class TRibbonObsidianColorMap : public TCustomRibbonColorMap;
```

File

Ribbon

Description

TRibbonObsidianColorMap is the color map class for the Obsidian ribbon style.

See Also

TRibbonLunaColorMap (see page 3525)

TRibbonSilverColorMap (see page 3549)

62.1.23.1 TRibbonObsidianColorMap Members

The following tables list the members exposed by TRibbonObsidianColorMap.

Public Methods

	Name	Description
	UpdateColors (see page 3532)	Updates an action component to reflect the current color property.

Published Properties

	Name	Description
	ActiveTabFontColor (see page 3532)	This is ActiveTabFontColor, a member of class TRibbonObsidianColorMap.
	BevelMinimizedInner (see page 3533)	This is BevelMinimizedInner, a member of class TRibbonObsidianColorMap.
	BevelMinimizedOuter (see page 3533)	This is BevelMinimizedOuter, a member of class TRibbonObsidianColorMap.
	BtnSelectedFont (see page 3533)	Changes the look and feel of your applications.
	CaptionFontColor (see page 3533)	This is CaptionFontColor, a member of class TRibbonObsidianColorMap.
	ControlColor (see page 3533)	This is ControlColor, a member of class TRibbonObsidianColorMap.
	ControlFrameColor (see page 3534)	This is ControlFrameColor, a member of class TRibbonObsidianColorMap.
	ControlInactiveColor (see page 3534)	This is ControlInactiveColor, a member of class TRibbonObsidianColorMap.
	DisabledFontColor (see page 3534)	Changes the look and feel of your applications.
	DocumentFontColor (see page 3534)	This is DocumentFontColor, a member of class TRibbonObsidianColorMap.
	FontColor (see page 3535)	Changes the look and feel of your applications.
	GroupFontColor (see page 3535)	This is GroupFontColor, a member of class TRibbonObsidianColorMap.
	HighlightColor (see page 3535)	Changes the look and feel of your applications.
	InactiveTabFontColor (see page 3535)	This is InactiveTabFontColor, a member of class TRibbonObsidianColorMap.
	QuickAccessToolbarMoreBorderColor (see page 3536)	This is QuickAccessToolbarMoreBorderColor, a member of class TRibbonObsidianColorMap.
	QuickAccessToolbarMoreColor (see page 3536)	This is QuickAccessToolbarMoreColor, a member of class TRibbonObsidianColorMap.

62.1.23.2 TRibbonObsidianColorMap Methods

The methods of the TRibbonObsidianColorMap class are listed here.

Public Methods

	Name	Description
	UpdateColors (see page 3532)	Updates an action component to reflect the current color property.

62.1.23.2.1 TRibbonObsidianColorMap.UpdateColors Method

Updates an action component to reflect the current color property.

Pascal

```
procedure UpdateColors; override;
```

C++

```
virtual __fastcall UpdateColors();
```

Description

UpdateColors is called automatically to update associated action components.

62.1.23.3 TRibbonObsidianColorMap Properties

The properties of the TRibbonObsidianColorMap class are listed here.

Published Properties

	Name	Description
	ActiveTabFontColor (see page 3532)	This is ActiveTabFontColor, a member of class TRibbonObsidianColorMap.
	BevelMinimizedInner (see page 3533)	This is BevelMinimizedInner, a member of class TRibbonObsidianColorMap.
	BevelMinimizedOuter (see page 3533)	This is BevelMinimizedOuter, a member of class TRibbonObsidianColorMap.
	BtnSelectedFont (see page 3533)	Changes the look and feel of your applications.
	CaptionFontColor (see page 3533)	This is CaptionFontColor, a member of class TRibbonObsidianColorMap.
	ControlColor (see page 3533)	This is ControlColor, a member of class TRibbonObsidianColorMap.
	ControlFrameColor (see page 3534)	This is ControlFrameColor, a member of class TRibbonObsidianColorMap.
	ControlInactiveColor (see page 3534)	This is ControlInactiveColor, a member of class TRibbonObsidianColorMap.
	DisabledFontColor (see page 3534)	Changes the look and feel of your applications.
	DocumentFontColor (see page 3534)	This is DocumentFontColor, a member of class TRibbonObsidianColorMap.
	FontColor (see page 3535)	Changes the look and feel of your applications.
	GroupFontColor (see page 3535)	This is GroupFontColor, a member of class TRibbonObsidianColorMap.
	HighlightColor (see page 3535)	Changes the look and feel of your applications.
	InactiveTabFontColor (see page 3535)	This is InactiveTabFontColor, a member of class TRibbonObsidianColorMap.
	QuickAccessToolbarMoreBorderColor (see page 3536)	This is QuickAccessToolbarMoreBorderColor, a member of class TRibbonObsidianColorMap.
	QuickAccessToolbarMoreColor (see page 3536)	This is QuickAccessToolbarMoreColor, a member of class TRibbonObsidianColorMap.

62.1.23.3.1 TRibbonObsidianColorMap.ActiveTabFontColor Property

Pascal

```
property ActiveTabFontColor: TColor;
```

C++

```
__property TColor ActiveTabFontColor;
```

Description

This is ActiveTabFontColor, a member of class TRibbonObsidianColorMap.

62.1.23.3.2 TRibbonObsidianColorMap.BevelMinimizedInner Property

Pascal

```
property BevelMinimizedInner: TColor;
```

C++

```
__property TColor BevelMinimizedInner;
```

Description

This is BevelMinimizedInner, a member of class TRibbonObsidianColorMap.

62.1.23.3.3 TRibbonObsidianColorMap.BevelMinimizedOuter Property

Pascal

```
property BevelMinimizedOuter: TColor;
```

C++

```
__property TColor BevelMinimizedOuter;
```

Description

This is BevelMinimizedOuter, a member of class TRibbonObsidianColorMap.

62.1.23.3.4 TRibbonObsidianColorMap.BtnSelectedFont Property

Changes the look and feel of your applications.

Pascal

```
property BtnSelectedFont;
```

C++

```
__property BtnSelectedFont;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

62.1.23.3.5 TRibbonObsidianColorMap.CaptionFontColor Property

Pascal

```
property CaptionFontColor: TColor;
```

C++

```
__property TColor CaptionFontColor;
```

Description

This is CaptionFontColor, a member of class TRibbonObsidianColorMap.

62.1.23.3.6 TRibbonObsidianColorMap.ControlColor Property

Pascal

```
property ControlColor: TColor;
```

C++

```
__property TColor ControlColor;
```

Description

This is ControlColor, a member of class TRibbonObsidianColorMap.

62.1.23.3.7 TRibbonObsidianColorMap.ControlFrameColor Property

Pascal

```
property ControlFrameColor: TColor;
```

C++

```
__property TColor ControlFrameColor;
```

Description

This is ControlFrameColor, a member of class TRibbonObsidianColorMap.

62.1.23.3.8 TRibbonObsidianColorMap.ControlInactiveColor Property

Pascal

```
property ControlInactiveColor: TColor;
```

C++

```
__property TColor ControlInactiveColor;
```

Description

This is ControlInactiveColor, a member of class TRibbonObsidianColorMap.

62.1.23.3.9 TRibbonObsidianColorMap.DisabledFontColor Property

Changes the look and feel of your applications.

Pascal

```
property DisabledFontColor;
```

C++

```
__property DisabledFontColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

62.1.23.3.10 TRibbonObsidianColorMap.DocumentFontColor Property

Pascal

```
property DocumentFontColor: TColor;
```

C++

```
__property TColor DocumentFontColor;
```

Description

This is DocumentFontColor, a member of class TRibbonObsidianColorMap.

62.1.23.3.11 TRibbonObsidianColorMap.FontColor Property

Changes the look and feel of your applications.

Pascal

```
property FontColor;
```

C++

```
__property FontColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

62.1.23.3.12 TRibbonObsidianColorMap.GroupFontColor Property

Pascal

```
property GroupFontColor: TColor;
```

C++

```
__property TColor GroupFontColor;
```

Description

This is GroupFontColor, a member of class TRibbonObsidianColorMap.

62.1.23.3.13 TRibbonObsidianColorMap.HighlightColor Property

Changes the look and feel of your applications.

Pascal

```
property HighlightColor;
```

C++

```
__property HighlightColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

62.1.23.3.14 TRibbonObsidianColorMap.InactiveTabFontColor Property

Pascal

```
property InactiveTabFontColor: TColor;
```

C++

```
__property TColor InactiveTabFontColor;
```

Description

This is InactiveTabFontColor, a member of class TRibbonObsidianColorMap.

62.1.23.3.15 TRibbonObsidianColorMap.QuickAccessToolbarMoreBorderColor Property

Pascal

```
property QuickAccessToolbarMoreBorderColor: TColor;
```

C++

```
__property TColor QuickAccessToolbarMoreBorderColor;
```

Description

This is QuickAccessToolbarMoreBorderColor, a member of class TRibbonObsidianColorMap.

62.1.23.3.16 TRibbonObsidianColorMap.QuickAccessToolbarMoreColor Property

Pascal

```
property QuickAccessToolbarMoreColor: TColor;
```

C++

```
__property TColor QuickAccessToolbarMoreColor;
```

Description

This is QuickAccessToolbarMoreColor, a member of class TRibbonObsidianColorMap.

62.1.24 TRibbonPage Class

Tab page for ribbon control.

Class Hierarchy

Pascal

```
TRibbonPage = class(TCustomRibbonPage);
```

C++

```
class TRibbonPage : public TCustomRibbonPage;
```

File

Ribbon

Description

TRibbonPage is a TCustomRibbonPage (see page 3425) tab page for the ribbon control that holds the groups of controls displayed.

62.1.24.1 TRibbonPage Members

The following tables list the members exposed by TRibbonPage.

Protected Methods

	Name	Description
	CMControlListChanging (see page 3429)	This is CMControlListChanging, a member of class TCustomRibbonPage.
	CMTextchanged (see page 3429)	This is CMTextchanged, a member of class TCustomRibbonPage.
V	CreateScrollButton (see page 3430)	This is CreateScrollButton, a member of class TCustomRibbonPage.
V	DoScrollButtonClick (see page 3430)	This is DoScrollButtonClick, a member of class TCustomRibbonPage.
	GetPageHeight (see page 3431)	This is GetPageHeight, a member of class TCustomRibbonPage.
	GetPageTop (see page 3431)	This is GetPageTop, a member of class TCustomRibbonPage.
V	Loaded (see page 3432)	Initializes the control after it is loaded from a stream.
V	Notification (see page 3433)	Responds to notifications that components are being created or destroyed.
V	Paint (see page 3433)	Renders the image of a custom control.
V	RequestAlign (see page 3434)	Instructs the parent of a control to reposition the control, enforcing its Align property.
V	Resize (see page 3434)	Respond to control resize.
V	SetParent (see page 3435)	Sets the parent of the control.
	UpdateScrollButtons (see page 3436)	This is UpdateScrollButtons, a member of class TCustomRibbonPage.

Protected Properties

	Name	Description
	GroupOffset (see page 3437)	This is GroupOffset, a member of class TCustomRibbonPage.

Public Constants

	Name	Description
	cRibbonGroupLeftOffset (see page 3428)	This is cRibbonGroupLeftOffset, a member of class TCustomRibbonPage.
	cRibbonGroupSpacing (see page 3428)	This is cRibbonGroupSpacing, a member of class TCustomRibbonPage.

Public Methods

	Name	Description
	AddGroup (see page 3429)	This is AddGroup, a member of class TCustomRibbonPage.
	AlignGroups (see page 3429)	This is AlignGroups, a member of class TCustomRibbonPage.
	CollapseGroup (see page 3430)	This is CollapseGroup, a member of class TCustomRibbonPage.
V	Create (see page 3426)	Creates an instance of TCustomControl.
V	Destroy (see page 3427)	Destroys an instance of TCustomControl.
	FindGroup (see page 3430)	This is FindGroup, a member of class TCustomRibbonPage.
	FindGroupAt (see page 3430)	This is FindGroupAt, a member of class TCustomRibbonPage.
	GetGroupPos (see page 3431)	This is GetGroupPos, a member of class TCustomRibbonPage.
	GetNextVisibleGroup (see page 3431)	This is GetNextVisibleGroup, a member of class TCustomRibbonPage.
	HandleKeyTips (see page 3432)	This is HandleKeyTips, a member of class TCustomRibbonPage.
	HideKeyTips (see page 3432)	This is HideKeyTips, a member of class TCustomRibbonPage.
V	Invalidate (see page 3432)	Schedules a control repaint.
	RibbonStyle (see page 3434)	Return style class to use when drawing specific Ribbon (see page 3438) elements.
V	SetBounds (see page 3435)	Sets the windowed control's boundary properties all at once.
	ShowKeyTips (see page 3436)	This is ShowKeyTips, a member of class TCustomRibbonPage.
	UpdateActionManager (see page 3436)	This is UpdateActionManager, a member of class TCustomRibbonPage.

Public Properties

	Name	Description
R	CollapseGroupCount (see page 3437)	This is CollapseGroupCount, a member of class TCustomRibbonPage.
R	GroupCount (see page 3437)	This is GroupCount, a member of class TCustomRibbonPage.

R	Groups (see page 3437)	This is Groups, a member of class TCustomRibbonPage.
	Ribbon (see page 3438)	This is Ribbon, a member of class TCustomRibbonPage.

Published Properties

	Name	Description
	BiDiMode (see page 3538)	Specifies the bi-directional mode for the control.
	Caption (see page 3539)	Specifies a text string that identifies the control to the user.
	Height (see page 3541)	Specifies the vertical size of the control in pixels.
	Index (see page 3542)	This is Index, a member of class TRibbonPage.
	KeyTip (see page 3543)	This is KeyTip, a member of class TRibbonPage.
	Name (see page 3543)	Specifies the name of the component as referenced in code.
	ParentBiDiMode (see page 3545)	Specifies whether the control uses its parent's BiDiMode.

62.1.24.2 TRibbonPage Properties

The properties of the TRibbonPage class are listed here.

Published Properties

	Name	Description
	BiDiMode (see page 3538)	Specifies the bi-directional mode for the control.
	Caption (see page 3539)	Specifies a text string that identifies the control to the user.
	Height (see page 3541)	Specifies the vertical size of the control in pixels.
	Index (see page 3542)	This is Index, a member of class TRibbonPage.
	KeyTip (see page 3543)	This is KeyTip, a member of class TRibbonPage.
	Name (see page 3543)	Specifies the name of the component as referenced in code.
	ParentBiDiMode (see page 3545)	Specifies whether the control uses its parent's BiDiMode.

62.1.24.2.1 TRibbonPage.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode;
```

C++

```
__property BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

UseRightToLeftAlignment

UseRightToLeftReading

UseRightToLeftScrollBar

Including Bi-directional Functionality in Applications

62.1.24.2.2 TRibbonPage.Caption Property

Specifies a text string that identifies the control to the user.

Pascal

```
property Caption;
```

C++

```
__property Caption;
```

Description

Use Caption to specify the text string that labels the control.

To underline a character in a Caption that labels a component, include an ampersand (&) before the character. This type of character is called an accelerator character. The user can then select the component by pressing Alt while typing the underlined character. To display an ampersand character in the caption, use two ampersands (&&).

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

Note: The Caption property inheritted from TControl is a protected property. Access to the Caption requires casting the class to an inheritted one where Caption is a published or public property.

C++ Examples:

```
/*
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Label1->AutoSize = false;
  Label1->Caption = "This string is too long to be the caption of this label";
}
/*
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would make a TTabSheet variable unnecessary since
PageControl1.->ActivePage is already of type TTabSheet.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TTabSheet *sheet = PageControl1->ActivePage;
  sheet->Caption = Edit1->Text;
}
/*
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
*/
#include <comctrls.hpp>
#include <memory>
```

```
void AddButtons(TToolBar *toolBar, TStringList *captions)
{
  for (int i = 0; i < captions->Count; i++)
  {
    TToolButton *button = new TToolButton(toolBar);  // The owner (toolBar) will clean this up.
    button->Parent = toolBar;
    button->Caption = captions->Strings[i];
    if (button->Caption == "|")
      button->Style = tbsSeparator;
    else
      button->Style = tbsButton;
  }
}

TToolBar *myToolBar;

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  myToolBar = new TToolBar(this); // The owner (this) will clean this up.
  myToolBar->Parent = this;
//  TStringList *captions = new TStringList();
  std::auto_ptr<TStringList> captions(new TStringList());

  captions->Add("New");
  captions->Add("Save");
  captions->Add("|");
  captions->Add("Cut");
  captions->Add("Copy");
  captions->Add("Paste");
  AddButtons(myToolBar, captions.get());
//  delete captions;
  myToolBar->ShowCaptions = True;
  myToolBar->Height = 40;
}
```

Delphi Examples:

```
{
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Label1.AutoSize := False;
  Label1.Caption :=
    'This string is too long to be the caption of this label';
end;
{
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would obviate the need for a TTabSheet variable since
PageControl1.->ActivePage is already of type TTabSheet.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  sheet: TTabSheet;
begin
  sheet := PageControl1.ActivePage;
  sheet.Caption := Edit1.Text;
end;
```

```
{
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
}
procedure AddButtons(ToolBar: TToolBar;
  Const ButtonCaptions: array of String);
var
  I: Integer;
begin
  for I := 0 to High(ButtonCaptions) do
    begin
      with TToolButton.Create(ToolBar) do
      begin
        Parent := ToolBar;
        Caption := ButtonCaptions[I];
        if (ButtonCaptions[I] = '|') then
          Style := tbsSeparator
        else
          Style := tbsButton;
      end;
    end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ToolBar1 := TToolBar.Create(Self);
  ToolBar1.Parent := Self;
  AddButtons(ToolBar1, ['New', 'Save', '|', 'Cut', 'Copy', 'Paste']);
  ToolBar1.ShowCaptions := True;
  ToolBar1.Height := 40;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  I: Integer;
begin
  for I := ToolBar1.ButtonCount - 1 downto 0 do
    ToolBar1.Buttons[I].Free;
  ToolBar1.Free;
end;
```

62.1.24.2.3 TRibbonPage.Height Property

Specifies the vertical size of the control in pixels.

Pascal

```
property Height;
```

C++

```
__property Height;
```

Description

Use the Height property to read or change the height of the control.

C++ Examples:

```
/*
This example needs only a blank form.  Three Rich Edit
controls are placed vertically on the form, each contain a
line of text, and the second form has HideSelection set to
false.  Try tabbing between the three Rich Edit controls and
observe the effect on the selected text.
*/
#include <ComCtrls.hpp>
```

```
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int I = 0; I <= 2; I++)
  {
    TRichEdit *pRich = new TRichEdit(this);
    pRich->Parent = this;
    pRich->Top = pRich->Height * I;
    pRich->Text = "This text will take the focus.";
    pRich->SelStart = 0;
    pRich->SelLength = pRich->Text.Length();
    if (I == 1)
      pRich->HideSelection = false;
  }
}
```

Delphi Examples:

```
{
This example needs only a blank form. Three Rich Edit
controls are placed vertically on the form, each contain a
line of text, and the second form has HideSelection set to
false.  Try tabbing between the three Rich Edit controls and
observe the effect on the selected text.
}
uses ComCtrls;

procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  for I := 0 to 2 do
    with TRichEdit.Create(Self) do
    begin
      Parent := Self;
      Top := Height * I;
      Text := 'This text will take the focus.';
      SelStart := 0;
      SelLength := Length(Text);
      if (I = 1) then
        HideSelection := False;
    end;
end;
```

62.1.24.2.4 TRibbonPage.Index Property

Pascal

```
property Index: Integer;
```

C++

```
__property int Index;
```

Description

This is Index, a member of class TRibbonPage.

62.1.24.2.5 TRibbonPage.KeyTip Property

Pascal

```
property KeyTip: string;
```

C++

```
__property UnicodeString KeyTip;
```

Description

This is KeyTip, a member of class TRibbonPage.

62.1.24.2.6 TRibbonPage.Name Property

Specifies the name of the component as referenced in code.

Pascal

```
property Name;
```

C++

```
__property Name;
```

Description

Use Name to change the name of a component to reflect its purpose in the current application. By default, the IDE assigns sequential names based on the type of the component, such as 'Button1', 'Button2', and so on.

Use Name to refer to the component in code.

Warning: Changing Name at runtime causes any references to the old name to become undefined. Any subsequent code that uses the old name will cause an exception.

C++ Examples:

```
/*
For the following example, add a button, a status bar, and a
list box to the form. Set the SimplePanel property of the
status bar to true, using the object inspector. Also, populate
the OnMouseUp event handler for the list box.  The following
code fills a list box with the names of all components on the
form when the user clicks the button. References to the
components themselves are inserted along with the names. The
components are all inserted at the front of the list, so that
the last component added to the form is the first component
in the list.  When the user right-clicks the name of an
object in the list, the component's coordinates are displayed
on the status bar. Note that because we are using the right-
click, the item need not be selected.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  for (int i = 0; i < ComponentCount; i++)
    ListBox1->Items->InsertObject(0,
                                  Components[i]->Name,
                                  dynamic_cast<TObject *>(Components[i]));
}

void __fastcall TForm1::ListBox1MouseUp(TObject *Sender, TMouseButton Button,
      TShiftState Shift, int X, int Y)
{
```

```
  if (Button == mbRight)
  {
    TClass ClassRef;
    int Index = ListBox1->ItemAtPos(Point(X,Y), true);
    // only components that are controls have a position
    // make sure the component is a control
    for (ClassRef = ListBox1->Items->Objects[Index]->ClassType();
         ClassRef != NULL;
         ClassRef = ClassRef->ClassParent())
      if (String(ClassRef->ClassName()) == "TControl")
      {
        TControl *TheObject = dynamic_cast<TControl *>(ListBox1->Items->Objects[Index]);
        StatusBar1->SimpleText =
          TheObject->Name + " is at (" +
          IntToStr(TheObject->Left) + ", " +
          IntToStr(TheObject->Top) + ")";
        break;
      }
    if (ClassRef == NULL) // if it wasn't a control
      MessageBeep(0);
  }
}
```

Delphi Examples:

```
{
For the following example, add a button, a status bar, and a
list box to the form. Set the SimplePanel property of the
status bar to true, using the object inspector. Also, populate
the OnMouseUp event handler for the list box.  The following
code fills a list box with the names of all components on the
form when the user clicks the button. References to the
components themselves are inserted along with the names. The
components are all inserted at the front of the list, so that
the last component added to the form is the first component
in the list.  When the user right-clicks the name of an
object in the list, the component's coordinates are displayed
on the status bar. Note that because we are using the right-
click, the item need not be selected.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I: Integer;
begin
  for I := 0 to Form1.ComponentCount-1 do
    ListBox1.Items.InsertObject(
      0, Form1.Components[I].Name,
      Form1.Components[I] as TObject);
end;

procedure TForm1.ListBox1MouseUp(
  Sender: TObject; Button: TMouseButton;
  Shift: TShiftState; X,Y: integer);
var
  APoint: TPoint;
  Index: integer;
  TheObject: TControl;
begin
  if Button = mbRight then
  begin
  APoint.X := X;
  APoint.Y := Y;
  Index := ListBox1.ItemAtPos(APoint, True);
  if (ListBox1.Items.Objects[Index] is TControl) then
  begin
    TheObject :=
      (ListBox1.Items.Objects[Index] as TControl);
```

```
      StatusBar1.SimpleText := TheObject.Name + ' is at (' +
                               IntToStr(TheObject.Left) + ', ' +
                               IntToStr(TheObject.Top) + ') ';
    end
    else
      Beep;
    end;
  end;
```

62.1.24.2.7 TRibbonPage.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode;
```

C++

```
__property ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

62.1.25 TRibbonQuickAccessPopupToolbar Class

Class Hierarchy

Pascal

```
TRibbonQuickAccessPopupToolbar = class(TCustomRibbonQuickAccessPopupToolbar);
```

C++

```
class TRibbonQuickAccessPopupToolbar : public TCustomRibbonQuickAccessPopupToolbar;
```

File

Ribbon

Description

This is class Ribbon.TRibbonQuickAccessPopupToolbar.

62.1.26 TRibbonQuickAccessToolbar Class

Quck Access Toolbar.

Class Hierarchy

Pascal

```
TRibbonQuickAccessToolbar = class(TCustomRibbonQuickAccessToolbar);
```

C++

```
class TRibbonQuickAccessToolbar : public TCustomRibbonQuickAccessToolbar;
```

File

Ribbon

Description

TRibbonQuickAccessToolbar is a TCustomRibbonQuickAccessToolbar (see page 3441) Quck Access Toolbar implementation.

62.1.26.1 TRibbonQuickAccessToolbar Members

The following tables list the members exposed by TRibbonQuickAccessToolbar.

Protected Methods

	Name	Description
	CMFontchanged (see page 3445)	This is CMFontchanged, a member of class TCustomRibbonQuickAccessToolbar.
	CreateControls (see page 3446)	This is CreateControls, a member of class TCustomRibbonQuickAccessToolbar.
	DoContextPopup (see page 3446)	OnContextPopup event dispatcher.
	DoDropActions (see page 3446)	This is DoDropActions, a member of class TCustomRibbonQuickAccessToolbar.
	DoDropItem (see page 3447)	This is DoDropItem, a member of class TCustomRibbonQuickAccessToolbar.
	DoMoreCommands (see page 3447)	This is DoMoreCommands, a member of class TCustomRibbonQuickAccessToolbar.

	DoScrollBtnClick (see page 3447)	This is DoScrollBtnClick, a member of class TCustomRibbonQuickAccessToolbar.
	DrawBackground (see page 3448)	This is DrawBackground, a member of class TCustomRibbonQuickAccessToolbar.
	GetBarHeight (see page 3448)	This is GetBarHeight, a member of class TCustomRibbonQuickAccessToolbar.
	GetBarWidth (see page 3449)	This is GetBarWidth, a member of class TCustomRibbonQuickAccessToolbar.
	GetScrollBtnClass (see page 3449)	This is GetScrollBtnClass, a member of class TCustomRibbonQuickAccessToolbar.
	Notification (see page 3449)	Responds to notifications that components are being created or destroyed.
	RequestAlign (see page 3450)	Instructs the parent of a control to reposition the control, enforcing its Align property.
	SetParent (see page 3450)	Sets the parent of the control.
	SetupDropDownBtn (see page 3451)	This is SetupDropDownBtn, a member of class TCustomRibbonQuickAccessToolbar.
	ShowCustomizeMenu (see page 3451)	This is ShowCustomizeMenu, a member of class TCustomRibbonQuickAccessToolbar.
	ShowMoreControls (see page 3451)	This is ShowMoreControls, a member of class TCustomRibbonQuickAccessToolbar.
	UpdateQATWidth (see page 3451)	This is UpdateQATWidth, a member of class TCustomRibbonQuickAccessToolbar.

Public Methods

	Name	Description
	BarHandleKeyTips (see page 3444)	Check if any commands on Action Bar are partial or full match for **KeyTip**.
	BarHandleKeyTips (see page 3913)	Check if any commands on Action Bar are partial or full match for **KeyTip**.
	BarHideKeyTips (see page 3444)	Hide any visible **KeyTip** windows.
	BarHideKeyTips (see page 3913)	Hide any visible **KeyTip** windows.
	BarShowKeyTips (see page 3445)	Show **KeyTip**s for any commands that support them.
	BarShowKeyTips (see page 3914)	Show **KeyTip**s for any commands that support them.
	Create (see page 3443)	Creates and initializes a TCustomActionToolBar instance.
	CreateControl (see page 3445)	This is CreateControl, a member of class TCustomRibbonQuickAccessToolbar.
	Customize (see page 3446)	This is Customize, a member of class TCustomRibbonQuickAccessToolbar.
	DoDropCategory (see page 3447)	This is DoDropCategory, a member of class TCustomRibbonQuickAccessToolbar.
	DoUpdateQATWidth (see page 3570)	This is DoUpdateQATWidth, a member of class IRibbonQuickAccessToolbar.
	DoUpdateQATWidth (see page 3448)	This is DoUpdateQATWidth, a member of class TCustomRibbonQuickAccessToolbar.
	DragDrop (see page 3448)	Generates an OnDragDrop event.

Public Nested Types

Name	Description
TMoreCommandsEvent (see page 3453)	This is nested type Ribbon.TCustomRibbonQuickAccessToolbar.TMoreCommandsEvent.

Public Properties

	Name	Description
	Items (see page 3452)	Lists the action clients that correspond to the child controls of this action band.
	Ribbon (see page 3452)	This is Ribbon, a member of class TCustomRibbonQuickAccessToolbar.
	ScrollMode (see page 3453)	This is ScrollMode, a member of class TCustomRibbonQuickAccessToolbar.
	ShowBorder (see page 3453)	This is ShowBorder, a member of class TCustomRibbonQuickAccessToolbar.

Published Properties

	Name	Description
	ActionManager (see page 3548)	Specifies the action manager component that is associated with the action band.
	OnMoreCommands (see page 3548)	This is OnMoreCommands, a member of class TRibbonQuickAccessToolbar.
	VertMargin (see page 3548)	Specifies the width of the vertical margins in pixels.

62.1.26.2 TRibbonQuickAccessToolbar Properties

The properties of the TRibbonQuickAccessToolbar class are listed here.

Published Properties

	Name	Description
	ActionManager (see page 3548)	Specifies the action manager component that is associated with the action band.
	OnMoreCommands (see page 3548)	This is OnMoreCommands, a member of class TRibbonQuickAccessToolbar.
	VertMargin (see page 3548)	Specifies the width of the vertical margins in pixels.

62.1.26.2.1 TRibbonQuickAccessToolbar.ActionManager Property

Specifies the action manager component that is associated with the action band.

Pascal

```
property ActionManager;
```

C++

```
__property ActionManager;
```

Description

Use ActionManager to access the action manager that uses this action band to render UI elements it manages. Typically, this association is created when you drag actions from the action manager and drop them on the action bar. When an action is dropped on an action band and the ActionManager property is not assigned, the ActionManager property is automatically assigned to the action manager that manages the action that was dropped on the action band.

At runtime, you can perform the equivalent operation to dragging an action onto the action band by setting the ActionBar property of one of the action clients that the action manager's ActionBars property lists so that it specifies this component.

62.1.26.2.2 TRibbonQuickAccessToolbar.OnMoreCommands Property

Pascal

```
property OnMoreCommands: TMoreCommandsEvent;
```

C++

```
__property TMoreCommandsEvent OnMoreCommands;
```

Description

This is OnMoreCommands, a member of class TRibbonQuickAccessToolbar.

62.1.26.2.3 TRibbonQuickAccessToolbar.VertMargin Property

Specifies the width of the vertical margins in pixels.

Pascal

```
property VertMargin;
```

C++

```
__property VertMargin;
```

Description

VertMargin specifies the width of the action band's top and bottom vertical margins in pixels.

62.1.27.1 TRibbonSilverColorMap Members

The following tables list the members exposed by TRibbonSilverColorMap.

Public Methods

	Name	Description
	UpdateColors (see page 3550)	Updates an action component to reflect the current color property.

Published Properties

	Name	Description
	ActiveTabFontColor (see page 3551)	This is ActiveTabFontColor, a member of class TRibbonSilverColorMap.
	BevelMinimizedInner (see page 3551)	This is BevelMinimizedInner, a member of class TRibbonSilverColorMap.
	BevelMinimizedOuter (see page 3551)	This is BevelMinimizedOuter, a member of class TRibbonSilverColorMap.

	BtnSelectedFont (see page 3551)	Changes the look and feel of your applications.
	CaptionFontColor (see page 3552)	This is CaptionFontColor, a member of class TRibbonSilverColorMap.
	ControlColor (see page 3552)	This is ControlColor, a member of class TRibbonSilverColorMap.
	ControlFrameColor (see page 3552)	This is ControlFrameColor, a member of class TRibbonSilverColorMap.
	ControlInactiveColor (see page 3552)	This is ControlInactiveColor, a member of class TRibbonSilverColorMap.
	DisabledFontColor (see page 3553)	Changes the look and feel of your applications.
	DocumentFontColor (see page 3553)	This is DocumentFontColor, a member of class TRibbonSilverColorMap.
	FontColor (see page 3553)	Changes the look and feel of your applications.
	GroupFontColor (see page 3553)	This is GroupFontColor, a member of class TRibbonSilverColorMap.
	HighlightColor (see page 3554)	Changes the look and feel of your applications.
	InactiveTabFontColor (see page 3554)	This is InactiveTabFontColor, a member of class TRibbonSilverColorMap.
	QuickAccessToolbarMoreBorderColor (see page 3554)	This is QuickAccessToolbarMoreBorderColor, a member of class TRibbonSilverColorMap.
	QuickAccessToolbarMoreColor (see page 3554)	This is QuickAccessToolbarMoreColor, a member of class TRibbonSilverColorMap.

62.1.27.2 TRibbonSilverColorMap Methods

The methods of the TRibbonSilverColorMap class are listed here.

Public Methods

	Name	Description
	UpdateColors (see page 3550)	Updates an action component to reflect the current color property.

62.1.27.2.1 TRibbonSilverColorMap.UpdateColors Method

Updates an action component to reflect the current color property.

Pascal

```
procedure UpdateColors; override;
```

C++

```
virtual __fastcall UpdateColors();
```

Description

UpdateColors is called automatically to update associated action components.

62.1.27.3 TRibbonSilverColorMap Properties

The properties of the TRibbonSilverColorMap class are listed here.

Published Properties

	Name	Description
	ActiveTabFontColor (see page 3551)	This is ActiveTabFontColor, a member of class TRibbonSilverColorMap.
	BevelMinimizedInner (see page 3551)	This is BevelMinimizedInner, a member of class TRibbonSilverColorMap.
	BevelMinimizedOuter (see page 3551)	This is BevelMinimizedOuter, a member of class TRibbonSilverColorMap.
	BtnSelectedFont (see page 3551)	Changes the look and feel of your applications.
	CaptionFontColor (see page 3552)	This is CaptionFontColor, a member of class TRibbonSilverColorMap.
	ControlColor (see page 3552)	This is ControlColor, a member of class TRibbonSilverColorMap.
	ControlFrameColor (see page 3552)	This is ControlFrameColor, a member of class TRibbonSilverColorMap.
	ControlInactiveColor (see page 3552)	This is ControlInactiveColor, a member of class TRibbonSilverColorMap.
	DisabledFontColor (see page 3553)	Changes the look and feel of your applications.

	DocumentFontColor (see page 3553)	This is DocumentFontColor, a member of class TRibbonSilverColorMap.
	FontColor (see page 3553)	Changes the look and feel of your applications.
	GroupFontColor (see page 3553)	This is GroupFontColor, a member of class TRibbonSilverColorMap.
	HighlightColor (see page 3554)	Changes the look and feel of your applications.
	InactiveTabFontColor (see page 3554)	This is InactiveTabFontColor, a member of class TRibbonSilverColorMap.
	QuickAccessToolbarMoreBorderColor (see page 3554)	This is QuickAccessToolbarMoreBorderColor, a member of class TRibbonSilverColorMap.
	QuickAccessToolbarMoreColor (see page 3554)	This is QuickAccessToolbarMoreColor, a member of class TRibbonSilverColorMap.

62.1.27.3.1 TRibbonSilverColorMap.ActiveTabFontColor Property

Pascal

```
property ActiveTabFontColor: TColor;
```

C++

```
__property TColor ActiveTabFontColor;
```

Description

This is ActiveTabFontColor, a member of class TRibbonSilverColorMap.

62.1.27.3.2 TRibbonSilverColorMap.BevelMinimizedInner Property

Pascal

```
property BevelMinimizedInner: TColor;
```

C++

```
__property TColor BevelMinimizedInner;
```

Description

This is BevelMinimizedInner, a member of class TRibbonSilverColorMap.

62.1.27.3.3 TRibbonSilverColorMap.BevelMinimizedOuter Property

Pascal

```
property BevelMinimizedOuter: TColor;
```

C++

```
__property TColor BevelMinimizedOuter;
```

Description

This is BevelMinimizedOuter, a member of class TRibbonSilverColorMap.

62.1.27.3.4 TRibbonSilverColorMap.BtnSelectedFont Property

Changes the look and feel of your applications.

Pascal

```
property BtnSelectedFont;
```

C++

```
__property BtnSelectedFont;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

62.1.27.3.5 TRibbonSilverColorMap.CaptionFontColor Property

Pascal

```
property CaptionFontColor: TColor;
```

C++

```
__property TColor CaptionFontColor;
```

Description

This is CaptionFontColor, a member of class TRibbonSilverColorMap.

62.1.27.3.6 TRibbonSilverColorMap.ControlColor Property

Pascal

```
property ControlColor: TColor;
```

C++

```
__property TColor ControlColor;
```

Description

This is ControlColor, a member of class TRibbonSilverColorMap.

62.1.27.3.7 TRibbonSilverColorMap.ControlFrameColor Property

Pascal

```
property ControlFrameColor: TColor;
```

C++

```
__property TColor ControlFrameColor;
```

Description

This is ControlFrameColor, a member of class TRibbonSilverColorMap.

62.1.27.3.8 TRibbonSilverColorMap.ControlInactiveColor Property

Pascal

```
property ControlInactiveColor: TColor;
```

C++

```
__property TColor ControlInactiveColor;
```

Description

This is ControlInactiveColor, a member of class TRibbonSilverColorMap.

62.1.27.3.9 TRibbonSilverColorMap.DisabledFontColor Property

Changes the look and feel of your applications.

Pascal

```
property DisabledFontColor;
```

C++

```
__property DisabledFontColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

62.1.27.3.10 TRibbonSilverColorMap.DocumentFontColor Property

Pascal

```
property DocumentFontColor: TColor;
```

C++

```
__property TColor DocumentFontColor;
```

Description

This is DocumentFontColor, a member of class TRibbonSilverColorMap.

62.1.27.3.11 TRibbonSilverColorMap.FontColor Property

Changes the look and feel of your applications.

Pascal

```
property FontColor;
```

C++

```
__property FontColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

62.1.27.3.12 TRibbonSilverColorMap.GroupFontColor Property

Pascal

```
property GroupFontColor: TColor;
```

C++

```
__property TColor GroupFontColor;
```

Description

This is GroupFontColor, a member of class TRibbonSilverColorMap.

62.1.27.3.13 TRibbonSilverColorMap.HighlightColor Property

Changes the look and feel of your applications.

Pascal

```
property HighlightColor;
```

C++

```
__property HighlightColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

62.1.27.3.14 TRibbonSilverColorMap.InactiveTabFontColor Property

Pascal

```
property InactiveTabFontColor: TColor;
```

C++

```
__property TColor InactiveTabFontColor;
```

Description

This is InactiveTabFontColor, a member of class TRibbonSilverColorMap.

62.1.27.3.15 TRibbonSilverColorMap.QuickAccessToolbarMoreBorderColor Property

Pascal

```
property QuickAccessToolbarMoreBorderColor: TColor;
```

C++

```
__property TColor QuickAccessToolbarMoreBorderColor;
```

Description

This is QuickAccessToolbarMoreBorderColor, a member of class TRibbonSilverColorMap.

62.1.27.3.16 TRibbonSilverColorMap.QuickAccessToolbarMoreColor Property

Pascal

```
property QuickAccessToolbarMoreColor: TColor;
```

C++

```
__property TColor QuickAccessToolbarMoreColor;
```

Description

This is QuickAccessToolbarMoreColor, a member of class TRibbonSilverColorMap.

62.1.28 TRibbonTabItem Class

Class Hierarchy

Pascal

```
TRibbonTabItem = class(TCollectionItem);
```

C++

```
class TRibbonTabItem : public TCollectionItem;
```

File

Ribbon

Description

This is class Ribbon.TRibbonTabItem.

62.1.28.1 TRibbonTabItem Members

The following tables list the members exposed by TRibbonTabItem.

Protected Methods

	Name	Description
	GetDisplayName (see page 3557)	Returns the name of the collection item as it appears in the collection editor.

Public Methods

	Name	Description
	Assign (see page 3556)	Copies the contents of another, similar object.
	Destroy (see page 3555)	Destroys the TCollectionItem instance and frees its memory.

Public Properties

	Name	Description
	BestTabWidth (see page 3558)	This is BestTabWidth, a member of class TRibbonTabItem.
	KeyTipForm (see page 3558)	This is KeyTipForm, a member of class TRibbonTabItem.
	MinTabwidth (see page 3558)	This is MinTabwidth, a member of class TRibbonTabItem.
	MinTruncatedWidth (see page 3559)	This is MinTruncatedWidth, a member of class TRibbonTabItem.
	Modified (see page 3559)	This is Modified, a member of class TRibbonTabItem.
	X (see page 3559)	This is X, a member of class TRibbonTabItem.
	Y (see page 3560)	This is Y, a member of class TRibbonTabItem.

Published Properties

	Name	Description
	Caption (see page 3558)	This is Caption, a member of class TRibbonTabItem.
	KeyTip (see page 3558)	This is KeyTip, a member of class TRibbonTabItem.
	Page (see page 3559)	This is Page, a member of class TRibbonTabItem.

62.1.28.2 TRibbonTabItem.Destroy Destructor

Destroys the TCollectionItem instance and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRibbonTabItem();
```

Description

Destroy is called indirectly by TCollection's Clear or Delete method.

See Also

Clear

Delete

System::TObject::Free

62.1.28.3 TRibbonTabItem Methods

The methods of the TRibbonTabItem class are listed here.

Protected Methods

	Name	Description
	GetDisplayName (see page 3557)	Returns the name of the collection item as it appears in the collection editor.

Public Methods

	Name	Description
	Assign (see page 3556)	Copies the contents of another, similar object.

62.1.28.3.1 TRibbonTabItem.Assign Method

Copies the contents of another, similar object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy the properties or other attributes of one object from another. The standard form of a call to Assign is

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

which tells the Destination object to copy the contents of the Source object to itself.

Most objects override Assign to handle the assignment of properties from similar objects. When overriding Assign, call the inherited method if the destination object can't handle the assignment of properties from the class of the Source parameter.

If no overridden Assign method can handle the assignment of properties from Source, the method implemented in TPersistent calls the source object's AssignTo method. This allows the source object to handle the assignment. If the Source object is nil (Delphi) or NULL (C++), Assign raises an EConvertError exception.

In general, the statement

```
Destination := Source; {Delphi}
Destination = Source; // C++
```

is not the same as the statement

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

The assignment operator makes Destination reference the same object as Source, whereas the Assign method copies the contents of the object referenced by Source into the object referenced by Destination.

Note: The types of some properties are also objects. If these properties have write methods that use Assign to set the value of the property, then in these cases the assignment operator does the same thing as the Assign method.

AssignTo

EConvertError

62.1.28.3.2 TRibbonTabItem.GetDisplayName Method

Returns the name of the collection item as it appears in the collection editor.

Pascal

```
function GetDisplayName: string; override;
```

C++

```
virtual __fastcall UnicodeString GetDisplayName();
```

Description

GetDisplayName is the protected read implementation of the DisplayName property.

GetNamePath

62.1.28.4 TRibbonTabItem Properties

The properties of the TRibbonTabItem class are listed here.

Public Properties

	Name	Description
R	BestTabWidth (see page 3558)	This is BestTabWidth, a member of class TRibbonTabItem.
	KeyTipForm (see page 3558)	This is KeyTipForm, a member of class TRibbonTabItem.
R	MinTabwidth (see page 3558)	This is MinTabwidth, a member of class TRibbonTabItem.
R	MinTruncatedWidth (see page 3559)	This is MinTruncatedWidth, a member of class TRibbonTabItem.
	Modified (see page 3559)	This is Modified, a member of class TRibbonTabItem.
	X (see page 3559)	This is X, a member of class TRibbonTabItem.
	Y (see page 3560)	This is Y, a member of class TRibbonTabItem.

Published Properties

	Name	Description
	Caption (see page 3558)	This is Caption, a member of class TRibbonTabItem.
	KeyTip (see page 3558)	This is KeyTip, a member of class TRibbonTabItem.
	Page (see page 3559)	This is Page, a member of class TRibbonTabItem.

62.1.28.4.1 TRibbonTabItem.BestTabWidth Property

Pascal

```
property BestTabWidth: Integer;
```

C++

```
__property int BestTabWidth;
```

Description

This is BestTabWidth, a member of class TRibbonTabItem.

62.1.28.4.2 TRibbonTabItem.Caption Property

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

This is Caption, a member of class TRibbonTabItem.

62.1.28.4.3 TRibbonTabItem.KeyTip Property

Pascal

```
property KeyTip: string;
```

C++

```
__property UnicodeString KeyTip;
```

Description

This is KeyTip, a member of class TRibbonTabItem.

62.1.28.4.4 TRibbonTabItem.KeyTipForm Property

Pascal

```
property KeyTipForm: TCustomControl;
```

C++

```
__property TCustomControl KeyTipForm;
```

Description

This is KeyTipForm, a member of class TRibbonTabItem.

62.1.28.4.5 TRibbonTabItem.MinTabwidth Property

Pascal

```
property MinTabwidth: Integer;
```

C++

```
__property int MinTabwidth;
```

Description

This is MinTabwidth, a member of class TRibbonTabItem.

62.1.28.4.6 TRibbonTabItem.MinTruncatedWidth Property

Pascal

```
property MinTruncatedWidth: Integer;
```

C++

```
__property int MinTruncatedWidth;
```

Description

This is MinTruncatedWidth, a member of class TRibbonTabItem.

62.1.28.4.7 TRibbonTabItem.Modified Property

Pascal

```
property Modified: Boolean;
```

C++

```
__property Boolean Modified;
```

Description

This is Modified, a member of class TRibbonTabItem.

62.1.28.4.8 TRibbonTabItem.Page Property

Pascal

```
property Page: TCustomRibbonPage;
```

C++

```
__property TCustomRibbonPage Page;
```

Description

This is Page, a member of class TRibbonTabItem.

62.1.28.4.9 TRibbonTabItem.X Property

Pascal

```
property X: Integer;
```

C++

```
__property int X;
```

Description

This is X, a member of class TRibbonTabItem.

62.1.28.4.10 TRibbonTabItem.Y Property

Pascal

```
property Y: Integer;
```

C++

```
__property int Y;
```

Description

This is Y, a member of class TRibbonTabItem.

62.1.29 TRibbonTabs Class

Collection of information about ribbon pages.

Class Hierarchy

Pascal

```
TRibbonTabs = class(TOwnedCollection);
```

C++

```
class TRibbonTabs : public TOwnedCollection;
```

File

Ribbon

Description

TRibbonTabs is a collection that maintains information about ribbon pages, their captions and keytip values.

The ribbon control can support many user selectable tabs. The TRibbonTabs object stores all tabs and tab specific values associated with the tab. TRibbonTabs also performs the calculations needed to determine if the tabs can fit in the user displayed area and, if not, performs the resizing of the tabs.

62.1.29.1 TRibbonTabs Members

The following tables list the members exposed by TRibbonTabs.

Protected Methods

	Name	Description
	Notify (see page 3562)	Responds when items are added to or removed from the collection.

Public Methods

	Name	Description
	Add (see page 3561)	Creates a new TCollectionItem instance and adds it to the Items array.
	Create (see page 3561)	Creates and initializes a TOwnedCollection instance.
	FindGroup (see page 3562)	This is FindGroup, a member of class TRibbonTabs.
	GetPageFromPageCaption (see page 3562)	This is GetPageFromPageCaption, a member of class TRibbonTabs.
	IndexOfCaption (see page 3562)	This is IndexOfCaption, a member of class TRibbonTabs.
	SelectNext (see page 3563)	Select next page in ribbon.

	SelectPrior (see page 3563)	Select prior page in ribbon.
	TabExists (see page 3564)	This is TabExists, a member of class TRibbonTabs.

Public Properties

	Name	Description
	DesignerAdd (see page 3564)	This is DesignerAdd, a member of class TRibbonTabs.
	Items (see page 3564)	Lists the items in the collection.
R	Ribbon (see page 3565)	This is Ribbon, a member of class TRibbonTabs.

62.1.29.2 TRibbonTabs.Create Constructor

Creates and initializes a TOwnedCollection instance.

Pascal

```
constructor Create(AOwner: TPersistent; ItemClass: TCollectionItemClass);
```

C++

```
__fastcall TRibbonTabs(TPersistent * AOwner, TCollectionItemClass ItemClass);
```

Description

The Create method takes two parameters: the name of an instance object descended from TPersistent and the name of a TCollectionItem descendant class. The first parameter is the owner of the TOwnedCollection instance. The second parameter determines the class of the items created by the Add method.

Add

62.1.29.3 TRibbonTabs Methods

The methods of the TRibbonTabs class are listed here.

Protected Methods

	Name	Description
V	Notify (see page 3562)	Responds when items are added to or removed from the collection.

Public Methods

	Name	Description
	Add (see page 3561)	Creates a new TCollectionItem instance and adds it to the Items array.
	FindGroup (see page 3562)	This is FindGroup, a member of class TRibbonTabs.
	GetPageFromPageCaption (see page 3562)	This is GetPageFromPageCaption, a member of class TRibbonTabs.
	IndexOfCaption (see page 3562)	This is IndexOfCaption, a member of class TRibbonTabs.
	SelectNext (see page 3563)	Select next page in ribbon.
	SelectPrior (see page 3563)	Select prior page in ribbon.
	TabExists (see page 3564)	This is TabExists, a member of class TRibbonTabs.

62.1.29.3.1 TRibbonTabs.Add Method

Creates a new TCollectionItem instance and adds it to the Items array.

Pascal

```
function Add: TRibbonTabItem;
```

C++

```
__fastcall TRibbonTabItem Add();
```

Description

Call Add to create an item in the collection. The new item is placed at the end of the Items array.

Add returns the new collection item.

Delete

62.1.29.3.2 TRibbonTabs.FindGroup Method

Pascal

```
function FindGroup(const GroupName: string): TControl;
```

C++

```
__fastcall TControl * FindGroup(const UnicodeString GroupName);
```

Description

This is FindGroup, a member of class TRibbonTabs.

62.1.29.3.3 TRibbonTabs.GetPageFromPageCaption Method

Pascal

```
function GetPageFromPageCaption(const Caption: string): TCustomRibbonPage;
```

C++

```
__fastcall TCustomRibbonPage GetPageFromPageCaption(const UnicodeString Caption);
```

Description

This is GetPageFromPageCaption, a member of class TRibbonTabs.

62.1.29.3.4 TRibbonTabs.IndexOfCaption Method

Pascal

```
function IndexOfCaption(const Caption: string): Integer;
```

C++

```
__fastcall int IndexOfCaption(const UnicodeString Caption);
```

Description

This is IndexOfCaption, a member of class TRibbonTabs.

62.1.29.3.5 TRibbonTabs.Notify Method

Responds when items are added to or removed from the collection.

Pascal

```
procedure Notify(Item: TCollectionItem; Action: TCollectionNotification); override;
```

C++

```
virtual __fastcall Notify(TCollectionItem Item, TCollectionNotification Action);
```

Description

Notify is called automatically when the items in the collection change.

Item is the item that was just added to or that is about to be removed from the collection.

Action indicates whether item was added, is about to be removed, or is about to be deleted:

As implemented in TCollection, Notify calls Added when `Action` is cnAdded and calls Deleting when `Action` is cnDeleting. TCollection ignores the cnExtracting action. Descendant classes can override Notify to modify this behavior.

Added

Deleting

62.1.29.3.6 TRibbonTabs.SelectNext Method

Select next page in ribbon.

Pascal

```
function SelectNext: Boolean;
```

C++

```
__fastcall Boolean SelectNext();
```

Description

Use SelectNext to select the next page in the ribbon.

See Also

SelectPrior (see page 3563)

62.1.29.3.7 TRibbonTabs.SelectPrior Method

Select prior page in ribbon.

Pascal

```
function SelectPrior: Boolean;
```

C++

```
__fastcall Boolean SelectPrior();
```

Description

Use SelectPrior to select the prior page in the ribbon.

See Also

SelectNext (see page 3563)

62.1.29.3.8 TRibbonTabs.TabExists Method

Pascal

```
function TabExists(const Caption: string): Boolean;
```

C++

```
__fastcall Boolean TabExists(const UnicodeString Caption);
```

Description

This is TabExists, a member of class TRibbonTabs.

62.1.29.4 TRibbonTabs Properties

The properties of the TRibbonTabs class are listed here.

Public Properties

	Name	Description
	DesignerAdd (see page 3564)	This is DesignerAdd, a member of class TRibbonTabs.
	Items (see page 3564)	Lists the items in the collection.
R	Ribbon (see page 3565)	This is Ribbon, a member of class TRibbonTabs.

62.1.29.4.1 TRibbonTabs.DesignerAdd Property

Pascal

```
property DesignerAdd: Boolean;
```

C++

```
__property Boolean DesignerAdd;
```

Description

This is DesignerAdd, a member of class TRibbonTabs.

62.1.29.4.2 TRibbonTabs.Items Property

Lists the items in the collection.

Pascal

```
property Items [Index: Integer]: TRibbonTabItem;
```

C++

```
__property TRibbonTabItem Items[int Index];
```

Description

Use Items to access individual items in the collection. The value of the `Index` parameter corresponds to the `Index` property of TCollectionItem. It represents the position of the item in the collection.

Insert

62.1.29.4.3 TRibbonTabs.Ribbon Property

Pascal

```
property Ribbon: TCustomRibbon;
```

C++

```
__property TCustomRibbon Ribbon;
```

Description

This is Ribbon, a member of class TRibbonTabs.

62.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IRibbon (see page 3566)	Interface for ribbon control.
	IRibbonGroup (see page 3568)	Interface for any ribbon-specific group.
	IRibbonQuickAccessToolbar (see page 3569)	This is class Ribbon.IRibbonQuickAccessToolbar.

62.2.1 IRibbon Interface

Interface for ribbon control.

Class Hierarchy

Ribbon.IRibbon

Pascal

```
IRibbon = interface;
```

C++

```
__interface IRibbon;
```

File

Ribbon

Description

Implement the IRibbon interface to acknowledge that the control supports the ribbon control.

See Also

Creating an Application that Uses Ribbon Controls

Adding Commands to the Ribbon

IRibbonGroup (see page 3568)

62.2.1.1 IRibbon Members

The following tables list the members exposed by IRibbon.

Public Methods

	Name	Description
	GetRibbon (see page 3567)	This is GetRibbon, a member of class IRibbon.
	SetRibbon (see page 3567)	This is SetRibbon, a member of class IRibbon.

Public Properties

	Name	Description
	Ribbon (see page 3567)	This is Ribbon, a member of class IRibbon.

62.2.1.2 IRibbon Methods

The methods of the IRibbon class are listed here.

Public Methods

	Name	Description
	GetRibbon (see page 3567)	This is GetRibbon, a member of class IRibbon.
	SetRibbon (see page 3567)	This is SetRibbon, a member of class IRibbon.

62.2.1.2.1 IRibbon.GetRibbon Method

Pascal

```
function GetRibbon: TCustomRibbon;
```

C++

```
__fastcall TCustomRibbon GetRibbon();
```

Description

This is GetRibbon, a member of class IRibbon.

62.2.1.2.2 IRibbon.SetRibbon Method

Pascal

```
procedure SetRibbon(const Value: TCustomRibbon);
```

C++

```
__fastcall SetRibbon(const TCustomRibbon Value);
```

Description

This is SetRibbon, a member of class IRibbon.

62.2.1.3 IRibbon Properties

The properties of the IRibbon class are listed here.

Public Properties

	Name	Description
	Ribbon (see page 3567)	This is Ribbon, a member of class IRibbon.

62.2.1.3.1 IRibbon.Ribbon Property

Pascal

```
property Ribbon: TCustomRibbon;
```

C++

```
__property TCustomRibbon Ribbon;
```

Description

This is Ribbon, a member of class IRibbon.

62.2.2 IRibbonGroup Interface

Interface for any ribbon-specific group.

Class Hierarchy

Pascal

```
IRibbonGroup = interface;
```

C++

```
__interface IRibbonGroup;
```

File

Ribbon

Description

IRibbonGroup is an interface implemented by any ribbon-specific group.

See Also

IRibbon (see page 3566)

62.2.2.1 IRibbonGroup Members

The following tables list the members exposed by IRibbonGroup.

Public Methods

	Name	Description
	AlignGroupControls (see page 3568)	Realign controls on group.
	CreateControl (see page 3569)	Recreate specific control.
	StyleChanged (see page 3569)	This is StyleChanged, a member of class IRibbonGroup.

62.2.2.2 IRibbonGroup Methods

The methods of the IRibbonGroup class are listed here.

Public Methods

	Name	Description
	AlignGroupControls (see page 3568)	Realign controls on group.
	CreateControl (see page 3569)	Recreate specific control.
	StyleChanged (see page 3569)	This is StyleChanged, a member of class IRibbonGroup.

62.2.2.2.1 IRibbonGroup.AlignGroupControls Method

Realign controls on group.

Pascal

```
procedure AlignGroupControls;
```

C++

```
__fastcall AlignGroupControls();
```

Description

AlignGroupControls realigns controls on a group.

See Also

CreateControl (see page 3569)

62.2.2.2.2 IRibbonGroup.CreateControl Method

Recreate specific control.

Pascal

```
function CreateControl(AnItem: TActionClientItem): TCustomActionControl;
```

C++

```
__fastcall TCustomActionControl CreateControl(TActionClientItem AnItem);
```

Description

CreateControl recreates a specific control.

See Also

AlignGroupControls (see page 3568)

62.2.2.2.3 IRibbonGroup.StyleChanged Method

Pascal

```
procedure StyleChanged(AStyle: TRibbonStyleActionBars);
```

C++

```
__fastcall StyleChanged(TRibbonStyleActionBars AStyle);
```

Description

This is StyleChanged, a member of class IRibbonGroup.

62.2.3 IRibbonQuickAccessToolbar Interface

Class Hierarchy

Pascal

```
IRibbonQuickAccessToolbar = interface;
```

C++

```
__interface IRibbonQuickAccessToolbar;
```

File

Ribbon

Description

This is class Ribbon.IRibbonQuickAccessToolbar.

62.2.3.1 IRibbonQuickAccessToolbar Members

The following tables list the members exposed by IRibbonQuickAccessToolbar.

Public Methods

	Name	Description
	DoUpdateQATWidth (see page 3570)	This is DoUpdateQATWidth, a member of class IRibbonQuickAccessToolbar.

62.2.3.2 IRibbonQuickAccessToolbar Methods

The methods of the IRibbonQuickAccessToolbar class are listed here.

Public Methods

	Name	Description
	DoUpdateQATWidth (see page 3570)	This is DoUpdateQATWidth, a member of class IRibbonQuickAccessToolbar.

62.2.3.2.1 IRibbonQuickAccessToolbar.DoUpdateQATWidth Method

Pascal

```
procedure DoUpdateQATWidth;
```

C++

```
__fastcall DoUpdateQATWidth();
```

Description

This is DoUpdateQATWidth, a member of class IRibbonQuickAccessToolbar.

62.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TCommandType (see page 3571)	TCommandType enumerates the possible types of items to be displayed in the right pane of the Application Menu.
	TIconSize (see page 3572)	This is record Ribbon.TIconSize.
	TRibbonGroupVariant (see page 3572)	This is record Ribbon.TRibbonGroupVariant.
	TRibbonMetric (see page 3573)	This is record Ribbon.TRibbonMetric.
	TRibbonScrollButton (see page 3573)	This is record Ribbon.TRibbonScrollButton.
	TTabActiveScrollButton (see page 3574)	This is record Ribbon.TTabActiveScrollButton.
	TTabSeparatorState (see page 3574)	Position of Quick Access Toolbar.

62.3.1 Ribbon.TCommandType Enumeration

TCommandType enumerates the possible types of items to be displayed in the right pane of the Application Menu.

Pascal

```
TCommandType = (
  ctRecent,
  ctCommands
);
```

C++

```
enum TCommandType {
  ctRecent,
  ctCommands
};
```

File

Ribbon

Description

TCommandType represents the types of items that will be displayed in the right pane of the Application Menu. The possible values are.

Value	Description
ctRecent	A list of recently used items will be displayed in the right pane of the application menu.
ctCommands	A list of commands will be displayed in the right pane of the application menu.

Note: Recent items are automatically prefixed with a number accelerator key for quick use.

See Also

TIconSize (see page 3572)

TApplicationMenu (see page 3350)

CommandType (see page 3354)

62.3.2 Ribbon.TIconSize Enumeration

Pascal

```
TIconSize = (
  isSmall,
  isMedium,
  isLarge
);
```

C++

```
enum TIconSize {
  isSmall,
  isMedium,
  isLarge
};
```

File

Ribbon

Description

This is record Ribbon.TIconSize.

62.3.3 Ribbon.TRibbonGroupVariant Enumeration

Pascal

```
TRibbonGroupVariant = (
  rgvCollapsed,
  rgvSmall,
  rgvMedium,
  rgvLarge
);
```

C++

```
enum TRibbonGroupVariant {
  rgvCollapsed,
  rgvSmall,
  rgvMedium,
  rgvLarge
};
```

File

Ribbon

Description

This is record Ribbon.TRibbonGroupVariant.

62.3.4 Ribbon.TRibbonMetric Enumeration

Pascal

```
  TRibbonMetric = (
    rmCaption,
    rmHeight,
    rmFullHeight,
    rmMinHeight,
    rmTabTop,
    rmPageHeight,
    rmGroupHeight,
    rmGroupCaptionHeight,
    rmQATWidth,
    rmSystemButtonHeight,
    rmSystemButtonWidth,
    rmTabHeight,
    rmFontSize
  );
```

C++

```
  enum TRibbonMetric {
    rmCaption,
    rmHeight,
    rmFullHeight,
    rmMinHeight,
    rmTabTop,
    rmPageHeight,
    rmGroupHeight,
    rmGroupCaptionHeight,
    rmQATWidth,
    rmSystemButtonHeight,
    rmSystemButtonWidth,
    rmTabHeight,
    rmFontSize
  };
```

File

Ribbon

Description

This is record Ribbon.TRibbonMetric.

62.3.5 Ribbon.TRibbonScrollButton Enumeration

Pascal

```
  TRibbonScrollButton = (
    tsbTabRight,
    tsbTabLeft,
    tsbGroupLeft,
    tsbGroupRight
  );
```

C++

```
  enum TRibbonScrollButton {
```

```
    tsbTabRight,
    tsbTabLeft,
    tsbGroupLeft,
    tsbGroupRight
  };
```

File

Ribbon

Description

This is record Ribbon.TRibbonScrollButton.

62.3.6 Ribbon.TTabActiveScrollButton Enumeration

Pascal

```
  TTabActiveScrollButton = (
    asbNone,
    asbRight,
    asbLeft
  );
```

C++

```
  enum TTabActiveScrollButton {
    asbNone,
    asbRight,
    asbLeft
  };
```

File

Ribbon

Description

This is record Ribbon.TTabActiveScrollButton.

62.3.7 Ribbon.TTabSeparatorState Enumeration

Position of Quick Access Toolbar.

Pascal

```
  TTabSeparatorState = (
    tssHidden,
    tssLight,
    tssMedium,
    tssDark
  );
```

C++

```
  enum TTabSeparatorState {
    tssHidden,
    tssLight,
    tssMedium,
    tssDark
  };
```

File

Ribbon

Description

TTabSeparatorState is the state of the separators that are displayed between tabs when the ribbon is being resized smaller.

Value	Meaning
tssHidden	Hidden
tssLight	Light
tssMedium	Medium
tssDark	Dark

See Also

TApplicationMenu (see page 3350)

62.4 Types

The following table lists types in this documentation.

Types

Name	Description
TCustomRibbonClass (see page 3576)	This is type Ribbon.TCustomRibbonClass.
TRecentItemClickEvent (see page 3576)	This is type Ribbon.TRecentItemClickEvent.
TRibbonScrollButtons (see page 3577)	This is type Ribbon.TRibbonScrollButtons.

62.4.1 Ribbon.TCustomRibbonClass Type

Pascal

```
TCustomRibbonClass = class of TCustomRibbon;
```

C++

```
TCustomRibbon TCustomRibbonClass;
```

File

Ribbon

Description

This is type Ribbon.TCustomRibbonClass.

62.4.2 Ribbon.TRecentItemClickEvent Type

Pascal

```
TRecentItemClickEvent = procedure (Sender: TObject; FileName: string; Index: Integer) of
object;
```

C++

```
(Sender: TObject; FileName: string; Index: Integer) ( TRecentItemClickEvent)();
```

File

Ribbon

Description

This is type Ribbon.TRecentItemClickEvent.

62.4.3 Ribbon.TRibbonScrollButtons Type

Pascal

```
TRibbonScrollButtons = set of TRibbonScrollButton;
```

C++

```
TRibbonScrollButton TRibbonScrollButtons;
```

File

Ribbon

Description

This is type Ribbon.TRibbonScrollButtons.

63 RibbonActnCtrls Namespace

This is namespace RibbonActnCtrls.

	TRibbonGalleryControlMenuItem (see page 3722)	This is class RibbonActnCtrls.TRibbonGalleryControlMenuItem.
	TRibbonGalleryItem (see page 3728)	This is class RibbonActnCtrls.TRibbonGalleryItem.

	TRibbonGalleryMenuItem (see page 3730)	This is class RibbonActnCtrls.TRibbonGalleryMenuItem.
	TRibbonGallerySplitButton (see page 3733)	This is class RibbonActnCtrls.TRibbonGallerySplitButton.
	TRibbonGripItem (see page 3735)	This is class RibbonActnCtrls.TRibbonGripItem.
	TRibbonGroupDropDown (see page 3738)	Display entire group as dropdown menu in Quick Access Toolbar.
	TRibbonLargeButtonControl (see page 3742)	This is class RibbonActnCtrls.TRibbonLargeButtonControl.
	TRibbonLargeSplitButton (see page 3745)	This is class RibbonActnCtrls.TRibbonLargeSplitButton.
	TRibbonMainMenuItem (see page 3752)	This is class RibbonActnCtrls.TRibbonMainMenuItem.
	TRibbonMainMenuSeparator (see page 3754)	This is class RibbonActnCtrls.TRibbonMainMenuSeparator.
	TRibbonMenuItem (see page 3755)	This is class RibbonActnCtrls.TRibbonMenuItem.
	TRibbonMenuSeparatorItem (see page 3760)	This is class RibbonActnCtrls.TRibbonMenuSeparatorItem.
	TRibbonMenuSmallButtonControl (see page 3762)	This is class RibbonActnCtrls.TRibbonMenuSmallButtonControl.
	TRibbonOptionButtonControl (see page 3765)	This is class RibbonActnCtrls.TRibbonOptionButtonControl.
	TRibbonQATScrollButton (see page 3767)	This is class RibbonActnCtrls.TRibbonQATScrollButton.
	TRibbonRadioButtonControl (see page 3771)	This is class RibbonActnCtrls.TRibbonRadioButtonControl.
	TRibbonRecentButtonControl (see page 3774)	This is class RibbonActnCtrls.TRibbonRecentButtonControl.
	TRibbonRichContentItem (see page 3776)	This is class RibbonActnCtrls.TRibbonRichContentItem.
	TRibbonRichContentMainMenuItem (see page 3780)	This is class RibbonActnCtrls.TRibbonRichContentMainMenuItem.
	TRibbonSeparator (see page 3784)	This is class RibbonActnCtrls.TRibbonSeparator.
	TRibbonSmallButtonControl (see page 3787)	This is class RibbonActnCtrls.TRibbonSmallButtonControl.
	TRibbonSmallSplitButton (see page 3789)	This is class RibbonActnCtrls.TRibbonSmallSplitButton.
	TRibbonSpinButton (see page 3796)	This is class RibbonActnCtrls.TRibbonSpinButton.
	TRibbonSpinEdit (see page 3836)	This is class RibbonActnCtrls.TRibbonSpinEdit.
	TRibbonSplitMenuItem (see page 3896)	This is class RibbonActnCtrls.TRibbonSplitMenuItem.
	TRibbonStyleMenuButton (see page 3902)	Top level menus when using Ribbon (see page 3347) Styles in applications not using Ribbon (see page 3347) interface.
	TRibbonTextControl (see page 3903)	This is class RibbonActnCtrls.TRibbonTextControl.
	TRibbonToolScrollButton (see page 3905)	This is class RibbonActnCtrls.TRibbonToolScrollButton.
	TTimerSpeedButton (see page 3906)	This is class RibbonActnCtrls.TTimerSpeedButton.

Constants

Name	Description
UM_FADECONTROL (see page 3932)	This is constant RibbonActnCtrls.UM_FADECONTROL.

Functions

	Name	Description
	DrawLine (see page 3924)	This is function RibbonActnCtrls.DrawLine.
	IsLeftMouseButtonPressed (see page 3924)	This is function RibbonActnCtrls.IsLeftMouseButtonPressed.
	ShowKeyTip (see page 3924)	Show **KeyTip** for control.
	ShowKeyTip (see page 3924)	Show **KeyTip** for control.

Interfaces

	Name	Description
	IRibbonBarKeyTip (see page 3912)	Action Bars that support KeyTips should implement this interface.
	IRibbonContainedControl (see page 3914)	Interface implemented by controls used as containers for displaying other controls.
	IRibbonControl (see page 3916)	Interface implemented by controls visible in Ribbon (see page 3347) Groups.
	IRibbonGroupDropdown (see page 3917)	This is class RibbonActnCtrls.IRibbonGroupDropdown.
	IRibbonKeyTip (see page 3918)	Commands with a **KeyTip (see page 3922)** should implement this interface.
	IRibbonSplitButton (see page 3922)	Interface implemented by controls that have split button.

Structs, Records, Enums

	Name	Description
	TKeyTipHandled (see page 3926)	Validate if command's **KeyTip** matches current user input.
	TKeyTipMatchType (see page 3927)	Type of match command's **KeyTip** is for current **KeyTip** value.
	TKeyTipPosition (see page 3927)	Position of KeyTips.

	TKeyTipState (see page 3928)	Current state of KeyTips.
	TQATScrollMode (see page 3929)	This is record RibbonActnCtrls.TQATScrollMode.
	TSpinButtonStyle (see page 3930)	This is record RibbonActnCtrls.TSpinButtonStyle.

Types

Name	Description
TNumGlyphs (see page 3931)	This is type RibbonActnCtrls.TNumGlyphs.
TTimeBtnState (see page 3931)	This is type RibbonActnCtrls.TTimeBtnState.

63.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TCustomRibbonComboBox (see page 3583)	This is class RibbonActnCtrls.TCustomRibbonComboBox.
	TKeyTipList (see page 3592)	**KeyTip** list.
	TKeyTipListEnumerator (see page 3596)	This is class RibbonActnCtrls.TKeyTipListEnumerator.
	TKeyTipMatchItem (see page 3598)	Details about Full and Partial **KeyTip** matches.
	TKeyTipValidator (see page 3600)	Used to validate **KeyTip**.
	TRibbonAddRemoveItem (see page 3601)	This is class RibbonActnCtrls.TRibbonAddRemoveItem.
	TRibbonApplicationButton (see page 3603)	This is class RibbonActnCtrls.TRibbonApplicationButton.
	TRibbonApplicationMenuButton (see page 3604)	Application Button when using Ribbon (see page 3347) interface.
	TRibbonApplicationMenuItem (see page 3612)	This is class RibbonActnCtrls.TRibbonApplicationMenuItem.
	TRibbonBaseButtonControl (see page 3616)	Common ancestor for many buttons in groups and Quick Access Toolbar.
	TRibbonCheckBoxControl (see page 3626)	This is class RibbonActnCtrls.TRibbonCheckBoxControl.
	TRibbonComboBox (see page 3628)	This is class RibbonActnCtrls.TRibbonComboBox.
	TRibbonComboBoxItem (see page 3682)	This is class RibbonActnCtrls.TRibbonComboBoxItem.
	TRibbonComboControl (see page 3684)	This is class RibbonActnCtrls.TRibbonComboControl.
	TRibbonCustomControl (see page 3698)	This is class RibbonActnCtrls.TRibbonCustomControl.
	TRibbonCustomizeItem (see page 3710)	This is class RibbonActnCtrls.TRibbonCustomizeItem.
	TRibbonCustomStatusControl (see page 3713)	This is class RibbonActnCtrls.TRibbonCustomStatusControl.
	TRibbonDropDownButton (see page 3715)	This is class RibbonActnCtrls.TRibbonDropDownButton.
	TRibbonGallery (see page 3720)	This is class RibbonActnCtrls.TRibbonGallery.
	TRibbonGalleryControl (see page 3720)	This is class RibbonActnCtrls.TRibbonGalleryControl.
	TRibbonGalleryControlMenuItem (see page 3722)	This is class RibbonActnCtrls.TRibbonGalleryControlMenuItem.
	TRibbonGalleryItem (see page 3728)	This is class RibbonActnCtrls.TRibbonGalleryItem.
	TRibbonGalleryMenuItem (see page 3730)	This is class RibbonActnCtrls.TRibbonGalleryMenuItem.
	TRibbonGallerySplitButton (see page 3733)	This is class RibbonActnCtrls.TRibbonGallerySplitButton.
	TRibbonGripItem (see page 3735)	This is class RibbonActnCtrls.TRibbonGripItem.
	TRibbonGroupDropDown (see page 3738)	Display entire group as dropdown menu in Quick Access Toolbar.
	TRibbonLargeButtonControl (see page 3742)	This is class RibbonActnCtrls.TRibbonLargeButtonControl.
	TRibbonLargeSplitButton (see page 3745)	This is class RibbonActnCtrls.TRibbonLargeSplitButton.
	TRibbonMainMenuItem (see page 3752)	This is class RibbonActnCtrls.TRibbonMainMenuItem.
	TRibbonMainMenuSeparator (see page 3754)	This is class RibbonActnCtrls.TRibbonMainMenuSeparator.
	TRibbonMenuItem (see page 3755)	This is class RibbonActnCtrls.TRibbonMenuItem.
	TRibbonMenuSeparatorItem (see page 3760)	This is class RibbonActnCtrls.TRibbonMenuSeparatorItem.
	TRibbonMenuSmallButtonControl (see page 3762)	This is class RibbonActnCtrls.TRibbonMenuSmallButtonControl.
	TRibbonOptionButtonControl (see page 3765)	This is class RibbonActnCtrls.TRibbonOptionButtonControl.
	TRibbonQATScrollButton (see page 3767)	This is class RibbonActnCtrls.TRibbonQATScrollButton.
	TRibbonRadioButtonControl (see page 3771)	This is class RibbonActnCtrls.TRibbonRadioButtonControl.
	TRibbonRecentButtonControl (see page 3774)	This is class RibbonActnCtrls.TRibbonRecentButtonControl.
	TRibbonRichContentItem (see page 3776)	This is class RibbonActnCtrls.TRibbonRichContentItem.
	TRibbonRichContentMainMenuItem (see page 3780)	This is class RibbonActnCtrls.TRibbonRichContentMainMenuItem.
	TRibbonSeparator (see page 3784)	This is class RibbonActnCtrls.TRibbonSeparator.
	TRibbonSmallButtonControl (see page 3787)	This is class RibbonActnCtrls.TRibbonSmallButtonControl.
	TRibbonSmallSplitButton (see page 3789)	This is class RibbonActnCtrls.TRibbonSmallSplitButton.
	TRibbonSpinButton (see page 3796)	This is class RibbonActnCtrls.TRibbonSpinButton.
	TRibbonSpinEdit (see page 3836)	This is class RibbonActnCtrls.TRibbonSpinEdit.

	TRibbonSplitMenuItem (see page 3896)	This is class RibbonActnCtrls.TRibbonSplitMenuItem.
	TRibbonStyleMenuButton (see page 3902)	Top level menus when using Ribbon (see page 3347) Styles in applications not using Ribbon (see page 3347) interface.
	TRibbonTextControl (see page 3903)	This is class RibbonActnCtrls.TRibbonTextControl.
	TRibbonToolScrollButton (see page 3905)	This is class RibbonActnCtrls.TRibbonToolScrollButton.
	TTimerSpeedButton (see page 3906)	This is class RibbonActnCtrls.TTimerSpeedButton.

63.1.1 TCustomRibbonComboBox Class

Class Hierarchy

Pascal

```
TCustomRibbonComboBox = class(TCustomEdit);
```

C++

```
class TCustomRibbonComboBox : public TCustomEdit;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TCustomRibbonComboBox.

63.1.1.1 TCustomRibbonComboBox Members

The following tables list the members exposed by TCustomRibbonComboBox.

Protected Methods

	Name	Description
	BeginAutoDrag (see page 3585)	Begin Automatic Drag.
	CMMouseenter (see page 3585)	This is CMMouseenter, a member of class TCustomRibbonComboBox.
	CMMouseleave (see page 3586)	This is CMMouseleave, a member of class TCustomRibbonComboBox.
	DragOver (see page 3586)	OnDragOver event dispatcher.
	KeyDown (see page 3587)	Respond to key press events.
	KeyPress (see page 3587)	Respond to keyboard input.
	MouseMove (see page 3588)	Respond to mouse moving over control area..
	Notification (see page 3588)	Responds to notifications that components are being created or destroyed.
	SetParent (see page 3589)	Sets the parent of the control.
	WMKillFocus (see page 3590)	This is WMKillFocus, a member of class TCustomRibbonComboBox.
	WMSetFocus (see page 3590)	This is WMSetFocus, a member of class TCustomRibbonComboBox.

Public Methods

	Name	Description
	Create (see page 3584)	Creates an instance of TCustomEdit.
	Destroy (see page 3584)	Destroys an instance of TWinControl.
	DragDrop (see page 3586)	OnDragDrop event dispatcher.
	SetBounds (see page 3589)	Sets the windowed control's boundary properties all at once.

Public Properties

	Name	Description
	Color (see page 3591)	Specifies the background color of the control.
	Items (see page 3592)	This is Items, a member of class TCustomRibbonComboBox.
	MouseInControl (see page 3592)	This is MouseInControl, a member of class TCustomRibbonComboBox.

63.1.1.2 TCustomRibbonComboBox.Create Constructor

Creates an instance of TCustomEdit.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomRibbonComboBox(TComponent * AOwner);
```

Description

Call Create to create and initialize an instance of TCustomEdit.

AOwner is another component, typically the form, that is responsible for freeing the edit control. It becomes the value of the Owner property.

Derived objects that override the Create method should call the inherited Create before performing any additional initialization.

See Also

Owner

63.1.1.3 TCustomRibbonComboBox.Destroy Destructor

Destroys an instance of TWinControl.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomRibbonComboBox();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TWinControl reference is not nil, and only then calls Destroy.

See Also

System::TObject::Free

Destroy

63.1.1.4 TCustomRibbonComboBox Methods

The methods of the TCustomRibbonComboBox class are listed here.

Protected Methods

	Name	Description
	BeginAutoDrag (see page 3585)	Begin Automatic Drag.
	CMMouseenter (see page 3585)	This is CMMouseenter, a member of class TCustomRibbonComboBox.
	CMMouseleave (see page 3586)	This is CMMouseleave, a member of class TCustomRibbonComboBox.
	DragOver (see page 3586)	OnDragOver event dispatcher.
	KeyDown (see page 3587)	Respond to key press events.
	KeyPress (see page 3587)	Respond to keyboard input.
	MouseMove (see page 3588)	Respond to mouse moving over control area..
	Notification (see page 3588)	Responds to notifications that components are being created or destroyed.
	SetParent (see page 3589)	Sets the parent of the control.
	WMKillFocus (see page 3590)	This is WMKillFocus, a member of class TCustomRibbonComboBox.
	WMSetFocus (see page 3590)	This is WMSetFocus, a member of class TCustomRibbonComboBox.

Public Methods

	Name	Description
	DragDrop (see page 3586)	OnDragDrop event dispatcher.
	SetBounds (see page 3589)	Sets the windowed control's boundary properties all at once.

63.1.1.4.1 TCustomRibbonComboBox.BeginAutoDrag Method

Begin Automatic Drag.

Pascal

```
procedure BeginAutoDrag; override;
```

C++

```
virtual __fastcall BeginAutoDrag();
```

Description

BeginAutoDrag is called automatically when a user drags a control whose DragMode is dmAutomatic. Do not call BeginAutoDrag in application code.

As implemented in TControl, BeginAutoDrag calls BeginDrag, passing in the global Mouse variable's DragImmediate and DragThreshold properties.

See Also

DragKind

DragMode

EndDrag

Mouse

DragImmediate

DragThreshold

63.1.1.4.2 TCustomRibbonComboBox.CMMouseenter Method

Pascal

```
procedure CMMouseenter(var Message: TMessage); message CM_MOUSEENTER;
```

C++

```
__fastcall CMMouseenter(TMessage Message);
```

Description

This is CMMouseenter, a member of class TCustomRibbonComboBox.

63.1.1.4.3 TCustomRibbonComboBox.CMMouseleave Method

Pascal

```
procedure CMMouseleave(var Message: TMessage); message CM_MOUSELEAVE;
```

C++

```
__fastcall CMMouseleave(TMessage Message);
```

Description

This is CMMouseleave, a member of class TCustomRibbonComboBox.

63.1.1.4.4 TCustomRibbonComboBox.DragDrop Method

OnDragDrop event dispatcher.

Pascal

```
procedure DragDrop(Source: TObject; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall DragDrop(TObject * Source, int X, int Y);
```

Description

When creating a component that descends from TControl, override DragDrop to add additional code that executes before the OnDragDrop event handler is called.

The Source parameter is the object that was dropped onto the control. The X and Y parameters are the mouse coordinates where the object was dropped.

See Also

DragCanceled

OnDragDrop

63.1.1.4.5 TCustomRibbonComboBox.DragOver Method

OnDragOver event dispatcher.

Pascal

```
procedure DragOver(Source: TObject; X: Integer; Y: Integer; State: TDragState; var Accept:
Boolean); override;
```

C++

```
virtual __fastcall DragOver(TObject * Source, int X, int Y, TDragState State, Boolean Accept);
```

Description

Override DragOver to add additional code that executes before the OnDragOver event handler is called.

DragOver sets the Accept parameter to true to indicate that the user can drop the dragged object on the control. It sets Accept to

false to indicate that the user cannot drop the dragged object on the control.

The Source parameter is the object being dragged. The State parameter indicates how the dragged object is moving in relation to the control. X and Y indicate the current position of the mouse.

See Also

DragDrop

OnDragOver

63.1.1.4.6 TCustomRibbonComboBox.KeyDown Method

Respond to key press events.

Pascal

```
procedure KeyDown(var Key: Word; Shift: TShiftState); override;
```

C++

```
virtual __fastcall KeyDown(Word Key, TShiftState Shift);
```

Description

When a windowed control receives a key-down message (WM_KEYDOWN) from Windows, its message handler calls the DoKeyDown method. If DoKeyDown determines that the control should, in fact, process the character, it calls KeyDown, passing the key code and shift-key state in the Key and Shift parameters, respectively.

KeyDown calls any event handler attached to the OnKeyDown event. Override KeyDown to provide other responses in addition to the event-handler call.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use WinAPI virtual key codes to determine the key pressed. For more information, search for virtual key codes in the Win32 Developer's Reference (WIN32.HLP).

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

Either KeyDown or the OnKeyDown event handler it calls can suppress further processing of a key by setting the Key parameter to zero.

See Also

KeyUp

OnKeyDown

DoKeyDown

DoKeyPress

DoKeyUp

63.1.1.4.7 TCustomRibbonComboBox.KeyPress Method

Respond to keyboard input.

Pascal

```
procedure KeyPress(var Key: Char); override;
```

C++

```
virtual __fastcall KeyPress(Char Key);
```

Description

When a windowed control receives a key-press message (WM_CHAR) from Windows, its message handler calls the DoKeyPress method. If DoKeyPress determines that the control should, in fact, process the character, it calls KeyPress, passing the key code in the Key parameter.

KeyPress calls any event handler attached to the OnKeyPress event. Override KeyPress to provide other responses in addition to the event-handler call.

Either KeyPress or the OnKeyPress event handler it calls can suppress further processing of a character by setting the Key parameter to zero.

Note: The Key parameter is the character represented by the key that is pressed, not a Windows virtual key code.

See Also

KeyDown

KeyUp

OnKeyPress

63.1.1.4.8 TCustomRibbonComboBox.MouseMove Method

Respond to mouse moving over control area..

Pascal

```
procedure MouseMove(Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseMove(TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseMove method to provide other responses in addition to calling the OnMouseMove event handler when the user moves the mouse.

A control calls MouseMove in response to any of the Windows mouse-move messages (WM_MOUSEMOVE), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively.

As the mouse cursor moves across a control, this method is called repeatedly. Each time it is called, it is with the new coordinates that reflect the continuous path of the mouse cursor across the screen real estate covered by the control's visual representation.

See Also

MouseDown

MouseUp

OnMouseMove

63.1.1.4.9 TCustomRibbonComboBox.Notification Method

Responds to notifications that components are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification allows TControl to update its PopupMenu property when the pop-up menu it refers to is destroyed.

Override the Notification method to respond to notifications that other components are about to be destroyed or have just been created. Use the Notification method to update controls that rely on other objects. Remove references to objects that are going away so that the control does not refer to objects that have been destroyed. For example, data-aware objects override the Notification method to update themselves when their data source is removed. Some objects respond to notifications that other objects of a specific type are being created. For example, the session component sets the Session property of new data-aware controls to itself when the AutoSessionName property is true.

By default, components pass along the notification to their owned components, if any.

PopupMenu

Notification

63.1.1.4.10 TCustomRibbonComboBox.SetBounds Method

Sets the windowed control's boundary properties all at once.

Pascal

```
procedure SetBounds(ALeft: Integer; ATop: Integer; AWidth: Integer; AHeight: Integer);
override;
```

C++

```
virtual __fastcall SetBounds(int ALeft, int ATop, int AWidth, int AHeight);
```

Description

Use SetBounds to change all of the control's boundary properties at once. The same effect can be achieved by setting the Left, Top, Width, and Height properties separately. By setting all four properties at once, SetBounds ensures that the control will not repaint between changes

Specify the values for the Left, Top, Width, and Height properties as the value of the ALeft, ATop, AWidth, and AHeight parameters, respectively.

See Also

Height

Left

Top

Width

63.1.1.4.11 TCustomRibbonComboBox.SetParent Method

Sets the parent of the control.

Pascal

```
procedure SetParent(AParent: TWinControl); override;
```

C++

```
virtual __fastcall SetParent(TWinControl * AParent);
```

Description

SetParent is the protected implementation of the Parent property. Override SetParent to execute additional code when the value of the Parent property changes.

The AParent parameter specifies the new parent of the control.

If the control already has a parent, SetParent removes the control from that parent's list of controls by calling the parent's RemoveControl method. If AParent is not nil (Delphi) or NULL (C++), SetParent calls its InsertControl method to add the control to its list of controls.

The TControl destructor calls SetParent(nil (Delphi) or NULL (C++)) to remove the control from its parent's control list before destroying the component.

See Also

Destroy

InsertControl

Parent

RemoveControl

63.1.1.4.12 TCustomRibbonComboBox.WMKillFocus Method

Pascal

```
procedure WMKillFocus(var Message: TWMKillFocus); message WM_KILLFOCUS;
```

C++

```
__fastcall WMKillFocus(TWMKillFocus Message);
```

Description

This is WMKillFocus, a member of class TCustomRibbonComboBox.

63.1.1.4.13 TCustomRibbonComboBox.WMSetFocus Method

Pascal

```
procedure WMSetFocus(var Message: TWMSetFocus); message WM_SETFOCUS;
```

C++

```
__fastcall WMSetFocus(TWMSetFocus Message);
```

Description

This is WMSetFocus, a member of class TCustomRibbonComboBox.

63.1.1.5 TCustomRibbonComboBox Properties

The properties of the TCustomRibbonComboBox class are listed here.

Public Properties

	Name	Description
	Color (see page 3591)	Specifies the background color of the control.
	Items (see page 3592)	This is Items, a member of class TCustomRibbonComboBox.
	MouseInControl (see page 3592)	This is MouseInControl, a member of class TCustomRibbonComboBox.

63.1.1.5.1 TCustomRibbonComboBox.Color Property

Specifies the background color of the control.

Pascal

```
property Color;
```

C++

```
__property Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor

63.1.1.5.2 TCustomRibbonComboBox.Items Property

Pascal

```
property Items: TStrings;
```

C++

```
__property TStrings Items;
```

Description

This is Items, a member of class TCustomRibbonComboBox.

63.1.1.5.3 TCustomRibbonComboBox.MouseInControl Property

Pascal

```
property MouseInControl: Boolean;
```

C++

```
__property Boolean MouseInControl;
```

Description

This is MouseInControl, a member of class TCustomRibbonComboBox.

63.1.2 TKeyTipList Class

KeyTip list.

Class Hierarchy

RibbonActnCtrls.TKeyTipList

Pascal

```
TKeyTipList = class;
```

C++

```
class TKeyTipList;
```

File

RibbonActnCtrls

Description

TKeyTipList is a **KeyTip** list.

63.1.2.1 TKeyTipList Members

The following tables list the members exposed by TKeyTipList.

Public Methods

	Name	Description
	Add (see page 3594)	Add new match to list of KeyTips.
	Clear (see page 3594)	Clear list of KeyTips.

	Create (see page 3593)	Create TKeyTipList (see page 3592) instance.
V	Destroy (see page 3593)	Destroy TKeyTipList (see page 3592) instance.

Public Properties

	Name	Description
R	Count (see page 3594)	Number of valid **KeyTip**s.
	Current (see page 3595)	Current **KeyTip** value so far.
R	Full (see page 3595)	Indicates **KeyTip** has full match in list and no other matches
R	Items (see page 3595)	Indexable list of TKeyTipList (see page 3592).
R	Partial (see page 3596)	**KeyTip** has partial match in list.

63.1.2.2 TKeyTipList.Create Constructor

Create TKeyTipList (see page 3592) instance.

Pascal

```
constructor Create;
```

C++

```
__fastcall TKeyTipList();
```

Description

This method creates a TKeyTipList (see page 3592) instance.

See Also

Destroy (see page 3593)

63.1.2.3 TKeyTipList.Destroy Destructor

Destroy TKeyTipList (see page 3592) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TKeyTipList();
```

Description

This method destroys a TKeyTipList (see page 3592) instance.

See Also

Create (see page 3593)

63.1.2.4 TKeyTipList Methods

The methods of the TKeyTipList class are listed here.

Public Methods

	Name	Description
	Add (see page 3594)	Add new match to list of KeyTips.
	Clear (see page 3594)	Clear list of KeyTips.

63.1.2.4.1 TKeyTipList.Add Method

Add new match to list of KeyTips.

Pascal

```
procedure Add(MatchType: TKeyTipMatchType; Handled: TKeyTipHandled; Control: TControl; Index:
Integer = -1);
```

C++

```
__fastcall Add(TKeyTipMatchType MatchType, TKeyTipHandled Handled, TControl * Control, int
Index = -1);
```

Description

This method adds a new match to the list of KeyTips.

See Also

Clear (see page 3594)

63.1.2.4.2 TKeyTipList.Clear Method

Clear list of KeyTips.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

This method clears the list of KeyTips.

See Also

Add (see page 3594)

63.1.2.5 TKeyTipList Properties

The properties of the TKeyTipList class are listed here.

Public Properties

	Name	Description
R	Count (see page 3594)	Number of valid **KeyTip**s.
	Current (see page 3595)	Current **KeyTip** value so far.
R	Full (see page 3595)	Indicates **KeyTip** has full match in list and no other matches
R	Items (see page 3595)	Indexable list of TKeyTipList (see page 3592).
R	Partial (see page 3596)	**KeyTip** has partial match in list.

63.1.2.5.1 TKeyTipList.Count Property

Number of valid **KeyTip**s.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Count contains the number of valid **KeyTip**s.

See Also

Current (see page 3595)

63.1.2.5.2 TKeyTipList.Current Property

Current **KeyTip** value so far.

Pascal

```
property Current: string;
```

C++

```
__property UnicodeString Current;
```

Description

Current is the current **KeyTip** value the user has typed in so far.

See Also

Count (see page 3594)

63.1.2.5.3 TKeyTipList.Full Property

Indicates **KeyTip** has full match in list and no other matches

Pascal

```
property Full: Boolean;
```

C++

```
__property Boolean Full;
```

Description

Full is True if the current **KeyTip** has a full match in the list and there are no other matches, and it is False otherwise.

See Also

Partial (see page 3596)

63.1.2.5.4 TKeyTipList.Items Property

Indexable list of TKeyTipList (see page 3592).

Pascal

```
property Items [Index: Integer]: TKeyTipMatchItem;
```

C++

```
__property TKeyTipMatchItem Items[int Index];
```

Description

Items is an indexable list of TKeyTipList (see page 3592).

63.1.2.5.5 TKeyTipList.Partial Property

KeyTip has partial match in list.

Pascal

```
property Partial: Boolean;
```

C++

```
__property Boolean Partial;
```

Description

Partial is True if the current **KeyTip** has a partial match in the list and false otherwise.

See Also

Full (see page 3595)

63.1.3 TKeyTipListEnumerator Class

Class Hierarchy

Pascal

```
TKeyTipListEnumerator = class;
```

C++

```
class TKeyTipListEnumerator;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TKeyTipListEnumerator.

63.1.3.1 TKeyTipListEnumerator Members

The following tables list the members exposed by TKeyTipListEnumerator.

Public Methods

	Name	Description
	Create (see page 3597)	This is Create, a member of class TKeyTipListEnumerator.
	GetCurrent (see page 3597)	This is GetCurrent, a member of class TKeyTipListEnumerator.
	MoveNext (see page 3597)	This is MoveNext, a member of class TKeyTipListEnumerator.

Public Properties

	Name	Description
R	Current (see page 3598)	This is Current, a member of class TKeyTipListEnumerator.

63.1.3.2 TKeyTipListEnumerator.Create Constructor

Pascal

```
constructor Create(AList: TKeyTipList);
```

C++

```
__fastcall TKeyTipListEnumerator(TKeyTipList AList);
```

Description

This is Create, a member of class TKeyTipListEnumerator.

63.1.3.3 TKeyTipListEnumerator Methods

The methods of the TKeyTipListEnumerator class are listed here.

Public Methods

	Name	Description
	GetCurrent (see page 3597)	This is GetCurrent, a member of class TKeyTipListEnumerator.
	MoveNext (see page 3597)	This is MoveNext, a member of class TKeyTipListEnumerator.

63.1.3.3.1 TKeyTipListEnumerator.GetCurrent Method

Pascal

```
function GetCurrent: TKeyTipMatchItem;
```

C++

```
__fastcall TKeyTipMatchItem GetCurrent();
```

Description

This is GetCurrent, a member of class TKeyTipListEnumerator.

63.1.3.3.2 TKeyTipListEnumerator.MoveNext Method

Pascal

```
function MoveNext: Boolean;
```

C++

```
__fastcall Boolean MoveNext();
```

Description

This is MoveNext, a member of class TKeyTipListEnumerator.

63.1.3.4 TKeyTipListEnumerator Properties

The properties of the TKeyTipListEnumerator class are listed here.

Public Properties

	Name	Description
	Current (see page 3598)	This is Current, a member of class TKeyTipListEnumerator.

63.1.3.4.1 TKeyTipListEnumerator.Current Property

Pascal

```
property Current: TKeyTipMatchItem;
```

C++

```
__property TKeyTipMatchItem Current;
```

Description

This is Current, a member of class TKeyTipListEnumerator.

63.1.4 TKeyTipMatchItem Class

Details about Full and Partial **KeyTip** matches.

Class Hierarchy

Pascal

```
TKeyTipMatchItem = class;
```

C++

```
class TKeyTipMatchItem;
```

File

RibbonActnCtrls

Description

TKeyTipMatchItem stores details about Full and Partial **KeyTip** matches. It contains a reference to the control that needs to be executed. If the MatchType (see page 3600) is **mtTabs**, then the Index (see page 3600) property is used to determine which Tab to change to.

See Also

Index (see page 3600)

MatchType (see page 3600)

TKeyTipMatchType (see page 3927)

63.1.4.1 TKeyTipMatchItem Members

The following tables list the members exposed by TKeyTipMatchItem.

Public Methods

	Name	Description
	Create (see page 3599)	This is Create, a member of class TKeyTipMatchItem.

Public Properties

	Name	Description
	Control (see page 3599)	This is Control, a member of class TKeyTipMatchItem.

	Handled (see page 3599)	This is Handled, a member of class TKeyTipMatchItem.
	Index (see page 3600)	Determines which Tab to change to.
	MatchType (see page 3600)	**KeyTip** match type.

63.1.4.2 TKeyTipMatchItem.Create Constructor

Pascal

```
constructor Create(AType: TKeyTipMatchType; AHandled: TKeyTipHandled; AControl: TControl;
AIndex: Integer = -1);
```

C++

```
__fastcall TKeyTipMatchItem(TKeyTipMatchType AType, TKeyTipHandled AHandled, TControl *
AControl, int AIndex = -1);
```

Description

This is Create, a member of class TKeyTipMatchItem.

63.1.4.3 TKeyTipMatchItem Properties

The properties of the TKeyTipMatchItem class are listed here.

Public Properties

	Name	Description
	Control (see page 3599)	This is Control, a member of class TKeyTipMatchItem.
	Handled (see page 3599)	This is Handled, a member of class TKeyTipMatchItem.
	Index (see page 3600)	Determines which Tab to change to.
	MatchType (see page 3600)	**KeyTip** match type.

63.1.4.3.1 TKeyTipMatchItem.Control Property

Pascal

```
property Control: TControl;
```

C++

```
__property TControl * Control;
```

Description

This is Control, a member of class TKeyTipMatchItem.

63.1.4.3.2 TKeyTipMatchItem.Handled Property

Pascal

```
property Handled: TKeyTipHandled;
```

C++

```
__property TKeyTipHandled Handled;
```

Description

This is Handled, a member of class TKeyTipMatchItem.

63.1.4.3.3 TKeyTipMatchItem.Index Property

Determines which Tab to change to.

Pascal

```
property Index: Integer;
```

C++

```
__property int Index;
```

Description

If the MatchType (see page 3600) is **mtTabs**, then the Index property is used to determine which Tab to change to.

See Also

MatchType (see page 3600)

TKeyTipMatchType (see page 3927)

63.1.4.3.4 TKeyTipMatchItem.MatchType Property

KeyTip match type.

Pascal

```
property MatchType: TKeyTipMatchType;
```

C++

```
__property TKeyTipMatchType MatchType;
```

Description

MatchType is the **KeyTip** match type.

See Also

Index (see page 3600)

TKeyTipMatchType (see page 3927)

63.1.5 TKeyTipValidator Class

Used to validate **KeyTip**.

Class Hierarchy

Pascal

```
TKeyTipValidator = class;
```

C++

```
class TKeyTipValidator;
```

File

RibbonActnCtrls

Description

TKeyTipValidator is a static class used to validate a **KeyTip**.

63.1.5.1 TKeyTipValidator Members

The following tables list the members exposed by TKeyTipValidator.

Public Methods

	Name	Description
	Validate (see page 3601)	This is Validate, a member of class TKeyTipValidator.

63.1.5.2 TKeyTipValidator Methods

The methods of the TKeyTipValidator class are listed here.

Public Methods

	Name	Description
	Validate (see page 3601)	This is Validate, a member of class TKeyTipValidator.

63.1.5.2.1 TKeyTipValidator.Validate Method

Pascal

```
class procedure Validate(const SrcKeyTip: string; const CmdKeyTip: string; Control: TControl;
var Handled: TKeyTipHandled);
```

C++

```
__fastcall Validate(const UnicodeString SrcKeyTip, const UnicodeString CmdKeyTip, TControl *
Control, TKeyTipHandled Handled);
```

Description

This is Validate, a member of class TKeyTipValidator.

63.1.6 TRibbonAddRemoveItem Class

Class Hierarchy

Pascal

```
TRibbonAddRemoveItem = class(TXPStyleAddRemoveItem);
```

C++

```
class TRibbonAddRemoveItem : public TXPStyleAddRemoveItem;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonAddRemoveItem.

63.1.6.1 TRibbonAddRemoveItem Members

The following tables list the members exposed by TRibbonAddRemoveItem.

Protected Methods

	Name	Description
	DrawBackground (see page 3602)	Draws a background image on the control.
	DrawGlyph (see page 3602)	Draws a symbol on the control.

63.1.6.2 TRibbonAddRemoveItem Methods

The methods of the TRibbonAddRemoveItem class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 3602)	Draws a background image on the control.
	DrawGlyph (see page 3602)	Draws a symbol on the control.

63.1.6.2.1 TRibbonAddRemoveItem.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

63.1.6.2.2 TRibbonAddRemoveItem.DrawGlyph Method

Draws a symbol on the control.

Pascal

```
procedure DrawGlyph(const Location: TPoint); override;
```

C++

```
virtual __fastcall DrawGlyph(const TPoint Location);
```

Description

Use DrawGlyph to draw a symbol on the control at the specified location.

See Also

DrawBackground

DrawText

63.1.7 TRibbonApplicationButton Class

Class Hierarchy

Pascal

```
TRibbonApplicationButton = class(TCustomMenuButton);
```

C++

```
class TRibbonApplicationButton : public TCustomMenuButton;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonApplicationButton.

63.1.7.1 TRibbonApplicationButton Members

The following tables list the members exposed by TRibbonApplicationButton.

Public Methods

	Name	Description
	CalcBounds (see page 3603)	Calculates the size of the control.

63.1.7.2 TRibbonApplicationButton Methods

The methods of the TRibbonApplicationButton class are listed here.

Public Methods

	Name	Description
	CalcBounds (see page 3603)	Calculates the size of the control.

63.1.7.2.1 TRibbonApplicationButton.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

This method is largely the same as CalcBounds (TCustomActionControl), with one minor exception. The width of the control is set to be one pixel wider. For more information, see the documentation for the inherited method.

See Also

CalcBounds

63.1.8 TRibbonApplicationMenuButton Class

Application Button when using Ribbon (see page 3347) interface.

Class Hierarchy

Pascal

```
TRibbonApplicationMenuButton = class(TCustomMenuButton, IRibbonKeyTip);
```

C++

```
class TRibbonApplicationMenuButton : public TCustomMenuButton, public IRibbonKeyTip;
```

File

RibbonActnCtrls

Description

TRibbonApplicationMenuButton is used for the Application Button when using the Ribbon (see page 3347) interface.

63.1.8.1 TRibbonApplicationMenuButton Members

The following tables list the members exposed by TRibbonApplicationMenuButton.

Protected Methods

	Name	Description
	CMMouseEnter (see page 3607)	This is CMMouseEnter, a member of class TRibbonApplicationMenuButton.
	CMMouseLeave (see page 3607)	This is CMMouseLeave, a member of class TRibbonApplicationMenuButton.
	DragOver (see page 3607)	OnDragOver event dispatcher.
	Paint (see page 3609)	Render control surface.
	RibbonStyle (see page 3609)	This is RibbonStyle, a member of class TRibbonApplicationMenuButton.
	SetParent (see page 3610)	Sets the parent of the control.
	UMFadeControl (see page 3611)	This is UMFadeControl, a member of class TRibbonApplicationMenuButton.
	WMLButtonDblClk (see page 3611)	This is WMLButtonDblClk, a member of class TRibbonApplicationMenuButton.

Protected Properties

	Name	Description
	MouseInControl (see page 3612)	This is MouseInControl, a member of class TRibbonApplicationMenuButton.

Public Methods

	Name	Description
	CalcBounds (see page 3606)	Calculates the size of the control.
	Create (see page 3605)	Creates an instance of TCustomMenuButton.
	Destroy (see page 3605)	Destroys an instance of TCustomMenuButton.
	GetKeyTip (see page 3607)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 3608)	Indicates if command's **KeyTip** matches currently input KeyTip.

	HideKeyTip (see page 3608)	Hide **KeyTip** for command.
	KeyTipClick (see page 3609)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 3610)	Sets **KeyTip** for command.
	ShowKeyTip (see page 3611)	Shows **KeyTip** for command in specified position.

Public Properties

	Name	Description
	KeyTip (see page 3612)	Current **KeyTip** for command

63.1.8.2 TRibbonApplicationMenuButton.Create Constructor

Creates an instance of TCustomMenuButton.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonApplicationMenuButton(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomMenuButton. However, you should never attempt to instantiate a TCustomMenuButton. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

AOwner is the component that is responsible for freeing the menu button instance. It becomes the value of the Owner property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

See Also

Owner

Create

Destroy

63.1.8.3 TRibbonApplicationMenuButton.Destroy Destructor

Destroys an instance of TCustomMenuButton.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRibbonApplicationMenuButton();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the graphic control reference is not nil, and only then calls Destroy.

Applications should only free controls explicitly when the constructor was called without assigning an owner to the control.

As the control is destroyed, it:

Frees the TCanvas object in its Canvas property.

Override Destroy to free any memory or resources allocated in the Create method. When declaring a Destroy method in a descendant control type, always add the override directive to the declaration and call the inherited Destroy as the last statement in the redeclared method.

When a control is created, Delphi automatically provides exception handling around the constructor call. The destructor is called if an exception escapes from the constructor. This means that the destructor code must be prepared to clean up a partially constructed instance. Check all data fields for zero before disposing of their contents.

Create

System::TObject::Free

63.1.8.4 TRibbonApplicationMenuButton Methods

The methods of the TRibbonApplicationMenuButton class are listed here.

Protected Methods

	Name	Description
	CMMouseEnter (see page 3607)	This is CMMouseEnter, a member of class TRibbonApplicationMenuButton.
	CMMouseLeave (see page 3607)	This is CMMouseLeave, a member of class TRibbonApplicationMenuButton.
	DragOver (see page 3607)	OnDragOver event dispatcher.
	Paint (see page 3609)	Render control surface.
	RibbonStyle (see page 3609)	This is RibbonStyle, a member of class TRibbonApplicationMenuButton.
	SetParent (see page 3610)	Sets the parent of the control.
	UMFadeControl (see page 3611)	This is UMFadeControl, a member of class TRibbonApplicationMenuButton.
	WMLButtonDblClk (see page 3611)	This is WMLButtonDblClk, a member of class TRibbonApplicationMenuButton.

Public Methods

	Name	Description
	CalcBounds (see page 3606)	Calculates the size of the control.
	GetKeyTip (see page 3607)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 3608)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 3608)	Hide **KeyTip** for command.
	KeyTipClick (see page 3609)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 3610)	Sets **KeyTip** for command.
	ShowKeyTip (see page 3611)	Shows **KeyTip** for command in specified position.

63.1.8.4.1 TRibbonApplicationMenuButton.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

This method is largely the same as CalcBounds (TCustomActionControl), with one minor exception. The width of the control is set to be one pixel wider. For more information, see the documentation for the inherited method.

See Also

CalcBounds

63.1.8.4.2 TRibbonApplicationMenuButton.CMMouseEnter Method

Pascal

```
procedure CMMouseEnter(var Message: TMessage); override;
```

C++

```
virtual __fastcall CMMouseEnter(TMessage Message);
```

Description

This is CMMouseEnter, a member of class TRibbonApplicationMenuButton.

63.1.8.4.3 TRibbonApplicationMenuButton.CMMouseLeave Method

Pascal

```
procedure CMMouseLeave(var Message: TMessage); override;
```

C++

```
virtual __fastcall CMMouseLeave(TMessage Message);
```

Description

This is CMMouseLeave, a member of class TRibbonApplicationMenuButton.

63.1.8.4.4 TRibbonApplicationMenuButton.DragOver Method

OnDragOver event dispatcher.

Pascal

```
procedure DragOver(Source: TObject; X: Integer; Y: Integer; State: TDragState; var Accept:
Boolean); override;
```

C++

```
virtual __fastcall DragOver(TObject * Source, int X, int Y, TDragState State, Boolean Accept);
```

Description

Override DragOver to add additional code that executes before the OnDragOver event handler is called.

DragOver sets the Accept parameter to true to indicate that the user can drop the dragged object on the control. It sets Accept to false to indicate that the user cannot drop the dragged object on the control.

The Source parameter is the object being dragged. The State parameter indicates how the dragged object is moving in relation to the control. X and Y indicate the current position of the mouse.

See Also

DragDrop

OnDragOver

63.1.8.4.5 TRibbonApplicationMenuButton.GetKeyTip Method

Returns current **KeyTip** for command.

Pascal

```
function GetKeyTip: string;
```

C++

```
__fastcall UnicodeString GetKeyTip();
```

Description

GetKeyTip returns the current **KeyTip** for the command

See Also

KeyTip (see page 3922)

HandleKeyTip (see page 3920)

HideKeyTip (see page 3920)

SetKeyTip (see page 3921)

ShowKeyTip (see page 3921)

63.1.8.4.6 TRibbonApplicationMenuButton.HandleKeyTip Method

Indicates if command's **KeyTip** matches currently input KeyTip.

Pascal

```
procedure HandleKeyTip(const KeyTip: string; var Handled: TKeyTipHandled);
```

C++

```
__fastcall HandleKeyTip(const UnicodeString KeyTip, TKeyTipHandled Handled);
```

Description

HandleKeyTip indicates whether this command's

KeyTip matches the currently input KeyTip by the user. Full and partial matches are taken into consideration.

See Also

KeyTip (see page 3922)

GetKeyTip (see page 3919)

HideKeyTip (see page 3920)

SetKeyTip (see page 3921)

ShowKeyTip (see page 3921)

63.1.8.4.7 TRibbonApplicationMenuButton.HideKeyTip Method

Hide **KeyTip** for command.

Pascal

```
procedure HideKeyTip(const Match: string);
```

C++

```
__fastcall HideKeyTip(const UnicodeString Match);
```

Description

This method hides the **KeyTip** for this command. If the **Match** parameter matches (full or partial) the command's **KeyTip**, the **KeyTip** remains visible.

See Also

KeyTip (see page 3922)

GetKeyTip (see page 3919)

HandleKeyTip (see page 3920)

SetKeyTip (see page 3921)

ShowKeyTip (see page 3921)

63.1.8.4.8 TRibbonApplicationMenuButton.KeyTipClick Method

Handle clicking a **KeyTip**.

Pascal

```
procedure KeyTipClick;
```

C++

```
__fastcall KeyTipClick();
```

Description

KeyTipClick Handle clicking a **KeyTip**. Some requires need to be handled differently when clicked by a **KeyTip**.

63.1.8.4.9 TRibbonApplicationMenuButton.Paint Method

Render control surface.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method is called automatically when a lightweight control needs update its display area. Code in the Paint method uses the Canvas property to render the control surface.

As implemented in TGraphicControl, Paint does nothing. Specific rendering logic is provided by Paint methods in descendant control classes.

See Also

Canvas

63.1.8.4.10 TRibbonApplicationMenuButton.RibbonStyle Method

Pascal

```
function RibbonStyle: TRibbonStyleActionBars;
```

C++

```
__fastcall TRibbonStyleActionBars RibbonStyle();
```

Description

This is RibbonStyle, a member of class TRibbonApplicationMenuButton.

63.1.8.4.11 TRibbonApplicationMenuButton.SetKeyTip Method

Sets **KeyTip** for command.

Pascal

```
procedure SetKeyTip(const Value: string);
```

C++

```
__fastcall SetKeyTip(const UnicodeString Value);
```

Description

This method sets the **KeyTip** for the command.

See Also

KeyTip (see page 3922)

GetKeyTip (see page 3919)

HandleKeyTip (see page 3920)

HideKeyTip (see page 3920)

ShowKeyTip (see page 3921)

63.1.8.4.12 TRibbonApplicationMenuButton.SetParent Method

Sets the parent of the control.

Pascal

```
procedure SetParent(AParent: TWinControl); override;
```

C++

```
virtual __fastcall SetParent(TWinControl * AParent);
```

Description

SetParent is the protected implementation of the Parent property. Override SetParent to execute additional code when the value of the Parent property changes.

The AParent parameter specifies the new parent of the control.

If the control already has a parent, SetParent removes the control from that parent's list of controls by calling the parent's RemoveControl method. If AParent is not nil (Delphi) or NULL (C++), SetParent calls its InsertControl method to add the control to its list of controls.

The TControl destructor calls SetParent(nil (Delphi) or NULL (C++)) to remove the control from its parent's control list before destroying the component.

See Also

Destroy

InsertControl

Parent

RemoveControl

63.1.8.4.13 TRibbonApplicationMenuButton.ShowKeyTip Method

Shows **KeyTip** for command in specified position.

Pascal

```
procedure ShowKeyTip(const Position: TKeyTipPosition);
```

C++

```
__fastcall ShowKeyTip(const TKeyTipPosition Position);
```

Description

This method shows the **KeyTip** for the command in the position specified. Only the Application Button uses a **KeyTip** position.

See Also

KeyTip (see page 3922)

GetKeyTip (see page 3919)

HandleKeyTip (see page 3920)

HideKeyTip (see page 3920)

SetKeyTip (see page 3921)

63.1.8.4.14 TRibbonApplicationMenuButton.UMFadeControl Method

Pascal

```
procedure UMFadeControl(var Message: TMessage); message UM_FADECONTROL;
```

C++

```
__fastcall UMFadeControl(TMessage Message);
```

Description

This is UMFadeControl, a member of class TRibbonApplicationMenuButton.

63.1.8.4.15 TRibbonApplicationMenuButton.WMLButtonDblClk Method

Pascal

```
procedure WMLButtonDblClk(var Message: TWMLButtonDblClk); message WM_LBUTTONDBLCLK;
```

C++

```
__fastcall WMLButtonDblClk(TWMLButtonDblClk Message);
```

Description

This is WMLButtonDblClk, a member of class TRibbonApplicationMenuButton.

63.1.8.5 TRibbonApplicationMenuButton Properties

The properties of the TRibbonApplicationMenuButton class are listed here.

Protected Properties

	Name	Description
	MouseInControl (see page 3612)	This is MouseInControl, a member of class TRibbonApplicationMenuButton.

Public Properties

	Name	Description
	KeyTip (see page 3612)	Current **KeyTip** for command

63.1.8.5.1 TRibbonApplicationMenuButton.KeyTip Property

Current **KeyTip** for command

Pascal

```
property KeyTip: string;
```

C++

```
__property UnicodeString KeyTip;
```

Description

KeyTip is the current **KeyTip** for the command

See Also

GetKeyTip (see page 3919)

SetKeyTip (see page 3921)

63.1.8.5.2 TRibbonApplicationMenuButton.MouseInControl Property

Pascal

```
property MouseInControl: Boolean;
```

C++

```
__property Boolean MouseInControl;
```

Description

This is MouseInControl, a member of class TRibbonApplicationMenuButton.

63.1.9 TRibbonApplicationMenuItem Class

Class Hierarchy

Pascal

```
TRibbonApplicationMenuItem = class(TRibbonMenuItem);
```

C++

```
class TRibbonApplicationMenuItem : public TRibbonMenuItem;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonApplicationMenuItem.

63.1.9.1 TRibbonApplicationMenuItem Members

The following tables list the members exposed by TRibbonApplicationMenuItem.

Protected Methods

	Name	Description
	CalcLayout (see page 3757)	This is CalcLayout, a member of class TRibbonMenuItem.
	DrawBackground (see page 3758)	Draws a background image on the control.
	DrawGlyph (see page 3614)	Draws a symbol on the control.
	DrawSelectedBackground (see page 3615)	This is DrawSelectedBackground, a member of class TRibbonApplicationMenuItem.
	DrawSeparator (see page 3615)	This is DrawSeparator, a member of class TRibbonApplicationMenuItem.
	DrawShadowedText (see page 3615)	This is DrawShadowedText, a member of class TRibbonApplicationMenuItem.
	DrawSubMenuGlyph (see page 3615)	This is DrawSubMenuGlyph, a member of class TRibbonApplicationMenuItem.
	DrawText (see page 3616)	Draws text on the control.
	GetImageSize (see page 3616)	This is GetImageSize, a member of class TRibbonApplicationMenuItem.
	GetShowShortCut (see page 3759)	This is GetShowShortCut, a member of class TRibbonMenuItem.
	RibbonStyle (see page 3760)	This is RibbonStyle, a member of class TRibbonMenuItem.

Protected Properties

	Name	Description
	DrawBanner (see page 3760)	This is DrawBanner, a member of class TRibbonMenuItem.

Public Methods

	Name	Description
	CalcBounds (see page 3614)	Calculates the size of the menu item.
	Click (see page 3757)	Executes the control's function.
	Create (see page 3613)	Creates an instance of TCustomMenuItem.

63.1.9.2 TRibbonApplicationMenuItem.Create Constructor

Creates an instance of TCustomMenuItem.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonApplicationMenuItem(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomMenuItem. However, you should never attempt to instantiate a TCustomMenuItem. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

After calling the inherited constructor, Create initializes the control, including the following property settings:

Initializes the TCanvas object for its Canvas property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

Destroy

63.1.9.3 TRibbonApplicationMenuItem Methods

The methods of the TRibbonApplicationMenuItem class are listed here.

Protected Methods

	Name	Description
	DrawGlyph (see page 3614)	Draws a symbol on the control.
	DrawSelectedBackground (see page 3615)	This is DrawSelectedBackground, a member of class TRibbonApplicationMenuItem.
	DrawSeparator (see page 3615)	This is DrawSeparator, a member of class TRibbonApplicationMenuItem.
	DrawShadowedText (see page 3615)	This is DrawShadowedText, a member of class TRibbonApplicationMenuItem.
	DrawSubMenuGlyph (see page 3615)	This is DrawSubMenuGlyph, a member of class TRibbonApplicationMenuItem.
	DrawText (see page 3616)	Draws text on the control.
	GetImageSize (see page 3616)	This is GetImageSize, a member of class TRibbonApplicationMenuItem.

Public Methods

	Name	Description
	CalcBounds (see page 3614)	Calculates the size of the menu item.

63.1.9.3.1 TRibbonApplicationMenuItem.CalcBounds Method

Calculates the size of the menu item.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as whether or not the menu item is a separator or not. CalcBounds computes the boundaries of the menu item considering these kinds of factors. At the end, it calls SetBounds and other routines to ensure that the values are set properly.

See Also

SetBounds

63.1.9.3.2 TRibbonApplicationMenuItem.DrawGlyph Method

Draws a symbol on the control.

Pascal

```
procedure DrawGlyph(const Location: TPoint); override;
```

C++

```
virtual __fastcall DrawGlyph(const TPoint Location);
```

Description

Use DrawGlyph to draw a symbol on the control at the specified location.

DrawBackground

DrawText

63.1.9.3.3 TRibbonApplicationMenuItem.DrawSelectedBackground Method

Pascal

```
procedure DrawSelectedBackground(ARect: TRect); override;
```

C++

```
virtual __fastcall DrawSelectedBackground(TRect ARect);
```

Description

This is DrawSelectedBackground, a member of class TRibbonApplicationMenuItem.

63.1.9.3.4 TRibbonApplicationMenuItem.DrawSeparator Method

Pascal

```
procedure DrawSeparator(const Offset: Integer); override;
```

C++

```
virtual __fastcall DrawSeparator(const int Offset);
```

Description

This is DrawSeparator, a member of class TRibbonApplicationMenuItem.

63.1.9.3.5 TRibbonApplicationMenuItem.DrawShadowedText Method

Pascal

```
procedure DrawShadowedText(Rect: TRect; Flags: Cardinal; Text: string; TextColor: TColor;
ShadowColor: TColor); override;
```

C++

```
virtual __fastcall DrawShadowedText(TRect Rect, unsigned Flags, UnicodeString Text, TColor
TextColor, TColor ShadowColor);
```

Description

This is DrawShadowedText, a member of class TRibbonApplicationMenuItem.

63.1.9.3.6 TRibbonApplicationMenuItem.DrawSubMenuGlyph Method

Pascal

```
procedure DrawSubMenuGlyph; override;
```

C++

```
virtual __fastcall DrawSubMenuGlyph();
```

Description

This is DrawSubMenuGlyph, a member of class TRibbonApplicationMenuItem.

63.1.9.3.7 TRibbonApplicationMenuItem.DrawText Method

Draws text on the control.

Pascal

```
procedure DrawText(var ARect: TRect; var Flags: Cardinal; Text: string); override;
```

C++

```
virtual __fastcall DrawText(TRect ARect, unsigned Flags, UnicodeString Text);
```

Description

Use DrawText to draw the text specified by Text on the control within the area specified by ARect.

DrawBackground

DrawGlyph

63.1.9.3.8 TRibbonApplicationMenuItem.GetImageSize Method

Pascal

```
function GetImageSize: TPoint; override;
```

C++

```
virtual __fastcall TPoint GetImageSize();
```

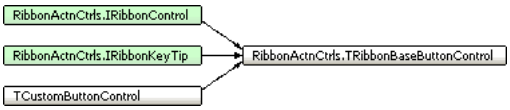
Description

This is GetImageSize, a member of class TRibbonApplicationMenuItem.

63.1.10 TRibbonBaseButtonControl Class

Common ancestor for many buttons in groups and Quick Access Toolbar.

Class Hierarchy



Pascal

```
TRibbonBaseButtonControl = class(TCustomButtonControl, IRibbonControl, IRibbonKeyTip);
```

C++

```
class TRibbonBaseButtonControl : public TCustomButtonControl, public IRibbonControl, public
IRibbonKeyTip;
```

File

RibbonActnCtrls

Description

TRibbonBaseButtonControl is the common ancestor for many buttons that appear in the groups and on the Quick Access Toolbar.

63.1.10.1 TRibbonBaseButtonControl Members

The following tables list the members exposed by TRibbonBaseButtonControl.

Protected Methods

	Name	Description
	AllowHotKeys (see page 3619)	This is AllowHotKeys, a member of class TRibbonBaseButtonControl.
	DrawBackground (see page 3621)	Draws a background image on the control.
	DrawGlyph (see page 3621)	Draws a symbol on the control.
	DrawSeparator (see page 3621)	This is DrawSeparator, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 3622)	This is DrawShadowedText, a member of class TRibbonBaseButtonControl.
	DrawText (see page 3622)	Draws text on the control.
	GetImageSize (see page 3622)	This is GetImageSize, a member of class TRibbonBaseButtonControl.
	IsButton (see page 3624)	This is IsButton, a member of class TRibbonBaseButtonControl.
	IsRibbonAvailable (see page 3624)	This is IsRibbonAvailable, a member of class TRibbonBaseButtonControl.
	RibbonStyle (see page 3624)	This is RibbonStyle, a member of class TRibbonBaseButtonControl.

Protected Properties

	Name	Description
	DrawDown (see page 3626)	This is DrawDown, a member of class TRibbonBaseButtonControl.

Public Methods

	Name	Description
	CalcBounds (see page 3619)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 3620)	This is CanAddToQuickAccessToolbar, a member of class TRibbonBaseButtonControl.
	Click (see page 3620)	Executes the control's function.
	Create (see page 3617)	Creates an instance of TCustomButtonControl.
	Destroy (see page 3618)	Destroys an instance of TCustomActionControl.
	DragDrop (see page 3620)	Performs actions and generates an OnDragDrop event.
	GetKeyTip (see page 3622)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 3623)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 3623)	Hide **KeyTip** for command.
	KeyTipClick (see page 3624)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 3625)	Sets **KeyTip** for command.
	ShowKeyTip (see page 3625)	Shows **KeyTip** for command in specified position.

Public Properties

	Name	Description
	KeyTip (see page 3922)	Current **KeyTip** for command

63.1.10.2 TRibbonBaseButtonControl.Create Constructor

Creates an instance of TCustomButtonControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonBaseButtonControl(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomButtonControl. However, you should never attempt to instantiate a TCustomButtonControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

AOwner is the component that is responsible for freeing the button control. It becomes the value of the Owner property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

See Also

Owner

Create

Destroy

63.1.10.3 TRibbonBaseButtonControl.Destroy Destructor

Destroys an instance of TCustomActionControl.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRibbonBaseButtonControl();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the graphic control reference is not nil, and only then calls Destroy.

Applications should only free controls explicitly when the constructor was called without assigning an owner to the control.

As the control is destroyed, it:

Frees the TCanvas object in its Canvas property.

Override Destroy to free any memory or resources allocated in the Create method. When declaring a Destroy method in a descendant control type, always add the override directive to the declaration and call the inherited Destroy as the last statement in the redeclared method.

When a control is created, Delphi automatically provides exception handling around the constructor call. The destructor is called if an exception escapes from the constructor. This means that the destructor code must be prepared to clean up a partially constructed instance. Check all data fields for zero before disposing of their contents.

63.1.10.4 TRibbonBaseButtonControl Methods

The methods of the TRibbonBaseButtonControl class are listed here.

Protected Methods

	Name	Description
	AllowHotKeys (see page 3619)	This is AllowHotKeys, a member of class TRibbonBaseButtonControl.
	DrawBackground (see page 3621)	Draws a background image on the control.
	DrawGlyph (see page 3621)	Draws a symbol on the control.
	DrawSeparator (see page 3621)	This is DrawSeparator, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 3622)	This is DrawShadowedText, a member of class TRibbonBaseButtonControl.
	DrawText (see page 3622)	Draws text on the control.
	GetImageSize (see page 3622)	This is GetImageSize, a member of class TRibbonBaseButtonControl.
	IsButton (see page 3624)	This is IsButton, a member of class TRibbonBaseButtonControl.
	IsRibbonAvailable (see page 3624)	This is IsRibbonAvailable, a member of class TRibbonBaseButtonControl.
	RibbonStyle (see page 3624)	This is RibbonStyle, a member of class TRibbonBaseButtonControl.

Public Methods

	Name	Description
	CalcBounds (see page 3619)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 3620)	This is CanAddToQuickAccessToolbar, a member of class TRibbonBaseButtonControl.
	Click (see page 3620)	Executes the control's function.
	DragDrop (see page 3620)	Performs actions and generates an OnDragDrop event.
	GetKeyTip (see page 3622)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 3623)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 3623)	Hide **KeyTip** for command.
	KeyTipClick (see page 3624)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 3625)	Sets **KeyTip** for command.
	ShowKeyTip (see page 3625)	Shows **KeyTip** for command in specified position.

63.1.10.4.1 TRibbonBaseButtonControl.AllowHotKeys Method

Pascal

```
function AllowHotKeys: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean AllowHotKeys();
```

Description

This is AllowHotKeys, a member of class TRibbonBaseButtonControl.

63.1.10.4.2 TRibbonBaseButtonControl.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

This method is largely the same as CalcBounds (TCustomActionControl), with one minor exception. The width of the control is set to be one pixel wider. For more information, see the documentation for the inherited method.

See Also

CalcBounds

63.1.10.4.3 TRibbonBaseButtonControl.CanAddToQuickAccessToolbar Method

Pascal

```
function CanAddToQuickAccessToolbar: Boolean;
```

C++

```
__fastcall Boolean CanAddToQuickAccessToolbar();
```

Description

This is CanAddToQuickAccessToolbar, a member of class TRibbonBaseButtonControl.

63.1.10.4.4 TRibbonBaseButtonControl.Click Method

Executes the control's function.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

This override of the method inherited from TCustomActionControl is almost identical to the inherited method. The only difference is that if the button control is being manipulated at design time, extra actions are taken to ensure that the control is properly selected.

See Also

Click

Click

UsageCount

63.1.10.4.5 TRibbonBaseButtonControl.DragDrop Method

Performs actions and generates an OnDragDrop event.

Pascal

```
procedure DragDrop(Source: TObject; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall DragDrop(TObject * Source, int X, int Y);
```

Description

This override of the method inherited from TControl executes instructions and generates an OnDragDrop event. The method is

called when a user drags and drops an item (Source) onto the custom action control at coordinates (X,Y).

See Also

DragDrop

63.1.10.4.6 TRibbonBaseButtonControl.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

63.1.10.4.7 TRibbonBaseButtonControl.DrawGlyph Method

Draws a symbol on the control.

Pascal

```
procedure DrawGlyph(const Location: TPoint); override;
```

C++

```
virtual __fastcall DrawGlyph(const TPoint Location);
```

Description

Use DrawGlyph to draw a symbol on the control at the specified location.

See Also

DrawBackground

DrawText

63.1.10.4.8 TRibbonBaseButtonControl.DrawSeparator Method

Pascal

```
procedure DrawSeparator(const Offset: Integer); override;
```

C++

```
virtual __fastcall DrawSeparator(const int Offset);
```

Description

This is DrawSeparator, a member of class TRibbonBaseButtonControl.

63.1.10.4.9 TRibbonBaseButtonControl.DrawShadowedText Method

Pascal

```
procedure DrawShadowedText(Rect: TRect; Flags: Cardinal; Text: string; TextColor: TColor;
ShadowColor: TColor); override;
```

C++

```
virtual __fastcall DrawShadowedText(TRect Rect, unsigned Flags, UnicodeString Text, TColor
TextColor, TColor ShadowColor);
```

Description

This is DrawShadowedText, a member of class TRibbonBaseButtonControl.

63.1.10.4.10 TRibbonBaseButtonControl.DrawText Method

Draws text on the control.

Pascal

```
procedure DrawText(var ARect: TRect; var Flags: Cardinal; Text: string); override;
```

C++

```
virtual __fastcall DrawText(TRect ARect, unsigned Flags, UnicodeString Text);
```

Description

Use DrawText to draw the text specified by Text on the control within the area specified by ARect.

See Also

DrawBackground

DrawGlyph

63.1.10.4.11 TRibbonBaseButtonControl.GetImageSize Method

Pascal

```
function GetImageSize: TPoint; override;
```

C++

```
virtual __fastcall TPoint GetImageSize();
```

Description

This is GetImageSize, a member of class TRibbonBaseButtonControl.

63.1.10.4.12 TRibbonBaseButtonControl.GetKeyTip Method

Returns current **KeyTip** for command.

Pascal

```
function GetKeyTip: string;
```

C++

```
__fastcall UnicodeString GetKeyTip();
```

Description

GetKeyTip returns the current **KeyTip** for the command

See Also

KeyTip (see page 3922)

HandleKeyTip (see page 3920)

HideKeyTip (see page 3920)

SetKeyTip (see page 3921)

ShowKeyTip (see page 3921)

63.1.10.4.13 TRibbonBaseButtonControl.HandleKeyTip Method

Indicates if command's **KeyTip** matches currently input KeyTip.

Pascal

```
procedure HandleKeyTip(const KeyTip: string; var Handled: TKeyTipHandled);
```

C++

```
__fastcall HandleKeyTip(const UnicodeString KeyTip, TKeyTipHandled Handled);
```

Description

HandleKeyTip indicates whether this command's

KeyTip matches the currently input KeyTip by the user. Full and partial matches are taken into consideration.

See Also

KeyTip (see page 3922)

GetKeyTip (see page 3919)

HideKeyTip (see page 3920)

SetKeyTip (see page 3921)

ShowKeyTip (see page 3921)

63.1.10.4.14 TRibbonBaseButtonControl.HideKeyTip Method

Hide **KeyTip** for command.

Pascal

```
procedure HideKeyTip(const Match: string);
```

C++

```
__fastcall HideKeyTip(const UnicodeString Match);
```

Description

This method hides the **KeyTip** for this command. If the **Match** parameter matches (full or partial) the command's **KeyTip**, the **KeyTip** remains visible.

See Also

KeyTip (see page 3922)

GetKeyTip (see page 3919)

HandleKeyTip (see page 3920)

SetKeyTip (see page 3921)

63.1.10.4.15 TRibbonBaseButtonControl.IsButton Method

Pascal

```
function IsButton(out ButtonProperties: TButtonProperties): Boolean;
```

C++

```
__fastcall Boolean IsButton(TButtonProperties ButtonProperties);
```

Description

This is IsButton, a member of class TRibbonBaseButtonControl.

63.1.10.4.16 TRibbonBaseButtonControl.IsRibbonAvailable Method

Pascal

```
function IsRibbonAvailable: Boolean;
```

C++

```
__fastcall Boolean IsRibbonAvailable();
```

Description

This is IsRibbonAvailable, a member of class TRibbonBaseButtonControl.

63.1.10.4.17 TRibbonBaseButtonControl.KeyTipClick Method

Handle clicking a **KeyTip**.

Pascal

```
procedure KeyTipClick; virtual;
```

C++

```
virtual __fastcall KeyTipClick();
```

Description

KeyTipClick Handle clicking a **KeyTip**. Some requires need to be handled differently when clicked by a **KeyTip**.

63.1.10.4.18 TRibbonBaseButtonControl.RibbonStyle Method

Pascal

```
function RibbonStyle: TRibbonStyleActionBars;
```

C++

```
__fastcall TRibbonStyleActionBars RibbonStyle();
```

Description

This is RibbonStyle, a member of class TRibbonBaseButtonControl.

63.1.10.4.19 TRibbonBaseButtonControl.SetKeyTip Method

Sets **KeyTip** for command.

Pascal

```
procedure SetKeyTip(const Value: string);
```

C++

```
__fastcall SetKeyTip(const UnicodeString Value);
```

Description

This method sets the **KeyTip** for the command.

See Also

KeyTip (see page 3922)

GetKeyTip (see page 3919)

HideKeyTip (see page 3920)

ShowKeyTip (see page 3921)

63.1.10.4.20 TRibbonBaseButtonControl.ShowKeyTip Method

Shows **KeyTip** for command in specified position.

Pascal

```
procedure ShowKeyTip(const Position: TKeyTipPosition);
```

C++

```
__fastcall ShowKeyTip(const TKeyTipPosition Position);
```

Description

This method shows the **KeyTip** for the command in the position specified. Only the Application Button uses a **KeyTip** position.

See Also

KeyTip (see page 3922)

63.1.10.5 TRibbonBaseButtonControl Properties

The properties of the TRibbonBaseButtonControl class are listed here.

Protected Properties

	Name	Description
	DrawDown (see page 3626)	This is DrawDown, a member of class TRibbonBaseButtonControl.

63.1.10.5.1 TRibbonBaseButtonControl.DrawDown Property

Pascal

```
property DrawDown: Boolean;
```

C++

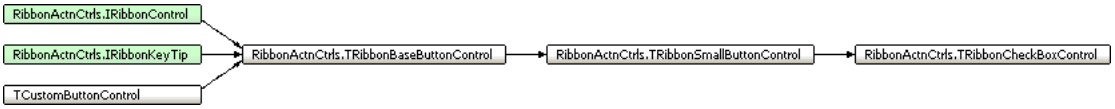
```
__property Boolean DrawDown;
```

Description

This is DrawDown, a member of class TRibbonBaseButtonControl.

63.1.11 TRibbonCheckBoxControl Class

Class Hierarchy



Pascal

```
TRibbonCheckBoxControl = class(TRibbonSmallButtonControl);
```

C++

```
class TRibbonCheckBoxControl : public TRibbonSmallButtonControl;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonCheckBoxControl.

63.1.11.1 TRibbonCheckBoxControl Members

The following tables list the members exposed by TRibbonCheckBoxControl.

Protected Methods

	Name	Description
	AllowHotKeys (see page 3619)	This is AllowHotKeys, a member of class TRibbonBaseButtonControl.
	DrawBackground (see page 3628)	Draws a background image on the control.
	DrawGlyph (see page 3628)	Draws a symbol on the control.
	DrawSeparator (see page 3621)	This is DrawSeparator, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 3622)	This is DrawShadowedText, a member of class TRibbonBaseButtonControl.
	DrawText (see page 3622)	Draws text on the control.
	GetImageSize (see page 3622)	This is GetImageSize, a member of class TRibbonBaseButtonControl.
	IsButton (see page 3624)	This is IsButton, a member of class TRibbonBaseButtonControl.
	IsRibbonAvailable (see page 3624)	This is IsRibbonAvailable, a member of class TRibbonBaseButtonControl.
	RibbonStyle (see page 3624)	This is RibbonStyle, a member of class TRibbonBaseButtonControl.

Protected Properties

	Name	Description
	DrawDown (see page 3626)	This is DrawDown, a member of class TRibbonBaseButtonControl.

Public Methods

	Name	Description
	CalcBounds (see page 3627)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 3916)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.
	CanAddToQuickAccessToolbar (see page 3620)	This is CanAddToQuickAccessToolbar, a member of class TRibbonBaseButtonControl.
	Click (see page 3620)	Executes the control's function.
	Create (see page 3617)	Creates an instance of TCustomButtonControl.
	Destroy (see page 3618)	Destroys an instance of TCustomActionControl.
	DragDrop (see page 3620)	Performs actions and generates an OnDragDrop event.
	GetKeyTip (see page 3919)	Returns current **KeyTip (see page 3922)** for command.
	GetKeyTip (see page 3622)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 3920)	Indicates if command's **KeyTip (see page 3922)** matches currently input KeyTip (see page 3922).
	HandleKeyTip (see page 3623)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 3920)	Hide **KeyTip (see page 3922)** for command.
	HideKeyTip (see page 3623)	Hide **KeyTip** for command.
	KeyTipClick (see page 3920)	Handle clicking a **KeyTip (see page 3922)**.
	KeyTipClick (see page 3624)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 3921)	Sets **KeyTip (see page 3922)** for command.
	SetKeyTip (see page 3625)	Sets **KeyTip** for command.
	ShowKeyTip (see page 3921)	Shows **KeyTip (see page 3922)** for command in specified position.
	ShowKeyTip (see page 3625)	Shows **KeyTip** for command in specified position.

Public Properties

	Name	Description
	KeyTip (see page 3922)	Current **KeyTip** for command

63.1.11.2 TRibbonCheckBoxControl Methods

The methods of the TRibbonCheckBoxControl class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 3628)	Draws a background image on the control.
	DrawGlyph (see page 3628)	Draws a symbol on the control.

Public Methods

	Name	Description
	CalcBounds (see page 3627)	Calculates the size of the control.

63.1.11.2.1 TRibbonCheckBoxControl.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

This method is largely the same as CalcBounds (TCustomActionControl), with one minor exception. The width of the control is set to be one pixel wider. For more information, see the documentation for the inherited method.

See Also

CalcBounds

63.1.11.2.2 TRibbonCheckBoxControl.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

DrawText

63.1.11.2.3 TRibbonCheckBoxControl.DrawGlyph Method

Draws a symbol on the control.

Pascal

```
procedure DrawGlyph(const Location: TPoint); override;
```

C++

```
virtual __fastcall DrawGlyph(const TPoint Location);
```

Description

Use DrawGlyph to draw a symbol on the control at the specified location.

63.1.12 TRibbonComboBox Class

Class Hierarchy

Pascal

```
TRibbonComboBox = class(TCustomRibbonComboBox);
```

C++

```
class TRibbonComboBox : public TCustomRibbonComboBox;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonComboBox.

63.1.12.1 TRibbonComboBox Members

The following tables list the members exposed by TRibbonComboBox.

Protected Methods

	Name	Description
	BeginAutoDrag (see page 3585)	Begin Automatic Drag.
	CMMouseenter (see page 3585)	This is CMMouseenter, a member of class TCustomRibbonComboBox.
	CMMouseleave (see page 3586)	This is CMMouseleave, a member of class TCustomRibbonComboBox.
	DragOver (see page 3586)	OnDragOver event dispatcher.
	KeyDown (see page 3587)	Respond to key press events.
	KeyPress (see page 3587)	Respond to keyboard input.
	MouseMove (see page 3588)	Respond to mouse moving over control area..
	Notification (see page 3588)	Responds to notifications that components are being created or destroyed.
	SetParent (see page 3589)	Sets the parent of the control.
	WMKillFocus (see page 3590)	This is WMKillFocus, a member of class TCustomRibbonComboBox.
	WMSetFocus (see page 3590)	This is WMSetFocus, a member of class TCustomRibbonComboBox.

Public Methods

	Name	Description
	Create (see page 3584)	Creates an instance of TCustomEdit.
	Destroy (see page 3584)	Destroys an instance of TWinControl.
	DragDrop (see page 3586)	OnDragDrop event dispatcher.
	SetBounds (see page 3589)	Sets the windowed control's boundary properties all at once.

Public Properties

	Name	Description
	Color (see page 3591)	Specifies the background color of the control.
	MouseInControl (see page 3592)	This is MouseInControl, a member of class TCustomRibbonComboBox.

Published Events

	Name	Description
	OnChange (see page 3648)	Occurs when the text for the edit control may have changed.
	OnClick (see page 3649)	Occurs when the user clicks the control.
	OnContextPopup (see page 3651)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 3651)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 3652)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 3655)	Occurs when the user drags an object over a control.
	OnEndDock (see page 3658)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

	OnEndDrag (see page 3658)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 3659)	Occurs when a control receives the input focus.
	OnExit (see page 3662)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 3666)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 3669)	Occurs when a key is pressed.
	OnKeyUp (see page 3670)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 3672)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 3673)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 3675)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 3676)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 3676)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 3678)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 3680)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 3681)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Published Properties

	Name	Description
	Alignment (see page 3631)	Determines how the text is aligned within the text edit control.
	AutoSelect (see page 3631)	Determines whether all the text in the edit control is automatically selected when the control gets focus.
	CharCase (see page 3632)	Determines the case of the text within the edit control.
	Font (see page 3632)	Controls the attributes of text written on or in the control.
	HideSelection (see page 3633)	Determines whether the visual indication of the selected text remains when focus shifts to another control.
	ImeMode (see page 3634)	Determines the behavior of the input method editor (IME).
	ImeName (see page 3634)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	Items (see page 3635)	This is Items, a member of class TRibbonComboBox.
	MaxLength (see page 3635)	Specifies the maximum number of characters the user can enter into the edit control.
	NumbersOnly (see page 3636)	Allows only numbers to be typed into the text edit.
	ParentFont (see page 3636)	Determines where a control looks for its font information.
	PasswordChar (see page 3636)	Indicates the character, if any, to display in place of the actual characters typed in the control.
	PopupMenu (see page 3637)	Identifies the pop-up menu associated with the control.
	ReadOnly (see page 3642)	Determines whether the user can change the text of the edit control.
	ShowHint (see page 3642)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 3644)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 3644)	Determines if the user can tab to a control.
	Text (see page 3645)	Contains a text string associated with the control.
	TextHint (see page 3646)	A hint or message to be displayed when the Text property is empty.
	Visible (see page 3646)	Determines whether the component appears onscreen.

63.1.12.2 TRibbonComboBox Properties

The properties of the TRibbonComboBox class are listed here.

Published Properties

	Name	Description
	Alignment (see page 3631)	Determines how the text is aligned within the text edit control.

	AutoSelect (see page 3631)	Determines whether all the text in the edit control is automatically selected when the control gets focus.
	CharCase (see page 3632)	Determines the case of the text within the edit control.
	Font (see page 3632)	Controls the attributes of text written on or in the control.
	HideSelection (see page 3633)	Determines whether the visual indication of the selected text remains when focus shifts to another control.
	ImeMode (see page 3634)	Determines the behavior of the input method editor (IME).
	ImeName (see page 3634)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	Items (see page 3635)	This is Items, a member of class TRibbonComboBox.
	MaxLength (see page 3635)	Specifies the maximum number of characters the user can enter into the edit control.
	NumbersOnly (see page 3636)	Allows only numbers to be typed into the text edit.
	ParentFont (see page 3636)	Determines where a control looks for its font information.
	PasswordChar (see page 3636)	Indicates the character, if any, to display in place of the actual characters typed in the control.
	PopupMenu (see page 3637)	Identifies the pop-up menu associated with the control.
	ReadOnly (see page 3642)	Determines whether the user can change the text of the edit control.
	ShowHint (see page 3642)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 3644)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 3644)	Determines if the user can tab to a control.
	Text (see page 3645)	Contains a text string associated with the control.
	TextHint (see page 3646)	A hint or message to be displayed when the Text property is empty.
	Visible (see page 3646)	Determines whether the component appears onscreen.

63.1.12.2.1 TRibbonComboBox.Alignment Property

Determines how the text is aligned within the text edit control.

Pascal

```
property Alignment;
```

C++

```
__property Alignment;
```

Description

Use Alignment to change the way the text is formatted in the text edit control. Alignment can take one of the following values:

Value	Meaning
taLeftJustify	Align text to the left side of the control
taCenter	Center text horizontally in the control.
taRightJustify	Align text to the right side of the control.

See Also

SetAlignment

Text

Displaying and Editing Fields in an Edit Box

63.1.12.2.2 TRibbonComboBox.AutoSelect Property

Determines whether all the text in the edit control is automatically selected when the control gets focus.

Pascal

```
property AutoSelect;
```

C++

```
__property AutoSelect;
```

Description

Set AutoSelect to select all the text when the edit control gets focus. AutoSelect only applies to single-line edit controls.

Use AutoSelect when the user is more likely to replace the text in the edit control than to append to it.

See Also

SelectAll

SelLength

SelStart

SelText

SetSelTextBuf

63.1.12.2.3 TRibbonComboBox.CharCase Property

Determines the case of the text within the edit control.

Pascal

```
property CharCase;
```

C++

```
__property CharCase;
```

Description

Use CharCase to force the contents of the edit control to assume a particular case.

When CharCase is set to ecLowerCase or ecUpperCase, the case of characters is converted as the user types them into the edit control. Changing the CharCase property to ecLowerCase or ecUpperCase changes the actual contents of the text, not just the appearance. Any case information is lost and can't be recaptured by changing CharCase to ecNormal.

Text

63.1.12.2.4 TRibbonComboBox.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font;
```

C++

```
__property Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

Displaying and Editing Text in a Memo Control

63.1.12.2.5 TRibbonComboBox.HideSelection Property

Determines whether the visual indication of the selected text remains when focus shifts to another control.

Pascal

```
property HideSelection;
```

C++

```
__property HideSelection;
```

Description

Set HideSelection to false to provide visual feedback of the selected portion of the text even when the edit control does not have

focus. Set HideSelection to true to show the selection only when the edit control has focus. HideSelection does not affect the actual value of the selection, only the visual indication. Always setting HideSelection to false can make forms with many edit controls look too busy.

SelStart

SelText

SetSelTextBuf

63.1.12.2.6 TRibbonComboBox.ImeMode Property

Determines the behavior of the input method editor (IME).

Pascal

```
property ImeMode;
```

C++

```
__property ImeMode;
```

Description

Set ImeMode to configure the way an IME processes user keystrokes. An IME is a front-end input processor for Asian language characters. The IME hooks all keyboard input, converts it to Asian characters in a conversion window, and sends the converted characters or strings on to the application.

ImeMode allows a control to influence the type of conversion performed by the IME so that it is appropriate for the input expected by the control. For example, a control that only accepts numeric input might specify an ImeMode of imClose, as no conversion is necessary for numeric input.

Note: The value of ImeMode only takes effect when the control receives focus. To change the value of ImeMode when the control already has input focus, call the SetIme method.

ResetIme

ResetImeComposition

SetIme

SetImeCompositionWindow

63.1.12.2.7 TRibbonComboBox.ImeName Property

Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.

Pascal

```
property ImeName;
```

C++

```
__property ImeName;
```

Description

Set ImeName to specify which IME to use for converting keystrokes. An IME is a front-end input processor for Asian language characters. The IME hooks all keyboard input, converts it to Asian characters in a conversion window, and sends the converted characters or strings on to the application.

ImeName must specify one of the IMEs that has been installed through the Windows control panel. The property inspector provides a drop-down list of all currently installed IMEs on the system. At runtime, applications can obtain a list of currently installed IMEs from the global Screen variable.

If ImeName specifies an unavailable IME, the IME that was active when the application started is used instead. No exception is generated.

Note: The value of ImeName only takes effect when the control receives focus. To change the value of ImeName after the control has input focus, call the SetIme method.

SetIme

DefaultIme

Imes

63.1.12.2.8 TRibbonComboBox.Items Property

Pascal

```
property Items: TStrings;
```

C++

```
__property TStrings Items;
```

Description

This is Items, a member of class TRibbonComboBox.

63.1.12.2.9 TRibbonComboBox.MaxLength Property

Specifies the maximum number of characters the user can enter into the edit control.

Pascal

```
property MaxLength;
```

C++

```
__property MaxLength;
```

Description

Use MaxLength to limit the number of characters that can be entered into the edit control. A value of 0 indicates that there is no application-defined limit on the length.

Use MaxLength to limit the length of the text in an edit control if that text will be copied into a fixed-length buffer.

Note: Setting MaxLength will not truncate the existing text, it merely prevents the user from adding more text after reaching the limit of MaxLength characters.

Note: Even when MaxLength is 0, there may be limitations imposed by the operating system on the number of characters that may be entered into an edit control.

Note: The unit of MaxLength is characters (not bytes) if the application is using themes.

Displaying and Editing Text in a Memo Control

Displaying and Editing Text in a Rich Edit Memo Control

63.1.12.2.10 TRibbonComboBox.NumbersOnly Property

Allows only numbers to be typed into the text edit.

Pascal

```
property NumbersOnly;
```

C++

```
__property NumbersOnly;
```

Description

Use NumbersOnly to prohibit entry of non-numeric characters in the textfield. Note, however, that a user can paste non-numeric characters in the textfield even when this property is set.

63.1.12.2.11 TRibbonComboBox.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont;
```

C++

```
__property ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

ParentShowHint

63.1.12.2.12 TRibbonComboBox.PasswordChar Property

Indicates the character, if any, to display in place of the actual characters typed in the control.

Pascal

```
property PasswordChar;
```

C++

```
__property PasswordChar;
```

Description

Use the PasswordChar property to create an edit control that displays a special character in place of any entered text. If PasswordChar is set to the null character (ANSI character zero), the edit control displays its text normally. If PasswordChar is any other character, the edit control displays PasswordChar in place of each character typed. PasswordChar affects the appearance of the edit control only. The value of the Text property reflects the actual characters that are typed.

Text

63.1.12.2.13 TRibbonComboBox.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu;
```

C++

```
__property PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
```

```
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    // The owner (PopupMenu1) will cleanup this menu item.
    TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
    int index = PopupMenu1->Items->Count;
    PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
    NewItem->Caption = "Menu Item " + IntToStr(index);
    NewItem->Tag = index;
    NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
    TNotifyEvent();
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)

OnContextPopup

63.1.12.2.14 TRibbonComboBox.ReadOnly Property

Determines whether the user can change the text of the edit control.

Pascal

```
property ReadOnly;
```

C++

```
__property ReadOnly;
```

Description

To restrict the edit control to display only, set the ReadOnly property to true. Set ReadOnly to false to allow the contents of the edit control to be edited.

Setting ReadOnly to true ensures that the text is not altered, while still allowing the user to select text. The selected text can then be manipulated by the application, or copied to the Clipboard.

CopyToClipboard

GetSelTextBuf

63.1.12.2.15 TRibbonComboBox.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint;
```

C++

```
__property ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls

example.
}

63.1.12.2.16 TRibbonComboBox.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder;
```

C++

```
__property TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

FindNextControl

TabStop

63.1.12.2.17 TRibbonComboBox.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop;
```

C++

```
__property TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder

63.1.12.2.18 TRibbonComboBox.Text Property

Contains a text string associated with the control.

Pascal

```
property Text;
```

C++

```
__property Text;
```

Description

Use the Text property to read the Text of the control or specify a new string for the Text value. By default, Text is the control name. For edit controls and memos, the Text appears within the control. For combo boxes, the Text is the content of the edit control portion of the combo box.

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
This example requires two edit boxes and a button.  This example
copies the text in an edit box into a null-terminated string, and
puts this string in another edit box when the user clicks the
button on the form.
*/
#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  int Size = Edit1->GetTextLen(); //Get length of string in Edit1
  Size++;                       //Add room for null character
//  Char *Buffer = new Char[Size];  //Creates Buffer dynamic variable
  std::auto_ptr<Char> Buffer(new Char[Size]);
  Edit1->GetTextBuf(Buffer.get(),Size); //Puts Edit1->Text into Buffer
  Edit2->Text = Buffer.get();
}
/*
Note: the same thing could be accomplished more simply as follows:
*/
void __fastcall TForm1::Button2Click(TObject *Sender)
{
  Edit2->Text = Edit1->Text;
}
```

Delphi Examples:

```
{
This example requires two edit boxes and a button.  This example
copies the text in an edit box into a null-terminated string, and
puts this string in another edit box when the user clicks the
button on the form.
}
```

```
procedure TForm1.Button1Click(Sender: TObject);
var
  Buffer: PChar;
  Size: Byte;
begin
  Size := Edit1.GetTextLen;       {Get length of string in Edit1}
  Inc(Size);                      {Add room for null character}
  GetMem(Buffer, Size);           {Creates Buffer dynamic variable}
  Edit1.GetTextBuf(Buffer,Size);  {Puts Edit1.Text into Buffer}
  Edit2.Text := StrPas(Buffer);   {Converts Buffer to a Pascal-style string}
  FreeMem(Buffer, Size);{Frees memory allocated to Buffer}
end;

{
Note: the same thing could be accomplished more simply as follows:
}
procedure TForm1.Button2Click(Sender: TObject);
begin
  Edit2.Text := Edit1.Text;
end;
```

Lines

63.1.12.2.19 TRibbonComboBox.TextHint Property

A hint or message to be displayed when the Text property is empty.

Pascal

```
property TextHint;
```

C++

```
__property TextHint;
```

Description

Use TextHint to cue the user on what kind of entry is expected in the text field. Runtime themes must be enabled.

63.1.12.2.20 TRibbonComboBox.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible;
```

C++

```
__property Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
```

```
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this); // The owner will clean this up.
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;

63.1.12.3 TRibbonComboBox Events

The events of the TRibbonComboBox class are listed here.

Published Events

	Name	Description
	OnChange (see page 3648)	Occurs when the text for the edit control may have changed.
	OnClick (see page 3649)	Occurs when the user clicks the control.
	OnContextPopup (see page 3651)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 3651)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 3652)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 3655)	Occurs when the user drags an object over a control.
	OnEndDock (see page 3658)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 3658)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 3659)	Occurs when a control receives the input focus.
	OnExit (see page 3662)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 3666)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 3669)	Occurs when a key is pressed.
	OnKeyUp (see page 3670)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 3672)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 3673)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 3675)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 3676)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 3676)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 3678)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 3680)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 3681)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

63.1.12.3.1 TRibbonComboBox.OnChange Event

Occurs when the text for the edit control may have changed.

Pascal

```
property OnChange;
```

C++

```
__property OnChange;
```

Description

Write an OnChange event handler to take specific action whenever the text for the edit control may have changed. Use the Modified property to see if a change actually occurred. The Text property of the edit control will already be updated to reflect any changes. This event provides the first opportunity to respond to modifications that the user types into the edit control.

Change

Text

63.1.12.3.2 TRibbonComboBox.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick;
```

C++

```
__property OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}
```

```
void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this); // The owner will clean this up.
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

63.1.12.3.3 TRibbonComboBox.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup;
```

C++

```
__property OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

63.1.12.3.4 TRibbonComboBox.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick;
```

C++

```
__property OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

See Also

OnClick

Responding to User Actions at Runtime

63.1.12.3.5 TRibbonComboBox.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop;
```

C++

```
__property OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

{
  reinterpret_cast<TForm1 *>(Source)->Left = X;
  reinterpret_cast<TForm1 *>(Source)->Top = Y;
}

void __fastcall TForm1::FormDragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = Source->ClassNameIs("TLabel");
}

void __fastcall TForm1::Panel1DragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = false;
  if ((Source->ClassNameIs("TLabel")) && (State == dsDragEnter))
    dynamic_cast<TLabel *>(Source)->EndDrag(false);
}
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
```

```
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = dynamic_cast<TListBox *>(Sender);
    DestList->Font = (dynamic_cast<TLabel *>(Source))->Font;
    DestList->Color = (dynamic_cast<TLabel *>(Source))->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}

63.1.12.3.6 TRibbonComboBox.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver;
```

C++

```
__property OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

63.1.12.3.9 TRibbonComboBox.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter;
```

C++

```
__property OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/

Using a Single Navigator for Multiple Datasets

63.1.12.3.10 TRibbonComboBox.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit;
```

C++

```
__property OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses three mask edit components on a form,
where the third mask edit box is set to be read only.
When the application runs, it initializes the mask edit boxes
to contain the empty string, to use the Courier font and to
use a particular mask, corresponding to IP address coding convetions.
The mask edit boxes display the IP address, the subnet mask
and the subnet address correspondingly. When the user exits the
subnet mask edit box, the subnet address is automatically calculated
using bit-wise AND operations and displayed in the third mask edit box.
An additional test is made to assure that the values in the IP address
and in the subnet mask are in the interval from 0 to 255 ,
as this validation test cannot be accomplished
using the edit mask property alone.
*/

OnEnter

ActiveControl

63.1.12.3.11 TRibbonComboBox.OnKeyDown Event

Occurs when a user presses any key while the control has focus.

Pascal

```
property OnKeyDown;
```

C++

```
__property OnKeyDown;
```

Description

Use the OnKeyDown event handler to specify special processing to occur when a key is pressed. The OnKeyDown handler can respond to keyboard keys, including function keys and keys combined with the `Shift`, `Alt`, and `Ctrl` keys, and pressed mouse buttons.

Note: TCheckBox does not fire OnKeyDown events for arrow keys.

The TKeyEvent type points to a method that handles keyboard events.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.

OnKeyPress

OnKeyUp

63.1.12.3.12 TRibbonComboBox.OnKeyPress Event

Occurs when a key is pressed.

Pascal

```
property OnKeyPress;
```

C++

```
__property OnKeyPress;
```

Description

Use the OnKeyPress event handler to make something happen as a result of a single character key press.

The Key parameter in the OnKeyPress event handler is of type Char; therefore, the OnKeyPress event registers the ASCII

character of the key pressed. Keys that don't correspond to an ASCII Char value (Shift or F1, for example) don't generate an OnKeyPress event. Key combinations (such as Shift+A), generate only one OnKeyPress event (for this example, Shift+A results in a Key value of "A" if Caps Lock is off). To respond to non-ASCII keys or key combinations, use the OnKeyDown or OnKeyUp event handlers.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This event handler displays a message dialog box specifying
which key was pressed:
*/

void __fastcall TForm1::FormKeyPress(TObject *Sender, char &Key)
{
  char keyString[25];
  keyString[0] = Key;
  strcpy(&keyString[1], " Was Pressed");
  TMsgDlgButtons() << mbOK;
  MessageDlg(AnsiString(keyString), TMsgDlgType(mtInformation), TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This event handler displays a message dialog box specifying
which key was pressed:
}
procedure TForm1.FormKeyPress(Sender: TObject; var Key: Char);
begin
  MessageDlg(Key + ' has been pressed', mtInformation, [mbOK], 0)
end;
```

OnKeyDown

OnKeyUp

KeyPreview

63.1.12.3.13 TRibbonComboBox.OnKeyUp Event

Occurs when the user releases a key that has been pressed.

Pascal

```
property OnKeyUp;
```

C++

```
__property OnKeyUp;
```

Description

Use the OnKeyUp event handler to provide special processing that occurs when a key is released. The OnKeyUp handler can

respond to all keyboard keys, including function keys and keys combined with the Shift, Alt, and Ctrl keys.

The TKeyEvent type points to a method that handles keyboard events. The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.

OnKeyDown

OnKeyPress

63.1.12.3.14 TRibbonComboBox.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate;
```

C++

```
__property OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

MouseCapture

63.1.12.3.15 TRibbonComboBox.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown;
```

C++

```
__property OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
```

```
*/

63.1.12.3.16 TRibbonComboBox.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter;
```

C++

```
__property OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

63.1.12.3.17 TRibbonComboBox.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave;
```

C++

```
__property OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

63.1.12.3.18 TRibbonComboBox.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove;
```

C++

```
__property OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse

MouseCapture

63.1.12.3.19 TRibbonComboBox.OnMouseUp Event

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Pascal

```
property OnMouseUp;
```

C++

```
__property OnMouseUp;
```

Description

Use an OnMouseUp event handler to implement special processing when the user releases a mouse button.

The OnMouseUp event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
```

```
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
}
procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X,
```

```
  Y: Integer);
  begin
    StartX := X;
    StartY := Y;
  end;

  procedure TForm1.FormMouseUp(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X, Y:
  Integer);
  begin
    Form1.Canvas.Rectangle(StartX, StartY, X, Y);
    StatusBar1.Panels[0].Text := '';
    StatusBar1.Panels[1].Text := '';
    StatusBar1.Panels[2].Text := '';
    StatusBar1.Panels[3].Text := '';
  end;

  procedure TForm1.FormMouseMove(Sender: TObject; Shift: TShiftState; X, Y: Integer);
  begin
    if ssLeft in Shift then { make sure button is down }
    begin
      if Y > StartY then
        begin
        StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
        StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
        end
      else
        begin
        StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
        StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
        end;
      if X > StartX then
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
        end
      else
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
        end;
    end;
  end;
```

OnMouseMove

Responding to a Mouse-up Action

63.1.12.3.20 TRibbonComboBox.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock;
```

C++

```
__property OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

OnDockDrop

63.1.12.3.21 TRibbonComboBox.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag;
```

C++

```
__property OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonComboBoxItem.

63.1.13.1 TRibbonComboBoxItem Members

The following tables list the members exposed by TRibbonComboBoxItem.

Protected Methods

	Name	Description
	CalcLayout (see page 3757)	This is CalcLayout, a member of class TRibbonMenuItem.
	DrawBackground (see page 3683)	Draws a background image on the control.
	DrawGlyph (see page 3758)	Draws a symbol on the control.
	DrawSelectedBackground (see page 3758)	This is DrawSelectedBackground, a member of class TRibbonMenuItem.
	DrawSeparator (see page 3759)	This is DrawSeparator, a member of class TRibbonMenuItem.
	DrawShadowedText (see page 3759)	This is DrawShadowedText, a member of class TRibbonMenuItem.
	DrawText (see page 3683)	Draws text on the control.
	GetShowShortCut (see page 3759)	This is GetShowShortCut, a member of class TRibbonMenuItem.
	RibbonStyle (see page 3760)	This is RibbonStyle, a member of class TRibbonMenuItem.

Protected Properties

	Name	Description
	DrawBanner (see page 3760)	This is DrawBanner, a member of class TRibbonMenuItem.

Public Methods

	Name	Description
	CalcBounds (see page 3683)	Calculates the size of the menu item.
	Click (see page 3757)	Executes the control's function.
	Create (see page 3756)	Creates an instance of TCustomMenuItem.

63.1.13.2 TRibbonComboBoxItem Methods

The methods of the TRibbonComboBoxItem class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 3683)	Draws a background image on the control.
	DrawText (see page 3683)	Draws text on the control.

Public Methods

	Name	Description
	CalcBounds (see page 3683)	Calculates the size of the menu item.

63.1.13.2.1 TRibbonComboBoxItem.CalcBounds Method

Calculates the size of the menu item.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as whether or not the menu item is a separator or not. CalcBounds computes the boundaries of the menu item considering these kinds of factors. At the end, it calls SetBounds and other routines to ensure that the values are set properly.

See Also

SetBounds

63.1.13.2.2 TRibbonComboBoxItem.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

63.1.13.2.3 TRibbonComboBoxItem.DrawText Method

Draws text on the control.

Pascal

```
procedure DrawText(var ARect: TRect; var Flags: Cardinal; Text: string); override;
```

C++

```
virtual __fastcall DrawText(TRect ARect, unsigned Flags, UnicodeString Text);
```

Description

Use DrawText to draw the text specified by Text on the control within the area specified by ARect.

See Also

DrawBackground

DrawGlyph

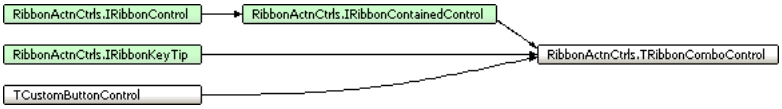
Class Hierarchy



Pascal

```
TRibbonComboControl = class(TCustomButtonControl, IRibbonContainedControl, IRibbonKeyTip);
```

C++

```
class TRibbonComboControl : public TCustomButtonControl, public IRibbonContainedControl,
public IRibbonKeyTip;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonComboControl.

63.1.14.1 TRibbonComboControl Members

The following tables list the members exposed by TRibbonComboControl.

Protected Methods

	Name	Description
	CMBidimodechanged (see page 3688)	This is CMBidimodechanged, a member of class TRibbonComboControl.
	CMMouseenter (see page 3688)	This is CMMouseenter, a member of class TRibbonComboControl.
	CMMouseleave (see page 3688)	This is CMMouseleave, a member of class TRibbonComboControl.
	CMVisiblechanged (see page 3689)	This is CMVisiblechanged, a member of class TRibbonComboControl.
	ComboClick (see page 3689)	This is ComboClick, a member of class TRibbonComboControl.
V	DrawBackground (see page 3689)	Draws a background image on the control.
	DrawFrame (see page 3689)	This is DrawFrame, a member of class TRibbonComboControl.
V	DropDownClick (see page 3690)	This is DropDownClick, a member of class TRibbonComboControl.
	GetCaptionWidth (see page 3690)	This is GetCaptionWidth, a member of class TRibbonComboControl.
	GetGlyphWidth (see page 3690)	This is GetGlyphWidth, a member of class TRibbonComboControl.
	GetLabelWidth (see page 3691)	This is GetLabelWidth, a member of class TRibbonComboControl.
V	MouseDown (see page 3692)	OnMouseDown event dispatcher.
V	Notification (see page 3693)	Responds to notifications that components are being created or destroyed.
V	Paint (see page 3693)	Render control surface.
	RibbonStyle (see page 3694)	This is RibbonStyle, a member of class TRibbonComboControl.

	SetActionClient (see page 3694)	This is SetActionClient, a member of class TRibbonComboControl.
	SetDragMode (see page 3695)	Sets the drag mode for the control.
	SetParent (see page 3695)	Sets the parent of the control.
	ShowComboItems (see page 3696)	This is ShowComboItems, a member of class TRibbonComboControl.

Public Methods

	Name	Description
	CalcBounds (see page 3687)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 3687)	This is CanAddToQuickAccessToolbar, a member of class TRibbonComboControl.
	Click (see page 3688)	Executes the control's function.
	Create (see page 3685)	Creates an instance of TCustomButtonControl.
	Destroy (see page 3686)	Destroys an instance of TCustomActionControl.
	GetContainedControl (see page 3690)	This is GetContainedControl, a member of class TRibbonComboControl.
	GetKeyTip (see page 3690)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 3691)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 3692)	Hide **KeyTip** for command.
	KeyTipClick (see page 3692)	Handle clicking a **KeyTip**.
	SetBounds (see page 3694)	Sets the Left, Top, Width, and Height properties all at once.
	SetContainedControl (see page 3694)	This is SetContainedControl, a member of class TRibbonComboControl.
	SetKeyTip (see page 3695)	Sets **KeyTip** for command.
	ShowKeyTip (see page 3696)	Shows **KeyTip** for command in specified position.

Public Properties

	Name	Description
	ComboBox (see page 3697)	This is ComboBox, a member of class TRibbonComboControl.
	ContainedControl (see page 3697)	This is ContainedControl, a member of class TRibbonComboControl.
	KeyTip (see page 3922)	Current **KeyTip** for command
	MouseInControl (see page 3697)	This is MouseInControl, a member of class TRibbonComboControl.

63.1.14.2 TRibbonComboControl.Create Constructor

Creates an instance of TCustomButtonControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonComboControl(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomButtonControl. However, you should never attempt to instantiate a TCustomButtonControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

AOwner is the component that is responsible for freeing the button control. It becomes the value of the Owner property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

See Also

Owner

Create

Destroy

63.1.14.3 TRibbonComboControl.Destroy Destructor

Destroys an instance of TCustomActionControl.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRibbonComboControl();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the graphic control reference is not nil, and only then calls Destroy.

Applications should only free controls explicitly when the constructor was called without assigning an owner to the control.

As the control is destroyed, it:

Frees the TCanvas object in its Canvas property.

Override Destroy to free any memory or resources allocated in the Create method. When declaring a Destroy method in a descendant control type, always add the override directive to the declaration and call the inherited Destroy as the last statement in the redeclared method.

When a control is created, Delphi automatically provides exception handling around the constructor call. The destructor is called if an exception escapes from the constructor. This means that the destructor code must be prepared to clean up a partially constructed instance. Check all data fields for zero before disposing of their contents.

63.1.14.4 TRibbonComboControl Methods

The methods of the TRibbonComboControl class are listed here.

Protected Methods

	Name	Description
	CMBidimodechanged (see page 3688)	This is CMBidimodechanged, a member of class TRibbonComboControl.
	CMMouseenter (see page 3688)	This is CMMouseenter, a member of class TRibbonComboControl.
	CMMouseleave (see page 3688)	This is CMMouseleave, a member of class TRibbonComboControl.
	CMVisiblechanged (see page 3689)	This is CMVisiblechanged, a member of class TRibbonComboControl.
	ComboClick (see page 3689)	This is ComboClick, a member of class TRibbonComboControl.
V	DrawBackground (see page 3689)	Draws a background image on the control.
	DrawFrame (see page 3689)	This is DrawFrame, a member of class TRibbonComboControl.
V	DropDownClick (see page 3690)	This is DropDownClick, a member of class TRibbonComboControl.
	GetCaptionWidth (see page 3690)	This is GetCaptionWidth, a member of class TRibbonComboControl.
	GetGlyphWidth (see page 3690)	This is GetGlyphWidth, a member of class TRibbonComboControl.
	GetLabelWidth (see page 3691)	This is GetLabelWidth, a member of class TRibbonComboControl.
V	MouseDown (see page 3692)	OnMouseDown event dispatcher.
V	Notification (see page 3693)	Responds to notifications that components are being created or destroyed.

	Paint (see page 3693)	Render control surface.
	RibbonStyle (see page 3694)	This is RibbonStyle, a member of class TRibbonComboControl.
	SetActionClient (see page 3694)	This is SetActionClient, a member of class TRibbonComboControl.
	SetDragMode (see page 3695)	Sets the drag mode for the control.
	SetParent (see page 3695)	Sets the parent of the control.
	ShowComboItems (see page 3696)	This is ShowComboItems, a member of class TRibbonComboControl.

Public Methods

	Name	Description
	CalcBounds (see page 3687)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 3687)	This is CanAddToQuickAccessToolbar, a member of class TRibbonComboControl.
	Click (see page 3688)	Executes the control's function.
	GetContainedControl (see page 3690)	This is GetContainedControl, a member of class TRibbonComboControl.
	GetKeyTip (see page 3690)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 3691)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 3692)	Hide **KeyTip** for command.
	KeyTipClick (see page 3692)	Handle clicking a **KeyTip**.
	SetBounds (see page 3694)	Sets the Left, Top, Width, and Height properties all at once.
	SetContainedControl (see page 3694)	This is SetContainedControl, a member of class TRibbonComboControl.
	SetKeyTip (see page 3695)	Sets **KeyTip** for command.
	ShowKeyTip (see page 3696)	Shows **KeyTip** for command in specified position.

63.1.14.4.1 TRibbonComboControl.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

This method is largely the same as CalcBounds (TCustomActionControl), with one minor exception. The width of the control is set to be one pixel wider. For more information, see the documentation for the inherited method.

See Also

CalcBounds

63.1.14.4.2 TRibbonComboControl.CanAddToQuickAccessToolbar Method

Pascal

```
function CanAddToQuickAccessToolbar: Boolean;
```

C++

```
__fastcall Boolean CanAddToQuickAccessToolbar();
```

Description

This is CanAddToQuickAccessToolbar, a member of class TRibbonComboControl.

63.1.14.4.3 TRibbonComboControl.Click Method

Executes the control's function.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

This override of the method inherited from TCustomActionControl is almost identical to the inherited method. The only difference is that if the button control is being manipulated at design time, extra actions are taken to ensure that the control is properly selected.

63.1.14.4.4 TRibbonComboControl.CMBidimodechanged Method

Pascal

```
procedure CMBidimodechanged(var Message: TMessage); message CM_BIDIMODECHANGED;
```

C++

```
__fastcall CMBidimodechanged(TMessage Message);
```

Description

This is CMBidimodechanged, a member of class TRibbonComboControl.

63.1.14.4.5 TRibbonComboControl.CMMouseenter Method

Pascal

```
procedure CMMouseenter(var Message: TMessage); message CM_MOUSEENTER;
```

C++

```
__fastcall CMMouseenter(TMessage Message);
```

Description

This is CMMouseenter, a member of class TRibbonComboControl.

63.1.14.4.6 TRibbonComboControl.CMMouseleave Method

Pascal

```
procedure CMMouseleave(var Message: TMessage); message CM_MOUSELEAVE;
```

C++

```
__fastcall CMMouseleave(TMessage Message);
```

Description

This is CMMouseleave, a member of class TRibbonComboControl.

63.1.14.4.7 TRibbonComboControl.CMVisiblechanged Method

Pascal

```
procedure CMVisiblechanged(var Message: TMessage); message CM_VISIBLECHANGED;
```

C++

```
__fastcall CMVisiblechanged(TMessage Message);
```

Description

This is CMVisiblechanged, a member of class TRibbonComboControl.

63.1.14.4.8 TRibbonComboControl.ComboClick Method

Pascal

```
procedure ComboClick(Sender: TObject);
```

C++

```
__fastcall ComboClick(TObject * Sender);
```

Description

This is ComboClick, a member of class TRibbonComboControl.

63.1.14.4.9 TRibbonComboControl.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

DrawText

63.1.14.4.10 TRibbonComboControl.DrawFrame Method

Pascal

```
procedure DrawFrame; reintroduce;
```

C++

```
__fastcall DrawFrame();
```

Description

This is DrawFrame, a member of class TRibbonComboControl.

63.1.14.4.11 TRibbonComboControl.DropDownClick Method

Pascal

```
procedure DropDownClick(const SelectFirst: Boolean); virtual;
```

C++

```
virtual __fastcall DropDownClick(const Boolean SelectFirst);
```

Description

This is DropDownClick, a member of class TRibbonComboControl.

63.1.14.4.12 TRibbonComboControl.GetCaptionWidth Method

Pascal

```
function GetCaptionWidth: Integer;
```

C++

```
__fastcall int GetCaptionWidth();
```

Description

This is GetCaptionWidth, a member of class TRibbonComboControl.

63.1.14.4.13 TRibbonComboControl.GetContainedControl Method

Pascal

```
function GetContainedControl: TControl;
```

C++

```
__fastcall TControl * GetContainedControl();
```

Description

This is GetContainedControl, a member of class TRibbonComboControl.

63.1.14.4.14 TRibbonComboControl.GetGlyphWidth Method

Pascal

```
function GetGlyphWidth: Integer;
```

C++

```
__fastcall int GetGlyphWidth();
```

Description

This is GetGlyphWidth, a member of class TRibbonComboControl.

63.1.14.4.15 TRibbonComboControl.GetKeyTip Method

Returns current **KeyTip** for command.

Pascal

```
function GetKeyTip: string;
```

C++

```
__fastcall UnicodeString GetKeyTip();
```

Description

GetKeyTip returns the current **KeyTip** for the command

63.1.14.4.16 TRibbonComboControl.GetLabelWidth Method

Pascal

```
function GetLabelWidth: Integer;
```

C++

```
__fastcall int GetLabelWidth();
```

Description

This is GetLabelWidth, a member of class TRibbonComboControl.

63.1.14.4.17 TRibbonComboControl.HandleKeyTip Method

Indicates if command's **KeyTip** matches currently input KeyTip.

Pascal

```
procedure HandleKeyTip(const KeyTip: string; var Handled: TKeyTipHandled);
```

C++

```
__fastcall HandleKeyTip(const UnicodeString KeyTip, TKeyTipHandled Handled);
```

Description

HandleKeyTip indicates whether this command's

KeyTip matches the currently input KeyTip by the user. Full and partial matches are taken into consideration.

63.1.14.4.18 TRibbonComboControl.HideKeyTip Method

Hide **KeyTip** for command.

Pascal

```
procedure HideKeyTip(const Match: string);
```

C++

```
__fastcall HideKeyTip(const UnicodeString Match);
```

Description

This method hides the **KeyTip** for this command. If the **Match** parameter matches (full or partial) the command's **KeyTip**, the **KeyTip** remains visible.

See Also

KeyTip (see page 3922)

63.1.14.4.19 TRibbonComboControl.KeyTipClick Method

Handle clicking a **KeyTip**.

Pascal

```
procedure KeyTipClick;
```

C++

```
__fastcall KeyTipClick();
```

Description

KeyTipClick Handle clicking a **KeyTip**. Some requires need to be handled differently when clicked by a **KeyTip**.

63.1.14.4.20 TRibbonComboControl.MouseDown Method

OnMouseDown event dispatcher.

Pascal

```
procedure MouseDown(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer);
override;
```

C++

```
virtual __fastcall MouseDown(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user presses the mouse button down while the cursor's hotspot is over the control.

The Button parameter determines which mouse button the user pressed. Shift indicates which shift keys (Shift, Ctrl, or Alt) were down when the user pressed the mouse button. X and Y are the pixel coordinates of the mouse pointer within the client area of

the control.

A control calls MouseDown in response to any of the Windows mouse-down messages (WM_LBUTTONDOWN, WM_MBUTTONDOWN, WM_RBUTTONDOWN), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was pressed down: left, right, or middle.

MouseUp

OnMouseDown

63.1.14.4.21 TRibbonComboControl.Notification Method

Responds to notifications that components are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification allows TControl to update its PopupMenu property when the pop-up menu it refers to is destroyed.

Override the Notification method to respond to notifications that other components are about to be destroyed or have just been created. Use the Notification method to update controls that rely on other objects. Remove references to objects that are going away so that the control does not refer to objects that have been destroyed. For example, data-aware objects override the Notification method to update themselves when their data source is removed. Some objects respond to notifications that other objects of a specific type are being created. For example, the session component sets the Session property of new data-aware controls to itself when the AutoSessionName property is true.

By default, components pass along the notification to their owned components, if any.

PopupMenu

Notification

63.1.14.4.22 TRibbonComboControl.Paint Method

Render control surface.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method is called automatically when a lightweight control needs update its display area. Code in the Paint method uses the Canvas property to render the control surface.

As implemented in TGraphicControl, Paint does nothing. Specific rendering logic is provided by Paint methods in descendant

control classes.

See Also

Canvas

63.1.14.4.23 TRibbonComboControl.RibbonStyle Method

Pascal

```
function RibbonStyle: TRibbonStyleActionBars;
```

C++

```
__fastcall TRibbonStyleActionBars RibbonStyle();
```

Description

This is RibbonStyle, a member of class TRibbonComboControl.

63.1.14.4.24 TRibbonComboControl.SetActionClient Method

Pascal

```
procedure SetActionClient(Value: TActionClientItem); override;
```

C++

```
virtual __fastcall SetActionClient(TActionClientItem Value);
```

Description

This is SetActionClient, a member of class TRibbonComboControl.

63.1.14.4.25 TRibbonComboControl.SetBounds Method

Sets the Left, Top, Width, and Height properties all at once.

Pascal

```
procedure SetBounds(ALeft: Integer; ATop: Integer; AWidth: Integer; AHeight: Integer);
override;
```

C++

```
virtual __fastcall SetBounds(int ALeft, int ATop, int AWidth, int AHeight);
```

Description

This override of the method inherited from TControl simultaneously sets all boundary properties at once, and thus avoiding the possibility of a control redraw between the time one value sets and another. In addition, some layout calculations are also performed.

See Also

SetBounds

63.1.14.4.26 TRibbonComboControl.SetContainedControl Method

Pascal

```
procedure SetContainedControl(const Value: TControl);
```

C++

```
__fastcall SetContainedControl(const TControl * Value);
```

Description

This is SetContainedControl, a member of class TRibbonComboControl.

63.1.14.4.27 TRibbonComboControl.SetDragMode Method

Sets the drag mode for the control.

Pascal

```
procedure SetDragMode(Value: TDragMode); override;
```

C++

```
virtual __fastcall SetDragMode(TDragMode Value);
```

Description

SetDragMode is the protected write implementation for the DragMode property. Override SetDragMode to execute additional code when the value of the DragMode property changes.

See Also

DragMode

63.1.14.4.28 TRibbonComboControl.SetKeyTip Method

Sets **KeyTip** for command.

Pascal

```
procedure SetKeyTip(const Value: string);
```

C++

```
__fastcall SetKeyTip(const UnicodeString Value);
```

Description

This method sets the **KeyTip** for the command.

HideKeyTip (see page 3920)

ShowKeyTip (see page 3921)

63.1.14.4.29 TRibbonComboControl.SetParent Method

Sets the parent of the control.

Pascal

```
procedure SetParent(AParent: TWinControl); override;
```

C++

```
virtual __fastcall SetParent(TWinControl * AParent);
```

Description

SetParent is the protected implementation of the Parent property. Override SetParent to execute additional code when the value of the Parent property changes.

The AParent parameter specifies the new parent of the control.

If the control already has a parent, SetParent removes the control from that parent's list of controls by calling the parent's RemoveControl method. If AParent is not nil (Delphi) or NULL (C++), SetParent calls its InsertControl method to add the control to its list of controls.

The TControl destructor calls SetParent(nil (Delphi) or NULL (C++)) to remove the control from its parent's control list before destroying the component.

63.1.14.4.30 TRibbonComboControl.ShowComboItems Method

Pascal

```
procedure ShowComboItems(const SelectFirst: Boolean); virtual;
```

C++

```
virtual __fastcall ShowComboItems(const Boolean SelectFirst);
```

Description

This is ShowComboItems, a member of class TRibbonComboControl.

63.1.14.4.31 TRibbonComboControl.ShowKeyTip Method

Shows **KeyTip** for command in specified position.

Pascal

```
procedure ShowKeyTip(const Position: TKeyTipPosition);
```

C++

```
__fastcall ShowKeyTip(const TKeyTipPosition Position);
```

Description

This method shows the **KeyTip** for the command in the position specified. Only the Application Button uses a **KeyTip** position.

63.1.14.5 TRibbonComboControl Properties

The properties of the TRibbonComboControl class are listed here.

Public Properties

	Name	Description
	ComboBox (see page 3697)	This is ComboBox, a member of class TRibbonComboControl.
	ContainedControl (see page 3697)	This is ContainedControl, a member of class TRibbonComboControl.
	MouseInControl (see page 3697)	This is MouseInControl, a member of class TRibbonComboControl.

63.1.14.5.1 TRibbonComboControl.ComboBox Property

Pascal

```
property ComboBox: TCustomRibbonComboBox;
```

C++

```
__property TCustomRibbonComboBox ComboBox;
```

Description

This is ComboBox, a member of class TRibbonComboControl.

63.1.14.5.2 TRibbonComboControl.ContainedControl Property

Pascal

```
property ContainedControl: TControl;
```

C++

```
__property TControl * ContainedControl;
```

Description

This is ContainedControl, a member of class TRibbonComboControl.

63.1.14.5.3 TRibbonComboControl.MouseInControl Property

Pascal

```
property MouseInControl: Boolean;
```

C++

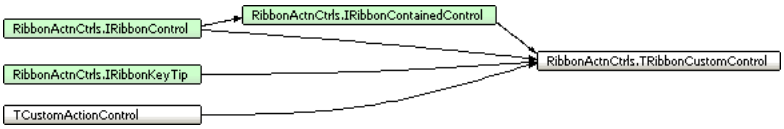
```
__property Boolean MouseInControl;
```

Description

This is MouseInControl, a member of class TRibbonComboControl.

63.1.15 TRibbonCustomControl Class

Class Hierarchy



Pascal

```
TRibbonCustomControl = class(TCustomActionControl, IRibbonControl, IRibbonContainedControl,
IRibbonKeyTip);
```

C++

```
class TRibbonCustomControl : public TCustomActionControl, public IRibbonControl, public
IRibbonContainedControl, public IRibbonKeyTip;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonCustomControl.

63.1.15.1 TRibbonCustomControl Members

The following tables list the members exposed by TRibbonCustomControl.

Protected Methods

	Name	Description
	CMVisiblechanged (see page 3701)	This is CMVisiblechanged, a member of class TRibbonCustomControl.
V	DrawBackground (see page 3702)	Draws a background image on the control.
	GetCaptionWidth (see page 3702)	This is GetCaptionWidth, a member of class TRibbonCustomControl.
	GetGlyphWidth (see page 3702)	This is GetGlyphWidth, a member of class TRibbonCustomControl.
	GetLabelWidth (see page 3703)	This is GetLabelWidth, a member of class TRibbonCustomControl.
V	Notification (see page 3704)	Responds to notifications that components are being created or destroyed.
V	Paint (see page 3705)	Render control surface.
V	SetActionClient (see page 3705)	This is SetActionClient, a member of class TRibbonCustomControl.
V	SetDragMode (see page 3708)	Sets the drag mode for the control.
V	SetParent (see page 3709)	Sets the parent of the control.

Public Methods

	Name	Description
V	CalcBounds (see page 3700)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 3701)	This is CanAddToQuickAccessToolbar, a member of class TRibbonCustomControl.
V	Click (see page 3701)	Executes the control's function in response to a mouse click.
V	Create (see page 3699)	Creates an instance of TCustomActionControl.
V	Destroy (see page 3699)	Destroys an instance of TCustomActionControl.
	GetContainedControl (see page 3702)	This is GetContainedControl, a member of class TRibbonCustomControl.
	GetKeyTip (see page 3703)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 3703)	Indicates if command's **KeyTip** matches currently input KeyTip.

	HideKeyTip (see page 3704)	Hide **KeyTip** for command.
	KeyTipClick (see page 3704)	Handle clicking a **KeyTip**.
	SetBounds (see page 3705)	Sets the Left, Top, Width, and Height properties all at once.
	SetContainedControl (see page 3708)	This is SetContainedControl, a member of class TRibbonCustomControl.
	SetKeyTip (see page 3708)	Sets **KeyTip** for command.
	ShowKeyTip (see page 3709)	Shows **KeyTip** for command in specified position.

Public Properties

	Name	Description
	ContainedControl (see page 3710)	This is ContainedControl, a member of class TRibbonCustomControl.
	KeyTip (see page 3922)	Current **KeyTip** for command

63.1.15.2 TRibbonCustomControl.Create Constructor

Creates an instance of TCustomActionControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonCustomControl(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomActionControl. However, you should never attempt to instantiate a TCustomActionControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

AOwner is the component that is responsible for freeing the TCustomActionControl instance. It becomes the value of the Owner property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

See Also

Owner

Create

Destroy

63.1.15.3 TRibbonCustomControl.Destroy Destructor

Destroys an instance of TCustomActionControl.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRibbonCustomControl();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the graphic control reference is not nil, and only then calls Destroy.

Applications should only free controls explicitly when the constructor was called without assigning an owner to the control.

As the control is destroyed, it:

Frees the TCanvas object in its Canvas property.

Override Destroy to free any memory or resources allocated in the Create method. When declaring a Destroy method in a descendant control type, always add the override directive to the declaration and call the inherited Destroy as the last statement in the redeclared method.

When a control is created, Delphi automatically provides exception handling around the constructor call. The destructor is called if an exception escapes from the constructor. This means that the destructor code must be prepared to clean up a partially constructed instance. Check all data fields for zero before disposing of their contents.

63.1.15.4 TRibbonCustomControl Methods

The methods of the TRibbonCustomControl class are listed here.

Protected Methods

	Name	Description
	CMVisiblechanged (see page 3701)	This is CMVisiblechanged, a member of class TRibbonCustomControl.
V	DrawBackground (see page 3702)	Draws a background image on the control.
	GetCaptionWidth (see page 3702)	This is GetCaptionWidth, a member of class TRibbonCustomControl.
	GetGlyphWidth (see page 3702)	This is GetGlyphWidth, a member of class TRibbonCustomControl.
	GetLabelWidth (see page 3703)	This is GetLabelWidth, a member of class TRibbonCustomControl.
V	Notification (see page 3704)	Responds to notifications that components are being created or destroyed.
V	Paint (see page 3705)	Render control surface.
V	SetActionClient (see page 3705)	This is SetActionClient, a member of class TRibbonCustomControl.
V	SetDragMode (see page 3708)	Sets the drag mode for the control.
V	SetParent (see page 3709)	Sets the parent of the control.

Public Methods

	Name	Description
V	CalcBounds (see page 3700)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 3701)	This is CanAddToQuickAccessToolbar, a member of class TRibbonCustomControl.
V	Click (see page 3701)	Executes the control's function in response to a mouse click.
	GetContainedControl (see page 3702)	This is GetContainedControl, a member of class TRibbonCustomControl.
	GetKeyTip (see page 3703)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 3703)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 3704)	Hide **KeyTip** for command.
	KeyTipClick (see page 3704)	Handle clicking a **KeyTip**.
V	SetBounds (see page 3705)	Sets the Left, Top, Width, and Height properties all at once.
	SetContainedControl (see page 3708)	This is SetContainedControl, a member of class TRibbonCustomControl.
	SetKeyTip (see page 3708)	Sets **KeyTip** for command.
	ShowKeyTip (see page 3709)	Shows **KeyTip** for command in specified position.

63.1.15.4.1 TRibbonCustomControl.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as the presence of an icon, caption, and shortcuts. CalcBounds computes the boundaries of the control considering these kinds of factors. At the end, it calls SetBounds and other routines to ensure that the values are set properly.

See Also

SetBounds

63.1.15.4.2 TRibbonCustomControl.CanAddToQuickAccessToolbar Method

Pascal

```
function CanAddToQuickAccessToolbar: Boolean;
```

C++

```
__fastcall Boolean CanAddToQuickAccessToolbar();
```

Description

This is CanAddToQuickAccessToolbar, a member of class TRibbonCustomControl.

63.1.15.4.3 TRibbonCustomControl.Click Method

Executes the control's function in response to a mouse click.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

This override of the method inherited from TControl executes the control's function in response to a user's mouse click. Usage data, which is used to determine whether a control is used frequently enough to be shown by default, is updated as well.

Click

UsageCount

Keyed

63.1.15.4.4 TRibbonCustomControl.CMVisiblechanged Method

Pascal

```
procedure CMVisiblechanged(var Message: TMessage); message CM_VISIBLECHANGED;
```

C++

```
__fastcall CMVisiblechanged(TMessage Message);
```

Description

This is CMVisiblechanged, a member of class TRibbonCustomControl.

63.1.15.4.5 TRibbonCustomControl.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

63.1.15.4.6 TRibbonCustomControl.GetCaptionWidth Method

Pascal

```
function GetCaptionWidth: Integer;
```

C++

```
__fastcall int GetCaptionWidth();
```

Description

This is GetCaptionWidth, a member of class TRibbonCustomControl.

63.1.15.4.7 TRibbonCustomControl.GetContainedControl Method

Pascal

```
function GetContainedControl: TControl;
```

C++

```
__fastcall TControl * GetContainedControl();
```

Description

This is GetContainedControl, a member of class TRibbonCustomControl.

63.1.15.4.8 TRibbonCustomControl.GetGlyphWidth Method

Pascal

```
function GetGlyphWidth: Integer;
```

C++

```
__fastcall int GetGlyphWidth();
```

Description

This is GetGlyphWidth, a member of class TRibbonCustomControl.

63.1.15.4.9 TRibbonCustomControl.GetKeyTip Method

Returns current **KeyTip** for command.

Pascal

```
function GetKeyTip: string;
```

C++

```
__fastcall UnicodeString GetKeyTip();
```

Description

GetKeyTip returns the current **KeyTip** for the command

See Also

KeyTip (see page 3922)

63.1.15.4.10 TRibbonCustomControl.GetLabelWidth Method

Pascal

```
function GetLabelWidth: Integer;
```

C++

```
__fastcall int GetLabelWidth();
```

Description

This is GetLabelWidth, a member of class TRibbonCustomControl.

63.1.15.4.11 TRibbonCustomControl.HandleKeyTip Method

Indicates if command's **KeyTip** matches currently input KeyTip.

Pascal

```
procedure HandleKeyTip(const KeyTip: string; var Handled: TKeyTipHandled);
```

C++

```
__fastcall HandleKeyTip(const UnicodeString KeyTip, TKeyTipHandled Handled);
```

Description

HandleKeyTip indicates whether this command's

KeyTip matches the currently input KeyTip by the user. Full and partial matches are taken into consideration.

See Also

KeyTip (see page 3922)

GetKeyTip (see page 3919)

HideKeyTip (see page 3920)

SetKeyTip (see page 3921)

63.1.15.4.12 TRibbonCustomControl.HideKeyTip Method

Hide **KeyTip** for command.

Pascal

```
procedure HideKeyTip(const Match: string);
```

C++

```
__fastcall HideKeyTip(const UnicodeString Match);
```

Description

This method hides the **KeyTip** for this command. If the **Match** parameter matches (full or partial) the command's **KeyTip**, the **KeyTip** remains visible.

See Also

KeyTip (see page 3922)

GetKeyTip (see page 3919)

HandleKeyTip (see page 3920)

63.1.15.4.13 TRibbonCustomControl.KeyTipClick Method

Handle clicking a **KeyTip**.

Pascal

```
procedure KeyTipClick;
```

C++

```
__fastcall KeyTipClick();
```

Description

KeyTipClick Handle clicking a **KeyTip**. Some requires need to be handled differently when clicked by a **KeyTip**.

63.1.15.4.14 TRibbonCustomControl.Notification Method

Responds to notifications that components are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification allows TControl to update its PopupMenu property when the pop-up menu it refers to is destroyed.

Override the Notification method to respond to notifications that other components are about to be destroyed or have just been created. Use the Notification method to update controls that rely on other objects. Remove references to objects that are going away so that the control does not refer to objects that have been destroyed. For example, data-aware objects override the Notification method to update themselves when their data source is removed. Some objects respond to notifications that other objects of a specific type are being created. For example, the session component sets the Session property of new data-aware controls to itself when the AutoSessionName property is true.

By default, components pass along the notification to their owned components, if any.

Canvas

63.1.15.4.16 TRibbonCustomControl.SetActionClient Method

Pascal

```
procedure SetActionClient(Value: TActionClientItem); override;
```

C++

```
virtual __fastcall SetActionClient(TActionClientItem Value);
```

Description

This is SetActionClient, a member of class TRibbonCustomControl.

63.1.15.4.17 TRibbonCustomControl.SetBounds Method

Sets the Left, Top, Width, and Height properties all at once.

Pascal

```
procedure SetBounds(ALeft: Integer; ATop: Integer; AWidth: Integer; AHeight: Integer);
override;
```

C++

```
virtual __fastcall SetBounds(int ALeft, int ATop, int AWidth, int AHeight);
```

Description

Use SetBounds to change all of the component's boundary properties at one time. The same effect can be achieved by setting the Left, Top, Width, and Height properties separately, but SetBounds changes all four properties at once ensuring that the control will not repaint between changes.

Specify the values for the Left, Top, Width, and Height properties as the value of the ALeft, ATop, AWidth, and AHeight parameters, respectively.

Calling SetBounds does not necessarily result in the Left, Top, Width, and Height properties changing to the specified values. Before the properties are changed, the AutoSize or Constraints property may limit the changes, and an OnCanResize (or OnConstrainedResize) event handler may change the new values. After the control's Left, Top, Width, and Height properties are changed, SetBounds generates an OnResize event.

Note: Component writers can change the Left, Top, Width, and Height properties while bypassing all resize events and constraint or autosize logic by using the UpdateBoundsRect method instead.

C++ Examples:

```
//
//This example demostrates the usage of Margins and AlignWithMargins
//properties. Note that Margins will only work when AlignWithMargins
//is set to true and Align is not alNone.
//

#define TopPanelMargin 10
#define BottomPanelMargin 20

TPanel *TopPanel, *BottomPanel;

void __fastcall TForm2::FormCreate(TObject *Sender)
{
    /* Create a new panel and align it to top */
    TopPanel = new TPanel(this);
    TopPanel->Parent = this;
    TopPanel->Align = alTop;
    TopPanel->Height = (ClientHeight / 2);

    /* Create a new panel and align it to the remaining client size */
    BottomPanel = new TPanel(this);
    BottomPanel->Parent = this;
    BottomPanel->Align = alClient;

    /* Set Top panel margins */
    /* Note: Margins will not have an effect if Align is alNone */
    TopPanel->Margins->SetBounds(TopPanelMargin, TopPanelMargin,
                                 TopPanelMargin, TopPanelMargin);
    TopPanel->AlignWithMargins = true;
    TopPanel->Caption = "TopPanel";

    /* Set Top Bottom margins */
    /* Note: Margins will not have an effect if Align is alNone */
    BottomPanel->Margins->SetBounds(BottomPanelMargin, BottomPanelMargin,
                                    BottomPanelMargin, BottomPanelMargin);
    BottomPanel->AlignWithMargins = true;
```

```
    BottomPanel->Caption = "BottomPanel";

    if ((TopPanel->Top != TopPanelMargin) ||
       (TopPanel->Left != TopPanelMargin) ||
       (TopPanel->Width != (ClientWidth - (TopPanelMargin * 2))) ||
       (BottomPanel->Top != (TopPanel->Height + (TopPanelMargin * 2) +
                                                BottomPanelMargin)) ||
       (BottomPanel->Left != BottomPanelMargin) ||
       (BottomPanel->Width != (ClientWidth - (BottomPanelMargin * 2))))
       {
          MessageDlg(AnsiString(
            "This should not happen! Position and size are ")+
            "calculated relative to the margins",
            mtError, TMsgDlgButtons() << mbOK, 0);
       }
}
```

Delphi Examples:

```
{
This example demostrates the usage of Margins and AlignWithMargins
properties. Note that Margins will only work when AlignWithMargins
is set to true and Align is not alNone.
}
const
  TopPanelMargin = 10;
  BottomPanelMargin = 30;

var
  TopPanel, BottomPanel : TPanel;

procedure TForm2.FormCreate(Sender: TObject);
begin
  { Create a new panel and align it to top }

63.1.15.4.18 TRibbonCustomControl.SetContainedControl Method

Pascal

```
procedure SetContainedControl(const Value: TControl);
```

C++

```
__fastcall SetContainedControl(const TControl * Value);
```

Description

This is SetContainedControl, a member of class TRibbonCustomControl.

63.1.15.4.19 TRibbonCustomControl.SetDragMode Method

Sets the drag mode for the control.

Pascal

```
procedure SetDragMode(Value: TDragMode); override;
```

C++

```
virtual __fastcall SetDragMode(TDragMode Value);
```

Description

SetDragMode is the protected write implementation for the DragMode property. Override SetDragMode to execute additional code when the value of the DragMode property changes.

See Also

DragMode

63.1.15.4.20 TRibbonCustomControl.SetKeyTip Method

Sets **KeyTip** for command.

Pascal

```
procedure SetKeyTip(const Value: string);
```

C++

```
__fastcall SetKeyTip(const UnicodeString Value);
```

Description

This method sets the **KeyTip** for the command.

See Also

KeyTip (see page 3922)

GetKeyTip (see page 3919)

HandleKeyTip (see page 3920)

HideKeyTip (see page 3920)

ShowKeyTip (see page 3921)

63.1.15.4.21 TRibbonCustomControl.SetParent Method

Sets the parent of the control.

Pascal

```
procedure SetParent(AParent: TWinControl); override;
```

C++

```
virtual __fastcall SetParent(TWinControl * AParent);
```

Description

SetParent is the protected implementation of the Parent property. Override SetParent to execute additional code when the value of the Parent property changes.

The AParent parameter specifies the new parent of the control.

If the control already has a parent, SetParent removes the control from that parent's list of controls by calling the parent's RemoveControl method. If AParent is not nil (Delphi) or NULL (C++), SetParent calls its InsertControl method to add the control to its list of controls.

The TControl destructor calls SetParent(nil (Delphi) or NULL (C++)) to remove the control from its parent's control list before destroying the component.

63.1.15.4.22 TRibbonCustomControl.ShowKeyTip Method

Shows **KeyTip** for command in specified position.

Pascal

```
procedure ShowKeyTip(const Position: TKeyTipPosition);
```

C++

```
__fastcall ShowKeyTip(const TKeyTipPosition Position);
```

Description

This method shows the **KeyTip** for the command in the position specified. Only the Application Button uses a **KeyTip** position.

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonCustomizeItem.

63.1.16.1 TRibbonCustomizeItem Members

The following tables list the members exposed by TRibbonCustomizeItem.

Protected Methods

	Name	Description
	DrawBackground (see page 3712)	Draws a background image on the control.
	DrawGlyph (see page 3712)	Draws a symbol on the control.
	RibbonStyle (see page 3712)	This is RibbonStyle, a member of class TRibbonCustomizeItem.

Public Methods

	Name	Description
	CalcBounds (see page 3711)	Calculates the size of the add/remove menu item.

63.1.16.2 TRibbonCustomizeItem Methods

The methods of the TRibbonCustomizeItem class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 3712)	Draws a background image on the control.
	DrawGlyph (see page 3712)	Draws a symbol on the control.
	RibbonStyle (see page 3712)	This is RibbonStyle, a member of class TRibbonCustomizeItem.

Public Methods

	Name	Description
	CalcBounds (see page 3711)	Calculates the size of the add/remove menu item.

63.1.16.2.1 TRibbonCustomizeItem.CalcBounds Method

Calculates the size of the add/remove menu item.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

CalcBounds updates the Height, Width, and TextBounds properties to reflect current conditions (such as the item's caption and the current font).

See Also

Height

Width

TextBounds

63.1.16.2.2 TRibbonCustomizeItem.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

63.1.16.2.3 TRibbonCustomizeItem.DrawGlyph Method

Draws a symbol on the control.

Pascal

```
procedure DrawGlyph(const Location: TPoint); override;
```

C++

```
virtual __fastcall DrawGlyph(const TPoint Location);
```

Description

Use DrawGlyph to draw a symbol on the control at the specified location.

See Also

DrawBackground

DrawText

63.1.16.2.4 TRibbonCustomizeItem.RibbonStyle Method

Pascal

```
function RibbonStyle: TRibbonStyleActionBars;
```

C++

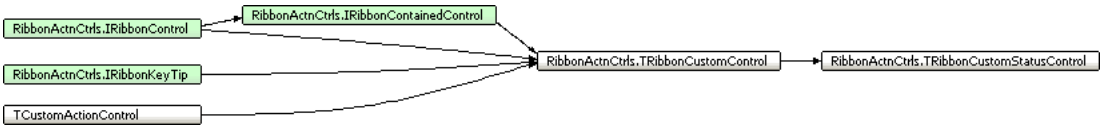
```
__fastcall TRibbonStyleActionBars RibbonStyle();
```

Description

This is RibbonStyle, a member of class TRibbonCustomizeItem.

63.1.17 TRibbonCustomStatusControl Class

Class Hierarchy



Pascal

```
TRibbonCustomStatusControl = class(TRibbonCustomControl);
```

C++

```
class TRibbonCustomStatusControl : public TRibbonCustomControl;
```

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonCustomStatusControl.

63.1.17.1 TRibbonCustomStatusControl Members

The following tables list the members exposed by TRibbonCustomStatusControl.

Protected Methods

	Name	Description
	CMVisiblechanged (see page 3701)	This is CMVisiblechanged, a member of class TRibbonCustomControl.
	DrawBackground (see page 3715)	Draws a background image on the control.
	GetCaptionWidth (see page 3702)	This is GetCaptionWidth, a member of class TRibbonCustomControl.
	GetGlyphWidth (see page 3702)	This is GetGlyphWidth, a member of class TRibbonCustomControl.
	GetLabelWidth (see page 3703)	This is GetLabelWidth, a member of class TRibbonCustomControl.
	Notification (see page 3704)	Responds to notifications that components are being created or destroyed.
	Paint (see page 3705)	Render control surface.
	SetActionClient (see page 3705)	This is SetActionClient, a member of class TRibbonCustomControl.
	SetDragMode (see page 3708)	Sets the drag mode for the control.
	SetParent (see page 3709)	Sets the parent of the control.

Public Methods

	Name	Description
	CalcBounds (see page 3714)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 3916)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.
	CanAddToQuickAccessToolbar (see page 3701)	This is CanAddToQuickAccessToolbar, a member of class TRibbonCustomControl.
	Click (see page 3701)	Executes the control's function in response to a mouse click.
	Create (see page 3699)	Creates an instance of TCustomActionControl.
	Destroy (see page 3699)	Destroys an instance of TCustomActionControl.
	GetContainedControl (see page 3915)	This is GetContainedControl, a member of class IRibbonContainedControl.
	GetContainedControl (see page 3702)	This is GetContainedControl, a member of class TRibbonCustomControl.
	GetKeyTip (see page 3919)	Returns current **KeyTip (see page 3922)** for command.
	GetKeyTip (see page 3703)	Returns current **KeyTip** for command.

	HandleKeyTip (see page 3920)	Indicates if command's **KeyTip (see page 3922)** matches currently input KeyTip (see page 3922).
	HandleKeyTip (see page 3703)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 3920)	Hide **KeyTip (see page 3922)** for command.
	HideKeyTip (see page 3704)	Hide **KeyTip** for command.
	KeyTipClick (see page 3920)	Handle clicking a **KeyTip (see page 3922)**.
	KeyTipClick (see page 3704)	Handle clicking a **KeyTip**.
	SetBounds (see page 3705)	Sets the Left, Top, Width, and Height properties all at once.
	SetContainedControl (see page 3915)	This is SetContainedControl, a member of class IRibbonContainedControl.
	SetContainedControl (see page 3708)	This is SetContainedControl, a member of class TRibbonCustomControl.
	SetKeyTip (see page 3921)	Sets **KeyTip (see page 3922)** for command.
	SetKeyTip (see page 3708)	Sets **KeyTip** for command.
	ShowKeyTip (see page 3921)	Shows **KeyTip (see page 3922)** for command in specified position.
	ShowKeyTip (see page 3709)	Shows **KeyTip** for command in specified position.

Public Properties

	Name	Description
	ContainedControl (see page 3915)	This is ContainedControl, a member of class IRibbonContainedControl.
	ContainedControl (see page 3710)	This is ContainedControl, a member of class TRibbonCustomControl.
	KeyTip (see page 3922)	Current **KeyTip** for command

63.1.17.2 TRibbonCustomStatusControl Methods

The methods of the TRibbonCustomStatusControl class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 3715)	Draws a background image on the control.

Public Methods

	Name	Description
	CalcBounds (see page 3714)	Calculates the size of the control.

63.1.17.2.1 TRibbonCustomStatusControl.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as the presence of an icon, caption, and shortcuts. CalcBounds computes the boundaries of the control considering these kinds of factors. At the end, it calls SetBounds and other routines to ensure that the values are set properly.

See Also

SetBounds

63.1.17.2.2 TRibbonCustomStatusControl.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

63.1.18 TRibbonDropDownButton Class

Class Hierarchy

Pascal

```
TRibbonDropDownButton = class(TRibbonBaseButtonControl);
```

C++

```
class TRibbonDropDownButton : public TRibbonBaseButtonControl;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonDropDownButton.

63.1.18.1 TRibbonDropDownButton Members

The following tables list the members exposed by TRibbonDropDownButton.

Protected Methods

	Name	Description
	AllowHotKeys (see page 3619)	This is AllowHotKeys, a member of class TRibbonBaseButtonControl.
	CalcLayout (see page 3717)	This is CalcLayout, a member of class TRibbonDropDownButton.
	DoDropDown (see page 3718)	This is DoDropDown, a member of class TRibbonDropDownButton.
	DrawArrow (see page 3718)	This is DrawArrow, a member of class TRibbonDropDownButton.
	DrawBackground (see page 3718)	Draws a background image on the control.
	DrawGlyph (see page 3621)	Draws a symbol on the control.

	DrawSeparator (see page 3621)	This is DrawSeparator, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 3718)	This is DrawShadowedText, a member of class TRibbonDropDownButton.
	DrawText (see page 3719)	Draws text on the control.
	GetArrowPosition (see page 3719)	This is GetArrowPosition, a member of class TRibbonDropDownButton.
	GetImageSize (see page 3622)	This is GetImageSize, a member of class TRibbonBaseButtonControl.
	GetPopupClass (see page 3719)	This is GetPopupClass, a member of class TRibbonDropDownButton.
	IsButton (see page 3624)	This is IsButton, a member of class TRibbonBaseButtonControl.
	IsRibbonAvailable (see page 3624)	This is IsRibbonAvailable, a member of class TRibbonBaseButtonControl.
	RibbonStyle (see page 3624)	This is RibbonStyle, a member of class TRibbonBaseButtonControl.

Protected Properties

	Name	Description
	DrawDown (see page 3626)	This is DrawDown, a member of class TRibbonBaseButtonControl.

Public Methods

	Name	Description
	CalcBounds (see page 3717)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 3916)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.
	CanAddToQuickAccessToolbar (see page 3620)	This is CanAddToQuickAccessToolbar, a member of class TRibbonBaseButtonControl.
	Click (see page 3717)	Executes the control's function.
	Create (see page 3617)	Creates an instance of TCustomButtonControl.
	Destroy (see page 3618)	Destroys an instance of TCustomActionControl.
	DragDrop (see page 3620)	Performs actions and generates an OnDragDrop event.
	GetKeyTip (see page 3919)	Returns current **KeyTip (see page 3922)** for command.
	GetKeyTip (see page 3622)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 3920)	Indicates if command's **KeyTip (see page 3922)** matches currently input KeyTip (see page 3922).
	HandleKeyTip (see page 3623)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 3920)	Hide **KeyTip (see page 3922)** for command.
	HideKeyTip (see page 3623)	Hide **KeyTip** for command.
	KeyTipClick (see page 3719)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 3921)	Sets **KeyTip (see page 3922)** for command.
	SetKeyTip (see page 3625)	Sets **KeyTip** for command.
	ShowKeyTip (see page 3921)	Shows **KeyTip (see page 3922)** for command in specified position.
	ShowKeyTip (see page 3625)	Shows **KeyTip** for command in specified position.

Public Properties

	Name	Description
	KeyTip (see page 3922)	Current **KeyTip** for command

63.1.18.2 TRibbonDropDownButton Methods

The methods of the TRibbonDropDownButton class are listed here.

Protected Methods

	Name	Description
	CalcLayout (see page 3717)	This is CalcLayout, a member of class TRibbonDropDownButton.
	DoDropDown (see page 3718)	This is DoDropDown, a member of class TRibbonDropDownButton.
	DrawArrow (see page 3718)	This is DrawArrow, a member of class TRibbonDropDownButton.
	DrawBackground (see page 3718)	Draws a background image on the control.
	DrawShadowedText (see page 3718)	This is DrawShadowedText, a member of class TRibbonDropDownButton.
	DrawText (see page 3719)	Draws text on the control.
	GetArrowPosition (see page 3719)	This is GetArrowPosition, a member of class TRibbonDropDownButton.

	GetPopupClass (see page 3719)	This is GetPopupClass, a member of class TRibbonDropDownButton.

Public Methods

	Name	Description
	CalcBounds (see page 3717)	Calculates the size of the control.
	Click (see page 3717)	Executes the control's function.
	KeyTipClick (see page 3719)	Handle clicking a **KeyTip**.

63.1.18.2.1 TRibbonDropDownButton.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

This method is largely the same as CalcBounds (TCustomActionControl), with one minor exception. The width of the control is set to be one pixel wider. For more information, see the documentation for the inherited method.

See Also

CalcBounds

63.1.18.2.2 TRibbonDropDownButton.CalcLayout Method

Pascal

```
procedure CalcLayout; override;
```

C++

```
virtual __fastcall CalcLayout();
```

Description

This is CalcLayout, a member of class TRibbonDropDownButton.

63.1.18.2.3 TRibbonDropDownButton.Click Method

Executes the control's function.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

This override of the method inherited from TCustomActionControl is almost identical to the inherited method. The only difference is that if the button control is being manipulated at design time, extra actions are taken to ensure that the control is properly selected.

Click

UsageCount

63.1.18.2.4 TRibbonDropDownButton.DoDropDown Method

Pascal

```
procedure DoDropDown(const SelectFirst: Boolean); virtual;
```

C++

```
virtual __fastcall DoDropDown(const Boolean SelectFirst);
```

Description

This is DoDropDown, a member of class TRibbonDropDownButton.

63.1.18.2.5 TRibbonDropDownButton.DrawArrow Method

Pascal

```
procedure DrawArrow(Location: TPoint; Color: TColor; ShadowColor: TColor; Size: Integer);
virtual;
```

C++

```
virtual __fastcall DrawArrow(TPoint Location, TColor Color, TColor ShadowColor, int Size);
```

Description

This is DrawArrow, a member of class TRibbonDropDownButton.

63.1.18.2.6 TRibbonDropDownButton.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

63.1.18.2.7 TRibbonDropDownButton.DrawShadowedText Method

Pascal

```
procedure DrawShadowedText(Rect: TRect; Flags: Cardinal; Text: string; TextColor: TColor;
ShadowColor: TColor); override;
```

C++

```
virtual __fastcall DrawShadowedText(TRect Rect, unsigned Flags, UnicodeString Text, TColor
TextColor, TColor ShadowColor);
```

Description

This is DrawShadowedText, a member of class TRibbonDropDownButton.

63.1.18.2.8 TRibbonDropDownButton.DrawText Method

Draws text on the control.

Pascal

```
procedure DrawText(var ARect: TRect; var Flags: Cardinal; Text: string); override;
```

C++

```
virtual __fastcall DrawText(TRect ARect, unsigned Flags, UnicodeString Text);
```

Description

Use DrawText to draw the text specified by Text on the control within the area specified by ARect.

See Also

DrawBackground

DrawGlyph

63.1.18.2.9 TRibbonDropDownButton.GetArrowPosition Method

Pascal

```
function GetArrowPosition(const ARect: TRect): TPoint; virtual;
```

C++

```
virtual __fastcall TPoint GetArrowPosition(const TRect ARect);
```

Description

This is GetArrowPosition, a member of class TRibbonDropDownButton.

63.1.18.2.10 TRibbonDropDownButton.GetPopupClass Method

Pascal

```
function GetPopupClass: TCustomPopupClass; virtual;
```

C++

```
virtual __fastcall TCustomPopupClass GetPopupClass();
```

Description

This is GetPopupClass, a member of class TRibbonDropDownButton.

63.1.18.2.11 TRibbonDropDownButton.KeyTipClick Method

Handle clicking a **KeyTip**.

Pascal

```
procedure KeyTipClick; override;
```

C++

```
virtual __fastcall KeyTipClick();
```

Description

KeyTipClick Handle clicking a **KeyTip**. Some requires need to be handled differently when clicked by a **KeyTip**.

63.1.19 TRibbonGallery Class

Class Hierarchy

Pascal

```
TRibbonGallery = class(TControl);

Description

This is class RibbonActnCtrls.TRibbonGalleryControl.

63.1.20.1 TRibbonGalleryControl Members

The following tables list the members exposed by TRibbonGalleryControl.

Public Methods

	Name	Description
	CanAddToQuickAccessToolbar (see page 3721)	This is CanAddToQuickAccessToolbar, a member of class TRibbonGalleryControl.

	GetContainedControl (see page 3721)	This is GetContainedControl, a member of class TRibbonGalleryControl.
	SetContainedControl (see page 3721)	This is SetContainedControl, a member of class TRibbonGalleryControl.

Public Properties

	Name	Description
	ContainedControl (see page 3722)	This is ContainedControl, a member of class TRibbonGalleryControl.
R	Gallery (see page 3722)	This is Gallery, a member of class TRibbonGalleryControl.

63.1.20.2 TRibbonGalleryControl Methods

The methods of the TRibbonGalleryControl class are listed here.

Public Methods

	Name	Description
	CanAddToQuickAccessToolbar (see page 3721)	This is CanAddToQuickAccessToolbar, a member of class TRibbonGalleryControl.
	GetContainedControl (see page 3721)	This is GetContainedControl, a member of class TRibbonGalleryControl.
	SetContainedControl (see page 3721)	This is SetContainedControl, a member of class TRibbonGalleryControl.

63.1.20.2.1 TRibbonGalleryControl.CanAddToQuickAccessToolbar Method

Pascal

```
function CanAddToQuickAccessToolbar: Boolean;
```

C++

```
__fastcall Boolean CanAddToQuickAccessToolbar();
```

Description

This is CanAddToQuickAccessToolbar, a member of class TRibbonGalleryControl.

63.1.20.2.2 TRibbonGalleryControl.GetContainedControl Method

Pascal

```
function GetContainedControl: TControl;
```

C++

```
__fastcall TControl * GetContainedControl();
```

Description

This is GetContainedControl, a member of class TRibbonGalleryControl.

63.1.20.2.3 TRibbonGalleryControl.SetContainedControl Method

Pascal

```
procedure SetContainedControl(const Value: TControl);
```

C++

```
__fastcall SetContainedControl(const TControl * Value);
```

Description

This is SetContainedControl, a member of class TRibbonGalleryControl.

63.1.20.3 TRibbonGalleryControl Properties

The properties of the TRibbonGalleryControl class are listed here.

Public Properties

	Name	Description
	ContainedControl (see page 3722)	This is ContainedControl, a member of class TRibbonGalleryControl.
R	Gallery (see page 3722)	This is Gallery, a member of class TRibbonGalleryControl.

63.1.20.3.1 TRibbonGalleryControl.ContainedControl Property

Pascal

```
property ContainedControl: TControl;
```

C++

```
__property TControl * ContainedControl;
```

Description

This is ContainedControl, a member of class TRibbonGalleryControl.

63.1.20.3.2 TRibbonGalleryControl.Gallery Property

Pascal

```
property Gallery: TRibbonGallery;
```

C++

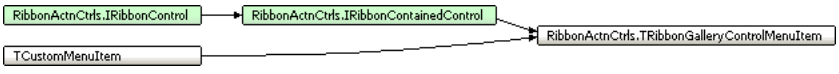
```
__property TRibbonGallery Gallery;
```

Description

This is Gallery, a member of class TRibbonGalleryControl.

63.1.21 TRibbonGalleryControlMenuItem Class

Class Hierarchy



Pascal

```
TRibbonGalleryControlMenuItem = class(TCustomMenuItem, IRibbonContainedControl);
```

C++

```
class TRibbonGalleryControlMenuItem : public TCustomMenuItem, public IRibbonContainedControl;
```

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonGalleryControlMenuItem.

63.1.21.1 TRibbonGalleryControlMenuItem Members

The following tables list the members exposed by TRibbonGalleryControlMenuItem.

Protected Methods

	Name	Description
	Paint (see page 3724)	Render control surface.
	SetParent (see page 3727)	Sets the parent of the control.

Public Methods

	Name	Description
	CalcBounds (see page 3723)	Calculates the size of the menu item.
	CanAddToQuickAccessToolbar (see page 3724)	This is CanAddToQuickAccessToolbar, a member of class TRibbonGalleryControlMenuItem.
	GetContainedControl (see page 3724)	This is GetContainedControl, a member of class TRibbonGalleryControlMenuItem.
	SetBounds (see page 3725)	Sets the Left, Top, Width, and Height properties all at once.
	SetContainedControl (see page 3727)	This is SetContainedControl, a member of class TRibbonGalleryControlMenuItem.

Public Properties

	Name	Description
	ContainedControl (see page 3728)	This is ContainedControl, a member of class TRibbonGalleryControlMenuItem.

63.1.21.2 TRibbonGalleryControlMenuItem Methods

The methods of the TRibbonGalleryControlMenuItem class are listed here.

Protected Methods

	Name	Description
	Paint (see page 3724)	Render control surface.
	SetParent (see page 3727)	Sets the parent of the control.

Public Methods

	Name	Description
	CalcBounds (see page 3723)	Calculates the size of the menu item.
	CanAddToQuickAccessToolbar (see page 3724)	This is CanAddToQuickAccessToolbar, a member of class TRibbonGalleryControlMenuItem.
	GetContainedControl (see page 3724)	This is GetContainedControl, a member of class TRibbonGalleryControlMenuItem.
	SetBounds (see page 3725)	Sets the Left, Top, Width, and Height properties all at once.
	SetContainedControl (see page 3727)	This is SetContainedControl, a member of class TRibbonGalleryControlMenuItem.

63.1.21.2.1 TRibbonGalleryControlMenuItem.CalcBounds Method

Calculates the size of the menu item.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as whether or not the menu item is a separator or not. CalcBounds computes the boundaries of the menu item considering these kinds of factors. At the end, it calls SetBounds and other routines to ensure that the values are set properly.

See Also

SetBounds

63.1.21.2.2 TRibbonGalleryControlMenuItem.CanAddToQuickAccessToolbar Method

Pascal

```
function CanAddToQuickAccessToolbar: Boolean;
```

C++

```
__fastcall Boolean CanAddToQuickAccessToolbar();
```

Description

This is CanAddToQuickAccessToolbar, a member of class TRibbonGalleryControlMenuItem.

63.1.21.2.3 TRibbonGalleryControlMenuItem.GetContainedControl Method

Pascal

```
function GetContainedControl: TControl;
```

C++

```
__fastcall TControl * GetContainedControl();
```

Description

This is GetContainedControl, a member of class TRibbonGalleryControlMenuItem.

63.1.21.2.4 TRibbonGalleryControlMenuItem.Paint Method

Render control surface.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method is called automatically when a lightweight control needs update its display area. Code in the Paint method uses the Canvas property to render the control surface.

As implemented in TGraphicControl, Paint does nothing. Specific rendering logic is provided by Paint methods in descendant control classes.

See Also

Canvas

63.1.21.2.5 TRibbonGalleryControlMenuItem.SetBounds Method

Sets the Left, Top, Width, and Height properties all at once.

Pascal

```
procedure SetBounds(ALeft: Integer; ATop: Integer; AWidth: Integer; AHeight: Integer);
override;
```

C++

```
virtual __fastcall SetBounds(int ALeft, int ATop, int AWidth, int AHeight);
```

Description

Use SetBounds to change all of the component's boundary properties at one time. The same effect can be achieved by setting the Left, Top, Width, and Height properties separately, but SetBounds changes all four properties at once ensuring that the control will not repaint between changes.

Specify the values for the Left, Top, Width, and Height properties as the value of the ALeft, ATop, AWidth, and AHeight parameters, respectively.

Calling SetBounds does not necessarily result in the Left, Top, Width, and Height properties changing to the specified values. Before the properties are changed, the AutoSize or Constraints property may limit the changes, and an OnCanResize (or OnConstrainedResize) event handler may change the new values. After the control's Left, Top, Width, and Height properties are changed, SetBounds generates an OnResize event.

Note: Component writers can change the Left, Top, Width, and Height properties while bypassing all resize events and constraint or autosize logic by using the UpdateBoundsRect method instead.

C++ Examples:

```
//
//This example demostrates the usage of Margins and AlignWithMargins
//properties. Note that Margins will only work when AlignWithMargins
//is set to true and Align is not alNone.
//

#define TopPanelMargin 10
#define BottomPanelMargin 20

TPanel *TopPanel, *BottomPanel;

void __fastcall TForm2::FormCreate(TObject *Sender)
{
    /* Create a new panel and align it to top */
    TopPanel = new TPanel(this);
    TopPanel->Parent = this;
    TopPanel->Align = alTop;
    TopPanel->Height = (ClientHeight / 2);

    /* Create a new panel and align it to the remaining client size */
    BottomPanel = new TPanel(this);
    BottomPanel->Parent = this;
    BottomPanel->Align = alClient;

    /* Set Top panel margins */
    /* Note: Margins will not have an effect if Align is alNone */
    TopPanel->Margins->SetBounds(TopPanelMargin, TopPanelMargin,
                                 TopPanelMargin, TopPanelMargin);
    TopPanel->AlignWithMargins = true;
    TopPanel->Caption = "TopPanel";
```

```
    /* Set Top Bottom margins */
    /* Note: Margins will not have an effect if Align is alNone */
    BottomPanel->Margins->SetBounds(BottomPanelMargin, BottomPanelMargin,
                                    BottomPanelMargin, BottomPanelMargin);
    BottomPanel->AlignWithMargins = true;
    BottomPanel->Caption = "BottomPanel";

    if ((TopPanel->Top != TopPanelMargin) ||
       (TopPanel->Left != TopPanelMargin) ||
       (TopPanel->Width != (ClientWidth - (TopPanelMargin * 2))) ||
       (BottomPanel->Top != (TopPanel->Height + (TopPanelMargin * 2) +
                                               BottomPanelMargin)) ||
       (BottomPanel->Left != BottomPanelMargin) ||
       (BottomPanel->Width != (ClientWidth - (BottomPanelMargin * 2))))
       {
          MessageDlg(AnsiString(
            "This should not happen! Position and size are ")+
            "calculated relative to the margins",
            mtError, TMsgDlgButtons() << mbOK, 0);
       }
}
```

Delphi Examples:

```
{
This example demostrates the usage of Margins and AlignWithMargins
properties. Note that Margins will only work when AlignWithMargins
is set to true and Align is not alNone.
}
const
  TopPanelMargin = 10;
  BottomPanelMargin = 30;

var
  TopPanel, BottomPanel : TPanel;

procedure TForm2.FormCreate(Sender: TObject);
begin
  { Create a new panel and align it to top }
  TopPanel := TPanel.Create(Self);
  TopPanel.Parent := Self;
  TopPanel.Align := alTop;
  TopPanel.Height := (ClientHeight div 2);

  { Create a new panel and align it to the remaining client size }
  BottomPanel := TPanel.Create(Self);
  BottomPanel.Parent := Self;
  BottomPanel.Align := alClient;

  { Set Top panel margins }
  { Note: Margins will not have an effect if Align is alNone }
  TopPanel.Margins.SetBounds(TopPanelMargin, TopPanelMargin,
                             TopPanelMargin, TopPanelMargin);
  TopPanel.AlignWithMargins := true;
  TopPanel.Caption:= 'TopPanel';

  { Set Bottom panel margins }
  { Note: Margins will not have an effect if Align is alNone }
  BottomPanel.Margins.SetBounds(BottomPanelMargin, BottomPanelMargin,
                                BottomPanelMargin, BottomPanelMargin);
  BottomPanel.AlignWithMargins := true;
  BottomPanel.Caption:= 'BottomPanel';

  if (TopPanel.Top <> TopPanelMargin) or
     (TopPanel.Left <> TopPanelMargin) or
     (TopPanel.Width <> (ClientWidth - (TopPanelMargin * 2))) or
```

```
      (BottomPanel.Top <> (TopPanel.Height + (TopPanelMargin * 2) +
                                              BottomPanelMargin)) or
      (BottomPanel.Left <> BottomPanelMargin) or
      (BottomPanel.Width <> (ClientWidth - (BottomPanelMargin * 2)))
      then
        MessageDlg('This should not happen! Position and size are ' +
             'calculated relative to the margins', mtError, [mbOK], 0);

63.1.21.2.6 TRibbonGalleryControlMenuItem.SetContainedControl Method

Pascal

```
procedure SetContainedControl(const Value: TControl);
```

C++

```
__fastcall SetContainedControl(const TControl * Value);
```

Description

This is SetContainedControl, a member of class TRibbonGalleryControlMenuItem.

63.1.21.2.7 TRibbonGalleryControlMenuItem.SetParent Method

Sets the parent of the control.

Pascal

```
procedure SetParent(AParent: TWinControl); override;
```

C++

```
virtual __fastcall SetParent(TWinControl * AParent);
```

Description

SetParent is the protected implementation of the Parent property. Override SetParent to execute additional code when the value of the Parent property changes.

The AParent parameter specifies the new parent of the control.

If the control already has a parent, SetParent removes the control from that parent's list of controls by calling the parent's

RemoveControl method. If AParent is not nil (Delphi) or NULL (C++), SetParent calls its InsertControl method to add the control to its list of controls.

The TControl destructor calls SetParent(nil (Delphi) or NULL (C++)) to remove the control from its parent's control list before destroying the component.

63.1.21.3 TRibbonGalleryControlMenuItem Properties

The properties of the TRibbonGalleryControlMenuItem class are listed here.

Public Properties

	Name	Description
	ContainedControl (see page 3728)	This is ContainedControl, a member of class TRibbonGalleryControlMenuItem.

63.1.21.3.1 TRibbonGalleryControlMenuItem.ContainedControl Property

Pascal

```
property ContainedControl: TControl;
```

C++

```
__property TControl * ContainedControl;
```

Description

This is ContainedControl, a member of class TRibbonGalleryControlMenuItem.

63.1.22 TRibbonGalleryItem Class

Class Hierarchy

Pascal

```
TRibbonGalleryItem = class(TRibbonBaseButtonControl);
```

C++

```
class TRibbonGalleryItem : public TRibbonBaseButtonControl;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonGalleryItem.

63.1.22.1 TRibbonGalleryItem Members

The following tables list the members exposed by TRibbonGalleryItem.

Protected Methods

	Name	Description
	AllowHotKeys (see page 3619)	This is AllowHotKeys, a member of class TRibbonBaseButtonControl.
	CalcLayout (see page 3730)	This is CalcLayout, a member of class TRibbonGalleryItem.
	DrawBackground (see page 3621)	Draws a background image on the control.
	DrawGlyph (see page 3621)	Draws a symbol on the control.
	DrawSeparator (see page 3621)	This is DrawSeparator, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 3622)	This is DrawShadowedText, a member of class TRibbonBaseButtonControl.
	DrawText (see page 3622)	Draws text on the control.
	GetImageSize (see page 3622)	This is GetImageSize, a member of class TRibbonBaseButtonControl.
	IsButton (see page 3624)	This is IsButton, a member of class TRibbonBaseButtonControl.
	IsRibbonAvailable (see page 3624)	This is IsRibbonAvailable, a member of class TRibbonBaseButtonControl.
	RibbonStyle (see page 3624)	This is RibbonStyle, a member of class TRibbonBaseButtonControl.

Protected Properties

	Name	Description
	DrawDown (see page 3626)	This is DrawDown, a member of class TRibbonBaseButtonControl.

Public Methods

	Name	Description
	CalcBounds (see page 3730)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 3916)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.
	CanAddToQuickAccessToolbar (see page 3620)	This is CanAddToQuickAccessToolbar, a member of class TRibbonBaseButtonControl.
	Click (see page 3620)	Executes the control's function.
	Create (see page 3617)	Creates an instance of TCustomButtonControl.
	Destroy (see page 3618)	Destroys an instance of TCustomActionControl.
	DragDrop (see page 3620)	Performs actions and generates an OnDragDrop event.
	GetKeyTip (see page 3919)	Returns current **KeyTip (see page 3922)** for command.
	GetKeyTip (see page 3622)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 3920)	Indicates if command's **KeyTip (see page 3922)** matches currently input KeyTip (see page 3922).
	HandleKeyTip (see page 3623)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 3920)	Hide **KeyTip (see page 3922)** for command.
	HideKeyTip (see page 3623)	Hide **KeyTip** for command.
	KeyTipClick (see page 3920)	Handle clicking a **KeyTip (see page 3922)**.
	KeyTipClick (see page 3624)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 3921)	Sets **KeyTip (see page 3922)** for command.
	SetKeyTip (see page 3625)	Sets **KeyTip** for command.
	ShowKeyTip (see page 3921)	Shows **KeyTip (see page 3922)** for command in specified position.
	ShowKeyTip (see page 3625)	Shows **KeyTip** for command in specified position.

Public Properties

	Name	Description
	KeyTip (see page 3922)	Current **KeyTip** for command

63.1.22.2 TRibbonGalleryItem Methods

The methods of the TRibbonGalleryItem class are listed here.

Protected Methods

	Name	Description
	CalcLayout (see page 3730)	This is CalcLayout, a member of class TRibbonGalleryItem.

Public Methods

	Name	Description
	CalcBounds (see page 3730)	Calculates the size of the control.

63.1.22.2.1 TRibbonGalleryItem.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

This method is largely the same as CalcBounds (TCustomActionControl), with one minor exception. The width of the control is set to be one pixel wider. For more information, see the documentation for the inherited method.

class TRibbonGalleryMenuItem : public TCustomMenuItem;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonGalleryMenuItem.

63.1.23.1 TRibbonGalleryMenuItem Members

The following tables list the members exposed by TRibbonGalleryMenuItem.

Protected Methods

	Name	Description
	DrawBackground (see page 3732)	Draws a background image on the control.
	DrawGlyph (see page 3732)	Draws a symbol on the control.
	DrawShadowedText (see page 3732)	This is DrawShadowedText, a member of class TRibbonGalleryMenuItem.
	DrawText (see page 3733)	Draws text on the control.

Public Methods

	Name	Description
	CalcBounds (see page 3731)	Calculates the size of the menu item.

63.1.23.2 TRibbonGalleryMenuItem Methods

The methods of the TRibbonGalleryMenuItem class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 3732)	Draws a background image on the control.
	DrawGlyph (see page 3732)	Draws a symbol on the control.
	DrawShadowedText (see page 3732)	This is DrawShadowedText, a member of class TRibbonGalleryMenuItem.
	DrawText (see page 3733)	Draws text on the control.

Public Methods

	Name	Description
	CalcBounds (see page 3731)	Calculates the size of the menu item.

63.1.23.2.1 TRibbonGalleryMenuItem.CalcBounds Method

Calculates the size of the menu item.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as whether or not the menu item is a separator or not. CalcBounds computes the boundaries of the menu item considering these kinds of factors. At the end, it calls SetBounds and other routines

to ensure that the values are set properly.

63.1.23.2.2 TRibbonGalleryMenuItem.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

63.1.23.2.3 TRibbonGalleryMenuItem.DrawGlyph Method

Draws a symbol on the control.

Pascal

```
procedure DrawGlyph(const Location: TPoint); override;
```

C++

```
virtual __fastcall DrawGlyph(const TPoint Location);
```

Description

Use DrawGlyph to draw a symbol on the control at the specified location.

See Also

DrawBackground

DrawText

63.1.23.2.4 TRibbonGalleryMenuItem.DrawShadowedText Method

Pascal

```
procedure DrawShadowedText(Rect: TRect; Flags: Cardinal; Text: string; TextColor: TColor;
ShadowColor: TColor); override;
```

C++

```
virtual __fastcall DrawShadowedText(TRect Rect, unsigned Flags, UnicodeString Text, TColor
TextColor, TColor ShadowColor);
```

Description

This is DrawShadowedText, a member of class TRibbonGalleryMenuItem.

63.1.23.2.5 TRibbonGalleryMenuItem.DrawText Method

Draws text on the control.

Pascal

```
procedure DrawText(var ARect: TRect; var Flags: Cardinal; Text: string); override;
```

C++

```
virtual __fastcall DrawText(TRect ARect, unsigned Flags, UnicodeString Text);
```

Description

Use DrawText to draw the text specified by Text on the control within the area specified by ARect.

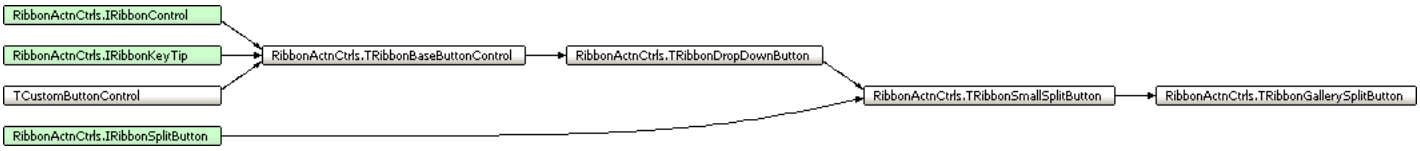
63.1.24 TRibbonGallerySplitButton Class

Class Hierarchy



Pascal

```
TRibbonGallerySplitButton = class(TRibbonSmallSplitButton);
```

C++

```
class TRibbonGallerySplitButton : public TRibbonSmallSplitButton;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonGallerySplitButton.

63.1.24.1 TRibbonGallerySplitButton Members

The following tables list the members exposed by TRibbonGallerySplitButton.

Protected Fields

	Name	Description
	FCursorInSplit (see page 3791)	This is FCursorInSplit, a member of class TRibbonSmallSplitButton.
	FSplitRect (see page 3791)	This is FSplitRect, a member of class TRibbonSmallSplitButton.

Protected Methods

	Name	Description
	AllowHotKeys (see page 3619)	This is AllowHotKeys, a member of class TRibbonBaseButtonControl.
	CalcLayout (see page 3717)	This is CalcLayout, a member of class TRibbonDropDownButton.
	CalcLayout (see page 3792)	This is CalcLayout, a member of class TRibbonSmallSplitButton.
	CMMouseLeave (see page 3793)	This is CMMouseLeave, a member of class TRibbonSmallSplitButton.
	DoDropDown (see page 3718)	This is DoDropDown, a member of class TRibbonDropDownButton.
	DrawArrow (see page 3718)	This is DrawArrow, a member of class TRibbonDropDownButton.
	DrawBackground (see page 3621)	Draws a background image on the control.
	DrawBackground (see page 3718)	Draws a background image on the control.
	DrawBackground (see page 3793)	Draws a background image on the control.
	DrawGlyph (see page 3621)	Draws a symbol on the control.
	DrawSeparator (see page 3621)	This is DrawSeparator, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 3622)	This is DrawShadowedText, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 3718)	This is DrawShadowedText, a member of class TRibbonDropDownButton.
	DrawText (see page 3622)	Draws text on the control.
	DrawText (see page 3719)	Draws text on the control.
	GetArrowPosition (see page 3719)	This is GetArrowPosition, a member of class TRibbonDropDownButton.
	GetArrowPosition (see page 3794)	This is GetArrowPosition, a member of class TRibbonSmallSplitButton.
	GetImageSize (see page 3622)	This is GetImageSize, a member of class TRibbonBaseButtonControl.
	GetPopupClass (see page 3735)	This is GetPopupClass, a member of class TRibbonGallerySplitButton.
	InSplit (see page 3794)	This is InSplit, a member of class TRibbonSmallSplitButton.
	IsButton (see page 3624)	This is IsButton, a member of class TRibbonBaseButtonControl.
	IsRibbonAvailable (see page 3624)	This is IsRibbonAvailable, a member of class TRibbonBaseButtonControl.
	MouseDown (see page 3794)	OnMouseDown event dispatcher.
	MouseMove (see page 3795)	Respond to mouse moving over control area..
	RibbonStyle (see page 3624)	This is RibbonStyle, a member of class TRibbonBaseButtonControl.

Protected Properties

	Name	Description
	DrawDown (see page 3626)	This is DrawDown, a member of class TRibbonBaseButtonControl.

Public Methods

	Name	Description
	CalcBounds (see page 3619)	Calculates the size of the control.
	CalcBounds (see page 3717)	Calculates the size of the control.
	CalcBounds (see page 3792)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 3916)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.
	CanAddToQuickAccessToolbar (see page 3620)	This is CanAddToQuickAccessToolbar, a member of class TRibbonBaseButtonControl.
	Click (see page 3620)	Executes the control's function.
	Click (see page 3717)	Executes the control's function.
	Click (see page 3793)	Executes the control's function.
	Create (see page 3617)	Creates an instance of TCustomButtonControl.
	Create (see page 3790)	Creates an instance of TCustomButtonControl.
	Destroy (see page 3618)	Destroys an instance of TCustomActionControl.
	DragDrop (see page 3620)	Performs actions and generates an OnDragDrop event.
	GetKeyTip (see page 3919)	Returns current **KeyTip (see page 3922)** for command.
	GetKeyTip (see page 3622)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 3920)	Indicates if command's **KeyTip (see page 3922)** matches currently input KeyTip (see page 3922).
	HandleKeyTip (see page 3623)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 3920)	Hide **KeyTip (see page 3922)** for command.
	HideKeyTip (see page 3623)	Hide **KeyTip** for command.

	KeyTipClick (see page 3920)	Handle clicking a **KeyTip (see page 3922)**.
V	KeyTipClick (see page 3624)	Handle clicking a **KeyTip**.
V	KeyTipClick (see page 3719)	Handle clicking a **KeyTip**.
V	KeyTipClick (see page 3794)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 3921)	Sets **KeyTip (see page 3922)** for command.
	SetKeyTip (see page 3625)	Sets **KeyTip** for command.
	ShowKeyTip (see page 3921)	Shows **KeyTip (see page 3922)** for command in specified position.
	ShowKeyTip (see page 3625)	Shows **KeyTip** for command in specified position.
	UpdateSplitBounds (see page 3923)	This is UpdateSplitBounds, a member of class IRibbonSplitButton.
V	UpdateSplitBounds (see page 3795)	This is UpdateSplitBounds, a member of class TRibbonSmallSplitButton.

Public Properties

	Name	Description
	CursorInSplit (see page 3796)	This is CursorInSplit, a member of class TRibbonSmallSplitButton.
	KeyTip (see page 3922)	Current **KeyTip** for command

63.1.24.2 TRibbonGallerySplitButton Methods

The methods of the TRibbonGallerySplitButton class are listed here.

Protected Methods

	Name	Description
V	GetPopupClass (see page 3735)	This is GetPopupClass, a member of class TRibbonGallerySplitButton.

63.1.24.2.1 TRibbonGallerySplitButton.GetPopupClass Method

Pascal

```
function GetPopupClass: TCustomPopupClass; override;
```

C++

```
virtual __fastcall TCustomPopupClass GetPopupClass();
```

Description

This is GetPopupClass, a member of class TRibbonGallerySplitButton.

63.1.25 TRibbonGripItem Class

Class Hierarchy

Pascal

```
TRibbonGripItem = class(TMenuResizeActionControl);
```

C++

```
class TRibbonGripItem : public TMenuResizeActionControl;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonGripItem.

63.1.25.1 TRibbonGripItem Members

The following tables list the members exposed by TRibbonGripItem.

Protected Methods

	Name	Description
	Paint (see page 3737)	Render control surface.
	RibbonStyle (see page 3738)	This is RibbonStyle, a member of class TRibbonGripItem.

Public Methods

	Name	Description
	CalcBounds (see page 3737)	Calculates the size of the control.
	Create (see page 3736)	Creates an instance of TCustomActionControl.

Public Properties

	Name	Description
	GalleryResize (see page 3738)	This is GalleryResize, a member of class TRibbonGripItem.

63.1.25.2 TRibbonGripItem.Create Constructor

Creates an instance of TCustomActionControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonGripItem(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomActionControl. However, you should never attempt to instantiate a TCustomActionControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

AOwner is the component that is responsible for freeing the TCustomActionControl instance. It becomes the value of the Owner property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

Owner

Create

Destroy

63.1.25.3 TRibbonGripItem Methods

The methods of the TRibbonGripItem class are listed here.

Protected Methods

	Name	Description
	Paint (see page 3737)	Render control surface.
	RibbonStyle (see page 3738)	This is RibbonStyle, a member of class TRibbonGripItem.

Public Methods

	Name	Description
	CalcBounds (see page 3737)	Calculates the size of the control.

63.1.25.3.1 TRibbonGripItem.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as the presence of an icon, caption, and shortcuts. CalcBounds computes the boundaries of the control considering these kinds of factors. At the end, it calls SetBounds and other routines to ensure that the values are set properly.

See Also

SetBounds

63.1.25.3.2 TRibbonGripItem.Paint Method

Render control surface.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method is called automatically when a lightweight control needs update its display area. Code in the Paint method uses the Canvas property to render the control surface.

As implemented in TGraphicControl, Paint does nothing. Specific rendering logic is provided by Paint methods in descendant control classes.

See Also

Canvas

63.1.25.3.3 TRibbonGripItem.RibbonStyle Method

Pascal

```
function RibbonStyle: TRibbonStyleActionBars;
```

C++

```
__fastcall TRibbonStyleActionBars RibbonStyle();
```

Description

This is RibbonStyle, a member of class TRibbonGripItem.

63.1.25.4 TRibbonGripItem Properties

The properties of the TRibbonGripItem class are listed here.

Public Properties

	Name	Description
	GalleryResize (see page 3738)	This is GalleryResize, a member of class TRibbonGripItem.

63.1.25.4.1 TRibbonGripItem.GalleryResize Property

Pascal

```
property GalleryResize: TGalleryResize;
```

C++

```
__property TGalleryResize GalleryResize;
```

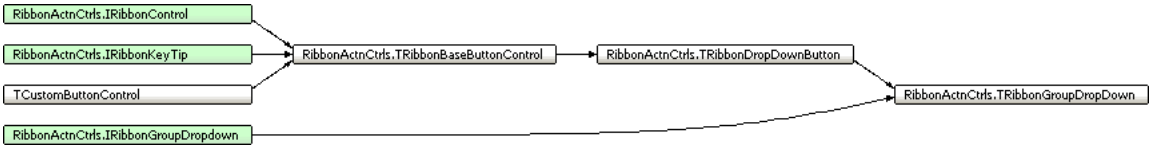
Description

This is GalleryResize, a member of class TRibbonGripItem.

63.1.26 TRibbonGroupDropDown Class

Display entire group as dropdown menu in Quick Access Toolbar.

Class Hierarchy



Pascal

```
TRibbonGroupDropDown = class(TRibbonDropDownButton, IRibbonGroupDropdown);
```

C++

```
class TRibbonGroupDropDown : public TRibbonDropDownButton, public IRibbonGroupDropdown;
```

File

RibbonActnCtrls

Description

TRibbonGroupDropDown is a control used to display an entire group as a dropdown menu in the Quick Access Toolbar.

See Also

TRibbonQuickAccessToolbar (see page 3546)

63.1.26.1 TRibbonGroupDropDown Members

The following tables list the members exposed by TRibbonGroupDropDown.

Protected Methods

	Name	Description
	AllowHotKeys (see page 3619)	This is AllowHotKeys, a member of class TRibbonBaseButtonControl.
	CalcLayout (see page 3717)	This is CalcLayout, a member of class TRibbonDropDownButton.
	DoDropDown (see page 3740)	This is DoDropDown, a member of class TRibbonGroupDropDown.
	DrawArrow (see page 3741)	This is DrawArrow, a member of class TRibbonGroupDropDown.
	DrawBackground (see page 3741)	Draws a background image on the control.
	DrawGlyph (see page 3621)	Draws a symbol on the control.
	DrawSeparator (see page 3621)	This is DrawSeparator, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 3622)	This is DrawShadowedText, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 3718)	This is DrawShadowedText, a member of class TRibbonDropDownButton.
	DrawText (see page 3622)	Draws text on the control.
	DrawText (see page 3719)	Draws text on the control.
	GetArrowPosition (see page 3719)	This is GetArrowPosition, a member of class TRibbonDropDownButton.
	GetImageSize (see page 3622)	This is GetImageSize, a member of class TRibbonBaseButtonControl.
	GetPopupClass (see page 3719)	This is GetPopupClass, a member of class TRibbonDropDownButton.
	IsButton (see page 3624)	This is IsButton, a member of class TRibbonBaseButtonControl.
	IsRibbonAvailable (see page 3624)	This is IsRibbonAvailable, a member of class TRibbonBaseButtonControl.
	RibbonStyle (see page 3624)	This is RibbonStyle, a member of class TRibbonBaseButtonControl.

Protected Properties

	Name	Description
	DrawDown (see page 3626)	This is DrawDown, a member of class TRibbonBaseButtonControl.

Public Methods

	Name	Description
	CalcBounds (see page 3619)	Calculates the size of the control.
	CalcBounds (see page 3717)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 3916)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.
	CanAddToQuickAccessToolbar (see page 3620)	This is CanAddToQuickAccessToolbar, a member of class TRibbonBaseButtonControl.
	Click (see page 3620)	Executes the control's function.
	Click (see page 3717)	Executes the control's function.
	CloseUp (see page 3740)	This is CloseUp, a member of class TRibbonGroupDropDown.
	Create (see page 3617)	Creates an instance of TCustomButtonControl.
	Destroy (see page 3618)	Destroys an instance of TCustomActionControl.
	DragDrop (see page 3620)	Performs actions and generates an OnDragDrop event.
	GetKeyTip (see page 3919)	Returns current **KeyTip (see page 3922)** for command.
	GetKeyTip (see page 3622)	Returns current **KeyTip** for command.
	GetParentControl (see page 3741)	This is GetParentControl, a member of class TRibbonGroupDropDown.
	GetTopPosition (see page 3741)	This is GetTopPosition, a member of class TRibbonGroupDropDown.
	HandleKeyTip (see page 3920)	Indicates if command's **KeyTip (see page 3922)** matches currently input KeyTip (see page 3922).

	HandleKeyTip (see page 3623)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 3920)	Hide **KeyTip (see page 3922)** for command.
	HideKeyTip (see page 3623)	Hide **KeyTip** for command.
	KeyTipClick (see page 3920)	Handle clicking a **KeyTip (see page 3922)**.
V	KeyTipClick (see page 3624)	Handle clicking a **KeyTip**.
V	KeyTipClick (see page 3719)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 3921)	Sets **KeyTip (see page 3922)** for command.
	SetKeyTip (see page 3625)	Sets **KeyTip** for command.
	ShowKeyTip (see page 3921)	Shows **KeyTip (see page 3922)** for command in specified position.
	ShowKeyTip (see page 3625)	Shows **KeyTip** for command in specified position.

Public Properties

	Name	Description
	Group (see page 3742)	This is Group, a member of class TRibbonGroupDropDown.
	KeyTip (see page 3922)	Current **KeyTip** for command

63.1.26.2 TRibbonGroupDropDown Methods

The methods of the TRibbonGroupDropDown class are listed here.

Protected Methods

	Name	Description
V	DoDropDown (see page 3740)	This is DoDropDown, a member of class TRibbonGroupDropDown.
V	DrawArrow (see page 3741)	This is DrawArrow, a member of class TRibbonGroupDropDown.
V	DrawBackground (see page 3741)	Draws a background image on the control.

Public Methods

	Name	Description
	CloseUp (see page 3740)	This is CloseUp, a member of class TRibbonGroupDropDown.
	GetParentControl (see page 3741)	This is GetParentControl, a member of class TRibbonGroupDropDown.
	GetTopPosition (see page 3741)	This is GetTopPosition, a member of class TRibbonGroupDropDown.

63.1.26.2.1 TRibbonGroupDropDown.CloseUp Method

Pascal

```
procedure CloseUp;
```

C++

```
__fastcall CloseUp();
```

Description

This is CloseUp, a member of class TRibbonGroupDropDown.

63.1.26.2.2 TRibbonGroupDropDown.DoDropDown Method

Pascal

```
procedure DoDropDown(const SelectFirst: Boolean); override;
```

C++

```
virtual __fastcall DoDropDown(const Boolean SelectFirst);
```

Description

This is DoDropDown, a member of class TRibbonGroupDropDown.

63.1.26.2.3 TRibbonGroupDropDown.DrawArrow Method

Pascal

```
procedure DrawArrow(Location: TPoint; Color: TColor; ShadowColor: TColor; Size: Integer);
override;
```

C++

```
virtual __fastcall DrawArrow(TPoint Location, TColor Color, TColor ShadowColor, int Size);
```

Description

This is DrawArrow, a member of class TRibbonGroupDropDown.

63.1.26.2.4 TRibbonGroupDropDown.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

63.1.26.2.5 TRibbonGroupDropDown.GetParentControl Method

Pascal

```
function GetParentControl: TWinControl;
```

C++

```
__fastcall TWinControl * GetParentControl();
```

Description

This is GetParentControl, a member of class TRibbonGroupDropDown.

63.1.26.2.6 TRibbonGroupDropDown.GetTopPosition Method

Pascal

```
function GetTopPosition: Integer;
```

C++

```
__fastcall int GetTopPosition();
```

Description

This is GetTopPosition, a member of class TRibbonGroupDropDown.

63.1.26.3 TRibbonGroupDropDown Properties

The properties of the TRibbonGroupDropDown class are listed here.

Public Properties

	Name	Description
	Group (see page 3742)	This is Group, a member of class TRibbonGroupDropDown.

63.1.26.3.1 TRibbonGroupDropDown.Group Property

Pascal

```
property Group: TControl;
```

C++

```
__property TControl * Group;
```

Description

This is Group, a member of class TRibbonGroupDropDown.

63.1.27 TRibbonLargeButtonControl Class

Class Hierarchy

Pascal

```
TRibbonLargeButtonControl = class(TRibbonBaseButtonControl);
```

C++

```
class TRibbonLargeButtonControl : public TRibbonBaseButtonControl;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonLargeButtonControl.

63.1.27.1 TRibbonLargeButtonControl Members

The following tables list the members exposed by TRibbonLargeButtonControl.

Protected Methods

	Name	Description
	AllowHotKeys (see page 3619)	This is AllowHotKeys, a member of class TRibbonBaseButtonControl.
	CalcLayout (see page 3744)	This is CalcLayout, a member of class TRibbonLargeButtonControl.
	DrawBackground (see page 3744)	Draws a background image on the control.
	DrawGlyph (see page 3621)	Draws a symbol on the control.
	DrawSeparator (see page 3621)	This is DrawSeparator, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 3745)	This is DrawShadowedText, a member of class TRibbonLargeButtonControl.
	DrawText (see page 3745)	Draws text on the control.
	GetImageSize (see page 3622)	This is GetImageSize, a member of class TRibbonBaseButtonControl.
	IsButton (see page 3624)	This is IsButton, a member of class TRibbonBaseButtonControl.
	IsRibbonAvailable (see page 3624)	This is IsRibbonAvailable, a member of class TRibbonBaseButtonControl.
	RibbonStyle (see page 3624)	This is RibbonStyle, a member of class TRibbonBaseButtonControl.

Protected Properties

	Name	Description
	DrawDown (see page 3626)	This is DrawDown, a member of class TRibbonBaseButtonControl.

Public Methods

	Name	Description
	CalcBounds (see page 3744)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 3916)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.
	CanAddToQuickAccessToolbar (see page 3620)	This is CanAddToQuickAccessToolbar, a member of class TRibbonBaseButtonControl.
	Click (see page 3620)	Executes the control's function.
	Create (see page 3617)	Creates an instance of TCustomButtonControl.
	Destroy (see page 3618)	Destroys an instance of TCustomActionControl.
	DragDrop (see page 3620)	Performs actions and generates an OnDragDrop event.
	GetKeyTip (see page 3919)	Returns current **KeyTip (see page 3922)** for command.
	GetKeyTip (see page 3622)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 3920)	Indicates if command's **KeyTip (see page 3922)** matches currently input KeyTip (see page 3922).
	HandleKeyTip (see page 3623)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 3920)	Hide **KeyTip (see page 3922)** for command.
	HideKeyTip (see page 3623)	Hide **KeyTip** for command.
	KeyTipClick (see page 3920)	Handle clicking a **KeyTip (see page 3922)**.
	KeyTipClick (see page 3624)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 3921)	Sets **KeyTip (see page 3922)** for command.
	SetKeyTip (see page 3625)	Sets **KeyTip** for command.
	ShowKeyTip (see page 3921)	Shows **KeyTip (see page 3922)** for command in specified position.
	ShowKeyTip (see page 3625)	Shows **KeyTip** for command in specified position.

Public Properties

	Name	Description
	KeyTip (see page 3922)	Current **KeyTip** for command

63.1.27.2 TRibbonLargeButtonControl Methods

The methods of the TRibbonLargeButtonControl class are listed here.

Protected Methods

	Name	Description
	CalcLayout (see page 3744)	This is CalcLayout, a member of class TRibbonLargeButtonControl.

	DrawBackground (see page 3744)	Draws a background image on the control.
	DrawShadowedText (see page 3745)	This is DrawShadowedText, a member of class TRibbonLargeButtonControl.
	DrawText (see page 3745)	Draws text on the control.

Public Methods

	Name	Description
	CalcBounds (see page 3744)	Calculates the size of the control.

63.1.27.2.1 TRibbonLargeButtonControl.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

This method is largely the same as CalcBounds (TCustomActionControl), with one minor exception. The width of the control is set to be one pixel wider. For more information, see the documentation for the inherited method.

See Also

CalcBounds

63.1.27.2.2 TRibbonLargeButtonControl.CalcLayout Method

Pascal

```
procedure CalcLayout; override;
```

C++

```
virtual __fastcall CalcLayout();
```

Description

This is CalcLayout, a member of class TRibbonLargeButtonControl.

63.1.27.2.3 TRibbonLargeButtonControl.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

63.1.27.2.4 TRibbonLargeButtonControl.DrawShadowedText Method

Pascal

```
procedure DrawShadowedText(Rect: TRect; Flags: Cardinal; Text: string; TextColor: TColor;
ShadowColor: TColor); override;
```

C++

```
virtual __fastcall DrawShadowedText(TRect Rect, unsigned Flags, UnicodeString Text, TColor
TextColor, TColor ShadowColor);
```

Description

This is DrawShadowedText, a member of class TRibbonLargeButtonControl.

63.1.27.2.5 TRibbonLargeButtonControl.DrawText Method

Draws text on the control.

Pascal

```
procedure DrawText(var ARect: TRect; var Flags: Cardinal; Text: string); override;
```

C++

```
virtual __fastcall DrawText(TRect ARect, unsigned Flags, UnicodeString Text);
```

Description

Use DrawText to draw the text specified by Text on the control within the area specified by ARect.

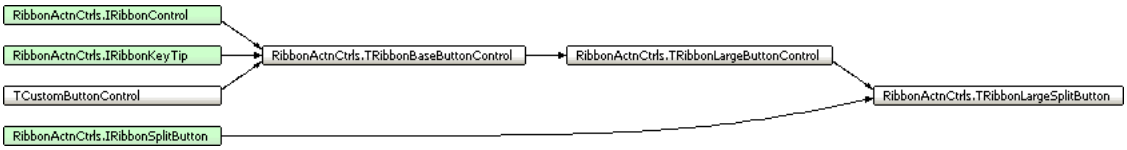
See Also

DrawBackground

DrawGlyph

63.1.28 TRibbonLargeSplitButton Class

Class Hierarchy



Pascal

```
TRibbonLargeSplitButton = class(TRibbonLargeButtonControl, IRibbonSplitButton);
```

C++

```
class TRibbonLargeSplitButton : public TRibbonLargeButtonControl, public IRibbonSplitButton;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonLargeSplitButton.

63.1.28.1 TRibbonLargeSplitButton Members

The following tables list the members exposed by TRibbonLargeSplitButton.

Protected Methods

	Name	Description
	AllowHotKeys (see page 3619)	This is AllowHotKeys, a member of class TRibbonBaseButtonControl.
	CalcLayout (see page 3748)	This is CalcLayout, a member of class TRibbonLargeSplitButton.
	CMMouseleave (see page 3748)	This is CMMouseleave, a member of class TRibbonLargeSplitButton.
	DoSplitButtonClick (see page 3748)	This is DoSplitButtonClick, a member of class TRibbonLargeSplitButton.
	DrawArrow (see page 3749)	This is DrawArrow, a member of class TRibbonLargeSplitButton.
	DrawBackground (see page 3749)	Draws a background image on the control.
	DrawGlyph (see page 3621)	Draws a symbol on the control.
	DrawSeparator (see page 3621)	This is DrawSeparator, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 3622)	This is DrawShadowedText, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 3745)	This is DrawShadowedText, a member of class TRibbonLargeButtonControl.
	DrawText (see page 3622)	Draws text on the control.
	DrawText (see page 3745)	Draws text on the control.
	GetArrowPosition (see page 3749)	This is GetArrowPosition, a member of class TRibbonLargeSplitButton.
	GetImageSize (see page 3622)	This is GetImageSize, a member of class TRibbonBaseButtonControl.
	InSplit (see page 3749)	This is InSplit, a member of class TRibbonLargeSplitButton.
	IsButton (see page 3624)	This is IsButton, a member of class TRibbonBaseButtonControl.
	IsRibbonAvailable (see page 3624)	This is IsRibbonAvailable, a member of class TRibbonBaseButtonControl.
	MouseDown (see page 3750)	OnMouseDown event dispatcher.
	MouseMove (see page 3750)	Respond to mouse moving over control area..
	MouseUp (see page 3751)	OnMouseUp event dispatcher.
	RibbonStyle (see page 3624)	This is RibbonStyle, a member of class TRibbonBaseButtonControl.

Protected Properties

	Name	Description
	DrawDown (see page 3626)	This is DrawDown, a member of class TRibbonBaseButtonControl.

Public Methods

	Name	Description
	CalcBounds (see page 3747)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 3916)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.
	CanAddToQuickAccessToolbar (see page 3620)	This is CanAddToQuickAccessToolbar, a member of class TRibbonBaseButtonControl.
	Click (see page 3748)	Executes the control's function.
	Create (see page 3617)	Creates an instance of TCustomButtonControl.
	Destroy (see page 3618)	Destroys an instance of TCustomActionControl.
	DragDrop (see page 3620)	Performs actions and generates an OnDragDrop event.
	GetKeyTip (see page 3919)	Returns current **KeyTip (see page 3922)** for command.
	GetKeyTip (see page 3622)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 3920)	Indicates if command's **KeyTip (see page 3922)** matches currently input KeyTip (see page 3922).
	HandleKeyTip (see page 3623)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 3920)	Hide **KeyTip (see page 3922)** for command.
	HideKeyTip (see page 3623)	Hide **KeyTip** for command.
	KeyTipClick (see page 3750)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 3921)	Sets **KeyTip (see page 3922)** for command.
	SetKeyTip (see page 3625)	Sets **KeyTip** for command.
	ShowKeyTip (see page 3921)	Shows **KeyTip (see page 3922)** for command in specified position.

	ShowKeyTip (see page 3625)	Shows **KeyTip** for command in specified position.
	UpdateSplitBounds (see page 3751)	This is UpdateSplitBounds, a member of class TRibbonLargeSplitButton.

Public Properties

	Name	Description
	CursorInSplit (see page 3752)	This is CursorInSplit, a member of class TRibbonLargeSplitButton.
	KeyTip (see page 3922)	Current **KeyTip** for command

63.1.28.2 TRibbonLargeSplitButton Methods

The methods of the TRibbonLargeSplitButton class are listed here.

Protected Methods

	Name	Description
	CalcLayout (see page 3748)	This is CalcLayout, a member of class TRibbonLargeSplitButton.
	CMMouseleave (see page 3748)	This is CMMouseleave, a member of class TRibbonLargeSplitButton.
	DoSplitButtonClick (see page 3748)	This is DoSplitButtonClick, a member of class TRibbonLargeSplitButton.
	DrawArrow (see page 3749)	This is DrawArrow, a member of class TRibbonLargeSplitButton.
	DrawBackground (see page 3749)	Draws a background image on the control.
	GetArrowPosition (see page 3749)	This is GetArrowPosition, a member of class TRibbonLargeSplitButton.
	InSplit (see page 3749)	This is InSplit, a member of class TRibbonLargeSplitButton.
	MouseDown (see page 3750)	OnMouseDown event dispatcher.
	MouseMove (see page 3750)	Respond to mouse moving over control area..
	MouseUp (see page 3751)	OnMouseUp event dispatcher.

Public Methods

	Name	Description
	CalcBounds (see page 3747)	Calculates the size of the control.
	Click (see page 3748)	Executes the control's function.
	KeyTipClick (see page 3750)	Handle clicking a **KeyTip**.
	UpdateSplitBounds (see page 3751)	This is UpdateSplitBounds, a member of class TRibbonLargeSplitButton.

63.1.28.2.1 TRibbonLargeSplitButton.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

This method is largely the same as CalcBounds (TCustomActionControl), with one minor exception. The width of the control is set to be one pixel wider. For more information, see the documentation for the inherited method.

See Also

CalcBounds

63.1.28.2.2 TRibbonLargeSplitButton.CalcLayout Method

Pascal

```
procedure CalcLayout; override;
```

C++

```
virtual __fastcall CalcLayout();
```

Description

This is CalcLayout, a member of class TRibbonLargeSplitButton.

63.1.28.2.3 TRibbonLargeSplitButton.Click Method

Executes the control's function.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

This override of the method inherited from TCustomActionControl is almost identical to the inherited method. The only difference is that if the button control is being manipulated at design time, extra actions are taken to ensure that the control is properly selected.

Click

UsageCount

63.1.28.2.4 TRibbonLargeSplitButton.CMMouseleave Method

Pascal

```
procedure CMMouseleave(var Message: TMessage); message CM_MOUSELEAVE;
```

C++

```
__fastcall CMMouseleave(TMessage Message);
```

Description

This is CMMouseleave, a member of class TRibbonLargeSplitButton.

63.1.28.2.5 TRibbonLargeSplitButton.DoSplitButtonClick Method

Pascal

```
procedure DoSplitButtonClick(const SelectFirst: Boolean); virtual;
```

C++

```
virtual __fastcall DoSplitButtonClick(const Boolean SelectFirst);
```

Description

This is DoSplitButtonClick, a member of class TRibbonLargeSplitButton.

63.1.28.2.6 TRibbonLargeSplitButton.DrawArrow Method

Pascal

```
procedure DrawArrow(Location: TPoint; Color: TColor; ShadowColor: TColor; Size: Integer);
virtual;
```

C++

```
virtual __fastcall DrawArrow(TPoint Location, TColor Color, TColor ShadowColor, int Size);
```

Description

This is DrawArrow, a member of class TRibbonLargeSplitButton.

63.1.28.2.7 TRibbonLargeSplitButton.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

63.1.28.2.8 TRibbonLargeSplitButton.GetArrowPosition Method

Pascal

```
function GetArrowPosition(const ARect: TRect): TPoint; virtual;
```

C++

```
virtual __fastcall TPoint GetArrowPosition(const TRect ARect);
```

Description

This is GetArrowPosition, a member of class TRibbonLargeSplitButton.

63.1.28.2.9 TRibbonLargeSplitButton.InSplit Method

Pascal

```
function InSplit(X: Integer; Y: Integer): Boolean;
```

C++

```
__fastcall Boolean InSplit(int X, int Y);
```

Description

This is InSplit, a member of class TRibbonLargeSplitButton.

63.1.28.2.10 TRibbonLargeSplitButton.KeyTipClick Method

Handle clicking a **KeyTip**.

Pascal

```
procedure KeyTipClick; override;
```

C++

```
virtual __fastcall KeyTipClick();
```

Description

KeyTipClick Handle clicking a **KeyTip**. Some requires need to be handled differently when clicked by a **KeyTip**.

63.1.28.2.11 TRibbonLargeSplitButton.MouseDown Method

OnMouseDown event dispatcher.

Pascal

```
procedure MouseDown(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer);
override;
```

C++

```
virtual __fastcall MouseDown(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user presses the mouse button down while the cursor's hotspot is over the control.

The Button parameter determines which mouse button the user pressed. Shift indicates which shift keys (Shift, Ctrl, or Alt) were down when the user pressed the mouse button. X and Y are the pixel coordinates of the mouse pointer within the client area of the control.

A control calls MouseDown in response to any of the Windows mouse-down messages (WM_LBUTTONDOWN, WM_MBUTTONDOWN, WM_RBUTTONDOWN), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was pressed down: left, right, or middle.

MouseMove

MouseUp

OnMouseDown

63.1.28.2.12 TRibbonLargeSplitButton.MouseMove Method

Respond to mouse moving over control area..

Pascal

```
procedure MouseMove(Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseMove(TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseMove method to provide other responses in addition to calling the OnMouseMove event handler when the user moves the mouse.

A control calls MouseMove in response to any of the Windows mouse-move messages (WM_MOUSEMOVE), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively.

As the mouse cursor moves across a control, this method is called repeatedly. Each time it is called, it is with the new coordinates that reflect the continuous path of the mouse cursor across the screen real estate covered by the control's visual representation.

MouseDown

MouseUp

OnMouseMove

63.1.28.2.13 TRibbonLargeSplitButton.MouseUp Method

OnMouseUp event dispatcher.

Pascal

```
procedure MouseUp(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseUp(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user releases a previously pressed mouse button while the cursor's hotspot is over the control.

A control calls MouseUp in response to any of the Windows mouse-up messages (WM_LBUTTONUP, WM_MBUTTONUP, WM_RBUTTONUP), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was released: left, right, or middle

63.1.28.2.14 TRibbonLargeSplitButton.UpdateSplitBounds Method

Pascal

```
procedure UpdateSplitBounds; virtual;
```

C++

```
virtual __fastcall UpdateSplitBounds();
```

Description

This is UpdateSplitBounds, a member of class TRibbonLargeSplitButton.

63.1.28.3 TRibbonLargeSplitButton Properties

The properties of the TRibbonLargeSplitButton class are listed here.

Public Properties

	Name	Description
	CursorInSplit (see page 3752)	This is CursorInSplit, a member of class TRibbonLargeSplitButton.

63.1.28.3.1 TRibbonLargeSplitButton.CursorInSplit Property

Pascal

```
property CursorInSplit: Boolean;
```

C++

```
__property Boolean CursorInSplit;
```

Description

This is CursorInSplit, a member of class TRibbonLargeSplitButton.

63.1.29 TRibbonMainMenuItem Class

Class Hierarchy

Pascal

```
TRibbonMainMenuItem = class(TRibbonApplicationMenuItem);
```

C++

```
class TRibbonMainMenuItem : public TRibbonApplicationMenuItem;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonMainMenuItem.

63.1.29.1 TRibbonMainMenuItem Members

The following tables list the members exposed by TRibbonMainMenuItem.

Protected Methods

	Name	Description
	CalcLayout (see page 3757)	This is CalcLayout, a member of class TRibbonMenuItem.
	DrawBackground (see page 3758)	Draws a background image on the control.

	DrawGlyph (see page 3614)	Draws a symbol on the control.
	DrawGlyph (see page 3758)	Draws a symbol on the control.
	DrawSelectedBackground (see page 3615)	This is DrawSelectedBackground, a member of class TRibbonApplicationMenuItem.
	DrawSelectedBackground (see page 3758)	This is DrawSelectedBackground, a member of class TRibbonMenuItem.
	DrawSeparator (see page 3615)	This is DrawSeparator, a member of class TRibbonApplicationMenuItem.
	DrawSeparator (see page 3759)	This is DrawSeparator, a member of class TRibbonMenuItem.
	DrawShadowedText (see page 3753)	This is DrawShadowedText, a member of class TRibbonMainMenuItem.
	DrawSubMenuGlyph (see page 3615)	This is DrawSubMenuGlyph, a member of class TRibbonApplicationMenuItem.
	DrawText (see page 3753)	Draws text on the control.
	GetImageSize (see page 3616)	This is GetImageSize, a member of class TRibbonApplicationMenuItem.
	GetShowShortCut (see page 3759)	This is GetShowShortCut, a member of class TRibbonMenuItem.
	RibbonStyle (see page 3760)	This is RibbonStyle, a member of class TRibbonMenuItem.

Protected Properties

	Name	Description
	DrawBanner (see page 3760)	This is DrawBanner, a member of class TRibbonMenuItem.

Public Methods

	Name	Description
	CalcBounds (see page 3614)	Calculates the size of the menu item.
	CalcBounds (see page 3757)	Calculates the size of the menu item.
	Click (see page 3757)	Executes the control's function.
	Create (see page 3613)	Creates an instance of TCustomMenuItem.
	Create (see page 3756)	Creates an instance of TCustomMenuItem.

63.1.29.2 TRibbonMainMenuItem Methods

The methods of the TRibbonMainMenuItem class are listed here.

Protected Methods

	Name	Description
	DrawShadowedText (see page 3753)	This is DrawShadowedText, a member of class TRibbonMainMenuItem.
	DrawText (see page 3753)	Draws text on the control.

63.1.29.2.1 TRibbonMainMenuItem.DrawShadowedText Method

Pascal

```
procedure DrawShadowedText(Rect: TRect; Flags: Cardinal; Text: string; TextColor: TColor;
ShadowColor: TColor); override;
```

C++

```
virtual __fastcall DrawShadowedText(TRect Rect, unsigned Flags, UnicodeString Text, TColor
TextColor, TColor ShadowColor);
```

Description

This is DrawShadowedText, a member of class TRibbonMainMenuItem.

63.1.29.2.2 TRibbonMainMenuItem.DrawText Method

Draws text on the control.

Pascal

```
procedure DrawText(var ARect: TRect; var Flags: Cardinal; Text: string); override;
```

C++

```
virtual __fastcall DrawText(TRect ARect, unsigned Flags, UnicodeString Text);
```

Description

Use DrawText to draw the text specified by Text on the control within the area specified by ARect.

DrawBackground

DrawGlyph

63.1.30 TRibbonMainMenuSeparator Class

Class Hierarchy

Pascal

```
TRibbonMainMenuSeparator = class(TRibbonSeparator);
```

C++

```
class TRibbonMainMenuSeparator : public TRibbonSeparator;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonMainMenuSeparator.

63.1.30.1 TRibbonMainMenuSeparator Members

The following tables list the members exposed by TRibbonMainMenuSeparator.

Protected Methods

	Name	Description
	DrawBackground (see page 3785)	Draws a background image on the control.
	DrawGlyph (see page 3786)	Draws a symbol on the control.
	DrawShadowedText (see page 3786)	This is DrawShadowedText, a member of class TRibbonSeparator.
	DrawText (see page 3786)	Draws text on the control.
	RibbonStyle (see page 3787)	This is RibbonStyle, a member of class TRibbonSeparator.

Public Methods

	Name	Description
	CalcBounds (see page 3755)	Calculates the size of the control.
	Create (see page 3784)	Creates an instance of TCustomActionControl.

63.1.30.2 TRibbonMainMenuSeparator Methods

The methods of the TRibbonMainMenuSeparator class are listed here.

Public Methods

	Name	Description
	CalcBounds (see page 3755)	Calculates the size of the control.

63.1.30.2.1 TRibbonMainMenuSeparator.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as the presence of an icon, caption, and shortcuts. CalcBounds computes the boundaries of the control considering these kinds of factors. At the end, it calls SetBounds and other routines to ensure that the values are set properly.

Pascal

```
TRibbonMenuItem = class(TCustomMenuItem);
```

C++

```
class TRibbonMenuItem : public TCustomMenuItem;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonMenuItem.

63.1.31.1 TRibbonMenuItem Members

The following tables list the members exposed by TRibbonMenuItem.

Protected Methods

	Name	Description
	CalcLayout (see page 3757)	This is CalcLayout, a member of class TRibbonMenuItem.
	DrawBackground (see page 3758)	Draws a background image on the control.
	DrawGlyph (see page 3758)	Draws a symbol on the control.
	DrawSelectedBackground (see page 3758)	This is DrawSelectedBackground, a member of class TRibbonMenuItem.
	DrawSeparator (see page 3759)	This is DrawSeparator, a member of class TRibbonMenuItem.
	DrawShadowedText (see page 3759)	This is DrawShadowedText, a member of class TRibbonMenuItem.
	DrawText (see page 3759)	Draws text on the control.
	GetShowShortCut (see page 3759)	This is GetShowShortCut, a member of class TRibbonMenuItem.
	RibbonStyle (see page 3760)	This is RibbonStyle, a member of class TRibbonMenuItem.

Protected Properties

	Name	Description
	DrawBanner (see page 3760)	This is DrawBanner, a member of class TRibbonMenuItem.

Public Methods

	Name	Description
	CalcBounds (see page 3757)	Calculates the size of the menu item.
	Click (see page 3757)	Executes the control's function.
	Create (see page 3756)	Creates an instance of TCustomMenuItem.

63.1.31.2 TRibbonMenuItem.Create Constructor

Creates an instance of TCustomMenuItem.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonMenuItem(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomMenuItem. However, you should never attempt to instantiate a TCustomMenuItem. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

After calling the inherited constructor, Create initializes the control, including the following property settings:

Initializes the TCanvas object for its Canvas property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

Create

Destroy

63.1.31.3 TRibbonMenuItem Methods

The methods of the TRibbonMenuItem class are listed here.

Protected Methods

	Name	Description
	CalcLayout (see page 3757)	This is CalcLayout, a member of class TRibbonMenuItem.
	DrawBackground (see page 3758)	Draws a background image on the control.
	DrawGlyph (see page 3758)	Draws a symbol on the control.
	DrawSelectedBackground (see page 3758)	This is DrawSelectedBackground, a member of class TRibbonMenuItem.
	DrawSeparator (see page 3759)	This is DrawSeparator, a member of class TRibbonMenuItem.
	DrawShadowedText (see page 3759)	This is DrawShadowedText, a member of class TRibbonMenuItem.
	DrawText (see page 3759)	Draws text on the control.
	GetShowShortCut (see page 3759)	This is GetShowShortCut, a member of class TRibbonMenuItem.
	RibbonStyle (see page 3760)	This is RibbonStyle, a member of class TRibbonMenuItem.

Public Methods

	Name	Description
	CalcBounds (see page 3757)	Calculates the size of the menu item.
	Click (see page 3757)	Executes the control's function.

63.1.31.3.1 TRibbonMenuItem.CalcBounds Method

Calculates the size of the menu item.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as whether or not the menu item is a separator or not. CalcBounds computes the boundaries of the menu item considering these kinds of factors. At the end, it calls SetBounds and other routines to ensure that the values are set properly.

See Also

SetBounds

63.1.31.3.2 TRibbonMenuItem.CalcLayout Method

Pascal

```
procedure CalcLayout; override;
```

C++

```
virtual __fastcall CalcLayout();
```

Description

This is CalcLayout, a member of class TRibbonMenuItem.

63.1.31.3.3 TRibbonMenuItem.Click Method

Executes the control's function.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

This override of the method inherited from TCustomActionControl does little except bring the form containing the item into focus, and prevent the inherited method from being called. The reason for this lack of action is that at runtime, no action should be taken until the primary mouse button is pressed and released, which makes the OnClick event handler responsible for taking action. Click takes place only when the mouse button is first pressed, prior to release.

See Also

OnClick

63.1.31.3.4 TRibbonMenuItem.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

63.1.31.3.5 TRibbonMenuItem.DrawGlyph Method

Draws a symbol on the control.

Pascal

```
procedure DrawGlyph(const Location: TPoint); override;
```

C++

```
virtual __fastcall DrawGlyph(const TPoint Location);
```

Description

Use DrawGlyph to draw a symbol on the control at the specified location.

DrawBackground

DrawText

63.1.31.3.6 TRibbonMenuItem.DrawSelectedBackground Method

Pascal

```
procedure DrawSelectedBackground(ARect: TRect); virtual;
```

C++

```
virtual __fastcall DrawSelectedBackground(TRect ARect);
```

Description

This is DrawSelectedBackground, a member of class TRibbonMenuItem.

63.1.31.3.7 TRibbonMenuItem.DrawSeparator Method

Pascal

```
procedure DrawSeparator(const Offset: Integer); override;
```

C++

```
virtual __fastcall DrawSeparator(const int Offset);
```

Description

This is DrawSeparator, a member of class TRibbonMenuItem.

63.1.31.3.8 TRibbonMenuItem.DrawShadowedText Method

Pascal

```
procedure DrawShadowedText(Rect: TRect; Flags: Cardinal; Text: string; TextColor: TColor;
ShadowColor: TColor); override;
```

C++

```
virtual __fastcall DrawShadowedText(TRect Rect, unsigned Flags, UnicodeString Text, TColor
TextColor, TColor ShadowColor);
```

Description

This is DrawShadowedText, a member of class TRibbonMenuItem.

63.1.31.3.9 TRibbonMenuItem.DrawText Method

Draws text on the control.

Pascal

```
procedure DrawText(var ARect: TRect; var Flags: Cardinal; Text: string); override;
```

C++

```
virtual __fastcall DrawText(TRect ARect, unsigned Flags, UnicodeString Text);
```

Description

Use DrawText to draw the text specified by Text on the control within the area specified by ARect.

63.1.31.3.10 TRibbonMenuItem.GetShowShortCut Method

Pascal

```
function GetShowShortCut: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetShowShortCut();
```

Description

This is GetShowShortCut, a member of class TRibbonMenuItem.

63.1.31.3.11 TRibbonMenuItem.RibbonStyle Method

Pascal

```
function RibbonStyle: TRibbonStyleActionBars;
```

C++

```
__fastcall TRibbonStyleActionBars RibbonStyle();
```

Description

This is RibbonStyle, a member of class TRibbonMenuItem.

63.1.31.4 TRibbonMenuItem Properties

The properties of the TRibbonMenuItem class are listed here.

Protected Properties

	Name	Description
	DrawBanner (see page 3760)	This is DrawBanner, a member of class TRibbonMenuItem.

63.1.31.4.1 TRibbonMenuItem.DrawBanner Property

Pascal

```
property DrawBanner: Boolean;
```

C++

```
__property Boolean DrawBanner;
```

Description

This is DrawBanner, a member of class TRibbonMenuItem.

63.1.32 TRibbonMenuSeparatorItem Class

Pascal

```
TRibbonMenuSeparatorItem = class(TRibbonMenuItem);
```

C++

```
class TRibbonMenuSeparatorItem : public TRibbonMenuItem;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonMenuSeparatorItem.

63.1.32.1 TRibbonMenuSeparatorItem Members

The following tables list the members exposed by TRibbonMenuSeparatorItem.

Protected Methods

	Name	Description
	CalcLayout (see page 3757)	This is CalcLayout, a member of class TRibbonMenuItem.
	DrawBackground (see page 3758)	Draws a background image on the control.
	DrawGlyph (see page 3758)	Draws a symbol on the control.
	DrawSelectedBackground (see page 3758)	This is DrawSelectedBackground, a member of class TRibbonMenuItem.
	DrawSeparator (see page 3762)	This is DrawSeparator, a member of class TRibbonMenuSeparatorItem.
	DrawShadowedText (see page 3759)	This is DrawShadowedText, a member of class TRibbonMenuItem.
	DrawText (see page 3759)	Draws text on the control.
	GetShowShortCut (see page 3759)	This is GetShowShortCut, a member of class TRibbonMenuItem.
	RibbonStyle (see page 3760)	This is RibbonStyle, a member of class TRibbonMenuItem.

Protected Properties

	Name	Description
	DrawBanner (see page 3760)	This is DrawBanner, a member of class TRibbonMenuItem.

Public Methods

	Name	Description
	CalcBounds (see page 3761)	Calculates the size of the menu item.
	Click (see page 3757)	Executes the control's function.
	Create (see page 3756)	Creates an instance of TCustomMenuItem.

63.1.32.2 TRibbonMenuSeparatorItem Methods

The methods of the TRibbonMenuSeparatorItem class are listed here.

Protected Methods

	Name	Description
	DrawSeparator (see page 3762)	This is DrawSeparator, a member of class TRibbonMenuSeparatorItem.

Public Methods

	Name	Description
	CalcBounds (see page 3761)	Calculates the size of the menu item.

63.1.32.2.1 TRibbonMenuSeparatorItem.CalcBounds Method

Calculates the size of the menu item.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as whether or not the menu item is a separator or not. CalcBounds computes the boundaries of the menu item considering these kinds of factors. At the end, it calls SetBounds and other routines to ensure that the values are set properly.

```
TRibbonMenuSmallButtonControl = class(TRibbonSmallButtonControl);
```

C++

```
class TRibbonMenuSmallButtonControl : public TRibbonSmallButtonControl;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonMenuSmallButtonControl.

63.1.33.1 TRibbonMenuSmallButtonControl Members

The following tables list the members exposed by TRibbonMenuSmallButtonControl.

Protected Methods

	Name	Description
	AllowHotKeys (see page 3619)	This is AllowHotKeys, a member of class TRibbonBaseButtonControl.

	DrawBackground (see page 3621)	Draws a background image on the control.
	DrawGlyph (see page 3621)	Draws a symbol on the control.
	DrawSeparator (see page 3621)	This is DrawSeparator, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 3622)	This is DrawShadowedText, a member of class TRibbonBaseButtonControl.
	DrawText (see page 3622)	Draws text on the control.
	GetImageSize (see page 3622)	This is GetImageSize, a member of class TRibbonBaseButtonControl.
	IsButton (see page 3624)	This is IsButton, a member of class TRibbonBaseButtonControl.
	IsRibbonAvailable (see page 3624)	This is IsRibbonAvailable, a member of class TRibbonBaseButtonControl.
	MouseUp (see page 3764)	OnMouseUp event dispatcher.
	RibbonStyle (see page 3624)	This is RibbonStyle, a member of class TRibbonBaseButtonControl.

Protected Properties

	Name	Description
	DrawDown (see page 3626)	This is DrawDown, a member of class TRibbonBaseButtonControl.

Public Methods

	Name	Description
	CalcBounds (see page 3619)	Calculates the size of the control.
	CalcBounds (see page 3788)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 3916)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.
	CanAddToQuickAccessToolbar (see page 3620)	This is CanAddToQuickAccessToolbar, a member of class TRibbonBaseButtonControl.
	Click (see page 3620)	Executes the control's function.
	Create (see page 3763)	Creates an instance of TCustomButtonControl.
	Destroy (see page 3618)	Destroys an instance of TCustomActionControl.
	DragDrop (see page 3620)	Performs actions and generates an OnDragDrop event.
	GetKeyTip (see page 3919)	Returns current **KeyTip (see page 3922)** for command.
	GetKeyTip (see page 3622)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 3920)	Indicates if command's **KeyTip (see page 3922)** matches currently input KeyTip (see page 3922).
	HandleKeyTip (see page 3623)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 3920)	Hide **KeyTip (see page 3922)** for command.
	HideKeyTip (see page 3623)	Hide **KeyTip** for command.
	KeyTipClick (see page 3920)	Handle clicking a **KeyTip (see page 3922)**.
	KeyTipClick (see page 3624)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 3921)	Sets **KeyTip (see page 3922)** for command.
	SetKeyTip (see page 3625)	Sets **KeyTip** for command.
	ShowKeyTip (see page 3921)	Shows **KeyTip (see page 3922)** for command in specified position.
	ShowKeyTip (see page 3625)	Shows **KeyTip** for command in specified position.

Public Properties

	Name	Description
	KeyTip (see page 3922)	Current **KeyTip** for command

63.1.33.2 TRibbonMenuSmallButtonControl.Create Constructor

Creates an instance of TCustomButtonControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonMenuSmallButtonControl(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomButtonControl. However, you should never attempt to instantiate a TCustomButtonControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

AOwner is the component that is responsible for freeing the button control. It becomes the value of the Owner property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

63.1.33.3 TRibbonMenuSmallButtonControl Methods

The methods of the TRibbonMenuSmallButtonControl class are listed here.

Protected Methods

	Name	Description
	MouseUp (see page 3764)	OnMouseUp event dispatcher.

63.1.33.3.1 TRibbonMenuSmallButtonControl.MouseUp Method

OnMouseUp event dispatcher.

Pascal

```
procedure MouseUp(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseUp(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user releases a previously pressed mouse button while the cursor's hotspot is over the control.

A control calls MouseUp in response to any of the Windows mouse-up messages (WM_LBUTTONUP, WM_MBUTTONUP, WM_RBUTTONUP), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was released: left, right, or middle

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonOptionButtonControl.

63.1.34.1 TRibbonOptionButtonControl Members

The following tables list the members exposed by TRibbonOptionButtonControl.

Protected Methods

	Name	Description
	AllowHotKeys (see page 3619)	This is AllowHotKeys, a member of class TRibbonBaseButtonControl.
	DrawBackground (see page 3766)	Draws a background image on the control.
	DrawGlyph (see page 3621)	Draws a symbol on the control.
	DrawSeparator (see page 3621)	This is DrawSeparator, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 3622)	This is DrawShadowedText, a member of class TRibbonBaseButtonControl.
	DrawText (see page 3622)	Draws text on the control.
	GetImageSize (see page 3622)	This is GetImageSize, a member of class TRibbonBaseButtonControl.
	IsButton (see page 3624)	This is IsButton, a member of class TRibbonBaseButtonControl.
	IsRibbonAvailable (see page 3624)	This is IsRibbonAvailable, a member of class TRibbonBaseButtonControl.
	MouseUp (see page 3764)	OnMouseUp event dispatcher.
	RibbonStyle (see page 3624)	This is RibbonStyle, a member of class TRibbonBaseButtonControl.

Protected Properties

	Name	Description
	DrawDown (see page 3626)	This is DrawDown, a member of class TRibbonBaseButtonControl.

Public Methods

	Name	Description
	CalcBounds (see page 3619)	Calculates the size of the control.
	CalcBounds (see page 3788)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 3916)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.
	CanAddToQuickAccessToolbar (see page 3620)	This is CanAddToQuickAccessToolbar, a member of class TRibbonBaseButtonControl.
	Click (see page 3620)	Executes the control's function.

	Create (see page 3617)	Creates an instance of TCustomButtonControl.
	Create (see page 3763)	Creates an instance of TCustomButtonControl.
	Destroy (see page 3618)	Destroys an instance of TCustomActionControl.
	DragDrop (see page 3620)	Performs actions and generates an OnDragDrop event.
	GetKeyTip (see page 3919)	Returns current **KeyTip (see page 3922)** for command.
	GetKeyTip (see page 3622)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 3920)	Indicates if command's **KeyTip (see page 3922)** matches currently input KeyTip (see page 3922).
	HandleKeyTip (see page 3623)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 3920)	Hide **KeyTip (see page 3922)** for command.
	HideKeyTip (see page 3623)	Hide **KeyTip** for command.
	KeyTipClick (see page 3920)	Handle clicking a **KeyTip (see page 3922)**.
	KeyTipClick (see page 3624)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 3921)	Sets **KeyTip (see page 3922)** for command.
	SetKeyTip (see page 3625)	Sets **KeyTip** for command.
	ShowKeyTip (see page 3921)	Shows **KeyTip (see page 3922)** for command in specified position.
	ShowKeyTip (see page 3625)	Shows **KeyTip** for command in specified position.

Public Properties

	Name	Description
	KeyTip (see page 3922)	Current **KeyTip** for command

63.1.34.2 TRibbonOptionButtonControl Methods

The methods of the TRibbonOptionButtonControl class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 3766)	Draws a background image on the control.

63.1.34.2.1 TRibbonOptionButtonControl.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

63.1.35 TRibbonQATScrollButton Class

Class Hierarchy

Pascal

```
TRibbonQATScrollButton = class(TCustomToolScrollBtn);
```

C++

```
class TRibbonQATScrollButton : public TCustomToolScrollBtn;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonQATScrollButton.

63.1.35.1 TRibbonQATScrollButton Members

The following tables list the members exposed by TRibbonQATScrollButton.

Protected Methods

	Name	Description
	CMMouseEnter (see page 3769)	This is CMMouseEnter, a member of class TRibbonQATScrollButton.
	CMMouseLeave (see page 3769)	This is CMMouseLeave, a member of class TRibbonQATScrollButton.
	DrawArrows (see page 3769)	This is DrawArrows, a member of class TRibbonQATScrollButton.
	DrawBackground (see page 3769)	Draws a background image on the control.
	MouseMove (see page 3770)	Respond to mouse moving over control area..
	RibbonStyle (see page 3770)	This is RibbonStyle, a member of class TRibbonQATScrollButton.

Protected Properties

	Name	Description
	CursorInBtn (see page 3771)	This is CursorInBtn, a member of class TRibbonQATScrollButton.

Public Methods

	Name	Description
	CalcBounds (see page 3768)	Calculates the size of the control.
	Click (see page 3768)	Executes the control's function.

Public Properties

	Name	Description
	DrawDown (see page 3771)	This is DrawDown, a member of class TRibbonQATScrollButton.
	ScrollMode (see page 3771)	This is ScrollMode, a member of class TRibbonQATScrollButton.

63.1.35.2 TRibbonQATScrollButton Methods

The methods of the TRibbonQATScrollButton class are listed here.

Protected Methods

	Name	Description
	CMMouseEnter (see page 3769)	This is CMMouseEnter, a member of class TRibbonQATScrollButton.
	CMMouseLeave (see page 3769)	This is CMMouseLeave, a member of class TRibbonQATScrollButton.
	DrawArrows (see page 3769)	This is DrawArrows, a member of class TRibbonQATScrollButton.
	DrawBackground (see page 3769)	Draws a background image on the control.
	MouseMove (see page 3770)	Respond to mouse moving over control area..
	RibbonStyle (see page 3770)	This is RibbonStyle, a member of class TRibbonQATScrollButton.

Public Methods

	Name	Description
	CalcBounds (see page 3768)	Calculates the size of the control.
	Click (see page 3768)	Executes the control's function.

63.1.35.2.1 TRibbonQATScrollButton.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

This method is largely the same as CalcBounds (TCustomActionControl), with one minor exception. The width of the control is set to be one pixel wider. For more information, see the documentation for the inherited method.

See Also

CalcBounds

63.1.35.2.2 TRibbonQATScrollButton.Click Method

Executes the control's function.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

This override of the method inherited from TCustomActionControl is almost identical to the inherited method. The only difference is that if the button control is being manipulated at design time, extra actions are taken to ensure that the control is properly selected.

63.1.35.2.3 TRibbonQATScrollButton.CMMouseEnter Method

Pascal

```
procedure CMMouseEnter(var Message: TMessage); override;
```

C++

```
virtual __fastcall CMMouseEnter(TMessage Message);
```

Description

This is CMMouseEnter, a member of class TRibbonQATScrollButton.

63.1.35.2.4 TRibbonQATScrollButton.CMMouseLeave Method

Pascal

```
procedure CMMouseLeave(var Message: TMessage); override;
```

C++

```
virtual __fastcall CMMouseLeave(TMessage Message);
```

Description

This is CMMouseLeave, a member of class TRibbonQATScrollButton.

63.1.35.2.5 TRibbonQATScrollButton.DrawArrows Method

Pascal

```
procedure DrawArrows; override;
```

C++

```
virtual __fastcall DrawArrows();
```

Description

This is DrawArrows, a member of class TRibbonQATScrollButton.

63.1.35.2.6 TRibbonQATScrollButton.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

63.1.35.2.7 TRibbonQATScrollButton.MouseMove Method

Respond to mouse moving over control area..

Pascal

```
procedure MouseMove(Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseMove(TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseMove method to provide other responses in addition to calling the OnMouseMove event handler when the user moves the mouse.

A control calls MouseMove in response to any of the Windows mouse-move messages (WM_MOUSEMOVE), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively.

As the mouse cursor moves across a control, this method is called repeatedly. Each time it is called, it is with the new coordinates that reflect the continuous path of the mouse cursor across the screen real estate covered by the control's visual representation.

63.1.35.2.8 TRibbonQATScrollButton.RibbonStyle Method

Pascal

```
function RibbonStyle: TRibbonStyleActionBars;
```

C++

```
__fastcall TRibbonStyleActionBars RibbonStyle();
```

Description

This is RibbonStyle, a member of class TRibbonQATScrollButton.

63.1.35.3 TRibbonQATScrollButton Properties

The properties of the TRibbonQATScrollButton class are listed here.

Protected Properties

	Name	Description
	CursorInBtn (see page 3771)	This is CursorInBtn, a member of class TRibbonQATScrollButton.

Public Properties

	Name	Description
	DrawDown (see page 3771)	This is DrawDown, a member of class TRibbonQATScrollButton.
	ScrollMode (see page 3771)	This is ScrollMode, a member of class TRibbonQATScrollButton.

63.1.35.3.1 TRibbonQATScrollButton.CursorInBtn Property

Pascal

```
property CursorInBtn: Boolean;
```

C++

```
__property Boolean CursorInBtn;
```

Description

This is CursorInBtn, a member of class TRibbonQATScrollButton.

63.1.35.3.2 TRibbonQATScrollButton.DrawDown Property

Pascal

```
property DrawDown: Boolean;
```

C++

```
__property Boolean DrawDown;
```

Description

This is DrawDown, a member of class TRibbonQATScrollButton.

63.1.35.3.3 TRibbonQATScrollButton.ScrollMode Property

Pascal

```
property ScrollMode: TQATScrollMode;
```

C++

```
__property TQATScrollMode ScrollMode;
```

Description

This is ScrollMode, a member of class TRibbonQATScrollButton.

63.1.36 TRibbonRadioButtonControl Class

Class Hierarchy

Pascal

```
TRibbonRadioButtonControl = class(TRibbonSmallButtonControl);
```

C++

```
class TRibbonRadioButtonControl : public TRibbonSmallButtonControl;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonRadioButtonControl.

63.1.36.1 TRibbonRadioButtonControl Members

The following tables list the members exposed by TRibbonRadioButtonControl.

Protected Methods

	Name	Description
	AllowHotKeys (see page 3619)	This is AllowHotKeys, a member of class TRibbonBaseButtonControl.
	DrawBackground (see page 3773)	Draws a background image on the control.
	DrawGlyph (see page 3773)	Draws a symbol on the control.
	DrawSeparator (see page 3621)	This is DrawSeparator, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 3622)	This is DrawShadowedText, a member of class TRibbonBaseButtonControl.
	DrawText (see page 3622)	Draws text on the control.
	GetImageSize (see page 3622)	This is GetImageSize, a member of class TRibbonBaseButtonControl.
	IsButton (see page 3624)	This is IsButton, a member of class TRibbonBaseButtonControl.
	IsRibbonAvailable (see page 3624)	This is IsRibbonAvailable, a member of class TRibbonBaseButtonControl.
	RibbonStyle (see page 3624)	This is RibbonStyle, a member of class TRibbonBaseButtonControl.

Protected Properties

	Name	Description
	DrawDown (see page 3626)	This is DrawDown, a member of class TRibbonBaseButtonControl.

Public Methods

	Name	Description
	CalcBounds (see page 3773)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 3916)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.
	CanAddToQuickAccessToolbar (see page 3620)	This is CanAddToQuickAccessToolbar, a member of class TRibbonBaseButtonControl.
	Click (see page 3620)	Executes the control's function.
	Create (see page 3617)	Creates an instance of TCustomButtonControl.
	Destroy (see page 3618)	Destroys an instance of TCustomActionControl.
	DragDrop (see page 3620)	Performs actions and generates an OnDragDrop event.
	GetKeyTip (see page 3919)	Returns current **KeyTip (see page 3922)** for command.
	GetKeyTip (see page 3622)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 3920)	Indicates if command's **KeyTip (see page 3922)** matches currently input KeyTip (see page 3922).
	HandleKeyTip (see page 3623)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 3920)	Hide **KeyTip (see page 3922)** for command.
	HideKeyTip (see page 3623)	Hide **KeyTip** for command.
	KeyTipClick (see page 3920)	Handle clicking a **KeyTip (see page 3922)**.
	KeyTipClick (see page 3624)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 3921)	Sets **KeyTip (see page 3922)** for command.
	SetKeyTip (see page 3625)	Sets **KeyTip** for command.
	ShowKeyTip (see page 3921)	Shows **KeyTip (see page 3922)** for command in specified position.
	ShowKeyTip (see page 3625)	Shows **KeyTip** for command in specified position.

Public Properties

	Name	Description
	KeyTip (see page 3922)	Current **KeyTip** for command

63.1.36.2 TRibbonRadioButtonControl Methods

The methods of the TRibbonRadioButtonControl class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 3773)	Draws a background image on the control.
	DrawGlyph (see page 3773)	Draws a symbol on the control.

Public Methods

	Name	Description
	CalcBounds (see page 3773)	Calculates the size of the control.

63.1.36.2.1 TRibbonRadioButtonControl.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

This method is largely the same as CalcBounds (TCustomActionControl), with one minor exception. The width of the control is set to be one pixel wider. For more information, see the documentation for the inherited method.

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonRecentButtonControl.

63.1.37.1 TRibbonRecentButtonControl Members

The following tables list the members exposed by TRibbonRecentButtonControl.

Protected Methods

	Name	Description
	AllowHotKeys (see page 3775)	This is AllowHotKeys, a member of class TRibbonRecentButtonControl.
	DrawBackground (see page 3621)	Draws a background image on the control.
	DrawGlyph (see page 3621)	Draws a symbol on the control.
	DrawSeparator (see page 3621)	This is DrawSeparator, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 3622)	This is DrawShadowedText, a member of class TRibbonBaseButtonControl.
	DrawText (see page 3622)	Draws text on the control.
	GetImageSize (see page 3622)	This is GetImageSize, a member of class TRibbonBaseButtonControl.
	IsButton (see page 3624)	This is IsButton, a member of class TRibbonBaseButtonControl.
	IsRibbonAvailable (see page 3624)	This is IsRibbonAvailable, a member of class TRibbonBaseButtonControl.
	MouseUp (see page 3764)	OnMouseUp event dispatcher.

	RibbonStyle (see page 3624)	This is RibbonStyle, a member of class TRibbonBaseButtonControl.

Protected Properties

	Name	Description
	DrawDown (see page 3626)	This is DrawDown, a member of class TRibbonBaseButtonControl.

Public Methods

	Name	Description
	CalcBounds (see page 3619)	Calculates the size of the control.
	CalcBounds (see page 3788)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 3916)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.
	CanAddToQuickAccessToolbar (see page 3620)	This is CanAddToQuickAccessToolbar, a member of class TRibbonBaseButtonControl.
	Click (see page 3620)	Executes the control's function.
	Create (see page 3617)	Creates an instance of TCustomButtonControl.
	Create (see page 3763)	Creates an instance of TCustomButtonControl.
	Destroy (see page 3618)	Destroys an instance of TCustomActionControl.
	DragDrop (see page 3620)	Performs actions and generates an OnDragDrop event.
	GetKeyTip (see page 3919)	Returns current **KeyTip (see page 3922)** for command.
	GetKeyTip (see page 3622)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 3920)	Indicates if command's **KeyTip (see page 3922)** matches currently input KeyTip (see page 3922).
	HandleKeyTip (see page 3623)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 3920)	Hide **KeyTip (see page 3922)** for command.
	HideKeyTip (see page 3623)	Hide **KeyTip** for command.
	KeyTipClick (see page 3920)	Handle clicking a **KeyTip (see page 3922)**.
	KeyTipClick (see page 3624)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 3921)	Sets **KeyTip (see page 3922)** for command.
	SetKeyTip (see page 3625)	Sets **KeyTip** for command.
	ShowKeyTip (see page 3921)	Shows **KeyTip (see page 3922)** for command in specified position.
	ShowKeyTip (see page 3625)	Shows **KeyTip** for command in specified position.

Public Properties

	Name	Description
	KeyTip (see page 3922)	Current **KeyTip** for command

63.1.37.2 TRibbonRecentButtonControl Methods

The methods of the TRibbonRecentButtonControl class are listed here.

Protected Methods

	Name	Description
	AllowHotKeys (see page 3775)	This is AllowHotKeys, a member of class TRibbonRecentButtonControl.

63.1.37.2.1 TRibbonRecentButtonControl.AllowHotKeys Method

Pascal

```
function AllowHotKeys: Boolean; override;
```

C++

```
virtual __fastcall Boolean AllowHotKeys();
```

Description

This is AllowHotKeys, a member of class TRibbonRecentButtonControl.

63.1.38 TRibbonRichContentItem Class

Class Hierarchy

Pascal

```
TRibbonRichContentItem = class(TRibbonMenuItem);
```

C++

```
class TRibbonRichContentItem : public TRibbonMenuItem;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonRichContentItem.

63.1.38.1 TRibbonRichContentItem Members

The following tables list the members exposed by TRibbonRichContentItem.

Protected Methods

	Name	Description
	CalcLayout (see page 3757)	This is CalcLayout, a member of class TRibbonMenuItem.
	CanCalculateHeight (see page 3778)	This is CanCalculateHeight, a member of class TRibbonRichContentItem.
	DrawBackground (see page 3778)	Draws a background image on the control.
	DrawGlyph (see page 3778)	Draws a symbol on the control.
	DrawSelectedBackground (see page 3758)	This is DrawSelectedBackground, a member of class TRibbonMenuItem.
	DrawSeparator (see page 3759)	This is DrawSeparator, a member of class TRibbonMenuItem.
	DrawShadowedText (see page 3779)	This is DrawShadowedText, a member of class TRibbonRichContentItem.
	DrawText (see page 3779)	Draws text on the control.
	GetItemHeight (see page 3779)	This is GetItemHeight, a member of class TRibbonRichContentItem.
	GetItemWidth (see page 3780)	This is GetItemWidth, a member of class TRibbonRichContentItem.
	GetMenuProps (see page 3780)	This is GetMenuProps, a member of class TRibbonRichContentItem.
	GetShowShortCut (see page 3759)	This is GetShowShortCut, a member of class TRibbonMenuItem.
	RibbonStyle (see page 3760)	This is RibbonStyle, a member of class TRibbonMenuItem.

Protected Properties

	Name	Description
	DrawBanner (see page 3760)	This is DrawBanner, a member of class TRibbonMenuItem.

Public Methods

	Name	Description
	CalcBounds (see page 3777)	Calculates the size of the menu item.
	Click (see page 3757)	Executes the control's function.
	Create (see page 3777)	Creates an instance of TCustomMenuItem.

63.1.38.2 TRibbonRichContentItem.Create Constructor

Creates an instance of TCustomMenuItem.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonRichContentItem(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomMenuItem. However, you should never attempt to instantiate a TCustomMenuItem. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

After calling the inherited constructor, Create initializes the control, including the following property settings:

Initializes the TCanvas object for its Canvas property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

Create

Destroy

63.1.38.3 TRibbonRichContentItem Methods

The methods of the TRibbonRichContentItem class are listed here.

Protected Methods

	Name	Description
	CanCalculateHeight (see page 3778)	This is CanCalculateHeight, a member of class TRibbonRichContentItem.
V	DrawBackground (see page 3778)	Draws a background image on the control.
V	DrawGlyph (see page 3778)	Draws a symbol on the control.
V	DrawShadowedText (see page 3779)	This is DrawShadowedText, a member of class TRibbonRichContentItem.
V	DrawText (see page 3779)	Draws text on the control.
	GetItemHeight (see page 3779)	This is GetItemHeight, a member of class TRibbonRichContentItem.
	GetItemWidth (see page 3780)	This is GetItemWidth, a member of class TRibbonRichContentItem.
	GetMenuProps (see page 3780)	This is GetMenuProps, a member of class TRibbonRichContentItem.

Public Methods

	Name	Description
V	CalcBounds (see page 3777)	Calculates the size of the menu item.

63.1.38.3.1 TRibbonRichContentItem.CalcBounds Method

Calculates the size of the menu item.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as whether or not the menu item is a separator or not. CalcBounds computes the boundaries of the menu item considering these kinds of factors. At the end, it calls SetBounds and other routines to ensure that the values are set properly.

See Also

SetBounds

63.1.38.3.2 TRibbonRichContentItem.CanCalculateHeight Method

Pascal

```
function CanCalculateHeight: Boolean;
```

C++

```
__fastcall Boolean CanCalculateHeight();
```

Description

This is CanCalculateHeight, a member of class TRibbonRichContentItem.

63.1.38.3.3 TRibbonRichContentItem.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

63.1.38.3.4 TRibbonRichContentItem.DrawGlyph Method

Draws a symbol on the control.

Pascal

```
procedure DrawGlyph(const Location: TPoint); override;
```

C++

```
virtual __fastcall DrawGlyph(const TPoint Location);
```

Description

Use DrawGlyph to draw a symbol on the control at the specified location.

See Also

DrawBackground

DrawText

63.1.38.3.5 TRibbonRichContentItem.DrawShadowedText Method

Pascal

```
procedure DrawShadowedText(Rect: TRect; Flags: Cardinal; Text: string; TextColor: TColor;
ShadowColor: TColor); override;
```

C++

```
virtual __fastcall DrawShadowedText(TRect Rect, unsigned Flags, UnicodeString Text, TColor
TextColor, TColor ShadowColor);
```

Description

This is DrawShadowedText, a member of class TRibbonRichContentItem.

63.1.38.3.6 TRibbonRichContentItem.DrawText Method

Draws text on the control.

Pascal

```
procedure DrawText(var Rect: TRect; var Flags: Cardinal; Text: string); override;
```

C++

```
virtual __fastcall DrawText(TRect Rect, unsigned Flags, UnicodeString Text);
```

Description

Use DrawText to draw the text specified by Text on the control within the area specified by ARect.

DrawGlyph

63.1.38.3.7 TRibbonRichContentItem.GetItemHeight Method

Pascal

```
function GetItemHeight: Integer;
```

C++

```
__fastcall int GetItemHeight();
```

Description

This is GetItemHeight, a member of class TRibbonRichContentItem.

63.1.38.3.8 TRibbonRichContentItem.GetItemWidth Method

Pascal

```
function GetItemWidth: Integer;
```

C++

```
__fastcall int GetItemWidth();
```

Description

This is GetItemWidth, a member of class TRibbonRichContentItem.

63.1.38.3.9 TRibbonRichContentItem.GetMenuProps Method

Pascal

```
function GetMenuProps: TMenuProperties;
```

C++

```
__fastcall TMenuProperties GetMenuProps();
```

Description

This is GetMenuProps, a member of class TRibbonRichContentItem.

63.1.39 TRibbonRichContentMainMenuItem Class

Class Hierarchy

Pascal

```
TRibbonRichContentMainMenuItem = class(TRibbonRichContentItem);
```

C++

```
class TRibbonRichContentMainMenuItem : public TRibbonRichContentItem;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonRichContentMainMenuItem.

63.1.39.1 TRibbonRichContentMainMenuItem Members

The following tables list the members exposed by TRibbonRichContentMainMenuItem.

Protected Methods

	Name	Description
	CalcLayout (see page 3782)	This is CalcLayout, a member of class TRibbonRichContentMainMenuItem.
	CanCalculateHeight (see page 3778)	This is CanCalculateHeight, a member of class TRibbonRichContentItem.
	DrawBackground (see page 3758)	Draws a background image on the control.

	DrawBackground (see page 3778)	Draws a background image on the control.
	DrawGlyph (see page 3782)	Draws a symbol on the control.
	DrawSelectedBackground (see page 3758)	This is DrawSelectedBackground, a member of class TRibbonMenuItem.
	DrawSeparator (see page 3759)	This is DrawSeparator, a member of class TRibbonMenuItem.
	DrawShadowedText (see page 3759)	This is DrawShadowedText, a member of class TRibbonMenuItem.
	DrawShadowedText (see page 3779)	This is DrawShadowedText, a member of class TRibbonRichContentItem.
	DrawText (see page 3783)	Draws text on the control.
	GetImageSize (see page 3783)	This is GetImageSize, a member of class TRibbonRichContentMainMenuItem.
	GetItemHeight (see page 3779)	This is GetItemHeight, a member of class TRibbonRichContentItem.
	GetItemWidth (see page 3780)	This is GetItemWidth, a member of class TRibbonRichContentItem.
	GetMenuProps (see page 3780)	This is GetMenuProps, a member of class TRibbonRichContentItem.
	GetShowShortCut (see page 3783)	This is GetShowShortCut, a member of class TRibbonRichContentMainMenuItem.
	RibbonStyle (see page 3760)	This is RibbonStyle, a member of class TRibbonMenuItem.

Protected Properties

	Name	Description
	DrawBanner (see page 3760)	This is DrawBanner, a member of class TRibbonMenuItem.

Public Methods

	Name	Description
	CalcBounds (see page 3782)	Calculates the size of the menu item.
	Click (see page 3757)	Executes the control's function.
	Create (see page 3781)	Creates an instance of TCustomMenuItem.

63.1.39.2 TRibbonRichContentMainMenuItem.Create Constructor

Creates an instance of TCustomMenuItem.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonRichContentMainMenuItem(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomMenuItem. However, you should never attempt to instantiate a TCustomMenuItem. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

After calling the inherited constructor, Create initializes the control, including the following property settings:

Initializes the TCanvas object for its Canvas property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

63.1.39.3 TRibbonRichContentMainMenuItem Methods

The methods of the TRibbonRichContentMainMenuItem class are listed here.

Protected Methods

	Name	Description
	CalcLayout (see page 3782)	This is CalcLayout, a member of class TRibbonRichContentMainMenuItem.
	DrawGlyph (see page 3782)	Draws a symbol on the control.
	DrawText (see page 3783)	Draws text on the control.
	GetImageSize (see page 3783)	This is GetImageSize, a member of class TRibbonRichContentMainMenuItem.
	GetShowShortCut (see page 3783)	This is GetShowShortCut, a member of class TRibbonRichContentMainMenuItem.

Public Methods

	Name	Description
	CalcBounds (see page 3782)	Calculates the size of the menu item.

63.1.39.3.1 TRibbonRichContentMainMenuItem.CalcBounds Method

Calculates the size of the menu item.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as whether or not the menu item is a separator or not. CalcBounds computes the boundaries of the menu item considering these kinds of factors. At the end, it calls SetBounds and other routines to ensure that the values are set properly.

See Also

SetBounds

63.1.39.3.2 TRibbonRichContentMainMenuItem.CalcLayout Method

Pascal

```
procedure CalcLayout; override;
```

C++

```
virtual __fastcall CalcLayout();
```

Description

This is CalcLayout, a member of class TRibbonRichContentMainMenuItem.

63.1.39.3.3 TRibbonRichContentMainMenuItem.DrawGlyph Method

Draws a symbol on the control.

Pascal

```
procedure DrawGlyph(const Location: TPoint); override;
```

C++

```
virtual __fastcall DrawGlyph(const TPoint Location);
```

Description

Use DrawGlyph to draw a symbol on the control at the specified location.

See Also

DrawBackground

DrawText

63.1.39.3.4 TRibbonRichContentMainMenuItem.DrawText Method

Draws text on the control.

Pascal

```
procedure DrawText(var ARect: TRect; var Flags: Cardinal; Text: string); override;
```

C++

```
virtual __fastcall DrawText(TRect ARect, unsigned Flags, UnicodeString Text);
```

Description

Use DrawText to draw the text specified by Text on the control within the area specified by ARect.

See Also

DrawBackground

DrawGlyph

63.1.39.3.5 TRibbonRichContentMainMenuItem.GetImageSize Method

Pascal

```
function GetImageSize: TPoint; override;
```

C++

```
virtual __fastcall TPoint GetImageSize();
```

Description

This is GetImageSize, a member of class TRibbonRichContentMainMenuItem.

63.1.39.3.6 TRibbonRichContentMainMenuItem.GetShowShortCut Method

Pascal

```
function GetShowShortCut: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetShowShortCut();
```

Description

This is GetShowShortCut, a member of class TRibbonRichContentMainMenuItem.

63.1.40 TRibbonSeparator Class

Class Hierarchy

Pascal

```
TRibbonSeparator = class(TCustomActionControl);
```

C++

```
class TRibbonSeparator : public TCustomActionControl;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonSeparator.

63.1.40.1 TRibbonSeparator Members

The following tables list the members exposed by TRibbonSeparator.

Protected Methods

	Name	Description
	DrawBackground (see page 3785)	Draws a background image on the control.
	DrawGlyph (see page 3786)	Draws a symbol on the control.
	DrawShadowedText (see page 3786)	This is DrawShadowedText, a member of class TRibbonSeparator.
	DrawText (see page 3786)	Draws text on the control.
	RibbonStyle (see page 3787)	This is RibbonStyle, a member of class TRibbonSeparator.

Public Methods

	Name	Description
	CalcBounds (see page 3785)	Calculates the size of the control.
	Create (see page 3784)	Creates an instance of TCustomActionControl.

63.1.40.2 TRibbonSeparator.Create Constructor

Creates an instance of TCustomActionControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonSeparator(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomActionControl. However, you should never attempt to instantiate a TCustomActionControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

AOwner is the component that is responsible for freeing the TCustomActionControl instance. It becomes the value of the Owner property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

63.1.40.3 TRibbonSeparator Methods

The methods of the TRibbonSeparator class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 3785)	Draws a background image on the control.
	DrawGlyph (see page 3786)	Draws a symbol on the control.
	DrawShadowedText (see page 3786)	This is DrawShadowedText, a member of class TRibbonSeparator.
	DrawText (see page 3786)	Draws text on the control.
	RibbonStyle (see page 3787)	This is RibbonStyle, a member of class TRibbonSeparator.

Public Methods

	Name	Description
	CalcBounds (see page 3785)	Calculates the size of the control.

63.1.40.3.1 TRibbonSeparator.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as the presence of an icon, caption, and shortcuts. CalcBounds computes the boundaries of the control considering these kinds of factors. At the end, it calls SetBounds and other routines to ensure that the values are set properly.

See Also

SetBounds

63.1.40.3.2 TRibbonSeparator.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

63.1.40.3.3 TRibbonSeparator.DrawGlyph Method

Draws a symbol on the control.

Pascal

```
procedure DrawGlyph(const Location: TPoint); override;
```

C++

```
virtual __fastcall DrawGlyph(const TPoint Location);
```

Description

Use DrawGlyph to draw a symbol on the control at the specified location.

DrawBackground

DrawText

63.1.40.3.4 TRibbonSeparator.DrawShadowedText Method

Pascal

```
procedure DrawShadowedText(Rect: TRect; Flags: Cardinal; Text: string; TextColor: TColor;
ShadowColor: TColor); override;
```

C++

```
virtual __fastcall DrawShadowedText(TRect Rect, unsigned Flags, UnicodeString Text, TColor
TextColor, TColor ShadowColor);
```

Description

This is DrawShadowedText, a member of class TRibbonSeparator.

63.1.40.3.5 TRibbonSeparator.DrawText Method

Draws text on the control.

Pascal

```
procedure DrawText(var ARect: TRect; var Flags: Cardinal; Text: string); override;
```

C++

```
virtual __fastcall DrawText(TRect ARect, unsigned Flags, UnicodeString Text);
```

Description

Use DrawText to draw the text specified by Text on the control within the area specified by ARect.

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonSmallButtonControl.

63.1.41.1 TRibbonSmallButtonControl Members

The following tables list the members exposed by TRibbonSmallButtonControl.

Protected Methods

	Name	Description
	AllowHotKeys (see page 3619)	This is AllowHotKeys, a member of class TRibbonBaseButtonControl.
	DrawBackground (see page 3621)	Draws a background image on the control.
	DrawGlyph (see page 3621)	Draws a symbol on the control.
	DrawSeparator (see page 3621)	This is DrawSeparator, a member of class TRibbonBaseButtonControl.

	DrawShadowedText (see page 3622)	This is DrawShadowedText, a member of class TRibbonBaseButtonControl.
	DrawText (see page 3622)	Draws text on the control.
	GetImageSize (see page 3622)	This is GetImageSize, a member of class TRibbonBaseButtonControl.
	IsButton (see page 3624)	This is IsButton, a member of class TRibbonBaseButtonControl.
	IsRibbonAvailable (see page 3624)	This is IsRibbonAvailable, a member of class TRibbonBaseButtonControl.
	RibbonStyle (see page 3624)	This is RibbonStyle, a member of class TRibbonBaseButtonControl.

Protected Properties

	Name	Description
	DrawDown (see page 3626)	This is DrawDown, a member of class TRibbonBaseButtonControl.

Public Methods

	Name	Description
	CalcBounds (see page 3788)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 3916)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.
	CanAddToQuickAccessToolbar (see page 3620)	This is CanAddToQuickAccessToolbar, a member of class TRibbonBaseButtonControl.
	Click (see page 3620)	Executes the control's function.
	Create (see page 3617)	Creates an instance of TCustomButtonControl.
	Destroy (see page 3618)	Destroys an instance of TCustomActionControl.
	DragDrop (see page 3620)	Performs actions and generates an OnDragDrop event.
	GetKeyTip (see page 3919)	Returns current **KeyTip (see page 3922)** for command.
	GetKeyTip (see page 3622)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 3920)	Indicates if command's **KeyTip (see page 3922)** matches currently input KeyTip (see page 3922).
	HandleKeyTip (see page 3623)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 3920)	Hide **KeyTip (see page 3922)** for command.
	HideKeyTip (see page 3623)	Hide **KeyTip** for command.
	KeyTipClick (see page 3920)	Handle clicking a **KeyTip (see page 3922)**.
	KeyTipClick (see page 3624)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 3921)	Sets **KeyTip (see page 3922)** for command.
	SetKeyTip (see page 3625)	Sets **KeyTip** for command.
	ShowKeyTip (see page 3921)	Shows **KeyTip (see page 3922)** for command in specified position.
	ShowKeyTip (see page 3625)	Shows **KeyTip** for command in specified position.

Public Properties

	Name	Description
	KeyTip (see page 3922)	Current **KeyTip** for command

63.1.41.2 TRibbonSmallButtonControl Methods

The methods of the TRibbonSmallButtonControl class are listed here.

Public Methods

	Name	Description
	CalcBounds (see page 3788)	Calculates the size of the control.

63.1.41.2.1 TRibbonSmallButtonControl.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

This method is largely the same as CalcBounds (TCustomActionControl), with one minor exception. The width of the control is set to be one pixel wider. For more information, see the documentation for the inherited method.

class TRibbonSmallSplitButton : public TRibbonDropDownButton, public IRibbonSplitButton;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonSmallSplitButton.

63.1.42.1 TRibbonSmallSplitButton Members

The following tables list the members exposed by TRibbonSmallSplitButton.

Protected Fields

	Name	Description
	FCursorInSplit (see page 3791)	This is FCursorInSplit, a member of class TRibbonSmallSplitButton.
	FSplitRect (see page 3791)	This is FSplitRect, a member of class TRibbonSmallSplitButton.

Protected Methods

	Name	Description
	AllowHotKeys (see page 3619)	This is AllowHotKeys, a member of class TRibbonBaseButtonControl.
	CalcLayout (see page 3792)	This is CalcLayout, a member of class TRibbonSmallSplitButton.
	CMMouseLeave (see page 3793)	This is CMMouseLeave, a member of class TRibbonSmallSplitButton.
	DoDropDown (see page 3718)	This is DoDropDown, a member of class TRibbonDropDownButton.
	DrawArrow (see page 3718)	This is DrawArrow, a member of class TRibbonDropDownButton.
	DrawBackground (see page 3793)	Draws a background image on the control.
	DrawGlyph (see page 3621)	Draws a symbol on the control.

	DrawSeparator (see page 3621)	This is DrawSeparator, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 3622)	This is DrawShadowedText, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 3718)	This is DrawShadowedText, a member of class TRibbonDropDownButton.
	DrawText (see page 3622)	Draws text on the control.
	DrawText (see page 3719)	Draws text on the control.
	GetArrowPosition (see page 3794)	This is GetArrowPosition, a member of class TRibbonSmallSplitButton.
	GetImageSize (see page 3622)	This is GetImageSize, a member of class TRibbonBaseButtonControl.
	GetPopupClass (see page 3719)	This is GetPopupClass, a member of class TRibbonDropDownButton.
	InSplit (see page 3794)	This is InSplit, a member of class TRibbonSmallSplitButton.
	IsButton (see page 3624)	This is IsButton, a member of class TRibbonBaseButtonControl.
	IsRibbonAvailable (see page 3624)	This is IsRibbonAvailable, a member of class TRibbonBaseButtonControl.
	MouseDown (see page 3794)	OnMouseDown event dispatcher.
	MouseMove (see page 3795)	Respond to mouse moving over control area..
	RibbonStyle (see page 3624)	This is RibbonStyle, a member of class TRibbonBaseButtonControl.

Protected Properties

	Name	Description
	DrawDown (see page 3626)	This is DrawDown, a member of class TRibbonBaseButtonControl.

Public Methods

	Name	Description
	CalcBounds (see page 3792)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 3916)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.
	CanAddToQuickAccessToolbar (see page 3620)	This is CanAddToQuickAccessToolbar, a member of class TRibbonBaseButtonControl.
	Click (see page 3793)	Executes the control's function.
	Create (see page 3790)	Creates an instance of TCustomButtonControl.
	Destroy (see page 3618)	Destroys an instance of TCustomActionControl.
	DragDrop (see page 3620)	Performs actions and generates an OnDragDrop event.
	GetKeyTip (see page 3919)	Returns current **KeyTip (see page 3922)** for command.
	GetKeyTip (see page 3622)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 3920)	Indicates if command's **KeyTip (see page 3922)** matches currently input KeyTip (see page 3922).
	HandleKeyTip (see page 3623)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 3920)	Hide **KeyTip (see page 3922)** for command.
	HideKeyTip (see page 3623)	Hide **KeyTip** for command.
	KeyTipClick (see page 3794)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 3921)	Sets **KeyTip (see page 3922)** for command.
	SetKeyTip (see page 3625)	Sets **KeyTip** for command.
	ShowKeyTip (see page 3921)	Shows **KeyTip (see page 3922)** for command in specified position.
	ShowKeyTip (see page 3625)	Shows **KeyTip** for command in specified position.
	UpdateSplitBounds (see page 3795)	This is UpdateSplitBounds, a member of class TRibbonSmallSplitButton.

Public Properties

	Name	Description
	CursorInSplit (see page 3796)	This is CursorInSplit, a member of class TRibbonSmallSplitButton.
	KeyTip (see page 3922)	Current **KeyTip** for command

63.1.42.2 TRibbonSmallSplitButton.Create Constructor

Creates an instance of TCustomButtonControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonSmallSplitButton(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomButtonControl. However, you should never attempt to instantiate a TCustomButtonControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

AOwner is the component that is responsible for freeing the button control. It becomes the value of the Owner property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

63.1.42.3 TRibbonSmallSplitButton Fields

The fields of the TRibbonSmallSplitButton class are listed here.

Protected Fields

	Name	Description
	FCursorInSplit (see page 3791)	This is FCursorInSplit, a member of class TRibbonSmallSplitButton.
	FSplitRect (see page 3791)	This is FSplitRect, a member of class TRibbonSmallSplitButton.

63.1.42.3.1 TRibbonSmallSplitButton.FCursorInSplit Field

Pascal

```
FCursorInSplit: Boolean;
```

C++

```
Boolean FCursorInSplit;
```

Description

This is FCursorInSplit, a member of class TRibbonSmallSplitButton.

63.1.42.3.2 TRibbonSmallSplitButton.FSplitRect Field

Pascal

```
FSplitRect: TRect;
```

C++

```
TRect FSplitRect;
```

Description

This is FSplitRect, a member of class TRibbonSmallSplitButton.

63.1.42.4 TRibbonSmallSplitButton Methods

The methods of the TRibbonSmallSplitButton class are listed here.

Protected Methods

	Name	Description
	CalcLayout (see page 3792)	This is CalcLayout, a member of class TRibbonSmallSplitButton.
	CMMouseLeave (see page 3793)	This is CMMouseLeave, a member of class TRibbonSmallSplitButton.
	DrawBackground (see page 3793)	Draws a background image on the control.
	GetArrowPosition (see page 3794)	This is GetArrowPosition, a member of class TRibbonSmallSplitButton.
	InSplit (see page 3794)	This is InSplit, a member of class TRibbonSmallSplitButton.
	MouseDown (see page 3794)	OnMouseDown event dispatcher.
	MouseMove (see page 3795)	Respond to mouse moving over control area..

Public Methods

	Name	Description
	CalcBounds (see page 3792)	Calculates the size of the control.
	Click (see page 3793)	Executes the control's function.
	KeyTipClick (see page 3794)	Handle clicking a **KeyTip**.
	UpdateSplitBounds (see page 3795)	This is UpdateSplitBounds, a member of class TRibbonSmallSplitButton.

63.1.42.4.1 TRibbonSmallSplitButton.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

This method is largely the same as CalcBounds (TCustomActionControl), with one minor exception. The width of the control is set to be one pixel wider. For more information, see the documentation for the inherited method.

CalcBounds

63.1.42.4.2 TRibbonSmallSplitButton.CalcLayout Method

Pascal

```
procedure CalcLayout; override;
```

C++

```
virtual __fastcall CalcLayout();
```

Description

This is CalcLayout, a member of class TRibbonSmallSplitButton.

63.1.42.4.3 TRibbonSmallSplitButton.Click Method

Executes the control's function.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

This override of the method inherited from TCustomActionControl is almost identical to the inherited method. The only difference is that if the button control is being manipulated at design time, extra actions are taken to ensure that the control is properly selected.

63.1.42.4.4 TRibbonSmallSplitButton.CMMouseLeave Method

Pascal

```
procedure CMMouseLeave(var Message: TMessage); override;
```

C++

```
virtual __fastcall CMMouseLeave(TMessage Message);
```

Description

This is CMMouseLeave, a member of class TRibbonSmallSplitButton.

63.1.42.4.5 TRibbonSmallSplitButton.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

DrawGlyph

DrawText

63.1.42.4.6 TRibbonSmallSplitButton.GetArrowPosition Method

Pascal

```
function GetArrowPosition(const ARect: TRect): TPoint; override;
```

C++

```
virtual __fastcall TPoint GetArrowPosition(const TRect ARect);
```

Description

This is GetArrowPosition, a member of class TRibbonSmallSplitButton.

63.1.42.4.7 TRibbonSmallSplitButton.InSplit Method

Pascal

```
function InSplit(X: Integer; Y: Integer): Boolean;
```

C++

```
__fastcall Boolean InSplit(int X, int Y);
```

Description

This is InSplit, a member of class TRibbonSmallSplitButton.

63.1.42.4.8 TRibbonSmallSplitButton.KeyTipClick Method

Handle clicking a **KeyTip**.

Pascal

```
procedure KeyTipClick; override;
```

C++

```
virtual __fastcall KeyTipClick();
```

Description

KeyTipClick Handle clicking a **KeyTip**. Some requires need to be handled differently when clicked by a **KeyTip**.

63.1.42.4.9 TRibbonSmallSplitButton.MouseDown Method

OnMouseDown event dispatcher.

Pascal

```
procedure MouseDown(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer);
override;
```

C++

```
virtual __fastcall MouseDown(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user presses the mouse button down while the cursor's hotspot is over the control.

The Button parameter determines which mouse button the user pressed. Shift indicates which shift keys (Shift, Ctrl, or Alt) were down when the user pressed the mouse button. X and Y are the pixel coordinates of the mouse pointer within the client area of the control.

A control calls MouseDown in response to any of the Windows mouse-down messages (WM_LBUTTONDOWN, WM_MBUTTONDOWN, WM_RBUTTONDOWN), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was pressed down: left, right, or middle.

MouseMove

MouseUp

OnMouseDown

63.1.42.4.10 TRibbonSmallSplitButton.MouseMove Method

Respond to mouse moving over control area..

Pascal

```
procedure MouseMove(Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseMove(TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseMove method to provide other responses in addition to calling the OnMouseMove event handler when the user moves the mouse.

A control calls MouseMove in response to any of the Windows mouse-move messages (WM_MOUSEMOVE), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively.

As the mouse cursor moves across a control, this method is called repeatedly. Each time it is called, it is with the new coordinates that reflect the continuous path of the mouse cursor across the screen real estate covered by the control's visual representation.

63.1.42.4.11 TRibbonSmallSplitButton.UpdateSplitBounds Method

Pascal

```
procedure UpdateSplitBounds; virtual;
```

C++

```
virtual __fastcall UpdateSplitBounds();
```

Description

This is UpdateSplitBounds, a member of class TRibbonSmallSplitButton.

63.1.42.5 TRibbonSmallSplitButton Properties

The properties of the TRibbonSmallSplitButton class are listed here.

Public Properties

	Name	Description
	CursorInSplit (see page 3796)	This is CursorInSplit, a member of class TRibbonSmallSplitButton.

63.1.42.5.1 TRibbonSmallSplitButton.CursorInSplit Property

Pascal

```
property CursorInSplit: Boolean;
```

C++

```
__property Boolean CursorInSplit;
```

Description

This is CursorInSplit, a member of class TRibbonSmallSplitButton.

63.1.43 TRibbonSpinButton Class

Class Hierarchy

Pascal

```
TRibbonSpinButton = class(TWinControl);
```

C++

```
class TRibbonSpinButton : public TWinControl;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonSpinButton.

63.1.43.1 TRibbonSpinButton Members

The following tables list the members exposed by TRibbonSpinButton.

Protected Methods

	Name	Description
	Control (see page 3798)	This is Control, a member of class TRibbonSpinButton.
	KeyDown (see page 3798)	Respond to key press events.
	Loaded (see page 3799)	Initializes the control after it is loaded from a stream.
	Notification (see page 3799)	Responds to notifications that components are being created or destroyed.

Public Methods

	Name	Description
	Create (see page 3797)	Creates an instance of TWinControl.
	SetBounds (see page 3800)	Sets the windowed control's boundary properties all at once.

Published Events

	Name	Description
	OnDownClick (see page 3820)	This is OnDownClick, a member of class TRibbonSpinButton.
	OnDragDrop (see page 3820)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 3823)	Occurs when the user drags an object over a control.
	OnEndDock (see page 3827)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 3827)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 3828)	Occurs when a control receives the input focus.
	OnExit (see page 3831)	Occurs when the input focus shifts away from one control to another.
	OnStartDock (see page 3835)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 3835)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUpClick (see page 3836)	This is OnUpClick, a member of class TRibbonSpinButton.

Published Properties

	Name	Description
	Align (see page 3801)	Determines how the control aligns within its container (parent control).
	Anchors (see page 3804)	Specifies how the control is anchored to its parent.
	Constraints (see page 3805)	Specifies the size constraints for the control.
	Ctl3D (see page 3806)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DownGlyph (see page 3806)	This is DownGlyph, a member of class TRibbonSpinButton.
	DownNumGlyphs (see page 3806)	This is DownNumGlyphs, a member of class TRibbonSpinButton.
	DragCursor (see page 3807)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 3807)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 3807)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 3809)	Controls whether the control responds to mouse, keyboard, and timer events.
	FocusControl (see page 3809)	This is FocusControl, a member of class TRibbonSpinButton.
	ParentCtl3D (see page 3810)	Determines where a component looks to determine if it should appear three dimensional.
	ParentShowHint (see page 3810)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 3810)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 3815)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 3817)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 3818)	Determines if the user can tab to a control.
	UpGlyph (see page 3818)	This is UpGlyph, a member of class TRibbonSpinButton.
	UpNumGlyphs (see page 3818)	This is UpNumGlyphs, a member of class TRibbonSpinButton.
	Visible (see page 3818)	Determines whether the component appears onscreen.

63.1.43.2 TRibbonSpinButton.Create Constructor

Creates an instance of TWinControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonSpinButton(TComponent * AOwner);
```

Description

Call Create to construct and initialize a new control and insert the newly-constructed control into its owner, as specified by the

AOwner parameter. Create inserts the control in the owner by calling the owner's InsertComponent method.

Most controls override Create to initialize their unique properties. Objects that override the Create method must always call the inherited Create method first, and then proceed with the component-specific initialization. Specify the override directive when overriding the Create method.

If a component's Create method allocates resources or memory, override the Destroy method to free those resources.

63.1.43.3 TRibbonSpinButton Methods

The methods of the TRibbonSpinButton class are listed here.

Protected Methods

	Name	Description
	Control (see page 3798)	This is Control, a member of class TRibbonSpinButton.
V	KeyDown (see page 3798)	Respond to key press events.
V	Loaded (see page 3799)	Initializes the control after it is loaded from a stream.
V	Notification (see page 3799)	Responds to notifications that components are being created or destroyed.

Public Methods

	Name	Description
V	SetBounds (see page 3800)	Sets the windowed control's boundary properties all at once.

63.1.43.3.1 TRibbonSpinButton.Control Method

Pascal

```
function Control: TRibbonSpinEdit;
```

C++

```
__fastcall TRibbonSpinEdit Control();
```

Description

This is Control, a member of class TRibbonSpinButton.

63.1.43.3.2 TRibbonSpinButton.KeyDown Method

Respond to key press events.

Pascal

```
procedure KeyDown(var Key: Word; Shift: TShiftState); override;
```

C++

```
virtual __fastcall KeyDown(Word Key, TShiftState Shift);
```

Description

When a windowed control receives a key-down message (WM_KEYDOWN) from Windows, its message handler calls the DoKeyDown method. If DoKeyDown determines that the control should, in fact, process the character, it calls KeyDown, passing the key code and shift-key state in the Key and Shift parameters, respectively.

KeyDown calls any event handler attached to the OnKeyDown event. Override KeyDown to provide other responses in addition to the event-handler call.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use WinAPI virtual key codes to determine the key pressed. For more information, search for virtual key codes in the Win32 Developer's Reference (WIN32.HLP).

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

Either KeyDown or the OnKeyDown event handler it calls can suppress further processing of a key by setting the Key parameter to zero.

63.1.43.3.3 TRibbonSpinButton.Loaded Method

Initializes the control after it is loaded from a stream.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call Loaded. The VCL streaming system calls Loaded automatically after the control's form is loaded into memory so that the control can complete any initializations that depend on other objects in the form.

Loaded overrides the inherited method in order to initialize the control from its associated Action. To change the properties the control copies from its action, override the ActionChange method.

See Also

Loaded

Action

ActionChange

63.1.43.3.4 TRibbonSpinButton.Notification Method

Responds to notifications that components are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification allows TControl to update its PopupMenu property when the pop-up menu it refers to is destroyed.

Override the Notification method to respond to notifications that other components are about to be destroyed or have just been created. Use the Notification method to update controls that rely on other objects. Remove references to objects that are going away so that the control does not refer to objects that have been destroyed. For example, data-aware objects override the Notification method to update themselves when their data source is removed. Some objects respond to notifications that other objects of a specific type are being created. For example, the session component sets the Session property of new data-aware controls to itself when the AutoSessionName property is true.

By default, components pass along the notification to their owned components, if any.

Notification

63.1.43.3.5 TRibbonSpinButton.SetBounds Method

Sets the windowed control's boundary properties all at once.

Pascal

```
procedure SetBounds(ALeft: Integer; ATop: Integer; AWidth: Integer; AHeight: Integer);
override;
```

C++

```
virtual __fastcall SetBounds(int ALeft, int ATop, int AWidth, int AHeight);
```

Description

Use SetBounds to change all of the control's boundary properties at once. The same effect can be achieved by setting the Left, Top, Width, and Height properties separately. By setting all four properties at once, SetBounds ensures that the control will not repaint between changes

Specify the values for the Left, Top, Width, and Height properties as the value of the ALeft, ATop, AWidth, and AHeight parameters, respectively.

63.1.43.4 TRibbonSpinButton Properties

The properties of the TRibbonSpinButton class are listed here.

Published Properties

	Name	Description
	Align (see page 3801)	Determines how the control aligns within its container (parent control).
	Anchors (see page 3804)	Specifies how the control is anchored to its parent.
	Constraints (see page 3805)	Specifies the size constraints for the control.
	Ctl3D (see page 3806)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DownGlyph (see page 3806)	This is DownGlyph, a member of class TRibbonSpinButton.
	DownNumGlyphs (see page 3806)	This is DownNumGlyphs, a member of class TRibbonSpinButton.
	DragCursor (see page 3807)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 3807)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 3807)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 3809)	Controls whether the control responds to mouse, keyboard, and timer events.
	FocusControl (see page 3809)	This is FocusControl, a member of class TRibbonSpinButton.
	ParentCtl3D (see page 3810)	Determines where a component looks to determine if it should appear three dimensional.
	ParentShowHint (see page 3810)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 3810)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 3815)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 3817)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 3818)	Determines if the user can tab to a control.
	UpGlyph (see page 3818)	This is UpGlyph, a member of class TRibbonSpinButton.
	UpNumGlyphs (see page 3818)	This is UpNumGlyphs, a member of class TRibbonSpinButton.
	Visible (see page 3818)	Determines whether the component appears onscreen.

63.1.43.4.1 TRibbonSpinButton.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align;
```

C++

```
__property Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of

the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1); // These objects will all be cleaned up by the owner
(Form1).
  TFileListBox* pflb = new TFileListBox(Form1); // The parent (Form1) will clean up these
objects.
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);  // The owner will clean this up.
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);  // The owner will clean this up.
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
```

```
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    ppc = new TPageControl(this); // The owner (this) will clean this up.
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this); // The owner (this) will clean this up.
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
  { each pane must be at least one quarter of the form's width }
  Split.MinSize := Form1.ClientWidth div 4;
  { Finally, create the last pane – a file list box }
  Files := TFileListBox.Create(Form1);
  Files.Parent := Form1;
  Files.Align := alClient;
  Dirs.FileList := Files; { link the file list box to the directory list box }
end;
{
Dynamically create a TProgressBar control and align it to
the bottom of the form.
}

Parent

Anchors

63.1.43.4.2 TRibbonSpinButton.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors;
```

C++

```
__property Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent

Align

63.1.43.4.3 TRibbonSpinButton.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints;
```

C++

```
__property Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

63.1.43.4.4 TRibbonSpinButton.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D;
```

C++

```
__property Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

63.1.43.4.5 TRibbonSpinButton.DownGlyph Property

Pascal

```
property DownGlyph: TBitmap;
```

C++

```
__property TBitmap DownGlyph;
```

Description

This is DownGlyph, a member of class TRibbonSpinButton.

63.1.43.4.6 TRibbonSpinButton.DownNumGlyphs Property

Pascal

```
property DownNumGlyphs: TNumGlyphs;
```

C++

```
__property TNumGlyphs DownNumGlyphs;
```

Description

This is DownNumGlyphs, a member of class TRibbonSpinButton.

63.1.43.4.7 TRibbonSpinButton.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor;
```

C++

```
__property DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor

DragKind

DragMode

63.1.43.4.8 TRibbonSpinButton.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind;
```

C++

```
__property DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor

DragMode

63.1.43.4.9 TRibbonSpinButton.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode;
```

C++

```
__property DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != dynamic_cast<TObject *>(TreeView1) || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == dynamic_cast<TObject *>(TreeView1));
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property must be set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;

Arranging the Order of Persistent Columns

63.1.43.4.10 TRibbonSpinButton.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled;
```

C++

```
__property Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to False. Some disabled controls appear dimmed (for example: buttons, check boxes, labels), while others (container controls) simply lose their functionality without changing their appearance. If Enabled is set to False, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to True.

Note: This property applies to all TControl descendants.

63.1.43.4.11 TRibbonSpinButton.FocusControl Property

Pascal

```
property FocusControl: TWinControl;
```

C++

```
__property TWinControl * FocusControl;
```

Description

This is FocusControl, a member of class TRibbonSpinButton.

63.1.43.4.12 TRibbonSpinButton.ParentCtl3D Property

Determines where a component looks to determine if it should appear three dimensional.

Pascal

```
property ParentCtl3D;
```

C++

```
__property ParentCtl3D;
```

Description

ParentCtl3D is provided for backwards compatibility. It has no effect on 32-bit versions of Windows or NT 4.0 and later.

ParentCtl3D determines whether the control uses its parent's Ctl3D property.

See Also

Ctl3D

63.1.43.4.13 TRibbonSpinButton.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint;
```

C++

```
__property ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

63.1.43.4.14 TRibbonSpinButton.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu;
```

C++

```
__property PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        // The owner (PopupMenu1) will cleanup this menu item.
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;
```

```
procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.

63.1.43.4.15 TRibbonSpinButton.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint;
```

C++

```
__property ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
```

```
    Edit1.Hint := 'Enter your name';
    Edit1.ShowHint := True;
    with ListBox1 do
    begin
      for I := 1 to 10 do
        Items.Add('Item ' + IntToStr(I));
      Hint := 'Select an item';
      ShowHint := True;
    end;
    Application.ShowHint := True;
  end;
  {
  Note: To see an example that displays the hints of controls
  in some place other than in a Help Hint box, see the OnHint
  example.
  }
```

Displaying Fly-over Help

63.1.43.4.16 TRibbonSpinButton.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder;
```

C++

```
__property TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

FindNextControl

TabStop

63.1.43.4.17 TRibbonSpinButton.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop;
```

C++

```
__property TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

TabOrder

63.1.43.4.18 TRibbonSpinButton.UpGlyph Property

Pascal

```
property UpGlyph: TBitmap;
```

C++

```
__property TBitmap UpGlyph;
```

Description

This is UpGlyph, a member of class TRibbonSpinButton.

63.1.43.4.19 TRibbonSpinButton.UpNumGlyphs Property

Pascal

```
property UpNumGlyphs: TNumGlyphs;
```

C++

```
__property TNumGlyphs UpNumGlyphs;
```

Description

This is UpNumGlyphs, a member of class TRibbonSpinButton.

63.1.43.4.20 TRibbonSpinButton.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible;
```

C++

```
__property Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this); // The owner will clean this up.
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.

	Name	Description
	OnDownClick (see page 3820)	This is OnDownClick, a member of class TRibbonSpinButton.
	OnDragDrop (see page 3820)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 3823)	Occurs when the user drags an object over a control.
	OnEndDock (see page 3827)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 3827)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 3828)	Occurs when a control receives the input focus.
	OnExit (see page 3831)	Occurs when the input focus shifts away from one control to another.
	OnStartDock (see page 3835)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 3835)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUpClick (see page 3836)	This is OnUpClick, a member of class TRibbonSpinButton.

63.1.43.5.1 TRibbonSpinButton.OnDownClick Event

Pascal

```
property OnDownClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDownClick;
```

Description

This is OnDownClick, a member of class TRibbonSpinButton.

63.1.43.5.2 TRibbonSpinButton.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop;
```

C++

```
__property OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

{
  reinterpret_cast<TForm1 *>(Source)->Left = X;
  reinterpret_cast<TForm1 *>(Source)->Top = Y;
}

void __fastcall TForm1::FormDragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = Source->ClassNameIs("TLabel");
}

void __fastcall TForm1::Panel1DragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = false;
  if ((Source->ClassNameIs("TLabel")) && (State == dsDragEnter))
    dynamic_cast<TLabel *>(Source)->EndDrag(false);
}
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
```

```
    TListBox *DestList = dynamic_cast<TListBox *>(Sender);
    DestList->Font = (dynamic_cast<TLabel *>(Source))->Font;
    DestList->Color = (dynamic_cast<TLabel *>(Source))->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

63.1.43.5.3 TRibbonSpinButton.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver;
```

C++

```
__property OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

{
  reinterpret_cast<TForm1 *>(Source)->Left = X;
  reinterpret_cast<TForm1 *>(Source)->Top = Y;
}

void __fastcall TForm1::FormDragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = Source->ClassNameIs("TLabel");
}

void __fastcall TForm1::Panel1DragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = false;
  if ((Source->ClassNameIs("TLabel")) && (State == dsDragEnter))
    dynamic_cast<TLabel *>(Source)->EndDrag(false);
}
/*

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag;
```

C++

```
__property OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = (dynamic_cast<TLabel *>(Sender))->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
```

```
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;

63.1.43.5.6 TRibbonSpinButton.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter;
```

C++

```
__property OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)

OnExit

ActiveControl

OnActivate

Using a Single Navigator for Multiple Datasets

63.1.43.5.7 TRibbonSpinButton.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit;
```

C++

```
__property OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses three mask edit components on a form,
where the third mask edit box is set to be read only.
When the application runs, it initializes the mask edit boxes
to contain the empty string, to use the Courier font and to
use a particular mask, corresponding to IP address coding convetions.
The mask edit boxes display the IP address, the subnet mask
and the subnet address correspondingly. When the user exits the
subnet mask edit box, the subnet address is automatically calculated
using bit-wise AND operations and displayed in the third mask edit box.
An additional test is made to assure that the values in the IP address
and in the subnet mask are in the interval from 0 to 255 ,
as this validation test cannot be accomplished
using the edit mask property alone.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  // initialize the maskedit boxes to contain the empty string
  MaskEdit1->Text = "";
  MaskEdit2->Text = "";
  MaskEdit3->Text = "";

  // use the Courier font in the maskedit boxes

  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses three mask edit components on a form,
where the third mask edit box is set to be read only.
When the application runs, it initializes the mask edit boxes
to contain the empty string, to use the Courier font and to
use a particular mask, corresponding to IP address coding convetions.
The mask edit boxes display the IP address, the subnet mask
and the subnet address correspondingly. When the user exits the
subnet mask edit box, the subnet address is automatically calculated
using bit-wise AND operations and displayed in the third mask edit box.
An additional test is made to assure that the values in the IP address
and in the subnet mask are in the interval from 0 to 255,
as this validation test cannot be accomplished
using the edit mask property alone.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  { initialize the maskedit boxes to contain the empty string }
  MaskEdit1.Text := '';
  MaskEdit2.Text := '';
  MaskEdit3.Text := '';

  { use the Courier font in the maskedit boxes }
  MaskEdit1.Font.Name := 'Courier';
  MaskEdit2.Font.Name := 'Courier';
  MaskEdit3.Font.Name := 'Courier';

  {
  initialize the mask of each maskedit box
  according to IP address coding conventions
  }
  MaskEdit1.EditMask := '!099.099.099.099;1; ';
  MaskEdit2.EditMask := '!099.099.099.099;1; ';
  MaskEdit3.EditMask := '!099.099.099.099;1; ';

  MaskEdit2.OnExit := MaskEdit2Exit;
end;

procedure TForm1.MaskEdit2Exit(Sender: TObject);
var
  net1, net2, host1, host2,
  netmask1, netmask2, hostmask1, hostmask2,
  sub_net1, sub_net2, sub_host1, sub_host2: Integer;

  IP, mask: String;

begin
  // extract the net and host address from the IP
  IP := MaskEdit1.Text;
  net1 := StrToInt(TrimRight(Copy(IP, 0, 3)));
  net2 := StrToInt(TrimRight(Copy(IP, 5, 3)));
  host1 := StrToInt(TrimRight(Copy(IP, 9, 3)));
  host2 := StrToInt(TrimRight(Copy(IP, 13, 3)));

  // a range test that you cannot validate through edit masks
```

```
    if ((net1 < 0) Or (net1 > 255) Or
        (net2 < 0) Or (net2 > 255) Or
        (host1 < 0) Or (host1 > 255) Or
        (host2 < 0) Or (host2 > 255)) then
      raise EArgumentException.Create('Not a valid IP address.');

    // extract the net and host mask from the subnet mask
    mask := MaskEdit2.Text;
    netmask1 := StrToInt(TrimRight(Copy(mask, 0, 3)));
    netmask2 := StrToInt(TrimRight(Copy(mask, 5, 3)));
    hostmask1 := StrToInt(TrimRight(Copy(mask, 9, 3)));
    hostmask2 := StrToInt(TrimRight(Copy(mask, 13, 3)));

    // a range test that you cannot validate through edit masks
    if ((netmask1 < 0) Or (netmask1 > 255) Or
        (netmask2 < 0) Or (netmask2 > 255) Or
        (hostmask1 < 0) Or (hostmask1 > 255) Or
        (hostmask2 < 0) Or (hostmask2 > 255)) then
      raise EArgumentException.Create('Not a valid subnet mask.');

    // compute the subnet address using bit-wise AND
    sub_net1 := net1 And netmask1;
    sub_net2 := net2 And netmask2;
    sub_host1 := host1 And hostmask1;
    sub_host2 := host2 And hostmask2;

    // display the subnet address
    MaskEdit3.Text :=
      IntToStr(sub_net1) + '.' + IntToStr(sub_net2) + '.' +
      IntToStr(sub_host1) + '.' + IntToStr(sub_host2);
  end;
  {
  This example uses an edit box and a memo control on a form.
  When either the edit box or the memo is the active control,
  it is colored yellow. When the active control becomes
  inactive, the color of the control returns to the Windows
  system color for a window.  These event handlers could also
  be shared.
  }
  procedure TForm1.Edit1Enter(Sender: TObject);
  begin
    Edit1.Color := clYellow;
  end;

  procedure TForm1.Edit1Exit(Sender: TObject);
  begin
    Edit1.Color := clWindow;
  end;

  procedure TForm1.Memo1Enter(Sender: TObject);
  begin
    Memo1.Color := clYellow;
  end;

  procedure TForm1.Memo1Exit(Sender: TObject);
  begin
    Memo1.Color := clWindow;
  end;
```

ActiveControl

63.1.43.5.8 TRibbonSpinButton.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock;
```

C++

```
__property OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

63.1.43.5.9 TRibbonSpinButton.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag;
```

C++

```
__property OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonSpinEdit.

63.1.44.1 TRibbonSpinEdit Members

The following tables list the members exposed by TRibbonSpinEdit.

Protected Methods

	Name	Description
	CMMouseenter (see page 3839)	This is CMMouseenter, a member of class TRibbonSpinEdit.
	CMMouseleave (see page 3840)	This is CMMouseleave, a member of class TRibbonSpinEdit.
V	CreateParams (see page 3840)	Initializes a window-creation parameter record passed in the Params parameter.
V	CreateWnd (see page 3840)	Creates a Windows control corresponding to the edit control.
V	DownClick (see page 3841)	This is DownClick, a member of class TRibbonSpinEdit.
V	IsValidChar (see page 3841)	This is IsValidChar, a member of class TRibbonSpinEdit.
V	KeyDown (see page 3842)	Respond to key press events.
V	KeyPress (see page 3842)	Respond to keyboard input.
V	SetEnabled (see page 3843)	Sets the value of the Enabled property.
V	SetParent (see page 3843)	Sets the parent of the control.
V	UpClick (see page 3844)	This is UpClick, a member of class TRibbonSpinEdit.
	WMKillFocus (see page 3844)	This is WMKillFocus, a member of class TRibbonSpinEdit.

Public Methods

	Name	Description
V	Create (see page 3838)	Creates an instance of TCustomEdit.
V	Destroy (see page 3838)	Destroys an instance of TWinControl.
V	GetChildren (see page 3841)	Calls a specified method for each child of the control.

Public Properties

	Name	Description
R	Button (see page 3847)	This is Button, a member of class TRibbonSpinEdit.

Published Events

	Name	Description
	OnChange (see page 3866)	Occurs when the text for the edit control may have changed.
	OnClick (see page 3867)	Occurs when the user clicks the control.
	OnDblClick (see page 3868)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 3869)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 3872)	Occurs when the user drags an object over a control.
	OnEndDrag (see page 3875)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 3876)	Occurs when a control receives the input focus.
	OnExit (see page 3878)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 3882)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 3886)	Occurs when a key is pressed.
	OnKeyUp (see page 3887)	Occurs when the user releases a key that has been pressed.
	OnMouseDown (see page 3889)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseMove (see page 3891)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 3893)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDrag (see page 3896)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Published Properties

	Name	Description
	Anchors (see page 3845)	Specifies how the control is anchored to its parent.
	AutoSelect (see page 3846)	Determines whether all the text in the edit control is automatically selected when the control gets focus.
	AutoSize (see page 3846)	Determines whether the height of the edit control automatically resizes to accommodate the text.

	Color (see page 3847)	Specifies the background color of the control.
	Constraints (see page 3848)	Specifies the size constraints for the control.
	Ctl3D (see page 3849)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DragCursor (see page 3849)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragMode (see page 3850)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	EditorEnabled (see page 3851)	This is EditorEnabled, a member of class TRibbonSpinEdit.
	Enabled (see page 3851)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 3852)	Controls the attributes of text written on or in the control.
	Increment (see page 3853)	This is Increment, a member of class TRibbonSpinEdit.
	MaxLength (see page 3853)	Specifies the maximum number of characters the user can enter into the edit control.
	MaxValue (see page 3854)	This is MaxValue, a member of class TRibbonSpinEdit.
	MinValue (see page 3854)	This is MinValue, a member of class TRibbonSpinEdit.
	ParentColor (see page 3854)	Determines where a control looks for its color information.
	ParentCtl3D (see page 3855)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 3855)	Determines where a control looks for its font information.
	ParentShowHint (see page 3855)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 3856)	Identifies the pop-up menu associated with the control.
	ReadOnly (see page 3861)	Determines whether the user can change the text of the edit control.
	ShowHint (see page 3861)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 3863)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 3864)	Determines if the user can tab to a control.
	Value (see page 3864)	This is Value, a member of class TRibbonSpinEdit.
	Visible (see page 3864)	Determines whether the component appears onscreen.

63.1.44.2 TRibbonSpinEdit.Create Constructor

Creates an instance of TCustomEdit.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonSpinEdit(TComponent * AOwner);
```

Description

Call Create to create and initialize an instance of TCustomEdit.

AOwner is another component, typically the form, that is responsible for freeing the edit control. It becomes the value of the Owner property.

Derived objects that override the Create method should call the inherited Create before performing any additional initialization.

See Also

Owner

63.1.44.3 TRibbonSpinEdit.Destroy Destructor

Destroys an instance of TWinControl.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRibbonSpinEdit();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TWinControl reference is not nil, and only then calls Destroy.

See Also

System::TObject::Free

Destroy

63.1.44.4 TRibbonSpinEdit Methods

The methods of the TRibbonSpinEdit class are listed here.

Protected Methods

	Name	Description
	CMMouseenter (see page 3839)	This is CMMouseenter, a member of class TRibbonSpinEdit.
	CMMouseleave (see page 3840)	This is CMMouseleave, a member of class TRibbonSpinEdit.
V	CreateParams (see page 3840)	Initializes a window-creation parameter record passed in the Params parameter.
V	CreateWnd (see page 3840)	Creates a Windows control corresponding to the edit control.
V	DownClick (see page 3841)	This is DownClick, a member of class TRibbonSpinEdit.
V	IsValidChar (see page 3841)	This is IsValidChar, a member of class TRibbonSpinEdit.
V	KeyDown (see page 3842)	Respond to key press events.
V	KeyPress (see page 3842)	Respond to keyboard input.
V	SetEnabled (see page 3843)	Sets the value of the Enabled property.
V	SetParent (see page 3843)	Sets the parent of the control.
V	UpClick (see page 3844)	This is UpClick, a member of class TRibbonSpinEdit.
	WMKillFocus (see page 3844)	This is WMKillFocus, a member of class TRibbonSpinEdit.

Public Methods

	Name	Description
V	GetChildren (see page 3841)	Calls a specified method for each child of the control.

63.1.44.4.1 TRibbonSpinEdit.CMMouseenter Method

Pascal

```
procedure CMMouseenter(var Message: TMessage); message CM_MOUSEENTER;
```

C++

```
__fastcall CMMouseenter(TMessage Message);
```

Description

This is CMMouseenter, a member of class TRibbonSpinEdit.

63.1.44.4.2 TRibbonSpinEdit.CMMouseleave Method

Pascal

```
procedure CMMouseleave(var Message: TMessage); message CM_MOUSELEAVE;
```

C++

```
__fastcall CMMouseleave(TMessage Message);
```

Description

This is CMMouseleave, a member of class TRibbonSpinEdit.

63.1.44.4.3 TRibbonSpinEdit.CreateParams Method

Initializes a window-creation parameter record passed in the Params parameter.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. TCustomEdit overrides the inherited method to specify a scrollable single-line edit control that reflects the current values of the BorderStyle, HideSelection, PasswordChar, and ReadOnly properties.

See Also

BorderStyle

CreateWindowHandle

CreateWnd

HideSelection

PasswordChar

ReadOnly

63.1.44.4.4 TRibbonSpinEdit.CreateWnd Method

Creates a Windows control corresponding to the edit control.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

CreateWnd is called when the edit control is created, and whenever a change to the edit control requires the window to be recreated. After calling the inherited method, CreateWnd sends the newly created window messages to enforce the MaxLength and PasswordChar properties.

See Also

CreateParams

CreateWindowHandle

DestroyWnd

MaxLength

PasswordChar

CreateWnd

63.1.44.4.5 TRibbonSpinEdit.DownClick Method

Pascal

```
procedure DownClick(Sender: TObject); virtual;
```

C++

```
virtual __fastcall DownClick(TObject * Sender);
```

Description

This is DownClick, a member of class TRibbonSpinEdit.

63.1.44.4.6 TRibbonSpinEdit.GetChildren Method

Calls a specified method for each child of the control.

Pascal

```
procedure GetChildren(Proc: TGetChildProc; Root: TComponent); override;
```

C++

```
virtual __fastcall GetChildren(TGetChildProc Proc, TComponent * Root);
```

Description

GetChildren is called by the streaming system that loads and saves components. Applications seldom need to call this routine.

GetChildren executes the callback specified by the Proc parameter for every child control listed by the Controls property that lists the Root parameter as its Owner.

Override GetChildren to limit or augment which child controls are saved with the control. When overriding GetChildren, call the procedure passed as the Proc parameter for every child control that should be saved. The Root parameter indicates the component (usually a form) that owns the control.

See Also

Controls

Owner

63.1.44.4.7 TRibbonSpinEdit.IsValidChar Method

Pascal

```
function IsValidChar(Key: Char): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsValidChar(Char Key);
```

Description

This is IsValidChar, a member of class TRibbonSpinEdit.

63.1.44.4.8 TRibbonSpinEdit.KeyDown Method

Respond to key press events.

Pascal

```
procedure KeyDown(var Key: Word; Shift: TShiftState); override;
```

C++

```
virtual __fastcall KeyDown(Word Key, TShiftState Shift);
```

Description

When a windowed control receives a key-down message (WM_KEYDOWN) from Windows, its message handler calls the DoKeyDown method. If DoKeyDown determines that the control should, in fact, process the character, it calls KeyDown, passing the key code and shift-key state in the Key and Shift parameters, respectively.

KeyDown calls any event handler attached to the OnKeyDown event. Override KeyDown to provide other responses in addition to the event-handler call.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use WinAPI virtual key codes to determine the key pressed. For more information, search for virtual key codes in the Win32 Developer's Reference (WIN32.HLP).

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

Either KeyDown or the OnKeyDown event handler it calls can suppress further processing of a key by setting the Key parameter to zero.

See Also

KeyUp

OnKeyDown

DoKeyDown

DoKeyPress

DoKeyUp

63.1.44.4.9 TRibbonSpinEdit.KeyPress Method

Respond to keyboard input.

Pascal

```
procedure KeyPress(var Key: Char); override;
```

C++

```
virtual __fastcall KeyPress(Char Key);
```

Description

When a windowed control receives a key-press message (WM_CHAR) from Windows, its message handler calls the DoKeyPress method. If DoKeyPress determines that the control should, in fact, process the character, it calls KeyPress, passing

the key code in the Key parameter.

KeyPress calls any event handler attached to the OnKeyPress event. Override KeyPress to provide other responses in addition to the event-handler call.

Either KeyPress or the OnKeyPress event handler it calls can suppress further processing of a character by setting the Key parameter to zero.

Note: The Key parameter is the character represented by the key that is pressed, not a Windows virtual key code.

KeyDown

KeyUp

OnKeyPress

63.1.44.4.10 TRibbonSpinEdit.SetEnabled Method

Sets the value of the Enabled property.

Pascal

```
procedure SetEnabled(Value: Boolean); override;
```

C++

```
virtual __fastcall SetEnabled(Boolean Value);
```

Description

SetEnabled is the protected write implementation of the Enabled property. After changing the internal representation of the Enabled property, SetEnabled sends a Windows message back to the control so that it can respond to the change. When TControl receives this message, it invalidates the control so that its appearance reflects the change (for example, so that it appears grayed). Some descendants respond to this message in other ways (for example, windowed controls ensure that a disabled control does not have focus).

Override GetEnabled and SetEnabled to change the implementation of the Enabled property. For example, A descendant of TControl might change the way the Enabled property interacts with an associated action. When overriding SetEnabled, be sure to call the inherited method.

See Also

GetEnabled

Enabled

Invalidate

63.1.44.4.11 TRibbonSpinEdit.SetParent Method

Sets the parent of the control.

Pascal

```
procedure SetParent(AParent: TWinControl); override;
```

C++

```
virtual __fastcall SetParent(TWinControl * AParent);
```

Description

SetParent is the protected implementation of the Parent property. Override SetParent to execute additional code when the value

of the Parent property changes.

The AParent parameter specifies the new parent of the control.

If the control already has a parent, SetParent removes the control from that parent's list of controls by calling the parent's RemoveControl method. If AParent is not nil (Delphi) or NULL (C++), SetParent calls its InsertControl method to add the control to its list of controls.

The TControl destructor calls SetParent(nil (Delphi) or NULL (C++)) to remove the control from its parent's control list before destroying the component.

63.1.44.4.12 TRibbonSpinEdit.UpClick Method

Pascal

```
procedure UpClick(Sender: TObject); virtual;
```

C++

```
virtual __fastcall UpClick(TObject * Sender);
```

Description

This is UpClick, a member of class TRibbonSpinEdit.

63.1.44.4.13 TRibbonSpinEdit.WMKillFocus Method

Pascal

```
procedure WMKillFocus(var Message: TWMKillFocus); message WM_KILLFOCUS;
```

C++

```
__fastcall WMKillFocus(TWMKillFocus Message);
```

Description

This is WMKillFocus, a member of class TRibbonSpinEdit.

63.1.44.5 TRibbonSpinEdit Properties

The properties of the TRibbonSpinEdit class are listed here.

Public Properties

	Name	Description
	Button (see page 3847)	This is Button, a member of class TRibbonSpinEdit.

Published Properties

	Name	Description
	Anchors (see page 3845)	Specifies how the control is anchored to its parent.

	AutoSelect (see page 3846)	Determines whether all the text in the edit control is automatically selected when the control gets focus.
	AutoSize (see page 3846)	Determines whether the height of the edit control automatically resizes to accommodate the text.
	Color (see page 3847)	Specifies the background color of the control.
	Constraints (see page 3848)	Specifies the size constraints for the control.
	Ctl3D (see page 3849)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DragCursor (see page 3849)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragMode (see page 3850)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	EditorEnabled (see page 3851)	This is EditorEnabled, a member of class TRibbonSpinEdit.
	Enabled (see page 3851)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 3852)	Controls the attributes of text written on or in the control.
	Increment (see page 3853)	This is Increment, a member of class TRibbonSpinEdit.
	MaxLength (see page 3853)	Specifies the maximum number of characters the user can enter into the edit control.
	MaxValue (see page 3854)	This is MaxValue, a member of class TRibbonSpinEdit.
	MinValue (see page 3854)	This is MinValue, a member of class TRibbonSpinEdit.
	ParentColor (see page 3854)	Determines where a control looks for its color information.
	ParentCtl3D (see page 3855)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 3855)	Determines where a control looks for its font information.
	ParentShowHint (see page 3855)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 3856)	Identifies the pop-up menu associated with the control.
	ReadOnly (see page 3861)	Determines whether the user can change the text of the edit control.
	ShowHint (see page 3861)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 3863)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 3864)	Determines if the user can tab to a control.
	Value (see page 3864)	This is Value, a member of class TRibbonSpinEdit.
	Visible (see page 3864)	Determines whether the component appears onscreen.

63.1.44.5.1 TRibbonSpinEdit.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors;
```

C++

```
__property Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

Align

63.1.44.5.2 TRibbonSpinEdit.AutoSelect Property

Determines whether all the text in the edit control is automatically selected when the control gets focus.

Pascal

```
property AutoSelect;
```

C++

```
__property AutoSelect;
```

Description

Set AutoSelect to select all the text when the edit control gets focus. AutoSelect only applies to single-line edit controls.

Use AutoSelect when the user is more likely to replace the text in the edit control than to append to it.

63.1.44.5.3 TRibbonSpinEdit.AutoSize Property

Determines whether the height of the edit control automatically resizes to accommodate the text.

Pascal

```
property AutoSize;
```

C++

```
__property AutoSize;
```

Description

Use AutoSize to make the edit control adjust its size automatically so the client area accommodates the height of the text. When AutoSize is false, the edit control has a fixed height. When AutoSize is true, the size of the control is readjusted whenever a change occurs that could affect the height of the control, such as a change to the font or border style.

Note: AutoSize only adjusts the height of the edit control. Even with AutoSize set to true, text in the edit control may appear truncated if it extends beyond the width of the control.

C++ Examples:

```
/*
This example uses an edit box and a button on a form. When
the user clicks the button, the font in the edit box
enlarges, and the edit box enlarges also to accommodate the
larger font size.
```

```
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Edit1->AutoSize = true;
  Edit1->Font->Size = 20;
  Edit1->Text = "The edit box is taller now";
}
```

Delphi Examples:

```
{
{
This example uses an edit box and a button on a form. When
the user clicks the button, the font in the edit box
enlarges, and the edit box enlarges also to accommodate the
larger font size.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Edit1.AutoSize := True;
  Edit1.Font.Size := 20;
  Edit1.Text := 'The edit box is taller now';
end;
```

63.1.44.5.4 TRibbonSpinEdit.Button Property

Pascal

```
property Button: TRibbonSpinButton;
```

C++

```
__property TRibbonSpinButton Button;
```

Description

This is Button, a member of class TRibbonSpinEdit.

63.1.44.5.5 TRibbonSpinEdit.Color Property

Specifies the background color of the control.

Pascal

```
property Color;
```

C++

```
__property Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

ParentColor

63.1.44.5.6 TRibbonSpinEdit.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints;
```

C++

```
__property Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

63.1.44.5.7 TRibbonSpinEdit.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D;
```

C++

```
__property Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

63.1.44.5.8 TRibbonSpinEdit.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor;
```

C++

```
__property DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor

DragKind

DragMode

63.1.44.5.9 TRibbonSpinEdit.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode;
```

C++

```
__property DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != dynamic_cast<TObject *>(TreeView1) || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == dynamic_cast<TObject *>(TreeView1));
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property must be set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the

63.1.44.5.10 TRibbonSpinEdit.EditorEnabled Property

Pascal

```
property EditorEnabled: Boolean;
```

C++

```
__property Boolean EditorEnabled;
```

Description

This is EditorEnabled, a member of class TRibbonSpinEdit.

63.1.44.5.11 TRibbonSpinEdit.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled;
```

C++

```
__property Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to False. Some disabled controls appear dimmed (for example: buttons, check boxes, labels), while others (container controls) simply lose their functionality without changing their appearance. If Enabled is set to False, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to True.

Note: This property applies to all TControl descendants.

63.1.44.5.12 TRibbonSpinEdit.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font;
```

C++

```
__property Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
```

```
  corresponding font name in the combo box.
  }
  procedure TForm1.FormCreate(Sender: TObject);
  var
    i : Integer;
  begin
    for i := 0 to Screen.Fonts.Count - 1 do
     ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
  //  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
    RichEdit1.Lines.Text := 'How is it to be you?';
  end;

  procedure TForm1.ComboBox1Click(Sender: TObject);
  begin
    RichEdit1.Font.Name := ComboBox1.Text;
  end;

63.1.44.5.13 TRibbonSpinEdit.Increment Property

Pascal

```
property Increment: LongInt;
```

C++

```
__property LongInt Increment;
```

Description

This is Increment, a member of class TRibbonSpinEdit.

63.1.44.5.14 TRibbonSpinEdit.MaxLength Property

Specifies the maximum number of characters the user can enter into the edit control.

Pascal

```
property MaxLength;
```

C++

```
__property MaxLength;
```

Description

Use MaxLength to limit the number of characters that can be entered into the edit control. A value of 0 indicates that there is no application-defined limit on the length.

Use MaxLength to limit the length of the text in an edit control if that text will be copied into a fixed-length buffer.

Note: Setting MaxLength will not truncate the existing text, it merely prevents the user from adding more text after reaching the limit of MaxLength characters.

Note: Even when MaxLength is 0, there may be limitations imposed by the operating system on the number of characters that may be entered into an edit control.

Note: The unit of MaxLength is characters (not bytes) if the application is using themes.

63.1.44.5.15 TRibbonSpinEdit.MaxValue Property

Pascal

```
property MaxValue: LongInt;
```

C++

```
__property LongInt MaxValue;
```

Description

This is MaxValue, a member of class TRibbonSpinEdit.

63.1.44.5.16 TRibbonSpinEdit.MinValue Property

Pascal

```
property MinValue: LongInt;
```

C++

```
__property LongInt MinValue;
```

Description

This is MinValue, a member of class TRibbonSpinEdit.

63.1.44.5.17 TRibbonSpinEdit.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor;
```

C++

```
__property ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

63.1.44.5.18 TRibbonSpinEdit.ParentCtl3D Property

Determines where a component looks to determine if it should appear three dimensional.

Pascal

```
property ParentCtl3D;
```

C++

```
__property ParentCtl3D;
```

Description

ParentCtl3D is provided for backwards compatibility. It has no effect on 32-bit versions of Windows or NT 4.0 and later.

ParentCtl3D determines whether the control uses its parent's Ctl3D property.

See Also

Ctl3D

63.1.44.5.19 TRibbonSpinEdit.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont;
```

C++

```
__property ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

ParentShowHint

63.1.44.5.20 TRibbonSpinEdit.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint;
```

C++

```
__property ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

63.1.44.5.21 TRibbonSpinEdit.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu;
```

C++

```
__property PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
```

```
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    // The owner (PopupMenu1) will cleanup this menu item.
    TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
    int index = PopupMenu1->Items->Count;
    PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
    NewItem->Caption = "Menu Item " + IntToStr(index);
    NewItem->Tag = index;
    NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
```

```
    TNotifyEvent();

    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        // The owner (PopupMenu1) will cleanup this menu item.
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

63.1.44.5.22 TRibbonSpinEdit.ReadOnly Property

Determines whether the user can change the text of the edit control.

Pascal

```
property ReadOnly;
```

C++

```
__property ReadOnly;
```

Description

To restrict the edit control to display only, set the ReadOnly property to true. Set ReadOnly to false to allow the contents of the edit control to be edited.

Setting ReadOnly to true ensures that the text is not altered, while still allowing the user to select text. The selected text can then be manipulated by the application, or copied to the Clipboard.

CopyToClipboard

GetSelTextBuf

63.1.44.5.23 TRibbonSpinEdit.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint;
```

C++

```
__property ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
```

```
    begin
      for I := 1 to 10 do
        Items.Add('Item ' + IntToStr(I));
      Hint := 'Select an item';
      ShowHint := True;
    end;
    Application.ShowHint := True;
  end;
  {
  Note: To see an example that displays the hints of controls
  in some place other than in a Help Hint box, see the OnHint
  example.
  }

63.1.44.5.24 TRibbonSpinEdit.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder;
```

C++

```
__property TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

FindNextControl

TabStop

63.1.44.5.25 TRibbonSpinEdit.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop;
```

C++

```
__property TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

TabOrder

63.1.44.5.26 TRibbonSpinEdit.Value Property

Pascal

```
property Value: LongInt;
```

C++

```
__property LongInt Value;
```

Description

This is Value, a member of class TRibbonSpinEdit.

63.1.44.5.27 TRibbonSpinEdit.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible;
```

C++

```
__property Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
```

```
*/

63.1.44.6 TRibbonSpinEdit Events

The events of the TRibbonSpinEdit class are listed here.

Published Events

	Name	Description
	OnChange (see page 3866)	Occurs when the text for the edit control may have changed.
	OnClick (see page 3867)	Occurs when the user clicks the control.
	OnDblClick (see page 3868)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 3869)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 3872)	Occurs when the user drags an object over a control.
	OnEndDrag (see page 3875)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 3876)	Occurs when a control receives the input focus.
	OnExit (see page 3878)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 3882)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 3886)	Occurs when a key is pressed.
	OnKeyUp (see page 3887)	Occurs when the user releases a key that has been pressed.
	OnMouseDown (see page 3889)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseMove (see page 3891)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 3893)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDrag (see page 3896)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

63.1.44.6.1 TRibbonSpinEdit.OnChange Event

Occurs when the text for the edit control may have changed.

Pascal

```
property OnChange;
```

C++

```
__property OnChange;
```

Description

Write an OnChange event handler to take specific action whenever the text for the edit control may have changed. Use the Modified property to see if a change actually occurred. The Text property of the edit control will already be updated to reflect any changes. This event provides the first opportunity to respond to modifications that the user types into the edit control.

Change

Text

63.1.44.6.2 TRibbonSpinEdit.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick;
```

C++

```
__property OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this); // The owner will clean this up.
```

```
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;

63.1.44.6.3 TRibbonSpinEdit.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick;
```

C++

```
__property OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

See Also

OnClick

Responding to User Actions at Runtime

63.1.44.6.4 TRibbonSpinEdit.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop;
```

C++

```
__property OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

{
  reinterpret_cast<TForm1 *>(Source)->Left = X;
  reinterpret_cast<TForm1 *>(Source)->Top = Y;
}

void __fastcall TForm1::FormDragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = Source->ClassNameIs("TLabel");
}

void __fastcall TForm1::Panel1DragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = false;
  if ((Source->ClassNameIs("TLabel")) && (State == dsDragEnter))
    dynamic_cast<TLabel *>(Source)->EndDrag(false);
}
/*
This code comes from an application that contains a list box
```

```
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*

63.1.44.6.5 TRibbonSpinEdit.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver;
```

C++

```
__property OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

{
  reinterpret_cast<TForm1 *>(Source)->Left = X;
  reinterpret_cast<TForm1 *>(Source)->Top = Y;
}

void __fastcall TForm1::FormDragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = Source->ClassNameIs("TLabel");
}
```

```
void __fastcall TForm1::Panel1DragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = false;
  if ((Source->ClassNameIs("TLabel")) && (State == dsDragEnter))
    dynamic_cast<TLabel *>(Source)->EndDrag(false);
}
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The

    (Source as TLabel).EndDrag(False);
end;
{
This code requires a list box and three labels, each with a
different font and color.  The DragMode property for each of
the labels is dmAutomatic.  The user can select a label and
drag it to a list box and drop it. When the label is dropped,
the items in the list box assume the color and font of the
dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
```

```
        Color := (Source as TLabel).Color;
        DoubleBuffered := true;
        Color := clWindow;
      end;
    end;
  end;
```

63.1.44.6.6 TRibbonSpinEdit.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag;
```

C++

```
__property OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = (dynamic_cast<TLabel *>(Sender))->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
```

```
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;
```

63.1.44.6.7 TRibbonSpinEdit.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter;
```

C++

```
__property OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
```

```
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   (dynamic_cast<TEdit *>(myActiveControl))->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    (dynamic_cast<TRichEdit *>(myActiveControl))->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

63.1.44.6.8 TRibbonSpinEdit.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit;
```

C++

```
__property OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses three mask edit components on a form,
where the third mask edit box is set to be read only.
When the application runs, it initializes the mask edit boxes
to contain the empty string, to use the Courier font and to
use a particular mask, corresponding to IP address coding convetions.
The mask edit boxes display the IP address, the subnet mask
and the subnet address correspondingly. When the user exits the
subnet mask edit box, the subnet address is automatically calculated
using bit-wise AND operations and displayed in the third mask edit box.
An additional test is made to assure that the values in the IP address
and in the subnet mask are in the interval from 0 to 255 ,
as this validation test cannot be accomplished
using the edit mask property alone.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)

OnEnter

ActiveControl

63.1.44.6.9 TRibbonSpinEdit.OnKeyDown Event

Occurs when a user presses any key while the control has focus.

Pascal

```
property OnKeyDown;
```

C++

```
__property OnKeyDown;
```

Description

Use the OnKeyDown event handler to specify special processing to occur when a key is pressed. The OnKeyDown handler can respond to keyboard keys, including function keys and keys combined with the `Shift`, `Alt`, and `Ctrl` keys, and pressed mouse buttons.

Note: TCheckBox does not fire OnKeyDown events for arrow keys.

The TKeyEvent type points to a method that handles keyboard events.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
Behavior is dependent on keyboard driver(USB, serial, etc).

KeyPreview

OnKeyPress

OnKeyUp

63.1.44.6.10 TRibbonSpinEdit.OnKeyPress Event

Occurs when a key is pressed.

Pascal

```
property OnKeyPress;
```

C++

```
__property OnKeyPress;
```

Description

Use the OnKeyPress event handler to make something happen as a result of a single character key press.

The Key parameter in the OnKeyPress event handler is of type Char; therefore, the OnKeyPress event registers the ASCII character of the key pressed. Keys that don't correspond to an ASCII Char value (Shift or F1, for example) don't generate an OnKeyPress event. Key combinations (such as Shift+A), generate only one OnKeyPress event (for this example, Shift+A results in a Key value of "A" if Caps Lock is off). To respond to non-ASCII keys or key combinations, use the OnKeyDown or OnKeyUp event handlers.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This event handler displays a message dialog box specifying
which key was pressed:
*/

void __fastcall TForm1::FormKeyPress(TObject *Sender, char &Key)
{
  char keyString[25];
  keyString[0] = Key;
  strcpy(&keyString[1], " Was Pressed");
  TMsgDlgButtons() << mbOK;
  MessageDlg(AnsiString(keyString), TMsgDlgType(mtInformation), TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This event handler displays a message dialog box specifying
which key was pressed:
}
procedure TForm1.FormKeyPress(Sender: TObject; var Key: Char);
begin
  MessageDlg(Key + ' has been pressed', mtInformation, [mbOK], 0)
end;
```

OnKeyDown

OnKeyUp

KeyPreview

63.1.44.6.11 TRibbonSpinEdit.OnKeyUp Event

Occurs when the user releases a key that has been pressed.

Pascal

```
property OnKeyUp;
```

C++

```
__property OnKeyUp;
```

Description

Use the OnKeyUp event handler to provide special processing that occurs when a key is released. The OnKeyUp handler can respond to all keyboard keys, including function keys and keys combined with the Shift, Alt, and Ctrl keys.

The TKeyEvent type points to a method that handles keyboard events. The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

C++ Examples:

```
/*
This example changes a form’s color to aqua when the user
```

```
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
Behavior is dependent on keyboard driver(USB, serial, etc).
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
Behavior is dependent on keyboard driver(USB, serial, etc).
}

OnKeyDown

OnKeyPress

63.1.44.6.12 TRibbonSpinEdit.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown;
```

C++

```
__property OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
```

```
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {

OnMouseMove

OnMouseUp

MouseCapture

63.1.44.6.13 TRibbonSpinEdit.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove;
```

C++

```
__property OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
```

```
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

OnMouseMove

Responding to a Mouse-up Action

63.1.44.6.15 TRibbonSpinEdit.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag;
```

C++

```
__property OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonSplitMenuItem.

63.1.45.1 TRibbonSplitMenuItem Members

The following tables list the members exposed by TRibbonSplitMenuItem.

Protected Fields

	Name	Description
	FMouseInSplit (see page 3898)	This is FMouseInSplit, a member of class TRibbonSplitMenuItem.
	FSplitRect (see page 3899)	This is FSplitRect, a member of class TRibbonSplitMenuItem.

Protected Methods

	Name	Description
	CalcLayout (see page 3757)	This is CalcLayout, a member of class TRibbonMenuItem.
	DrawBackground (see page 3900)	Draws a background image on the control.
	DrawGlyph (see page 3614)	Draws a symbol on the control.
	DrawGlyph (see page 3758)	Draws a symbol on the control.
	DrawSelectedBackground (see page 3900)	This is DrawSelectedBackground, a member of class TRibbonSplitMenuItem.
	DrawSeparator (see page 3615)	This is DrawSeparator, a member of class TRibbonApplicationMenuItem.
	DrawSeparator (see page 3759)	This is DrawSeparator, a member of class TRibbonMenuItem.
	DrawShadowedText (see page 3615)	This is DrawShadowedText, a member of class TRibbonApplicationMenuItem.
	DrawShadowedText (see page 3759)	This is DrawShadowedText, a member of class TRibbonMenuItem.
	DrawSubMenuGlyph (see page 3615)	This is DrawSubMenuGlyph, a member of class TRibbonApplicationMenuItem.
	DrawText (see page 3616)	Draws text on the control.
	DrawText (see page 3759)	Draws text on the control.
	GetImageSize (see page 3616)	This is GetImageSize, a member of class TRibbonApplicationMenuItem.
	GetShowShortCut (see page 3759)	This is GetShowShortCut, a member of class TRibbonMenuItem.
	IsInSplit (see page 3900)	This is IsInSplit, a member of class TRibbonSplitMenuItem.
	MouseMove (see page 3901)	Respond to mouse moving over control area..
	RibbonStyle (see page 3760)	This is RibbonStyle, a member of class TRibbonMenuItem.

Protected Properties

	Name	Description
	DrawBanner (see page 3760)	This is DrawBanner, a member of class TRibbonMenuItem.
	MouseInSplit (see page 3902)	This is MouseInSplit, a member of class TRibbonSplitMenuItem.

Public Methods

	Name	Description
	CalcBounds (see page 3899)	Calculates the size of the menu item.
	Click (see page 3899)	Executes the control's function.
	Create (see page 3898)	Creates an instance of TCustomMenuItem.
	UpdateSplitBounds (see page 3901)	This is UpdateSplitBounds, a member of class TRibbonSplitMenuItem.

63.1.45.2 TRibbonSplitMenuItem.Create Constructor

Creates an instance of TCustomMenuItem.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonSplitMenuItem(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomMenuItem. However, you should never attempt to instantiate a TCustomMenuItem. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

After calling the inherited constructor, Create initializes the control, including the following property settings:

Initializes the TCanvas object for its Canvas property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

Create

Destroy

63.1.45.3 TRibbonSplitMenuItem Fields

The fields of the TRibbonSplitMenuItem class are listed here.

Protected Fields

	Name	Description
	FMouseInSplit (see page 3898)	This is FMouseInSplit, a member of class TRibbonSplitMenuItem.
	FSplitRect (see page 3899)	This is FSplitRect, a member of class TRibbonSplitMenuItem.

63.1.45.3.1 TRibbonSplitMenuItem.FMouseInSplit Field

Pascal

```
FMouseInSplit: Boolean;
```

C++

```
Boolean FMouseInSplit;
```

Description

This is FMouseInSplit, a member of class TRibbonSplitMenuItem.

63.1.45.3.2 TRibbonSplitMenuItem.FSplitRect Field

Pascal

```
FSplitRect: TRect;
```

C++

```
TRect FSplitRect;
```

Description

This is FSplitRect, a member of class TRibbonSplitMenuItem.

63.1.45.4 TRibbonSplitMenuItem Methods

The methods of the TRibbonSplitMenuItem class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 3900)	Draws a background image on the control.
	DrawSelectedBackground (see page 3900)	This is DrawSelectedBackground, a member of class TRibbonSplitMenuItem.
	IsInSplit (see page 3900)	This is IsInSplit, a member of class TRibbonSplitMenuItem.
	MouseMove (see page 3901)	Respond to mouse moving over control area..

Public Methods

	Name	Description
	CalcBounds (see page 3899)	Calculates the size of the menu item.
	Click (see page 3899)	Executes the control's function.
	UpdateSplitBounds (see page 3901)	This is UpdateSplitBounds, a member of class TRibbonSplitMenuItem.

63.1.45.4.1 TRibbonSplitMenuItem.CalcBounds Method

Calculates the size of the menu item.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as whether or not the menu item is a separator or not. CalcBounds computes the boundaries of the menu item considering these kinds of factors. At the end, it calls SetBounds and other routines to ensure that the values are set properly.

See Also

SetBounds

63.1.45.4.2 TRibbonSplitMenuItem.Click Method

Executes the control's function.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

This override of the method inherited from TCustomActionControl does little except bring the form containing the item into focus, and prevent the inherited method from being called. The reason for this lack of action is that at runtime, no action should be taken until the primary mouse button is pressed and released, which makes the OnClick event handler responsible for taking action. Click takes place only when the mouse button is first pressed, prior to release.

See Also

OnClick

63.1.45.4.3 TRibbonSplitMenuItem.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

63.1.45.4.4 TRibbonSplitMenuItem.DrawSelectedBackground Method

Pascal

```
procedure DrawSelectedBackground(ARect: TRect); override;
```

C++

```
virtual __fastcall DrawSelectedBackground(TRect ARect);
```

Description

This is DrawSelectedBackground, a member of class TRibbonSplitMenuItem.

63.1.45.4.5 TRibbonSplitMenuItem.IsInSplit Method

Pascal

```
function IsInSplit(const Pt: TPoint): Boolean;
```

C++

```
__fastcall Boolean IsInSplit(const TPoint Pt);
```

Description

This is IsInSplit, a member of class TRibbonSplitMenuItem.

63.1.45.4.6 TRibbonSplitMenuItem.MouseMove Method

Respond to mouse moving over control area..

Pascal

```
procedure MouseMove(Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseMove(TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseMove method to provide other responses in addition to calling the OnMouseMove event handler when the user moves the mouse.

A control calls MouseMove in response to any of the Windows mouse-move messages (WM_MOUSEMOVE), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively.

As the mouse cursor moves across a control, this method is called repeatedly. Each time it is called, it is with the new coordinates that reflect the continuous path of the mouse cursor across the screen real estate covered by the control's visual representation.

MouseDown

MouseUp

OnMouseMove

63.1.45.4.7 TRibbonSplitMenuItem.UpdateSplitBounds Method

Pascal

```
procedure UpdateSplitBounds; virtual;
```

C++

```
virtual __fastcall UpdateSplitBounds();
```

Description

This is UpdateSplitBounds, a member of class TRibbonSplitMenuItem.

63.1.45.5 TRibbonSplitMenuItem Properties

The properties of the TRibbonSplitMenuItem class are listed here.

Protected Properties

	Name	Description
	MouseInSplit (see page 3902)	This is MouseInSplit, a member of class TRibbonSplitMenuItem.

63.1.45.5.1 TRibbonSplitMenuItem.MouseInSplit Property

Pascal

```
property MouseInSplit: Boolean;
```

C++

```
__property Boolean MouseInSplit;
```

Description

This is MouseInSplit, a member of class TRibbonSplitMenuItem.

63.1.46 TRibbonStyleMenuButton Class

Top level menus when using Ribbon (see page 3347) Styles in applications not using Ribbon (see page 3347) interface.

Class Hierarchy

Pascal

```
TRibbonStyleMenuButton = class(TCustomMenuButton);
```

C++

```
class TRibbonStyleMenuButton : public TCustomMenuButton;
```

File

RibbonActnCtrls

Description

TRibbonStyleMenuButton is used for the top level menus when using one of the Ribbon (see page 3347) Styles in an application that doesn't use the Ribbon (see page 3347) interface.

63.1.46.1 TRibbonStyleMenuButton Members

The following tables list the members exposed by TRibbonStyleMenuButton.

Protected Methods

	Name	Description
	DrawBackground (see page 3903)	Draws a background image on the control.
	RibbonStyle (see page 3903)	This is RibbonStyle, a member of class TRibbonStyleMenuButton.

63.1.46.2 TRibbonStyleMenuButton Methods

The methods of the TRibbonStyleMenuButton class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 3903)	Draws a background image on the control.
	RibbonStyle (see page 3903)	This is RibbonStyle, a member of class TRibbonStyleMenuButton.

63.1.46.2.1 TRibbonStyleMenuButton.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

63.1.46.2.2 TRibbonStyleMenuButton.RibbonStyle Method

Pascal

```
function RibbonStyle: TRibbonStyleActionBars;
```

C++

```
__fastcall TRibbonStyleActionBars RibbonStyle();
```

Description

This is RibbonStyle, a member of class TRibbonStyleMenuButton.

63.1.47 TRibbonTextControl Class

Class Hierarchy

Pascal

```
TRibbonTextControl = class(TCustomActionControl);
```

C++

```
class TRibbonTextControl : public TCustomActionControl;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonTextControl.

63.1.47.1 TRibbonTextControl Members

The following tables list the members exposed by TRibbonTextControl.

Protected Methods

	Name	Description
	DrawBackground (see page 3904)	Draws a background image on the control.
	DrawText (see page 3905)	Draws text on the control.

Public Methods

	Name	Description
	CalcBounds (see page 3904)	Calculates the size of the control.

63.1.47.2 TRibbonTextControl Methods

The methods of the TRibbonTextControl class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 3904)	Draws a background image on the control.
	DrawText (see page 3905)	Draws text on the control.

Public Methods

	Name	Description
	CalcBounds (see page 3904)	Calculates the size of the control.

63.1.47.2.1 TRibbonTextControl.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as the presence of an icon, caption, and shortcuts. CalcBounds computes the boundaries of the control considering these kinds of factors. At the end, it calls SetBounds and other routines to ensure that the values are set properly.

See Also

SetBounds

63.1.47.2.2 TRibbonTextControl.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

63.1.47.2.3 TRibbonTextControl.DrawText Method

Draws text on the control.

Pascal

```
procedure DrawText(var ARect: TRect; var Flags: Cardinal; Text: string); override;
```

C++

```
virtual __fastcall DrawText(TRect ARect, unsigned Flags, UnicodeString Text);
```

Description

Use DrawText to draw the text specified by Text on the control within the area specified by ARect.

See Also

DrawBackground

DrawGlyph

63.1.48 TRibbonToolScrollButton Class

Class Hierarchy

Pascal

```
TRibbonToolScrollButton = class(TCustomToolScrollBtn);
```

C++

```
class TRibbonToolScrollButton : public TCustomToolScrollBtn;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonToolScrollButton.

63.1.48.1 TRibbonToolScrollButton Members

The following tables list the members exposed by TRibbonToolScrollButton.

Protected Methods

	Name	Description
	DrawArrows (see page 3906)	This is DrawArrows, a member of class TRibbonToolScrollButton.
	DrawBackground (see page 3906)	Draws a background image on the control.

63.1.48.2 TRibbonToolScrollButton Methods

The methods of the TRibbonToolScrollButton class are listed here.

Protected Methods

	Name	Description
	DrawArrows (see page 3906)	This is DrawArrows, a member of class TRibbonToolScrollButton.
	DrawBackground (see page 3906)	Draws a background image on the control.

63.1.48.2.1 TRibbonToolScrollButton.DrawArrows Method

Pascal

```
procedure DrawArrows; override;
```

C++

```
virtual __fastcall DrawArrows();
```

Description

This is DrawArrows, a member of class TRibbonToolScrollButton.

63.1.48.2.2 TRibbonToolScrollButton.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

63.1.49 TTimerSpeedButton Class

Class Hierarchy

Pascal

```
TTimerSpeedButton = class(TSpeedButton);
```

C++

```
class TTimerSpeedButton : public TSpeedButton;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TTimerSpeedButton.

63.1.49.1 TTimerSpeedButton Members

The following tables list the members exposed by TTimerSpeedButton.

Protected Methods

	Name	Description
	CMMouseenter (see page 3908)	This is CMMouseenter, a member of class TTimerSpeedButton.
	CMMouseleave (see page 3908)	This is CMMouseleave, a member of class TTimerSpeedButton.
	MouseDown (see page 3909)	OnMouseDown event dispatcher.
	MouseUp (see page 3909)	OnMouseUp event dispatcher.
	Paint (see page 3910)	Render control surface.

Protected Properties

	Name	Description
	MouseInControl (see page 3910)	This is MouseInControl, a member of class TTimerSpeedButton.

Public Methods

	Name	Description
	Create (see page 3907)	Creates and initializes an instance of TSpeedButton.
	Destroy (see page 3908)	Destroys an instance of TSpeedButton.

Public Properties

	Name	Description
	ButtonStyle (see page 3910)	This is ButtonStyle, a member of class TTimerSpeedButton.
	TimeBtnState (see page 3911)	This is TimeBtnState, a member of class TTimerSpeedButton.

63.1.49.2 TTimerSpeedButton.Create Constructor

Creates and initializes an instance of TSpeedButton.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TTimerSpeedButton(TComponent * AOwner);
```

Description

Call Create to create a speed button at runtime. Speed buttons placed on forms at design time are created automatically.

AOwner is the component, typically a form, that is responsible for freeing the speed button.

See Also

Owner

63.1.49.3 TTimerSpeedButton.Destroy Destructor

Destroys an instance of TSpeedButton.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TTimerSpeedButton();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the speed button is not nil, and only then calls Destroy.

See Also

System::TObject::Free

63.1.49.4 TTimerSpeedButton Methods

The methods of the TTimerSpeedButton class are listed here.

Protected Methods

	Name	Description
	CMMouseenter (see page 3908)	This is CMMouseenter, a member of class TTimerSpeedButton.
	CMMouseleave (see page 3908)	This is CMMouseleave, a member of class TTimerSpeedButton.
V	MouseDown (see page 3909)	OnMouseDown event dispatcher.
V	MouseUp (see page 3909)	OnMouseUp event dispatcher.
V	Paint (see page 3910)	Render control surface.

63.1.49.4.1 TTimerSpeedButton.CMMouseenter Method

Pascal

```
procedure CMMouseenter(var Message: TMessage); message CM_MOUSEENTER;
```

C++

```
__fastcall CMMouseenter(TMessage Message);
```

Description

This is CMMouseenter, a member of class TTimerSpeedButton.

63.1.49.4.2 TTimerSpeedButton.CMMouseleave Method

Pascal

```
procedure CMMouseleave(var Message: TMessage); message CM_MOUSELEAVE;
```

C++

```
__fastcall CMMouseleave(TMessage Message);
```

Description

This is CMMouseleave, a member of class TTimerSpeedButton.

63.1.49.4.3 TTimerSpeedButton.MouseDown Method

OnMouseDown event dispatcher.

Pascal

```
procedure MouseDown(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer);
override;
```

C++

```
virtual __fastcall MouseDown(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user presses the mouse button down while the cursor's hotspot is over the control.

The Button parameter determines which mouse button the user pressed. Shift indicates which shift keys (Shift, Ctrl, or Alt) were down when the user pressed the mouse button. X and Y are the pixel coordinates of the mouse pointer within the client area of the control.

A control calls MouseDown in response to any of the Windows mouse-down messages (WM_LBUTTONDOWN, WM_MBUTTONDOWN, WM_RBUTTONDOWN), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was pressed down: left, right, or middle.

See Also

MouseMove

MouseUp

OnMouseDown

63.1.49.4.4 TTimerSpeedButton.MouseUp Method

OnMouseUp event dispatcher.

Pascal

```
procedure MouseUp(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseUp(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user releases a previously pressed mouse button while the cursor's hotspot is over the control.

A control calls MouseUp in response to any of the Windows mouse-up messages (WM_LBUTTONUP, WM_MBUTTONUP, WM_RBUTTONUP), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was released: left, right, or middle

See Also

MouseDown

MouseMove

OnMouseUp

63.1.49.4.5 TTimerSpeedButton.Paint Method

Render control surface.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method is called automatically when a lightweight control needs update its display area. Code in the Paint method uses the Canvas property to render the control surface.

As implemented in TGraphicControl, Paint does nothing. Specific rendering logic is provided by Paint methods in descendant control classes.

See Also

Canvas

63.1.49.5 TTimerSpeedButton Properties

The properties of the TTimerSpeedButton class are listed here.

Protected Properties

	Name	Description
	MouseInControl (see page 3910)	This is MouseInControl, a member of class TTimerSpeedButton.

Public Properties

	Name	Description
	ButtonStyle (see page 3910)	This is ButtonStyle, a member of class TTimerSpeedButton.
	TimeBtnState (see page 3911)	This is TimeBtnState, a member of class TTimerSpeedButton.

63.1.49.5.1 TTimerSpeedButton.ButtonStyle Property

Pascal

```
property ButtonStyle: TSpinButtonStyle;
```

C++

```
__property TSpinButtonStyle ButtonStyle;
```

Description

This is ButtonStyle, a member of class TTimerSpeedButton.

63.1.49.5.2 TTimerSpeedButton.MouseInControl Property

Pascal

```
property MouseInControl: Boolean;
```

C++

```
__property Boolean MouseInControl;
```

Description

This is MouseInControl, a member of class TTimerSpeedButton.

63.1.49.5.3 TTimerSpeedButton.TimeBtnState Property

Pascal

```
property TimeBtnState: TTimeBtnState;
```

C++

```
__property TTimeBtnState TimeBtnState;
```

Description

This is TimeBtnState, a member of class TTimerSpeedButton.

63.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IRibbonBarKeyTip (see page 3912)	Action Bars that support KeyTips should implement this interface.
	IRibbonContainedControl (see page 3914)	Interface implemented by controls used as containers for displaying other controls.
	IRibbonControl (see page 3916)	Interface implemented by controls visible in Ribbon (see page 3347) Groups.
	IRibbonGroupDropdown (see page 3917)	This is class RibbonActnCtrls.IRibbonGroupDropdown.
	IRibbonKeyTip (see page 3918)	Commands with a **KeyTip (see page 3922)** should implement this interface.
	IRibbonSplitButton (see page 3922)	Interface implemented by controls that have split button.

63.2.1 IRibbonBarKeyTip Interface

Action Bars that support KeyTips should implement this interface.

Class Hierarchy

RibbonActnCtrls.IRibbonBarKeyTip

Pascal

```
IRibbonBarKeyTip = interface;
```

C++

```
__interface IRibbonBarKeyTip;
```

File

RibbonActnCtrls

Description

Action Bars that support KeyTips should implement IRibbonBarKeyTip. The TRibbonQuickAccessToolbar and TRibbonGroup classes implement this interface.

See Also

TRibbonGroup (see page 3500)

TRibbonQuickAccessToolbar (see page 3546)

63.2.1.1 IRibbonBarKeyTip Members

The following tables list the members exposed by IRibbonBarKeyTip.

Public Methods

	Name	Description
	BarHandleKeyTips (see page 3913)	Check if any commands on Action Bar are partial or full match for **KeyTip**.
	BarHideKeyTips (see page 3913)	Hide any visible **KeyTip** windows.

	BarShowKeyTips (see page 3914)	Show **KeyTip**s for any commands that support them.

63.2.1.2 IRibbonBarKeyTip Methods

The methods of the IRibbonBarKeyTip class are listed here.

Public Methods

	Name	Description
	BarHandleKeyTips (see page 3913)	Check if any commands on Action Bar are partial or full match for **KeyTip**.
	BarHideKeyTips (see page 3913)	Hide any visible **KeyTip** windows.
	BarShowKeyTips (see page 3914)	Show **KeyTip**s for any commands that support them.

63.2.1.2.1 IRibbonBarKeyTip.BarHandleKeyTips Method

Check if any commands on Action Bar are partial or full match for **KeyTip**.

Pascal

```
procedure BarHandleKeyTips(const KeyTip: string; var KeyTips: TKeyTipList);
```

C++

```
__fastcall BarHandleKeyTips(const UnicodeString KeyTip, TKeyTipList KeyTips);
```

Description

BarHandleKeyTips checks if any commands on the Action Bar are a partial or full match for the **KeyTip**. Matches are returned as a TKeyTipMatchItem (see page 3598) in the `List` parameter. If only one item is a match, that command is executed.

See Also

TKeyTipMatchItem (see page 3598)

BarHideKeyTips (see page 3913)

BarShowKeyTips (see page 3914)

63.2.1.2.2 IRibbonBarKeyTip.BarHideKeyTips Method

Hide any visible **KeyTip** windows.

Pascal

```
procedure BarHideKeyTips(KeyTips: TKeyTipList);
```

C++

```
__fastcall BarHideKeyTips(TKeyTipList KeyTips);
```

Description

BarHideKeyTips hides any visible **KeyTip** windows. `ExceptList` may contain a list of TKeyTipMatchItem (see page 3598) objects for commands that should not be hidden. These items are current partial matches and require additional handling.

See Also

TKeyTipMatchItem (see page 3598)

BarHandleKeyTips (see page 3913)

BarShowKeyTips (see page 3914)

63.2.1.2.3 IRibbonBarKeyTip.BarShowKeyTips Method

Show **KeyTip**s for any commands that support them.

Pascal

```
procedure BarShowKeyTips;
```

C++

```
__fastcall BarShowKeyTips();
```

Description

BarShowKeyTips shows **KeyTip**s for any commands that support them.

See Also

BarHandleKeyTips (see page 3913)

BarHideKeyTips (see page 3913)

63.2.2 IRibbonContainedControl Interface

Interface implemented by controls used as containers for displaying other controls.

Class Hierarchy

Pascal

```
IRibbonContainedControl = interface(IRibbonControl);
```

C++

```
__interface IRibbonContainedControl : public IRibbonControl;
```

File

RibbonActnCtrls

Description

IRibbonContainedControl is an interface implemented by a control that is used as a container for displaying other controls.

See Also

IRibbonControl (see page 3916)

IRibbonSplitButton (see page 3922)

63.2.2.1 IRibbonContainedControl Members

The following tables list the members exposed by IRibbonContainedControl.

Public Methods

	Name	Description
	CanAddToQuickAccessToolbar (see page 3916)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.
	GetContainedControl (see page 3915)	This is GetContainedControl, a member of class IRibbonContainedControl.
	SetContainedControl (see page 3915)	This is SetContainedControl, a member of class IRibbonContainedControl.

Public Properties

	Name	Description
	ContainedControl (see page 3915)	This is ContainedControl, a member of class IRibbonContainedControl.

63.2.2.2 IRibbonContainedControl Methods

The methods of the IRibbonContainedControl class are listed here.

Public Methods

	Name	Description
	GetContainedControl (see page 3915)	This is GetContainedControl, a member of class IRibbonContainedControl.
	SetContainedControl (see page 3915)	This is SetContainedControl, a member of class IRibbonContainedControl.

63.2.2.2.1 IRibbonContainedControl.GetContainedControl Method

Pascal

```
function GetContainedControl: TControl;
```

C++

```
__fastcall TControl * GetContainedControl();
```

Description

This is GetContainedControl, a member of class IRibbonContainedControl.

63.2.2.2.2 IRibbonContainedControl.SetContainedControl Method

Pascal

```
procedure SetContainedControl(const Value: TControl);
```

C++

```
__fastcall SetContainedControl(const TControl * Value);
```

Description

This is SetContainedControl, a member of class IRibbonContainedControl.

63.2.2.3 IRibbonContainedControl Properties

The properties of the IRibbonContainedControl class are listed here.

Public Properties

	Name	Description
	ContainedControl (see page 3915)	This is ContainedControl, a member of class IRibbonContainedControl.

63.2.2.3.1 IRibbonContainedControl.ContainedControl Property

Pascal

```
property ContainedControl: TControl;
```

C++

```
__property TControl * ContainedControl;
```

Description

This is ContainedControl, a member of class IRibbonContainedControl.

63.2.3 IRibbonControl Interface

Interface implemented by controls visible in Ribbon (see page 3347) Groups.

Class Hierarchy

Pascal

```
IRibbonControl = interface;
```

C++

```
__interface IRibbonControl;
```

File

RibbonActnCtrls

Description

IRibbonControl is an interface implemented by a control that is visible in Ribbon (see page 3347) Groups.

See Also

IRibbonContainedControl (see page 3914)

IRibbonSplitButton (see page 3922)

63.2.3.1 IRibbonControl Members

The following tables list the members exposed by IRibbonControl.

Public Methods

	Name	Description
	CanAddToQuickAccessToolbar (see page 3916)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.

63.2.3.2 IRibbonControl Methods

The methods of the IRibbonControl class are listed here.

Public Methods

	Name	Description
	CanAddToQuickAccessToolbar (see page 3916)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.

63.2.3.2.1 IRibbonControl.CanAddToQuickAccessToolbar Method

Pascal

```
function CanAddToQuickAccessToolbar: Boolean;
```

C++

```
__fastcall Boolean CanAddToQuickAccessToolbar();
```

Description

This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.

63.2.4 IRibbonGroupDropdown Interface

Class Hierarchy

RibbonActnCtrls.IRibbonGroupDropdown

Pascal

```
IRibbonGroupDropdown = interface;
```

C++

```
__interface IRibbonGroupDropdown;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.IRibbonGroupDropdown.

63.2.4.1 IRibbonGroupDropdown Members

The following tables list the members exposed by IRibbonGroupDropdown.

Public Methods

	Name	Description
	CloseUp (see page 3917)	This is CloseUp, a member of class IRibbonGroupDropdown.
	GetParentControl (see page 3918)	This is GetParentControl, a member of class IRibbonGroupDropdown.
	GetTopPosition (see page 3918)	This is GetTopPosition, a member of class IRibbonGroupDropdown.

63.2.4.2 IRibbonGroupDropdown Methods

The methods of the IRibbonGroupDropdown class are listed here.

Public Methods

	Name	Description
	CloseUp (see page 3917)	This is CloseUp, a member of class IRibbonGroupDropdown.
	GetParentControl (see page 3918)	This is GetParentControl, a member of class IRibbonGroupDropdown.
	GetTopPosition (see page 3918)	This is GetTopPosition, a member of class IRibbonGroupDropdown.

63.2.4.2.1 IRibbonGroupDropdown.CloseUp Method

Pascal

```
procedure CloseUp;
```

C++

```
__fastcall CloseUp();
```

Description

This is CloseUp, a member of class IRibbonGroupDropdown.

63.2.4.2.2 IRibbonGroupDropdown.GetParentControl Method

Pascal

```
function GetParentControl: TWinControl;
```

C++

```
__fastcall TWinControl * GetParentControl();
```

Description

This is GetParentControl, a member of class IRibbonGroupDropdown.

63.2.4.2.3 IRibbonGroupDropdown.GetTopPosition Method

Pascal

```
function GetTopPosition: Integer;
```

C++

```
__fastcall int GetTopPosition();
```

Description

This is GetTopPosition, a member of class IRibbonGroupDropdown.

63.2.5 IRibbonKeyTip Interface

Commands with a **KeyTip (see page 3922)** should implement this interface.

Class Hierarchy

Pascal

```
IRibbonKeyTip = interface;
```

C++

```
__interface IRibbonKeyTip;
```

File

RibbonActnCtrls

Description

Commands that have a **KeyTip (see page 3922)** should implement IRibbonKeyTip.

63.2.5.1 IRibbonKeyTip Members

The following tables list the members exposed by IRibbonKeyTip.

Public Methods

	Name	Description
	GetKeyTip (see page 3919)	Returns current **KeyTip (see page 3922)** for command.
	HandleKeyTip (see page 3920)	Indicates if command's **KeyTip (see page 3922)** matches currently input KeyTip (see page 3922).
	HideKeyTip (see page 3920)	Hide **KeyTip (see page 3922)** for command.
	KeyTipClick (see page 3920)	Handle clicking a **KeyTip (see page 3922)**.
	SetKeyTip (see page 3921)	Sets **KeyTip (see page 3922)** for command.
	ShowKeyTip (see page 3921)	Shows **KeyTip (see page 3922)** for command in specified position.

Public Properties

	Name	Description
	KeyTip (see page 3922)	Current **KeyTip** for command

63.2.5.2 IRibbonKeyTip Methods

The methods of the IRibbonKeyTip class are listed here.

Public Methods

	Name	Description
	GetKeyTip (see page 3919)	Returns current **KeyTip (see page 3922)** for command.
	HandleKeyTip (see page 3920)	Indicates if command's **KeyTip (see page 3922)** matches currently input KeyTip (see page 3922).
	HideKeyTip (see page 3920)	Hide **KeyTip (see page 3922)** for command.
	KeyTipClick (see page 3920)	Handle clicking a **KeyTip (see page 3922)**.
	SetKeyTip (see page 3921)	Sets **KeyTip (see page 3922)** for command.
	ShowKeyTip (see page 3921)	Shows **KeyTip (see page 3922)** for command in specified position.

63.2.5.2.1 IRibbonKeyTip.GetKeyTip Method

Returns current **KeyTip (see page 3922)** for command.

Pascal

```
function GetKeyTip: string;
```

C++

```
__fastcall UnicodeString GetKeyTip();
```

Description

GetKeyTip returns the current **KeyTip (see page 3922)** for the command

See Also

KeyTip (see page 3922)

HandleKeyTip (see page 3920)

HideKeyTip (see page 3920)

SetKeyTip (see page 3921)

ShowKeyTip (see page 3921)

63.2.5.2.2 IRibbonKeyTip.HandleKeyTip Method

Indicates if command's **KeyTip (see page 3922)** matches currently input KeyTip (see page 3922).

Pascal

```
procedure HandleKeyTip(const KeyTip: string; var Handled: TKeyTipHandled);
```

C++

```
__fastcall HandleKeyTip(const UnicodeString KeyTip, TKeyTipHandled Handled);
```

Description

HandleKeyTip indicates whether this command's

KeyTip (see page 3922) matches the currently input KeyTip (see page 3922) by the user. Full and partial matches are taken into consideration.

See Also

KeyTip (see page 3922)

GetKeyTip (see page 3919)

HideKeyTip (see page 3920)

SetKeyTip (see page 3921)

ShowKeyTip (see page 3921)

63.2.5.2.3 IRibbonKeyTip.HideKeyTip Method

Hide **KeyTip (see page 3922)** for command.

Pascal

```
procedure HideKeyTip(const Match: string);
```

C++

```
__fastcall HideKeyTip(const UnicodeString Match);
```

Description

This method hides the **KeyTip (see page 3922)** for this command. If the **Match** parameter matches (full or partial) the command's **KeyTip (see page 3922)**, the **KeyTip (see page 3922)** remains visible.

See Also

KeyTip (see page 3922)

GetKeyTip (see page 3919)

HandleKeyTip (see page 3920)

SetKeyTip (see page 3921)

ShowKeyTip (see page 3921)

63.2.5.2.4 IRibbonKeyTip.KeyTipClick Method

Handle clicking a **KeyTip (see page 3922)**.

Pascal

```
procedure KeyTipClick;
```

C++

```
__fastcall KeyTipClick();
```

Description

KeyTipClick Handle clicking a **KeyTip (see page 3922)**. Some requires need to be handled differently when clicked by a **KeyTip (see page 3922)**.

63.2.5.2.5 IRibbonKeyTip.SetKeyTip Method

Sets **KeyTip (see page 3922)** for command.

Pascal

```
procedure SetKeyTip(const Value: string);
```

C++

```
__fastcall SetKeyTip(const UnicodeString Value);
```

Description

This method sets the **KeyTip (see page 3922)** for the command.

See Also

KeyTip (see page 3922)

GetKeyTip (see page 3919)

HandleKeyTip (see page 3920)

HideKeyTip (see page 3920)

ShowKeyTip (see page 3921)

63.2.5.2.6 IRibbonKeyTip.ShowKeyTip Method

Shows **KeyTip (see page 3922)** for command in specified position.

Pascal

```
procedure ShowKeyTip(const Position: TKeyTipPosition);
```

C++

```
__fastcall ShowKeyTip(const TKeyTipPosition Position);
```

Description

This method shows the **KeyTip (see page 3922)** for the command in the position specified. Only the Application Button uses a **KeyTip (see page 3922)** position.

See Also

KeyTip (see page 3922)

GetKeyTip (see page 3919)

HandleKeyTip (see page 3920)

HideKeyTip (see page 3920)

SetKeyTip (see page 3921)

63.2.5.3 IRibbonKeyTip Properties

The properties of the IRibbonKeyTip class are listed here.

Public Properties

	Name	Description
	KeyTip (see page 3922)	Current **KeyTip** for command

63.2.5.3.1 IRibbonKeyTip.KeyTip Property

Current **KeyTip** for command

Pascal

```
property KeyTip: string;
```

C++

```
__property UnicodeString KeyTip;
```

Description

KeyTip is the current **KeyTip** for the command

See Also

GetKeyTip (see page 3919)

SetKeyTip (see page 3921)

63.2.6 IRibbonSplitButton Interface

Interface implemented by controls that have split button.

Class Hierarchy

Pascal

```
IRibbonSplitButton = interface;
```

C++

```
__interface IRibbonSplitButton;
```

File

RibbonActnCtrls

Description

IRibbonSplitButton is an interface implemented by controls that have a split button.

See Also

IRibbonContainedControl (see page 3914)

IRibbonControl (see page 3916)

63.2.6.1 IRibbonSplitButton Members

The following tables list the members exposed by IRibbonSplitButton.

Public Methods

	Name	Description
	UpdateSplitBounds (see page 3923)	This is UpdateSplitBounds, a member of class IRibbonSplitButton.

63.2.6.2 IRibbonSplitButton Methods

The methods of the IRibbonSplitButton class are listed here.

Public Methods

	Name	Description
	UpdateSplitBounds (see page 3923)	This is UpdateSplitBounds, a member of class IRibbonSplitButton.

63.2.6.2.1 IRibbonSplitButton.UpdateSplitBounds Method

Pascal

```
procedure UpdateSplitBounds;
```

C++

```
__fastcall UpdateSplitBounds();
```

Description

This is UpdateSplitBounds, a member of class IRibbonSplitButton.

63.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	DrawLine (see page 3924)	This is function RibbonActnCtrls.DrawLine.
	IsLeftMouseButtonPressed (see page 3924)	This is function RibbonActnCtrls.IsLeftMouseButtonPressed.
	ShowKeyTip (see page 3924)	Show **KeyTip** for control.
	ShowKeyTip (see page 3924)	Show **KeyTip** for control.

63.3.1 RibbonActnCtrls.DrawLine Function

Pascal

```
procedure DrawLine(ACanvas: TCanvas; const AFromPt: TPoint; const AToPt: TPoint);
```

C++

```
DrawLine(TCanvas ACanvas, const TPoint AFromPt, const TPoint AToPt);
```

File

RibbonActnCtrls

Description

This is function RibbonActnCtrls.DrawLine.

63.3.2 RibbonActnCtrls.IsLeftMouseButtonPressed Function

Pascal

```
function IsLeftMouseButtonPressed(Control: TControl): Boolean;
```

C++

```
Boolean IsLeftMouseButtonPressed(TControl * Control);
```

File

RibbonActnCtrls

Description

This is function RibbonActnCtrls.IsLeftMouseButtonPressed.

63.3.3 RibbonActnCtrls.ShowKeyTip Function

Show **KeyTip** for control.

Pascal

```
function ShowKeyTip(const KeyTip: string; const Enabled: Boolean; const Control: TControl;
const Position: TKeyTipPosition): TCustomControl; overload;
function ShowKeyTip(const KeyTip: string; const Enabled: Boolean; const Center: Boolean; const
Rect: TRect; const Position: TKeyTipPosition): TCustomControl; overload;
```

C++

```
TCustomControl ShowKeyTip(const UnicodeString KeyTip, const Boolean Enabled, const TControl *
Control, const TKeyTipPosition Position);
TCustomControl ShowKeyTip(const UnicodeString KeyTip, const Boolean Enabled, const Boolean
Center, const TRect Rect, const TKeyTipPosition Position);
```

File

RibbonActnCtrls

Description

ShowKeyTip shows the **KeyTip** for control.

The parameters are:

- **KeyTip**: The **KeyTip** to display
- **Enabled**: If the **KeyTip** should have an enabled appearance
- **Control**: The control that the **KeyTip** is for. The **KeyTip** displays close to the control
- **Position** - The position of the **KeyTip**. The position of the **KeyTip** can be either **ktpCenter** or **ktpBottom**. Most **KeyTip**s are displayed with the bottom third of the control covered with the **KeyTip**.

63.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TKeyTipHandled (see page 3926)	Validate if command's **KeyTip** matches current user input.
	TKeyTipMatchType (see page 3927)	Type of match command's **KeyTip** is for current **KeyTip** value.
	TKeyTipPosition (see page 3927)	Position of KeyTips.
	TKeyTipState (see page 3928)	Current state of KeyTips.
	TQATScrollMode (see page 3929)	This is record RibbonActnCtrls.TQATScrollMode.
	TSpinButtonStyle (see page 3930)	This is record RibbonActnCtrls.TSpinButtonStyle.

63.4.1 RibbonActnCtrls.TKeyTipHandled Enumeration

Validate if command's **KeyTip** matches current user input.

Pascal

```
TKeyTipHandled = (
  ktNone,
  ktPartial,
  ktFull
);
```

C++

```
enum TKeyTipHandled {
  ktNone,
  ktPartial,
  ktFull
};
```

File

RibbonActnCtrls

Description

Use TKeyTipHandled to validate if a command's **KeyTip** matches the current user input. It can have one of the following values:

Value	Meaning
ktNone	Current KeyTip didn't match the command's **KeyTip**.
ktPartial	Current **KeyTip** matches the first character of the commands **KeyTip**.
ktFull	Current **KeyTip** is a full match for the command. The source **KeyTip** could be either one character or two characters.

See Also

TKeyTipMatchType (see page 3927)

TKeyTipPosition (see page 3927)

TKeyTipState (see page 3928)

63.4.2 RibbonActnCtrls.TKeyTipMatchType Enumeration

Type of match command's **KeyTip** is for current **KeyTip** value.

Pascal

```
TKeyTipMatchType = (
  mtApplicationMenu,
  mtTabs,
  mtControl,
  mtGroup,
  mtCollapsed,
  mtDialogButton
);
```

C++

```
enum TKeyTipMatchType {
  mtApplicationMenu,
  mtTabs,
  mtControl,
  mtGroup,
  mtCollapsed,
  mtDialogButton
};
```

File

RibbonActnCtrls

Description

TKeyTipMatchType is the type of match the command's **KeyTip** is for the current **KeyTip** value. It can have one of the following values:

Value	Meaning
mtApplicationMenu	For ApplicationMenu.
mtTabs	For Tabs.
mtControl	For a Control.
mtGroup	For a Group.
mtCollapsed	For a Collapsed item.
mtDialogButton	For a Dialog Button.

See Also

TKeyTipHandled (see page 3926)

TKeyTipPosition (see page 3927)

TKeyTipState (see page 3928)

63.4.3 RibbonActnCtrls.TKeyTipPosition Enumeration

Position of KeyTips.

Pascal

```
TKeyTipPosition = (
  ktpApplicationButton,
  ktpQuickAccessToolbar,
  ktpTabs,
  ktpGroupA,
  ktpGroupB,
  ktpGroupC,
  ktpGroupD
);
```

C++

```
enum TKeyTipPosition {
  ktpApplicationButton,
  ktpQuickAccessToolbar,
  ktpTabs,
  ktpGroupA,
  ktpGroupB,
  ktpGroupC,
  ktpGroupD
};
```

File

RibbonActnCtrls

Description

TKeyTipPosition is the position of KeyTips. It can have one of the following values:

Value	Meaning
ktpApplicationButton	On Application Button.
ktpQuickAccessToolbar	On Quick Access Toolbar.
ktpTabs	On tabs.
ktpGroupA	On Group A
ktpGroupB	On Group B
ktpGroupC	On Group C
ktpGroupD	On Group D

See Also

TKeyTipHandled (see page 3926)

TKeyTipMatchType (see page 3927)

TKeyTipState (see page 3928)

63.4.4 RibbonActnCtrls.TKeyTipState Enumeration

Current state of KeyTips.

Pascal

```
TKeyTipState = (
  ktsTabs,
  ktsControls,
```

```
    ktsCollapsedGroup
  );
```

C++

```
  enum TKeyTipState {
    ktsTabs,
    ktsControls,
    ktsCollapsedGroup
  };
```

File

RibbonActnCtrls

Description

TKeyTipState is the current state KeyTips are in. It can have one of the following values:

Value	Meaning
ktsTabs	Initial state where the user hasn't yet selected a Tab to display the `KeyTips` for. In this state, `KeyTips` are displayed for the Application Button, Quick Access Toolbar and the Tabs.
ktsControls	`KeyTips` are displayed for all commands on the Active Tab. `KeyTips` are also displayed for Groups dialog buttons and collapsed group buttons.
ktsCollapsedGroup	KeyTips are being displayed for commands that are on a collapsed group.

See Also

TKeyTipHandled (see page 3926)

TKeyTipMatchType (see page 3927)

TKeyTipPosition (see page 3927)

63.4.5 RibbonActnCtrls.TQATScrollMode Enumeration

Pascal

```
  TQATScrollMode = (
    qsCustomize,
    qsMoreControls
  );
```

C++

```
  enum TQATScrollMode {
    qsCustomize,
    qsMoreControls
  };
```

File

RibbonActnCtrls

Description

This is record RibbonActnCtrls.TQATScrollMode.

63.4.6 RibbonActnCtrls.TSpinButtonStyle Enumeration

Pascal

```
TSpinButtonStyle = (
  sbsUp,
  sbsDown
);
```

C++

```
enum TSpinButtonStyle {
  sbsUp,
  sbsDown
};
```

File

RibbonActnCtrls

Description

This is record RibbonActnCtrls.TSpinButtonStyle.

63.5 Types

The following table lists types in this documentation.

Types

Name	Description
TNumGlyphs (see page 3931)	This is type RibbonActnCtrls.TNumGlyphs.
TTimeBtnState (see page 3931)	This is type RibbonActnCtrls.TTimeBtnState.

63.5.1 RibbonActnCtrls.TNumGlyphs Type

Pascal

```
TNumGlyphs = Buttons.TNumGlyphs;
```

C++

```
Buttons.TNumGlyphs TNumGlyphs;
```

File

RibbonActnCtrls

Description

This is type RibbonActnCtrls.TNumGlyphs.

63.5.2 RibbonActnCtrls.TTimeBtnState Type

Pascal

```
TTimeBtnState = set of (tbFocusRect, tbAllowTimer);
```

C++

```
(tbFocusRect, tbAllowTimer) TTimeBtnState;
```

File

RibbonActnCtrls

Description

This is type RibbonActnCtrls.TTimeBtnState.

63.6 Constants

The following table lists constants in this documentation.

Constants

Name	Description
UM_FADECONTROL (see page 3932)	This is constant RibbonActnCtrls.UM_FADECONTROL.

63.6.1 RibbonActnCtrls.UM_FADECONTROL Constant

Pascal

```
UM_FADECONTROL = WM_USER + 100;
```

C++

```
UM_FADECONTROL = WM_USER + 100;
```

File

RibbonActnCtrls

Description

This is constant RibbonActnCtrls.UM_FADECONTROL.

64 RibbonActnMenus Namespace

This is namespace RibbonActnMenus.

Topics

Name	Description
Classes (see page 3934)	The following table lists classes in this documentation.

Classes

	Name	Description
	TOptionItem (see page 3934)	Item added to OptionItems collection for TRibbonApplicationMenuBar (see page 3942).
	TOptionItems (see page 3938)	Stores additional option items appearing in border of Application Menu.
	TRibbonActionPopupMenu (see page 3940)	Display top level menus when using Ribbon (see page 3347) Style without Ribbon (see page 3347) interface.
	TRibbonApplicationMenuBar (see page 3942)	Display Application Menu for Ribbon (see page 3347).
	TRibbonApplicationPopupMenu (see page 3961)	Ddisplay popup menu when Application Button clicked.
	TRibbonQATCustomizeMenu (see page 3968)	This is class RibbonActnMenus.TRibbonQATCustomizeMenu.
	TRibbonRecentDocuments (see page 3970)	This is class RibbonActnMenus.TRibbonRecentDocuments.
	TRibbonStyleMainPopupMenu (see page 3975)	This is class RibbonActnMenus.TRibbonStyleMainPopupMenu.
	TRibbonStylePopupMenu (see page 3977)	This is class RibbonActnMenus.TRibbonStylePopupMenu.

64.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TOptionItem (see page 3934)	Item added to OptionItems collection for TRibbonApplicationMenuBar (see page 3942).
	TOptionItems (see page 3938)	Stores additional option items appearing in border of Application Menu.
	TRibbonActionPopupMenu (see page 3940)	Display top level menus when using Ribbon (see page 3347) Style without Ribbon (see page 3347) interface.
	TRibbonApplicationMenuBar (see page 3942)	Display Application Menu for Ribbon (see page 3347).
	TRibbonApplicationPopupMenu (see page 3961)	Ddisplay popup menu when Application Button clicked.
	TRibbonQATCustomizeMenu (see page 3968)	This is class RibbonActnMenus.TRibbonQATCustomizeMenu.
	TRibbonRecentDocuments (see page 3970)	This is class RibbonActnMenus.TRibbonRecentDocuments.
	TRibbonStyleMainPopupMenu (see page 3975)	This is class RibbonActnMenus.TRibbonStyleMainPopupMenu.
	TRibbonStylePopupMenu (see page 3977)	This is class RibbonActnMenus.TRibbonStylePopupMenu.

64.1.1 TOptionItem Class

Item added to OptionItems collection for TRibbonApplicationMenuBar (see page 3942).

Class Hierarchy

Pascal

```
TOptionItem = class(TCollectionItem);
```

C++

```
class TOptionItem : public TCollectionItem;
```

File

RibbonActnMenus

Description

TOptionItem is an item added to the OptionItems collection for the TRibbonApplicationMenuBar (see page 3942) component. This class represents the action to use for the command as well as the **KeyTip (see page 3937)** to use.

See Also

TRibbonApplicationMenuBar (see page 3942)

OptionItems (see page 3956)

64.1.1.1 TOptionItem Members

The following tables list the members exposed by TOptionItem.

Protected Methods

	Name	Description
	GetDisplayName (see page 3936)	Returns the name of the collection item as it appears in the collection editor.

Public Methods

	Name	Description
	Assign (see page 3935)	Copies the contents of another, similar object.

Published Properties

	Name	Description
	Action (see page 3936)	This is Action, a member of class TOptionItem.
	Caption (see page 3937)	This is Caption, a member of class TOptionItem.
	Hint (see page 3937)	This is Hint, a member of class TOptionItem.
	KeyTip (see page 3937)	This is KeyTip, a member of class TOptionItem.
	Tag (see page 3937)	This is Tag, a member of class TOptionItem.

64.1.1.2 TOptionItem Methods

The methods of the TOptionItem class are listed here.

Protected Methods

	Name	Description
	GetDisplayName (see page 3936)	Returns the name of the collection item as it appears in the collection editor.

Public Methods

	Name	Description
	Assign (see page 3935)	Copies the contents of another, similar object.

64.1.1.2.1 TOptionItem.Assign Method

Copies the contents of another, similar object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy the properties or other attributes of one object from another. The standard form of a call to Assign is

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

which tells the Destination object to copy the contents of the Source object to itself.

Most objects override Assign to handle the assignment of properties from similar objects. When overriding Assign, call the inherited method if the destination object can't handle the assignment of properties from the class of the Source parameter.

If no overridden Assign method can handle the assignment of properties from Source, the method implemented in TPersistent calls the source object's AssignTo method. This allows the source object to handle the assignment. If the Source object is nil (Delphi) or NULL (C++), Assign raises an EConvertError exception.

In general, the statement

```
Destination := Source; {Delphi}
```

```
Destination = Source; // C++
```

is not the same as the statement

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

The assignment operator makes Destination reference the same object as Source, whereas the Assign method copies the contents of the object referenced by Source into the object referenced by Destination.

Note: The types of some properties are also objects. If these properties have write methods that use Assign to set the value of the property, then in these cases the assignment operator does the same thing as the Assign method.

See Also

AssignTo

EConvertError

64.1.1.2.2 TOptionItem.GetDisplayName Method

Returns the name of the collection item as it appears in the collection editor.

Pascal

```
function GetDisplayName: string; override;
```

C++

```
virtual __fastcall UnicodeString GetDisplayName();
```

Description

GetDisplayName is the protected read implementation of the DisplayName property.

See Also

DisplayName

GetNamePath

64.1.1.3 TOptionItem Properties

The properties of the TOptionItem class are listed here.

Published Properties

	Name	Description
	Action (see page 3936)	This is Action, a member of class TOptionItem.
	Caption (see page 3937)	This is Caption, a member of class TOptionItem.
	Hint (see page 3937)	This is Hint, a member of class TOptionItem.
	KeyTip (see page 3937)	This is KeyTip, a member of class TOptionItem.
	Tag (see page 3937)	This is Tag, a member of class TOptionItem.

64.1.1.3.1 TOptionItem.Action Property

Pascal

```
property Action: TContainedAction;
```

C++

```
__property TContainedAction Action;
```

Description

This is Action, a member of class TOptionItem.

64.1.1.3.2 TOptionItem.Caption Property

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

This is Caption, a member of class TOptionItem.

64.1.1.3.3 TOptionItem.Hint Property

Pascal

```
property Hint: string;
```

C++

```
__property UnicodeString Hint;
```

Description

This is Hint, a member of class TOptionItem.

64.1.1.3.4 TOptionItem.KeyTip Property

Pascal

```
property KeyTip: string;
```

C++

```
__property UnicodeString KeyTip;
```

Description

This is KeyTip, a member of class TOptionItem.

64.1.1.3.5 TOptionItem.Tag Property

Pascal

```
property Tag: Integer;
```

C++

```
__property int Tag;
```

Description

This is Tag, a member of class TOptionItem.

64.1.2 TOptionItems Class

Stores additional option items appearing in border of Application Menu.

Class Hierarchy

Pascal

```
TOptionItems = class(TOwnedCollection);
```

C++

```
class TOptionItems : public TOwnedCollection;
```

File

RibbonActnMenus

Description

TOptionItems stores the additional option items that appear in the border of the Application Menu.

See Also

TRibbonApplicationMenuBar (see page 3942)

64.1.2.1 TOptionItems Members

The following tables list the members exposed by TOptionItems.

Public Methods

	Name	Description
	Add (see page 3938)	Creates a new TCollectionItem instance and adds it to the Items array.
	Insert (see page 3939)	Creates a new TCollectionItem instance and adds it to the Items array.

Public Properties

	Name	Description
R	ApplicationMenu (see page 3939)	This is ApplicationMenu, a member of class TOptionItems.
	Items (see page 3940)	Lists the items in the collection.

64.1.2.2 TOptionItems Methods

The methods of the TOptionItems class are listed here.

Public Methods

	Name	Description
	Add (see page 3938)	Creates a new TCollectionItem instance and adds it to the Items array.
	Insert (see page 3939)	Creates a new TCollectionItem instance and adds it to the Items array.

64.1.2.2.1 TOptionItems.Add Method

Creates a new TCollectionItem instance and adds it to the Items array.

Pascal

```
function Add: TOptionItem;
```

C++

```
__fastcall TOptionItem Add();
```

Description

Call Add to create an item in the collection. The new item is placed at the end of the Items array.

Add returns the new collection item.

See Also

Items

Insert

Create

Delete

64.1.2.2.2 TOptionItems.Insert Method

Creates a new TCollectionItem instance and adds it to the Items array.

Pascal

```
function Insert(Index: Integer): TOptionItem;
```

C++

```
__fastcall TOptionItem Insert(int Index);
```

Description

Call Insert to add a new item at a specified position in the collection. Existing items (starting from the specified position) are moved up in the Items array.

Insert returns the new collection item.

See Also

Add

Items

64.1.2.3 TOptionItems Properties

The properties of the TOptionItems class are listed here.

Public Properties

	Name	Description
	ApplicationMenu (see page 3939)	This is ApplicationMenu, a member of class TOptionItems.
	Items (see page 3940)	Lists the items in the collection.

64.1.2.3.1 TOptionItems.ApplicationMenu Property

Pascal

```
property ApplicationMenu: TRibbonApplicationMenuBar;
```

C++

```
__property TRibbonApplicationMenuBar ApplicationMenu;
```

Description

This is ApplicationMenu, a member of class TOptionItems.

64.1.2.3.2 TOptionItems.Items Property

Lists the items in the collection.

Pascal

```
property Items [Index: Integer]: TOptionItem;
```

C++

```
__property TOptionItem Items[int Index];
```

Description

Use Items to access individual items in the collection. The value of the `Index` parameter corresponds to the `Index` property of TCollectionItem. It represents the position of the item in the collection.

Add

Insert

64.1.3 TRibbonActionPopupMenu Class

Display top level menus when using Ribbon (see page 3347) Style without Ribbon (see page 3347) interface.

Class Hierarchy

Pascal

```
TRibbonActionPopupMenu = class(TXPStylePopupMenu);
```

C++

```
class TRibbonActionPopupMenu : public TXPStylePopupMenu;
```

File

RibbonActnMenus

Description

TRibbonActionPopupMenu displays top level menus when using the Ribbon (see page 3347) Style without the Ribbon (see page 3347) interface.

64.1.3.1 TRibbonActionPopupMenu Members

The following tables list the members exposed by TRibbonActionPopupMenu.

Protected Methods

	Name	Description
	NCPaint (see page 3941)	This is NCPaint, a member of class TRibbonActionPopupMenu.

Public Methods

	Name	Description
	CreateControl (see page 3941)	This is CreateControl, a member of class TRibbonActionPopupMenu.
	TrackMenu (see page 3942)	Executes the action associated with the menu item.

Public Properties

	Name	Description
	SelectFirstItem (see page 3942)	This is SelectFirstItem, a member of class TRibbonActionPopupMenu.

64.1.3.2 TRibbonActionPopupMenu Methods

The methods of the TRibbonActionPopupMenu class are listed here.

Protected Methods

	Name	Description
	NCPaint (see page 3941)	This is NCPaint, a member of class TRibbonActionPopupMenu.

Public Methods

	Name	Description
	CreateControl (see page 3941)	This is CreateControl, a member of class TRibbonActionPopupMenu.
	TrackMenu (see page 3942)	Executes the action associated with the menu item.

64.1.3.2.1 TRibbonActionPopupMenu.CreateControl Method

Pascal

```
function CreateControl(AnItem: TActionClientItem): TCustomActionControl; override;
```

C++

```
virtual __fastcall TCustomActionControl CreateControl(TActionClientItem AnItem);
```

Description

This is CreateControl, a member of class TRibbonActionPopupMenu.

64.1.3.2.2 TRibbonActionPopupMenu.NCPaint Method

Pascal

```
procedure NCPaint(DC: HDC); override;
```

C++

```
virtual __fastcall NCPaint(HDC DC);
```

Description

This is NCPaint, a member of class TRibbonActionPopupMenu.

64.1.3.2.3 TRibbonActionPopupMenu.TrackMenu Method

Executes the action associated with the menu item.

Pascal

```
procedure TrackMenu; override;
```

C++

```
virtual __fastcall TrackMenu();
```

Description

TrackMenu is called internally to execute the action associated with the selected menu item..

64.1.3.3 TRibbonActionPopupMenu Properties

The properties of the TRibbonActionPopupMenu class are listed here.

Public Properties

	Name	Description
	SelectFirstItem (see page 3942)	This is SelectFirstItem, a member of class TRibbonActionPopupMenu.

64.1.3.3.1 TRibbonActionPopupMenu.SelectFirstItem Property

Pascal

```
property SelectFirstItem: Boolean;
```

C++

```
__property Boolean SelectFirstItem;
```

Description

This is SelectFirstItem, a member of class TRibbonActionPopupMenu.

64.1.4 TRibbonApplicationMenuBar Class

Display Application Menu for Ribbon (see page 3347).

Class Hierarchy

Pascal

```
TRibbonApplicationMenuBar = class(TCustomActionMainMenuBar);
```

C++

```
class TRibbonApplicationMenuBar : public TCustomActionMainMenuBar;
```

File

RibbonActnMenus

Description

TRibbonApplicationMenuBar is used to display the Application Menu for the Ribbon (see page 3347).

The TRibbonApplicationMenuBar component is not available on the component palette and should not be created dynamically. To add an Application Menu to your Ribbon (see page 3347), select the Add Application Menu command in the Ribbon (see page 3347) component editor.

The Application Menu consists of two vertical panes. On the left is a list of Menu items. You can modify the menu items at design time.

On the right is a place to display Recent items. This area is mostly intended for use as a recently used file list. To use this as a Recent Items pane, use the TRibbon.AddRecentItem method to add items. There are a number of Recent Item functions to help you setup the list of items. You can also use the right pane to add more commands. Do this by setting the TApplicationMenu.CommandType to **ctCommand**. See the CommandType property for more details.

The bottom section of the Application button can also display commands. Usually this section is set aside for the Application Exit command and Application Options command. Set your commands in the OptionItems (see page 3956) collection.

To modify the contents of the Application Menu, you can drag actions from the customize dialog and drop them in the menu on the left of the application menu.

See Also

TApplicationMenu (see page 3350)

TRibbon (see page 3480)

CommandType (see page 3354)

AddRecentItem (see page 3370)

64.1.4.1 TRibbonApplicationMenuBar Members

The following tables list the members exposed by TRibbonApplicationMenuBar.

Protected Methods

	Name	Description
	CreateControls (see page 3946)	This is CreateControls, a member of class TRibbonApplicationMenuBar.
	DragOver (see page 3946)	OnDragOver event dispatcher.
	DrawBackground (see page 3946)	This is DrawBackground, a member of class TRibbonApplicationMenuBar.
	GetControlClass (see page 3946)	This is GetControlClass, a member of class TRibbonApplicationMenuBar.
	NewPopup (see page 3947)	This is NewPopup, a member of class TRibbonApplicationMenuBar.
	Notification (see page 3947)	Responds to notifications that components are being created or destroyed.
	Paint (see page 3948)	This is Paint, a member of class TRibbonApplicationMenuBar.
	RibbonStyle (see page 3948)	This is RibbonStyle, a member of class TRibbonApplicationMenuBar.
	ShowKeyTips (see page 3949)	This is ShowKeyTips, a member of class TRibbonApplicationMenuBar.
	WMSysCommand (see page 3949)	This is WMSysCommand, a member of class TRibbonApplicationMenuBar.

Public Methods

	Name	Description
	CloseMenu (see page 3945)	Closes the menu currently being displayed.
	Create (see page 3944)	Creates and initializes a TCustomActionMainMenuBar instance.
	CreateControl (see page 3945)	This is CreateControl, a member of class TRibbonApplicationMenuBar.
	Destroy (see page 3944)	Destroys an instance of TCustomActionMainMenuBar.
	GetRibbon (see page 3947)	This is GetRibbon, a member of class TRibbonApplicationMenuBar.
	SelectApplicationButton (see page 3948)	This is SelectApplicationButton, a member of class TRibbonApplicationMenuBar.
	SetBounds (see page 3948)	Sets the bounds based on whether the popup is expanded or not
	SetRibbon (see page 3949)	This is SetRibbon, a member of class TRibbonApplicationMenuBar.

Public Properties

	Name	Description
	Align (see page 3950)	Determines how the control aligns within its container (parent control).
	HorzMargin (see page 3955)	Specifies the width of the horizontal margins in pixels.
	Spacing (see page 3956)	Determines where the image and text appear on an action band's rendered control that represents the action client.
	VertMargin (see page 3958)	Specifies the width of the vertical margins in pixels.
R	VisibleMenu (see page 3959)	This is VisibleMenu, a member of class TRibbonApplicationMenuBar.
R	VisibleMenuCount (see page 3959)	This is VisibleMenuCount, a member of class TRibbonApplicationMenuBar.

Published Properties

	Name	Description
	ActionManager (see page 3950)	Specifies the action manager component that is associated with the action band.
	Height (see page 3954)	Specifies the vertical size of the control in pixels.
	Left (see page 3955)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	OptionItems (see page 3956)	Commands displayed at bottom of Application Menu.
	RecentItems (see page 3956)	Recent items displayed in right pane of Application.
	Top (see page 3957)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 3959)	Specifies the horizontal size of the control or form in pixels.

64.1.4.2 TRibbonApplicationMenuBar.Create Constructor

Creates and initializes a TCustomActionMainMenuBar instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonApplicationMenuBar(TComponent * AOwner);
```

Description

Create generates a TCustomActionMainMenuBar and initializes its properties.

```
__fastcall virtual TCustomActionMainMenuBar (Classes::TComponentTComponent_Object* AOwner);
__fastcall TCustomActionMainMenuBar (HWND ParentWindow) :
Controls::TWinControlTWinControl_Create(ParentWindow) { }
```

64.1.4.3 TRibbonApplicationMenuBar.Destroy Destructor

Destroys an instance of TCustomActionMainMenuBar.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRibbonApplicationMenuBar();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TCustomActionMainMenuBar reference is not nil, and only then calls Destroy.

See Also

System::TObject::Free

Destroy

64.1.4.4 TRibbonApplicationMenuBar Methods

The methods of the TRibbonApplicationMenuBar class are listed here.

Protected Methods

	Name	Description
	CreateControls (see page 3946)	This is CreateControls, a member of class TRibbonApplicationMenuBar.
	DragOver (see page 3946)	OnDragOver event dispatcher.
	DrawBackground (see page 3946)	This is DrawBackground, a member of class TRibbonApplicationMenuBar.
	GetControlClass (see page 3946)	This is GetControlClass, a member of class TRibbonApplicationMenuBar.
	NewPopup (see page 3947)	This is NewPopup, a member of class TRibbonApplicationMenuBar.
	Notification (see page 3947)	Responds to notifications that components are being created or destroyed.
	Paint (see page 3948)	This is Paint, a member of class TRibbonApplicationMenuBar.
	RibbonStyle (see page 3948)	This is RibbonStyle, a member of class TRibbonApplicationMenuBar.
	ShowKeyTips (see page 3949)	This is ShowKeyTips, a member of class TRibbonApplicationMenuBar.
	WMSysCommand (see page 3949)	This is WMSysCommand, a member of class TRibbonApplicationMenuBar.

Public Methods

	Name	Description
	CloseMenu (see page 3945)	Closes the menu currently being displayed.
	CreateControl (see page 3945)	This is CreateControl, a member of class TRibbonApplicationMenuBar.
	GetRibbon (see page 3947)	This is GetRibbon, a member of class TRibbonApplicationMenuBar.
	SelectApplicationButton (see page 3948)	This is SelectApplicationButton, a member of class TRibbonApplicationMenuBar.
	SetBounds (see page 3948)	Sets the bounds based on whether the popup is expanded or not
	SetRibbon (see page 3949)	This is SetRibbon, a member of class TRibbonApplicationMenuBar.

64.1.4.4.1 TRibbonApplicationMenuBar.CloseMenu Method

Closes the menu currently being displayed.

Pascal

```
procedure CloseMenu; override;
```

C++

```
virtual __fastcall CloseMenu();
```

Description

CloseMenu is called to close the menu currently being displayed, including any submenus that may be open.

64.1.4.4.2 TRibbonApplicationMenuBar.CreateControl Method

Pascal

```
function CreateControl(AnItem: TActionClientItem): TCustomActionControl; override;
```

C++

```
virtual __fastcall TCustomActionControl CreateControl(TActionClientItem AnItem);
```

Description

This is CreateControl, a member of class TRibbonApplicationMenuBar.

64.1.4.4.3 TRibbonApplicationMenuBar.CreateControls Method

Pascal

```
procedure CreateControls; override;
```

C++

```
virtual __fastcall CreateControls();
```

Description

This is CreateControls, a member of class TRibbonApplicationMenuBar.

64.1.4.4.4 TRibbonApplicationMenuBar.DragOver Method

OnDragOver event dispatcher.

Pascal

```
procedure DragOver(Source: TObject; X: Integer; Y: Integer; State: TDragState; var Accept:
Boolean); override;
```

C++

```
virtual __fastcall DragOver(TObject * Source, int X, int Y, TDragState State, Boolean Accept);
```

Description

Override DragOver to add additional code that executes before the OnDragOver event handler is called.

DragOver sets the Accept parameter to true to indicate that the user can drop the dragged object on the control. It sets Accept to false to indicate that the user cannot drop the dragged object on the control.

The Source parameter is the object being dragged. The State parameter indicates how the dragged object is moving in relation to the control. X and Y indicate the current position of the mouse.

See Also

DragDrop

OnDragOver

64.1.4.4.5 TRibbonApplicationMenuBar.DrawBackground Method

Pascal

```
procedure DrawBackground; override;
```

C++

```
virtual __fastcall DrawBackground();
```

Description

This is DrawBackground, a member of class TRibbonApplicationMenuBar.

64.1.4.4.6 TRibbonApplicationMenuBar.GetControlClass Method

Pascal

```
function GetControlClass(AnItem: TActionClientItem): TCustomActionControlClass; override;
```

C++

```
virtual __fastcall TCustomActionControlClass GetControlClass(TActionClientItem AnItem);
```

Description

This is GetControlClass, a member of class TRibbonApplicationMenuBar.

64.1.4.4.7 TRibbonApplicationMenuBar.GetRibbon Method

Pascal

```
function GetRibbon: TWinControl;
```

C++

```
__fastcall TWinControl * GetRibbon();
```

Description

This is GetRibbon, a member of class TRibbonApplicationMenuBar.

64.1.4.4.8 TRibbonApplicationMenuBar.NewPopup Method

Pascal

```
function NewPopup: TCustomActionPopupMenu; override;
```

C++

```
virtual __fastcall TCustomActionPopupMenu NewPopup();
```

Description

This is NewPopup, a member of class TRibbonApplicationMenuBar.

64.1.4.4.9 TRibbonApplicationMenuBar.Notification Method

Responds to notifications that components are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification allows TControl to update its PopupMenu property when the pop-up menu it refers to is destroyed.

Override the Notification method to respond to notifications that other components are about to be destroyed or have just been created. Use the Notification method to update controls that rely on other objects. Remove references to objects that are going away so that the control does not refer to objects that have been destroyed. For example, data-aware objects override the Notification method to update themselves when their data source is removed. Some objects respond to notifications that other objects of a specific type are being created. For example, the session component sets the Session property of new data-aware controls to itself when the AutoSessionName property is true.

By default, components pass along the notification to their owned components, if any.

PopupMenu

Notification

64.1.4.4.10 TRibbonApplicationMenuBar.Paint Method

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

This is Paint, a member of class TRibbonApplicationMenuBar.

64.1.4.4.11 TRibbonApplicationMenuBar.RibbonStyle Method

Pascal

```
function RibbonStyle: TRibbonStyleActionBars;
```

C++

```
__fastcall TRibbonStyleActionBars RibbonStyle();
```

Description

This is RibbonStyle, a member of class TRibbonApplicationMenuBar.

64.1.4.4.12 TRibbonApplicationMenuBar.SelectApplicationButton Method

Pascal

```
procedure SelectApplicationButton;
```

C++

```
__fastcall SelectApplicationButton();
```

Description

This is SelectApplicationButton, a member of class TRibbonApplicationMenuBar.

64.1.4.4.13 TRibbonApplicationMenuBar.SetBounds Method

Sets the bounds based on whether the popup is expanded or not

Pascal

```
procedure SetBounds(ALeft: Integer; ATop: Integer; AWidth: Integer; AHeight: Integer);
override;
```

C++

```
virtual __fastcall SetBounds(int ALeft, int ATop, int AWidth, int AHeight);
```

Description

SetBounds calls the inherited method after altering the AWidth and AHeight parameters (if necessary) to include the width and height of the expanded popup menu. For more information about SetBounds, see the documentation for the inherited method.

See Also

SetBounds

64.1.4.4.14 TRibbonApplicationMenuBar.SetRibbon Method

Pascal

```
procedure SetRibbon(const Value: TWinControl);
```

C++

```
__fastcall SetRibbon(const TWinControl * Value);
```

Description

This is SetRibbon, a member of class TRibbonApplicationMenuBar.

64.1.4.4.15 TRibbonApplicationMenuBar.ShowKeyTips Method

Pascal

```
procedure ShowKeyTips;
```

C++

```
__fastcall ShowKeyTips();
```

Description

This is ShowKeyTips, a member of class TRibbonApplicationMenuBar.

64.1.4.4.16 TRibbonApplicationMenuBar.WMSysCommand Method

Pascal

```
procedure WMSysCommand(var Message: TWMSysCommand); message WM_SYSCOMMAND;
```

C++

```
__fastcall WMSysCommand(TWMSysCommand Message);
```

Description

This is WMSysCommand, a member of class TRibbonApplicationMenuBar.

64.1.4.5 TRibbonApplicationMenuBar Properties

The properties of the TRibbonApplicationMenuBar class are listed here.

Public Properties

	Name	Description
	Align (see page 3950)	Determines how the control aligns within its container (parent control).
	HorzMargin (see page 3955)	Specifies the width of the horizontal margins in pixels.
	Spacing (see page 3956)	Determines where the image and text appear on an action band's rendered control that represents the action client.
	VertMargin (see page 3958)	Specifies the width of the vertical margins in pixels.
R	VisibleMenu (see page 3959)	This is VisibleMenu, a member of class TRibbonApplicationMenuBar.
R	VisibleMenuCount (see page 3959)	This is VisibleMenuCount, a member of class TRibbonApplicationMenuBar.

Published Properties

	Name	Description
	ActionManager (see page 3950)	Specifies the action manager component that is associated with the action band.
	Height (see page 3954)	Specifies the vertical size of the control in pixels.

	Left (see page 3955)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	OptionItems (see page 3956)	Commands displayed at bottom of Application Menu.
	RecentItems (see page 3956)	Recent items displayed in right pane of Application.
	Top (see page 3957)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 3959)	Specifies the horizontal size of the control or form in pixels.

64.1.4.5.1 TRibbonApplicationMenuBar.ActionManager Property

Specifies the action manager component that is associated with the action band.

Pascal

```
property ActionManager;
```

C++

```
__property ActionManager;
```

Description

Use ActionManager to access the action manager that uses this action band to render UI elements it manages. Typically, this association is created when you drag actions from the action manager and drop them on the action bar. When an action is dropped on an action band and the ActionManager property is not assigned, the ActionManager property is automatically assigned to the action manager that manages the action that was dropped on the action band.

At runtime, you can perform the equivalent operation to dragging an action onto the action band by setting the ActionBar property of one of the action clients that the action manager's ActionBars property lists so that it specifies this component.

See Also

ActionBars

ActionClient

ActionBar

64.1.4.5.2 TRibbonApplicationMenuBar.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align;
```

C++

```
__property Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1); // These objects will all be cleaned up by the owner
(Form1).
  TFileListBox* pflb = new TFileListBox(Form1); // The parent (Form1) will clean up these
objects.
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);  // The owner will clean this up.
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);  // The owner will clean this up.
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
```

```
series of Tab Sheets on the Page Control.

        pts[i]->Brush->Color = colorPalette[i];
  }
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
  { each pane must be at least one quarter of the form's width }
  Split.MinSize := Form1.ClientWidth div 4;
  { Finally, create the last pane - a file list box }
  Files := TFileListBox.Create(Form1);
  Files.Parent := Form1;
  Files.Align := alClient;
  Dirs.FileList := Files; { link the file list box to the directory list box }
end;
{
Dynamically create a TProgressBar control and align it to
```

```
  the bottom of the form.
  }

  var
    I: Integer;

64.1.4.5.3 TRibbonApplicationMenuBar.Height Property

Specifies the vertical size of the control in pixels.

Pascal

```
property Height;
```

C++

```
__property Height;
```

Description

Use the Height property to read or change the height of the control.

C++ Examples:

```
/*
This example needs only a blank form.  Three Rich Edit
controls are placed vertically on the form, each contain a
line of text, and the second form has HideSelection set to
false.  Try tabbing between the three Rich Edit controls and
observe the effect on the selected text.
*/
#include <ComCtrls.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int I = 0; I <= 2; I++)
  {
    TRichEdit *pRich = new TRichEdit(this);
    pRich->Parent = this;
    pRich->Top = pRich->Height * I;
    pRich->Text = "This text will take the focus.";
    pRich->SelStart = 0;
    pRich->SelLength = pRich->Text.Length();
    if (I == 1)
      pRich->HideSelection = false;
  }
}
```

Delphi Examples:

```
{
This example needs only a blank form. Three Rich Edit
controls are placed vertically on the form, each contain a
line of text, and the second form has HideSelection set to
false.  Try tabbing between the three Rich Edit controls and
observe the effect on the selected text.
}
uses ComCtrls;

procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  for I := 0 to 2 do
    with TRichEdit.Create(Self) do
    begin
      Parent := Self;
      Top := Height * I;
      Text := 'This text will take the focus.';
      SelStart := 0;
      SelLength := Length(Text);
      if (I = 1) then
        HideSelection := False;
```

```
    end;
end;

64.1.4.5.4 TRibbonApplicationMenuBar.HorzMargin Property

Specifies the width of the horizontal margins in pixels.

Pascal

```
property HorzMargin;
```

C++

```
__property HorzMargin;
```

Description

HorzMargin specifies the width of the action band's left and right horizontal margins in pixels.

See Also

VertMargin

VertSeparator

64.1.4.5.5 TRibbonApplicationMenuBar.Left Property

Specifies the horizontal coordinate of the left edge of a component relative to its parent.

Pascal

```
property Left;
```

C++

```
__property Left;
```

Description

Use the Left property to determine where the left side of the control begins or to reposition the left side of the control.

If the control is contained in another control, the Left and Top properties are relative to the parent control. If the control is contained directly by the form, the property values are relative to the form. For forms, the value of the Left property is relative to the screen in pixels.

C++ Examples:

```
/*
Place a TTimer object in the form and enter Timer1Timer in
the OnTimer event.  Place other controls in the form and
change the active control at runtime.  The following event
handler responds to timer events by moving the active control
one pixel to the right every 100 miliseconds:
*/
void __fastcall TForm1::Timer1Timer(TObject *Sender)
{
  Timer1->Interval = 100;
  if (ActiveControl)
    ActiveControl->Left = ActiveControl->Left + 1;
```

```
}
```

Delphi Examples:

```
{
Place a TTimer object in the form and enter Timer1Timer in
the OnTimer event.  Place other controls in the form and
change the active control at runtime.  The following event
handler responds to timer events by moving the active control
one pixel to the right every 100 miliseconds:
}
procedure TForm1.Timer1Timer(Sender: TObject);
begin
  Timer1.Interval := 100;
  if ActiveControl <> nil then
    ActiveControl.Left := ActiveControl.Left + 1;
end;
```

64.1.4.5.6 TRibbonApplicationMenuBar.OptionItems Property

Commands displayed at bottom of Application Menu.

Pascal

```
property OptionItems: TOptionItems;
```

C++

```
__property TOptionItems OptionItems;
```

Description

OptionItems are displayed at the bottom of the Application Menu. Usually this section of commands has Application Exit and Application Options commands.

64.1.4.5.7 TRibbonApplicationMenuBar.RecentItems Property

Recent items displayed in right pane of Application.

Pascal

```
property RecentItems: TOptionItems;
```

C++

```
__property TOptionItems RecentItems;
```

Description

RecentItems are displayed in the right pane of the Application Menu. RecentItems can be added dynamically using one of the RecentItems helper methods. To handle the user clicking on a Recent Item, use the OnRecentItemClick event.

See Also

OnRecentItemClick (see page 3498)

64.1.4.5.8 TRibbonApplicationMenuBar.Spacing Property

Determines where the image and text appear on an action band's rendered control that represents the action client.

Pascal

```
property Spacing;
```

C++

```
__property Spacing;
```

Description

Spacing is used internally to set the number of pixels that should appear between the image specified in an action client's ImageIndex and the text specified in its Caption property.

See Also

Caption

ImageIndex

64.1.4.5.9 TRibbonApplicationMenuBar.Top Property

Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.

Pascal

```
property Top;
```

C++

```
__property Top;
```

Description

Use Top to locate the top of the control or reposition the control to a different Y coordinate. The Top property, like the Left property, is the position of the control relative to its container. Thus, if a control is contained in a TPanel, the Left and Top properties are relative to the panel. If the control is contained directly by the form, it is relative to the form. For forms, the value of the Top property is relative to the screen in pixels.

C++ Examples:

```
/*
This example uses an updown control and a group box on a
form, with several controls contained within the group box.
When the updown control or is clicked, the controls within
the group box are moved in the appropriate direction.
*/
void __fastcall TForm1::UpDown1Click(TObject *Sender, TUDBtnType Button)
{
  int I;
  TControl *ChildControl;

  for (I = 0; I < GroupBox1->ControlCount; I++)
  {
    ChildControl = GroupBox1->Controls[I];
    if (Button == btNext)
      ChildControl->Top = ChildControl->Top + 15;
    else
      ChildControl->Top = ChildControl->Top - 15;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  const TColor colorarray[5] = {clYellow, clGreen, clBlue, clLime, clFuchsia};
  GroupBox1->Brush->Color = clRed;
  for (int i = 0; i < GroupBox1->ControlCount; i++)
    dynamic_cast<TWinControl *>(GroupBox1->Controls[i])->Brush->Color = colorarray[i];
```

```
}
```

Delphi Examples:

```
{
This example uses an updown control and a group box on a
form, with several controls contained within the group box.
When the updown control is clicked, the controls within
the group box are moved in the appropriate direction.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
const
  colorarray : Array[0..4] of TColor = (clYellow, clGreen, clBlue, clLime, clFuchsia);
begin
   GroupBox1.Brush.Color := clRed;
  for I:= 0 to GroupBox1.ControlCount -1 do
  begin
    TWinControl(GroupBox1.Controls[I]).Brush.Color := colorarray[I];
  end;
end;

procedure TForm1.UpDown1Click(Sender: TObject; Button: TUDBtnType);
var
  I: Integer;
  ChildControl: TControl;
begin
  for I:= 0 to GroupBox1.ControlCount -1 do
  begin
    ChildControl := GroupBox1.Controls[I];
    if Button = btNext then
      ChildControl.Top := ChildControl.Top + 15
    else
      ChildControl.Top := ChildControl.Top - 15;
  end;
end;
```

Pascal

```
property VisibleMenu: TCustomActionMenuBar;
```

C++

```
__property TCustomActionMenuBar VisibleMenu;
```

Description

This is VisibleMenu, a member of class TRibbonApplicationMenuBar.

64.1.4.5.12 TRibbonApplicationMenuBar.VisibleMenuCount Property

Pascal

```
property VisibleMenuCount: Integer;
```

C++

```
__property int VisibleMenuCount;
```

Description

This is VisibleMenuCount, a member of class TRibbonApplicationMenuBar.

64.1.4.5.13 TRibbonApplicationMenuBar.Width Property

Specifies the horizontal size of the control or form in pixels.

Pascal

```
property Width;
```

C++

```
__property Width;
```

Description

Use the Width property to read or change the width of the control.

Note: For tab sheet controls, changing this property at runtime has no effect.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.

64.1.5 TRibbonApplicationPopupMenu Class

Ddisplay popup menu when Application Button clicked.

Class Hierarchy

Pascal

```
TRibbonApplicationPopupMenu = class(TCustomActionPopupMenu);
```

C++

```
class TRibbonApplicationPopupMenu : public TCustomActionPopupMenu;
```

File

RibbonActnMenus

Description

TRibbonApplicationPopupMenu is used to display the popup menu when the Application Button has been clicked. The Application Popup Menu is a two paned menu that shows a normal list of commands on the left pane, as well as a specialized list of commands on the right pane. Additional commands can also be displayed in the bottom border of the menu.

64.1.5.1 TRibbonApplicationPopupMenu Members

The following tables list the members exposed by TRibbonApplicationPopupMenu.

Protected Methods

	Name	Description
	AlignControls (see page 3963)	Aligns any controls for which the control is the parent within a specified area of the control.
	CMTextchanged (see page 3963)	This is CMTextchanged, a member of class TRibbonApplicationPopupMenu.
	CreateControls (see page 3963)	This is CreateControls, a member of class TRibbonApplicationPopupMenu.
	CreateOptionsItems (see page 3964)	This is CreateOptionsItems, a member of class TRibbonApplicationPopupMenu.
	CreateRecentDocuments (see page 3964)	This is CreateRecentDocuments, a member of class TRibbonApplicationPopupMenu.
	CreateWnd (see page 3964)	Creates the underlying window.
	CustomAlignPosition (see page 3965)	Returns aligned position of custom-aligned child control.
	DoDropActions (see page 3965)	This is DoDropActions, a member of class TRibbonApplicationPopupMenu.
	DoDropItem (see page 3966)	This is DoDropItem, a member of class TRibbonApplicationPopupMenu.
	DrawBackground (see page 3966)	This is DrawBackground, a member of class TRibbonApplicationPopupMenu.
	GetBorderHeight (see page 3966)	This is GetBorderHeight, a member of class TRibbonApplicationPopupMenu.
	NCPaint (see page 3967)	This is NCPaint, a member of class TRibbonApplicationPopupMenu.
	PositionPopup (see page 3967)	This is PositionPopup, a member of class TRibbonApplicationPopupMenu.
	RibbonStyle (see page 3967)	This is RibbonStyle, a member of class TRibbonApplicationPopupMenu.
	SetColorMap (see page 3967)	This is SetColorMap, a member of class TRibbonApplicationPopupMenu.

Public Methods

	Name	Description
	Create (see page 3962)	Creates and initializes a TCustomActionPopupMenu instance.
	Destroy (see page 3962)	Destroys an instance of TCustomActionMenuBar.

	DoDropCategory (see page 3966)	This is DoDropCategory, a member of class TRibbonApplicationPopupMenu.
	GetRibbon (see page 3966)	This is GetRibbon, a member of class TRibbonApplicationPopupMenu.
	SetRibbon (see page 3968)	This is SetRibbon, a member of class TRibbonApplicationPopupMenu.

64.1.5.2 TRibbonApplicationPopupMenu.Create Constructor

Creates and initializes a TCustomActionPopupMenu instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonApplicationPopupMenu(TComponent * AOwner);
```

Description

Create generates a TCustomActionPopupMenu and initializes its properties.

```
__fastcall virtual TCustomActionMenuBar (Classes::TComponentTComponent_Object* AOwner);
__fastcall TCustomActionMenuBar (HWND ParentWindow) :
Controls::TWinControlTWinControl_Create(ParentWindow) { }
```

64.1.5.3 TRibbonApplicationPopupMenu.Destroy Destructor

Destroys an instance of TCustomActionMenuBar.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRibbonApplicationPopupMenu();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TCustomActionMenuBar reference is not nil, and only then calls Destroy.

See Also

System::TObject::Free

Destroy

64.1.5.4 TRibbonApplicationPopupMenu Methods

The methods of the TRibbonApplicationPopupMenu class are listed here.

Protected Methods

	Name	Description
	AlignControls (see page 3963)	Aligns any controls for which the control is the parent within a specified area of the control.
	CMTextchanged (see page 3963)	This is CMTextchanged, a member of class TRibbonApplicationPopupMenu.
	CreateControls (see page 3963)	This is CreateControls, a member of class TRibbonApplicationPopupMenu.
	CreateOptionsItems (see page 3964)	This is CreateOptionsItems, a member of class TRibbonApplicationPopupMenu.
	CreateRecentDocuments (see page 3964)	This is CreateRecentDocuments, a member of class TRibbonApplicationPopupMenu.
	CreateWnd (see page 3964)	Creates the underlying window.

	CustomAlignPosition (see page 3965)	Returns aligned position of custom-aligned child control.
	DoDropActions (see page 3965)	This is DoDropActions, a member of class TRibbonApplicationPopupMenu.
	DoDropItem (see page 3966)	This is DoDropItem, a member of class TRibbonApplicationPopupMenu.
	DrawBackground (see page 3966)	This is DrawBackground, a member of class TRibbonApplicationPopupMenu.
	GetBorderHeight (see page 3966)	This is GetBorderHeight, a member of class TRibbonApplicationPopupMenu.
	NCPaint (see page 3967)	This is NCPaint, a member of class TRibbonApplicationPopupMenu.
	PositionPopup (see page 3967)	This is PositionPopup, a member of class TRibbonApplicationPopupMenu.
	RibbonStyle (see page 3967)	This is RibbonStyle, a member of class TRibbonApplicationPopupMenu.
	SetColorMap (see page 3967)	This is SetColorMap, a member of class TRibbonApplicationPopupMenu.

Public Methods

	Name	Description
	DoDropCategory (see page 3966)	This is DoDropCategory, a member of class TRibbonApplicationPopupMenu.
	GetRibbon (see page 3966)	This is GetRibbon, a member of class TRibbonApplicationPopupMenu.
	SetRibbon (see page 3968)	This is SetRibbon, a member of class TRibbonApplicationPopupMenu.

64.1.5.4.1 TRibbonApplicationPopupMenu.AlignControls Method

Aligns any controls for which the control is the parent within a specified area of the control.

Pascal

```
procedure AlignControls(AControl: TControl; var Rect: TRect); override;
```

C++

```
virtual __fastcall AlignControls(TControl * AControl, TRect Rect);
```

Description

Use AlignControls to align all controls within an area of a form, panel, group box, scroll box, or any container control. Specify the area in which to align the controls as the value of the Rect parameter.

AlignControls uses the Align property value for each child control to determine how to align it. The AControl parameter can be nil (Delphi) or NULL (C++). If you specify a control in AControl, that control takes precedence in alignment over other, similarly-aligned controls.

See Also

Align

64.1.5.4.2 TRibbonApplicationPopupMenu.CMTextchanged Method

Pascal

```
procedure CMTextchanged(var Message: TMessage); message CM_TEXTCHANGED;
```

C++

```
__fastcall CMTextchanged(TMessage Message);
```

Description

This is CMTextchanged, a member of class TRibbonApplicationPopupMenu.

64.1.5.4.3 TRibbonApplicationPopupMenu.CreateControls Method

Pascal

```
procedure CreateControls; override;
```

C++

```
virtual __fastcall CreateControls();
```

Description

This is CreateControls, a member of class TRibbonApplicationPopupMenu.

64.1.5.4.4 TRibbonApplicationPopupMenu.CreateOptionsItems Method

Pascal

```
procedure CreateOptionsItems; virtual;
```

C++

```
virtual __fastcall CreateOptionsItems();
```

Description

This is CreateOptionsItems, a member of class TRibbonApplicationPopupMenu.

64.1.5.4.5 TRibbonApplicationPopupMenu.CreateRecentDocuments Method

Pascal

```
procedure CreateRecentDocuments; virtual;
```

C++

```
virtual __fastcall CreateRecentDocuments();
```

Description

This is CreateRecentDocuments, a member of class TRibbonApplicationPopupMenu.

64.1.5.4.6 TRibbonApplicationPopupMenu.CreateWnd Method

Creates the underlying window.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

CreateWnd is called automatically when the control is first created or when the underlying screen object must be destroyed and recreated to reflect property changes. Override CreateWnd to pass additional initialization messages to the screen object when it is created.

CreateWindowHandle

Perform

DestroyWnd

64.1.5.4.7 TRibbonApplicationPopupMenu.CustomAlignPosition Method

Returns aligned position of custom-aligned child control.

Pascal

```
procedure CustomAlignPosition(Control: TControl; var NewLeft: Integer; var NewTop: Integer;
var NewWidth: Integer; var NewHeight: Integer; var AlignRect: TRect; AlignInfo: TAlignInfo);
override;
```

C++

```
virtual __fastcall CustomAlignPosition(TControl * Control, int NewLeft, int NewTop, int
NewWidth, int NewHeight, TRect AlignRect, TAlignInfo AlignInfo);
```

Description

CustomAlignPosition determines the specific position of custom-aligned child controls. CustomAlignPosition is called once for each child control with an Align property of **alCustom**, in an order previously determined by calls to CustomAlignInsertBefore.

CustomAlignPosition triggers the OnAlignPosition event. If this event is defined, CustomAlignPosition uses the alignment parameters it obtains from OnAlignPosition. Defining this event allows users to set the alignment parameters without overriding CustomAlignPosition.

These are the parameters:

Control	The child control being placed.
NewLeft | NewTop | NewWidth | NewHeight	Location and size of child control, as determined by container's size and the Anchors TControl_Anchors constraints for the control. CustomAlignPosition can modify these values to reposition the control.
AlignRect	The client area in which the control is aligned. CustomAlignPosition can modify this value.
AlignInfo	Alignment information in a TAlignInfo.
As implemented in TWinControl, CustomAlignPosition does nothing.

64.1.5.4.8 TRibbonApplicationPopupMenu.DoDropActions Method

Pascal

```
procedure DoDropActions(Source: TActionDragObject; const X: Integer; const Y: Integer);
override;
```

C++

```
virtual __fastcall DoDropActions(TActionDragObject Source, const int X, const int Y);
```

Description

This is DoDropActions, a member of class TRibbonApplicationPopupMenu.

64.1.5.4.9 TRibbonApplicationPopupMenu.DoDropCategory Method

Pascal

```
procedure DoDropCategory(Source: TCategoryDragObject; const X: Integer; const Y: Integer);
override;
```

C++

```
virtual __fastcall DoDropCategory(TCategoryDragObject Source, const int X, const int Y);
```

Description

This is DoDropCategory, a member of class TRibbonApplicationPopupMenu.

64.1.5.4.10 TRibbonApplicationPopupMenu.DoDropItem Method

Pascal

```
procedure DoDropItem(Source: TActionItemDragObject; const X: Integer; const Y: Integer);
override;
```

C++

```
virtual __fastcall DoDropItem(TActionItemDragObject Source, const int X, const int Y);
```

Description

This is DoDropItem, a member of class TRibbonApplicationPopupMenu.

64.1.5.4.11 TRibbonApplicationPopupMenu.DrawBackground Method

Pascal

```
procedure DrawBackground; override;
```

C++

```
virtual __fastcall DrawBackground();
```

Description

This is DrawBackground, a member of class TRibbonApplicationPopupMenu.

64.1.5.4.12 TRibbonApplicationPopupMenu.GetBorderHeight Method

Pascal

```
function GetBorderHeight: Integer; virtual;
```

C++

```
virtual __fastcall int GetBorderHeight();
```

Description

This is GetBorderHeight, a member of class TRibbonApplicationPopupMenu.

64.1.5.4.13 TRibbonApplicationPopupMenu.GetRibbon Method

Pascal

```
function GetRibbon: TWinControl;
```

C++

```
__fastcall TWinControl * GetRibbon();
```

Description

This is GetRibbon, a member of class TRibbonApplicationPopupMenu.

64.1.5.4.14 TRibbonApplicationPopupMenu.NCPaint Method

Pascal

```
procedure NCPaint(DC: HDC); override;
```

C++

```
virtual __fastcall NCPaint(HDC DC);
```

Description

This is NCPaint, a member of class TRibbonApplicationPopupMenu.

64.1.5.4.15 TRibbonApplicationPopupMenu.PositionPopup Method

Pascal

```
procedure PositionPopup(AnOwner: TCustomActionBar; ParentItem: TCustomActionControl); override;
```

C++

```
virtual __fastcall PositionPopup(TCustomActionBar AnOwner, TCustomActionControl ParentItem);
```

Description

This is PositionPopup, a member of class TRibbonApplicationPopupMenu.

64.1.5.4.16 TRibbonApplicationPopupMenu.RibbonStyle Method

Pascal

```
function RibbonStyle: TRibbonStyleActionBars;
```

C++

```
__fastcall TRibbonStyleActionBars RibbonStyle();
```

Description

This is RibbonStyle, a member of class TRibbonApplicationPopupMenu.

64.1.5.4.17 TRibbonApplicationPopupMenu.SetColorMap Method

Pascal

```
procedure SetColorMap(const Value: TCustomActionBarColorMap); override;
```

C++

```
virtual __fastcall SetColorMap(const TCustomActionBarColorMap Value);
```

Description

This is SetColorMap, a member of class TRibbonApplicationPopupMenu.

64.1.5.4.18 TRibbonApplicationPopupMenu.SetRibbon Method

Pascal

```
procedure SetRibbon(const Value: TWinControl);
```

C++

```
__fastcall SetRibbon(const TWinControl * Value);
```

Description

This is SetRibbon, a member of class TRibbonApplicationPopupMenu.

64.1.6 TRibbonQATCustomizeMenu Class

Class Hierarchy

Pascal

```
TRibbonQATCustomizeMenu = class(TCustomizeActionToolBar);
```

C++

```
class TRibbonQATCustomizeMenu : public TCustomizeActionToolBar;
```

File

RibbonActnMenus

Description

This is class RibbonActnMenus.TRibbonQATCustomizeMenu.

64.1.6.1 TRibbonQATCustomizeMenu Members

The following tables list the members exposed by TRibbonQATCustomizeMenu.

Protected Methods

	Name	Description
	DisplayShadow (see page 3969)	This is DisplayShadow, a member of class TRibbonQATCustomizeMenu.
	DoAddCustomizeItems (see page 3969)	This is DoAddCustomizeItems, a member of class TRibbonQATCustomizeMenu.
	GetControlClass (see page 3969)	This is GetControlClass, a member of class TRibbonQATCustomizeMenu.
	HideShadow (see page 3969)	This is HideShadow, a member of class TRibbonQATCustomizeMenu.
	NCPaint (see page 3970)	This is NCPaint, a member of class TRibbonQATCustomizeMenu.
	PositionPopup (see page 3970)	This is PositionPopup, a member of class TRibbonQATCustomizeMenu.
	VisibleChanging (see page 3970)	Provides the interface for a method that responds to changes in the control's visibility.

64.1.6.2 TRibbonQATCustomizeMenu Methods

The methods of the TRibbonQATCustomizeMenu class are listed here.

Protected Methods

	Name	Description
	DisplayShadow (see page 3969)	This is DisplayShadow, a member of class TRibbonQATCustomizeMenu.
	DoAddCustomizeItems (see page 3969)	This is DoAddCustomizeItems, a member of class TRibbonQATCustomizeMenu.
	GetControlClass (see page 3969)	This is GetControlClass, a member of class TRibbonQATCustomizeMenu.
	HideShadow (see page 3969)	This is HideShadow, a member of class TRibbonQATCustomizeMenu.
	NCPaint (see page 3970)	This is NCPaint, a member of class TRibbonQATCustomizeMenu.
	PositionPopup (see page 3970)	This is PositionPopup, a member of class TRibbonQATCustomizeMenu.
	VisibleChanging (see page 3970)	Provides the interface for a method that responds to changes in the control's visibility.

64.1.6.2.1 TRibbonQATCustomizeMenu.DisplayShadow Method

Pascal

```
procedure DisplayShadow; override;
```

C++

```
virtual __fastcall DisplayShadow();
```

Description

This is DisplayShadow, a member of class TRibbonQATCustomizeMenu.

64.1.6.2.2 TRibbonQATCustomizeMenu.DoAddCustomizeItems Method

Pascal

```
procedure DoAddCustomizeItems(const ActionClient: TActionClient); override;
```

C++

```
virtual __fastcall DoAddCustomizeItems(const TActionClient ActionClient);
```

Description

This is DoAddCustomizeItems, a member of class TRibbonQATCustomizeMenu.

64.1.6.2.3 TRibbonQATCustomizeMenu.GetControlClass Method

Pascal

```
function GetControlClass(AnItem: TActionClientItem): TCustomActionControlClass; override;
```

C++

```
virtual __fastcall TCustomActionControlClass GetControlClass(TActionClientItem AnItem);
```

Description

This is GetControlClass, a member of class TRibbonQATCustomizeMenu.

64.1.6.2.4 TRibbonQATCustomizeMenu.HideShadow Method

Pascal

```
procedure HideShadow; override;
```

C++

```
virtual __fastcall HideShadow();
```

Description

This is HideShadow, a member of class TRibbonQATCustomizeMenu.

64.1.6.2.5 TRibbonQATCustomizeMenu.NCPaint Method

Pascal

```
procedure NCPaint(DC: HDC); override;
```

C++

```
virtual __fastcall NCPaint(HDC DC);
```

Description

This is NCPaint, a member of class TRibbonQATCustomizeMenu.

64.1.6.2.6 TRibbonQATCustomizeMenu.PositionPopup Method

Pascal

```
procedure PositionPopup(AnOwner: TCustomActionBar; ParentItem: TCustomActionControl); override;
```

C++

```
virtual __fastcall PositionPopup(TCustomActionBar AnOwner, TCustomActionControl ParentItem);
```

Description

This is PositionPopup, a member of class TRibbonQATCustomizeMenu.

64.1.6.2.7 TRibbonQATCustomizeMenu.VisibleChanging Method

Provides the interface for a method that responds to changes in the control's visibility.

Pascal

```
procedure VisibleChanging; override;
```

C++

```
virtual __fastcall VisibleChanging();
```

Description

VisibleChanging is called before the value of a control's Visible property changes. As implemented in TControl, it does nothing. Override VisibleChanging to respond to changes in the control's visibility. For example, if a control should not change its visibility, override VisibleChanging to raise an exception when an attempt is made to alter the control's visibility.

Visible

64.1.7 TRibbonRecentDocuments Class

Class Hierarchy

Pascal

```
TRibbonRecentDocuments = class(TGraphicControl);
```

C++

```
class TRibbonRecentDocuments : public TGraphicControl;
```

File

RibbonActnMenus

Description

This is class RibbonActnMenus.TRibbonRecentDocuments.

64.1.7.1 TRibbonRecentDocuments Members

The following tables list the members exposed by TRibbonRecentDocuments.

Protected Methods

	Name	Description
	Paint (see page 3972)	Render control surface.

Public Methods

	Name	Description
	Create (see page 3971)	Creates an instance of TGraphicControl.

Published Properties

	Name	Description
	Caption (see page 3972)	Specifies a text string that identifies the control to the user.

64.1.7.2 TRibbonRecentDocuments.Create Constructor

Creates an instance of TGraphicControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonRecentDocuments(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TGraphicControl. However, you should never attempt to instantiate a TGraphicControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

AOwner is the component, typically a form, that is responsible for freeing the graphic control. It becomes the value of the Owner property. If you do not explicitly provide an Owner to the constructor (that is, if AOwner is nil (Delphi) or NULL (C++)), your application is responsible for explicitly freeing the graphic control.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

Owner

Create

Destroy

64.1.7.3 TRibbonRecentDocuments Methods

The methods of the TRibbonRecentDocuments class are listed here.

Protected Methods

	Name	Description
	Paint (see page 3972)	Render control surface.

64.1.7.3.1 TRibbonRecentDocuments.Paint Method

Render control surface.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method is called automatically when a lightweight control needs update its display area. Code in the Paint method uses the Canvas property to render the control surface.

As implemented in TGraphicControl, Paint does nothing. Specific rendering logic is provided by Paint methods in descendant control classes.

See Also

Canvas

64.1.7.4 TRibbonRecentDocuments Properties

The properties of the TRibbonRecentDocuments class are listed here.

Published Properties

	Name	Description
	Caption (see page 3972)	Specifies a text string that identifies the control to the user.

64.1.7.4.1 TRibbonRecentDocuments.Caption Property

Specifies a text string that identifies the control to the user.

Pascal

```
property Caption;
```

C++

```
__property Caption;
```

Description

Use Caption to specify the text string that labels the control.

To underline a character in a Caption that labels a component, include an ampersand (&) before the character. This type of character is called an accelerator character. The user can then select the component by pressing Alt while typing the underlined

character. To display an ampersand character in the caption, use two ampersands (&&).

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

Note: The Caption property inheritted from TControl is a protected property. Access to the Caption requires casting the class to an inheritted one where Caption is a published or public property.

C++ Examples:

```
/*
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Label1->AutoSize = false;
  Label1->Caption = "This string is too long to be the caption of this label";
}
/*
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would make a TTabSheet variable unnecessary since
PageControl1.->ActivePage is already of type TTabSheet.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TTabSheet *sheet = PageControl1->ActivePage;
  sheet->Caption = Edit1->Text;
}
/*
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
*/
#include <comctrls.hpp>
#include <memory>

void AddButtons(TToolBar *toolBar, TStringList *captions)
{
  for (int i = 0; i < captions->Count; i++)
  {
    TToolButton *button = new TToolButton(toolBar);  // The owner (toolBar) will clean this up.
    button->Parent = toolBar;
    button->Caption = captions->Strings[i];
    if (button->Caption == "|")
      button->Style = tbsSeparator;
    else
      button->Style = tbsButton;
  }
}

TToolBar *myToolBar;

void __fastcall TForm1::FormCreate(TObject *Sender)
{
```

```
  myToolBar = new TToolBar(this); // The owner (this) will clean this up.
  myToolBar->Parent = this;
//  TStringList *captions = new TStringList();
  std::auto_ptr<TStringList> captions(new TStringList());

  captions->Add("New");
  captions->Add("Save");
  captions->Add("|");
  captions->Add("Cut");
  captions->Add("Copy");
  captions->Add("Paste");
  AddButtons(myToolBar, captions.get());
//  delete captions;
  myToolBar->ShowCaptions = True;
  myToolBar->Height = 40;
}
```

Delphi Examples:

```
{
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Label1.AutoSize := False;
  Label1.Caption :=
    'This string is too long to be the caption of this label';
end;
{
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would obviate the need for a TTabSheet variable since
PageControl1.->ActivePage is already of type TTabSheet.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  sheet: TTabSheet;
begin
  sheet := PageControl1.ActivePage;
  sheet.Caption := Edit1.Text;
end;
{
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
}
procedure AddButtons(ToolBar: TToolBar;
  Const ButtonCaptions: array of String);
var
  I: Integer;
begin
  for I := 0 to High(ButtonCaptions) do
    begin
      with TToolButton.Create(ToolBar) do
      begin
        Parent := ToolBar;
        Caption := ButtonCaptions[I];
        if (ButtonCaptions[I] = '|') then
          Style := tbsSeparator
        else
          Style := tbsButton;
```

```
      end;
    end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ToolBar1 := TToolBar.Create(Self);
  ToolBar1.Parent := Self;
  AddButtons(ToolBar1, ['New', 'Save', '|', 'Cut', 'Copy', 'Paste']);
  ToolBar1.ShowCaptions := True;
  ToolBar1.Height := 40;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  I: Integer;
begin
  for I := ToolBar1.ButtonCount - 1 downto 0 do
    ToolBar1.Buttons[I].Free;
  ToolBar1.Free;
end;
```

64.1.8 TRibbonStyleMainPopupMenu Class

Class Hierarchy

Pascal

```
TRibbonStyleMainPopupMenu = class(TCustomActionPopupMenu);
```

C++

```
class TRibbonStyleMainPopupMenu : public TCustomActionPopupMenu;
```

File

RibbonActnMenus

Description

This is class RibbonActnMenus.TRibbonStyleMainPopupMenu.

64.1.8.1 TRibbonStyleMainPopupMenu Members

The following tables list the members exposed by TRibbonStyleMainPopupMenu.

Protected Methods

	Name	Description
	NCPaint (see page 3976)	This is NCPaint, a member of class TRibbonStyleMainPopupMenu.
	PositionPopup (see page 3976)	This is PositionPopup, a member of class TRibbonStyleMainPopupMenu.

Public Methods

	Name	Description
	Create (see page 3976)	Creates and initializes a TCustomActionPopupMenu instance.

64.1.8.2 TRibbonStyleMainPopupMenu.Create Constructor

Creates and initializes a TCustomActionPopupMenu instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonStyleMainPopupMenu(TComponent * AOwner);
```

Description

Create generates a TCustomActionPopupMenu and initializes its properties.

```
__fastcall virtual TCustomActionMenuBar (Classes::TComponentTComponent_Object* AOwner);
__fastcall TCustomActionMenuBar (HWND ParentWindow) :
Controls::TWinControlTWinControl_Create(ParentWindow) { }
```

64.1.8.3 TRibbonStyleMainPopupMenu Methods

The methods of the TRibbonStyleMainPopupMenu class are listed here.

Protected Methods

	Name	Description
	NCPaint (see page 3976)	This is NCPaint, a member of class TRibbonStyleMainPopupMenu.
	PositionPopup (see page 3976)	This is PositionPopup, a member of class TRibbonStyleMainPopupMenu.

64.1.8.3.1 TRibbonStyleMainPopupMenu.NCPaint Method

Pascal

```
procedure NCPaint(DC: HDC); override;
```

C++

```
virtual __fastcall NCPaint(HDC DC);
```

Description

This is NCPaint, a member of class TRibbonStyleMainPopupMenu.

64.1.8.3.2 TRibbonStyleMainPopupMenu.PositionPopup Method

Pascal

```
procedure PositionPopup(AnOwner: TCustomActionBar; ParentItem: TCustomActionControl); override;
```

C++

```
virtual __fastcall PositionPopup(TCustomActionBar AnOwner, TCustomActionControl ParentItem);
```

Description

This is PositionPopup, a member of class TRibbonStyleMainPopupMenu.

64.1.9 TRibbonStylePopupMenu Class

Class Hierarchy

Pascal

```
TRibbonStylePopupMenu = class(TRibbonActionPopupMenu);
```

C++

```
class TRibbonStylePopupMenu : public TRibbonActionPopupMenu;
```

File

RibbonActnMenus

Description

This is class RibbonActnMenus.TRibbonStylePopupMenu.

64.1.9.1 TRibbonStylePopupMenu Members

The following tables list the members exposed by TRibbonStylePopupMenu.

Protected Methods

	Name	Description
	AlignControls (see page 3978)	Aligns any controls for which the control is the parent within a specified area of the control.
	CanAutoSize (see page 3979)	Indicates how the control can be resized.
	NCPaint (see page 3941)	This is NCPaint, a member of class TRibbonActionPopupMenu.
	WMExitsizemove (see page 3980)	This is WMExitsizemove, a member of class TRibbonStylePopupMenu.
	WMNCHitTest (see page 3980)	This is WMNCHitTest, a member of class TRibbonStylePopupMenu.

Public Methods

	Name	Description
	Create (see page 3977)	Creates and initializes a TCustomActionPopupMenu instance.
	CreateControl (see page 3979)	This is CreateControl, a member of class TRibbonStylePopupMenu.
	Destroy (see page 3978)	Destroys an instance of TCustomActionMenuBar.
	TrackMenu (see page 3942)	Executes the action associated with the menu item.

Public Properties

	Name	Description
	GalleryResize (see page 3980)	This is GalleryResize, a member of class TRibbonStylePopupMenu.
	SelectFirstItem (see page 3942)	This is SelectFirstItem, a member of class TRibbonActionPopupMenu.

64.1.9.2 TRibbonStylePopupMenu.Create Constructor

Creates and initializes a TCustomActionPopupMenu instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonStylePopupMenu(TComponent * AOwner);
```

Description

Create generates a TCustomActionPopupMenu and initializes its properties.

```
__fastcall virtual TCustomActionMenuBar (Classes::TComponentTComponent_Object* AOwner);
__fastcall TCustomActionMenuBar (HWND ParentWindow) :
Controls::TWinControlTWinControl_Create(ParentWindow) { }
```

64.1.9.3 TRibbonStylePopupMenu.Destroy Destructor

Destroys an instance of TCustomActionMenuBar.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRibbonStylePopupMenu();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TCustomActionMenuBar reference is not nil, and only then calls Destroy.

See Also

System::TObject::Free

Destroy

64.1.9.4 TRibbonStylePopupMenu Methods

The methods of the TRibbonStylePopupMenu class are listed here.

Protected Methods

	Name	Description
	AlignControls (see page 3978)	Aligns any controls for which the control is the parent within a specified area of the control.
	CanAutoSize (see page 3979)	Indicates how the control can be resized.
	WMExitsizemove (see page 3980)	This is WMExitsizemove, a member of class TRibbonStylePopupMenu.
	WMNCHitTest (see page 3980)	This is WMNCHitTest, a member of class TRibbonStylePopupMenu.

Public Methods

	Name	Description
	CreateControl (see page 3979)	This is CreateControl, a member of class TRibbonStylePopupMenu.

64.1.9.4.1 TRibbonStylePopupMenu.AlignControls Method

Aligns any controls for which the control is the parent within a specified area of the control.

Pascal

```
procedure AlignControls(AControl: TControl; var Rect: TRect); override;
```

C++

```
virtual __fastcall AlignControls(TControl * AControl, TRect Rect);
```

Description

Use AlignControls to align all controls within an area of a form, panel, group box, scroll box, or any container control. Specify the area in which to align the controls as the value of the Rect parameter.

AlignControls uses the Align property value for each child control to determine how to align it. The AControl parameter can be nil (Delphi) or NULL (C++). If you specify a control in AControl, that control takes precedence in alignment over other, similarly-aligned controls.

See Also

Align

64.1.9.4.2 TRibbonStylePopupMenu.CanAutoSize Method

Indicates how the control can be resized.

Pascal

```
function CanAutoSize(var NewWidth: Integer; var NewHeight: Integer): Boolean; override;
```

C++

```
virtual __fastcall Boolean CanAutoSize(int NewWidth, int NewHeight);
```

Description

CanAutoSize is called automatically when the AutoSize property is true and an attempt is made to resize the control. It allows controls to implement the AutoSize property before the resize sequence that begins with the OnCanResize and OnConstrainedResize events and ends with the OnResize event.

When CanAutoSize is called, the NewWidth and NewHeight parameters indicate the proposed new dimensions of the control. CanAutoSize adjusts these values so that the control's size adjusts to its contents. If the adjustment results in values of NewWidth and NewHeight that differ from the control's current width and height, CanAutoSize returns true, indicating that the resize sequence should proceed. If, after adjustment, NewWidth and NewHeight equal Width and Height, CanAutoSize returns false, and the resize sequence is aborted.

As implemented in TWinControl, CanAutoSize returns true, adjusting NewWidth and NewHeight so that all the control's children fit.

AdjustSize

64.1.9.4.3 TRibbonStylePopupMenu.CreateControl Method

Pascal

```
function CreateControl(AnItem: TActionClientItem): TCustomActionControl; override;
```

C++

```
virtual __fastcall TCustomActionControl CreateControl(TActionClientItem AnItem);
```

Description

This is CreateControl, a member of class TRibbonStylePopupMenu.

64.1.9.4.4 TRibbonStylePopupMenu.WMExitsizemove Method

Pascal

```
procedure WMExitsizemove(var Message: TMessage); message WM_EXITSIZEMOVE;
```

C++

```
__fastcall WMExitsizemove(TMessage Message);
```

Description

This is WMExitsizemove, a member of class TRibbonStylePopupMenu.

64.1.9.4.5 TRibbonStylePopupMenu.WMNCHitTest Method

Pascal

```
procedure WMNCHitTest(var Message: TWMNCHitTest); message WM_NCHITTEST;
```

C++

```
__fastcall WMNCHitTest(TWMNCHitTest Message);
```

Description

This is WMNCHitTest, a member of class TRibbonStylePopupMenu.

64.1.9.5 TRibbonStylePopupMenu Properties

The properties of the TRibbonStylePopupMenu class are listed here.

Public Properties

	Name	Description
	GalleryResize (see page 3980)	This is GalleryResize, a member of class TRibbonStylePopupMenu.

64.1.9.5.1 TRibbonStylePopupMenu.GalleryResize Property

Pascal

```
property GalleryResize: TGalleryResize;
```

C++

```
__property TGalleryResize GalleryResize;
```

Description

This is GalleryResize, a member of class TRibbonStylePopupMenu.

65 RibbonGalleryBar Namespace

This is namespace RibbonGalleryBar.

This is class RibbonGalleryBar.TCustomRibbonGalleryBar.

65.1.1.1 TCustomRibbonGalleryBar Members

The following tables list the members exposed by TCustomRibbonGalleryBar.

Protected Methods

	Name	Description
	AlignControls (see page 3983)	Aligns any controls for which the control is the parent within a specified area of the control.

Public Methods

	Name	Description
	Create (see page 3983)	Creates and initializes a TCustomActionToolBar instance.
	CreateControl (see page 3984)	This is CreateControl, a member of class TCustomRibbonGalleryBar.
	DoDropCategory (see page 3984)	This is DoDropCategory, a member of class TCustomRibbonGalleryBar.

Public Properties

	Name	Description
	ItemsPerRow (see page 3988)	This is ItemsPerRow, a member of class TCustomRibbonGalleryBar.

	ShowItemCaptions (see page 3988)	This is ShowItemCaptions, a member of class TCustomRibbonGalleryBar.

Published Properties

	Name	Description
	Align (see page 3984)	Determines how the control aligns within its container (parent control).

65.1.1.2 TCustomRibbonGalleryBar.Create Constructor

Creates and initializes a TCustomActionToolBar instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomRibbonGalleryBar(TComponent * AOwner);
```

Description

Create generates a TCustomActionToolBar and initializes its properties.

```
__fastcall virtual TCustomActionToolBar (Classes::TComponentTComponent_Object* AOwner);
__fastcall (HWND ParentWindow) : Controls::TWinControlTWinControl_Create(ParentWindow) { }
```

65.1.1.3 TCustomRibbonGalleryBar Methods

The methods of the TCustomRibbonGalleryBar class are listed here.

Protected Methods

	Name	Description
	AlignControls (see page 3983)	Aligns any controls for which the control is the parent within a specified area of the control.

Public Methods

	Name	Description
	CreateControl (see page 3984)	This is CreateControl, a member of class TCustomRibbonGalleryBar.
	DoDropCategory (see page 3984)	This is DoDropCategory, a member of class TCustomRibbonGalleryBar.

65.1.1.3.1 TCustomRibbonGalleryBar.AlignControls Method

Aligns any controls for which the control is the parent within a specified area of the control.

Pascal

```
procedure AlignControls(AControl: TControl; var Rect: TRect); override;
```

C++

```
virtual __fastcall AlignControls(TControl * AControl, TRect Rect);
```

Description

Use AlignControls to align all controls within an area of a form, panel, group box, scroll box, or any container control. Specify the area in which to align the controls as the value of the Rect parameter.

AlignControls uses the Align property value for each child control to determine how to align it. The AControl parameter can be nil (Delphi) or NULL (C++). If you specify a control in AControl, that control takes precedence in alignment over other, similarly-aligned controls.

Align

65.1.1.3.2 TCustomRibbonGalleryBar.CreateControl Method

Pascal

```
function CreateControl(AnItem: TActionClientItem): TCustomActionControl; override;
```

C++

```
virtual __fastcall TCustomActionControl CreateControl(TActionClientItem AnItem);
```

Description

This is CreateControl, a member of class TCustomRibbonGalleryBar.

65.1.1.3.3 TCustomRibbonGalleryBar.DoDropCategory Method

Pascal

```
procedure DoDropCategory(Source: TCategoryDragObject; const X: Integer; const Y: Integer);
override;
```

C++

```
virtual __fastcall DoDropCategory(TCategoryDragObject Source, const int X, const int Y);
```

Description

This is DoDropCategory, a member of class TCustomRibbonGalleryBar.

65.1.1.4 TCustomRibbonGalleryBar Properties

The properties of the TCustomRibbonGalleryBar class are listed here.

Public Properties

	Name	Description
	ItemsPerRow (see page 3988)	This is ItemsPerRow, a member of class TCustomRibbonGalleryBar.
	ShowItemCaptions (see page 3988)	This is ShowItemCaptions, a member of class TCustomRibbonGalleryBar.

Published Properties

	Name	Description
	Align (see page 3984)	Determines how the control aligns within its container (parent control).

65.1.1.4.1 TCustomRibbonGalleryBar.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align;
```

C++

```
__property Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form,

panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1); // These objects will all be cleaned up by the owner
(Form1).
  TFileListBox* pflb = new TFileListBox(Form1); // The parent (Form1) will clean up these
objects.
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/
```

```
#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);  // The owner will clean this up.
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);  // The owner will clean this up.
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    ppc = new TPageControl(this); // The owner (this) will clean this up.
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this); // The owner (this) will clean this up.
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
```

```
    { make sure the splitter is to the right of the directory list box! }
    Split.Left := Dirs.Left + Dirs.Width + 1;
    Split.Align := Dirs.Align; { give it the same alignment as the directory }
    { each pane must be at least one quarter of the form's width }
    Split.MinSize := Form1.ClientWidth div 4;
    { Finally, create the last pane - a file list box }
    Files := TFileListBox.Create(Form1);
    Files.Parent := Form1;
    Files.Align := alClient;
    Dirs.FileList := Files; { link the file list box to the directory list box }
end;
{
Dynamically create a TProgressBar control and align it to
the bottom of the form.
}

var
  I: Integer;

procedure TForm1.Button1Click(Sender: TObject);
var

RibbonGalleryBar

Description

This is class RibbonGalleryBar.TCustomRibbonGalleryPopupBar.

65.1.2.1 TCustomRibbonGalleryPopupBar Members

The following tables list the members exposed by TCustomRibbonGalleryPopupBar.

Protected Methods

	Name	Description
	AlignControls (see page 3989)	Aligns any controls for which the control is the parent within a specified area of the control.
	CreateControls (see page 3990)	This is CreateControls, a member of class TCustomRibbonGalleryPopupBar.
	DoGetControlClass (see page 3990)	This is DoGetControlClass, a member of class TCustomRibbonGalleryPopupBar.
	NCPaint (see page 3941)	This is NCPaint, a member of class TRibbonActionPopupMenu.
	SetColorMap (see page 3990)	This is SetColorMap, a member of class TCustomRibbonGalleryPopupBar.

Public Methods

	Name	Description
	CreateControl (see page 3941)	This is CreateControl, a member of class TRibbonActionPopupMenu.
	TrackMenu (see page 3942)	Executes the action associated with the menu item.

Public Properties

	Name	Description
	SelectFirstItem (see page 3942)	This is SelectFirstItem, a member of class TRibbonActionPopupMenu.

65.1.2.2 TCustomRibbonGalleryPopupBar Methods

The methods of the TCustomRibbonGalleryPopupBar class are listed here.

Protected Methods

	Name	Description
	AlignControls (see page 3989)	Aligns any controls for which the control is the parent within a specified area of the control.
	CreateControls (see page 3990)	This is CreateControls, a member of class TCustomRibbonGalleryPopupBar.
	DoGetControlClass (see page 3990)	This is DoGetControlClass, a member of class TCustomRibbonGalleryPopupBar.
	SetColorMap (see page 3990)	This is SetColorMap, a member of class TCustomRibbonGalleryPopupBar.

65.1.2.2.1 TCustomRibbonGalleryPopupBar.AlignControls Method

Aligns any controls for which the control is the parent within a specified area of the control.

Pascal

```
procedure AlignControls(AControl: TControl; var Rect: TRect); override;
```

C++

```
virtual __fastcall AlignControls(TControl * AControl, TRect Rect);
```

Description

Use AlignControls to align all controls within an area of a form, panel, group box, scroll box, or any container control. Specify the area in which to align the controls as the value of the Rect parameter.

AlignControls uses the Align property value for each child control to determine how to align it. The AControl parameter can be nil (Delphi) or NULL (C++). If you specify a control in AControl, that control takes precedence in alignment over other, similarly-aligned controls.

65.1.2.2.2 TCustomRibbonGalleryPopupBar.CreateControls Method

Pascal

```
procedure CreateControls; override;
```

C++

```
virtual __fastcall CreateControls();
```

Description

This is CreateControls, a member of class TCustomRibbonGalleryPopupBar.

65.1.2.2.3 TCustomRibbonGalleryPopupBar.DoGetControlClass Method

Pascal

```
function DoGetControlClass(AnItem: TActionClientItem): TCustomActionControlClass; override;
```

C++

```
virtual __fastcall TCustomActionControlClass DoGetControlClass(TActionClientItem AnItem);
```

Description

This is DoGetControlClass, a member of class TCustomRibbonGalleryPopupBar.

65.1.2.2.4 TCustomRibbonGalleryPopupBar.SetColorMap Method

Pascal

```
procedure SetColorMap(const Value: TCustomActionBarColorMap); override;
```

C++

```
virtual __fastcall SetColorMap(const TCustomActionBarColorMap Value);
```

Description

This is SetColorMap, a member of class TCustomRibbonGalleryPopupBar.

65.1.3 TRibbonGalleryBar Class

This is class RibbonGalleryBar.TRibbonGalleryBar.

65.1.3.1 TRibbonGalleryBar Members

The following tables list the members exposed by TRibbonGalleryBar.

Protected Methods

	Name	Description
	AlignControls (see page 3983)	Aligns any controls for which the control is the parent within a specified area of the control.

Public Methods

	Name	Description
	Create (see page 3983)	Creates and initializes a TCustomActionToolBar instance.
	CreateControl (see page 3984)	This is CreateControl, a member of class TCustomRibbonGalleryBar.
	DoDropCategory (see page 3984)	This is DoDropCategory, a member of class TCustomRibbonGalleryBar.

Published Properties

	Name	Description
	Align (see page 3984)	Determines how the control aligns within its container (parent control).
	Items (see page 3991)	Lists the action clients that correspond to the child controls of this action band.
	ItemsPerRow (see page 3992)	This is ItemsPerRow, a member of class TRibbonGalleryBar.
	ShowItemCaptions (see page 3992)	This is ShowItemCaptions, a member of class TRibbonGalleryBar.

65.1.3.2 TRibbonGalleryBar Properties

The properties of the TRibbonGalleryBar class are listed here.

Published Properties

	Name	Description
	Items (see page 3991)	Lists the action clients that correspond to the child controls of this action band.
	ItemsPerRow (see page 3992)	This is ItemsPerRow, a member of class TRibbonGalleryBar.
	ShowItemCaptions (see page 3992)	This is ShowItemCaptions, a member of class TRibbonGalleryBar.

65.1.3.2.1 TRibbonGalleryBar.Items Property

Lists the action clients that correspond to the child controls of this action band.

Pascal

```
property Items;
```

C++

```
__property Items;
```

Description

Items is used internally to access the components that the action manager lists to represent the child controls of this action band. Each action client object in the Items collection corresponds to one of the controls that the ActionControls property lists. The entire collection of items belongs to the action client specified by this action band's ActionClient property.

65.1.5.1 TRibbonPopupGalleryBar Members

The following tables list the members exposed by TRibbonPopupGalleryBar.

Protected Methods

	Name	Description
	AlignControls (see page 3983)	Aligns any controls for which the control is the parent within a specified area of the control.
	CreateParams (see page 3994)	Initializes a window-creation parameter data structure.

Public Methods

	Name	Description
	Assign (see page 3994)	Copies the contents of another, similar object.
	Create (see page 3983)	Creates and initializes a TCustomActionToolBar instance.
	CreateControl (see page 3984)	This is CreateControl, a member of class TCustomRibbonGalleryBar.
	DisplayGallery (see page 3995)	This is DisplayGallery, a member of class TRibbonPopupGalleryBar.
	DoDropCategory (see page 3984)	This is DoDropCategory, a member of class TCustomRibbonGalleryBar.

Public Properties

	Name	Description
	ItemsPerRow (see page 3988)	This is ItemsPerRow, a member of class TCustomRibbonGalleryBar.
	ShowItemCaptions (see page 3988)	This is ShowItemCaptions, a member of class TCustomRibbonGalleryBar.

Published Properties

	Name	Description
	Align (see page 3984)	Determines how the control aligns within its container (parent control).
	Items (see page 3991)	Lists the action clients that correspond to the child controls of this action band.
	ItemsPerRow (see page 3992)	This is ItemsPerRow, a member of class TRibbonGalleryBar.
	ShowItemCaptions (see page 3992)	This is ShowItemCaptions, a member of class TRibbonGalleryBar.

65.1.5.2 TRibbonPopupGalleryBar Methods

The methods of the TRibbonPopupGalleryBar class are listed here.

Protected Methods

	Name	Description
	CreateParams (see page 3994)	Initializes a window-creation parameter data structure.

Public Methods

	Name	Description
	Assign (see page 3994)	Copies the contents of another, similar object.
	DisplayGallery (see page 3995)	This is DisplayGallery, a member of class TRibbonPopupGalleryBar.

65.1.5.2.1 TRibbonPopupGalleryBar.Assign Method

Copies the contents of another, similar object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy the properties or other attributes of one object from another. The standard form of a call to Assign is

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

which tells the Destination object to copy the contents of the Source object to itself.

Most objects override Assign to handle the assignment of properties from similar objects. When overriding Assign, call the inherited method if the destination object can't handle the assignment of properties from the class of the Source parameter.

If no overridden Assign method can handle the assignment of properties from Source, the method implemented in TPersistent calls the source object's AssignTo method. This allows the source object to handle the assignment. If the Source object is nil (Delphi) or NULL (C++), Assign raises an EConvertError exception.

In general, the statement

```
Destination := Source; {Delphi}
Destination = Source; // C++
```

is not the same as the statement

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

The assignment operator makes Destination reference the same object as Source, whereas the Assign method copies the contents of the object referenced by Source into the object referenced by Destination.

Note: The types of some properties are also objects. If these properties have write methods that use Assign to set the value of the property, then in these cases the assignment operator does the same thing as the Assign method.

AssignTo

EConvertError

65.1.5.2.2 TRibbonPopupGalleryBar.CreateParams Method

Initializes a window-creation parameter data structure.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. Override CreateParams to customize the way a control creates its Windows representation. When overriding CreateParams, always call the inherited method first to set the default values, then make any desired adjustments.

CreateParams fills in the parameter that is passed as the value of the Params parameter. This data structure holds information needed when telling Windows to create a window handle. The fields of a TCreateParams record become the parameters to a call to the CreateWindowEx API function.

TWinControl implements CreateParams by setting all the fields of Params to generic base values. A number of the standard controls override CreateParams to change one or more of the default values in Params.

65.1.5.2.3 TRibbonPopupGalleryBar.DisplayGallery Method

Pascal

```
procedure DisplayGallery(AX: Integer; AY: Integer);
```

C++

```
__fastcall DisplayGallery(int AX, int AY);
```

Description

This is DisplayGallery, a member of class TRibbonPopupGalleryBar.

66 RibbonLunaStyleActnCtrls Namespace

This is namespace RibbonLunaStyleActnCtrls.

Topics

Name	Description
Classes (see page 3998)	The following table lists classes in this documentation.
Variables (see page 4002)	The following table lists variables in this documentation.

66.1.1.1 TRibbonLunaSkin Members

The following tables list the members exposed by TRibbonLunaSkin.

Enumerations

	Name	Description
	TRibbonSkinLoadType (see page 4020)	Indicates how skins are loaded.

Protected Methods

	Name	Description
	DoLoadByFile (see page 4021)	This is DoLoadByFile, a member of class TCustomRibbonSkin.
	DoLoadByResource (see page 4021)	This is DoLoadByResource, a member of class TCustomRibbonSkin.

Public Methods

	Name	Description
	Create (see page 4019)	Create TCustomRibbonSkin (see page 4018) instance.
	Destroy (see page 4019)	Destroy TCustomRibbonSkin (see page 4018) instance.
	GetLoadType (see page 3999)	Set method for loading skins.
	GetLoadTypeValue (see page 3999)	This is GetLoadTypeValue, a member of class TRibbonLunaSkin.
	GetResourceHandle (see page 4021)	Override `GetResourceHandle` to supply skins in separate DLL.

	LoadSkin (see page 4022)	This is LoadSkin, a member of class TCustomRibbonSkin.

Public Properties

	Name	Description
	Bitmap (see page 4022)	This is Bitmap, a member of class TCustomRibbonSkin.

66.1.1.2 TRibbonLunaSkin Methods

The methods of the TRibbonLunaSkin class are listed here.

Public Methods

	Name	Description
	GetLoadType (see page 3999)	Set method for loading skins.
	GetLoadTypeValue (see page 3999)	This is GetLoadTypeValue, a member of class TRibbonLunaSkin.

66.1.1.2.1 TRibbonLunaSkin.GetLoadType Method

Set method for loading skins.

Pascal

```
function GetLoadType: TCustomRibbonSkin; override;
```

C++

```
virtual __fastcall TCustomRibbonSkin GetLoadType();
```

Description

GetLoadType sets the method for loading the skins for use by the application.

66.1.1.2.2 TRibbonLunaSkin.GetLoadTypeValue Method

Pascal

```
function GetLoadTypeValue: string; override;
```

C++

```
virtual __fastcall UnicodeString GetLoadTypeValue();
```

Description

This is GetLoadTypeValue, a member of class TRibbonLunaSkin.

66.1.2 TRibbonLunaStyleActionBars Class

Class Hierarchy

Pascal

```
TRibbonLunaStyleActionBars = class(TRibbonStyleActionBars);
```

C++

```
class TRibbonLunaStyleActionBars : public TRibbonStyleActionBars;
```

File

RibbonLunaStyleActnCtrls

Description

This is class RibbonLunaStyleActnCtrls.TRibbonLunaStyleActionBars.

66.1.2.1 TRibbonLunaStyleActionBars Members

The following tables list the members exposed by TRibbonLunaStyleActionBars.

Public Methods

	Name	Description
	Create (see page 4023)	Create TRibbonStyleActionBars (see page 4022) instance.
	Destroy (see page 4023)	Destroy TRibbonStyleActionBars (see page 4022) instance.
	DrawElement (see page 4024)	This is the overview for the DrawElement method overload.
	GetAddRemoveItemClass (see page 4026)	Returns the base class for ActionBand menus for customizing action bands.
	GetColorMapClass (see page 4000)	Returns the class type of the colormap for an action bar.
	GetControlClass (see page 4027)	Returns the control class type on an action bar item.
	GetPopupClass (see page 4027)	Returns the popup class added to a menu action band.
	GetScrollBtnClass (see page 4027)	This is GetScrollBtnClass, a member of class TRibbonStyleActionBars.
	GetSkinClass (see page 4001)	This is GetSkinClass, a member of class TRibbonLunaStyleActionBars.
	GetStyleName (see page 4001)	Returns the style associated with action manager.

Public Properties

	Name	Description
	RibbonSkin (see page 4028)	Enter a short sentence, starting with a verb, that states the basic purpose of the property.

66.1.2.2 TRibbonLunaStyleActionBars Methods

The methods of the TRibbonLunaStyleActionBars class are listed here.

Public Methods

	Name	Description
	GetColorMapClass (see page 4000)	Returns the class type of the colormap for an action bar.
	GetSkinClass (see page 4001)	This is GetSkinClass, a member of class TRibbonLunaStyleActionBars.
	GetStyleName (see page 4001)	Returns the style associated with action manager.

66.1.2.2.1 TRibbonLunaStyleActionBars.GetColorMapClass Method

Returns the class type of the colormap for an action bar.

Pascal

```
function GetColorMapClass(ActionBar: TCustomActionBar): TCustomColorMapClass; override;
```

C++

```
virtual __fastcall TCustomColorMapClass GetColorMapClass(TCustomActionBar ActionBar);
```

Description

Returns the class type TCustomActionBarColorMap, which is a colormap associated with an action bar. Override this method to customize the appearance of your applications.

66.1.2.2.2 TRibbonLunaStyleActionBars.GetSkinClass Method

Pascal

```
function GetSkinClass: TCustomRibbonSkinClass; override;
```

C++

```
virtual __fastcall TCustomRibbonSkinClass GetSkinClass();
```

Description

This is GetSkinClass, a member of class TRibbonLunaStyleActionBars.

66.1.2.2.3 TRibbonLunaStyleActionBars.GetStyleName Method

Returns the style associated with action manager.

Pascal

```
function GetStyleName: string; override;
```

C++

```
virtual __fastcall UnicodeString GetStyleName();
```

Description

Returns the value of the Style property.

66.2 Variables

The following table lists variables in this documentation.

Variables

Name	Description
RibbonLunaStyle (see page 4002)	This is variable RibbonLunaStyleActnCtrls.RibbonLunaStyle.

66.2.1 RibbonLunaStyleActnCtrls.RibbonLunaStyle Variable

Pascal

```
RibbonLunaStyle: TRibbonLunaStyleActionBars;
```

C++

```
TRibbonLunaStyleActionBars RibbonLunaStyle;
```

File

RibbonLunaStyleActnCtrls

Description

This is variable RibbonLunaStyleActnCtrls.RibbonLunaStyle.

67 RibbonObsidianStyleActnCtrls Namespace

This is namespace RibbonObsidianStyleActnCtrls.

Topics

Name	Description
Classes (see page 4004)	The following table lists classes in this documentation.
Variables (see page 4008)	The following table lists variables in this documentation.

Classes

	Name	Description
	TRibbonObsidianSkin (see page 4004)	This is class RibbonObsidianStyleActnCtrls.TRibbonObsidianSkin.
	TRibbonObsidianStyleActionBars (see page 4005)	This is class RibbonObsidianStyleActnCtrls.TRibbonObsidianStyleActionBars.

Variables

Name	Description
RibbonObsidianStyle (see page 4008)	This is variable RibbonObsidianStyleActnCtrls.RibbonObsidianStyle.

67.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TRibbonObsidianSkin (see page 4004)	This is class RibbonObsidianStyleActnCtrls.TRibbonObsidianSkin.
	TRibbonObsidianStyleActionBars (see page 4005)	This is class RibbonObsidianStyleActnCtrls.TRibbonObsidianStyleActionBars.

67.1.1 TRibbonObsidianSkin Class

Class Hierarchy

Pascal

```
TRibbonObsidianSkin = class(TCustomRibbonSkin);
```

C++

```
class TRibbonObsidianSkin : public TCustomRibbonSkin;
```

File

RibbonObsidianStyleActnCtrls

Description

This is class RibbonObsidianStyleActnCtrls.TRibbonObsidianSkin.

67.1.1.1 TRibbonObsidianSkin Members

The following tables list the members exposed by TRibbonObsidianSkin.

Enumerations

	Name	Description
	TRibbonSkinLoadType (see page 4020)	Indicates how skins are loaded.

Protected Methods

	Name	Description
	DoLoadByFile (see page 4021)	This is DoLoadByFile, a member of class TCustomRibbonSkin.
	DoLoadByResource (see page 4021)	This is DoLoadByResource, a member of class TCustomRibbonSkin.

Public Methods

	Name	Description
	Create (see page 4019)	Create TCustomRibbonSkin (see page 4018) instance.
	Destroy (see page 4019)	Destroy TCustomRibbonSkin (see page 4018) instance.
	GetLoadType (see page 4005)	Set method for loading skins.
	GetLoadTypeValue (see page 4005)	This is GetLoadTypeValue, a member of class TRibbonObsidianSkin.
	GetResourceHandle (see page 4021)	Override `GetResourceHandle` to supply skins in separate DLL.

	LoadSkin (see page 4022)	This is LoadSkin, a member of class TCustomRibbonSkin.

Public Properties

	Name	Description
	Bitmap (see page 4022)	This is Bitmap, a member of class TCustomRibbonSkin.

67.1.1.2 TRibbonObsidianSkin Methods

The methods of the TRibbonObsidianSkin class are listed here.

Public Methods

	Name	Description
	GetLoadType (see page 4005)	Set method for loading skins.
	GetLoadTypeValue (see page 4005)	This is GetLoadTypeValue, a member of class TRibbonObsidianSkin.

67.1.1.2.1 TRibbonObsidianSkin.GetLoadType Method

Set method for loading skins.

Pascal

```
function GetLoadType: TCustomRibbonSkin; override;
```

C++

```
virtual __fastcall TCustomRibbonSkin GetLoadType();
```

Description

GetLoadType sets the method for loading the skins for use by the application.

67.1.1.2.2 TRibbonObsidianSkin.GetLoadTypeValue Method

Pascal

```
function GetLoadTypeValue: string; override;
```

C++

```
virtual __fastcall UnicodeString GetLoadTypeValue();
```

Description

This is GetLoadTypeValue, a member of class TRibbonObsidianSkin.

67.1.2 TRibbonObsidianStyleActionBars Class

Class Hierarchy

Pascal

```
TRibbonObsidianStyleActionBars = class(TRibbonStyleActionBars);
```

C++

```
class TRibbonObsidianStyleActionBars : public TRibbonStyleActionBars;
```

File

RibbonObsidianStyleActnCtrls

Description

This is class RibbonObsidianStyleActnCtrls.TRibbonObsidianStyleActionBars.

67.1.2.1 TRibbonObsidianStyleActionBars Members

The following tables list the members exposed by TRibbonObsidianStyleActionBars.

Public Methods

	Name	Description
	Create (see page 4023)	Create TRibbonStyleActionBars (see page 4022) instance.
	Destroy (see page 4023)	Destroy TRibbonStyleActionBars (see page 4022) instance.
	DrawElement (see page 4024)	This is the overview for the DrawElement method overload.
	GetAddRemoveItemClass (see page 4026)	Returns the base class for ActionBand menus for customizing action bands.
	GetColorMapClass (see page 4006)	Returns the class type of the colormap for an action bar.
	GetControlClass (see page 4027)	Returns the control class type on an action bar item.
	GetPopupClass (see page 4027)	Returns the popup class added to a menu action band.
	GetScrollBtnClass (see page 4027)	This is GetScrollBtnClass, a member of class TRibbonStyleActionBars.
	GetSkinClass (see page 4007)	This is GetSkinClass, a member of class TRibbonObsidianStyleActionBars.
	GetStyleName (see page 4007)	Returns the style associated with action manager.

Public Properties

	Name	Description
	RibbonSkin (see page 4028)	Enter a short sentence, starting with a verb, that states the basic purpose of the property.

67.1.2.2 TRibbonObsidianStyleActionBars Methods

The methods of the TRibbonObsidianStyleActionBars class are listed here.

Public Methods

	Name	Description
	GetColorMapClass (see page 4006)	Returns the class type of the colormap for an action bar.
	GetSkinClass (see page 4007)	This is GetSkinClass, a member of class TRibbonObsidianStyleActionBars.
	GetStyleName (see page 4007)	Returns the style associated with action manager.

67.1.2.2.1 TRibbonObsidianStyleActionBars.GetColorMapClass Method

Returns the class type of the colormap for an action bar.

Pascal

```
function GetColorMapClass(ActionBar: TCustomActionBar): TCustomColorMapClass; override;
```

C++

```
virtual __fastcall TCustomColorMapClass GetColorMapClass(TCustomActionBar ActionBar);
```

Description

Returns the class type TCustomActionBarColorMap, which is a colormap associated with an action bar. Override this method to customize the appearance of your applications.

67.1.2.2.2 TRibbonObsidianStyleActionBars.GetSkinClass Method

Pascal

```
function GetSkinClass: TCustomRibbonSkinClass; override;
```

C++

```
virtual __fastcall TCustomRibbonSkinClass GetSkinClass();
```

Description

This is GetSkinClass, a member of class TRibbonObsidianStyleActionBars.

67.1.2.2.3 TRibbonObsidianStyleActionBars.GetStyleName Method

Returns the style associated with action manager.

Pascal

```
function GetStyleName: string; override;
```

C++

```
virtual __fastcall UnicodeString GetStyleName();
```

Description

Returns the value of the Style property.

67.2 Variables

The following table lists variables in this documentation.

Variables

Name	Description
RibbonObsidianStyle (see page 4008)	This is variable RibbonObsidianStyleActnCtrls.RibbonObsidianStyle.

67.2.1 RibbonObsidianStyleActnCtrls.RibbonObsidianStyle Variable

Pascal

```
RibbonObsidianStyle: TRibbonObsidianStyleActionBars;
```

C++

```
TRibbonObsidianStyleActionBars RibbonObsidianStyle;
```

File

RibbonObsidianStyleActnCtrls

Description

This is variable RibbonObsidianStyleActnCtrls.RibbonObsidianStyle.

68 RibbonSilverStyleActnCtrls Namespace

This is namespace RibbonSilverStyleActnCtrls.

Topics

Name	Description
Classes (see page 4010)	The following table lists classes in this documentation.
Variables (see page 4014)	The following table lists variables in this documentation.

Classes

	Name	Description
	TRibbonSilverSkin (see page 4010)	This is class RibbonSilverStyleActnCtrls.TRibbonSilverSkin.
	TRibbonSilverStyleActionBars (see page 4011)	This is class RibbonSilverStyleActnCtrls.TRibbonSilverStyleActionBars.

Variables

Name	Description
RibbonSilverStyle (see page 4014)	This is variable RibbonSilverStyleActnCtrls.RibbonSilverStyle.

68.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TRibbonSilverSkin (see page 4010)	This is class RibbonSilverStyleActnCtrls.TRibbonSilverSkin.
	TRibbonSilverStyleActionBars (see page 4011)	This is class RibbonSilverStyleActnCtrls.TRibbonSilverStyleActionBars.

68.1.1 TRibbonSilverSkin Class

Class Hierarchy

Pascal

```
TRibbonSilverSkin = class(TCustomRibbonSkin);
```

C++

```
class TRibbonSilverSkin : public TCustomRibbonSkin;
```

File

RibbonSilverStyleActnCtrls

Description

This is class RibbonSilverStyleActnCtrls.TRibbonSilverSkin.

68.1.1.1 TRibbonSilverSkin Members

The following tables list the members exposed by TRibbonSilverSkin.

Enumerations

	Name	Description
	TRibbonSkinLoadType (see page 4020)	Indicates how skins are loaded.

Protected Methods

	Name	Description
	DoLoadByFile (see page 4021)	This is DoLoadByFile, a member of class TCustomRibbonSkin.
	DoLoadByResource (see page 4021)	This is DoLoadByResource, a member of class TCustomRibbonSkin.

Public Methods

	Name	Description
	Create (see page 4019)	Create TCustomRibbonSkin (see page 4018) instance.
	Destroy (see page 4019)	Destroy TCustomRibbonSkin (see page 4018) instance.
	GetLoadType (see page 4011)	Set method for loading skins.
	GetLoadTypeValue (see page 4011)	This is GetLoadTypeValue, a member of class TRibbonSilverSkin.
	GetResourceHandle (see page 4021)	Override `GetResourceHandle` to supply skins in separate DLL.

	LoadSkin (see page 4022)	This is LoadSkin, a member of class TCustomRibbonSkin.

Public Properties

	Name	Description
	Bitmap (see page 4022)	This is Bitmap, a member of class TCustomRibbonSkin.

68.1.1.2 TRibbonSilverSkin Methods

The methods of the TRibbonSilverSkin class are listed here.

Public Methods

	Name	Description
	GetLoadType (see page 4011)	Set method for loading skins.
	GetLoadTypeValue (see page 4011)	This is GetLoadTypeValue, a member of class TRibbonSilverSkin.

68.1.1.2.1 TRibbonSilverSkin.GetLoadType Method

Set method for loading skins.

Pascal

```
function GetLoadType: TCustomRibbonSkin; override;
```

C++

```
virtual __fastcall TCustomRibbonSkin GetLoadType();
```

Description

GetLoadType sets the method for loading the skins for use by the application.

68.1.1.2.2 TRibbonSilverSkin.GetLoadTypeValue Method

Pascal

```
function GetLoadTypeValue: string; override;
```

C++

```
virtual __fastcall UnicodeString GetLoadTypeValue();
```

Description

This is GetLoadTypeValue, a member of class TRibbonSilverSkin.

68.1.2 TRibbonSilverStyleActionBars Class

Class Hierarchy

Pascal

```
TRibbonSilverStyleActionBars = class(TRibbonStyleActionBars);
```

C++

```
class TRibbonSilverStyleActionBars : public TRibbonStyleActionBars;
```

File

RibbonSilverStyleActnCtrls

Description

This is class RibbonSilverStyleActnCtrls.TRibbonSilverStyleActionBars.

68.1.2.1 TRibbonSilverStyleActionBars Members

The following tables list the members exposed by TRibbonSilverStyleActionBars.

Public Methods

	Name	Description
	Create (see page 4023)	Create TRibbonStyleActionBars (see page 4022) instance.
	Destroy (see page 4023)	Destroy TRibbonStyleActionBars (see page 4022) instance.
	DrawElement (see page 4024)	This is the overview for the DrawElement method overload.
	GetAddRemoveItemClass (see page 4026)	Returns the base class for ActionBand menus for customizing action bands.
	GetColorMapClass (see page 4012)	Returns the class type of the colormap for an action bar.
	GetControlClass (see page 4027)	Returns the control class type on an action bar item.
	GetPopupClass (see page 4027)	Returns the popup class added to a menu action band.
	GetScrollBtnClass (see page 4027)	This is GetScrollBtnClass, a member of class TRibbonStyleActionBars.
	GetSkinClass (see page 4013)	This is GetSkinClass, a member of class TRibbonSilverStyleActionBars.
	GetStyleName (see page 4013)	Returns the style associated with action manager.

Public Properties

	Name	Description
	RibbonSkin (see page 4028)	Enter a short sentence, starting with a verb, that states the basic purpose of the property.

68.1.2.2 TRibbonSilverStyleActionBars Methods

The methods of the TRibbonSilverStyleActionBars class are listed here.

Public Methods

	Name	Description
	GetColorMapClass (see page 4012)	Returns the class type of the colormap for an action bar.
	GetSkinClass (see page 4013)	This is GetSkinClass, a member of class TRibbonSilverStyleActionBars.
	GetStyleName (see page 4013)	Returns the style associated with action manager.

68.1.2.2.1 TRibbonSilverStyleActionBars.GetColorMapClass Method

Returns the class type of the colormap for an action bar.

Pascal

```
function GetColorMapClass(ActionBar: TCustomActionBar): TCustomColorMapClass; override;
```

C++

```
virtual __fastcall TCustomColorMapClass GetColorMapClass(TCustomActionBar ActionBar);
```

Description

Returns the class type TCustomActionBarColorMap, which is a colormap associated with an action bar. Override this method to customize the appearance of your applications.

68.1.2.2.2 TRibbonSilverStyleActionBars.GetSkinClass Method

Pascal

```
function GetSkinClass: TCustomRibbonSkinClass; override;
```

C++

```
virtual __fastcall TCustomRibbonSkinClass GetSkinClass();
```

Description

This is GetSkinClass, a member of class TRibbonSilverStyleActionBars.

68.1.2.2.3 TRibbonSilverStyleActionBars.GetStyleName Method

Returns the style associated with action manager.

Pascal

```
function GetStyleName: string; override;
```

C++

```
virtual __fastcall UnicodeString GetStyleName();
```

Description

Returns the value of the Style property.

68.2 Variables

The following table lists variables in this documentation.

Variables

Name	Description
RibbonSilverStyle (see page 4014)	This is variable RibbonSilverStyleActnCtrls.RibbonSilverStyle.

68.2.1 RibbonSilverStyleActnCtrls.RibbonSilverStyle Variable

Pascal

```
RibbonSilverStyle: TRibbonSilverStyleActionBars;
```

C++

```
TRibbonSilverStyleActionBars RibbonSilverStyle;
```

File

RibbonSilverStyleActnCtrls

Description

This is variable RibbonSilverStyleActnCtrls.RibbonSilverStyle.

69 RibbonStyleActnCtrls Namespace

This is namespace RibbonStyleActnCtrls.

Topics

Name	Description
Classes (see page 4017)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 4029)	The following table lists structs, records, enums in this documentation.
Types (see page 4053)	The following table lists types in this documentation.

Classes

	Name	Description
	TAlphaBitmap (see page 4017)	Set AlphaFormat property to **afDefined**.
	TCustomRibbonSkin (see page 4018)	Load resources from file or application.
	TRibbonStyleActionBars (see page 4022)	Action bar style.

Structs, Records, Enums

	Name	Description
	TRibbonElement (see page 4029)	Elements of Ribbon (see page 3347) that need to be skinned.
	TSkinApplicationMenu (see page 4030)	Individual skinned items of Application Menu.
	TSkinButton (see page 4032)	Individual skinned items of Button.
	TSkinCheckBox (see page 4036)	This is record RibbonStyleActnCtrls.TSkinCheckBox.
	TSkinComboBox (see page 4037)	Individual skinned items of Combo.
	TSkinForm (see page 4038)	Individual skinned items of Form.
	TSkinGallery (see page 4040)	Individual skinned items of Gallery.
	TSkinMenu (see page 4041)	Individual skinned items of Menu.
	TSkinQuickAccessToolbar (see page 4043)	Individual skinned items of Quick Access Toolbar.
	TSkinRadioButton (see page 4045)	This is record RibbonStyleActnCtrls.TSkinRadioButton.
	TSkinRibbon (see page 4045)	Individual skinned items of Ribbon (see page 3347).
	TSkinRibbonGroup (see page 4046)	Individual skinned items of Group.
	TSkinScrollBar (see page 4048)	Individual skinned items of ScrollBar.
	TSkinSpinEdit (see page 4049)	Individual skinned items of Spinner.
	TSkinStatusBar (see page 4050)	Individual skinned items of Status Bar.
	TSkinTab (see page 4051)	Individual skinned items of Tab.

Types

Name	Description
TCustomRibbonSkinClass (see page 4053)	This is type RibbonStyleActnCtrls.TCustomRibbonSkinClass.

69.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TAlphaBitmap (see page 4017)	Set AlphaFormat property to **afDefined**.
	TCustomRibbonSkin (see page 4018)	Load resources from file or application.
	TRibbonStyleActionBars (see page 4022)	Action bar style.

69.1.1 TAlphaBitmap Class

Set AlphaFormat property to **afDefined**.

Class Hierarchy

Pascal

```
TAlphaBitmap = class(TBitmap);
```

C++

```
class TAlphaBitmap : public TBitmap;
```

File

RibbonStyleActnCtrls

Description

TAlphaBitmap is a TBitmap descendant that automatically sets the AlphaFormat property to **afDefined**.

See Also

TBitmap

AlphaFormat

TAlphaFormat

69.1.1.1 TAlphaBitmap Members

The following tables list the members exposed by TAlphaBitmap.

Public Methods

	Name	Description
	Create (see page 4018)	Create TAlphaBitmap (see page 4017) instance.

69.1.1.2 TAlphaBitmap.Create Constructor

Create TAlphaBitmap (see page 4017) instance.

Pascal

```
constructor Create; override;
```

C++

```
virtual __fastcall TAlphaBitmap();
```

Description

This method creates an TAlphaBitmap (see page 4017) instance.

69.1.2 TCustomRibbonSkin Class

Load resources from file or application.

Class Hierarchy

RibbonStyleActnCtrls.TCustomRibbonSkin

Pascal

```
TCustomRibbonSkin = class;
```

C++

```
class TCustomRibbonSkin;
```

File

RibbonStyleActnCtrls

Description

TCustomRibbonSkin is responsible for loading the resources from a file or application. It also loads the common elements in each skin. Each descendant then modifies the resource or file to be loaded.

See Also

TRibbonSkinLoadType (see page 4020)

69.1.2.1 TCustomRibbonSkin Members

The following tables list the members exposed by TCustomRibbonSkin.

Enumerations

	Name	Description
	TRibbonSkinLoadType (see page 4020)	Indicates how skins are loaded.

Protected Methods

	Name	Description
	DoLoadByFile (see page 4021)	This is DoLoadByFile, a member of class TCustomRibbonSkin.
	DoLoadByResource (see page 4021)	This is DoLoadByResource, a member of class TCustomRibbonSkin.

Public Methods

	Name	Description
	Create (see page 4019)	Create TCustomRibbonSkin (see page 4018) instance.
	Destroy (see page 4019)	Destroy TCustomRibbonSkin (see page 4018) instance.
	GetLoadType (see page 4021)	Set method for loading skins.
	GetLoadTypeValue (see page 4021)	This is GetLoadTypeValue, a member of class TCustomRibbonSkin.
	GetResourceHandle (see page 4021)	Override `GetResourceHandle` to supply skins in separate DLL.
	LoadSkin (see page 4022)	This is LoadSkin, a member of class TCustomRibbonSkin.

Public Properties

	Name	Description
	Bitmap (see page 4022)	This is Bitmap, a member of class TCustomRibbonSkin.

69.1.2.2 TCustomRibbonSkin.Create Constructor

Create TCustomRibbonSkin (see page 4018) instance.

Pascal

```
constructor Create; virtual;
```

C++

```
virtual __fastcall TCustomRibbonSkin();
```

Description

This method creates a TCustomRibbonSkin (see page 4018) instance.

See Also

Destroy (see page 4019)

69.1.2.3 TCustomRibbonSkin.Destroy Destructor

Destroy TCustomRibbonSkin (see page 4018) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomRibbonSkin();
```

Description

This method destroys a TCustomRibbonSkin (see page 4018) instance.

See Also

Create (see page 4019)

69.1.2.4 TCustomRibbonSkin Enumerations

The enumerations of the TCustomRibbonSkin class are listed here.

Enumerations

	Name	Description
	TRibbonSkinLoadType (see page 4020)	Indicates how skins are loaded.

69.1.2.4.1 RibbonStyleActnCtrls.TCustomRibbonSkin.TRibbonSkinLoadType Enumeration

Indicates how skins are loaded.

Pascal

```
TRibbonSkinLoadType = (
  ltResource,
  ltFile
);
```

C++

```
enum TRibbonSkinLoadType {
  ltResource,
  ltFile
};
```

File

RibbonStyleActnCtrls

Description

TRibbonSkinLoadType enumerates how skins are loaded.

Value	Meaning
ltResource	Skins are loaded as a resource.
ltFile	Skins are loaded from a single file.
ltFolder	Skins are loaded from a specific folder.

See Also

TCustomRibbonSkin (see page 4018)

69.1.2.5 TCustomRibbonSkin Methods

The methods of the TCustomRibbonSkin class are listed here.

Protected Methods

	Name	Description
	DoLoadByFile (see page 4021)	This is DoLoadByFile, a member of class TCustomRibbonSkin.
	DoLoadByResource (see page 4021)	This is DoLoadByResource, a member of class TCustomRibbonSkin.

Public Methods

	Name	Description
	GetLoadType (see page 4021)	Set method for loading skins.
	GetLoadTypeValue (see page 4021)	This is GetLoadTypeValue, a member of class TCustomRibbonSkin.
	GetResourceHandle (see page 4021)	Override `GetResourceHandle` to supply skins in separate DLL.
	LoadSkin (see page 4022)	This is LoadSkin, a member of class TCustomRibbonSkin.

69.1.2.5.1 TCustomRibbonSkin.DoLoadByFile Method

Pascal

```
procedure DoLoadByFile; virtual;
```

C++

```
virtual __fastcall DoLoadByFile();
```

Description

This is DoLoadByFile, a member of class TCustomRibbonSkin.

69.1.2.5.2 TCustomRibbonSkin.DoLoadByResource Method

Pascal

```
procedure DoLoadByResource; virtual;
```

C++

```
virtual __fastcall DoLoadByResource();
```

Description

This is DoLoadByResource, a member of class TCustomRibbonSkin.

69.1.2.5.3 TCustomRibbonSkin.GetLoadType Method

Set method for loading skins.

Pascal

```
function GetLoadType: TRibbonSkinLoadType; virtual;
```

C++

```
virtual __fastcall TRibbonSkinLoadType GetLoadType();
```

Description

GetLoadType sets the method for loading the skins for use by the application.

69.1.2.5.4 TCustomRibbonSkin.GetLoadTypeValue Method

Pascal

```
function GetLoadTypeValue: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetLoadTypeValue();
```

Description

This is GetLoadTypeValue, a member of class TCustomRibbonSkin.

69.1.2.5.5 TCustomRibbonSkin.GetResourceHandle Method

Override `GetResourceHandle` to supply skins in separate DLL.

Pascal

```
function GetResourceHandle: THandle; virtual;
```

C++

```
virtual __fastcall THandle GetResourceHandle();
```

Description

This method overrides `GetResourceHandle` to supply skins in a separate DLL file.

69.1.2.5.6 TCustomRibbonSkin.LoadSkin Method

Pascal

```
procedure LoadSkin; virtual;
```

C++

```
virtual __fastcall LoadSkin();
```

Description

This is LoadSkin, a member of class TCustomRibbonSkin.

69.1.2.6 TCustomRibbonSkin Properties

The properties of the TCustomRibbonSkin class are listed here.

Public Properties

	Name	Description
	Bitmap (see page 4022)	This is Bitmap, a member of class TCustomRibbonSkin.

69.1.2.6.1 TCustomRibbonSkin.Bitmap Property

Pascal

```
property Bitmap: TAlphaBitmap;
```

C++

```
__property TAlphaBitmap Bitmap;
```

Description

This is Bitmap, a member of class TCustomRibbonSkin.

69.1.3 TRibbonStyleActionBars Class

Action bar style.

Class Hierarchy

Pascal

```
TRibbonStyleActionBars = class(TXPStyleActionBars);
```

C++

```
class TRibbonStyleActionBars : public TXPStyleActionBars;
```

File

RibbonStyleActnCtrls

Description

TRibbonStyleActionBars is an action bar style.

69.1.3.1 TRibbonStyleActionBars Members

The following tables list the members exposed by TRibbonStyleActionBars.

Public Methods

	Name	Description
	Create (see page 4023)	Create TRibbonStyleActionBars (see page 4022) instance.
	Destroy (see page 4023)	Destroy TRibbonStyleActionBars (see page 4022) instance.
	DrawElement (see page 4024)	This is the overview for the DrawElement method overload.
	GetAddRemoveItemClass (see page 4026)	Returns the base class for ActionBand menus for customizing action bands.
	GetColorMapClass (see page 4026)	Returns the class type of the colormap for an action bar.
	GetControlClass (see page 4027)	Returns the control class type on an action bar item.
	GetPopupClass (see page 4027)	Returns the popup class added to a menu action band.
	GetScrollBtnClass (see page 4027)	This is GetScrollBtnClass, a member of class TRibbonStyleActionBars.
	GetSkinClass (see page 4028)	This is GetSkinClass, a member of class TRibbonStyleActionBars.

Public Properties

	Name	Description
	RibbonSkin (see page 4028)	Enter a short sentence, starting with a verb, that states the basic purpose of the property.

69.1.3.2 TRibbonStyleActionBars.Create Constructor

Create TRibbonStyleActionBars (see page 4022) instance.

Pascal

```
constructor Create; virtual;
```

C++

```
virtual __fastcall TRibbonStyleActionBars();
```

Description

This method creates a TRibbonStyleActionBars (see page 4022) instance.

See Also

Destroy (see page 4023)

69.1.3.3 TRibbonStyleActionBars.Destroy Destructor

Destroy TRibbonStyleActionBars (see page 4022) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRibbonStyleActionBars();
```

Description

This method destroys a TRibbonStyleActionBars (see page 4022) instance.

See Also

Create (see page 4023)

69.1.3.4 TRibbonStyleActionBars Methods

The methods of the TRibbonStyleActionBars class are listed here.

Public Methods

	Name	Description
	DrawElement (see page 4024)	This is the overview for the DrawElement method overload.
	GetAddRemoveItemClass (see page 4026)	Returns the base class for ActionBand menus for customizing action bands.
	GetColorMapClass (see page 4026)	Returns the class type of the colormap for an action bar.
	GetControlClass (see page 4027)	Returns the control class type on an action bar item.
	GetPopupClass (see page 4027)	Returns the popup class added to a menu action band.
	GetScrollBtnClass (see page 4027)	This is GetScrollBtnClass, a member of class TRibbonStyleActionBars.
	GetSkinClass (see page 4028)	This is GetSkinClass, a member of class TRibbonStyleActionBars.

69.1.3.4.1 DrawElement Method

This is the overview for the DrawElement method overload.

Overload List

	Name	Description
	TRibbonStyleActionBars.DrawElement (TSkinApplicationMenu, TCanvas, Integer, Integer, Byte) (see page 4025)	Methods to draw ribbon skin element.
	TRibbonStyleActionBars.DrawElement (TSkinApplicationMenu, TCanvas, TRect) (see page 4025)	Methods to draw ribbon skin element.
	TRibbonStyleActionBars.DrawElement (TSkinButton, TCanvas, TRect, Byte) (see page 4025)	Methods to draw ribbon skin element.
	TRibbonStyleActionBars.DrawElement (TSkinCheckBox, TCanvas, TRect) (see page 4025)	Methods to draw ribbon skin element.
	TRibbonStyleActionBars.DrawElement (TSkinComboBox, TCanvas, TRect) (see page 4025)	Methods to draw ribbon skin element.
	TRibbonStyleActionBars.DrawElement (TSkinForm, TCanvas, TRect, Integer) (see page 4025)	Methods to draw ribbon skin element.

	TRibbonStyleActionBars.DrawElement (TSkinGallery, TCanvas, TRect) (see page 4025)	Methods to draw ribbon skin element.
	TRibbonStyleActionBars.DrawElement (TSkinMenu, TCanvas, TRect) (see page 4025)	Methods to draw ribbon skin element.
	TRibbonStyleActionBars.DrawElement (TSkinQuickAccessToolbar, TCanvas, TRect) (see page 4025)	Methods to draw ribbon skin element.
	TRibbonStyleActionBars.DrawElement (TSkinRadioButton, TCanvas, TRect) (see page 4025)	Methods to draw ribbon skin element.
	TRibbonStyleActionBars.DrawElement (TSkinRibbon, TCanvas, TRect, Integer) (see page 4025)	Methods to draw ribbon skin element.
	TRibbonStyleActionBars.DrawElement (TSkinRibbonGroup, TCanvas, TRect) (see page 4025)	Methods to draw ribbon skin element.
	TRibbonStyleActionBars.DrawElement (TSkinScrollBar, TCanvas, TRect) (see page 4025)	Methods to draw ribbon skin element.
	TRibbonStyleActionBars.DrawElement (TSkinSpinEdit, TCanvas, TRect) (see page 4025)	Methods to draw ribbon skin element.
	TRibbonStyleActionBars.DrawElement (TSkinStatusBar, TCanvas, TRect) (see page 4025)	Methods to draw ribbon skin element.
	TRibbonStyleActionBars.DrawElement (TSkinTab, TCanvas, TRect, Byte) (see page 4025)	Methods to draw ribbon skin element.

69.1.3.4.1.1 TRibbonStyleActionBars.DrawElement Method (TSkinApplicationMenu, TCanvas, Integer, Integer, Byte)

Methods to draw ribbon skin element.

Pascal

```
procedure DrawElement(Element: TSkinRibbon; Canvas: TCanvas; Rect: TRect; Height: Integer);
overload;
procedure DrawElement(Element: TSkinForm; Canvas: TCanvas; Rect: TRect; Height: Integer);
overload;
procedure DrawElement(Element: TSkinApplicationMenu; Canvas: TCanvas; Rect: TRect); overload;
procedure DrawElement(Element: TSkinApplicationMenu; Canvas: TCanvas; const X: Integer; const
Y: Integer; const Opacity: Byte); overload;
procedure DrawElement(Element: TSkinTab; Canvas: TCanvas; Rect: TRect; Opacity: Byte = 255);
overload;
procedure DrawElement(Element: TSkinRibbonGroup; Canvas: TCanvas; Rect: TRect); overload;
procedure DrawElement(Element: TSkinMenu; Canvas: TCanvas; Rect: TRect); overload;
procedure DrawElement(Element: TSkinButton; Canvas: TCanvas; Rect: TRect; Opacity: Byte =
255); overload;
procedure DrawElement(Element: TSkinComboBox; Canvas: TCanvas; Rect: TRect); overload;
procedure DrawElement(Element: TSkinSpinEdit; Canvas: TCanvas; Rect: TRect); overload;
procedure DrawElement(Element: TSkinGallery; Canvas: TCanvas; Rect: TRect); overload;
procedure DrawElement(Element: TSkinQuickAccessToolbar; Canvas: TCanvas; Rect: TRect);
overload;
```

```
procedure DrawElement(Element: TSkinScrollBar; Canvas: TCanvas; Rect: TRect); overload;
procedure DrawElement(Element: TSkinStatusBar; Canvas: TCanvas; Rect: TRect); overload;
procedure DrawElement(Element: TSkinCheckBox; Canvas: TCanvas; Rect: TRect); overload;
procedure DrawElement(Element: TSkinRadioButton; Canvas: TCanvas; Rect: TRect); overload;
```

C++

```
__fastcall DrawElement(TSkinRibbon Element, TCanvas Canvas, TRect Rect, int Height);
__fastcall DrawElement(TSkinForm Element, TCanvas Canvas, TRect Rect, int Height);
__fastcall DrawElement(TSkinApplicationMenu Element, TCanvas Canvas, TRect Rect);
__fastcall DrawElement(TSkinApplicationMenu Element, TCanvas Canvas, const int X, const int Y,
const Byte Opacity);
__fastcall DrawElement(TSkinTab Element, TCanvas Canvas, TRect Rect, Byte Opacity = 255);
__fastcall DrawElement(TSkinRibbonGroup Element, TCanvas Canvas, TRect Rect);
__fastcall DrawElement(TSkinMenu Element, TCanvas Canvas, TRect Rect);
__fastcall DrawElement(TSkinButton Element, TCanvas Canvas, TRect Rect, Byte Opacity = 255);
__fastcall DrawElement(TSkinComboBox Element, TCanvas Canvas, TRect Rect);
__fastcall DrawElement(TSkinSpinEdit Element, TCanvas Canvas, TRect Rect);
__fastcall DrawElement(TSkinGallery Element, TCanvas Canvas, TRect Rect);
__fastcall DrawElement(TSkinQuickAccessToolbar Element, TCanvas Canvas, TRect Rect);
__fastcall DrawElement(TSkinScrollBar Element, TCanvas Canvas, TRect Rect);
__fastcall DrawElement(TSkinStatusBar Element, TCanvas Canvas, TRect Rect);
__fastcall DrawElement(TSkinCheckBox Element, TCanvas Canvas, TRect Rect);
__fastcall DrawElement(TSkinRadioButton Element, TCanvas Canvas, TRect Rect);
```

Description

DrawElement are methods to draw a particular ribbon skin element.

The parameters are:

- **Element**: The item to draw from the Element group.
- **Canvas**: Where the element is to be drawn.
- **Rect**: The rectangle for drawing the element.
- **Center**: Set to True to center the element within the given Rectangle.

69.1.3.4.2 TRibbonStyleActionBars.GetAddRemoveItemClass Method

Returns the base class for ActionBand menus for customizing action bands.

Pascal

```
function GetAddRemoveItemClass(ActionBar: TCustomActionBar): TCustomAddRemoveItemClass;
override;
```

C++

```
virtual __fastcall TCustomAddRemoveItemClass GetAddRemoveItemClass(TCustomActionBar ActionBar);
```

Description

Call GetAddRemoveItemClass to customize action bands.

See Also

TCustomAddRemoveItem

69.1.3.4.3 TRibbonStyleActionBars.GetColorMapClass Method

Returns the class type of the colormap for an action bar.

Pascal

```
function GetColorMapClass(ActionBar: TCustomActionBar): TCustomColorMapClass; override;
```

C++

```
virtual __fastcall TCustomColorMapClass GetColorMapClass(TCustomActionBar ActionBar);
```

Description

Returns the class type TCustomActionBarColorMap, which is a colormap associated with an action bar. Override this method to customize the appearance of your applications.

69.1.3.4.4 TRibbonStyleActionBars.GetControlClass Method

Returns the control class type on an action bar item.

Pascal

```
function GetControlClass(ActionBar: TCustomActionBar; AnItem: TActionClientItem):
TCustomActionControlClass; override;
```

C++

```
virtual __fastcall TCustomActionControlClass GetControlClass(TCustomActionBar ActionBar,
TActionClientItem AnItem);
```

Description

Returns the control class type on an item in the action bar, such as a button or menu item.

69.1.3.4.5 TRibbonStyleActionBars.GetPopupClass Method

Returns the popup class added to a menu action band.

Pascal

```
function GetPopupClass(ActionBar: TCustomActionBar): TCustomPopupClass; override;
```

C++

```
virtual __fastcall TCustomPopupClass GetPopupClass(TCustomActionBar ActionBar);
```

Description

Call GetPopupClass to find the popup menu associated with a menu action band. Override GetPopupClass to change which popup class is associated with a menu action band depending on the state of the control.

See Also

TCustomActionPopupMenu

69.1.3.4.6 TRibbonStyleActionBars.GetScrollBtnClass Method

Pascal

```
function GetScrollBtnClass: TCustomToolScrollBtnClass; override;
```

C++

```
virtual __fastcall TCustomToolScrollBtnClass GetScrollBtnClass();
```

Description

This is GetScrollBtnClass, a member of class TRibbonStyleActionBars.

69.1.3.4.7 TRibbonStyleActionBars.GetSkinClass Method

Pascal

```
function GetSkinClass: TCustomRibbonSkinClass; virtual; abstract;
```

C++

```
virtual __fastcall TCustomRibbonSkinClass GetSkinClass() = 0;
```

Description

This is GetSkinClass, a member of class TRibbonStyleActionBars.

69.1.3.5 TRibbonStyleActionBars Properties

The properties of the TRibbonStyleActionBars class are listed here.

Public Properties

	Name	Description
	RibbonSkin (see page 4028)	Enter a short sentence, starting with a verb, that states the basic purpose of the property.

69.1.3.5.1 TRibbonStyleActionBars.RibbonSkin Property

Enter a short sentence, starting with a verb, that states the basic purpose of the property.

Pascal

```
property RibbonSkin: TCustomRibbonSkin;
```

C++

```
__property TCustomRibbonSkin RibbonSkin;
```

Description

The long description elaborates on the short description, containing no more than a paragraph or two.

69.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TRibbonElement (see page 4029)	Elements of Ribbon (see page 3347) that need to be skinned.
	TSkinApplicationMenu (see page 4030)	Individual skinned items of Application Menu.
	TSkinButton (see page 4032)	Individual skinned items of Button.
	TSkinCheckBox (see page 4036)	This is record RibbonStyleActnCtrls.TSkinCheckBox.
	TSkinComboBox (see page 4037)	Individual skinned items of Combo.
	TSkinForm (see page 4038)	Individual skinned items of Form.
	TSkinGallery (see page 4040)	Individual skinned items of Gallery.
	TSkinMenu (see page 4041)	Individual skinned items of Menu.
	TSkinQuickAccessToolbar (see page 4043)	Individual skinned items of Quick Access Toolbar.
	TSkinRadioButton (see page 4045)	This is record RibbonStyleActnCtrls.TSkinRadioButton.
	TSkinRibbon (see page 4045)	Individual skinned items of Ribbon (see page 3347).
	TSkinRibbonGroup (see page 4046)	Individual skinned items of Group.
	TSkinScrollBar (see page 4048)	Individual skinned items of ScrollBar.
	TSkinSpinEdit (see page 4049)	Individual skinned items of Spinner.
	TSkinStatusBar (see page 4050)	Individual skinned items of Status Bar.
	TSkinTab (see page 4051)	Individual skinned items of Tab.

69.2.1 RibbonStyleActnCtrls.TRibbonElement Enumeration

Elements of Ribbon (see page 3347) that need to be skinned.

Pascal

```
TRibbonElement = (
  reRibbon,
  reForm,
  reApplicationMenu,
  reTab,
  reGroup,
  reMenu,
  reButton,
  reCombo,
  reSpinner,
  reGallery,
  reQuickAccessToolbar,
  reScrollBar,
  reStatusBar,
  reCheckBox,
  reRadioButton
);
```

C++

```
enum TRibbonElement {
  reRibbon,
  reForm,
  reApplicationMenu,
  reTab,
```

```
    reGroup,
    reMenu,
    reButton,
    reCombo,
    reSpinner,
    reGallery,
    reQuickAccessToolbar,
    reScrollBar,
    reStatusBar,
    reCheckBox,
    reRadioButton
  };
```

File

RibbonStyleActnCtrls

Description

TRibbonElement enumerates the available elements of the Ribbon (see page 3347) that need to be skinned.

Value	Meaning
reRibbon	Ribbon (see page 3347)
reForm	Form
reApplicationMenu	Application Menu
reTab	Tab
reGroup	Group
reMenu	Menu
reButton	Button
reCombo	Combo
reSpinner	Spinner
reGallery	Gallery
reQuickAccessToolbar	Quick Access Toolbar
reScrollBar	Scroll Bar
reStatusBar	Status Bar

69.2.2 RibbonStyleActnCtrls.TSkinApplicationMenu Enumeration

Individual skinned items of Application Menu.

Pascal

```
  TSkinApplicationMenu = (
    samButton,
    samButtonHover,
    samButtonPressed,
    samButtonShadow,
    samBorder,
    samMenuNormal,
    samMenuDisabled,
    samMenuHover,
```

```
    samMenuPressed,
    samMenuSplitNormal,
    samMenuSplitHover,
    samMenuSplitPressed,
    samMenuSubMenu
  );
```

C++

```
  enum TSkinApplicationMenu {
    samButton,
    samButtonHover,
    samButtonPressed,
    samButtonShadow,
    samBorder,
    samMenuNormal,
    samMenuDisabled,
    samMenuHover,
    samMenuPressed,
    samMenuSplitNormal,
    samMenuSplitHover,
    samMenuSplitPressed,
    samMenuSubMenu
  };
```

File

RibbonStyleActnCtrls

Description

TSkinApplicationMenu enumerates the individual skinned items of the Application Menu.

Value	Meaning
samButton	Button
samButtonHover	Button hover
samButtonPressed	Button pressed
samButtonShadow	Button shadow
samBorder	Border
samMenuNormal	Normal menu
samMenuDisabled	Disabled menu
samMenuHover	Menu hover
samMenuPressed	Pressed split menu
samMenuSplitNormal	Normal split menu
samMenuSplitHover	Split menu hover
samMenuSplitPressed	Pressed split menu
samMenuSubMenu	Submenu menu
samBorderTopStart	Top border start
samBorderTop	Top border
samBorderTopEnd	Top border end
samBorderBottomStart	Bottom border start
samBorderBottom	Bottom border
samBorderBottomEnd	Bottom border end

See Also

TRibbonElement (see page 4029)

69.2.3 RibbonStyleActnCtrls.TSkinButton Enumeration

Individual skinned items of Button.

Pascal

```
TSkinButton = (
  sbSmall,
  sbSmallDisabled,
  sbSmallHover,
  sbSmallPressed,
  sbSmallSelected,
  sbSmallHoverSelected,
  sbSmallInactive,
  sbLarge,
  sbLargeDisabled,
  sbLargeSplitActive,
  sbLargeHover,
  sbLargePressed,
  sbLargeSelected,
  sbLargeHoverSelected,
  sbSmallSplit,
  sbSmallSplitDisabled,
  sbSmallSplitHover,
  sbSmallSplitPressed,
  sbSmallSplitSelected,
  sbSmallSplitHoverSelected,
  sbSmallSplitInactive,
  sbSmallSplitHoverSplit,
  sbSmallSplitPressedSplit,
  sbSmallSplitInactiveSplit,
  sbLargeSplit,
  sbLargeSplitDisabled,
  sbLargeSplitHover,
  sbLargeSplitPressed,
  sbLargeSplitSelected,
  sbLargeSplitHoverSelected,
  sbLargeSplitHoverSplit,
  sbLargeSplitPressedSplit,
  sbArrow,
  sbArrowDisabled,
  sbArrowPressed,
  sbLargeArrowDown,
  sbLargeArrowDownDisabled,
  sbSeparator,
  sbDisabledSeparator,
  sbGroup,
  sbGroupStart,
  sbGroupStartHover,
  sbGroupStartPressed,
  sbGroupStartSelected,
  sbGroupStartHoverSelected,
  sbGroupStartInactive,
  sbGroupMiddle,
  sbGroupMiddleHover,
  sbGroupMiddlePressed,
  sbGroupMiddleSelected,
  sbGroupMiddleHoverSelected,
```

```
    sbGroupMiddleInactive,
    sbGroupEndSplitInactive,
    sbGroupStartSplitInactive,
    sbGroupSingleSplitInactive,
    sbGroupMiddleSplitInactive,
    sbGroupEnd,
    sbGroupEndHover,
    sbGroupEndPressed,
    sbGroupEndSelected,
    sbGroupEndHoverSelected,
    sbGroupEndInactive,
    sbGroupSingle,
    sbGroupSingleHover,
    sbGroupSinglePressed,
    sbGroupSingleSelected,
    sbGroupSingleHoverSelected,
    sbGroupSingleInactive,
    sbGroupSplit,
    sbGroupStartSplitHover,
    sbGroupMiddleSplitHover,
    sbGroupEndSplitHover,
    sbGroupSingleSplitHover,
    sbGroupStartInactiveSplit,
    sbGroupEndSplitInactiveSplit,
    sbGroupStartSplitHoverSplit,
    sbGroupEndSplitHoverSplit,
    sbGroupSingleSplitHoverSplit,
    sbGroupSingleSplitInactiveSplit,
    sbGroupMiddleSplitPressed,
    sbGroupMiddleSplitInactiveSplit,
    sbGroupMiddleSplitHoverSplit,
    sbGroupStartSplitInactiveSplit,
    sbGroupStartSplitPressed,
    sbGroupEndSplitPressed,
    sbGroupSingleSplitPressed,
    sbGroupStartSplitPressedSplit,
    sbGroupMiddleSplitPressedSplit,
    sbGroupEndSplitPressedSplit,
    sbGroupSingleSplitPressedSplit
  );
```

C++

```
  enum TSkinButton {
    sbSmall,

```

```
  sbGroupSingleSplitPressedSplit
};
```

File

RibbonStyleActnCtrls

Description

TSkinButton enumerates the individual skinned items of a Button.

Value	Meaning
sbSmall	Small
sbSmallDisabled	Disabled small
sbSmallHover	Small hover
sbSmallPressed	Pressed small
sbSmallSelected	Selected small
sbSmallHoverSelected	Selected small hover
sbSmallGroup	Small group
sbSmallGroupHover	Small group hover
sbSmallGroupPressed	Pressed small group
sbSmallGroupSelected	Selected small group
sbSmallGroupHoverSelected	Selected small group hover
sbLarge	Large
sbLargeDisabled	Disabled Large
sbLargeSplitActive	Active large split
sbLargeHover	Large hover
sbLargePressed	Pressed Large
sbLargeSelected	Selected Large
sbLargeHoverSelected	Selected Large hover
sbSmallSplit	Small split
sbSmallSplitDisabled	Disabled small split
sbSmallSplitHover	Small split hover
sbSmallSplitPressed	Pressed small split
sbSmallSplitSelected	Selected small split
sbSmallSplitHoverSelected	Selected small split hover
sbSmallSplitHoverSplit	Split small split hover
sbSmallSplitPressedSplit	Pressed split small split
sbLargeSplit	Large split
sbLargeSplitDisabled	Disabled large split
sbLargeSplitHover	Large split hover
sbLargeSplitPressed	Pressed large split
sbLargeSplitSelected	Selected large split
sbLargeSplitHoverSelected	Selected large split hover

sbLargeSplitHoverSplit	Split large split hover
sbLargeSplitPressedSplit	Pressed split large split
sbGroup	Group
sbGroupStart	Group start
sbGroupStartHover	Group start hover
sbGroupStartPressed	Pressed group start
sbGroupStartSelected	Selected group start
sbGroupStartHoverSelected	Selected group start hover
sbGroupStartInactive	Inactive group start
sbGroupMiddle	Group middle
sbGroupMiddleHover	Group middle hover
sbGroupMiddlePressed	Pressed group middle
sbGroupMiddleSelected	Selected group middle
sbGroupMiddleHoverSelected	Selected group middle hover
sbGroupMiddleInactive	Inactive group middle
sbGroupEnd	Group end
sbGroupEndHover	Group end hover
sbGroupEndPressed	Pressed group end
sbGroupEndSelected	Selected group end
sbGroupEndHoverSelected	Selected group end hover
sbGroupEndInactive	Inactive group end
sbGroupSingle	Single group
sbGroupSingleHover	Single group hover
sbGroupSinglePressed	Pressed single group
sbGroupSingleSelected	Selected single group
sbGroupSingleHoverSelected	Selected single group hover
sbGroupSingleInactive	Inactive single group

69.2.4 RibbonStyleActnCtrls.TSkinCheckBox Enumeration

Pascal

```
TSkinCheckBox = (
  scNormal,
  scDisabled,
  scHover,
  scPressed,
  scSelected,
  scHoverSelected,
```

```
  scDisabledSelected
);
```

C++

```
enum TSkinCheckBox {
  scNormal,
  scDisabled,
  scHover,
  scPressed,
  scSelected,
  scHoverSelected,
  scDisabledSelected
};
```

File

RibbonStyleActnCtrls

Description

This is record RibbonStyleActnCtrls.TSkinCheckBox.

69.2.5 RibbonStyleActnCtrls.TSkinComboBox Enumeration

Individual skinned items of Combo.

Pascal

```
TSkinComboBox = (
  scButton,
  scButtonInactive,
  scButtonHover,
  scButtonPressed,
  scButtonIcon
);
```

C++

```
enum TSkinComboBox {
  scButton,
  scButtonInactive,
  scButtonHover,
  scButtonPressed,
  scButtonIcon
};
```

File

RibbonStyleActnCtrls

Description

TSkinComboBox enumerates the individual skinned items of a Combo.

Value	Meaning
scButton	Button
scButtonInactive	Inactive button
scButtonHover	Button hover
scButtonPressed	Pressed button
scButtonIcon	Button icon

    sfMaximizeHover,
    sfMaximizePressed,
    sfMaximizeDisabled,
    sfRestore,
    sfRestoreHover,
    sfRestorePressed,
    sfRestoreDisabled,
    sfClose,
    sfCloseHover,
    sfClosePressed,
    sfCloseDisabled,
    sfHelp,
    sfHelpHover,
    sfHelpPressed,
    sfHelpDisabled
  };
```

File

RibbonStyleActnCtrls

Description

TSkinForm enumerates the individual skinned items of the Form.

Value	Meaning
sfLeftFrame	Left frame
sfLeftFrameTop	Left frame top
sfLeftFrameTopDisabled	Disabled left frame top
sfRightFrame	Right frame
sfRightFrameTop	Right frame top
sfRightFrameTopDisabled	Disabled right frame top
sfBottomFrame	Bottom frame
sfButton	Button
sfButtonHover	Button hover
sfButtonPressed	Button pressed
sfMinimize	Minimize
sfMinimizeHover	Minimize hover
sfMinimizePressed	Minimize pressed
sfMinimizeDisabled	Minimize disabled
sfMaximize	Maximize
sfMaximizeHover	Maximize hover
sfMaximizePressed	Maximize pressed
sfMaximizeDisabled	Maximize disabled
sfRestore	Restore
sfRestoreHover	Restore hover

sfRestorePressed	Restore pressed
sfRestoreDisabled	Restore disabled
sfClose	Close
sfCloseHover	Close hover
sfClosePressed	Close pressed
sfCloseDisabled	Close disabled

69.2.7 RibbonStyleActnCtrls.TSkinGallery Enumeration

Individual skinned items of Gallery.

Pascal

```
TSkinGallery = (
  sgButton,
  sgUpButton,
  sgUpButtonHover,
  sgUpButtonPressed,
  sgUpButtonDisabled,
  sgDownButton,
  sgDownButtonHover,
  sgDownButtonPressed,
  sgDownButtonDisabled,
  sgMoreButton,
  sgMoreButtonHover,
  sgMoreButtonHoverDisabled
);
```

C++

```
enum TSkinGallery {
  sgButton,
  sgUpButton,
  sgUpButtonHover,
  sgUpButtonPressed,
  sgUpButtonDisabled,
  sgDownButton,
  sgDownButtonHover,
  sgDownButtonPressed,
  sgDownButtonDisabled,
  sgMoreButton,
  sgMoreButtonHover,
  sgMoreButtonHoverDisabled
};
```

File

RibbonStyleActnCtrls

Description

TSkinGallery enumerates the individual skinned items of a Gallery.

Value	Meaning
sgBackground	Background
sgUpButton	Up button
sgUpButtonHover	Up button hover
sgUpButtonPressed	Pressed up button
sgupButtonDisabled	Disabled up button
sgDownButton	Down button
sgDownButtonHover	Down button hover
sgDownButtonPressed	Pressed down button
sgDownButtonDisabled	Disabled down button
sgMoreButton	More button
sgMoreButtonHover	More button hover
sgUpIcon	Up icon
sgDownIcon	Down icon
sgMoreIcon	More icon

    smScrollButtonDownIcon,
    smOptionButton,
    smOptionButtonHover,
    smOptionButtonDisabled
  };
```

File

RibbonStyleActnCtrls

Description

TSkinMenu enumerates the individual skinned items of a Menu.

Value	Meaning
smBackground	Background
smBanner	Banner
smNormal	Normal
smSelected	Selected
smSelectedStart	Selected start
smSelectedEnd	Selected end
smHover	Hover
smHoverStart	Hover start
smHoverEnd	Hover end
smHoverSelected	Selected hover

smDisabled	Disabled
smCheck	Check
smCheckDisabled	Disabled check
smCheckIcon	Check icon
smCheckDisabledIcon	Disabled check icon
smRadio	Radio
smRadioDisabled	Disabled radio
smSeparator	Separator
smArrowLeftIcon	Left arrow icon
smArrowRightIcon	Right arrow icon
smResize	Resize
smResizeVertical	Vertical resize
smResizeBoth	Resize both
smRichContentHover	Rich content hover
smRichContentDisabled	Disabled rich content
smScrollButton	Scroll button
smScrollButtonHover	Scroll button hover
smScrollButtonUpIcon	Up scroll button icon
smScrollButtonDownIcon	Down scroll button icon
smOptionButton	Option button
smOptionButtonHover	Option button hover
smOptionButtonDisabled	Disabled option button

  };
```

File

RibbonStyleActnCtrls

Description

TSkinRibbonGroup enumerates the individual skinned items of a Group.

Value	Meaning
srgBackground	Background
srgBackgroundStart	Background start
srgBackgroundEnd	Background end
srgBackgroundHover	Background hover
srgBackgroundHoverStart	Background start hover
srgBackgroundHoverEnd	Background end hover
srgBackgroundDisabled	Disabled background
srgBackgroundDisabledStart	Disabled background start
srgBackgroundDisabledEnd	Disabled background end
srgCaption	Caption
srgCaptionHover	Caption hover
srgCaptionDisabled	Disabled caption
srgDialogButton	Dialog button
srgDialogButtonHover	Dialog button hover
srgDialogButtonPressed	Pressed dialog button
srgDialogButtonIcon	Dialog button icon
srgDialogButtonIconHover	Dialog button icon hover
srgDialogButtonIconPressed	Pressed dialog button icon
srgMinimizeButton	Minimize button
srgMinimizeButtonStart	Minimize button start
srgMinimizeButtonEnd	Minimize button end
srgMinimizeButtonHover	Minimize button hover
srgMinimizeButtonHoverStart	Minimize button hover start
srgMinimizeButtonHoverEnd	Minimize button hover end

srgMinimizeButtonPressed	Pressed minimize button
srgMinimizeButtonPressedStart	Pressed minimize button start
srgMinimizeButtonPressedEnd	Pressed minimize button end
srgMinimizeButtonIcon	Minimize button icon
srgMinimizeButtonPressedIcon	Pressed minimize button icon
srgScrollLeft	Left scroll
srgScrollLeftHover	Left scroll hover
srgScrollRight	Scroll right
srgScrollRightHover	Scroll right hover

69.3 Types

The following table lists types in this documentation.

Types

Name	Description
TCustomRibbonSkinClass (see page 4053)	This is type RibbonStyleActnCtrls.TCustomRibbonSkinClass.

69.3.1 RibbonStyleActnCtrls.TCustomRibbonSkinClass Type

Pascal

```
TCustomRibbonSkinClass = class of TCustomRibbonSkin;
```

C++

```
TCustomRibbonSkin TCustomRibbonSkinClass;
```

File

RibbonStyleActnCtrls

Description

This is type RibbonStyleActnCtrls.TCustomRibbonSkinClass.

70 Rio Namespace

This is namespace Rio.

Topics

Name	Description
Classes (see page 4056)	The following table lists classes in this documentation.
Interfaces (see page 4068)	The following table lists interfaces in this documentation.
Types (see page 4070)	The following table lists types in this documentation.
Constants (see page 4072)	The following table lists constants in this documentation.

Classes

	Name	Description
	TRIO (see page 4056)	TRIO is the base class for components that generate calls to remote interfaced objects.

Constants

Name	Description
StubSize (see page 4072)	This is constant Rio.StubSize.

Interfaces

	Name	Description
	IRIOAccess (see page 4068)	IRIOAccess is the interface for accessing a remote interfaced object from its invokable interface.

Types

Name	Description
TAfterExecuteEvent (see page 4070)	TAfterExecuteEvent is the type of event handlers that respond after a remote interfaced object receives the encoded results from executing a method call to a Web Service.
TBeforeExecuteEvent (see page 4070)	TBeforeExecuteEvent is the type of event handlers that respond before a remote interfaced object sends an encoded method call to a Web Service provider.

70.1 Classes

The following table lists classes in this documentation.

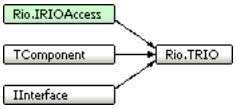
Classes

	Name	Description
	TRIO (see page 4056)	TRIO is the base class for components that generate calls to remote interfaced objects.

70.1.1 TRIO Class

TRIO is the base class for components that generate calls to remote interfaced objects.

Class Hierarchy



Pascal

```
TRIO = class(TComponent, IInterface, IRIOAccess);
```

C++

```
class TRIO : public TComponent, public IInterface, public IRIOAccess;
```

File

Rio

Description

Use TRIO as a base class for components that generate statically-linked calls to invokable interfaces. When an application casts a TRIO descendant to a registered invokable interface, it dynamically generates an in-memory method table, providing an implementation to that invokable interface. TRIO uses two helper objects when generating this implementation. These helper objects implement the IOPConvert (see page 2730) and IWebNode interfaces. IOPConvert (see page 2730) handles the marshaling and unmarshaling of calls to methods on the generated method table, and IWebNode receives the marshaled message call, executes it (typically by sending it to a remote server application), and returns the results of executing the call. These interfaces do not assume any particular encoding or transport protocol. Each TRIO descendant uses its own protocol-specific helper objects to implement these interfaces.

Before TRIO can generate a method table for an invokable interface, the interface must be registered with the invocation registry. To register an invokable interface, use the global InvRegistry (see page 930) function to obtain access to the registry, and call its RegisterInterface method.

Do not create instances of TRIO. To add a component that generates calls to a registered invokable interface, use a TRIO descendant such as THTTPRIO.

See Also

THTTPRIO

InvRegistry (see page 930)

TInvokableClassRegistry (see page 840)

IWebNode

IOPConvert (see page 2730)

IRIOAccess (see page 4068)

70.1.1.1 TRIO Members

The following tables list the members exposed by TRIO.

Protected Fields

	Name	Description
	FConverter (see page 4059)	This is FConverter, a member of class TRIO.
	FIID (see page 4059)	This is FIID, a member of class TRIO.
	FWebNode (see page 4059)	This is FWebNode, a member of class TRIO.
	IntfMD (see page 4059)	This is IntfMD, a member of class TRIO.

Protected Methods

	Name	Description
V	DoAfterExecute (see page 4061)	Generates an OnAfterExecute (see page 4065) event.
V	DoBeforeExecute (see page 4061)	Generates an OnBeforeExecute (see page 4066) event.
V	GetResponseStream (see page 4062)	Returns a newly created stream that receives the results of executing a method call.
V	QueryInterface (see page 4063)	Implements the IInterface QueryInterface method.

Public Methods

	Name	Description
V	AfterConstruction (see page 4060)	Updates the reference count after the last constructor has executed.
V	BeforeDestruction (see page 4060)	Prevents the destruction of a TRIO (see page 4056) instance if the reference count is greater than zero.
V	Create (see page 4058)	Creates an instance of TRIO (see page 4056).
V	Destroy (see page 4058)	Destroys the instance of a TRIO (see page 4056) object.
	GetRIO (see page 4069)	Returns the value of the RIO (see page 4069) property.
V	NewInstance (see page 4062)	Allocates memory for each instance of a remote interfaced object.

Public Properties

	Name	Description
	Converter (see page 4063)	Handles the marshaling and unmarshaling of calls to an invokable interface.
R	RefCount (see page 4064)	Maintains a reference count on the use of the TRIO (see page 4056) object's interface.
R	RIO (see page 4069)	Provides access to the remote interfaced object that implements this interface.
R	SOAPHeaders (see page 4064)	Provides access to the headers of SOAP messages that the remote interface object sends or receives.
	WebNode (see page 4065)	Handles the execution of method calls on the invokable interface.

Published Events

	Name	Description
	OnAfterExecute (see page 4065)	Occurs when TRIO (see page 4056) receives the results from executing a method of the invokable interface.
	OnBeforeExecute (see page 4066)	Occurs before TRIO (see page 4056) sends an encoded method call for execution.
	OnGetAttachment (see page 4067)	Occurs when TRIO (see page 4056) reads each attachment included in the results from executing a method of the invokable interface.
	OnSendAttachment (see page 4067)	Occurs when TRIO (see page 4056) sends each attachment that is the value of an argument of the method call on the invokable interface.

70.1.1.2 TRIO.Create Constructor

Creates an instance of TRIO (see page 4056).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRIO(TComponent * AOwner);
```

Description

Call Create to instantiate a TRIO (see page 4056) descendant at runtime. TRIO (see page 4056) descendants added to forms or data modules at design time are created automatically.

The AOwner parameter specifies another component (usually a form or data module) that is responsible for freeing the TRIO (see page 4056) instance. It becomes the value of the Owner property. If the TRIO (see page 4056) instance is created with AOwner set to nil (Delphi) or NULL (C++), then it is automatically freed when its reference count drops to zero.

See Also

RefCount (see page 4064)

Owner

70.1.1.3 TRIO.Destroy Destructor

Destroys the instance of a TRIO (see page 4056) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRIO();
```

Description

There is no need to explicitly free a TRIO (see page 4056) instance.

If the TRIO (see page 4056) object is created with an Owner, then that Owner handles the freeing of the TRIO (see page 4056) instance. If the TRIO (see page 4056) object is created without an Owner, then it is automatically freed when the reference count on its interface drops to zero.

See Also

Create (see page 4058)

Owner

RefCount (see page 4064)

70.1.1.4 TRIO Fields

The fields of the TRIO class are listed here.

Protected Fields

	Name	Description
	FConverter (see page 4059)	This is FConverter, a member of class TRIO.
	FIID (see page 4059)	This is FIID, a member of class TRIO.
	FWebNode (see page 4059)	This is FWebNode, a member of class TRIO.
	IntfMD (see page 4059)	This is IntfMD, a member of class TRIO.

70.1.1.4.1 TRIO.FConverter Field

Pascal

```
FConverter: IOPConvert;
```

C++

```
IOPConvert FConverter;
```

Description

This is FConverter, a member of class TRIO.

70.1.1.4.2 TRIO.FIID Field

Pascal

```
FIID: TGUID;
```

C++

```
TGUID FIID;
```

Description

This is FIID, a member of class TRIO.

70.1.1.4.3 TRIO.FWebNode Field

Pascal

```
FWebNode: IWebNode;
```

C++

```
IWebNode FWebNode;
```

Description

This is FWebNode, a member of class TRIO.

70.1.1.4.4 TRIO.IntfMD Field

Pascal

```
IntfMD: TIntfMetaData;
```

C++

```
TIntfMetaData IntfMD;
```

Description

This is IntfMD, a member of class TRIO.

70.1.1.5 TRIO Methods

The methods of the TRIO class are listed here.

Protected Methods

	Name	Description
	DoAfterExecute (see page 4061)	Generates an OnAfterExecute (see page 4065) event.
	DoBeforeExecute (see page 4061)	Generates an OnBeforeExecute (see page 4066) event.
	GetResponseStream (see page 4062)	Returns a newly created stream that receives the results of executing a method call.
	QueryInterface (see page 4063)	Implements the IInterface QueryInterface method.

Public Methods

	Name	Description
	AfterConstruction (see page 4060)	Updates the reference count after the last constructor has executed.
	BeforeDestruction (see page 4060)	Prevents the destruction of a TRIO (see page 4056) instance if the reference count is greater than zero.
	NewInstance (see page 4062)	Allocates memory for each instance of a remote interfaced object.

70.1.1.5.1 TRIO.AfterConstruction Method

Updates the reference count after the last constructor has executed.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

AfterConstruction is called automatically after the TRIO (see page 4056) object's last constructor has executed. Do not call it explicitly in your applications.

TRIO (see page 4056) overrides the AfterConstruction method to update the RefCount (see page 4064) property. TRIO (see page 4056) artificially increments the reference count when it is first created to prevent changes to the reference count from causing the TRIO (see page 4056) instance to be freed before it is fully instantiated. AfterConstruction returns the reference count back to an appropriate level, now that the constructor is finished.

See Also

RefCount (see page 4064)

Create (see page 4058)

NewInstance (see page 4062)

70.1.1.5.2 TRIO.BeforeDestruction Method

Prevents the destruction of a TRIO (see page 4056) instance if the reference count is greater than zero.

Pascal

```
procedure BeforeDestruction; override;
```

C++

```
virtual __fastcall BeforeDestruction();
```

Description

BeforeDestruction is called automatically before the TRIO (see page 4056) object's first destructor executes. Do not call it explicitly in your applications.

TRIO (see page 4056) overrides the BeforeDestruction method to check the RefCount (see page 4064) property. If RefCount (see page 4064) is greater than zero, then there is still an outstanding reference to the TRIO (see page 4056) object's interface,. and BeforeDestruction raises an exception to prevent the destruction of this object.

See Also

RefCount (see page 4064)

70.1.1.5.3 TRIO.DoAfterExecute Method

Generates an OnAfterExecute (see page 4065) event.

Pascal

```
procedure DoAfterExecute(const MethodName: string; Response: TStream); virtual;
```

C++

```
virtual __fastcall DoAfterExecute(const UnicodeString MethodName, TStream Response);
```

Description

TRIO (see page 4056) calls DoAfterExecute internally after it receives the results of a method call but before it unmarshals those results. This method simply generates an OnAfterExecute (see page 4065) event, passing the MethodName and Response parameters to the event handler. Override this method to perform class-specific actions before or after the OnAfterExecute (see page 4065) event.

MethodName is the name of the method that was just executed on the server.

Response is a stream from that contains the results that the server returned after executing the specified method.

See Also

OnAfterExecute (see page 4065)

70.1.1.5.4 TRIO.DoBeforeExecute Method

Generates an OnBeforeExecute (see page 4066) event.

Pascal

```
procedure DoBeforeExecute(const MethodName: string; Request: TStream); virtual;
```

C++

```
virtual __fastcall DoBeforeExecute(const UnicodeString MethodName, TStream Request);
```

Description

TRIO (see page 4056) calls DoBeforeExecute internally before it sends a SOAP packet to the server for execution. This method simply generates an OnBeforeExecute (see page 4066) event, passing the MethodName parameter and the string in the Request parameter to the event handler. Override this method to perform class-specific actions before or after the OnBeforeExecute (see page 4066) event.

MethodName is the name of the method that the encoded SOAP request calls.

Request is a stream from which the encoded SOAP request packet can be read.

See Also

OnBeforeExecute (see page 4066)

70.1.1.5.5 TRIO.GetResponseStream Method

Returns a newly created stream that receives the results of executing a method call.

Pascal

```
function GetResponseStream(BindingType: TWebServiceBindingType): TStream; virtual;
```

C++

```
virtual __fastcall TStream GetResponseStream(TWebServiceBindingType BindingType);
```

Description

TRIO (see page 4056) calls GetResponseStream internally when it executes a method call. It passes the returned stream as the Response parameter of the Execute method on the interface that the WebNode (see page 4065) property specifies. After this stream receives the encoded response of a method call, the RIO (see page 4069) component decodes the response and frees the stream.

BindingType indicates the expected coding of the response that the stream will hold. GetResponseStream can use this information to determine what type of stream to create.

See Also

Execute

WebNode (see page 4065)

70.1.1.5.6 TRIO.NewInstance Method

Allocates memory for each instance of a remote interfaced object.

Pascal

```
class function NewInstance: TObject; override;
```

C++

```
virtual __fastcall TObject * NewInstance();
```

Description

All constructors call NewInstance automatically. NewInstance calls InstanceSize to determine how much memory to allocate from the heap to contain a particular instance. Do not call NewInstance directly.

TRIO (see page 4056) overrides NewInstance to increment the reference count when a new instance is created. This prevents any constructor from accidentally deleting the instance due to a RefCount (see page 4064) of zero. The AfterConstruction (see page 4060) method decrements the value of RefCount (see page 4064) after all constructors have executed.

See Also

System::TObject::InstanceSize

System::TObject::NewInstance

AfterConstruction (see page 4060)

70.1.1.5.7 TRIO.QueryInterface Method

Implements the IInterface QueryInterface method.

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; override; stdcall;
```

C++

```
virtual __fastcall __stdcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

QueryInterface is called through the IInterface interface to obtain an interface pointer for the interface identified by the IID parameter. In Delphi, this call is generated when an application casts TRIO (see page 4056) to an invokable interface using the as operator.

TRIO (see page 4056) can only return a single type of interface pointer. The first time an application calls QueryInterface, TRIO (see page 4056) generates an in-memory method table to support calls to the methods on the requested interface.

IID specifies the invokable interface that the application wants to call using this TRIO (see page 4056) instance. If the TRIO (see page 4056) object has already been typecast to an interface, then IID must identify that interface. If the TRIO (see page 4056) instance has not yet been typecast to an interface, then IID must be a registered invokable interface.

Obj returns an interface pointer for the specified interface, unless TRIO (see page 4056) was already implementing a different interface or IID identified an interface that was not registered.

QueryInterface returns 0 (S_OK) if Obj successfully returns an interface pointer. It returns E_NOINTERFACE otherwise.

If QueryInterface successfully returns an interface pointer, it automatically increments the reference count.

See Also

InvRegistry (see page 930)

RegisterInterface (see page 864)

RefCount (see page 4064)

70.1.1.6 TRIO Properties

The properties of the TRIO class are listed here.

Public Properties

	Name	Description
	Converter (see page 4063)	Handles the marshaling and unmarshaling of calls to an invokable interface.
R	RefCount (see page 4064)	Maintains a reference count on the use of the TRIO (see page 4056) object's interface.
R	SOAPHeaders (see page 4064)	Provides access to the headers of SOAP messages that the remote interface object sends or receives.
	WebNode (see page 4065)	Handles the execution of method calls on the invokable interface.

70.1.1.6.1 TRIO.Converter Property

Handles the marshaling and unmarshaling of calls to an invokable interface.

Pascal

```
property Converter: IOPConvert;
```

C++

```
__property IOPConvert Converter;
```

Description

TRIO (see page 4056) uses Converter internally to marshal and unmarshal calls to an invokable interface. That is, when the TRIO (see page 4056) object has been typecast to an invokable interface, it implements each method call by using Converter to marshal the call into an encoding protocol, and to unmarshal any return values after that call is executed.

Each TRIO (see page 4056) descendant uses its own protocol-specific helper object as the value of the Converter property.

See Also

WebNode (see page 4065)

TOPToSoapDomConvert (see page 2747)

70.1.1.6.2 TRIO.RefCount Property

Maintains a reference count on the use of the TRIO (see page 4056) object's interface.

Pascal

```
property RefCount: Integer;
```

C++

```
__property int RefCount;
```

Description

RefCount keeps track of the usage on the TRIO (see page 4056) object's interface. RefCount is incremented by the interface's _AddRef method (Delphi) or AddRef method (C++) and decremented by its _Release method (Delphi) or Release method (C++).

If the TRIO (see page 4056) object is created without an Owner, then when RefCount drops to zero, the TRIO (see page 4056) instance is automatically freed.

See Also

QueryInterface (see page 4063)

Create (see page 4058)

_AddRef

_Release

70.1.1.6.3 TRIO.SOAPHeaders Property

Provides access to the headers of SOAP messages that the remote interface object sends or receives.

Pascal

```
property SOAPHeaders: TSOAPHeaders;
```

C++

```
__property TSOAPHeaders SOAPHeaders;
```

Description

SOAPHeaders is a helper object that lets TRIO (see page 4056) support the ISOAPHeaders (see page 923) interface. It has methods to add headers to an outgoing request message and to retrieve the headers from the resulting response message. You can use the SOAPHeaders property directly, or access it through an ISOAPHeaders (see page 923) interface, which is

obtained from the invokable interface using the as operator (Delphi) or the Supports method (C++).

Note: Although TRIO (see page 4056) uses the SOAPHeaders property to implement an ISOAPHeaders (see page 923) interface, you can't obtain an ISOAPHeaders (see page 923) interface directly from TRIO (see page 4056). Rather, you must obtain this interface from an invokable interface.

See Also

ISOAPHeaders (see page 923)

70.1.1.6.4 TRIO.WebNode Property

Handles the execution of method calls on the invokable interface.

Pascal

```
property WebNode: IWebNode;
```

C++

```
__property IWebNode WebNode;
```

Description

TRIO (see page 4056) uses WebNode internally to execute method calls after they have been marshaled by Converter (see page 4063). That is, when the TRIO (see page 4056) object has been typecast to an invokable interface, it implements each method call by using Converter (see page 4063) to marshal the call into an encoding protocol, and then uses WebNode to execute the encoded call.

Each TRIO (see page 4056) descendant uses its own protocol-specific helper object as the value of the WebNode property.

See Also

Converter (see page 4063)

THTTPReqResp

OnAfterExecute (see page 4065)

OnBeforeExecute (see page 4066)

70.1.1.7 TRIO Events

The events of the TRIO class are listed here.

Published Events

	Name	Description
	OnAfterExecute (see page 4065)	Occurs when TRIO (see page 4056) receives the results from executing a method of the invokable interface.
	OnBeforeExecute (see page 4066)	Occurs before TRIO (see page 4056) sends an encoded method call for execution.
	OnGetAttachment (see page 4067)	Occurs when TRIO (see page 4056) reads each attachment included in the results from executing a method of the invokable interface.
	OnSendAttachment (see page 4067)	Occurs when TRIO (see page 4056) sends each attachment that is the value of an argument of the method call on the invokable interface.

70.1.1.7.1 TRIO.OnAfterExecute Event

Occurs when TRIO (see page 4056) receives the results from executing a method of the invokable interface.

Pascal

```
property OnAfterExecute: TAfterExecuteEvent;
```

C++

```
__property TAfterExecuteEvent OnAfterExecute;
```

Description

Write an OnAfterExecute event handler to examine or alter the encoded results from executing a method call. OnAfterExecute occurs after TRIO (see page 4056) calls the Execute method of the interface that the WebNode (see page 4065) property specifies, but before the interface that the Converter (see page 4063) property specifies unmarshals those results.

You can use the SOAPResponse stream of the event handler to alter the encoded results from the server before they are unmarshaled. This lets you compensate for known idiosyncrasies of a server or of the Converter (see page 4063) that is the value of the Converter (see page 4063) property. For example, if the Web Service provider publishes interoperability information, you can use this event to adjust SOAP packets to compensate for differences that the Web Service provider reports.

See Also

OnBeforeExecute (see page 4066)

Execute

WebNode (see page 4065)

Converter (see page 4063)

OnGetAttachment (see page 4067)

70.1.1.7.2 TRIO.OnBeforeExecute Event

Occurs before TRIO (see page 4056) sends an encoded method call for execution.

Pascal

```
property OnBeforeExecute: TBeforeExecuteEvent;
```

C++

```
__property TBeforeExecuteEvent OnBeforeExecute;
```

Description

Write an OnBeforeExecute event handler to examine or alter an encoded method call before it is sent to the server. OnBeforeExecute occurs after the interface that the Converter (see page 4063) property specifies marshals a method call into a SOAP request packet, but before TRIO (see page 4056) calls the Execute method of the interface that the WebNode (see page 4065) property specifies.

You can use the SoapRequest parameter to read or alter the SOAP request before it is passed to the server. For example, if the Web Service provider publishes interoperability information, you can use this parameter to adjust SOAP packets to compensate for differences that the Web Service provider reports.

See Also

OnAfterExecute (see page 4065)

Execute

WebNode (see page 4065)

Converter (see page 4063)

OnSendAttachment (see page 4067)

70.1.1.7.3 TRIO.OnGetAttachment Event

Occurs when TRIO (see page 4056) reads each attachment included in the results from executing a method of the invokable interface.

Pascal

```
property OnGetAttachment: TOnGetAttachmentEvent;
```

C++

```
__property TOnGetAttachmentEvent OnGetAttachment;
```

Description

Write an OnGetAttachment event handler to examine the encoded attachments included in the results from executing a method call or to redirect them so that they are saved to a specific file. OnGetAttachment occurs once for each attachment received in the results from a call to the Execute method of the interface that the WebNode (see page 4065) property specifies. All OnGetAttachment events occur before the OnAfterExecute (see page 4065) event.

See Also

OnAfterExecute (see page 4065)

Execute

WebNode (see page 4065)

70.1.1.7.4 TRIO.OnSendAttachment Event

Occurs when TRIO (see page 4056) sends each attachment that is the value of an argument of the method call on the invokable interface.

Pascal

```
property OnSendAttachment: TOnSendAttachmentEvent;
```

C++

```
__property TOnSendAttachmentEvent OnSendAttachment;
```

Description

Write an OnSendAttachment event handler to examine or alter the attachments that are to be included in a request message that represents a method call. OnSendAttachment occurs once for each attachment sent with the request message to the Web Service provider. All OnSendAttachment events occur after the OnBeforeExecute (see page 4066) event.

See Also

OnBeforeExecute (see page 4066)

Execute

WebNode (see page 4065)

70.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IRIOAccess (see page 4068)	IRIOAccess is the interface for accessing a remote interfaced object from its invokable interface.

70.2.1 IRIOAccess Interface

IRIOAccess is the interface for accessing a remote interfaced object from its invokable interface.

Class Hierarchy

Pascal

```
IRIOAccess = interface;
```

C++

```
__interface IRIOAccess;
```

File

Rio

Description

Remote interfaced objects (TRIO (see page 4056) and its descendants) implement IRIOAccess so that you can access the TRIO (see page 4056) instance given an invokable interface that it implements. This interface defines a single property, RIO (see page 4069), which returns the TRIO (see page 4056) instance that implements it.

Note: C++ method declarations that use IRIOAccess use the _di_IRIOAccess type instead. This type is a DelphiInterface wrapper around the IRIOAccess interface:

Note: typedef System::DelphiInterface< IRIOAccess > _di_IRIOAccess;

See Also

TRIO (see page 4056)

70.2.1.1 IRIOAccess Members

The following tables list the members exposed by IRIOAccess.

Public Methods

	Name	Description
	GetRIO (see page 4069)	Returns the value of the RIO (see page 4069) property.

Public Properties

	Name	Description
	RIO (see page 4069)	Provides access to the remote interfaced object that implements this interface.

70.2.1.2 IRIOAccess Methods

The methods of the IRIOAccess class are listed here.

Public Methods

	Name	Description
	GetRIO (see page 4069)	Returns the value of the RIO (see page 4069) property.

70.2.1.2.1 IRIOAccess.GetRIO Method

Returns the value of the RIO (see page 4069) property.

Pascal

```
function GetRIO: TRIO;
```

C++

```
__fastcall TRIO GetRIO();
```

Description

GetRIO is the read implementation for the RIO (see page 4069) property.

See Also

RIO (see page 4069)

70.2.1.3 IRIOAccess Properties

The properties of the IRIOAccess class are listed here.

Public Properties

	Name	Description
	RIO (see page 4069)	Provides access to the remote interfaced object that implements this interface.

70.2.1.3.1 IRIOAccess.RIO Property

Provides access to the remote interfaced object that implements this interface.

Pascal

```
property RIO: TRIO;
```

C++

```
__property TRIO RIO;
```

Description

Call GetRIO (see page 4069) to access the underlying remote interfaced object. This method is useful when the client of a Web Service uses the automatically-generated function to obtain an invokable interface rather than explicitly creating a TRIO (see page 4056) instance.

70.3 Types

The following table lists types in this documentation.

Types

Name	Description
TAfterExecuteEvent (see page 4070)	TAfterExecuteEvent is the type of event handlers that respond after a remote interfaced object receives the encoded results from executing a method call to a Web Service.
TBeforeExecuteEvent (see page 4070)	TBeforeExecuteEvent is the type of event handlers that respond before a remote interfaced object sends an encoded method call to a Web Service provider.

70.3.1 Rio.TAfterExecuteEvent Type

TAfterExecuteEvent is the type of event handlers that respond after a remote interfaced object receives the encoded results from executing a method call to a Web Service.

Pascal

```
TAfterExecuteEvent = procedure (const MethodName: string; SOAPResponse: TStream) of object;
```

C++

```
(const MethodName: string; SOAPResponse: TStream) ( TAfterExecuteEvent)();
```

File

Rio

Description

TAfterExecuteEvent is the type of the OnAfterExecute event handler, which is called after a client receives the encoded results from executing a method on an invokable interface, but before those results have been unmarshaled.

MethodName is the name of the method that was just executed on the server.

SOAPResponse is a stream from which you can read the encoded results that the server returned after executing the specified method.

See Also

Procedural types

Creating events

70.3.2 Rio.TBeforeExecuteEvent Type

TBeforeExecuteEvent is the type of event handlers that respond before a remote interfaced object sends an encoded method call to a Web Service provider.

Pascal

```
TBeforeExecuteEvent = procedure (const MethodName: string; SOAPRequest: TStream) of object;
```

C++

```
(const MethodName: string; SOAPRequest: TStream) ( TBeforeExecuteEvent)();
```

File

Rio

Description

TBeforeExecuteEvent is the type of the OnBeforeExecute event handler, which is called before a client sends a method call to a Web Service provider, but after it has marshaled the method call into a transportable string.

MethodName is the name of the method that is about to be executed on the server.

SOAPRequest is the text of the SOAP request packet. You can use this parameter to read or alter the SOAP request before it is passed to the server.

See Also

Procedural types

Creating events

70.4 Constants

The following table lists constants in this documentation.

Constants

Name	Description
StubSize (see page 4072)	This is constant Rio.StubSize.

70.4.1 Rio.StubSize Constant

Pascal

```
StubSize = 19;
```

C++

```
StubSize = 19;
```

File

Rio

Description

This is constant Rio.StubSize.
