of overbank flow, whether or not affected by artificial works, are relevant to floodplain risk and floodplain management. Notably in the conterminous United States, floodplain zoning is causing risks to be reduced by the withdrawal of installations from the most floodliable portions of floodplains or risks to be totally accepted by occupiers.

Catastrophic events

In the long geomorphic term the transmission of sediment through floodplain storage systems and through stream channels seems to result mainly from the operation of processes of modest magnitude and high frequency. Specifically, analyses suggest that total sediment transport by rivers is normally affected by flows approximating bankfull over durations ranging down from 25 to 1 percent of total time. Infrequent discharges of great magnitude, which can be expected on grounds of the probabilities of precipitation, snowmelt, and streamflow, range widely in destructive effect. Severe flooding is normally accompanied by great loss of life and property damage, the mean annual floods along the Huang Ho themselves affecting some 29,800 square kilometres of floodplain, but geomorphic effects may be minimal, even with very large floods. The approximately 100-year floods of eastern England in the spring of 1947, fed by unusually great and deferred snowmelt, scarcely affected either channels or floodplains. The 1955 floods in Connecticut, fed by rains amounting to 58 centimetres in places, produced only spotty effects of erosion and deposition, even where floodplains were inundated to a depth of six metres. For a given valley, there could be a threshold of inundation, river velocity, and sediment load, beyond which drastic changes occur. This is suggested, for example, by the catastrophic alluviation of valleys in eastern Australia and New Zealand during the last 4,000 or 2,000 years.

Sudden catastrophes in historical and geomorphic records are related to special events, mainly nonrecurrent: the 1841 Indus flood, which destroyed an army; the Gohna Lake flood of 1894 on the Ganges; and the 1925 Gros

Ventre flood in Wyoming, accompanied the breaching of natural landslide barriers. The Lake Issyk-Kul (U.S.S.R.) flood of 1963, which caused widespread erosion and deposition, followed the overtopping of a landslide barrier by waves produced by a mudflow. The Vajont Dam (Italy), although itself holding, was overtopped in 1963 by 91-metre-high waves raised by a landslide: the floods downstream took more than 2,500 lives in 15 minutes. On the Huang Ho the floods of 1887 took an estimated 900,000 lives. In late Pleistocene time the overtopping of an erodible natural dam by the then-existing Lake Bonneville eventually released nearly 1,666 cubic kilometres of water; the maximum discharge of about 280,000 cubic metres per second is comparable to the flow of the Amazon, but velocities were very high, perhaps ranging to 7.6 metres per second. The greatest flood peak so far identified is that of the ice-dammed Lake Missoula in Montana, which, on release, discharged 2,085 cubic kilometres of water at an estimated peak flow of 8,500,000 cubic metres per second. Iceland is notable for glacier bursts, which are nonrecurrent where they result from subglacial eruptions but recurrent where they involve the sudden failure of ice dams, as with Grímsvötn, which periodically releases 8.3 or more cubic kilometres of water in floods that peak at 57,000 cubic metres per second. Deposition by glacier-burst floods is illustrated by Iceland's Sandur plains.

Ice-dam flooding

Peak discharges that close the range between natural floods of great magnitude and low frequency on noncatastrophic streams and natural catastrophic floods of great magnitude and perceptible frequency include stormwater discharges from expanding urban areas. Because of the progressive spread of impermeable catchment and efficient runoff systems, such floods tend to increase both in frequency and in magnitude. (G.H.D./Ed.)

SEDIMENT YIELD AND SEDIMENT LOAD

All of the water that reaches a stream and its tributaries carries sediment eroded from the entire area drained by it. The total amount of erosional debris exported from such a drainage basin is its sediment yield. Sediment yield is generally expressed in two ways: either as a volume or as a weight—*i.e.*, as acre-feet (one-foot depth of material over one acre) or as tons. In order to adjust for the very different sizes of drainage basins, the yield frequently is expressed as a volume or weight per unit area of drainage basin—*e.g.*, as acre-feet per square mile or as tons per square mile or per square kilometre. The conversion between the two forms of expression is made by obtaining an average weight for the sediment and calculating the total weight from the measured volume of sediment. Further, sediment yield is usually measured during a period of years, and the results are thus expressed as an annual average.

The sediment delivered to and transported by a stream is its sediment load. This can be classified into three types, depending on sediment size and the competence of the river. The coarsest sediment, consisting of boulders and cobbles as well as sand, moves on or near the bed of the stream and is the bed load of the river. The finer particles, silts and clays, are carried in suspension by the turbulent action of flowing water; and these fine particles, which are moved long distances at the velocity of the flowing water, constitute the suspended load of the river. The remaining component of the total sediment load is the dissolved load, which is composed of chemical compounds taken into solution by the water moving on or in the soils of the drainage basin. These three types of sediment constitute the total sediment load of the stream and, of course, the sediment yield of the drainage basin.

The sediment load can be measured in different ways. Collection of water samples from a river and measurement of the sediment contained in each unit of water will, when sufficient samples have been taken and the water discharge from the system is known, permit calculation of annual sediment yield. Because sediment in a stream channel is transported in suspension, in solution, and as material rolling or moving very near the bed, the water samples will contain suspended and dissolved load and perhaps some bed load. Much of the bed load, however, cannot be sampled by existing techniques, as it moves too

Measurement of the load

near the bed of a stream. It is fortunate, therefore, that the greatest part of the total sediment load is in the form of suspended load.

When a dam is constructed, the sediment transported by a stream is deposited in the still waters of the reservoir. In this case, both bed load and suspended load are deposited, but the dissolved load eventually moves out with the water released from the reservoir. Frequent, precise surveys of the configuration of the reservoir provide data on the volume of sediment that accumulates in the reservoir (Figure 8). Water samples can be taken to provide data on the dissolved load transported into the reservoir; and when this quantity is added to the measurements of suspended and bed load, a reasonably accurate measure of sediment yield from the drainage basin above the reservoir can be obtained.

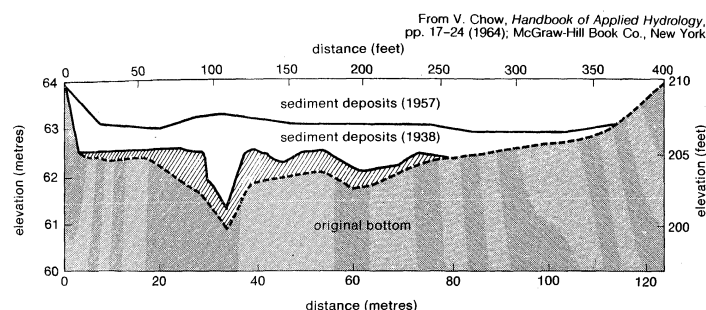

Figure 8: Cross section of sediment deposits, Lake Barcroft, Virginia.

In areas where information on sediment yield is required but the necessary samples have not been taken (perhaps because of the infrequent occurrence of flow in ephemeral streams), estimates of sediment yields may be obtained from measurements of hillslope and channel erosion within the basin or by the evaluation of erosion conditions. Certain characteristics of the drainage basin, such as the average slope of the basin or the number and spacing of drainage channels, may be used to provide an estimate of sediment yield (see below).

All of the techniques utilized to measure sediment yield are subject to considerable error, but data sufficiently accurate for the design of water-regulatory structures can be obtained by sampling or by reconnaissance surveys of the drainage systems.

Sources of sediment and nature of deposition. *Erosion in drainage basins.* The ultimate source of the sediment that is measured as sediment yield is the rock underlying the drainage basins. Until the rock is broken or weathered into fragments of a size that can be transported from the basin, the sediment yield will be low. The diverse mechanisms, both chemical and physical, that produce sediment and soil from rock are termed weathering processes. Depending on type of rock and type of weathering process, the result may be readily transported silts, clays, and sands or less easily transported cobbles and boulders.

Most rocks have been fractured during the vicissitudes of geologic history, thereby permitting penetration of water and roots. Wedging by ice and growing roots produces blocks of rock that are then subject to further disintegration and decomposition by chemical and physical agencies. These rocks, if exposed on a hillslope, move slowly down the slope to the stream channel—the rate of movement depending on slope inclination; density of vegetation; frequency of freeze and thaw events; and the size, shape, and density of the materials involved. In addition, water moving through rocks and soil can dissolve soluble portions of rock or weathering products. This is especially important in limestone regions and in regions of warm, humid climate, where chemical decomposition of rocks is rapid and where the dissolved load of streams is at a maximum.

When sediment eroded from the hillslopes is not delivered directly to a channel, it may accumulate at the base of the slope to form a colluvial deposit. The sediment derived directly from the hillslope may be stored temporarily at the slope base; therefore, sediment once set in motion

does not necessarily move directly through the stream system. It is more likely, in fact, that a given particle of sediment will be stored as colluvium before moving into the stream. Even then, it may be stored as alluvium in the floodplain, bed, or bank of the stream for some time before eventually moving out of the drainage system. Thus there is a steady export of sediment from a drainage basin, but an individual grain of sediment may be deposited and eroded many times before it leaves the system.

The preceding suggests that, over a period of time, the total erosion within a drainage basin is greater than the sediment yield of the system. Proof of this statement is the fact that the quantity of sediment per unit area that leaves a drainage system decreases as the size of the drainage basin increases. This is partly explained by the decrease in stream gradient and basin relief in a downstream direction. That is to say, much sediment is produced in the steeper areas near drainage divides, and sediment production decreases downstream. Moreover, the increasing width of valleys and floodplains downstream and the decreasing gradient of the streams provide an increasing number of opportunities for sediment to be deposited and temporarily stored within the system.

Each of the components of the drainage system—hillslopes and channels—produces sediment. The quantity provided by each, however, will vary during the erosional development of the basin and during changes of the vegetational, climatic, and hydrologic character of the drainage system. Most rivers flow on the upper surface of an alluvial deposit, and considerable sediment is thus stored in most river valleys. During great floods or when floodplain vegetation does not stabilize this sediment, large quantities may be flushed from the system as the channel widens and deepens. At these times, the sediment produced by stream-channel erosion is far greater than that produced by the hillslopes, and sediment yields will be far in excess of rates of hillslope erosion. Such cycles of rapid channel erosion or gullying and subsequent healing and deposition are common in arid and semiarid regions.

Environments of deposition. It is clear that a great range of sediment sizes may be transported by a river. Sediment of small size (e.g., suspended load), when set in motion by erosive agents, may be transported through a river system to the sea, where it may be deposited as a deep-sea clay. Most sedimentary particles, however, have a more eventful journey to their final resting place. (In a geologic context, this may be a temporary resting place; sediment, for example, when it reaches the coast, may be incorporated in a delta at the river mouth or be acted upon by tides, currents, and waves to become a beach deposit.)

If sediment is moved downstream into a progressively more arid environment, the probability of deposition is high. Thousands of metres of alluvial-fan deposits flank the mountains of the western United States, the basin-and-range terrain of Iran and Pakistan, and similar desert regions (see below). In the arid climates of these areas the sediment cannot be moved far, because the transporting medium—water—diminishes in a downstream direction as it infiltrates into the dry alluvium. In extremely arid regions, wind action may be important: the transport of sand-size and smaller sediment by wind may be the only significant mechanism for the transport within and out of some drainage systems in deserts.

The impact of human activity on river flow has come to play a major role in determining the site of sediment deposition. The many dams that have been constructed for flood control, recreation, and power generation hold much of the sediment load of rivers in reservoirs. Furthermore, the contribution of sediment from the small upstream drainage systems has been decreased by the construction of stock-water reservoirs and various erosion-control techniques aimed at retaining both water and sediment in the headwater areas. Diversion of water for irrigation also decreases the supply of water available to transport sediment; and in many cases, the diversion actually moves sediment out of the streams into irrigation canals and back onto the land.

Factors that influence sediment yield. Of greatest concern to the human community are the factors that cause

Factors related to quantity of sediment

Effects of climate on deposition

Effects of weathering and breakdown of rocks

Sediment in storage

rapid rates of erosion and high sediment yields. The quantity and type of sediment moving through a stream channel are intimately related to the geology, topographic character, climate, vegetational type and density, and land use within the drainage basin. The geologic and topographic variables are fixed, but short-term changes in climatic conditions, vegetation, and land use produce abrupt alterations in the intensity of erosion processes and in sediment yields.

The sediment yield from any drainage system is calculated by averaging the data collected over a period of years. It is, therefore, an average of the results of many different hydrologic events. The sediment yield for each storm or flood will vary, depending on the meteorologic character of the storm event and the resulting hydrologic character of the floods. High-intensity storms may produce sediment yields well above the norm, whereas an equal amount of precipitation occurring over a longer period of time may yield relatively little sediment. During short spans of time (days or years), sediment yields may fluctuate greatly because of natural or man-induced accidents (*e.g.*, floods and fires), but over longer periods of time, the average sediment yield will be typical of the geologic and climatic character of a region.

Short-term variations. An example of a short-term change in sediment yield is provided by data on the sediment transported by the Colorado River in Arizona for the years 1926–54 (Figure 9). It is evident that sediment yield varied widely from year to year. It is greatest for years of highest runoff, but for a given amount of runoff, the maximum sediment yield may be twice the minimum sediment yield. These variations reflect the frequency of storms and their duration and intensity during the years of record.

Another interesting aspect of the relation is that in each of the years after 1940 the annual sediment load at the Grand Canyon was 50,000,000 to 100,000,000 tons less than would be expected on the basis of the curve fitted to the data for the period 1926–40 (Figure 9). This major decrease in sediment yield reflects some significant change

in the hydrology of the Colorado River drainage basin. A study of the precipitation patterns for the years 1926–54 suggests that the change in the sediment yield–runoff relation beginning in 1941 is the result of a drought in the southwestern United States. The high-sediment-producing, weak-rock areas of the Colorado plateaus were affected by the drought, but the low-sediment-producing, hard-rock areas of the Rocky Mountains were not. Thus, during the years 1941–50 the amount of water delivered from the main runoff-producing areas in Colorado, Wyoming, and northern Utah was normal. Runoff was much reduced from the high-sediment-producing areas in southern Utah and Arizona, however. The result was essentially normal runoff but greatly reduced sediment yield. From 1950 the drought encompassed the entire Colorado River Basin, and low runoff was recorded for the years 1950, 1951, 1953, and 1954; yet, the proportion of runoff produced by the high-sediment-producing areas remained low, as did the sediment yield.

It can be expected that sediment-yield rates will fluctuate with climatic variations. It is possible, therefore, that an average value of sediment yield obtained for a short period of record may not provide a valid measure of the characteristic sediment yield that would be expected over a longer period of years.

A further example of short-term variation of sediment yield, in this case the result of human activity on the landscape, is provided by data illustrating the change from natural conditions to conditions produced by upland farming and from farming conditions to urban conditions in the Piedmont region of the eastern United States. Sediment yields for forested regions normally are about 37 tons per square kilometre (100 tons per square mile), and this was the case during the early part of the 19th century in this region. A significant increase in sediment yield occurred after 1820 as the land was occupied and farmed. During the period of intense farming, 1850–1930, the sediment yield reached almost 310 tons per square kilometre, but a decrease occurred between 1930 and 1960, as much land was permitted to revert to forest or grazing land. With the onset of construction and real estate development, however, vegetation was destroyed, and large quantities of sediment were eroded. The sediment yields for some small areas reached about 770 tons per square kilometre during urbanization, but with the paving of streets, completion of sewage systems, and planting of lawns, the sediment yields decreased markedly. This example demonstrates very clearly both the long-term and short-term effects of human activity on sediment yield rates.

In any drainage basin, even one not affected unduly by human action, short periods of high sediment yield will alternate with periods of little export of sediment. Prime examples are small drainage basins in arid or semiarid regions, where sediment yield occurs only during and following precipitation. Runoff and sediment yield can be zero between storms but high during and immediately following precipitation.

Even temperature variations have been demonstrated to influence sediment transport and sediment yields. Cooler water is more viscous, and this decreases the fall velocity of sediment particles and enables the stream to transport a larger amount of sediment. Thus, the sediment load of the Colorado River is greater during winter months.

The disastrous effect of fire on sediment yields may be seen in the example of the conditions that followed a major storm and flood in the steep drainage basins of the San Gabriel and San Bernardino mountains of California in 1938. Maximum vegetational cover on these drainage basins is only 65 percent at best, and they are notoriously high sediment producers under the most favourable conditions. Sediment-yield rates were established for several drainage basins that had been subjected to fires as recently as one year before the storm and as long as 15 years before the storm. The results shown (Figure 10) further demonstrate the great effect of vegetational disturbance on sediment yields; for example, a drainage area with only 40 percent of the area burned had a 340 percent increase in sediment yield if the fire occurred one year before the storm. According to the information provided, the burned

Figure 10: Increase in the sediment yields of southern California drainage basins following the 1938 storm. The several curves show the percentage increase in sediment yield in relation to the area burned and the date of burning (see text).

From Anderson and Trobitz, *Journal of Forestry*, vol. 47, p. 347 (1949)

area one year after the fire had a 10 percent vegetational cover. Obviously, a storm immediately following the fire would have had even more disastrous consequences. Three years after the burn, a 35 percent vegetation cover had been established on the burned area, and sediment yields decreased markedly to only twice the yield preceding the fire. After seven years a 45 percent cover had been established on the burned area, and sediment yields were only 50 percent greater than pre-burn values. After 15 years a 55 percent vegetal cover had been established, and sediment yields were almost normal. The decrease in sediment yield with increased plant cover is apparent. It is also obvious that an average value of sediment yield from a burned drainage basin for a 15-year period would be meaningless; with progressive reestablishment of vegetation, sediment-yield rates progressively decrease with time.

Long-term or average sediment yield. It has been estimated that modern sediment loads of the rivers draining to the Atlantic Ocean may be four to five times greater than the prehistoric rates because of the effects of human activity. Even where human impact is large, however, it is possible to recognize several other independent variables that exert a major influence on long-term sediment yield. These variables can be grouped into three main classes: geologic, geomorphic, and climatic-vegetational.

The major geologic influence on sediment yield is through lithology, or the composition and physical properties of rocks and their resistance to weathering and erosion. An easily weathered and eroded shale, siltstone, or poorly cemented sandstone will provide relatively large quantities of sediment, whereas a lava flow, a well-cemented sandstone, or metamorphic and igneous rocks produce negligible quantities of transportable sediment. The highest known sediment yields that have been recorded are produced by the erosion of unconsolidated silts (loess). Loess is readily eroded, especially when the protecting vegetational cover is disturbed, as has happened in the high-sediment-producing areas of western Iowa in the United States and the Huang Ho Basin in China.

Influence of rock type and soils

In general, sediment yield from drainage systems underlain by granitic rocks is from one-fourth to one-half that of drainage basins underlain by sedimentary rocks. There are exceptions. Limestone, which may be a massive rock, is highly resistant to erosion in arid regions, where mechanical or physical weathering is dominant. It is, however, highly susceptible to chemical weathering, especially solution, in humid regions. Most of the earth material removed from a limestone terrain will be transported as dissolved load, with some suspended load derived from erosion of the residual soil.

Another factor of importance in determining erosion rates is the permeability of earth materials. When soils are permeable, much of the water delivered to the surface infiltrates and does not produce surface runoff, thereby inhibiting surface erosion. This condition is characteristic of very sandy soils. On the other hand, when soil materials are of low permeability (e.g., clayey soils), a greater part of the precipitation runs off on the surface, thereby causing greater erosion and higher sediment yields.

Most drainage areas are composed of more than one rock type. In some areas the sedimentary rocks have been folded, and rocks of different resistance are exposed, with hard rocks forming ridges and mountains and weak rocks forming valleys. The erosional development of such a terrain is complex, and the sediment produced by a drainage basin of this kind will reflect the complex geologic situation, the greater part of the sediment yield being derived from the areas underlain by the rocks that are most susceptible to erosion.

The character of the topography of a drainage basin significantly influences the quantity and type of runoff and sediment yield. The steeper a slope, the greater is the gravitational force acting to remove earth materials from the slope. In fact, the rate of movement of rocks and soil particles is directly related to the sine of the angle of slope inclination.

Geomorphic variables

Steep slopes are readily eroded, and it follows that drainage basins with a great range of relief or steep average slope will produce not only higher sediment yields but coarser sediment. The average slope of a drainage basin can be expressed simply as a ratio of basin relief to basin length. Sediment yields increase exponentially with an increase in this relief-length ratio.

Another important characteristic of a drainage system is the spacing and distribution of drainage channels within the drainage basin. This is referred to as the texture of the topography, and it can be described by a ratio of total channel length to drainage area. This ratio is the drainage density of the system. High drainage density indicates numerous, closely spaced channels that provide an escape route for both runoff and its entrained sediment load.

When relief-length ratio (r), expressing the role of gravity, is combined with drainage density (d), expressing the efficiency of the drainage system, this yields a texture-slope product (rd), a parameter that describes the gross morphology of a drainage system. Hence it is not surprising that it is closely related to sediment yield of small drainage basins of similar geology and land use.

The relation between the texture-slope product and sediment yield is such that a high sediment yield can be expected from basins with a large drainage density and steep slope. For basins with similar relief-length ratios, those with the highest drainage density produce the greater quantity of sediment. In general, however, the basins with the highest drainage density are also those with the steepest slope.

Many geomorphic characteristics can be related to sediment yield, but it can be stated with assurance that the steeper and the better drained the system, the greater will be the quantity of sediment produced per unit area.

The relationship may be used to estimate yield from other drainage basins in the region from which these data were obtained. Similar relations may be developed for other regions when sufficient geomorphic data become available.

In all studies, the sediment yield per unit area has been found to decrease as the size of the drainage basin increases. This reflects the previously discussed downstream decrease in gradient and slope and the increase in area

available for temporary storage of sediment. Therefore total sediment yield per unit area invariably is related inversely to drainage area. Several other factors are involved, of course, but the largest drainage basins do not produce the largest quantity of sediment per unit area of drainage basin.

The morphology of a drainage basin is significantly related to sediment yield, but scientists have not yet done sufficient research to enable the prediction of sediment yields from drainage basins in the diverse regions of the world.

Relation-
ship
between
climatic
and vege-
tational
influences

It is difficult to separate the influences of climate and vegetation on erosion and sediment yield, because the primary effect of climate on sediment yield is determined by the interaction between vegetation and runoff. This effect is displayed by the contrast between the dissolved load and the suspended load and bed load transported by streams. Dissolved load increases from a negligible amount in arid regions to 60 tons per square kilometre in humid regions, where chemical weathering and groundwater contribution to river flow is greatest. The dense vegetational cover of humid regions retards runoff and aids infiltration, thereby enhancing the effects of chemical decomposition of the rocks and soils to produce soluble material. The available data also show a sharp increase in sediment yield (suspended and bed load) as precipitation increases from low to moderate amounts. In semiarid regions, however, the increase of vegetation density with increased precipitation exerts a significant influence on erosion; and sediment transport and sediment yield decrease as the climate becomes increasingly humid. This relationship can, of course, be significantly modified by human activities. As the previously mentioned effect of urbanization demonstrates, removal of vegetation from the land in humid regions greatly accelerates erosion, and it may increase sediment yield to the maximum expected in semiarid regions.

Average temperature also affects sediment yields. The hotter the climate, the more water is lost to evapotranspiration, and the critical zone where vegetation becomes dominant consequently shifts to areas of higher precipitation.

The effect of vegetational cover on sediment yield has been discussed previously for areas where fires have destroyed much of the cover and catastrophically increased erosion and export of sediment from the system (Figure 10). Additional data on the effect of vegetation on erosion rates reveal that with a 65 percent plant cover little erosion will occur, but as plant cover decreases erosion increases significantly.

Although erosion increases greatly with a decrease in plant cover between 20 and 15 percent, it cannot continue to increase at this high rate. At some point, the maximum rate of erosion of the soil will be achieved. At some value of low-plant-cover density, the influence of vegetation must be negligible; erosion then will be determined only by soil erodibility.

Although average precipitation significantly influences vegetation type and density and the sediment yield, it has been demonstrated that, for a given quantity of annual precipitation, sediment yields will be greatest where highly seasonal (*e.g.*, monsoonal) climatic conditions prevail. Precipitation, when concentrated during a few months of the year, produces large quantities of sediment because of the higher intensity of the precipitation events and the long dry season when vegetational cover is severely weakened by drought.

Climate also plays a role in determining the type of sediment produced by a drainage basin. A study of the type of sediment deposited on the inner continental shelf reveals that the type of sediment (mud, sand, or gravel) is indeed influenced by climate. Mud, for example, is most abundant off shores of high temperature and rainfall, where chemical weathering is important. Gravel is common off areas of both low temperature and rainfall, where mechanical weathering is dominant. Sand is found everywhere, but it is most abundant in areas of moderate climate and in arid areas. Average temperature also may be important where the annual temperature is below the freezing point.

type

Rivers as agents of landscape evolution

Every landform at the Earth's surface reflects a particular accommodation between properties of the underlying geologic materials, the type of processes affecting those materials, and the amount of time the processes have been operating. Because landforms are the building blocks of regional landscapes, the character of the local surroundings is ultimately controlled by those factors of geology, process, and time—a conclusion reached in the late 19th century by the noted American geologist and geographer William Morris Davis. In some regions, severe climatic controls cause a particular process agent to become pre-eminent. Deserts, for example, are often subjected to severe wind action, and the resulting landscape consists of landforms that reflect the dominance of erosional or depositional processes accomplished by the wind. Other landscapes may be related to processes operating beneath the surface. Regions such as Japan or the Cascade Range in the northwestern part of the United States clearly have major topographic components that were produced by repeated volcanic activity. Nevertheless, rivers are by far the most important agents in molding landscapes because their ubiquity ensures that no region of the Earth can be totally devoid of landforms developed by fluvial processes.

Rivers are much more than sluiceways that simply transport water and sediment. They also change a nondescript geologic setting into distinct topographic forms. This happens primarily because movement of sediment-laden water is capable of pronounced erosion, and when transporting energy decreases, landforms are created by the deposition of fluvial sediment. Some fluvial features are entirely erosional, and the form is clearly unrelated to the transportation and deposition of sediment. Other features may be entirely depositional. In these cases, topography is constructed of sediment that buries some underlying surface that existed prior to the introduction of the covering sediment. Realistically, many fluvial features result from some combination of both erosion and deposition, and the pure situations probably represent end members of a continuum of fluvial forms.

VALLEYS AND CANYONS

River valleys constitute a major portion of the natural surroundings. In rare cases, spectacular valleys are created by tectonic activity. The Jordan River and the Dead Sea, for example, occupy a valley that developed as a fault-bounded trough known as a rift valley. The distinct property of these and other tectonically controlled valleys is that the low topographic zone (valley) existed before the river. Notwithstanding tectonic exceptions, the overwhelming majority of valleys, including canyons and gorges, share a common genetic bond in that their characteristics are the result of river erosion—*i.e.*, rivers create the valleys in which they flow. In most cases, erosion was accomplished by the same river that occupies the valley bottom, although sometimes rivers are diverted from one valley into another by a process known as stream piracy, or stream capture. Piracy of a large river into another valley often creates a situation where the original expansive valley is later occupied by a river that is too small to have created such a large valley. The opposite case also may occur. The implication here is that valley size is directly related to river size, an observation that generally holds true. Exceptions to this rule arise because of capture events during the evolution of a valley and because valley morphology is strongly influenced by variations in the bedrock into which the valley is carved.

A genuine bedrock valley is usually covered by valley-fill deposits that obscure the actual configuration of the valley floor. Therefore, little is known about valley morphology unless drill holes or geophysical techniques are employed to document the buried bedrock-alluvium contact. Where information is available, it suggests that the deepest part of most valleys is not directly beneath the river. Commonly, the influx of load at a tributary junction forces the river to the opposite side of the valley, a phenomenon demonstrated clearly in the upper Mississippi River Valley between St. Louis, Mo., and St. Paul, Minn.

The key
role of
rivers in
molding
landscapes

Stream
piracy

Where a valley is devoid of thick deposits and is completely occupied by a river, the bedrock valley floor often develops an asymmetrical configuration such that the deepest part of the valley occurs on the inside of bends. This general rule is not inviolate because the position of incision depends on the amount of load entrained by the river. When sediment load is totally entrained and velocity is high, entrenchment will most likely occur on the inside of the bend. If deposition occurs or sediment cannot be entrained, however, incision will normally be on the outside of the bend. In straight reaches the deepest part of the valley floor is normally associated with an inner channel cut into bedrock. Its position is determined by where the river was at the time that it flowed at the level of the valley floor. Inner channels form as the culmination of a progressive change in erosional features during the initial phase of incision. Scour features gradually coalesce until a distinct channel appears that is able to contain the entire river flow. Inner channels are rarely seen except when exposed during excavation associated with dam construction. Where observed, such channels commonly have a narrow, deep gorgelike shape. For example, at the site of the Prineville Dam in the state of Oregon, the inner channel averages 21 metres wide and as much as 18 metres deep.

Initial stage
of valley
develop-
ment

Valley evolution. The ultimate form assumed by any valley reflects events that occurred during its developmental history and the characteristics of the underlying geology. During initial valley development in areas well above regional baselevel, valley relief tends to increase as rivers expend most of their energy in vertical entrenchment. Valleys are generally narrow and deep, especially in areas where they are cut into unfractured rocks with lithologic properties that resist erosion (most igneous rocks, well-indurated sedimentary rocks such as quartzites, and high-rank, silica-rich metamorphic rocks). Abrupt changes in river and valley bottom gradients, such as knickpoints and waterfalls, are common in the initial developmental phase. As downcutting continues, however, rivers gradually smooth out the longitudinal profile of the valley floor. Eventually most, if not all, waterfalls are eliminated, and rivers reach an elevation close to their baselevel (see above). In this condition, more energy is expended laterally than vertically, and a river progressively broadens its valley floor. As a result, most river valleys change over time from narrow forms to broader ones, the shape at any time being dependent on baselevel, rock type, and rock structures.

In areas where pronounced macrostructures such as major folds or faults exist in the geologic framework, the position and character of valleys are controlled by those structures. For example, the folds in the Appalachian Mountains in the eastern United States exert a very strong control on the orientation and form of many valleys developed in the region.

Rejuvena-
tion

Formation of canyons and gorges. The most spectacular valley forms are canyons and gorges that result from accelerated entrenchment prompted by recent tectonic activity, especially vertical uplift. Canyons and gorges are still in the initial phase of valley development. They range in size from narrow slits in resistant bedrock to enormous trenches (Figure 11). Where underlying bedrock is composed of flat-lying sedimentary rocks, regional uplift creates high-standing plateaus and simultaneously reinvigorates the erosive power of existing rivers, a phenomenon known as rejuvenation. Vertical entrenchment produces different valley styles depending on the size of the river and the magnitude and rate of uplift. The Grand Canyon of the Colorado River, located in the southwestern United States and formed in response to uplift of the Colorado Plateau, has entrenched about 1,800 metres and widened its walls six to 29 kilometres during the past 10,000,000 years. The Grand Canyon is only one of many spectacular canyons that developed in response to uplift of the Colorado Plateau. Uplift of the Allegheny Plateau in the eastern United States has led to the creation of the narrow, deep valleys that are so prominent in West Virginia and western Pennsylvania.

Canyons and gorges frequently develop across the trends

Figure 11: Canyon of the Yellowstone River in Yellowstone National Park, northwestern Wyoming.

of underlying macrostructures. In normal situations, valleys should follow the orientation of the major folds and faults; however, the geologic setting prior to uplift and the processes associated with tectonic activity permit the development of transverse canyons. Transverse canyons, gorges, or water gaps are most easily explained in terms of accelerated headward erosion of rivers along faults cutting across the trend of resistant ridges. In such cases, the fault zone allows rivers to preferentially expand through an already existing ridge of resistant rocks, thereby creating a canyon.

Most transverse canyons, however, are not associated with faults. When faults are absent, transverse canyons are usually interpreted as developing in one of two ways. First, valleys may have been eroded into the landscape before the tectonic features (folds and faults) were developed. Such macrostructures rise across the trend of these valleys, and if the rate of river downcutting can keep pace with the rate at which the structures rise, gorges or canyons will be developed transverse to the structural trend. Because the valleys are older than the tectonic displacement, they are called antecedent. Antecedent canyons have been identified in the Alps, the Himalayas, the Andes, the Pacific coastal ranges of the United States, and every other region of the world that has experienced recent or ongoing tectonism. Second, complexly folded and faulted terranes are sometimes buried by a variable thickness of younger sediment. Drainage patterns develop on the sedimentary cover in a manner similar to those formed in any basin where there is no structural control. If the region is vertically uplifted, the rejuvenated rivers begin to entrench and will eventually be let down across the trends of resistant rocks in the underlying complex of folds and faults. Canyons and their formative rivers following this evolutionary path are said to be superimposed. The concept of superimposition was first used to explain water gaps in the Appalachians, but superimposition has since been employed as a model for drainage evolution in most areas of the world that have experienced uplift during the Cenozoic Era (the past 65,000,000 years).

In light of the above, it is well to note that detailed studies of physiography are indeed rare in mountain belts where the initial topography created by deformation is

Concept of
superimpo-
sition

still preserved. One area that has been investigated is the Zagros Mountain system near the borderlands of Iraq and Iran from eastern Turkey to the Gulf of Oman. In this region, none of the accepted models for the creation of transverse canyons is totally acceptable, even though all of them may be involved to a certain degree. Instead, it seems likely that drainage development associated with normal processes of denudation can produce canyons transverse to a fold belt (given some heterogeneity in the geologic framework) without requiring some unique preexisting condition in the system.

FLOODPLAINS

Floodplains are perhaps the most common of fluvial features in that they are usually found along every major river and in most large tributary valleys. Floodplains can be defined topographically as relatively flat surfaces that stand adjacent to river channels and occupy much of the area constituting valley bottoms. The surface of a floodplain is underlain by alluvium deposited by the associated river and is partially or totally inundated during periods of flooding. Thus, a floodplain is not only constructed by but also serves as an integral part of the modern fluvial system, indicating that the surface and alluvium must be related to the activity of the present river.

The hydrologic role of floodplains

The above definition suggests that, in addition to being a distinct geomorphic feature, a floodplain has a significant hydrologic role. A floodplain directly influences the magnitude of peak discharge in the downstream reaches of a river during episodes of flooding. In extreme precipitation events, runoff from the watershed enters the trunk river faster than it can be removed from the system. Eventually water overtops the channel banks and is stored on the floodplain surface until the flood crest passes a given locality farther downstream. As a consequence, the flood crest on a major river would be significantly greater if its floodplain did not store water long enough to prevent it from becoming part of the downstream peak discharge. The capacity of a floodplain system to store water can be enormous. The volume of water stored during the 1937 flood of the Ohio River in the east-central United States, for example, was roughly 2.3 times the volume of Lake Mead, the largest artificial reservoir in North America. The natural storage in the Ohio River watershed during this particular event represented approximately 57 percent of the direct runoff.

Because a floodplain is so intimately related to floods, it also can be defined in terms of the water level attained during some particular flow condition of a river. In that sense a floodplain is commonly recognized as the surface corresponding to the bank-full stage of a river—i.e., the water level at which the channel is completely filled. Numerous studies have shown that the average recurrence interval of the bank-full stage is 1.5 years, though this value might vary from river to river. Nonetheless, this suggests that most floodplain surfaces will be covered by water twice every three years. It should be noted, however, that the water level having a recurrence interval of 1.5 years will cover only a portion of the relatively flat valley bottom surface that was defined as the topographic floodplain. Clearly parts of the topographic floodplain will be inundated only during river stages that are considerably higher than bankfull and occur less frequently. Thus, it seems that the definition of a hydrologic floodplain is different from that of the topographic floodplain, and how one ultimately studies a floodplain surface depends on which point of view concerning the feature is considered of greatest significance.

Floodplain deposits, origins, and features. Although valley-bottom deposits result from processes operating in diverse sub-environments, including valley-side sheetwash, the most important deposits in the floodplain framework are those developed by processes that function in and near the river channel. These deposits are normally referred to as (1) lateral accretion deposits, which develop within the channel itself as the river migrates back and forth across the valley bottom, and (2) vertical accretion deposits, which accumulate on the floodplain surface when the river overflows its channel banks.

In any valley where the river tends to meander, maximum erosion will occur on the outside bank just downstream from the axis of the meander bend. Detailed studies have shown, however, that deposition occurs simultaneously on the inside of the bend, the volume of deposition being essentially equal to the volume of bank erosion. Thus, a meandering river can shift its position laterally during any interval of time without changing its channel shape or size. Deposition on the inside of the meander bend creates a channel feature known as a point bar (see above *River channel patterns*), which represents the most common type of lateral accretion. Over a period of years point bars expand laterally as the opposite bank is continually eroded backward. The bars progressively spread across the valley bottom, usually as a thin sheet of sand or gravel containing layers that dip into the channel bottom. Point bars tend to increase in height until they reach the level of older parts of the floodplain surface, and the maximum thickness of laterally accreted deposits is controlled by how deeply a river can scour its bottom during recurrent floods. A general rule of thumb is that river channels are probably scoured to a depth 1.75 to two times the depth of flow attained during a flood. Because bank-full depth increases in the downstream direction, the thickness of lateral accretion deposits should increase gradually down the valley.

Lateral accretion deposits

Vertical accretion (also called overbank deposition) occurs when rivers leave their channel confines during periodic flooding and deposit sediment on top of the floodplain surface. The floodplain, therefore, increases in elevation during a flood event. Overbank deposition is usually minor during any given flood event. Table 3 shows measured increments of vertical accretion of floodplain surfaces during a few major floods in the United States. The insignificant deposition reflects the documented phenomenon that maximum concentration of suspended load occurs during the rising phase of any flood. Thus, much of the potential overbank sediment is removed from the system before a river rises to bank-full stage.

Vertical accretion deposits

Table 3: Increment Rates of Overbank Deposition in Major Floods

river basin	flood	average thickness of deposition (metres)

Source: Based on M.G. Wolman and L.B. Leopold, "River Flood Plains: Some Observations on Their Formation," U.S. Geological Survey professional paper no. 282-C, 1957

Because lateral and vertical accretionary processes occur during the same time interval, alluvium beneath a floodplain surface usually consists of both type of deposits. The two types often differ in their particle-size characteristics, with lateral accretion deposits having larger grain sizes. These textural differences, however, are not always present. In fact, suspended-load rivers that transport mostly silt and clay develop point bars composed of fine-grained sediment. Conversely, mixed-load rivers with cohesive banks may deposit sand and gravel on a floodplain surface as vertical accretion deposits.

Floodplains also are developed by braided rivers, but the fluvial processes are more dynamic and less regular. Bars and bank erosion, for example, are not confined to one particular side of the channel, and the river often changes its position without laterally eroding the intervening material. Channels and islands associated with the braided-stream pattern become abandoned, and these eventually coalesce into a continuous floodplain surface when old channels become filled with overbank sediment. The result is that floodplain sediments in a braided system are often irregular in thickness, and recognition of the true floodplain sequence may be complicated because braided streams are often associated with long-term valley aggradation. In this case, the total deposit might appear to be very thick, but the actual floodplain sediment relates only to the present river hydrology. The true floodplain

deposit, therefore, is merely a thin cap on top of a thick, continuous valley fill.

Meander scrolls

Topography developed on a floodplain surface is directly related to depositional and erosional processes. The dominant feature of lateral accretion, a point bar, is subjected to erosion during high discharge when small channels called chutes are eroded across the back portion of the point bar. As the river shifts laterally and chutes continue to form, point bars are molded into alternating ridges and swales that characterize a distinct topography known as meander scrolls. As the river changes its position, meander-scroll topography becomes preserved as part of the floodplain surface itself. Overbank processes also create microtopography. The latter includes natural levees, which are elongate narrow ridges that form adjacent to channels when the largest particles of the suspended load are deposited as soon as the river leaves the confines of its channel. Natural levees build vertically faster than the area away from the channel, which is known as a backswamp. For example, during the 1973 flood on the Mississippi River, 53 centimetres of sediment were deposited on natural levees, while only 1.1 centimetres accumulated in the backswamp area. The backswamp area of a floodplain is usually much more regular, and its flatness is disrupted only by oxbow channels (abandoned river channels) or by ridgelike deposits known as splay deposits that have broken through natural levees and spread onto the backswamp surface. Oxbows, or oxbow lakes, gradually fill in with silts and clays during normal overbank deposition, leaving that surface more regular than might be expected.

Primacy of lateral river migration

Time and the floodplain system. The variety of floodplain deposits and features raises the question as to which process, lateral river migration or overbank flow, is the most important in floodplain development. There is probably no universal answer to this question, but rates of the depositional processes suggest that most floodplains should result primarily from the processes and deposition associated with lateral migration. Assuming that vertical accretion proceeds according to the increments shown in Table 3, the level of a floodplain constructed entirely by overbank deposition should rise at a progressively decreasing rate. This follows because as the floodplain surface is elevated relative to the channel floor, the river stage needed to overtop the banks is also increasing. The floodplain surface, therefore, is inundated less frequently, and the growth rate necessarily decreases. Indeed, studies have shown that the initial phase of floodplain elevation by vertical accretion is quite rapid because flooding occurs frequently. It is generally accepted that 80 to 90 percent of floodplain construction by vertical accretion would take place in the first 50 years of the process. A three-metre thick overbank deposit would probably take several thousand years to accumulate.

Given the above, it seems certain that the total thickness of vertically accumulated sediment will depend primarily on the rate at which the river migrates laterally. In fact, the total thickness of overbank deposition will be controlled by the amount of time it takes a river to migrate across the entire width of the valley. For example, if a floodplain is one kilometre wide and the river shifts laterally at a rate of two metres a year, it will take approximately 500 years for the river to migrate completely across the valley bottom. At any given point in the valley bottom, several metres of overbank sediment may accumulate in that 500-year interval, but the entire deposit will be reworked by lateral erosion when the river once again reoccupies that particular position. Thus the lateral migration rate becomes a limiting factor on the thickness of vertical accretion deposits. Table 4 provides a small sample of lateral migration rates in alluvial rivers of various sizes. Given the rapidity of lateral migration shown in these rivers, it is doubtful that the minor rates of vertical accretion shown in Table 3 could create floodplain surfaces that are predominantly formed by overbank deposition. This conclusion, however, cannot be considered as an inviolate rule. Many rivers have extremely slow rates of lateral migration when geologic conditions prevent bank erosion. In these cases, vertical accretion may be the dominant process of floodplain development.

RIVER TERRACES

Terraces are flat surfaces preserved in valleys that represent floodplains developed when the river flowed at a higher elevation than its present channel (Figure 12). A terrace consists of two distinct topographic components: (1) a tread, which is the flat surface of the former floodplain, and (2) a scarp, which is the steep slope that connects the tread to any surface standing lower in the valley. Terraces are commonly used to reconstruct the history of a river valley. Because the presence of a terrace scarp requires river downcutting, some significant change in controlling factors must have occurred between the time that the tread formed and the time that the scarp was produced. Usually the phase of trenching begins as a response to climatic change, tectonics (movement and deformation of the crust), or baselevel lowering. Like most floodplains, abandoned or active, the surface of the tread is normally underlain by alluvium deposited by the river. Strictly speaking, however, these deposits are not part of the terrace because the term refers only to the topographic form.

Treads and scarps

The extent to which a terrace is preserved in a valley usually depends on the age of the surface. Old terraces are those that were formed when the river flowed at very high levels above the present-day river channel, while terraces of even greater age are those usually cut into widely separated, isolated segments. In contrast, very young terraces may be essentially continuous along the entire length of the trunk valley, being dissected only where tributary streams emerge from the valley sides. These young terraces may be close in elevation to the modern floodplain, and the two surfaces may be difficult to distinguish. This difficulty emphasizes the importance of how a floodplain and terrace are defined. Presumably the surface of a terrace is no longer related to the modern hydrology in terms of frequency and magnitude of flow events. Thus, any flat surface standing above the level inundated by a flow having a recurrence interval of 1.5 years is by definition a terrace. The complication arises, however, because some low terraces may be covered by floodwater during events of higher magnitude and lower frequency. These

Classi-
fication
of river
terraces

terrace surfaces are inundated by the modern hydrologic system but less frequently than the definition of a hydrologic floodplain would allow. In some cases, a low terrace may be underlain by sediment that has been continuously deposited for thousands of years during infrequent large floods.

Terraces are most commonly classified on the basis of topographic relationships between their segments. Where terrace treads stand at the same elevation on both sides of the valley, they are called paired terraces. The surfaces of the paired relationship are presumed to be equivalent in age and part of the same abandoned floodplain. Where terrace levels are different across the valley, they are said to be unpaired terraces. In most cases the staggered elevations in these systems were formed when the river eroded both laterally and vertically during the phase of degradation. Levels across the valley, therefore, are not precisely the same age but differ by the amount of time needed for the river to cross from one side of the valley to the other. Actually, the topographic classification is purely descriptive and is not intended to be used as a method for determining terrace origin. A more useful classification provides a genetic connotation by categorizing terraces as either erosional or depositional. Erosional terraces are those in which the tread (abandoned floodplain) has been formed primarily by lateral erosion under the conditions of a constant baselevel. Where erosion cuts across bedrock, the terms bench, strath, or rock-cut terrace are employed. The terms fill-cut or fillstrath are used to indicate that the lateral erosion has occurred across unconsolidated debris. Depositional terraces are those in which the tread represents the upper surface of a valley fill.

Rock-cut terraces and depositional terraces can be distinguished by certain properties that reflect their mode of origin. Rock-cut surfaces are usually capped by a uniformly thin layer of alluvium, the total thickness of which is determined by the depth of scour of the river that formed the terrace tread. In addition, the surface eroded across the bedrock or older alluvium is remarkably flat and essentially mirrors the configuration of the tread. In contrast, alluvium beneath the tread of a depositional terrace can be extremely variable in thickness and usually exceeds any reasonable scouring depth of the associated river; moreover, the eroded surface in the bedrock beneath the fill can be very irregular even though the surface of the terrace tread is flat. The most difficult terrace to distinguish by these criteria are erosional terraces that are cut across a thick, unconsolidated valley fill.

Depo-
sitional
terraces

Origin of river terraces. The treads of river terraces are formed by processes analogous to those that produce floodplains. In depositional terraces, however, the origin of the now abandoned floodplain is much less significant than the long-term episode of valley filling that preceded the final embellishment of the tread. The thickness of

valley-fill deposits is much greater than anything that could be produced by vertical accretion on a floodplain surface. In fact, most of the valley fill is composed of channel deposits rather than floodplain deposits. Thus, the sediment beneath a depositional terrace reflects a continuously rising valley floor. The tread represents the highest level attained by the valley floor as it rose during this episode of aggradation, and the upper skim of the deposit is that affected by processes of floodplain origin. What caused the extended period of valley filling is thus the important aspect of depositional terraces rather than the processes that developed the final character of the tread.

Valley filling that creates the underpinning of a depositional terrace occurs when the amount of sediment produced in a basin over an extended period of time is greater than the amount that the river system can remove from the basin. Usually this phenomenon is produced by climate change, influx of glacial outwash, uplift in source areas, or rises in baselevel that trigger deposition in the lower portions of the basin. Development of the actual terrace requires an interval subsequent to valley filling during which the river entrenches into the fill. Many of the same factors that trigger valley filling are those which, oppositely impressed, initiate the episode of entrenchment.

The relationship between glaciation and depositional terraces constitutes the cornerstone of reconstructing geomorphic history in valleys that have been glaciated. The balance between load and discharge that ultimately determines whether a river will deposit or erode is severely altered during glacial episodes. An enormous volume of coarse-grained bed load is carried by an active glacier and released at the glacial margin. This influx of sediment simply overwhelms the downstream fluvial system, even though meltwater produced near the ice margin provides greater than normal transporting power to a river emerging from the glacier. As a result, valley reaches downstream from the ice margin begin to fill with coarse debris (outwash), which cannot be transported on the channel gradient that existed prior to the glacial event (Figure 13). Deposition ensues, and the valley aggrades until the gradient, load, and discharge conditions are modified enough to allow transport of the entire load or to initiate river entrenchment into the fill.

Valley fills composed of outwash and the depositional terraces that result from later entrenchment are closely associated with moraines (ridges composed of rock debris deposited directly by ice) developed simultaneously at the ice margin. Characteristically the gradient on the terrace surface increases drastically near the moraine, and outwash beneath the terrace tread thickens significantly and becomes notably more coarse-grained. The terrace and its associated alluvium end at the moraine, being totally absent up the valley from the morainal position. This allows the location of an ice margin to be determined as the

Figure 13: Meltwater and outwash coming from the Straightaway Glacier, Alaska Range, near Mount McKinley. The dark mass in the centre is the stagnant glacial margin darkened by load. The outwash is deposited by the braided river that emerges from beneath the ice.

D.F. Ritter

upstream extremity of an outwash terrace even if the associated moraine has been removed by subsequent erosion.

In unglaciated river systems, valley fills are most commonly associated with climatic changes, tectonics, or rising sea levels. Climatically produced valley aggradation is controlled by very complex interrelationships between precipitation, vegetation, and the amount of sediment yielded from basin slopes. Every climatic regime has a particular combination of precipitation and vegetation type and density that will produce a maximum value of sediment yield. The effect of a particular climate change can increase or decrease sediment yield in a basin, depending on what conditions existed prior to the climate change with respect to the values that would produce the maximum yield.

Erosional
terraces

In contrast to depositional terraces, erosional terraces are specifically related to the processes of floodplain development. Erosional terraces are those in which lateral river migration and lateral accretion are the dominant processes in constructing the floodplain surface that subsequently becomes the terrace tread. Most of the terrace surface is underlain by point bar deposits. These deposits are usually thin and maintain a constant thickness of sediment that rests on a flat surface eroded across the underlying bedrock or unconsolidated debris. The thickness of the point bar deposits is controlled by the depth to which the formative river was able to scour during the formation of the floodplain. Any thickness greater than the depth of scour indicates that deposits underlying the tread represent a valley fill (depositional terrace) rather than an erosional terrace. Rock-cut terraces were first and best described in the Big Horn Basin of Wyoming, although some of the terraces in that area may be depositional in origin.

Physical
correlation
of terrace
surfaces

Terraces and geomorphic history. The use of terraces to determine regional geomorphic history requires careful field study involving correlation of surfaces within a valley or between valleys. The process is not easy, because each terrace sequence must be examined according to its own climatic, tectonic, and geologic setting. Terraces that have been dissected into segments often have only isolated remnants of the original surface. These remnants are commonly separated by considerable distances, often many kilometres. Reconstruction of the original terrace surface requires that the isolated remnants be correctly correlated along the length of the valley, and every method used in this procedure has fundamental assumptions that may or may not be valid. Furthermore, errors in physical correlation of surfaces lead to faulty interpretation of valley history. This problem is exacerbated because fluvial mechanics may be out of phase in different parts of a valley or from one valley to its adjacent neighbour. For

example, pronounced filling by outwash deposition (discussed above) may be occurring in the upper reaches of a major valley such as the Mississippi during the maximum of a glacial stage. At the same time, however, near the Gulf of Mexico, the lower reaches of the Mississippi River would be actively entrenching because baselevel (sea level) is drastically lowered during glacial periods when storage of ice on the continents upsets the balance in the hydrologic cycle. Deposition and entrenchment involved in terrace formation is clearly not synchronous along the entire length of such a river system.

In addition, it is now known that more than one terrace can result during a period of entrenchment. This indicates that the downcutting that presumably results during a change in climate or some other controlling factor may not be a continuous unidirectional event. Instead, the response to that change is complex. It often involves pauses in vertical entrenchment during which the river may form erosional terraces by lateral planation or depositional terraces by short intervals of valley alluviation. The complicating factor with regard to valley history is that multiple terraces may be formed during an adjustment to one equilibrium-disrupting change in factors that control fluvial mechanics.

ALLUVIAL FANS

Alluvial fans are depositional features formed at one end of an erosional-depositional system in which sediment is transferred from one part of a watershed to another. Erosion is dominant in the upper part of the watershed, and deposition occurs at its lower reaches where sediment is free to accumulate without being confined within a river valley. The two areas are linked by a single trunk river. Fans are best developed where erosion occurs in a mountain area and sediment for the fan is placed in an adjacent basin. A fan is best described topographically as a segment of a cone that radiates away from a single point source. The apex of the cone stands where the trunk river emerges from the confines of the upland area. It is possible, however, that the point source can shift to a position well down the original fan surface. This occurs when the trunk stream entrenches the fan surface, and the mountain-bred flow, still confined in the channel cut into the fan, eventually emerges at a location far removed from the mountain front. The location where the stream emerges onto the fan surface then becomes the point source for a still younger fan segment. Fans also expand upward and laterally. In many cases, adjacent fans merge at their lateral extremities, and the individual cone or fan shape becomes obliterated. Widespread coalescing of

Structure

fans produces a rather nondescript topography that covers an entire piedmont area (stretch of land along the base of mountains) and is commonly referred to as a bajada, alluvial plain, or alluvial slope.

Alluvial fans have been studied in greatest detail in areas of arid or semiarid climate, where they tend to be larger and better preserved. This is especially true where considerable relief exists between the erosional part of the basin and the zone of deposition. Fans in this particular climatic setting have been described in various parts of the world, including the western United States, Afghanistan, Pakistan, Peru, Central Asia, and many other semiarid regions where mountains exist adjacent to well-defined basins. The dominance of fans in arid and semiarid regions does not mean that fans are absent in other climatic zones. On the contrary, fans can develop in almost any climatic zone where the physiographic controls are similar. For example, fans have been identified in Canada, Sweden, Japan, Alaska, and very high mountain areas such as the Alps and Himalayas. The one common factor that links these fans together, regardless of their climatic setting, is the similar plan-view geometry. Other characteristics, such as morphology and depositional processes, may be significantly different, however. Table 5 shows the different characteristics of fans that have developed under a variety of climatic conditions. The widespread distribution of fans has led to the characterization of these features as being one of two types—either dry or wet. Dry fans are those that seem to form under conditions of ephemeral flow, while wet fans are those that are created by streams that flow constantly. This classification suggests that fan type is climatically controlled, because ephemeral flow is normally associated with the spasmodic rainfall typical of arid climates, and perennial streamflow is more dominant in humid climates.

Size, morphology, and surface characteristics. The size of an alluvial fan seems to be related to many factors, such as the physiography and geology of the source area and the regional climate. There appears to be no lower limit to the size of fans as the feature may appear on a microscale in almost any environment. It is known from studies in various parts of the world that a large number of modern-day fans have a radius from 1.5 to 10 kilometres. Some fans have a radius as large as 20 kilometres, but these are rare because fans of that size tend to merge with their neighbours, and limited space in depositional basins often prevents free expansion. It is now firmly established that the area of a dry fan seems to be closely related to the area of the basin supplying the fan sediment. For example, in the western part of the United States, area of the fan and source basin area are related by a simple power function $A_f = cA_d^n$, where A_f is the area of the fan and A_d is the

area of the drainage basin. The value of the exponent n is reasonably constant for fans in California and Nevada, with a value of approximately 0.9 when the measurements are made in square miles. The coefficient c in the equation, however, varies widely and reflects the effect of other geomorphic factors on fan size. The most important of these factors are climate, lithology of source rock, tectonics, and the space available for fan growth. Fans studied in Fresno County, Calif., for example, showed that for a given drainage basin area fans derived from basins underlain by mudstones and shale are almost twice as large as those that receive sediment from basins underlain by sandstone. In basins underlain by different rocks, the value of n was approximately the same, but the effect of particle size was seen clearly in the value of the coefficient c , which varied from 0.96 for sandstone basins to 2.1 in mudstone drainage basins. Presumably basins underlain by fine-grained sediments are much more erodible and produce a much greater sediment load.

Fans are, by the very nature of their semi-conical shape, convex upward across the fan surface. The longitudinal slope of a fan usually decreases from the apex to the toe even though its value at any particular location depends on the load-discharge characteristics of the fluvial system. Near the mountain front in the apical area, slopes on fans are commonly very steep, though they probably never exceed 10° . In their distal margins near the toe, gradients may be as low as two metres per kilometre ($<1^\circ$). The steepest gradients are often associated with coarse-grained loads, high sediment production, and transport processes other than normal streamflow. These same factors may often counteract one another within any given region. The afore-mentioned fans derived from basins underlain by the mudstones are much steeper than fans of the same size related to sandstone basins. The small particle size would presumably create a more gentle slope, but this expectation is offset by the high rate of sediment production in the mudstone basins which produces a much greater total load.

Fan gradients are often known to have special characteristics. First, the gradient of most fans at the apex is approximately the same as that of the trunk river where it moves from the mountain area onto the fan itself. This indicates that deposition on the fan is not caused by a dramatic decrease in gradient as the trunk river passes from the source area to the fan apex. The decrease in velocity required for deposition to occur is caused by some change in hydraulic geometry or because total river discharge decreases as water infiltrates from the channel bottom into the fan material itself. Second, the normal concave-up longitudinal profile that exists on most fans between the apex and the toe is not a smooth exponential curve.

Fan slope

Dry and wet fans

Table 5: Generalized Characteristics of Alluvial Fans Formed in Different Environments

parameter	arid fans	humid-glacial fans	humid-tropical fans	Virginia humid-temperate fans
Fan morphology

Instead, on many fans such as some found in Canada, New Zealand, and the western United States, concavity is produced by the junction of several relatively straight segments, each successive down-fan segment having a lower gradient. Each of the individual segments is probably related to changes imposed on the channel of the trunk river upstream from the fan apex. On some fans, intermittent uplifts of the source area have increased stream gradients, and, in response to these spasmodic tectonic events, there formed a new fan segment that gradually adjusted its slope until it was essentially the same as the newly developed steeper slope of the trunk river. Segmentation, however, may also result from other factors, such as a climatic change that produces a different load/discharge balance. The overall longitudinal profile may be a sensitive indicator of changes that have occurred in the balance between erosional and depositional parts of the fluvial system.

Although fan size and gradients appear to be related to the characteristics of the drainage basin, considerable variation exists on the surface of fans that have been developed under the same physiographic, geologic, and climatic controls. Surface characteristics of dry fans can often be subdivided into major zones called modern washes, abandoned washes, and desert pavements (Figure 14). These different zones seem to reflect areas that are involved to

a greater or lesser degree in modern fan processes. For example, on the Shadow Mountain fan in Death Valley, California, washes of various types make up almost 70 percent of the surface area, but only a few of them are occupied by present-day streamflow. These are modern washes and represent the primary areas of deposition on the fan surface under the present discharge regime (Figure 15). They normally contain unweathered sediment particles and have virtually no vegetation.

The large majority of washes are now abandoned, meaning that they are no longer occupied by flow coming from the mountain basins. Abandoned washes have a scrub vegetation, and the gravel in the channels tends to be coated with a dark surface veneer known as desert varnish. Most authorities believe that desert varnish, a brownish-black veneer of iron and manganese oxides, requires several thousand years to develop. This indicates that washes recognized as abandoned have not been occupied by water for millennia.

Desert pavements are surfaces composed of tightly packed gravel, the particles of which are covered by a thick varnish coating. The gravel usually exists as a thin surface cover or armour, which protects an underlying layer of silt that formed under long weathering of the original deposits. Silt that was originally in the spaces between the gravel at

the surface has been blown away by wind action, leaving behind a lag deposit composed entirely of gravel. Areas of desert pavement are commonly cut by gullies that head within the pavement area itself. The gullies carry a fine-grained load, which is locally derived from the silt layer beneath the surface gravel cap. Because of this, they often meander and may stand at lower elevations than adjacent modern washes that originate in the mountains. This topographic relationship sets up a geomorphic situation that allows water flowing down modern washes to be diverted periodically into the gullies. With time, part of the desert pavement area may revert back into an active wash by shifting the entire position of the river draining from the mountain. When this occurs, the segment of the wash downstream from where it is diverted gradually turns back into an area of an abandoned wash. What results from these activities is the possibility that processes functioning on dry fans are continuously creating and destroying the various surface areas mentioned above. This means that modern washes will eventually become abandoned washes, and, with time, such abandoned washes will gradually turn into the smooth, heavily varnished surface of a desert pavement. At other places on the same fan, desert pavement areas are being converted back into modern washes, so that the history of the fan becomes a complex continuum of change referred to as dynamic equilibrium.

The dynamic equilibrium model is not accepted by all fan experts. Some believe fans are formed and destroyed (*i.e.*, deposited and eroded) in response to climatic changes that produce different load/discharge relationships. Others hold that some fans have been building continuously for a long time and are approaching some type of equilibrium condition but as yet have not attained that condition. It should be noted that these diverse opinions have been produced by examination of the same fans. Thus, the significance of features and materials found on a fan surface is not so readily discernible that everyone will arrive at the same conclusion as to how they formed.

Fan deposits and depositional processes. Transfer of sediment from source basins to depositional sites on a fan surface involves flow consisting of several types, ranging from high-viscosity debris or mudflows to flows involving normal water. The type of flow experienced on any fan depends primarily on the geologic characteristics of the basin and on the magnitude of precipitation that initiates the flow event. In arid regions the ephemeral nature of rivers and the character of rainfall results in spasmodic rather than continuous deposition on the fan surface. The location of deposition tends to change repeatedly. Deposits of any single flow usually are confined to shallow channels and because of this assume a long, linear distribution. Each deposit may be up to several kilometres long and only 100 to 700 metres wide. The dimensions of each

deposit depend on the viscosity of flow, the permeability of surface material, and how far down the fan flow can be held within a distinct channel. Although flow emerging onto the fan surface follows well-defined channels near the apex, water overflows the banks and spreads outward as diffuse flow at some point along the down-fan path of movement. Where the channel is capable of shifting laterally, the location of deposition tends to develop a sheet of rather poorly bedded sand and gravel in which individual layers can be traced for some distance away from the channel. Commonly these sheets are interrupted by thick deposits that represent entrenchment and backfill into the fan surface.

Debris flows or mudflows must follow well-defined channels because a greater depth of flow is needed to offset the high viscosity of the fluid. Nonetheless, debris flows may overflow banks and spread out as sheets, though their viscosity suggests that they will not spread as far laterally as normal water flows. Debris flows are so dense that they are capable of transporting large boulders for considerable distances. The distance of transport, however, is limited by the high viscosity of the fluid, and so movement down the channel may simply stop, even though the fluid is still confined within the channel. Fan deposits that result from debris flows are characteristically unsorted, having clast sizes that range from clay to boulders. Usually no sedimentary structures such as bed forms or cross-beds are observed in deposits of this type. Also, the deposits of debris flows are usually lobate and have well-defined margins often marked by distinct ridges. Some fans are built almost entirely by debris flows. The flow characteristics seem to be generated most commonly in arid or semiarid climates, where torrential rains are separated by periods of little or no precipitation. This pattern allows material to collect on the slopes of the source basin and provides the load necessary to generate a debris-flow pattern.

This does not mean that debris flows are restricted only to those climatic regions. Fans developed primarily by debris-flow action have been described in humid-temperate regions, such as New Zealand and Virginia in the United States. In general, fans in Virginia, found on the east flank of the Blue Ridge Mountains, are smaller than arid fans and do not have the same areal relationships as the dry fans in California. They are typically elongate and rather irregular. Such fans probably result from major storm events, which in some cases erode deep trenches near the apex and deposit coarse debris across the lower fan surface. Geologic evidence suggests that the interval between depositional events can be extremely long, some possibly having a depositional recurrence interval from 3,000 to 6,000 years. Therefore, alluvial fans developed by these processes may be extremely old and not necessarily related to the modern climate. This also is demonstrated

Deposits
of debris
flows

Figure 15: Alluvial fan in Hanaupah Canyon, Death Valley, California. The darkest areas are desert pavement. Prominent modern wash is feeding a new fan segment.

in some fans in the White Mountains of California, which have been continuously accumulating for more than 700,000 years and appear to be totally composed of debris-flow deposits.

Deposition on true wet fans seems to be considerably different from that associated with dry fans. Fans developed in the Kosi River basin in India contrast drastically with classic dry fans. The Kosi fan has as its source the Himalayas, and sediment derived from that source is being collected in the piedmont area. During the last several hundred years, the Kosi River has shifted approximately 100 kilometres while creating its large wet fan. At the fan apex, sediment is characteristically coarse gravel, which is rarely transported far downstream. The river tends to widen drastically in a downstream direction, and braiding becomes the dominant channel pattern spread over an extremely wide area of the fan—approximately six kilometres. The shift in channel location seems to be a progressive event rather than the almost random shifting noted on dry fans. Fans developed by this perennial flow should have rather well-defined stratification and be very well sorted. Both of these characteristics have been demonstrated by experimental flume studies of wet fans, and such characteristics are occasionally shown in the natural field setting.

Although lateral shifting of modern washes is necessary for the development of some fan characteristics, it is equally important to recognize that the loci of deposition also migrate along radial lines during fan development. Such longitudinal shifting is facilitated by entrenching and/or backfilling the channel that links the source area to the fan. Incision at the fan apex produces a fan-head trench, which has a lower gradient than the fan surface. The trench is thus deepest at the apex and becomes shallower as it progresses down the fan; it eventually becomes part of the normal drainage system on the fan surface. This property is significant because sediment may be transported and deposited farther down fan in the confines of a trench than it would be in a normal surface channel. The location of fan deposition may thus depend on where the trench channel emerges onto the fan surface. Entrenchment near the fan apex can be temporary or permanent. Distinguishing between these two possibilities is critical in an analysis of fan origin, and it often demands an understanding of whether the fan surface is still part of the active system. Many fan-head trenches appear to be short-term features in that they show evidence of alternating episodes of trenching and filling. In that sense, the entrenchment is temporary in nature. Experimental studies of wet fans and field observations have increased scientific perception of how the temporary nature of fan-head trenches is controlled. In wet fans, sediment is spread as a sheet over most of the area near the fan apex. Deposition in the down-fan area, however, occurs in numerous braided channels. This depositional pattern will continue until the fan slope near the apex becomes so steep that it initiates vertical incision by the trunk river. The result of incision is the fan-head trench. Flow becomes confined within that channel rather than being spread evenly across the upper part of the fan. Thus, the fan surface near the apex is temporarily starved of sediment, and most of the water and debris coming from the source area is transported down the fan in the entrenched channel. As entrenchment migrates upstream into the source area, increased load is derived as the trunk river is rejuvenated. The load is subsequently transported downstream and deposited in the fan-head trench. This initiates a phase of deposition within the trench that raises the channel floor until the trench is totally filled, and deposition begins again over the entire apical area. Eventually the gradient becomes over-steepened and the process repeats itself. In this case, it is clear that the fan-head trench is temporary. The entire fan may continue to grow with time, but the apex area experiences episodes of entrenchment during which sediment is reworked and moved farther down the fan. These episodes alternate with filling of the channel until the slope of the fan near the apex is increased to a threshold condition.

Temporary entrenchment may result from processes other than the built-in system described above. It may be that

alternating trenching and filling results when fan processes change during variations of climate that produce different amounts of sediment, rainfall, and discharge. In such a case, the primary driving force is external to the system and is involved more with characteristics of the drainage basin than with processes operating at the fan apex.

In some cases, entrenchment on a fan surface is permanent or certainly long-term. Depths of incision are often greater than 30 metres below the fan surface, making trenches of that magnitude very difficult to refill. The cause of incision of this magnitude is usually external to the fan system itself. In basins of deposition that are open, the most common cause of permanent entrenchment is a decline in baselevel by the river flowing through the basin. This will initiate a wave of fan incision that is propagated up the fan from the toe. Eventually the entire fan is dissected when entrenchment reaches the apex and proceeds into the drainage basin. When this occurs, the fan surface standing above the trench is no longer part of the active fan. In fact, soils will develop on the alluvium, and drainage networks will be established on the old fan surface.

Economic significance. Alluvial fans are important for a variety of practical reasons. In some cases, very porous and permeable fan deposits are the primary source of groundwater, which is used for irrigation and for water supply. This is especially true in arid or semiarid climates. Wet fans are known to have economic significance because their process mechanics tend to concentrate heavy mineral particles in placer deposits. As discussed above, experimental work on wet fans shows that water tends to spread as a sheet near the fan head, but flow down the fan is subdivided into many braided channels that shift their position laterally. This flow pattern is periodically interrupted by fan-head trenching. Therefore, as noted both in nature and in experimental flume studies, wet fans grow progressively with time, but processes producing alternating trenching and filling at the fan head tend to rework and distribute the sediment down the fan. Experimental studies in the United States have shown that heavy minerals derived from a source area are preferentially concentrated in the area of the fan head by repeated trenching and filling. The concentration is great enough to expect economic placer deposits to develop at the fan head and at the base of backfilled channels.

Perhaps the classic example of the connection between wet-fan processes and the concentration of valuable metals is the Witwatersrand Basin in South Africa, which ranks as one of the greatest gold-producing areas of the world. Although the six major goldfields in the basin and their sedimentary deposits are not entirely fluvial, gold seems to be concentrated in ancient fan deposits from the source areas of granite that originally contained the gold. Evidence suggests that each of these fields is associated with a wet fan that developed where a large river discharged from the source rocks.

DELTA

The most important landform produced where a river enters a body of standing water is known as a delta. The term is normally applied to a depositional plain formed by a river at its mouth, with the implication that sediment accumulation at this position results in an irregular progradation of the shoreline. This surface feature was first recognized and named by the ancient Greek historian Herodotus, who noted that sediment accumulated at the mouth of the Nile River resembled the Greek letter Δ (delta). Even though a large number of modern deltas have this triangular form, many display a variety of sizes and shapes that depend on a number of environmental factors. Thus, the term now has little, if any, shape connotation. Deltas, in fact, exhibit tremendous variation in their morphological and sedimentologic characteristics and also in their mode of origin. Most of the variation results from (1) characteristics within the drainage basin that provides the sediment (*e.g.*, climate, lithology, tectonic stability, and basin size); (2) properties of the transporting agent, such as river slope, velocity, discharge, and sediment size; and (3) energy that exists along the shoreline, including

Permanent or long-term entrenchment

Causes of variations in morphological, and sedimentologic characteristics

Fan-head trenches

such factors as wave characteristics, longitudinal currents, and tidal range. The shoreline zone, therefore, becomes the battleground between variable amounts and sizes of sediment delivered to the river mouth and the energy of the ocean waters at that site. The balance between these two factors determines whether accumulation of the river-borne sediment will occur or whether ocean processes will disperse the sediment or prevent its deposition. The combination of these numerous variables tends to create deltas that occur in a complete spectrum of form and depositional style.

Deltas are distributed over all portions of the Earth's surface. They form along the coasts of every landmass and occur in all climatic regimes and geologic settings. The largest deltas of the world are those created by major river systems draining regions that are subcontinental in size and yield abundant sediment from the watershed.

Classification of deltas. Deltas come in a multitude of plan-view shapes, as their characteristics are determined by the balance between the energy and sediment load of a fluvial system and the dynamics of the ocean. Various ways of classifying deltas have been devised. One of the

more widely used schemes is based on deltaic form as it reflects controlling energy factors. This scheme divides deltas into two principal classes: high-constructive and high-destructive.

High-constructive deltas develop when fluvial action and depositional process dominate the system. These deltas usually occur in either of two forms. One type, known as elongate, is represented most clearly by the modern bird-foot delta of the Mississippi River. The other, called lobate, is exemplified by the older Holocene deltas of the Mississippi River system (see Figure 16). Both of these high-constructive types have a large sediment supply relative to the marine processes that tend to disperse sediment along the shoreline. Normally, elongate deltas have a higher mud content than lobate deltas and tend to subside rather rapidly when they become inactive.

High-destructive deltas form where the shoreline energy is high and much of the sediment delivered by the river is reworked by wave action or longshore currents before it is finally deposited. Deltas formed by rivers such as the Nile and the Rhône have been classified as wave-dominated. In this class of high-destructive delta, sediment is

From W.L. Fisher et al., (1969); Bureau of Economic Geology, the University of Texas at Austin

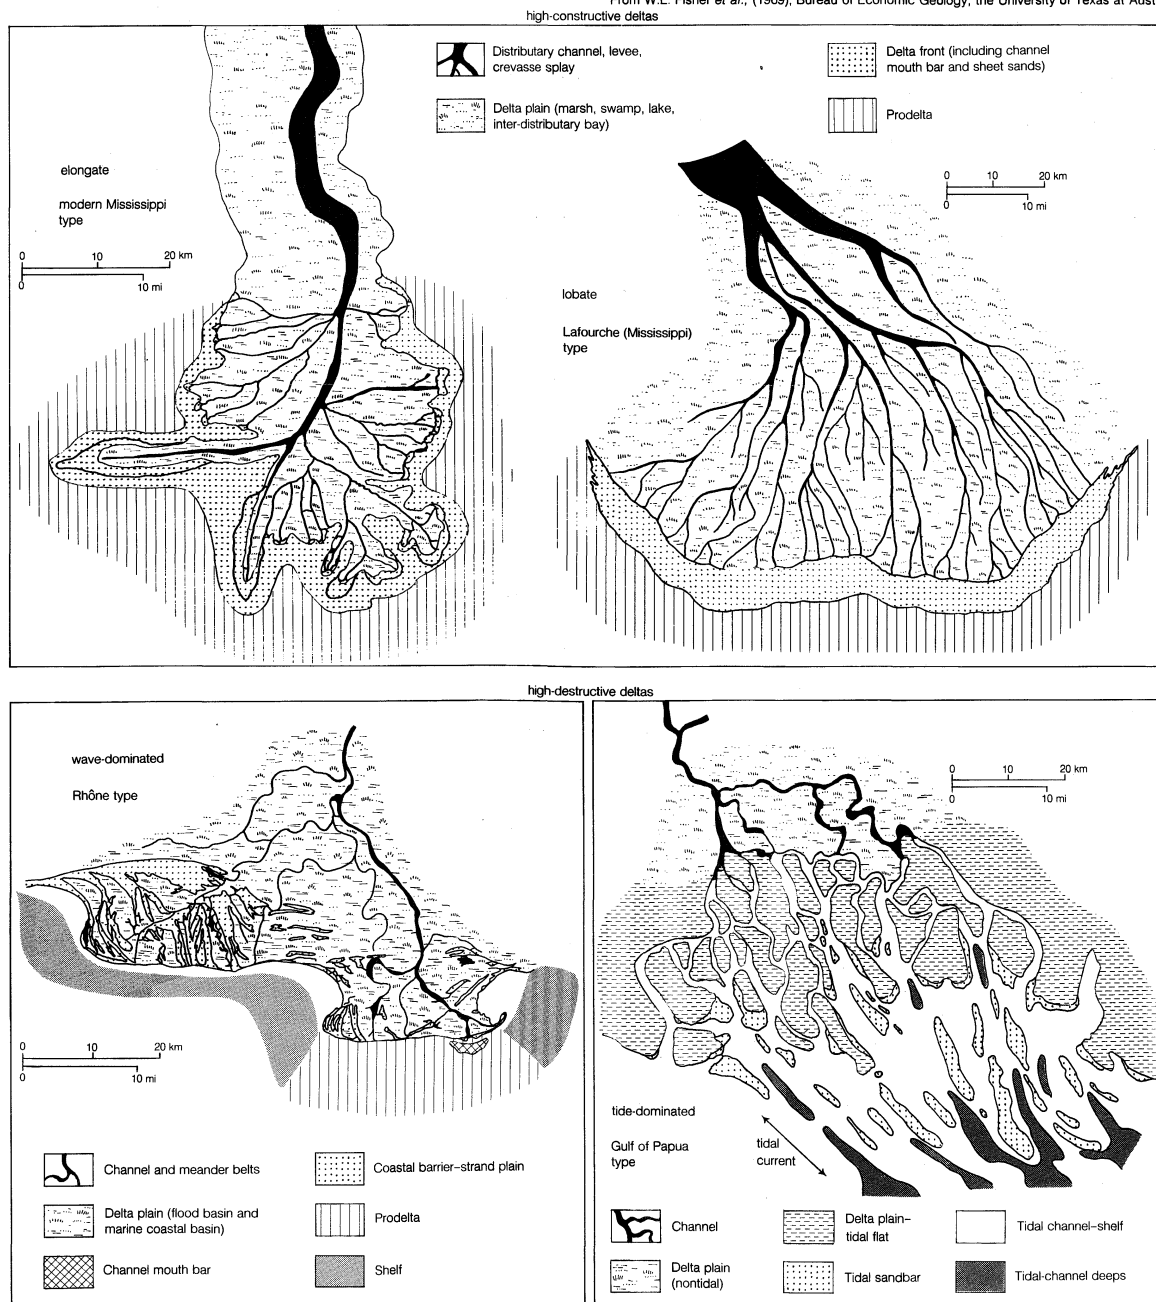

Figure 16: Basic delta types.

finally deposited as arcuate sand barriers near the mouth of the river. In another subtype, called tide-dominated, tidal currents mold the sediment into sandy units that tend to radiate in a linear pattern from the river mouth. In such a delta, muds and silts are deposited inland of the linear sands, and extensive tidal flats or mangrove swamps characteristically develop in that zone.

Considerable attention has been given to deltas that are composed of very coarse deposits—those of sand and gravel. Deltas developing from this type of material are commonly classified as either fan deltas or braid deltas. A fan delta is a depositional feature that is formed where an alluvial fan develops directly in a body of standing water from some adjacent highland. A braid delta is a coarse-grained delta that develops by progradation of a braided fluvial system into a body of standing water. The two are related by the fact that they are composed primarily of very coarse sediment; however, they differ in that braid deltas result from well-defined, highly channelized braided rivers that are deeper and have more sustained flow than streams which develop alluvial fans. In addition, the braided system that ultimately forms the braid delta may have its source far removed from the body of standing water and may in fact consist of large alluvial plains rather than the restricted areal and longitudinal extent associated with alluvial fans.

Morphology of deltas. Deltas consist of three physiographic parts called the upper delta plain, the lower delta plain, and the subaqueous delta. The upper delta plain begins as the river leaves the zone where its alluvial plain is confined laterally by valley walls. When the valley wall constraint ends, the river breaks into a multitude of channels, and the depositional plain widens. This point source of the upper delta plain can be thought of as the apex of the entire delta, which is analogous to the same reach of an alluvial fan. The entire upper delta plain is fluvial in origin except for marshes, swamps, and freshwater lakes that exist in areas between the many river channels. The surface of the upper delta plain is above the highest tidal level and thus is not affected by marine processes. In contrast, the lower delta plain is occasionally covered by tidal water. For this reason, the boundary between the upper delta plain and the lower delta plain is determined by the maximum tidal elevation. Features and deposits in the lower delta plain are the result of both fluvial and marine processes. Tidal flats, mangrove swamps, beach ridges, and brackish-water bays and marshes are common in this zone.

Deltas affected by high tidal ranges, such as those constructed by the Niger River and the Ganges–Brahmaputra system, are dominated by marine incursions and expansive lower delta plains. For example, the Ganges–Brahmaputra system in Bangladesh has a lower delta plain that occupies more than half of its total surface area of 60,000 square kilometres and is characterized by enormous mangrove swamps. Low tidal ranges result in deltas having much better developed upper delta plains (e.g., the Nile of Egypt and the Volga of the Soviet Union).

A subaqueous delta plain is located entirely below sea level, and marine processes dominate the system. This part of the delta is responsible for the topographic bulge seen on the continental shelf seaward of channels that flow across the exposed delta plains. Sediment-laden river flow entering the ocean in well-defined channels loses transporting power where the channels end, and sediment is deposited as the subaqueous delta plain. Large subaqueous plains are best developed where the continental shelf is shallow and gently sloping and where sediment loads derived from source basins are great. The subaqueous deltas of the Amazon, the Orinoco, and the Huang Ho are broad and widespread in response to these controls. It is true, however, that even if these ideal conditions exist, a broad subaqueous delta does not always result. This is especially true where large submarine canyons exist near the terminations of river channels. In these cases, sediment delivered to the ocean is funneled down the canyon and deposited beyond the margin of the continental shelf. If a subaqueous delta develops in such situations, it is usually very small.

River channels that traverse the subaerial portion of a delta (upper and lower delta plain) serve as the conduits through which sediment is delivered to the subaqueous component. The channels assume any one of three patterns: (1) long, straight single channels, (2) braided or anastomotic (veinlike) multiple channels, or (3) channels that bifurcate (branch) in a downstream direction. In general, the channel pattern is controlled both by source basin characteristics (sediment size and volume, flood-discharge features, etc.) and marine properties (tidal range and wave energy, for example). Rivers transporting fine-grained sediment tend to develop either single channels or downstream bifurcating patterns. The single-channel pattern results where offshore wave energy is high (e.g., the Mekong and Congo deltas). Braided or anastomotic channels develop best where rivers carry a large volume of coarse-grained bed load. Branching distributaries form most commonly where tidal range and wave energy is low (e.g., the Mississippi and Volga deltas).

Most delta channels are bordered by natural levees that resemble those found on floodplains. These features are best developed by rivers that flood frequently and transport large volumes of suspended load, as, for example, the Mississippi. Interfluvial areas (those between adjacent streams flowing in the same direction) are variable in character, depending on climate, tidal range, and offshore wave energy.

Deposits and stratigraphy. Delta growth indicates that a river delivers sediment to the shore faster and in greater volume than marine processes can remove the load. During the delta-building process, sediment is distributed in such a way that the feature develops a unique form. Under normal discharge conditions, sediment remains within the channel until it reaches the river mouth. No lateral dispersion of the load occurs on the subaerial delta plain, and because river velocity is so low, waves and currents spread the fine-grained portion of the sediment laterally along the delta front. During floods, however, suspended sediment and organic matter are deposited in the interfluvial areas, causing those portions of the subaerial delta to aggrade. The high river velocity at the mouth offsets wave and current action, allowing sediment to be transported farther seaward. This facilitates accumulation at the delta front and causes the subaqueous delta to prograde.

The dispersal of sediment during floods and normal discharges creates a well-defined horizontal and vertical depositional sequence. On the subaerial delta plain, silts and clays accumulate vertically in inter-distributary zones. At the mouths of deltaic rivers, marine processes rework fine-grained sediment, but more coarse deposits of sands and silts usually build forward while maintaining a steep seaward slope. Smaller clay particles pass over the delta slope and are deposited on the continental shelf in front of the subaqueous delta plain. Therefore, in a horizontal sense, many deltas have silty, organic-rich deposits in their subaerial portion, though channel sands and levee deposits interrupt the fine-grained interfluvial sequence. More coarse sediment is deposited at the river mouth, and very fine-grained materials (clays) accumulate beyond the delta front. The vertical sequence is essentially the same with marine clays at the lowest elevation (greatest depth), silts and sands at nearshore depths, and silts, clays, and organics—along with associated channel and levee sands—at the highest (subaerial) elevations. This model of alluviation does not accommodate very coarse (gravel and sand) deposition on the subaerial delta plain, which provides the special deltaic types known as fan deltas or braid deltas (see above), but it is representative of most of the major deltas of the world.

Deposits found in the deltaic stratigraphic sequence were named topset, foreset, and bottomset by the American geologist Grove K. Gilbert in his 1890 report on Lake Bonneville, the vast Pleistocene ancestor of what is now the Great Salt Lake of Utah. Although Gilbert examined small deltas along the margins of the ancient lake, the stratigraphic sequence he observed is similar to that found in large marine deltas. Topset beds are a complex of lithologic units deposited in various sub-environments of the subaerial delta plain. Layers in the topset unit are almost

Special
delta types

Subaqueous
delta
plain

horizontal. Foreset deposits accumulate in the subaqueous delta front zone. The deposits are usually coarser at the river mouth and become finer as they radiate seaward into deeper water. Strata in the foreset unit are inclined seaward at an angle reflecting that of the delta slope or front. In large marine deltas the beds rarely dip more than 1° , but where bed load is coarse, such as in braid deltas, foreset beds may be inclined at angles greater than 20° . Foreset layers are beveled at their landward positions by topset beds, which expand horizontally as the entire delta advances into the ocean. At their seaward extremity, foreset beds grade imperceptibly into the bottomset strata. Bottomset deposits are composed primarily of clays that were swept beyond the delta front. These beds usually dip at very low angles that are consistent with the topography of the continental shelf or lake bottom in front of the subaqueous delta. This depositional environment is commonly referred to as the prodelta zone.

Deltas and time. One of the most important perceptions needed to understand deltas is how their depositional framework changes with time. Because delta characteristics are controlled by factors that are subject to change, it follows that deltaic growth patterns are dynamic and variable.

The most significant effect is that the site of deposition shifts dramatically with time. This occurs because the channel gradient and transporting power of a delta river decreases as the deltaic lobe extends farther seaward and shorter routes to the ocean become available. These shorter pathways may begin far inland, usually being occupied when the river is diverted through breaches in levees called crevasses. This process effectively shifts the locus of deposition and initiates the development of a new deltaic lobe. For example, the Mississippi Delta actually consists of the coalescence of seven major lobes constructed at different times and positions during the last 5,000 years (Figure 17). In fact, the modern bird-foot delta of the Mississippi River is only a small part of the entire deltaic system, and there is good reason to believe that another major shift in the depositional position is imminent. The Atchafalaya River, a major distributary, branches from the Mississippi upstream from Baton Rouge, La., and its route to the ocean is approximately 300 kilometres shorter than the present course of the Mississippi. This channel carries 30 percent of the Mississippi flow, and sediment reaching Atchafalaya Bay (160 kilometres west of New Orleans) is actively building a new delta lobe. Complete diversion of the Mississippi discharge into the Atchafalaya will accelerate growth of the new delta. The present bird-foot delta will be abandoned and, starved of any incoming

sediment, will become severely eroded by the unopposed attack of marine processes.

Even within a modern delta, water and sediment, funneled through crevasses, build smaller subdeltas, which are ephemeral in space and time. What emerges is a picture of a dynamic system in which depositional sites change over different time scales. On a short-term basis (years to decades), a limited area (subdelta) may receive sediment, but the position of accumulation shifts rapidly. On a longer time scale (hundreds to thousands of years), the position of an entire active delta may migrate over a considerable distance.

ESTUARIES

Estuaries are partially enclosed bodies of water located along coastal regions where flow in downstream reaches of rivers is mixed with and diluted by seawater. The landward limit of an estuary is defined in terms of salinity, often where chlorinity is 0.01 parts per thousand. The inland extent of this chemical marker, however, varies according to numerous physical and chemical controls, especially the tidal range and the chemistry of river water. Actually, the term estuary is derived from the Latin words *aestus* ("the tide") and *aestuo* ("boil"), indicating the effect generated when tidal flow and river flow meet. Nonetheless, if estuaries are defined on the basis of salinity, many coastal features such as bays, tidal marshes, and lagoons can be regarded as estuaries (Figure 18).

Estuaries have always been extremely important to humankind. From early times, they have served as centres of shipping and commerce. In fact, many seaports were originally founded at the seaward margin of major river systems. Concomitantly, some of the oldest civilizations developed in estuarine environments. In addition to shipping, much of the world's fishing industry is dependent on the estuarine environment. Many species of fish and shelled bottom dwellers spend much of their life cycle there. In most cases, these animals have a tolerance for wide ranges in salinity and temperature. Pollutants introduced by humans, however, can affect such forms of marine life significantly if large enough amounts of the contaminants accumulate among bottom sediments.

Origin and classification. Most modern estuaries formed as the result of a worldwide rise in sea level, which began approximately 18,000 years ago during the waning phase of the Wisconsin Glacial Stage. When glaciation was at its maximum, sea level was significantly lower than it is today because much of the precipitation falling on the continents was locked up in massive ice bodies rather than returning to the ocean. In response, rivers entrenched their

downstream reaches as baselevel (sea level) declined. As the ice began to dissipate, sea level rose, and marine waters invaded the entrenched valleys and inundated other portions of the coastal zone, such as deltas and coastal plains. It is known that the subsidence of a coast produces the same effect as a rise in sea level; thus tectonic activity sometimes creates estuaries.

In general, estuaries develop in one of three ways. First, estuaries represent drowned valleys. The valleys may have been formed by normal river entrenchment (e.g., Chesapeake Bay in the eastern United States) or as the result of glacial erosion. The latter type, called fjords, are deep, narrow gorges cut into bedrock by tongues of glacial ice advancing down a former stream valley (see *CONTINENTAL LANDFORMS: Glacial landforms*). Fjords are most common in Norway and the coastal margins of British Columbia, Can. Both valley types (river and glacial) became estuarine environments with the postglacial rise in sea level. Second, some estuaries develop when barrier islands and/or spits enclose large areas of brackish water between the open ocean and the continental margin. These depositional features restrict free exchange between river and marine water and create lagoons or partially enclosed bays that develop the chemical characteristics of an estuarine environment. Such settings are best exemplified in the

Gulf Coast region of the United States (e.g., Galveston Bay), the Vadehavet tidal area of Denmark, the Swan Estuary of Western Australia, and the Waddenzee of The Netherlands. Third, some estuaries are clearly submerged in response to tectonic activity, such as down-faulted coastal zones or isostatically controlled subsidence (e.g., San Francisco Bay).

Physical oceanographers commonly classify valley-type estuaries by the process and extent of mixing between fresh water and seawater. A salt-wedge estuary is dominated by river discharge, and tidal effects are negligible. In this situation, fresh water floats on top of seawater as a distinct layer, which thins toward the ocean. A wedge-shaped body of seawater underlies the freshwater layer and thins toward the continent. The interface between the two water types is well defined, and very little mass transfer or mixing of the two waters occurs. Partially mixed estuaries are characterized by an increased tidal effect to a condition where river discharge does not dominate the system. Mixing of the two water types is prominent in this system and is caused by increased turbulence. Mass transfer of water involves movement in both directions across a boundary that becomes less distinct than the one found in the salt-wedge estuaries. In vertically homogeneous estuaries, the velocity of tidal currents is large enough to produce total mixing and eliminate the fresh/salt water boundary. The water salinity is constant in the vertical sense and tends to decrease toward the continent. In general, the classification of estuaries by mixing indicates that the more substantial the river discharge, the weaker is the mixing. In addition, the dominance of river flow causes a greater salinity gradient. This indicates that sizable fluvial activity tends to block the entrance of seawater into the estuary environment.

Sedimentation in estuaries. The bedrock floor near the mouth of most estuaries is usually buried by a thick accumulation of sediment. The texture and composition of sediment in estuaries in the United States is known to be a function of river-basin geology, bathymetry, and hydrologic setting. Where sediment supply is inadequate to fill drowned valleys, clay and silt are usually deposited in the central part of bays and grade shoreward and seaward into bodies of sand. Where sediment supply and tidal range are both large, such as in Oregon and northern California in the western United States, the clay and silt are commonly swept from the channels and deposited on the marginal flats. In the Gulf Coast region, small tides and abundant fine-grained sediment tend to create very shallow estuaries. Silt and clay are usually deposited in lagoons behind barrier bars, although these grade into sands around the lagoonal margins.

The character and distribution of estuarine sediment are influenced by many physical, chemical, and biologic processes, such as tidal currents, flocculation, bioturbation (the reworking and alteration of sediment by organisms), storms, morphology of the estuary, and human activities. The sediment type that is deposited, therefore, depends on the dynamics of the system, which in turn are controlled by an equilibrium between river and tidal flow. River discharge develops inertia, which results in the collision of river and ocean waters in the estuary itself. Most sediment is derived from the river system, and whether or not it is deposited within the estuary depends on how quickly the velocity is diminished by the effect of tidal currents and by the extent of the tidal range. Notwithstanding the above, it has been long recognized that net sediment transport in many open estuaries can be from the sea toward the land. (D.F.R.)

Factors influencing the character and distribution of estuarine sediment

The river system through time

Natural river systems can be assumed to have operated throughout the period of geologic record, ever since continental masses first received sufficient precipitation to sustain external surface runoff. The Precambrian portion of the record, prior to 570,000,000 years ago, is complicated by the widely metamorphosed character of the surviving rocks, although even here the typical cross-bedding of shallow-water sands can be recognized in many

Modes of formation

Evidence
of ancient
rivers

places. The Cambrian and post-Cambrian succession of the last 570,000,000 years contains multiple instances of deposition of deltaic sandstones, which record intermittent deposition by rivers in many areas at many intervals of past time. The span since the Precambrian is long enough, at present rates of erosion, for rivers to have shifted the equivalent of 25 to 30 times the bulk of the existing continental masses, but the rate of erosion and sedimentation is estimated to have increased with time. Of necessity, river systems now in existence date from times not earlier than the latest emergence of their basins above sea level, but this limitation allows numbers of them to have histories of 100,000,000 years or more in length.

DRAINAGE DIVERSION BY STREAM CAPTURE

A river system of appreciable size is likely to have undergone considerable changes in drainage area, network pattern, and profile and channel geometry. Adjoining streams compete with one another for territory. Although competition is effectively nil where divides consist of expanses of plateau or where opposing low-order streams of similar slope flow down the sides of ridges, it frequently happens that fluvial erosion is shifting a divide away from some more powerful trunk stream and toward a weaker competing trunk. In extreme cases, the height difference is so marked that a tributary head from one system can invade, and divert, a channel in the adjoining system: such diversion, termed stream capture, has already been noted as a principal mechanism in the adjustment of network patterns to structural patterns. Close general adjustment to structure implies multiple individual adjustments, unless the stream network has developed solely by the headward extension of tributaries along lines of structural and lithologic weakness: the network predicated on a single regional slope is dendritic in pattern. By encroachment and capture a successfully competing stream becomes yet more powerful, the headward extension of its basin increasing the discharge of the trunk channel and permitting reduction of slope; *i.e.*, additional downcutting. Seaward extensions of basins occur where deltas lead the outbuilding of alluvial plains and where crustal uplift (and also at times strandline movements) result in emergence. Conversely, basin area is reduced along the seaward edge by submergence, in response to crustal depression or rise in sea level. The potential limits to basin size are fixed by available areas of continent with surface moisture surplus, in combination with theoretical optimum shape of basin; however, actual basin shapes, for all large rivers, are to some extent affected by crustal deformation.

NON-FLUVIAL INVASION AND DEPOSITION

Derangements other than the captures effected in stream competition include those due to non-fluvial invasion and deposition. Regional flooding by basalts, as during the Tertiary Period (from 65,000,000 to 2,500,000 years ago) in the Deccan of India and the northwestern part of the United States, obliterates the former landscape and provides a new surface on which new drainage networks form. Major invasions by continental ice displaces fluvial systems for the time being. Glacial deposits, especially till sheets, can conceal the preglacial topography and provide initial slope systems for postglacial streams. Individual diversions occur at and near ice fronts, also where preglacial divides in mountain country are breached by the ice of caps or impounded mountain glaciers. The full history of drainage derangement by continental ice is often complex, depending on the particular combinations of preglacial outlet directions, extent of glacial invasion, relationship of regional slope to direction of ice advance, thickness of glacial sedimentation, amount and speed of postglacial isostatic rebound, and self-selection of postglacial outlet directions and drainage lines. The North American Great Lakes and Midwest areas, the Thames Basin in England, and the Eurasian plain all record intricate histories of damming during glacial maxima, with postglacial networks and outlets differing markedly from those of preglacial times. Glacial breaching of divides requires the passage of thick ice through a preglacial notch or gap, with erosion severe enough to provide a new drainage line when the ice

Role of
continental
ice

melts. The spinal divide of Scandinavia was breached by the ice cap centred over the Gulf of Bothnia, just as the highland rim of Greenland is being breached by effluent glaciers today. After deglaciation, areas of divide breaching display streams with anomalous courses through gaps in major relief barriers. Morphologically related to glacial breaching, especially with respect to indeterminate present-day divides, are the disordered drainage nets of formerly glaciated terrains where bedrock is widely exposed and where relief is subdued.

Changes through time in channel slope have already been partly treated in connection with terraces. In the long view, streams must tend to reduce their slopes as the basin relief is lowered, although isostatic (balancing) compensation for erosional reduction of load largely offsets the reduction of slope. The effects involved here are independent of, although necessarily associated with, glacial-deglacial changes in the strandline level, crustal warping, and isostatic rebound from glacial reduction of load. It can be argued that large river systems, removing large quantities of sediment and dumping them offshore, should promote intermittent isostatic uplift when yield thresholds are passed and, in consequence, promote the generation of new waves of erosion that, working upstream, are recorded in sequences of cyclic knickpoints. The implications of this conceptual view have been applied especially to the unglaciated shield areas (central and oldest part of continents, generally) of tropical latitudes and extratropical parts of the Southern Hemisphere, in all of which rivers descend in high falls or lengthy cascades across the edges of major erosional platforms. In the shorter term, severe and rapid erosion of a trunk channel can leave a tributary valley stranded at height. Channel geometry demands that tributary glacier troughs should hang above the floors of main troughs, while tributary stream valleys often hang above trunk valleys formerly occupied by long glacier tongues. Hanging valleys on shorelines are correspondingly due to the outpacing of channel erosion by cliffing.

Long-term
changes in
channel
slope

EFFECTS OF CLIMATIC CHANGE

Climatic shifts are known to be capable of effecting fill or clearance of channels and valleys: they can also change channel habit. In addition to the alternation in some near-glacial areas between braiding during maximum cold and meandering during interglacial warmth, the record includes conversions of channel width and meander pattern. On numerous mid-latitude streams, existing channels have been much reduced from their earlier dimensions; and on many, but by no means all streams, existing floodplains are contained in the floors of meandering valleys where the wavelength is determined by the plan of the floodplain as opposed to the existing channel. Valley meanders were cut by streams 20 to 100 times as voluminous as existing streams, at the bank-full stage. They illustrate only one variant, although a widespread one, of the underfit stream, which combines a former large with an existing reduced channel. Reduction to the underfit state is commonly, although not invariably, accompanied by the infilling of former large channels both laterally and from below, so that existing floodplains are contained in valley-bottom fills. Accidents of capture and glacial diversion apart, the underfit condition results generally from climatic shift. The last major shift responsible for channel shrinkage appears to have occurred in the interval 12,000–9,000 BP, or later in areas that were still ice-covered 9,000 years ago. Involving a reduction of bed width to as much as one-tenth of earlier values, and in meander wavelength by similar proportions, channel shrinkage is known to have succeeded in well-studied areas by lesser fluctuations that are recorded in episodes of partial clearance followed by renewed fill. Significant alternations between cut and fill during the last 10,000 to 20,000 years have perhaps averaged a periodicity of 1,000 to 2,000 years. There is no *a priori* reason to suppose that the corresponding periodicity differed from this value during the whole Pleistocene, 2,000,000 to 3,000,000 years in duration so far. Inferences about pre-Pleistocene fluctuations await detailed analysis of rates of deposition of graded beds, coral growth, and the like.

River
channels
and
networks
as open
systems

On account of the temporal-dynamic qualities that have been discussed, river channels and networks are to be regarded as open systems (those open to additions or subtractions of materials or energy through time), whether in relation to short-term adjustments to individual peak discharges, in relation to accommodation to the constraints of climate, vegetal cover, characteristics of infiltration and overland flow, or in relation to the long-term influences of crustal movement, interbasin competition, and land wastage. Channels and networks experience inputs and outputs of matter and energy. Some of them, but probably a small minority at any one time and for a minor duration of total time in any one channel or network, act as open systems in disequilibrium. The general tendency seems to be for channel and river systems to attain steady-state conditions, wherein negative feedback tends to counter individual disequilibrium tendencies, and counteracting effects ensure variations about recurrent norms of form and behaviour. Rivers as agents of landscape evolution: Literature concerning the evolution of valleys and the origin of transverse canyons is found mostly in older classic treatments of the topic, such as

WILLIAM MORRIS DAVIS, *Geographical Essays* (1909, reprinted 1954); and two articles from the *Bulletin of the Geological Society of America*: ARTHUR N. STRAHLER, "Hypotheses of Stream Development in the Folded Appalachians of Pennsylvania," 56 (1):45-87 (Jan. 1945); and J. HOOVER MACKIN, "Erosional History of the Big Horn Basin, Wyoming," 48(6):813-893 (June 1, 1937). An excellent discussion of the initial development of valleys and canyons in an area of recent tectonism is given in THEODORE OBERLANDER, *The Zagros Streams: A New Interpretation of Transverse Drainage in an Orogenic Zone* (1965). Discussions and additional references about valley morphology in natural and experimental settings can be found in STANLEY A. SCHUMM, *The Fluvial System* (1977); and STANLEY A. SCHUMM, M. PAUL MOSLEY, and WILLIAM E. WEAVER, *Experimental Fluvial Geomorphology* (1987).

Detailed analyses of floodplains are provided by EDWARD J. HICKIN and GERALD C. NANSON, "The Character of Channel Migration on the Beaton River, Northeast British Columbia," *Geological Society of America Bulletin*, 86(4):487-494 (April 1975); and by two U.S. Geological Survey professional papers: M. GORDON WOLMAN and LUNA B. LEOPOLD, *River Flood Plains: Some Observations on Their Formation* (1957), no. 282-C; and STANLEY A. SCHUMM and R.W. LICHTY, *Channel Widening and Flood-Plain Construction Along Cimarron River in Southwestern Kansas* (1963), no. 352-D.

Detailed discussions of terrace formation can be found in LUNA B. LEOPOLD and JOHN P. MILLER, *A Postglacial Chronology for Some Alluvial Valleys in Wyoming* (1954), U.S. Geological Survey water-supply paper no. 1261; and two papers in the *Geological Society of America Bulletin*: JOHN H. MOSS and WILLIAM BONINI, "Seismic Evidence Supporting a New Interpretation of the Cody Terrace near Cody, Wyoming," 72(4):547-555 (April 1961); and DALE F. RITTER, "Complex River Terrace Development in the Nenana Valley near Healy, Alaska," 93(4):346-356 (April 1982).

Important papers treating processes and characteristics of alluvial fans in detail include two U.S. Geological Survey professional papers: WILLIAM B. BULL, *Geomorphology of Segmented Alluvial Fans in Western Fresno County, California* (1964), no. 352-E; and CHARLES S. DENNY, *Alluvial Fans in the Death Valley Region, California and Nevada* (1965), no. 466. See also R. CRAIG KOCHER and ROBERT A. JOHNSON, "Geomorphology and Sedimentology of Humid-Temperate Alluvial Fans, Central Virginia," in EMLYN H. KOSTER and RON J. STEEL (eds.), *Sedimentology of Gravels and Conglomerates* (1984), pp. 109-122; NEIL A. WELLS and JOHN A. DORR, JR., "Shifting of the Kosi River, Northern India," *Geology*, 15(3):204-207 (March 1987); and RICHARD H. KESEL, "Alluvial Fan Systems in a Wet-Tropical Environment, Costa Rica," *National Geographic Resources*, 1(4):450-469 (Autumn 1985). More general reviews and discussions of experimental work are ROGER LEB. HOOKE, "Processes on Arid-Region Alluvial Fans," *The Journal of Geology*, 75(4):438-460 (July 1967); and WILLIAM B. BULL, "Alluvial Fans," *Journal of Geological Education*, 16(3):101-106 (June 1968).

Extensive reviews of delta formation can be found in MARTHA L. SHIRLEY (ed.), *Deltas in Their Geologic Framework* (1966); W. FISHER et al., *Delta Systems in the Exploration for Oil and Gas* (1969, reprinted 1974); and JAMES P. MORGAN, "Deltas—A Résumé," *Journal of Geological Education*, 18(3):107-117 (May 1970). Detailed analyses of specific deltas, including the Mississippi River delta, can be found in FRANCIS P. SHEPARD, FRED B. PHLEGER, and TJEERD H. VAN ANDEL (eds.), *Recent Sediments, Northwest Gulf of Mexico* (1960); and RICHARD J. RUSSELL, "Geomorphology of the Rhône Delta," *Annals of the Association of American Geographers*, 32(2):149-254 (June 1942), and *River and Delta Morphology* (1967).

The characteristics and formative processes of estuaries are discussed in ANDRÉ GUILCHER, *Coastal and Submarine Morphology* (1958); MAURICE L. SCHWARTZ (ed.), *The Encyclopedia of Beaches and Coastal Environments* (1982), with illustrated entries on estuaries and on estuarine coasts, deltas, habitats, and sedimentation; RUSSELL SACKETT, *Edge of the Sea*, rev. ed. (1985); and ERIC C.F. BIRD, *Coasts: An Introduction to Coastal Geomorphology*, 3rd ed. (1984). More technical treatment is presented in GEORGE H. LAUFF (ed.), *Estuaries* (1967); BRUCE W. NELSON (ed.), *Environmental Framework of Coastal Plain Estuaries* (1973); and L. EUGENE CRONIN (ed.), *Estuarine Research*, vol. 1, *Chemistry, Biology, and the Estuarine System* (1975). Estuarine sediment is described for 45 estuarine zones of the United States in DAVID W. FOLGER, *Characteristics of Estuarine Sediments of the United States* (1972), U.S. Geological Survey professional paper no. 742.

(D.F.R.)

Roman Catholicism

As both its critics and its champions would probably agree, Roman Catholicism has been the decisive spiritual force in the history of Western civilization. There are more Roman Catholics in the world than there are believers of any other religious tradition—not merely more Roman Catholics than all other Christians combined, but more Roman Catholics than all Muslims or Buddhists or Hindus. The papacy is the oldest continuing absolute monarchy in the world. To millions the pope is the infallible interpreter of divine revelation and the vicar of Christ; to others he is the fulfillment of the biblical prophecies about the coming of the Antichrist.

These incontestable statistical and historical facts suggest that some understanding of Roman Catholicism—its history, its institutional structures, its beliefs and practices, and its place in the world—is an indispensable component of cultural literacy, regardless of how one may individually answer the ultimate questions of life and death and faith. Without a grasp of what Roman Catholicism stands for, it is difficult to make political sense of the settlement of the Germanic tribes in Europe at the end of the Roman Empire, or intellectual sense of Thomas Aquinas, or literary sense of *The Divine Comedy* of Dante Alighieri, or artistic sense of the Gothic cathedrals, or musical sense of many of the compositions of Haydn or Mozart.

At one level, of course, the interpretation of Roman Catholicism is closely related to the interpretation of Christianity as such. For by its own reading of history, Roman Catholicism began with the very beginnings of the Christian movement. An essential component of the definition of any one of the other branches of Christendom, moreover, is the examination of its relation to Roman Catholicism: How did Eastern Orthodoxy and Roman Catholicism come into schism? Was the break between the Church of England and Rome inevitable? Conversely, such questions are essential to the definition of Roman Catholicism itself, even to a definition that adheres strictly to the official view, according to which the Roman Catholic Church has maintained an unbroken continuity since the days of the Apostles, while all other denominations, from the ancient Copts to the latest storefront church, are deviations from it.

Like any intricate and ancient phenomenon, Roman

Catholicism can be described and interpreted from a variety of perspectives and by one or more of several methodologies. Thus the Roman Catholic Church is itself a complex institution, for which the usual diagram of a pyramid, extending from the pope at the apex to the believers in the pew, is vastly oversimplified; within that institution, moreover, sacred congregations, archdioceses and dioceses, provinces, religious orders and societies, seminaries and colleges, parishes and confraternities, and countless other institutions all invite the social scientist to the consideration of power relations, leadership roles, social dynamics, and other sociological connections that it uniquely represents. As a world religion among world religions, Roman Catholicism in its belief and practice manifests, somewhere within the range of its multicoloured life, some of the features of every religion of the human race; thus only the methodology of comparative religion can encompass them all. Furthermore, because of the normative role of Scholasticism in the formulation of Roman Catholic dogma, a philosophical analysis of its system of doctrine is indispensable even for grasping its theological vocabulary. Nevertheless, the historical method is especially appropriate to this task, not only because two millennia of history are represented in the Roman Catholic Church, but because the heart of its understanding of itself is the hypothesis of continuity and because the centre of its definition of authority is the embodiment of divine truth in that historical continuity.

The history of the early church during the first three centuries of its existence is recounted at greater length in the article CHRISTIANITY, and its general outlines must be presupposed here. The present article concentrates on identifying those historical forces that worked to transform the primitive Christian movement into a church that was recognizably "catholic," namely, a church that had begun to possess identifiable norms of doctrine and life, fixed structures of church authority, and, at least in principle, a universality (which is what "catholic" meant) that extended to all of humanity.

History of Roman Catholicism

THE EMERGENCE OF CATHOLIC CHRISTIANITY

At least in an inchoate form all the elements of catholicity—doctrine, authority, universality—are evident in the New Testament. The Acts of the Apostles begins by focusing on the demoralized band of the disciples of Jesus in Jerusalem; but by the time its account of the first decades is finished, the Christian community has developed some nascent criteria for determining the difference between authentic (“apostolic”) and inauthentic teaching and behaviour. It has also moved beyond the borders of Judaism, as the dramatic sentence of the closing chapter announces: “And so we came to Rome” (Acts 28:14). The later epistles of the New Testament admonish their readers to “guard what has been entrusted to you” (1 Timothy 6:20) and to “contend for the faith which was once for all delivered to the saints” (Jude 3), and they speak about the Christian community itself in exalted and even cosmic terms as the church, “which is [Christ’s] body, the fulness of him who fills all in all” (Ephesians 1:23). It is clear even from the New Testament that the specification of these catholic features was called forth by challenges from within, not only from without; indeed, scholars have concluded that the early church was far more pluralistic from the very beginning than the somewhat idealized pictures in the New Testament might suggest.

As such challenges continued in the 2nd and 3rd centuries, further specification became necessary. The schema of apostolic authority formulated by the bishop of Lyon, Irenaeus (c. 130–c. 200), may serve to set forth systematically the three main lines of authority for catholic Christianity: the Scriptures of the New Testament (alongside the Christianized “Old Testament”) as the writings of the Apostles of Christ; the episcopal centres established by the Apostles as the seats of their identifiable successors in the governance of the church; and the apostolic tradition of normative doctrine as the “rule of faith” and the standard of Christian conduct. Each of the three depended on the other two for validation; one could determine which purportedly scriptural writings were genuinely apostolic by appealing to their conformity with acknowledged apostolic tradition and to the usage of the apostolic churches, and so on. This was not a circular argument but an appeal to a single catholic authority of apostolicity, in which the three elements were inseparable. Inevitably, however, there arose conflicts—of doctrine and jurisdiction, of worship and pastoral practice, and of social and political strategy—among the three sources of authority, as well as between equally “apostolic” bishops. When bilateral means for resolving such conflicts proved insufficient, there could be recourse to either the precedent of convoking an apostolic

council (Acts 15) or to what Irenaeus had already called “the preeminent authority of this church [of Rome], with which, as a matter of necessity, every church should agree.” Catholicism was on the way to becoming Roman Catholic.

THE EMERGENCE OF ROMAN CATHOLICISM

Internal factors. Several historical factors, some of them more prominent at one time and others at another, help to account for the emergence of Roman Catholicism from the catholic Christianity of the early church. The twin factors that would eventually be regarded as the most decisive, at any rate by the champions of the primacy of Rome in the church, were the primacy of Peter among the 12 Apostles of Christ and the identification of Peter with the church of Rome. In the several enumerations of the Apostles in the New Testament (Matthew 10:2–5; Mark 3:16–19; Luke 6:14–16; Acts 1:13) there are considerable variations, with further variations in the manuscripts; but what they all have in common is that they list (in Matthew’s words) “first, Simon, who is called Peter.” “But I have prayed for you,” Jesus said to Peter, “that your faith may not fail; and when you have turned again, strengthen your brethren” (Luke 22:32); and again: “Feed my lambs. . . . Tend my sheep. . . . Feed my sheep” (John 21:15–17). Above all, when Christ, according to the New Testament, said to the Apostle Peter, “And I tell you, you are Peter, and on this rock [Greek *petra*] I will build my church” (Matthew 16:18), that was, according to Roman Catholic teaching, the charter of the church—i.e., of the Roman Catholic Church.

The identification of this obvious “primacy” of Peter in the New Testament with the “primacy” of the church of Rome is not self-evident, since, for one thing, the same New Testament remains almost silent about a connection of Peter with Rome. The reference at the close of the Acts of the Apostles to the arrival of the Apostle Paul in Rome gives no indication that Peter was there as the bishop or even as a resident, and the epistle that Paul had addressed somewhat earlier to the church at Rome devotes its entire closing chapter to greetings for many believers in the city but fails to mention Peter’s name. On the other hand, the first of the two epistles ascribed to Peter does use the phrase (presumably referring to a Christian congregation) “she who is at Babylon” (1 Peter 5:13), which was a code name for Rome. It is, moreover, the unanimous testimony of early Christian tradition that Peter, having been at Jerusalem and then at Antioch, finally came to Rome, where he was crucified (with his head down, according to Christian legend, in deference to the crucifixion of Christ); there was, however, and still is, dispute about the exact location of his grave. Writing around the end of the 2nd century, the North African theologian Tertullian (c. 160–

c. 225) spoke of "Rome, from which there comes even into our own hands the very authority of the apostles themselves. How happy is its church, on which apostles poured forth all their doctrine along with their blood! where Peter endures a passion like his Lord's! where Paul wins his crown in a death like that of John [the Baptist]!"

Alongside this apostolic argument for Roman primacy—and often interwoven with it—Rome was honoured because of its position as the capital of the Roman Empire: the church in the prime city ought to be prime among the churches. As the capital Rome drew visitors or tourists or pilgrims from everywhere and eventually became, for church no less than for state, what Jerusalem had originally been called, "the church from which every church took its start, the mother city [*metropolis*] of the citizens of the new covenant." Curiously, the transfer of the capital of the Roman Empire from Rome to Constantinople by the newly converted emperor Constantine in 330, which weakened Rome's civil authority, served only to strengthen its spiritual authority: the title "supreme priest [*pontifex maximus*]," which had been the prerogative of the emperor, now devolved upon the pope. The transfer of the capital also occasioned a dispute between Rome ("Old Rome") and Constantinople ("New Rome") over whether the new capital, as capital, should be entitled to a commensurate ecclesiastical preeminence alongside the see of Peter. The second ecumenical council of the church (at Constantinople in 381) and the fourth (at Chalcedon in 451) both legislated such a position for the see of Constantinople, but Rome refused to acknowledge the legitimacy of that prerogative.

It was also at the Council of Chalcedon, convoked to resolve the doctrinal controversy between Antioch and Alexandria over the person of Christ, that the council fathers accepted the formula proposed by Pope Leo I (reigned 440–461). "Peter," they declared, "has spoken through the mouth of Leo!" That was only one in a long series of occasions when the authority of Rome, sometimes by invitation and sometimes by its own intervention, served as a court of appeal in jurisdictional and dogmatic disputes that had erupted in various parts of Christendom. During the first six centuries of the church the bishop of every major Christian centre was, at one time or another, charged with heresy and convicted—except the bishop of Rome (although his turn was to come later). The titles that the see of Rome gradually assumed and the claims of primacy it made within the internal life and governance of the church were, in many ways, little more than the formalization of what had meanwhile become widely accepted practice during these first four or five centuries of its history.

External factors. In addition to the transfer of the capital from Rome to Constantinople, there were at least two other external factors at the beginning of the Middle Ages that contributed decisively to the development of Roman Catholicism as a distinct form of Christianity. One was the rise of Islām in the 7th century. During the decade following the death of the Prophet Muḥammad in 632 CE his followers captured three of the five "patriarchates" of the early church—Alexandria, Antioch, and Jerusalem—leaving only Rome and Constantinople, located at opposite ends of the Mediterranean and, eventually, also at opposite ends of the East–West Schism. The other force that encouraged the emergence of Roman Catholicism as a distinct entity was the fall of the Roman Empire and the migration into Europe of the Germanic and other tribes that were eventually to constitute its principal population. Some of them, particularly the Goths, had already become Christian before even coming into western Europe. The form of Christianity they had adopted in the 4th century was, however, by the standards of Christian orthodoxy both Eastern and Western, heretical in its doctrine of the Trinity. Therefore the future of medieval Europe belonged not to the Christian tribes but to the pagan tribes, particularly the Franks, once these had become Christian. The Christianity they accepted after their arrival was not only orthodox on the doctrine of the Trinity but it was allied with the authority of the pope. The coronation by the pope of the Frankish king Charles (Charlemagne) as Ro-

man emperor on Christmas Day 800 clearly symbolized that alliance.

The early medieval papacy. During the centuries that marked the transition from the early to the medieval church Roman Catholicism benefited from the leadership of several outstanding popes; at least two of them—both called "the Great" by historians and "Saint" by the Roman Catholic Church—merit special consideration even in a brief article. Pope Leo I was, even for his pagan contemporaries, the embodiment of the ideal of *Romanitas* in his resistance to the barbarian conquerors. Twice in the space of a few years he was instrumental in saving Rome, from the Huns in 452, when he achieved their withdrawal to the banks of the Danube, and from the Vandals in 455, when his intercession mitigated their depredations in the city. His aforementioned intervention in the doctrinal controversy among Eastern theologians over the person of Christ and the role played by his *Tome* of 449 in the formula of the Council of Chalcedon in 451 was part of a concerted campaign to consolidate and extend the jurisdiction of the see of Rome over such remote areas as Gaul, Spain, and North Africa—a jurisdiction officially acknowledged by the Roman emperor. Pope Gregory I (reigned 590–604), more than any pope before or after him, laid the foundations for the Roman Catholicism of the Middle Ages. It was he who selected Augustine of Canterbury to bring about the conversion of England to the Christian faith and the Roman Catholic obedience. He asserted the primacy of his see over the entire church, including the patriarchate of Constantinople, and his diplomatic and political skills secured the independence of the Western Roman Catholic Church both from the Byzantine Empire and from the Germanic tribes occupying Italy. Gregory the Great was also one of the most important patrons of the Benedictine monastic movement, to which he owed a considerable part of his own spiritual upbringing (as his biography of Benedict manifests).

Nevertheless, medieval Roman Catholicism would not have taken the form it did without the conversion of the emperor Constantine in 312. As a consequence of that event Christianity moved in a few decades from an illegal

to a legal to a dominant position in the Roman Empire. Henceforth every branch of Christendom had to deal with rulers who claimed to profess its faith; conversely, the character of every branch of Christendom could in considerable measure be described on the basis of its way of relating church and state. For medieval Roman Catholicism the centralization of church authority in the pope made the relation of church and state a persistent issue in the very understanding of the nature of the church itself. As the church approached the conclusion of the first millennium of its history, it had become the legatee of the spiritual, administrative, and intellectual resources of the early centuries.

Most of the preceding analysis pertains to the whole of Christendom. The Eastern Orthodox Church has almost as large a share in the developments of the early centuries as does the Roman Catholic Church, and even Protestantism looks to these centuries for its authentication. The Middle Ages may be defined as the era in which the distinctively Roman Catholic forms and institutions of the church were set. The following chronological account of medieval developments shows how these forms and institutions emerged from the context of the shared history of the early Christian centuries. (J.J.Pe.)

THE CHURCH OF THE EARLY AND HIGH MIDDLE AGES

The concept of Christendom. By the 10th century the religious and cultural community that is called Christendom had come into being. In every European state the religion of the state was Roman Catholicism. Christendom fought back against Islām in the Crusades (see below), which failed to repossess the lost territories but strengthened the unity of Christendom and rendered it conscious of its power.

The Middle Ages saw the rise of the universities and of a "Catholic" learning, sparked, oddly enough, by the transmission of Aristotle through Arab scholars. Scholasticism, the highly formalized philosophical and theological systems developed by the medieval masters, dominated Roman Catholic thought into the 20th century and contributed to the formation of the European intellectual tradition. With the rise of the universities, the threefold level of the ruling classes of Christendom was established; *imperium* (political authority), *sacerdotium* (ecclesiastical authority), and *studium* (intellectual authority). The principle that each of these three was independent of the other two within its sphere of authority had enduring consequences in Europe.

The same period saw the growth of monasticism. One may see in this withdrawal from the world a response to the essential conflict between Christianity and Roman civilization; those who refused to accept the prevailing compromise between the religious and secular spheres could find no place in the world of the early Middle Ages. Perhaps the most remarkable feature of monasticism was that this withdrawal did not take the form of heresy or schism. Monasticism found a way of refusing the compromise without departing from the church that had made the compromise. (F.C.O./J.L.McK./Ed.)

A period of decadence. This period also revealed the possibilities of corruption within the Roman Catholic Church. Without the accumulated prestige and the precedents established by the 9th-century popes, the claim to primacy would have had difficulty in surviving the subsequent period of papal decadence. In the 870s the imperial government in Italy declined in influence, and the bishopric of Rome, along with other European bishoprics, was increasingly at the mercy of the local nobility, with spasmodic interventions by the 10th-century German emperors.

German kingship entered upon a new epoch in the 10th century. Under Otto I, the Great, the bishops and greater abbots were drawn into royal service and enriched with estates and counties, for which they did feudal homage. Otto conquered northern Italy and extracted from the pope an imperial coronation (962). Both he and his grandson Otto III regarded the papal territory as part of their realm; they appointed and removed popes and presided at synods. Otto III, an enlightened ruler, appointed as pope

his old tutor, Gerbert of Aurillac—who took the name Sylvester II—whose brief reign (999–1003) was a shaft of light between two periods in which Roman factions dominated the papacy.

German "protection," however, had its price. When the emperor Henry III descended into Italy in 1046, deposing three rival claimants to the papacy (Sylvester III, Gregory VI, and Benedict IX) and then appointing his own candidate, Clement II (and later several successors), the Roman Church was in grave danger of becoming an imperial proprietary church, similar to those multitudinous lower churches in Europe whose royal or aristocratic owners regarded them, in accordance with age-old custom, as their own private property to be disposed of at will.

France during this period was fragmented into many feudal domains. This allowed the ecclesiastical hierarchy there a certain independence and cohesion, while the growth of the French reform-oriented monastery at Cluny prepared the country for its message of reform. In England there was a unique intermingling of ecclesiastical and royal administration that, in fact, left the church entirely free. On the fringes of Christendom—Scandinavia, Scotland, Ireland, and northern Spain—there was little hierarchical development.

Popular Christianity c. 1000. The greater part of central Christendom had by the 11th century been divided into bishops' dioceses and individual parishes. But in the northern and western regions the proliferation of small private churches had not yet been wholly absorbed, and the existence of proprietary and exempt enclaves continued to the Reformation and beyond. The priest, in rural districts usually a vassal of the lord (subject to the lord but not to others), cultivated his acres of glebe (revenue lands of the parish church), celebrated mass on Sundays and feasts, recited some of the hours (liturgical or devotional services for use at certain hours of the day, according to the monastic daily schedule), and saw that his flock was baptized, anointed, and buried. Lay people normally received communion four times a year—Christmas, Easter, Pentecost, and Assumption (August 15). Auricular (privately heard) confession was widespread but not universal.

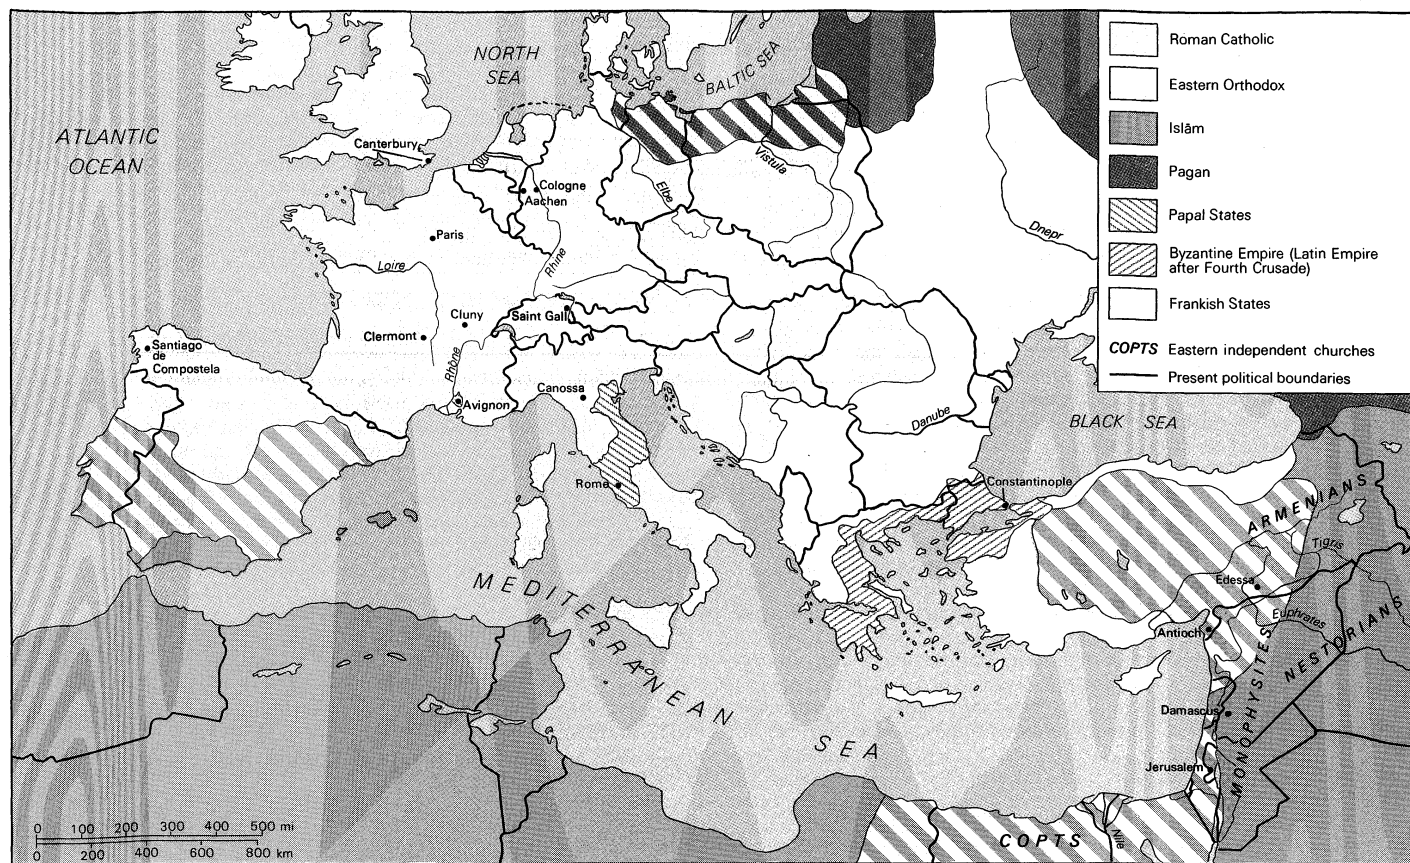

Education in the early Middle Ages was at a very low ebb outside the monasteries. Cathedral schools were few, and rural priests who could read Latin easily were rare. Almost all literary work came from the monasteries and in Celtic lands (mainly Ireland) from the half-monastic Culdees (religious recluses). The larger monasteries, such as Cluny or St. Gall (Switzerland), were towns in miniature with a variety of social services; they were also the only reservoirs of learning and artistic skill. On the land, pious practices and beliefs often merged into superstition or "white" magic; and marriage customs, together with the complicated degrees of prohibited relationships, provided endless problems in an epoch when the presence of a priest was not necessary for a valid union. In an age of protective lordship, heavenly patrons were highly valued, and the body or relics of a reputed saint made him the *persona*, a quasi-living protective presence, of a church or abbey. This aspect of belief explains the popularity of pilgrimages to shrines such as that of the Apostles at Rome, St. James at Santiago de Compostela (Spain), the Magi at Cologne (Germany), and countless others. Monastic piety was expressed not only in the liturgy but also in "little offices" (liturgical or devotional services) of the Blessed Virgin, of the cross, of all saints, and of the dead; the primary reason for a monastery's existence was intercessory prayer—hence the numerous monastic foundations by royal and noble families.

The first reformers: Leo IX and Nicholas II. Leo IX (reigned 1049–54) was the first pope to impose his authority upon the church in general; he achieved this by a tactic of lengthy tours beyond the Alps, punctuated by synods, in which decrees both dogmatic and disciplinary were passed. He also began the practice of appointing non-Romans to curial (papal administrative) posts and sending legates (papal representatives) to carry out his decrees. A man of great energy and spiritual purpose, he must nevertheless bear the responsibility for a disastrous war that ended in capitulation to the Normans and for

choosing the rigid and violent Humbert for the mission to Constantinople in 1054, the year from which the Schism between the churches of the East and West is dated. In the years of confusion that followed, the papal election decree of Nicholas II in 1059 stands out: it gave the right and duty of papal election to the cardinals, tacitly eliminating the king of Germany. The same pope shortly afterward renewed earlier decrees on simony and clerical celibacy but avoided the issue of pope and empire.

The reign of Gregory VII. Hildebrand, who succeeded in 1073 as Gregory VII (reigned 1073–85), proved to be one of the greatest of his line and had more influence than any other person of his time upon the external fabric of the church. In his long struggle with the German king Henry IV he suspended and excommunicated his opponent, pardoned him as penitent at Canossa, Italy (1077), excommunicated him again (and was himself twice deposed), and was finally driven from Rome by Henry to die in exile at Salerno (1085). In opposition to Henry's claim to be the divinely appointed vice regent of Christ over the activities of the church, Gregory presented himself as heir to the unlimited commission of Christ to Peter over all souls (Matthew 16:18–19). Beneath these lofty claims lay the ruler's resistance to losing his ancestral right of appointing to office his most influential subjects (who often also held the richest fiefs) and the pope's insistence on the authority of ancient canon law and papal decrees. If the king's claims were inconsistent with the current conception of a free church, the pope's claim and actions were without precedent within the memory or records of his age.

Even more directly influential was Gregory's centralization of the church. Through the appointment of plenipotentiary legates (representatives with full power to negotiate), the immediate control of diocesan bishops, canonical elections, and Roman and local synods, and the publication of canonical collections and polemical manifestos a web was spun in which every thread led to Rome. The scattered priests and the distant bishops were gradually becoming a class, the clergy, distinct from others and with

a law and a loyalty of their own. Although Gregory died a lonely exile, his principles of reform had found reception all over Europe, and the new generation of bishops was Gregorian in sympathy and obedient in practice to papal commands in a way unknown to their predecessors.

The Investiture Conflict (1085–1122). The efforts of the reformers to make the church independent of lay control inevitably centred upon the appointment of bishops by the ruler of the country or region. In ancient canon law, election of bishops had been by clergy and people; entrance upon office followed lawful consecration. Feudalism and royal claims had transformed election into royal appointment, and admission to office was by means of the bestowal, or investiture, by the lord, of ring and staff (symbols of the episcopal office), preceded by an act of homage. This savoured of simony, both because a layman bestowed a spiritual benefice and because money was often offered or demanded. The conservatives appealed to immemorial practice, accepted and even enjoined by the papacy.

Gregory VII, though asserting the principle of freedom, was in fact tolerant of royal appointments free from simony. Pope Urban II (reigned 1088–99) was equally inconsistent, though in other ways he was a reformer. Pope Paschal II (reigned 1099–1118) at once condemned lay investiture, thus precipitating the crisis in England between Anselm, archbishop of Canterbury, and King Henry I. This and a similar crisis in France were settled by a compromise. Election (by the cathedral chapter) was to be free; lay investiture was waived, but homage before the bestowal of the fief was allowed. Meanwhile Paschal, at odds with the German king Henry V, who was demanding imperial coronation, suddenly offered to renounce all church property held by the king if lay investiture were also abandoned. Henry accepted, but the bishops refused the terms; thereupon the King seized the Pope who, under duress, allowed lay investiture. By this time, however, a large majority of the bishops were Gregorians, and the Pope was persuaded to retract. Eleven years later Pope Gelasius II accepted the Concordat of Worms (1122). Ac-

The
Concordat
of Worms

cording to this agreement free election by ecclesiastics was to be followed by investiture (without staff and ring) and homage to the king.

This ended a strife of 50 years, in which pamphleteers on both sides had revived every kind of claim to supremacy and God-given authority. Nominally a compromise, the concordat was in effect a victory for the monarch, for he could usually control the election. Nevertheless, the war of ideologies had exposed the weakness of the emperor who in the last resort had to admit the spiritual authority of the pope, and the struggle left intact the claim of the church to moderate the whole of society.

The Crusades. The authority of the papacy and the relative decline of the empire also became clear in the unforeseen emergence of the Crusades as a major preoccupation of Europe. The papacy had been stirred more than once by the disasters befalling Eastern Christians, such as their defeats by the Seljuq Turks at Manzikert (1071) and Antioch (1085) in Asia Minor, when the Byzantine emperor Alexius I appealed for help to Pope Urban II. Although this appeal may have been the decisive motive for the Crusade, there were obvious advantages in diverting the Normans of Sicily and other turbulent warriors from Europe to wage a sacred war elsewhere. Urban's celebrated call to the Crusade at Clermont (France) in 1095 was unexpectedly effective, placing the pope at the head of a large army of volunteers. Even though the capture of Jerusalem (1099) and the establishment of a Latin kingdom in Palestine were balanced by disasters and quarrels, the papacy had gained greatly in prestige. Though Germany as a whole had remained aloof, a pope had for the first time stood out as the leader of a European endeavour. The Crusades, with their combination of idealism, ambition, heroism, cruelty, and folly are a medieval phenomenon and, as such, outside modern man's experience. But they were part of the religious background for two centuries and added greatly to the anxieties, both spiritual and financial, of the papacy.

THE CHURCH OF THE LATE MIDDLE AGES

The Proto-Renaissance. The 12th century, or, more correctly, the century 1050–1150, has been called the first Renaissance. A more accurate title would be the adoles-

cence of Europe, in which higher education, techniques of thought and speech, and a fresh attack upon the old problems of philosophy and theology appeared for the first time in postclassical Europe. All these activities were carried out by clerics and controlled by churchmen. The focus of educational activity was the cathedral school, and the new agent of instruction was the semiprofessional, unattached teacher, such as the French philosopher-theologians Berengarius, Roscelin, and Abelard, though monks such as Lanfranc, Anselm of Canterbury, and Hugh and Richard of the Monastery of St. Victor, Paris, still had a share.

Philosophy was revived through the development of logic and dialectic, which were applied to doctrines of the faith, either as formal exercises, Augustinian speculation, or critical reformulation. From 1100 onward theology, in the modern sense of the word (first used by Abelard), emerged. The teachings of Scripture and of the early Church Fathers on the various doctrines were consolidated and organized in works called *Sentences*. The first handbook of theology was composed by Abelard. Finally, Peter Lombard (bishop c. 1159) published his *Four Books of Sentences*, which summarized the Christian faith, using the *sic-et-non* (yes-and-no) dialectic popularized by Abelard and the canon lawyers, and he also pronounced on vexing questions. His classic manual may be said, in modern terms, to have created the syllabus of theological study for the age that followed. Together with the expansion of logic—brought about by the arrival (through Muslim sources) of what was called the new logic of Aristotle—and the emergence of the university, the *Sentences* ended the era of literary, humanistic, and monastic culture and opened that of the formal, impersonal, Scholastic age.

Reformed monasticism. The most distinctive feature of the century 1050–1150, according to some scholars, was the appearance and diffusion of reformed monasticism. Beginning with a few relatively small quasi-hermit orders in Italy, such as the Camaldolese and the Vallombrosans, the movement spread to France with the extreme eremitical Grandmontines (founded in 1077) and the eremitical Carthusians (founded in 1084) and became as wide as Christendom with the multiplication of the daughter monasteries of Cîteaux (founded in 1098). of the Cistercians (based at Cîteaux) was exact observance of the Rule of St. Benedict, with emphasis on simplicity, poverty, and manual work. The addition of lay brothers tapped a large reservoir in an age of economic and demographic expansion, and the organization of the order—with annual visitations and a general chapter—ensured good discipline and enabled the order to accommodate itself to the strain of a vast family of houses scattered throughout the Latin Church. The success of Cîteaux owed much to the genius of St. Bernard, abbot of Clairvaux from 1115 to 1153, who was for 30 years the untitled religious leader of Europe. Owing to his influence, other new orders, such as the Premonstratensians, the English Gilbertines, and the military Knights Templars, accepted or imitated Cistercian practices. All these and others had a popularity that in any other age would have seemed miraculous, since they practiced austerity. By the end of the 12th century the saturation point for monasticism had been reached all over Europe, save in a few peripheral regions, and the golden age of monasticism had passed.

The papacy at its height: the 12th and 13th centuries. Gregory VII has often been portrayed as an innovator who lacked both authentic ancestors and true successors. It must be affirmed, nonetheless, that the later history of the papacy, modern as well as medieval, was shaped by what he and his followers did, while the continuing disabilities characteristic of the medieval papacy owed much to what they left undone. Thus, the assimilation of the biblical notion of church office as grounded in love for others to the political notions of office as grounded in power and law—a development in process since the 4th century and earlier—reached a point of no return with Gregory. He functioned within a unified Christian society in which “state” and “church” were no longer conceived as distinct societal entities and was thus impelled by its very dynamic to assert a claim to jurisdictional supremacy even over the Christian emperor. For the next two centuries papal history was characterized by a deepening involvement, direct and indirect, in matters political. As a result there were, under Alexander III (reigned 1159–81) and Innocent IV (reigned 1243–54), renewed clashes with the German emperors and, under Innocent III (reigned 1198–1216), extensive and damaging papal interference in German internal affairs. What alarmed these popes was the fear that imperial policy, by encroaching upon papal territorial independence, also threatened the autonomy of papal action. But with Innocent IV, at least, such a fear was matched by his wish to vindicate, even in temporal matters, the papal claim to supremacy.

Though much of the drama of papal history in this period focused upon these conflicts, the impact that the thoroughgoing politicization of church office had upon the nature and structure of ecclesiastical government and the pope's place in it was of more enduring significance. Here again Gregory's pontificate was something of a watershed. Any lingering belief that the pope's primacy might be regarded primarily as one of honour was now dispelled, and any hesitation about implementing the jurisdictional primacy that had supplanted it now disappeared. The need for papal leadership was so widely accepted that throughout much of the 12th and 13th centuries the demand for it came from the local churches themselves. The outcome was an acceleration in the process that had led, by the late 13th century, to a papal exercise of judicial authority going far beyond the mere acceptance of appeals from lower courts; to an arrogation of the wide-ranging legislative powers manifest in the *Decretals* of Gregory IX (1234), the first officially promulgated collection of papal laws; and to the system of “papal provisions” (direct papal intervention in the disposal of benefices) that was finally to be completed by Benedict XII in 1335.

Papal leadership in the church was eventually replaced by papal monarchy over the church. Positively, this transformation was evident in the reforming legislation of the fourth Lateran Council (1215). The negative aspect was to become increasingly obvious as the 13th century wore on. It was no accident that what turned out to be the permanent schism between the Latin and Greek churches occurred at a time when Leo IX had embarked upon a

more active exercise of the papal primacy. The more his successors succeeded in establishing the fullness of their jurisdictional power (*plenitudo potestatis*) within the Latin Church, the less chance there was of healing the schism. Nor did papal sponsorship of the Crusades, however great the prestige it had brought to Urban II at the time of the First Crusade, ultimately redound to the benefit of the religious life of the church.

Least justified of all was the administrative centralization attendant upon the exercise of the *plenitudo potestatis* when it was finally measured against the price that had to be paid—notably the corruption spawned by the stringent financial measures (e.g., sale of indulgences, benefices, etc.) needed to support the growing army of clerical bureaucrats at Rome. And on this point one of the things left undone by the Gregorian reformers proved to be crucial. Their failure to uproot the notion of the “proprietary church” explains both the willingness of later canonists to classify the laws governing the disposition of ecclesiastical benefices under the heading not of public but of private law (law pertaining to the protection of proprietary right) and also the tendency of medieval persons in general to regard ecclesiastical office less as a focus of duty than as a source of income or an object of proprietary right. When the 13th-century popes found that direct papal taxation did not yield funds sufficient to support their bureaucrats, they adopted the practice of “providing” them to benefices all over Europe, for the law itself encouraged them to think of such benefices as sources of much needed revenue. Thus arose the characteristic abuses of pluralism (holding more than one benefice) and nonresidence against which church reformers from the mid-13th century on railed in vain and the blame for which they were soon to lay at the door of a papacy that had finally come to be regarded as an obstacle rather than a spur to reform.

The age of faith. Below the level of the papacy, however, a spiritual revival had taken place. The 12th century, perhaps more than any other, was an age of faith in the sense that all men, good or bad, pious or worldly, were fundamentally believers, and religious causes and interests (crusades, monastic foundations, building churches, and assisting education and charities) made up much of the life of the literate and administrative classes. Lay religion was, as never before or since, permeated with monastic ideals. Prodigious numbers of the populace became monks, knights (members of military-religious orders), labourers (lay brothers), and lay people who followed monastic rules, and the favourite lay devotions were short versions of monastic offices. Almost every church—whether cathedral, monastic, parochial, or private—was built or rebuilt between 1050 and 1200. Almost all baronial families founded a monastery, and townspeople not only paid for their cathedrals but often supplied materials and labour.

The pontificate of Innocent III saw the appearance of a totally new form of religious life, that of the penniless or mendicant friar. Francis of Assisi (1181/82–1226), a personality of magnetic originality who believed that he was called by Christ to preach poverty, had no thought of founding an order; but his message and his genius exactly suited his age, and the vast concourse of his followers gradually changed from a homeless, penniless band of preachers and missionaries in Italy into an international body governed by a single general and devoted to the service of the papacy. Dominic of Spain (c. 1170–1221), on the other hand, with a vocation to preach doctrine to heretics and with followers keeping a canonical rule, changed his existing institute into one of friars. Gradually the two groups became similar: international, articulated groups of men bound to an order but not to a community. They took the customary monastic vows of poverty, chastity, and obedience but dropped the vow of *stabilitas* (stability) in favour of mobility, and they were governed by elected superiors under a supreme chapter and general. Unpredictably, first the Dominicans and then the Franciscans entered and soon dominated the theological schools of Paris and Oxford. Two similar bodies joined them, the Carmelites and Austin Friars, and for almost a century the friars were the theologians, the preachers, and the confessors of the Christian people.

orders

The papal
monarchy

The rise of heresy. Before the middle of the 12th century heresy on a large scale was unknown in the West. The early dissenters were often radical reformers such as the Italian canon Arnold of Brescia (d. 1155), an outspoken critic of clerical wealth and corruption. Then there appeared in northern Italy and southern France the sect, Eastern and Manichaean in origin, later known as the Cathari (the "pure," from the ascetic lives of their leaders). This sect had an organization and liturgical life that imitated Christianity; but it overtly denied many key doctrines, such as the incarnation of Christ, and was dualistic in that it regarded matter and the human body as evil and the spirit as good. Its emphasis on poverty and its genuine solidarity of mutual assistance appealed to many by contrast with the luxury and wealth of the Catholic hierarchy. A little later another type of dissent appeared with the Waldenses (founded by a French reformer named Valdes) of the Rhône Valley and Piedmont. These groups, basically and professedly orthodox, together with the reform-minded Humiliati of Lombardy (Italy), practiced poverty, Scripture reading, and preaching. The Cathari were proscribed as heretics by the papacy and were attacked by a crusade and later by the Inquisition, and they gradually disappeared. The Humiliati remained orthodox as a quasi-religious order. The Waldenses, largely through mismanagement by the bishops, drifted away from the church and remained throughout the Middle Ages and after a non-Catholic body. These heretical movements, together with numerous legal disputes between monks and bishops, and bishops and metropolitans (ecclesiastical provincial leaders), imparted a sense of decline and peril to the last decades of the 12th century, which were notably barren of saints and great men. The church was too rich and too set in its hierarchical ways to meet the demands of larger populations and economic stresses, especially in urban conditions. Reformers demanded a spirit of poverty and a fresh wind of spirituality.

The golden age of Scholasticism. The 13th century was an age of fresh endeavour and splendid maturity in the realms of thought, theology, and art. Philosophy, hitherto almost exclusively devoted to logic and dialectic, had stagnated in the later 12th century. It was revived by the gradual arrival from Spain and Sicily of translations of the whole corpus of Aristotle's writings, often accompanied by Arabic and Jewish commentaries and treatises. Aristotle, especially in his *Metaphysics* and *Ethics*, opened the whole field of philosophy to the schools. After a short period of hesitation his works were used by theologians, at first eclectically and then systematically. The great German philosopher and theologian Albert of Cologne (known as Albertus Magnus) and his more famous pupil Thomas Aquinas rethought the system of Aristotle in Christian idiom, pouring into it a fair dose of Neoplatonism from St. Augustine. Aquinas, in some 25 years of work, set theology firmly on a philosophical foundation. The Italian theologian Bonaventure (1217–74), in an even shorter career, renewed the traditional approach of Augustine and the Victorine monks regarding theology as the guide of the soul to the vision of God. At the same time masters in the arts school of Paris used Aristotelian thought to present a naturalistic system that clashed with orthodox teaching. The condemnations that ensued in 1272 and 1277, coinciding with the deaths of Bonaventure and Aquinas (1274), included some Thomist theses. This apparent victory of conservatism ended the long era in which Greek thought was regarded as right reason and foreshadowed the age of individual systems and the divorce of philosophy from theology.

Ecclesiastical life in the 13th century. The coming of the friars and the legislation of the fourth Lateran Council in Rome (1215)—including requirements of annual confession and communion and a reduction in number of the impediments to marriage—saved the lower classes for the church and silenced many of the critics of the establishment. Well-trained and extremely mobile, the friars were able to reach and hold regions and peoples that the static monks and clergy had failed to move. The 13th century in Europe as a whole was a time of pastoral endeavour in which bishops and university-trained clergy perfected

the diocesan and parish organization and reformed many abuses. It was an age of active and spiritual bishops, many of them masters in theology and themselves friars. There also were controversies. The early friars served and were welcomed by the bishops and parish clergy, but clashes soon occurred; the papacy gave the friars exemptions and privileges so wide that the basic rights of the secular clergy were threatened. An academic war of pamphlets led to an attack on the vocation and work of the friars. A compromise was finally arranged by Boniface VIII (reigned 1294–1303) that was just and workable; under a revised form it lasted for two centuries. The bishop could refuse friars entry into his diocese, but once they had been admitted, the friars were free from his control.

Troubles of the church c. 1300. The last quarter of the 13th century was a time of growing bitterness and harshness. The golden age of Scholastic theology had come to an abrupt end. The troubles of the Franciscans—divided into those who stood for the absolute poverty prescribed by the rule and testament of Francis (the Spirituals) and those who accepted papal relaxation and exemptions (the Conventuals)—were a running sore for 60 years, vexing the papacy and infecting the whole church. The Inquisition (the ecclesiastical tribunal instituted in 1229 to deal with heretics) and the papal court incurred odium for their inhumane and inequitable treatment of those suspected of heresy.

Another instance of hardening sentiment is seen in the treatment of the Jews. Between 800 and 1200 the Jewish population had increased significantly in Lombardy, Provence, and the towns of the river valleys of the Rhône, the Rhine, and the Danube. They entered England only after the Norman Conquest (1066.) Apart from heretics such as the Cathari they were the only "foreign body" in Western Christendom and as such attracted the special notice of the ignorant and brutal. There were shocking massacres of Jews when the Crusades were preached, especially in the Rhineland, and after various instances of panic on the part of Christians, Jews were accused of sacrilege and child murder. These, however, were all mob movements, resisted by kings and bishops. Later the Jews suffered from suspicions that were aroused by the Cathari. The fourth Lateran Council gave the Jews a distinguishing badge and forbade their employment by governments. This established once and for all the ghetto system in large towns but did not at first impair Jewish prosperity. Later on the growing class of Christian merchants became jealous and hostile, and in 1290 and 1306 the Jews were expelled from England and France. This swelled their numbers in Germany, thenceforward called "the classic land of Jewish martyrdom." Groups remained in Italy, and the Roman colony was never disturbed. In Spain toleration gave way to widespread persecution and conversion under duress, which left a heritage of sorrow for the future.

The "Babylonian Captivity." In 1303, despite its resounding claims and its complex governmental machinery, the prestige of the papacy had fallen so low that it was possible for mercenaries in French pay and under French leadership to harass and humiliate the pope with impunity; Boniface VIII, at Anagni was arrested in his own family (Caetani) palace. The aftermath of this "outrage of Anagni" was the "Babylonian Captivity"—the desertion of Rome by the popes and their long residence (1309–77) at Avignon, Fr.—so called after the 70 years of Jewish exile in Babylon in the 6th century BC.

The disputes of the Franciscans, which had crystallized finally upon the teaching of the Spiritual Franciscans that their absolute poverty was that of Christ, were harshly settled (1322) by the irascible octogenarian John XXII (reigned 1316–34). A group of Franciscans, however, led by Michael of Cesena, general of the order, and William of Ockham, became bitter and formidable critics of the papacy. With them for a time was the Italian political philosopher Marsilius of Padua, a Paris master who, in his *Defensor pacis* (1324), outlined a secular state in which the church was a government department, the papacy, and episcopate human institutions, and the spiritual sanctions of religion relegated to a position of honourable nonentity.

Persecution of the Jews

Revival of philosophy

Advocacy of a secular state

Between them, Ockham and Marsilius used almost all the arguments that have ever been devised against the papacy. Condemned more than once, Marsilius had little immediate effect or influence, but during the Great Schism of the papacy (1378–1417) and later, in the 16th century, he and Ockham had their turn.

With the papacy “in captivity” and Nominalism capturing the universities, Europe and the church entered upon an epoch of disasters, of which the Hundred Years’ War between England and France (began 1337) and the Black Death (1348–49) were the most clearly seen by contemporaries. For all this, Christian life in the first half of the 14th century changed little. Many of the largest parish churches of Europe date from this time, as do many popular devotions, prayers, hymns, and carols; also, many hospitals and almshouses were founded. Though the relations between the friars and the secular clergy had been canonically settled, friction continued. The friars came under wider criticism for worldliness and immorality, but they remained popular. Though heresy and antisacerdotal (anticlerical) sentiment became almost endemic in the cities of Belgium and the Netherlands, the 14th century produced some of the greatest mystical writers of the church’s history: Johann Tauler and Jan van Ruysbroeck in the north, Catherine of Siena in Italy, and the anonymous author of *The Cloud of Unknowing* and Walter Hilton in England.

The missionary enterprise during the period 1000–1350 involved three principal fields of work: Spain, central Europe, and Asia. In Spain the absorption of the Mozarabic Church (the Arabic term for Spanish Christians under Moorish rule) and the reestablishment of Catholic practices was accomplished by Spaniards who followed the crusade ideal and by volunteers, partly monastic, from beyond the Pyrenees. In central Europe, Pope Sylvester II (reigned 999–1003) had founded the ecclesiastical hierarchies of Hungary and Poland. The region between these countries and Germany was gradually conquered and Christianized by neighbouring bishops and German missionaries. The Baltic lands were won by a mixture of preaching and the swords of the Teutonic Knights (a military monastic order) between 1100 and 1400. Purer in motive and magnificent in design were the efforts of the Franciscans and Dominicans in the Middle and Far East. Both orders preached to the Muslims, and early in the 13th century the Franciscans were in Georgia (now in the U.S.S.R.) and Persia and the Dominicans in Syria. In mid-century the Franciscans penetrated Mongolia and established a church in China with an archbishop and 10 suffragan bishops, and under John XXII there was a hierarchy in Persia. All this might well have endured, had not the last of the great invasions (1383), under the Turkic conqueror Timur, or Tamerlane, broken all links between Europe and the East.

(M.D.K./F.C.O./Ed.)

FROM THE LATE MIDDLE AGES TO THE REFORMATION

The most decisive—and the most traumatic—era in the entire history of Roman Catholicism was the period of three centuries from the middle of the 14th to the middle of the 16th century. This was the time when Protestantism, through its definitive break with Roman Catholicism, arose to take its place on the Christian map. It was as well the period during which the Roman Catholic Church, as an entity distinct from other “branches” of Christendom, even of Western Christendom, came into being. There is therefore much to be said for the thesis that Roman Catholicism in the form in which it is known today is, in many fundamental ways, a product of the Reformation.

Late medieval reform: the Great Western Schism and conciliarism. Reformation of the church and the papacy was what the advocates of a return of the papacy from Avignon to Rome had in mind. In the pope’s absence, both the ecclesiastical and the territorial authority of the papacy had deteriorated within Italy itself, and the moral and spiritual authority of the papacy was in jeopardy throughout Christian Europe. This condition, so many believed, would continue and even worsen so long as the papacy remained in Avignon. Pope Urban V (reigned 1362–70) attempted to reestablish the papacy in Rome in

1367, but after a stay of only three years he returned to Avignon, only to die soon after his return. It was finally Gregory XI (reigned 1370–78) who, in 1377, permanently moved the papal headquarters back to Rome; but he died only a few months later. The immediate result of the return to Rome was the very opposite of the restoration of confidence and credibility that, for differing reasons, the prophetic voices and the political calculations of the 14th century had predicted would come from it. For not only had the church during its residence in Avignon come under the political and religious domination of France, which resisted the repatriation of the papacy to Italy, but the weakness of the papacy in Avignon had enabled the college of cardinals and the papal bureaucracy to fill the administrative vacuum by developing a pattern of government that can only be described as oligarchic. The powers that the cardinals had succeeded in appropriating were difficult for the centralized authority of the papacy, whether in Avignon or in Rome, to reclaim for itself.

Meeting in Rome for the first time in nearly a century, the college of cardinals elected Pope Urban VI (reigned 1378–89). But his desire to reassert the monarchical powers of the papacy, as well as his evident mental illness, prompted the cardinals to renege on that choice later in the same year. In his stead they elected Clement VII (reigned 1378–94), who soon thereafter took up residence back in Avignon. (This Clement VII is officially listed as an antipope, and the name was later taken by another pope, Clement VII [reigned 1523–34].) The years from 1378 to 1417 count as the time of the Great Western Schism, so identified to distinguish it from the no less great East–West Schism. The Great Western Schism divided the loyalties of Western Christendom between two popes, each of whom excommunicated the other and all of the other’s followers. In the conflict between them, kingdoms, dioceses, religious orders, parishes, even families were split; and the pretensions of a church that claimed to be, as the Nicene Creed said, “one, holy, catholic, and apostolic” were seen as a mockery, since the empirical church—whichever it was—was in fact none of these. No one could be absolutely certain about the validity of the sacraments if the integrity and very unity of the church, and therefore of the episcopate, and therefore of the priesthood, were in doubt. Speaking for a broad consensus, the University of Paris proposed three alternatives for resolving the crisis of the institution, which had now become, for laity and clergy alike, a crisis of faith: resignation by both popes, with the election of a single unchallenged successor; adjudication of the dispute between the two popes by some independent tribunal; or appeal to an ecumenical council, which would function as a supreme court with jurisdiction over both claimants.

The third of these, the summoning of a general church council, seemed to the theologians at Paris and to many others to be the preferable route. The first of several reform councils was held at Pisa in 1409 to deal with the schism and with the many other problems of discipline and doctrine that had arisen. Pisa elected Alexander V (reigned 1409–10) as pope in place of both incumbents. But because neither of the other two would acknowledge the authority of the council and resign, the immediate result was that for a few years, as one cardinal said, the church was treated to “a simulacrum of the Holy Trinity”—the spectacle of three popes. That spectacle and the Great Western Schism itself came to an end through the work of the Council of Constance (1414–18). In addition to the settlement of the question of papal legitimacy Constance enacted legislation on a variety of reform issues. Among others it stipulated that thenceforth, as a matter of church law, the church council was not to be seen as an expedient to be resorted to in an emergency but as a standing legislative body, a kind of ecclesiastical senate that should meet at brief and regular intervals. The decree of the Council of Constance justified this provision on the principle that the authority of the ecumenical council as the true representative of the entire church was superior to that of the pope, who could not make a similar claim for himself apart from the council. In oversimplified form, this elevation of conciliar over papal authority may be

Council of
Constance

taken as the central tenet of the late medieval movement called conciliarism.

This action also helps to account for the ambiguous position of the Council of Constance in the history of later Roman Catholic canon law, with opinions of canonists and historians differing to this day about which sessions of the council are entitled to the status of a true ecumenical council. An ambiguity even more complex attended the next of the reform councils, which used to be known in history books as the Council of Basel-Ferrara-Florence but is now sometimes divided into two councils, that of Basel and that of Ferrara-Florence, with the legitimacy of the Council of Basel contested in whole or at least in part. The council opened at Basel in 1431, was transferred by the pope to Ferrara in 1438 (although a substantial portion of its membership remained in Basel, continued discussing and legislating, and was eventually excommunicated as schismatic), moved to Florence in 1439, and held its closing sessions at Rome in 1443–45. While still at Basel, the council reaffirmed the conciliarist teaching of Constance about the superiority of the council to the pope.

Both the Council of Constance and the Council of Florence have additional importance in the history of late medieval reform in Roman Catholicism: Constance for dealing with the problem of heresy within the Western Church, Florence for addressing itself to the relation of Western Roman Catholicism to Eastern Christendom.

Jan Hus. A major item on the agenda of the Council of Constance was the challenge posed to the authority of both contending parties, council as well as pope, by the teachings of the Czech preacher and reformer Jan Hus (c. 1372–1415) in Prague. In every century of the Middle Ages there had been calls for reform in the church, and in times of moral corruption or of administrative chaos such calls inevitably became more intense. But the Hussite movement proved to be more than just another protest. It was animated by a definition of the church, rooted in the Augustinian tradition, that drew a sharp distinction, if not quite a disjunction, between institutional Christendom as headed by the pope and the true church as headed by Christ. The true church consisted only of those who had been predestined for membership by God and who were true believers and saints; no hypocrite, even one in the highest ecclesiastical position, could belong to that true church.

Despite the accusations of his critics, it seems clear that Hus did not draw from this premise the radical conclusion that sacraments administered by a hypocritical priest or bishop or pope were invalid in themselves; the priestly office and the sacraments retained their objective validity. A prominent element of the Hussite demands, however, was a call for the administration of Holy Communion to the laity “under both kinds—bread and wine—[*sub utraque specie*],” that is, they demanded the restoration of the chalice; the followers of Hus emblazoned a chalice on their banners. The Hussite program of reform coalesced with the rising nationalism of the Czech people, many of whom saw in the Roman Catholic Church a symbol of Italian and German domination.

In 1411 Hus was excommunicated by Pope John XXIII (reigned 1410–15), now identified as an antipope, but in keeping with the widespread spirit of conciliarism he appealed his case to an ecumenical council of the church. Therefore he was summoned to appear before the Council of Constance and was promised a safe-conduct by Sigismund (1368–1437), the Holy Roman emperor. Once at the council, however, Hus was arrested and incarcerated. He was tried for heresy (particularly because of his doctrine of the church) and condemned, and on July 6, 1415, he was put to death. His main prosecutors were also the leaders of the reform movement at the Council of Constance, notably Jean de Gerson (1363–1429), chancellor of the University of Paris. The death of Hus was not, however, the end of his movement. A principal difference between Hus and most other medieval reformers was that while they and their followers remained (though sometimes just barely) within the boundaries of Roman Catholicism, the outcome of his agitation was in fact the founding of a new church, one that continued to exist outside the structure

of Roman Catholicism. In this respect, as well as in various specific doctrinal and moral teachings, he anticipated the development of the Protestant Reformation a century later, and his 16th-century disciples saw that development as a vindication of his and their position.

Efforts to heal the East-West Schism. At Basel, and then especially at Florence, there were extensive negotiations and discussions over the newly revived proposals for effecting a reunion of the Eastern Orthodox Church and Western Roman Catholicism. Earlier attempts at such a reunion, for example at the Council of Lyon in 1274, had failed. But now the time seemed ripe on both sides for a new effort at negotiation and reconciliation. Christian Constantinople was under increasing threat from the Turks and wanted Western support, moral as well as military. Leaders of the West, regardless of party, saw the prospect of achieving a long-sought rapprochement with the East as a means of restoring the prestige of both the papacy and the ecumenical council, which could then be seen as having resolved both of the major schisms of Christian history—the Great Western Schism and the East-West Schism—in the space of one generation. The patriarch of Constantinople, Joseph II (c. 1360–1439), and the Byzantine emperor, John VIII Palaeologus (1391–1448), both came in person to the Council of Florence for the theological negotiations pointing toward reunion of the two churches.

In the course of the doctrinal discussions between Greeks and Latins all the major points of difference that had historically separated the two churches received detailed attention. The Greeks acknowledged the primacy of the pope, and the West acknowledged the right of the East to ordain married men into the priesthood. The chief sticking point, as always, was the doctrine of the *Filioque*: Did the Holy Spirit in the Trinity proceed from the Father only, as the East taught, or “from the Father and the Son [*ex Patre Filioque*],” as the Western addition to the text of the Nicene Creed affirmed? At stake here was not only the dogmatic Trinitarian question itself, over which the disputes between the Latins and the Greeks had been raging since the 9th century, but the authority of one part of the church, viz., the Roman Catholic Church, to make an alteration in the text of an ecumenical creed through unilateral action, that is, without the sanction of a truly ecumenical council representing the entire church. Almost all those present at Florence came to an agreement that the dispute over the *Filioque* was chiefly one of words, not of content, since it could be amply documented that both versions of the doctrine of the procession of the Holy Spirit had substantial attestation from the teachings of the Church Fathers in both churches. Agreement on the *Filioque* and on all other points at issue led to the adoption of a document of union, *Laetentur Coeli*, promulgated on July 6, 1439 (and still commemorated in a plaque on the wall of the Duomo in Florence). But the reunion came too late for both sides. It was repudiated in the East, both at Constantinople and in the other Orthodox churches, notably the Church of Russia; and it was soon evident that in the West the internal problems of the church and the papacy had not been laid to rest by this temporary victory. Once again, as so many times throughout Christian history, the reunion of the Eastern and the Western Churches proved to have been a dead letter and an unattainable goal.

Roman Catholicism on the eve of the Reformation. *The decline of Scholastic theology.* The transition from the Middle Ages to the Reformation was a gradual one, but—at least in hindsight—its direction seems to have become clear already in the 14th and especially in the 15th century. One development that was both a cause and a result of that transition was the decline of Scholastic theology. As practiced, albeit with great divergence of opinion on many issues, by its leading expositors, Thomas Aquinas and Bonaventure, Scholasticism had been the systematization of the Roman Catholic understanding of the relation between the claims of human reason and the authority of divine revelation. To that end it had made use of philosophy, particularly of the newly available works of Aristotle, to describe the natural potentialities of human ways to

truth in order then to enthrone Christian theology as "the queen of the sciences."

With good reason have historians seen in that schema of reason and revelation the counterpart in the life of the mind to the schema of church and society set forth, earlier in the century of Aquinas and Bonaventure, by Pope Innocent III (reigned 1198–1216). These historians draw a similar correlation between the waning prestige of the papacy in the late Middle Ages and the shattering of the Scholastic synthesis by the work of such philosophical theologians as William of Ockham. Some of the theological descendants of Bonaventure, less confident of the powers of human reason than he, elevated the primacy of faith and the authority of Scripture to an almost exclusive position as a way to truth, while some of the philosophical descendants of Aquinas appeared, at least to their critics, to be expanding the realm of what was knowable by natural means to the point that the primacy of faith was threatened by an all-engulfing rationalism. All the varieties of Scholastic teaching, moreover, were under attack from those leaders of late medieval Roman Catholic piety who contended that the crisis of faith and of the church called for a return to the authentic religious experience of the primitive church as set forth in the New Testament.

The Imitation of Christ

Expressions of spirituality and folk piety. Late medieval spirituality cannot be dismissed as merely a symptom of the general malaise in Roman Catholic Christendom; it must be recognized as a dynamic force. One of its noblest monuments, the devotional manual entitled *The Imitation of Christ*, became, second only to the Bible itself, the most widely circulated book in Christian history. Traditionally attributed to Thomas à Kempis in 1441, the *Imitation*, although impeccably orthodox in its doctrinal emphases, took the reader beyond (or behind) the authoritative structures of both church and dogma to the inner meaning of the gospel and the inner life of the believing heart: the Christ of the creeds was, above all, the Christ of the Gospels, who summoned his followers not only to orthodoxy in their theology but to discipleship in their lives. The author of the *Imitation* participated in the spiritual life and discipline of the Brethren of the Common Life, one of the many lay communities, both female and male, that sprang up during the 15th century as centres for the cultivation of authentic Christianity even in the midst of ecclesiastical corruption and theological sterility.

Other expressions of folk piety, too, were flourishing on the eve of the Reformation. Partly as a continuing effect of the establishment of the orders of friars in the 12th and 13th centuries, there was a revival of interest in preaching throughout Roman Catholic Europe. Along with it developed a growing attention to the Bible, which for the first time began to circulate widely, also in vernacular translations, as a consequence of the invention of printing. The 15th century is also in many ways the high point in the history of Roman Catholic devotion to the Virgin Mary. At the same time there is also evidence among the common people of a tide of anticlericalism, much of it in reaction to the corruption of the church and the clergy, and of a growing skepticism among intellectuals and secular rulers even about fundamental Roman Catholic teachings.

Roman Catholicism and Renaissance humanism. At least some of that skepticism arose within the intellectual and literary milieu of Renaissance humanism, whose relation to Roman Catholicism was far more complex than has often been supposed. The efforts of 19th-century historians of the Renaissance—many of whom were themselves under the influence of both anticlericalism and skepticism—to interpret humanism as a neopaganism in revolt against traditional Christian beliefs have been fundamentally recast by modern scholarship. Not only were many of the popes during the 15th and 16th centuries themselves devotees and patrons of Renaissance thought and art, but a Renaissance figure like Nicholas of Cusa, arguably the greatest mind in Christendom East or West during the 15th century, was at the same time a metaphysician of astonishing boldness and creativity, an ecumenical theologian looking for points of contact not only with other Christians but even with Islām, and a reform cardinal of the Roman Catholic Church.

Thus in the light of recent study the humanists emerge as Christians who were working simultaneously for the reform of the church and of literary culture. To achieve those ends, they urged a return to the basics of Christian civilization, that is, to the Greek and Latin classics and to the monuments of biblical and patristic literature. Lorenzo Valla in Italy and then Desiderius Erasmus in the North are by no means isolated cases among the humanists for this blending of Christianity and classical culture. Erasmus ridiculed the Scholastics for their philosophical abstractions and for their bad Latin, and in his anonymous satire *Julius exclusus e coelis* he lampooned the effort of Pope Julius II (reigned 1503–13) to get into heaven. Erasmus also edited the writings of most of the major Church Fathers in both Latin and Greek. His edition of the Greek New Testament, the *Novum instrumentum* of 1516, was intended to stimulate a renewal of authentic Christian faith and life, which he himself called "the philosophy of Christ," in a corrupt Roman Catholicism. Significantly, this merciless critic of the current state of Roman Catholicism nevertheless found it impossible to affiliate himself with the Protestant Reformation when it arose, and he died a faithful, if unappreciated, member of the Roman Catholic Church.

Roman Catholicism and the emergence of national consciousness. As it had done since the time of the emperor Constantine, the relation of church and state shaped much of the history of Roman Catholicism on the eve of the Reformation. In most of the states constituting Western Christendom the 15th century was the time of an awakening of national consciousness, whose particularity and regionalism could set it into opposition with the universalism of a world church. In the Protestant Reformation of the 16th century such opposition between nation and church was to lead to a break with Roman Catholicism as such; but it is evident from the examples of 15th-century France and Spain that it could also lead to the alternative of a national Catholicism that remained in communion with Rome. As the seat of the Avignon papacy and the stronghold of the conciliarism represented by Chancellor Jean de Gerson and Cardinal Pierre d'Ailly, 15th-century France stood for just such a definition of Catholicism; and in the Pragmatic Sanction of Bourges of July 7, 1438, the French clergy came out in support of what were taken to be the historical rights of the Gallican Church to administer its own affairs independently of Rome while maintaining its ties of filial loyalty and doctrinal obedience to the Holy See.

A few decades later, in 1469, the marriage of King Ferdinand of Aragon and Queen Isabella of Castile effected the union of Catholic Spain. In 1482 Ferdinand and Isabella concluded a concordat with the Holy See, under whose terms the Spanish crown retained the right to nominate candidates for the episcopate. Queen Isabella's father confessor, the humanist educator, Roman Catholic primate of Spain, and grand inquisitor, Francisco Jiménez de Cisneros (1436–1517), blended Spanish patriotism, Renaissance scholarship, and a strictly orthodox Roman Catholicism in a form that was to characterize the church in the Hispanic lands of both the Old and the New World for centuries to come.

National
Catholicism

The Age of Reformation and Counter-Reformation

The spectre of many national churches supplanting a unitary Catholic Church became a grim reality during the age of the Reformation. What neither heresy nor schism had been able to do before—to divide Western Christendom permanently and irreversibly—was done by a movement that confessed a loyalty to the orthodox creeds of Christendom and professed an abhorrence for schism. By the time the Reformation was over, Roman Catholicism had become something different from what it had been in the early centuries or even in the later Middle Ages.

Roman Catholicism and the Protestant Reformation. Whatever its nonreligious causes may have been, the Protestant Reformation arose within Roman Catholicism; there both its positive accomplishments and its negative ef-

fects had their roots. The standing of the church within the political order and the class structure of western Europe had been irrevocably altered in the course of the later Middle Ages. Thus the most extravagant claims put forward for the political authority of the church and the papacy, as formulated by Pope Boniface VIII (reigned 1294–1303), had come just at the time when such authority was in fact rapidly declining. By the time Protestantism arose to challenge the spiritual authority of the papacy, therefore, there was no longer any way to invoke that political authority against the challenge. The medieval class structure, too, had undergone fundamental and drastic changes with the rise of the bourgeoisie throughout western Europe; it is not a coincidence that in northern Europe and Britain the middle class was to become the principal bulwark of the Protestant opposition to Roman Catholicism. The traditional Roman Catholic prohibition of any lending of money at interest as “usury,” the monastic glorification of poverty as an ascetic ideal, and the Roman Catholic system of holidays as times when no work was to be done were all seen by the rising merchant class as obstacles to financial development.

Accompanying these sociopolitical forces in the crisis of late medieval Roman Catholicism were spiritual and theological factors that also helped to bring on the Protestant Reformation. By the end of the 15th century there was a widely-held impression that the resources for church reform within Roman Catholicism had been tried and found wanting: the papacy refused to reform itself, the councils had not succeeded in bringing about lasting change, and the professional theologians were more interested in scholastic debates than in the nurture of genuine Christian faith and life. Such sentiments were often oversimplified and exaggerated, but their very currency made them a potent influence even when they were mistaken (and they were not always mistaken). The financial corruption and pagan immorality within Roman Catholicism, even at the highest levels, reminded critics of “the abomination of desolation” spoken of by the prophet Daniel, and nothing short of a thoroughgoing “reformation in head and members [*in capite et membris*]” seemed to be called for.

These demands were in themselves nothing new, but the Protestant Reformation took place when they coincided with, and found dramatic expression in, the highly personal struggle of one medieval Roman Catholic. Martin Luther asked an essentially medieval question: “How do I obtain a God who is merciful to me?” He also tried a medieval answer to that question by becoming a monk and by subjecting himself to fasting and discipline—but all to no avail. The answer that he eventually did find, the conviction that God was merciful not because of anything that the sinner could do but because of a freely given grace that was received by faith alone (the doctrine of justification by faith), was not utterly without precedent in the Roman Catholic theological tradition; but in the form in which Luther stated it there appeared to be a fundamental threat to Catholic teaching and sacramental life. And in his treatise *The Babylonian Captivity of the Church*, issued in 1520, Luther denounced the entire system of medieval Christendom as an unwarranted human invention foisted on the church.

Although Luther in his opposition to the practice of selling indulgences was unsparing in his attacks upon the moral, financial, and administrative abuses within Roman Catholicism, using his mastery of the German language to denounce them, he insisted throughout his life that the primary object of his critique was not the life but the doctrine of the church, not the corruption of the ecclesiastical structure but the distortion of the gospel. The late medieval mass was “a dragon’s tail,” not because it was liturgically unsound but because the medieval definition of the mass as a sacrifice offered by the church to God—not only, as Luther believed, as a means of grace granted by God to the church—jeopardized the uniqueness of the unrepeatable sacrifice of Christ on Calvary. The cult of the Virgin Mary and of the saints diminished the office of Christ as the sole mediator between God and the human race. Thus the pope was the Antichrist because he represented and enforced a substitute religion in which the true

church, the bride of Christ, had been replaced by—and identified with—an external juridical institution that laid claim to the obedience due to God himself. When, after repeated warnings, Luther refused such obedience, he was excommunicated by Pope Leo X in 1521.

Until his excommunication Luther had gone on regarding himself as a loyal Roman Catholic and had appealed “from a poorly informed Pope to a Pope who ought to be better informed.” He had, moreover, retained an orthodox Roman Catholic perspective on most of the corpus of Christian doctrine, not only the Trinity and the two natures in the person of Christ but baptismal regeneration and the Real Presence of the body and blood of Christ in the Eucharist. Many of the other Protestant Reformers who arose during the 16th century were considerably less conservative in their doctrinal stance, distancing themselves from Luther’s position no less than from the Roman Catholic one. Thus Luther’s Swiss opponent, Ulrich Zwingli, lumped Luther’s sacramental teaching with the medieval one, and Luther in turn exclaimed: “Better to hold with the papists than with you!” John Calvin was considerably more moderate than Zwingli, but both sacramentally and liturgically he broke with the Roman Catholic tradition. The Anglican Reformation strove to retain the historical episcopate and, particularly under Queen Elizabeth I, steered a middle course, liturgically and even doctrinally, between Roman Catholicism and continental Protestantism.

The polemical Roman Catholic accusation—which the mainline Reformers vigorously denied—that these various species of conservative Protestantism, with their orthodox dogmas and quasi-Catholic forms, were a pretext for the eventual rejection of most of traditional Christianity, seemed to be confirmed with the emergence of the radical Reformation. The Anabaptists, as their name indicated, were known for their practice of “rebaptizing” those who had received the sacrament of baptism as infants; this was, at its foundation, a redefinition of the nature of the church, which they saw not as the institution allied with the state and embracing good and wicked members but as the community of true believers who had accepted the cost of Christian discipleship by a free personal decision. Although the Anabaptists, in their doctrines of God and Christ, retained the historical orthodoxy of the Nicene Creed while rejecting the orthodox doctrines of church and sacraments, those Protestants who went on to repudiate orthodox Trinitarianism as part of their Reformation claimed to be carrying out, more consistently than either Luther and Calvin or the Anabaptists had done, the full implications of the rejection of Roman Catholicism, which they all had in common.

The challenge of the Protestant Reformation became also the occasion for a resurgent Roman Catholicism to clarify and to reaffirm Roman Catholic principles; that endeavour had, in one sense, never been absent from the life and teaching of the church, but it came out now with new force. As the varieties of Protestantism proliferated, the apologists for Roman Catholicism pointed to the Protestant principle of the right of the private interpretation of Scripture as the source of this confusion. Against the Protestant elevation of the Scripture to the position of sole authority, they emphasized that Scripture and church tradition were inseparable and always had been. Pressing that point further, they denounced justification by faith alone and other cherished Protestant teachings as novelties without grounding in authentic church tradition. And they warned that the doctrine of “faith alone, without works” as taught by Luther would sever the moral nerve and remove all incentive for holy living.

Yet these negative reactions to Protestantism were not by any means the only, perhaps not even the primary, form of participation by Roman Catholicism in the history of the Reformation. The emergence of the Protestant phenomenon did not exhaust the reformatory impulse within Roman Catholicism, nor can it be seen as the sole inspiration for Catholic reform. Rather, to a degree that has usually been overlooked by Protestant historians and that has often been ignored even by Roman Catholic historians, there was a distinct historical movement in the 16th

century that can only be identified as the Roman Catholic Reformation.

The Roman Catholic Reformation. *The Council of Trent.* The most important single event in that movement was almost certainly the Council of Trent, which met intermittently in 25 sessions between 1545 and 1563. The bitter experiences of the late medieval papacy with the conciliarism of the 15th century made the popes of the 16th century wary of any so-called reform council, for which many were clamouring. After several false starts, however, the council was finally summoned, and it opened on Dec. 13, 1545. The legislation of the Council of Trent enacted the formal (and apparently final) Roman Catholic reply to the doctrinal challenges of the Protestant Reformation and thus represents the official adjudication of many questions about which there had been continuing ambiguity throughout the early church and the Middle Ages. The either/or doctrines of the Protestant Reformers—justification by faith alone, the authority of Scripture alone—were anathematized, in the name of a both/and doctrine of justification by faith *and* works on the basis of the authority of Scripture *and* tradition; and the privileged standing of the Latin Vulgate was reaffirmed, against Protestant insistence upon the original Hebrew and Greek texts of Scripture.

No less important for the development of modern Roman Catholicism, however, was the legislation of Trent aimed at reforming—and at re-forming—the internal life and discipline of the church. Two of its most far-reaching provisions were the requirement that every diocese provide for the proper education of its future clergy in seminaries under church auspices and the requirement that the clergy and especially the bishops should give more attention to the task of preaching. The financial abuses that had been so flagrant in the church at all levels were brought under control, and stricter rules were set requiring the residency of bishops in their dioceses. In place of the liturgical chaos that had prevailed, the council laid down specific prescriptions about the form of the mass and liturgical music. What emerged from the Council of Trent, therefore, was a chastened but consolidated church and papacy, the Roman Catholicism of modern history.

New religious orders. Some of the outcome, and much of the enforcement, of the Council of Trent was in the hands of the newly established religious orders, above all of the Society of Jesus, the Jesuits. Unlike the Benedictine monks or the Franciscan and Dominican friars, the Jesuits were specifically dedicated to the task of reconstructing church life and teaching in the aftermath of the Protestant Reformation. They thus came to be called the “shock troops of the Counter-Reformation.” In pursuit of that mission they became especially active in scholarship and education, above all in the education of the nobility; through their pupils they sometimes wielded as great an influence in the affairs of the state as in those of the church. Although they were by no means the only religious order in the foreign missions of the church, their responsibility for regaining outside of Europe the power and territory that the church had lost in Europe as a consequence of the Protestant Reformation made them the leading force in the Christianization of newly discovered lands in the Western Hemisphere, Asia, and the islands of the sea. At the beginning of the 17th century, for example, they established in Paraguay a virtually autonomous Jesuit colony.

In addition to the Jesuits, other Roman Catholic religious orders, too, owed their origin to the age of the Reformation. The Capuchin friars renewed the ideals of the Franciscan order, and by their missions both within and beyond the historical boundaries of Christendom they furthered the revival of Roman Catholicism. The Theatines were founded by Gaetano da Thiene and the bishop of Chieti (Theate), Gian Pietro Carafa, who went on to become Pope Paul IV (reigned 1555–59); both through the program of the order and in his pontificate, the correction of abuses in the church assumed primary importance. Despite the attacks of the Reformers on the institutions and even the ideals of monasticism, it was in considerable measure a reformed monasticism that carried out the program of the Roman Catholic Reformation.

The Counter-Reformation. Recognition of the scope and success of the indigenous movements for reform within 16th-century Roman Catholicism, therefore, has rendered obsolete the practice of certain earlier historians, who lumped all of these movements under the heading “Counter-Reformation,” as though only Protestantism (or, perhaps, only the historian’s own version of Protestantism) had the right to the title of “the Reformation”; hence the use here of the term Roman Catholic Reformation. Yet that does not deny a proper meaning of “Counter-Reformation” as part of the larger phenomenon, for counteracting the effects of Protestantism was part of the program of the Council of Trent, the Society of Jesus, and the papacy during the second half of the 16th century and beyond.

The Counter-Reformation was launched wherever there had been a Protestant Reformation, but it met with strikingly varied degrees of success. Most of the “German lands” in which Luther had worked remained Protestant after his death in 1546, but major territories, above all Bavaria and Austria, had been regained for Roman Catholicism by the time the 16th century was over. The Huguenot Wars between 1562 and 1598 regained France for the Roman Catholic cause, although the Edict of Nantes of 1598 granted a limited toleration to the Protestants; it was revoked in 1685. Perhaps the most complete victory for the Counter-Reformation was the restoration of Roman Catholic domination in Poland and in Hussite Bohemia.

The victory of the Habsburg Counter-Reformation there and the defeat of Czech Protestantism were a consequence of the Battle of White Mountain of 1620 in the early years of the Thirty Years’ War. Often called the first modern war, this series of conflicts wrought devastation in the populations of central Europe, Roman Catholic at least as much as Protestant. The conclusion of the war in the Peace of Westphalia of 1648 meant for Roman Catholicism the de facto acceptance of the religious pluralism that had come out of the Reformation: Protestantism, both Lutheran and Calvinist, obtained a legal standing alongside Roman Catholicism in what had previously been regarded as “Catholic Europe.” In a war that had presumably begun as a “religious war” aimed at the resolution of the confessional impasse brought about by the Reformation, the formation of a military alliance between Cardinal Richelieu of France and the Lutheran king of Sweden, Gustav II Adolf, was a symbol of a process of the secularization of politics in which the old antitheses, including finally the very antithesis between Roman Catholic and Protestant, no longer seemed as relevant as they had once been.

(J.J.Pe.)

Post-Reformation conditions. The signing of the peace in 1648 may have meant that the era of the Reformation had ended, but for those who remained loyal to the see of Rome it meant that what had been thought of as a temporary disturbance would now be a permanent condition. The church still claimed to be the only true church of Jesus Christ on earth, but, in the affairs of men and of nations, it had to live with the fact of its being one church among several. The Roman Catholic Church was also obliged to deal with the nations and national states of the modern era one by one. To understand the history of modern Roman Catholicism, therefore, it is necessary to identify trends that went beyond geographic boundaries and to consider trends within particular states or regions—such as France, Germany, the New World, or the mission field—only as illustrations of tendencies that permeated the entire life of the church. Most of the development of Roman Catholicism since 1648 makes sense only in the light of this changed situation.

The results of the change became evident in the papacy of the 17th and 18th centuries. On June 6, 1622, Gregory XV (1621–23) created the Congregation for the Propagation of the Faith (Congregatio de Propaganda Fide, hence “propaganda”). Its responsibility was, and still is, the organization and direction of the missions of the church to the non-Christian world as well as the administration of the affairs of the church in areas that do not have an ordinary ecclesiastical government (for example, the United States as late as 1908). It has therefore played an important role

in the efforts to restore Roman Catholicism in Protestant and, to some degree, in Eastern Orthodox territories.

Developments in France. *The Gallican problem.* In many ways it was the relation of the church to individual political powers rather than the leadership of the popes that determined the course of church history. Not only the shrinking authority of the church as a consequence of the Reformation but also the expanding ambition of the state as a consequence of the growth of nationalism put ecclesiastical and secular governments on a collision course throughout Europe. France, "the first daughter of the church," was the national state whose development during the 17th and 18th centuries most strikingly dramatized the collision, so much so that Gallicanism, as the nationalistic ecclesiastical movement was called in France, is still the label put on the efforts of any national church to achieve autonomy.

Usually the autonomy from Rome implied subjection to the French crown, particularly during the reign of Louis XIV, who sought to extend still further the so-called prerogatives of France when Rome resisted. A conclave of bishops and deputies met on March 19, 1682, in Paris and adopted the Four Gallican Articles, which had been drafted by Jacques-Bénigne Bossuet, a French bishop and historian. These asserted that: (1) In temporal matters rulers are independent of the authority of the church. (2) In spiritual matters the authority of the pope is subject to the authority of a general council, as had been declared at the Council of Constance. (3) The historic rights and usages of the French church cannot be countermanded even by Rome. (4) In matters of faith the judgment of the pope is not irrefragable but must be ratified by a general council. The next move was up to the papacy: Innocent XI and Alexander VIII rejected Louis's candidates for bishoprics in France, and only in 1693, when Innocent XII was pope, was this all but schismatic conflict resolved. Gallicanism was in part an expression of the distinctive traditions of French Catholicism and in part a result of the personal power of Louis XIV, the Sun King. But it was also, and perhaps even more fundamentally, a systematic statement of the inevitable opposition between the papacy and a series of rulers from Henry VIII (1491–1547) of England to Joseph II (1741–90) of Austria, who, though remaining basically Catholic in their piety and belief, wanted no papal interference in their royal business but insisted on the right of royal interference in the business of the church.

Jansenism. The church in France was the scene of controversies other than these administrative and political ones. In 1640 there was published, posthumously, a book by the Dutch theologian Cornelius Jansen, entitled *Augustinus*, which was a defense of the theology of Augustine against the dominant theological trends of the time within Roman Catholicism. Its special target was the teachings and practices associated with the Jesuits. Jansen and his followers claimed that the theologians of the Counter-Reformation in their opposition to Luther and Calvin had erred in the other direction in their definition of the doctrine of grace; *i.e.*, emphasizing human responsibility at the expense of the divine initiative and thus relapsing into the Pelagian heresy, against which Augustine had fought in the early 5th century. Over against this emphasis, Jansenism asserted the Augustinian doctrine of original sin, including the teaching that man cannot keep the commandments of God without a special gift of grace and that the converting grace of God is irresistible. Consistent with this anthropology was the rigoristic view on moral issues taken by Jansenism in its condemnation of the tendency, which it claimed to discern in Jesuit ethics, to find loopholes for evading the uncompromising demands of the divine law. When it was espoused in the *Lettres Provinciales* ("Provincial Letters") of Blaise Pascal, a French philosopher, this campaign against Jesuit theology became a cause célèbre. The papacy struck out against Jansenism in 1653, when Innocent X issued his bull *Cum Occasione* ("With Occasion"), and again in 1713, when Clement XI promulgated his constitution *Unigenitus* ("Only-Begotten").

Theologically, Jansenism represented the lingering conviction, even of those who refused to follow the Reformers, that the official teaching of the Roman Catholic Church

was Augustinian in form but not in content; morally, it bespoke the ineluctable suspicion of many devout Roman Catholics that the serious call of the Gospel to a devout and holy life was being compromised in the moral theology and penitential practice of the church. Though Jansenism was condemned, it did not remain without effect, and in the 19th and 20th centuries it contributed to an evangelical reawakening not only in France but throughout the church.

Quietism. Quietism, another movement within French Roman Catholicism, was far less strident in its polemics and far less ostentatious in its erudition but no less threatening in its ecclesiastical and theological implications. Quietism was, in many ways, yet another form of the Augustinian opposition to any recrudescence of the Pelagian idea that man's religious activity can make God propitious to him. In Quietism this belief was associated with the development of a technique of prayer in which passive contemplation became the highest form of religious activity. Christian mysticism had always combined, in an uneasy alliance, the techniques of an aggressive prayer that stormed the gates of heaven and a resigned receptivity that awaited the way and will of God, whatever it might be. In the theology of François de Fénelon, a French archbishop and mystical writer, Quietism was combined with a scrupulous orthodoxy of doctrine to articulate the distinction between authentic Catholic mysticism and false spiritualism. Nevertheless, as scholars of medieval mystical movements have suggested, Quietism showed the great gulf between the Roman Catholicism that came out of the Counter-Reformation and the spirituality of the preceding centuries, both Greek and Latin. A devotion such as that of St. Gregory of Nyssa and Evagrius of Pontus, Greek theologians of the 4th century, was completely ruled out by the legalistic theology that condemned Quietism.

Controversies involving the Jesuits. *The Chinese rites controversy.* An analogous judgment would have to be voiced concerning the Chinese rites controversy centring on Matteo Ricci, an Italian Jesuit missionary in China. Decades of scholarly research into Buddhist and Confucian thought had prepared Ricci for a campaign that sought to attach the Roman Catholic understanding of the Christian faith to the deepest spiritual apprehensions of the Chinese religious tradition; the veneration of Confucius, the great Chinese religious and philosophical leader of the 6th century BC, and the religious honours paid to ancestors were to be seen not as elements of paganism to be rejected out of hand, nor yet as pagan anticipations of Christianity, but as rituals of Chinese society that could be adapted to Christian purposes. Ricci's apostolic labours won him many converts in China, but they also won the suspicion of many in the West that the distinctiveness of Christianity was being compromised in syncretistic fashion. The suspicion did not assert itself officially until long after Ricci's death; but, when it did, the outcome was a condemnation of the Chinese rites by Pope Clement XI in 1704 and again in 1715 and by Pope Benedict XIV in 1742. Ancestor worship and Confucian devotion were said to be an inseparable element of traditional Chinese religion and hence incompatible with Christian worship and doctrine. Here again, the embattled situation of the Roman Catholic Church in the 17th and 18th centuries helps to account for an action that seems, in historical perspective, to have been excessively defensive and rigoristic.

Suppression of the Jesuits. Among the repercussions of the controversy over Chinese rites was an intensification of the resentment directed against the Society of Jesus, to which some of the other movements mentioned above also contributed. The widespread support enjoyed by Jansenism was due in part to its attack on the moral theology associated with the Jesuits. Pascal's *Lettres Provinciales*, although placed on the Index in 1657, voiced an opposition to Jesuit thought and practice that continued to be read throughout the century that followed. The political role played by members of the Society most probably evoked the campaign to suppress it. The Portuguese crown expelled the Jesuits in 1759, France made them illegal in 1764, and in 1767 Spain and the Kingdom of the Two Sicilies also took repressive action against them. But the

Nationalistic ecclesiastical movements

Adaptation to non-Western religious traditions

opponents of the Society achieved their greatest success when they took their case to Rome. Pope Clement XIII is said to have replied that the Jesuits "should be as they are or not be at all" and refused to act against them. But his successor, Clement XIV (1769–74), whose election was urged by the anti-Jesuit forces, finally did take action. On July 21, 1773, he issued a brief, *Dominus ac Redemptor* ("Lord and Redeemer"), suppressing the Society for the good of the church. Frederick II of Prussia and Empress Catherine II of Russia—one of them Protestant and the other Eastern Orthodox—were the only monarchs who refused to promulgate the order to suppress the Jesuits when it was issued. In these lands and in others the Society of Jesus maintained a shadow existence until, on Aug. 7, 1814, Pope Pius VII restored it to full legal validity. Meanwhile, however, the suppression of the Jesuits had done serious damage to the missions and the educational program of the church, and this at a time when both enterprises were under great pressure.

Religious life in the 17th and 18th centuries. Yet it would be a mistake to allow the narrative of these controversies to monopolize one's attention. Less dramatic but no less important was the continuing life of the Roman Catholic Church during these centuries as "mother and teacher." Bossuet was not only the formulator of Gallican ideology but also one of the finest preachers of Christian history. He addressed king and commoner alike and asserted the will of God with eloquence, if sometimes with undue precision. Together with Jean Mabillon, a Benedictine monk and scholar, Bossuet helped to lay the foundations of modern Roman Catholic historiography. During the 18th century their work was continued and expanded, especially by Mabillon's confreres, the Maurists, a Benedictine group that edited the works of the Greek and Latin fathers. Both Jansenism and Quietism must be seen not only as parties in a controversy but also as symptoms of religious vitality. Engaging as they did considerable segments of the Roman Catholic laity, they expressed "the practice of the presence of God" with a new vigour.

The Roman Catholic Church of this period exercised a profound influence on culture and the arts. Indeed, the spirit of Baroque is inseparable from the Counter-Reformation, as is visible, for example, in the church of Il Gesù in Rome and in the sculpture and architecture of Gian Lorenzo Bernini. Pascal and Cervantes are notable literary figures who expressed Roman Catholic thought and piety through their works. The most fateful of the church's conflicts with modern culture in this period took place in the natural sciences. The condemnation of Galileo in 1616 and again in 1633 as "vehemently suspected of heresy" was more important symbolically than intrinsically, as a sign of the alienation between science and theology. This period saw the establishment or further development of several major religious orders, including the Daughters of Charity, founded by Vincent de Paul in 1633, and the Trappists, who take their name from the Cistercian abbey of La Trappe, which in 1664 was transformed into a community of the Strict Observance.

THE CHURCH IN THE MODERN PERIOD

Catholicism in Revolutionary France. The period of the Reformation and the Counter-Reformation was a time of convulsion for the Roman Catholic Church, but the era of revolution that followed it was, if anything, even more traumatic. This was partly because, despite the polemical rancour of Reformation theology, both sides in the controversies of the 16th and 17th centuries still shared much of the Catholic tradition. Politically, too, the assumption on all sides was that rulers, even when they opposed one another or the church, stood in the Catholic tradition. In the 18th century, however, there arose a political system and a philosophical outlook that no longer took Christianity for granted, that in fact explicitly opposed it, compelling the church to redefine its position more radically than it had done since the conversion of the Roman emperor Constantine in the 4th century.

What made the relation of the Roman Catholic Church to the ancien régime, the political and social system before the French Revolution in 1789, so problematic at the time

of the Revolution was a subtle but fundamental difference between them. Although the rhetoric of the Revolution spoke as though the church and the old order had been one, no one could study the history of the church under (or over against) Louis XIV and accept so simplistic an interpretation. Conflict there had been, bitter and uncompromising conflict—and yet conflict within the context of given presuppositions. It is significant, for example, that the French aristocracy, soon to become the hated object of revolutionary zeal, constituted the source of almost all the bishops of the church in the ancien régime. This also meant that positions of authority in the church were largely foreclosed to the lower clergy because of their class. The theological and ecclesiastical parties identified with opposition to Rome were frequently those that drew the support of the laity; Jansenism, for example, was identified as the position of the lay lawyers who spoke for the French courts of justice over against the hierarchy. In spite of the hostility between church and state, therefore, the old regime appeared to its critics to be a monolith. Thus, when the French philosopher Voltaire said, "Écrasez l'infâme" ("Crush the infamous one"), he may have meant superstition, ignorance, and tyranny, but what it added up to concretely in the minds of the revolutionaries was the supposed alliance of the monarchy with the Roman Catholic Church. This identification was only confirmed when the defenders of the established order, both lay and clerical, spoke out against the threat of revolution with a greater awareness of its dangers than of its justification.

Complicating the predicament of the church in the old regime was the corrosive influence of the Enlightenment on the religious beliefs of much of the lay intelligentsia. Enlightenment rationalism took hold among many defenders of the political status quo as well as among clerical scholars, helping to produce the beginnings of critical biblical scholarship and of religious toleration. It would be an oversimplification, therefore, to put the Enlightenment unequivocally on the side of the critics and revolutionaries. Perhaps no one embodied the spirit of the Enlightenment more completely than Frederick II the Great of Prussia. But the confidence in reason and the hostility to "superstition" cultivated by the Enlightenment inevitably clashed with the Christian reliance on revelation and with the belief in supernatural grace as communicated by the sacraments.

The political and social prerogatives of the church were also threatened by the Enlightenment, especially when it was allied with the expanding claims of an autocratic "enlightened despotism." The brotherhood taught by such groups as the Freemasons, members of secret fraternal societies, and the Illuminati, a rationalistic secret society, provided a rival to the Catholic sense of community. In *The Magic Flute*, the Austrian composer Wolfgang Amadeus Mozart (who wrote his *Requiem Mass* in the same year) celebrated the Masonic alternative to the mass of the church.

Although leaders of the state were often more hospitable to the ideas of the Enlightenment than were leaders of the church, the latter proved more accurate in their estimate of the revolutionary implications of these ideas. The "heavenly city of the 18th century philosophers" may originally have been intended as a substitute for the City of God, but it also provided much of the ideological rationale for the attack upon the ancien régime. In the familiar epigram of the Swiss writer Jacques Mallet du Pan, after the French Revolution, "philosophy may boast her reign over the country she has devastated." The action of the French Revolution against the church took many forms, but the most significant was the Civil Constitution of the Clergy of 1790. In it, a Gallicanism originally enunciated in the name of the absolute French monarchy attempted to subject the church to the National Assembly. The entire church in France was reorganized, with the authority of the pope restricted to doctrinal matters. Later in that year a constitutional oath was required of all the French clergy, most of whom refused. Pope Pius VI (1775–99) denounced the Civil Constitution in 1791, and Catholic France was divided between the adherents of the papal system and the proponents of the new order. The closing

Underlying causes of anti-ecclesiastical sentiments

Scholarly and literary activities

decade of the 18th century was dominated by this conflict, and no resolution was provided by either church or state. The ultimate humiliation of the church came when Pius VI was driven out of Rome by the French armies in 1798 and in the following year was taken captive by them and dragged back to France, where he died. Not since the Great Schism and the Babylonian Captivity had the prestige of the papacy sunk so low.

Napoleon I—exportation of the Revolution. As it was obvious that the French Revolution itself had to be carried to some more permanent settlement, so it was recognized on all sides that a more stable arrangement of church-state relations was essential. This was achieved by Napoleon Bonaparte in a concordat concluded with Pope Pius VII on July 15/16, 1801. It recognized that Roman Catholicism was the faith of most Frenchmen and granted freedom of worship. All incumbents of bishoprics were to resign and were to be replaced by bishops whom Napoleon, as first consul, would nominate. The properties of the church that had been secularized during the Revolution were to remain so, but the clergy was to be provided with proper support by the government. Many historians maintain that the Concordat of 1801 was as decisive for modern church history as the conversion of Constantine had been for ancient church history. As Constantine had first recognized and then established Christianity in the Roman Empire, so a series of concordats and other less formal agreements created the *modus vivendi* between the church and modern secular culture. What this meant for the papacy was the realization that most of the temporal holdings of the church in Europe had to be surrendered. The eventual outcome of this realization was the creation of Vatican City as a distinct political entity, but only after a long conflict over the States of the Church during the unification of Italy in 1869–70. First, however, came the period after the fall of Napoleon, when those who had emerged victorious at the Battle of Waterloo (1815) attempted to restore the previous condition. The Society of Jesus was revived in 1814, and the Congress of Vienna in 1814–15 helped to establish a basis for the recovery of the church during the 19th century. Temporary though these supposed settlements were, they made it clear to those living in the following period that the church would continue to be a force to be reckoned with in the affairs of Europe and America.

The reign of Pius IX (1846–78). Much of the history of Roman Catholicism in the 19th century is identified with the pontificates of two men: Pius IX, who was pope for a third of a century, and his successor, Leo XIII, who was pope for a quarter of a century (1878–1903).

Few popes of modern times have presided over so momentous a series of decisions and actions as Pius IX. During his reign the development of the modern papacy reached a kind of climax with the promulgation of the dogma of papal infallibility. It had long been taught that the church, as “the pillar and bulwark of the truth,” could not fall away from the truth of divine revelation and therefore was “indefectible” or even “infallible.” Inerrancy had likewise been claimed for the Bible by both Roman Catholic and Protestant theologians. As the visible head of that church and as the authorized custodian of the Bible, the pope had also been thought to possess a special gift of the Holy Spirit, enabling him to speak definitively on faith and morals. But this gift had not itself been identified in a definitive way. The outward conflicts of the church with modern thought and the inner development of its theology converged in the doctrinal constitution *Pastor Aeternus* (“Eternal Shepherd”), promulgated by the first Vatican Council on July 18, 1870. It asserted that “the Roman Pontiff, when he speaks *ex cathedra*, that is, when in discharge of the office of pastor and teacher of all Christians, by virtue of his supreme apostolic authority he defines a doctrine regarding faith or morals to be held by the universal Church, by the divine assistance promised to him in blessed Peter, is possessed of that infallibility with which the divine Redeemer willed that his Church should be endowed.” The decree was, of course, retroactive, even though there were historical incidents that appeared to contradict the retroactivity, such as the condemnation of

Pope Honorius I by the third Council of Constantinople in 680, which were cited by opponents of the decree. This opposition was, however, ineffective, and the dogma of infallibility became the public doctrine of the church. Those who continued to disagree withdrew to form the Old Catholic Church, which was centred in The Netherlands, Germany, and Switzerland.

Even before the promulgation of this dogma, Pope Pius had exercised the authority that it conferred on him. In 1854, acting on his own prerogative and without any council, he defined as official teaching the doctrine of the immaculate conception of the Virgin Mary, “that the Most Blessed Virgin Mary, at the first instant of her conception, was preserved immaculate from all stain of original sin, by the singular grace and privilege of the Omnipotent God, in virtue of the merits of Jesus Christ.” This put the church unequivocally on one side of a debate over the doctrine of Mary that had been going on since the Middle Ages. Ten years later, Pius issued a document that was in some ways even more controversial, the *Syllabus of Errors* (Dec. 8, 1864). In it he condemned various “errors” characteristic of modern times, including pantheism, Socialism, civil marriage, secular education, and religious indifferentism. By thus appearing to put the church on the side of reaction against the forces of liberalism, science, democracy, and tolerance, the *Syllabus* seemed to be part of the retreat of Roman Catholicism from the modern world. At the same time, it did seek to clarify the identity of Roman Catholic teaching at a time when it was being threatened on all sides.

This combination of reactions to modern thought and society came to a head in the conflict over “Americanism,” which was condemned by Leo XIII in 1899, and even more vigorously in the *Kulturkampf* (*i.e.*, struggle in Germany with Catholicism). Prince Otto von Bismarck, both because he was a Prussian and because he was a Protestant, resisted the basic trend of the developments just traced. In the Roman Catholic parties of the centre in the German states, he saw an obstacle to the form of German reunion to which he was dedicated, *viz.*, a predominantly Protestant Germany without Roman Catholic Austria. The *Syllabus of Errors* and the dogma of infallibility represented the hostility of Roman Catholicism to the very sort of state he was trying to establish. Much of the theological opposition to papal infallibility came from German thinkers, notably Ignaz von Döllinger, to whose defense Bismarck sprang. The conflict between church and state came in several principal areas. The *Kulturkampf* began with the exclusion of the Roman Catholic Bureau from the Ministry of Culture and Cultus in the Prussian state. Bismarck asserted the authority of the state over all education in Prussia and had the Society of Jesus expelled. Then, in direct defiance of the *Syllabus of Errors*, he required civil marriage of all, regardless of whether or not they had also exchanged their vows before a clergyman. Laws were passed compelling candidates for the Roman Catholic priesthood to attend a German university for at least three years. Bismarck summarized his defiance of the Pope in an allusion to the conflict between Pope Gregory VII and Emperor Henry IV in the 11th century: “We are not going to Canossa!” When Pius IX died in 1878, the conflict was still unresolved.

The reign of Leo XIII (1878–1903). Although Leo XIII was no less conservative in his theological inclinations than his predecessor, his positive appreciation of the church’s opportunities in modern society gave his pontificate a significantly different cast from that of Pius. On issues of church doctrine and discipline his administration was a strict one. It was during his reign that the Modernist movement, which advocated the use of biblical and historical criticism and freedom of conscience, arose within Roman Catholicism; and, although the formal condemnation of its tendencies did not come until 1907, four years after his death, he had made his opposition to this trend clear by the establishment of the Pontifical Biblical Commission as a monitor over the work of scriptural scholars. The positive side of his theology came to voice in the encyclical *Aeterni Patris* (“Eternal Father”) of Aug. 4, 1879, which, more than any other single document, provided a char-

movement

ter for the revival of Thomism (the medieval theological system based on the thought of Thomas Aquinas) as the official philosophical and theological system of the Roman Catholic Church. It was to be normative not only in the training of priests at the seminaries of the church but also in the education of the laity at universities. To this end Leo also sponsored the launching of a definitive critical edition of the works of Thomas Aquinas. In 1895 Pope Leo appointed a commission to decide the long-mooted question whether, despite the separation from Rome in the 16th century, the priestly ordination of the Anglican communion was valid, as, for instance, that of the separated Eastern churches was; in 1896 he issued *Apostolicae Curiae* ("Apostolic Concerns"), which denied the validity of Anglican orders and was a setback for ecumenical hopes on both sides.

The "pope of peace"

Nevertheless, Leo XIII is best remembered for his social and political thought, which earned him the sobriquet the "pope of peace." He managed to mollify the church's position toward the policies of Bismarck, and the Chancellor in turn moved toward a compromise. Diplomatic relations between Germany and the Vatican were restored in 1882, and gradually the restrictive laws were lifted. But the greatest achievements of Leo's work in the relation between the church and modern culture were his social and political encyclicals. Without repudiating the theological presuppositions of the *Syllabus of Errors*, these encyclicals articulated a positive social philosophy, not merely a defensive one. In *Libertas* ("Liberty"), an encyclical issued on June 20, 1888, he sought to affirm what was good about political liberalism, democracy, and freedom of conscience. Above all, the encyclical *Rerum Novarum* ("Of New Things") of 1891 put the church on the side of the modern struggle for social justice. Though rejecting the program of 19th-century Socialism, the Pope was also severe in his condemnation of an exploitative laissez-faire capitalism and in his insistence upon the duty of the state to strive for the welfare of all its citizens. The social thought of Leo XIII helped to stimulate concrete social action among Roman Catholics in various lands, such as the Christian Social Movement. When he died, soon after the close of the 19th century, the church seemed in many ways to be entering a new era of respect and influence, but the turmoil of war, depression, and revolution in the 20th century intervened.

Two historical forces, one external and the other internal, came to dominate the development of Roman Catholicism during the 20th century: the world wars of 1914–18 and 1939–45, with the accompanying upheavals of politics, economics, and society; and the second Vatican Council of 1962–65, with upheavals no less momentous in the life and teaching of the church.

The period of the world wars. Pope Pius X (1903–14) symbolized the transition from the 19th century to World War I. In his encyclical, *Pascendi Dominici Gregis* ("Feeding the Lord's Flock"), of Sept. 8, 1907, he formally condemned Modernism as "the résumé of all the heresies," and in 1910 he prescribed that clergy and seminary professors take an oath abjuring Modernism and affirming the correctness of the church's teachings about revelation, authority, and faith. He sponsored the revision and clarification of the code of canon law. More perhaps than any of his immediate predecessors or successors, Pius X gave attention to the reform of the church's liturgy, especially to the Gregorian chant, and advocated early and frequent reception of Holy Communion. Yet hanging like a cloud over his pontificate was the growing threat of the world war, which neither diplomacy nor piety was able to forestall. The last major document issued by Pius X was a lament over the outbreak of war, dated Aug. 2, 1914; less than three weeks later he was dead.

World War I, often called the real end of the 19th century, was also a major turning point in modern Roman Catholic history. Ever since ancient times the church had been accustomed to order its relations to human society by negotiations with kings and emperors, preferably members of its own fellowship. The war and the revolutions attending it meant the end of the Hohenzollern (Germany), Habsburg (Austria-Hungary), and Romanov (Russia) dy-

nasties, obliging the church to come to terms with the new realities of democratic, Communist, and Fascist regimes.

Of special significance was a series of pacts with the Fascist Italy of Benito Mussolini. In 1929 the church and the Italian government signed the Lateran Treaty, which finally regularized relations between them and gave Vatican City independent status. In 1933 the church went on to conclude a concordat with Nazi Germany, hoping to protect its own interests and those of minorities; but this hope proved to be ill founded, and the church's relation with Hitler and his regime deteriorated. Although Pius XI (1922–39) and Pius XII (1939–58) both spoke out several times against the excesses of the regime, they did little to restrain it. The papacy spoke out much more often, for example, during the Spanish Civil War (1936–39), against the dangers of Communism, the eventual dominance of which over Poland, Hungary, and other strongly Roman Catholic lands was a major setback to the church of the 20th century. As a diplomat and former papal secretary of state, Pope Pius XII was obliged, under the pressures of World War II, to clarify and redefine the church's teachings on war and peace as well as to work out a strategy of survival. In 1950 he became the first pope since the first Vatican Council to exercise the right of defining doctrine, proclaiming the bodily assumption of the Virgin Mary to be a dogma binding on all members of the church. Earlier in that same year, in the encyclical *Humani Generis* ("Of the Human Race"), he had given a reproof to various theological trends that appeared to be reviving the ideas and methods of Modernism.

Vatican II. From these two papal promulgations of 1950 many observers were ready to conclude that in the second half of the 20th century Roman Catholicism would assume an essentially defensive posture in relation to the modern world. Those who had come to that conclusion were compelled to revise it by the pontificate of John XXIII (1958–63) and by the second Vatican Council (1962–65). During his brief reign Pope John issued several important encyclicals. Of special interest was *Mater et Magistra* ("Mother and Teacher"), published in 1961, which explicitly attached itself to the *Rerum Novarum* of Leo XIII in calling for justice and the common good as the norms of social conduct. Two years later, in *Pacem in Terris* ("Peace on Earth"), the Pope addressed himself not only to members of the church but to "all men of good will." In this encyclical he formulated, more completely than any previous pope had done, a social philosophy for peace among men and between nations. This spirit of reform and concern came to expression in the council, which Pope John convoked but which he did not live to see to its conclusion. The council brought about drastic changes in the life and worship of the church, encouraging the use of the vernacular in the liturgy and greater lay participation everywhere. Perhaps even more historic were its actions in regard to those outside the borders of the Roman Catholic Church. To Eastern Orthodox and Protestant Christians it extended the hand of fraternal understanding instead of denouncing them as heretics. To the Jewish community it addressed words of reconciliation and regret for the anti-Semitism of the Christian past. To the world religions it spoke of the church's admiration for the spiritual values that had been preserved in those traditions that did not know the name of Christ. And to all people, believers and unbelievers, the council expressed its respect for the integrity and freedom of humanity and its repudiation of coercion as a means for bringing people to faith. In its importance for the development of the church the second Vatican Council will probably rank with the councils of Nicaea (325), Chalcedon (451), and Trent (1545–63). (J.J.Pe.)

The Lateran Treaty

Influence of Vatican II

ROMAN CATHOLICISM OUTSIDE EUROPE

The New World: the Spanish and Portuguese empires. *Colonial period.* The Western Hemisphere was discovered by Europeans immediately before the Protestant Reformation began in Europe. The fact of that discovery at that moment in history and the original development of the New World by Roman Catholic empires (e.g., Spain) is of major significance in the religious history of the hemi-

Relations between missionaries, colonists, traders, and indigenous peoples

sphere. The only part of it that was to be non-Catholic in its general cultural outlook was the area of those colonies that was to become the United States and Anglophone Canada. Spain and Portugal were in their prime as sea powers in the late 15th and early 16th centuries, and they were most responsible for exploring, colonizing, and establishing the Christian faith in the southern two-thirds of the American half of the world.

The chief institutions for Catholicizing were the Franciscans, Dominicans, Augustinians, Jesuits, and other religious orders. Well-trained and self-sacrificing representatives of the orders were able to go wherever Spanish and Portuguese ships went. Sometimes they were accused of serving as religious supporters of anything the Crown desired, but because the missionaries were in quest of souls, there were also clashes between Catholic churchmen and colonizers or traders. Some missionary efforts met with successes among the natives. At times Catholicism was able to temper the inhumanity of the conquerors. Best known among the humane spokesmen for Indians was the Dominican Bartolomé de Las Casas (1474–1566), “the Apostle of the Indians,” who gave widespread publicity to white atrocities against the Indians and was named bishop of Chiapas (Mexico) in 1543.

In the course of the 16th through the 19th centuries European colonists and immigrants from nations other than Spain and Portugal came to Latin America. Even when these movements were made up of Protestant minorities or when they included Protestant missionaries, they did little to disrupt the generally or nominally Catholic cultures.

Modern secular forces also jostled the Catholic settlements. The case of Mexico is illustrative; its ruling powers repeatedly proscribed Catholic education and embodied anticlerical interests. Still, the Mexican people remained largely Catholic, although they blended some of their native religious values and practices with Catholic forms.

After independence. The inevitable reaction by Catholic and non-Catholic alike arose against the colonial powers. This took the form of movements of independence, anticlerical revolts that were directed against European powers. Some institutions, particularly those devoted to education, were opposed to the practices of Catholicism. Because so many of the clergy came from Europe, anti-European sentiment assured that the American fields were not attractive, and chronic clerical shortages prevailed. As was the case in Europe, the various revolutions were often concurrent with or encouraging to the various versions of Enlightenment thought, and this meant that they were expectably uncongenial to the truth claims of Christianity.

By the middle of the 20th century, wherever Latin-American Catholicism remained strong, it was dismissed by much of the rest of the world as appearing to be uncongenial to the legitimate aspirations of majorities. Because of the cosmopolitan influences of the second Vatican Council (1962–65), however, the self-generated renewal of the church, and the presence of a new socially responsible leadership, there appeared during the 1960s a more radical Catholicism. Dom Helder Câmara of Recife, Braz., exemplified the impulse toward drastic social reform. Camillo Torres, killed in the role of a Colombian guerrilla, typified the association of a Catholic minority with violent revolutionary programs. It was a widespread conviction that the future of Roman Catholicism lay in Brazil and in Africa.

Spanish and French missions in North America. Though at the time of its settlement the United States under British and continental Protestant influences became a largely Protestant outpost, Spanish Catholics did establish missions in Florida and elsewhere. Franciscans began work in California in 1514 and in New Mexico in 1581; this work reached its greatest success when the Spanish missionary Fra Junípero Serra founded stations all along the California coast after 1769. Similarly, to the north, French explorers, traders, and conquerors settled much of eastern Canada and brought with them a Catholic Church that has remained dominant there up to the present. French missionaries also penetrated the Great Lakes region and the Mississippi Valley, but their efforts left few traces when the North American interior came to be settled by English-speaking people late in the 18th century.

Effects of anticlericalism and revolutionary Catholicism

Roman Catholicism in the United States and Canada.

United States. As far as the 13 colonies of the emerging United States were concerned, only Maryland, which had been settled in 1634 and established in 1649, included an appreciable number of Catholics before American independence. Catholics were often unwelcome in and even excluded from many colonies, where Congregational or Episcopal churches were supported by law. According to some estimates, there were at most 25,000 Catholics in a colonial population of almost 4,500,000 at the time of independence after 1776.

From the first, however, Catholic leadership enjoyed its place in the free society of the new United States. Bishop John Carroll, a representative of a notable colonial Catholic family, pioneered in exploring positive relations between Catholic religionists and their fellow citizens. Beginning in the 1830s and 1840s, the assurances of religious freedom were added attractions for millions of Catholic immigrants who had to make their way to the United States for economic reasons. Coming as most of them did from Ireland or the European continent to a nation of largely British and almost exclusively Protestant provenance, they awakened suspicion and hostility and were met by what has since been called a nativist Protestant Crusade.

Catholicism endured, however, and built impressive institutions, including parochial schools. These elementary and secondary schools were formed late in the 19th century because Catholic leaders feared Protestant influences in the public schools. Through these Catholic agencies, Catholic leaders were able to help their people combine religious loyalties to Rome and civil loyalties to America. The church was plagued by several issues: “trusteeism,” a debate over lay versus clerical control of ecclesiastical institutions; “Americanism,” the charge that American Catholics were innovating in doctrine and practice; immigration; and the rescue of souls. The church prospered through all these adversities.

After World War I anti-Catholicism declined. By 1960 a Roman Catholic, John F. Kennedy, had become president—an office previously thought to be out of range for Catholics. Tensions over church-state issues remained, but these were minimized, or at least they grew more confused, because neither Catholics nor their old opponents continued to present a united front. The ecumenical age also brought about better relations between the various faiths.

Canada. Farther north, in Canada, England came to dominance in 1713, but the Quebec Act of 1774 guaranteed Catholic rights. The period of new nationalisms after World War II found French Catholics in Quebec nervous about the assimilation and even possible disappearance of their culture. They took steps to assure the perpetuation of the faith, language, and outlook of the French-speaking Catholic millions in an otherwise largely Protestant nation. Some militant movements even asked for separation and the formation of a new nation in Quebec.

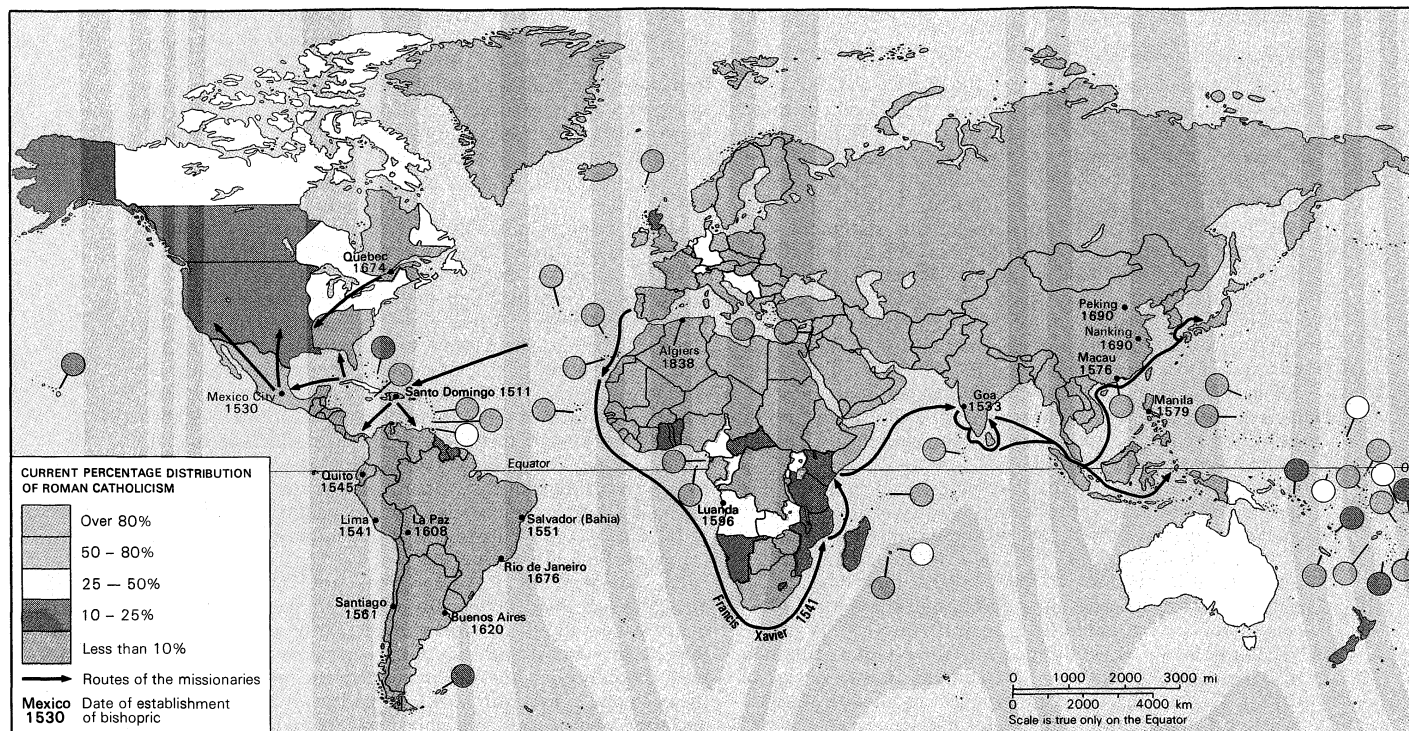

The spread of Roman Catholicism in Africa and Asia. Though Catholicism had shaped Latin-American and eastern Canadian culture, and though it came to be at home in the United States, it also found itself to be a worldwide presence for the first time in the 19th century. This expansion was the result both of Western nations’ imperial presence in Africa and Asia and of the rebirth of a missionary spirit in Christendom.

Some of the expansive efforts were built upon the traces of 16th-century missionary activities, such as those of St. Francis Xavier, a Jesuit missionary to Asia; usually, however, they had to develop on the basis of original methods and in new territories.

Early missions in Africa. In Africa almost nothing remained of the strong early Christian communities in the north. Through the centuries North Africa had become largely Muslim. The Muslim presence there offered more resistance than did native African religionists in the remaining part of the continent. Christians were not welcomed and were often persecuted. Even in partly Christian Abyssinia (Ethiopia), where the Coptic Church was prominent, Catholics were largely excluded except between 1702 and 1839. An archbishopric was established in Algiers, and in 1868 Archbishop Charles Lavignerie founded the

Relationship of Catholics to Protestants

Catholicism as a worldwide presence

Routes of missionaries, dates of establishment of dioceses, and current distribution of Roman Catholicism.

White Fathers, who were energetic but largely unsuccessful missionaries from that base.

West Africa presented obvious and persistent problems for all Christians, because it was from there that European nations had carried on most of the slave trade. Portuguese colonialists did help the Catholic Church establish itself in parts of West Africa, but progress was slow. Catholicism fared better in East Africa, particularly in Madagascar and around Lake Victoria. Uganda, Kenya, and Tanganyika (now Tanzania), for example, have thriving churches. The record was less triumphant farther south, in no small measure because of Dutch and British Protestant power. Yet there, as elsewhere, independent missionary societies worked despite considerable hardship.

Early missions in Asia. In Asia Catholicism was able to profit from Portuguese and Spanish adventures from the 16th century on. In that part of the world, however, different kinds of clashes occurred. Asians had not had contact, as Muslims had, with biblical views of history and destiny. Buddhists, Taoists, followers of Confucianism, and Hindus were devoted to worldviews uncongenial to Western attitudes toward God, time, and history. In the encounter Catholicism was itself torn over debates concerning the permissible degrees of accommodation to Eastern ways and views of life, rituals, and terms.

In India there were traces of missionary extensions from premodern centuries (*e.g.*, the Malabar Syrian Christians), and Catholicism here and there succeeded in finding new bases. But the suppression of the Jesuits in 1773 for reasons of European politics removed the most assertive group from the scene at the most inopportune moment. Catholics flourished under persecution in Indochina, in what is now called Vietnam. The major drama occurred, however, in China and Japan, which were opened to Westerners after centuries of relative isolation. In the 19th century Catholic institutions, such as churches, hospitals, and schools, became familiar sights on the Chinese landscape. The Boxer Rebellion in 1900 symbolized the growing resistance of the Chinese to Western presences in their country.

In Japan little was left of the 16th-century missions except for an isolated sect of Catholics on an island near Nagasaki. In both China and Japan only a small percentage of the people ever became Catholic. The triumph of Communism in China in 1949 brought the end

of Catholic missionary activity and proscriptions against native Catholic practices, but an indigenous Catholicism survived, divided between Roman loyalists and the adherents of an autonomous Chinese church. Postwar Japan saw Catholicism engulfed by resurgent religions and a new secular spirit.

The development of indigenous clergy and native institutions. Foreseeing some of the 20th-century difficulties, thoughtful Catholics began during the 19th century to argue that Western religions were not able to be appropriated directly and may not long be permitted in many places. Therefore they began to advocate the development of indigenous clergy. The resultant native institutions often adopted some elements from the local cultures, but seldom were fusions of distinctive elements of Asian or African religion with Christian doctrine consciously permitted.

Conflicts and relations with national governments. If the recent centuries represented much promise for Catholicism's self-definition as a universal church, they also meant setbacks. Christians of the West had often exploited the developing nations, looted their resources, enslaved or demeaned their populations, and extirpated their religions and cultures. As colonial yokes were thrown off, new nations in quest of their own identities encouraged the renewal of the non-Christian religions that had long been part of their cultures. The Western Catholic could serve as a bogey. Overt anti-Christianity of most Marxist or Communist parties in these countries meant a rolling back of Catholicism.

The new world consciousness of Roman Catholicism. On the other hand, the second Vatican Council also saw the definition of more positive views of non-Catholic high religions, a fact that served somewhat to diminish the impulse to convert the whole world to explicit faith in Christ and obedience to Rome. Catholicism engaged in internal reforms that suggested a new responsiveness to revolutionary social situations. At least minor new local adaptations in Asian and African churches were permitted, and Western imperial pride was specifically condemned by modern popes. Although the impulses to dominate and to convert do not seem to have wholly died, in the majority of the world's nations Catholics nevertheless have shown themselves more ready than ever before to be brothers to adherents of other religions and to have a new regard for secular human development.

Problems of accommodation

Effects of the second Vatican Council

Structure of the church

DOCTRINAL BASIS

The nature of the church. In 1965 M.-J. le Guillou, a Roman Catholic theologian, defined the church in these terms: "The Church is recognized as a society of fellowship with God, the sacrament of salvation, the people of God established as the body of Christ and the temple of the Holy Spirit." The progress of Roman Catholic theology can be seen in the contrast between this statement and the definition still current as late as 1960, substantially the definition formulated by Robert Bellarmine, a Jesuit controversialist, in 1621: "the society of Christian believers united in the profession of the one Christian faith and the participation in the one sacramental system under the government of the Roman Pontiff." The older definition, created in response to the Protestant claims, defines the church in external and juridical terms. The more recent definition is an attempt to describe the church in terms of its inner and spiritual reality.

From the time of the earliest heresies the church has thought of itself as the one and only worshiping community that traced itself back to the group established by Jesus Christ. Those who withdrew from it were religiously no different from those who had never belonged to it. The ancient adage, "There is no salvation outside the church," was understood as applying to membership in this group. When this adage was combined with the notions contained in Bellarmine's definition of the church, lines were clearly drawn. These lines were maintained in the breakup of Western Christendom in the Reformation.

There were, however, other factors determining the idea of the one true church. The Roman Catholic Church had never excluded the Orthodox Church, which had seceded from the Roman Church in 1054, from the community of Christian believers. Furthermore, the juridical definition of the church did not include such traditional themes as the communion of the saints and the body of Christ, both of which look beyond the visible, juridically constituted church. The theme of the communion of saints refers to the church as a whole, including both the living (the church militant) and the dead (the church suffering in purgatory—a state for those who must be cleansed from lesser sins—and the church triumphant in heaven). The idea of "communion" appears in early church literature to indicate the mutual recognition of union in the one church and the notion of mutual services.

The theme of the body of Christ appears in the letters of Paul (Romans 12; 1 Corinthians 12; Ephesians 4 and 5; Colossians 1). In modern Roman Catholic theology the term mystical has been added to "body," doubtless with the intention of distinguishing the church as body from the juridical society. Pius XII, in the encyclical *Mystici Corporis* (1943; "The Mystical Body"), identified the mystical body with the Roman Catholic Church. Most Roman Catholic theologians and the second Vatican Council have taken a less rigorous view, trying to find some way of affirming membership in the body for those who are not members of the Roman Catholic Church. The documents of the council described the church as the "People of God" and as a "Pilgrim Church," but no generally accepted statement of membership in this church has yet emerged. The second Vatican Council also departed from established Roman Catholic theology since the Reformation by using the word church in connection with the Protestant churches. This use has caused some confusion, but the trend is now rather to think of one church divided than of one true church and other false churches.

Apostolic succession. The claim of the Roman Catholic Church to be the one legitimate continuation of the community established by Jesus Christ is based on apostolic succession. This does not mean that there are apostles, nor does it mean that individual Apostles transmitted some or all of their commission to others. The officers of the church, the bishops, are a college (organized group or body) that continues the college of the Apostles, and the individual bishop is a successor of the Apostles only through his membership in the college.

The idea of apostolic succession appears in the writings

of Irenaeus, a Church Father who died about 202. Against the Gnostics (dualistic sects that maintained that salvation is not from faith but from some esoteric knowledge) Irenaeus urged that the Catholic teaching was verified because a continuous succession of teachers, beginning with the Apostles, could be demonstrated. In the 3rd and 4th centuries problems of schism within churches were resolved by appealing to the power of orders (*i.e.*, the powers a person has by reason of his ordination either as deacon, priest, or bishop) transmitted by the imposition of hands through a chain from the Apostles. Orders in turn empowered the subject to receive the power of jurisdiction (*i.e.*, the powers an ordained person has by reason of his office). In disputes between Rome and the Eastern churches the idea of apostolic succession was centred in the Roman pontiff, the successor of Peter; it will be observed that this goes beyond the idea of collegial succession. Apostolic authority is defined as the power to teach, to administer the sacraments, and to rule the church. Apostolic succession in the Roman Catholic understanding is validated only by the recognition of the Roman pontiff; and the Roman Catholic Church understands the designation "apostolic" in the creed as referring to this threefold power under the primacy of the Roman pontiff.

The Roman Catholic Church has not entirely denied apostolic succession to non-Roman churches. Rome recognizes the validity of orders in the Orthodox churches; this means that it recognizes the sacramental power of the priesthood but does not recognize the government of these churches as legitimate. The orders of the Anglican and the Swedish Lutheran churches, on the contrary, are not recognized by Rome, and the entire threefold quality of apostolic succession is denied them. Oriental churches in union with Rome (Eastern Catholics) are recognized as in full apostolic succession. Luther and Calvin saw clearly that their position could not be maintained if apostolic succession were necessary; they therefore affirmed that apostolic succession had been lost in the Roman Church by doctrinal and moral corruption and that the true church was found only where the gospel was rightly

The mystical body of Christ

preached and the sacraments were rightly administered. Thus, Protestant churches generally have not accepted the necessity of apostolic succession. (J.L.McK.)

THE PAPACY

The papal office. The word papacy (Latin *papatia*, derived from *papa*, "pope"; i.e., father) is of medieval origin. In its primary usage it denotes the office of the pope (of Rome) and, hence, the system of ecclesiastical and temporal government over which he directly presides.

The multiplicity and variety of papal titles themselves indicate the complexity of the papal office. In the *Anuario Pontificio*, the official Vatican directory, the pope is described as bishop of Rome, vicar of Jesus Christ, successor of the prince of the Apostles, *pontifex maximus* ("supreme pontiff") of the universal church, patriarch of the West, primate of Italy, archbishop and metropolitan of the Roman province, sovereign of the state of Vatican City, and servant of the servants of God. In his more circumscribed capacities as bishop of Rome, metropolitan of the Roman province, primate of Italy, and patriarch of the West, the pope is the bearer of responsibilities and the wielder of powers that have their counterparts in the other episcopal, metropolitan, primatial, and patriarchal jurisdictions of the Roman Catholic Church. What differentiates his particular jurisdiction from these others and renders his office unique is the Roman Catholic teaching that the bishop of Rome is at the same time successor to St. Peter, prince of the Apostles. As the bearer of the Petrine office, he is raised to a position of lonely eminence as chief bishop or primate of the universal church.

Basic to the claim of primacy is the Petrine theory, according to which Christ, during his lifetime, promised the primacy to Peter alone, and, after his Resurrection, actually conferred that role upon him. Thus John 1:42 and, especially, Matthew 16:18 f.: "And I tell you, you are Peter, and on this rock I will build my church, and the powers of death shall not prevail against it. I will give you the keys of the kingdom of heaven, and whatever you bind on earth shall be bound in heaven, and whatever you loose on earth shall be loosed in heaven." Also John 21:15 f.: "Feed my lambs . . . Tend my sheep." Vatican I, in defining the Petrine primacy, cited these three texts, interpreting them to signify that Christ himself directly established St. Peter as prince of the Apostles and visible head of the Church Militant, bestowing on him a primacy not merely of honour but of true jurisdiction. In defining also that the Petrine primacy was, by Christ's establishment, to pass in perpetuity to his successors and that the bishops of Rome were these successors, Vatican I cited no further scriptural texts. In defining further, however, that the Roman pontiffs, as successors in the Petrine primacy, possess the authority to issue infallible pronouncements in matters of faith or morals, the council cited both Matthew 16:18 f. and Christ's promise to Peter at the Last Supper: "But I have prayed for you that your faith may not fail; and when you have turned again, strengthen your brethren" (Luke 22:32).

Historical conceptions of papal authority within the church. Of the Petrine texts, Matthew 16:18 f. is clearly central and has the distinction of being the first scriptural text invoked to support the primatial claims of the Roman bishops. Before the mid-3rd century, however, and even after that date, some Western, as well as Eastern, patristic exegetes (early Church Fathers who in their interpretation of the Bible used critical techniques) understood that by the "rock" Christ meant to refer not to Peter but to himself or to the faith that Peter professed. Nevertheless, in the late 4th and 5th centuries there was an increasing tendency on the part of the Roman bishops to justify scripturally and to formulate in theoretical terms the ill-defined preeminence in the universal church that had long been attached to the Roman Church and to its bishop. Thus, Damasus I, despite the existence of other churches of apostolic foundation, began to call the Roman Church "the apostolic see." About the same time the categories of the Roman law were borrowed to explicate and formulate the prerogatives of the Roman bishop. The process of theoretical elaboration reached a culmination in the views

of Leo I and Gelasius I, the former understanding himself not simply as Peter's successor but also as his representative, or vicar. He was Peter's "unworthy heir," possessing by analogy with the Roman law of inheritance the full powers Peter himself had wielded, which he interpreted as monarchical, since Peter had been endowed with the *principatus* over the church.

Medieval views. On the purely theoretical level the distance between the claims advanced by Leo I and the position embodied in Vatican I's primacy decree is not great. Medieval popes, such as Gregory VII, Innocent III, and Innocent IV, clarified by their practice as well as by their theoretical statements the precise meaning of that fullness of power (*plenitudo potestatis*) over the church to which, according to some scholars, Leo I himself had laid claim. In this they were aided not only by the efforts of publicists such as the Italian theologian and philosopher Aegidius Romanus (d. 1316), who magnified the pope's monarchical powers in unrestrained and secular terms, but also by the massive development during the late 11th, 12th, and 13th centuries of a highly romanized canon law. Gratian's *Decretum* (c. 1140), the unofficial collection of canons that became the fundamental textbook for the medieval student of canon law, laid great emphasis on the primacy of the Roman see, accepting as genuine certain canons that were the work of 8th- and 9th-century forgers—such as two principles that the 1917 Code of Canon Law restates: "that there cannot be an ecumenical council which is not convoked by the Roman Pontiff" and that "the First See is under the judgment of nobody."

The prevalence of such ideas and the absence of a formidable challenge to papal primatial claims during the High Middle Ages explains the lack of any conciliar definition of the Roman primacy at the great "papal" general councils of that period. Hence it took the (abortive) attempt at reunion with the Orthodox Church at the Council of Florence in 1439 to evoke the first solemn conciliar definition of the Roman primacy. This definition was included in the decree of union with the Greeks (*Laetentur Coeli*), and it went as follows:

We define that the Holy Apostolic See and the Roman Pontiff hold the primacy over the whole world, that the Roman Pontiff himself is the successor of Peter, prince of the Apostles, that he is the true vicar of Christ, head of the whole church, father and teacher of all Christians, and [we define] that to him in [the person] of Peter was given by our Lord Jesus Christ the full power of nourishing, ruling and governing the universal church; as it is also contained in the acts of the ecumenical councils and in the holy canons.

Early modern and modern views. This decree was the basis for the solemn definition that Vatican I promulgated in 1870 as part of its dogmatic constitution (*Pastor Aeternus*). Having asserted as a matter of faith the primacy of Peter and the succession of the popes in that primacy and having quoted in full the Florentine definition, the constitution clarified what is to be understood by "the full power of nourishing, ruling, and governing" the church, which, according to that definition, inhered in the pope's primacy. Unlike the conciliar definition arrived at in Florence, *Pastor Aeternus* specified this to include the pope's judicial supremacy, insisting that there is "no higher authority," not even an ecumenical council, to which appeal can be made from a papal judgment.

This definition marked the culmination of a development reaching back at least to the 4th and 5th centuries. But the doctrinal development that culminated in Vatican I's definition of papal infallibility cannot lay claim to a comparable antiquity. There has always been much discussion about the meaning of the prerogative of infallibility and what it implies about the status of individual doctrinal pronouncements of the church's teaching authority. The notion that the church (conceived as the community of the faithful) is by virtue of Christ's own promise infallible—in the sense that it cannot totally deviate from the truth—is clearly scriptural in foundation and was not questioned even by the Protestant Reformers. Similarly, the notion that a preeminent authority attached to the doctrinal pronouncements of the Roman Church and its bishops was of great antiquity, long predating the exten-

Primacy of Peter

Ultra-
montanism

sion of papal jurisdictional claims by the 4th- and 5th-century popes. But the combination of these two notions—*i.e.*, the identification of the supreme teaching authority of the universal church with that of the pope, and the claim that the infallibility promised to the church itself was possessed also by the pope acting as its head, thus guaranteeing the inerrancy even of his individual doctrinal pronouncements—is essentially a modern theological development and one characteristic primarily of the Roman or Ultramontane (propapal) theological school. This school rose to prominence in the 16th and 17th centuries; one of its most distinguished representatives was Cardinal Robert Bellarmine (d. 1621). Though it drew from earlier materials—notably from the Pseudo-Isidorian decretals and from the writings of such medieval theologians as St. Thomas Aquinas, Aegidius Romanus, and Augustinus Triumphus—the Ultramontane school derived much of its initial strength from the papalist reaction that followed in the wake of the conciliar movement, and it was shaped very much in opposition to the claims that the conciliarists and their Gallican successors made on behalf of the general council. This is evident in the solemn definition of the doctrine promulgated by Vatican I, with its insistence that the *ex cathedra* definitions of the pope (those made from “the chair,” or papal throne), “are irreformable of themselves and not by virtue of the consent of the Church.” The conciliar debates indicate that this sentence was intended to exclude the Gallican notion that a papal definition could not claim infallibility unless, subsequently or concomitantly, it received episcopal assent. Despite the maximalist (extremist) tendencies both of subsequent Catholic apologists and of their Protestant critics, the sentence apparently was not intended to restrict the church’s infallible teaching authority to the pope alone or to suggest that the pope was free to define doctrine without making every effort to take into account the mind of the church.

Episcopal
collegiality

Nevertheless, after 1870, when the memory of the heated conciliar debates had faded away, maximalist interpretations became prominent. In particular, there was a marked tendency to stress the absolute and unlimited nature of papal jurisdictional power and to end in favour of the papacy the hitherto unresolved question of the source of episcopal jurisdiction. In response to this development, Vatican II, in its dogmatic constitution, *De Ecclesia* (1964), while endorsing Vatican I’s teaching on papal primacy and infallibility, also focused on the nature of episcopal authority. It insisted that bishops “are not to be regarded as vicars of the Roman Pontiff, for they exercise an authority which is proper to them,” since, “by divine institution . . . [they] . . . have succeeded to the place of the apostles as shepherds of the Church” and are themselves, in fact, “the vicars and ambassadors of Christ.” Also, “Just as, by the Lord’s will, St. Peter and the other apostles constituted one apostolic college, so in a similar way the Roman Pontiff as the successor of Peter and the bishops as the successors of the apostles are joined together.” This college, “together with its head, the Roman Pontiff, and never without this head” is “the subject of supreme and full power over the universal Church,” a supreme authority that it can exercise in more than one fashion but “in a solemn way through an ecumenical council.” The supreme authority in the church can be exercised not only personally by the pope himself but also in a collegial fashion by the *whole* episcopate, which of necessity includes the bishop of Rome as its head.

In so emphasizing the doctrine of episcopal collegiality, Vatican II was responding to the findings of modern New Testament and patristic scholarship concerning the nature of the primitive and ancient church, and it insisted that it was restoring an ecclesiological emphasis of great antiquity. Recent medieval scholarship indicates that this emphasis persisted into the Middle Ages and survived, in the writings of canonists and theologians, side by side with the more prominent concern with the papal primacy. The great conciliarists active at the Council of Constance made an unsuccessful attempt to effect a stable balance between these two emphases, and even in the modern period, despite the growing prominence of Ultramontane views and their eventual triumph at Vatican I, the collegial concern

was never fully displaced. It was not lost sight of by the Gallican theologians of the 16th, 17th, and 18th centuries who, however much their subservience to the exigencies of royal policy may have damaged their credibility, apparently are now recovering in Catholic eyes, at least, a certain measure of esteem.

Eastern Orthodox views and critiques. The recovery of this ecclesiological emphasis has an importance outside Roman Catholic theology. It has never ceased to dominate in the churches of Eastern Orthodoxy, with their stress on episcopal equality, their respect for the autonomy of the national or regional churches, and their insistence that the supreme teaching authority in the universal church resides (if anywhere) in the collegial decisions of the bishops assembled together in an ecumenical council. Up to the 11th century Byzantine churchmen and theologians certainly accorded some sort of primacy to the church of Rome and its bishop. But with the growth of papal claims to a universal jurisdictional power, with the growing conviction that the Roman Church had fallen into heresy, and above all with the disastrous crusading onslaught on Byzantium in 1204, the attitude of Orthodox churchmen to Rome underwent an understandable shift. Though Byzantine theologians rarely questioned the fact of Peter’s primacy among the Apostles, they concluded that their own fundamentally collegial ecclesiology necessitated the rejection of the primatial claims advanced on behalf of those who claimed to be uniquely his successors. The very attempt by the bishops of a single local church to claim a monopoly on the Petrine succession was regarded as something of a deviation, in that all bishops, insofar as they professed the faith of Peter, were to be understood as his successors.

In the modern period, then, the Eastern Orthodox churches have been unanimously adamant in their rejection of the papal claims to primacy and infallibility. Orthodox theologians are often careful to insist that what they are rejecting is not the notion of primacy itself but rather that actual primacy of jurisdiction as it was conceived in the Latin Middle Ages and as it has been exercised by Rome in the modern period—with its apparent corollary that all power in the church is to be regarded as proceeding outward from the primatial office and its concomitant tendency to stifle independent life in the local churches. The original primacy of honour, which these theologians argue, was one accorded to the Roman bishops by emperors and ecumenical councils, they clearly regard as a different matter altogether. Given this fact, and also the common ground shared in ecclesiological matters by the Roman Catholic and Orthodox churches, Vatican II’s affirmation of episcopal collegiality may soften the edges of the Orthodox rejection of the papal primacy.

Protestant views and critiques. The impact of that doctrine on Protestant thinking is more difficult to predict. Historically, the Protestant rejection of papal claims has been much less qualified than that of the Orthodox. Thus, in the view of the 20th-century theologian Karl Barth, Vatican I’s definition of papal infallibility completed the process by which the Roman Catholic Church abandoned the Christian belief in the unique character of divine revelation, identified itself instead with that revelation, and made the pope’s teaching “the infallible revelation for the present age.” Philipp Melancthon, the Lutheran author of the Augsburg Confession of 1530, may have been willing to admit that a truly evangelical pope had a certain superiority over other bishops; however, even if one de-emphasizes Luther’s denunciations of the pope as the Antichrist, the rejection by the major Reformers and their successors of the Petrine theory and of papal primacy by divine institution is absolute. Peter, they argued, exercised no primacy. The powers communicated to him were the powers communicated to all the Apostles. By the “rock” Christ meant himself; upon him the church is founded, and in Matthew 16:17 f. Peter stands only as the type or figure of the Christian faithful who believe in Christ as the sole “rock.”

Unlike such medieval predecessors as the Waldenses or the political philosopher Marsilius of Padua, who had likewise attacked the Petrine theory, the Reformers did

Rejection

claims

not base their attack upon the historical argument that Peter had never visited Rome. This argument was embraced by many a liberal Protestant theologian of the 19th century, but in the 20th it has lost most of its appeal. In the mid-20th century some Protestant theologians shifted toward the Roman Catholic understanding of the status and meaning of Matthew 16:17 f. According to Oscar Cullmann (the French Protestant biblical critic and theologian) any sound exegesis of the relevant scriptural texts points to the conclusion that Peter enjoyed a preeminence among the disciples even during Christ's lifetime; that the "rock" in Matthew refers not to Christ or to the faith of Peter but to his person; that Christ promised him, therefore, the leadership of the church; and that after the Resurrection Peter actually exercised that leadership. Though Cullmann argued that Peter did so only for a short time, being replaced in the leadership by James, other Protestant scholars have disagreed and have claimed for Peter a more enduring role. All, however, continue with Cullmann to distinguish sharply between conditions in the apostolic and post-apostolic church, to deny on exegetical grounds that the "primacy," or leadership, promised to Peter was intended to be passed on to any post-apostolic successors, and to insist on historical grounds that no such succession in the primacy actually occurred in the primitive church. Nevertheless, because of the degree of convergence already occurring between the Roman Catholic and Protestant exegesis of the Petrine texts, because of the reexamination of the Catholic tradition begun by Vatican II, and because of the growing Protestant sense of the need for some striking symbol of unity in the worldwide Christian community, some Protestant ecumenists in the last third of the 20th century have shown a degree of openness to the papal office that would have been unimaginable only 50 or 60 years before.

Historical conceptions of the relationship of the papacy to the world. Theories concerning the relationship of the papacy to the world at large have both reflected the established political conceptions of the day and been in tension with them. The pope has been conceived successively as a leading dignitary in an imperial church headed in effect by the emperor, as a majestic potentate possessed of a supreme and direct authority even in temporal matters, and as a primarily spiritual figure who had in temporal matters no more than an indirect power of intervention. With the post-Reformation fragmentation of Christendom, the growth of secularism, and the emergence of the unified modern state claiming within its own borders jurisdictional omniscience, even such attenuated claims to an indirect power became increasingly anachronistic. In the 20th century, in his relations with the world at large, the pope, while affected by the conventions regulating the relationships of heads of state with one another, possesses primarily a moral authority deriving from the dignity and prestige of his office. The strength of that authority, however, depends upon his moral standing as a person, upon the persuasive force of his cause, and upon the degree of enthusiasm it can arouse within the church.

Contemporary teaching on papal authority. After the mid-20th century some voices were raised in Roman Catholic circles questioning both the doctrine of papal infallibility and the exercise of the papal primacy—at least as it is envisaged in the teaching of Vatican I and the Code of Canon Law. The church's official teaching on the papal office remains that of Vatican I, solemnly reaffirmed at Vatican II. Nevertheless, the latter council's juxtaposition of the doctrine of episcopal collegiality with the existing teaching on papal primacy and infallibility created something of a dilemma in Catholic ecclesiology. Though the text of *De Ecclesia* had insisted that the doctrine of episcopal collegiality in no way impugned the pope's primacy, a minority of the council fathers remained unconvinced and were commonly said to have been won over by the explanatory note that the Theological Commission by papal authority appended to the decree as an "authentic norm of interpretation." The note is framed in much more juristic terms than is the decree itself, and, in discussing the possession by the College of Bishops of "supreme and full power over the whole Church" it insists

that "there is no distinction between the Roman Pontiff and the bishops taken collectively," that "necessarily and always, the College carries with it the idea of its head" so that the bishops acting independently of the pope cannot be considered to constitute a college. At the same time, the note insists that "since the Supreme Pontiff is the head of the College, he alone can perform certain acts which in no wise belong to the bishops, for example, convoking and directing the College, approving the norms of action etc.," norms that "must always be observed."

Already in 1964 there were some who regarded this note with considerable misgiving, feeling that it withdrew from the bishops, in practical and legal terms, that supreme authority in which they had been said, on theological grounds, to be sharers. Subsequent events did little to dispel such misgivings. Despite the unquestionable vitality shown at its 1967 and 1969 meetings, the Synod of Bishops was not really allowed to function as a decision-making rather than a merely advisory body, and it was no more consulted than were the bishops as a whole when, in 1968, the pope promulgated *Humanae Vitae* (the encyclical on birth control)—considered by some observers to be the most divisive papal initiative of recent times and one that amounted to a de facto negation of collegiality.

Because of the dissent over *Humanae Vitae* and the tension engendered by the rigour of the pope's stand on the much-debated problem of clerical celibacy, attention probably will focus increasingly on the old and difficult question of the limits of papal power. Because of this, considerable importance attaches to the current revival of interest in the late medieval conciliar movement and to the assertion made by some Roman Catholic scholars (if hotly disputed by others) that a continuing dogmatic validity must be accorded to the decree *Sacrosancta*, promulgated in 1415 by the Council of Constance. This decree declared that the general council possessed an authority superior to that of the pope in matters pertaining to the faith, the ending of the schism, and the reform of the church. Those who assert this view do not always wish by so doing to cast any doubt on the dogmatic validity of Vatican I's teaching on papal primacy and infallibility, but the efforts thus far made to demonstrate the compatibility of the respective teachings of the two councils (*i.e.*, Constance and Vatican I) remain somewhat less than persuasive.

THE OFFICES OF THE CLERGY

The Roman Curia and the College of Cardinals. In the day-to-day exercise of his primatial jurisdiction the pope relies on the assistance of the Roman Curia, a name first used of the body of papal assistants in the 11th century. The Curia had its origins in the local body of presbyters (priests), deacons (lower order of clergy), and notaries (lower clerics with secretarial duties) upon which, like other bishops in their own dioceses, the early bishops of Rome relied for help. By the 11th century this body had, on the one hand, been narrowed down to include only the leading (or cardinal) presbyters and deacons of the Roman diocese, while, on the other hand, being broadened to embrace the cardinal-bishops (the heads of the seven neighbouring, or "suburbicarian," dioceses). From this emerged the Sacred College of Cardinals, a corporate body possessed, from 1179 onward, of the exclusive right to elect the pope. This right it still possesses, as it does the right to govern the church in urgent matters during a vacancy in the papal office. Recent popes have extended the size of the Sacred College beyond the traditional limit of 70 and have attempted, with growing success, to broaden its national complexion and to make its membership more representative of the church's international character.

Cardinals are selected by the personal choice of the pope, in consultation with the cardinals in Rome at the time, in a consistory, or solemn meeting, which is secret. The cardinals reside either as bishops in their own sees or in the Vatican as the highest rank of papal advisers and officers in the Roman Curia.

During the Middle Ages the cardinals played an important role as a corporate body, not only during papal vacancies, as today, but also during the pope's lifetime. In the 12th century the Roman councils that popes had

of papal
infallibility and
primacy

hitherto convoked when urgent matters were at hand were replaced by the assembly of the cardinals, or consistory, which thus became the most important collegial (corporate) body advising the pope and participating in his judicial activity. Eventually it began to make oligarchic claims to a share in the powers of the Petrine office and attempted, with sporadic success, to bind the pope to act on important matters only with its consent. During the 16th century, however, with the final establishment of the Roman congregations (administrative committees), each charged with the task of assisting the pope in a specific area of government, the significance of the consistory began to decline, and with it the importance of the cardinals as a corporate body. At the same time, there was an increase in the power and influence of the "curial" cardinals—those cardinals who did not administer local dioceses but served as the pope's representatives in important foreign affairs or resided permanently in Rome, holding responsibilities in the curial congregations, tribunals, and offices that proliferated in the course of the next three centuries.

Modern
reforms of
the Curia

By the early 20th century the growth of the Roman Curia had produced a bewildering tangle of administrative and judicial bodies, in which neither temporal and ecclesiastical functions nor executive and judicial powers were clearly demarcated. The reforms of Pius X (reigned 1903–14) and Benedict XV (reigned 1914–22) clarified and streamlined the work of the Curia, introducing a measure of order into its maze of overlapping jurisdictions. But in the wake of the complaints about abuses of curial power that were voiced at the second Vatican Council (along with requests for an internationalization of curial staff and a modernization of curial functions and procedures), Paul VI pledged himself to act.

Though Paul VI (reigned 1963–78) made some changes in detail, his reforms left intact the basic curial structure created by Pius X, with its tripartite division of the various curial bodies: the Roman congregations composed of cardinals nominated by the pope (*e.g.*, the Congregation for the Doctrine of the Faith, which was the former Holy Office and direct descendant of the Roman Inquisition); the tribunals, three in number, which compose the judicial branch of the Curia and one of which, the Rota, handles matrimonial cases; a group of offices, councils, and secretariates, the most important of which is the Secretariate of State, presided over by the cardinal secretary of state, who now emerges as the pope's "prime minister." To promote a higher degree of coordination among the various jurisdictions, provision was made for regular meetings of department heads, summoned and presided over by the cardinal secretary of state. Similarly, to prevent bureaucratic empire-building, most curial appointments were to be made for an initial term of five years. Finally, in response to Vatican II's request, some diocesan bishops were to be present at the plenary sessions of the congregations, efforts were to be made to internationalize the curial staff, and there was to be some attempt to consult the laity. These reforms went into effect in January 1968.

Monarchi-
cal officers

The college of bishops. It has been noted that in Roman Catholicism the college of bishops is the successor to the college of the Apostles. This is said in spite of certain differences between the two offices. The Apostles in the New Testament were a college (except for Paul, not one of the Twelve); the bishops are individual officers, and their collegial function has not been operative in recent centuries. The Apostles had a power that was not defined locally; every Roman Catholic bishop is a bishop of a place, either a proper area, a jurisdiction, of which he is the ordinary (as he is called in church law), or a fictitious place, a see no longer existing, of which he is named titular bishop. Such a monarchical officer does not appear in the New Testament. Nevertheless, Ignatius of Antioch, whose letters (written about 107) provide an early description of the Christian community, was clearly a monarchical bishop, and he did not think himself the only one of his kind; thus, the institution must have arisen in apostolic or early post-apostolic times.

The bishops in Roman Catholic belief succeed to the apostolic power, which is understood as the power to

teach Catholic doctrine, to sanctify the church through the administration of the sacraments, and to govern the church. The residential bishop is supreme in his territory in this threefold function, having no superior other than the Roman pontiff. An archbishop governs a metropolitan see, usually the largest or oldest see in a region of several dioceses called a province. The metropolitan archbishop convokes and presides at provincial synods, or meetings, and has certain rights of visitation; but he has no jurisdiction in the suffragan, or subordinate, sees. The power of the bishop in governing is only over his own diocese; even there, however, it is not absolute, because church law provides the bishop with certain advisory bodies.

Until the second Vatican Council the Roman Catholic Church had not dealt with the ambiguity of two concurrent jurisdictions, pontifical and episcopal. The pope cannot define or limit the powers of a bishop; the powers are "ordinary," inhering in the office itself. The second Vatican Council accepted the emphasis that recent theologians have laid on the collegial character of episcopacy, and the supremacy of the pope is understood as supremacy in the college; the pope needs the college of which he is head, although the first Vatican Council declared that he needs neither its consultation nor its approval. It is now understood that such solitary action should be the emergency rather than the rule; and the synod of bishops, established after the second Vatican Council, was a step toward involving the body of bishops in the policy of the entire church, hitherto formulated exclusively by the Roman see.

The qualifications for a bishop as defined in church law, which is known as canon law, are so general as to suit candidates for any office in the church, major or minor. Bishops have been chosen by the pope since the 11th century; the qualifications are not made public, and the decisions depend on a number of factors that are difficult to assess. In modern practice most bishops have been career administrators in the church, rarely pastors or scholars. Election is a much older tradition, and there have been many calls for a restoration of election of bishops. But because the selection of bishops is a basis of Rome's power over the whole Catholic Church, Rome has been generally unsympathetic to these calls.

Bishops in modern times are more visible as managers of the business of the diocese than as pastors and teachers. The responsibilities of the office are great and demand leadership and the ability to delegate business to a competent staff. A common criticism from certain quarters within the Catholic Church in the mid-20th century was that the episcopacy has been conceived more in terms of power than in terms of leadership. One of the reasons for setting up episcopal conferences of nations and regions following the second Vatican Council was to promote leadership by giving bishops the strength that lies in community. No authentic "Catholic" activity is conducted in a diocese without at least the tacit approval of the bishop; his disposal of funds and persons makes it evident that the activity will flourish much more vigorously if it enjoys his active support and encouragement. His power to discourage or forbid activities, which he is free to use according to his own sole judgment, is both a strength and a weakness of the Roman Catholic structure.

The bishop is assisted in governing the diocese by a staff called, like the staff of the pope, a curia. The structure of the staff is to some extent determined by canon law—*e.g.*, vicar general, chancellor, and official, or head, of the diocesan tribunals. Otherwise, the bishop at his discretion may appoint a staff according to the needs of the diocese. In modern times a great amount of diocesan business has settled upon the bishop. This has become a constant strain on the structure of the Roman Catholic episcopacy; it cannot be a strength when so much of the time of the supreme officer must be consumed by purely routine business.

The power of the bishop over his clergy has been absolute, with almost no effective restraint except the human kindness of the bishop. This appeared to be changing, following the second Vatican Council, with the institution of senates of priests. The council strongly recommended that bishops introduce priests into the decisions of the diocese, but this was left to the discretion of the bishop.

Modern
duties of a
bishop

The settling of doctrinal and disciplinary questions

Ecumenical councils. Regional councils of bishops to settle doctrinal and disciplinary questions appeared in the 2nd century. The first general council representing the bishops of the whole world (the Greek *oikumenē* referred to the inhabited world) occurred at Nicaea in Asia Minor in 325. The council was convoked not by an ecclesiastical authority but by Constantine, who wished to have a final decision on the Arian controversy. (According to Arius, the Son of God was a creature of similar but not the same substance as God the Father.) The representatives of Constantine's bishop, the bishop of Rome, presided over the council. The Roman Catholic Church has held 21 such assemblies. The chronological distribution of the last three (Trent, 1545–63; first Vatican, 1869–70; second Vatican, 1962–65) shows that in modern times the ecumenical council has been convened less frequently.

Canon law defines an ecumenical council and its procedure; actually, the law represents the procedure followed in the convocation of the first Vatican Council. There is no real criterion for an ecumenical council, and one can say only that those councils are ecumenical that the Roman Catholic Church regards as ecumenical. The Orthodox Churches recognize the first eight only.

The ecumenical council is recognized by the Roman Catholic Church as the supreme authority. With the pope this makes two supreme authorities; the Roman Church reconciles this logical dilemma by asserting that the ecumenical council, acting with the pope, is supreme. Only the pope can convoke an ecumenical council, and he or his legates must preside. There are no limits to the competence of an ecumenical council, but its decrees must be approved by the pope for validity.

The scandals of the Great Western Schism, which at its worst saw three men claiming the papacy, and the corruption of the papal court during the 15th century led to the movement of conciliarism, according to which the ecumenical council was the means of saving the church from scandal and corruption. Much of the policy of the Roman see since that time has been devoted to the suppression of any conciliarist sentiments. This has naturally led to questions about the value of ecumenical councils, which are cumbersome and expensive, when an omniscient office such as the papacy is prepared to handle the business of the Roman Catholic Church. Both the first and second Vatican councils illustrated the values of the ecumenical council. Apart from the public and psychological impact produced by a consensus so broad, the council not only makes available for the church a fund of worldwide wisdom and experience not available to the Roman Curia but also seems to generate a state of mind that raises the members of the council above their normal level of thought and action.

The priesthood. The title of priest (Greek *hiereus*) is given to no church officer in the New Testament. Nevertheless, the office appears in the 2nd century, no doubt with the development of the monarchical episcopate; the bishop needed assistance in his threefold task of teaching, sanctifying, and governing, and the priest exercised this power as an officer of the bishop. A priest is either a member of a diocese or of a religious community; but in the exercise of the threefold ministry every priest is subject to the bishop of the diocese where the ministry is conducted.

The priest is by definition a cultic officer, and the title designates the second element of the office, the work of sanctification. Certain ambiguities in the Roman Catholic clerical hierarchical system appear clearly in the priesthood. Ordination empowers the priest to administer the sacraments, but he cannot use this power except by receiving "faculties" (proper permission or license) from a bishop. Teaching and preaching are not powers conferred by ordination, but they are subject to the same "faculties." The priest is lowest in the system of government and actually does not govern unless he is a pastor. Governing is not exercised by curates (priests who assist the pastor) or by the large number of priests engaged in specialized works that can hardly be called ministries: administration, teaching, scholarship, journalism, and other activities.

The pastor of the parish is the model priest; in spite of the fact that in large parishes the pastor may be primarily an

administrator, Catholics experience their church directly through the parochial clergy. Catholics hear sermons, worship, receive the sacraments, and look for religious counsel and direction in their parish. Many Catholics, particularly in the United States, have their children educated in a school run by the parish. The parish is also the centre of activities ranging from recreation to adult education and to social works, all under the direction of the clergy. In Roman Catholicism the parochial clergy are genuine pastors; the pastoral office has often been reduced for the bishop and is barely visible in the pope. The strength of the Roman Catholic Church historically has been rooted in its priests, especially in its parochial clergy.

Roman Catholicism for centuries has fostered a distinct clerical identity, symbolized by clerical garb, which sets priests as a class apart not only from non-Catholics but from Catholics. The most striking feature of this class, celibacy, has stirred up considerable dissatisfaction in the modern church with celibacy as well as a feeling that it interferes with the ministry. Critics point out that neither in the New Testament nor in the pre-Constantinian church was there a clerical class; the whole church was a people set apart with a mission to the unbelieving world. Because of this dissatisfaction with celibacy and issues related to it there have been a significant number of departures from the priesthood and an alarming fall in the number of candidates.

RELIGIOUS COMMUNITIES

Religious communities in the Roman Catholic Church consist of groups of men or women who live a common life and pronounce vows of poverty, chastity, and obedience (the evangelical counsels). The aim of such a life has traditionally been regarded as the achievement of Christian perfection (theologically defined as perfect love); thus it is an option only for a minority of the members of the church. Roman Catholic theology has never quite rationalized the elitism implicit in this idea nor escaped the implicit denigration of the lay state; but up to modern times both religious and seculars have overcome the need for rationalization by mutual respect and mutual services.

Hermits and monks. The origins of the religious life are seen in the anchorites, or hermits, of the 2nd and 3rd centuries, who escaped sin and temptation by flight from the world, mostly in the deserts of Syria, Egypt, and Palestine. Flight from the world became the rule of the cloister, forbidding both free entrance of "externs" into the enclosure and free egress of religious from the enclosure and imposing supervision in all dealings with seculars. The evangelical counsels meant a life of solitude and destitution and an effort to attain union with God by prolonged, almost constant contemplation. Where large numbers of hermits assembled in the same place, cenobitism (common life) emerged, and the hermits or monks (Greek *monachos*, "solitary") elected one of their members abbot (Aramaic *abba*, "father"). Eastern monasticism produced the rules of Pachomius and Basil in the 4th century, and travelers (most notably John Cassian) introduced monasticism into the Latin Church. Eastern monasticism, principally because of a lack of discipline, dissipated much of its energy and had no further influence on the West. Western monasticism was dominated by the rule of Benedict of Nursia in Italy, who founded his communities in the 5th century.

The Benedictine Rule emphasized less austerity and contemplation and more common life and common work in charity and harmony. It has many offshoots and variations, and it has proved itself sturdy; it is the longest continuous religious community in the Roman Catholic Church, and it has survived many near collapses and reforms. The monk did not join an "order" but a monastery. Benedictine monasteries were almost always located in remote areas. However, because the labour of the monks transformed them into food-producing areas, they became centres of settlement. Thus the monks who had fled the world found that the world sought them out for services, which they gladly rendered. Whatever charitable works existed, were done by them. The monks were also the only people who did anything to preserve the learning of

Assistant to the bishop and cultic officer

antiquity. They supported church reform and furnished many reforming popes and bishops. Benedict did not put contemplation into his rule; prayer was fulfilled by the chanting of the divine office (a set form of liturgical prayer), celebrated at specific times during the day.

Mendicant friars and clerks regular. The 13th century saw the rise of the mendicant friars (Franciscans, Dominicans, Carmelites, Augustinians). The friary was like a monastery, with common life and the divine office in choir; but the friars made excursions, sometimes at great length both in time and distance, for apostolic works, mostly preaching. All of the mendicant orders had apostolic work in mind in their foundation, and they desired a mobility that was had neither by the monks nor the diocesan clergy. They were thus at the ready disposal of the pope, and the principle of clerical exemption (exemption from the jurisdiction of the bishop) became much more important than it had been for the monks. Originally, the friars did not need even the approval of the bishop to preach in his diocese, although this freedom has been restricted in modern times. Preaching became almost the specialty of the mendicant friars in the Middle Ages, and they were important in the foundation of the universities of the Middle Ages.

The 16th century saw the emergence of the third major form of religious life, that of the clerks regular. These communities were formally and frankly directed to the active ministry. Even the friary, with the divine office in choir and other monastic restrictions, was dropped; they wore no distinctive religious habit. According to Ignatius of Loyola, founder of the Society of Jesus (Jesuits), the best-known example of clerks regular, their life imitated the manner of living of devout secular priests. The Jesuits, almost by accident, had no particular ministry and placed themselves at the disposition of the pope. The clerks regular had even greater mobility than the friars and had the resources to undertake specialized works. Since the 16th century the works of religious communities have been education, foreign missions, preaching, and theological scholarship. Orders founded since the 16th century have adopted the manner of life of the clerks regular.

Nuns and brothers. Religious communities of women until the 17th century were entirely contemplative and subject to rigid cloister, although from the 16th century onward they began to admit girls into the convent not as novices (those admitted to probationary membership in the community) but to educate them as gentlewomen. The modern communities of women all stem from the type of community instituted in France in the mid-17th century by Vincent de Paul under the name of the Daughters of Charity. At first these women were not religious and deliberately so; Vincent did not wish cloister. The

group was founded to help the poor and sick and to train their children in religion and the rudiments of education. These have remained the major works of the communities of women.

Religious communities are orders if the members (or some of them) pronounce solemn vows; they are congregations if the members pronounce simple vows. Solemn vows are perpetual; simple vows may be perpetual or temporary. The difference is subtle; solemn vows, although dispensable, were meant to be a more permanent and durable consecration than simple vows. Men who make religious profession but who do not receive the sacrament of holy orders are "brothers."

Secular institutes have arisen since World War II. They are not religious (and therefore do not pronounce the three vows), have little or no common life in a common residence, have no superior but rather a manager of the few common affairs, and intend to bear Christian witness in the world in any type of secular employment.

THE LAITY

The laity as a class do not appear in the New Testament; there could only be a laity when a clergy had come into being. When the laity appear, they are the passive element of the church. If the office of the clergy is conceived as teaching, sanctifying, and governing, then the function of the laity is to be taught, sanctified, and governed. Misleading identification of the church with the clergy (and, within the clergy, with the hierarchy) results.

The modern term Catholic Action (especially under Pius X and Pius XI) meant in general the assistance of the laity in the mission of the church. Yet, as it was more closely defined, the mission of the church was still entirely clerical, and lay action was accessory to the mission proper. The laity were merely the arm of the hierarchy. Furthermore, lay action fell under close direction and supervision of the hierarchy and clergy. It is not surprising that an action so vaguely defined, so patronized, and so uninspiring aroused relatively little response.

Much of the 19th and 20th centuries saw the Roman Catholic Church engaged with anticlericalism in the "Catholic" countries of Europe; this seems to be a peculiarly Roman Catholic phenomenon. Actually, anticlericalism is a rejection of the medieval belief in the power of the clergy to direct all the decisions of the layperson that they thought themselves entitled to direct. Reaction in an exaggerated form nearly excluded the clergy from any activity except public worship in some countries.

The second Vatican Council definitely rejected clericalism. It called "secular" all nonecclesiastical activity and declared that the secular is the proper area of the layperson. This means that laypersons are the judges of how to realize their Christian destiny in the secular sphere. Proper does not mean exclusive, but the statement implies that the clergy can offer only principles and general directions, not make specific decisions. The Roman Catholic Church intended to make the laity the channel of its relevance in the world.

The council also took steps against the passive role of the laity in ecclesiastical life. It recommended the establishment of lay councils in each diocese and in each parish. This has moved slowly because Roman Catholics are not accustomed to the idea and are uncertain about how it should be implemented. As the secular is the proper but not the exclusive area of the laity, so the ecclesiastical is the proper but not the exclusive area of the hierarchy and the clergy.

CANON LAW

The earliest individual church law was called a canon (Greek *kanōn*, "rule, measure, standard"); the canons were finally called Canon Law. Church laws appear almost as soon as church authority, and some passages of the New Testament reflect early rules; whether they should be called law at this primitive stage is doubtful. Laws of dioceses or of regions appear even before Constantine; they were formed by diocesan synods or regional councils. Laws for the whole church appear with the earliest ecumenical councils. Canon Law remained scattered pieces

Anticlericalism and clericalism

Mendicant friars preaching the gospel, 13th-century manuscript illumination. In the Bodleian Library, Oxford (MS. Douce 180).

Published on Bodleian Library colour filmstrip 164A

of papal, conciliar, and diocesan legislation until the 12th century. The first collection and synthesis of Canon Law was made by Gratian in 1142, the *Decretum Gratiani*. To this collection in the next 400 years were added the decretals (papal decrees on points of law) produced in the reigns of Gregory IX (1234), Boniface VIII (1298), and John XXII (1317) and two collections known as *Extravagantes* (1500). These formed the *Corpus Juris Canonici* ("Body of Canon Law"); no further collection of laws was made later than the *Corpus*. Effectively, although not formally, Canon Law included the opinions of canonists interpreting the *Corpus*.

This unsatisfactory and cumbersome collection led to calls for codification. No doubt the desire was influenced by the production of the Napoleonic Code, which became the basic law of most of the nations of western Europe. The codification was begun by a document of Pius X (1904) and was completed, directed by Cardinal Pietro Gasparri throughout, under Benedict XV (1917); it became law in 1918. This code remained the basic law of the Roman Catholic Church until 1983, when a new *Codex Juris Canonici* was instituted.

The history and structure of church law are treated more fully under CHRISTIANITY.

Beliefs and practices

FAITH

Concepts of faith. The idea of faith shared by all Christian churches is rooted in the New Testament. But the New Testament idea of faith is not simple, and it permits a breadth of meaning that has led to variations even within a single Christian communion. Most modern interpreters of the New Testament would agree to a description of New Testament faith as a total commitment of the self to God revealing himself in Christ. Yet it is doubtful whether the post-Reformation theology of any Christian church has presented faith simply in these terms.

Even before the Reformation, faith in Roman Catholicism had developed an emphasis that is not rooted in the New Testament but can be traced back to the Alexandrian school of theology and to Augustine. Faith appeared primarily as acceptance of revelation, and revelation appeared as a revelation of doctrine rather than as revelation of a person. This emphasis ultimately was formulated in the 13th century by Thomas Aquinas in a definition of faith—canonized by the Council of Trent and the first Vatican Council—as an intellectual assent given to revealed truth by the command of the will inspired by grace and motivated by the authority of God revealing.

The Reformers, with Martin Luther as the leader, rejected this idea of faith as nonbiblical and exclusively doctrinal; it seemed to place the teaching authority of the Roman Catholic Church between man and God not as a means of communication but as a replacement of God. Luther saw faith as confidence in the saving power of grace. This, Luther believed, was a return to the New Testament faith, but Roman Catholicism rejected this as a mere sentiment; these positions were crystallized up to the 20th century. At the risk of oversimplification, it is possible to say that both represented exaggerations of the New Testament. New Testament faith is more than either trust in the saving power and will of God or assent to revealed truth, although neither element can be entirely excluded. Efforts were wasted in trying to prove the adversaries wrong rather than in trying to understand the New Testament. The documents of the second Vatican Council reflect a shift in Roman Catholic theology from emphasis solely on faith as intellectual assent to recognition of faith as a loyal adherence to a personal God.

Roman Catholic theology, having chosen the option of faith as assent, was faced with the problems of showing that it was a rational assent rather than an irrational assent and of maintaining that faith was a deliberate and free meritorious act under the inspiration of grace. At first glance the two problems seem to cancel each other out; one can maintain one affirmation only by denying the other.

Preambles and motivation of faith. The study of the

problems connected with faith involves the investigation of what are called the preambles of faith and also of the motivation of faith. The preambles of faith include those processes by which the believer reaches the conclusion that it is reasonable to believe—e.g., the proof of the existence of God by the use of one's own reason. The freedom of faith is respected by affirming that this conclusion is as far as the preambles can take one. This process as proposed is a theoretical construction that actually occurs in no one, but the analysis can be of value in uncovering the psychological processes that occur without reflection. The preambles include the study of the scientific and historical difficulties raised against the Christian fact (i.e., the incarnation, Resurrection, Ascension, and glorification of Jesus Christ) itself or against the Roman Catholic interpretation and proclamation of the Christian fact or against the Roman Catholic claim to be the exclusive custodian of revealed doctrine and the means of salvation. These studies were efforts to show what cannot be shown by scientific and critical methods, but in the exaggerated claims of their defenders they showed that faith was a necessary conclusion of a valid rational process. Such a faith could be neither free nor the result of grace.

The study of the motivation of faith attempted to meet this difficulty. Some earlier analyses candidly presented faith as resting on evidence and clumsily postulated a movement of grace necessary to assent to this particular evidence. Normally, one "wills" to believe something because the evidence is not compelling; thus, people choose to believe that the candidate of their choice has the qualities desired for the office, although the evidence is less than overwhelming. The Roman Catholic thinks this is an assent to the probably rather than the certainly true and yet insists that the certainty of faith is the highest of all certainties. Ultimately, the Roman Catholic analysis must say that the evidence that belief is reasonable can never be so clear and convincing that it compels the radical deviation from worldly patterns that assent implies. At this point, the will inspired by grace chooses to accept revelation for other reasons than the evidence.

The motive of faith that has been presented by Catholic theologians is "the authority of God revealing." It is held that the preambles of faith show beyond reasonable doubt that God exists and that he has revealed himself. This evidence and an acceptance of the notion that, if God reveals himself, he does so authoritatively motivate a person to make the act of faith. The problem with such an analysis has been to define how the authority of the revealer is manifest to the believer. It seems that the notion of the authority of God revealing must be an object of faith rather than a motive, because the conjunction of this authority with the fact of revelation cannot be the object of historical experience. In the mid-20th century this dilemma caused an increasing number of Catholic theologians to move closer to a view that emphasized faith as a personal commitment to God rather than as an assent to revealed truth.

Heresy. Heresy is the denial by a professed, baptized Christian of a revealed truth or that which the Roman Catholic Church has proposed as a revealed truth. The unbaptized person is incapable of heresy, and the baptized person is not guilty of "formal" but only of "material" heresy if he does not know that he denies a revealed truth. The seriousness with which Roman Catholicism regarded heresy is shown by the ancient penalty of excommunication. Civil penalties, including the supreme penalty, did not appear until the Constantinian age. Lesser civil disabilities continued in force, although the law was often ignored, into the 20th century. Protestant governments often borrowed some of this severity from Roman Catholic governments.

Roman Catholic theologians often deal with heresy, paradoxically, as a necessary step in the development of dogma. In order to save themselves from an extremely crass and even cruel rationalization, they point out that the questions raised by heresy were legitimate but that heretics too quickly assumed a one-sided and exclusive view of doctrine that they wished to impose on the entire church. Modern studies have sometimes been less kind

The evidence for the act of faith

Faith as an intellectual assent

to such champions of orthodoxy as Athanasius and Cyril of Alexandria, who were not themselves free of one-sided views and who showed themselves unwilling to listen to their adversaries with sympathy and understanding. In recent times most of the theses of Modernism (a movement to change the Catholic Church by means of radical renovation), which were condemned vigorously by Pius X in 1907, have found their way into Catholic theology. This may have something to do with the absence of the words heresy and heretics from the acts of the second Vatican Council. Like the use of the word church for Protestant churches, this indicates a substantial change of attitude toward a genuinely ecumenical position.

REVELATION

The concept of revelation. Although other religions have ideas of revelation, none of these bears a close resemblance to the idea of revelation found in the Old and New Testaments and in Christianity. Roman Catholic theologians distinguish between revelation in a broad sense, which means knowledge about God deduced from nature and man (and therefore actually philosophy), and revelation in the strict formal sense, by which they mean the utterance of God. This latter idea, of course, can only be conceived by analogy with the utterance of man, and its precise definition involves difficulties.

The earliest idea of revelation is the one found in the Old Testament in which the speech of God is addressed to Moses and the prophets. They in turn are described as quoting the words of God rather than interpreting them. Jesus, the fulfillment of the prophets, does not speak the word of God; he is the word of God. This phrase, which occurs only in the opening verse of both the Gospel and the First Letter of John, has become a technical term in theology; Jesus is the Incarnate Word. As such he is both the revealer and the revealed. He reveals the Father both by what he says and by what he is. Thus, the earliest Gospel (literally "good news") is the account of the life, death, and Resurrection of Jesus. The Gospel as the recital of his words appears in a later phase of development.

It has been noted that the Roman Catholic Church has regarded revelation primarily as the revelation of propositions rather than the revelation of a person. Thus, even Jesus has been thought of more as a spokesman who tells of God than as a reality who himself in his being and actions manifests God. Though this latter aspect is found to some extent in the documents of the second Vatican Council, it has normally been considered only in the miracles of Jesus, which have been regarded in Roman Catholic apologetics as works of divine power that assure the credibility of the words of Jesus. These words, which were spoken in a particular historical context, have been preserved in a twofold way. They are written in the Gospels, which together with the Old Testament form a book of revelation that is distinct from the spoken words; but, because the Bible itself is written under divine inspiration, it has the same authority of revelation as the spoken words of Jesus. The Roman Catholic Church also preserves the words of Jesus, independently of the Bible, in its traditional teaching; but it does not utter the very words spoken by Jesus, and thus its words have a lower formal quality of revelation than the words of the Bible, although they are of equal authority. The idea of a book of revelation was taken by the early Christian Church from Judaism when it accepted the sacred books of the Jews as its own, just as it accepted the God of Judaism as the Father whom Jesus claimed for his own.

The content of revelation. The proper content of revelation is designated in Roman Catholic teaching as mystery; this theme was important in the documents of the first Vatican Council. The development of the theme of mystery responded to those intellectual movements of the 18th and 19th centuries that are called by such titles as the Enlightenment, Rationalism, scientism, and historicism. To the Roman Catholic Church these movements were threats to the idea of a sacred revelation; they appeared to claim that human reason had no frontiers or that human reason had demonstrated that revelation was historically false or unfounded or that the content of revelation was

irrational. The affirmation of mystery meant that the reality of God was unattainable to unaided human reason; theologians had long used the word incomprehensible, which says more than modern theologians wished to say. Mystery refers both to the divine reality and to the divine operations of the world. These operations can be observed only in their effects; the operation itself is not seen, nor is its motivation seen. The plan of God, which is realized in history, is mysterious. The first Vatican Council insisted that the existence of God and of a moral order is attainable to reason, and some of the fathers of the council wished to state that these truths were imposed upon reason by the evidence, a step that the council did not choose to take. Mystery does not mean the incomprehensible or the unintelligible; it means, in popular language, that man cannot know who God is or what God is doing or why God is doing it unless God tells him. Mystery also means that, even when the revelation is made, the reality of God and his works escapes human comprehension.

The term supernatural has been used in Roman Catholic theology since the 17th century to designate not only revelation but other aspects of the divine work in the world. The term has an inescapable ambiguity that has led many modern theologians to avoid its use. The "natural" that the supernatural presupposes is the world of human experience; the quality of this experience is not altered by technological and social changes as long as these are fulfillments of the potentialities of nature. Indeed, it is the spectacular growth in the knowledge of these potentialities in modern times that leads to doubt as to whether there can be a supernatural at all. The supernatural reality is identified with God in his reality and in his operations. This is a reality that man cannot create or control. The supernatural in cognition is this reality as it is perceptible to man; it is, for man, simply unknown as far as unaided reason can move. The first Vatican Council affirmed that without revelation human reason has not reached anything but a distorted idea of the divine and an imperfect idea of the moral order. This means also that human beings are unaware of their destiny, either individually or collectively, without revelation and that they are unable to achieve it without the entrance of the supernatural into the world of history and experience.

Contemporary theologians of revelation are aware of the problems raised by historical and literary criticism that render it impossible to cherish the primitive idea of revelation as the direct utterance of God to man. Roman Catholic theologians have not found a satisfactory way of describing revelation, but they do not see that the destruction of a naive idea of revelation destroys the whole idea. Theologians also recognize that the older idea of revelation of propositions as a collection of timeless and changeless verities, almost like a string of pearls, is no longer tenable. Every utterance that is called revelation was formed in a definite time and place and bears the marks of its history. There is no revealed proposition that cannot be restated in another cultural situation. Indeed, contemporary theologians are aware that these propositions must be restated if the Roman Catholic Church is to speak meaningfully in the modern world. Roman Catholicism does not accept the possibility of a new revelation; it believes that reason can never completely penetrate the "mystery" and that it must continue the exploration of the mystery that has already been revealed.

TRADITION AND SCRIPTURE

In Roman Catholic theology tradition is understood both as channel and as content. As channel it is identical with the living teaching authority of the Catholic Church. As content it is "the deposit of faith," revealed truth concerning faith and morals. In Roman Catholic belief, revelation ends with the death of the Apostles; the deposit was transmitted to the college of bishops, which succeeds the Apostles.

The Reformers contended that the Roman Catholic Church had imposed teachings that were not contained in the Scriptures, and this Protestant objection has been maintained in modern times. The objection was raised more intensely when the Immaculate Conception of Mary,

Jesus as re-
vealer and
revealed

Mystery
and the
super-
natural

Tradition
as channel
and
content

the mother of Jesus (Pius IX, 1854), and her Assumption (Pius XII, 1950) were defined as dogmas. For neither of these is there any biblical evidence; more significantly, there is no evidence in tradition for either before the 6th century.

The Roman Catholic Church recognizes that the Bible is the word of God and that tradition is the word of the church. In one sense, therefore, tradition yields to the Scriptures in dignity and authority. But against the Protestant slogan of *sola Scriptura* ("Scripture alone"), itself subject to misinterpretation, the Roman Catholic Church advanced the argument that the church existed before the New Testament. In fact, the church both produced and authenticated the New Testament as the word of God. For this belief, at least, tradition is the exclusive source; and this furnished a warrant for the Catholic affirmation of the body of truth that is transmitted to the church through the college of bishops and preserved by oral tradition (meaning that it was not written in the Scriptures). The Roman Church therefore affirmed its right to find out what it believed by consulting its own beliefs as well as the Scriptures. The Council of Trent affirmed that the deposit of faith was preserved in the Scriptures and in unwritten (not in the Bible) traditions and that the Catholic Church accepts these two with equal reverence. The council studiously avoided the statement that they meant these "two" as two sources of the deposit, but most Catholic theologians after the council understood the statement as meaning two sources. Protestants thought it meant the Roman Catholic Church had written a second Bible.

Only in contemporary Catholic theology has the question been raised again, and a number of theologians believe that Scripture and tradition must be viewed as one source. They are, however, faced with the problem of nonbiblical articles of faith. To this problem several remarks are pertinent. The first is that no Protestant church preaches "pure" gospel; they have all developed dogmatic traditions, concerning which they have differed vigorously. It is true, on the other hand, that they do not treat these dogmatic traditions "with equal devotion and reverence" with the Bible. The second is that the early Christian Church through the first eight ecumenical councils (before the Eastern Schism in 1054) arrived at nonbiblical formulas to profess its faith. Protestants respond that this is at least a matter of degree and that the consubstantiality of the Son (*i.e.*, that he is of the same substance as the Father), defined by the Council of Nicaea, is more faithful to the Scriptures than the Assumption of Mary.

Roman Catholics and Protestants should be able to reach some consensus that tradition and Scripture mean the reading of the Bible in the church. Protestants never claimed that a man and his Bible made a self-sufficient Christian church. The New Testament itself demands that the word be proclaimed and heard in a church, and the community is formed on a common understanding of the word proclaimed. This suggests a way to a Christian consensus on the necessity and function of tradition. No church pretends to treat its own history of belief as nonexistent or unimportant. By reading the Scriptures in the light of its own beliefs it is able to address itself to new problems of faith and morals that did not exist in earlier times or to which the church did not attend.

Catholic theologians of the 19th century dealt with the problem under the heading of development of dogma. To a certain extent the question can be reduced to epistemology (*i.e.*, theory of knowledge): is a new understanding of an ancient truth a "new" truth? The problem does not arise out of faith; Sir Isaac Newton's observations of falling bodies consisted of nothing that people had not seen for thousands of years. Yet the effects of Newton's insights and calculations altered an understanding of the universe and the actions of people within the universe. The problem is important in theology because of the necessity of basing belief on the historical event of the revelation of God in Christ. Unless the link is maintained, the church is teaching philosophy and science, not dogma. Hence, the Roman Catholic theological teaching has tended to say that dogma develops through new understanding, not through new discoveries.

THE TEACHING AUTHORITY OF THE CHURCH (THE MAGISTERIUM)

The concept of teaching authority. The Roman Catholic Church claims for itself a teaching authority that is unparalleled in the Christian community. The Reformation was primarily a rebellion against the teaching authority, and the Reformers did not claim for their own churches the authority they rejected in the Roman Church.

To teach with authority means that the teacher is able to impose his doctrine upon the listener under a religious and moral obligation. This moral obligation does not flow from the nature of teaching, which of itself imposes no obligation upon the learner; the learner is morally obliged only to assent to manifest truth. Instead it flows from the understanding that the Roman Church derives its teaching authority from the commission given by Jesus to the Apostles as contained in the New Testament ("He who hears you hears me"). But whereas the response of the hearers of the Apostles was faith, the response of the Roman Catholic is expected to go beyond faith. The Apostles were presumed to speak to those who did not yet believe, whereas the Roman Catholic Church imposes its teaching authority only upon its members. The definition of the teaching authority must show that these modifications do not exceed the limits of legitimate doctrinal development.

Organs of teaching authority. The teaching authority is not vested in the whole church but in certain well-defined organs. These organs are the hierarchy—the pope and the bishops. The Roman Catholic Church traditionally has divided the church into "the teaching church" and "the listening church." Clergy below the hierarchical level are included in "the listening church," even though they are the assistants of the bishops in the teaching office. The hierarchy alone teaches what the Roman Catholic Church calls "authentic" doctrine. There is an unresolved antithesis between this idea and the traditional belief that "the consent of the faithful" is a source of authentic doctrine; the conventional resolution that defines the consent as formed under the direction of the pastors of the faithful resolves the problem by depriving the consent of the faithful of any meaning.

The Roman pontiff is vested with the entire teaching authority of the Roman Catholic Church; this was solemnly declared in the first Vatican Council. This means that he is the only spokesman for the entire Roman Church; the papacy carries in itself the power to act as supreme pastor. It is expected that he will assure himself that he expresses the existing consensus of the church, but in fact the documents of the first Vatican Council are open to the understanding that the pope may form the consensus by his utterance. The second Vatican Council clarified this ambiguity in the idea of the spokesman of the church by its emphasis on the collegial character of the primacy of the pope. The pope, however, does not always speak as the supreme pastor and head of the Roman Church, and he is expected to make this clear in his utterance.

The bishops are authentic teachers within their dioceses. Thus, the same implicit conflict exists in regard to teaching as was noted in connection with governing. The conflict is resolved by collegiality; that the authentic teacher teaches orthodox doctrine is recognized by comparing his doctrine with that of his episcopal colleagues. In this way doctrinal disputes were resolved in the pre-Constantinian church, and a regional council was called if necessary. Since the Reformation the Roman see has never admitted publicly that a bishop has fallen into doctrinal error; the united front of authentic doctrine is preserved, and the matter is dealt with by subtle means. What is taught by all the bishops is authentic doctrine; it is understood that they teach in communion with the Roman pontiff, and a conflict of doctrine on this level is simply not regarded as a possibility. This consensus of the bishops is known as "the ordinary teaching." "The extraordinary teaching" signifies the solemn declaration of an ecumenical council, which is the assembly of the bishops, or the most solemn type of papal declaration, known as a definition of doctrine *ex cathedra* ("from the throne"), a term that signifies that the declaration exhibits the marks of the teaching of the supreme pastor addressed to the universal church.

The question of the two sources of faith

The hierarchy

Development of dogma

Object and response. The object of authentic teaching is defined as "faith and morals." Faith means revealed truth. Morals theoretically means revealed moral principles, but it has long been understood as moral judgment in any area of human conduct; thus, the Roman Catholic Church not only prohibits contraception for its members, but by declaring it contrary to "the natural law" the church declares contraception to be universally wrong. Thus, morals includes the declaration and interpretation of the natural law. The limits of faith and morals have never been defined by the Roman Catholic Church, nor can one take the exercise of the teaching authority as a reliable guide. Thus the teaching authority condemned the heliocentric theory of Galileo as contrary to the Bible because it has always understood that revealed truth involves propositions that are not themselves revealed but that must be affirmed or denied, at least in the present context of knowledge, because of revealed doctrine.

Dogma is the name given to a proposition that is proclaimed with all possible solemnity either by the Roman pontiff or by an ecumenical council. A dogma is a revealed truth that the Roman Catholic Church solemnly declares to be true and to be revealed; it is most properly the object of faith.

Infallibility

The first Vatican Council declared that the pope, when he teaches solemnly and in the area of faith and morals as the supreme universal pastor, teaches infallibly with that infallibility that the church has. The infallibility of the church has never been defined, and its extent is understood by theologians in the sense of pontifical infallibility as limited to faith and morals. These terms are ambiguous, as noted above. Infallibility is actually hedged in with many reservations; nevertheless, pontifical documents often have an aggressive tone that may mislead the incautious reader. The real problem is how a teaching authority that can and does make errors in doctrinal teaching can be called infallible, even with numerous and serious reservations. In the early 1970s some Catholic theologians (*e.g.*, Hans Küng) suggested that the church should be understood as indefectible (*i.e.*, not able to fail or be totally led astray) rather than infallible.

The proper response of the Roman Catholic to authoritative teaching that is "ordinary" and does not clearly deal with "faith or morals" is religious assent. This is extremely difficult to define; it admits dissent under poorly defined conditions. But the theory of religious assent does in fact permit the considerable dissent from the authoritative teaching of Paul VI in 1968 against contraception. Religious assent is particularly relevant to the pontifical document called the encyclical, a type of document that first appeared in the 18th century and became the normal mode of pontifical communication in the 19th century. The encyclical letter is a channel of ordinary teaching, not solemn and definitive and somewhat provisional by definition. Religious assent may be withheld, in popular language, by anyone who in good conscience thinks he knows better. The traditional discipline has made Roman Catholics slow to say this; in modern times they say it more quickly. At the same time, the documents of the second Vatican Council indicate that the authoritative teaching body will be slower to assert itself in the future.

MAJOR DOGMAS AND DOCTRINES

The Roman Catholic Church in its formula of baptism still asks candidates to recite the Apostles' Creed as a sign that they believe what they must believe. The early Church Fathers made the creed the basis of the baptismal homilies given to catechumens, those preparing for the rite. The homilies, like modern Roman Catholic doctrine, went considerably beyond the bare articles of the creed.

Roman Catholic faith incorporates into its structure the books of the Old Testament. From these books it derives its belief in original sin, conceived as a hereditary and universal moral defect that makes human beings incapable of achieving their destiny and even of achieving basic human decency. The importance of this doctrine lies in its explanation of the human condition as caused by the failure of man and not by the failure of God (nor, in modern Roman Catholic theology, by diabolical influence). Man

can be delivered from the human condition only by a saving act of God. This act is accomplished by God in the death and Resurrection of Jesus. In Jesus, God is revealed as the Father who sends the Son on his saving mission, and through the Son the Spirit comes to dwell in the redeemed. Thus the Trinity of Persons is revealed, and the destiny of man is to share the divine life of the three Persons. The saving act of Jesus introduces into the world grace, a theological idea that has been much and hotly disputed. Grace signifies in Roman Catholic belief both the love of God and the effect produced in man by this love. The response of believers to the presence of grace is the three theological virtues of faith, hope, and charity; these enable them to live the Christian life. Human beings are introduced to grace and initiated into the church by baptism, which must be preceded by repentance and faith. The life of grace is sustained in the church by the sacraments.

Grace

The life of grace reaches its fulfillment in eschatology; in this area of belief about the end of the world and "the last things," there is some uncertainty in modern theology. Most theologians recognize the mythological character of most of the imagery of heaven, hell, and purgatory. The peculiarly Roman Catholic belief in purgatory was an effort to state that most men at death are neither good enough for heaven nor bad enough for hell. The theology of the last things is still unable to cope with the implications of this statement. Belief in a resurrection to eternal life has never been easy, and modern times have produced more difficulties than solutions. Christianity, in fact, shows oscillation between a transcendental direction and an immanent direction; in modern times the emphasis is on immanence—that is, on the meaning of religion in the world. The second Vatican Council reflected this in its statements on the "secular" and the response of the church to the secular.

This summary can state no more than the basic elements of the Christian fact. The complex Roman Catholic dogmatic structure has been mentioned several times, and probably no two statements of "major dogmas and doctrines" would be the same.

THE LITURGY

Cultic worship is so universal in religion that some historians of religion define religion as cult. Cultic worship is social, and this means more than a group worshipping the same deity in the same place at the same time. Cult is structured with a division of sacred personnel (priests) who lead and perform the cultic ceremonies for the people, who are in a more distant relation with the deity. The sacred personnel are designated by the choice and acceptance both of the deity and of the worshiping group. The words and actions of the cultic performance are divided into roles assigned to the leaders and to the worshipers. It is the tendency of cultic worship to replace spontaneity, which it once had, with set and even rigid forms of words and acts. These are preserved by tradition, and they generally have a sacredness that is based on the belief that the directions for cultic worship came ultimately from the deity.

The eucharistic assembly or mass. Roman Catholic liturgy has its roots in Judaism and the New Testament. The central act of liturgy from earliest times was the eucharistic assembly, the commemorative celebration of the Last Supper of Jesus. This was set in a structure of liturgical prayer. The first six centuries of the Christian Church saw the development of a rich variety of liturgical systems, many of which have survived in the Oriental churches. In the West the Latin liturgy appeared fully developed in Rome in the 6th and 7th centuries. From the 8th century the Roman liturgy was adopted throughout western Europe. In this same period, however, liturgy developed in Frankish territories; and the Roman rite that emerged as dominant in the 10th century was a Roman-Frankish creation. The Roman rite was reformed by the Council of Trent by the removal of some corruptions and the imposition of uniformity; after Trent the Roman see was the supreme authority over liturgical practice in the entire Roman Catholic Church.

Central act of liturgy

By the 11th century Roman liturgy had acquired the

classic form that it retained up to the second Vatican Council. The fullness of the liturgy could be witnessed only in some cathedrals, collegiate churches, and monastic churches. The full liturgy included the daily celebration of the solemn high mass and recitation of the divine office in choir. The solemn high mass was performed by at least three major officers (celebrant, deacon, and subdeacon), assisted by many acolytes and ministers. Except during the penitential seasons of Advent and Lent, the altar was decorated, and numerous candles (in the Middle Ages for light rather than ornamentation) and incense were employed. The singing and chanting were accompanied by the organ and in modern times even by orchestral music; Mozart once complained that the Archbishop of Salzburg compelled him to compose a mass without the resources of a full symphonic orchestra.

Official
prayer of
the church

The divine office. The divine office was a legacy to the clergy from the monks. From the beginnings monks assembled several times daily for prayer in common. This developed into set common prayer at stated times each day (Matins, midnight; Lauds, first daylight; Prime, sunrise; Terce, mid-morning; Sext, noon; None, mid-afternoon; Vespers, sunset; Compline, before retiring). The divine office consisted basically of the chanting of the Psalms (in a weekly cycle), the recital of prayers, and the reading of the Scriptures (to which were later added selections from the writings of the Church Fathers, probably instead of a homily given by one of those present). Together with the mass the office has been the only "official" prayer of the Roman Catholic Church; all other prayer forms are "private," even if several hundred people recite them together. For this reason clerics in major orders for centuries since the Middle Ages have been obliged to recite the divine office, or "breviary," privately if they are not bound to attend the office in choir. It was long recognized that there is an inconsistency in the private silent reading of a prayer structure that is intended for choral chanting, and the second Vatican Council recommended a reform, after which time many priests abandoned the breviary.

The cycle and the language of the liturgy. The liturgy has long been arranged in an annual cycle that is a re-enactment of the saving events of the life, death, Resurrection, and glorification of Jesus Christ. Even many Catholics do not realize that the cycle has an eschatological outlook; the events are reenacted as an assurance that the saving act will reach its eschatological fullness, and the liturgy is an expression and a support of the Christian hope. The cult of the saints is an intrusion into the liturgical cycle, and it has been much reduced in the contemporary liturgical reforms.

Latin did not become the language of the Roman rite until the 6th century; the language of imperial Rome was Greek. As a sacred language Latin really has no parallel. Jews have always made a genuine effort to learn some Hebrew, and other sacred languages are archaic forms of the vernacular; the English of the Authorized Version of the Bible became the language of prayer in many Protestant churches. The effect of Latin was to make the liturgy the preserve of the clergy, and the laity became purely passive. This was countered by the efforts to use sound and spectacle in the performance of the solemn liturgy. The Canon of the mass, the central eucharistic formula, for centuries was recited by the celebrant inaudibly; this was a kind of verbal "sanctuary" that the laity were not even supposed to hear. The abandonment of Latin as a result of the second Vatican Council excited deep antagonisms; one sees in the Latin liturgy an image, cherished by many, of the timeless and changeless Roman Catholic Church. Yet the restoration of the vernacular should restore to the liturgy two functions that it had in the early centuries: to instruct converts and to confirm members in their faith.

THE SACRAMENTS

The sacraments in general. In Roman Catholic theology a sacrament is an outward sign, instituted by Jesus Christ, that is productive of inner grace. The number of sacraments is seven (defined by the Council of Trent against the Reformers, who reduced the number). The number seven does not appear in Roman Catholic teaching before

the 11th century, and it is an example of truth for which the Roman Catholic Church relies on its own tradition.

The sacrament in modern theology is frequently described as an encounter with mystery, the mystery being the saving act of God in Christ. Theological studies have been directed to the exploration of the idea of sign and significance. The traditional Roman Catholic statement of the effectiveness of the sacraments (defined by the Council of Trent) is described by the untranslatable *ex opere operato*, which is best explained briefly by saying that the faith and virtue of the minister neither add to the sacrament by their presence nor detract from it by their absence. The minister is merely the agent of the church, and the effectiveness of the sacrament is based on the saving act of God in Christ, which is signified by the rite and applied to the recipient of the sacrament.

Protestant theologians formerly charged the Roman Catholic Church with a belief in magic; this controversial angle has generally been abandoned, but the theological explanation of the sign that effects by signifying is still difficult. Roman Catholic theologians remark that the mystery of God's saving act is not capable of complete rational explanation. There are analogies, however, in common experience, and there is no society that does not employ effective signs. These signs are not merely for display. The inauguration of the president of the United States makes the man president; the sign is effective because it signifies the reality of the election that this individual won. The sign of the coronation of a monarch is equally effective, but it is more difficult to define the reality signified. Such effective symbols are a part of human society.

The Roman Catholic Church adheres strictly to the external sign. Traditionally the church attributes the institution of the sign to Jesus Christ (although this has been the subject of discussion among modern theologians), and this removes the right of anyone to tamper with it. The Roman Catholic Church believes that, if God gave a sign, the alteration of the sign so that the significance is lost might render the sign ineffective. Hence, the use of the proper material and the retention of the traditional formula are treated as sacred. The Roman Catholic Church maintains its exclusive competence to supervise matter and form "in detail," a competence not precisely defined. Since Thomas Aquinas the material used is called matter, and the words are called form; the terms are borrowed from the Aristotelian theory of the constitution of matter. The material becomes sacred and salutary only by its conjunction with the proper words. The effect produced has for centuries been called grace, but it is difficult to assert a single effect and still explain why there are seven symbols.

The term sacramental is used to designate verbal formulas (such as blessings) or objects (such as holy water or medals) to which a religious significance has been attached. These are symbols of personal prayer and dedication, and their effectiveness is measured by the particular dispositions of the person who uses them. Although superstition has arisen in connection with sacramentals, the Roman Catholic with elementary instruction knows the difference between them.

Baptism. Baptism is the sacrament of regeneration and initiation into the church. According to a theme of St. Paul, probably influenced by Jewish belief in the circumcision of adult proselytes, baptism is death to a former life and the emergence of a new person, signified by the conferring of a new name; it is the total annulment of the sins of one's past and the emergence of a totally innocent person. One becomes a member of the church and is incorporated into the body of Christ, thus becoming empowered to lead the life of Christ. Nothing but pure natural water may be used, and baptism must be conferred in the name of the Father, the Son, and the Holy Spirit. Baptism is normally conferred by a priest, but the Roman Catholic Church accepts the baptism conferred by anyone having the use of reason "with the intention of doing what the church does." As the sacrament of rebirth it cannot be repeated. The Roman Catholic Church baptizes conditionally in case of doubt of the fact of baptism or the use of the proper rite.

Two points of controversy still exist in modern times.

The
sacrament
as an
encounter
with
mystery

Sacra-
mentals

Points of
contro-
versy

One is baptism by pouring rather than immersion, even though immersion was probably the biblical and early Christian rite. The change was almost certainly the result of the spread of Christianity into Europe north of the Alps and the occurrence of the baptismal feasts, Easter and Pentecost, often in early spring. The Roman Catholic Church simply asserts that the symbolism of the bath is preserved by a ritual infusion of water.

The second is the baptism of infants. There is no certain evidence of this earlier than the 3rd century, and the ancient baptismal liturgies are all intended for adults. The liturgy and the instructions clearly understand the acceptance of baptism as an independent adult decision; without this decision the sacrament cannot be received. The Roman Catholic Church accepts this principle by introducing adults (sponsors, godparents), who make the decision for the infant at the commission of the parents. In Roman law as in modern law, adults are empowered to make decisions for minors. It is expected that the children will accept the decision made for them and will thus supply the adult decision that was presumed.

Until the recent liturgical renewal baptism did not have the religious and ceremonial importance that it had in the early church; the ceremonies were intended to make the adult aware that he had made the most important decision of his life, and the whole church witnessed the ceremony, performed only twice a year on a group of catechumens. Doubtless the baptism of infants contributed to this loss of ceremonialism and to a corresponding lower esteem of baptism.

Confirmation. Confirmation since the 11th century has been conferred by the bishop through the anointing with oil and the imposition of hands; the words are a declaration that the Holy Spirit is conferred. This is an echo of the accounts in the Acts of the Apostles (chapters 8 and 19) in which a distinction is made between baptism and the conferring of the Spirit. In Acts, however, the reception of the Spirit meant the reception and the manifestation of charismatic gifts (*e.g.*, prophecy, speaking with tongues, ecstasy); something else is now meant. Confirmation is normally conferred at or near the beginning of adolescence. The modern liturgical renewal has empowered pastors of parishes to confer confirmation.

Neglect of the theology of confirmation has left some ambiguities. The Oriental churches confer it on infants as a part of the initiation rites of baptism. The postponement of confirmation has led many Roman Catholic theologians to interpret it as a rite of passage from childhood, like the Jewish Bar Mitzvah ceremony; such rites of passage are common in tribal cultures. Early Christian baptism, however, was conferred on adults; thus the catechumenate was the period of "immaturity." It seems that there should

be a return to the theology of the Spirit and a consideration of confirmation as the sacrament that empowers the Christian to take an active part in the church. The traditional Roman Catholic view of the laity as passive has contributed to the neglect of the theology of confirmation; it left no room for a charismatic laity.

The Eucharist. The Eucharist (the Lord's Supper, Holy Communion) is with baptism one of the two sacraments most clearly found in the New Testament; most Christian churches have it in some form. The Roman Catholic Church distinguishes the Eucharist as sacrifice (mass) and sacrament (communion).

The formula of institution of the Eucharist and the command to repeat it are found in the three Synoptic Gospels (Matthew, Mark, Luke) and in Paul. Originally the Eucharist was a repetition of the common meal of the local group of disciples with the addition of the bread and the cup symbolizing the presence of Jesus. Even in the 2nd century the meal became vestigial and was finally abandoned. The Eucharist was originally celebrated every Sunday; by the 4th century it was celebrated daily. The eucharistic formula was set in a framework of biblical readings, psalms, hymns, and prayers that depended in form somewhat on the synagogue service. This remained one basis of the various liturgies that arose, including the Roman rite.

The sacrificial character of the Eucharist was determined by its relation to the death of Jesus. The Eucharist is not seen as sacrificial everywhere in the New Testament, but the theme is so clearly elaborated in the Letter to the Hebrews that it is universally accepted as Christian belief. The Protestant churches denied the sacrificial character of the Eucharist and rejected the mass. Roman Catholic theology has never reached a universally accepted theory explaining the connection between the death of Jesus and the mass, but it has firmly insisted that the mass repeats the rite that Jesus told his disciples to repeat and that the rite is an effective symbolic commemoration of his death. The mass is the only act of worship that the Roman Catholic Church imposes upon its members. Historically, the Roman Church has attached great importance to the mass, conceding almost anything to secure its celebration.

Roman Catholicism believes in the Real Presence, and this has dominated Catholic-Protestant controversies about Holy Communion. Protestant belief can generally be called dynamic as contrasted with Catholic realism. The celebrated term transubstantiation is defined as the change of the substance of bread and wine into the substance of the body and blood of Jesus Christ. Protestants believe that Jesus is experienced as present. The Roman Catholic theory is difficult to explain in terms other than those of antiquated Aristotelian physics, and recent theories,

"The Last Supper," relief sculpture on the rood loft of the Naumburg cathedral; after 1250.

Sacrament of unity

not yet successful, have attempted to explore sacramental symbolism in other ways. The realism of belief in the presence is associated with the Roman Catholic practice of distributing only the bread to the laity, a serious modification in the sacramental sign. Not yet universally restored, Holy Communion under both species has become much more common since the second Vatican Council.

Neither in Roman Catholic nor in Protestant eucharistic practice does the sacrament retain much of the symbolism of Christian unity, which it clearly has in the New Testament. Originally the symbolism was that of a community meal, an accepted social symbol of community throughout the whole of human culture. Roman Catholic efforts to restore this have included the use of the vernacular and the active participation of the laity. Furthermore, the ancient rite of concelebration—*i.e.*, several priests or bishops jointly celebrating a single eucharistic liturgy—was restored by the second Vatican Council as a means of symbolizing unity; and the practice of celebrating the Eucharist in an informal setting—*i.e.*, in private homes or classrooms—was instituted in some places as a way of drawing the laity more intimately into the rite. But a great obstacle to the symbolism of unity remains the liturgical isolation of the celebrant and the silence that suited the atmosphere of mystery and the presence of God.

Church law obliges the Roman Catholic to receive Holy Communion once a year (during the Lent-Easter season). Practice of frequency has varied over the centuries; the present law reflects the infrequency that was common in the Middle Ages. The symbolism of the sacrament as nutrition becomes rather feeble with such infrequency; it was rationalized both by the theology of the power of the sacrament and by considerations of the general unworthiness of Christians to receive it.

Penance. The name of the fourth sacrament, penance, reflects the earliest discipline of the penitential rite. Those who sinned seriously were excluded from Holy Communion until they showed repentance by undergoing a period of public penance that included such practices as fasting, public humiliation, the wearing of sackcloth, and other austerities. At the end of the period they were publicly reconciled to the church. There were some sins, called capital (murder, adultery, apostasy), for which certain local churches at certain times did not perform the rite; this did not mean that God did not forgive but that good standing in the church was permanently lost. Elsewhere it was believed that the rite of penance could be performed only once; relapsed sinners lost good standing permanently. Rigorist sects that denied the power to forgive certain sins were regarded as heretical. The penitential rite did not endure beyond the early Middle Ages, and there can be no doubt that it was too rigorous for most Christians. It may also be noticed that the penitential discipline did not reflect the forgiveness of Jesus in the Gospels with all fidelity.

Confessing of sins

It is impossible to assign an exact date for “auricular confession”—the confessing of faults by an individual penitent to a priest—but it must have arisen in the early Middle Ages with the disappearance of the penitential system. This is the penitential rite that has endured into modern times. It was rejected by most of the Reformers on the ground that God alone can forgive sins. The Roman Catholic Church claims that the absolution of the priest is an act of forgiveness; to receive it the penitent must confess all serious (mortal) sins and manifest genuine “contrition,” sorrow for sins, and a reasonably firm purpose of amendment. No quality or quantity of sin is too great for sacramental absolution. Roman Catholic theologians have not arrived at an explanation of the process of absolution. They do not admit that absolution is merely a recognition by the priest of dispositions on the part of the penitent that merit forgiveness nor that it is merely a process whereby the penitent is reconciled with the church. There seems to be an unspoken belief that it is a rare person who is really sorry for his sins and that the sacrament is a manifestation of the graciousness of God to human weakness.

Indulgences, which caused such a stir at the beginning of the Reformation, are neither instant forgiveness to the un-

repentant nor licenses of sin to the habitual sinner. They are declarations that the church accepts certain prayers and good works, listed in an official publication, as the equivalent of the rigorous penances of the ancient discipline.

The anointing of the sick. This sacrament was long known in English as “extreme unction,” literally rendered from its Latin title, *unctio extrema*. This non-English designation concealed the meaning of the Latin, “last anointing.” It is conferred by anointing the sense organs (eyes, ears, nostrils, lips, hands, and formerly the feet and the loins) with blessed oil and the pronunciation of a formula. It may be conferred only on those who are seriously ill; seriousness is measured by the danger of death, but a danger, however certain, from external causes (such as the execution of the death sentence) does not render one apt for the sacrament. It may be administered only once during the same illness; recovery renders one apt again. Its effects are described as strengthening both of soul and body; it is an ancient rite that continues Jesus’ ministry of healing. The sacrament is directed against “the remains of sin,” an ill-defined phrase; but it was long ago recognized that illness saps one’s spiritual resources as well as one’s physical strength, and one is not able to meet the crisis of mortal danger with all of one’s powers. In popular belief anointing is most valuable as a complement to confession or, in case of unconsciousness, as a substitute for it.

The anointing is not the sacrament of the dying; it is the sacrament of the sick. The New Testament passage (James 5:14–15) to which the Roman Catholic Church appeals for this rite does not envisage a person beyond recovery. Postponement until the patient is critically ill in modern medical terms means that the sacrament is often administered to an unconscious or heavily sedated patient. Under such circumstances the rite can no longer be effective as a sacrament of the sick, and to the uninformed a magical rite of forgiveness is suggested.

Marriage. The inclusion of marriage among the sacraments gives the Roman Catholic Church jurisdiction over an institution that is of concern to the state and to non-Catholic persons and groups within society. The Roman Church claims complete jurisdiction over the marriages of its members, even though it is unable to urge this jurisdiction in modern secular states. The sacrament in Roman Catholic teaching is administered by the spouses through the exchange of consent; the priest, whose presence is required, is an authorized official witness; in addition, the church requires two other witnesses. Marriage is safeguarded by a number of impediments that render the marriage null and void whether they are known or not, and the freedom of the spouses must be assured. This means that the Roman Catholic Church demands an unusually rigorous examination before the marriage, and this in turn means that it is practically impossible to marry on impulse in the Catholic Church. All of this is for the purpose of assuring that the marriage so contracted will not be declared null in the future because of some defect.

The rigid Roman Catholic rejection of divorce has been a major point of hostility in the modern world. Absolute indissolubility is declared only of the marriage of two baptized persons (Protestants as well as Catholics). The same indissolubility is not declared of marriages of the unbaptized, but the Roman Church recognizes no religious or civil authority except itself that is empowered to dissolve such marriages; this claim is extremely limited and is not used unless a Roman Catholic is involved. Because of its rigorous conditions for contracting marriage, the Roman Catholic Church finds grounds for nullity that do not exist in civil law, and it is willing to make a more searching examination. Declarations of nullity, however, should not be confused with divorce nor be thought a substitute for divorce. Some Roman theologians have suggested that Roman Catholic rigour is based on a misunderstanding of the Gospel texts that reject divorce; but a position maintained for centuries is not easily modified.

The onerous conditions that Roman Catholicism formerly imposed upon non-Catholic partners in mixed marriages have been notably relaxed since the second Vatican Council, particularly as regards written promises that the children would receive religious education in the

The claim of jurisdiction over marriages

Roman Catholic faith. The former coldness of the Roman Church toward such marriages is also relaxed; they may be celebrated in church during the mass, and a Protestant minister or a Jewish rabbi may share the witness function with the priest.

Power to administer the sacraments

Holy orders. This sacrament confers upon candidates the power over the sacred, which means the power to administer the sacraments. The Latin Church had long recognized four minor orders (porter, lector, exorcist, acolyte) and four major orders (subdeacon, deacon, priest, bishop). The minor orders represented church services rendered by persons not ordained. In 1972 Pope Paul VI issued the apostolic letter *Ministeria quaedam*, which abolished the major order of subdeacon and all minor orders and which created the lay liturgical ministries of lector and acolyte. Only the major orders are held to be sacramental, but they are regarded as one sacrament within which a tripartite hierarchy of sacramental effects is administered separately. Ordination is conferred only by the bishop; the rite includes the imposition of hands, anointing, and the delivery of the symbols of the order. The power of the sacred peculiar to the bishop is shown only in the sacraments of confirmation and orders. Ordination can neither be repeated nor annulled. Priests who are suspended from priestly powers or laicized (permanently authorized to live as a layman) retain their sacred power but are forbidden to exercise it except in emergency. The priest is always ordained to a "title," meaning that he is accepted in some ecclesiastical jurisdiction. Lectors and acolytes are instituted by a bishop or by the major superior of a clerical religious institute. Following a calling of the candidates, instruction, and prayer, lectors are presented a Bible and acolytes a vessel with bread or wine.

Other theological developments following the second Vatican Council concerned the ordination of women, against which no solid theological objection has been shown; the restoration of the permanent diaconate (with the powers to baptize, preach, and administer the Eucharist), to which both married and single men are admitted; and the idea of ordination for a fixed period of service. Except for the diaconate, these are radical suggestions in Roman Catholicism.

PARALITURGICAL DEVOTIONS

In the Roman Catholic Church, liturgy in the proper sense is the liturgy of the mass, the divine office, and the sacraments. The Latin language, the clerical character of the liturgy, and the search for novelty for hundreds of years have combined to produce forms of worship that are paraliturgical—by which is meant that they lie outside the liturgy and in some cases in opposition to it. These acts are also known as devotions or devotional practices, by which is meant that they are accepted voluntarily and not from obligation.

Eucharistic devotions. A number of eucharistic devotional practices arose in the Middle Ages, when Catholics rarely received the Eucharist more than once a year. These were cultic forms that were directed to the Real Presence of Jesus in the Eucharist rather than to sacrifice and Holy Communion. Such were Benediction of the Blessed Sacrament and "exposition." Benediction was a blessing conferred by a priest holding a consecrated Host in a vessel of display called the monstrance; the priest's hands were covered to signify that it was the blessing of Jesus and not his own. This blessing was accompanied by hymns and the use of the organ and incense. Exposition was the public and solemn display of the eucharistic bread, again with the accompaniment of hymns, the organ, incense, and processions. The reservation of the Eucharist in churches was a way in which Catholics could address themselves in personal prayer to Jesus really present. These have often functioned as substitutes for mass and Holy Communion, and since the modern renewal of liturgy they occur much less frequently.

Cult of the saints. Other devotions revolve about the cult of the saints, a practice repudiated by the Reformers as a denial of the total mediation of Christ. This objection oversimplified Catholic practice, but the devotions did sometimes approach superstition. Catholic theologians

distinguish (by Greek technical terms) the worship paid to God (latría, "adoration") from the veneration addressed to Mary (hyperdulía, "super-service") and the saints (dulía, "service"). Protestants do not disagree with the principle of admitting the saints as examples of genuine Christianity, but they reject the intercession of the saints as utterly superfluous and ineffective. The Roman Catholic understanding of the intercession of the saints is an extension of the belief in the communion of saints. Although such veneration does tend to multiply mediators, it has often fostered a simple and not displeasing familiarity with the world of the supernatural. The excesses of the cult of Mary have stirred up controversy, and the tendency to superstition and the deification of Mary have sometimes been painfully present. Mary represents the feminine principle in Roman Catholicism; often in other religions this principle has been personified as a goddess. Mary is given the feminine traits of sympathy and tenderness that are not improper to the deity but are somewhat improper to the father figure and the king figure. The multitude of apparitions of Mary (e.g., at Lourdes, Fr., and Fatima, Port.) come from the need of a local and national symbol of presence, which enables the Roman Catholics of a nation or region to identify with Mary. Because Mary as a historical person is almost totally unknown, Catholics have been able to find in her all the traits of the ideal person that they needed to find.

Roman Catholicism has always insisted on its right to official supervision of devotional cults, and only approved forms of devotions may be used in the churches or under clerical auspices. Approval does not imply the historical reality of the vision or apparition involved; no Roman Catholic is obliged to believe that Mary appeared to anyone at Lourdes or Fatima, that the rosary (prayer beads) was delivered by a private revelation, or that Jesus manifested himself as the Sacred Heart. Nor is any Catholic obliged to practice any of these devotions. Generally, they serve the purpose of emphasizing some element of Christian faith that is obscured in the preaching and the liturgy at a particular time and place. Devotion to the Sacred Heart, for example, turned the attention of Catholics to the humanity of Jesus and to Christian love in the somewhat arid spirituality of the 17th and 18th centuries. It may be urged that more authentic biblical proclamation would have brought out these things; Roman Catholicism has often manifested itself through devotions when authentic biblical preaching was not available. In approving devotions the Roman Catholic Church simply declares that they are not in conflict with Roman Catholic faith and morals. It does not deny that they may be entirely products of the imagination.

Mysticism. The search for God through mysticism has never been received cordially by the official Roman Catholic Church. In general terms, the mystical experience can be described as a direct experience of the reality of the divine. A sufficient number of mystics have been proved fraudulent to justify caution but not to justify a blanket antecedent disapproval. Every saint who has been recognized as a mystic had some trouble with church authority. Indeed, one may see in the mystical experience of God something that the official church can neither furnish nor control. In addition, mystics have often had a prophetic character that expressed itself in criticism of abuses in the official church. Whatever the explanation, mystical phenomena have become extremely rare in the modern Roman Catholic Church.

Direct experience of God

THE ROLE OF THE CHURCH IN SOCIETY

Missions. From its beginnings Christianity alone among the great religions has regarded itself as a true world religion that appeals to all men without distinction of race, nation, or culture. Roman Catholicism believes that it has preserved this missionary thrust more faithfully than any of the non-Roman churches. From the 4th to the 10th century the Roman Church devoted itself to the evangelization of the barbarians. The barbarians wished to become "Roman," and they accepted the church as a component of Roman civilization. The spread of Islām was met with crusades and not with missionaries, and

Benediction and "exposition"

the Roman Catholic Church has never mounted more than a feeble missionary effort toward Muslims. Thus, the missionary movement languished from the 10th to the 16th century; but the ages of the expansion of Europe, in which the Catholic countries were the early leaders, spread Roman Catholicism to the Americas, Asia, Oceania, and Africa.

Centralized control by the Roman see

This missionary effort differed from both the New Testament missions and the missions to the European barbarians in its very close, centralized control by the Roman see. Missionary churches have begun to achieve that independence proper to the diocesan structure only in the 20th century. It has been difficult for the Roman Catholic missions to divorce themselves from colonialism, and many missionaries did not want the divorce. Again until recent times most of the clergy and all the hierarchy in mission countries were European or American, as were the heads of educational and benevolent operations. Even the peoples of the mission countries, including their clergy and religious personnel, generally wished to give their church a European identity rather than an Asian or African identity. The Roman see, which had suppressed efforts to admit Chinese rites in the 18th century, was unsympathetic to what appeared to be "non-Roman" practices. The second Vatican Council officially ended the colonial phase of missions; in practice, however, the end will take longer. Where possible—meaning where the personnel are available—the operation of the mission churches has been given to native hierarchy and clergy.

Education. Between the barbarian invasions and the Protestant Reformation, education in Europe, except for the Arabic and Jewish centres of learning, was conducted by Roman Catholicism. Learning during the early Middle Ages was preserved by the monasteries; and, although the monks did little more than copy the manuscripts of Greek and Latin pagan writers and of the Church Fathers, they educated the few people who had any learning. The foundation of the European universities after 1200 was also the work of Roman Catholicism; these institutions were stimulated by the learning of Arabic scholars, through whom Europeans became acquainted with the philosophy of Aristotle and produced the learning of Scholastic philosophy and theology. The cultivation of literature and the arts in the 15th century flourished under the patronage of the papacy and Catholic princes and prelates.

The birth of modern science was coincidental with the Reformation and the age of the expansion of Europe. The Roman Catholic response to the new science, accompanied by new philosophical systems, was hostile; and the world of European learning after 1600 was dissociated from the Roman Catholic Church, which patronized only defensive learning. At the same time, Roman Catholic initiatives in educating the poor were gaining momentum. The invention of printing had diffused education far beyond earlier possibilities, and the churches were all interested in reaching the minds of the young. This interest was matched after the French Revolution by the modern states, which in the 19th century moved toward the exclusion of church influence from education. But the Roman Catholic Church, through its religious communities, was a pioneer in the elementary education of the children of the poor.

Critical problems for Catholic schools

In the 20th century the Roman Catholic educational endeavour in many European and American countries, particularly in the United States, had become a vast enterprise. In the second half of the 20th century, however, mounting costs and diminished religious personnel created critical problems for Catholic schools, and even their survival was at stake in many regions. The problems were not lightened by the realization that Roman Catholic education, even where it was strongest, reached only a minority of Catholic students; and the Roman Church had to face its established reputation as an adversary of the intellectual freedom that the modern academic world cherishes.

Eleemosynary activities. Institutional benevolence to the poor, the sick, orphans, and other helpless people has been characteristic of the Christian Church from its beginning. It involved organized assistance, supported by the contributions of the entire community and rendered

by dedicated persons. The church in this way fulfilled the duty of "the seven corporal works of mercy" mentioned in the Gospel According to Matthew (chapter 25) and carried on the healing mission of Jesus. Protestant churches continued the works of institutional benevolence after their separation from the Roman Church, and the history of Christian benevolence is a noble portion of church history. Institutional assistance to the helpless is a legacy from the church to modern governments.

This work, which would seem to be above criticism, was beset with troubles in the latter half of the 20th century. Costs for these works, like the costs for education, soared beyond the possibilities of individual contributions. Governmental assumption of responsibility for benevolence both rendered the necessity of church works doubtful and narrowed the base of contributions. Church organizations as they existed were not well equipped to deal either with modern urban poverty or with the problem of international poverty.

Church and state relations. The most important modification in Roman Catholic theory and practice of church-state relations was the declaration of the second Vatican Council in which the Roman Catholic Church recognized the modern, secular, pluralistic nation as a valid political society. Union of church and state had been the common pattern since the era of Constantine, and all pontifical declarations of the 19th century rejected separation of church and state as pernicious. This position was steadfastly maintained in spite of the fact that the union of church and state had been accepted by the Protestant countries of Europe; it reflects a long history of domination of the church by the state and of the church's involvement in political power struggles. The second Vatican Council declared that the Roman Catholic Church is not a political agent and will not ask political support for ecclesiastical ends. A significant change in the Roman attitude toward the state is the council's express declaration of freedom of religion.

Recognition of the pluralistic state

Economic views and practice. In the centuries when the Roman Catholic Church was Christendom, there was a place for every member in the church that corresponded to the individual's place in the social structure. In modern times the church hierarchy became identified with the landed aristocracy; this dangerous identification led the revolutionaries of 18th-century France to attempt to destroy the Roman Catholic Church with other components of the old order. The Roman Catholic Church entered the 19th century with a firm official bias against revolutionary movements, and the brief liberalism of Pius IX was ended with his experiences in the Italian revolution of 1848. The Roman Catholic Church was inflexibly opposed to all forms of Socialism, and its opposition to Marxist Communism was implacable. Thus, the Roman Catholic hierarchy was identified with the new capitalist classes of the industrial society. In many European countries this meant that the church lost membership among the working classes. Leo XIII in *Rerum Novarum* (1891; "Of New Things") was the first pope to speak against the abuses of capitalism. Social teaching was further elaborated by Pius XI in *Quadragesimo Anno* (1931; "In the 40th Year"), John XXIII in *Mater et Magistra* (1961; "Mother and Teacher") and *Pacem in Terris* (1963; "Peace on Earth"), and Paul VI in *Populorum Progressio* (1967; "The Progress of Peoples"). Catholic opposition to Socialism has gradually been diminished, although Catholic teaching tends in the direction of the diffusion of capital and not in its nationalization. In some features, however, such as the approval of labour unions, Catholic teaching has reached points that Pius IX would have regarded as Socialism.

In its own practices the Roman Catholic Church has accepted full control over the ownership of property and of productive investments. It does not admit accountability to the laity for its funds, which are managed by the hierarchy; hence the wealth of the Catholic Church has long been a mystery, often attractive to greedy anticlerical governments. Their raids as well as some public disclosures indicate that popular belief exaggerates the wealth of the Catholic Church. Following the second Vatican Council, there was a strong movement in Catholicism for public financial reports.

Stability
of the
family

The family. Roman Catholic teaching on the family is conservative and attributes to the family a social and moral centrality that many people think it no longer has. The teaching has grown up around a number of factors, not all of which come from the New Testament. The medieval family (whether that of nobles or commoners) is reflected in the guiding principle of Roman Catholic teaching, the stability of the family. This principle does not admit divorce. The family is preserved by a strong authority structure in which the father is the head; this reflects not only the Old Testament but Roman law. The family, moreover, is child-centred; traditional Catholic teaching makes the primary end of marriage the procreation and rearing of children. Only recently have Catholic theologians begun to speak of mutual love as an end "equally primary." Rigid monogamy was not unrelated to the common and widely tolerated practice of adultery, which the Roman Catholic Church regarded as more tolerable than divorce. The principle of the stability of the family also mirrored a certain tribal view of the family that saw the individual's chief security not in the law and the courts but in kinsmen. Such a view of stability is, however, not well adapted to the mobility of the modern family. Nor is it well adapted to the independence possible to the person who wishes it strongly enough. In the late 20th century the Roman Catholic Church was faced with the problem of preserving for its members the unquestioned values of mutual love and responsibility associated with the family without imposing on it an antiquated authoritarian structure. But the major problem was certainly the practice of birth control. The moral arguments for the Catholic position against birth control had suffered general erosion, and many Catholics regarded the declaration of Paul VI in 1968, reiterating the traditional prohibition, as a blind exercise of authority.

Roman Catholicism following the second Vatican Council

The Roman Catholic Church has been experiencing a renewal that reached its official peak in the second Vatican Council. Renewal has brought benefits, but it has also brought internal disturbances greater than any the church has known since the Protestant Reformation. There has been a clear polarization between liberal and conservative wings of the type that tends to leave no room for moderates. Although such disunity poses a real threat of schism, there have been no group departures except in a few instances. The number of individual departures, however, has been large enough to cause concern. The exact number is unknown, because discontented Catholics in modern times leave quietly.

The Roman Catholic Church has officially abandoned its "one true church" position. It has entered into ecumenical conversations with the Protestant churches that could lead to Christian union; the Catholic Church has expressed a readiness to make doctrinal and disciplinary concessions, but how far these may go is not yet clear. The church has even made gestures of friendliness to Islam and Judaism and does not speak of the great Oriental religions as simple paganism. The openness of the Catholic Church toward social movements has been mentioned; this has taken a surprising form in some unexpected places such as Spain and Latin America. The edge of Catholic opposition to Marxism was for a time taken off, and the Roman see engaged in unobtrusive diplomatic conversations with some Communist governments. A period of increased involvement in international affairs was seen under the leadership of Pope John Paul II in the 1980s.

Problems
within the
church

Problems, however, are more in evidence than progress. The long, latent conflict between hierarchy and lower clergy has become open. Priests are resistant to the traditional total obedience in style of life and ministry. This conflict has come to a focus on the issue of clerical celibacy; although there are no sure statistics, it is a reasonable assumption that at least half of the Catholic clergy wish celibacy to become an option. The discontent with life and ministry has led to a large number of losses in the priesthood and in religious communities, some of which

face the possibility of extinction. Much of this discontent revolves around ministry as much as around a way of life; many religious workers feel that the conventional ministries are not reaching enough people and are not touching their most urgent needs. The desire to work "in the world," while hardly alien to the New Testament ministry, is not adaptable to traditional clerical and religious rules. What might appear to be a minor point in some places has become major; priests and religious (women religious in particular, who have had more of a problem) no longer wish to wear the identifying garb; they believe that it immediately becomes an obstacle to personal relations. Actually, there is a widespread but not explicit, perhaps not even recognized, rejection of the traditional use of authority and obedience in Roman Catholic clergy and religious communities.

Roman Catholic liturgy has been profoundly changed. The results have not been altogether satisfactory, but some observers say that the effects of the new liturgy cannot be assessed until a new generation has grown up that knows no other liturgy. On this point minor local schisms have occurred, led by reactionary Catholics wishing to return to the traditional liturgy in Latin. Others find the new liturgy stodgy; but the degree to which liturgy ought to be exciting has never been established.

The place of the laity, like that of the clergy, in church decisions remains uncertain. Bishops, clergy, and laity generally are timid in undertaking a modification in church government for which nothing in their previous church experience has prepared them. They seem hesitant to draw on their experience in government and business, where shared responsibility is the rule rather than the exception. Many Catholics find it difficult to examine the role of their hierarchical officers without also questioning their credibility. Yet the direction of the movements where the problems lie is toward greater responsibility of each member of the Catholic Church—hierarchy, clergy, and laity, each in its own way. (J.L.McK.)

General: Reference works include ROBERT C. BRODERICK (ed.), *The Catholic Encyclopedia*, rev. and updated ed. (1987); *New Catholic Encyclopedia*, 17 vol. (1967–79, reissued 1981), which treats all phases of Roman Catholicism and includes a volume on change in the church; *Sacramentum Mundi: An Encyclopedia of Theology*, ed. by KARL RAHNER et al., 6 vol. (1968–70), which deals with Catholic doctrine and theological thought; and F.L. CROSS and E.A. LIVINGSTONE (eds.), *The Oxford Dictionary of the Christian Church*, 2nd ed. (1974, reprinted 1983), with informative articles on Roman Catholic subjects and helpful bibliographies. An excellent brief compendium of doctrine is *A New Catechism: Catholic Faith for Adults* (1967; originally published in Dutch, 1966). The contemporary Roman Catholic Church is surveyed by JOHN L. MCKENZIE, *The Roman Catholic Church* (1969, reissued 1971). A balanced and comprehensive introduction is RICHARD P. MCBRIEN, *Catholicism*, 2 vol. (1980), with additional bibliographies. See also BARRIE RUTH STRAUS, *The Catholic Church* (1987). JAROSLAV PELIKAN, *The Christian Tradition: A History of the Development of Doctrine* (1971–), of which 4 vol. had appeared by 1987, opens with the apostolic Fathers and is to close with the second Vatican Council. ROSEMARY RUETHER and ELEANOR MCLAUGHLIN (eds.), *Women of Spirit: Female Leadership in the Jewish and Christian Traditions* (1979), is a step toward redressing the imbalance in most scholarship. For developments in Roman Catholic theology after the second Vatican Council, see HANS KÜNG, *On Being a Christian* (1976, reissued 1984; originally published in German, 1974). On recent developments in Roman Catholic feminist theology, see MARY JO WEAVER, *New Catholic Women: A Contemporary Challenge to Traditional Religious Authority* (1985).

The papacy: Of the general histories, JOHANNES HALLER, *Das Papsttum: Idee und Wirklichkeit*, rev. and enl. ed., 5 vol. (1950–53, reissued 1965), is a classic. A chronological listing of the popes and antipopes, with concise biographical information, is found in J.N.D. KELLY, *The Oxford Dictionary of Popes* (1986). Useful largely for reference is HORACE K. MANN, *The Lives of the Popes in the Early Middle Ages*, 18 vol. (1902–32), which covers the period to 1304; it is continued for the period to 1800 by LUDWIG PASTOR, *The History of the Popes: From the Close of the Middle Ages*, various editions, 40 vol. (1891–1953; originally published in German, various editions, 16 vol. in 21, 1866–1938). JOSEPH SCHMIDLIN, *Papst-geschichte der neuesten Zeit*, 4 vol. (1933–39), discusses history to 1939. The standard

collection of documents is CARL MIRBT, *Quellen zur Geschichte des Papsttums und des römischen Katholizismus*, 6th ed. rev. by KURT ALAND (1967). An excellent brief introduction to papal history up to the Reformation, including a good bibliography, is GEOFFREY BARRACLOUGH, *The Medieval Papacy* (1968, reissued 1979). For the development of medieval papal claims, see W. ULLMANN, *The Growth of Papal Government in the Middle Ages: A Study in the Ideological Relation of Clerical to Lay Power*, 3rd ed. (1970). For the subsequent crisis of papal authority, see FRANCIS OAKLEY, *Council over Pope? Towards a Provisional Ecclesiology* (1969). EDWARD CUTHBERT BUTLER, *The Vatican Council, 1869–70: Based on Bishop Ullathorne's Letters*, new ed. edited by CHRISTOPHER BUTLER (1962), is a history of the first Vatican Council; see also JAMES J. HENNESEY, *The First Council of the Vatican: The American Experience* (1963). WALTER M. ABBOTT (ed.), *The Documents of Vatican II* (1966, reissued 1982), is an introduction to the achievement of the second council, including commentaries and responses by Catholic, Protestant, and Orthodox scholars.

Works on the papacy from the theological perspective include PAUL C. EMPIE and T. AUSTIN MURPHY (eds.), *Papal Primacy and the Universal Church* (1974), an ecumenical dialogue; and RUDOLF SCHNACKENBURG, *The Church in the New Testament* (1965, reissued 1974; originally published in German, 1961), which presents the results of 20th-century Roman Catholic biblical scholarship. RAYMOND BROWN, KARL P. DONFRIED, and JOHN REUMANN (eds.), *Peter in the New Testament: A Collaborative Assessment by Protestant and Roman Catholic Scholars* (1973), considers the biblical problems in the Petrine question. KARL RAHNER and JOSEPH RATZINGER, *The Episcopate and the Primacy* (1962; originally published in German, 1961), is an analysis of the pope–bishop relationship; and HANS KÜNG, *Infallible? An Inquiry* (1971, reissued 1983; originally published in German, 1970), *The Church* (1967, reissued 1976; originally published in German, 1967), and *Structures of the Church* (1964, reissued 1982; originally published in German, 1962), are basic to an understanding of contemporary “liberal” Roman Catholic thinking on the papacy. For Eastern Orthodox views on the papal primacy, see FRANCIS DVORNIK, *Byzantium and the Roman Primacy* (1966, reprinted 1979; originally published in French, 1964); and J. MEYENDORFF et al., *The Primacy of Peter*, 2nd ed. (1973; originally published in French, 1960).

The Latin Church in the West (1000–1517): The only large-scale work covering the entire period (except for the century 1274–1378) is AUGUSTIN FLICHE and VICTOR MARTIN (eds.), *Histoire de l'église depuis les origines jusqu'à nos jours*, vol. 8–10, 12–14 (1940–64). Another classic is ALBERT HAUCK, *Kirchengeschichte Deutschlands*, 9th ed., 5 vol. in 6 (1958), which covers most of continental Europe to 1437. A shorter history is DAVID KNOWLES and DIMITRI OBOLENSKY, *The Middle Ages* (1968, reissued 1983), with a bibliography. For a perceptive introduction, see R.W. SOUTHERN, *Western Society and the Church in the Middle Ages* (1970, reprinted 1985). See also R.W. CARLYLE and A.J. CARLYLE, *A History of Mediaeval Political Theory in the West*, 6 vol. (1928–36, reprinted 1970), especially vol. 3–5. ETIENNE GILSON, *History of Christian Philosophy in the Middle Ages* (1955, reprinted 1980), is a masterly summary with full bibliography; DAVID KNOWLES, *The Monastic Order in England: A History of Its Development from the Times of St. Dunstan to the Fourth Lateran Council, 940–1216*, 2nd ed. (1963, reprinted 1966), also covers part of Europe. Other recommended studies include HENRY CHARLES LEA, *The Inquisition of the Middle Ages: Its Organization and Operation* (1954, reissued 1969), 8 chapters from the author's original 1887 3-vol. work; GUILLAUME MOLLAT, *The Popes at Avignon, 1305–1378* (1963, reprinted 1965; originally published in French, 9th ed. 1949); and SCHAFER WILLIAMS (ed.), *The Gregorian Epoch: Reformation, Revolution, Reaction?* (1964), a useful collection of studies by early and more recent authorities.

The late Middle Ages: FRANCIS OAKLEY, *The Western Church in the Later Middle Ages* (1979, reissued 1985); and STEVEN OZMENT, *The Age of Reform (1250–1550): An Intellectual and Religious History of Late Medieval and Reformation Europe* (1980), both cover the period with sound judgment. See also W.A. PANTIN, *The English Church in the Fourteenth Century* (1955, reissued 1980); ROGER AUBENAS and ROBERT RICARD, *L'Église et la Renaissance (1449–1517)* (1951); E. DE MOREAU, PIERRE JOURDA, and PIERRE JANELLE, *La Crise religieuse du XVI^e siècle* (1950, reprinted 1956); and L. CRISTIANI, *L'Église à l'époque du concile de Trente* (1948). GEORGES DE LAGARDE, *La Naissance de l'esprit laïque, au déclin du Moyen Âge*, 3rd ed., 5 vol. (1956–70), studies the lay movement in the Middle Ages. JOSEPH LORTZ, *History of the Church*, 2nd ed. (1939, reprinted 1948; originally published in German, 5th–6th ed., 1937), analyzes the history of the church from the point of view of the history of ideas. HEIKO AUGUSTINUS OBERMAN, *The Harvest of Medieval Theology: Gabriel Biel and Late Medieval Nominalism*, 3rd ed. (1983), looks at the theology of the late Middle

Ages in its entirety, with special emphasis on Nominalism. See also BRIAN TIERNEY, *Foundations of the Conciliar Theory: The Contributions of the Medieval Canonists from Gratian to the Great Schism* (1955, reprinted 1968).

Reformation and Counter-Reformation: CONRAD BERGENDOFF, *The Church of the Lutheran Reformation: A Historical Survey of Lutheranism* (1967), provides a study of Reformation history from its beginnings to the 20th century. COMMISSION INTERNATIONALE D'HISTOIRE ECCLÉSIASTIQUE COMPARÉE, *Bibliographie de la Réforme, 1450–1648*, vol. 1–7 (1958–70), is a reference work on the history of the Reformation. An important resource is *The New Cambridge Modern History*: vol. 1, G.R. POTTER (ed.), *The Renaissance, 1493–1520* (1957); and vol. 2, G.R. ELTON (ed.), *The Reformation, 1520–1559* (1958). A.G. DICKENS, *Reformation and Society in Sixteenth-Century Europe* (1966, reprinted 1979), is an account of the sociological relationships in the 16th century. HAROLD JOHN GRIMM, *The Reformation Era, 1500–1650*, 2nd ed. (1973), presents a study of the Reformation and the Counter-Reformation. Also useful is HUBERT JEDIN (ed.), *Handbuch der Kirchengeschichte*: vol. 3, pt. 1, *Die mittelalterliche Kirche* (1966); vol. 3, pt. 2, *Vom kirchlichen Hochmittelalter bis zum Vorabend der Reformation* (1968); and vol. 4, *Reformation, katholische Reform und Gegenreformation* (1967). See also G.R. ELTON, *Reformation Europe, 1517–1559* (1963, reissued 1967); PHILIP HUGHES, *The Reformation in England*, 5th rev. ed., 3 vol. in 1 (1963); and JOSEPH LORTZ, *How the Reformation Came* (1964; originally published in German, 3rd ed., 1955), on the causes of the Reformation in England, and *The Reformation in Germany*, 2 vol. (1968; originally published in German, 2 vol., 1939–40), a standard work on the history of the Reformation. JAROSLAV PELIKAN, *Obedient Rebels: Catholic Substance and Protestant Principle in Luther's Reformation* (1964), is an investigation of Luther's thought. Other scholarly works include MAURICE POWICKE, *The Reformation in England* (1941, reissued 1973); GOLO MANN and AUGUST NITSCHKE (eds.), *Propyläen Weltgeschichte: Eine Universalgeschichte*, vol. 7, *Von der Reformation zur Revolution* (1964, reissued 1976); and HERBERT MAYNARD SMITH, *Henry VIII and the Reformation* (1948, reprinted 1964). GEORGES HUNTSTON WILLIAMS, *The Radical Reformation* (1962), is a synoptic presentation of the “left wing” of the Reformation. ERNST WALTER ZEEDEN, *Die Entstehung der Konfessionen* (1965), discusses the formation of various confessions of faith at the time of the development of different denominations, and *Das Zeitalter der Gegenreformation* (1967) covers the battle for the reorganization of the Roman Church.

Roman Catholicism outside Europe in modern times: The standard work on church history is KARL BIIHLMAYER, *Church History*, rev. by HERMANN TÜCHLE, 3 vol. (1958–66, reprinted 1966–68; originally published in German, 13th ed., 3 vol., 1952–56). The documents of Roman Catholicism are assembled in HENRICUS (HEINRICH) DENZINGER, *Enchiridion Symbolorum: Definitionum et Declarationum de Rebus Fidei et Morum*, 36th ed. (1976). ROLAND H. BAINTON, *The Horizon History of Christianity* (1964, reissued with the title *Christianity*, 1985), is a well-written, beautifully illustrated, comprehensive introduction to Western Christianity through the centuries and includes references to modern Catholicism worldwide. Much more extensive and valuable, especially because of the excellent bibliography, is KENNETH SCOTT LATOURETTE, *Christianity in a Revolutionary Age: A History of Christianity in the Nineteenth and Twentieth Centuries*, 5 vol. (1958–62, reissued 1973); vol. 1, 3, and 5 concentrate on Roman Catholic themes. AUGUST FRANZEN, *A History of the Church*, rev. and ed. by JOHN P. DOLAN (1969; originally published in German, 2nd ed., 1968), is a convenient brief introduction that includes some modern materials. E.E.Y. HALES, *The Catholic Church in the Modern World: A Survey from the French Revolution to the Present*, new rev. ed. (1960), concentrates on Europe and America. STEPHEN NEILL, *Colonialism and Christian Missions* (1966), and *A History of Christian Missions*, 2nd ed. rev. by OWEN CHADWICK (1986), provide brief and generally fair comments on Catholic ventures. A much more conservative Protestant bias is present in the standard work by ROBERT HALL GLOVER, *The Progress of World-Wide Missions*, rev. and enl. by J. HERBERT KANE (1960). ROBERT L. DELAVIGNETTE, *Christianity and Colonialism* (1964; originally published in French, 1960), is written by a Roman Catholic and concentrates on Catholic experience, but in too narrow a scope. Two works that make aspects of the American Catholic experience readily available to readers are JOHN TRACY ELLIS, *American Catholicism*, 2nd ed. rev. (1969); and the somewhat less adequate THEODORE MAYNARD, *The Story of American Catholicism* (1941, reprinted 1960). GUSTAVO GUTIÉRREZ, *A Theology of Liberation: History, Politics, and Salvation* (1973; originally published in Spanish, 1972), is a provocative introduction to Roman Catholicism in the Third World.

(J.L.McK./F.C.O./M.E.M./M.D.K./J.J.Pe.)

Romania

Romania (or Rumania), a country of southeastern Europe, derives much of its ethnic and cultural character from its position astride major continental migration routes. But there are also three distinct elements basic to the physical geography. The vast arc of the Carpathian Mountains and their extension, the Transylvanian Alps, crosses the country from north to south, encircling the Transylvanian Plateau to create a huge amphitheatre. In terms of drainage, Romania is indisputably Danubian, for the lower course of this great river runs eastward across the lowlands of the southern portion of the country, emptying into the Black Sea by way of a delta.

Finally, a small eastern portion of the country, because of its Black Sea littoral, exhibits maritime characteristics.

Since the late 19th century, Romania has undergone an economic and social transformation marked by accelerating urbanism and a drop in the traditional predominance of agriculture. Its area is 91,699 square miles (237,500 square kilometres), and its boundaries total 1,959 miles (3,153 kilometres), with the Soviet Union on the north and east, the Black Sea on the east, Bulgaria on the south, Yugoslavia on the southwest, and Hungary on the west. The national capital is Bucharest (Bucureşti).

Physical and human geography

THE LAND

There is a certain symmetry in the physical structure of Romania. The country forms a complex geographical unit centred on the Transylvanian Plateau, around which the peaks of the Carpathians and their associated subranges and structural platforms form a series of crescents. Beyond this zone, the extensive plains of the south and east of the country, their potential increased by the Danube and its tributaries, form a fertile outer crescent extending to the frontiers. There is great diversity in the topography, geology, climate, hydrology, flora, and fauna. For millennia this natural environment has borne the imprint of a human population, ever renewed by migratory movements but nevertheless having roots deep in the country's past.

Relief. *The Carpathians.* The relief of Romania is dominated by the Carpathian Mountains, which can be divided into the Eastern Carpathians (Carpații Orientali), the Southern Carpathians (also known as the Transylvanian Alps and called in Romanian the Carpații Meridionali), and the Western Carpathians (Carpații Occidentali).

The Eastern Carpathians extend from the Soviet frontier to the Prahova River Valley and reach their maximum height in the Rodna Mountains (Munții Rodnei), with Pietrosul rising to 7,556 feet (2,303 metres). They are made

up of a series of parallel crests that are oriented in a more or less north-south direction. Within these mountains is a central core made up of hard, crystalline rocks and with a bold and rugged relief. Rivers have cut narrow gorges here (known locally as *chei*)—in, for example, Cheile Bistriței and Bicazului—and these offer some magnificent scenery. This portion of the Carpathians is bounded on the eastern side by a zone of softer flysch. For some 250 miles on the western fringe the volcanic ranges Oaș (Munții Oașului) and Harghita, with a concentration of volcanic necks and cones, some with craters still preserved, lend character to the landscape. St. Ana Lake—the only crater lake in Romania—is also found here. The volcanic crescent provides rich mineral resources (notably copper, lead, and zinc) as well as the mineral-water springs on which are founded several health resorts. The Carpathian range proper is made up in large part of easily weathered limestones and conglomerates, which again provide some striking scenery. The Maramureș, Giurgiu, Ciuc, and Birsei depressions further break up the mountainous relief.

The Southern Carpathians, or Transylvanian Alps, lie between the Prahova River Valley on the east and the structurally formed Timiș and Cerna river valleys to the west. They are mainly composed of hard crystalline and volcanic rocks, which give the region the massive character that differentiates it from the other divisions of the

Volcanic
scenery

Carpathians. The highest points in Romania are reached in the peaks of Moldoveanu (8,346 feet [2,544 metres]) and Negoiu (8,317 feet [2,535 metres]), both in the Făgăraș Massif (Munții Făgărașului), which, together with the Bucegi, Parâng, and Retezat-Godeanu massifs, forms the major subdivision of the region. The last named contains a national park of more than 49,000 acres (20,000 hectares), which, besides offering spectacular mountain scenery, provides an important refuge for the chamois (*Rupicapra rupicapra*) and other animals. Ancient erosion platforms, another distinguishing feature of the area, have been utilized as pastures since the dawn of European history. At the highest levels, beautiful glacial lakes testify to the last Ice Age. The southern slopes of this region offer special interest: the waters of the Bistrița, Cerna, and other rivers have carved deep valleys in the soft limestone rock, and the region also contains the Polovragi Cave and the Muierii Grotto. Communication is possible through the high passes of Bran, Novaci-Șugag, and Vîlcan, at altitudes of up to 7,400 feet, but the scenic Olt, Jiu, and Danube river valleys carry the main roads and railways through the mountains. At the Porțile de Fier (Iron Gate) on the Danube, a joint Romanian-Yugoslavian navigation and power project has harnessed the fast-flowing waters of the gorge; its power station has a capacity exceeding 2,000,000 kilowatts, and navigation facilities have been greatly improved. Finally, as in the Eastern Carpathians, there are important lowland depressions within the mountains (notably Brezoi, Hațeg, and Petroșani), and agriculture and industry are concentrated in them.

The Western Carpathians extend for about 220 miles (350 kilometres) between the Danube and Someș rivers. Unlike the other divisions of the Carpathians, these do not form a continuous range but a cluster of massifs around a north-south axis. Separating the massifs is a series of deeply penetrating structural depressions. Historically, these have functioned as easily defended "gates," as is reflected in their names: the Iron Gate of Transylvania (at Bistra); the Eastern Gate, or Poarta Orientală (at Timiș-Cerna); and, most famous, the Iron Gate on the Danube.

Among the massifs themselves, the Banat and Poiana Ruscă mountains contain a rich variety of mineral resources and are the site of two of the country's three largest metallurgical complexes, at Reșița and Hunedoara. The marble of Ruschița is well known. To the north lie the Apuseni Mountains, centred on the Bihor Massif, from which emerge fingerlike protrusions of lower relief. On the east, the Bihor Mountains merge into the limestone tableland of Cetățile Ponorului, where the erosive action of water along joints in the rocks has created a fine example of the rugged karst type of scenery. To the west lie the parallel mountain ranges of Zărand, Codru-Moma (also called Munții Codrului), and Pădurea Craiului; on the south, along the Mureș River, the Metaliferi and Trască mountains contain a great variety of metallic and other ores, with traces of ancient Roman mine workings still visible.

The Western Carpathians generally are less forested than other parts of the range, and human settlement reaches to the highest altitudes. The population maintains many traditional features in architecture, costumes, and social mores, and the old market centres, or *nedei*, are still important. The Tîrgul de Fete (Maidens' Fair) is still held every year in late July on Găina Mountain and is attended by peasants from the Arieș and Crișul Alb valleys. Mining, livestock raising, and agriculture are the main economic activities, the last named being characterized by terrace cultivation on the mountain slopes, a survival from Roman times.

The Subcarpathians. The great arc of the Carpathians is accompanied by an outer fringe of rolling terrain known as the Subcarpathians and extending from the Moldova River in the north to the Motru River in the southwest. It is from two to 19 miles wide and reaches heights ranging between 1,300 and 3,300 feet (400 and 1,000 metres). The topography and the milder climate of this region favour vegetation (including such Mediterranean elements as the edible chestnut) and aid agriculture; the region specializes in cereals and fruits, and its wines—notably

those of Odobești and the Călugărească Valley—have a European reputation. The area is densely populated, and there are serious problems of economic development in remoter areas where there is little scope for further agricultural expansion.

The tablelands. Tablelands are another important element in the physical geography of Romania. The largest is in Transylvania, with large deposits of methane gas and salt, first exploited for a chemical industry in the 1930s. The salt lakes have given rise to the health resorts of Ocna Sibiului and Sovata. The region as a whole is well populated, with a good transport system. A belt of towns has grown up on the margins, and these often parallel another outer fringe of towns commanding the main trans-Carpathian passes. Examples of such "double towns" are Suceava and Bistrița; Făgăraș and Cîmpulung; Sibiu and Rîmnicu Vîlcea; Alba Iulia and Arad; and Cluj and Oradea.

In the east, between the outer fringe of the Subcarpathians and the Prut River, lies the Moldavian Plateau (Podișul Moldovei), with an average height of 1,600 to 2,000 feet. In contrast to Transylvania, which experienced considerable urban development during the Dacian and Roman periods, Moldavia did not begin to develop towns until the Middle Ages, when the old Moldavian capitals of Iași and Suceava had close commercial connections with the towns of Transylvania and derived benefit from trade passing between the Baltic and Black Sea ports. Finally, the Dobruja tableland, an ancient, eroded rock mass in the southeast, has an average altitude of 820 feet and reaches a maximum of 1,532 feet (467 metres) in the Pricopan Hills (Dealul Pricopanului).

The plains. Plains cover a third of Romania, reaching their fullest development in the south and west. Their economic importance has increased very greatly since the early 19th century. In the southern part of Romania is the lower Danube Plain, which can be divided into the Romanian Plain (Cîmpia Romînă), to the east of the Olt River, and the Oltenian Plateau (Podișul Olteniei), to the west. The whole region is covered by deposits of loess, on which rich, black chernozem soils have developed, providing a strong base for agriculture. The Danube floodplain is important economically, and along the entire stretch of the river, from Calafat in the west to Galați in the east, former marshlands have been diked and drained to increase food production. Willow and poplar woods border the river, which is important for fishing but much more so for commerce. Ten river port towns (including Drobeta-Turnu Severin, Turnu Măgurele, Giurgiu, Brăila, and Galați) complement the rural settlements. There are good rail connections with the main lines, including the two that cross the Danube, at Cernavodă (linking Bucharest with the Black Sea port of Constanța) and Giurgiu (connecting Romania with Bulgaria).

The Danube Delta. On the northern edge of the Dobruja region, adjoining the Soviet Union, the great, swampy triangle of the Danube Delta is a unique physiographic region covering some 1,950 square miles, of which 1,750 square miles (4,530 square kilometres) are in Romania. The delta occupies the site of an ancient bay, which in prehistoric times became wholly or partially isolated from the sea by the Letea sandbanks. The delta contributes about half of Romania's fish production from home waters, fishing off the Danube mouth contributing 90 percent of the sturgeon catch (and subsequent caviar production) as well as 80 percent of the Danube herring catch. The plant and animal life of the delta region is unique in Europe, with many rare species. The area is also a stopping place for migratory birds. A great number of birds, including pelicans, swans, wild geese, ibis, and flamingos, as well as wild pig and lynx, are protected by law, and a large part of the region has been declared a nature reserve, with hunting and fishing prohibited. The whole delta is of great interest to scientists, conservationists, and a growing number of tourists from other countries. Two dozen or more settlements are scattered over the region, but many are exposed to serious flood risks. The ports of Sulina and Tulcea have attained urban status.

own special environment, including a temperate climate with continental aspects and good sand beaches. Lakes—among which Tașaul, Siutghiol, Agigea, Techirghiol, and Mangalia are the most significant—further enhance the attractions of the region. Several of them contain deposits of mud and sulfurous hot springs believed to have therapeutic properties. The development of recreational facilities dates back to the turn of the century, and a series of health and tourist centres has sprung up in recent decades. The towns of Năvodari, Mamaia, and Eforia are relatively new creations, while the older settlements of Mangalia and Techirghiol have undergone extensive redevelopment.

Climate. Romania's geographic situation in the south-eastern portion of the European continent gives it a climate that is transitional between temperate regions and the harsher extremes of the continental interior. In the centre and west, humid Atlantic climatic characteristics prevail; in the southeast the continental influences of the Russian Plain make themselves felt; and in the extreme southeast there are even milder sub-Mediterranean influences. This overall pattern, however, is substantially modified by relief, and there are many examples of climatic zones induced by altitudinal changes.

The average annual temperature is 52° F (11° C) in the south and 45° F (7° C) in the north, although, as noted, there is much variation according to altitude and related factors. Extreme temperatures range from 111° F (44° C) in the Bărăgan region to -36° F (-38° C) in the Brașov Depression. Average annual rainfall amounts to 26 inches (660 millimetres), but in the Carpathians it reaches about 55 inches (1,400 millimetres) and in the Dobruja region it is only about 16 inches (400 millimetres). Humid winds from the northwest are commonest, but often the drier winds from the northeast are strongest. A hot southwesterly wind, the *austru*, blows over western Romania, par-

ticularly in summer. In winter, cold and dense air masses encircle the eastern portions of the nation, with the cold northeasterly known as the *civă* blowing in from the Russian Plain, while oceanic air masses from the Azores, in the west, bring rain and mitigate the severity of the cold.

Drainage. The rivers of Romania are virtually all tributary to the Danube, which forms the southern frontier from Moldova Nouă to Călărași. Nearly 40 percent of the total Danubian discharge into the Black Sea is, in fact, provided by Romanian rivers. The final discharge takes place through three arms—the Chilia (two-thirds of the flow), Sfîntu Gheorghe (one quarter), and Sulina (the remainder)—that add to the scenic attractions of the delta region. The most significant of the Romanian tributary rivers are the Prut, Mureș, Siret, Ialomița, and Someș. The rivers have considerable hydroelectric potential, although there are great seasonal fluctuations in the discharge and few natural lakes to regulate the flow. The total surface-water potential of the tributary rivers exceeds 1,400,000,000,000 cubic feet (40,000,000,000 cubic metres) annually, although this figure is dwarfed by the volume discharged at the Danube mouth, which is more than five times as large. Subsoil waters have been estimated at an annual volume of some 250,000,000,000 cubic feet (7,000,000,000 cubic metres). These overall figures, like those for many aspects of the Romanian environment, mask the fact that water resources are not uniformly distributed over the country and may vary not only from year to year but within the same year.

The total theoretical hydroelectric potential of Romania—given optimum technological conditions—has been calculated at some 70,000,000,000 kilowatt-hours in an average year, but for technical and economic reasons only a fraction of this potential has been developed. Geographically, the hydroelectric reserves of Romania are

The effect of relief on climate

Hydro-electricity

concentrated along the Danube and in the valleys of rivers emerging from the mountain core of the country. Other hydrographic resources include the more than 2,500 lakes, ranging from the glacial lakes of the mountains to those of the plains and the marshes of the Danube Delta region. The main effort since the 1940s, however, has been on the Argeş, Bistriţa, Lotru, Olt, and Someş as well as on the Danube at the Iron Gate.

Plant and animal life. Forests, which cover about a quarter of Romania's area, are an important component of the vegetation cover, particularly in the mountains. Up to about 2,600 feet (800 metres) oaks predominate, followed by beeches between 2,600 and 4,600 feet and conifers between 4,600 and 5,900 feet. At the highest levels, alpine and subalpine pastures are found. In the tableland and plains regions, the natural vegetation has to a large degree been obliterated by centuries of human settlement and agriculture.

The rich and varied Romanian animal life includes some rare species, notably the chamois, which is found on the alpine heights of the Carpathians. Forest animals include brown bear, red deer, wolf, fox, wild pig, lynx, marten, and various songbirds. The lower course of the Danube, and particularly the delta, is rich in animal, bird, and fish life. Among the fish, the most valuable is undoubtedly the sturgeon, yielding caviar.

Settlement patterns. The natural environment of Romania has offered favourable conditions for human settlement. The accessibility of the region to the movements of peoples across the Eurasian landmass has also meant that the region has absorbed cultural influences from many nations and peoples, and this, too, is reflected in the contemporary patterns of Romanian life.

The population is fairly uniformly distributed from the shores of the Black Sea, across the plains, and up to the mountain foothills. The mountain areas themselves are inhabited by peoples whose origins are found in very early European history and who have, in many respects, been little changed by contemporary events. The villages scattered among the mountains up to altitudes of more than 5,000 feet, the sheepfolds, the newer holiday resorts, and the large number of roads all combine to give the human geography of the Carpathian Mountains a distinctive character. Pastures on the ancient erosional platforms among the mountain peaks can be found up to the highest levels, and cultivation is possible up to 3,900 to 4,300 feet. Further, the ancient commercial trade between the old market towns on either side of the Carpathians lends support to the view that the mountains have served as much as a link as a barrier in the country's development. In the many lowland areas scattered among the mountains there has been a long continuity of settlement, as may be seen in very old place-names and distinct regional consciousness.

(V.S.C./D.T.)

THE PEOPLE

Ethnic composition. Historical and archaeological evidence and linguistic survivals seem to confirm that the present territory of Romania had a fully developed population, with a high degree of economic, cultural, and even political development, long before the Roman armies crossed the Danube into what became known as the province of Dacia. Roman influence was profound and created a civilization that managed to maintain its identity during the great folk migrations that followed the collapse of the empire. Farming and particularly transhumance played an important part in the lives of the Dacian-Romanian population. Primitive agriculture was practiced on the upland terraces and in the more secluded river valleys. The ethnic core of contemporary Romania thus developed in the remoter regions, although settlement did take place on the more exposed plains. The first mention of Walachs (Voloeks, Vlachs), the name given to the Romanian people by their neighbours, appears in the 9th century.

Beginning in the 9th century with the Magyar invasion, the existing largely Romanian population was augmented by colonists brought to Transylvania, particularly into the Carpathians; the colonists included Saxons, Szeklers, and

Teutonic Knights. During the same period, with the mountain crests marking a political frontier, there appeared two independent Romanian feudal states: Walachia (called in Romania *Țara Românească*, literally "Romanian Land") and Moldavia (Romanian Moldova), both on the southern and eastern slopes of the Carpathians. Initially, the core areas of these states were centred in the foothills of the Carpathians; only later, as the Romanian lands on the plains were gradually consolidated, were the major settlements transferred from the mountains, first to Tirgoviste and Suceava and later to Bucharest and Iași. In the 18th century another group of Germans, the Swabians, arrived and settled in the Banat region. Jews from Poland and Russia arrived during the first half of the 19th century.

Hungarians are the largest minority in Romania, making up about 7 percent of the population; Germans constitute about 2 percent. Other ethnic groups in Romania include Ukrainians in the southern part of the Danube delta and along the Soviet border, Serbs in southern Banat, Russians in northern Dobruja, Tatars and Turks in Dobruja, and Gypsies.

Linguistic composition. The Romanian language is a Romance language and is spoken by the majority of the people. Its Latin origin is evident in the grammar and syntax, but Turkish, Albanian, Hungarian, and German influence is apparent in Romanian vocabulary. The use of minority languages was discouraged during the Communist era.

Religions. Under Communist rule, religion was officially viewed as a personal matter, and relatively few restrictions were placed upon it (as compared with other Communist regimes), although the government made efforts to undermine religious teachings and faith in favour of science and empirical knowledge. When the Communists came to power in 1948, they continued the monarchy's practice of requiring all churches to be registered with the state (under its Department of Cults), which retained administrative and financial control, and the state thus became the ultimate authority on matters of religion. Despite these incursions, Romanians remained devout, and about 70 percent belonged to the Romanian Orthodox Church, headed by a patriarch in Bucharest. Roman Catholicism is the primary religion of ethnic Hungarians and Swabian Germans. Until 1948, when it was forced by the Communists to unite with the Romanian Orthodox Church, the Uniate Church was important in Transylvania. Protestantism, both Lutheran and Calvinist, is practiced by ethnic Hungarians and Germans. In 1950 Baptists, Seventh-day Adventists, and Pentecostals were forced to unite into the Federation of Protestant Cults. The Jewish community is small, and Islam is practiced in Dobruja by ethnic Tatars and Turks. Other churches include the Unitarian Church, the Armenian Apostolic Church, and the Christians of the Old Rite.

(V.S.C./D.T./Ed.)

Demography. Substantial changes in the social composition of the population have taken place as a result of increasing industrialization, reflected in the rise of the working-class population. Similarly, the collectivization of agriculture transformed the rural population, the proportion of peasants with individual households falling dramatically.

Since World War II there has been a sharp rise in the proportion of the population that has achieved some kind of higher education. Differing rates of economic development in different parts of Romania have produced a movement toward towns and cities, largely for daily and seasonal work. Government planners sought to reduce migration across county boundaries by trying to ensure that each area had its share of development, and the benefits of modernization were consciously spread out over both favoured and unfavoured areas of the country.

The population density of the country as a whole has doubled since 1900 although, in contrast to other central European states, there is still considerable room for further growth. The overall density figures, however, conceal considerable regional variation. Population densities are naturally highest in the towns, with the plains (up to altitudes of some 700 feet) having the next highest density,

Latin
origin

The
Carpathian
heritage

Variations in density especially in areas with intensive agriculture or a traditionally high birth rate (*e.g.*, northern Moldavia and the "contact" zone with the Subcarpathians); altitudes of 700 to 2,000 feet, rich in mineral resources, orchards, vineyards, and pastures, support the lowest densities.

At least half of the population still lives in rural areas. A dispersed type of rural settlement is generally found in the foothill, tableland, and upland regions. The scattered village proper is found at the highest levels and reflects the rugged terrain and the pastoral economic life. Small plots and dwellings are carved out of the forests and on the upland pastures wherever physical conditions permit. Where the relief is less difficult, the villages are slightly more concentrated, although individual dwellings still tend to be scattered among agricultural plots.

The Subcarpathian region, with hills and valleys covered by plowed fields, vineyards, orchards, and pastures and dotted with dwelling places, typically has this type of settlement. The more familiar concentrated villages, marked by uniform clustering of buildings, are to be found in the plains, particularly those given over to cereal cultivation.

Urban settlements The first urban settlements were situated at points of commercial or strategic significance, and the great majority of present-day towns are either on or in the immediate neighbourhood of the ruins of ancient settlements, whether of fortress or market town. The oldest towns were founded on the Black Sea shores, and urban development only later spread to the plains and then to the mountains. The turbulent history of the country favoured some of these early settlements, which grew into modern towns and cities, while other, once important towns have regressed to become villages or have simply vanished.

THE ECONOMY

A program of economic development has transformed the nation since independence. A formerly backward and largely agricultural economy has been transformed into a modern economy, with a strong emphasis on industry.

A very radical land reform was carried out in 1921 (and completed in 1948), although the independence of the peasantry has since been compromised. The restructuring of the economy since the Communist takeover included compulsory collectivization of agriculture, carried out between 1949 and 1962. The means of production were nationalized, including the banks and the main branches of industry, and a system of medium-term central planning was introduced. The result has been an acceleration of economic growth but along lines that had been clearly established by World War II.

Economic growth The industrial base of the economy has been developed by expanding both those industrial branches that have a raw material base within the country—notably the chemical, power, building materials, and food industries—and those that depend on imported raw materials; the metallurgical industry is probably most important in this respect. Parallel with this process, an attempt has been made to achieve a rational distribution of industrial centres. The growth of new plants began to accelerate in the late 1960s, and this process was facilitated by the purchase of licenses and patents from firms all over the world.

Economic growth, and in particular the expansion of industry, has required a major program of capital investment. About one-third of the national income is allocated to this expansion. This high rate is thought by many experts to be the only feasible method by which intensive development can take place and reduce the gap that still separates Romania from other industrialized nations. The intensification of industrial activity, however, has caused some problems of air and water pollution, particularly in the case of old industries sited in narrow valleys or low-lying areas. Strict environmental controls have been introduced, although the problem is major only in certain restricted areas.

Industry. The majority of the national income is produced by industry, in marked contrast to the pre-World War II situation. The main emphasis has been on the development of heavy industry, and the metallurgical, machine-building, metal-processing, petroleum and natu-

ral gas, and chemical industries have shown the strongest rate of growth.

Coal. The largest reserves are those of bituminous coal; half of Romania's bulk coal production comes from the Petroşani Depression alone. Reserves of poorer quality lignite are being tapped more and more to meet energy requirements. Except for the Baraolt-Vîrghiş Basin, which lies within the Carpathians, most deposits are found along the fringe of the mountain areas. A large lignite field in the Motru Valley (Gorj) supplies two of the largest power stations in the country, Rovinari and Turceni.

Oil. Oil deposits are found in the flysch formations that run in a band along the outer rim of the Carpathians and through the Subcarpathians. Deposits in the plains, notably Videle, have been tapped since World War II. Bacău and Prahova districts have long been famous for their oil-refining industry, and they have been joined by production from Argeş (Piteşti). Oil was discovered in the Romanian sector of the Black Sea in 1981. Natural gases—mainly methane—are produced in the centre of the Transylvanian Plateau, and gases produced as by-products of the oil industry are becoming of increasing importance. Oil shales mined at Anina, in the Caraş-Severin district, supply several power stations, including a 990,000-kilowatt station at Anina.

Electric power. One of the greatest problems facing Romania after World War II, when the Soviet Union demanded the delivery of Romanian petroleum as war reparations, was the very limited development of power stations based on other fuels. Under a plan spanning the years 1951–60 and supplemented by later plans, a remarkable rise in power output took place. The foundation for this increase was a series of large power projects, each having 200,000 to 1,000,000 kilowatts' capacity. The most important projects have been the hydroelectric projects of the Argeş, Bistriţa, Danube, and Olt and Lotru rivers and the thermal stations based on Motru lignite.

Hydro-
electric
projects

The metallurgical industry. Romanian iron industry has particularly strong connections with Galaţi as well as with Hunedoara and Reşiţa, where iron was smelted in classical times. Small units exist at Brăila, Cîmpia Turzii (near Turda), Iaşi, Roman, and Tîrgovişte, and a complex is projected for Călăraşi. The nonferrous metallurgical industry, which also dates from the Dacian-Roman period, is largely concentrated in the southwest and west, with copper, gold, and silver production still very active. Aluminum production is a more recent development; alumina factories at Oradea and Tulcea supply the aluminum reduction complex at Slatina in the Olt district. Small quantities of lead, mercury, and zinc are also produced.

The machine-building and metal-processing industry is the main branch of the industrial economy, accounting for nearly a third of bulk industrial production. It provides a good index of the changing priorities in the Romanian economy; before World War II it accounted for only 10 percent of the total, being exceeded in importance by food processing and even the textile and ready-made clothing industry. Contemporary centres of production are Bucharest, Braşov, Ploieşti, Cluj, Craiova, Arad, Reşiţa, and many others, with a considerable degree of regional specialization. There has been a strong tendency to concentrate on such modern branches as the electronics industry, as well as to widen and diversify the range of production.

Other industries. In contrast to metallurgy (which relies on imports of ore and coke to supplement the modest domestic resources), the timber industry can rely on domestic raw materials. The emphasis, in what is a traditional industry, has switched from production of sawn timber to finished products. A chain of modern wood industrialization combines turns out a range of products, including furniture and chipboard, which have done well in foreign markets. The building materials industry also utilizes a wide range of resources across the country; cement manufacture represents an important sub-branch. The main centres are at Turda, Medgidia, Bicăz, Fieni, and Tîrgu Jiu. The long-established textile industry has also undergone a steady development since its radical overhaul in the 1930s. The closely connected ready-made clothing indus-

Timber
industry

try has undergone considerable expansion, with a heavy investment in new plants. Silkworm production retains a modest importance despite the introduction of man-made fibres. Silk, the weaving of which was long the occupation of peasant women in the south and southwest, has lent much to the beauty of local folk costumes, especially the richly embroidered blouses and headscarves. Finally, the food industry—formerly the foundation of the economy—has been all but eclipsed by the rapid development of other branches. It has, nevertheless, continued to grow in absolute terms, and centres are distributed throughout the country.

Agriculture. The natural conditions within Romania make possible a great diversity of agriculture. The resources of the plains, hills, and mountains tend to be complementary, and, despite a strong subsistence element in peasant agriculture, exchanges of staple products are traditional.

Field crops. The climate and relief of the extensive Romanian plains are most favourable to the development of cereal crops, although these are also found in the Subcarpathians and in the Transylvanian Plateau, where they occupy a high proportion of the total arable land. Wheat and corn (maize) are most important, followed by barley, rye, and oats. Two-row barley is cultivated in the Braşov, Cluj, and Mureş areas, where it is used for brewing. The tendency is for the acreage of cereals to fall as yields increase and industrial crops require more land.

Vegetables. Vegetables—peas, beans, and lentils—are planted on a relatively small area. Peas are the predominant crop; being capable of early harvest, they allow a second crop, usually fodder plants, to be grown on the same ground. Vegetable cultivation is particularly marked around the city of Bucharest, with specialization in the production of early potatoes, tomatoes, onions, cabbages, and green peppers. Similar gardening areas are found around Timişoara, Arad, Craiova, Galaţi, Brăila, and other cities. The most important potato-growing areas are Braşov, Sibiu, Harghita, and Mureş districts. Other related crops include sugar beets; sunflower seed, mostly on the Danube, Tisa, and Jijia plains; and hemp, flax, rape, soybeans, and tobacco.

Wines

Viticulture. Romania can be counted among the main wine-producing countries of Europe. It specializes in the production of high-quality wines, using modern methods; with the growth of the tourist trade, its wines are becoming known to, and appreciated by, a larger international public. Large quantities are exported annually. The major vineyards are at Odobesti, Panciu, and Nicoreşti, with a half-dozen or more other major centres. Both white and red wines have won various international awards.

Orchards. At an altitude of between 1,000 and 1,600 feet (300 and 500 metres), orchards are found on almost all the hillslopes on the fringe of the Carpathians. There is specialization in fruits with a high economic yield. Orchards have solved problems of soil erosion on many unstable hillsides.

Livestock. Livestock raising has a very long history in Romania. Sheep can be raised wherever grass is available, whether in the alpine pastures or the Danube plain and valley. About half of the cattle are beef and important to exports.

Fishing. The rivers of Romania, its lakes—especially the group around Razelm—and its Black Sea coastal region support a well-developed fishing industry. The largest quantity of fish is obtained from the Danube and its delta, and most of the annual catch is consumed fresh. The canneries that process the remainder, especially the marine species, are located at Tulcea, Constanţa, and Galaţi. Ocean fishing in foreign waters is developing rapidly to supplement the production from home waters and allow more meat to be exported.

Transportation. Railways provide the main method of transportation for both freight and passengers in Romania. Since World War II, diesel and electric motors have been placed in service, and the major lines have been electrified. Romania also has a system of national roads, the majority of which have been brought up to modern standards. The main lines of communication tend to focus on Bucharest

and include many scenic routes. The country has maritime connections with many countries, and the port of Constanţa, which has undergone major expansion, plays a major role in the national economy. Finally, the Danube River continues to be a major transportation route, supplemented by the Danube-Black Sea Canal.

Bucharest is the main centre for air transportation. In addition to local routes, its international traffic—again aided by the growing tourist trade—has grown in significance. The great majority of flights by the national airline (Tarom, derived from Transporturile Aeriene Române) are to Europe, North Africa, and the Middle East.

Trade and tourism. The modernization of the Romanian economy has resulted in a considerable upsurge in its foreign trade and commercial contacts, which involves more than 100 countries. The nation has also taken part in international fairs and exhibitions. Romania became an active participant in the Council for Mutual Economic Assistance (Comecon), the eastern European international trade group, under the Romanian policy of "Socialist internationalism." Great attention has also been paid to broadening trade with the developing countries as well as with industrialized Western countries. Romania became the first Comecon country to independently negotiate with the European Economic Community (EEC), signing a trade agreement in 1980. Total foreign trade in fact has tended to increase, and there have been radical changes in exports, notably toward emphasis on machinery, industrial equipment, and other durable goods.

Tourism has become of special significance to Romania. Tourist attractions range from winter sports in the mountains to summer seaside activities in the resort belt fringing the Black Sea, with health spas receiving special emphasis. The Danube Delta, too, has become increasingly popular because of the growing worldwide interest in ecology and conservation. Special features of interest to tourists include the mountain lakes and underground cave systems that are features of the Carpathians and the fine churches and monasteries, with frescoes dating from the 14th to the 16th century, that are found in northern Moldavia. More generally, the folk costumes and the ancient folklore of Romanians, notably in the Carpathian Mountains, provide a reminder of the country's long traditions. Foreign tourists have been encouraged by much-improved hotels and by favourable tourist rates of exchange. Compulsory currency exchange regulations and a prohibition on the use of private accommodation, however, prove frustrating to the individual tourist.

Finance. The basic financial vehicle for Romanian economic policy is the state budget presented annually to the Grand National Assembly. Most of the budget income is derived from taxation and insurance, and the remainder comes from profits of state enterprises. Most of the annual budget expenditure goes toward financing economic development, a large part goes toward state services and cultural activity, and the rest goes toward national defense and administration. The National Bank of Romania, founded in 1880, is the heart of the banking system, managing budgetary cash resources and issuing currency. It also establishes foreign exchange rates and engages in foreign exchange operations. It is supported by an investment bank, which finances the investment projects of all state and cooperative organizations; an agricultural bank; and a foreign trade and loan bank, which also handles the money incomes—deposited as current and savings accounts—of individual citizens.

Interest rates do not reflect scarcity of money or the element of risk; they are used by the government as one of the economic levers intended to motivate enterprises toward greater efficiency; penalties are built into the system to allow discrimination against enterprises that are poorly managed. Prices, too, are set arbitrarily. They have tended to assure high profits for many enterprises and provide resources from which unprofitable enterprises can be subsidized. Prices of agricultural commodities and other raw materials have usually been set low. In this way the price system has served to transfer resources from agriculture to industry and keep consumption low for the benefit of investment. This strategy, however, gives industrial enter-

Role in
Comecon

Prices

prises little incentive to cut costs, and the government's drive for economic efficiency is thereby compromised.

(V.S.C./D.T.)

ADMINISTRATION AND SOCIAL CONDITIONS

Government. The constitutional framework derives from the state constitution adopted in 1965, which characterized Romania as a Socialist republic. The constitution gives equal rights to all citizens, without regard to nationality, sex, or religion, and state power is said to rest on an alliance of peasants, workers, and intellectuals. Prior to the December 1989 revolution, which deposed the Communist government, the Grand National Assembly was the supreme organ of state power, and in the intervals between its sessions the State Council, composed of the president (head of state), three vice presidents, a secretary, and 20 members, exercised supreme power.

The administration of state affairs was in the hands of the Council of Ministers, which, on the authority of the Grand National Assembly, acted as the national executive. Local people's councils were elected at the district level. Judicial functions were headed by the Supreme Court—elected by the Grand National Assembly—which supervised the activities of all district courts, lawcourts, and military tribunals.

Until the revolution, the most fundamental fact of the political system was the constitutional status of the Communist Party of Romania (CPR; Partidul Comunist Român)—the only legal party and the leading force of society and of every organized group within it. Other political parties were suppressed, although exiles continued to propagate their philosophies. Left-wing parties survived but lost their independent existence through amalgamation into a large grouping dominated by the Communists. With the formation of the provisional government in February 1990 and subsequent legislative elections in May, more than 80 political parties emerged.

Education. With the exception of certain university courses, education has been free and universal in Romania, and its development has been a key to the economic transformation of the country in modern times and to the gradual elimination of illiteracy. After the obligatory general school, students attend middle schools (general or specialized, four or five years) or one of the wide range of professional and technical schools and institutes of higher education. Associated with this educational system is an extensive national library network.

The major institution of academic research is the Academia Republicii Socialiste România (Academy of the Socialist Republic of Romania), which traces its origins to the Societatea Literară Română founded in 1866. The academy's library contains more than 7,000,000 volumes and is the national depository for all Romanian and United Nations publications. The Central State Library, founded in 1955, is the copyright depository, with several million volumes and periodicals.

Of the institutions of higher learning, the University of Bucharest was founded in 1864. Other important schools are Babeş-Bolyai University in Cluj and the "Gh. Gheorghiu-Dej" Polytechnic Institute in Bucharest.

Health and welfare. During Communist rule medical care was provided free by the state, and public funds were allotted also to pensions and health resorts for children and workers. The quality of medical service improved with the training of more doctors and the construction of hospitals in the main towns and administrative centres and with the new drugs that became available from the country's growing pharmaceutical industry. Following the revolution, however, it was revealed that health statistics had been distorted throughout the tenure of the deposed president, Nicolae Ceauşescu. The death rate increased annually from 1965, and during the same period infant and child mortality rose 36 percent. The practice of giving underweight babies microtransfusions of unscreened blood resulted in large numbers testing positive for human immunodeficiency virus, which causes acquired immune deficiency syndrome (AIDS). Under Ceauşescu, abortion and contraception were illegal, and large numbers of unwanted children were placed in orphanages. In order to

keep the population young, medical treatment was refused to the elderly.

(V.S.C./D.T./Ed.)

CULTURAL LIFE

The authorities have emphasized the need to bring the broad mass of the populace in contact with the nation's contemporary culture and with its heritage. This includes emphasis on open public expression of varying viewpoints on cultural life, as well as access to the works of culture. However, this policy was compromised during the Communist period by party control of all cultural activity and the consequent necessity for all contributors to the national culture to support party prescriptions. This control was exercised through the Council on Socialist Culture and Education, a government ministry, and the professional unions to which all practicing artists had to belong.

Institutions of mass cultural education put on performances, often in remote regions and sometimes in the languages of minority ethnic groups (Hungarian, German, Ukrainian, etc.). Performances include theatres and puppet shows, operas, music hall shows, song and dance ensemble productions, and musical performances ranging from folk music to symphony concerts. The institutions in which they take place are village clubs, houses of culture, and clubs run by trade unions and other mass organizations. The "people's universities" in both towns and villages also emphasize mass cultural life.

The number of museums has dramatically increased. The film industry, present in Romania since 1912, was controlled by the state. Studios in the Bucharest area produce documentaries and some feature-length films. There are thousands of cinemas in the country; a special feature is the village film festival of the winter months.

In spite of these modern developments, Romania still offers a variety of customs, traditions, and forms of folk art. Wood carvings, brightly ornamented costumes, skillfully woven carpets, pottery, and other elements of traditional Romanian culture remain popular and, with the onset of tourism, have become known internationally. Folk art is characterized by abstract or geometric designs and stylized representations of plants and animals. In embroidery and textiles, designs and colour schemes can be associated with particular regions of the country. Special folk arts of Romania are the decoration of highly ornamental Easter eggs and painting on glass, which, however, is becoming a lost skill. Folk music includes dance music, laments and ballads, and pastoral music. Major instruments are the violin, the *cobza* (a stringed instrument resembling a lute), the *tambal* (a dulcimer played with small hammers), and the flute. Folk melodies are preserved in the music of modern Romanian composers such as Georges Enesco.

The Romanian language, although developing over the centuries in difficult historical conditions, is as Latin as any other Romance language and, like the culture as a whole, continues to exhibit a remarkable vitality. The fact is perhaps paralleled by some of the Modernist tendencies in the Romanian fine arts; the sculptor Constantin Brancusi, a promoter of absolute Modernism coupled with a firm sense of classical Mediterranean values, had great international influence early in the 20th century. Romanian poets and writers, too, have operated in a cultural tradition somewhat different from that in neighbouring countries; in architecture, the elegant Bucharest television centre is but one example of another Modernist trend.

(V.S.C./D.T.)

History

DACIA

The early history of Romania can be traced back to Dacia, the ancient Roman name given primarily to the area in modern Romania of the Carpathian Mountains and Transylvania, though the Roman province eventually included wider territories to both the north and east. The Dacians were closely related to the nearby Getae (with whom they shared a common culture) and first appear in the Athenian slave market in the 4th century, after which *Daos* (Latin *Davus*) is common as a slave name in comedy. Though speaking a Thracian dialect the Dacians had

Emphasis on mass cultural activity

The Communist Party

absorbed considerable Scythian influence, of which the most important indication was their cult of the Scythian deity Zalmoxis and their belief in immortality. They were sedentary grain growers; they traded with Greece from early Hellenistic times; they used Greek coins; and they worked their rich mines of silver, iron, and above all gold.

Dacians appear in alliance with other tribes against Roman generals in 112, 109, and 75 BC, but the unified kingdom erected about 60–50 BC by the Dacian king Burebista was much more formidable. In 44 Julius Caesar was planning a vast expedition against the new kingdom; but Caesar was murdered and soon afterward Burebista also. His kingdom broke up into at least four parts, but the Dacians continued to harass Rome.

The origins of the more serious wars under the emperors Domitian and Trajan are hard to discern. Roman provocation is not ruled out, but the first event was a Dacian raid in AD 85, the Moesian governor Oppius Sabinus being killed. Domitian restored the situation the next year, but his commander Cornelius Fuscus was then killed with a large part of his army in an attempted invasion. In 88 Rome won a victory, but owing to difficulties with tribes farther west Domitian gave Dacia a favourable peace; Roman suzerainty was recognized, but the Dacians received a subsidy and the loan of engineers.

In 101 Trajan reopened the struggle and at the end of two years dictated a peace under which the Dacian capital, Sarmizegethusa (probably near modern Sarmizegetusa, Romania), received a Roman garrison. In 105 the war was renewed, and in 106 the whole country was subdued, large parts of its population being exterminated or driven northward. Trajan acquired enormous booty, and the mines, perhaps a motive for the conquest, were immediately exploited; important roads were built; and Sarmizegethusa and Tsierna (modern Orșova) became colonies. The new Roman province was at first put under a consular legate with at least two legions, but under Hadrian it was divided: Dacia Superior under a praetorian legate comprised Transylvania, with a single legion at Apulum (Alba Iulia, German Karlsburg), while Dacia Inferior in what was afterward Walachia was governed by a procurator. In 159 Antoninus Pius redivided the area into three provinces, the Tres Daciae (Dacia Porolissensis, Dacia Apulensis, and Dacia Malvensis), all subordinate to one governor of consular rank; Marcus Aurelius made them a single military area about 168.

The limits of Roman territory were probably never clearly defined, but militarily the occupation had great advantages for Rome. It was not so much the unsatisfactory character of the Dacian frontiers as the need for troops south of the Danube that caused the abandonment of the province by Aurelian about 270. The people who entered after the conquest, however, were able to impose new cults and customs from all parts of the Roman Empire, and the influence of the Latin language on modern Romanian remains the most striking survival in this region from ancient times. (G.E.F.C.)

From the 3rd to the 12th century wave after wave of barbarian invaders from the east passed over the undefended country—first came the Germanic Goths and Gepidae, then Slavs, followed by the Avars, and in the second half of the 7th century by the Bulgars. The Bulgarian domination, lasting for two centuries, allowed a rudimentary civic life to take shape, and it was the Bulgars who, after the conversion of their tsar Boris in 864, brought Christianity in its eastern form to the ancestors of the Romanians, building on earlier Latin foundations. At the end of the 9th century the Bulgars were overcome by the Magyars; later came a brief incursion by the now almost vanished Pechenegs and Cumans.

One school of historians maintains that the Daco-Roman population north of the Danube was obliterated during these invasions and that the Romanians of today are descended from Vlach tribes south of the river who pushed northward in the early 13th century. The Romanian view, supported by linguistic and other evidence, is that the Roman withdrawal affected only the military and official classes, while the body of the Daco-Roman inhabitants were driven by the invaders into the Carpathians, be-

coming the Vlachs of Transylvania. The Macedo-Romans south of the Danube, later known as Kutso-Vlachs, similarly sought shelter in the Pindus Mountains.

Transylvania, regarded by Romanians as the cradle of their nation, was conquered in the 11th century by King Stephen I of Hungary, but all records of its early inhabitants were destroyed in the Tatar-Mongol invasion of that country in 1241. The authentic history of the Vlachs does not begin until the end of the 13th century, when they are found establishing themselves south of the Carpathians in two distinct groups, one settling in the area later known as Walachia (called Muntenia by the chroniclers) and the other to the east in Moldavia. The incoming Vlachs fused with a population that already contained a Vlach element but consisted mainly of Slavs and Tatars with an admixture of Pechenegs and Cumans.

The two regions thus colonized became the principalities Walachia and Moldavia, whose annals remain distinct until 1774, but can thereafter be combined in one narrative, the Turkish administration being uniform. In 1859 the two principalities were formally united under the name of Romania.

Principalities of Walachia and Moldavia

WALACHIA

Tradition, embodied in a local chronicle of the 16th century entitled "History of the Ruman Land Since the Arrival of the Rumans" (*Istoria țierei Românești decându au descălicati Românii*), gives 1290 as the date of the founding of the Walachian state, asserting that in that year a voivode (prince) of Făgăraș in southern Transylvania crossed the mountains with a body of followers and established himself at Cîmpulung in the foothills, moving later to Curtea de Argeș. The name given for this first leader, Radu Negru (Ralph the Black), is probably a confusion with that of a later Walachian voivode, but the southward movement at that period of Vlach peoples from the mountains to the Danubian plain can be affirmed with certainty. Walachia itself was known to its own people as Muntenia, land of the mountains, after their former home. Historians who deny the continuity of Daco-Roman (Vlach) settlement in Transylvania have to postulate a northward migration of Vlachs from across the Danube to the Carpathians at the beginning of the 13th century to account for the indisputable southward movement in its close. The search for a new home in the south was due to the consolidation of Hungarian feudal power in Transylvania and of the feudal system, to the arrival of German settlers, and to the growing proselytizing zeal of the Hungarian kings as faithful servants of the papacy. The Vlachs, since the introduction of organized Christianity under Bulgarian influence, had belonged to the Eastern Orthodox Church, taking the Byzantine side against Rome in the Schism of 1054, though later some of their leaders came under Roman influence.

The new principality remained at first under the domination of Hungary, but the prince Basarab I defeated the Hungarian king Charles I Robert in 1330 and secured independence. Vladislav (c. 1364–77), although again defeating the Hungarians, accepted a form of Hungarian suzerainty in return for investiture by Louis I the Great, Charles Robert's successor, with the banat (frontier province) of Severin and the duchy of Omlas.

The early days of the principality were conditioned by the struggle against Hungary, but with the reign of Mircea the Old (1386–1418) a new period began, that of the struggle against the Turks. The first princes of Walachia, in search of help against Hungary, had contracted matrimonial and military alliances with the two Slav states south of the Danube, Bulgaria and Serbia, but both empires were already at the point of extinction at the hands of the Turks. Tradition recounts that a Walachian contingent helped the Serbs at the Battle of Kosovo in 1389; it is a fact that the Sultan followed up his victory by invading Walachia, which first appears in 1391 as a tributary of the Sublime Porte. The final overthrow of Bulgaria in 1393 left Walachia open to further Turkish advance, but Mircea succeeded in holding the invaders back on the Danube marshes in 1394 and in the following year made an alliance with Hungary. The joint Christian forces,

Roman
suzerainty
over
Dacia

which included French and Burgundian contingents, were defeated in 1396 at the Battle of Nikopol (Nicompolis). Mircea had thrown over an earlier alliance with Poland in order to secure one with Hungary; accordingly the Poles, taking advantage of the defeat at Nikopol, intrigued for his deposition and replaced him by his son Vlad, who accepted Polish suzerainty. Mircea later returned, reestablished, and, for a time, increased his power by exploiting the quarrels between the sons of the sultan Bayezid I. In 1417, however, Walachia was forced to capitulate to Turkey under Sultan Mehmed I, though its dynasty, territory, and Christian religion were left intact. Mircea died a year later.

Early years of Turkish rule. After Mircea's death, Walachia, convulsed by internal struggles, could take no active part against the Turks, but they were for a time again driven back by the Hungarians under the brilliant János Hunyadi, a Romanian by race though enrolled in the Hungarian nobility. He deposed one of the weak Walachian princes and nominated Vlad III—who in 1456 acknowledged Hungary as suzerain—a man whose unbelievable cruelties earned him the name of “the Impaler” (Tepeş). Vlad (1456–62, 1476) was able briefly to defy the Turks; with his death, resistance crumbled rapidly, Walachian princes succeeding one another after very short reigns.

The instability of the throne was in part due to the mixture of the hereditary and elective principles in the system of succession; the council of boyars (nobles), which came under Turkish rule to be known as the *divan* by analogy with the Turkish institution of that name, chose the prince from legitimate and illegitimate heirs of his dead predecessor.

The only prince of the 16th century deserving mention is Neagoe Basarab (1512–21), who founded cathedrals at Curtea de Argeş and at Tîrgovişte, which had become the Walachian capital, and endowed monasteries in Walachia, besides making noble contributions to Mt. Athos. The patriarch of Constantinople honoured the dedication of the Argeş monastery with his presence.

Neagoe's son and successor was imprisoned by the Turks who proceeded to nominate Turkish governors in the towns and villages of Walachia. The Walachians resisted desperately. They elected Radu, a kinsman of Neagoe, as prince and defeated the Turkish commander Mahmud Bey with Hungarian help at Grumatz in 1522. The continuance and extension of Turkish control became inevitable, however, after the crushing defeat of Hungary in 1526 at the Battle of Mohács.

Walachia thereafter became a line of communication for Turkish expeditions against Hungary and Transylvania. The prince Alexander, who succeeded in 1591, actually farmed out his possessions to his Turkish supporters, and it seemed that Walachia must succumb to direct Ottoman rule.

Michael the Brave, 1593–1601. The Turkish advance was once more to be halted, though for the last time, under a new prince, Michael, son of Petraşcu, *ban* (governor) of Craiova. In 1593 he secured the deposition of Alexander and his own election by raising a loan at Constantinople of 400,000 ducats to make the customary presents to the Porte and was supported by Sigismund Báthory, prince of Transylvania, and by the English ambassador at Constantinople, Edward Barton. Michael was to prove a thorn in the flesh to the Turks but was much criticized for making Walachia once more subject to Hungarian princes in return for their help. In concert with the Moldavian prince Aaron, Michael organized a massacre of Turkish guards and settlers (November 1594) and with the support given by Báthory in return for the acknowledgment of his suzerainty proceeded to invade Turkish territory, taking Ruse (Ruschuk), Silistra, and other places on the right bank of the Danube. A simultaneous invasion of Walachia by a large Turkish and Tatar host was defeated in the battles of Serpăteşti and Stăneşti (1595). The Sultan next sent Sinan Pasha the Renegade to invade Walachia with 100,000 men. Michael withdrew to the mountains, but with aid from Báthory and a Transylvanian contingent resumed the offensive and stormed Bucharest, pursuing

the main body of Sinan's forces to the Danube. In 1597 the Sultan, wearied with these defeats, reinvested Michael for life.

Walachia's subjection to Hungary was not permanent. On the abdication of Sigismund Báthory, Michael, with the support of the emperor Rudolf II, attacked and defeated his successor Andreas Báthory in October 1599 and had himself proclaimed prince of Transylvania, being acknowledged by the Emperor as his lieutenant and having his position ratified by the Diet. The Vlach peasant population of Transylvania was encouraged to revolt against the Magyars by having an overlord of their own race, but Michael, whose support in Walachia rested on the boyars, helped the Magyar nobility to suppress the peasant rising. Despite this the Magyars distrusted Michael, both as a despised Vlach and as a Habsburg agent, and he found his position in Transylvania insecure while Moldavia remained as a centre for Magyar and Polish intrigue. In May 1600 he invaded that principality, deposed the prince Jeremy (Jeremia) Movilă, and without waiting for the Emperor's sanction had himself proclaimed “prince of Walachia, Transylvania, and of all Moldavia.”

Though Rudolf confirmed Michael in his appointment he grew suspicious of his vassal's progress and determined to undermine his position. The imperial commissioner, Gen. Georgio Basta, was instructed to give support to the disaffected Magyar element in Transylvania, and Michael was driven out by a successful revolt. At the same time the Poles invaded Moldavia and restored the unseated prince, while Walachia itself was also attacked. Michael appealed to the Emperor, who restored him to favour, and in conjunction with Basta he defeated the Transylvanian forces at Gorăslău in 1601. Basta, however, jealous of Michael's returning prosperity, procured his murder at Turda (Cimpia Turzii) almost immediately after their joint victory.

Michael the Brave (Mihai Viteazul) is the leading Romanian national hero, partly because it was he who made the last stand before the era of Turkish and Greek domination, but chiefly because for the first time since Dacian days he brought all the Romanians, scattered in three principalities, under one rule, thus weaving the stuff of the national dream which was not to become reality until 1918.

Period of Greek penetration, 1634–1711. After Michael's death Radu Şerban of the Basarab dynasty was appointed prince of Walachia by the Emperor's wish but was deposed by the Turks in 1611. A succession of insignificant puppet princes followed him, the Greek element becoming increasingly apparent. There was a temporary rally in the second quarter of the 17th century under Matei Basarab, who succeeded in holding the throne for 22 years—warding off repeated attacks from his rival Vasile Lupu of Moldavia—and did much of the arts and the endowment of churches. He founded a printing press at the Govora monastery which issued a compendium of canon law, *Pravila cea mică*, the first Romanian book to be printed in the principalities (Gospels in Romanian had been printed in the preceding century by the Protestants in Transylvania).

The successor of Matei, Constantin Şerban, was the last Basarab to rule in Walachia. On his death the Turks, who in 1698 moved the capital to Bucharest—at a safer distance from the Transylvanian frontier—began to exercise a more direct influence over the ruling families, who were now frequently of Greek origin. Şerban Cantacuzino (1678–88), the first important Greek prince, was an able man; forced to assist the Turks at the siege of Vienna, he opened up secret communications with the Emperor, who granted him a diploma creating him a count of the empire and recognizing his descent from the imperial House of Cantacuzino. In 1688, the year of Şerban's death, the first Romanian Bible was printed.

Şerban's successor was his nephew Constantin Brancovan (Brîncoveanu), descended on his mother's side from the Basarabs, who pursued a policy of cautious balancing between the Porte, the emperor, Poland, and the rapidly westward-thrusting Russia. Brancovan sent congratulations to Peter I the Great on his victory at Poltava and asked for help for the Christian cause. Finally falling a

victim to intrigues, Brancovan was deposed and executed at Constantinople in 1714.

Phanariote regime, 1714–1821. At the beginning of the 18th century Turkish power was in obvious decline and the strength of Austria and Russia growing. Alarmed by the intrigues of Brancovan of Walachia and Cantemir of Moldavia with Vienna and Moscow, the Porte decided to exercise direct control over the principalities. Instead of reducing them to mere pashaliks, however, the Turks employed Greeks from the Phanar district of Constantinople as their agents. The new princes, or hospodars, insecure of tenure, had to extract the maximum from the country in the minimum of time—the average duration of a reign was only two and a half years—and thus the word Phanariote has come to stand for bribery, exaction, and corruption, though the hospodars themselves were often men of culture and intelligence.

Under this oppressive regime many peasants emigrated; in 1741 there were 147,000 peasant families in Walachia, but four years later their number was reduced by half. In the face of this, the enlightened prince Konstantinos Mavrokordatos decreed the abolition of serfdom in 1747, but after numerous rises and falls from favour he was finally imprisoned in 1763 after efforts at reform had proved abortive.

The tide of Ottoman domination was now ebbing fast under Russian pressure; after defeating the Turks at Hotin in 1769, Russian troops occupied both principalities, the bishops and clergy taking an oath to the empress Catherine. At Focșani in 1772 Catherine demanded that the Porte recognize the independence of Walachia and Moldavia under Russian guarantee, but she was deterred by Austrian opposition and temporarily satiated by the partition of Poland.

MOLDAVIA

From the 14th century. Moldavia took shape in circumstances similar to those of its sister state but somewhat later: according to chronicles, more plentiful than those dealing with Walachia, Dragoș, founder of the principality, emigrated southward with his followers from Maramureș in the northern Carpathians (the dates given vary from 1299 to 1342). An independent state first emerged about 1359 under Bogdan I. One of the early princes, Petru Mușat (1374–92), was a member of the Basarab family of Walachia and, in pursuance of the interests of his kinsman, Mircea the Old, recognized the suzerainty of the King of Poland whose sister he married. From this period date Poland's ambitions to control the new state, which had hardly emancipated itself from Hungarian tutelage. The first important prince, Alexander the Good (1400–32), acknowledged Polish overlordship and laid the foundations of organized life in the principality. Civil war reigned among Alexander's successors, but a new era in Moldavian history opened with the reign of his grandson Stephen the Great (1457–1504), who was to prove one of the greatest champions of Christendom against the Turks. Patriotic and religious, Stephen was doubly affected by the fall of Constantinople four years before his accession; the cutting of the trade route through the Bosphorus was disastrous for the commerce of the principalities and the desecration of Hagia Sophia was a blow to Christian feeling. Stephen's whole reign was devoted to the attempt to rally the west against the infidel; he appealed for help to Poland, Hungary, and Venice as well as to the pope Sixtus IV, who gave him the title "athlete of Christ."

Stephen inflicted a crushing defeat on the Turks at Vaslui in 1475 and again repelled them the following year. Poland and Hungary, however, never gave him the solid support for which he had hoped; in 1484 the Turks captured his key fortresses of Chilia and Cetatea Albă (Akkerman, from 1944 Belgorod-Dnestrovski), and the following year burned the Moldavian capital Suceava. Once again Stephen rallied and defeated the Turks in 1486 at Scheia near Roman. As early as 1484, after the loss of his fortresses, he had been compelled to do public homage to King Casimir IV of Poland, but in 1499 he was able to draw up a treaty on equal terms. Poland, however, once again failed to honour its pledge to give help. On his

deathbed Stephen, realizing the hopelessness of securing united action from Christendom, advised his son to submit to the Turks if they would respect the framework of church and state.

Stephen encouraged the arts, gave generous grants of monastic lands, and built more than 40 stone churches and the great monastery of Putna. Stephen's son Bogdan III, the "one-eyed" (1504–17), at feud with Poland over Pokućia (Pokucie), which his father had annexed, and lacking support from the already shaken Hungary, was forced in 1513 to pay annual tribute to the sultan while securing guarantees for the Christian religion and Moldavian institutions. In the anarchy following the Battle of Mohács a strange figure ascended the Moldavian throne, Petru Rareș (1527–38 and 1541–46), an illegitimate son of Stephen. Allying himself with the Turks, he made war on the imperial forces in Transylvania and on Poland, attempting to recover the lost Pokućia. Later he allied himself with the Emperor against Poland and the Sultan but was defeated and deposed in 1538. In 1541 he returned to the throne with Turkish help but concluded a secret treaty with the Emperor against the Turks. His successors could no longer oppose Turkish power.

Turkish penetration. Petru's son actually accepted Islam; the Sultan strengthened his hold on Moldavia by occupying a series of fortresses and increased the tribute. From the middle of the 16th century each aspirant to the Moldavian throne had to buy the consent of the Porte and the way was thus open to adventurers. The most dramatic was Jacob Basiliscus Heraclides who seized Moldavia from the prince Alexander IV Lăpușneanu (1552–61) with Turkish support. A Greek by birth, he had travelled over Europe and had become the friend of Philipp Melanchthon; he attempted to found an educational system in Moldavia, but his heavy taxation led to revolt and he was assassinated in 1563. Under the restored Lăpușneanu (1563–68) and under Bogdan IV (1568–72), Moldavia relapsed into obscurity. Bogdan's successor John the Terrible (1572–74), provoked by the Porte's demand for increased tribute, rose against the oppressor, but was defeated and slain in 1574. Moldavia did not rally until the victories of Michael the Brave at the turn of the century when it was actually incorporated for a year in Michael's Great Dacian realm. After Michael's murder, the Poles again asserted supremacy, but the Porte resumed its domination in 1618. No prince of any importance occupied the throne until Vasile Lupu (1634–53), a brave soldier of Albanian origin. He might have achieved success against the Turks, but chose instead to attack his neighbour Walachia, coveting its throne. He married one of his daughters to Timothy, son of the celebrated Ukrainian hetman (general) Bohdan Chmielnicki, and raided Walachia with the help of his son-in-law, but was routed by the veteran Matei Basarab. He was overthrown by a conspiracy of Moldavian boyars, and after his death Greek influence became paramount. One of the Greek princes, Dmitry Kantemir (1710–11), attempted to exchange Turkish for Russian sovereignty, and proving unsuccessful went into exile in St. Petersburg. He was a scholar whose *Descriptio Moldaviae* is a valuable historical source.

The Phanariote regime in Moldavia is generally reckoned from the reign of Nikolaos Mavrokordatos, Kantemir's successor; it was similar to that in Walachia, and indeed the princes were frequently shifted by the Turks from one throne to the other. Moldavia was perhaps more prosperous than Walachia at this period and had a considerable export trade in timber, salt, wine, and foodstuffs.

DANUBIAN PRINCIPALITIES

After 1774. The Treaty of Küçük Kaynarca, which ended the Russo-Turkish War in 1774, altered the situation in both Walachia and Moldavia. Russia restored the principalities that it had occupied to the sultan (Moldavia, however, lost its northern tip, Bukovina, which Austria, profiting by the situation, annexed in 1775) on conditions that included provisions favourable to the territories themselves. The tribute was to be reduced, and the agents of Walachia and Moldavia at the Porte were to have diplomatic status; Russia was accorded a virtual protec-

torate. In view of Turkish attempts to evade fulfillment of the treaty, Russia secured a more precise definition of its rights in the convention of Ainali-Kavak in 1779 and strengthened its position in 1782 by appointing a consul in Bucharest. Austria countered by dispatching an "agent" Ignazio Rajčević, whose *Osservazioni storiche intorno la Valachia* (1788) is one of the best sources for the period. In the Russo-Turkish War which broke out again in 1787 the principalities once more provided battlefields, and Prince G.A. Potemkin made his headquarters at Jassy (Iasi). In 1791, when peace was imminent, a group of Walachian boyars, fearing the effects of renewed Ottoman rule, addressed an appeal to Austria and Russia which, though it achieved no results, is of interest as an early sign of the awakening of national feeling. The boyars asked for the ending of Phanariote rule, the return of native princes, and the creation of a national army. By the Peace of Jassy (January 9 [new style], 1792) Russia had to evacuate the principalities, the Dnestr (Nistru) being recognized as its frontier, and the privileges of the principalities accorded in earlier treaties were confirmed. In defiance of treaties the Porte continued to change the princes almost yearly, until in 1802 the Russians obtained a fresh convention under which every prince was to hold office for at least seven years and could not be dispossessed without Russian consent.

The two new princes were strongly under Russian influence. Konstantinos Ypsilantis of Walachia, encouraged by the convention, refused some Turkish requisitions, acted as intermediary between the Serbs and Russia in the Serb revolt of 1804 and tried to embroil the French and the Porte. Napoleon's envoy at Bucharest denounced both princes as traitors and influenced the Porte's decision to dethrone them in 1806 without consulting Russia. Russia occupied the principalities and the Turks declared war in December 1806; Moldavia and Walachia had become pawns in the intrigues between the emperor Alexander, the Porte, and Napoleon. The Russian occupation, which lasted six years, reduced the country to a desert; produce was carried off, the coinage debased, and labour requisitioning was enforced by the deportation of recalcitrants to Serbia. The Christian populations exchanged hope and confidence in a liberator for a profound suspicion and fear of Russia which remained rooted in Romanian minds.

Russia's design to incorporate the principalities in its empire was frustrated by the Peace of Bucharest (1812), but it secured the cession of southeastern Moldavia, known as Bessarabia. The two princes who were appointed after the peace in 1812, Ion Caragea in Walachia and Scarlat Callimachi in Moldavia, were masters of extortion. The former increased the taxation eightfold, partly by creating 4,000 new boyars. Both were strongly Greek in feeling and were supported by some of the boyars, who, disappointed in Russia, dreamed of a new Greco-Romanian Byzantium. Caragea was in secret relations with the Greek revolutionary movement, Philiki Etaireia, which was being fostered at Odessa under Russian auspices. The way was thus prepared for the adventure of Alexandros Ypsilantis, son of the Walachian prince Konstantinos and aide-de-camp of the Tsar, who marched into Moldavia at the head of the Etaireists in 1821. He received the support of the Moldavian prince Michael Suțu, but the boyars were hostile in Moldavia and still more so in Walachia where a national popular movement led by Tudor Vladimirescu turned not against the Turks but against the Phanariots. Turkish troops which invaded to crush Ypsilantis were not finally withdrawn until 1824. The Turks, anxious to divide the Romanians from the Greeks, thought it wise to heed the former's demands, and the Romanians took advantage of this to secure a number of reforms in the national interest. The reforms included the promulgation of laws in Romanian and the appointment of native princes, the first of whom were Ion Sandu Sturdza (Sturza) in Moldavia and Grigore IV Ghica in Walachia. Ghica's family, though of Albanian extraction and settled at the Phanar, was highly influenced by Romanian culture. Both princes were anti-Greek and unacceptable to the Russians; Sturdza was accused of subversive tendencies because he cherished plans for constitutional reform, including an elected assembly.

Kiselev and the "Règlement organique." Russia and Turkey resumed relations in 1825, and by the Convention of Akkerman signed by them in 1826 the privileges of the principalities were once more confirmed, and Russia was again allowed a voice in elections to the two thrones. On the outbreak of hostilities between Russia and Turkey again in 1828, Russia once more occupied Walachia and Moldavia. The Peace of Adrianople in 1829 left them still tributary to the sultan, but wholly under Russian protection. The two princes were thenceforth elected for life.

Russia secured a continuation of its occupation by making evacuation conditional on the payment of an impossibly high indemnity by Turkey. The occupation, which had again been exceedingly onerous during the war, became more enlightened after the signing of the treaty, a change that was largely due to the Russian administrator, Count Pavel Kiselev. The boyars, under Kiselev's supervision, drew up a constitution known as the *Règlement organique*, promulgated in Walachia in 1831 and in Moldavia in 1832. It was wholly oligarchic in character but was an advance insofar as legislative and administrative powers were vested in a native elected body. The economic provisions of the *Règlement*, however, deepened the cleavage between the boyars and the peasant class and were censured by Kiselev. The *Règlement* was ratified by the Porte in 1834, whereupon Russia withdrew its troops.

The national movement and 1848. The new princes, Alexandru II Ghica (1834-42) in Walachia and Mihai Sturdza in Moldavia, were, however, strongly under Russian influence. Ghica's successor Gheorghe Bibescu (1842-48) had been educated in Paris and was influenced by the new spirit of romantic nationalism. In agreement with Sturdza he removed the fiscal barriers between the principalities. Meanwhile a new generation of Romanians was growing up, educated in Paris or looking to France for inspiration; these came rapidly to the front in the great crisis of 1848 which in the principalities took a form partly national and partly social. The national movements in Moldavia and Walachia were spurred on by the dramatic upsurge among the downtrodden Romanian peasants of Transylvania, which culminated in the "field of liberty" demonstrations at Blaj in May 1848. Sturdza in Moldavia proved able to quell popular agitation; Bibescu, although he had some sympathy with the movement, lacked courage to lead it and fled, leaving in power a provisional government largely controlled by Ion C. Brătianu, first head of the great Liberal family that for so long dominated Romanian politics. The Turks, under Russian pressure, were forced to put down the new movement; joint Russo-Turkish military intervention restored the *Règlement organique*. The Balta-Liman convention of 1849 laid down that the princes should again be appointed for seven years only; the assemblies were replaced by so-called *divans ad hoc*. Grigore V Ghica was appointed prince in Moldavia and Barbu Știrbey, brother of Gheorghe Bibescu, in Walachia.

Crimean War and Treaty of Paris. Russian troops did not evacuate the principalities until 1851, and during the Crimean War they were occupied in turn by Russia and Austria. Although they suffered severely, the Austrian occupation brought material benefits and opportunities of contact with the West. The Treaty of Paris (1856) placed the principalities with their existing privileges under the collective guarantee of the contracting powers, thus ending the Russian protectorate, though retaining the suzerainty of the Porte. The Russian frontier was withdrawn from the mouths of the Danube by the return of a strip of southern Bessarabia to Moldavia. The existing statutes were revised in 1857 by a European commission with a Turkish member meeting at Bucharest, assisted by two *divans ad hoc* called together by the Porte.

Union of the principalities. The *divans* voted unanimously for autonomy, union of the principalities under the name of Romania, a foreign hereditary prince, and neutrality. The *divans* were dissolved by the Porte in January 1858, and in August the convention of Paris accepted their decisions with modifications. There were still to be two princes and two assemblies, but a central commission at Focșani was to prepare measures of joint concern. The two assemblies, meeting at Iași and Bucharest respectively,

then elected a single prince in the person of Alexandru Ion Cuza on January 17 (new style), 1859. The de facto union of Romania was thus accomplished.

ROMANIA

Election of Prince Cuza

A new conference met in Paris to discuss the situation, and in 1861 the election of Prince Cuza was ratified by the powers and the Porte. In February 1862 a single ministry and a single assembly replaced the divans and central commission. Cuza, in May 1864, promulgated by plebiscite a new constitution providing for a senate as well as an assembly and extending the franchise to all citizens, with the reservation of a cumulative voting power for property. An important agrarian law of the same year emancipated the peasantry from forced labour. Prince Cuza's agrarian and educational reforms were progressive, but his methods of enforcement were despotic. He alienated the boyars by abolishing forced labour and the clergy by confiscating monastic estates, while the agrarian reform was not radical enough to satisfy the peasantry.

In February 1866 Cuza was compelled to abdicate, and the principalities by referendum elected as prince, almost unanimously, Charles, second son of Prince Charles Antony of Hohenzollern-Sigmaringen, the candidate of Ion Brătianu, who had secured the veiled support of Napoleon III. The new prince reached Bucharest on May 22, 1866, and in July took the oath to a new constitution modelled on the Belgian Charter of 1831, which provided for upper and lower houses and gave the prince an unconditional veto on all legislation. Turkish assent was secured in October; Prince Charles was recognized as hereditary ruler and was allowed to maintain an army of 30,000 men.

Internal politics, 1866–75. Prince Charles's policy was to avoid all political adventures and to give Romania a sound administration. The internal situation was at first unsettled; 10 governments held office in five years. The dominant figure was the Liberal leader Ion Brătianu.

In 1869 Prince Charles paid a series of state visits to consolidate his position and married Princess Elizabeth of Neuwied, the poetess later known as Carmen Sylva, who earned great popularity in her adopted country. Prince Charles was a Roman Catholic and his wife a Protestant, but he agreed to bring up his successor in the Eastern Orthodox faith.

Tension arose between the German prince and his pro-French politicians on the outbreak of the Franco-German War in 1870, and there was an abortive attempt to overthrow him in a revolutionary outbreak at Ploesti. Anti-German feelings were increased by a scandal in the new Romanian railways; the German contractor failed to honour the coupons of the bonds, mainly held by influential Germans, and the Prussian government attempted to coerce the Romanian government into payment. Indignation in Romania culminated in a mob attack on the German colony in Bucharest in March 1871, and Prince Charles contemplated abdication. A Conservative government formed under Lascăr Catargiu succeeded in restoring order, however, and retained office for five years. After another crisis threatening Prince Charles, the Liberals again took office in 1876 and Brătianu became premier; he enjoyed almost absolute power for the next 12 years.

Russo-Turkish War, 1877–78, and the Treaty of Berlin. Domestic problems were temporarily eclipsed by the re-opening of the Eastern Question in 1877. Russia rejected Romania's offer of cooperation on equal terms against Turkey and threatened occupation. On April 16, 1877, Romania signed a secret convention allowing free passage to the Russian armies, while the Tsar promised to respect Romanian territory. The Russians crossed the Romanian frontier in April, and on May 11 Romania declared war on Turkey. Romanian troops contributed materially to the joint victory at Plevna (Pleven), which left the Russian forces free to march on Constantinople. Nonetheless, Russia refused to admit Romanian representatives to the peace negotiations at Adrianople and later at San Stefano. The Russians insisted on the handing back of southern Bessarabia which had been restored to Moldavia after the Crimean War, and despite bitter Romanian protests this

provision was incorporated in the Treaty of Berlin (July 13, 1878); Romania received an alternative outlet to the mouths of the Danube in northern Dobruja, a territory with little or no Romanian population, the possession of which later caused discord with Bulgaria.

The treaty recognized Romanian independence and guaranteed absolute freedom of worship without loss of political rights. The latter article (XLIV) caused indignation in the country and could not be implemented without constitutional revision. Article VII of the 1866 constitution stated that "only Christians can become citizens of Romania," thus excluding Jews from civic rights. Jews had not been numerous in the principalities until the early 19th century, but their influx after the Treaty of Adrianople had caused the clause to be put into the constitution. Under pressure from the powers, Article VII was finally repealed.

Independence of Romania: the kingdom. The independence of Romania was recognized by Italy in December 1879 and by Great Britain, France, and Germany in February 1880. Prince Charles, having no children, regulated the succession in 1880 in favour of his nephew Prince Ferdinand of Hohenzollern, and the idea of making Romania a kingdom was mooted. The Liberal government, accused by the Conservatives of republican tendencies, itself took the initiative in proclaiming the kingdom. This action was hastened by the general fear of revolution consequent on the assassination of Emperor Alexander II. Charles was crowned king on May 22, 1881, and secured the immediate recognition of the powers.

Internal politics, 1878–1912. Since 1876 Brătianu had exercised almost dictatorial power. His Liberals stood for the rapid development of a strong middle class interested in dominating the Jews, and they were mainly Francophile. The Conservatives were divided into the old boyar group, which tended to look to Russia, and the so-called Young Conservatives, the Junimists, led by Petre Carp, who had studied in Germany rather than France and favoured the Central Powers. Brătianu retired after electoral defeat in 1888 and died three years later. Thereafter various Conservative and Junimist administrations held office, the Liberals under Dimitrie Sturdza returning to power in 1895.

The country was in considerable financial difficulties, and there was much discontent, particularly in the countryside among the poverty-stricken peasants. A serious peasant rising in 1907, stimulated by the Russian upheaval of 1905, attacked first the Jews and then the large landowners. The Conservative ministry had to resign, and it was a Liberal government that restored order. In 1909 the Liberal leader Sturdza resigned and was succeeded by Ionel Brătianu, eldest son of the great statesman, who continued to base his policy on the expansion of the urban middle class, though some of his younger colleagues concentrated on the agrarian problem. The Conservatives under Carp came to power again in 1911 but were violently attacked by the Liberals and a group of Conservative dissidents formed after the peasant rising under Take Ionescu. Under the pressure of foreign events the Cabinet was reconstituted in 1912 with Titu Maiorescu as premier and Ionescu as minister of the interior. In January 1914 Ionel Brătianu succeeded Maiorescu and formed a Liberal administration; together with the party theorist Constantine Stere, a Bessarabian boyar who had been banished to Siberia for his radical views, he worked out a program of agrarian reform.

Foreign affairs, 1878–1912. The foreign political situation remained comparatively calm between the Treaty of Berlin and the outbreak of the Balkan wars, though Romania's relations with its neighbours could not be cordial. Bulgaria, a traditional friend, was embittered by the loss of northern Dobruja; against Russia the Romanians were incensed by the forced retrocession of southern Bessarabia. The resentment aroused against Austria at the end of the 18th century by its seizure of Bukovina, the first home of the Moldavian principality and repository of its chief artistic and ecclesiastical treasures, had died down, but ill feeling was aroused by the commercial treaty of 1875, which Romania considered unfair, and was intensified by Austria's insistence on having a delegate on the

Unrest among the peasants

Danube commission, though the commission's writ only ran from Galați to Orșova and did not reach Austrian soil. The oppressed Romanians of Transylvania had been increasingly conscious of grievance against Hungary since 1848, and their feelings were shared in Romania. With Greece there was a constantly reviving dispute in which Bulgaria was also involved, concerning the status of the Vlach communities in Macedonia over which Romania claimed the rights of a protector; this caused a diplomatic rupture between Romania and Greece from 1905 to 1911.

King Charles had a natural and pronounced preference for the Central Powers, and in this he was supported by Ion Brătianu, whose fear and dislike of Russia after the Treaty of Berlin outweighed his Francophilia. It was Brătianu, with Sturdza as foreign minister, who signed the secret treaty of 1883 with Austria and Germany. The treaty, remaining a close secret, was formally renewed under a Conservative administration in 1892. It was, however, the first signatory, Sturdza, leader of the Liberals since 1893, who was most active in support of the claims of the Transylvanian Romanians against Hungary. The Bosnian crisis of 1908 alarmed Romania because it showed that Austria was prepared to further the fortunes of Bulgaria in order to destroy Serbia. Ionel Brătianu, however, on succeeding Sturdza in 1909, remained faithful to the secret treaty.

First Balkan War, 1912. The outbreak of war between the Balkan League and Turkey in October 1912 found the Conservatives in office. Romania's sympathies were at first uncertain; the secret Serbo-Bulgarian military convention of March 13, 1912, had provided against a possible Romanian attack. The rapid success of the Bulgarians caused Romania to abandon its original profession of disinterestedness and to stake a claim. Romania intimated to Bulgaria that in the event of a partition of European Turkey it would, in the interests of the balance of power in the Balkans, require a frontier rectification in the Dobruja. Stoyan Danev, the Bulgarian foreign minister, returning through Bucharest from a visit to Vienna and Budapest, offered only minor frontier rectifications, excluding Silistra, which was the kernel of Romania's claims. He did, however, consider the renunciation of Bulgaria's claim to northern Dobruja and the giving of a guarantee for the Vlachs of Macedonia. No agreement was reached in Bucharest or in London in January 1913. The case was finally submitted for arbitration to the Conference of St. Petersburg (May 1913), which assigned Silistra to Romania. Bulgaria regarded the concession as excessive, and Romania no longer looked on it as a satisfactory price for neutrality.

Second Balkan War, 1913. Bulgaria's attack on its allies on June 28, 1913, was used by Romania as a pretext for intervention. The Romanian Army, 500,000 strong and commanded by the Crown Prince, crossed the frontier on July 11, occupied southern Dobruja, and advanced on Sofia. Negotiations were immediately opened at Bucharest, where an armistice was signed on July 30, 1913, between Romania, Serbia, Greece, and Bulgaria. By the Treaty of Bucharest, signed on August 10, Romania obtained southern Dobruja, which it had already occupied.

Romania's position was now precarious in view of the growing tension between Vienna and St. Petersburg. The King renewed the secret treaty with the Central Powers at the beginning of 1914, and Austria made great efforts to win Romanian friendship, but popular sentiment ran the other way. The feeling of kinship with Transylvania grew steadily among the younger generation, while Austria's continued diplomatic support of Bulgaria aroused resentment. The growing feeling of the need for a policy covering the interests of the entire Romanian nation, within and without the national frontiers, led to a new inclination toward Russia. Though Russia held Moldavian Bessarabia, Austria-Hungary, as arbitrator of the destinies of the much more highly developed Romanian communities in Transylvania, was the greater obstacle to the realization of dreams of unity. The visit to St. Petersburg of Prince Ferdinand, heir to the throne, in March 1914 and of the emperor Nicholas II to Constanța in June, did not bring about a definite change of policy, however.

Romania and World War I. On the outbreak of war

in 1914 Ionel Brătianu and his Liberal Party were in office. The politicians were divided in their views, not along party lines, and Romania at first maintained armed neutrality, though tempted by the Central Powers with the promise of the return of Bessarabia and by the Allies with the offer of Transylvania. Grief at the country's failure to honour the secret alliance hastened King Charles's death in October 1914. His successor, Ferdinand, had married Marie of Edinburgh, granddaughter of Queen Victoria and of Alexander II, stronger in character than her husband and a staunch lover of Britain and Russia. Her influence, Allied promises, and alarm at the extent of German victories finally brought Romania into the war. By a treaty of August 17, 1916, Great Britain, France, Russia, and Italy guaranteed Romania the Banat, Transylvania, the Hungarian plain up to the Tisza River, and Bukovina as far as the Prut River. Romania declared war on Austria-Hungary on August 27; its troops at once crossed the passes into Transylvania but were expelled by mid-November. Bucharest was occupied by the Central Powers on December 6, 1916. The King and his ministers and Parliament had already retired to Iași and were followed by the Army, which reorganized in Moldavia under the shelter of the Russian forces. The Russian Revolution of February 1917 led to the collapse of the front and left the German Field Marshal August von Mackensen free to throw all his forces against the Romanian Army, which was rendered incapable of further resistance after a prolonged stand at Mărășești (on August 16, 1916), Mărăști, and Oituz. After the October Revolution the Russian Army disintegrated into pillaging bands, hostilities were suspended, and an armistice was concluded on December 6, 1917, at Focșani.

During this period the Parliament in exile at Iași was busy with projects of agrarian and electoral reform. Brătianu had already been considering these topics in 1914, and in December 1916 he made a coalition with Take Ionescu and his dissident Conservatives, who had been concerned with the peasant question since the 1907 rising. The effects of the Russian Revolution in the Ukraine and Bessarabia, where the peasants had appropriated the land, made the question urgent. King Ferdinand was personally concerned and induced the Conservatives to agree to a project of radical expropriation, which was passed in July 1917.

Treaty of Bucharest. After Brătianu resigned on February 9, 1918, Gen. Alexandru Averescu was charged with the peace negotiations at Bufta, near Bucharest. The Dobruja was ceded as far as the Danube, Bulgaria taking over the southern half which it had lost in 1913, while the Central Powers administered the northern half conjointly. Romania was to have a trade route to the Black Sea via Constanța. The old frontier of Hungary was restored. The Central Powers secured such terms on the Danube, in the Romanian old fields, and over the railways as would have placed Romania in a state of economic slavery to them for many years. Averescu's Cabinet hesitated to sign and resigned on March 12 in favour of the pro-German Alexandru Marghiloman ministry, which signed the treaty at Bucharest on May 7, 1918.

Marghiloman's ministry struggled against almost unsurmountable difficulties throughout the succeeding months. The Central Powers forced the Banque Générale to issue 2,500,000,000 lei in paper money. This disorganized the finance of the kingdom, while economic ruin was ensured by the forced export of sheep and cattle, the cutting down of forests, and the dismantling of factories. The population meanwhile was starving, and the morale of the working class was being perverted by revolutionary propaganda.

On November 8, 1918, when the defeat of the Central Powers was assured, the King called to power General Coandă, who repealed all laws introduced by the Marghiloman ministry and decreed universal, obligatory, and secret suffrage for all male voters over 21 years of age. War was declared again on November 9. The King reentered Bucharest on November 30 after the German troops had evacuated Romania under the terms of the Armistice. Ionel Brătianu again became premier on December 14.

Russian
Revolution
of 1917

GREATER ROMANIA

The dream of greater Romania was realized, but it was no easy task to unite provinces that had been under the domination of different alien states. Bessarabia was already incorporated in the old kingdom, having abandoned an earlier idea of autonomy. Its council voted for unconditional union on December 9, 1918. The incorporation of Transylvania followed in virtue of a resolution passed by a Romanian assembly at Alba Iulia on December 1, and that of Bukovina on November 28. The government had to carry on difficult diplomatic negotiations for the recognition by the Allies of the new frontiers. Those fixed by the agreement of August 1916 were drawn back in places to give the Hungarians a part of the hinterland of Oradea (Nagyvárad), and the Yugoslavs the western half of the Banat. A line of demarcation was fixed in Hungary, and Romanian troops occupied the country up to this line, pending final settlement by treaty. In March 1919 a further neutral zone was established, and Romania was given the right of occupying it. Béla Kun's Communist government, which then came into power in Hungary, started a campaign as a result of which the Romanians advanced to the Tisza River, where they were stopped by the Allies on May 9. On July 22 Kun started a new offensive, but the Romanian Army defeated his troops, crossed the Tisza—despite the interdiction of the Allies—and occupied Budapest on August 4. There they remained, in the face of numerous protests, until November 14. The treaties of Saint-Germain and Trianon recognized as Romanian the predominantly Romanian territories of the old Dual Monarchy, and the Treaty of Neuilly sanctioned Romanian possession of southern Dobruja.

Romanian
occupation
of
Budapest

Domestic politics, 1919–30. The political scene was transformed after 1918; the old Conservative Party was swept away because of its pro-German policy and the impoverishment of its chief supporters, the boyars. The Liberals became the party of the business and professional classes, while the peasants, who gained new status through the land reform, founded a party of their own in the old kingdom headed by Ion Mihalache. More radical elements came in from Transylvania, notably the National Popular Party headed by Iuliu Maniu and Alexandre Vaida-Voevod. The Socialists were not influential, as more than 80 percent of the population of Romania were peasants; in the old kingdom the Socialists were mainly Marxist and supported the Russian Revolution, but in Transylvania they looked to the West.

The new parties had their chance as early as December 1919 in a coalition Cabinet headed by Vaida-Voevod, the Brătianu government having resigned in protest against the minorities clause of the Treaty of Trianon (Article LX), but their tenure of office was short. General fear of Communist propaganda and the alarm of the landowners at the proposed expropriation led to the government's resignation in March 1920 and the return of a new People's Party containing many former Conservatives, led by General Averescu, hero of two wars.

He secured the able Take Ionescu as minister of foreign affairs. The General, despite personal sympathy with the peasants, had to take strong measures to restore order. A revolutionary movement was breaking out on the Dneestr and securing support among Socialists and Communists in the old kingdom, and social tension reached a climax in the general strike of October 1920. The failure of the strike split the Romanian Socialist movement. The more moderate leaders were imprisoned, and the Communists, who had kept underground, gained the upper hand. They voted for the affiliation of the Social Democratic Party with the Comintern at a congress in May 1921, whereupon 70 leaders were arrested. The Social Democrats thereafter kept separate, and the newly formed Communist Party was outlawed in 1924.

Meanwhile Averescu had to put through the promised land reform. The bill was introduced in the spring of 1921 by the minister of agriculture, Constantin Garoflid, himself a large landowner. After impassioned controversy, expropriation was put through on the lines agreed in July 1917, estates being limited to 500 hectares in the old kingdom, and to much smaller areas in Bessarabia and

Bukovina. The peasants were not wholly satisfied; the holdings allotted were often unduly small, and there was no adequate arrangement for the granting of credits for the purchase of seed and tools.

The Liberals came to power at the beginning of 1922, remaining in office with one short break until 1928. Brătianu dominated the scene until his death in 1927 and thus had the satisfaction of being in office for the coronation of King Ferdinand as sovereign of united Romania at Alba Iulia on October 15, 1922.

A new constitution was adopted in March 1923 based on that of 1866 but with the addition of manhood suffrage. The Jews were given citizenship rights, but their inflow in large numbers after World War I awakened long-standing hostility. In the financial sphere the Liberal government pushed through the difficult policy of coupling industrialization with the exclusion as far as possible of foreign capital, which bore heavily on the peasants who had to pay for it by export duties. The chief cause of Liberal unpopularity, however, was the centralization of administration. All the new provinces, even including backward Bessarabia, had hoped for a measure of autonomy, and this feeling was strongest in Transylvania where bitter hostility was aroused by the arrival of officials from the old kingdom. The minorities problem was to prove troublesome to all Romanian administrations in the years following World War I, and none succeeded in finding a solution.

Brătianu proceeded in 1926 to push through an electoral law giving great advantages to the party in power at election time. By this law those who secured 40 percent or more of the votes were given half the seats in the chamber, plus a share in the remainder in proportion to the number of votes obtained. When a ministry fell as a result of an adverse vote in the chamber, the king could call on the leader of the next largest party to form a Cabinet and hold elections. Until 1937 no party in charge ever failed to secure the necessary 40 percent. The Liberal Party's popularity was slowly waning at the end of 1925, and in the face of growing discontent King Ferdinand again called on Averescu to form a Cabinet. His party, with some peasant support, secured four-fifths of the seats in the chamber in the elections of March 1926, largely because of successful pressure at the polls. Though the Liberals only had 16 deputies it was clear that the new administration governed largely with their support. Meanwhile the opposition was greatly strengthened by the fusion, in October 1926, of Maniu's National Popular Party with Mihalache's Peasant group to form the National Peasant Party, which was to represent the majority of the Romanian people. Averescu resigned in June 1927 and Brătianu was again returned; the newly formed National Peasant Party, despite universal popularity, polled only 22 percent of the votes in the obviously manipulated elections.

Electoral
reform

The political situation was complicated by the dynastic position. In December 1925 Crown Prince Carol was forced to leave Romania, renouncing all his rights in favour of his young son Michael. In view of King Ferdinand's precarious health a council of regency was formed in January 1926 consisting of the patriarch Miron Cristea, the president of the supreme court Gheorghe Buzdugan, and the King's second son, Prince Nicholas.

King Ferdinand died on July 20, 1927, and Brătianu died in November of the same year. The Liberal Party, thus weakened, was faced with an economic crisis and peasant demonstrations. The regency council in November 1928 entrusted Maniu with forming a government and holding elections: on December 12, in the first and, so far, only free elections in Romania, his National Peasant Party was returned with a majority of 349 seats out of 387. The new government abolished censorship and martial law, mitigated the police regime, promised concessions to the minorities, and in June 1929 introduced, to the great satisfaction of the Transylvanians, an administrative reform bill aiming at extensive decentralization. The peasants were helped by the repeal of the export duties; cooperatives were encouraged and free sale of land allowed, a measure that unfortunately led to an increase of the rural proletariat rather than to a consolidation of prosperous peasant holdings as had been intended. The economic

situation was greatly eased by the entry, at last allowed, of foreign capital.

Foreign policy, 1920–37. Romania's foreign policy after Trianon was necessarily based on an endeavour to maintain the status quo and to protect itself against aggression. Romania was from the first a consistent member of the League of Nations but built up a careful system of regional pacts to buttress collective security. The first such pact was concluded with Poland in March 1921, when Take Ionescu and Prince Eustachy Sapieha signed a treaty providing for mutual assistance in the event of unprovoked attack on the eastern frontier. Both countries were threatened by the U.S.S.R., which had not recognized Romania's right to Bessarabia and seemed little satisfied with Poland's possession of its former Ukrainian and Belorussian territories.

Take Ionescu had hoped to form a Baltic-Aegean bloc to act as a buffer between Germany and the U.S.S.R. but had to be content with joining the Little Entente system. An agreement with Czechoslovakia for mutual protection against Hungary was signed in April 1921 and with Yugoslavia for similar protection against Hungary and Bulgaria in June. He sought further to cement Balkan friendships by dynastic alliances. Marriages were concluded between Crown Prince Carol and Princess Helen of Greece on March 10, 1921, between his elder sister Princess Elizabeth and the Crown Prince of Greece in February 1921, and between Princess Marie and King Alexander I of Yugoslavia on June 8, 1922.

General Averescu, in his 1926–27 administration, extended Romania's system of pacts to include its "Latin sisters." Treaties of alliance and nonaggression were signed with France in June and with Italy in September 1926. The Italians, after long hesitation, recognized the incorporation of Bessarabia in Romania in March 1927. Relations with the U.S.S.R. remained tense; during 1924 the Soviet Union kept up continuous agitation and threats of war, even setting up a three-day Communist republic at Tătăr Bunar in southern Bessarabia. A conference held in Vienna in April 1924 between Romanian and Soviet representatives led to no results. The situation was eased when Nicolae Titulescu became foreign minister in 1927. In 1933 both countries signed the Convention of London defining the aggressor, and with the U.S.S.R.'s entry into the League in 1934 and the exchange of letters between Titulescu and Maksim Litvinov later that year it was hoped that the Bessarabian question was settled. Romania entered into diplomatic relations with the U.S.S.R. in 1934, but the Bessarabian question remained open and was raised again by the Russians after Titulescu had been dropped from the Romanian Cabinet in 1936.

Agreement with Bulgaria, resentful at the loss of southern Dobruja to Romania and at the inclusion of parts of Macedonia in Yugoslavia and Greece, proved out of reach; nonetheless, the Balkan Entente, concluded on February 9, 1934, between Romania, Yugoslavia, Turkey, and Greece, was left open to Bulgaria.

Romania under King Carol. Maniu, dissatisfied with the regency, arranged for the return of Carol from exile with the agreement of all the major parties. Carol was proclaimed king on June 9, 1930, his son Michael becoming crown prince (grand voivode). Conflict soon arose between the King and Maniu, who had exacted a promise that Carol would leave his Jewish mistress Magda Lupescu abroad if he resumed the throne and would seek reconciliation with Queen Helen. On the King's breaking this promise Maniu resigned the premiership in October 1930, though his party remained in power under Gheorghe Mironescu. King Carol was from the first determined to secure absolute power and to break up the old political parties. Maniu's resignation and the world economic crisis helped to bring down the National Peasants in 1931. After Mironescu's resignation the foreign minister Titulescu attempted to form a Cabinet, and on his failure the King appointed one of his own choice headed by his former tutor Nicolae Iorga. The elections of June 1931 gave the government a majority of 291 seats out of 387, but it resigned a year later. The National Peasants had a brief return to power, and it fell to Vaida-Voevod to deal with

the serious Communist-inspired railway strike at Grivița in February 1933, but the party, split through King Carol's intrigues, could no longer keep itself in power. The Liberals returned to power in 1933 under an anti-Carol leader, Ion Duca.

Rise of the Iron Guard. The King was helped in his disruption of the older parties by the rise of a new group of fascist type that was taking shape in Moldavia, feeding on endemic Romanian anti-Semitism and the economic crisis. The leader, a young man named Corneliu Zelea Codreanu, called his group the *Legiunea Arhanghelului Mihail* (Legion of the Archangel Michael); it would become most commonly known by the name it adopted in 1930, *Garda de Fier* (Iron Guard). Its slogan was the Christian and racial renovation of Romania: in foreign affairs it sympathized with Germany and Italy and later with Francisco Franco in Spain; at home it tempted the peasants with the slogan *omul și pogonul*—"one man, one acre."

The Iron Guard gained its first five seats in Parliament in 1932; its policy of violence, which had already been demonstrated by the murder of the prefect of Iași, was carried forward by the assassination of Premier Duca, in December 1933. The new Liberal premier, Gheorghe Tătărescu, proscribed the Iron Guard, but it reappeared under another name, *Totul Pentru Țară* (Everything for the Country). Titulescu was removed from the foreign ministry in August 1936.

In the 1937 elections, presided over by Tătărescu, the government for the first time failed to secure the necessary 40 percent of the votes. It was highly unpopular, and the opposition was unexpectedly consolidated by the conclusion of an electoral pact between the National Peasants and the Iron Guard, which led to much criticism of Maniu. The Guard secured 16 percent of the votes. King Carol, alarmed at this success and not wishing to have Codreanu as a rival dictator, dropped his earlier policy of covert support and called on the elderly Transylvanian poet Octavian Goga, leader of the right-wing anti-Semitic National Christian Party, to form a government. After a few weeks of violent anti-Semitic action, Goga was dismissed and King Carol proclaimed a personal dictatorship. A new constitution of corporative type was published on February 20, 1938, and "accepted" in a plebiscite.

(B.Br.)

King Carol's political manoeuvring. Faced with revisionist Hungary in the west, but above all haunted by the Soviet Union's potential threat to Bessarabia, Romania found itself in 1938 in an insolubly difficult situation. The events of that year brought out in full relief the obvious truth that small states alone cannot pursue an effective reinsurance policy against an aggressive great power: to be successful such a policy requires association with another great power. Aware of his country's predicament, King Carol chose the path of political and economic rapprochement with Germany. On September 29, 1938, on the eve of the Munich tragedy, he informed Berlin that he desired to establish closer relations with the Third Reich. On October 22 he asked for an interview with Hitler because he wished "to orientate his policy toward Germany."

Receiving Carol at Berchtesgaden on November 24, Hitler agreed to increase trade, since, he said, Germany could supply most of Romania's needs, whereas the Reich could use Romania's petroleum products and foodstuffs. On the other hand, he rejected Carol's suggestion of a motor road across Bohemia, Slovakia, and Carpatho-Ukraine to Romania as being not only too costly but also strategically dangerous for Germany in the event of Soviet aggression, though Carol protested that Romania was always anti-Soviet and would never permit the passage of Soviet troops across its territory. Finally, Hitler granted Carol's request for the recall of an official at the German Legation in Bucharest who was the channel for the Nazi financial support of the Iron Guard.

A few days after Carol's return to Bucharest, Codreanu, head of the Iron Guard, and 13 of his followers were "shot while trying to escape." On December 16 the King founded a monopoly party, the National Renaissance Front, to support his government. Miron Cristea, the patriarch and premier, died in March 1939 and was succeeded by Ar-

and Hitler

mand Călinescu, former minister of the interior, who was murdered by the Guard on September 21.

The disruption of Czechoslovakia in March 1939 confirmed the collapse of the Little Entente, which had been directed against Hungarian revisionism. The Balkan Entente, of which Romania was also a member, was a loose political association against Bulgaria and had never been meant as a basis for security against a great power. Of the old elements of Romanian security only one was left—the alliance with Poland, which, however, could be applied only in the event of Soviet aggression. Carol then started a subtle game. Strengthening his ties with Germany, he was at the same time anxious to build up some counterweight to Berlin in the West. To that effect, simultaneously with the signing on March 23 of a commercial agreement granting to the Reich exceptional privileges, he staged a diplomatic manoeuvre in London producing the impression that Romania, in dealing with Germany, was acting under duress. Rumours of imminent German threats to Romania were spread, and appeals to the Western powers for support were launched. This resulted on April 13 in the Franco-British guarantee of Romania's territorial integrity.

Grigore Gafencu, Romania's foreign minister from December 23, 1938, was sent to Berlin, London, and Paris on an exploratory trip. Hitler, who received him on April 19, told him that he considered Romania's acceptance of the Franco-British guarantee as an unfriendly act but acquiesced in Gafencu's assurance that this guarantee was peaceful and not reciprocal. Gafencu met Lord Halifax, the British foreign secretary, in London on April 25, and Georges Bonnet, his French counterpart, in Paris two days later. To both of them he expressed the view that if a satisfactory agreement for mutual assistance was concluded among Great Britain, France, and the U.S.S.R., Romania would have no reason to stand aside. Instead of entering into an agreement with the Western powers to stop Hitler, however, Stalin made with him a "nonaggression pact" with a secret protocol for the partition of eastern Europe between Germany and the U.S.S.R.

German
invasion
of Poland

The German invasion of Poland started on September 1, 1939. When, on September 17, Soviet troops entered Poland, the terms of the Polish-Romanian alliance theoretically could have required Romania's immediate intervention on Poland's side. Practically, however, the struggle would have been a hopeless one in view of the Soviet-German collusion, and, facing the realities of the situation, the Polish foreign minister, Jozef Beck, released Romania from its treaty obligation toward Poland. With German and Soviet troops closing on them, the Polish authorities decided to make their way through Romania in order to continue the fight alongside their British and French allies; but on crossing the Romanian borders the Polish head of state and the members of his government were interned, in contravention of international law.

German victories in western Europe convinced Carol that only by putting himself into Hitler's hands could he save Romania's territorial integrity. He did not know, of course, that on August 23 Hitler had already agreed that "Bessarabia should be a Soviet sphere of influence." On May 29, 1940, a new German-Romanian trade agreement was signed: for petroleum products and foodstuffs, Germany would pay Romania in armaments. Two days later Gafencu was released to be sent as ambassador to Moscow and replaced by Ion Gigurtu.

Nothing, however, could now save Romania from disaster. On June 27 it was forced to allow the Soviet annexation of Bessarabia and northern Bukovina. On July 1 Romania renounced the British guarantee (France had already capitulated on June 22) and asked for a German military mission to Bucharest. On July 15 Hitler advised Carol that direct negotiations with Hungary and Bulgaria were necessary to satisfy the territorial demands of those states. As the Romanian-Hungarian negotiations almost immediately came to a deadlock, Hitler and Mussolini decided to impose on Romania on August 30 the so-called Vienna Award, transferring all northern Transylvania to Hungary. Eight days later the Germans induced Romania to restore southern Dobruja to Bulgaria. Within 10 weeks Romania had lost 40 percent of its territory and 50 percent

of its population, and this national humiliation required a scapegoat: under the pressure of a national protest led by the Iron Guard, Carol abdicated on September 6, leaving his 19-year-old son, Michael, to be king (as Mihai I).

Antonescu's dictatorship. Before his departure Carol entrusted power to Gen. Ion Antonescu, whom King Michael immediately appointed *conducator* (leader) of Romania. On September 14, 1940, under Nazi pressure, Antonescu agreed that the commander of the Iron Guard, Horia Sima, Codreanu's successor, should be deputy premier and that Romania be declared a "national legionary state." The staff of the German Military Mission arrived in Bucharest on October 14, followed shortly afterward by a German motorized division. Hitler received Antonescu for the first time in Berlin on November 22; but Nazi agents in Romania armed the Iron Guard, which on November 27–28 carried out a massacre in which 64 prominent statesmen and generals of the old regime were assassinated. Antonescu now decided to rid himself of his Guardist allies: at his second interview with Hitler, at Berchtesgaden on January 14, 1941, he explained that the Romanian Army was disgusted with the Guardist instigators of anarchy. Shortly after Antonescu's return to Bucharest, another bloodbath took place in Romania (January 21–23, 1941): thousands of Guardists were killed, but Sima escaped to Germany.

Antonescu formed a new government, mainly military. There were soon about 500,000 German troops in Romania, and on February 10, 1941, Great Britain severed diplomatic relations. Not until June 13, at Munich, did Hitler apprise Antonescu of his plan to attack the U.S.S.R. Antonescu, who had foreseen this enterprise many months before, asked for the honour of participating in it. His proposal was accepted, and a German-Romanian army group was formed under Antonescu's command. On June 22 Romania entered into a "holy war" against the U.S.S.R. Bessarabia was liberated a month later, and Michael made Antonescu marshal of Romania on August 23. On August 30 Germany agreed to the organization of a new Romanian province, Transnistria, between the rivers Dnestr and Southern Bug, with Odessa as its chief town. The Romanian armies cooperated with the Germans in the offensives of 1941–42 in the Ukraine and in southern Russia; but these offensives culminated in disaster at Stalingrad.

King Michael's coup d'état. The National Peasants under Maniu and the Liberals under Dinu Brătianu formed a rallying point for popular discontent with the fruits of Antonescu's pro-Axis policy and undertook secret negotiations with the Allies during 1943. The parties were supported in the desire for an armistice by the Social Democrats under Constantin Titel Petrescu and the Communists under Lucrețiu Patrascanu. In the spring of 1944 the four parties agreed to form a National Bloc to bring Romania out of the war.

The coup d'état of August 23, 1944, which overthrew Antonescu and brought Romania into the war against Germany, was largely the work of King Michael himself. The armistice was signed in Moscow on September 12, Soviet troops having been in occupation of most of Romania since the end of August.

Until elections could be held, three short-lived governments of a mainly military character took office, the first two headed by Gen. Constantin Sănătescu (1885–1947) and the third by the chief of staff, Nicolae Rădescu (1874–1953), an open anti-Communist. The Soviet deputy foreign minister, Andrei Vyshinski, went in person to Bucharest to insist on Rădescu's removal and the installation as premier of Petru Groza, head of a splinter left-wing party known as the Plowmen's Front, which, though not forming part of the National Bloc, had been included under Soviet pressure in the last Sănătescu administration.

The Groza government, which took office in March 1945, excluded the National Peasants and the Liberals and proved highly unpopular. In August of that year the Potsdam Conference of U.S., British, and Soviet leaders proposed the resumption of diplomatic relations with Romania provided that the government was "recognized and democratic." The U.S.S.R. immediately resumed relations, but Great Britain and the U.S. refrained on the ground

Romania's
diplomatic
relations

of the unrepresentative nature of the administration. King Michael then appealed to the three powers, which, meeting in Moscow in December 1945, advised that a government, broadened by the inclusion of a National Peasant and a Liberal member, should hold elections. (Antonescu was shot as a war criminal in 1946.)

The 1923 constitution had been restored after the armistice, but before the elections a law was passed abolishing the Senate. The government bloc announced that it had polled 71 percent of the votes in the elections held on November 19, 1946. The Communists "secured" the key portfolios in the new government, excepting that of foreign affairs (which was given to Tătărescu), and split the Social Democrats, the bulk of the party remaining aloof under its leader, Petrescu, who was later imprisoned. The elections were followed by a wave of arrests of former leaders and their supporters, including Maniu, Brătianu, and Petrescu. The National Peasant Party was declared illegal in August 1947, and Maniu himself was tried and condemned to life imprisonment on November 11; he died in prison in 1953. Evidence given at his trial was used for removing Tătărescu from the Ministry of Foreign Affairs, Ana Pauker, Moscow-trained, taking his place.

Communist regime. In December 1947 King Michael was forced to abdicate. In February 1948 the remnant of the Social Democrats under Lothar Radaceanu (died 1955) merged with the Communists to form the Romanian Workers' Party (Partidul Muncitoresc Român), which, together with the Plowmen's Front and the Hungarian People's Union, presented a single list as a People's Democratic Front in the ensuing elections. The front claimed 405 out of 414 seats in the Grand National Assembly elected on March 28, 1948. A constitution of Soviet type was adopted in April and the Romanian People's Republic proclaimed, with Constantin Parhon as first president. Patrașcanu, dismissed from the Ministry of Justice and arrested in February 1948, was tried on charges of spying for Great Britain and the United States and executed in April 1954. In May 1952 three leading Communist ministers and Politburo members, Teohari Georgescu, Vasile Luca, and Ana Pauker (all of Jewish origin), were purged. On June 2 Gheorghe Gheorghiu-Dej then became premier, Groza retiring to the presidency vacated by Parhon (died 1969).

A revised constitution, still closer to that of the U.S.S.R., was adopted on September 24, 1952, and a new assembly elected on November 30. When Groza died in January 1958 he was succeeded by Ion Gheorghe Maurer. On October 3, 1955, Gheorghiu-Dej abandoned the premiership to Chivu Stoica, himself reverting to the first secretaryship of the Romanian Workers' Party. In March 1961 the National Assembly elected a State Council, a new organ of supreme administration to replace the former Presidium. Gheorghiu-Dej was made president of the council, while retaining his key party post. Maurer became premier in place of Stoica, who became a secretary of the Central Committee of the party. Gheorghiu-Dej died on March 19, 1965; he was succeeded as first secretary of the party by Nicolae Ceaușescu and as president of the State Council by Stoica.

On March 7, 1965, a new Grand National Assembly was elected. The congress that the Communist Party of Romania (CPR; formerly Workers' Party) held in Bucharest in July 1965 approved the draft of yet another constitution and new party rules. The party then numbered 1,550,000 members. The new constitution was voted by the Grand National Assembly on August 21. On December 9, 1967, the Grand National Assembly elected Ceaușescu president of the State Council, but he remained as well general secretary of the CPR.

On April 26, 1968, Alexandru Drăghici, deputy premier and former minister of the interior (1952-65), was dismissed from the government, from the CPR Presidium, and from the Central Committee for his part in rigging Stalinist trials in the early 1950s. The Central Committee not only accused Drăghici of "crude inventions" and illegalities that had sent Patrașcanu to the firing squad but also rehabilitated his victims. The Central Committee also rehabilitated 19 Romanian Communists executed in

the U.S.S.R. during the great Stalinist purges of 1936-38. Significantly, Drăghici's dismissal, the rehabilitations, and the curbing of the political police (*securitate*) took place in the year when Ceaușescu finally felt strong enough to assert his authority as national leader.

A new Grand National Assembly was elected on March 2, 1969. More than 13,543,000 of the country's 13,577,143 votes cast approved the manifesto submitted to them by the Socialist Unity Front. Ștefan Voitec was elected chairman of the National Assembly. As 1969 marked the 25th anniversary of the 1944 revolution, Ceaușescu, speaking in Bucharest on February 28, considered it his "sacred duty" to express the nation's gratitude "to those who fought for the country's liberation and are no longer in our midst."

Foreign policy. By the peace treaty, ratified on September 15, 1947, the cession of Bessarabia and northern Bukovina to the U.S.S.R. and of southern Dobruja to Bulgaria was confirmed; in exchange northern Transylvania was restored to Romania by Hungary.

A treaty of friendship, collaboration, and mutual assistance was signed with the U.S.S.R. on February 4, 1948, and Romania later entered into the network of alliances of similar people's republics. In January 1949 Romania became a member of the Council for Mutual Economic Assistance (Comecon). On May 14, 1955, in Warsaw, Romania signed a treaty of mutual assistance concluded by the U.S.S.R. with its seven European satellite states (the Warsaw Treaty Organization, or Warsaw Pact).

Long docile to the U.S.S.R., Romania began to take a more defiant line in 1963. To clear himself of the former subservience, Gheorghiu-Dej refused to follow the Soviet line in relations with Communist China or to commit Romania to overall plans for the Comecon area. In the same spirit Ceaușescu, on May 7, 1966, claimed that the CPR was continuing the historic struggle waged by the Romanian people for complete national independence. He criticized the Comintern for packing the key bodies of the CPR with people "who did not live in Romania."

On January 31, 1967, Romania established diplomatic relations with West Germany, thus setting off a public dispute with East Germany. On February 20 Ceaușescu explained that Romania proceeded from the principle that a prerequisite of creating a true détente in Europe was the recognition of the realities resulting from World War II, in the first place, the existence of the two German states. In June Romania did not break off diplomatic relations with Israel as did its Warsaw Pact partners, and even Yugoslavia, after the Arab-Israeli war.

On August 15, 1968, Ceaușescu arrived in Prague to renew the Romanian-Czechoslovak alliance treaty of July 21, 1948, for the following 20 years. However, the similar Soviet-Romanian treaty of February 4, 1948, remained tacitly binding for an additional five years because Romania was reluctant to agree to the Soviet draft of a new treaty.

The occupation of Czechoslovakia on August 20-21, 1968, by five members of the Warsaw Pact alarmed Romania profoundly. However, Romania maintained an independent and dignified attitude. Declaring that Romania's policy was focussed on friendship and cooperation with all the socialist countries, Ceaușescu missed no occasion to emphasize the necessity of respecting the sovereignty and independence of every member of the socialist camp. Three days later presidents Ceaușescu and Josip Broz Tito met at the Romanian-Yugoslav frontier to discuss the possibility of common defense against Soviet-Bulgarian military intervention.

On February 1-2, 1969, Ceaușescu and Tito met again at Timișoara to reassert their determination to cooperate with the socialist countries on the basis of "independence, sovereignty, full equality of rights, and non-interference in internal affairs." In Bucharest on February 28, Ceaușescu stated that there was no immediate danger of any foreign military intervention, but he added that "should anybody try . . . he would come up against the resistance of a 20,000,000 strong, closely united people, determined to fight in defense of its sacred right to liberty." (K.M.S./Ed.)

Development of Romanian Communism. The Roma-

The
Warsaw
Pact

nian Communist congress reelected Ceaușescu to the general secretaryship in 1974, 1979, 1984, and 1989, thereby endorsing his policy of increasing independence from the Soviet Union, of expanding links to the non-Communist world, and of developing modern industry. Romania condemned the Moscow-backed Vietnamese invasion of Kampuchea in 1979 and in 1980 reportedly urged Moscow to withdraw its forces from Afghanistan. But as *perestroika* (restructuring) and *glasnost* (openness) became permanent features of the Soviet reform effort toward a free-market economy—with other eastern European countries following suit—Romania was conspicuous for adamant adherence to its doctrinaire philosophy and to its highly centralized economic policies.

In addition to cultivating existing relations with several Western countries, including the United States, France, and West Germany, Romania also entered into various cooperative agreements with Third World countries. In April of 1985, however, Ceaușescu, along with representatives of the six other Warsaw Pact countries, signed the extension of the Warsaw Pact treaty.

Industrialization and foreign debt

Industrialization progressed at a rapid pace. During the 1970s Romania achieved the highest rate of industrial growth in eastern Europe, although other sectors, especially the agricultural sector, which was largely neglected, suffered as a result. By 1981 the foreign debt had risen to such alarming heights that Ceaușescu embarked on a rigorous austerity program. While it led to severe domestic food and energy shortages and drastically reduced the country's standard of living, the program accomplished its goal; according to the government the deficit of well over \$10,000,000,000 was eliminated by April 1989. (Ed.)

The debt repayment had a heavy price, however. Ceaușescu's draconian economic policies triggered an unprecedented demonstration in November 1987 in Brașov, Romania's second largest city, when thousands of citizens, angered at further restrictions on energy consumption, stormed the town hall and Communist Party headquarters, shouting anti-Ceaușescu slogans. By the late 1980s the Romanian government had also come under increasing international attack for human-rights violations against its sizable ethnic minority populations. When Ceaușescu announced in March 1988 his "systematization plan," which would urbanize about half of Romania's 13,000 villages by bulldozing private homes and moving peasants into "agro-industrial" complexes, Hungary reacted with alarm, believing the policy to be an effort to destroy the cultural identity of Romania's 2,500,000 ethnic Hungarians.

End of Ceaușescu rule. In 1989 ethnic strife and economic hardship combined to ignite a spontaneous revolution that began on December 15 in Timișoara, about 300 miles west of Bucharest. Apparent injury to the popular ethnic Hungarian clergyman and minority-rights activist Laszlo Tokes—by police who had come to deport him—enraged demonstrators (largely students) who had been keeping vigil outside his house, which brought even more demonstrators into the streets. Troops were called in, and two days later thousands of people were dead. News of the events in Timișoara fanned revolts around the country. Returning from a three-day visit to Iran, Ceaușescu blamed the revolts on "fascists." After a supposed pro-government demonstration in Bucharest turned into a freedom rally supported by the military, Ceaușescu, with his wife, Elena, fled.

Death of Ceaușescu

Six former senior Communist Party officials, who had the previous March criticized the regime in an open letter published in the West, formed a National Salvation Front Council, with Ion Iliescu, a former party secretary, as president. Heavy fighting continued as loyal members of the Securitate, Ceaușescu's highly trained, well-armed secret police, held out against the army. The Ceaușescus were caught and on December 25 were secretly tried and executed.

The council immediately overturned some of Ceaușescu's most hated laws: the Securitate was abolished, the systematization plan cancelled, and food rationing ended. Anti-Communist fervour was high, however, and in February 1990 the council, whose members were largely former Communists, gave way to the Provisional Council of

National Unity, its 241 members representing new political parties, ethnic minorities, former political prisoners, and the National Salvation Front. Iliescu continued as president.

On May 20, 1990, 94 percent of the population turned out for Romania's first free elections since 1937. Iliescu was elected president with 85 percent of the vote, and National Salvation Front members held the majority of seats in the National Assembly and the Senate as well. The main opposition parties, the National Peasants' Party and the National Liberal Party (both resurrections of their prewar counterparts), received a small percentage of the seats. An anti-Communist demonstration begun in April in Bucharest ended on June 13 with a police raid and an appeal by Iliescu for "responsible people" to protect public buildings. Thousands of miners and other workers loyal to the government responded to the call, streaming into the capital, ransacking opposition party offices and newspapers, and brutally beating anyone who looked like a member of the opposition. In the face of worldwide condemnation of the new government's action, Iliescu blamed the demonstrations on a "fascist rebellion."

Rome

A capital of kingdoms and of republics and of an empire the armies and polity of which defined the Western world in antiquity and left seemingly indelible imprints thereafter, a city called eternal, as the spiritual and physical centre of the Roman Catholic Church, and a city whose name evokes major pinnacles of artistic and intellectual achievement, Rome, in the late decades of the 20th century, retains all of these attributes: the capital of Italy, a font of religious authority, and a memorial to the creative imagination of the past. Probably more than any other city in the West, possibly more than any other in the world, it is a city whose history continues to shape nearly every aspect of its being but, at the same time, whose contemporary consciousness of that history projects it into the very core of modern life.

For well over a millennium, Rome (Latin and Italian Roma) controlled the destiny of all civilization known to Europe, then fell into dissolution and disrepair. Physically mutilated, economically paralyzed, politically senile, and militarily impotent by the late Middle Ages, Rome nevertheless remained a world power—as an idea. The force of Rome the lawgiver, teacher, and builder continued to radiate throughout Europe. Although the situation of the popes from the 6th to the 15th century was often precarious—at times tragic, ridiculous, or shameful—Rome knew glory as the fountainhead of Christianity and eventually won back its power and wealth and reestablished itself as a place of beauty, a source of learning, and a capital of the arts.

Physical and human geography

THE LANDSCAPE

Location and layout. Rome is located in central Italy on the Tiber (Tevere) River, 15 miles (24 kilometres) inland from the Tyrrhenian Sea. The Roman countryside, the Campagna, was one of the last areas of central Italy to be settled in antiquity. The city was built on a defensible hill dominating the last downstream, high-banked river crossing where traverse was facilitated by a midstream island.

The city of the seven hills, of treasures and tourists, and of fountains and cupolas lies mostly within the old city walls. The so-called Servian Wall, built almost certainly 12 years after the Gauls' destruction of Rome in 390 BC, enclosed most of the Esquiline and Caelian hills and all the other five. It was built into ramparts that dated from the early republic or even the late kingdom. Although Rome grew beyond the Servian defenses, no new wall was constructed until Aurelian began building in brick-faced concrete in AD 270. Almost 12 miles long and girdling about four square miles (10 square kilometres), this is the wall that Italian troops had to breach to claim their capital in 1870, and it is still largely intact.

The ancient walled city of Rome embraces only 4 percent of the modern municipality's 582 square miles (1,507 square kilometres) and is the smallest of the city's 12 administrative zones. The walled centre is divided into 22 *rioni* ("districts"), the names of most dating from classical

times, while surrounding it are 35 *quartieri urbani* ("urban sectors") that began to be absorbed officially into the municipality after 1911. Within the city limits on the western and northwestern fringes are six large *suburbi* ("suburbs"), while beyond the municipal boundaries the commune of Rome about doubles the area of the city itself.

About six miles out from the centre of Rome, a belt highway describes a huge circle around the capital, tying together the antique roads that led from everywhere to Rome: the Via Flaminia, Via Aurelia, Via Appia. Masses of modern apartment buildings rise in the districts outside the centre, in which the small amount of contemporary construction is inconspicuous. Street frontages and show windows are often rebuilt to keep pace with the times, and the Romans succeed in harmonizing the new, the simply old, and the antique with a talent that they have demonstrated since the first extensions of the republican Forum were made under the emperors.

Small as it is, the old city contains some 300 hotels and 300 *pensioni*, more than 200 palaces, 20 churches, eight of the city's major parks, the residence of the Italian president, the houses of Parliament, offices of city and national government, and the great historical monuments, in addition to thousands of offices, workshops, restaurants, and bars. It is there that the millions of tourists seem to descend annually.

Climate. Rome's hot, dry summer days, with temperatures often above 75° F (24° C), are frequently cooled

The Esposizione Universale di Roma on the outskirts of Rome. The tall building (centre) serves as a corporate headquarters. The dome (right) is that of the covered stadium built for the 1960 Olympics.

Paolo Koch—Rapho/Photo Researchers

in the afternoons by the *ponentino*, a west wind that rises from the Tyrrhenian Sea 15 miles away. The city receives about 33 inches (840 millimetres) of precipitation annually; spring and autumn are the rainiest seasons. Frosts and occasional light snowfalls punctuate the otherwise mild winters, when temperatures average about 45° F (7° C). The *tramontana*, a stormy wind from the north, frequents the city in the winter.

The Via del Corso

The main streets and their monuments. The main street in central Rome is the Via del Corso, an important thoroughfare since classical times, when it was the Via Flaminia, the road to the Adriatic. Its present name comes from the horseraces (*corse*) that were part of the Roman carnival celebrations. From the foot of the Capitoline Hill, the Corso runs to the Piazza del Popolo and through a gate in the city wall, the Porta del Popolo, there to resume its ancient name. It begins spectacularly with the Vittoriano, the monument to Victor Emmanuel II, first king of united Italy. The nation's unknown soldier was interred there after World War I. A Neo-Baroque marble mountain, it is the whitest, biggest, tallest, newest (1911), and possibly the most pompous of Rome's major monuments. Useful as well as ornamental, it contains a museum of the 19th-century cultural revival.

Along the Corso among the smart shops are five churches, eight palaces (and one palazzetto), and the column of Marcus Aurelius. The first church is S. Marco, the first of Rome's parish churches to be built (c. AD 336) on the plan of a classical basilica. The present church, third on the site, dates from the 9th century and was restored in the 15th by the Venetian pope Paul II, who built the Palazzo and the Palazzetto Venezia around the church in 1445, when he was cardinal, enlarging the residence when he became pope. Thereafter, the basilica's priest was always a Venetian cardinal, sharing the palace with the Venetian embassy. Mussolini had his headquarters there

and harangued the crowds from the balcony from which Paul II had cheered the carnival races and given his papal benediction. The palace is now a Renaissance art museum and contains the Biblioteca dell'Istituto Nazionale d'Archeologia e Storia dell'Arte (Library of the National Institute of Archaeology and Art History).

While her son Napoleon languished on St. Helena, Madame Letizia languished in the Palazzo Bonaparte, now Palazzo Misciattelli. Across the way is the Palazzo Salviati, built by the Duc de Nevers in the 17th century, owned in the 19th by Louis Bonaparte. The Palazzo Doria is a late 15th-century building behind a 1734 facade. Four mornings a week the public is admitted—through a side door—to the state rooms and the art gallery, in which there are many Titians, Bruegels, and Caravaggios, a Bronzino, a Memling, and a Velázquez portrait and Bernini bust of the family pope, Innocent X. Behind S. Marcello, the Baroque reworking of a church founded in the 4th century, is the mid-17th-century Palazzo Ballestra, in which Bonnie Prince Charlie of Scotland was born in 1720 and to which he returned in 1788 to die.

The column of Marcus Aurelius, with reliefs showing his victory over Danubian tribes, was preserved from the assorted Christian looters of Rome because it was the property of a religious order. In the square around the column, the Piazza Colonna, are the Palazzo Chigi (1562), for many years the Ministry of Foreign Affairs and now the official residence of the prime minister, and the Palazzo Wedekind. Although built in the 19th century, the Wedekind, which now houses a daily newspaper, is not without its plundered antique columns.

The Corso emerges onto the splendid oval Piazza del Popolo, which is monumental without being intimidating, a sort of toy theatre stage set magically magnified. Over a period of 300 years, it was constructed as the ceremonial entryway to Rome, and, although its elements are diverse

The Piazza del Popolo

in style and in age (13th century BC–19th century AD), a remarkable harmony prevails. In 1561 the Porta del Popolo, the medieval gate in the city wall, was rebuilt. Ninety-four years later its inner face was redone by Bernini for the grand entrance of Queen Christina, who had abandoned the Protestant throne of Sweden for the Catholic hospitality of Rome. In 1589 Pope Sixtus V punctuated the plaza centre with an obelisk (13th century BC) brought by Augustus from Heliopolis to the Circus Maximus.

The church next to the gate, Sta. Maria del Popolo, which stood for centuries before the piazza existed and gives its name to the area, was founded in 1227 to replace a 1099 chapel built over what was presumed to be Nero's tomb. It was replaced in 1472–77 by the present-day church, further disguised on the piazza frontage by a Neoclassical facade. The interior is fraught with the works of great Renaissance and Baroque artists. The main chapel has tombs by Andrea Sansovino and frescoes by Pinturicchio. In the Cerasi Chapel are Caravaggio's "Conversion of St. Paul" and his "Crucifixion of St. Peter." The Chigi Chapel, unique for the early 16th century in being a miniature church, was designed by Raphael. Bernini sculpted two of the four prophets in the corners.

At the opposite end of the piazza stand "twin" churches (1662) framing the entrance to three streets. The streets were there first, so the churches were ingeniously squeezed into awkward, different-sized plots between them. Sta. Maria in Montesanto, on the east, has an oval plan and dome, while Sta. Maria dei Miracoli, on the narrower plot toward the Tiber on the west, has a round dome. Carlo Rainaldi, the architect, turned both facades slightly inward to frame the welcoming parades that would proceed up the Corso between the two churches. One of the streets, the Via del Babuino, was one of many built by Sixtus V (1585–90) to try to repopulate parts of Rome deserted after the Gothic wars.

Since lack of water had driven residents off the high

ground, he restored the aqueduct of Alexander Severus, the Aqua Alexandrina, and gave it his own first name, Aqua Felice. He laid out new roads, the basis for the modern street plan of Rome. He also built the Vatican Library, saw to the completion of St. Peter's dome, rebuilt the papal palaces of the Vatican, the Quirinal, and S. Giovanni in Laterano (St. John Lateran), refurbishing the squares in front of the last two, and built a new square at Sta. Maria Maggiore. He reerected four obelisks found among the ruins and restored a great number of fountains, dearly beloved of the Romans.

An obelisk in the Piazza di Spagna is not his work but was discovered in the piazza in Campo Marzio in 1778 and erected in 1857 to commemorate the 1854 promulgation of the dogma of the Immaculate Conception. The fountain is fed by the Aqua Vergine, Agrippa's aqueduct of 19 BC, which escaped Gothic destruction because it was mainly underground and which was repaired in 1447. When the fountain was planned in the early 1600s by Bernini (whether by father or son has not been established), there was insufficient water pressure for spouting jets, so the Barcaccia (Scow) was conceived, an ancient marble boat foundering endearingly in its marble bath.

The most striking architectural element in the piazza—indeed, one of the most striking in all Rome—is the renowned Scalinata della Trinità dei Monti (known as the Spanish Steps, or Stairs). The staircase is a rare case of the failure of French cultural propaganda, for while they are called the Spanish Steps—the Spanish Embassy moved onto the square in the 17th century—they are unequivocally French. First suggested by the French about the time the Spanish Embassy was being installed, the idea was approved by papal authorities 100 years later and paid for with a legacy from a French diplomat. The stairs ascend to the French-built church and convent of Trinità dei Monti, begun in 1495 with a gift from the visiting French king Charles VIII and restored by Louis XVIII.

Spagna

The Piazza Navona with the church of S. Agnese designed by Borromini and, facing it, Bernini's "Fountain of the Four Rivers"; at right is Bernini's "Fountain of the Moor."

Carofalo—Grimoldi

Charles Dickens described the steps as thronged with unengaged "artist's models" in regional costume. They are still crowded with loiterers in distinctive dress, students from all over the world. Artists were among the first to move into the area, and some few who have not been shouldered out by galleries and ultra-modish shops retain their studios among the walled gardens of the Via Margutta. Since the end of the 16th century, the Piazza di Spagna, with its innkeepers who followed the artists, has been a stopping place for tourists. Young lords on the Grand Tour of Europe left their heavy touring coaches for refitting in a side street still called Via delle Carozze (Carriage Street). The room on the piazza in which John Keats died in 1821 has been made into a museum. The surrounding streets at both the top and the bottom of the steps are among the smartest shopping streets in Rome.

THE PEOPLE

The knowledge that Rome is eternal, that nothing lasts but nothing changes, gives rise to the local watchword, *pazienza* ("patience"). In this overcrowded, understaffed city, *pazienza* is demonstrated everywhere, every day. Except for brief, lowering, summer-lightning flashes of an underlying volatility, the Roman is apt to be cheery and courteous, a little less operatic in his reactions than many other Italians.

Family life

In Rome, as in the rest of Italy, all children are godsend and are demonstrably, publicly loved, patted, petted, cuddled, and kissed. Unmonied families make sacrifices to provide the biggest possible dolls and the flashiest possible tricycles. This continues far into life, with the man playing the role of adored but respectful princeling to his queen mother and imperious but indulgent king to his wife and children. In society outside the family the important thing is *bella figura*, or keeping face. Thus the *dottore* (the only degree the university of Rome gives is the doctorate) salutes the street sweeper as *capo* ("chief"), a gesture of respect called for by the uniform.

For 1,000 years, to be a citizen of Rome was to hold the keys to the world, to live in safety, pride, and relative comfort. Today there is still considerable pride in being a *Romano di Roma*, a Roman Roman. Among such are the "black nobility," families with papal titles who form a society within high society, shunning publicity and not given to great intimacy with the "white nobility," whose titles were conferred by mere temporal rulers.

Both Romans and visitors alike continue to congregate at the café tables ranged on the plane-tree-shaded sidewalks

of the Via Vittorio Veneto, a street of grand hotels, airline offices, and government buildings. Laid out in 1887 from the Villa Borghese gardens to the Piazza Barberini, it runs downhill in a dogleg. During the 15 or so years of peak prosperity in Italian filmmaking, about 1950–65, international film celebrities abounded, and clouds of beautiful career hopefuls drifted among the tables, making the Via Veneto one of the most intriguing—in both senses of the word—streets in the world. The street remains a fashionable thoroughfare, gaily and expensively animated until long after midnight.

At the same hour, less glittering Romans can be found in the Piazza Navona, on the flat plain in the bend of the Tiber that was the Campus Martius of classical times. The piazza retains the shape and some of the remains of Domitian's circus (AD 81–89), which remained intact until at least 1450. This is far more typical of central Rome than the Via Veneto, a mere centenarian and therefore a new street. Mussolini's regime cut some new routes through the city, mainly to render historic sites more accessible, but modern streets are rare in the historic centre.

The inhabitants who consider themselves the most nobly Roman of them all are the people of Trastevere (Across the Tiber). They have been in their neighbourhood for a very long time, although they are of neither pure nor primordial stock. Trastevere was the quarter for sailors and foreigners, whereas the founding fathers eastward across the river were soldiers and farmers. In the Middle Ages a number of palaces were the homes of powerful families, and palaces continued to be built during the Renaissance (the Palazzo Farnesina) and even in the 18th century (the Palazzo Corsini). Some authorities—not all from Trastevere—claim Sta. Maria in Trastevere as the oldest church in Rome, pointing out that under the empire the district was the home of Orientals with alien religions, among them a goodly number of Jews proselytized by SS. Peter and Paul. It is said that Alexander Severus (reigned 222–235) permitted Christians to foregather at this site under the leadership of Pope St. Calixtus I, and it is recorded that Pope St. Julius I either raised or rebuilt a church there in 341–352. Today's church is largely 12th-century Romanesque, with a beguiling mosaic facade.

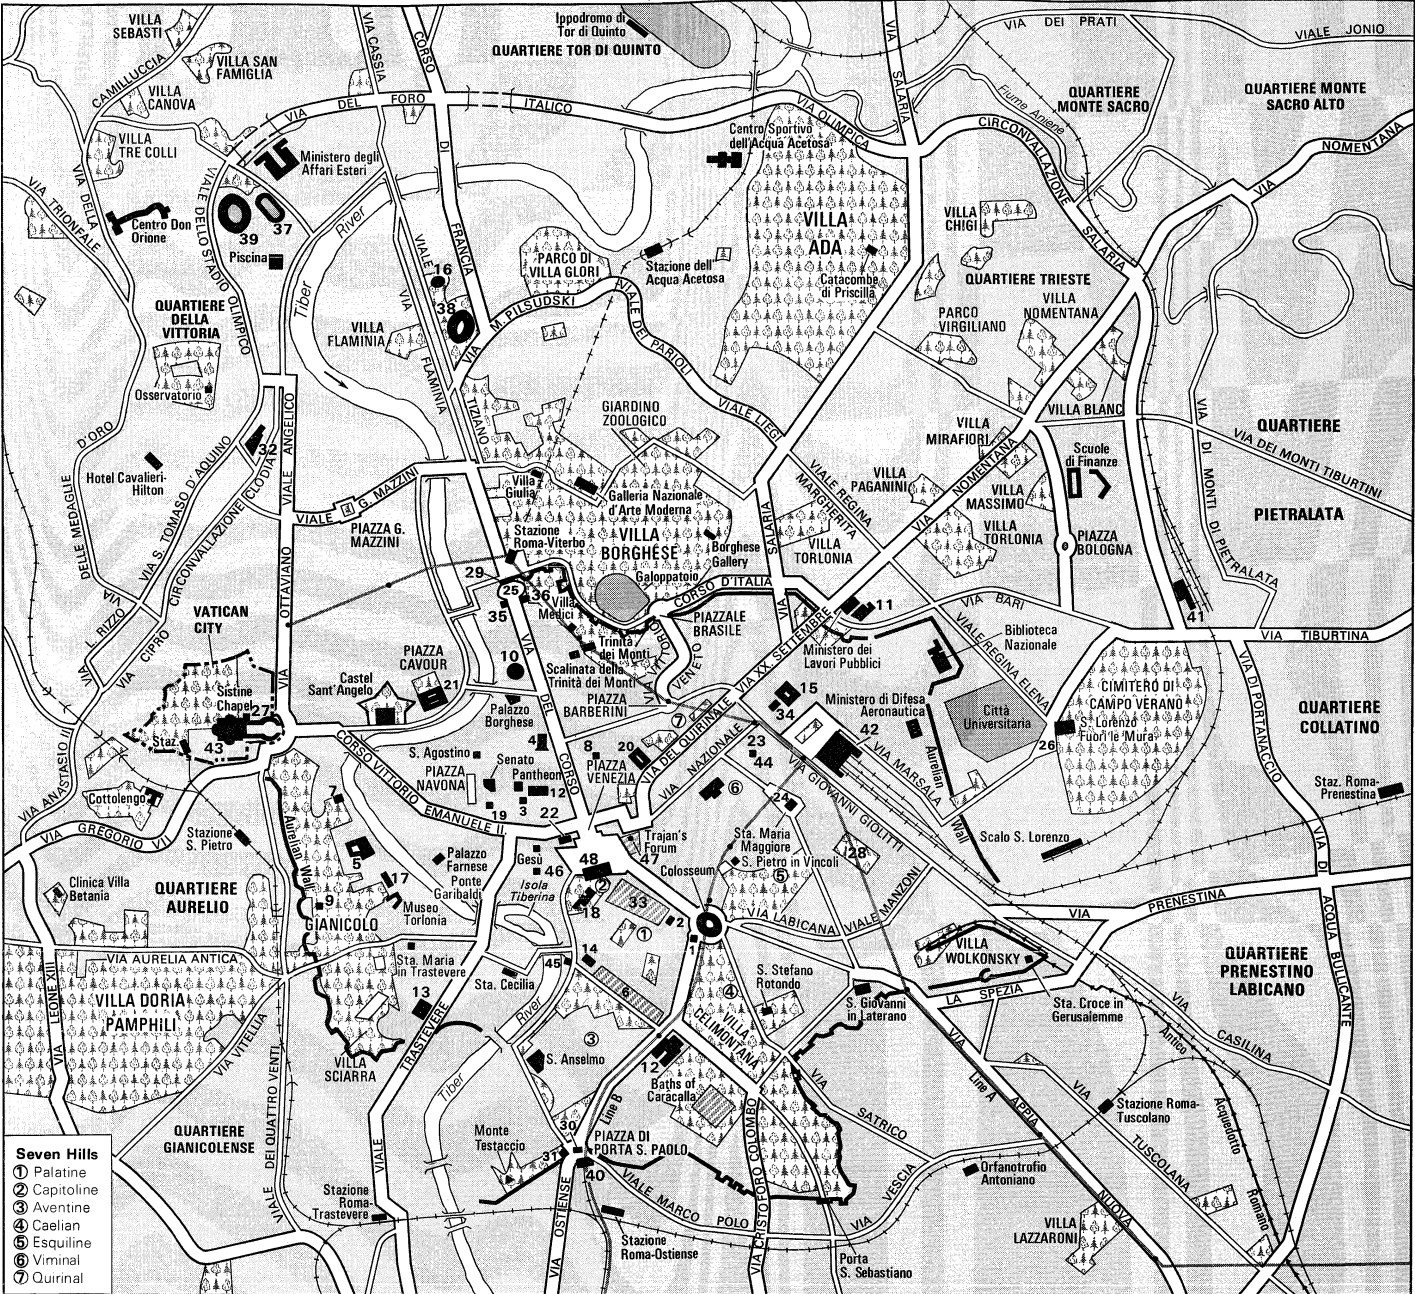

Over the millennia the area has lost little of its vigour. The people have maintained the earthiest of Roman accents, and their taverns have remained generally faithful to simple fare, robust wine, and the unison bawling of irreverent songs. One of Rome's few secular statues—a top-hatted marble effigy of Giuseppe Gioacchino Belli, a

Central Rome and (inset) its metropolitan area.

19th-century satirical dialect poet—stands near the Ponte (Bridge) Garibaldi.

Most of the streets are still narrow and without sidewalks, appearing only on the most detailed maps and baffling taxi drivers who do not live there. Every 100 paces or so the haphazard cobbled lanes open upon some surprising, small plaza with a church, a palace, a cloister, or a group of cafés.

THE ECONOMY

Industry. Rome cannot be called an industrial city, although it has a substantial amount of medium and light industries. Factories are located mostly in the northwestern part of the city. The chief industries include engineering, electronics, chemicals, printing, clothing, and food processing. The major employers are the building, tourism, and motion-picture industries, the latter centred at Cinecittà (Cinema City), a few miles outside of Rome, and the government.

Transportation. Traffic becomes a typical Roman dilemma because much of the municipal revenue is derived from the more than 1,000,000 automobiles and motor scooters that help render city life difficult. The average noise during waking hours is at or above the level that gradually induces deafness, whereas the speed of motor traffic, in spite of the audacity and acuity of the drivers, is four miles per hour.

In 45 BC Julius Caesar forbade any wagon to be led or driven during the daytime within the continuous built-up area of Rome. Unfortunately, the police force required for enforcement was seriously under strength so that generally during the daytime almost no traffic police were on duty. "Where can you find lodgings that give you a chance of sleep?" a celebrated writer demanded. "The roar of the wheeled traffic in the City's narrow, winding streets and the shouts of abuse . . ." thus wrote Juvenal, who lived in Rome in the late 1st and early 2nd centuries AD. Beginning in 1973, both to reduce congestion and noise and air pollution, private vehicles were banned from parts of the city's ancient section.

Deterioration of the city's monuments has been accelerated by traffic fumes and vibration, yet the monuments themselves have impeded the one undertaking that could reduce road traffic: subway construction. Mussolini decreed the building of a subway from Rome's central railway station, the Stazione Termini, and by 1955 it was in operation along a seven-mile southwestern route via the Colosseum and the Porta S. Paolo to the Esposizione Universale di Roma (EUR), the exhibition grounds outside the city. (This line, called Line B, now extends to Ostia.)

In 1959 a comprehensive metropolitan subway system was approved. After five years of tunnelling through the bureaucracy, the first line of the system began tunnelling a route some 14 miles long under the streets. It was diverted to protect monuments, halted when it unearthed archaeological remains, and, at long last, resumed again. The second line (Line A) of the system, which was completed in 1980, runs from the district just north of St. Peter's via the Termini to Cinecittà, southeast of the city. Additional lines and extensions are to be constructed.

Rome is served by two international airports, the Leonardo da Vinci Airport, on the coast 15 miles southwest of the city, and the Ciampino Airport, about seven miles southeast.

ADMINISTRATIVE AND SOCIAL CONDITIONS

Government. Rome is governed by an elected council of 80 members. A mayor and an executive council of 14 members (with four reserves) are selected from among the council members. The council is responsible for such amenities as police protection, health services, transportation, and certain aspects of public assistance.

Public services. Rome is one of the most beautiful and exciting capitals in the Western world. According to local authorities, it is also the filthiest, noisiest, and most heavily indebted city in Italy.

The city that invented both concrete and the apartment house (*insula*) suffers a perennial housing shortage. The housing shortage persists because of the incessant arrival

of job-seeking migrants from all over Italy but mostly from the impoverished south. All the plans, powers, agencies, and even state building funds are available, but three things impede construction: first, land cannot be built upon until the municipality supplies public services and schools (the city is so short of school space that schools sometimes operate classes in three successive shifts for 12 straight hours a day); second, Roman politics are more Byzantine—more labyrinthine and convoluted—than a 5th-century mosaic; third, the notorious glacier-slow Roman bureaucracy can, by paper shuffling alone, delay an approved project up to five years. Life in Rome remains an endless paper chase through the obscure corridors of petty authority.

The city's main institution of higher education is the University of Rome (founded 1303), whose buildings, the Città Universitaria, are located east of the Stazione Termini.

Monuments of the city

Many of the treasures of Rome no longer can be seen where they were placed originally, many can be seen only in other cities of the world, while many others still in Rome represent the spoils of conquest brought to the city from around the ancient world or the cannibalizing of one age or of one faith upon the creations of an earlier one. Rome was sacked first by the Gauls in 390 BC and subsequently by the Visigoths in AD 410, the Vandals in 445, the Normans in 1084, and Spanish troops in 1527. Muslims laid it under siege in 846. The Great Fire of Rome—Nero's fire—occurred in AD 64, and fires and earthquakes ravaged individual buildings or whole areas fairly often over the millennia. But, of all these scourges, it was the stripping of the structures of antiquity for building materials, especially from the 9th century through the 16th, that destroyed more of Classical Rome than any other force. The heritage of the past that survives in Rome is nevertheless unsurpassed in any city of the West, and it is so ubiquitous that its highlights must be comprehended in terms both of geography and of type.

THE SEVEN HILLS

The Palatine. The origins of Rome, as of all ancient cities, are wrapped in fable. The Roman fable is of Romulus and Remus, twin sons of Mars, abandoned on the flooding Tiber and deposited by the receding waters at the foot of the Palatine. Suckled by a she-wolf, they were reared by a shepherd and grew up to found Rome, Romulus being obliged to execute Remus for disobeying one of the city's first laws. The Etruscan bronze statue of the maternally ferocious wolf (late 6th or early 5th century BC; Capitoline Museum) is one of the greatest works among the thousands of masterpieces in Rome. The nursing infants were sculpted and placed under the Etruscan statue in 1509.

The wolf cave, the Lupercal, was maintained as a shrine at least until the fall of the empire but is now lost. On the same side of the Palatine, "Romulus' House," a timber-framed circular hut covered in clay-plastered wickerwork, was kept in constant repair. Modern excavations have revealed the emplacement of just such Iron Age huts from the period (8th–7th century BC) given in the fable for the founding of Rome.

On this hill the columns of lost palaces rise in uncompromised beauty from fields of wildflowers and the dust of history. Ilex and pine and bay frame views of Rome. This is the landscape—classical, with figures—that has stirred romantics since it was first limned by 17th-century etchers and sketchers. Before the emperors departed, virtually the entire hill was one vast palace.

The Palatine was a superior residential district by the 3rd century BC. Augustus was born there in 63 BC and continued to live there after he became emperor. His private dwelling, built about 50 BC and never seriously modified, still stands. Known as the House of Livia, for his widow, it has small, graceful rooms decorated with paintings. Other private houses, now excavated and visible, were incorporated into the foundations of the spreading imperial structures, which eventually projected down into

The historic scourges of Rome

Residences of the 1st century

Housing shortage

The Stazione Termini in the Piazza dei Cinquecento and the remains of the 4th-century-BC Servian Wall (left) that abuts the building.

Garofalo—Grimoldi

the Forum on one side and onto the Circus Maximus on the other. The three crests of the hill were flattened in the course of building. The palace was begun by Tiberius, to whose work Nero, Caligula, Trajan, Hadrian, and Septimius Severus made their own additions.

The biggest and richest structure of all was created for Domitian (reigned AD 81–96), whose architect achieved feats of construction engineering not seen before in Rome. Parts of the lavish structure—the richly marbled, centrally heated dining hall of which is among the chambers visible today—were occupied by popes after there were no more emperors, and then the hill was abandoned.

After some six centuries the great Roman families returned to the Palatine, planting 16th-century pleasure gardens and pavilions over past glories. A whole set of rooms from the private wing of Domitian's palace was preserved by incorporation into the Villa Mattei. Atop Tiberius' palace the Farnese family built two aviaries and a garden house and laid out one of Europe's first botanical gardens—some parts of which have escaped archaeological excavation.

The Capitoline. The seat of Roman government, the Capitoline is little changed from Michelangelo's design and represents one of the earliest examples of modern town planning. The centrepiece of this piazza of three palaces is a bronze equestrian statue of Marcus Aurelius, which stood unmolested for ages by the barracks of the imperial guard (later the Palazzo del Laterano) because it was believed to be a statue of Constantine, the first Christian emperor.

The Palazzo Senatorio incorporates remains of the facade of the Tabularium, a state-records office constructed in 78 BC and one of the first buildings to use concrete vaulting and employ the arch with the Classical architectural orders. After a popular uprising in 1143, a palace was built on the site for the revived 56-member Senate, supposedly elected by the people but by 1358 a body of one appointed by the pope; when it was rebuilt to Michelangelo's design, it was called the Palazzo Senatorio (Senate Palace).

The palace of the municipal councillors, the *conservatori*, is on the south side of the square opposite the Palazzo del Museo Capitolino (Capitoline Palace), which, as a papal collection of Classical works offered back to the citizens of Rome by Sixtus IV in 1471, became the first public museum of sculpture in the Western world. Now occupying both the Capitoline Palace and the Palazzo dei

Conservatori, as well as a later private palace, the museum contains only objects found in Rome, including the famed Romulus and Remus wolf, the "Capitoline Venus," the "Dying Gaul," and the "Boy with Thorn," as well as the host of portrait busts that can, in imagination, repeople the Forum just below.

The hill was the fortress and asylum of Romulus' Rome. The northern peak was the site of the Temple of Juno Moneta (the word money derives from the temple's function as the early mint) and the citadel emplacements now occupied by the Victor Emmanuel monument and the church of Sta. Maria d'Aracoeli. The southern crest, sacred to Jupiter, became, in 509 BC, the site of the Temple of Jupiter Optimus Maximus, the largest temple in central Italy. The tufa platform on which it was built, now exposed behind and beneath the Palazzo dei Conservatori, measured 203 by 174 feet (62 by 53 metres), probably with three rows of six columns across each facade and six columns and a pilaster on either flank. The first temple, of stuccoed volcanic stone quarried at the foot of the hill, had a timber roof faced with brightly painted terra-cottas. Three times it burned and was rebuilt, always of richer materials. The temple that Domitian built was marble with gilded roof tiles and gold-plated doors. It was filled with loot by victorious generals who came robed in purple to lay their laurel crowns before Jupiter after riding in triumph through the Forum. The Clivus Capitolinus, the antique pavings of which can be walked today, was lined with 40 elephants bearing torches to light the way for Caesar coming in triumph from Gaul. In this centre of divine guidance, the Roman Senate held its first meeting every year. When Petrarch was crowned with laurel among the ruins of the capitol in 1341, it was a harbinger of the Renaissance.

The church of Sta. Maria d'Aracoeli, built before the 6th century, remade in its present form in the 13th, is lined with columns rifled from Classical buildings. It is the home of "Il Bambino," a much loved miracle-performing wooden Christ child who is called to save desperately ill children. At Christmas, adorned in jewels given by the grateful, he can be seen in the church's celebrated manger scene, where he is serenaded by shepherd pipers.

The Aventine. Though considerably built over with modern houses and travelled by modern bus lines, the Aventine still bespeaks a Rome of the past, if not the Classical past. The repeated fires that swept the city de-

stroyed all the republican buildings, and the Temple of Diana remains only as a street name. Under the 4th-century church of Sta. Prisca is one of the best preserved and maintained Mithraic basilicas in the city. The basilica of Sta. Sabina, little altered since the 5th century, is lined with 24 magnificent matching Corinthian columns rescued out of Christian charity from an abandoned pagan temple or palace. The Parco Savello, a small public park, was the walled area of the Savello family fortress, one of 12 that ringed the city in medieval times.

The
Knights of
Malta

A romantic gem is the Piazza dei Cavalieri di Malta, designed in the late 1700s by Giambattista Piranesi, an engraver with the heart of a poet and the eye of an engineer. To the right of this obelisk and trophied square, set about with cypresses, is the Knight's Priory, residence of the grand master of the Knights of Malta. In 1113 the newly founded order, the Knights Hospitaller of St. John of Jerusalem, was in the Holy Land, whence it was driven to Rhodes, which it held until 1522, thence to Malta until 1789, when the order repaired to its stronghold in a Roman side street. The sovereign military order continues its long history of international medical work.

The Caelian. Almost half parkland, the Caelian includes the public park of Villa Celimontana, once the garden of the Mattei family, who had another on the Palatine, a clutch of palaces in the Campus Martius, and another in the Trastevere quarter. The six churches on the hill date from the 4th to the 9th century.

In the medieval confines of the only fortified abbey left in Rome stands SS. Quattro Coronati, today sheltering nuns and their charges, deaf-mute children. The basilica of SS. Giovanni e Paolo, from the 5th century, stands in a piazza that has few buildings later than the Middle Ages. Alongside the church are the remains of the platform of the Temple of Claudius, partly dismantled by Nero, completely by Vespasian. The round church of S. Stefano Rotondo (460–483) may have been modelled on the Church of the Holy Sepulchre in Jerusalem.

The Hospital of St. John was founded in the Middle Ages as a dependence of S. Giovanni in Laterano (St. John Lateran), just off the hill, and maintains its Romanesque gateway. The Hospital of St. Thomas, established at the same period, has disappeared save for its mosaic gateway, signed by the original Cosmate of the Cosmati school of carvers and decorators and by his father Jacobus. Nearby stands the Arch of Dolabella (AD 10), and not far away are the ruins of Nero's extension of the Claudian aqueduct. Also on the hill is the extensive Military Hospital of Celio.

Nero's
palace

The Esquiline. Between the Esquiline and the Caelian, the end of the Forum valley is filled by the Colosseum and the Arch of Constantine, with the Palatine edging down from the north. After the fire of AD 64 had destroyed so much of the city, Nero undertook to rebuild the end of it—200 acres (81 hectares)—as a palace for himself: sea-water and sulfur water were piped into its baths; flowers were sprinkled down through its fretted ivory ceilings; and the facade was covered in gold, from which the name *Domus Aurea*, the Golden House. The expropriation so enraged the citizens that his successors hastened to efface all trace of Nero's incredible palace: the ornamental artificial lake was drained and on its bed the Colosseum was erected for free entertainment; Trajan built magnificent baths—also with free admission—atop the domestic wing of the Golden House; and Domitian converted the portico on the edge of the Forum into Rome's smartest shopping street. The obliterations were aided by the fire of AD 104. In 131 Hadrian erected his Temple of Venus and Rome where the vestibule had stood at this end of the Forum; the church and former convent buildings of Sta. Maria Nova were built on the western corner of the temple platform in the 10th century. Less than 70 years after the Golden House had been started, nothing was left of it but a 150-foot gilded statue of Nero. Popular tradition has it that the face was changed with each succeeding emperor, but it was destroyed by one of the early popes.

The removal was so complete that later Romans could not remember where the Golden House had stood. When the domestic wing was discovered under Trajan's Baths in the 15th century, the rooms painted in the Pompeian

style were thought to be decorated grottoes. Some years later, when Raphael and his friends were let down on ropes to look, the style they imitated in decorating the Vatican loggias was called *grottesche*.

The
Colosseum

The Colosseum that replaced Nero's lake is more correctly called the Flavian Amphitheatre. It was begun by Vespasian and inaugurated by Titus in AD 80. The oval stadium measures one-third of a mile around, with external dimensions of 615 by 415 feet. The 160-foot facade has three superimposed series of 80 arches and an attic story. The attached columns follow the order applied on the Theatre of Marcellus (13 BC): sturdy, unadorned Doric on the ground floor, more elegant Ionic next, and luxuriant Corinthian on top. The attic story bore corbels supporting masts from which royal sailors manipulated awnings to protect the 50,000 seats from the sun during the gladiatorial contests, combats with wild animals, sham battles, and, when the arena was flooded, naval displays. The main structural framework and facade are travertine, the secondary walls of volcanic tufa, the inner bowl and the arcade vaults of concrete. Until Pius VIII (reigned 1829–30) began conserving what was left, it had been a convenient quarry for 1,000 years.

The nearby Arch of Constantine was erected hastily in 315 to celebrate a victory two years earlier. Almost all the sculpture on this splendid arch was snatched from earlier monuments: a battle frieze from the Forum of Trajan, a series of Hadrianic roundels, and eight panels from a Marcus Aurelius monument.

Not all the rooms of the Golden House on the Oppio have been excavated. Above them spread the remains of Trajan's Baths, theatrical decorations for the public garden, Parco di Traiano. They served as models for the baths of Caracalla (c. 212–217) and Diocletian (298–305/306), which, in turn, served as a pattern for the Basilica of Maxentius. The bath building that housed the hot, warm, cold, and exercise rooms and the swimming pool was a huge, rectangular concrete structure lined with marble. It was surrounded by a garden enclosed in an outer rectangle of libraries, lecture halls, art galleries, and other facilities of a big community centre.

Caracalla's baths on the river flats behind the Caelian Hill covered more than six acres, part of which is occupied today by the modern glass-fronted buildings of the United Nations Food and Agriculture Organization and the Ministry of Posts and Telecommunications. Among the towering remains set in a large park, the caldarium (steamroom) is now used for summer opera performances. Much of the famed Farnese collection of marbles was stripped from these baths.

The Baths of Diocletian are over the brow of the Viminal, and some idea of their size (130,000 square yards, or 110,000 square metres, for the main bath block) can be gained from the fact that the church of S. Bernardo was built into one of the chambers some 500 feet west of the central hall of the 92-foot-high *frigidarium* ("cold room"), into which Michelangelo built the cloister church of Sta. Maria degli Angeli in 1561.

The first seven halls of the Museo Nazionale Romano, also called the Museo delle Terme, are rooms of the *frigidarium* block. This matchless collection of antiquities includes wall paintings from villas, mosaics, sarcophagi, and sculptures, including the famous Ludovisi throne (Greek, 5th century BC), the Niobid from the Gardens of Sallust where the Via Veneto winds today, and the bronze "Pugilist" (2nd century BC), discovered in 1884 in a building site on the Quirinal.

The Basilica of Maxentius (also named after Constantine, who completed it after dispatching Maxentius) was started about 311. This massive hall of justice and commerce was an oblong 265 feet long and 120 feet high, covered by three groin vaults with three deeply coffered tunnel-vaulted bays on either side. Probably ruined by the earthquake of 847, it was also mined for its materials. One of the great Corinthian columns stands obelisk-like before Sta. Maria Maggiore on the Esquiline. The head of Constantine's 40-foot-high statue reposes in the courtyard of the Palazzo dei Conservatori.

The Viminal and Quirinal. Like much of the Esquiline,

The hill
of family
strong-
holds

the Viminal and Quirinal lie in the heart of modern Rome. Heavily built upon and sclerotic with traffic, the former seems almost flattened under the Ministry of the Interior, the weighty department that directs the state's police forces. The Quirinal, pierced by a modern traffic tunnel, has been a distinguished address since Pomponius Atticus, recipient of Cicero's letters, was a resident. Starting with the Crescentii, who planted the family fortress there in the Middle Ages, powerful Roman families built their homes in this location. The Palazzo Colonna, at the foot of the hill near the Corso, is an art gallery open to the public; and its gardens, climbing the slope to the Piazza Quirinale, contain remnants of Caracalla's Temple of Sarapis. The piazza has been graced since antiquity with two large statues of men with rearing horses, "The Horsetamers" or "Castor and Pollux." Closed on three sides by palaces, the piazza opens on the fourth to a splendid view over the Tiber. The Quirinal Palace, built by Pope Gregory VIII in 1574 as a summer palace away from the heat and malaria of the Vatican, was enlarged and embellished over the next 200 years by a succession of noted architects. The palace, with many extensions and wings, is huge, and its garden is five times as big as the building. From 1550 to 1870, the Quirinal rather than the Vatican was the official papal residence. In 1870 it became the royal palace of the new Kingdom of Italy and in 1948 was made the presidential palace. Both monarchs and presidents, however, have preferred to inhabit the homier palazetto at the far end.

The handsome buildings opposite are the stables (1730–40), built on the site of the Crescentii 10th-century stronghold. The Palazzo della Consulta (1734) was erected for part of the papal administration. The Palazzo Pallavicini-Rospigliosi, built by a Borghese cardinal in 1603, is still a private house. The Palazzo Barberini farther up the hill, constructed 1629–33 on the site of the old Palazzo Sforza, was occupied by the family until 1949. Part of the collection of the Galleria Nazionale d'Arte Antica is housed here, the rest across the river in the Palazzo Corsini in Trastevere. The 1,700 pictures, most of them works by celebrated masters, were contributed by distinguished families, including the Barberinis. Architecturally, the palace is important, because it marks a departure from the heavy-set four-square town houses of the early and High Renaissance. In the Rome region, only country villas had previously been built on so open a plan, with two wings coming forward from an open, arcaded facade. Further, it pioneered the Baroque style in domestic architecture.

Carlo Maderno, who put the facade on St. Peter's, made the plans, which were carried out after his death by Bernini, assisted by Borromini. Each of these two rivals has a church just around the corner. After 20 years of apprenticeship, Borromini was given his first chance to do his own building. It was an impossibly tiny site at the crossroads of the Quattro Fontane (Four Fountains, one of which is built into a niche in the church wall), but S. Carlo alle Quattro Fontane was a triumph. To his revolutionary solutions of site problems, for which he employed a brilliant variation on the oval, Borromini added a facade in 1667, the year he died, which responded to the waves of motion generated by the spatially complex interior. Walls that flow and sway created a sensation, and the idea was seized upon by Baroque artists, especially from other nations.

Bernini's S. Andrea al Quirinale is also small, but it took 12 years to build (1658–70), late in his career. An oval building with the naves sculpted into the outer wall, it enlarges on concepts advanced by Michelangelo. Bernini's use of coloured marbles and shrewd lighting effects gives the small structure extra dimension. Nearby is the Teatro dell'Opera (Opera House), built in 1880 by Achille Sfondrini. It was acquired by the state in 1926 and is Rome's most important lyric theatre.

Other hills. Behind the river plain of Trastevere is the Gianicolo (Janiculum), and behind the Piazza del Popolo across the river is the Pincio. Both are now parkland, with villas, gardens, and churches discreetly disposed. The Janiculum crest was made into a park in 1870 to honour Garibaldi for his heroic but unsuccessful defense of the

Roman Republic in 1849. During the Roman Empire the Pincio was covered with villas and gardens, but it was made into a public park only in the 19th century. By day, nannies wheel their charges through the greenery, and toward sunset Romans arrive to carry on the tradition of the before-dining Pincio promenade. Down the road toward Trinità dei Monti is the 1554 Villa Medici, bought by Napoleon in 1801 to house the Accademia di Francia (French Academy), which is still in occupation. This academy, founded in 1666, is the oldest of many national academies established from the 17th to the 19th century to give architects, artists, writers, and musicians the opportunity to study the vast textbook that is the city itself and to use its museums and libraries.

The Villa Giulia and the Villa Borghese are also on the hill, both housing art collections of world importance. The Villa Giulia was a typical mid-16th-century Roman suburban villa, conceived not as a dwelling but as a place for repose and entertainment during the afternoon and early evening. It houses the Museo Nazionale di Villa Giulia, which has a collection of Etruscan art and artifacts of singular beauty and historical value. The Borghese collection is small but choice, with a roomful of Caravaggios and, in addition, Titian's "Sacred and Profane Love." Canova's Neoclassical nude statue of Pauline Bonaparte, for a time a Borghese princess, as Venus retains its capacity to scandalize. The Italian government bought the grounds, house, and contents in 1902. The Zoological Garden (established in 1911) on the grounds of the Villa Borghese, is the largest of its kind in Italy and is landscaped to reproduce the natural habitats of the animals. To the west is the Galleria Nazionale d'Arte Moderna, founded in 1883, with an important collection of 19th- and 20th-century Italian art.

THE FORUM

The Forum was the religious, civic, and commercial centre of pastoral, royal, and republican Rome. After Julius Caesar, though it became more imposing, it was only one (albeit the most distinguished) of several complexes serving the same functions. Essentially, it was a small, closed valley ringed by the Seven Hills. There were two meeting places, formal open spaces in the northwest corner, the political Comitium and the social Forum—the name later applied to the entire valley—with shops down both sides. At the other end of the valley was the precinct of the high priest next to the Vestals, the keepers of the sacred flame. Between these two were the temples of the gods. Various emperors opened up the ends of the valley, and there was more building; but the poles of activity did not alter.

Fires, earthquakes, and invasions repeatedly levelled the buildings, and new ones were erected on their remains until the valley was covered by 50 feet of debris, earth, and ashes. Medieval Romans called it Campo Vaccino (Cow Field) and the abutting Capitoline Hill, Monte Caprino (Goat Hill). Excavation began late in the 19th century, and most of the accumulation has been dug away, down to the level at which Julius Caesar knew it.

The little stream cutting diagonally across the valley floor was, according to tradition, canalized as the Cloaca Maxima in the 6th century. Stratigraphic excavations again support the folktales and date the sewer construction at about 575 bc. Although later buildings perpetuated the name and roughly the position of the first halls and temples, they do not necessarily stand where earlier buildings stood, and many details of the earlier Forum are still the subject of scholarly speculation.

Janus and Saturn, both of whom have temples there, were among the gods of early Rome, and the Temple of Vesta, even in its last marble version (AD 191), retained the circular shape of a primitive clay-and-wattle hut. The forge of Vulcan, the Volcanal, had very early beginnings. The Regia, traditionally described as the residence of Numa Pompilius, the priest-king, became the administrative building for the *pontifex maximus*, who took on the monarchy's priestly duties. The Temple of Castor and Pollux was built at the establishment of the republic.

The oldest formally consecrated monument was the open space of the social Forum. A roughly trapezoidal stretch of ground about 125 by 70 feet, it was bare save for three

of Rome

Building and rebuilding of the Forum

plants essential to Mediterranean agriculture: the grape, the fig, and the olive. Centuries later, when the basilicas were built behind the bordering shops, they served as a protective palisade for the Forum and a covered extension of its open space. At the wide end of the Forum and to one side was the Comitium, in which the Popular Assembly met. Between the two clearings lay the orators' platform, the Rostra, decorated in 338 BC with the iron rams (*rostra*) taken as trophies from the warships of Antium.

At the other end of the Comitium stood the Curia, where the Senate met. When it was destroyed by fire, along with the Basilica Porcia (184 BC, the first of the basilicas), Julius Caesar built a new and greatly enlarged one that encroached on the open space of the Comitium. For the assembly, he built a meeting hall in the Campus Martius, outside the valley altogether. He built a new and much bigger Rostra, though, across the wide end of the Forum. He supplanted the Basilica Sempronia (170 BC) on the western side of the Forum with his own Basilica Julia (54 BC), installing new shops in place of the old Tabernae Veteres. On the other side of the Forum already stood the shop-fronted Basilica Aemilia (179 BC), named for the censor who constructed the Tiber bridge now called the Ponte Rotto.

Caesar also carried his building program onto the flat ground just north of the valley between the Quirinal and Esquiline hills, making his own forum of shops and temple, alongside which Augustus, Trajan, Nerva, and Vespasian later constructed their forums. Pompey's theatre in the bed of the Tiber (55 BC) was followed by the Theatre of Marcellus (13 BC). The great baths, Agrippa's grand concourse in the Campus Martius, the circuses, and the Colosseum all drew the populace away to other centres of activity. The political attraction of the Forum, already vitiated in Caesar's day, continued to decline.

Nevertheless, the halls and temples of the Forum were assiduously rebuilt, ever grander, and more were added. Caesar, after his death, was made a god, and his temple was erected between the Forum proper and the Regia. Eventually, the sacred open space was defiled with honorary columns and an equestrian statue of Domitian. The last thing to be erected in the Forum was a column, raised by Phocas, a Byzantine usurper (608), to honour himself. Septimius Severus placed his arch over the Via

Sacra. Other temples were rammed into empty places, and the whole became a forest of towering columns, gleaming walls, and ornate statuary. The dazzling marble mountain of the Palatine flowed down into the Forum as well, and the opposite rim glittered with the splendours of the imperial forums.

The Forum is now a confusing boneyard of history. Of the thousands of columns, not many more than 50 stand erect. Amid the ruins are Christian churches, thickets of trees and bushes, and hundreds upon hundreds of free-living cats.

THE RIVERLANDS

Along a 1½-mile stretch of the Tiber, around a big kangaroo-nosed bend, lie all the historic quarters of the river plain. On the left (east) bank are the Campus Martius, Circus Flaminius, Forum Boarium, and Forum Holitorium; on the right, the Palazzo di Giustizia (Palace of Justice, built 1889–1910), the Castel Sant'Angelo, or Hadrian's Tomb, the entrance to Vatican City, and Trastevere. At the bottom of the bend is Tiber Island.

Castel Sant'Angelo and the bridges. Four of the 11 bridges along this part of the Tiber are of special interest. The Ponte Sant'Angelo, to which Bernini was asked to add angels, is in the main the Pons Aelius built in AD 134. A year later Hadrian began his tomb, just off the end of the bridge. A towering cylinder 20 metres high on a square base, it was in size and form a typical imperial mausoleum. In 271 it was built into the Aurelian Wall and became a key fortress in the defense of Rome. In 587 Gregory the Great, leading a procession to pray for the end to a plague, allegedly had a vision of the archangel Michael atop the tomb. The epidemic ceased and the tomb-citadel became known as the Castel Sant'Angelo (Castle of the Holy Angel). In time it became a papal castle, with richly furnished and frescoed rooms, loggias for the view, a siege store of 5,800 gallons (22,000 litres) of oil and 770,000 pounds (350,000 kilograms) of grain, a centrally heated bathroom, a prison that incarcerated Benvenuto Cellini, among others, and a still-intact fortified passage from the Vatican to carry the pope to refuge there. It is now a state museum with an arboured terrace.

At Tiber Island are two bridges. The Ponte Cestio, often rebuilt since the 1st century BC, leads to Trastevere, while

The palace-citadel-tomb on the Tiber

Ruins of the Roman Forum with the Colosseum (left background).

Authenticated News International

the Ponte Fabricio (62 BC), the oldest in Rome, runs from the shore below the Capitoline. The island, 1,100 feet long and less than 330 feet wide at its widest, has been a place of healing since the Temple of Aesculapius was erected after the plague of 291 BC; the largest building there is the Fatebenefratelli Hospital (also called the Hospital of S. Giovanni di Dio). Facing the hospital is another of Rome's towered medieval family fortresses, this one built by the Pierleone. The traffic howls along both banks, noisier and more voracious than the wolves of the Pierleone's anarchic Rome, but on the island peace prevails. Just downstream are the remains of the Ponte Rotto (Broken Bridge) of 179 BC and two bridges farther along. The modern Ponte Sublicio is named for the wooden bridge defended by Horatius and his comrades on this part of the river.

The lower east bank. On the shore by the Ponte Rotto is the site of the earliest cattle market (Forum Boarium) and vegetable market (Forum Holitorium), girt with temples, of which two remain: the elegant, circular Pentellic marble structure of the 1st century BC and a nicely proportioned, rectangular Ionic building, perhaps a few decades older. Their dedications are disputed, save that they are not, as they are popularly called, temples of Vesta and of Fortuna Virilis. In the 6th century the church of Sta. Maria in Cosmedin was built into the antique grain-commission offices. Some of the Forum Boarium columns can still be seen on the interior of the church, and one of its drain lids, fixed to the outer wall, was carved to represent a face with a gaping mouth. This classical manhole cover became the dread Bocca della Verità (Mouth of Truth), which allegedly would crunch down upon the hand of anyone telling a lie.

Nearby is the Theatre of Marcellus, begun by Caesar and completed in 13 BC by Augustus, who named it for a short-lived nephew. It owes its preservation to its conversion into a fortress for one of the quarrelsome clans of the Middle Ages. Converted into a palace for the Orsinis in the 16th century, it remains private property. The classical orders of the facade, adopted for the Colosseum, became the model for Renaissance architects.

From there northward to the tomb of Augustus and as far inland as the Via Flaminia (modern Corso), the river plain was a vast plantation of temples, baths, and sports grounds until the Middle Ages, when the remaining Romans took up residence there. Today, three major imperial monuments survive: the Pantheon, the reconstructed Ara Pacis Augustae (Altar of Augustan Peace), and Hadrian's Column. Interspersed among the 40 palaces and 100 churches are remnants of what the emperors built.

The portion closest to Tiber Island was once a major republican racing and sports ground, the Circus Flaminius (220 BC), which in the 16th century became the Jewish ghetto. Jews were not persecuted in Rome until Pope Paul IV (1555–59) herded them into a ghetto under curfew. Although Paul was so loathed that the Romans decapitated his statue when he died, other popes carried on his anti-Jewish program. Except for brief respites under Napoleon and the momentary Roman Republic of 1848, Jews until 1870 were debarred from all the professions, government service, and landownership. For many years the neighbourhood retained a Jewish flavour, with some 3,000 Jews living there in the 1960s, but only a few remain, as the ghetto, like Trastevere, became ripe for conversion to luxurious flats. Nearby, the Largo Argentina, excavated 1926–29, contains four small temples of the 1st and 2nd centuries BC.

The crescent of buildings between the Piazza del Biscione and the Piazza dei Satiri take their curved shape from having been built into and around Pompey's Theatre, the first stone theatre building in Rome. Inspired by the Greek theatre of Mytilene, in which Pompey had been so spectacularly entertained, it had a portico of 100 columns that was equipped to be a community centre almost as much as the baths. The Senate met there on the Ides of March in 44 BC, when Julius Caesar was stabbed 23 times and fell at the foot of Pompey's statue. For almost 400 years a piece of sculpture, unearthed nearby in 1550 and deposited in the Palazzo Spada, was erroneously believed to be the Pompey statue. A part of the theatre was fortified

by the Orsinis in the 12th century and later converted into the Palazzo Righetti, or Pio.

The Campus Martius. The rest of the river bend northward was known as the Campus Martius. Marshy in places, with a few temples and public buildings, it was made into one of the grandeurs of Rome by Agrippa (died 12 BC), a landscape of lawns, baths, temples, and parks. The swamp became a lake, the Stagnum Agrippae, where—according to Tacitus—Nero led one of his more elaborate orgies from a sumptuous raft.

Of all this splendour almost nothing remained after the fire of AD 80. Hadrian undertook to restore some of it. Among his works was the new Pantheon, one of the West's great buildings, extraordinary as architecture, remarkable as a feat of engineering. This "Temple of All the Gods," imperial property, survived because it became a church, the gift of the Byzantine emperor Phocas to Pope Boniface IV in 608. This protected the building from everyone but the pope: the bronze roof beams of the grandiose pedimental porch of 18 sixty-ton columns of Egyptian granite were stripped by Urban VIII, the Barberini pope, who took them as raw material for the baldachin in St. Peter's, provoking the celebrated anonymous comment, *Quod non fecerunt barbari, fecerunt Barberini*, "What was not done by the barbarians was done by the Barberinis."

It has been suggested that the temple was designed by Hadrian himself, whose villa at Tivoli is another landmark in the development of architecture. The Pantheon was possibly the first monumental building of antiquity conceived as an interior. Evenly lighted from a single source—the open eye (*oculus*) in the centre of the dome—the enormous interior, circular and richly marbled, is almost unchanged from classical times. Until the 20th century the dome was the largest ever built, 141 feet in diameter, exactly the height of the building. Two things made its construction feasible: the magnificent quality of the mortar used in the concrete and the meticulous selection and grading of the aggregate, which became lighter in weight with increasing height. Roman concrete was essentially a hydraulic cement, deriving its unique strength from the properties of the dark volcanic ash (*pozzolana*) of the Roman subsoil that was substituted for sand. There is some brick ribbing in the lowest part of the dome and thrust-containing brick outer facing, but, in general, brick was not used by the Romans as a building material in itself. Brick and tile were used to help hold the concrete until it dried, making for a less brutal exterior. The stamped trademarks on the bricks from the big yards behind Vatican Hill and up the Tiber Valley help in determining chronology. The Pantheon, for example, bears the original dedicatory inscription of Agrippa, modestly replaced by Hadrian. The latter's name does not appear, but the stampings on the bricks show that construction does indeed date from Hadrian's reign. The original bronze doors are still in place. Italy's first two kings are buried in the Pantheon, as are many artists, of whom Raphael is the most notable. Nearby are fragments of Agrippa's baths, and the Rome stock exchange gains considerable dignity from the incorporation of some of the Temple of Hadrian.

The shattered drum of Augustus' tomb marks the spot where he was buried AD 14. The mausoleum became a 12th-century Colonna fortress, a 16th-century garden, a ring for Spanish bullfights in the 17th century, and then a concert hall until 1936, when it was scraped down to its impressive but mournful foundations by Mussolini, who may have planned to be buried there himself. Next to the tomb is the delicately beautiful white marble Ara Pacis Augustae (Altar of Augustan Peace, designed 13 BC, dedicated 9 BC). The altar, raised on steps, is enclosed in a sculptured screen. Bits of the friezes were discovered off the Corso in the 15th century, and the altar itself was dug up there in 1938 after 35 years of labour. The pieces unearthed earlier were bought back from museums, and the whole was reassembled to stand four streets away from its original location.

In the Campus Martius Italy's Chamber of Deputies sits in the Bernini-designed Palazzo di Montecitorio, its Senate in Palazzo Madama (17th century), and its Council of State in Palazzo Spada (c. 1540), the picture gallery

The
Pantheon

The
Jewish
ghetto

of which is open to the public. The Museo di Roma, which illustrates the life of the city through the ages, is in Palazzo Braschi (18th century). The Brazilian embassy is in the Palazzo Pamphili, which has a gallery designed by Borromini and painted by Pietro da Cortona. The early 16th-century Palazzo di Firenze was the Florentine embassy until the union of Italy; it is now occupied by the Società Dante Alighieri. The Palazzo della Sapienza, located near the Senate, is now the National Archives, but from 1431 to 1935 it was the seat of the University of Rome (founded 1303).

Architec-
ture of the
palaces

The palaces. The three architecturally celebrated palaces in this palace-studded quarter are the Cancelleria, the Farnese, and the Massimo alle Colonne. Because all the pertinent documents were destroyed in the Spanish sack of Rome in 1527, the architect of the Cancelleria remains unknown. Dated 1486–98, it was built by Cardinal Raffaele Riario out of a night's winnings at the gaming table. Seized by the Medici Pope Leo X (1513–21), it has housed some portion of the Vatican chancellery ever since, except for Napoleonic and revolutionary interruptions. A square building with a rusticated ground floor, its upper stories are plain and rhythmically pilastered, while the columned inner court is noble and deeply harmonious. The city's first High Renaissance building, it could be said to symbolize Rome's displacement of Florence as art capital of the world—its artists drawn from north and south but not from Rome.

The Farnese, the most monumental of Rome's Renaissance palaces, was designed by Antonio da Sangallo the Younger, who was succeeded after his death by Michelangelo, Vignola, and Giacomo della Porta. Sangallo followed the Renaissance precepts regarding the architectural orders on the lower floors, but Michelangelo's top story uses the traditional elements in a willful way, capping it all with an overpowering cornice—a personal expression that foreshadowed Mannerism, a leaching of Renaissance ideals, and the subsequent theatrical self-expression of Baroque. Michelangelo's project to join this palace to the Farnesina by a bridge over the river was actually begun. It can be seen from the surviving arch over the Via Giulia, one of the city's most charming streets.

Mannerist architecture is typified by Baldassare Peruzzi's Palazzo Massimo alle Colonne (1535), the name of which comes from a colonnaded palace on the site destroyed in the 1527 sack. It disregards all Renaissance canons, with its brooding entry and heavy cornice below a slightly bowed and airy facade punched with small windows. The Massimo family gave shelter to Konrad Swenheym and Arnold Pannartz, who produced Rome's first printed book in their house in 1467.

THE CHURCHES

Some 25 of the original parish churches, or *tituli*, the first legal churches in Rome, still function. Most had been private houses in which the Christians illegally congregated, and some of these houses, as at SS. Giovanni e Paolo, are still preserved underneath the present church buildings. Since the 4th century the *tituli* priests have been cardinals who, over the centuries, have rebuilt, enlarged, and embellished their churches.

In the 4th century, basilicas were built to mark the burial places of martyrs. Most martyrs had been interred beyond the city walls in the catacombs, underground galleries with recesses used as tombs. When later sieges of Rome laid waste the Campagna, saintly relics were removed to the safety of city churches. During the Middle Ages, when the prevalence of malaria and of tomb robbers—there was a brisk commerce in religious relics—made ventures beyond the walls risky, some of the oratories and basilicas fell almost to ruin and the location of some catacombs was forgotten.

The great basilicas. Among the basilicas, seven are designated as great (*maggiore*): St. Peter's, S. Paolo Fuori le Mura (St. Paul's Outside the Walls), and S. Giovanni in Laterano, all built by Constantine; and those of S. Lorenzo Fuori le Mura (St. Lawrence Outside the Walls), Sta. Croce in Gerusalemme (Holy Cross in Jerusalem), S. Pietro in Vincoli (St. Peter in Chains), and Sta. Maria Maggiore.

Under the 1929 concordat with Vatican City, the Italian government grants them extraterritorial privileges.

The basilicas established the model for Western ecclesiastical architecture for centuries to come. Basilica, a Greek word meaning royal, was used by the pre-Christian Romans to designate a public hall, but no surviving example of a Roman basilica anywhere in the empire is the architectural predecessor of the Christian basilica.

The basilical church has a nave higher than the aisles, from which it is separated by a colonnade on each side. It has either a cloistered court (atrium) or anteroom (narthex) or both at the west end and a semicircular projection (apse) at the east. The basilicas in Rome that are closest to the early Christian structures are the churches of competing cults, as strikingly exemplified by the Neo-Pythagorean-sect basilica of the Porta Maggiore, unearthed by the railroad viaduct in 1926.

Some early Christian churches were centrally rather than longitudinally organized, a plan dictated by the circular form of the imperial mausoleums into which they were built. A good example is Sta. Costanza (c. AD 320), which also has a superb series of 4th-century vault mosaics in pagan designs. Although churches of this type were few, they had a strong influence on the development of the centrally planned house of worship.

St. Peter's. Protected by the fortified Castel Sant'Angelo, St. Peter's Basilica and the Vatican Palace gained precedence over the cathedral church and Lateran Palace during the papacy's troubled centuries. St. Peter's was built over the traditional burial place of the Apostle from whom all popes claim succession. The spot was marked by a three-niched monument (*aedicula*) of AD 166–170. Excavations in 1940–49 revealed well-preserved catacombs, with both pagan and Christian graves dating from the period of St. Peter's burial.

Constantine enclosed the *aedicula* within a shrine and during the last 15 years of his life (died 337) built his basilica around it. The shrine was sheltered by a curved open canopy supported by four serpentine pillars that he brought from the Middle East. The design, enormously magnified, was followed in making the baldachin (1623–33) over today's papal altar.

In spite of fires, depredations by invaders, and additions by various popes, the original basilica stood for 1,000 years much as it had been built, but in 1506 Julius II ordered it razed and a new St. Peter's built. His architect was Donato Bramante, a Florentine who in 1502 had completed the first great masterpiece of the High Renaissance, the Tempietto in the courtyard of S. Pietro in Montorio, a mile away on the Janiculum Hill. Built to mark the spot where, according to tradition, St. Peter had been crucified, the Tempietto is round, domed, and unadorned. Its outer face is a colonnade of bare Tuscan Doric, the earliest modern use of this order. Because of its proportions, the tiny temple has the majesty of a great monument.

Bramante's ground plan for St. Peter's was central: a Greek cross, all of the arms of which are equal, around a central dome. Both he and the Pope died before much could be built. Successive architects, including Raphael, drew fresh plans. The last of them, Antonio da Sangallo, died in 1546, and the 71-year-old Michelangelo was solicited to complete Sangallo's projects, which included St. Peter's, the Palazzo Farnese, and the Capitol. He accepted but refused payment for his work on the basilica.

Michelangelo adapted Bramante's original plan, the effect being more emotional and mighty, less classically serene. Of the exterior, only the back of the church, visible from the Vatican Gardens, and the dome are Michelangelo's. After his death Giacomo della Porta and Domenico Fontana, who executed the dome, altered the shape, making it taller and steeper than the original design.

The east end remained unfinished, and it was there that Carlo Maderna was ordered to construct a nave, the clergy having won its century-long battle to have a longitudinal church for liturgical reasons. Thus, St. Peter's orientation reverses the normal. Maderna added a Baroque facade in 1626. He was followed by Gian Lorenzo Bernini, who worked on the building from 1633 to 1677, both inside and outside. His pontifical crowd-funnelling colonnade in

and
Michel-
angelo on
St. Peter's

the shape of a keyhole around the piazza, a fountain for the piazza, the breathtaking baldachin, his several major pieces of sculpture, his interior arrangements for the church, and his dazzling Scala Regia (Royal Stair) to the Vatican exhibit his legendary technical brilliance and his masterful showman's flair. Before the lamentable assault in 1972, which damaged the sculptural masterpiece, one could enter the church and, in the first chapel at the right, see the "Pieta" (1499) of Michelangelo in the original splendour.

All the planning, plotting, labour, and faith of all the popes, priests, artists, and artisans produced a vast, gorgeous ceremonial chamber. Amid the gleam and glitter of gold and bronze and precious stones eddy throngs of awed, dwarfed humanity.

S. Giovanni in Laterano. When Borromini redid the interior of S. Giovanni in Laterano (St. John Lateran) in 1646–50, little of the original Constantinian fabric remained after destruction by the Vandals (5th century), damage by earthquake (9th), two devastating fires (14th), and four consequent rebuildings. The Emperor had built a five-aisled basilica over the remains of the barracks of the imperial guard, the Equites Singulares. The bronze doors come from the Curia (the Senate chamber in the Forum); the silver reliquaries containing the heads of SS. Peter and Paul are copies of the twice-stolen originals.

The octagonal 5th-century baptistry replaced that of the 4th, which had been built into the baths of the House of Fausta, Constantine's second wife. (Later, in another palace, she was strangled in the hot room of the bath, a conventional Roman device for suggesting accidental suffocation of an awkward relative.) Its chapels are decorated with mosaics of the period. The cloisters contain some of the finest examples of early 13th-century carved and inlaid decoration called Cosmatesque after the Cosmati, one of several families of traditional craftsmen. (The cloisters of S. Cosimato, S. Paolo Fuori le Mura, and SS. Quattro Coronati are notable examples of this work, which often was accomplished with porphyries and marbles robbed from classical buildings.)

On the exterior a 1732 facade is topped with 15 giant statues that were visible across the city. The piazza around which the Lateran buildings are grouped is decorated with another obelisk, the oldest and tallest in Rome (15th century BC), one of those erected by Sixtus V late in the 16th century. At the same time, he demolished the old patriarchate, from which the Sancta Sanctorum (the papal chapel) and the Scala Santa (Holy Stairs) were preserved. The Scala had been the principal ceremonial stairway of the palace, but about the 8th or 9th century it began to be identified popularly as having been brought from Jerusalem by St. Helena, Constantine's mother, reportedly from Pilate's palace and thus the stair climbed by the Saviour. The steps are protected by a wooden cover, and believers mount on their knees. The Scala Santa is not mentioned, however, in ecclesiastic, imperial, or personal writings from the 4th, 5th, or 6th century.

Sta. Croce in Gerusalemme. There is similar lack of record regarding St. Helena's acquisition of the True Cross, which is at Sta. Croce in Gerusalemme. This basilica was built into the palace in which St. Helena lived (317–322). At about this time a hall of the palace was converted into a church and two adjoining small rooms were converted into chapels. The rest of the palace continued to be lived in for centuries. The alleged relics of the cross, found in 1492 walled into a niche, are now in a modern chapel. The facade and narthex of the church are 1743 Rococo, the interior an earlier Baroque with a 12th-century Cosmatesque pavement, some antique columns, a few Renaissance details, and, somewhere within it all, part of a palace built around 180–211.

S. Lorenzo Fuori le Mura. Now in the midst of the Campo Verano cemetery, Rome's Catholic burying ground since 1830, S. Lorenzo Fuori le Mura (St. Lawrence Outside the Walls) dates from the 4th century. The nave is a 13th-century basilica built by Pope Honorius III, and the chancel is another basilica built by Pope Pelagius II in the late 6th century as a replacement for the 4th-century original. On the inner part of the triumphal arch between

the two is a 6th-century mosaic, and along the walls are giant Corinthian columns of rare marble taken from a non-Christian building.

S. Paolo Fuori le Mura. A basilica built by Constantine over the Apostle's grave, S. Paolo Fuori le Mura (St. Paul's Outside the Walls) was replaced starting in 386 by a structure mammoth for its time, 328 by 170 feet. It was faithfully restored after a fire in 1823 and thus remains an outstanding example of early basilical architecture. It has a single eastern apse, a lofty transept, and five majestic nave aisles. Before the Muslim rampage around the walls in 846, the approach to the basilica was a mile-long colonnade down the Ostian Way from the Porta S. Paolo. Today, after leaving the tomb of Gaius Cestius (died 12 BC), a 120-foot pyramid that has inspired many monument builders since, one-third of the route is fenced by gasworks on one side and warehouses on the other.

Sta. Maria Maggiore. Located on the Esquiline, Sta. Maria Maggiore was founded in 432, just after the Council of Ephesus, which raised the Virgin above all created things; it was thus the first great church of Mary in Rome. Behind its Neoclassic facade (1741–43), the original basilica has resisted change. Most of the mosaics date from the time it was built, lining the walls and bursting with blue and gold around the altar. When a new apse was added in the 13th century, it was also decorated with mosaics. Although the ceiling is Renaissance, the slabs of fine marble and the classical columns are pieces of original plunder from other buildings. The great treasure of the church is the Crib of Christ, five pieces of wood connected by bits of metal. Another pope, St. Liberius (352–366), built another church on the Esquiline in response to a vision of the Virgin, who told him to erect a church where snow fell on the night of August 5. In remembrance, it "snows" white flower petals from the roof of the Pope Paul V chapel in Sta. Maria Maggiore every August 5.

Other major churches. *Gesù.* The mother church of the Jesuit order, Gesù, was built 1568–84. Over the following four centuries, it supplied one of the most pervasively influential designs for church building. Michelangelo offered the new order plans for their first church but died before his plans could be acted upon. Building began under Giacomo Vignola (1507–73), very possibly following Michelangelo's ideas. The Jesuits, shock troops of the Counter-Reformation, proselytizers rather than liturgists, needed a new kind of church for their new approach. Vignola combined the central plan (for preaching) with the longitudinal plan (for ritual) by transforming the aisles into a series of chapels opening into the nave. The facade carried the classical orders upward, though only across the width of the tall nave, and the space above the lower aisles to either side was filled with a scroll. The ideas were not new in the history of architecture, but they were new to Rome and new to the age; and they spread with rapidity.

S. Pietro in Vincoli. Originally the Basilica Eudoxiana, S. Pietro in Vincoli (St. Peter in Chains) was built in 432–440 with money from the empress Eudoxia for the veneration of the chains of St. Peter's Jerusalem imprisonment. Later, his Roman chains were added. The chains became famous after they were mentioned at the Council of Ephesus (431). Michelangelo's thunderous Moses is on the tomb of Julius II. Behind the main altar is a 4th-century sarcophagus with seven compartments, brought to Rome from Antioch during the 6th century in the belief that it contained relics of the seven Maccabees.

Sta. Maria della Vittoria. Built 1605–26, Sta. Maria della Vittoria harbours an unflinching crowd pleaser, Bernini's "Ecstasy of St. Teresa" (1645–52). It is a chapel conceived entirely in theatrical terms, even to having the Cornaro family (in marble) seated in opera boxes at the sides of the chapel. Their eyes are directed at the central group in a niche framed in columns, exactly like a proscenium arch, the back wall concealed by gilded metal beams of glory, the scene lighted from above and behind by a hidden yellow-paned window. Amid this setting the angel hovers above the swooning saint, who is—and the illusion is nigh to perfect—borne into the air at the moment of her ecstatic mystical union with Christ. Extraordinarily convincing and utterly voluptuous, it has been both praised as

The Trevi Fountain, designed by Niccolò Salvi in 1732.

Ferrio Jacobs—Photo Researchers

a masterwork of consummate spirituality and condemned as an impious, pornographic peepshow.

S. Agostino. Of the scores of churches in the Campus Martius of historical, architectural, and artistic interest, S. Agostino (1479–83) is the most Roman, the church to which would-be mothers come and in which they have offered ex-votos when their prayers have been answered. The “Madonna and Child” (1521) by Jacopo Sansovino, obviously derived from a pagan Juno, is covered with gold and jewels given by the gratified. The church was constructed entirely of travertine looted from the Colosseum. Caravaggio painted the “Madonna with Pilgrims”; Raphael did the fresco of Isaiah. This was these artists’ favourite church, and some of the more celebrated among them managed to be interred in it.

THE FOUNTAINS

Rome is as much a city of fountains as it is of churches or palaces, antiquities or urban problems. The more than 300 monumental fountains are an essential part of Rome’s seductive powers. Part of the everyday, yet part of the daily surprise, they are points of personal, often sentimental attachment to the city. The Roman composer Ottorino Respighi found in them inspiration for his orchestral tone poem *Fontane di Roma* (1917). In their ceaseless pouring forth, they also provide a sense of luxury: on her arrival Queen Christina, having watched the fountains in St. Peter’s Square, gave her permission for them to be turned off only to learn that they flowed all the time.

Every fountain has its history and many have legends, the best known of which guarantees a return to Rome to those who toss coins into the Trevi Fountain. Restored after 1,000 years of silence by Pope Nicholas V in 1485, the fountain was renewed in the 17th century and then transformed from a handy source of household water into a scenic wonder. The huge fountain bulges into most of a tiny square and takes up the entire end of an abutting palace. Niccolò Salvi won a 1732 competition by designing a late Baroque marble mass of rocks and rills, rush and gush, beards and buttocks, all very allegorical and damp. It took 30 years to complete. Its water, from Acqua Vergine, was considered Rome’s softest and best tasting; for centuries, barrels of it were taken every week to the Vatican and carried off by the jugful by expatriate English tea brewers. Declared nonpotable in 1961, the waters are now recycled by electric pumps.

Out of the Bernini–Borromini rivalry that so enriched the Roman cityscape arose a legend, still believed and recounted today. This explains that, on Bernini’s allegorical Piazza Navona fountain, the statue of the Nile River, whose source was then unknown, hides its head to avoid seeing the Borromini facade on the church opposite, and that of the Río de la Plata raises its arm in alarm to prevent the building from falling. The fountain was, in fact, unveiled in 1651, a year before the church of S. Agnese was begun, two years before Borromini was called in, and 15 years before the facade was completed. The church is owned and maintained by the Doria-Pamphili family.

The oldest of the city’s fountains is really a spring, the Lacus Juturnae in the Forum, restored in 1952 to the appearance it had in Augustan times. The newest fountain in the old city is one of the most admired. Inaugurated as simple jets of water in the Piazza Esedra (now the Piazza della Repubblica) by Pius IX just 10 days before the troops of united Italy broke into the city, it was probably the last public work dedicated by a pope in his role of temporal magistrate of the city. In 1901 the nymphs frolicking with sea beasts were added.

The least-liked fountain figure in Rome, unpopular since it was installed in 1587, is on the triumphal arch fountain in the Piazza S. Bernardo, commissioned by Sixtus V. The figure is a pallid Moses, apparently in imitation of Michelangelo’s, and its sculptor, Prospero Bresciano, is said to have been so hurt by the public’s jeers that he died of a broken heart. (B.E./Ed.)

History

ROME OF ANTIQUITY

Founding and the kingdom. Although the site of Rome was occupied as early as the Bronze Age (c. 1500 BC) and perhaps earlier, continuous settlement did not take place until the beginning of the 1st millennium BC. By the 8th century BC, separate villages of various iron-using Indo-European peoples appeared, first on the Palatine and the Aventine hills and soon thereafter on the Esquiline and Quirinal ridges. The artifacts and especially the funerary customs of these communities indicate that, from the beginning, diverse culture groups—including Latins, Sabines, and perhaps others—played important roles in the formation of the future city.

With the settlement of the valleys between the Palatine,

Early peoples and cultures

Legends of the waters

Esquiline, and Caelian hills in the 7th century, the independent villages began to merge. Before the end of this century, the Forum valley, originally used as a cemetery, was partially drained and occupied by wattle-and-daub huts. The mixed agricultural and pastoral economies of the earliest settlements were slowly exposed to commercial contacts with both Etruscan and Greek traders. The formation of a politically unified city probably occurred in the early 6th century BC under the influence of the Etruscan city-states to the north. Under the rule of its kings, traditionally seven in number (the last three probably Etruscans), Rome became a powerful force in central Italy.

During the regal period, social and economic differences began to shape the two classes, patrician and plebeian, whose struggles for political power dominated the early republic. The tribal organization of the populace was replaced by one based on military units, whose composition in the late regal period depended on property qualifications.

The early Roman Republic. The overthrow of the last Roman king and the establishment of the republic, either in 509 BC or a generation or two later, coincided with the decline of Etruscan power in central Italy. The new government under the leadership of two patrician consuls was at first a mixed blessing. Although Etruscan techniques and symbols survived in republican Rome, commercial ties with the Etruscans and with the Greek colonies in southern Italy gradually withered. During the ensuing economic crisis, grain shortages occurred, a problem that was to plague the city intermittently for a millennium and more; the government was forced to make purchases from as far away as Sicily.

Political upheaval followed economic depression. The first major confrontation between the patricians and plebeians in the mid-5th century led to the writing down of the customary laws in the Law of the Twelve Tables (451–450) and to the formation of a plebeian political organization whose leaders, the tribunes, acted to protect the plebeians from arbitrary patrician actions. In the last half of the 5th century, Rome began again to expand its control over neighbouring territories and peoples, a process that culminated in the conquest of the Etruscan city of Veii in 396.

In 390 Rome suffered a disastrous check when a Gallic army laid siege to the city. After seven months, during which only the Capitoline remained in Roman hands, the Gauls were bought off but left Rome in ruins. The Romans set about reconstructing their city almost immediately, surrounding it with a continuous wall of huge tufa blocks. Later writers attributed Rome's haphazard appearance to the rapid rebuilding during this period; Livy described Rome as looking more like a squatters' community than a planned community. For eight centuries, however, no foreign invader was to breach Rome's walls.

The economic dislocation caused by the Gallic attack helped renew the conflict between the patricians and the plebeians; but, before the end of the 4th century, through a series of judicious compromises, the plebeians had won access to all of the offices of the state, and the actions of the plebeian assembly (plebiscites) had been made legally binding on all Romans. Economic legislation dealing with debt and land distribution was directed toward relieving the distress of the lower classes.

The city of world power. The remarkable though largely unplanned territorial expansion of Rome between 375 and 275 brought lasting economic gains. With control of all of peninsular Italy, Rome established colonies on some of the conquered territories and elsewhere assigned lands to individual Roman citizens. The nearly 60,000 holdings distributed before the middle of the 3rd century helped to solve the pressure of Rome's land-hungry population; nevertheless, by c. 250 the city's population had grown to almost 100,000. The booty from conquests also helped to defray the costs of such public works as the building of temples and roads and the improvement of the city's water supply. By the early 3rd century, two aqueducts carried fresh water into the city.

In 264 Rome was drawn into a war with Carthage, the great Phoenician emporium in North Africa. After more

than a century of conflict, Rome emerged as the strongest power in the Mediterranean; but the acquisition of an empire, which, for the most part, had not been the conscious desire of the Roman people, brought new social and economic problems to the city itself. During the Second Punic War (218–201) large areas of the peninsula were devastated by invading troops from Carthage, led by the famous general Hannibal; much land was abandoned and many peasants sought refuge in Rome. The growing requirements of a standing army depopulated the countryside and concentrated veterans in the city. The Roman nobility, prohibited by law and by custom from investing in commerce or industry, profited from the economic distress of the peasantry by buying up large tracts of land in central and southern Italy. Slaves, whom Rome's wars in the Mediterranean made available in large numbers, were introduced into Italy as farm labourers and herdsmen, causing further dislocation among the free peasantry. In general, the Roman economy lagged well behind the political development of both city and empire.

The late republic. During the 2nd century, the rapid growth of the urban population and the extension of Roman citizenship led to the effective disenfranchisement of the urban vote. The Senate, now the chief policy-making body of the Roman state, was preoccupied with the problems of the empire and too often ignored the needs of the city. With no separate municipal government, public works and the management of food and water supplies were left to private initiative or to amateur public officials. Nevertheless, some progress did occur. Some of the main streets were paved; drains were covered; and several large basilicas and a new row of shops were built in the Forum. The first stone bridge across the Tiber was completed in 142, and the first high-level aqueduct was erected in 144, allowing settlement on the higher ground of the city's eastern ridges. From the early 2nd century, the river port at the base of the Aventine acquired new warehouses and docking facilities.

These and other projects, however, were inadequate to deal with the growing urban proletariat increasingly swollen with slaves and freedmen. Crowded into jerry-built apartment houses (*insulae*) and with only minimum employment opportunities in what was an essentially non-industrial city, the lower classes were surviving on the sporadic public-works projects of the state and the largess of the rich before the end of the 2nd century. Rome had, moreover, neither police nor fire protection.

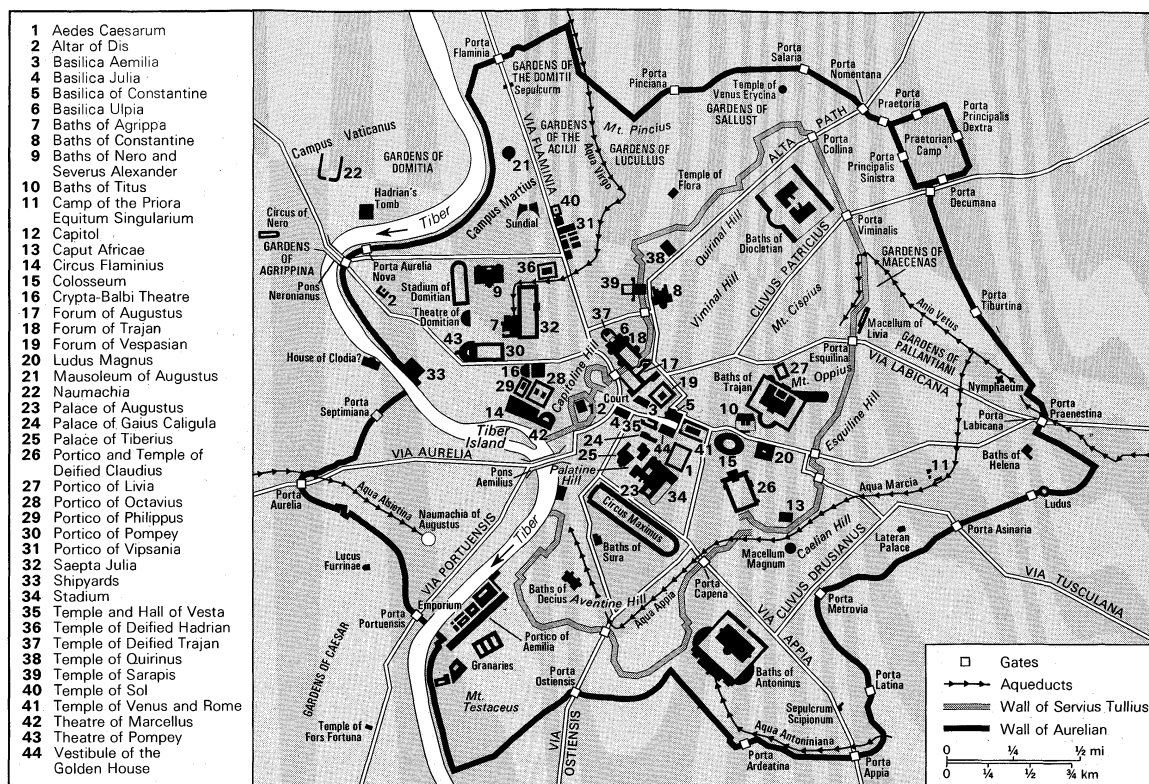

The Gracchi—Tiberius and later Gaius—attempted to deal with the problems of urban unemployment and rising food prices, first by advocating the reestablishment of a small farmer class in Italy, then through the subsidization of the grain supply for the poor. Gaius Gracchus also encouraged public expenditure on roads and buildings. Coupled with currency reforms and heavy government spending, these measures partially restored prosperity to Rome in the late 2nd century, but the basic structural faults in the city's economy and political life remained.

During the civil strife that occupied most of the first half of the 1st century BC, both population and problems multiplied in Rome. The creation of private armies attached to the Roman nobility offered employment to some of the urban lower classes but contributed greatly to the political violence that eventually spelled the end of the republic. Securing an adequate supply of cheap grain offered possibilities for the political manipulation of the urban masses. By the middle of the century, perhaps as many as 500,000 persons were receiving free grain. The upper classes became more interested in luxurious living and their tastes were matched in the public sphere by the building programs of Sulla and Pompey. Public buildings and theatres paid for with tribute and booty enhanced Rome's beauty but did not make a more livable city. In addition, heavy migration to Rome, especially from the Hellenistic east, added to the burdens of the already overcrowded city.

Municipal reforms of Augustus. Julius Caesar, the first to try to deal with the problems of Rome in a systematic way, did not live long enough to carry out his plans, which included canalizing the Tiber and building up the Campus Martius. His adopted son and successor, August-

Origins of the haphazard municipal plan

Impact of the Gracchi on municipal squalor

Rome during the imperial period.

tus, attempted to transform Rome into a worthy capital for the new empire. Although his claim that he found the city brick and left it marble is exaggerated, Augustus and his colleagues did provide it with many fine public buildings, baths, theatres, temples, and warehouses. Such construction projects, together with the restoration of old buildings, provided employment for the urban masses; but the lack of any overall city planning left them to live in the unsafe and unsanitary tenements amid the narrow, winding streets and alleys of old Rome. Agrippa, a friend and supporter of Augustus, used his own immense wealth to further enhance the city's beauty and improve its water supply.

Advent of
a profes-
sional city
manage-
ment

Augustus' reorganization of the administration of the city and his institution of certain public services were a significant break with the republican past. In 7 bc he divided Rome into 14 *regiones* ("wards") and these into *vici* ("precincts"), each with officials who performed both administrative and religious functions. The office of urban prefect, which Augustus revived c. 26 bc, did not become permanent until later, but in the late empire the post became the most important in Rome.

In response to an obvious need, Augustus organized a fire brigade in 21 bc, placing a number of public slaves under the command of *aediles*, officials in charge of streets and markets; after a bad fire in AD 6, he established a corps of professional firemen (*vigiles*), comprising seven squads, or cohorts, of 1,000 freedmen apiece. The *vigiles* also had minor police duties, especially at night. He sought to impose order in the often violent streets by creating three cohorts under the command of the urban prefect; their main duty was to keep order in the city, and they could call on the Praetorian Guard for help if necessary. Altogether, Augustus saw to it that the amateur system of Roman municipal administration was replaced by a more professional and permanent set of institutions—a work that probably contributed more to making Rome a great city than all of his marble monuments.

Contributions of later emperors. For the most part, the successors to Augustus continued his administrative policies and building program, though with less innovation and more ostentation. Claudius began a great port near Ostia, at the mouth of the Tiber, to facilitate grain shipments directly to Rome. Commerce remained largely in

private hands, with public officials acting to ensure a regular supply and to prevent speculation.

Nero can be credited with introducing the most up-to-date ideas on town planning, though at a terrible price. The great fire of AD 64 destroyed large sections of the city. In the devastated areas Nero built new streets and colonnades as well as his fabulous Golden House, and he encouraged private citizens to build more spacious and more fireproof houses and apartment buildings with better access to the public water supply. Although Nero made Rome a more pleasant city in which to live, his measures did not prevent other devastating fires such as the one in 191 that gave Septimius Severus the opportunity to rebuild the city.

Other emperors in the late 1st and early 2nd centuries added to the glory of the imperial house and the amenities of Roman life—grandiose imperial forums, temples, arches, baths, and stadiums. Trajan's Forum, with its complex of buildings and courtyards, and his market, with its tiers of shops and its great market hall, represent, in the judgment of many historians, the supreme achievement of city planning in Rome. Trajan's Column, which narrates his victories beyond the Danube, was recognized as without peer even in the Christian Middle Ages. Hadrian left two enduring structures in Rome: the great domed Pantheon and his mausoleum, which in AD 590 was renamed Castel Sant'Angelo.

In the late 1st and early 2nd centuries Rome was at the peak of its grandeur and population, which has been estimated at more than 1,000,000 persons but was probably less. It was kept at a high level by a steady stream of immigrants, both slave and free, from the provinces and beyond—although life expectancy in the city was probably lower than elsewhere in the empire. Rome's famous paved streets, water supply, and sewage system, however, should not be overestimated; even after the reforms of Nero, large numbers of the urban inhabitants continued to live in expensive, poorly built, overcrowded, and unheated slums without water or cooking facilities. The arena and the public bath relieved some pressures of high density and physical squalor, but Rome's refined technology was applied haphazardly to the problems of urban social organization. Garbage was usually dumped into the Tiber or pits on the city's outskirts.

Populace
and
economy
at the
height of
the empire

Rome was a city of consumers, both rich and poor, and never a great industrial or commercial centre. The small shop was the basic unit of production and distribution through the imperial period, and the numerous trade associations served social and religious functions until they were enveloped in the economic regimentation of the late empire. Although Rome far surpassed any other ancient city in size and monumental splendour, its minimal economic and social achievement augured ill for the future.

Slow decline of the late empire. Rome's population probably began to decline in the late 2nd century. At the height of an outbreak of the plague in the reign of Marcus Aurelius, 2,000 persons a day are thought to have died. The economic and political disasters of the 3rd century did little good for Rome. In the 270s the walls built by Aurelian were more a symbol of the danger of barbarian attack than a restoration of Rome's grandeur.

By the time Diocletian reformed the imperial government and ushered in the period of relative prosperity symbolized in his great baths, Rome was no longer the administrative capital of the empire. The founding of Constantinople merely confirmed Rome's loss of political primacy. Constantine, however, did much to restore the buildings and monuments of imperial Rome. In addition, his patronage of Rome's small Christian community laid the foundations of Christian and papal Rome of the medieval and modern periods.

Rome in the 4th century remained, nonetheless, a distinctly conservative and pagan city dominated by proud senatorial families. When the Visigothic army of Alaric first threatened the city in 408, the Senate and the prefect proposed pagan sacrifices to ward off the enemy, and even the pope would have allowed them to be performed in secret. In 410 Alaric seized Rome and allowed his troops to pillage the city for three days; much booty was taken, and many Romans fled.

It is unlikely, however, that the monuments of Rome suffered extensive damage. Its churches, for the most part, were spared. Even the longer, 14-day sack of Rome by the Vandals in 455 did less damage than the Romans themselves. In the 4th and 5th centuries, the emperors repeatedly legislated against those who were stripping buildings and monuments for their materials, especially the marble. By the mid-5th century, the population had dropped to fewer than 250,000.

THE CITY OF THE POPES

Decay of imperial authority. Within a decade of Theodoric's death in 526, Justinian began his attempt to restore Roman imperial rule in the West. His ultimate success was disastrous for Italy and for Rome. Three times Rome was under siege; its aqueducts were cut, and once it was abandoned by its inhabitants. By the end of the century, with the urban population fewer than 50,000, civil authority and the responsibility for protecting the city were in the hands of the church. Pope Gregory I tried to provide an adequate urban administration, and for nearly two centuries his successors played a similar role.

In the middle of the 8th century, when the Byzantines were no longer able or willing to supply Rome with adequate military aid, the papacy turned to the Franks. The "Donation" of Pepin—who owed his new title as king of the Franks in part to the Pope—and that of his son Charlemagne were the theoretical foundations of the temporal power of the papacy. In 774 Charlemagne conquered the Lombard kingdom, and in 800 he was crowned emperor by Pope Leo III and acclaimed by the people of Rome. The period of the late 8th and early 9th centuries was one of vigorous building and restoration of churches in Rome.

Factional struggles: papacy and nobility. The decline of Carolingian authority in Italy led to the renewal of family and factional struggles. After the Muslims plundered St. Peter's and the outlying areas of Rome in 846, Pope Leo IV built a wall around the area of the Vatican, thus enclosing the suburb that came to be known as the Leonine City. From the late 9th through the mid-11th century, Rome and the papacy were controlled by various families from Rome's landed nobility, with brief interludes of intervention from the German emperors.

After decades of dispute between the Roman nobility and the papacy, the latter was able to establish an uneasy peace in Rome by the end of the 11th century. Much rebuilding was necessary after the Norman sack of 1084. Generally, the reformed papacy, begun under Leo IX (1049–54), was supported and financed by new Roman families such as the Frangipane and the Pierleone, whose wealth came from commerce and banking rather than landholdings. By the late 11th century the seat of the church had begun to draw many pilgrims and prelates to Rome, and their gifts and expenditures on food and housing stimulated a considerable flow of money. Although Rome had a population of fewer than 30,000 (occupying less than one-quarter of the lands within the old walls), it was becoming once again a city of consumers dependent on the presence of a governmental bureaucracy.

Emergence of the Roman commune. The Roman revolution in 1143 had fundamentally the same goals as other contemporaneous communal movements in northern Italy: freedom from episcopal (in Rome's case, papal) authority and control of the surrounding countryside. The revival of the Roman Senate and other echoes of the Classical past perhaps owed something to the preaching of Arnold of Brescia, a priest and monk, who said strong things against ecclesiastical property and church interference in temporal affairs. Rome's new republican constitution survived both papal and imperial attack alike, and in 1188 Pope Clement III recognized the communal government. In theory, the senators were to become papal vassals, but, in fact, the Pope had to make large cash payments to the senators and other communal officials. In the 1190s a single senator was able to exercise wide authority in the territories surrounding Rome.

Pope Innocent III made it his first order of business to secure a firm papal position in Rome and in the Vatican. Only moderately successful, he found it expedient to support the Roman commune's expansionist policies. Territorial rivalry between Innocent's family and the Orsini led to rioting and finally open warfare in the streets of Rome in 1204, during which siege machines destroyed many ancient buildings. After a settlement, Innocent's many charitable projects won him Roman support. Gregory IX and the Roman commune clashed over Rome's expansionist policies and its claims to the right to tax the clergy and church property. Bitter struggles with the Hohenstaufen emperor Frederick II as well as the varied interests of Rome's leading families—the Orsini, the Savelli, the Annibaldi, and, above all, the Colonna—complicated the situation. After Frederick's death, an antipapal regime promoted a rising middle class and a resurgence of the commune.

Period of the Avignon papacy. Few popes in the second half of the 13th century were able to reside in Rome. In the 1280s and 1290s, Rome was torn by the bitter rivalries among the Colonna, the Orsini, and the Annibaldi families, a discord encouraged by Pope Boniface VIII. In 1309 Clement V moved the papal residence to Avignon in France; Rome was left to its factional strife and its economic impoverishment.

In spite of sharp rivalries, Roman and papal interests had often coincided throughout the 13th century. Since Rome was never an important industrial or commercial city, its citizens, from the small shopkeepers and innkeepers to the great banking families, had depended economically on the presence of the papal Curia and the large numbers of pilgrims, prelates, and litigants it brought to Rome. The many brick campaniles of its Romanesque churches and the fortress towers on the palaces of its leading families symbolized Rome's ecclesiastical character; but, with a population of never more than 30,000 in the 13th century, it retained a village air for all its urbanity and classical aspirations. Most of the populace was concentrated around St. Peter's and in the low-lying areas of the Campus Martius and Trastevere; large sections of the city within the old Aurelian walls were pastures, gardens, vineyards, and wastelands.

The popes in Avignon were able to maintain a tenuous rule over the city, especially Benedict XII (1334–42). The brief popular revolution (1347) of Cola di Rienzo—who,

Papal and communal authority in conflict

Bases of the papacy's temporal power

Ambience of the city in the late Middle Ages

styling himself tribune of Rome, combined apocalyptic visions with ideas of a renewal of Rome's ancient glories—had more dramatic than political impact. The terrible mortality of the Black Death reduced Rome's population to less than 20,000, and the city staggered through the last half of the 14th century still racked by factional strife. The return of the papacy from Avignon in 1377 did not help. Around 1400, Rome was described as a city filled with huts, thieves, and vermin, and in the neighbourhood of St. Peter's wolves could be seen at night.

The city of the Renaissance. The entry of Pope Martin V (a member of the Colonna family) into Rome in 1420 marked the beginning of the Renaissance city and of the absolute papal rule that lasted until 1870. Although Martin was neither a builder nor a patron of the arts, he laid the foundations of government that made Rome the capital of a Renaissance state. From this period, the apostolic vice chamberlain, as governor of Rome, controlled municipal offices, communal finances, and the statutes of the city. The Roman commune was transformed into a unit of authoritarian papal rule, and the papal states increasingly came under the firm control of papal officials.

From the pontificates of Nicholas V (1447–55) and, especially, Sixtus IV (1471–84), the squalid narrow streets of medieval Rome were widened and paved, and new Renaissance buildings replaced crumbling structures. At the same time, the monuments of ancient Rome suffered further damage as they were torn apart for their building materials, and their marble went too often into the lime kilns rather than into new structures. The popes attracted scholars and artists from across Italy, and, by the end of the 15th century, Rome was the principal centre of Renaissance culture. The high point was reached under Leo X (1513–21), with his plans for a new St. Peter's and his patronage of such artists as Michelangelo and Raphael. Rome flourished economically under the Renaissance popes. Banking and the exploitation of alum deposits near Civitavecchia by the popes (with the help of the Medici family of Florence) stimulated a flow of capital into the city. Although Rome once again had become a great consumer of imported luxuries, it still had little large-scale industry or commerce.

EVOLUTION OF THE MODERN CITY

Rebuilding and repopulation. The sack of Rome in 1527 by the armies of Emperor Charles V ended the city's preeminence as a Renaissance centre. In eight days, thousands of churches, palaces, and houses were pillaged and destroyed. But, even under the repressive rule of the Counter-Reformation papacy, Rome recovered; a new era of construction was begun, culminating in a vast program of city planning by Sixtus V (1585–90) and his architect Domenico Fontana. New streets and squares were laid out, obelisks raised, the Lateran and Vatican palaces rebuilt, and aqueducts repaired. Fortunately, his project to convert the Colosseum into a wool factory to provide employment for Rome's prostitutes came to nothing.

By 1600, Rome was again a prosperous cosmopolitan city. A great influx of new inhabitants attracted by employment opportunities in the papal bureaucracy and related service industries increased Rome's population to more than 100,000. Much of the big business of the city remained in the hands of foreigners, however, for the wealth and power of the Roman nobility was based on land and ecclesiastical officeholding.

Decline and fall of the papal empire. In the 17th and 18th centuries Rome's noble families built fine palaces and patronized the arts while manoeuvring to win high positions in the church hierarchy. The highest prize of all, the papal crown, brought wealth and status to the wearer's family. But as corruption and bribery within these circles became a way of life, the influence of the papacy and of Rome declined throughout Europe and even throughout the Papal States. Although Sixtus V had created one of the best planned cities in Europe, by the 18th century Rome was still a backward town, with poorly paved streets on which there were no road signs nor public lighting and little sanitation. To foreign observers, the Romans, from the most aristocratic families to the poorest classes, seemed

to lead lives of provincial vacuity unconcerned with anything outside Rome. The population reached 165,000 by 1790, but as many as one-quarter of the inhabitants were employed in the petty bureaucracy that overran the city.

The armies of Napoleon occupied Rome for the first time in 1798, and a republic was declared; but in 1809 Rome and the Papal States were annexed into the French Empire. The return of the pope to Rome in 1814 led to a long period of repression and reaction, though popes Leo XII and Gregory XVI promoted educational improvements and new public baths and hospitals. With the liberal attitude that characterized the early part of his reign, Pope Pius IX (1846–78) granted Rome a constitution in 1848; but, after the Revolution of 1848–49, he became an archconservative, attempting with French support to save the temporal power of the papacy and to stave off the modern world.

Capital of a united Italy. Most of the Papal States were included in the Kingdom of Italy, proclaimed in 1861, but Rome was excluded. Attempts by Garibaldi to capture the city in 1862 and 1867 were unsuccessful, but the withdrawal of the French garrison supporting Pius allowed Italian troops to enter Rome on September 20, 1870. After a plebiscite in October, Rome became the capital of a united Italy. Pius refused to accept the government's offer of settlement, choosing to style himself a prisoner in the Vatican. The situation was not resolved until 1929, when the Lateran Treaty between Pius XI and Mussolini recognized the pope's sovereignty within Vatican City.

Rome's population grew rapidly after 1870, passing the 500,000 mark before World War I and reaching more than 1,000,000 by 1930. Its area of settlement also expanded for the first time well beyond the old walls of the ancient city. During the Fascist regime of Benito Mussolini in the 1920s and 1930s, Rome was transformed into a modern capital, with grandiose new avenues and pompous buildings. Mussolini's encouragement of archaeological excavation contributed to the revelation and preservation of many of the monuments of classical Rome. Throughout the 20th century, Rome has been a great administrative and tourist centre, though it still lacks the large-scale commerce or industry characteristic of most modern urban development. Franklin D. Roosevelt

Franklin Delano Roosevelt, popularly known as F.D.R., the 32nd president of the United States, held office from 1933 to 1945 during the New Deal era and World War II. The modern role of the United States government, in both its domestic and foreign policies, owes much to the changes that Roosevelt helped bring about. To counter the Great Depression of the 1930s he enlisted the powers of the federal government to promote the economic welfare of the U.S. people. He was a leader in the Allied struggle against the Axis powers in World War II, preparing the way for the United States to assume a continuing role in world security. He was the only president to be reelected three times.

EARLY LIFE AND POLITICAL GROWTH

Roosevelt was born at Hyde Park, New York, on January 30, 1882, the only son of James and Sara Delano Roosevelt. The Roosevelts lived in unostentatious and genteel luxury, dividing their time between the Hudson River Valley and European resorts. They often took young Franklin to Europe; he was taught privately at home and was reared to be a gentleman, responsible toward those less fortunate. At 14, Roosevelt, a rather shy youth, entered Groton School (Groton, Massachusetts), modeled after the great public schools of England, where wealthy young men were trained to exercise Christian stewardship through public service.

After he entered Harvard in 1900, Franklin Roosevelt threw himself into undergraduate activities. His strenuous extracurricular and social life left him relatively little time for his academic studies, in which his record was undistinguished. He was, however, influenced by his economics professors, who modified traditional laissez-faire views with advocacy of government regulation of economic activities, but, even more, Roosevelt fell under the spell of the progressive president, his glamorous distant relative Theodore Roosevelt, a fifth cousin.

During his final year at Harvard, Franklin became engaged to Theodore Roosevelt's niece, Eleanor Roosevelt, who was then active in settlement work in New York City; they were married on March 17, 1905. Eleanor helped open young Roosevelt's eyes to the deplorable living conditions of the underprivileged in the slums.

New York social life interested Roosevelt more than did his studies at Columbia University School of Law. As soon as he passed the New York bar examination, he discontinued his schooling. This attitude of indifference toward the legal profession carried over into Roosevelt's years as a clerk with the distinguished Wall Street firm of Carter, Ledyard & Milburn, defense counsel in several spectacular antitrust cases.

Roosevelt, 1937.

Early political activities. His admiration for his cousin Theodore, who continued to urge young men of substance to enter public service, led Roosevelt toward politics. His opportunity came in 1910 when the Democratic leaders of Dutchess County, New York, persuaded him to undertake an apparently futile campaign for the state senate. Roosevelt, whose branch of the family had always been Democratic, hesitated only long enough to make sure his distinguished Republican relative would not speak against him.

State senator. He campaigned so strenuously that, with the aid of a Republican schism and his famous name, he won the election. Roosevelt, not quite 29, quickly won statewide and even some national attention by leading a small group of Democratic insurgents who refused to vote for the nominee of Tammany Hall, the New York City organization. For three months Roosevelt helped hold the insurgents firm, until Tammany switched to another candidate.

Roosevelt became the foremost champion in the New York Senate of the upstate farmers, and in the process he converted to the full program of progressive reform. From the New York City legislators, whom he had earlier scorned and now continued to fight, he learned much of the give-and-take of politics. Among them were James J. Walker, later mayor of New York City; Robert Ferdinand Wagner, who became a leading U.S. senator; and Alfred E. Smith, later governor of New York. Roosevelt gradually abandoned his patrician airs and attitude of superiority.

Before the end of 1911, Roosevelt supported the presidential boom for Gov. Woodrow Wilson of New Jersey, the leading Democratic progressive. An attack of typhoid fever kept Roosevelt from participating in the 1912 campaign, but, even without making a single public appearance, he was reelected to the state senate. This was because of publicity by an Albany newspaperman, Louis McHenry Howe, who saw in the tall, handsome young Roosevelt a promising politician. Howe served Roosevelt for the rest of his life with a jealous loyalty.

Assistant secretary of the navy. For his work on behalf of Wilson, Roosevelt was rewarded in March 1913 with an appointment as assistant secretary of the navy under Josephus Daniels. Roosevelt loved the sea and naval traditions, and he knew more about them than did his superior, with whom he was frequently impatient. Roosevelt tried with mixed success to bring reforms to the navy yards, which were under his jurisdiction, meanwhile learning to negotiate with labour unions among the civilian employees. After war broke out in Europe, Roosevelt became a vehement advocate of preparedness; following U.S. entrance, he built a reputation as an effective administrator. In the summer of 1918 he made an extended tour of naval bases and battlefields overseas. During much of his seven years as assistant secretary, he had been less than loyal to Daniels, but in the end he came to appreciate his superior's skill in dealing with Southern congressmen and his solid worth as an administrator.

Paralytic attack. At the 1920 Democratic convention Roosevelt was nominated for vice president. He campaigned vigorously with the presidential nominee, James M. Cox, on behalf of U.S. entrance into the League of Nations. After a Republican landslide, Roosevelt became a vice president of the Fidelity & Deposit Company of Md., a bonding company, entered into numerous business schemes (some of a speculative nature), and remained active in Democratic politics. Suddenly, in August 1921, while on vacation at Campobello Island, New Brunswick, Roosevelt was severely stricken with poliomyelitis. He suffered intensely and for some time was almost completely paralyzed, but he soon began predicting (as he did for some years) that he would quickly regain the use of his

Vice-presidential nomination

Schooling and training

legs. His mother wished him to retire to Hyde Park, but his wife and his secretary, Louis Howe, felt it essential to his morale that he remain active in his career and in politics. Because Roosevelt could not himself go to political gatherings, his wife attended for him, acting as his eyes and ears (a service she frequently performed for him during the rest of his life). Under the tutelage of Howe, she overcame her shyness and became an effective political worker and speaker. Because he could not run for office for the time being, Roosevelt was able to function effectively as a sort of premature "elder statesman," trying to promote unity between the urban and rural wings of the Democratic Party. Himself a rural Democrat, he nominated Gov. Al Smith of New York, the favourite of the city faction, at the 1924 and 1928 Democratic conventions.

Smith urged Roosevelt to run for governor of New York in 1928 to strengthen the ticket. Roosevelt was reluctant; he still could not walk without braces and assistance. In the years since 1921 he had worked incessantly to try to regain the use of his legs—for several winters he swam in warm Florida waters and, beginning in 1924, in the mineralized water at Warm Springs, Georgia. Wishing to share with others the beneficent effect of the warm water and a systematic program of therapy, Roosevelt in 1927 established the Warm Springs Foundation, a nonprofit institution for the care of polio victims. He wished to develop Warm Springs further and to continue treatments in the hope of regaining full use of his legs.

Governor of New York. Nevertheless, despite these concerns and his feeling that 1928 was not a propitious year to run on the Democratic ticket, Roosevelt succumbed to strong persuasion and accepted the nomination. When he began campaigning by automobile, he demonstrated that he had retained his youthful buoyance and vitality; he also showed that he had matured into a more serious and human person. Opponents raised the question of his health, but his vigorous campaigning effectively disposed of the issue. Smith was defeated in Herbert Hoover's landslide, and he failed to carry New York state; but Roosevelt won by 25,000 votes.

Program as
governor

Succeeding Smith as governor, Roosevelt decided he must establish his own type of administration. He did not keep Smith's closest adviser nor did he depend upon Smith for advice. Smith, already stung by his defeat for the presidency, was hurt and alienated. Whereas Smith had built his reputation on administrative reform, Roosevelt concentrated upon a program to give tax relief to farmers and to provide cheaper public utilities for consumers. The appeal of this program in upstate New York, coupled with the effects of the deepening Depression, led to Roosevelt's reelection in 1930 by the overwhelming plurality of 725,000 votes.

During his first term as governor, Roosevelt's policies, except on the power issue, were scarcely further to the left than those of President Hoover in Washington, D.C. But during Roosevelt's second term, as the Depression became more catastrophic in its effects, he acted to mobilize the machinery of the state government to aid the economy. In the fall of 1931 he obtained legislation establishing the Temporary Emergency Relief Administration, the first of the state relief agencies. Throughout his four years, he was successful in most of his bouts with the Republican legislature, sharpening skills that would prove vital in the future. And, increasingly, beginning with some slight speculation in November 1928, he was being talked of as the most likely Democratic presidential nominee in 1932. After his spectacular victory in 1930, he was so conspicuous a target for the Republicans and for rival Democratic aspirants that he had no choice but to begin immediately and quietly to obtain support for the convention. Because it then took a two-thirds vote in the Democratic convention to nominate, a leading contender could be stopped with relative ease. It soon became apparent that Roosevelt's strongest opposition would come from urban and conservative Eastern Democrats still loyal to Smith; his strongest support was in the South and the West.

Progressives and intellectuals found Roosevelt's overall program attractive, but many feared that he was weak because he sidestepped Republican challenges to oust cor-

rupt Democratic officials in New York City. The opposition became stronger when John Nance Garner of Texas, speaker of the House of Representatives, won the California primary.

PRESIDENCY

At the 1932 convention Roosevelt had an early majority of the delegates but seemed blocked by a combination of the Smith and Garner forces. On the third ballot, Garner allowed his delegates to be thrown to Roosevelt; in return, Garner was nominated for the vice presidency.

First term. In the campaign of 1932 the Depression was the only issue of consequence. Roosevelt, displaying smiling confidence, campaigned throughout the country, outlining in general terms a program for recovery and reform that came to be known as the New Deal. In a series of addresses carefully prepared by a team of speech writers, popularly called the Brain Trust, he promised aid to farmers, public development of electric power, a balanced budget, and government policing of irresponsible economic power. He declared in his most notable speech in San Francisco: "Private economic power is . . . a public trust as well." His program appealed to millions who were nominally Republicans, especially Western progressives. Roosevelt received 22,822,000 popular votes in the election to Hoover's 15,762,000; the electoral vote was 472 to 59. The Democrats also won substantial majorities in both houses of Congress.

Election
to the
presidency

Inauguration as president. Roosevelt took office on March 4, 1933. Following the election, President Hoover had sought Roosevelt's cooperation in stemming the deepening economic crisis that culminated in the closing of banks in several states during February 1933. But Roosevelt refused either to accept responsibility without the accompanying power or to subscribe to Hoover's proposals for reassuring business; Hoover himself granted that his proposals would mean "the abandonment of 90 per cent of the so-called new deal."

When Roosevelt took office, most of the nation's banks were closed, industrial production was down to 56 percent of the 1929 level, 13,000,000 or more persons were unemployed, and farmers were in desperate straits. Even the congressional leaders were so shaken that for the time being they were ready to follow Roosevelt's recommendations.

In his inaugural address Roosevelt promised prompt, decisive action and somehow conveyed to the nation some of his own unshakable self-confidence. "This great Nation will endure as it has endured, will revive and will prosper," he asserted, "... the only thing we have to fear is fear itself." For the moment, people of all political views were Roosevelt's allies, and he acted swiftly to obtain enactment of the most sweeping peacetime legislative program in U.S. history.

The Hundred Days. Through a broad array of measures, Roosevelt first sought quick recovery and then reform of the malfunctions in the economic system that he thought had caused the collapse. He tried to aid each of the main interest groups in the U.S. economy and, at a time when the Democrats were the minority political party, to hold the backing of many who were previously Republicans. His choice of Cabinet members indicated his efforts to maintain a consensus; it was geographically and politically balanced, containing both liberal and conservative Democrats, three Republicans, and, for the first time, a woman—Secretary of Labor Frances Perkins.

Attempts
to main-
tain a
consensus

He also directed his legislative program toward a broad constituency. The prelude was the enactment of several conservative measures, to inspire confidence among businessmen and bankers. First Roosevelt ended depositors' runs on banks by closing all banks until Congress, meeting in special session on March 9, could pass a cautious measure allowing those in a sound condition to reopen (Roosevelt also strongly favoured banking reform, but it came later). In March, Roosevelt redeemed one of his most important campaign pledges by introducing a program of drastic government economy. He firmly believed in economy and never became a convert to the Keynesian views so often attributed to him. The emergency banking and economy acts brought him the enthusiastic support of an

overwhelming proportion of the electorate but, he pointed out at the time, could do little to bring real recovery.

Roosevelt was already preparing, and he soon sent to Congress, a series of messages and draft bills proposing the program that comprised the early New Deal. Roosevelt first obtained from Congress federal funds for the relief of human suffering. Congress established the Federal Emergency Relief Administration (FERA), which granted funds to state relief agencies for direct relief. It also established a Civilian Conservation Corps (CCC), which at its peak employed 500,000 young men in reforestation and flood-control work; it was a favourite project of Roosevelt's and remained popular through the New Deal. Mortgage relief aided other millions of persons, both farmers and homeowners. The key loan agency of the New Deal was the previously established Reconstruction Finance Corporation (RFC), the powers of which were broadened so that it could make loans to small enterprises as well as to large. Although at the time Roosevelt did not envisage public spending as the primary role of these relief agencies, the agencies poured so much money into the economy that within several years they were stimulating recovery.

Recovery measures. The two key recovery measures of the New Deal were acts to restore farm prosperity and to stimulate business enterprise. The first act, in 1933, established the Agricultural Adjustment Administration (AAA), the objective of which was to raise farm prices and increase the proportion of the national income going to farmers. The principal means was through subsidies given to growers of seven basic commodities in return for their willingness to reduce production. The subsidies were to be paid from a processing tax on the commodities. Roosevelt accepted this scheme as a temporary expedient, which Congress would enact because a majority of farm organization leaders favoured it. He also hoped to raise farm prices through mild inflation. Roosevelt envisaged a program, following farm recovery, of extensive rural planning—moving farmers from submarginal to better lands and luring some of the unemployed from metropolises to rural and village life. In 1935 Roosevelt obtained the Resettlement Administration, which gave some aid to smaller, poorer farmers. When the Supreme Court invalidated the processing tax in 1936, he switched the AAA program to one of soil conservation. Nevertheless, throughout the New Deal, farm leaders and Congress succeeded in maintaining an agricultural program the major emphasis of which was to raise farm prices. Thanks to this legislation and several years of drought, production fell, and farm income gradually improved. But not until 1941 did it reach even the inadequate level of 1929.

National Industrial Recovery Act

The demand of businessmen for government stabilization and of labour for a shorter workweek led Roosevelt to recommend to Congress the National Industrial Recovery Act (NIRA) of 1933. It was a two-pronged program. On one side was a \$3,300,000,000 appropriation for public works. Had this money been poured into the economy rapidly, it would probably have done much to bring recovery, but Roosevelt wanted to be sure it would be spent soundly on self-liquidating public works, through the Public Works Administration (PWA). Because careful planning took time, the PWA did not become an important factor until late in the New Deal. On the other side of the NIRA was a National Recovery Administration (NRA), to administer codes of fair practice within given industries. At first under a "blanket code," then under specific codes negotiated by representatives of each industry and labour, minimum wages, maximum hours, and fair trade practices were established within each industry. The codes were designed to stabilize production, raise prices, and protect labour and consumers. Consumers received scant protection, but labour received guarantees on wages and hours and also the right to bargain collectively. During the summer of 1933 there was a quick flurry of recovery as manufacturers produced goods in anticipation of sale at higher prices under the codes; the boom collapsed by fall because prices had risen faster than purchasing power.

By February 1934 the code making was over, but far too many—557 basic codes and 208 supplementary ones—had come into existence, containing innumerable provi-

sions that were difficult to enforce. By 1935 the business community, which had demanded the NRA at the outset, was becoming disillusioned with it and blaming Roosevelt for its ineffectiveness. In May the Supreme Court, in the *Schechter* decision, invalidated the code system. Despite shortcomings, however, the NRA had aided several highly competitive industries, such as textiles, and brought reforms that were re-enacted in other legislation: federal wages-and-hours regulation, collective-bargaining guarantees, and abolition of child labour in interstate commerce.

In the fall of 1933 Roosevelt had already turned to other expedients for bolstering the economy. He experimented with "managed currency," driving down the gold content of the dollar and tripling the price of silver through large purchases. These efforts brought only small price increases at home, but they improved the position of the United States in foreign trade by making dollars cheaper abroad. In January 1934 Roosevelt stabilized the gold content of the dollar at 59.06 percent of its earlier value. Managed currency created a significant precedent, even though it did little to bring recovery at the time.

Altogether, by the fall of 1934 Roosevelt's program was bringing a limited degree of recovery, but it was alienating conservatives, including many businessmen. They contended that much of the program was unconstitutional, that it created uncertainties for business that hampered recovery, and that the lowering of the gold content of the dollar had deprived holders of government obligations of their just return. At the same time, many of the underprivileged who were still in serious difficulties felt that the New Deal had not gone far enough. They were ready to listen to demagogic leaders offering still more. In the 1934 mid-term election they voted overwhelmingly for Democratic candidates for Congress; but there was a danger that in the 1936 presidential election they might vote for a third-party candidate to the left of Roosevelt.

Reform measures. To meet the threat to his political coalition from the left, Roosevelt emphasized reform in his annual message to Congress in January 1935. This was less a shift from a first to a second New Deal than it was a rush to enact reform measures that Roosevelt had long been planning. In 1933 he had obtained the Tennessee Valley Authority (TVA), to provide flood control, cheap hydroelectric power, and regional planning for an impoverished region. At his recommendation also, Congress had enacted two laws to protect investors: the Truth-in-Securities Act of 1933 and an act establishing the regulatory Securities and Exchange Commission (SEC) in 1934.

Additional legislation in 1935 did much to undermine the appeal of demagogues to the needy, especially the Social Security Act, which included unemployment insurance and old-age insurance. For workers still unemployed, Congress created the Works Progress Administration (WPA), to provide relief that would stem the erosion of their skills and self-respect (between 1935 and 1941 the WPA employed an average of 2,100,000 workers, and by the end of 1935 it was already bringing a marked measure of recovery by pouring billions of dollars into the economy). For workers who were employed, the National Labor Relations Act (the Wagner Act), only belatedly accepted by Roosevelt, strengthened the government guarantees of collective bargaining and created a National Labor Relations Board (NLRB) to adjudicate labour disputes. The Public Utility Holding Company Act, also of 1935, regulated the control holding companies had over operating public utility companies. A new 1935 tax measure, labelled by its opponents the "soak-the-rich" tax, raised the levies on persons with large incomes and on big corporations and became a significant factor in redistributing U.S. income.

Second term. These measures effectively undercut the left-wing opposition to Roosevelt, but they further alienated conservatives. He ran for reelection in 1936 with the firm support of farmers, labourers, and the underprivileged; and the epithets that the extreme right hurled at him merely helped unify his following. The Republican nominee, Gov. Alfred Mossman Landon of Kansas, a moderate, could do little to stem the Roosevelt tide. Roosevelt received 27,752,000 popular votes to Landon's 16,680,000 and carried every state except Maine and Vermont.

Opposition from the right and left

Reelection in 1936

Supreme Court fight. The only hope of conservatives to thwart the New Deal was for the Supreme Court to invalidate its key measures. Following the Schechter decision, the court in 1936 ruled against the AAA processing taxes, and cases challenging the Social Security Act and the Wagner Act were also pending. Roosevelt, beginning his second term with a massive mandate, was determined to remove this threat. Believing that the measures were well within the scope of the Constitution and that the reasoning of the justices was old-fashioned and at fault, he proposed early in 1937 the reorganization of the court, including the appointment of as many as six new justices. The proposal, labelled by opponents as a courtpacking scheme, touched off a vehement debate in which many of Roosevelt's previous supporters in and out of Congress expressed their opposition. Meanwhile, in the spring of 1937, the Supreme Court upheld both the Wagner Act and the Social Security Act. With the need for the court plan dissolving, its enemies managed by summer to bring about its defeat. This was a severe political blow for Roosevelt, even though the new decisions by the court opened the way for almost unlimited government regulation of the economy.

Growing opposition. Roosevelt's prestige dropped further in the summer of 1937, when much of the public blamed him for labour difficulties that grew out of organizing drives in the steel, automobile, and other mass-production industries. Operating under the protection of the Wagner Act, the unions engaged in strikes that often resulted in violence. Roosevelt himself preferred paternalistic government aid to all workers, such as the wages-and-hours guarantees of the Fair Labor Standards Act of 1938. But union membership jumped to about 9,500,000 by 1941, while most middle class people returned to the Republican Party.

A sharp economic recession in the fall of 1937 added to Roosevelt's troubles. There had been substantial recovery by 1937; but Roosevelt, wishing to balance the budget, had curtailed government spending drastically, sending the economy plummeting back toward 1932 levels. Businessmen blamed the New Deal spending policies; Roosevelt blamed the businessmen and inaugurated an antimonopoly program. In October 1937 massive government spending began again, and by June 1938 the crisis was past.

From 1938 on, many of the conservative Southern Democrats heading key congressional committees openly opposed the New Deal. In 1938 Roosevelt tried unsuccessfully to defeat several of them in the primaries and was inveighed against as a dictator trying to conduct a "purge." Democrats won the November elections, but the Republicans gained 80 seats in the House and seven in the Senate, permitting a coalition of Republicans and conservative Democrats that could thwart the President.

Nevertheless, the second Roosevelt administration saw the passage of some notable reform legislation, extending and improving earlier legislation and moving into some new fields. The development of soil conservation to stem erosion and the large-scale construction of public works, including public housing and slum clearance, also occurred during these years. Many New Deal innovations, such as social security, the agricultural program, the TVA, and the SEC, had now become accepted as permanent functions of the federal government.

Foreign policy. By 1939 foreign policy was overshadowing domestic policy. Even before taking office, Roosevelt had endorsed Hoover's refusal to recognize Japanese conquests in Manchuria. From the outset of his administration, Roosevelt was deeply involved in foreign-policy questions, mostly relating to the Depression. In the early summer of 1933 he refused to support international currency stabilization at the London Economic Conference, but by 1934 he had stabilized the dollar and had begun helping France and Great Britain to keep their currencies from being undermined by dictator nations. In November 1933 Roosevelt recognized the government of the Soviet Union in the mistaken hope that he could thus promote trade. Greater opportunities seemed to exist in negotiating reciprocal trade agreements with numerous nations—a program that began in 1935—and in fostering more

cordial relations with Latin American nations. In his first inaugural address Roosevelt had pledged himself to the "policy of the good neighbor." Secretary of State Cordell Hull had interpreted this to mean no unilateral U.S. intervention in Latin America; but, gradually, as European war became imminent, the Good Neighbor Policy led to collective-security and mutual-defense agreements.

In the early New Deal years, Roosevelt not only pursued programs of economic nationalism but, like most Americans, was also intent upon keeping the United States out of any impending war. He thus supported a series of neutrality laws, beginning with the Neutrality Act of August 1935. Roosevelt moved toward a new policy in 1937, after Japan began a major thrust into northern China. In October, speaking in Chicago, he proposed that peace-loving nations make concerted efforts to quarantine aggressors. He seemed to mean nothing more drastic than the breaking off of diplomatic relations, but the proposal created such national alarm that during ensuing months he was slow to develop a collective-security position. He quickly accepted Japanese apologies when the U.S. gunboat "Panay" was sunk on the Yangtze River in December 1937. Relations between the United States and Japan gradually worsened, but the rapid domination of Europe by Adolf Hitler of Germany was more threatening.

The outbreak of war. When World War II began in Europe in September 1939, Roosevelt called Congress into special session to revise the Neutrality Act to permit belligerents to buy arms on a "cash-and-carry" basis. With Hitler's aggressions and the fall of France in the spring and early summer of 1940, Roosevelt and Congress turned to defense preparations and "all aid short of war" to Great Britain. Roosevelt even gave Great Britain 50 overage destroyers in exchange for eight Western Hemisphere bases. Isolationists, fearing U.S. involvement in the war, debated hotly with those who felt the national self-interest demanded aid to Britain.

The third and fourth terms. In the 1940 presidential campaign the Republicans nominated Wendell L. Willkie, who agreed with Roosevelt's foreign policy. Both candidates pledged to keep the nation out of foreign war; but isolationists tended to support Willkie, while those favouring strong measures against Hitler swung toward Roosevelt. By a closer margin than before—27,244,000 to 22,305,000 popular votes and 449 electoral votes to 82—Roosevelt was elected to an unprecedented third term.

Through 1941 the nation moved gradually closer toward actual belligerency with Germany. After a bitter debate in Congress, Roosevelt in March 1941 obtained the Lend-Lease Act, enabling the United States to finance aid to Great Britain and its allies. Preventing submarines from sinking goods en route to Europe gradually involved more drastic protection by the U.S. Navy; in the fall Roosevelt authorized the navy to "shoot on sight" at German submarines. Meanwhile, in August, on a battleship off Newfoundland, Roosevelt met with Prime Minister Winston Churchill of Great Britain and signed a joint press release proclaiming an Atlantic Charter to provide national self-determination, greater economic opportunities, freedom from fear and want, freedom of the seas, and disarmament.

U.S. entry into the war. Yet it was in the Pacific that war came to the United States. Japan, bound in a treaty of alliance with Germany and Italy, the so-called Axis, extended its empire in East Asia. Roosevelt, viewing these moves as part of Axis world aggression, began to deny Japan supplies essential to its war making. Throughout 1941 the United States negotiated with Japan, but proposals by each side were unsatisfactory. Roosevelt did not want war with Japan in the fall of 1941, but he miscalculated in thinking the Japanese were bluffing. By the end of November he knew that Japanese fleet units and transports were at sea and that war was imminent; an attack in Southeast Asia and perhaps on the Philippines seemed likely. To Roosevelt's angered surprise, the Japanese, on December 7, 1941, struck Pearl Harbor, Hawaii. On December 8, at Roosevelt's request, Congress voted a war resolution within four hours; on December 11, Germany and Italy declared war on the United States.

Roosevelt made concessions to the conservatives in

Good Neighbor Policy

Reelection in 1940

Congress in order to obtain support in prosecuting the war. Several New Deal agencies were abolished. At a press conference Roosevelt asserted that "Dr. Win the War" had replaced "Dr. New Deal" but that this was to be only for the duration of the war. Roosevelt also fought resourcefully although not always successfully against inflationary pressures.

One of the immediate problems after Pearl Harbor was to build up massive production for war. Roosevelt had begun experimenting in 1939 with various defense agencies to mobilize the economy. Eventually, a workable organization had evolved. At the time of Pearl Harbor, U.S. war production was already nearly as great as that of Germany and Japan combined; by 1944 it was double the total of all Axis nations.

Relations with allies. During the war, Roosevelt concentrated upon problems of strategy, negotiations with the nation's allies, and the planning of the peace. From the outset, he took the lead in establishing a grand alliance among all countries fighting the Axis.

Roosevelt met with Churchill in a number of wartime conferences at which differences were settled amicably. Debate at the earlier conferences centred upon the question of a landing in France, which the British succeeded in postponing repeatedly; the great Normandy invasion was finally launched in June 1944. Meanwhile, the United States had followed the British lead in invading North Africa in November 1942, Sicily in July 1943, and Italy in September 1943. At one of the most significant of the meetings, at Casablanca, Morocco, in January 1943, Roosevelt, after previous consultation with Churchill, proclaimed the doctrine of unconditional surrender of the Axis. He seemed to want to avoid the sort of differences of opinion among the Allies and misunderstanding by the Germans that had made trouble at the time of the 1918 Armistice. There is no tangible evidence that the doctrine in any way lengthened the war.

Relations with the Soviet Union posed a difficult problem for Roosevelt. Throughout the war the Soviet Union accepted large quantities of lend-lease supplies but seldom divulged its military plans or acted in coordination with its Western Allies. Roosevelt, feeling that the maintenance of peace after the war depended upon friendly relations with the Soviet Union, hoped to win Joseph Stalin's confidence. Roosevelt seemed to get along well with Stalin when he and Churchill first met with the Soviet leader at Teheran, Iran, in November 1943. In their optimism, Roosevelt and Churchill seemed not to see realistically that the sort of peace being foreshadowed at Teheran would leave the Soviet Union dominant in Europe.

Meanwhile, the Axis had been suffering serious defeats in both Europe and the Pacific. By February 1945, when the Big Three met again at Yalta in the Crimea, the war seemed almost over in Europe. As for Japan, the United States expected a last-ditch defense that might require another 18 months or more of fighting. Work in developing an atomic bomb was well advanced, but its power was expected to be only a fraction of what it actually turned out to be. Consequently, Roosevelt and his military advisers were eager to obtain Soviet aid in Asia; and, in return for Stalin's promise to enter the war against Japan, Roosevelt and Churchill offered concessions in the Far East. As for eastern Europe, earlier decisions were ratified, and plans were made for the establishment of democratic govern-

ments. Had the arrangements for eastern Europe been followed by Stalin in the manner expected by Roosevelt and Churchill, there would have been little room for criticism. But the understandings were not precise enough, and they received different interpretations in the Soviet Union. By mid-March false Soviet accusations against the United States led Roosevelt to send a sharp telegram to Stalin.

Declining health and death. Roosevelt hoped that the establishment of an effective international organization, the United Nations, could maintain the peace in years to come. He planned to attend a conference of 50 nations at San Francisco, opening April 25, 1945, to draft a United Nations charter. But, since January 1944, his health had been declining. His political opponents had tried to make much of this during the campaign of 1944, when he ran for a fourth term against Gov. Thomas E. Dewey of New York. A final burst of vigour on Roosevelt's part, however, seemed to refute the rumours. Roosevelt won by 25,602,000 to 22,006,000 in popular votes and 432 to 99 in electoral votes. But his address to Congress after he returned from Yalta had to be delivered sitting down. He went to Warm Springs for a rest, and there, on April 12, 1945, he died of a massive cerebral hemorrhage.

Reelection
in 1944

EVALUATION

During Roosevelt's years as president, he had relatively little time for personal life. He continued his interest in his lands at Hyde Park. His zest for sailing and his enjoyment in collecting stamps and naval books and prints continued unabated. His tight schedule and the incessant publicity imposed upon him limited the time he could give to his wife, who became an important figure in her own right, and to his five children: Anna Eleanor, James, Elliott, Franklin D., Jr., and John A. As a public figure he was, at the same time, one of the most loved and most hated men in U.S. history. Opponents ascribed to him shallowness, incompetence, trickiness, and dictatorial ambitions. His supporters hailed him as the saviour of his nation's economy and the defender of democracy not only in the United States but throughout the world. It was generally conceded that as a political leader he was unexcelled in winning and holding popular support and in retaining, in his administration, leaders of diverse views. Many experts have expressed the opinion that despite occasional confusion and overlapping authority, his administration was unusually effective. He brought even more than this to the office: in 1932 he stated what remained his view through peace and war, "The Presidency . . . is pre-eminently a place of moral leadership." (F.Fr.)

BIBLIOGRAPHY. SAMUEL I. ROSENMAN (ed.), *The Public Papers and Addresses of Franklin D. Roosevelt*, 13 vol. (1938-50, reprinted 1969), contains official statements. JAMES M. BURNS, *Roosevelt*, 2 vol. (1956-70); and FRANK B. FREIDEL, *Franklin D. Roosevelt*, 4 vol. of a projected six-volume work (begun in 1952), are the most detailed biographies. ARTHUR M. SCHLESINGER, JR., *The Age of Roosevelt*, 3 vol. (1957-60), is a brilliant survey both of the man and of the years 1919-36; WILLIAM E. LEUCHTENBERG, *Franklin D. Roosevelt and the New Deal, 1932-1940* (1963), is an authoritative brief account. See also ROBERT DALLEK, *Franklin D. Roosevelt: A Selected Bibliography of Periodical, Essay, and Dissertation Literature, 1945-1971*, 2nd ed. (1974).

Wartime
leader

Jean-Jacques Rousseau

Jean-Jacques Rousseau, the least academic of modern philosophers, was in many ways the most influential. His thought marked the end of the Age of Reason and the birth of Romanticism. He propelled political and ethical thinking into new channels. His reforms revolutionized taste, first in music, then in the other arts. He had a profound impact on people's way of life; he taught parents to take a new interest in their children and to educate them differently; he furthered the expression of emotion rather than polite restraint in friendship and love. He introduced the cult of religious sentiment among people who had discarded religious dogma. He opened men's eyes to the beauties of nature, and he made liberty an object of almost universal aspiration.

Rousseau, drawing in pastels by Maurice-Quentin de La Tour, 1753. In the Musée d'Art et d'Histoire, Geneva.

Formative years. Rousseau was born in Geneva—the city of Calvin—on June 28, 1712. His mother died in childbirth and he was brought up by his father, who taught him to believe that the city of his birth was a republic as splendid as Sparta or ancient Rome. Rousseau senior had an equally glorious image of his own importance; after marrying above his modest station as a watchmaker, he got into trouble with the civil authorities by brandishing the sword that his upper-class pretensions prompted him to wear, and he had to leave Geneva to avoid imprisonment. Rousseau, the son, then lived for six years as a poor relation in his mother's family, patronized and humiliated, until he, too, at the age of 16, fled from Geneva to live the life of an adventurer and a Roman Catholic convert in the kingdoms of Sardinia and France.

Rousseau was fortunate in finding in the province of Savoy a benefactress named the Baronne de Warens, who provided him with a refuge in her home and employed him as her steward. She also furthered his education to such a degree that the boy who had arrived on her doorstep as a stammering apprentice who had never been to school developed into a philosopher, a man of letters, and a musician.

Mme de Warens, who thus transformed the adventurer into a philosopher, was herself an adventuress—a Swiss convert to Catholicism who had stripped her husband of his money before fleeing to Savoy with the gardener's son to set herself up as a Catholic missionary specializing in the conversion of young male Protestants. Her morals distressed Rousseau, even when he became her lover. But

she was a woman of taste, intelligence, and energy, who brought out in Rousseau just the talents that were needed to conquer Paris at a time when Voltaire had made radical ideas fashionable.

Rousseau reached Paris when he was 30 and was lucky enough to meet another young man from the provinces seeking literary fame in the capital, Denis Diderot. The two soon became immensely successful as the centre of a group of intellectuals—or “Philosophes”—who gathered round the great French *Encyclopédie*, of which Diderot was appointed editor. The *Encyclopédie* was an important organ of radical and anticlerical opinion, and its contributors were as much reforming and even iconoclastic pamphleteers as they were philosophers. Rousseau, the most original of them all in his thinking and the most forceful and eloquent in his style of writing, was soon the most conspicuous. He wrote music as well as prose, and one of his operas, *Le Devin du village* (1752; *The Cunning-Man*), attracted so much admiration from the king and the court that he might have enjoyed an easy life as a fashionable composer, but something in his Calvinist blood rejected this type of worldly glory. Indeed, at the age of 37 Rousseau had what he called an “illumination” while walking to Vincennes to visit Diderot, who had been imprisoned there because of his irreligious writings. In the *Confessions*, which he wrote late in life, Rousseau says that it came to him then in a “terrible flash” that modern progress had corrupted instead of improved men. He went on to write his first important work, a prize essay for the Academy of Dijon entitled *Discours sur les sciences et les arts* (1750; *A Discourse on the Sciences and the Arts*), in which he argues that the history of man's life on earth has been a history of decay.

This *Discourse* is by no means Rousseau's best piece of writing, but its central theme was to inform almost everything else he wrote. Throughout his life he kept returning to the thought that man is good by nature but has been corrupted by society and civilization. He did not mean to suggest that society and civilization were inherently bad but rather that both had taken a wrong direction and become more harmful as they had become more sophisticated. This idea in itself was not unfamiliar when Rousseau published his *Discourse on the Sciences and the Arts*. Many Roman Catholic writers deplored the direction that European culture had taken since the Middle Ages. They shared the hostility toward progress that Rousseau had expressed. What they did not share was his belief that man was naturally good. It was, however, just this belief in man's natural goodness that Rousseau made the cornerstone of his argument.

Rousseau may well have received the inspiration for this belief from Mme de Warens; for although that unusual woman had become a communicant of the Roman Catholic Church, she retained—and transmitted to Rousseau—much of the sentimental optimism about human purity that she had herself absorbed as a child from the mystical Protestant Pietists who were her teachers in the canton of Bern. At all events, the idea of man's natural goodness, as Rousseau developed it, set him apart from both conservatives and radicals. Even so, for several years after the publication of his first *Discourse*, he remained a close collaborator in Diderot's essentially progressive enterprise, the *Encyclopédie*, and an active contributor to its pages. His speciality there was music, and it was in this sphere that he first established his influence as reformer.

Controversy with Rameau. The arrival of an Italian opera company in Paris in 1752 to perform works of *opera buffa* by Pergolesi, Scarlatti, Vinci, Leo, and other such composers suddenly divided the French music-loving public into two excited camps, supporters of the new Italian opera and supporters of the traditional French opera. The

The natural goodness of man

Italian vs. French music

Mme de Warens

Philosophes of the *Encyclopédie*—d'Alembert, Diderot, and d'Holbach among them—entered the fray as champions of Italian music, but Rousseau, who had arranged for the publication of Pergolesi's music in Paris and who knew more about the subject than most Frenchmen after the months he had spent visiting the opera houses of Venice during his time as secretary to the French ambassador to the doge in 1743–44, emerged as the most forceful and effective combatant. He was the only one to direct his fire squarely at the leading living exponent of French operatic music, Jean-Philippe Rameau.

Rousseau and Rameau must at that time have seemed unevenly matched in a controversy about music. Rameau, already in his 70th year, was not only a prolific and successful composer but was also, as the author of the celebrated *Traité de l'harmonie* (1722; *Treatise on Harmony*) and other technical works, Europe's leading musicologist. Rousseau, by contrast, was 30 years younger, a newcomer to music, with no professional training and only one successful opera to his credit. His scheme for a new notation for music had been rejected by the Academy of Sciences, and most of his musical entries for Diderot's *Encyclopédie* were as yet unpublished. Yet the dispute was not only musical but also philosophical, and Rameau was confronted with a more formidable adversary than he had realized. Rousseau built his case for the superiority of Italian music over French on the principle that melody must have priority over harmony, whereas Rameau based his on the assertion that harmony must have priority over melody. By pleading for melody, Rousseau introduced what later came to be recognized as a characteristic idea of Romanticism, namely, that in art the free expression of the creative spirit is more important than strict adherence to formal rules and traditional procedures. By pleading for harmony, Rameau reaffirmed the first principle of French Classicism, namely, that conformity to rationally intelligible rules is a necessary condition of art, the aim of which is to impose order on the chaos of human experience.

In music, Rousseau was a liberator. He argued for freedom in music, and he pointed to the Italian composers as models to be followed. In doing so he had more success than Rameau; he changed people's attitudes. Gluck, who succeeded Rameau as the most important operatic composer in France, acknowledged his debt to Rousseau's teaching, and Mozart based the text for his one-act opera *Bastien und Bastienne* on Rousseau's *Devin du village*. European music had taken a new direction. But Rousseau himself composed no more operas. Despite the success of *Le Devin du village*, or rather because of its success, Rousseau felt that, as a moralist who had decided to make a break with worldly values, he could not allow himself to go on working for the theatre. He decided to devote his energies henceforth to literature and philosophy.

Major works of political philosophy. As part of what Rousseau called his "reform," or improvement of his own character, he began to look back at some of the austere principles that he had learned as a child in the Calvinist republic of Geneva. Indeed he decided to return to that city, repudiate his Catholicism, and seek readmission to the Protestant church. He had in the meantime acquired a mistress, an illiterate laundry maid named Thérèse Levasseur. To the surprise of his friends, he took her with him to Geneva, presenting her as a nurse. Although her presence caused some murmurings, Rousseau was readmitted easily to the Calvinist communion, his literary fame having made him very welcome to a city that prided itself as much on its culture as on its morals.

Rousseau had by this time completed a second *Discourse* in response to a question set by the Academy of Dijon: "What is the origin of the inequality among men and is it justified by natural law?" In response to this challenge he produced a masterpiece of speculative anthropology. The argument follows on that of his first *Discourse* by developing the proposition that natural man is good and then tracing the successive stages by which man has descended from primitive innocence to corrupt sophistication.

Rousseau begins his *Discours sur l'origine de l'inégalité* (1755; *Discourse on the Origin of Inequality*) by distinguishing two kinds of inequality, natural and artificial, the

first arising from differences in strength, intelligence, and so forth, the second from the conventions that govern societies. It is the inequalities of the latter sort that he sets out to explain. Adopting what he thought the properly "scientific" method of investigating origins, he attempts to reconstruct the earliest phases of man's experience of life on earth. He suggests that original man was not a social being but entirely solitary, and to this extent he agrees with Hobbes's account of the state of nature. But in contrast to the English pessimist's view that the life of man in such a condition must have been "poor, nasty, brutish and short," Rousseau claims that original man, while admittedly solitary, was healthy, happy, good, and free. The vices of men, he argues, date from the time when men formed societies.

Rousseau thus exonerates nature and blames society for the emergence of vices. He says that passions that generate vices hardly exist in the state of nature but begin to develop as soon as men form societies. Rousseau goes on to suggest that societies started when men built their first huts, a development that facilitated cohabitation of males and females; this in turn produced the habit of living as a family and associating with neighbours. This "nascent society," as Rousseau calls it, was good while it lasted; it was indeed the "golden age" of human history. Only it did not endure. With the tender passion of love there was also born the destructive passion of jealousy. Neighbours started to compare their abilities and achievements with one another, and this "marked the first step towards inequality and at the same time towards vice." Men started to demand consideration and respect; their innocent self-love turned into culpable pride, as each man wanted to be better than everyone else.

The introduction of property marked a further step toward inequality since it made it necessary for men to institute law and government in order to protect property. Rousseau laments the "fatal" concept of property in one of his more eloquent passages, describing the "horrors" that have resulted from men's departure from a condition in which the earth belonged to no one. These passages in his second *Discourse* excited later revolutionaries such as Marx and Lenin, but Rousseau himself did not think that the past could be undone in any way; there was no point in men dreaming of a return to the golden age.

Civil society, as Rousseau describes it, comes into being to serve two purposes: to provide peace for everyone and to ensure the right to property for anyone lucky enough to have possessions. It is thus of some advantage to everyone, but mostly to the advantage of the rich, since it transforms their de facto ownership into rightful ownership and keeps the poor dispossessed. It is a somewhat fraudulent social contract that introduces government since the poor get so much less out of it than do the rich. Even so, the rich are no happier in civil society than are the poor because social man is never satisfied. Society leads men to hate one another to the extent that their interests conflict, and the best they are able to do is to hide their hostility behind a mask of courtesy. Thus Rousseau regards the inequality between men not as a separate problem but as one of the features of the long process by which men become alienated from nature and from innocence.

In the dedication Rousseau wrote for the *Discourse*, in order to present it to the republic of Geneva, he nevertheless praises that city-state for having achieved the ideal balance between "the equality which nature established among men and the inequality which they have instituted among themselves." The arrangement he discerned in Geneva was one in which the best men were chosen by the citizens and put in the highest positions of authority. Like Plato, Rousseau always believed that a just society was one in which everyone was in his right place. And having written the *Discourse* to explain how men had lost their liberty in the past, he went on to write another book, *Du Contrat social* (1762; *The Social Contract*), to suggest how they might recover their liberty in the future. Again Geneva was the model; not Geneva as it had become in 1754 when Rousseau returned there to recover his rights as a citizen, but Geneva as it had once been; i.e., Geneva as Calvin had designed it.

Argument
of the
*Discourse
on the
Origin of
Inequality*

Geneva as
a model
for a just
society

The Social Contract begins with the sensational opening sentence: "Man was born free, but he is everywhere in chains," and proceeds to argue that men need not be in chains. If a civil society, or state, could be based on a genuine social contract, as opposed to the fraudulent social contract depicted in the *Discourse on the Origin of Inequality*, men would receive in exchange for their independence a better kind of freedom, namely true political, or republican, liberty. Such liberty is to be found in obedience to a self-imposed law.

Rousseau's definition of political liberty raises an obvious problem. For while it can be readily agreed that an individual is free if he obeys only rules he prescribes for himself, this is so because an individual is a person with a single will. A society, by contrast, is a set of persons with a set of individual wills, and conflict between separate wills is a fact of universal experience. Rousseau's response to the problem is to define his civil society as an artificial person united by a general will, or *volonté générale*. The social contract that brings society into being is a pledge, and the society remains in being as a pledged group. Rousseau's republic is a creation of the general will—of a will that never falters in each and every member to further the public, common, or national interest—even though it may conflict at times with personal interest.

Rousseau sounds very much like Hobbes when he says that under the pact by which men enter civil society everyone totally alienates himself and all his rights to the whole community. Rousseau, however, represents this act as a form of exchange of rights whereby men give up natural rights in return for civil rights. The bargain is a good one because what men surrender are rights of dubious value, whose realization depends solely on an individual man's own might, and what they obtain in return are rights that are both legitimate and enforced by the collective force of the community.

There is no more haunting paragraph in *The Social Contract* than that in which Rousseau speaks of "forcing a man to be free." But it would be wrong to interpret these words in the manner of those critics who see Rousseau as a prophet of modern totalitarianism. He does not claim that a whole society can be forced to be free but only that an occasional individual, who is enslaved by his passions to the extent of disobeying the law, can be restored by force to obedience to the voice of the general will that exists inside of him. The man who is coerced by society for a breach of the law is, in Rousseau's view, being brought back to an awareness of his own true interests.

For Rousseau there is a radical dichotomy between true law and actual law. Actual law, which he describes in the *Discourse on the Origin of Inequality*, simply protects the status quo. True law, as described in *The Social Contract*, is just law, and what ensures its being just is that it is made by the people in its collective capacity as sovereign and obeyed by the same people in their individual capacities as subjects. Rousseau is confident that such laws could not be unjust because it is inconceivable that any people would make unjust laws for itself.

Rousseau is, however, troubled by the fact that the majority of a people does not necessarily represent its most intelligent citizens. Indeed, he agrees with Plato that most people are stupid. Thus the general will, while always morally sound, is sometimes mistaken. Hence Rousseau suggests the people need a lawgiver—a great mind like Solon or Lycurgus or Calvin—to draw up a constitution and system of laws. He even suggests that such lawgivers need to claim divine inspiration in order to persuade the dim-witted multitude to accept and endorse the laws it is offered.

This suggestion echoes a similar proposal by Machiavelli, a political theorist Rousseau greatly admired and whose love of republican government he shared. An even more conspicuously Machiavellian influence can be discerned in Rousseau's chapter on civil religion, where he argues that Christianity, despite its truth, is useless as a republican religion on the grounds that it is directed to the unseen world and does nothing to teach citizens the virtues that are needed in the service of the state, namely, courage, virility, and patriotism. Rousseau does not go so far as

Machiavelli in proposing a revival of pagan cults, but he does propose a civil religion with minimal theological content designed to fortify and not impede (as Christianity impedes) the cultivation of martial virtues. It is understandable that the authorities of Geneva, profoundly convinced that the national church of their little republic was at the same time a truly Christian church and a nursery of patriotism, reacted angrily against this chapter in Rousseau's *Social Contract*.

By the year 1762, however, when *The Social Contract* was published, Rousseau had given up any thought of settling in Geneva. After recovering his citizen's rights in 1754, he had returned to Paris and the company of his friends around the *Encyclopédie*. But he became increasingly ill at ease in such worldly society and began to quarrel with his fellow Philosophes. An article for the *Encyclopédie* on the subject of Geneva, written by d'Alembert at Voltaire's instigation, upset Rousseau partly by suggesting that the pastors of the city had lapsed from Calvinist severity into unitarian laxity and partly by proposing that a theatre should be erected there. Rousseau hastened into print with a defense of the Calvinist orthodoxy of the pastors and with an elaborate attack on the theatre as an institution that could only do harm to an innocent community such as Geneva.

Years of seclusion and exile. By the time his *Lettre à d'Alembert sur les spectacles* (1758; *Letter to Monsieur d'Alembert on the Theatre*) appeared in print, Rousseau had already left Paris to pursue a life closer to nature on the country estate of his friend Mme d'Épinay near Montmorency. When the hospitality of Mme d'Épinay proved to entail much the same social round as that of Paris, Rousseau retreated to a nearby cottage, called Montlouis, under the protection of the Maréchal de Luxembourg. But even this highly placed friend could not save him in 1762 when his treatise on education, *Émile*, was published and scandalized the pious Jansenists of the French Parlements even as *The Social Contract* scandalized the Calvinists of Geneva. In Paris, as in Geneva, they ordered the book to be burned and the author arrested; all the Maréchal de Luxembourg could do was to provide a carriage for Rousseau to escape from France. Rousseau spent the rest of his life as a fugitive moving from one refuge to another.

The years at Montmorency had been the most productive of his literary career; besides *The Social Contract* and *Émile*, *Julie: ou, la nouvelle Héloïse* (1761; *Julie: or, The New Eloise*) came out within 12 months, all three works of seminal importance. *The New Eloise*, being a novel, escaped the censorship to which the other two works were subject; indeed of all his books it proved to be the most widely read and the most universally praised in his lifetime. It develops the Romanticism that had already informed his writings on music and perhaps did more than any other single work of literature to influence the spirit of its age. It made the author at least as many friends among the reading public—and especially among educated women—as *The Social Contract* and *Émile* made enemies among magistrates and priests. If it did not exempt him from persecution, at least it ensured that his persecution was observed, and admiring femmes du monde intervened from time to time to help him so that Rousseau was never, unlike Voltaire and Diderot, actually imprisoned.

The theme of *The New Eloise* provides a striking contrast to that of *The Social Contract*. It is about people finding happiness in domestic as distinct from public life, in the family as opposed to the state. The central character, Saint-Preux, is a middle-class preceptor who falls in love with his upper-class pupil, Julie. She returns his love and yields to his advances, but the difference between their classes makes marriage between them impossible. Baron d'Étange, Julie's father, has indeed promised her to a fellow nobleman named Wolmar. As a dutiful daughter, Julie marries Wolmar and Saint-Preux goes off on a voyage around the world with an English aristocrat, Bomston, from whom he acquires a certain stoicism. Julie succeeds in forgetting her feelings for Saint-Preux and finds happiness as wife, mother, and chatelaine. Some six years later Saint-Preux returns from his travels and is engaged as tutor to the Wolmar children. All live together in harmony,

The

*The New
Eloise*

and there are only faint echoes of the old affair between Saint-Preux and Julie. The little community, dominated by Julie, illustrates one of Rousseau's political principles: that while men should rule the world in public life, women should rule men in private life. At the end of *The New Eloise*, when Julie has made herself ill in an attempt to rescue one of her children from drowning, she comes face-to-face with a truth about herself: that her love for Saint-Preux has never died.

The novel was clearly inspired by Rousseau's own curious relationship—at once passionate and platonic—with Sophie d'Houdetot, a noblewoman who lived near him at Montmorency. He himself asserted in the *Confessions* (1781–88) that he was led to write the book by “a desire for loving, which I had never been able to satisfy and by which I felt myself devoured.” Saint-Preux's experience of love forbidden by the laws of class reflects Rousseau's own experience; and yet it cannot be said that *The New Eloise* is an attack on those laws, which seem, on the contrary, to be given the status almost of laws of nature. The members of the Wolmar household are depicted as finding happiness in living according to an aristocratic ideal. They appreciate the routines of country life and enjoy the beauties of the Swiss and Savoyard Alps. But despite such an endorsement of the social order, the novel was revolutionary; its very free expression of emotions and its extreme sensibility deeply moved its large readership and profoundly influenced literary developments.

Émile is a book that seems to appeal alternately to the republican ethic of *The Social Contract* and the aristocratic ethic of *The New Eloise*. It is also halfway between a novel and a didactic essay. Described by the author as a treatise on education, it is not about schooling but about the upbringing of a rich man's son by a tutor who is given unlimited authority over him. At the same time the book sets out to explore the possibilities of an education for republican citizenship. The basic argument of the book, as Rousseau himself expressed it, is that vice and error, which are alien to a child's original nature, are introduced by external agencies, so that the work of a tutor must always be directed to counteracting those forces by manipulating pressures that will work with nature and not against it. Rousseau devotes many pages to explaining the methods the tutor must use. These methods involve a noticeable measure of deceit, and although corporal punishment is forbidden, mental cruelty is not.

Whereas *The Social Contract* is concerned with the problems of achieving freedom, *Émile* is concerned with achieving happiness and wisdom. In this different context religion plays a different role. Instead of a civil religion, Rousseau here outlines a personal religion, which proves to be a kind of simplified Christianity, involving neither revelation nor the familiar dogmas of the church. In the guise of *La Profession de foi du vicaire savoyard* (1765; *The Profession of Faith of a Savoyard Vicar*) Rousseau sets out what may fairly be regarded as his own religious views, since that book confirms what he says on the subject in his private correspondence. Rousseau could never entertain doubts about God's existence or about the immortality of the soul. He felt, moreover, a strong emotional drive toward the worship of God, whose presence he felt most forcefully in nature, especially in mountains and forests untouched by the hand of man. He also attached great importance to conscience, the “divine voice of the soul in man,” opposing this both to the bloodless categories of rationalistic ethics and to the cold tablets of biblical authority.

This minimal creed put Rousseau at odds with the orthodox adherents of the churches and with the openly atheistic Philosophes of Paris, so that despite the enthusiasm that some of his writings, and especially *The New Eloise*, excited in the reading public, he felt himself increasingly isolated, tormented, and pursued. After he had been expelled from France, he was chased from canton to canton in Switzerland. He reacted to the suppression of *The Social Contract* in Geneva by indicting the regime of that city-state in a pamphlet entitled *Lettres écrites de la montagne* (1764; *Letters Written from the Mountain*). No longer, as in the *Discourse on the Origin of Inequality*, was

Geneva depicted as a model republic but as one that had been taken over by “twenty-five despots”; the subjects of the king of England were said to be free men by comparison with the victims of Genevan tyranny.

It was in England that Rousseau found refuge after he had been banished from the canton of Bern. The Scottish philosopher David Hume took him there and secured the offer of a pension from King George III; but once in England, Rousseau became aware that certain British intellectuals were making fun of him, and he suspected Hume of participating in the mockery. Various symptoms of paranoia began to manifest themselves in Rousseau, and he returned to France incognito. Believing that Thérèse was the only person he could rely on, he finally married her in 1768, when he was 56 years old.

The last decade. In the remaining 10 years of his life Rousseau produced primarily autobiographical writings, mostly intended to justify himself against the accusations of his adversaries. The most important was his *Confessions*, modeled on the work of the same title by St. Augustine and achieving something of the same classic status. He also wrote *Rousseau juge de Jean-Jacques* (1780; “Rousseau, Judge of Jean-Jacques”) to reply to specific charges by his enemies and *Les Rêveries du promeneur solitaire* (1782; *Reveries of the Solitary Walker*), one of the most moving of his books, in which the intense passion of his earlier writings gives way to a gentle lyricism and serenity. And indeed, Rousseau does seem to have recovered his peace of mind in his last years, when he was once again afforded refuge on the estates of great French noblemen, first the Prince de Conti and then the Marquis de Girardin, in whose park at Ermenonville he died on July 2, 1778.

MAJOR WORKS

NOVELS: *Julie: ou, la nouvelle Héloïse* (1761; *Julie: or, The New Eloise*, trans. by Judith H. McDowell, 1968); *Émile: ou, de l'éducation* (1762; *Emile: or, On Education*, trans. by Allan Bloom, 1979).

AUTOBIOGRAPHICAL WORKS: *Rousseau juge de Jean-Jacques: dialogue* (1780); *Les Rêveries du promeneur solitaire* (1782; *The Reveries of the Solitary Walker*, trans. by Charles E. Butterworth, 1979); *Les Confessions* (1782–89; *The Confessions*, trans. by J.M. Cohen, 1953).

ESSAYS: *Discours qui a remporté le prix à l'Académie de Dijon en l'année 1750; sur cette question proposée par la même académie si le rétablissement des sciences et des arts a contribué à épurer les mœurs* (1750; “Discourse on the Sciences and Arts,” trans. by Roger D. Masters and Judith R. Masters, in *The First and Second Discourses*, 1964); *Discours sur l'origine et les fondements de l'inégalité parmi les hommes* (1755; *Discourse on Inequality*, trans. by Maurice Cranston, 1984); *Du Contrat social* (1762; *The Social Contract*, trans. by Maurice Cranston, 1968); *Considérations sur le gouvernement de Pologne* (1782; *The Government of Poland*, trans. by Willmoore Kendall, 1972); *Lettres élémentaires sur la botanique* (1780; *Letters on the Elements of Botany*, trans. by Thomas Martyn, 1785).

LETTERS: *J.J. Rousseau, citoyen de Genève, à M. d'Alembert, sur son article Genève dans le septième volume de l'Encyclopédie, et particulièrement sur le projet d'établir un Théâtre de Comédie en cette ville* (1758; *Politics and the Arts: Letter to M. d'Alembert on the Theatre*, trans. by Allan Bloom, 1960); *Lettres écrites de la montagne* (1764).

COLLECTED WORKS: *Oeuvres complètes*, ed. by Bernard Gagnebin and Marcel Raymond (1959–), will eventually be the definitive collected edition. Four carefully annotated volumes have been published so far. *Oeuvres complètes*, ed. by Michel Launay, 3 vol. (1967–71), is the most comprehensive contemporary edition, but far from complete. In some earlier editions of Rousseau's collected works, published at the end of the 18th and the beginning of the 19th centuries, material can be found that has not been reprinted in the 20th-century collections.

The Correspondance complète de Jean Jacques Rousseau: édition critique, ed. by R.A. Leigh (1965–), of which 43 volumes have so far appeared, wholly supersedes the *Correspondance générale de J.-J. Rousseau*, 20 vol., ed. by Théophile Dufour and Pierre P. Plan (1924–34).

BIBLIOGRAPHY

Bibliography: JEAN SÉNELIER, *Bibliographie générale des oeuvres de Jean-Jacques Rousseau* (1950), is still the best available source. THÉOPHILE DUFOUR, *Recherches bibliographiques sur les oeuvres imprimées de J.J. Rousseau*, 2 vol. (1925, reprinted in 1 vol., 1971), is not entirely superseded by Sénelier's work. ALBERT SCHINZ, *État présent des travaux sur J.-J. Rousseau* (1941, reprinted 1971), includes publications in languages other than

Paranoia
and
marriage

A minimal
creed

French. PETER GAY, *The Party of Humanity* (1963, reissued 1971), contains a critical bibliography in English of Rousseau and his contemporaries. SOCIÉTÉ JEAN-JACQUES ROUSSEAU, GENEVA, *Annales* (irregular), published since 1905, contains reviews of all important publications in several languages, concerning Rousseau. HERMINE DE SOUSSURE, *Rousseau et les manuscrits des Confessions* (1958), and *Étude sur le sort des manuscrits de J.-J. Rousseau* (1974), provide information on the whereabouts of Rousseau's manuscripts.

Biographies: JEAN GUÉHENNO, *Jean-Jacques Rousseau*, 2 vol. (1966; originally published in French, 1948–52; new ed. 1983), is still the most comprehensive biography. LESTER G. CROCKER, *Jean-Jacques Rousseau*, 2 vol. (1968–73), is a detailed but somewhat hostile biographical study; as is FREDERICK C. GREEN, *Jean-Jacques Rousseau: A Critical Study of His Life and Writings* (1955, reprinted 1970). BERNARDIN DE SAINT-PIERRE, *La Vie et les ouvrages de Jean-Jacques Rousseau*, ed. from the author's unfinished manuscript by MAURICE SOURIAU (1907), is the only biography by an author who knew Rousseau personally. LOUIS J. COURTOIS, *Chronologie critique de la vie et des oeuvres de Jean-Jacques Rousseau* (1924, reprinted 1973), sets out the events of Rousseau's life in chronological order; as does, on a smaller scale and in English, GEORGE R. HAVENS, *Jean-Jacques Rousseau* (1978). MAURICE CRANSTON, *Jean-Jacques: The Early Life and Work of Jean-Jacques Rousseau, 1712–1754* (1983), is based on original manuscript sources but covers only the first 42 years of Rousseau's life. WILLIAM H. BLANCHARD, *Rousseau and the Spirit of Revolt* (1967); and JACQUES BOREL, *Génie et folie de Jean-Jacques Rousseau* (1966), are both Freudian biographies; while RONALD GRIMSLEY, *Jean-Jacques Rousseau: A Study in Self-Awareness*, 2nd ed. (1969), discusses the psychological aspects of Rousseau's *Confessions* from a more philosophical perspective. DANIEL MORNET, *Rousseau, l'homme et l'oeuvre*, 5th ed. (1967), sets out to correct many popular misconceptions about Rousseau's life and work. GASPARD VALLETTE, *Jean-Jacques Rousseau, Genevois* (1911); and J.S. SPINK, *Jean-Jacques Rousseau et Genève* (1934), investigate Rousseau's origins in Geneva. RENÉ HUBERT, *Rousseau et l'Encyclopédie: essai sur la formation des idées politiques de Rousseau, 1742–1756* (1928), examines Rousseau's relations as a young man with the Philosophes of Paris. JULIEN TIERSOT, *J.-J. Rousseau*, 2nd ed. (1920, reprinted 1978), is one of the rare studies of Rousseau's career as a reformer of music. HENRI GUILLEMIN, *Un Homme, deux ombres: (Jean-Jacques, Julie, Sophie)* (1943), discusses Rousseau's relationships with women as reflected in his novels. ELIZABETH A. FOSTER, *Le Dernier Séjour de J.J. Rousseau à Paris* (1921), is an account of Rousseau's last years.

Philosophy: RONALD GRIMSLEY, *The Philosophy of Rousseau* (1973), provides a clear scholarly introduction to Rousseau's philosophical ideas. Other useful introductory commentaries are ERNEST HUNTER WRIGHT, *The Meaning of Rousseau* (1929, reissued 1963); and J.H. BROOME, *Rousseau: A Study of His Thought* (1963). ERNST CASSIRER, *The Question of Jean-Jacques Rousseau* (1954, reprinted 1963; originally published in German, 1932), is an influential study, written from a Kantian perspective; and CHARLES WILLIAM HENDEL, *Jean-Jacques Rousseau, Moraliste*, 2 vol. (1934, reissued 1962), is a longer study reaching much the same conclusions. ROBERT DERATHÉ, *Le Rationalisme de Jean-Jacques Rousseau* (1948, reprinted 1979), which opened a new phase in Rousseau's scholarship, reaffirms Rousseau's place in the Cartesian tradition. PIERRE BURGELIN, *La Philosophie de l'existence de J.-J. Rousseau*, 2nd ed. (1973), places Rousseau between Pascal and Kierkegaard. BERNHARD GROETHUYSEN, *J.-J. Rousseau* (1949), demonstrates Rousseau's importance from the point of view of 20th-century philosophy. MARC F. PLATTNER, *Rousseau's State of Nature: An Interpretation of the "Discourse on Inequality"* (1979), is a scholarly though brief study of Rousseau's concepts.

Literature: LÉO LAUNAY and MICHEL LAUNAY, *Le Vocabulaire littéraire de Jean-Jacques Rousseau* (1979), provides a linguistic key to Rousseau's literary work. JEAN STAROBINSKI,

Jean-Jacques Rousseau: la transparence et l'obstacle, new ed. (1971, reprinted 1976), is a seminal work by an academic psychologist turned literary critic. MARCEL RAYMOND, *Jean-Jacques Rousseau: la quête de soi et la rêverie* (1962), provides a subtle analysis of Rousseau's literary achievement. PHILIP E.J. ROBINSON, *Jean-Jacques Rousseau's Doctrine of the Arts* (1984), is a pioneering attempt to depict Rousseau's ideas on literature and the other arts as a coherent system. HENRI GOUIER, *Rousseau et Voltaire: portraits dans deux miroirs* (1983), is an impartial appraisal of the two literary giants of the French Enlightenment. ALBERT SCHINZ, *La Pensée de Jean-Jacques Rousseau* (1929), is an important study of Rousseau's Romanticism.

Religion: The most substantial study of Rousseau's religious ideas is still PIERRE MAURICE MASSON, *La Religion de J.-J. Rousseau*, 3 vol. (1916, reprinted 1970). The best introduction to the subject in English is by RONALD GRIMSLEY, *Rousseau and the Religious Quest* (1968). PIERRE BURGELIN, *Jean-Jacques Rousseau et la religion de Genève* (1962), examines Rousseau's debt to Calvinism; and J.F. THOMAS, *Le Pélagianisme de J.-J. Rousseau* (1956), studies his links to Roman Catholic philosophy. ALBERT SCHINZ, *La Pensée religieuse de Rousseau et ses récents interprètes* (1927), relates Rousseau's theological views to those of his contemporaries. JEAN-JACQUES ROUSSEAU, *Religious Writings of Rousseau*, ed. by RONALD GRIMSLEY (1970), contains key passages in English translation.

Political and social theory: ROBERT DERATHÉ, *Jean-Jacques Rousseau et la science politique de son temps*, 2nd ed. (1970), interprets Rousseau's political ideas within the tradition of the natural law school. A similar view is taken by ALFRED COBBAN, *Rousseau and the Modern State*, 2nd ed. (1964). The suggestion that Rousseau must be seen as a forerunner of totalitarianism is put forward unambiguously by J.L. TALMON, *The Origins of Totalitarian Democracy* (1952, reissued 1970; U.S. title, *The Rise of Totalitarian Democracy*); and in a modified form by JUDITH N. SHKLAR, *Men and Citizens: A Study of Rousseau's Social Theory* (1969, reprinted 1985). JOHN W. CHAPMAN, *Rousseau—Totalitarian or Liberal?* (1956, reprinted 1968), considers arguments for and against Talmon's interpretation. A commentary that stays close to the text is ROGER D. MASTERS, *The Political Philosophy of Rousseau* (1968, reprinted 1976); and an equally exacting study is JOHN CHARVET, *The Social Problem in the Philosophy of Rousseau* (1974). JAMES MILLER, *Rousseau: Dreamer of Democracy* (1984), stresses the democratic elements in Rousseau's political thought; while DAVID CAMERON, *The Social Thought of Rousseau and Burke* (1973), draws attention to resemblances between Rousseau's political ideas and those of the Irish conservative. STEPHEN ELLENBURG, *Rousseau's Political Philosophy: An Interpretation from Within* (1976), studies different interpretations of Rousseau's views. MICHEL LAUNAY, *Jean-Jacques Rousseau, écrivain politique, 1712–1762* (1971), depicts Rousseau both as champion of the popular classes in Geneva and as a theorist of the left; while GALVANO DELLA VOLPE, *Rousseau and Marx* (1978; originally published in Italian, 4th ed., 1964), presents Rousseau as a prophet of Communism. RAYMOND POLIN, *La Politique de la solitude: essai sur la philosophie politique de Jean-Jacques Rousseau* (1971), considers Rousseau as a philosopher rather than an ideologue; and BRONISLAW BACZKO, *Rousseau, solitude et communauté* (1974; originally published in Polish, 1970), gives new grounds for regarding Rousseau as one of the greatest social thinkers of modernity. JOEL SCHWARTZ, *The Sexual Politics of Jean-Jacques Rousseau* (1984), analyzes Rousseau's views on the role of sexuality in social politics and morals.

Shorter writings on his political thought are in SIMON HARVEY et al. (eds.), *Reappraisals of Rousseau* (1980); MAURICE CRANSTON and RICHARD S. PETERS (eds.), *Hobbes and Rousseau* (1982); R.A. LEIGH (ed.), *Rousseau After Two Hundred Years* (1982); COMITÉ NATIONAL POUR LA COMMÉMORATION DE J.-J. ROUSSEAU, *Jean-Jacques Rousseau et son oeuvre: problèmes et recherches* (1964); MICHEL LAUNAY et al., *Jean-Jacques Rousseau et son temps: politique et littérature au XVIII^e siècle* (1969).

(M.C.)

Russian Literature

The term Russian literature is used to describe the literature of different areas at different periods. Thus, from the beginning of written literature in the 11th century to the 16th century, it can describe the literature of Kievan Rus—that is, the loose confederation of East Slav tribes ruled by the dynasty descended from Rurik; from the 16th to the early 20th century, that of unified Russia, but not of other parts of the Russian Empire; and from 1917, that of the Russian Soviet Federated Socialist Republic, but not of the other republics constituting the Soviet Union.

Russian literature is generally divided into two main periods: the Old Russian period, from the 11th to the end of the 17th century; and the modern period, which is subdivided into Pre-Revolutionary, from the end of the 17th century to 1917, and Post-Revolutionary, from 1917. The literature of the Old Russian period corresponds roughly to the medieval literature of western European countries. It was dominated at first by Kievan Rus; but during the Tatar Mongol invasion in the 13th century, regional literatures gained in importance; and from the late 15th and early 16th centuries, the city of Moscow was the main literary centre.

During the early period, literature was influenced by the connections between Rus and Byzantium, and between literature and the Orthodox Church, which began with the conversion to Eastern Christianity of St. Vladimir, grand

prince of Kiev, in 988. But the influence of earlier East Slav oral folk poetry was also felt.

The beginnings of modern literature were marked by growing westernization, already noticeable in the 17th century, and increased by the reforms of Peter I the Great. From the beginning of the 18th to the early 20th century, Western influence was predominant, especially that of France. English influence also made itself felt, for example, in the foundation of periodicals (mid-18th century) and the rise of the sentimental school. The greatest period of Russian literature from the point of view of western Europe, and the one which has had most influence on world literature, was the 19th century.

The Revolution of 1917 was a landmark in modern Russian literature. Post-Revolutionary literature, although developing from foundations laid in the Old Russian and Pre-Revolutionary periods, showed tendencies to some extent related to political circumstances and to the close supervision exercised by the Communist Party on all aspects of life and culture. This period was marked by a developing struggle between creative artists and the state, which, after Stalin's death in 1953, seemed to result in renewed contact with Western literatures, and some degree of freedom for writers.

Old Russian literature

The earliest works of Old Russian literature arose in the 11th century. (It should be pointed out that the conventional term Old Russian is inaccurate in that it refers to the writings not only of Russians but also of other Slavic peoples, including Ukrainians and Belorussians.) Because the development of literature was connected from the first with the acceptance of Christianity by St. Vladimir in 988 and the Christianization of the inhabitants of Rus, early literature was primarily religious and didactic, and didactic works were influenced by Byzantine literature in translations from the Greek. Secular literature was influenced by oral folk poetry, which had existed among the East Slavs long before Rus had a written literature. The most valuable heritage of this region's folklore was an epic or heroic folk song, the *bylina*, already being composed in the 10th century; these folk songs were produced in Kiev, Novgorod, and Galicia.

THE KIEVAN PERIOD

The first phase of Old Russian literature, from the 11th to the early 13th century, is called the Kievan period or, sometimes, because of the Tatar Mongol invasion that followed it, the pre-Mongol period. The chief concentration of literary activity was in Kiev, although isolated works were written in other towns in the south and in the north. The language of both northern and southern writers was basically the same—the old literary language of the East

Slavs, which had absorbed to a greater or lesser extent elements of Old Church Slavonic.

The literature of the Kievan period possessed from the first many translations, mainly from Greek but also some from Latin. Among them were service books, mostly in Old Bulgarian, that included prayers and chants. Several kinds of biblical books appeared, among them "Aprakos" Gospels, in which readings from the Gospels were arranged by days of the week as part of the church service; the earliest surviving manuscript of an "Aprakos" Gospel is *Ostromir's Evangelium*, copied in 1056–57, and the oldest known manuscript of the Four Gospels was the *Galician Gospel* (1144). Other translated works included apocryphal literature, saints' lives, chronicles, books about the creation of the world, an Alexander romance, and versions of the Troy legend and various Byzantine romances.

One of the oldest literary genres, widely developed in this period, was the chronicle. As early as the mid-11th century, compilations of chronicles were beginning to be made, and by the early 12th century a compilation of outstanding historical and literary significance was taking definite shape. This was the *Povest vremennykh let* ("Tale of Bygone Years"; Eng. trans., *The Russian Primary Chronicle*), the first version of which was compiled c. 1112, probably by Nestor, a monk of the Kiev-Pechersk Monastery (Monastery of the Caves).

Sermons occupied an important place in the literature of the Kievan period, the best example being *Slovo o zakone i blagodati* ("The Discourse on Law and Grace") by Ilar-

Old
Russian
chronicles
and
sermons

ion, written before 1051. In the 12th century, the second native metropolitan of Kiev, Kliment Smolyatich, and, in particular, Kirill, bishop of Turov, were outstanding exponents of the art of ecclesiastical oratory in Kievan Rus. Of early hagiographical works, the anonymous *Skazaniye* ("Legend") of the princes Boris and Gleb, the sons of St. Vladimir, merits particular attention. It resembles the historical legend rather than the traditional Byzantine saint's life, and it is full of lyrical laments, monologues, prayers, and meditations.

In the first quarter of the 13th century was written *Kievo-Pechersky paterik* ("The Paterikon of the Kiev-Pechersk Monastery"), based on correspondence between Simeon, bishop of Vladimir, a former monk of the Kiev-Pechersk Monastery, and Polikarp, a monk at the monastery. The literature of pilgrimage to the Holy Land originated in Kievan Rus. The most noteworthy work of this kind was a *Khozhdeniye* ("Pilgrimage") to Palestine in 1106–08 of Daniil, prior of a monastery in Chernigov.

The most outstanding work of Kievan Rus was *Slovo o polku Igoreve* (*The Song of Igor's Campaign*, trans. by Vladimir Nabokov, 1960), an account of the unsuccessful campaign in 1185 by Prince Igor of Novgorod-Seversky and the princes allied with him against the Polovtsians. It was written between 1185 and 1187 and was preserved in a single manuscript, discovered in 1795 and lost in the burning of Moscow during Napoleon's invasion of Russia in 1812. The copies that were made before it was lost have been authenticated, and the events narrated in the account were probably written shortly after they took place.

DEVELOPMENT OF REGIONAL LITERATURES

During its brief existence Kievan Rus created a literature distinguished for both artistry and ideas. From the mid-12th century, nevertheless, a gradual decline set in, accentuated in the 13th century by the Tatar Mongol invasion, and there was a marked falling off of literary activity.

The Tatar invasion was reflected as a great disaster in a number of 13th-century works. As literature, most noteworthy is *Povest o razorenii Ryazani Batiem* ("The Story of the Destruction of Ryazan by Batu Khan"). The eloquent, fiery sermons of Serapion, archimandrite of the Kiev-Pechersk Monastery, are full of grief at the Tatar invasion. At the end of the 13th or in the early 14th century, a life of Prince Alexander Nevsky was written in the traditional form of a hagiography but closely akin to a war narrative; it was dominated by the epic figure of Alexander. An outstanding literary work of 13th-century Galicia and Volhynia (by then a separate principality) was "The Galich-Volynsk Chronicle," describing events from 1201 to 1292, which formed part of a copy of a compilation of chronicles called the Hypatian collection, written in the 1420s.

The regional character of Russian literature resulted from increased lack of communication between the territories of Rus and was still apparent in the 14th and 15th centuries. But by the beginning of the 15th century the literature of Moscow began to predominate, for Moscow had, from the mid-14th century, played the part of a unifying centre for Great Russian nationalism. Tendencies toward unification are particularly clear in the tales of *Mamayevo poboishche* ("The Rout of Mamay"), composed at the end of the 14th century about the Battle of Kulikovo (1380). The conquest of Constantinople by the Turks in 1453 inspired Nestor-Iskander's *Povest o vzyati Tsargrada* ("Tale of the Taking of Tsargrad"—i.e., Constantinople), mainly written in the style of a traditional war narrative. In the late 15th and early 16th centuries other stories were written in Moscow on the theme of Russia's political succession to the inheritance of Byzantium.

Also of the 15th century was the *Khozhdeniye za tri morya* ("Journey Across Three Seas") by Afanasy Nikitin, a merchant from Tver who from 1466 to 1472 travelled in India and Persia. The "Journey" was written in lively, colloquial Russian, with an admixture of Persian, Arabic, and Turkish words. Regional traits are also absent from *Povest o Petre i Fevronii* ("The Tale of Peter and Fevronia"), which may be ascribed to the 15th century.

Of other 15th-century regional literatures, that of Nov-

gorod was particularly highly developed, producing works in defense of Novgorod's political and ecclesiastical independence. In the literature of Tver, which vied with that of Moscow, the most outstanding work was a eulogistic discourse on the Orthodox Great Prince Boris Aleksandrovich, written c. 1453. The most significant work of the literature of Pskov was *O pskovskom vzyati*, describing the subjugation of Pskov by Moscow in 1510.

The surge of literary activity beginning at the end of the 14th century was connected with the influx from Bulgaria and Serbia of clerics into Russia after the conquest of their countries by the Turks. As well as in retranslations from the Greek, the content and style of South Slavonic literature was brought to Russia largely in hagiographical works.

LITERATURE OF UNIFIED RUSSIA

The establishment of a unified Russian state dates from the reign of Ivan III the Great. In 1480 the liberation of Russia from Tatar domination was finally achieved, and autocratic power was centralized in the Moscow state. In about the middle of the 16th century Ivan IV the Terrible (died 1584) began an energetic campaign against the powerful feudal princelings, the boyars, a struggle that was reflected in literature. The most notable spokesman for the new nobility, created by Ivan in opposition to the boyars, was Ivan Peresvetov, whose work included several propagandist tales and two petitions to Ivan the Terrible. The boyars were represented by a publicist of exceptional literary gifts, Prince Andrey Mikhaylovich Kurbsky. In his *Istoriya o velikom knyaze moskovskom* (written in the 1560s and 1570s; "History of Ivan IV"), Kurbsky severely castigated Ivan for his persecution of innocent boyars.

About the middle of the 16th century Moscow's conception of itself as a centre of learning, of Orthodoxy, and of political authority began to take shape. There appeared a succession of literary undertakings aimed at exalting and strengthening Muscovite ecclesiastical and political traditions and at demonstrating that these had come down from the very beginning of Russian statehood. In 1552 there appeared the grandiose compilation known as the *Velikiye Minei-Cheti* ("Grand Minei Cheti"), by the metropolitan of Moscow, Makary, in which were collected works of original and translated ecclesiastical literature. It was followed by the *Stepennaya kniga* ("Book of Degrees"—i.e., generations), containing biographies of Russian princes and ecclesiastical figures and completed in 1563 by Makary's successor. At this period also were collected the important Muscovite chronicle compilations, among them the *Litsevoy svod* ("Illuminated Compilation"), which begins with the creation and ends in the 1560s. Other works such as the *Domostroy* ("Household Management") and the Stoglav (Council of a Hundred Chapters) aimed at strengthening moral, social, and political standards of conduct. The introduction of printing in Moscow did much to help Russian unification, and the first dated book, *Apostol*, was printed in 1564.

The end of the 16th and the beginning of the 17th century in Russia were marked by stormy political events characterized by an intense anti-feudal struggle, into which were drawn both the peasants, who were impoverished by serfdom, and the boyars, who had been defeated by the feudal nobility. The situation was complicated by the intervention of the Swedes and Poles, who were repulsed only by the united efforts of the Russian people. The events of the Time of Troubles were described in a succession of tales, echoing the social and political upheavals and commemorating the surge of patriotism against foreign intervention. The elegance and artistry of the Muscovite literary tradition was shattered; new writers and readers farther down the social scale introduced secular themes, realism, and folklore into literature. Examples are the stories of the capture of the town of Azov in 1637 by the Don Cossacks and its siege in 1641 by the Turks, which are outstanding literary works. The international relations of the state of Muscovy helped the flow of secular literature from the West. The secular translated story, the tale of chivalry, and the humorous tale replaced Byzantine religious didactic literature or existed alongside it, and folklore began to intrude noticeably.

The original Russian secular story began to appear from about the second half of the 17th century. Side by side with tales in which the conservative tradition of the church still predominated, there appeared comic tales such as *Povest o Frole Skobeyeve* ("The Tale of Frol Skobeyev") and *Povest o Karpe Sutulove* ("The Story of Karp Sutulov"), both free from accepted moral and religious principles. Satire and parody of the court, church, and legal procedure also began to be written. The autobiography of the head of the Old Believers, the archpriest Avvakum Petrovich, written between 1672 and 1675 (*Zhitiye protopova Avvakuma, im samim napisannoye* ["The Life of the Archpriest Avvakum by Himself"]) turns the canonical form of a typical hagiography into a polemically incisive narrative written in vivid conversational speech.

Modern Pre-Revolutionary literature

Modern Russian literature dates from the first decade of the 18th century, when literary works, as distinct from religious and official books, began to be printed. Classicism was the dominant movement in 18th-century literature, but in the second half of the century it was displaced by the sentimental movement, which itself was yielding to Romanticism and Realism by 1800.

THE RISE OF RUSSIAN CLASSICISM

The most prominent literary figure at the beginning of the century was Feofan Prokopovich, archbishop of Novgorod, one of Peter I the Great's close associates. He was the progenitor of two of the main themes in Russian literature: autocracy as a form of government and satire as a means of attack on his political adversaries.

The leading writers of the classical school were Antiokh Dmitriyevich Kantemir, the first Russian secular poet; Vasily Kirillovich Trediakovsky, one of the most scholarly men of his time; Mikhail Vasilyevich Lomonosov, poet, grammarian, scientist, and literary critic; and Aleksandr Petrovich Sumarokov, poet and dramatist. Kantemir is known mainly for his love lyrics and his nine satires, and is regarded as the founder of Russian satire. Trediakovsky began by translating from the French Paul Tallemant's *Voyage de l'Isle d'Amour* (1663; "Voyage to the Isle of Love"), the first erotic work to be published in Russia, and he helped reform Russian prosody. Lomonosov created the famous "three styles" of poetic diction characteristic of Russian Neoclassicism: the "high" (or grand) style for heroic poems, odes, etc.; the "middle" style for dramatic works demanding colloquial speech; and the "low" style for comedies, epigrams, songs, letters in prose, and precise descriptions. Lomonosov also advanced the theoretical study of the Russian language, which he maintained was no whit inferior to any European language in natural richness, beauty, and strength.

Sumarokov, who wrote the first Russian classical tragedy, *Khorev* (1747), was adept in a variety of genres and opposed Lomonosov's "florid" style. He owed his popularity to his numerous love lyrics, elegies, eclogues, and idylls. He also wrote six tragedies, including a free adaptation of *Hamlet*, and four comedies. His tragedies, strongly influenced by Racine, were intended as a school of noblemen's moral values, and even in his comedies he sought to improve the moral standards of the Russian aristocracy. In his periodical *Trudolyubivaya pchela* ("The Industrious Bee") he exposed corruption among officials and attacked landowners for mistreating their serfs but defended social inequality as natural and lawful. His satiric articles and fables laid the foundation of the satire of the next decade.

The first breach in classicism was made by Mikhail Matveyevich Kheraskov, famous for two epic poems modelled on Voltaire's *Henriade*: the *Rossiada* (written 1771–79, published 1799; "Russian Epic"), on the capture of Kazan by Ivan the Terrible; and *Vladimir Vozrozhdyonny* (1785; "Vladimir Reborn"), on St. Vladimir's introduction of Christianity to Russia.

POLITICAL AND SENTIMENTAL THEMES

Influenced by a Cossack and peasant rebellion of 1773–75, writers of the period chose as their most important theme

that of serfdom. The social influence of literature greatly increased, leading to a widening circle of readers and to active participation in literature of all classes. Sumarokov, in his last three tragedies, attacked the idea of a tyrannical ruler and pleaded for an enlightened emperor. In *Tilemakhida* (1766) a free rendering of Fénelon's *Télémaque*, Trediakovsky declared that while the tsar wielded power over the whole people, the laws had power over the tsar too. The empress Catherine II herself edited a journal, modelled on the English *Spectator*, in which she poured scorn on Trediakovsky.

The two most prominent writers of the period were a playwright, Denis Ivanovich Fonvizin, and a writer and publisher, Nikolay Ivanovich Novikov. Beginning by translating fables, Fonvizin later wrote original satirical fables, such as *The Fox and the Preacher* (1762), written shortly after the death of the old empress Elizabeth (Yelizaveta Petrovna), in which he attacked her hypocritical courtiers. But it was with two prose comedies, *Brigadir* (1783; "Brigadier") and *Nedorosl* (1783; "The Minor"), that Fonvizin triumphed as a playwright. Novikov, like Fonvizin, directed his satire not against serfdom itself but against the landowners' misuse of their powers. The most important novelist of the period was Fyodor Aleksandrovich Emin, whose best novel, *Letters of Ernest and Doravra* (1776), a free adaptation of Rousseau's *La Nouvelle Héloïse*, is interesting as the first attempt in Russian fiction at psychological analysis of the thoughts and feelings of ordinary people. A popular novelist to emerge from the lower classes, Mikhail Dmitriyevich Chulkov, was concerned with entertaining his readers: his novels lacked the lofty moral admonitions that abound in the works of classical writers.

The first indication of the declining power of classicism came in the popular narrative poems of Ippolit Fyodorovich Bogdanovich, especially his *Dushenka* (1775), a free adaptation of La Fontaine's *Les Amours de Psyché et de Cupidon*. Bogdanovich was regarded by the sentimentalist writers as their predecessor.

Gavril Romanovich Derzhavin, the greatest Russian poet of the 18th century, gave the most vigorous expression to the change from classicism to sentiment. His first works—odes as well as lyrics—showed the influence of Lomonosov and Sumarokov, but he soon took up an independent attitude toward social evils. His ode on the death of Prince Meshchersky (1779) is full of reflections on the transience of life and the inevitability of death but ended on a note of cheerful resignation characteristic of the Latin poet Horace. He reached his greatest heights during the next decade with such odes as "On the Capture of Ismail" and "To the Nobleman." His finest poems—"The Waterfall" (1794) and "The Peacock" and his poems in the tradition of the ancient Greek poet Anacreon (collected 1804), such as "Invitation to Dinner" and "Life in Zvanka" (the poet's small estate)—belong to this period. Derzhavin accepted serfdom as natural and lawful, and his poetry expressed the ideology of the ruling classes; yet his realistic representation of everyday life and his simplification of poetic diction by introducing colloquial speech tended to emphasize the democratization of poetry.

Russian literature of the 1790s, influenced by the French Revolution, raised the themes of the rights of man and the role of the nation as a whole. Aleksandr Nikolayevich Radishchev in his "Ode to Liberty" (1781–83) hailed the American Revolution and attacked serfdom, but it was his denunciation of autocracy that made Catherine II describe the ode as "a rebellious poem," in which the tsar was threatened with execution.

Apart from violently satiric works, among them the famous comedy *Chicane* (1793–98) by Vasily Vasilyevich Kapnist, the main literary movement was sentimentalism, led by Nikolay Mikhailovich Karamzin. In Russian sentimentalism subjective perception is combined with denial of classical abstractions and idealization of man's natural condition. Karamzin opposed to the classical emphasis on reason a doctrine of poetry as an expression of feeling. The sentimentalists, moreover, put forward the claims of sensibility as a precondition of aesthetic impressions, emphasizing art's emotional foundation. Unlike Derzhavin,

The theme of serfdom

The lyrics and odes of Gavril Romanovich Derzhavin

Sentimentalism

Karamzin was interested less in reality than in the feelings and moods reality arouses in the poet. According to him the greatest poetic creation is "an effusion of a languorous and grieving heart." This elegiac mood, so characteristic of Karamzin's later poetry, is expressed in his famous novel *Bednaya Liza* (1792; *Poor Liza*), in which for the first time in Russian fiction descriptive passages, used to emphasize the hero's feelings, are an important component. In his novel *Julia* he idealized country life and withdrawal into "the embraces of nature." His other novels—*The Island of Bornholm* and *Sierra Morena* (both 1793)—were precursors of the Russian Romantic novel.

THE 19TH CENTURY

Poetry. The greatest Russian poet of the early 19th century was Aleksandr Pushkin. Although his early poems displayed surpassing technical mastery and great versatility of theme, it was not until his great narrative poem, *Yevgeny Onegin* (written 1823–31), that he achieved what no other Russian poet had achieved: integration of idea and character; portrayal of urban and rural society; a blend of light, humorous commentary and real awareness of the human heart; and mastery of language astonishing in its simplicity and profundity. His earlier longer poems, such as *Ruslan and Lyudmila* (1820), *Kavkasky plennik* (1822; *The Prisoner of the Caucasus*), and *Bakhchisaraysky fontan* (1824; *The Fountain of Bakhchisaray*), were generally composed in a lighthearted, folkloric, or Romantic vein, but, with the appearance of *Tsygane* (1824; *The Gypsies*), *Count Nulin* (1825), and *Domik v Kolomne* (1830; "The Small House in Kolomna"), his work revealed a more realistic manner and a playful satiric vein, laced with good-humoured sympathy for human foibles. During the same period Pushkin wrote his greatest lyrics and the often-quoted rhetorical *Prorok* ("Prophet"). Among his masterpieces of the late 1820s and early 1830s were his *Poltava* (1829), his fairy tales in verse, and the magnificent "King Saltan." In 1833 he wrote *Medny vsadnik* ("The Bronze Horseman"), in which Peter the Great personified the elemental forces that sweep puny man out of their path. Pushkin never surpassed this poem, with its magnificent evocation of St. Petersburg and its undertow of horror. His poetic dramas included a historical play, *Boris Godunov* (1831).

The period's other major poet, Mikhail Lermontov, sprang to fame in 1837 with a poem on the death of Pushkin that resulted in his exile to the Caucasus. Lermontov's most Romantic poems, such as *Mtsyri* (1840; "The Novice") and the celebrated *Demon* (begun 1829), dealt with Caucasian themes.

Predating Pushkin was Ivan Andreyevich Krylov, whose simple and profound fables are among the great treasures of Russian literature. Vasily Zhukovsky, most important for his influence on Pushkin, was a poet and translator who helped to create a new poetic diction on Karamzinian principles. Of Pushkin's contemporaries, the most illustrious and original as poets were Konstantin Nikolayevich Batyushkov and Yevgeny Abramovich Baratynsky. Most important among the "civic" poets of the period (*i.e.*, those who held that poetry should serve social and civic purposes) was the Decembrist Kondraty Fyodorovich Ryleev, who expressed abhorrence of tsarist oppression and glorified death in the struggle against it. The most philosophical of the 19th-century Russian poets was Fyodor Ivanovich Tyutchev, also renowned as the celebrant of "last love"; but the dominant poet of the midcentury was Nikolay Alekseyevich Nekrasov, the most noted exponent of civic poetry. His long narrative poem *Moroz krasny-nos* (1863; "The Red-Nosed Frost") remains justly famous for its blend of realism and legend in the portrayal of peasant life.

Prose. With Pushkin and Lermontov the golden age of poetry ended, and the great age of prose fiction began. Pushkin turned increasingly to prose in the last years of his life. Lermontov's novel *Geroy nashego vremeni* (1840; *A Hero of Our Time*) was immediately successful. Its Byronic hero was one of the typical misfits of Lermontov's generation, a man of great gifts but with an insatiable and destructive desire for novelty.

The first widely popular 19th-century novelist was

Mikhail Nikolayevich Zagoskin, whose *Yury Miloslavsky* (1829), on the expulsion of the Poles from Russia in 1612, appealed to the public by its crude nationalistic spirit, while a most popular Romantic novelist was Aleksandr Aleksandrovich Bestuzhev (pseudonym Marlinsky). An outstanding prose writer was Nikolay Gogol, who was a great influence on Russian literature. In part because he was a Ukrainian by birth and saw the Russians from the standpoint of an outsider, he revealed the Russians to themselves and, through the grotesque exaggerations of his style and portraiture, forced them to recognize the moral inadequacies of their society. The extraordinary impact of Gogol's writings became evident in 1836 with the performance of his satirical comedy *Revizor* (*The Government Inspector*). It dealt with the corrupt officials of an obscure provincial town, but it presented a microcosm of the Russian state. It was saved from being banned by its laughter, which Gogol considered the only positive character in it. Shortly afterward he left for Europe, settling for a while in Rome, where he finished the first part of his famous novel *Myortvye dushi* (1842; *Dead Souls*). Gogol was a political conservative and an upholder of autocracy, to the dismay of those, like the critic Vissarion Grigoryevich Belinsky, who regarded him as a leader of the "natural" school of Russian writers and as an enemy of serfdom.

One of Gogol's last stories, "Shinel" (1842; "The Overcoat"), contributed to the creation of the "natural" school. It initiated a number of studies of poor government clerks in St. Petersburg settings. His most outstanding successor was Fyodor Dostoyevsky, whose early career was notable mainly for his stories of St. Petersburg slums and the life of poor degraded civil servants, such as *Bednye lyudi* (1845; *Poor Folk*). In 1849 he was arrested for his membership in a revolutionary group and sentenced to death, but the sentence was commuted at the last moment to penal servitude and exile for life. Ten years later he was permitted to return to European Russia. He set about rehabilitating his literary reputation by editing a journal, *Vremya*, which was closed by the authorities in 1863, and the collapse of a second journal, *Epokha*, and resulting serious indebtedness brought him close to despair. In 1866, in dire straits, he wrote his first great novel, *Prestupleniye i nakazaniye* (1866; *Crime and Punishment*). His other great novels, *Idiot* (1868–69; *The Idiot*), *Besny* (1871–72; *The Devils*, or *The Possessed*), and *Bratya Karamazovy* (1879–80; *The Brothers Karamazov*), all showed his astonishing dramatic powers, his range and realism as a novelist of ideas, the profundity of his psychological understanding, and his ability to portray the tragic aspects of life, together with unsurpassed moments of illumination.

Although Ivan Turgenev may have lacked Dostoyevsky's profundity and tragic range, his stories and novels also transcended topical problems. *Zapiski okhotnika* (1852; *A Sportsman's Sketches*, 1895), in which serfs were shown to be superior to their masters, united poetically atmospheric depictions of the Russian countryside with sympathetic portrayals of the peasantry, which helped to lead to the abolition of serfdom. With his first novels he enhanced his reputation as a liberal-minded thinker and as one of the finest prose writers of the day. His greatest novel, *Otsy i deti* (1862; *Fathers and Sons*), dealing with the issues dividing the generations, set the younger generation of the intelligentsia (who took Bazarov, its nihilist hero, for a caricature of themselves) against him, and he never regained popularity with young progressives. *Dym* (1867; *Smoke*), in which he had bitter truths to say about all classes of Russian society, and *Nov* (1877; *Virgin Soil*), in which he analyzed the Russian revolutionary movement and forecast the rising power of the managerial class, deepened the enmity of the radicals.

Another great creative writer of the century, Leo Tolstoy, mostly stood aloof from the literary scene. Two great novels, *Voyna i mir* (1865–69; *War and Peace*) and *Anna Karenina* (1875–77), raised him to a pinnacle; and even his denial of his art, following his "conversion" to a radical Christianity at the end of the 1870s, failed to affect his supremacy. Tolstoy's distinguishing mark as a writer was his genius for describing the physical reality of experience with an almost cinematic effect of movement

The simplicity and profundity of Pushkin's language

The "natural" school

and a pictorial exactitude that brought his characters into brilliant focus. Simultaneously he was able to psychologize their perception of the world and thus illuminate their moral problems and their quest for truth. In "Kreytserova sonata" (1891; "The Kreutzer Sonata"), "Smert Ivana Ilyicha" (1886; "The Death of Ivan Ilich"), and *Voskreseniye* (1899; *Resurrection*), his creative genius asserted itself over the philosophic and religious convictions that marred many of his last stories.

Ivan Aleksandrovich Goncharov achieved a portrait of supreme slothfulness in the hero of his finest novel, *Obломov* (1859; Eng. trans. 1954), by an accumulation of realistic details. Aleksey Pisemsky was another major novelist. His masterpiece of realistic portraiture, *Tsytyacha dush* (1858; *A Thousand Souls*), charted the rise and fall of a provincial civil servant. The great satirist of the century, Mikhail Saltykov, was a pillar of the radical movement. In *Gospoda Golovlyovy* (1876; *The Golovlyov Family*), Saltykov wrote one of the century's most brilliant novels; its hero, Iudushka (Little Judas), surpassed even Gogol's most villainous characters in idleness, uselessness, and drunkenness.

Drama, memoirs, and short stories. The first major work of the Russian theatre was Aleksandr Sergeyevich Griboyedov's verse comedy, *Gore ot uma* (1822–24; *Woe from Wit*). Apart from Gogol's *Revizor*, the most important and prolific contribution to the development of Russian drama was made by Aleksandr Nikolayevich Ostrovsky, in such plays as *Bankrot* (1850; "The Bankrupt") and *Groza* (1860; "The Storm"), in which he exposed and protested against the low business morality, ignorance, and brutality of the Moscow merchant class.

Memoir literature was an especially rich feature of 19th-century Russian writing. Most noteworthy of the works in this genre are Sergey Timofeyevich Aksakov's *Semynaya khronika* (1856; *Chronicles of a Russian Family*) and Aleksandr Herzen's memoirs of the first generation of the Russian intelligentsia, *Byloye i dumy* (1852–68; *My Past and Thoughts*).

Although the short story was developed by many writers, such as Nikolay Leskov, author of *Ocharovanny strannik* (1873; *The Enchanted Wanderer*), and Vsevolod Garshin, whose fame rests chiefly on his penetrating study of madness, *Krasny tsvetok* (1883; *The Red Flower*), it was Anton Chekhov who became its acknowledged master, as well as a brilliant innovator in drama. Chekhov was the first great Russian writer to adopt a neutral attitude to politics. Most of his short stories were written while he was a medical student and later as a young doctor. In his greatest short stories, including "Step" (1888; "The Steppe") and "Skuchnaya istoriya" (1889; "A Dreary Story"), as well as in four famous plays, *Chayka* (1896; *The Seagull*), *Dyadya Vanya* (1897; *Uncle Vanya*), *Tri sestry* (1901; *The Three Sisters*), and *Vishnyovy sad* (1903–04; *The Cherry Orchard*), his training can be seen both in the medical men he introduces and in his attitude toward his characters, which is that of the expert diagnostician of human weakness and loneliness.

Prose at the turn of the century. Vladimir Galaktionovich Korolenko, Aleksandr Ivanovich Kuprin, and especially Ivan Alekseyevich Bunin, the first Russian writer to be awarded the Nobel Prize for Literature (for 1933), all contributed to a vigorous prose literature at the turn of the century, but the dominant writer of this period was Maksim Gorky, who overflowed with pity and compassion, though only for the working classes. Self-educated, and embittered by a childhood of poverty and ill treatment, he early threw himself into revolutionary work. A romantic poem in prose, "Pesnya o burevestnike" (1901; "The Song of the Stormy Petrel")—with its refrain, "The Storm! The Storm is about to break!"—became a powerful rallying cry of the revolutionary movement. In his first and most popular play, *Na dne* (1902; *The Lower Depths*), Gorky introduced philosophizing down-and-outs onto the Russian stage. Apart from his early novels—especially *Mai* (1906; *Mother*)—his most impressive work is an autobiographical trilogy: *Detstvo* (1913; *Childhood*), *V lyudyakh* (1915–16; *In the World*), and *Moi universitety* (1923; *My Universities*).

Gorky's
social
themes

EARLY 20TH CENTURY

Symbolism. The revival of poetry in Russia stemming from the 19th-century Symbolist movement had as its leader Vladimir Sergeyevich Solovyov. His poetry expressed a belief that the world was a system of symbols expressing metaphysical realities. Konstantin Balmont and Valery Bryusov were more talented poets, and the greatest poet of the movement was Aleksandr Aleksandrovich Blok, who in *Dvenadtsat* (1918; *The Twelve*) united the Revolution and God in an apocalyptic vision in which 12 Red Army men became apostles of the New World, headed by Christ. Other important Symbolist poets were Vyacheslav Ivanovich Ivanov, Fyodor Sologub, and Andrey Bely. Each brought his particular field of knowledge to his conception of reality: Ivanov, a Greek scholar, proclaimed the identity of Christ and Dionysus, and Bely, outstanding theoretician of the movement, worked out his philosophy in novels strongly reminiscent of Gogol and Dostoyevsky.

Acmeism. In reaction against the dominance of Symbolism the poet Nikolay Stepanovich Gumilyov founded Acmeism in 1911, a poetic movement that attributed great importance to craftsmanship and clarity of expression. Its leading figure was to be Gumilyov's wife, the poet Anna Akhmatova, whose moving lyric poetry brought her widespread popularity before the Revolution and persecution during the Soviet period.

Futurism. Velimir Vladimirovich Khlebnikov founded a most revolutionary poetic movement in 1910. A manifesto announcing the establishment of Futurism, also signed by Vladimir Vladimirovich Mayakovsky, the future "poet laureate," appeared under the title of *Poshchochina obshchestvennomu vkusu* (1912; "A Slap in the Face of Public Taste"). Futurists wanted to shock readers into awareness by abandoning forms they considered to be artificial and adopting instead the language of the streets. Mayakovsky rallied at first to the Soviet regime. His later satires, *Klop* (1929; *The Bedbug*) and *Banya* (1930; "The Bathhouse"), showed disillusion with Soviet bureaucracy. His suicide in 1930 was ascribed to this political disillusionment. Boris Pasternak also began as a Futurist poet and by 1917 had published most of the poems included in *Sestra moya zhizn* (1922; *Sister My Life*).

Post-Revolutionary literature

The impetus of the Revolution led to brilliant experimentation, and contending literary groups sprang up, in particular over rejection of the 19th-century literary heritage in favour of a proletarian culture. Fiction was dominated by stories of violence about the civil war; Isaak Emmanuilovich Babel's Cossack tales *Konarmiya* (1926; *Red Cavalry*) and Aleksandr Aleksandrovich Fadeyev's *Razgrom* (1927; *The Nineteen*) shared an emphasis on realism.

Among authors concerned with the struggle between old and new—whom Trotsky called mere fellow travellers of the Revolution—were Konstantin Aleksandrovich Fedin, Leonid Maksimovich Leonov, Yuri Karlovich Olesha, and the satirist Valentin Petrovich Katayev.

FIVE-YEAR-PLAN LITERATURE AND SOCIALIST REALISM

The struggle between "fellow travellers," who demanded creative self-determination, and the left-wing writers, arguing for proletarian literature subservient to the Communist Party, became so bitter that the Central Committee refused to endorse any one group. When the First Five-Year Plan was launched, however, the party backed the Russian Association of Proletarian Writers (RAPP) and other left-wing groups, thereby supporting themes of construction and collectivization. RAPP was abolished by the Central Committee in 1932, and it was suggested that all literary groups form a single union. A national Union of Soviet Writers was thereupon organized in 1934, and a new doctrine of "Socialist Realism" propounded to guide creative efforts. Literature was expected to show reality in its "revolutionary development," which in practice meant it was supposed to propagate the party's ideological objectives. Some tolerance was permitted during this period of economic success and Popular Front agitation. The ablest

The
abolish-
ment of
RAPP

writers, such as Mikhail Sholokhov and Leonov, took advantage of this. Melekhov, for example, hero of Sholokhov's *Tikhyy Don* (1928–40; vol. I and II translated as *And Quiet Flows the Don*, 1934, and continued in *The Don Flows Home to the Sea*, 1940), remains a tragic "White" Cossack throughout. It remained for Nikolay Ostrovsky to create the "new Soviet man" in *Kak zakalyalas stal* (1932–34; *How the Steel Was Tempered*) and most writers took up this model. The party required "positive heroes" and optimistic themes that romanticized heroic efforts to achieve Communism. Literary critics imitated one another in insistence on the party's version of Socialist Realism. Some authors were "liquidated" in Stalinist purges, and others, among them Anna Akhmatova, a major poet of exquisite skill, and Pasternak, perhaps the most celebrated Soviet poet, fell virtually silent.

(N.K.G./Da.Ma./E.J.Si./R.H.Fr.)

WAR LITERATURE AND ZHDANOVISM

During World War II the quality of literature improved somewhat. Writers shared the general fervent patriotism, and many of them were assigned to the front as correspondents. They described firsthand real horrors, real dangers, and real heroes, as distinct from the synthetic variety preferred by literary officials before the war. The best known novel to come out of this experience was Fadeyev's *Molodaya gvardiya* (1945; *The Young Guard*), which described in vivid and heroic terms the resistance activities of the Young Communist League in the Donets Coal Basin in the German-occupied Ukraine. Viktor Nekrasov's *V okopakh Stalingrada* (1947; "In the Trenches of Stalingrad") portrayed the Battle of Stalingrad from the viewpoint of the common soldier, with a degree of irreverent realism, and was equally effective. Of the wartime lyrics, those by Konstantin Mikhailovich Simonov were enormously popular. Authors who are still widely read include Olga Berggolts, Margarita Aliger, and Vera Mikhailovna Inber. Aleksandr Trifonovich Tvardovsky kept the public both moved and entertained with his long-running verse narrative *Vasily Tyorkin* (1941–45), on the vicissitudes of life for an ordinary private in the Red Army.

Any hope that the relative wartime freedom would continue was crushed by the Central Committee's decree in August 1946 that all art must be politically inspired. The decree was the work of Stalin's cultural adviser, Andrey Aleksandrovich Zhdanov, and the word Zhdanovism (Zhdanovshchina) soon was given to both the policy and the sterile writing it engendered. Party spirit and a narrowly conceived Russian patriotism were to become the hallmarks of all acceptable literature. Some authors took refuge in war themes, on which many novels were based; others complied with the official demand for literature dealing with peaceful reconstruction. Even the ultraloyal Fadeyev was required to rewrite *Molodaya gvardiya* because it was held to underplay the role of the party. The works of the poet Anna Akhmatova and the satirist Mikhail Mikhailovich Zoshchenko were singled out for savage attack and were condemned for "ideological nihilism" and "servility toward everything foreign."

LITERATURE AFTER STALIN

The post-1953 period can be divided into two stages. During the first, up to 1962–63, a series of intermittent and hesitant thaws took place, during which literature became freer both in the formal sense and in its criticism of Soviet society. Even at this time, however, Pasternak's novel, *Doctor Zhivago*, which broke its author's long silence, was rejected for publication. Pasternak reacted by sending it to the West, where it appeared through an Italian publisher in 1957; as a result he was hounded out of the Writers' Union in disgrace. This was the beginning of a development by which Russian literature became geographically divided, with much of the best work, especially if politically controversial, being published in the West (even if written in Russia).

The limit of official tolerance was reached in 1962, when Aleksandr Solzhenitsyn, an unknown schoolmaster in Ryazan and a former political prisoner, published a short novel, *Odin den iz zhizni Ivana Denisovicha* (*One Day in*

the Life of Ivan Denisovich), which gave a frank and honest picture of the daily routine in one of Stalin's labour camps. Thereafter the political authorities and the Writers' Union bureaucrats reasserted themselves, both to prevent any further such revelations and to try to revive optimistic literature with a positive social message. Solzhenitsyn's later novels, *Rakovy korpus* (1968; *Cancer Ward*) and *V krughe pervom* (1968; *The First Circle*), which extended his canvas of Stalinist society, were rejected for publication in the Soviet Union. After circulating for some time as *samizdat*, or self-published, literature, in homemade typewritten copies, they eventually reached the West and were published there. Solzhenitsyn was expelled from the country in 1974.

During the thaws, the Writers' Union and the main literary journals helped to launch young writers on a literary career. Many of the most talented of these subsequently pushed their explorations both of literary form and of Soviet life to the point where they transgressed the uncertain and changing boundaries of the politically permissible, and they had to follow the example of Pasternak and Solzhenitsyn. Most notable among them were Vladimir Voinovich, whose innocently perceptive picaresque hero acts as the medium for devastating satire in *Zhizn i neobychnyye priklyucheniya soldata Ivana Chonkina* (1975; *The Life and Extraordinary Adventures of Private Ivan Chonkin*); Georgy Nikolayevich Vladimov, who in *Verny Ruslan* (1975; "Faithful Ruslan") views Stalinist Russia and its heritage through the revealing eyes of a dog in a labour camp; and Vasily Pavlevich Aksyonov, whose best novel, *Ozhog* (1980; "The Burn"), reflects the painful maturing of the young people of the 1960s as they rediscover their nation's immediate past and reassess its present.

At the same time, a few good prose writers managed, in the midst of struggle and controversy, to continue publishing in the Soviet Union. Most notable were the so-called rural writers, who, through the microcosm of the village, illuminated man's spiritual development in an era of technical "progress." Among these are Vasily Belov, Fyodor Abramov, and Valentin Rasputin. Vasily Shukshin's pithy short stories reflected the disjointed consciousness of recently urbanized peasants, while Yury Trifonov exposed the moral dilemmas of the modern Soviet intelligentsia in prose of delicate psychological insight and almost infinite ambiguity, which at times seemed radically to question the whole official view of Soviet history.

During the 1950s and early '60s oral poetry became a vehicle for semitolerated self-expression on political and cultural themes, and poetry readings, sometimes held in huge stadiums, became major public occasions. The declamatory civic verse of Yevgeny Yevtushenko was well suited to the events. As the authorities became more worried by such readings, tape recordings became a more convenient medium, and many people listened in their own homes to the guitar-accompanied lyrics of Bulat Okudzhava, Aleksandr Galich, and Vladimir Vysotsky, with their background in folklore, labour camp songs, and popular ditties. Among the best lyric poets of the period were the philosophically inclined Arseny Tarkovsky and Joseph Brodsky (who emigrated in 1972), the more experimental Andrey Voznesensky, and the gently reflective Bella Akhmadulina. (G.A.H.)

BIBLIOGRAPHY. The availability of Russian prose and poetry for English-language readers is documented in many bibliographic sources, including MAURICE B. LINE, *A Bibliography of Russian Literature in English Translation to 1900, Excluding Periodicals* (1963); and AMREI ETTLINGER and JOAN M. GLADSTONE, *Russian Literature, Theatre, and Art: A Bibliography of Works in English Published 1900–1945* (1947). The two works were reissued together as *Bibliography of Russian Literature in English Translation to 1945* (1972). See also GEORGE GIBIAN, *Soviet Russian Literature in English* (1967); and FRED MOODY (ed.), *10 Bibliographies of 20th Century Russian Literature* (1977). New translations appear continuously and are listed in periodicals dealing with Russian and Slavic studies.

Information on the history of Russian literature is offered in WILLIAM E. HARKINS, *Dictionary of Russian Literature* (1956, reprinted 1971); and VICTOR TERRAS (ed.), *Handbook of Russian Literature* (1985), a source covering literary figures, genres, and styles. WEBER and GEORGE J. GUTSCHE (eds.), *The Modern Encyclopedia of Russian and Soviet Literature* (1977–), an ongoing work with 9 volumes published by 1990.

(Ed.)

Rutherford

Ernest Rutherford, Baron Rutherford of Nelson, nuclear physicist and Nobel prize winner, is to be ranked in fame with Sir Isaac Newton and Michael Faraday. Indeed, just as Faraday is called the “father of electricity” so a similar description might be applied to Rutherford in relation to nuclear energy. He contributed substantially to the understanding of the disintegration and transmutation of the radioactive elements; discovered and named the particles expelled from radium; identified the alpha particle as a helium atom and with its aid evolved the nuclear theory of atomic structure; and used that particle to produce the first artificial disintegration of elements. In the universities of McGill, Manchester, and Cambridge he led and inspired two generations of physicists who—to use his own words—“turned out the facts of Nature,” and in the Cavendish Laboratory his “boys” discovered the neutron and artificial disintegration by accelerated particles.

Education
in New
Zealand

Rutherford was born in Spring Grove, New Zealand, on August 30, 1871, the fourth of the 12 children of James, a wheelwright at Brightwater near Nelson on South Island, and Martha Rutherford. His parents, who had emigrated from Great Britain, denied themselves many comforts so that their children might be well educated. In 1887 Ernest won a scholarship to Nelson College, a secondary school—similar to a public (private) school in England—where he was a popular boy, clever with his hands, and a keen footballer. He won prizes in history and languages as well as mathematics. Another scholarship allowed him to enroll in Canterbury College, Christchurch, from where he graduated with the B.A. in 1892 and the M.A. in 1893 with first class honours in mathematics and physics. Financing himself by part-time teaching, he stayed for a fifth year to do research in physics, studying the properties of iron in high-frequency alternating magnetic fields. He found that he could detect the electromagnetic waves—wireless waves—newly discovered by the German physicist Heinrich Hertz, even after they had passed through brick walls. Two substantial scientific papers on this work won for him an “1851 Exhibition” scholarship, which provided for further education in England.

Before leaving New Zealand he became unofficially engaged to Mary Newton, a daughter of his landlady in Christchurch. Mary preserved his letters from England, as did his mother, who lived to age 92. Thus, a wealth of material is available that sheds much light on the nonscientific aspects of his fascinating personality.

Rutherford, oil painting by J. Dunn, 1932. In the National Portrait Gallery, London.

On his arrival in Cambridge in 1895, Rutherford began to work under J.J. Thomson, professor of experimental physics at the university's Cavendish Laboratory. Continuing his work on the detection of Hertzian waves over a distance of two miles, he gave an experimental lecture on his results before the Cambridge Physical Society and was delighted when his paper was published in the *Philosophical Transactions* of the Royal Society of London, a signal honour for so young an investigator.

Arrival
at the
Cavendish
Labora-
tory

Rutherford made a great impression on colleagues in the Cavendish Laboratory, but also aroused jealousies in the more conservative members of the Cavendish fraternity, as is clear from his letters to Mary; and Thomson held him in high esteem. In December 1895, when Röntgen discovered X-rays, Thomson asked Rutherford to join him in a study of the effects of passing a beam of X-rays through a gas. They discovered that the X-rays produced large quantities of electrically charged particles, or carriers of positive and negative electricity, and that these carriers, or ionized atoms, recombined to form neutral molecules. Working on his own, Rutherford then devised a technique for measuring the velocity and rate of recombination of these positive and negative ions. The published papers on this subject remain classics to the present day.

In 1896 the French physicist Henri Becquerel discovered that uranium emitted rays that could fog a photographic plate as did X-rays. Rutherford soon showed that they also ionized air but that they were different from X-rays, consisting of two distinct types of radiation. He named them alpha rays, highly powerful in producing ionization but easily absorbed, and beta rays, which produced less radiation but had more penetrating ability. He thought they must be extremely minute particles of matter.

In 1898 Rutherford was appointed to the chair of physics at McGill University in Montreal. To Mary he wrote, “the salary is only 500 pounds but enough for you and me to start on.” In the summer of 1900 he travelled to New Zealand to visit his parents and get married. When his daughter Eileen, their only child, was born the next year, he wrote his mother “it is suggested that I call her ‘Ione’ after my respect for ions in gases.”

Toward the end of the 19th century, many scientists thought that no new advances in physics remained to be made. Yet within three years Rutherford succeeded in marking out an entirely new branch of physics called radioactivity. He soon discovered that thorium or its compounds disintegrated into a gas that in turn disintegrated into an unknown ‘active deposit,’ likewise radioactive. Rutherford and a young chemist, Frederick Soddy, then investigated three groups of radioactive elements—radium, thorium, and actinium. They concluded in 1902 that radioactivity was a process in which atoms of one element spontaneously disintegrated into atoms of an entirely different element, which also remained radioactive. This interpretation was opposed by many chemists who held firmly to the concept of the indestructibility of matter; the suggestion that some atoms could tear themselves apart to form entirely different kinds of matter was to them a remnant of medieval alchemy.

Nevertheless, Rutherford's outstanding work won him recognition by the Royal Society, which elected him a fellow in 1903 and awarded him the Rumford medal in 1904. In his book *Radio-activity* he summarized in 1904 the results of research in that subject. The evidence he marshalled for radioactivity was that it is unaffected by external conditions, such as temperature and chemical change; that more heat is produced than in an ordinary chemical reaction; that new types of matter are produced at a rate in equilibrium with the rate of decay; and that the new products possess distinct chemical properties.

Rutherford, a prodigious worker with tremendous pow-

ers of concentration, continued to make a succession of brilliant discoveries—and with remarkably simple apparatus. For example, he showed (1903) that alpha rays can be deflected by electric and magnetic fields, the direction of the deflection proving that the rays are particles of positive charge; he determined their velocity and the ratio of their charge (E) to their mass (M). These results were obtained by passing such particles between thin metal plates stacked closely together, the size of a matchbox, each plate charged oppositely to its neighbour in one experiment; and in another experiment putting the assembly in a strong magnetic field; and in each experiment he measured the strengths of the fields which just sufficed to prevent the particles from emerging from the stack.

Rutherford wrote 80 scientific papers during his seven years at McGill, made many public appearances, among them the Silliman Memorial Lectures at Yale University in 1905, and received offers of Chairs at other universities. In 1907 he returned to England to accept a Chair at the University of Manchester, where he continued his research on the alpha particle. With the ingenious apparatus that he and his research assistant, Hans Geiger, had invented they counted the particles as they were emitted one by one from a known amount of radium; and they also measured the total charge collected from which the charge on each particle could be detected. Combining this result with the rate of production of helium from radium, determined by Rutherford and the American chemist, Bertram Borden Boltwood, Rutherford was able to deduce Avogadro's number (the constant number of molecules in the molecular weight in grams of any substance) in the most direct manner conceivable. With his student, Thomas D. Royds, he proved in 1908 that the alpha particle really is a helium atom by allowing alpha particles to escape through the thin glass wall of a containing vessel into an evacuated outer glass tube and showing that the spectrum of the collected gas was that of helium. Almost immediately, in 1908, came the Nobel Prize—but for Chemistry, for his investigations concerning the disintegration of elements.

The
nuclear
theory
of the
atom

In 1911 Rutherford made his greatest contribution to science with his nuclear theory of the atom. He had observed in Montreal that fast-moving alpha particles on passing through thin plates of mica produced diffuse images on photographic plates, whereas a sharp image was produced when there was no obstruction to the passage of the rays. He considered that the particles must be deflected through small angles as they passed close to atoms of the mica, but calculation showed that to deflect such particles travelling at 20,000 kilometres per second, an electric field of 100,000,000 volts per centimetre was necessary, a most astonishing conclusion. This phenomenon of scattering was found in the counting experiments with Geiger; Rutherford suggested to Geiger and another student, Ernest Marsden, that it would be of interest to examine whether any particles were scattered backward, *i.e.*, deflected through an angle of more than 90 degrees. To their astonishment, a few particles in every 10,000 were indeed so scattered, emerging from the same side of a gold foil as that on which they had entered. After a number of calculations Rutherford came to the conclusion that the requisite intense electric field to cause such a large deflection could only occur if all the positive charge in the atom, and therefore almost all the mass, were concentrated on a very small central nucleus some 10,000 times smaller in diameter than that of the entire atom. The positive charge on the nucleus would therefore be balanced by an equal charge on all the electrons distributed somehow around the nucleus.

Although Hantaro Nagaoka, a Japanese physicist, in

1904 had proposed an atomic model with electrons rotating in rings about a central nucleus, it was not taken seriously because, according to classical electrodynamics, electrons in orbit would have a centripetal acceleration toward the centre of rotation and would thus radiate away their energy, falling into the central nucleus almost immediately. This idea is in marked contrast with the view developed by J.J. Thomson in 1910; he envisaged all the electrons distributed inside a uniformly charged positive sphere of atomic diameter, in which the negative "corpuscles" (electrons) are imbedded. It was not until 1913 that Niels Bohr, a Danish physicist, postulated that electrons, contrary to classical electrodynamics, do not radiate energy during rotation, and do indeed move in orbits about a central nucleus, thus upholding the convictions of Nagaoka and Rutherford. A knighthood conferred in 1914 further marked the public recognition of Rutherford's services to science.

During World War I he worked on the practical problem of submarine detection by underwater acoustics. He produced the first artificial disintegration of an element in 1919, when he found that on collision with an alpha particle an atom of nitrogen was converted into an atom of oxygen and an atom of hydrogen. The same year he succeeded Thomson as Cavendish professor. Although his experimental contributions henceforth were not as numerous as in earlier years, his influence on research students was enormous. In the second Bakerian lecture he gave to the Royal Society in 1920, he speculated upon the existence of the neutron and of isotopes of hydrogen and helium; three of them were eventually discovered by workers in the Cavendish Laboratory.

His service as president of the Royal Society (1925–30) and as chairman of the Academic Assistance Council, which helped almost 1,000 university refugees from Germany, increased the claims upon his time. But whenever possible he worked in the Cavendish Laboratory, where he encouraged students, probed for the facts, and always sought an explanation in simple terms. When in 1934 Enrico Fermi in Rome successfully disintegrated many different elements with neutrons, Rutherford wrote to congratulate him "for escaping from theoretical physics."

Rutherford read widely and enjoyed good health, the game of golf, his home life, and hard work. He could listen to the views of others, his judgments were fair, and from his many students he earned affection and esteem. In 1931 he was made a peer, but any gratification this honour may have brought was marred by the death of his daughter. He died in Cambridge on October 19, 1937, following a short illness, and was buried in Westminster Abbey.

Sacred Offices and Orders

The concept of the religious or sacred personage, as distinguished from the lay practitioner, is a central structural element in most organized religions and in many societies in which religion cannot be regarded as a separate organized entity *per se*. Although the status and functions of religious personages vary considerably worldwide and throughout history, certain major categories are recognizable for the purposes of discussion.

The role of the founders of religions is obviously of primary importance but the uniqueness of such positions precludes cross-cultural examination. The concepts of prophecy and sainthood, likewise centring upon the

singularity of an individual's relationship to the divine, are treated in the *Macropædia* article DOCTRINES AND DOGMAS, RELIGIOUS. The less strictly religious functions of magician, diviner, and seer are treated in the *Macropædia* article OCCULTISM.

This article treats four highly institutionalized types of religious personage and the institutions, offices, or orders in which such personages function.

For coverage of related topics in the *Macropædia* and the *Micropædia*, see the *Propædia*, sections 811, 812, 821, 827, and the *Index*.

Priesthood

Throughout the long and varied history of religion, the priesthood has been the official institution that has mediated and maintained a state of equilibrium between the sacred and the profane aspects of human society and that has exercised a stabilizing influence on social structures and on cultic organizations. The term priest is derived etymologically from the Greek word *presbyteros* ("elder"), of which it is a contraction, and it is equated with the Latin word *sacerdos* (the Roman officiant at the sacrifices and sacred rites).

NATURE AND SIGNIFICANCE

The primary role of the priest is that of the ritual expert, the one who has a special and sometimes secret knowledge of the techniques of worship, including incantations, prayers, sacrificial acts, songs, and other acts that are believed to bridge the separation between the divine or sacred and the profane realms. The priest gains such knowledge through the institution known as the priesthood, which may be composed of various groups or guilds devoted to all or only a few aspects of the priestly craft. Because the priest gains his special knowledge from a school for priests, he is differentiated from other religious and cultic leaders, such as the magician, shaman (healer and visionary), diviner, or prophet, who obtain their positions by means of individual efforts (e.g., learning from a master magician or diviner; individual ecstatic experiences that are publicly recognized). As a member of the institution that regulates the relationship between the divine or sacred and the

profane realms through the various rituals of a particular religion, the priest is the accepted religious and spiritual leader in his society.

At various times in the history of a culture or society the priestly institution may be attacked by other institutions or groups that vie for the religious leadership (and thus sometimes the social, political, and economic leadership) of a people. Such anticlericalism is a phenomenon not only of modern society (as noted in the Russian Revolution of 1917, the Mexican Civil War that began in 1857, and other less dramatic movements) but also in the ancient world, such as in Egypt in the 14th century BC, when the priesthood of the god Amon and the priesthood of the god Aton changed positions. Anticlericalism may be fostered by battles for religious leadership between two or more opposing priestly groups, or by prophets and others who are concerned with religious experiences in their personal rather than in their institutional forms. Among Protestants, the doctrine of the priesthood of all believers (*i.e.*, all believers have direct access to God) militates generally against strong anticlerical tendencies within their own ranks. In Islām, there is, technically, no priesthood, though there are local spiritual and community leaders, such as the *imām*, the *mullah*, the *mufīī*, the *qāḍī*, and others.

THE PRIEST AND HIS OFFICE

The function of the priest as the mediator and maintainer of the equilibrium between the sacred and the profane in human society, and as the stabilizer of the social structures and the cultic organizations, determines the various

The role
of the
priest

Functions and
criteria

criteria for holding the priestly office. In preliterate society the functions are accomplished by ritual experts who are trained in the special knowledge and techniques of magico-religious disciplines in which sacred power is believed to be inherent. They also are trained in disciplines that enable them to gain a supernormal psychic knowledge and in the techniques of mystical experience. As agents of the sacred power, they are believed to have the ability to control and manipulate through ritual natural processes and events, and to engage in a sacramental relationship between man and the sacred order on which the community and its members depend for their sustenance, survival, and well-being.

Because religious institutions and beliefs are intimately connected with other social institutions, those who are set apart to establish efficacious relations with the transcendental powers that are believed to control the universe, as well as human affairs and destinies, occupy a key position at the dynamic centre in the social structure. Thus, in certain types of societies the office and functions of the priest may be limited to those having a particular ancestry, those belonging to certain tribes (such as the Levites in Judaism), families (such as the Eumolpids of the Eleusinian mystery religion of Greece), or castes (such as the Brahmins in Hinduism), and those initiated into certain professional orders (such as the cure doctors among the Maya).

Besides such sociocultural criteria, there are also certain personal requirements in various cultures for those who would become members of a priesthood. Celibacy (as in Roman Catholicism and the Arcakas of the Digambara sect in Jainism), asceticism (as in various Buddhist groups), and religious experiences (as among some holiness Protestant sects) are among the personal requirements for those who aspire to or are chosen to assume the priestly office.

The religious functions of priests are quite varied. In his specific role as the officiant of the rites that unite the sacred and the profane realms, the priest as a *pontifex* (from the Latin word that means maker of a bridge) celebrates or administers at the rituals of initiation into the cult or church, presides over ritual reenactments of creative, redemptive, or salvatory (salvation-working) events, and offers sacrifices to the gods or to one God. He also functions as a perpetuator of the sacred traditions, practices, and beliefs and as a teacher, healer, counsellor, and diviner.

In all their respective offices, functions, and capacities, those who have exercised and manipulated sacred power have attained a uniquely prestigious position as the spiritual and social leaders *par excellence*. When perplexing and emotional situations that appear to be beyond human control, knowledge, skill, or techniques have arisen in a community, the people have a recourse in the priest, who has the special knowledge of the relationship between the divine or sacred and the profane realms. The priest is often called upon at critical junctures in the lives of individuals (such as birth, puberty, marriage, and death) and in the life of a community (such as seasonal changes or at times of flood, drought, and famine).

PRIESTHOOD IN THE RELIGIONS OF THE WORLD

Medicine
men and
cult leaders

Nonliterate cultures. The office of priesthood in nonliterate society ranges from the medicine man, who magically manipulates the sacred power as a quasi-impersonal force, to the shaman, who, as an agent of divine or spiritual beings, may be at once a medicine man, a visionary, an occult diviner, and a genuine sacerdotal cult leader. Not infrequently, chiefs or headmen of a clan or village may become sacred men or ritual experts displaying supernatural insight and knowledge as the agents of spiritual beings. As such, they may eventually become prophets or sacred kings occupying a unique status in the community. This status may be acquired by accepted claims of descent from a mythical divine ancestor or god on whom the fertility of the crops and the welfare of the community in general are thought to depend. Occult power and insight may be derived from spirits with which the prophet or diviner is related in a trance or ecstasy, or else in dreams, visions, or auguries and oracles that make known the divine will. To occupy such a position, a strenuous course of training is frequently required involving some knowledge of ther-

apeutics (healing), leechcraft (use of leeches in healing), trephining (operating on the skull), herbs, poisons, and perhaps sleight of hand and similar techniques, together with the development of psychical and occult qualities. While charlatanry (pretensions to medical knowledge) is often practiced, the office also demands an understanding of the technical equipment calculated to bring about the results that are sought, and the proper type of temperament, conditions of mind, and state of emotion.

Unlike the shaman and the medicine man, both of whom exercise their respective functions while relying largely on their own initiative and psychic and occult powers of divination, healing, and direct access to the spirit world at their command, the priest supplicates and conciliates supernatural forces superior to himself, guards the sacred tradition in his care, and acts as the master of sacrifice. The shaman or magician officiates in his own name and by his own methods and techniques; the priest serves the altar, in the temple or shrine, as the representative of the community in his relations with the gods and the sacred order by virtue of the status and its functions that have been conferred upon him at his ordination, bestowing its sacredness and attendant taboos.

The ancient Middle East. In the Nile Valley the occupant of the throne (the pharaoh) was regarded as a god incarnate, the sacred king. Because he was believed to be the epitome of all that was divine, he alone was the intermediary between mankind and the gods whom he summed up in his complex personality. Before the rule of Upper and Lower Egypt was centralized by the founder of the 1st dynasty (c. 3100–c. 2890 BC), Menes, the high priest and king “Scorpion” was traditionally considered to be the incarnation of Horus (the sky god). Under the powerful influence of the priesthood of Heliopolis, the sacred kingship was given a solar significance; the pharaohs were represented as the sons of the sun god Re, who was identified with the god Atum. When Memphis became the imperial city, Re-Atum was brought into relation with its god Ptah (the creator) and subsequently with Osiris, a fertility god who also was regarded as a god of the dead. Osiris was equated with the life-giving waters of the Nile and believed to be the first civilizing king, reigning in the person of the pharaoh as his posthumous son Horus. Therefore in Egypt the divine origin and status of the monarchy was so firmly established that it became the stabilizing force of the civilization in the Nile Valley.

In theory, the king of Egypt was the high priest of every god, and in all important ceremonies he alone was depicted in the temple scenes as the officiant. For practical purposes, however, he delegated his functions to the particular professional local priesthoods. In due course the priests, courtiers, and officials shared in his divine powers and privileges. Even though they only acted on behalf of the divine ruler, they shared in some measure his personality and potency. As the priest *par excellence*, the pharaoh remained unique, and it was from him that the priesthood and nobility exercised their sacerdotal functions when the solar theology of Heliopolis was established in the 5th dynasty (c. 2494–c. 2345 BC). After the 5th dynasty he was accredited exclusively with having built all the temples, and on their walls he was portrayed officiating as the mediator between mankind and the gods in all important rites. In fact, nevertheless, his place was taken by one of the retinue of priests attached to the royal household or to the local temples. Only very occasionally did he perform his sacerdotal duties in person. Every temple had its high priest who, in addition to his sacred offices, might also be a high judicial official, thereby combining sacred and profane roles, varying with the actions performed.

From the number of titles assigned to priestly officials in the Old Kingdom (c. 2686–c. 2160 BC), it appears that one priest must have served simultaneously a multiplicity of cults in the shrine to which he was attached and received a share of the offerings and emoluments. In wealthy great temples in the New Kingdom (c. 1567–c. 1085 BC) there was an elaborate organization, and a large staff engaged in administrative, civil, and educational duties, as well as in their sacerdotal and mortuary functions. There were also a number of priestesses associated with the mother-

Sacred
kingship
and the
priesthood
in Egypt

goddess Hathor (wife of the sun god Re), who were mainly concerned with playing the sacred sistra and other musical instruments. From the 18th to the 21st dynasties (1567–1085 bc), however, under the Theban priesthood of Amon-Re, the priestly hierarchy was able to create an absolute “state within a state.”

Priestly
classes
and func-
tions in
Mesopo-
tamia

In Mesopotamia, where kingship occupied a less prominent position than it did in the Nile Valley, powerful priesthoods and highly organized temples were firmly established in and after the 4th millennium bc. The temples were centres of sacred learning of the content and methods of incantation, prognostication, exorcism, and of political and economic administration, and their attendant priests were divided into classes with special sacerdotal and secular functions. The valleys of the Tigris and Euphrates rivers contained a series of city-states loosely bound together under the rule of a governor (*patesi* or *ensi*) and of a high priest (*sangu mahi*). Their main functions were to integrate the temple communities of the city, their revenues and boundaries, and the *unigallu*, or head of the priesthood, was responsible for the performance of the seasonal rites, with the assistance of those who sang the liturgies and directed the temple music and those who uttered the lamentations, invoked the oracles, and interpreted the astrological signs and omens. The duties of other members of the priesthood included making incantations and pronouncing spells and exorcisms. The seers, or *baru*, foretold the future by means of soothsaying, interpreting dreams and visions, and revealing revelations.

An important function of the priesthood in the ancient Middle East was that of exorcism. All down the ages good and evil have been viewed as two contending forces in perpetual conflict, and in the dual task of the riddance of evil and the induction of good the exorcist, the shaman, and the seer have exercised complementary functions hardly distinguishable in the higher cultural levels in Babylonia and Assyria. When the function of the driving out of demons from human beings and buildings by incantations and ritual expulsions was separated from the interpretation of omens and astrological portents, the office of the exorcists was in ever increasing demand. According to cuneiform texts from around the 3rd millennium bc, exorcists held a position of supreme importance, assisting at the consecration of temples, at funerals, and at seasonal ceremonies. In the temple schools, exorcists, diviners, and astrologers, together with physicians, scribes, and judges, fostered the study of astronomy, medicine, and jurisprudence. In their sacerdotal functions and capacities they were regarded as the agents and exponents of the gods, having a monopoly on sacred knowledge, controlling for good or evil the destinies of the community and its members. Therefore, their power was enormous, and they maintained the relation between religion and culture by their all-embracing hierarchy that determined the present welfare and future destinies of both human beings and the social order.

Canaanite
priesthood

Similar beliefs and practices occurred in northern Syria in the middle of the 2nd millennium bc, before the Israelite settlement in Canaan. Here, again, the priesthood was responsible for the dramatic rituals on which the social structure and the well-being of mankind were believed to depend, especially in the climax of the autumnal festival that culminated in the enthronement of the year god. The priestly movement was centred in the temple of Ugarit, and the religious texts discovered there (Ras Shamra) were essentially liturgical documents devised to make the sacred drama enacted efficacious. Baal, the weather god, was regarded as “the lord of the furrows of the field,” responsible for the rain and the production of the fruits of the earth. A series of temples was erected in his honour in Syria and Palestine. The temple at Ras Shamra was a considerable structure with a lattice, the opening of which was supposed to produce the autumnal rains, and its liturgical ritual was celebrated by the priests and priestesses in their official capacities as those who personified the gods and goddesses responsible for providential bounty and beneficence.

With the advent of Persian sovereignty in Mesopotamia, a new approach to cosmology and mythology was introduced. In the religion founded by Zoroaster (c. 7th cen-

tury bc), the ultimate ground of the universe was reduced to a single supreme deity, Ahura Mazda, the All-wise Lord. Astrology became widely practiced by the Iranian Magi (priests of the Zoroastrian religion) who were highly skilled in the knowledge of astral lore and the signs of the zodiac. In the three centuries after the Persian occupation of Mesopotamia (6th century bc), the Babylonian priests under Iranian influence made remarkable strides in astronomical learning that ultimately dethroned astrology from its exalted position in sacred tradition. Beyond the Euphrates Valley, however, it survived until after the Muslim rule, when the astrologer and the astronomer became indistinguishable.

Greece and Rome. The ancient Greeks were devoid of hierarchic institutions composed of men and women through whom the gods were approached, though priests and priestesses could be found in many places engaging in specific sacerdotal functions and ritual acts. Some of them attained considerable social and civic prestige and importance and were attached to particular temples or shrines such as the oracle at Delphi, which was consulted on private and state matters. Their duties, however, were generally those of members of a household engaged in everyday affairs, rather than of a caste or sacerdotal order set apart and consecrated for the performance of sacrificial and other rites, functions, and practices. Though not regarded as mediators between the gods and men, they did act in such ritualistic capacities in certain civic and administrative areas. There was no specific distinction, however, between them and lay members of society. On the contrary, such officials as magistrates might be priests and vice versa. Some exercised considerable influence if they were regarded as outstandingly efficient, wise, or distinguished in their respective civic or religious capacities.

Civic
importance
of the
priesthood
in ancient
Greece
and Rome

Similarly, in ancient Rome when the agricultural religion of Numa (the legendary second king) was transformed into an institutional state cult in the republic, it was organized as a hierarchy with the *rex sacrorum* (“king of the sacred things”) inheriting the office and attributes of the former priest-king. The *rex sacrorum* had to be a patrician and was chosen for life, subordinate only to the *pontifex maximus*, who was the head of the college of *pontifices* (“advisors on the sacred law”) and *flamines* (“priests devoted to a particular god”), three of whom were assigned to the gods Jupiter, Mars, and Quirinus, the remaining 12 to other deities. The flamen Dialis, dedicated to the supreme sky god, Jupiter, occupied a unique position socially, politically, and sacerdotally and was subject to strict taboos and regulations because of his sacred office. The *flaminica*, the wife of the flamen Dialis, participated in his sacredness and official status, and so vital was her association with him and his office that if she died he ceased to perform his functions.

Attached to the temple of the goddess Vesta on the Forum in Rome were the six Vestal Virgins dedicated from childhood to the service of the sacred fire in the *atrium Vestae* (hearth temple), and to the care of the storehouse (*penus*). Originally they were selected from patrician families by the *pontifex maximus*, but later plebians were eligible for election. During their 30 years of service to the goddess, beginning in childhood, chastity had to be strictly observed on pain of death by starvation, but after the completion of the period of service the virgins were free to marry. The duties assigned to them at very ancient festivals, such as the Lupercalia (a fertility festival) on February 15, and at other occasions, indicate their unique position and significance in the state cult going back, in all probability, to their origins in the family tradition, associated with the *pontifices* as the officiating priests. Augurs (divinatory personages) had a powerful influence on state religious beliefs and practices, especially in divination to ascertain the will of the gods and the blessing of the crops. They also interpreted signs in the sky as good or bad for the guidance of the magistrates. At the end of the republic (in the 1st century bc) this practice led to abuses that were ridiculed by the politician and orator Cicero. Among other groups of Roman priests were the Salii on the Palatine Hill (the 12 Leapers of the god Mars), and the Luperci, whose sacerdotal functions were confined to the

Lupercalia. The *fetiales* were Roman officials employed in making treaties or declarations of war, whose work gradually fell into disuse at the beginning of the empire (late 1st century BC) when the state cult was in decline and losing its vitality.

Ancient Judaism. When Christianity became the legal religion of the Roman Empire after AD 313, it had already inherited from its Jewish background a concept of an organized priesthood. The Jewish priesthood had been centralized in the Temple at Jerusalem (destroyed by the Romans in AD 70) since the 10th century BC. The Hebrew designations for those who exercised oracular, divinatory, and ecstatic functions in ancient sanctuaries that were prominent cultic centres prior to the building of the temple, such as Mamre, Hebron, Bethel, Shechem, and Gilgal, were *kohen* (cohen), *levi*, *navi*, and *ro'e*, corresponding to priest, Levite, prophet, and seer, respectively. *Kohen* is the equivalent of the Arabic word *kāhin*, diviner, and in Hebrew it has the meaning of "priest," denoting the occupant of the office concerned with obtaining oracles by the aid of the ephod ("pouch") containing the Urim and Thummim (sacred lots) and by inspiration, as well as with officiating at a sanctuary. After the 7th century BC, when worship was concentrated in Jerusalem, the capital, the priesthood was restricted to the Levitical house of Aaron (brother of Moses, the 13th-century-BC lawgiver) after having been previously drawn from other lines of descent, such as those of David, Nathan, Micah, and Abinadab (royal, prophetic, and priestly families).

Whether in fact the Levites ever were members of a sacerdotal tribe is open to debate, but in any case they represented a special fraternity set apart to be guardians of the sanctuary and to engage in oracular and prophetic function, over against the rival priestly *kohanim* in their respective independent confraternities. It was not until after the Exile of the Jews to Babylon in 586 BC, when the Priestly Code was drawn up, that the distinction between priests and Levites became absolute. The priesthood was confined exclusively to those claiming succession from Aaron, in spite of the Zadokites claiming priestly descent from Eleazar as an "everlasting covenant" (Num. 18:2-7, 25:13; I Chron. 24:37). The Zadokites may have represented the survival of an ancient Jebusite (Canaanite) royal priesthood, giving them special duties and privileges in the Temple worship above those of the Levites. Later, when the priesthood became reserved for the descendants of the family of Aaron alone, the title was restricted to members of the non-Aaronic families of the tribe acting as the servants of the Temple.

The oracle given by the priests as the inspired word of the Law, called the Torah, which was referred back to Moses in postexilic Judaism, acquired a new significance, involving a rigid observance of its ritual and legal commands that permeated every aspect of life, worship, and conduct. The cessation of the daily sacrifice and other Levitical priestly ministrations in the Temple after the fall of Jerusalem (AD 70) gave a new emphasis to and interpretation of the Torah in the synagogue and in domestic rituals. The prerogatives of the high priest, and those of the priesthood in general, with its exclusive lineage, were maintained after the revolt of the Jews under the leadership of the Maccabees against the Hellenistic Syrians in the 2nd century BC, and the priestly blessing (*dukhan*) in the synagogue remained the exclusive right of the *kohanim* claiming descent from Aaron. They also have had the right to be the first called upon to read the Torah in the synagogue, followed by a Levite. Their privileges, however, have been questioned by some rabbinical authorities (nonpriestly Torah scholars and religious leaders). The Sadducees (deriving their name from the Zadokites) were the high priests in Jerusalem during and after the time of the Hasmoneans, the descendants of the Maccabees (135-104 BC). They exercised considerable influence in the Jewish Sanhedrin (supreme rabbinic court) as the conservative class of the religious aristocracy, favoured accommodations to Greek culture, and maintained the importance of the letter of the Written Law over against the oral tradition of the rival Pharisees. The high priesthood, however, was declining in status under the increasing control of the Roman authorities.

Christianity. At this critical juncture in Judaism, Christianity, with its own particular conception of priesthood and sacrificial redemption, began in Palestine and rapidly spread throughout the surrounding regions in the Greco-Roman world. In the New Testament, the imminent destruction of the Temple in Jerusalem and its worship is predicted, and the culmination of its high priesthood in the person of Christ, after the order of Melchizedek (the priest-king of Jerusalem revered by Abraham in the Old Testament), is proclaimed. The Jewish Aaronic priesthood and its ritual are represented in the Letter to the Hebrews as imperfect shadows, in a Platonic sense, of the archetypal order of the eternal sacrifice of Christ. Only Christ, who was described as "beyond the veil" (referring to the veil that separated the "Holy of Holies" section from the other areas of the Temple), was believed to be able to save those who came to God through him, since he had removed the barrier of sin that separated man and God for those in a state of grace. In Christ's reconciling offering as both priest and victim on the cross, the writer of the Letter to the Hebrews stated that he accomplished the removal of the barrier in the heavenly tabernacle. This was interpreted in terms of the Hebrew Day of Atonement, a ceremony in which the Jewish high priest made expiation annually for himself, the priesthood, and the whole congregation of Israel. The view of Christ as king, high priest, mediator, and victim influenced the establishment and gradual development of the Christian priesthood in the church, which shares in and makes accessible to its baptized members the all-sufficient priesthood of Christ.

Originally the terms *presbyteros* ("elder") and *episkopos* ("overseer"), current in the New Testament and the early church, were probably identical. From the 2nd century on, however, the sacerdotal hierarchy developed along the lines of the Hebrew priesthood, the title *episcopus*, or bishop, becoming reserved for those who presided over the presbyterate, then called *sacerdotes* because they shared in the episcopal *sacerdotium* ("priesthood"), which included the offering of the eucharistic sacrifice of bread and wine. But the conferring of holy orders (ordination of presbyters) and administering the sacrament of confirmation were confined to the episcopate, together with administration of the diocese (jurisdictional area). In due course the threefold ministry of bishops, priests, and deacons (administrative and liturgical assistants in a parish) became organized on a diocesan basis. This remained the norm in the Western Church until the Reformation in the 16th century, when it was repudiated by the continental Reformers (e.g., Luther, Calvin, and Zwingli). In Roman Catholicism, Anglicanism, Swedish Lutheranism, and Eastern Orthodoxy, apostolic succession and jurisdiction has been maintained, especially in the Roman Catholic papacy and in Eastern Orthodox patriarchates.

In European Christianity in the Middle Ages (c. 6th to 14th centuries), the deeply laid tradition inherited from the theocracies and priesthoods in the ancient Near East of a common social, judicial, political, and religious structure was sustained and gave expression to medieval civilization, especially in the Latin West. Church and state became so closely associated that they were virtually identical, as in the cases of the sacred and secular in preliterate societies. As Dante (1265-1321) contended in *De Monarchia* ("Concerning the Monarchy"), the pope, as the head of the spiritual aspects of society, and the emperor, as the ruler of the temporal areas of concern, were equally ordained by God to exercise their functions in their respective spheres of power and influence for the welfare of mankind. If this duality of control did not endure, because the church gradually usurped more and more of the civil jurisdiction and dominated emperors, kings, and other ecclesiastical rulers, the unification of the body politic was rendered more complete as an integrated whole, and the life and character of medieval civilization was determined through the papacy and its priesthood.

Hinduism. In Vedic India, the early period of Hinduism, when the priestly caste (Brahmin, or Brāhmaṇa) was vested in a particular tribe or special class, it occupied the primary place of importance in the segmentation of Hindu society. The king was subordinate in some respects

to the Brahmins, though at one time both sometimes were chosen from the Kṣatriya, or warrior caste. Nevertheless, because the existence of the universe and all cosmic processes were made to depend upon sacrificial offerings, the king delegated such functions to the priests before the end of the 7th century BC, the priests having usurped that position previously held by the kings. The priesthood then exercised supreme control over the fortunes of the gods and men, of heaven and earth, and of the state, though not infrequently priests worked in the service of princes. The Brahmins, however, were so firmly established in the caste system as the twice-born masters of sacrifice and of the sacred knowledge that they alone possessed that they were viewed as holding the universe in their grasp. As "lords of creation" by divine right they were divided into 10 tribes, above all other castes. They were required to pass through four *ashrams* (the celibate religious student, married householder, forest hermit, and wandering ascetic), or conditions of life, prior to and after marriage, to become anchorites (or hermits), and to attain the plenitude of their status, vocation, and authority, thus renewing the creative process by the due performance of the sacrificial offering.

Against this Brahmanic sacerdotalism and its caste organization, the reaction noted in the *Upaniṣads* (writings representing the end of the Vedic period), about 1000–500 BC, introduced a mystical conception of the priesthood in Hinduism, and subsequently in Buddhism. Living as hermits in the forest, groups of mystics, reacting to Brahmanic ritualism, gathered around them disciples to learn and propagate a philosophical doctrine based upon the quest to discover a new function for the priesthood, in which the identification of the inner eternal self of man (*Ātman*) with the divine ground of the universe (Brahman) was achieved by asceticism, renunciation of the world, and mystical experience and realization, rather than by the sacrificial offering. This quest was eventually associated with the meditative techniques of *yoga* (mental and physical exercises) and opened the way for the rejection of the exclusive claims of the Brahmins in favour of the mystical insights and esoteric knowledge accessible to all who adopted the Upaniṣadic teaching and way of life.

With the establishment of the four *ashrams*, sacrifice and Brahmanic study of the Vedas were rehabilitated and brought into relationship with the Upaniṣadic tradition. The Brahmin was thus regarded as occupying the highest state of life; he was

one who has sensed the deepest self and acts out of that consciousness, [communicating it to others], . . . gives moral guidance, . . . lays down the science of values, draws out the blueprints for social reconstruction, and persuades the world to accept the high ends of life. (From S. Radhakrishnan, *Eastern Religions and Western Thought*.)

This view has lacked, however, a conception of the god-head with whom personal relations are possible, thereby making the priesthood an aspect of an impersonal divine power (Brahman), of a pantheistic principle executing its functions with automatic precision by virtue of its sacerdotal equipment, of an alternating mystical and ascetic priestly sublimation.

Jainism and Buddhism. In Jainism and Buddhism, arising within Brahmanism as nontheistic sectarian movements, the Brahmin priesthood was sublimated and the Vedic caste and sacrifice eliminated. In their place a monastic system was evolved, with monks and nuns devoted primarily to rigorous asceticism in the quest of perfection and in the pursuit of chastity and truthfulness. Complete detachment from all phenomenal possessions and connections in Jainism (founded by Mahāvīra in the 6th century BC) made paramount the mendicant life of meditation and spiritual exercises dependent upon the fulfillment of vows of poverty. The functions of the priesthood were sublimated in a process of self-salvation, centred around the purpose of the deliverance of a suffering humanity from the cycles of rebirth. Since in Buddhism *tanhā* ("desire") was regarded as the fundamental cause of *dukkha* ("the burden of existence"), priestly intervention and the sacrificial offerings were considered to be of no avail in the pursuit of the Eightfold Path leading to the passionless peace of Nirvāṇa (the state of bliss).

In the absence of any conception of a deity in Buddhism, the question of sacerdotal mediation could be ignored, though, in the Mahāyāna ("Greater Vehicle") school, and in the Tantric (esoteric, magical) school, some elements of the priestly tradition survived. The earliest converts to Buddhism were Brahmins for the most part, and a religious organization in monasteries developed, with various prescribed roles for their inhabitants, with daily routines, certain periods devoted to alms and quests, and periods for sacred learning and the translation of literary and theological works. To these activities were added other functions, such as recitations of the sacred texts at births, marriages, and in sicknesses to keep evil influences at bay. In the temples, shrines were erected to the honour of the eternal Buddha, and the image of the Blessed One on a lotus bedecked with flowers has become the central object of worship in certain Buddhist groups. The recitation of the ancient Pāli *sūtras* (divine revelations) is believed to transmit the merit inherent in the texts, as is the endless repetition of the sacred formula *Namu O-mi-to (Amida-butsu)*, "Homage be to the Buddha of infinite light." This, however, is not a sacerdotal devotion performed by, or requiring the presence of, a priest. Buddhism, in fact, has never been able to produce a strong and lasting ecclesiastical organization or a hierarchical segmentation (as in Hinduism), because it has interpreted unity in terms of Becoming, instead of in terms of Being.

Buddhism, Taoism, and Shintō in China and Japan. In the Mahāyāna Buddhist sects, the monks, and those who are popularly known as bonzes, can hardly be said to exercise definitely sacerdotal functions in the temples, monasteries, and shrines. For the most part, these functions have been confined to recitations and invocations, which all of the believers share. In China, the Taoist "priesthood" emerged as an organized institution at the beginning of the Christian Era. Some were celibates and others were married, living ordinary domestic lives. A number were mendicants and some engaged in alchemy and astrology; others were illiterate. There were also those who assisted in ceremonies and collecting the revenues. In the 6th century AD, in imitation of Buddhism, the Taoist celibates lived in monasteries with a patriarch as the head and interchanged facilities with their Buddhist counterparts. In the Zen contemplative sect in Japan, an attempt was made to attain a state of enlightenment (*satori*) by a strict discipline and training in quasi-*yoga* intuitive methods, without priestly intervention or divine grace. The Zen temples and halls of meditation have become centres of learning, art, and education as well as of vigorous austerity and contemplative mysticism, which has not been without attractions to various persons of the West in recent times.

When Buddhism reached China, Japan, and Tibet in the opening centuries of the Christian Era, it came under the influence of the indigenous faiths, cults, and social structures, and, reciprocally, it became a most important influence, adapting its beliefs and customs to those already established in these regions. In the second half of the 6th century AD, after Buddhism had acquired official recognition, pagodas, temples, and monasteries were erected with ornamentations of Buddhist origin. Buddhism adapted itself to Shintō, the native religion of Japan, and to its shrines, festivals, and rites. The functions of the four priestly classes (e.g., as ritual experts, diviners, musicians, female dancers, and "abstainers" to ward off pollution) that emerged from the family or tribal cults of Shintō were absorbed by Buddhism.

When Shintō was restored as the national religion of Japan in the 19th century, after a period of decline, the Shintō and Buddhist priests were assigned their respective duties and offices by the State Department of Religion without discrimination, for the maintenance of reverence for the gods and love of country (the Truth of Heaven and the Way of Humanity) and proper respect for the sacral emperor (the mikado). This dual sacerdotal combination lasted only until 1875, because Buddhism and Shintō were basically incompatible. This resulted in Shrine Shintō becoming the national faith under the Imperial family, maintaining its divine status, cultic practices, and priesthood, but leaving Buddhism free to propagate its *dharma*

Priestly traditions in Tantric and Mahāyāna Buddhism

Revival of sacrifice and Vedic study

(or law) in its own way. New rituals and ceremonies were composed by the government for use at the Shintō shrines, and the duties and grades of the priests were fixed.

THE MODERN SITUATION

In recent years, in Christianity especially, notwithstanding the doctrinal divergencies and modes of expression in the nature and function of the priesthood, new approaches have been made by both Catholic and Protestant theologians, liturgical scholars, and laymen. This is particularly apparent in the ecumenical and liturgical movements in Western Christendom, in the administration of the sacraments, and in the participation of the laity in the liturgy and in the other offices. In Roman Catholicism, especially under the influence of the second Vatican Council (1962–65), and in the contemporary Anglican Convocations, the “priesthood of the laity” has been more widely recognized and practiced, though this has been a cardinal doctrine of Protestantism since the Reformation. Lay persons trained in liturgical functions have assumed functions, such as reading of the Scriptures and administering the eucharistic elements of bread and wine, in various Protestant churches and, in some instances, in Roman Catholic celebrations that in the past have been the prerogatives of priests. In the Eastern Orthodox churches, such movements and influences have been less effective and operative, largely because of the heavy pressure they have endured from governments that have been hostile in the Communist countries where Orthodox membership is concentrated. They have always, however, preserved a living unity of faith, worship, and organization. Priesthood is inherent in these institutions; it has proved to be the unifying, stabilizing force in Eastern Orthodoxy, the second largest Christian body (after Roman Catholicism), beset as it has been by so many hazards and hostilities in its long and checkered history. (E.O.J.)

Shamanism

Shamanism is a religious phenomenon centred on the shaman, an ecstatic figure believed to have power to heal the sick and to communicate with the world beyond. The term applies primarily to the religious systems and phenomena of the north Asian, Ural-Altaic (e.g., Vogul, Ostyak, Samoyed, Tungus), and Paleo-Asian (e.g., Yukaghir, Chukchi, Koryak) peoples.

The term shamanism comes from the Manchu-Tungus word *šaman*. The noun is formed from the verb *ša-* (“to know”); thus, “shaman” literally means “he who knows.” Various other terms are used by other peoples among whom shamanism exists.

There is no single definition of shamanism that applies to the elements of shamanistic activity found in North and South America, in southeast India, in Australia, and in small areas all over the world as well as to the phenomena among the north Asian, Ural-Altaic, and Paleo-Asian peoples. It is generally agreed that shamanism evolved before the development of class society in the Neolithic Period and the Bronze Age; that it was practiced among peoples living in the hunting-and-gathering stage; and that it continued to exist, somewhat altered, among peoples who had reached the animal-raising and horticultural stage. According to some scholars, it originated and evolved among the more developed societies that bred cattle for production. Opinions differ as to whether the term shamanism may be applied to all religious systems in which the central personage is believed to have direct intercourse through an ecstatic state with the transcendent world that permits him to act as healer, diviner, and psychopomp (escort of souls of the dead to the other world). Since ecstasy is a psychosomatic phenomenon that may be brought about at any time by persons with the ability to do so, the essence of shamanism lies not in the general phenomenon but in specific notions, actions, and objects connected with the ecstatic state.

NATURE AND SIGNIFICANCE OF CLASSIC SHAMANISM

Among the peoples of northern Asia, shamanism developed into a more definitely articulated and specialized

form than among other peoples. Shamanism as practiced there is distinguished by its special clothing, accessories, and rites as well as by the specific world view connected with them. North Asiatic shamanism in the 19th century, which may be taken as the classical form, was characterized by the following traits:

- (1) A specialist (man or woman) is accepted by the society as being able to communicate directly with the transcendent world and thereby also possessed of the ability to heal and to divine; this person is held to be of great use to society in dealing with the spirit world.
- (2) This figure has special physical and mental characteristics; he is neurasthenic or epileptic, with perhaps some minor defect (e.g., six fingers or more teeth than normal), and with an intuitive, sensitive, mercurial personality.
- (3) He is believed to have an active spirit or group of spirits to assist him and may also have a passive guardian spirit present in the form of an animal or a person of the other sex—possibly as a sexual partner.
- (4) The exceptional abilities and the consequent social role of the shaman are believed to result from his being the “choice” of the spirits, though the one who is chosen—often an adolescent—may resist his selection, sometimes for years. Torture by the spirits, appearing in the form of illness, breaks the resistance of the shaman candidate and he (or she) has to accept the vocation.
- (5) The initiation of the shaman, depending on the belief system, may happen on a transcendent level or on a realistic level, or sometimes on both, one after the other. While the candidate lies as if dead, in a trance state, the body is cut into pieces by the spirits of the Yonder World or is submitted to a similar trial. The reason for cutting up his body is to see whether he has more bones than the average person. After awakening, the rite of symbolic initiation, climbing the World Tree, is occasionally performed.
- (6) By falling into ecstasy at will, the shaman is believed to be able to communicate directly with the spirits either by his soul leaving the body to enter their realm or by acting as their mouthpiece, like a medium.
- (7) One of the distinguishing traits of shamanism is the combat of two shamans in the form of animals, usually reindeer or horned cattle. The combat rarely has a definite purpose but rather seems to be a deed the shaman is compelled to do. The outcome of the combat means well-being for the victor and destruction for the loser.
- (8) In going into ecstasy, as well as in his mystical combat, certain objects are used: drum, drumstick, headgear, gown, metal rattlers, and staff. (The specific materials and shapes of these instruments are useful for identifying the types and species of shamanism and following their development.)
- (9) Characteristic folklore texts and shaman songs have come into being as improvisations on traditional formulas in luring calls and imitations of animal sounds.

As an ethnological term, shamanism is applied primarily to the religious systems of those regions in which all these traits are present together. In addition, there are primitive religions in which some of the above criteria are missing but which are still partially shamanistic; e.g., among the Chukchi of northeast Siberia, the specialist chosen by the spirits does not fall into ecstasy. Such religious systems may be regarded as marginally shamanistic.

Phenomena similar to some of the traits of shamanism may be found among primitive peoples everywhere in the world. Such detached traits, however, are not necessarily shamanistic. The central personalities in such systems—sorcerers, medicine men, and the like—may communicate with the other world through ecstasy, but, unlike the shaman, they have attained their position through deliberate study and the application of rational knowledge. Although they perform ceremonies as priests, hold positions of authority, and possess magical abilities, the structure and quality of their transcendental activities are entirely different from that of the shaman.

WORLDVIEW

The universe. The classic world view of shamanism is found among the peoples of northern Asia. In their view, the universe is full of heavenly bodies peopled by spiritual beings. Their own world is disk-shaped—saucer-like—with an opening in the middle leading into the

The basic characteristics of shamanism

Peripheral or marginal shamanism

Netherworld; the Upper World stands over the Central World, or Earth, this world having a manifold vault. The Earth, or Central World, stands in water held on the back of a colossal monster that may be a turtle, a huge fish, a bull, or a mammoth. The movement of this animal causes earthquakes. The Earth is surrounded by an immense belt. It is connected with the Upper World by the Pillar of the World. The Upper World consists of several strata—three, seven, nine, or 17. On the navel of the Earth stands the Cosmic Tree, which reaches up to the dwelling of the upper gods.

Gods, spirits, and souls. All three worlds are inhabited by spirits. Among the Mongolian and Turkish peoples, Ülgen, a benevolent deity and the god of the Upper World, has seven sons and nine daughters. Among the Buryats of southern Siberia, Tengri (often identified with Ülgen) also has children, the Khat's—the western ones being good and the eastern ones wicked. The gods of the Buryats number 99 and fall into two categories: the 55 good gods of the west whose attribute is "white," and the 44 wicked gods of the east whose attribute is "black." The leader of the latter is Erlen khan, a figure equivalent to Erlik khan of the Altai Kizhi people, who is the ruler of the Underworld. Besides gods and the progeny of gods—both sons and daughters—other spirits also inhabit all the three worlds. Fire is also personified, as is the Earth itself. Such personifications are represented in idols as well. Man, besides his body, consists of a soul, even of several souls. Man also has a mirror soul, which can be seen when looking into water, and a shadow soul, which is visible when the sun is shining.

SOCIAL ROLE, PERSONALITY STRUCTURE, AND FUNCTIONS OF THE SHAMAN

Social role. The extraordinary profession of the shaman naturally distinguishes him socially. The belief that he communicates with the spirits gives him authority. Furthermore, the belief that his actions may not only bring benefit but also harm makes him feared. Even a good (white) shaman may do harm, and a wicked (black) shaman, who is in contact with the spirits of the Lower World, is very alarming. In consequence of his profession, the shaman cannot go hunting and fishing and cannot participate in productive work; therefore, he must be supported by the community, which considers his professional activity necessary. Some shamans make use of their special position for economic gain. Among the reindeer-raising Evenks of northern Siberia, poor families have to pay yearly one animal, and rich ones pay two, three, or even four, to the shaman for his activities. A saying of the Altai Kizhi illustrates this situation: "If the beast becomes ill, the dogs fatten; if man becomes ill, the shaman fattens."

Among the Evenks, it was the duty of every member of the clan to aid the shaman economically. When distributing the fishing spots in the spring and in the summer, the part of the river most abundant in fish was given to the shaman and even the fishing devices were set up for him. He was aided in grazing and herding the reindeer in autumn, and in winter the members of the clan went hunting in his stead. Even furs were presented to the shaman occasionally. The social authority of the shaman was shown through the honours bestowed on him and the practice of always giving him the best food. Generally, the shaman was never contradicted, nor was any unfavourable opinion expressed about him behind his back.

Such an economic and social position resulted in the shaman attaining political power. As early as 1752, for instance, it was noted that the Tungus shaman was also the leader of his clan. Along the Yenisey River, shamans led armed groups of the Evenks on the left and the right banks who fought against each other. In the northern forest regions of Mongolia, the shamans stood at the head of the tribes and clans. In the fight of the Buryats against the Russians in the 17th and 18th centuries, the shaman always led the fight. The ruler of one domain among the Vadeyev Samoyed in northern Siberia was a shaman as well as a reigning prince. Among the Eskimo of North America and Asia, the positions of leader and of shaman are often occupied by the same person: indeed, the two Es-

kimo terms *angakok* ("shaman") and *angajkok* ("leader") have the same root.

Personal characteristics and selection. Scholars generally agree that the shaman acquires his profession through inheritance, learning, or an inner call, or "vocation," but each of these terms requires some qualification. "Inheritance" means that the soul of a dead shaman or the so-called shaman illness is inherited. "Learning" here does not usually mean the study of exact knowledge and explicit dogma, for the shaman, it is believed, is taught by the spirits. The inner "call" is in reality not the call of the person but of the spirit who has chosen him and who forces him to accept his vocation. This compulsion is unavoidable. "Had I not become shaman, I would have died," said a Gilyak (southeast Siberia). The future shaman of the Altai Kizhi was subjected to terrible torture until, finally, he grasped the drum and began to act as a shaman.

According to the abundant literature on the subject and the experience of investigators in the field, no one voluntarily ventures into the shaman role, nor does a candidate have time to study the role. Such study, however, is not necessary, because peoples born into a culture with shamanistic beliefs know them thoroughly, and when the "call" arrives, the future shaman can learn specific practices by close observation of active shamans, even the technique of "ecstasy." The shamanistic view of the world and spirits is already familiar to him. The various qualitative categories by which shamans are distinguished—small, intermediate, and great—are explained by the category of the spirit who chose the shaman. It is evident, however, that this depends on the personal abilities of the shaman himself, his mental capacities, his dramatic talent, and his power to make his will effective. All of these elements add to the quality of his shaman performance, the art expressed in it.

The shaman is born to his role, as is evident in certain marks distinguishing him from ordinary men. He may be born with more bones in his body—e.g., teeth or fingers—than other people. Therefore, he does not become a shaman simply by willing it, for it is not the shaman who summons up the spirits, but they, the supernatural beings, who choose him. They call him before his birth. At the age of adolescence, usually at the period of sexual ripening, the chosen one suddenly falls into hysterics with faintings, visions, and similar symptoms, being tortured sometimes for weeks. Then, in a vision or a dream, the spirit who has chosen him appears and announces his being chosen. This "call" is necessary for the shaman to acquire his powers. The spirit who has chosen him first lavishes the unwilling shaman-to-be with all sorts of promises and, if he does not win his consent, goes on to torment him. This so-called shaman illness will anguish him for months, perhaps for years, as long as he does not accept the shaman profession. When the candidate finally gives way to the compulsion and becomes a shaman, he falls asleep and sleeps for a long time—three days, seven days, or thrice three days. During the "long sleep," the candidate, according to belief, is cut into pieces by the spirits, who count his bones, determining whether he truly has an "extra bone." If so, he has become a shaman. Some people, such as the Mongols and the Manchu-Tungus, still initiate the shaman. They introduce him to the supernatural beings, and he symbolically ascends the "tree-up-to-the-heavens," that is, the pole representing it.

The central activity of the shaman is ecstasy at the wish of his clients, and some have inferred from this that he is a psychopath. A person becomes a shaman at puberty, according to this view, when, especially in subarctic and Arctic climatic conditions, changes in his constitution and nervous system may result in the loss of mental balance and in various mental disorders. Social and ethnic factors also may be seen to support the psychopathological factor. A person born with certain marks knows he is destined to the vocation and becomes apprehensive of the call of the spirits. His fears of the event, according to this theory, create the hallucinations, and the hallucinations reinforce the belief.

Types and functions. *Differences in quality and degree.* Shamans differ greatly in quality and in degree. Difference

The compulsory nature of shamanism as a vocation

Special economic position of the shaman

The shaman as psychopath

of quality is manifest in the kind of spirits the shaman communicates with. "White" shamans, for example, apply to a benevolent deity and the good spirits, while "black" shamans call on a wicked deity and the wicked spirits.

The difference in degree is exemplified in the Yakut belief (in northeastern Siberia) that the souls of the future shamans are reared upon an immensely high tree in the Upper World, in nests at various heights. The greatest shamans are brought up close to the top of the tree, the intermediate ones toward the middle, the smaller ones on the lower branches. Hence, shamans may be classified into three groups: great, intermediate, and last, according to their powers.

Basic tasks. It is the obligation of the shaman to know all matters that human beings need to know in everyday life but are unable to learn through their own capacities. He foresees events distant in time and space, discovers the place of a lost animal, forecasts prospects for fishing and hunting, and assists in increasing the gain. Besides these everyday functions, he is a healer and a psychopomp. He fulfills all these obligations by communicating with the spirits directly whenever he pleases.

The shaman's assistance is necessary at the three great events of life: birth, marriage, and death. If a woman bears no child, for instance, then, according to the belief of the Nanais (Golds), in the Amur region of northeast Asia, the shaman ascends to heaven and sends an embryo soul (*omija*) from the tree of embryos (*omija muoni*). Among the Buryats, the shaman performs libations after birth to keep the infant from crying and to help him develop more quickly. Among the Nanais, when death occurs the shaman is necessary to catch the soul of the deceased floating in the universe and to escort it to the Yonder World. Illness is believed to be caused by the spirits, who must be appeased for a cure to be effected. Among the Ostyaks of northern Siberia, the shaman decides how many reindeer should be sacrificed to appease the spirit who causes an illness. Among the Altai Kizhi, he states which *körmös* (soul of the dead) caused the disaster and what to do to conciliate it. Illness might be caused by the soul having left the patient's body and fallen into the hands of spirits who are angry with it and therefore torment it; the shaman liberates the strayed soul. Illness may also be caused by spirits entering into a man; the shaman cures it by driving the spirits out.

Forms of ecstasy. The shaman may fulfill his obligations either by communicating with the spirits at will or through ecstasy. The latter has two forms: possession ecstasy, in which the body of the shaman is possessed by the spirit, and wandering ecstasy, in which his soul departs into the realm of spirits. In passive ecstasy, the possessed gets into an intense mental state and shows superhuman strength and knowledge; he quivers, rages, struggles, and finally falls into an unconscious trancelike condition. After accepting the spirit, the shaman becomes its mouthpiece—"he becomes him who entered him." In active ecstasy, the shaman's life functions decrease to an abnormal minimum, and he falls into a trancelike condition. The soul of the shaman, it is believed, then leaves his body and seeks one of the three worlds, or strata, of heaven. After awakening, he relates his experiences, where he wandered, and with whom he spoke. There are cases of possession ecstasy and wandering ecstasy combined, when the spirit first enters the shaman and then leads his soul to the world of supernatural beings. Scholars differ as to which is the original and which the derivative form; e.g., the historian of religions Mircea Eliade does not consider possession ecstasy to be essential to shamanism.

SYMBOLISM IN OBJECTS AND ACTIONS

The shaman attains the ecstasy necessary for communicating with the spirits through the performance of the shaman rite, which requires certain appurtenances.

Dress. He wears a ritual gown, which usually imitates an animal—a deer, a bird, a bear. Similarly, the headdress is a crown made of antlers or a band into which feathers of birds have been pierced. The footwear is also symbolic—iron deer hooves, birds' claws, or bears' paws. The clothing of the shamans among the Tofalar (Karagasy), Soyot,

and Darhat are decorated with representations of human bones—ribs, arm and finger bones. The shamans of the Goldi-Ude tribe perform the ceremony in a singular shirt and in a front and back apron on which there are representations of snakes, lizards, frogs, and other animals.

Drums, sticks, and other objects. An important device of the shaman is the drum, which always has only one membrane. It is usually oval but sometimes round. The outer side of the membrane, and the inside as well among some peoples, is decorated with drawings; e.g., the Turks, or Tatars, of Abakan mark the Upper and Lower World. The handle is usually in the shape of a cross, but sometimes there is only one handle in a vertical direction or in the shape of the letter Y or X. The drumstick is made of wood or horn and the beating surface is covered with fur. In some cases, the drumstick is decorated with human and animal figures, and rattling rings often hang down from it. During the ecstasy brought on by the sound of the drum, the spirits move to the shaman—into him or into the drum—or the soul of the shaman travels to the realm of the spirits. In the latter case, the shaman makes the journey on the drum as if riding on an animal, the drumstick being his lash. Sometimes the shaman makes the journey on a river and the drum is his boat, the drumstick his oar. All this is revealed in the shaman song. Besides the drum, the Buryat shaman sometimes makes the journey with sticks ending in the figure of a horse's head. The shaman of the Tungus people, who raise reindeer, makes the journey on a stick ending in the figure of a reindeer's head. Among some people, the shaman wears a metal disk, a "shaman-mirror."

The drum as symbolic bearer of the shaman

The shaman Tulayev of the Karagas, Siberia, photographed in 1927. He wears a deerskin coat, embroidered with a rib cage, and holds a drumstick of fur-covered reindeer horn and a deerskin-covered drum. The shaman's soul is said to "ride" the soul of the animal whose skin is stretched over his drum and to use the drumstick as a knout.

Drama and dance. Shamanic symbolism is impressively presented in dramatic enactment and dance, as observed among the peoples where the shamanistic rites survived longest (such as the Samoyed, Tofalar, Buryat, and Tungus). The shaman, garbed in his ritual robes, lifts his voice in song to the spirits. This song is always improvised, with certain obligatory images and similes, dialogue, and refrains. The performance always takes place in the evening. The theatre is the conical tent, or yurt; the stage

The shaman as healer

is the space around the fire where the spirits are invoked. The audience consists of the invited members of the clan, awaiting the spirits in awe. The stage lighter and decorator, the shaman's assistant, tends the fire so as to throw fantastic shadows onto the wall. All these effects help those present to visualize everything that the recited action of the shaman narrates. The shaman is an actor, dancer and singer, and a whole orchestra. This restless figure is a fascinating sight, with his cloak floating in the light of a fire in which anything might be imagined. The ribbons of his gown flit around him, his round mirror reflects the flames, and his trinkets jingle. The sound of his drum excites not only the shaman but also his audience. An integral characteristic of this drama is that those who are present are not mere objective spectators but rather faithful believers, and their belief enables the shaman to achieve results, as in healing mental illnesses. Among some people—the Altai Kizhi, for instance—a tall tree is set into the smoke opening at the top of the tent, symbolizing the Tree of the World. The shaman ascends the tree to the height of the Upper World, which is announced to his audience by the text of his song.

CONTEMPORARY RESIDUES AND RECONSTRUCTIONS OF SHAMANISM

The residues of shamanism may be found among peoples who have been converted to religions of a later stage of culture; e.g., Finno-Ugric peoples who became Christians, Turkic peoples in Central Asia and Asia Minor who became Muslim, and Mongols who became Buddhists. Among the Finns, the *tietäjä*, a figure equivalent to the shaman, is also born with one more tooth than normal. Among the Osmanlı Turks of Asia Minor, the horned headwear of the shaman is remembered in popular belief. Among people who formerly believed in shamanism but later were converted to various world religions (e.g., Christianity or Islām), former shamanism may be revealed through an analysis of their folklore and folk beliefs. An example of such a case is the discovery of former Hungarian shamanism. In north Asia, shamanism appears in various forms that may be attributed to differences in cultural phases. In the most northern parts, among the Chukchi, Koryak, and Kamchadal, the shaman does not exist as a member of a special profession: a suitable member of the family—often an old woman—performs the activity of the shaman. Often the shamans are of “changed sex”—effeminate men who have adopted feminine clothing and behaviour at the command of their “spirit.” Among the Yukaghir of Arctic Siberia, shamanism is part of the cult of the clan; so also among pockets in the Ob-Ugrian peoples, and among all three Altaic peoples: Turkic, Mongol, and Manchu-Tungusic. These are instances of definitely professional shamanism, which, however, have been excluded by so-called higher religions. Shamanism was excluded among the Khalkha-Mongolian and eastern Buryats, who became Buddhists, and among the Kazakh and Kirgiz who adopted Islām, and it was greatly changed and developed into an atypical form by the Manchurians.

Certain scholars have investigated ecstatic actions that may be adjudged outside the area of shamanism in the strictest sense. Mircea Eliade has studied North and South America, Southeastern Asia and Oceania, Tibet, and China (see below *Shamanistic activity in other cultures*), and S.P. Tokarev has also studied Africa. Some scholars suppose that the phenomena of shamanism spread to the two American continents when the first settlers migrated from Asia. The shamanistic phenomena in the Shintō religion of Japan are attributed to the migration of nomadic peoples from the territory bordering Northern Korea. No such theory of migration has yet been developed to explain the “shamanism” of Southeast Asia and Oceania. Those who oppose this broad usage of the term shamanism argue that an apparent structural similarity among phenomena in widely separated areas does not justify an assertion of a common source or that typological similarity must be distinguished from a genetic connection. For them, shamanism may be attributed only to a precise pattern of cultural phenomena in a specific, well-defined territory, one that forms a concrete, systematic whole, such as the religious

systems of the peoples mentioned at the beginning of this section. (V.D.)

SHAMANISTIC ACTIVITY IN OTHER CULTURES

Although the classic model and most complete expression of shamanism is found in the Arctic and central Asian regions, the phenomenon must not be considered as limited to those countries. It is encountered, for example, in Southeast Asia, Oceania, and among many North American aboriginal tribes (shamanism does not play a role of the first order in Africa). A distinction is to be made, however, between the religions dominated by a shamanistic ideology and by shamanistic techniques (as is the case with Siberian and Indonesian religions) and those in which shamanism constitutes rather a secondary phenomenon.

Eskimo. Shamanism predominates in the religious life of the Eskimos. The chief prerogatives of the Eskimo shaman (*angakok*; plural, *angakut*) are healing, the ecstatic underwater journey to the Mother of Animals for the purpose of assuring an abundance of game, and the aid he brings to barren women. Sickness is brought on by the violation of taboos or results from the capture of the soul by a ghost. In the first case, the shaman strives to drive out the impurity by collective confessions; in the second case, he undertakes the ecstatic journey to heaven or to the depths of the sea to retrieve the sick person's soul and restore it to his body. The *angakok* is also a specialist in magic fight. Some shamans are reputed to have visited the moon; others claim to have flown around the earth. The *angakut* also know the future, make prophecies, predict changes in the weather, and excel at magic feats.

American Indians. Among many North American tribes shamanism constitutes the most important aspect of the religious life. The shaman is characterized by the supernatural power he acquires as the result of a direct personal experience. This power is obtained either spontaneously or after a volutary quest, but in either case the future shaman has to undergo certain initiatory trials. In general, the power is utilized in such a way as to affect the whole society. The shaman's principal function is healing, but he also plays an important role in other magico-religious rites such as communal hunting and, where they exist, secret societies or mystical movements (Ghost Dance religion type). North American shamans, like all their fellows, claim to control the weather (bring on or stop the rain, etc), know future events, expose the perpetrators of thefts, etc. Furthermore, they defend men against sorcerers. But the magico-medical powers held by North American shamans do not exhaust their ecstatic abilities. There is every reason to suppose that modern secret societies and mystical movements among the Indians have appropriated in large part the ecstatic activity that once characterized shamanism.

In the tribes of South America the shaman enjoys considerable prestige and authority. Not only is he the healer par excellence and, in certain regions, the guide of souls of the dead to their new abode; he is also the intermediary between men and the gods or spirits, substituting himself for the priest at times. He guarantees the respect for ritual observances, defends the tribe against evil spirits, points out places for fruitful hunting and fishing, increases the wild life, controls the weather, eases childbirth, reveals future events, etc. Of course, the South American shaman can also fill the role of sorcerer; he can, for example, change himself into an animal and drink the blood of his enemies. Yet it is rather to his ecstatic abilities that the South American shaman owes his magico-religious position and social authority.

It is probably that a certain form of shamanism was diffused on the two American continents with the first waves of immigrants from Asia; later contacts between northern Asia and North America made Asian influence possible well after the penetration of the first immigrants.

Southeast Asia and Oceania. Shamanism is prevalent in the Malay Peninsula and in Oceania. Among the Negritos of the Malay Peninsula, the shaman heals with the help of celestial spirits or by using crystals of quartz. But the influence of Indo-Malayan beliefs is noticeable, too (the shaman changing into a tiger, trance achieved by dancing,

etc.). In the Andaman Islands, the shaman gets his power from contact with spirits. The commonest method is to "die" and return to life, the traditional pattern of shamanic initiation. The shamans gain their reputation through their acts of healing and their meteorological magic (they are thought to bring on storms).

The distinctive marks of Malayan shamanism are the calling forth of the tiger's spirit and the achievement of the trance (*lupa*), during which the spirits seize the shaman, possess him, and reply to questions asked by the audience. Mediumship is also characteristic of different forms of shamanism in Sumatra, Borneo, and Celebes. Among the Ngadju-Dayak of Borneo there even exists a special class of shamans, the *basirs* (literally, "incapable of procreation"), hermaphrodites who dress and act like women. These are considered to be intermediaries between heaven and earth because they unite in their own person the feminine element (earth) and the masculine element (heaven).

Possession by gods or spirits is a peculiarity of Polynesian ecstatic religion. The extreme frequency of possession in that region has made possible a proliferation of healers. Priests, inspired persons, medicine men, and sorcerers may all perform magical cures. For this reason it is not possible to speak of shamanism *stricto sensu* in Polynesia.

In Australia, a person becomes a medicine man through a ritual of initiatory death, followed by a resurrection to a new and superhuman condition. But the initiatory death of the Australian medicine man, like that of the Siberian shaman, has two specific marks not found elsewhere in combination: first, a series of operations performed on the candidate's body (opening of the abdomen, renewal of the organs, washing and drying of the bones, insertion of magical substances); second, and ascent to heaven, sometimes followed by other ecstatic journeys into the other world. The revelations concerning the secret techniques of the medicine men are obtained in a trance, a dream, or in the waking state before, during, or after the initiatory ritual proper. (M.Ee.)

Monasticism

The word monasticism is derived from the Greek *monachos* "living alone"; but the etymology indicates only one of the elements of monasticism as a force in history and society. The etymological method of arriving at an understanding of monasticism is, at any rate, misleading because a large section of the world's monastics live in cenobite (common life) communities. The term monasticism does, however, indicate what later became a socially and historically highly significant feature; *i.e.*, living alone in the sense of being unmarried or celibate, though this feature is not directly related to its etymology.

Still, even this aspect of monasticism does not extend beyond the cultures and languages within which was formulated the religious terminology that originated in the eastern Mediterranean; *i.e.*, the Judeo-Christian and Islāmic religions. In the Islāmic world, terms that can be translated by "monk," "monastic," and similar words do not mean "single" in the Arabic and Persian terminologies as in the Greek. Other aspects (*e.g.*, *zuhd*, "asceticism") of the monastic life in Islām provided the etymological and definitional sets denoting "monasticism." None of the many Indic (Sanskrit, Pāli, Apabhraṃśa, Prākṛit) terms for monk means "single" or "living alone" in these languages, although monastics within those traditions—Brahmin-Hindu, Buddhist, and Jaina—do indeed live alone or in groupings that are set off from the rest of their societies, analogously to Jewish, Christian, and Islāmic monastics. The etymologies of the Indian as well as of some of the Arabic and Persian terms connote poverty, certain ecstatic states of mind, dress conventions, while some (by historical rather than semantic connection) imply single, celibate living.

NATURE AND SIGNIFICANCE

Within a cross-cultural perspective, monastics can be seen to have been instrumental in creating, preserving, and augmenting institutions of learning, religious as well as secular, and in transmitting cultural goods, artifacts, and

intellectual skills through the generations. Monastic institutions have also had medical, political, and military-related functions, though the latter two have all but disappeared in most societies.

A definition of monasticism that would cover all of its forms, Eastern and Western, must necessarily be wide; particulars must be relegated to the analysis of specific monastic systems. A universal definition might thus be: "monasticism" is a term covering religious institutions, ritual, and belief systems whose agents, members, or participants attempt to practice religious works that are above and beyond those required by the religious teachings of their society or of exceptional individual religious and spiritual leaders in their society; *i.e.*, those who have interpreted radically the tenets that apply to all believers or to the whole society. Beyond such a statement, one can speak only of the major characteristics of the monastic life and its institutions, since none of them is universal. Celibacy is fundamental to the majority of the world's religious orders, but it is by no means universal; asceticism is universal, provided the term is defined widely enough so as to include all supererogatory religious practices. The truly universal characteristic of monasticism follows from its definition: the monastic separates himself from his society, either to be by himself as a hermit or an anchorite (religious recluse) or to join a society of others who have separated themselves from their surroundings with similar intentions; *i.e.*, the full-time pursuit of the religious life in its most radical and usually its most fundamentalistic interpretation.

There is no monasticism in societies that do not have a written and transmitted lore. Nonliterate societies do not have monastic institutions, since the monastic takes his departure from an established corpus, or written body, of religious doctrine, which has undergone criticism and has generated counter criticism as well as a dialectic that presupposes a literate, codified manipulation of the doctrine. The monk and the monastic founders may either support or oppose the official religious tradition, but the presence of such a tradition is essential as the matrix of all monastic endeavour.

PURPOSES OF MONASTICISM

Discovery of the true self. *Overcoming imperfections.* All monasticism has its mainstay in theologically based convictions that the present state of things leaves much to be desired—that life in society cannot generate the spiritual consummation stipulated by the religious world view that was or is recommended overtly or covertly by its founder. In some traditions, especially in those of South Asian provenance, the true "self" is clogged and covered by imperfections—by sin, ignorance, or other theologically suggested impediments. The ego with which the layman and the seeking neophyte identifies is not his true self—it is the latter that has to be discovered, uncovered. The sundry barriers—differently conceived as matter, individuated mind, or as a soul-mind aggregate defiled by sin, ignorance, and perversion—must be broken through, or a veil lifted, so that the true self, the primordial spirit, may shine forth. In most traditions, this breakthrough is held to be unattainable through the ordinarily acceptable good social life. A new, hardened, and disillusioned approach must be sought. The body and the mind, which are part or the whole of the impediment, have to be controlled, disciplined, and chastised—hence either asceticism or a set of psychophysical experimentations that differ radically from the normal acts of life is espoused.

Spiritual perfection. The quest for spiritual perfection is elitistic, even when, as within Christian monastic orders, humility is essential. Withdrawal from society is necessary, since the instrumentalities of perfection cannot normally be acquired and augmented in the surroundings of everyday life. The operational basis is meditation on a set of spiritual concepts that either represent the supreme value or provide crutches to support the body and the mind on their tedious journey toward whatever their supreme consummation may be. Processes of intense contemplation, often accompanied by physical exercise, constitute the mystical practice—*i.e.*, prayer, worship, incantation,

Definition and characteristics

Forms of mystical practice

propitiation, and various forms of self-abasement or self-inflation. All these are pursued in enormously variegated forms and degrees.

Emancipation of the self. *Salvation.* Seen cross-culturally, the ultimate purpose of the monastic endeavour is the attainment of a state free from bondage, both bondage and freedom in such endeavours being defined in theological terms. Most languages of cultures with monastic traditions have special terms to denote bondage and freedom; others use terms of common parlance that are then understood by members of society as referring to theologically adumbrated types of bondage and freedom. Thus, the term salvation in the Christian context means deliverance from the powers of evil besetting the person's body, mind, and soul. Varying concepts of salvation, liberation, and emancipation are generated by, or closely related to, the society's identification of an individual, the extensions of his body, mind, soul, and spirit, and his status within a larger universe. The idea of salvation, like other such concepts, presupposes a specific cosmological view against which to frame the answers to the question—formulated or unformulated—"What is it that is bound and that can, should, or must be freed to achieve the most desirable state within or vis-à-vis the totality of things; e.g., the cosmos, God, and other absolutes?" The question has spatial and temporal parameters; in some of the indigenous Indian religions, salvation can be achieved during one's lifetime, but whether this happens or whether the achievement is delayed into another existence is actually accidental to Indian notions of liberation. In the Judeo-Christian and Muslim world, salvation proper cannot be achieved as long as the body continues to exist. "Salvation" and its semantic equivalents, in other words, refer to the present or future in the South Asian religions but refer only to the future in the eastern Mediterranean creeds. The life of the monastic is a full-time seeking of salvation, in contradistinction to that of the "part-time" general believer.

Redemption. Redemption as deliverance from the spiritual effect of past transgressions may or may not be identical with salvation, though the terms are in many cases synonymous. In any event, as part of his monastic ambition, the monk seeks redemption from his sins or he intercedes, takes upon himself and works out the redemption of others. This is accomplished through personal sacrifice or many forms of self-mortification. The processes of mortification augment or stabilize the austerities required of the monastic and are part of the picture in all monastic traditions. The emphasis on the autocentric or the vicarious aspect of the quest for redemption depends entirely on the doctrinal framework with which the monastic identifies. In either case, the dialectic of autocentric and vicarious emphases cuts both ways—in mortifying his own body and mind for the benefit of others, the monk also helps his own advancement along the spiritual path. When a Jaina monk (a follower of a 6th-century-bc Indian religious reformer, Mahāvīra) volunteers to lie upon a bed infested with vermin that suck his blood, he may do so for a client or a patron with a view to diminishing that person's karmic load (involving the doctrine that every deed, good or bad, receives due retribution), but at the same time he practices the monastic virtues prescribed for him as a monk. When a Franciscan monk (a follower of Francis of Assisi, the 12th–13th century Christian monastic leader) serves the poor and the sick, he also improves his own virtues of service and humility, all of which are instruments for his own redemption.

Liberation. When liberation from cycles of birth and death constitutes the foundation of a belief system, as in the basic pattern of *samsāra* (i.e., an inevitable metempsychotic chain that can be broken only through supererogatory efforts of the meditational order) in the Indian traditions, the monks are the harbingers of the methods of liberation. In India and Tibet as well as in Southeast Asia, the monk has always been the centre of attention of the religious life far more than in the Christian world, in which he was and is marginal to the main ritualistic and ideological thrust. The importance of the monastic life in a religious system is related to its ideological content. Thus, if the state of life after salvation is transformed, but

is yet basically a continuous type with the present life, then the monastic has less importance than he does in belief systems in which salvation means a totally different state, one that cancels finitude and eradicates all traces of separate individual existence.

Limited personal goals—e.g., power or wealth—are aimed at by some Hindu monastics, but these are infrequent and atypical for the total monastic situation.

Social and institutional purposes. *Conquest of the spiritual forces of evil.* Social goals are interwoven with those of salvation in most monastic traditions, and there is a vacillating emphasis on one or the other depending on the founders' interpretation of the theological framework. The first Christian hermits of the Egyptian desert (c. AD 250–500), Anthony of Egypt, Paul of Thebes, Pachomius of the Thebaid and others, were referred to as the "Desert Fathers." They presaged later monastic institutions and were the inceptors of cenobitism—literally "lying [i.e., eating, sleeping, and living] together"—which was to be fundamental to all later Christian monastic institutions. Though the early hermits, mostly native Egyptian (Coptic) peasants, were inspired by the example of famous recluses, their rigorous monastic asceticism soon projected an orientation toward communal life that was related to paramilitary models encountered at one time or another in virtually all monastic traditions—the community that was viewed as composed of soldiers of the spirit. The Desert Fathers believed that they were to combat the forces of the devil tempting them in the desert. Much of this might have been antedated by the Jewish Qumrān community, which was located near the Dead Sea and is often identified with the Essenes, a religious group that flourished in the Judaean desert between 150 BC and AD 70. The Qumrān ascetics considered themselves to be the true, unpolluted priests of orthodox Judaism, decrying the Jerusalem priesthood that they characterized as defiled, spurious, and unclean, sullied by Hellenism and potentially heretical. This may have been the first instance of a monastic elite versus an urban sacerdotal establishment in which the interpretation of the canonical teachings was under dispute. Rigorous asceticism, communal prayer, and common work were the rule, though celibacy might not as yet have been part of that community.

Improvement of society. By and large, monastic institutions may have aided the progress of civilization, even though they are often, and perhaps rightly, blamed for obstructing and retarding it.

Monasticism as an instrument for the creation, preservation, and transmission of secular and religious traditions was pervasive in all those cultures that gave a special status to the cenobite institution. Its function as a propagating or proselytizing agent of the religious tradition, however, is by no means universal, nor even regionally determined. In the Mediterranean religions, as well as in those that originated in South Asia, there are discrete, uninterrupted, ordered sequences from the totally contemplative, hence nonproselytizing, to the teaching and preaching orders with virtually no scope for contemplation. The role of monks and their orders in the arts, sciences, letters, as well as in the pedagogical and the therapeutic social services, is thus discussed under the headings of the diverse monastic systems (see below).

Institutional centres for religious leadership. In some religions, monasteries become training centres for institutional religious leaders. There is, however, a clear dichotomy between training centres for ecclesiastical and for monastic leaders. Even though the distinction may seem to be blurred in the Roman Catholic and Eastern Orthodox traditions, the fact that monastic training could also be priestly should be viewed in a cross-cultural survey as accidental. In all Indian religions, by contrast, there is a radical and exclusive division between the priestly and the monastic careers and their concomitant institutions. The common denominator lies in the supererogatory status of the monastic life—if churches and seminaries prepare ecclesiastical leaders, teachers, and intellectuals, monasteries may train people to whom the same epithets apply, but with a difference: the monk is usually said to be more radical and less compromising than the ecclesiastic.

Other purposes. Apart from the ubiquitous redemptory, spiritual, and social goals of monastic systems, most of them condone peripheral goals of more or less mundane types. Thus, a Tibetan lamasery (monastic religious centre) is not only a centre of spiritual counsel but also a bank, a judicial court, a school, and a gossip centre for the laity. Some of the most specialized operations are found in monasteries, including coaching in wrestling, in some Hindu orders, and the preparation of perfumes by the Muslim Sanūsiyah (a conservative, rational, and missionary order established in the 19th century).

TYPES OF MONASTICISM

Organizational or institutional types. *Eremitic.* A taxonomy of institutional types includes several varieties: first, historically and in terms of simplicity, is the eremitic (religious recluse) type, including the early Christian hermits or anchorites; the actual or legendary *r̥ṣis* ("seers") of Vedic India (pre-800 BC); some of the earliest Jaina *śramaṇas* ("ascetics"), particularly the semihistorical founders of Jainism (Mahāvira and Pārśvanātha); the Taoist recluses of early southwestern China; and, down even to today, sporadic hermits in the various religious areas of the world—such as Gauribala in Ceylon (now Sri Lanka), La Mère in Pondicherry, India, and other Western converts to Asian belief systems without organized monastic trappings. Some of the European and American neomystics should also be included in this class.

Common to all true hermits and eremitic institutions is an emphasis on living alone, on a highly regularized contemplative life (with individually generated, often experimental spiritual disciplines), and on frequently idiosyncratic and even heretical interpretations of underlying scriptural or disciplinary codes. Incipient self-mortification and individual austerities can be traced, but these are incidental to the eremitic style.

Quasi-eremitic. The lauras (communities of anchorites) of early Christianity in Greece and Cyrenaica (exemplified by the Mt. Athos tradition that exists even today), the small-scale *ashrams* ("religious retreats") of monastic Hinduism from at least 300 BC to this day, and perhaps the semiformal congregations of the early Buddhist monks and nuns, preceding the establishment of the *saṅgha* ("monastic order," or "community"), are best called "quasi-eremitic." Common elements in this type of monastic assembly are loose organizational structures with no administrative links to mother institutions and no external hierarchies. The category forms a transition between the eremitic and the cenobitic; in many cases, such as that of the medieval Indian *panthā* organizations (sectarian), groups may display eremitic and cenobitic features consecutively, either during different annual seasons or on the occasion of special conventions. In the 20th century, some Nepalese followers of Gorakhnāth (8th century AD) live as recluses during most of the time but form themselves into a quasi-military association on certain occasions, such as during the all-Indian monastic assemblies (*kumbhamelā*) every sixth year at certain centres of pilgrimage. During these periods they become organizationally indistinguishable from the most highly structured cenobitic units present at the conventions.

Cenobitic. It is probably not wrong to identify proper "monasticism" with cenobitism. There seems to be a correlation between a formulated rule, or set of rules (*regula* in the Christian orders, *vinaya* and *śīla* as part of the Buddhist canon), and cenobitic institutions; eremitic and quasi-eremitic settings lack formulated rules and give more scope to the individual's self-imposed disciplines. A Christian ascetic, Pachomius of the Thebaid (c. AD 290–346), was reputedly the founder of organized cenobitism in the Western world and is said to have built nine monasteries for men and two for women. These monasteries may have been the model for the monasteries founded by the Greek theologian St. Basil the Great (c. 330–379), who set down what was the first monastic rule. The basis for all subsequent Eastern Christian (Greek) monastic institutions, it was simple and primitive compared to the *regulae* ("rules") of the orders founded in later centuries in Europe. Avoiding the extreme austerities of the Desert

Fathers, St. Basil's rule was strict but not severe. Its asceticism was an instrument in the consummate service of God; it was to be pursued in community life and in obedience. Liturgical prayer and manual and mental work were obligatory. Germinally, the Rule of St. Basil enjoined or implied chastity and poverty, though these were far less explicit than in the later *regulae*. What Basil's rule was for Eastern monachism, St. Benedict's was for early Western monasticism. Benedict of Nursia (c. 480–543/547) was a practical Roman, and his *regulae* (enjoining poverty, chastity, obedience, and stability), which was used—for the most part—by most of the paramilitary aristocratic orders, such as the Knights Templars, until the 13th century, and which is the rule of the Benedictine Order today, incorporates instructions on institutionally held property. It also set the model for all subsequent Roman Catholic monastic orders; *i.e.*, the requirement that the individual monk does not own property, but that it is held by the order through its appointed trustees.

One-third of the Theravāda (southern, or so-called Way of the Elders) Buddhist canonical literature is *vinaya* ("comportment"), the Buddha's own statement of more than 200 rules for his monks. Compared to these, the later Brahmanic (Hindu) orders, such as the *Śaṃnyāsīn* order founded by the Hindu reformer Śaṅkarācārya (8th century AD), contain hardly any "rules" except an implicit renunciation of worldly desires, a detachment from society, and an indifference toward the "opposites" such as pleasure and pain. The 6th-century-BC founder of Jainism, Mahāvira, about 80 years senior to the Buddha, formulated the nucleus of the Jaina doctrine and also established the core Jaina order, giving it a very elaborate rule that goes into minute regulations for monastic residence: restricting the itinerant monk's sojourn to one week at a time in a village and one month in a town; requiring that the monk must not sleep more than three hours and that he must spend the day and the rest of the night in expiation, meditation, studying Jaina scripture, and begging for alms. Some scholars believe that the Jaina rule provided the model for all monastic rules in India and thus for the monastic traditions in all the Asian countries that came under India's religious tutelage.

The Essenes of Judaism, regardless of whether or not they were identical with the Qumrān settlement, probably had a written rule; certainly, they were highly formalistic, emphasizing ritualistic purity, with ablutions prescribed for the members, and with a fundamentalistic adherence to the letter of the Jewish ritualistic and legal books Leviticus and the Deuteronomy written into their discipline. In modern times, the so-called hippie communes, insofar as they seek religious experience, should be included in a historical list of cenobitic organizations; growing food, preparing and consuming it jointly, and sharing common dormitory facilities are essential elements of the cenobitic structure.

Quasi-monastic. Paramilitary, or quasi-monastic, associations are another type of monastic group. Most Christian orders of this type also had medical or healing commitments; non-Christian monastic orders of this type did not cater to the sick. The Knights Templars, whose order was founded in the 12th century during the Crusades—the most prestigious and most thoroughly defamed aristocratic organization—styled themselves "poor fellow soldiers of Christ and the Temple of Solomon"; their foundational commitment was the protection and the guidance of pilgrims en route to and in the Holy Land. Though the Templars, following the rules of St. Basil and St. Benedict, took vows of poverty, chastity, and obedience, their corporate wealth and the secrecy of their initiation and of all their internal affairs helped bring about their extermination under the French king Philip IV the Fair in the early 14th century. The military model was evident in their hierarchical structure—there were chaplains, knights, and sergeants under a grand master of the temple.

The Templars were inspired by the Knights Hospitallers (or Order of the Hospital of St. John of Jerusalem), founded in the 11th century. The Hospitallers were probably the first to generate genuine medical and hospital services, at first for pilgrims to Jerusalem. They were the

Indian and other monastic orders and groups

Christian military orders

classical nursing order, and their first foundation was the Hospital Saint-Antoine-de-Viennois (c. 1100). There were other houses in Spain, Italy, and Germany. Their chief officers were ordained priests, but the majority of the members were nonsacerdotal "hospitallers," or lay brothers and sisters. They adopted the Benedictine rule until 1231, meeting under an elected master, and an annually rotating chapter-general assembling the "commanders"; the order switched to the "modern" rule of St. Augustine in 1247.

The Teutonic Knights (Deutscher Ritterorden), founded in Jerusalem in 1189, had a feudally independent relationship to Rome and the papal administrative bureaucracy (Curia) specially defined by over 100 papal bulls; their grand master, who had the same rights as a prince of the Holy Roman Empire, was assisted by five "grand commanders." The organization was composed of knights (usually noblemen), middle-class priests, and sisters (mostly noblewomen), well trained in hospital services. After the fall of Acre to the Muslims in 1291, the order moved its headquarters to various places in Europe. But in the 13th century and after, the order revived its erstwhile function, when European rulers called upon it to war against the Altaic and the Prussian pagan peoples.

The popular, and wrong, identification of Tibetan monks as "lamas" has obscured the highly segmented institution of the Tibetan Buddhist clergy. Among the Khamba (*kham pa*) in eastern Tibet, men with minimal monastic initiation (*lung*) organized themselves as a military or police force to protect the unarmed higher initiated clergy as well as the monastic territory. These were not defenders of, or fighters for, Buddhism, but were a type of monastic police force, sartorially indistinguishable from the actual clerics. They were very evident in Tibet's confrontation with the Chinese Communists (1959–65).

In the Islamic world, the mystical orders (*Ṣūfī*) and the partially overlapping dervish (*darvīsh*) assemblies constituted a living critique, as it were, of the formalistic, fundamentalist, and Qur'ān-oriented (scriptural) orthodoxy controlled by the '*ulamā*' ("teachers") from Cairo, the assemblage of Muslim learned ones who set standards for orthodox faith and practice. The Ṣūfīs' direct approach to divinity through such meditative or ecstatic practices as the *dhikr* (the chanting of the names of Allāh, or God)—that was accompanied by variegated physical expressions such as dances and songs and by the ingesting of drugs, usually of the genus *Cannabis* (such as hashish)—became symbolic representations of the criticism of officially sanctioned behaviour. The Turkish Bektāṣi (Bektāshī) excelled in poetry and in humorous repartee, which even now is recalled in references to the art of the Bektāṣi. The Sanūsīyah (Senussi) order of Ṣūfīs, in Libya and other northeast African countries, not only antagonized the Wahhābiyah (a generic name for fundamentalistic orthodoxy in Islām rather than a term denoting any specific group) but also achieved impressive political and military corporate stature in very recent times, opposing the Italian colonialist forces in Libya with some measure of success. These orders sought communion with Allāh through mystical practices rather than salvation by righteousness. "Not I and God but only God" was one of their mottoes.

Though the religion of Sikhism is historically Hindu, the early "pure" (*khālsā*) did not encourage monasticism; Gurū Nānak, the founder of Sikhism (1469–1539), was a married man, and so were most of the other nine Gurūs ("teachers"). In the late 17th century, however, the Nirmal-akhāḍā was created in complete analogy to the celibate monastic orders of Hinduism and organized on the same principles. Underlying this development is a universal Hindu tendency to create monastic corollaries to lay teachings; the process has been repeated in India much more recently. The Arya Samaj (a Hindu reform society), founded by Swami Dayananda Sarasvati in 1875, is a good case in point. Although Sarasvati was a monk in the Daśanāmī *sannyāsīn* order (Holy Men of the Ten Names), he discouraged monasticism—yet, bending to an all-Hindu cultural pressure, monks have been ordained in his organization since the early decades of this century. An older quasi-monastic organization among the Sikhs is the Nihāṅg Sāhibs, a basically military organization within

Sikhism. Created to fight Muslim incursions into the Sikh communities of the Punjab, the Nihāṅg Sāhibs wear robes that are blue and yellow military uniforms that have been unchanged since the 17th century. The Nihāṅg Sāhibs are married, but during their temporary active service as *nihāngs* they abstain from sexual intercourse and live in a cenobitic manner.

Mendicant monks and orders. By a strict definition, mendicancy (living by begging) would preclude cenobitism. In actual fact, however, there are many orders that are mendicant and cenobitic at different times. The Hindu and Buddhist official orders are really both. During his training, the neophyte lives in a strictly cenobitic setting; on subsequent peregrinations, he eats the food he obtains by begging, which is part of his advanced discipline, and he eats alone. The Burmese, Thai, and Sinhalese Buddhist clergy could be termed mendicant stationary—the monks wander out in the early morning to collect food in their alms bowls, but they consume it jointly at the house in a cenobitic fashion.

In the Christian world, the Franciscans, founded by St. Francis of Assisi (1181/82–1226), with their numerous subsections, and the Dominicans, founded by Domingo de Guzmán (1170–1221), were and are the most powerful statutory mendicant orders. The synthesis of contemplation and the apostolic ministry is strong in these orders; the Dominican motto "to contemplate and to give the fruits of contemplation to others" is significant. The Sanskrit term *parivrājaka* ("walking around") quite literally connotes mendicant status and as a title is carried by a large number of Hindu monastic organizations. It has canonical sanction—the Hindu scriptural definition of a monk is "[one who] having renounced the desire for sons, for wealth, the fear of social opprobrium and the craving for social approval, he sallies forth, begging for food." Here also there is a blend between the contemplative and the preaching life; the various Hindu orders place varying emphases on the one or the other, a distribution that seems quite parallel to that of the Christian orders. The vow of chastity is spelled out for the Hindu mendicants, but poverty and obedience are implied rather than enjoined. The Hindu monastic organization is much looser than either the Buddhist or the Christian, and in this sense it resembles the earliest eremitic and quasi-eremitic types in Judaism and Christianity.

Other organizational or institutional types. Permanent versus temporary membership correlates with different monastic institutional types, though it does not seem to have any bearing on organizational structure. In the Theravāda Buddhist order (*saṅgha*) of Thailand, Burma, and Sri Lanka, men join a monastery for an unspecified period of time, with minimum periods (three months to a year) prescribed in the *Dhammayut*, the smaller and more highly ascetic of the two sections of the Siamese *saṅgha*; the Mahāssaṅghikas, who form the monastic majority, do not specify any such duration. Lifelong monastic views are, in those regions, a matter of individual choice. The order itself does not take any official stance on them. This differs radically from all full-fledged Catholic orders as well as from those Hindu organizations that initiate members by the *virajā-homa* (i.e., the Vedic rite of renunciation); since the initiate is declared dead by this ceremony, he cannot return to the world of the living (i.e., to society). Dispensations, on the other hand, were given, though reluctantly, to Roman and Greek Christian monks and nuns who wanted to leave their orders. In the Hindu monastic code, there can be no such dispensation—monks who leave and return to social life are highly stigmatized.

Hierarchical and status types. *Sacerdotal.* In addition to organizational and institutional forms, a typological survey must also include aspects of monastic status and hierarchy. The first and most important division here is between sacerdotal and nonsacerdotal full-time supererogatory specialists. Most of the canon-based (scriptural) religions of the world distinguish between priests and nonpriestly practitioners. In the case of Greek and Roman Catholic Christianity, the distinction is crucial on the sacerdotal but incidental on the monastic end. Monks who have priestly ordination are full priests and full monks; monks

The
Christian
mendicant
orders

Buddhist,
Muslim,
and Sikh
military
orders

and nuns who do not have it are full monastic members nevertheless, sharing the same vows and the same discipline. Islām does not officially recognize monastic status, nor does it have priests—the *imām* is the leader in prayer, but he has no special vows or ordinations. The dichotomy does not apply in Judaism either.

Separations of sacerdotal and monastic functions in Hinduism

In the case of the religions originating in India, the situation is markedly different: in Hinduism, only a male person born into a Brahmin (highest) caste is entitled to perform sacerdotal, Vedic (scriptural) ritual; this requires no further initiation than that given to all high-caste boys. A Hindu priest (*purohita*) must be married. Celibacy is not incumbent on all Hindu monastic orders, though it is in those of high prestige. But the monk cannot perform any sacerdotal service, even if he was born into a Brahmin family. The fact of monastic ordination cancels his sacerdotal status. Monastic organizations ordain monks in various ways, and the types of ordination are numerous; but monastic and priestly ordinations are totally different and distinctive in type, scope, and intent. The Brahmin priest supports and enhances the mundane well-being of his client and the worldly estate of his society through Vedic and other rituals. The monk, on the other hand, withdraws from the mundane in a radical sense by rejecting sacerdotal commitments, and he recommends such withdrawal to his clients in a long-range perspective.

Secondary and tertiary orders. The notion of secondary and tertiary orders was generated in the Roman Catholic world, though by analogy it could be extended to non-Christian cultures. The triple division of the Franciscans and the Dominicans epitomizes this hierarchical and status type: the first order consists of ordained priests and lay brothers, the second of contemplative nuns; the third order incorporates laymen and laywomen, "tertiaries," who live under abridged, or "minor," vows that do not always include celibacy. In the Theravāda Buddhist world, these tertiary have parallels in the *saṅgha*, which can be viewed as the Buddhist analogue to the first orders of Dominicans and Franciscans. Whereas the full-fledged Buddhist monk has over 200 vows, parttime monks (*śramaṇas*) have less than one-third that number. In Burma, quasi-monastic, but unordained practitioners (*upāsakas*) may stay at monasteries and participate in the meditative and congregational activities of the monks, for a limited period and with payment of a nominal fee to the bursar of the cloister.

Status of nuns

In all monastic traditions of the world, the status of nuns is considerably lower than that of monks. The only conceivable exception is that of certain famous saintly women in Hindu India, today and in the past; some of them, known for their extreme piety or, more importantly, for their physical-mental (yogic) and mesmeric (hypnotic) powers, have gained high charismatic (spiritually influential) status that may place them, as individuals, above male monastics. Yet there is no truly hierarchical superiority wherein an ever so exalted nun could have disciplinary powers over a monk or even over a male novice. Though the Roman Catholic tradition has refused equal status to nuns, because women cannot obtain sacerdotal ordination, the Indian attitude rests on notions of ritualistic impurity—women, being polluted through the menstrual cycle, never have access to the ritual complex due to their innate defilement, hence their status is much lower—even though some noncanonical texts (e.g., the *Bhagavadgītā*) assert spiritual, though not ritualistic, equality of women and men.

When women postulants approached the Buddha for admission into the order, he was reluctant; finally, when his disciples and sponsors had succeeded in establishing nunneries, the Buddha said that this step augured the decline of the order. This did not discourage women either then or later. Buddhist nunneries are not numerous, and their ratio to male convents does not exceed 1:20 in any of the Buddhist countries. The modal Buddhist monastic attitude toward the nuns is one of embarrassed silence except in Japan, where the general loosening of monastic rules has worked in their favour.

Tertiary orders

Tertiary orders in the Christian world were established by noblewomen who combined piety with pioneering

medical knowledge and strong motivation to gear the latter to religious pursuits approaching the monastic in degree of dedication. Though the term tertiary did not originally contain reference to the sex of the membership, its selective denotation was well established by the 13th century, usually referring to women, often of aristocratic background, who led a saintly life in a cenobitic setting but were inspired by humanitarian ideals rather than by that of sheer contemplation. In a very real sense, women belonging to such groups were the first nurses; their tradition has been continued in all the Christian nursing orders extant today and is being emulated by some new non-Christian orders, such as the Hindu Ramakrishna Mission. Where there are male tertiary, as in some segments of the Dominican and Carmelite orders, the humanitarian connotation dominates.

Though the hierarchical types in the Christian West must be viewed from an organizational or managerial vantage point, there is much variation in Eastern orders. In the religious world derived from the teachings of India, a true hierarchy comparable to the Christian orders is found only in the Tibetan ecclesiastic setting. Contrary to the popular notion, the lamas are not simply high-ranking monks but are viewed as incarnations of a particular aspect of the Buddha or of a teacher who in turn was such an incarnation. Though Tibetan monasteries prided themselves on the presence of one or more lamas, they really stood above and outside the operational hierarchy, and their function was and is advisory rather than executive.

VARIETIES OF MONASTICISM IN THE RELIGIONS OF THE WORLD

Since monastic systems developed mainly in the Mediterranean monotheistic, and in South Asia's theologically more complex situation, their diffusion into other parts of the Western and Eastern world can generally be viewed as a modification of the two historical core areas that were located in two relatively small regions; i.e., the Judeo-Christian-Islāmic and Hindu-Buddhist-Jaina areas.

Religions of the East. Hinduism. With some reservations, the religion of the majority of the population of the Indian subcontinent after the decline and exit of Buddhism can be called "Hinduism," to supplant the erstwhile "Brahmanism" or the Vedic religion of pre-Buddhist days. Buddhism, like Christianity, is an export religion in the sense that it did not survive in an ecclesiastically organized fashion in its homeland. Hinduism—on the other hand—has absorbed so many Buddhist traits that it is virtually impossible to isolate the latter in medieval and later Hinduism. The most important Buddhist-inspired element in Hinduism is no doubt its monastic tradition. Where there were hermitages in ancient, pre-Buddhist India (such as the abodes of the Vedic "seers" [*ṛṣis*] and the *gurukula* [teacher's family]—which was a germinal cenobitic setting comprising the *ṛṣis* and their disciples), typically monastic features such as vows of chastity and an unequivocal rule of monastic comportment were not operative before the time of the Buddhist *saṅgha* ("monastic order") in the 6th century BC and its little-known early contemporary movements, such as the Ājīvikas, which are viewed as proto-Jaina, and other incipiently monastic institutions.

The most outstanding Hindu monastic founders and thinkers, comparable in many ways to the Christian St. Benedict of Nursia or the great theologian Thomas Aquinas (1225/26–1274) with regard to their importance in their respective areas, were Śaṅkarā (8th century AD) and Rāmānuja (11th century AD). Both of these teachers propounded the Vedānta theology (a religio-philosophical system concerned with the nature of ultimate reality), albeit in very different, mutually incompatible interpretations. Śaṅkarā's order of Dasanāmi *sannyāsīn* (Holy Men of Ten Names) was and has remained the monastic order that set the monastic standards for the rest of Hindu India. Based on a scholastic, nondualistic reading of the four "great dicta" (*mahāvākya*) of the canonical *Upaniṣads* (one of the Hindu scriptures), the monk, following the example given by the founder, meditates constantly on the numerical identity of his individual soul (*Ātman*) with the cosmic soul (Brahman). All his other observances—

Śaṅkarā
and
Rāmānuja

such as group incantation of canonical liturgy, participation in the monastic assemblies with other orders (*kumbhamelā*) at various places and at astrologically computed time intervals, alms begging, teaching religious topics to the laity, and conducting scriptural discourse with lay and monastic scholars (*śāstrārtha*)—are ancillary to his main purpose; *i.e.*, meditation. He does no social work, and there is nothing to parallel the humanitarian deeds of some other orders in the Indian and most orders in the Judeo-Christian world. He cannot conduct ritual and he has no obligation whatever toward society; but society has its obligation toward him—it feeds and clothes him. For this, he instructs those who wish to be instructed in the methods of meditation leading to emancipation from rebirth, which is believed to be caused by one's good or evil thoughts, words, and deeds in one's previous existence. In a more formal manner, he may or may not initiate lay seekers and monastic postulants (potential monks) into meditation by imparting to them a *mantra*, a sacred secret formula aiding the emancipatory process. Since the monk's initiation entails the symbolic cremation of his body, he is not cremated at his death as is done in the case of lay Hindus, but is interred or immersed in the river.

Most of the prestigious Hindu monastic orders follow this pattern, though their disciplinary codes are often radically different. Thus, the followers of Rāmānuja, referred to as Śrīvaiṣṇavas (worshippers of Viṣṇu and his spouse), are largely lay, high-caste Hindus. The monastic order relating to this tradition emphasizes ritual and worship of the personally conceived deity; its rules of celibacy, compared with the strict and unexceptional rules in the Daśanāmī *sannyāsin* order, are somewhat vague and flexible—so that, in theory at least, a person who claims the title of a monk could be a married man.

Of the approximately 90 monastic orders in Hinduism, some 70 impose celibacy and a cenobitic rule on their ordained members. Others—such as the Dādū-panthis (created by Dādū, an important Indian saint of the 16th century) and a number of other orders whose designation ends in *-panthis* (“path-goers”) of relatively recent origin (14th century and later)—follow specific theistic doctrines of medieval Hinduism. Unlike the Daśanāmī, who accept only Brahmins (highest caste Hindus) into their order, the *panthis* do not discriminate on grounds of caste in their recruitment. In fact, most of these orders can be viewed as anti-Brahmanic revival, or even rebellion, movements.

Jainism. Jainism, founded in the 6th century BC by Mahāvīra in reaction to Brahmanic Hinduism, has fewer than 12,000,000 followers today; but due to its mercantile predilection, it is a wealthy community that has given traditional and substantial support to its monastic organizations. The two main lay divisions of the Jainas derive their primary designation from the monastic setting, which is unique, in India and the West. The Śvetāmbara (“White-Clad”) sect is so called because its monks wear a white robe and a white piece of cloth to cover the mouth, thereby preventing the inhaling and annihilation of microbes and insects, and carry a broom with which they sweep the ground in front of them as they walk so as to clear away insects and other living beings that would be hurt or killed by being stepped on. The Digambara (“Heaven-Clad”; *i.e.*, nude) sect is so called because its monks used to go naked, to signify their complete detachment from worldly things and social trappings. Under Muslim rule, this custom was interdicted and since then (15th century) the Digambara monks have been wearing the white robe, thus becoming sartorially indistinguishable from the Śvetāmbaras. The Jaina monk stresses mendicancy, extreme austerity, and detachment. Both Jainism and Buddhism were purely monastic religions—in fact the only ones in a cross-cultural perspective; the rules for the laity are derived from monastic rules. The founders of Jainism (Mahāvīra, the semi-legendary Pārśvanātha), as well as the Buddha, directed their instructions to monks and postulants exclusively—the vows of the monks are more numerous and more intensive, but the way of life enjoined on the laity is simply an abridged monastic rule with more dispensations and compromise.

Buddhism. The generic term for the Buddhist monastic

order is the *saṅgha* (“community”), the terms connoting the order in all Buddhist countries are literal translations of the Indian word. Far more than in other monastic traditions of the world—with the possible exception of Jainism—the Buddhist doctrine attaches central importance to the order. The recitation of the “threefold refuge” formula that makes a person a Buddhist, either lay or monastic, imparts a pledge of allegiance to the Buddha, the *dharma* (“teaching”), and the *saṅgha*; most commentaries imply that each of these three constituents is equally important. In northern Buddhism (*i.e.*, Mahāyāna) the role of the historical Buddha has been and is negligible, and the order has acquired an even more exalted position. Since the Buddha began every single one of his sermons with the address *bhikkhave* (“O ye begging monks”), fundamentalistic Buddhism is tantamount to monastic Buddhism. The monastic discipline of the Buddhist clergy varies widely in the different parts of the Buddhist world. Ideally, the rules are laid down in the *vinaya* (“monastic rules”) portion of the Buddha's sermons, but monastic traditions and regulations have been influenced by the ecological and cultural conditions of Buddhist areas. Rules of vicinity or distance from lay settlements had to be differently interpreted and implemented depending on whether tropical, moderate, or (as in the case of Tibet and Outer Mongolia) subarctic climatic situations are involved. Although celibacy is postulated for the Buddhist clergy everywhere, there have been and are liberal exceptions. The married monks of pre-20th-century Ceylon and those of some of the Japanese Buddhist clergies were highly evident exceptions. Since the vows of the Buddhist monk in principle are not permanent, the theoretical emphasis on celibacy became academic in many parts of Asia. In the Theravāda (“Way of the Elders”) countries of South and Southeast Asia, the monks were and still are teachers to the people—not only of religious matters, but of basic education—particularly in Burma. There appears to be a correlation between the regional stress on educational and other forms of monastic involvement with the lay society and the provision of special amenities for monks who prefer a strictly contemplative life, as in Sri Lanka and Thailand; conversely, where the involvement is not spelled out, as in Japan, no such special division is apparent. The differences in living style between the northern (Mahāyāna, or “Greater Vehicle”) and the southern (Theravāda, wrongly called Hinayāna, or “Lesser Vehicle”) monastic institutions are quite radical. The fundamental feature, however, is meditation (Sanskrit *dhyaṇa*, Pāli *jhāna*, from which is derived the Chinese Ch'an and Japanese Zen). The path of meditation leads positively toward the intuitive understanding of momentariness—the condition of existence—or negatively toward the total rejection of all notions of permanence. The negation of existence is described by the term Nirvāṇa, “Fading Away”—Pāli Nibbāna; Tibetan Thar Pa, or “Crossing Over”—which is identical with the Zen term Satori, a translation of the Sanskrit *bodhi*, “enlightenment,” which was the discovery of the Buddha. All these terms are operational synonyms.

Sikhism. Sikhism, founded by the Punjabi reformer Nānak, was and is a martial version of Hinduism. Of all the indigenous Indian religions, it was the least sympathetic to monastic inspirations. The aforementioned Sikh monastic Nirmal-akhādā and the quasi-monastic Nihāṅg are patently compromises with the overall Indian trend to establish monastic traditions to express full-time involvement with redemptive practice. During the last two centuries only, the monastic Udāsīn order (founded by Nānak's elder son Śrī Chand) has achieved a most successful rapprochement with Hindu elements. Its disciplinary, sartorial, cenobitic settings are identical with those of the Hindu *sannyāsin* (“holy man”). They refer to the *Granth Sahib*, the sacred book of the Sikhs, as their basic text, in spite of the fact that their intramonastic and intermonastic discourse proceeds on Sanskritic, Vedāntic (religio-philosophical) lines similar to those of the orthodox Hindu orders. This accounts for the fact that the Udāsīns are now respected as equal to the most prestigious and ancient Hindu orders.

Taoism. Taoism, a Chinese religion based on folk re-

Taoist sage

ligion with Buddhist influences, with some very weak emulation in Japan, holds a middling position with respect to monastic ventures, lying somewhere between the powerfully antimonastic Confucian schools that always represented the official culture and mainstream of sophisticated Chinese opinion and the radically monastic Buddhists. Some scholars believe that since Taoism originated in the southwestern parts of China, Indian influences are conceivable. The chief object of Taoism, however, is not the redemptive, salvational purpose evinced in other scripturally based religions, Eastern and Western. The ultimate aim of the Taoist sage was longevity or ultimate physical immortality rather than salvation from this world or the self. The Taoist quest after the elixir of life, and its expression in cryptic and enigmatic poetry that is well known to, and generally misunderstood by, European and American seekers of the mysterious East in the 20th century, is in no way comparable to the supererogatory search of the monastics thus far discussed. The Taoist settlements of sages, in forests and mountain glades as well as in the cities, are, at best, analogous to the eremitic type of proto-monasticism. When Taoist settlements were cenobitic or celibate, these features were indeed incidental to Taoism, which defies and rejects rules of any corporate kind.

Other Eastern varieties. Monastic orders are thus either of Mediterranean or of Indian origin. The connections between the monasticisms of the two regions are immensely complicated, since the Indian subcontinent has absorbed or generated traditions that, though abhorrent to the orthodox Islām of the Arabic *'ulamā'* are nevertheless Muslim rather than Hindu in origin. North Indian Hindus have felt a strong attraction to Šūfī (Islāmic mystical) poetry, and dozens of Šūfī saints are worshipped by Muslims and Hindus alike. With India as one of the centres of monastic diffusion, new quasi-monastic types can be expected to spring up in the present or near future. In a strictly descriptive account, leaving aside historical development, the Šūfī orders must be seen as separate from both the Indian and the Mediterranean backgrounds.

South
Asian
quasi-
monastic
groups

Of the slightly less than 100 monastic and quasi-monastic orders in South Asia, well over half are local and regional growths. They usually lack even a body of rules and conventions that would be recognized or accepted by a wider Hindu-Buddhist-Jaina consensus. About a dozen orders are rejected and feared as heretical, outside the pale of the acceptable, and charged with using religious pretexts to indulge in antisocial behaviour. The Hindu and Buddhist Tantric sects (practicing occult, esoteric, meditative techniques) represent esoteric countermonasticism in India, though they have been accepted fully in certain Tibetan Buddhist hierarchies.

Of the not numerous but clearly evident monastic or quasimonastic organizations of recent origin in other parts of Asia, the Vietnamese Cao Dai achieved some recognition. They had a military organization and their own army "regulars" up to the mid-1950s; an eclectic theology with such heterogeneous patron saints as the 19th-century French novelist Victor Hugo, the World War II British prime minister Winston Churchill, and the Buddha; and a monastery-fortress in south central Vietnam. The members were bound by vows that did not include celibacy or poverty but stressed obedience to the hierarchy.

Religions of the West. *Judaism.* Judaism and Islām, the two Western religions that assume a father-oriented, social hierarchy as the supreme secular value, did not generate monastic traditions as part of their official institutions. The Essenes of the Qumrān community were, in their own vision, inimical to the ecclesiastic centre and marginal to the official Judaic complex. The weak eschatology (doctrine of the last times) of Jewish theology might account for the lack of a lasting monastic quest, which is typically inspired by individual salvational expectations.

Islām. In a somewhat milder fashion, this holds for Islāmic orders as well. Whereas some Jewish prophets might have had celibate leanings, the Prophet Muḥammad discouraged celibacy. Non-Arabic Islām, nevertheless, generated monastic orders, "Šūfism" being the generic name for a monastic attitude rather than for monastic institutions. The Bektāšī (see above) and the Sanūsīyah (conservative

Šūfī orders

order founded in the 19th century) are typical for the marginal status of monastic settings in Islām; vestigial rules and formalized vows are discernible, but the main thrust of these monastics was of an interpersonal type, centring on the relation between the individual teacher of esoteric wisdom (*murshid*) and his disciple (*murid*) and on the practices of chanting and meditation on the secret or known names of God (*dhikr*) and of other ecstasy-producing methods. The "way" (*ṭariqah*) meant something that, by implication, was not accessible to the pious, orthodox Muslim alone. The Naqshbandīyah order, which originated in Turkic-speaking areas of southwestern Central Asia, became widespread in the Islāmic Middle Ages, rediffusing from India into the western reaches of the Ottoman Empire (14th–20th centuries). The actual or alleged ingestion of *Cannabis* drugs (such as hashish) and the nonconformist, antilegalistic doctrines of the order have made it attractive on the popular level. The ritualization of the esoteric, contrasted with that of the social and the civil in the official Muslim prayer, seemed to provide an outlet and an alternative for a large number of devout but nonconformist Muslims, much as the modern cultic movements (such as spiritualist, "hippie," and similar groups) do for the religiously alienated in the West. Nonconformity to the official doctrine was often enhanced by unexpected or deviant behaviour; thus, the Sanūsīyah brethren prepared and used a variety of perfumes for their personal toilets. The element of rebellion, frequently manifested in eccentric behaviour, is typical for a setting where the official religion is antimonastic, as is the case of Islām.

Christianity. Since the terms monk and monastic are historically and etymologically Christian terms, the ideal-type monasticism is the Christian type by a semantic fiat—thus, the denotation of monastic terms has been extended to religions other than Christianity, the lexical donor for monastic terminology.

An overall view of Christian monastic history reveals a shift of emphasis from the contemplative to the socially active; this shift, if observed in a geographical dimension, moves roughly from East to West. The Eastern Orthodox and other Greek-liturgy-based sections of Christianity generated highly meditative orders, the Mt. Athos (Greece) complex being the most famous among them. The large variety of Roman Catholic orders displays eclectic emphases: the Benedictines, Franciscans, and all the orders designated as "minor" (in the Latin sense of humble or modest, rather than hierarchical or organizational) emphasize meditation; the Dominicans should be called "major"—though they are not—because the areas of preaching, scholastic continuity, and evangelizing rank far above contemplation in their order; and the Society of Jesus, or Jesuits (founded 1534), stands on the other end of the contemplative-social-centred continuum—teaching, social work, and the active life being regarded as the quintessence of supererogatory piety that is so important to this powerful organization.

Viewed from the social-centred end of the continuum, certain institutions in the Protestant tradition should be called monastic. The Taizé (France) communities of the Reformed Protestant tradition, founded in the 1940s, initiated an ecumenical monastic movement. Where emphasis is on faith rather than on works, monasticism would seem to be a viable expression of the Protestant tradition—yet, due to a set of historical accidents whose ideological summation was described in *The Protestant Ethic and the Spirit of Capitalism* by the German sociologist Max Weber (1864–1920), the operational emphasis has been on active engagement in the world rather than on seclusion. This explains why the various kinds of part-time Protestant retreats (linked to places especially designated for recuperation from the Christian involvement in work) are often placed in rural settings, and where they are urban, there is usually an apology at hand. Professional Western monasticism, by contrast, never made much of the rural-urban division, with important monastic centres randomly built in rural and urban settings; it is only the eremitic and some quasi-monastic types that insisted on rural or sylvan environments.

MONASTICISM IN THE 20TH CENTURY

A discernible trend can be noticed in modern Western monasticism. It appears to be directed towards an enhanced individual liberalism, covertly or overtly condoned and granted to monks who wish to reinterpret fundamental traditions in the light of individualistic experience. If the work of Teilhard de Chardin, the Jesuit paleontologist, and of the Trappist monk Thomas Merton are in any way typical of this trend, it may be a clue for the future of Christian monasticism. Even though the disciplinary bases of the standard religious orders are likely to remain conservative for a very long time, there is much more ideological permissiveness. Individual monks and their disciples have been interpreting the monastic ideal in psychological, anthropological, phenomenological, and existentialist terms. It is perhaps the Christian monks of the future rather than nonmonastic priests and ministers who will seek a trans-Christian ecumenism through religious experimentation. Of significance is the fact that Thomas Merton was killed in an accident while in Bangkok to visit the Dalai Lama (leader of Tibetan Buddhists). Monks had been the religious entrepreneurs of early Christianity—they may well emerge as innovators in an era of infinitely greater inter-religious information and diffusion.

Sponsored largely by college-campus religious organizations (both Protestant and Catholic), a retreat pattern based on ecumenical concerns has been emerging in North America and in Great Britain during the second half of the 20th century, though much less so in other parts of the Western world. There were roughly 1,000 such paracademic, campus-sponsored organizational retreats in North America alone in 1968. Most were Protestant, but with an increasing participation by Catholic and Jewish groups; almost all the participants were of college age. No vows of any sort are enforced or even recommended, but there is emphasis on meditation, discussion, and religious reflection. The projection of ideas about the future of monasticism is easier to discuss than that of the future of religion in general. Since the end of World War II (1945) there has been a highly visible resurgence of monastic ideals and an overall increase of monastic organizations in all parts of the world outside the Communist-dominated countries. The models were admittedly Christian, particularly Jesuit in the case of neo-Hindu orders—such as the Ramakrishna Mission (an eclectic Hindu order founded in the 19th century), which has over a dozen well-established centres in America and Europe. One Hindu monk, a swami—which correctly means an ordained Hindu monk—presides over each of these centres, often assisted by a younger monk; in theory, these centres train monks in the *sannyāsin* tradition, but they actually serve a European and American laity committed in various degrees to the Vedānta theology. On the model of the Ramakrishna Mission, there are some two dozen other India-originated organizations of this quasi-monastic or semimonastic type that have spread over the Western world, some of them with considerable wealth and popularity. Among such groups are the Self-Realization Fellowship, founded by the late Swami Yogananda Paramahansa, with its headquarters in Los Angeles, California; and the Hare Krishna movement with chapters all over North America and western Europe. Founded by A.C. Bhaktivedanta, Swami Prabhupāda, it attracts and assembles young men and women who temporarily dress in the monastic ochre robe of Hindu monks and chant the names of the Lord as incarnated in Rāma and Kṛṣṇa (Krishna), accompanied by simple, arcane dance movements. Zen Buddhism has been established in North America and Europe, with Zen churches and centres in many major cities. Again, it is usually only the leader and the teacher who is a Japanese Buddhist monk, instructing a variously interested laity.

Since the 1960s much attention has been given to the monastic potential of the communes, the “hippie” and kindred congregations in various parts of the Western world, some of whom have already established settings that have many genuine monastic traits—though with none of the foundational vows of traditional monasticism, Eastern or Western. The growing concern with mystical experience since the mid-20th century, with or without

the use of psychedelic (“mind-expanding”) drugs, and the general alienation from the official religions parallel many, if not most, of the monastic creations of the last 2,000 years or more.

In the countries of non-Christian monastic traditions (i.e., India, Sri Lanka, Burma, Thailand, Laos, Vietnam, and Japan), monasticism is, in varying degrees, on the decline. If the monastic distribution of the future could be assessed, an intelligent appraisal might be that monastic commitments and organizations will increase in the West and decline in Asia, perhaps in direct proportion to the changing religious concerns of the societies involved—the West, often believed to have had a surfeit of material progress, might seek the spiritual; the East, tired of contemplation, might turn to the pursuit of material progress on the former Western model.

(A.Bh.)

Sacred kingship

Sacred kingship, a religio-political concept by which a ruler is seen as an incarnation, manifestation, mediator, or agent of the sacred or holy (the transcendent or supernatural realm), traces its origins to prehistoric times and, at the same time, exerts a recognizable influence in the modern world. At one time, when religion was totally connected with the whole existence of the individual as well as that of the community and when kingdoms were in varying degrees connected with religious powers or religious institutions, there could be no kingdom that was not in some sense sacral.

Among the many possible kinds of sacral kingdoms, there was a special type in which the king was regarded and revered as a god—the god-kingdom, a polity of which there were three forms: preliminary, primary, and secondary.

The preliminary form exists in primitive cultures in which the chieftain is regarded as divine. The primary form was the god-kingdom of the large empires of the ancient Middle and Far East, of ancient Iran, and of pre-Columbian Meso-America and South America. The secondary form occurred in the Persian, Hellenistic (Greco-Roman cultural), and European empires. Between these three forms there are many transitional types.

Forms of the god-kingdom

PRINCIPAL SCHOOLS OF INTERPRETATION

The phenomenon of sacred kingship was known and described in ancient times by various travellers (e.g., Aristotle, in the 4th century BC, and the 1st-century BC Greek geographers and historians Strabo and Diodorus Siculus). In more recent times, Sir James Frazer, a British anthropologist, introduced the study of sacred kingship in *The Golden Bough* (1890–1915). Taking his comprehensive material from ethnological reports and studies, Frazer concentrated on the preliminary stage. With the discovery of texts in cuneiform writing in Mesopotamia and Asia Minor, however, a new stage of research began. Called Pan-Babylonism by some scholars, the theories based on the results of these discoveries placed the god-kingdom of the ancient Middle East in the foreground.

Building on the thesis of Pan-Babylonism that a homogeneous Middle Eastern culture existed and on the theories of cult as a ritual drama, the so-called British and Scandinavian cult-historical schools maintained that the king, as the personified god, played the main role in the overall cultural pattern. The English branch of this school (the “Myth and Ritual School”) concentrated on anthropological and folklore studies. The Scandinavian branch (the “Uppsala School”) concentrated on Semitic philological, cultural, and history-of-religions studies. It is represented in the latter part of the 20th century by Swedish historians of religion who have theorized that, for the entire ancient Middle East, certain cult patterns existed and that behind those cult patterns lay the sacred-king ideology.

Rejecting the cult-historical school theory of an unchanging cult pattern and an unchanging sacred-king ideology, many scholars in the latter part of the 20th century have tended to emphasize individual research of case histories. The fundamental differences between the kingdom ideology in Egypt and that in Mesopotamia have been

The “Myth and Ritual” and “Uppsala” schools

Infusion of Oriental groups in the West

investigated by historians and questions concerning sacred kingship in the Old Testament by Old Testament scholars. One result of such scholarly research is that the theory and practice of sacred kingship—in a history extending over thousands of years—has undergone immense changes and that, because of these widespread and extensive differences, all generalizations and categorizations are difficult to maintain. Though there may be an amazing correspondence among numerous individual phenomena, each individual sacral form of government can be explained only in its own historical, social, and religious context.

STATUS AND FUNCTIONS

The sacred status of kings, leaders, and chieftains. Basic to an understanding of sacred kingship is a recognition that the exercise of power of one person over other persons or over a community (local, regional, or imperial) in early times was general and not divided. Power could be exercised only by one person—one who simultaneously had the necessary physical (individual and corporate) and spiritual (psychic) strength and influence—over both people and objects. As ruler over a community, the king's power extended to everything pertaining to the life of the community. Only gradually did a division of these powers develop.

The sacral status of the ruler differs in form and origins. Three main forms can be distinguished: (1) the possessor of supernatural power, (2) the divine or semidivine king, or (3) the agent of the sacred.

The possessor of supernatural power. The ruler may be viewed as the possessor of supernatural power—both beneficial as well as malevolent—needed to maintain the welfare and order of the community and to avert danger and damage. In primitive, or preliterate, societies, he represents the life-force of the tribe, in which worldly and spiritual or political and religious spheres are not distinguished. Concentrated in the chief is the common inheritance of the magical power of the community, and his authority is based solely on the possession and exercise of this supernatural power. The impact and comprehensiveness of such power wielded by a chief, for example, reaches into all areas of life of the tribe: provision of food, fertility, weather, all forms of communal life, and protection against enemies and misfortune. Because the supernatural (magical) power of the chief is identical with his own life-force, the chief (or king) of such a society is not allowed to have any physical defects. With the dwindling of his own physical powers (illness, graying of hair, and loss of teeth), his own power to maintain and secure the common welfare and his own ability to rule are believed to be correspondingly diminished.

This form of sacral status is found mainly among rulers over one tribe (or several) in primitive cultures—he may be a chief, medicine man, shaman (a religious personage who has healing and psychic transformation powers), or king (as, for example, a rainmaker-king in Africa)—in which a fixed definition or limitation of such functions is not possible.

The divine or semidivine king. In some societies, especially in ancient kingdoms or empires, the king was regarded as a god (or identified with some god). In early Egypt he was identified with the sky-god (Horus) and with the sun-god (Re, Amon, or Aton). Similar identifications were made in early China and early Erech in Mesopotamia. In the Turin Papyrus (a list of kings written c. 13th–12th centuries BC), the sun-god Ra is viewed as the first king of Egypt and the prototype of the pharaoh (the god-king). The symbol of the sun circle, one of the most prevalent artistic representations of the sacred king, and the practice of addressing the king as “my sun” are well depicted in rock reliefs and inscriptions in areas ruled by the Hittite kings. The Persian king was regarded as the incarnation of the sun-god or of the moon-god. In addition to sky or sun deities, the sacred king has also been identified with other gods: the town-god (Mesopotamia), the gods of the country, the god of the storm, and the weather-god. Generally, however, the king was not identified with a specific god but rather was regarded as himself a god. As the incarnation of all that is divine, the Egyptian pharaoh was

addressed simultaneously in inscriptions as Aton, Horus, and Re (sun deities). Significant for Egyptian royal theology was the doctrine of the god-kingdom spanning two generations; each king ruled as King Horus and became Osiris (the father of Horus, a fertility god and later god of the dead) after his death.

A broader foundation for the divinity of the king is the view of the king as the son of a god, which can take on different forms. The first king has been regarded as a god and his successors as sons of the god in a number of societies—in Africa, Polynesia, Japan (where the emperor, until the end of World War II, was revered as a descendant of the sun goddess), Peru (where the inca, or ruler, was believed to be a descendant of the sun-god), Egypt, Mesopotamia, and Canaan. Because he personifies the divine national hero (as among the Shilluk in Africa), the king can demand divine status, a practice that was taken up in the Greco-Roman world by Alexander III the Great and by the Roman emperors. When a king who has been sired by a god or when a god who takes on the external form of the living king approaches his queen, he begets the future king—the queen is thus called the mother of God. An essentially different foundation is the king's divine sonship through adoption, as, for example, in the legend of King Sargon of Akkad in ancient Mesopotamia. The adoption of the crown prince by a god is often part of the coronation ritual, especially in Mesopotamia: the god declares the king as his son when he ascends the throne.

An especially frequent expression of the relationship of the king to divinity, in Egypt and Mesopotamia, was that of the king as a god's image. In Egypt, the king—addressed by the god as “my living image on earth”—is shown in the likeness of Re, Aton, Amon, or Horus. In Mesopotamia, this kind of description was rare.

The king as a god's image

The myth of divine birth, such as that of Romulus, the legendary founder of Rome, in many places served to legitimize the claims of the king. Unusual natural phenomena, such as an especially bright star, are sometimes connected with the birth of a divine king.

The conception and practice of making a king divine after his death are very old and widespread. Probably connected with ancestor worship, deification is practiced most often when the living king, although connected with gods, is not regarded as a god in the fullest sense. Only after his death does he become god. Among the Hittites, for example, the expression “the king becomes a god” means that the king has died.

The king as the principal agent of the sacred. In addition to the conception of a king as the incarnation of supernatural power and the possible equality of the king with the divinity, there is also a widespread belief that the king is the executive agent of a god. As the servant of a god, he carries out the work of the god on Earth. The divine character of this form of sacred kingship is connected not so much with the individual king as with the institution of kingship. In this emphasis on the institution of kingship lies the difference between kingship in Mesopotamia and Egypt and in India and China. The institution was emphasized in Mesopotamia and China. Sharp distinctions cannot be drawn between the different conceptions of the relationship of a god to kingship. Despite all the different expressions of kingship in the history of Mesopotamia (especially among the empires of Sumer, Babylon, and Assyria), there nevertheless was a continuous theme: the real lord of the city, the country, or the state remains the god, and the king remains in a subservient relationship to him. Even when the king possessed or disposed divine power and had sacral character and sacral duties, he remained subordinate to the god who selected him and put him into his regal position. The king had a mediating position between the gods and man, especially in his significance for the cult (thus, Sargon of Akkad is first described in inscriptions as deputy of Ishtar). The king also had a similar status as agent in Mongolia, where it was believed that the king came from heaven and was enthroned by God to carry out his will.

Functions of the sacred king: the king as the source of cosmic power, order, and control. *The king as bringer of blessed power.* The usual function of a sacred king is to

The basis of authority in tribal communities

The king's
influence
over men
and nature

bring blessings to his people and area of control. Because he has a supernatural power over the life and welfare of the tribe, the chief or king is believed to influence the fertility of the soil, cattle, and man but mostly the coming of rain. He has power over the forces of nature. Where rain is vitally necessary for the welfare and continuity of a people, the king can be described primarily in terms of this special function. Protection against evil of all sorts also is important for the welfare of the country. If the tribe or the country is beset by misfortune, epidemic, starvation, bad harvests, or floods, the king can be held responsible. Sometimes the king is believed to have the power to heal sickness by means of touch or contact with his garment.

The function of the king as bringer of good fortune is prevalent in primitive cultures. Especially prevalent in Africa, it also has been observed in Polynesia, Scandinavia, and in ancient Greece. This power to bring good fortune is also an aspect of sacral kingship in advanced cultures, such as in India, Iran, China, Japan, pre-Columbian Meso-America, Egypt, Mesopotamia, and Canaan. The difference between Egypt and Mesopotamia is significant; in Egypt the pharaoh is the direct dispenser of all good fortune in the country, whereas in Mesopotamia the king mediates for good fortune through cultic speeches and actions.

The function of the king as dispenser of good fortune has had an amazingly long influence: the English king was believed to have had healing power over a special disease (the king's evil) until the time of the Stuarts in the 17th century, and until the 20th century a folklore belief persisted in Germany that the ruler has influence over the weather ("emperor weather"). Words sometimes used to symbolize the king as the wielder of beneficial influence are gardener, fisherman, and shepherd.

The king as shepherd. An Egyptian pharaoh once said of himself: "He made me the shepherd of this country." In Mesopotamia the description of the king as a shepherd was quite frequent; in the 3rd millennium BC, the term was applied to Sumerian city princes (e.g., Lugalbanda in the 1st Dynasty of Uruk [Erech]). The function of the king as shepherd also has been noted in India. The image of the shepherd expresses the most important functions of the king—he provides his people with food; he leads them and protects them from dangers and, at the same time, shows his superiority over them. Christ's description of himself in the New Testament as the "good shepherd" is, in a sense, a description of his official position in the Christian Church, which also describes him as king, prince of peace, and Lord.

The king as judge. From earliest times, in addition to other functions, the chief was the judge of his tribe; he personified the protection that the community provided for the individual. Providing for a balance of power in the community, mediating quarrels, and protecting individual rights, the chief or king was the lawgiver and the highest administrator for all community affairs. The *ensi*, the lawgiver and the highest judicial authority in the Sumerian city-state, was responsible for order. In Egypt the king was the highest judge, the guarantor of all public order, the lord over life and death. Early Egypt and India developed a high degree of justice that described the activities of the king as *māat* in Egypt and *dharma* in India. Both conceptions may be expressed as "justice" or "order" but actually are more comprehensive. Because the king preserves the god-given world order, the task to be just has been viewed as one of his fundamental functions. The pharaoh of Egypt and the emperor of China were believed to be responsible for the maintenance of cosmic as well as social order.

The king as warlord. Belief in the supernatural power of the ruler caused him to be viewed as the protector of his tribe or his people from enemies. On the one hand, he was the chief warlord and decided on questions of war and peace (as in ancient Sumer). The Egyptian pharaoh was represented, in his divine capacity as warrior, in larger-than-life dimensions. He alone was regarded as the one who triumphed over the enemy. On the other hand, there was the concept that the king, because of his sacral character, should not personally take part in war. These concepts existed, for example, among the Persian kings.

The king as priest and seer. Religious duties quite often are connected with the office of chieftain, who is also priest or seer and rainmaker—all in one. Correspondingly, in nontribal societies, cultic functions belong to the office of the king. In the 3rd Dynasty of Uruk, Lugalzaggisi is described as king of the country, priest of the god Anu (the god of the heavens), and prophet of Nisaba (goddess of grasses and writing).

When a division of functions evolved, the intrinsically royal priestly and other cultic functions were transferred to priests, seers, and other servants of the cult; the old concept of the king as priest, however, survived in some fashion for thousands of years. The Egyptian king was the chief priest of the land and the superior of all priests and other cult functionaries. In many images he is portrayed as presiding over the great festivals and bringing offerings to the gods. Later, priests carried out their functions as his representative. In Mesopotamia, the king was viewed as the cultic mediator between god and man. As head of all of the priests of the country, he had important cultic functions at the New Years' festival. In critical situations, the king might issue an oracle of blessing; through him the land would be promised salvation, which was often accompanied by the words, "Fear not!" The Persian king performed the sacrifice at the horse offering and was also the "guardian of the fire." In all questions of religion he was the highest authority; he was also the most cultivated of the magicians. The king in Ugarit (in Canaan) also carried out priestly functions and as prophet was the receiver of revelations. Like other ancient Middle Eastern monarchs, the Hittite king was the chief priest.

The relationship between sacred kingship and priestly cultic functions has extended over widespread geographical areas and historical eras: East Asia, China, Japan, India, Europe (among the Germanic and Scandinavian kings), Africa (in the great empires), and Madagascar. Sometimes, the division of functions brought about a transfer of the royal title to those who carried out cultic functions. In Africa, from the earliest times, there was a type of king who was called lord of the earth; he originally combined political and cultic functions but, with changing times, retained only the cultic ones. The strict separation of the priestly office from that of the king, as in India, where king and priest belong to different castes—Kṣatriya and Brāhman, respectively—is an unusual exception, however.

The king may be the recipient of a direct revelation of the will of a god. Thus, in Egypt the pharaoh received a divine oracle through dreams in the temple (a practice known as incubation). In Mesopotamia, the duty of the king to ascertain the will of the gods was more strongly emphasized; a directive of the gods could result from omens, dreams, or reading the entrails of offerings. All major undertakings of the king were dependent on directives of the god, who was to be consulted in advance. A direct divine revelation to a king is related in the Old Testament I Kings, chapter 3, which tells of a dream of the 10th-century-BC Israelite Solomon in which he received the promise of the gift of wisdom. Likewise, in the Old Testament (in Genesis, chapter 41), Yahweh, god of the Hebrews, gives the pharaoh a directive in a dream.

The king as the centre of ruler cults. Although a pharaonic cult occasionally existed in Egypt, the ruler cult differs entirely from sacred kingship, because it came into being from political impulses. The ruler cult, generally developed in a country or empire with many peoples and many religions, was one of the ruler's means of power. Syncretism, the fusing of various beliefs and practices, often succeeded in bringing together completely different religious and nonreligious motives. Alexander the Great (who established an empire of many peoples and religions), for example, revealed a conscious effort at continuity with the Egyptian kingdom, inasmuch as the oracle of the Egyptian god Amon at Siwah designated him as the son of Amon and thus the successor of the pharaohs. Among the *diadochoi* (successors to Alexander) of the first generation, the ruler cult remained limited, but, under Ptolemy II Philadelphus of Egypt (reigned 285–246 BC), it became an established institution that was connected with the deified Alexander. When the ruler cult was car-

ried over to Rome, the emperor Augustus (reigned 27 BC–AD 14) allowed it to be practiced only in the east in connection with the worship of the goddess Roma—though he allowed it to be pursued with fewer restrictions in the newly conquered western provinces; the adaptation of honouring the divine Caesar (or emperor of Rome) soon became, however, an important expression of the unity of the empire. Serious resistance to the imperial cult was encountered only among the two radical monotheistic religions: Judaism (e.g., against Antiochus IV Epiphanes of Syria in the mid-2nd century BC) and Christianity. The Hellenistic and Roman ruler cults never generated a strong religious movement. The sacrifices brought to the king (emperor) go back to the custom of bringing tribute to the king (or chief) of primitive cultures. From this practice, the custom of bringing offerings to the deceased king developed.

Regal ceremonies. Modes of selection and succession. Succession to rulership was not in the beginning necessarily connected with the sacral kingship; the sacral king could also be elected or, through a power struggle, could also receive a divine, magical, or supernatural anointment. If the first-born son of the king was not stipulated to succeed him or if the king left no children, severe struggles for the succession often occurred, generally resulting in a change of dynasty. The death of a king often was kept secret until the succession was assured, because of potential danger to the people and country. To counteract problems of succession, there were rituals to secure the continuity of the sacral power. In primitive cultures the successor of the dead chief was brought into physical connection with his predecessor, his utensils, or clothing—he had to stay, for example, in the home of the dead chief and use his utensils. The funeral of the dead king took place after the new king was established in his office or just before his coronation (as in Egypt). Efforts to secure the succession show high regulatory standards; in Egypt a complicated succession theology linked the new and old king as Osiris and Horus. During the lifetime of his father, the crown prince could be designated as co-regent. The designation of the successor often came through an oracle, a sign, or some other manifestation of the word of the god; Thutmose III of Egypt (reigned 1504–1450 BC), for example, reported how he was designated to the succession through the oracle of the god Amon. In ancient Iran, after an interregnum, the election of the king took place through an omen. The king was chosen by the god; sometimes he was described as divinely predestined in the womb of his mother as the ruler.

Forms and types of sacred legitimation of kings. The coronation or ascent to the throne by a king is an official act that most clearly shows the sacral character of the kingdom. Until the 20th century two characteristics in the coronations of kings and emperors remained: through ascent to the throne, the king is placed higher than other men, and the act of accession is connected with supernatural powers. With this action a new era begins. This was expressed in Egypt and Mesopotamia in two acts that marked the beginning of the government of the new ruler. First, with the death of the old ruler, the crown prince took control of the government and soon thereafter established his accession in a festive celebration. The coronation, however, generally had to coincide with a new beginning in nature, such as the New Years' festival. The coronation also was viewed as a cosmic new beginning. The most important initial actions of sacred kingship—the ascent to the throne and coronation with proper insignia and king's robes—have remained the same in primitive cultures in ancient and modern times, as well as in the high cultures of the present. The throne, crown, headdress, garment (as sign of dignity), and sceptre (the staff through which the rule is carried out) were originally believed to contain the power through which the king ruled. The star garment of the Persian king symbolized his world rulership, similar to the feather mantle of the kings of Hawaii. In many higher cultures the throne, the crown, and the sceptre are viewed as divine and identified with gods and goddesses. This view was especially expressed in the Egyptian royal theology: in the hymnal prayer during coronations, the crowns

of Upper and Lower Egypt were addressed as goddesses of the red and white crown by the king. In India the throne personified the kingdom. Sometimes, the throne that a new king ascends is viewed as the throne of the god. For example, Hatshepsut, an Egyptian queen (reigned 1503–1482 BC), was announced by Horus: "You have appeared on the throne of Horus." On many Egyptian images the king sits on the throne, and the god is at his side holding a hand over the king. In becoming someone else (a god), the king receives a new name, a throne name. Throne names are known in Africa, Mesopotamia, and Egypt (where the five throne names comprise the whole king theology: birth name, royal name, hawk name, serpent name, and a name that designates the king as heir of the power of the gods of the stars). In Iran, for example, the king is proclaimed by his royal name as world ruler. Immediately upon the proclamation of the new status of the king and his royal name, the subject people generally evoke a jubilant shout, such as "Long live the king." An African variety of a response to the proclamation is "He is our corn and our shield," which shows the importance of the king for his people. Another response to the proclamation is a prayer for the king: African and Polynesian prayers; Egyptian, Mesopotamian, and Israelite psalms; and hymns, such as the British hymn "God Save the King."

The act of adoration of a king is based on the throne rite, which is known only in areas having national kings. Though ascent to the throne and coronation with investiture are worldwide, there are many other rituals connected with sacred kingship. Among these are the anointment of the kings in Israel, India, and Iran, which originally was a ritual that gave strength to the recipient—as noted in primitive cultures (e.g., rubbing with the fat of a lion); pseudo-fights (sham battles), from which the king emerges as victor; ritual cleansing; and ritual meals. The survival of elements of the sacred kingship in the Christian West is especially depicted in coronation rites. In early Christian art, Christ is shown as kingly ruler on his throne with a royal court; he is emperor and universal ruler. Sacred kingship also survived in the papacy, as well as in the Holy Roman Empire (until the words Holy Roman were dropped in 1806). In the papacy, for example, the court ceremonies employ forms of address that go back to the imperial language of ancient sacred kingdoms: "Holy Father" or "Holiness."

Ritual roles prescribed for kings in public or state functions. Many and various rituals express the concept that in the chief or king is concentrated the well-being of the country. At the order of a god, a Mesopotamian king might become involved in war; thus, his loot was placed before the god in the temple. If the king made a decision as judge, it was because of his unique wisdom as king. If he mediated a quarrel, the parties recognized his supreme power. The king acted to protect his land against the enemy; after his accession, in some areas, the king shot four arrows to the cardinal directions of the compass. In Africa and Egypt, for example, he then said: "I am shooting down the nations, to overcome them." He acted to insure fertility and to distribute growth power when he started sowing corn, the seed of the tribe. He also was regarded as the guardian of the hearth fire (e.g., Africa and Rome).

The king exercised an important function through his participation in the great festivals, which were of utmost importance to the life of his people. In such festivals, various functions were differentiated: (1) priestly, as when the king presided over the sacrifices, said prayers, and gave the benediction; and (2) cultic participation, as when the king took part in the cult drama. The origin of the cult drama as a spontaneous event is known in primitive cultures (e.g., the Ashanti in Africa), but it had its fullest expression in Mesopotamia and Egypt. In the Sed festival (in Egypt), the king, as ruler, renewed his rulership over the whole world. In the New Years' festival his ascent to the throne was renewed; and at the festival of Min, the god of life-force and reproduction, the king played a significant role.

In Mesopotamia, festivals, originating in cultic drama had great importance, especially the Babylonian New Years' festival. The events of the epic *Enuma elish*, which

describes the sun god Marduk's victory over the powers of chaos and the resulting creation of the universe, were re-created in the cultic drama of the New Years' festival, in which the king represented Marduk, the victor and creator. Another cult drama represented the death and resurrection of the god of vegetation, in which the participants in mourning processions searched for the vanished god (represented by the king) and rejoiced at this triumphant return. Another Mesopotamian cult drama was the sacred marriage that the god Dumuzi celebrated with the goddess Innana. In the "holy wedding" the king and a priestess represented the god and the goddess and through this sexual union the forces of growth and fertility in nature were renewed. These cult dramas originated in early prehistory, when gods were identified with the forces of nature and the cultic actions were understood as exerting direct influences on nature. At the Persian New Years' festival the king appeared as a killer of the dragon, whose rule was identified with the dry season.

The theory of the kingship in which the king occupied the position of mediator between people and gods also implies that the king may have to atone and suffer for the people of the cult. Under such a theory the absolution and reinstatement of the king meant the renewal of land and people. Perhaps behind this theory was a ritual similar to that found among African coronations of prehistory (as, for example, among the Ashanti) in which the king was beaten by priests before his installation.

Private ritual forms peculiar to kings and their families. The special status of the sacral king necessarily also influences his private life. In order to keep the supernatural force dwelling within him, the king had to observe a number of regulations and taboos in the details of his daily life. To this belongs temporary separation—in some cases, the king lived completely separated (e.g., in Africa). The king often appeared only for audiences, on great festivals, or special occasions—sometimes veiled (as in Iran) or with a mask. There also have been special food taboos: he was not allowed to eat certain foods or may have had to drink only from a certain well. The custom of the king taking his meals alone is widespread. The isolation-separation theme in sacred kingship also appears in court ceremonies: the king must be addressed only from a certain measured distance; a person is only allowed to approach the king kneeling; if the king is encountered the head of the subject must be covered with the hands (as in Iran); he must not be touched; and the king must not touch the ground. Inasmuch as the king is filled with supernatural power, everything he touches can take on some of that power (as in Tahiti). Such proscriptions and taboos for the private life of the king are especially evident in Africa but also occur in Polynesia and Micronesia, East Asia, and the ancient Middle East. The divine or superhuman character pertained not only to the king but also, in lesser measure, to his family. The king's consecration could involve ritual incest. The participation of the family in the sacral status of the king was evidenced in several places (e.g., Egypt), where, upon the death of the king or queen, members of the royal family and the court were killed or buried with them. Brother-sister marriages in some areas give evidence to this kind of royal ideology.

When a king began to grow old, it was said in Africa: "The grass is fading." To preserve the growth and well-being of the land, it was necessary to kill the aging king so that his power could be transferred to a successor. The compulsory killing of the king was widespread among the Hamitic and Nilotic peoples in northern Africa; and among some peoples the killing of the king occurred after a specified period of time and was integrated into the cosmic ritualistic rhythm. The real meaning of the killing of the king showed itself in rituals in which the blood of the murdered king is mixed with the seed corn, which then became especially fertile.

CONCLUSION

With the increasing secularization of all areas of life, sacred kingship will of necessity disappear everywhere. Where monarchies are still retained, the sacred features will most likely diminish or vanish altogether. Only in the

great regal ceremonies—especially coronations—are traces of sacred kingship still retained in the 20th century.

Certain elements of sacred kingship, however, are still encountered in modern life: in state ceremonies (e.g., the red carpet at formal receptions), in governmental and ecclesiastical titles, and in the honour and respect given to particular personalities in different walks of life, such as in politics, art, and sports, in which the title king is often used to designate the secular veneration of an individual in the modern cult of personalities. (C.W.)

BIBLIOGRAPHY

Priesthood: The nature, characteristics, and significance of priesthood in primitive cultures ancient and modern are discussed by GRAHAME CLARK in *Archaeology and Society*, 3rd rev. ed. (1957); EMILE DURKHEIM, *Les Formes élémentaires de la vie religieuse* (1912; Eng. trans., *Elementary Forms of the Religious Life*, 1915, reprinted 1964); and the cultural and scientific development by JACQUETTA HAWKES and LEONARD WOOLLEY, *History of Mankind*, vol. 1, *Prehistory and the Beginnings of Civilization* (1963). The prominent features of priests and kings in the rise of civilization are considered by H.J.E. PEAKE and H.J. FLEURE in the 4th volume of their "Corridors of Time" series (1927). G. LANDTMAN, *The Origin of Priesthood* (1905); and E.O. JAMES, *The Nature and Function of Priesthood* (1956), are comparative and anthropological studies of the subject in its wider aspects with full bibliographies. In ancient Egypt and the Near East the organized priesthoods are treated by J.H. BREASTED (ed.), *Ancient Records of Egypt*, 5 vol. (1906-07), and in *Development of Religion and Thought in Ancient Egypt* (1912, paperback edition 1959); by HENRI FRANKFORT in *Ancient Egyptian Religion* (1948), and in his important exposition of the *Kingship and the Gods* in Egypt and Mesopotamia (1948). The available Sumerian evidence is produced by S.N. KRAMER in his *Sumerian Mythology* (1944). The priestly aspects of the Annual Festival are surveyed by S.H. HOOKE in the *Origins of Early Semitic Ritual* (1938), and in *Myth, Ritual and Kingship* (1958). The Canaanite counterparts are recorded in G.H. GORDON, *Ugaritic Literature* (1949); and in G.R. DRIVER, *Canaanite Myths and Legends* (1956). For the Hellenic conceptions of priesthood, a full bibliography is appended to the article on "The Religion and Mythology of the Greeks" by W.K.C. GUTHRIE in *The Cambridge Ancient History*, rev. ed., vol. 2, ch. 40 (1961). The origin and status of the Levites and the Levitical code in the Hebrew priesthood are investigated by T.J. MEEK in *Hebrew Origins*, rev. ed. (1950). For the origin of the Christian priesthood, see K.E. KIRK (ed.), *The Apostolic Ministry* (1946). In India the Vedic, Brahmanic and Upanisadic conceptions of priesthood, and the predominance of the Brahmin caste in Hinduism are discussed in A.B. KEITH, *Religion and Philosophy of the Veda and Upanishads*, 2 vol. (1926); J.H. HUTTON, *Caste in India*, 2nd ed. (1951); S. RADHAKRISHNAN, *Eastern Religions and Western Thought*, 2nd ed. (1940), and *The Hindu Way of Life* (1963); and R.C. ZAEHNER, *Hinduism* (1962), with a full bibliography. For the sublimation of priesthood in Buddhism in India, China, and Japan, see EDWARD CONZE, *Buddhism: Its Essence and Development* (1951); and P. DAHLKE, *Buddhism* (1927). D.H. SMITH, *Chinese Religions* (1968), is an introduction to religious thought and sacerdotal practice in China. *Religious Studies in Japan* (1959), is a very informative composite volume by a group of Japanese scholars in English. Concerning the Zen sect, see D.T. SUZUKI, *The Manual of Zen Buddhism* (1950); A.W. WATTS, *The Way of Zen* (1957); and reference to it in R.C. ZAEHNER, *Mysticism, Sacred and Profane* (1957). The priesthood in Shintō is discussed by D.C. HOLTOM in *The National Faith of Japan* (1938). For studies on the present situation of the priesthood in Christianity, the following works should be consulted: J.D. BENOIT, *Liturgical Renewal* (1958); J.H. SRAWLEY, *The Liturgical Movement* (1954); E.B. KOENKER, *The Liturgical Renaissance in the Roman Catholic Church* (1954); B. LEEMING, *The Vatican Council and Christian Unity* (1966); B.C. BUTLER, *The Theology of Vatican II* (1967); and B.C. PAWLEY (ed.), *The Second Vatican Council* (1967).

Shamanism: A thorough description of the shamanism of the peoples of Siberia is given in M.A.C. CZAPLICKA, *Aboriginal Siberia* (1914); and in MIRCEA ELIADE, *Le Chamanisme et les techniques archaïques de l'extase* (1951; Eng. trans., *Shamanism: Archaic Techniques of Ecstasy*, 1964). The latter not only deals with phenomena in Central and Northern Asia but also from North and South America, Southeast Asia, and Oceania. See especially the chapters on "Shamanic Ideologies and Techniques Among the Indo-Europeans" and "Shamanic Symbolisms and Techniques in Tibet, China, and the Far East." The English translation includes an extensive bibliography. Shamanism among the Finno-Ugrian Siberian peoples is described by UNO HOLMBERG in *The Mythology of All Races*, vol. 4 (1927). A very thorough summary of the world view and

Personal
regula-
tions for a
king's daily
life

specific traits of shamanism in North Asia, based on a good knowledge of literature on the subject in Russian, may be found in GEORG NIORADZE, *Der Schamanismus bei den sibirischen Völkern* (1925). The shamanism of the same territory, but only the traits considered most significant, has been discussed by AKE, OHLMARKS, *Studien zum Problem des Schamanismus* (1939). The volume *Glaubenswelt und Folklore der sibirischen Völker* (1963; Eng. trans., *Popular Beliefs and Folklore Tradition in Siberia*, ed. by V. DIOSZEGI, 1968) contains studies on the shamanistic conceptions of the Lapp, Hungarian, and Siberian peoples.

Monasticism: AGEHANANDA BHARATI, *The Ochre Robe* (1962), and *The Tantric Tradition* (1966), partly autobiographical analyses of the official and the esoteric monastic traditions in Hinduism; OWEN CHADWICK, *Western Asceticism* (1958), a good survey, especially of the Roman Catholic orders; E.C. BUTLER, *Benedictine Monachism*, 2nd ed. (1962), a classic study on this subject; SUKUMAR DUTT, *Buddhist Monks and Monasteries of India: Their History and Their Contribution to Indian Culture* (1963), a classic work relating the monastic to the other cultural tradition of India; E.E. EVANS-PRITCHARD, *The Sanusi of Cyrenaica* (1949), an important anthropological study of a regional Sufi tradition; J.N. FARQUHAR, *The Fighting Ascetics of India* (1925), a classic by default, as no other work has been written since dealing exclusively with the military orders of Hindu India; G.S. GHURYE, *Indian Sadhus* (1964), the only English language survey of the total contemporary monastic situation in India; P.S. JAINI, "Śramanas: Their Conflict with Brahmanical Society," in J.W. ELDER (ed.), *Chapters in Indian Civilization* (1970), an excellent short survey of the Jaina monastic tradition juxtaposed with the Hindu and Buddhist orders; DAVID KNOWLES, *Christian Monasticism* (1969), a good survey of the history of monasticism and religious orders; NORBERT MCMAHON, *The Story of the Hospitallers of St. John of God* (1959), a history of monastic knightdom in the Crusade and post-Crusade eras; R.J. MILLER, *Monasteries and Culture Change in Inner Mongolia* (1959), an anthropological account of Buddhist monachism in Mongolia (the only study in English to date); J.A.N. MULDER, *Monks, Merit and Motivation* (1969), a report on monastic behaviour in contemporary South and Southeast Asian Buddhism; WALTER NIGG, *Warriors of God: The Great Religious Orders and Their Founders* (1959), an excellent account of the inceptors of monastic traditions, with special reference to the paramilitary trends in early monastic attitudes; J.C. OMAN, *Mystics, Ascetics, and the Saints of India* (1903), a classic work that is a fair account of the monastic situation in both ancient and contemporary India; *Palladius: The Lausiac History*, trans. and annot. by R.T. MEYER (1965), a translation of one of the original classics on early Christian monasticism; J. PRIP-MØLLER, *Chinese Buddhist Monasteries*, 2nd ed. (1967), a good account of the monastic ecology and discipline of the Chinese orders; D.T. SUZUKI, *The Training of the Zen Buddhist Monk* (1934), a classic by a famous Zen scholar; L.A. WADDELL, *The Buddhism of Tibet*, 2nd ed. (1934), the classic by way of an overall view of Lamaism; J.B. WILLIAMSON, *The History of the*

Temple (1924), an erudite historical account of the Templars; A.W. WISHART, *A Short History of Monks and Monasteries* (1902), a classical introduction to Christian monachism; NUR YALMAN, "Islamic Reform and the Mystic Tradition in Eastern Turkey," *Archives of European Sociology*, 10:41–60 (1969), an excellent sociological account of Sufism in action; ERIK ZURCHER, *The Buddhist Conquest of China*, 2 vol. (1959), an excellent, learned study of Chinese monastic and lay Buddhism and its conflicts with the official Chinese culture.

Sacred kingship: SIR JAMES FRAZER, *The Golden Bough*, 3rd ed., 12 vol. (1911–15; abridged ed., 1922 and 1959), is the fundamental and classical work. Also significant is ARTHUR M. HOCART, *Kingship* (1927), which considers the apotheosis of the king for the oldest religions of mankind. (*The English school*): SAMUEL H. HOOKE (ed.), *Myth and Ritual* (1933), *The Labyrinth* (1935), *Myth, Ritual and Kingship* (1958). (*The Scandinavian school*): IVAN ENGNELL, *Studies in Divine Kingship in the Ancient Near East*, 2nd ed. (1967); AAGE BENTZEN, *Messias-Moses Redivivus-Menschensohn* (1948; Eng. trans., *King and Messiah*, 1955); GEO WIDENGREN, *Sakrales Königtum im Alten Testament und im Judentum* (1955); SIGMUND MOWINCKEL, *He That Cometh*, pp. 21–95 (1956). (*On particular areas*): HENRI FRANKFORT, *Kingship and the Gods* (1948), ushers in the new epoch of research.
