1 IB Namespace

This is namespace IB.

Topics

Name	Description
Classes (see page 3)	The following table lists classes in this documentation.
Functions (see page 7)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 11)	The following table lists structs, records, enums in this documentation.
Types (see page 17)	The following table lists types in this documentation.
Variables (see page 20)	The following table lists variables in this documentation.
Constants (see page 21)	The following table lists constants in this documentation.

Classes

	Name	Description
	EIBClientError (see page 3)	EIBClientError represents a client-specific error in an InterBase Express application.
	EIBError (see page 3)	EIBError is the exception class for InterBase errors.
	EIBInterBaseError (see page 5)	EIBInterBaseError is used to raise server-specific errors.
	EIBInterBaseRoleError (see page 6)	EIBInterbaseRoleError is the exception class for InterBase errors that arise when a caller's role does not have sufficient rights.

Constants

Name	Description
IBBigLocalBufferLength (see page 21)	This is constant IB.IBBigLocalBufferLength.
IBErrorMessages (see page 21)	This is constant IB.IBErrorMessages.
IBHugeLocalBufferLength (see page 22)	This is constant IB.IBHugeLocalBufferLength.
IBLocalBufferLength (see page 23)	This is constant IB.IBLocalBufferLength.
IBPalette1 (see page 23)	This is constant IB.IBPalette1.
IBPalette2 (see page 23)	This is constant IB.IBPalette2.

Functions

	Name	Description
	CheckStatusVector (see page 7)	Sets or unsets status vector checking.
	GetIBDataBaseErrorMessages (see page 7)	Returns the current error message setting.
	IBAlloc (see page 8)	Allocates or de-allocates memory for a given size, and initializes the new memory to zero.

	IBDataBaseError (see page 8)	Interprets the SQLCode and IBErrorCode status and passes it to the EIBInterBaseError (see page 5) exception.
	IBError (see page 8)	Returns the error message for the specified error code.
	SetIBDataBaseErrorMessages (see page 9)	Enables you to choose the error messages you want to see.
	StatusVector (see page 9)	Retrieves the thread-specific status vector from thread-local storage.
	StatusVectorArray (see page 9)	Returns a pointer to the status vector array.
	StatusVectorAsText (see page 10)	Gets the status vector and returns it as a formatted string.

Structs, Records, Enums

	Name	Description
	TIBClientError (see page 11)	This is record IB.TIBClientError.
	TIBDataBaseErrorMessage (see page 15)	This is record IB.TIBDataBaseErrorMessage.
	TTraceFlag (see page 15)	This is record IB.TTraceFlag.

Types

Name	Description
PStatusVector (see page 17)	This is type IB.PStatusVector.
TIBDataBaseErrorMessages (see page 17)	TIBDataBaseErrorMessage (see page 15) and TIBDataBaseErrorMessages indicate the various strings available to describe an error that an IBX component encountered.
TStatusVector (see page 18)	This is type IB.TStatusVector.
TTraceFlags (see page 18)	TTraceFlag (see page 15) and TTraceFlags indicate the types of messages that pass between an application and the InterBase server.

Variables

Name	Description
IBCS (see page 20)	This is variable IB.IBCS.

1.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EIBClientError (see page 3)	EIBClientError represents a client-specific error in an InterBase Express application.
	EIBError (see page 3)	EIBError is the exception class for InterBase errors.
	EIBInterBaseError (see page 5)	EIBInterBaseError is used to raise server-specific errors.
	EIBInterBaseRoleError (see page 6)	EIBInterbaseRoleError is the exception class for InterBase errors that arise when a caller's role does not have sufficient rights.

1.1.1 EIBClientError Class

EIBClientError represents a client-specific error in an InterBase Express application.

Class Hierarchy

Pascal

```
EIBClientError = class(EIBError);
```

C++

```
class EIBClientError : public EIBError;
```

File

IB

Description

Use EIBClientError to raise an exception for client-specific errors. It is raised when an application tries to use a component improperly. For example, an EIBClientError is raised when a component can't access the database because it does not have an IBDatabase (see page 163) component specified, attempts to edit a read-only dataset, tries to execute an empty query, and so on.

1.1.2 EIBError Class

EIBError is the exception class for InterBase errors.

Class Hierarchy

Pascal

```
EIBError = class(EDatabaseError);
```

C++

```
class EIBError : public EDatabaseError;
```

File

IB

Description

Use EIBError to raise an exception when a component detects an error in the database or in the component implementation. EIBError is the base class for all errors that arise in the use of InterBase Express. Its descendants represent specific types of errors, and include EIBClientError (see page 3), EIBInterBaseError (see page 5), and EIBInterBaseRoleError (see page 6).

1.1.2.1 EIBError Members

The following tables list the members exposed by EIBError.

Public Methods

	Name	Description
	Create (see page 4)	This is the overview for the Create constructor overload.

Public Properties

	Name	Description
R	IBErrorCode (see page 5)	Returns the InterBase error code.
R	SQLCode (see page 5)	Translates an InterBase error code in the error status vector to an SQL error number code.

1.1.2.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	EIBError.Create (Long, Long, string) (see page 4)	Calls the inherited Create and sets the SQLCode (see page 5) and IBErrorCode (see page 5)
	EIBError.Create (Long, string) (see page 4)	Calls the inherited Create and sets the SQLCode (see page 5) and IBErrorCode (see page 5)

1.1.2.2.1 EIBError.Create Constructor (Long, Long, string)

Calls the inherited Create and sets the SQLCode (see page 5) and IBErrorCode (see page 5)

Pascal

```
constructor Create(ASQLCode: Long; Msg: string); overload;
constructor Create(ASQLCode: Long; AIBErrorCode: Long; Msg: string); overload;
```

C++

```
__fastcall EIBError(Long ASQLCode, UnicodeString Msg);
__fastcall EIBError(Long ASQLCode, Long AIBErrorCode, UnicodeString Msg);
```

Description

Note: Use Create to call to the inherited Create and sets the SQL code and IBErrorCode (see page 5).

1.1.2.3 EIBError Properties

The properties of the EIBError class are listed here.

Public Properties

	Name	Description
	IBErrorCode (see page 5)	Returns the InterBase error code.
	SQLCode (see page 5)	Translates an InterBase error code in the error status vector to an SQL error number code.

1.1.2.3.1 EIBError.IBErrorCode Property

Returns the InterBase error code.

Pascal

```
property IBErrorCode: Long;
```

C++

```
__property Long IBErrorCode;
```

Description

Use IBErrorCode to get the InterBase error code.

1.1.2.3.2 EIBError.SQLCode Property

Translates an InterBase error code in the error status vector to an SQL error number code.

Pascal

```
property SQLCode: Long;
```

C++

```
__property Long SQLCode;
```

Description

Translates an InterBase error code in the error status vector to an SQL error number code.

Delphi syntax:

```
property SQLCode: Long;
```

C++ syntax:

```
__property
        int SQLCode = {read=FSQLCode, nodefault};
```

Description

Use SQLCode to translate an InterBase error code in the error status vector to an SQL error number code. Typically, this call is used to populate a program variable with an SQL error number for use in an SQL error-handling routine.

1.1.3 EIBInterBaseError Class

EIBInterBaseError is used to raise server-specific errors.

Class Hierarchy

Pascal

```
EIBInterBaseError = class(EIBError);
```

C++

```
class EIBInterBaseError : public EIBError;
```

File

IB

Description

Use EIBInterBaseError to raise an exception that represents an error code that the InterBase server returns.

1.1.4 EIBInterBaseRoleError Class

EIBInterbaseRoleError is the exception class for InterBase errors that arise when a caller's role does not have sufficient rights.

Class Hierarchy

Pascal

```
EIBInterBaseRoleError = class(EIBError);
```

C++

```
class EIBInterBaseRoleError : public EIBError;
```

File

IB

Description

EIBInterbaseRoleError is raised when InterBase reports failure due to an incorrect role.

1.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	CheckStatusVector (see page 7)	Sets or unsets status vector checking.
	GetIBDataBaseErrorMessages (see page 7)	Returns the current error message setting.
	IBAlloc (see page 8)	Allocates or de-allocates memory for a given size, and initializes the new memory to zero.
	IBDataBaseError (see page 8)	Interprets the SQLCode and IBErrorCode status and passes it to the EIBInterBaseError (see page 5) exception.
	IBError (see page 8)	Returns the error message for the specified error code.
	SetIBDataBaseErrorMessages (see page 9)	Enables you to choose the error messages you want to see.
	StatusVector (see page 9)	Retrieves the thread-specific status vector from thread-local storage.
	StatusVectorArray (see page 9)	Returns a pointer to the status vector array.
	StatusVectorAsText (see page 10)	Gets the status vector and returns it as a formatted string.

1.2.1 IB.CheckStatusVector Function

Sets or unsets status vector checking.

Pascal

```
function CheckStatusVector(ErrorCodes: array of ISC_STATUS): Boolean;
```

C++

```
Boolean CheckStatusVector(array of ISC_STATUS ErrorCodes);
```

File

IB

Description

Set CheckStatusVector to true to enable status vector checking.

1.2.2 IB.GetIBDataBaseErrorMessages Function

Returns the current error message setting.

Pascal

```
function GetIBDataBaseErrorMessages: TIBDataBaseErrorMessages;
```

C++

```
TIBDataBaseErrorMessages GetIBDataBaseErrorMessages();
```

File

IB

Description

Use the GetIBDataBaseErrorMessages function to return the current error message setting.

1.2.3 IB.IBAlloc Function

Allocates or de-allocates memory for a given size, and initializes the new memory to zero.

Pascal

```
procedure IBAlloc(var P; OldSize: Integer; NewSize: Integer);
```

C++

```
IBAlloc( P, int OldSize, int NewSize);
```

File

IB

Description

Use IBAlloc to allocate or de-allocate memory for a given size, and initialize the new memory to zero.

1.2.4 IB.IBDataBaseError Function

Interprets the SQLCode and IBErrorCode status and passes it to the EIBInterBaseError (see page 5) exception.

Pascal

```
procedure IBDataBaseError;
```

C++

```
IBDataBaseError();
```

File

IB

Description

Use the IBDataBaseError procedure to look at the status vector, interpret the SQLCode and IBErrorCode status, construct the status string, and pass it to the EIBInterBaseError (see page 5) exception.

1.2.5 IB.IBError Function

Returns the error message for the specified error code.

Pascal

```
procedure IBError(ErrMess: TIBClientError; const Args: array of const);
```

C++

```
IBError(TIBClientError ErrMess, const array of const Args);
```

File

IB

Description

Use the IBError procedure to look up the appropriate error message for a specified error code and raise an EIBClientError (see page 3) exception.

1.2.6 IB.SetIBDataBaseErrorMessages Function

Enables you to choose the error messages you want to see.

Pascal

```
procedure SetIBDataBaseErrorMessages(Value: TIBDataBaseErrorMessages);
```

C++

```
SetIBDataBaseErrorMessages(TIBDataBaseErrorMessages Value);
```

File

IB

Description

Use the SetIBDataBaseErrorMessages procedure to choose the error messages that you want to use. The available options are defined in TIBDataBaseErrorMessages (see page 17).

1.2.7 IB.StatusVector Function

Retrieves the thread-specific status vector from thread-local storage.

Pascal

```
function StatusVector: PISC_STATUS;
```

C++

```
PISC_STATUS StatusVector();
```

File

IB

Description

Use the StatusVector function to retrieve the thread-specific status from the thread-local storage.

1.2.8 IB.StatusVectorArray Function

Returns a pointer to the status vector array.

Pascal

```
function StatusVectorArray: PStatusVector;
```

C++

```
PStatusVector StatusVectorArray();
```

File

IB

Description

Use the StatusVectorArray function to return a pointer to the status vector array from the thread-local storage.

1.2.9 IB.StatusVectorAsText Function

Gets the status vector and returns it as a formatted string.

Pascal

```
function StatusVectorAsText: string;
```

C++

```
UnicodeString StatusVectorAsText();
```

File

IB

Description

Use the StatusVector (see page 9) function to retrieve the status vector and return it as a formatted string.

1.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TIBClientError (see page 11)	This is record IB.TIBClientError.
	TIBDataBaseErrorMessage (see page 15)	This is record IB.TIBDataBaseErrorMessage.
	TTraceFlag (see page 15)	This is record IB.TTraceFlag.

1.3.1 IB.TIBClientError Enumeration

Pascal

```
TIBClientError = (
  ibxeUnknownError,
  ibxeInterBaseMissing,
  ibxeInterBaseInstallMissing,
  ibxeIB60feature,
  ibxeNotSupported,
  ibxeNotPermitted,
  ibxeFileAccessError,
  ibxeConnectionTimeout,
  ibxeCannotSetDatabase,
  ibxeCannotSetTransaction,
  ibxeOperationCancelled,
  ibxeDPBConstantNotSupported,
  ibxeDPBConstantUnknown,
  ibxeTPBConstantNotSupported,
  ibxeTPBConstantUnknown,
  ibxeDatabaseClosed,
  ibxeDatabaseOpen,
  ibxeDatabaseNameMissing,
  ibxeNotInTransaction,
  ibxeInTransaction,
  ibxeTimeoutNegative,
  ibxeNoDatabasesInTransaction,
  ibxeUpdateWrongDB,
  ibxeUpdateWrongTR,
  ibxeDatabaseNotAssigned,
  ibxeTransactionNotAssigned,
  ibxeXSQLDAIndexOutOfRange,
  ibxeXSQLDANameDoesNotExist,
  ibxeEOF,
  ibxeBOF,
  ibxeInvalidStatementHandle,
  ibxeSQLOpen,
  ibxeSQLClosed,
  ibxeDatasetOpen,
  ibxeDatasetClosed,
  ibxeUnknownSQLDataType,
  ibxeInvalidColumnIndex,
  ibxeInvalidParamColumnIndex,
  ibxeInvalidDataConversion,
  ibxeColumnIsNotNullable,
  ibxeBlobCannotBeRead,
```

```
    ibxeBlobCannotBeWritten,
    ibxeEmptyQuery,
    ibxeCannotOpenNonSQLSelect,
    ibxeNoFieldAccess,
    ibxeFieldReadOnly,
    ibxeFieldNotFound,
    ibxeNotEditing,
    ibxeCannotInsert,
    ibxeCannotPost,
    ibxeCannotUpdate,
    ibxeCannotDelete,
    ibxeCannotRefresh,
    ibxeBufferNotSet,
    ibxeCircularReference,
    ibxeSQLParseError,
    ibxeUserAbort,
    ibxeDataSetUniDirectional,
    ibxeCannotCreateSharedResource,
    ibxeWindowsAPIError,
    ibxeColumnListsDontMatch,
    ibxeColumnTypesDontMatch,
    ibxeCantEndSharedTransaction,
    ibxeFieldUnsupportedType,
    ibxeCircularDataLink,
    ibxeEmptySQLStatement,
    ibxeIsASelectStatement,
    ibxeRequiredParamNotSet,
    ibxeNoStoredProcName,
    ibxeIsAExecuteProcedure,
    ibxeUpdateFailed,
    ibxeNotCachedUpdates,
    ibxeNotLiveRequest,
    ibxeNoProvider,
    ibxeNoRecordsAffected,
    ibxeNoTableName,
    ibxeCannotCreatePrimaryIndex,
    ibxeCannotDropSystemIndex,
    ibxeTableNameMismatch,
    ibxeIndexFieldMissing,
    ibxeInvalidCancellation,
    ibxeInvalidEvent,
    ibxeMaximumEvents,
    ibxeNoEventsRegistered,
    ibxeInvalidQueueing,
    ibxeInvalidRegistration,
    ibxeInvalidBatchMove,
    ibxeSQLDialectInvalid,
    ibxeSPBConstantNotSupported,
    ibxeSPBConstantUnknown,
    ibxeServiceActive,
    ibxeServiceInActive,
    ibxeServerNameMissing,
    ibxeQueryParamsError,
    ibxeStartParamsError,
    ibxeOutputParsingError,

    ibxeInvalidOption,
    ibxeInvalidOnErrorResult,
    ibxeInvalidOnStatusResult,
    ibxeDPBConstantUnknownEx,
```

```
    ibxeTPBConstantUnknownEx,
    ibxeUnknownPlan,
    ibxeFieldSizeMismatch,
    ibxeEventAlreadyRegistered,
    ibxeStringTooLarge
  };
```

File

IB

Description

This is record IB.TIBClientError.

1.3.2 IB.TIBDataBaseErrorMessage Enumeration

Pascal

```
  TIBDataBaseErrorMessage = (
    ShowSQLCode,
    ShowIBMessage,
    ShowSQLMessage
  );
```

C++

```
  enum TIBDataBaseErrorMessage {
    ShowSQLCode,
    ShowIBMessage,
    ShowSQLMessage
  };
```

File

IB

Description

This is record IB.TIBDataBaseErrorMessage.

1.3.3 IB.TTraceFlag Enumeration

Pascal

```
  TTraceFlag = (
    tfQPrepare,
    tfQExecute,
    tfQFetch,
    tfError,
    tfStmt,
    tfConnect,
    tfTransact,
    tfBlob,
    tfService,
    tfMisc
  );
```

C++

```
  enum TTraceFlag {
    tfQPrepare,
```

```
    tfQExecute,
    tfQFetch,
    tfError,
    tfStmt,
    tfConnect,
    tfTransact,
    tfBlob,
    tfService,
    tfMisc
  };
```

File

IB

Description

This is record IB.TTraceFlag.

1.4 Types

The following table lists types in this documentation.

Types

Name	Description
PStatusVector (see page 17)	This is type IB.PStatusVector.
TIBDataBaseErrorMessages (see page 17)	TIBDataBaseErrorMessage (see page 15) and TIBDataBaseErrorMessages indicate the various strings available to describe an error that an IBX component encountered.
TStatusVector (see page 18)	This is type IB.TStatusVector.
TTraceFlags (see page 18)	TTraceFlag (see page 15) and TTraceFlags indicate the types of messages that pass between an application and the InterBase server.

1.4.1 IB.PStatusVector Type

Pascal

```
PStatusVector = ^TStatusVector;
```

C++

```
^TStatusVector PStatusVector;
```

File

IB

Description

This is type IB.PStatusVector.

1.4.2 IB.TIBDataBaseErrorMessages Type

TIBDataBaseErrorMessage (see page 15) and TIBDataBaseErrorMessages indicate the various strings available to describe an error that an IBX component encountered.

Pascal

```
TIBDataBaseErrorMessages = set of TIBDataBaseErrorMessage;
```

C++

```
TIBDataBaseErrorMessage TIBDataBaseErrorMessages;
```

File

IB

Description

TIBDataBaseErrorMessages is a set of TIBDataBaseErrorMessage (see page 15) values. The following table lists the possible values:

Value Meaning

ShowSQLCode The SQL code that the server was trying to execute when the error occurred.

ShowIBMessage The error message InterBase provides for the error.

ShowSQLMessage The error message that describes what part of the SQL code caused the error.

1.4.3 IB.TStatusVector Type

Pascal

```
TStatusVector = array[0..19] of ISC_STATUS;
```

C++

```
array[0..19] of ISC_STATUS TStatusVector;
```

File

IB

Description

This is type IB.TStatusVector.

1.4.4 IB.TTraceFlags Type

TTraceFlag (see page 15) and TTraceFlags indicate the types of messages that pass between an application and the InterBase server.

Pascal

```
TTraceFlags = set of TTraceFlag;
```

C++

```
TTraceFlag TTraceFlags;
```

File

IB

Description

TTraceFlags is a set of TTraceFlag (see page 15) values. The following table lists the possible values:

Values Meaning

tfQPrepare Monitor Prepare statements.

tfQExecute Monitor ExecSQL statements.

tfError Monitor server error messages. Such messages may include an error code.

tfStmt Monitor all SQL statements.

tfConnect Monitor database connect and disconnect operations, including allocation of connection handles, and freeing connection handles.

tfTransact Monitor transaction statements, such as StartTransaction, Commit, and Rollback.

tfBlob Monitor operations on blob data types.

tfService Monitor messages to one of the IB (see page 1) services.

tfMisc Monitor any statements not covered by other flag options.

1.5 Variables

The following table lists variables in this documentation.

Variables

Name	Description
IBCS (see page 20)	This is variable IB.IBCS.

1.5.1 IB.IBCS Variable

Pascal

```
IBCS: TRTLCriticalSection;
```

C++

```
TRTLCriticalSection IBCS;
```

File

IB

Description

This is variable IB.IBCS.

1.6 Constants

The following table lists constants in this documentation.

Constants

Name	Description
IBBigLocalBufferLength (see page 21)	This is constant IB.IBBigLocalBufferLength.
IBErrorMessages (see page 21)	This is constant IB.IBErrorMessages.
IBHugeLocalBufferLength (see page 22)	This is constant IB.IBHugeLocalBufferLength.
IBLocalBufferLength (see page 23)	This is constant IB.IBLocalBufferLength.
IBPalette1 (see page 23)	This is constant IB.IBPalette1.
IBPalette2 (see page 23)	This is constant IB.IBPalette2.

1.6.1 IB.IBBigLocalBufferLength Constant

Pascal

```
IBBigLocalBufferLength = IBLocalBufferLength * 2;
```

C++

```
IBBigLocalBufferLength = IBLocalBufferLength * 2;
```

File

IB

Description

This is constant IB.IBBigLocalBufferLength.

1.6.2 IB.IBErrorMessages Constant

Pascal

```
IBErrorMessages: array[TIBClientError] of string = ( SUnknownError, SInterBaseMissing,
SInterBaseInstallMissing, SIB60feature, SNotSupported, SNotPermitted, SFileAccessError,
SConnectionTimeout, SCannotSetDatabase, SCannotSetTransaction, SOperationCancelled,
SDPBConstantNotSupported, SDPBConstantUnknown, STPBConstantNotSupported, STPBConstantUnknown,
SDatabaseClosed, SDatabaseOpen, SDatabaseNameMissing, SNotInTransaction, SInTransaction,
STimeoutNegative, SNoDatabasesInTransaction, SUpdateWrongDB, SUpdateWrongTR,
SDatabaseNotAssigned, STransactionNotAssigned, SXSQLDAIndexOutOfRange,
SXSQLDANameDoesNotExist, SEOF, SBOF, SInvalidStatementHandle, SSQLOpen, SSQLClosed,
SDatasetOpen, SDatasetClosed, SUnknownSQLDataType, SInvalidColumnIndex,
SInvalidParamColumnIndex, SInvalidDataConversion, SColumnIsNotNullable, SBlobCannotBeRead,
SBlobCannotBeWritten, SEmptyQuery, SCannotOpenNonSQLSelect, SNoFieldAccess, SFieldReadOnly,
SFieldNotFound, SNotEditing, SCannotInsert, SCannotPost, SCannotUpdate, SCannotDelete,
SCannotRefresh, SBufferNotSet, SCircularReference, SSQLParseError, SUserAbort,
SDataSetUniDirectional, SCannotCreateSharedResource, SWindowsAPIError, SColumnListsDontMatch,
SColumnTypesDontMatch, SCantEndSharedTransaction, SFieldUnsupportedType, SCircularDataLink,
SEmptySQLStatement, SIsASelectStatement, SRequiredParamNotSet, SNoStoredProcName,
SIsAExecuteProcedure, SUpdateFailed, SNotCachedUpdates, SNotLiveRequest, SNoProvider,
SNoRecordsAffected, SNoTableName, SCannotCreatePrimaryIndex, SCannotDropSystemIndex,
```

```
  STableNameMismatch, SIndexFieldMissing, SInvalidCancellation, SInvalidEvent, SMaximumEvents,
  SNoEventsRegistered, SInvalidQueueing, SInvalidRegistration, SInvalidBatchMove,
  SSQLDialectInvalid, SSPBConstantNotSupported, SSPBConstantUnknown, SServiceActive,
  SServiceInActive, SServerNameMissing, SQueryParamsError, SStartParamsError,
  SOutputParsingError, SUseSpecificProcedures, SSQLMonitorAlreadyPresent, SCantPrintValue,
  SEOFReached, SEOFInComment, SEOFInString, SParamNameExpected, SSuccess, SDelphiException,
  SNoOptionsSet, SNoDestinationDirectory, SNosourceDirectory, SNoUninstallFile,
  SOptionNeedsClient, SOptionNeedsServer, SInvalidOption, SInvalidOnErrorResult,
  SInvalidOnStatusResult, SDPBConstantUnknownEx, STPBConstantUnknownEx, SUnknownPlan,
  SFieldSizeMismatch, SEventAlreadyRegistered, SStringTooLarge );
```

C++

```
  array[TIBClientError] of string IBErrorMessages = ( SUnknownError, SInterBaseMissing,
  SInterBaseInstallMissing, SIB60feature, SNotSupported, SNotPermitted, SFileAccessError,
  SConnectionTimeout, SCannotSetDatabase, SCannotSetTransaction, SOperationCancelled,
  SDPBConstantNotSupported, SDPBConstantUnknown, STPBConstantNotSupported, STPBConstantUnknown,
  SDatabaseClosed, SDatabaseOpen, SDatabaseNameMissing, SNotInTransaction, SInTransaction,
  STimeoutNegative, SNoDatabasesInTransaction, SUpdateWrongDB, SUpdateWrongTR,
  SDatabaseNotAssigned, STransactionNotAssigned, SXSQLDAIndexOutOfRange,

1.6.3 IB.IBHugeLocalBufferLength Constant

Pascal

```
  IBHugeLocalBufferLength = IBBigLocalBufferLength * 20;
```

C++

```
  IBHugeLocalBufferLength = IBBigLocalBufferLength * 20;
```

File

IB

Description

This is constant IB.IBHugeLocalBufferLength.

1.6.4 IB.IBLocalBufferLength Constant

Pascal

```
IBLocalBufferLength = 512;
```

C++

```
IBLocalBufferLength = 512;
```

File

IB

Description

This is constant IB.IBLocalBufferLength.

1.6.5 IB.IBPalette1 Constant

Pascal

```
IBPalette1 = 'InterBase';
```

C++

```
IBPalette1 = 'InterBase';
```

File

IB

Description

This is constant IB.IBPalette1.

1.6.6 IB.IBPalette2 Constant

Pascal

```
IBPalette2 = 'InterBase Admin';
```

C++

```
IBPalette2 = 'InterBase Admin';
```

File

IB

Description

This is constant IB.IBPalette2.

2 IBBatchMove Namespace

This is namespace IBBatchMove.

Topics

Name	Description
Classes (see page 26)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 38)	The following table lists structs, records, enums in this documentation.

Classes

	Name	Description
	TIBBatchMove (see page 26)	TIBBatchMove enables applications to perform database operations on groups of records or entire tables.

Structs, Records, Enums

	Name	Description
	TBatchMode (see page 38)	This is record IBBatchMove.TBatchMode.

2.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TIBBatchMove (see page 26)	TIBBatchMove enables applications to perform database operations on groups of records or entire tables.

2.1.1 TIBBatchMove Class

TIBBatchMove enables applications to perform database operations on groups of records or entire tables.

Class Hierarchy

Pascal

```
TIBBatchMove = class(TComponent);
```

C++

```
class TIBBatchMove : public TComponent;
```

File

IBBatchMove

Description

Set the properties of the TIBBatchMove object to

- Add the records in a dataset to a database table.
- Delete the records in a dataset from a database table.
- Copy a dataset to create a new database table or overwrite an existing table.

Call the Execute (see page 28) method to perform the actual operation. TIBTable (see page 600) objects can also perform the same batch operations, but only with the options specified by the default TIBBatchMove property values.

2.1.1.1 TIBBatchMove Members

The following tables list the members exposed by TIBBatchMove.

Protected Methods

	Name	Description
	Notification (see page 29)	Forwards notification messages to all owned components.

Public Methods

	Name	Description
	Create (see page 27)	Creates an instance of TIBBatchMove (see page 26).
	Destroy (see page 28)	Destroys an instance of TIBBatchMove (see page 26).

	Execute (see page 28)	Performs the batch operation specified by Mode (see page 34).

Public Properties

	Name	Description
R	ChangedCount (see page 31)	Indicates the number of records from the Destination (see page 32) table that are altered as a result of the batch operation.
R	KeyViolCount (see page 32)	Reports the number of records that could not be replaced, added, or deleted from Destination (see page 32) because of integrity or key violations.
R	MovedCount (see page 34)	Reports the number of records form the Source (see page 36) which were applied to the destination.
R	ProblemCount (see page 35)	Indicates the number of records which could not be added to Destination (see page 32) without loss of data due to a field type mismatch.

Published Properties

	Name	Description
	AbortOnKeyViol (see page 30)	Specifies whether the batch operation is terminated immediately when integrity or key violations occur.
	AbortOnProblem (see page 30)	Specifies whether the batch operation is terminated immediately when it is necessary to truncate data to make it fit in the specified Destination (see page 32).
	ChangedTableName (see page 31)	Specifies the name of a local Interbase table that is created to hold copies of all records from the destination table that are changed by the batch operation.
	CommitCount (see page 31)	Specifies how many records are batch moved before a commit occurs.
	Destination (see page 32)	Specifies the TIBTable (see page 600) object for the database table that is the destination of the batch operation.
	KeyViolTableName (see page 33)	Specifies the name of an InterBase table that will be created to contain all records from the Source (see page 36) that cannot participate in the batch operation because of integrity or key violations.
	Mappings (see page 33)	Specifies the column mappings for a batch operation.
	Mode (see page 34)	Specifies what the TIBBatchMove (see page 26) object does when the Execute (see page 28) method is called.
	ProblemTableName (see page 35)	Specifies the name of a Interbase table that will be created to contain all records from the Source (see page 36) that contain fields which were trimmed to match the corresponding field type in the Destination (see page 32) table.
	RecordCount (see page 36)	Specifies the maximum number of records that are applied to the Destination (see page 32) when Execute (see page 28) is called.
	Source (see page 36)	Specifies the dataset that is the source of the batch operation.
	Transliterate (see page 37)	Specifies whether the data in the Source (see page 36) records should be converted form the locale of the Source (see page 36) to the locale of the Destination (see page 32) when the Execute (see page 28) method is called.

2.1.1.2 TIBBatchMove.Create Constructor

Creates an instance of TIBBatchMove (see page 26).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBBatchMove(TComponent * AOwner);
```

Description

Call Create to create an instance of TIBBatchMove (see page 26) for performing a batch operation. Create allocates the memory for the TIBBatchMove (see page 26) object and

- Sets AbortOnKeyViol (see page 30) to True.
- Sets AbortOnProblem (see page 30) to True.
- Sets Transliterate (see page 37) to True.

- Creates a TStringList object to hold the Mappings (see page 33).

The property settings made by Create are the values used when a TIBTable (see page 600) object performs batch operations using its BatchMove method.

2.1.1.3 TIBBatchMove.Destroy Destructor

Destroys an instance of TIBBatchMove (see page 26).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBBatchMove();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TIBBatchMove (see page 26) object is not already freed and only then calls Destroy.

Before calling the inherited destructor, Destroy frees the TStringList object that implements the Mappings (see page 33) property.

2.1.1.4 TIBBatchMove Methods

The methods of the TIBBatchMove class are listed here.

Protected Methods

	Name	Description
	Notification (see page 29)	Forwards notification messages to all owned components.

Public Methods

	Name	Description
	Execute (see page 28)	Performs the batch operation specified by Mode (see page 34).

2.1.1.4.1 TIBBatchMove.Execute Method

Performs the batch operation specified by Mode (see page 34).

Pascal

```
procedure Execute;
```

C++

```
__fastcall Execute();
```

Description

After setting properties to indicate what batch operation should be performed and how, call Execute to perform the operation. As a minimum, the Mode (see page 34), Source (see page 36), and Destination (see page 32) properties must be set.

After calling Execute, the values of the ChangedCount (see page 31), KeyViolCount (see page 32), MovedCount (see page 34), ProblemCount (see page 35), and RecordCount (see page 36) properties will become available. These properties will give an indication of what happened as a result of the call to Execute. Additional information about the batch operation will be available through the creation of a changed table, a keyviol table, and/or a problems table if it was requested.

2.1.1.4.2 TIBBatchMove.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

2.1.1.5 TIBBatchMove Properties

The properties of the TIBBatchMove class are listed here.

Public Properties

	Name	Description
R	ChangedCount (see page 31)	Indicates the number of records from the Destination (see page 32) table that are altered as a result of the batch operation.
R	KeyViolCount (see page 32)	Reports the number of records that could not be replaced, added, or deleted from Destination (see page 32) because of integrity or key violations.
R	MovedCount (see page 34)	Reports the number of records form the Source (see page 36) which were applied to the destination.
R	ProblemCount (see page 35)	Indicates the number of records which could not be added to Destination (see page 32) without loss of data due to a field type mismatch.

Published Properties

	Name	Description
	AbortOnKeyViol (see page 30)	Specifies whether the batch operation is terminated immediately when integrity or key violations occur.
	AbortOnProblem (see page 30)	Specifies whether the batch operation is terminated immediately when it is necessary to truncate data to make it fit in the specified Destination (see page 32).
	ChangedTableName (see page 31)	Specifies the name of a local Interbase table that is created to hold copies of all records from the destination table that are changed by the batch operation.
	CommitCount (see page 31)	Specifies how many records are batch moved before a commit occurs.
	Destination (see page 32)	Specifies the TIBTable (see page 600) object for the database table that is the destination of the batch operation.

	KeyViolTableName (see page 33)	Specifies the name of an InterBase table that will be created to contain all records from the Source (see page 36) that cannot participate in the batch operation because of integrity or key violations.
	Mappings (see page 33)	Specifies the column mappings for a batch operation.
	Mode (see page 34)	Specifies what the TIBBatchMove (see page 26) object does when the Execute (see page 28) method is called.
	ProblemTableName (see page 35)	Specifies the name of a Interbase table that will be created to contain all records from the Source (see page 36) that contain fields which were trimmed to match the corresponding field type in the Destination (see page 32) table.
	RecordCount (see page 36)	Specifies the maximum number of records that are applied to the Destination (see page 32) when Execute (see page 28) is called.
	Source (see page 36)	Specifies the dataset that is the source of the batch operation.
	Transliterate (see page 37)	Specifies whether the data in the Source (see page 36) records should be converted form the locale of the Source (see page 36) to the locale of the Destination (see page 32) when the Execute (see page 28) method is called.

2.1.1.5.1 TIBBatchMove.AbortOnKeyViol Property

Specifies whether the batch operation is terminated immediately when integrity or key violations occur.

Pascal

```
property AbortOnKeyViol: Boolean;
```

C++

```
__property Boolean AbortOnKeyViol;
```

Description

Set AbortOnKeyViol to true (the default) to cancel the batch operation when it causes integrity or key violations in the destination table. Set AbortOnKeyViol to false to cause records that would cause integrity or key violations to be posted to a key violations table instead. Provide a KeyViolTableName (see page 33) when setting AbortOnKeyViol to false. If there is no KeyViolTableName (see page 33), AbortOnKeyViol may still be set to false, in which case problem records are counted but not saved in a table.

Key violations occur when appending records to a table that has a primary key. On a table with a primary key, no two records may have the same values on all of the key fields. If a record that is being appended has the same values on all the key fields as a record in the destination table, it cannot be appended.

Integrity violations occur when deleting, appending or updating records to a table that has a referential integrity specification. A referential integrity specification requires that certain fields in one table must have values that exist in a particular field of another table. If a record that is being added does not match the restrictions imposed by referential integrity, it cannot be added. If deleting record would cause tighter referential integrity restrictions that another table cannot meet, it cannot be deleted.

2.1.1.5.2 TIBBatchMove.AbortOnProblem Property

Specifies whether the batch operation is terminated immediately when it is necessary to truncate data to make it fit in the specified Destination (see page 32).

Pascal

```
property AbortOnProblem: Boolean;
```

C++

```
__property Boolean AbortOnProblem;
```

Description

Set AbortOnProblem to true to cancel the batch operation when types of the fields in the Source (see page 36) table records do not match the types of the fields in the Destination (see page 32) table records. Set AbortOnProblem to false to cause the

mismatched fields to be 'trimmed'. When AbortOnProblem is false, set the ProblemTableName (see page 35) to have all the untrimmed versions of records that were trimmed saved to a separate table.

Trimming a field means converting its value to a value compatible with the destination field type. For example, if a field in the destination table holds a string of size 10 characters, and the corresponding field in the source table holds a string of size 15 characters, any values from the source table longer than 10 characters must be truncated. Values that cannot be converted will cause TIBBatchMove (see page 26) to raise an exception.

Trimming does not occur when the Mode (see page 34) property is set to batCopy. Trimming fields on a delete operation means that records in the destination table that do not exactly match the values from the source table may be deleted.

2.1.1.5.3 TIBBatchMove.ChangedCount Property

Indicates the number of records from the Destination (see page 32) table that are altered as a result of the batch operation.

Pascal

```
property ChangedCount: Longint;
```

C++

```
__property Longint ChangedCount;
```

Description

Use ChangedCount to learn the number of records in the Destination (see page 32) table that are updated when the Mode (see page 34) is batUpdate or batAppendUpdate, or to learn the number that are deleted when the Mode (see page 34) is batDelete.

Set the ChangedTableName (see page 31) property to save the unchanged versions of the altered records to a separate table. ChangedCount is then the number of records in that separate table.

2.1.1.5.4 TIBBatchMove.ChangedTableName Property

Specifies the name of a local Interbase table that is created to hold copies of all records from the destination table that are changed by the batch operation.

Pascal

```
property ChangedTableName: TFileName;
```

C++

```
__property TFileName ChangedTableName;
```

Description

Set ChangedTableName to create a table that saves all unchanged versions of records that are changed by the batch operation. ChangedTableName must specify the name of a Interbase table. Setting ChangedTableName ensures that no information in the Destination (see page 32) table gets lost when the records are altered or deleted.

When the Mode (see page 34) property is batUpdate or batAppendUpdate, the new table will hold all records that were updated. When the Mode (see page 34) property is batDelete, the new table will hold all records that were deleted.

The ChangedCount (see page 31) property specifies the number of records in the new table.

2.1.1.5.5 TIBBatchMove.CommitCount Property

Specifies how many records are batch moved before a commit occurs.

Pascal

```
property CommitCount: Integer;
```

C++

```
__property int CommitCount;
```

Description

Use CommitCount to chunk batch operations into smaller operations. CommitCount allows an application to accommodate server transaction logs that are not big enough to handle the entire batch. Setting CommitCount to 0 will cause chunking into the number of records that will fit in 32K bytes.

Note: If the Execute (see page 28) method is called within an explicit transaction on the database containing the tables, CommitCount is ignored.

2.1.1.5.6 TIBBatchMove.Destination Property

Specifies the TIBTable (see page 600) object for the database table that is the destination of the batch operation.

Pascal

```
property Destination: TIBTable;
```

C++

```
__property TIBTable Destination;
```

Description

Use Destination to indicate the database table that will be created or altered by the batch operation. The batch operation affects the Destination differently depending on the Mode (see page 34):

Mode (see page 34) Effect on Destination

- batAppend Records are added to the destination table. No pre-existing records are altered. The destination table must already exist.
- batUpdate Records in the destination table with key fields matching the corresponding fields in the source are changed to match the source records. No new records are added. The destination table must already exist and must have an index defined.
- batAppendUpdate Records in the destination table with key fields matching the corresponding fields in the source are changed to match the source. Source (see page 36) records that do not match key fields are added to the destination table. The destination table must already exist and must have an index defined.
- batDelete Records in the destination table that match the records in the source are deleted. The destination table must already exist and must have an index defined.
- batCopy The destination table is created to match the records in the source. If Destination already exists, it is replaced by the copy of the source.

2.1.1.5.7 TIBBatchMove.KeyViolCount Property

Reports the number of records that could not be replaced, added, or deleted from Destination (see page 32) because of integrity or key violations.

Pascal

```
property KeyViolCount: Longint;
```

C++

```
__property Longint KeyViolCount;
```

Description

Use KeyViolCount to learn the number of records form the Source (see page 36) table that could not be applied to the Destination (see page 32) table because of integrity or key violations. To obtain a table of the offending records from the Source (see page 36) table, specify a KeyViolTableName (see page 33).

Key violations occur when appending records to a table that has a primary key. On a table with a primary key, no two records may have the same values on all of the key fields. If a record that is being appended has the same values on all the key fields as a record in the destination table, it cannot be appended.

Integrity violations occur when deleting, appending or updating records to a table that has a referential integrity specification. A referential integrity specification requires that certain fields in one table must have values that exist in a particular field of another table. If a record that is being added does not match the restrictions imposed by referential integrity, it cannot be added. If deleting record would cause tighter referential integrity restrictions that another table cannot meet, it cannot be deleted.

Note: If AbortOnKeyViol (see page 30) is true, KeyViolCount will never be greater than one, because the first violation will cause the batch operation to terminate.

2.1.1.5.8 TIBBatchMove.KeyViolTableName Property

Specifies the name of an InterBase table that will be created to contain all records from the Source (see page 36) that cannot participate in the batch operation because of integrity or key violations.

Pascal

```
property KeyViolTableName: TFileName;
```

C++

```
__property TFileName KeyViolTableName;
```

Description

Use KeyViolTableName to obtain a table of records that could not be applied to the Destination (see page 32) table because of integrity or key violations. KeyViolCount (see page 32) has the number of records in the table that is created.

Key violations occur when appending records to a table that has a primary key. On a table with a primary key, no two records may have the same values on all of the key fields. If a record that is being appended has the same values on all the key fields as a record in the destination table, it cannot be appended.

Integrity violations occur when deleting, appending or updating records to a table that has a referential integrity specification. A referential integrity specification requires that certain fields in one table must have values that exist in a particular field of another table. If a record that is being added does not match the restrictions imposed by referential integrity, it cannot be added. If deleting record would cause tighter referential integrity restrictions that another table cannot meet, it cannot be deleted.

Note: If AbortOnKeyViol (see page 30) is true, then there will be at most one record in this table because the operation aborts with that first record.

2.1.1.5.9 TIBBatchMove.Mappings Property

Specifies the column mappings for a batch operation.

Pascal

```
property Mappings: TStrings;
```

C++

```
__property TStrings Mappings;
```

Description

Set Mappings to specify the correspondence between fields in the Source (see page 36) and fields in the Destination (see page 32). By default TIBBatchMove (see page 26) matches fields based on their position in the source and destination tables. That is, the first column in the source is matched with the first column in the destination, and so on. Mappings enables an application to override this default.

Mappings is a list of column mappings (one per line) in one of two forms. To map the column ColName in the source table to the column of the same name in the destination table, use:

```
ColName
```

To map the column named SourceColName in the source table to the column named DestColName in the destination table, use:

```
DestColName=SourceColName
```

When adding or appending records, fields in Destination (see page 32) which have no entry in Mappings will be set to NULL. When copying a dataset, fields in Destination (see page 32) which have no entry in Mappings will not appear as columns in the copy of the table.

If source and destination column data types are not the same, TIBBatchMove (see page 26) can either cancel the batch operation or perform a 'best fit.' If AbortOnProblem (see page 30) is true, type mismatches will terminate the batch move. Otherwise, the field values from the Source (see page 36) will be converted, if possible, to be compatible with the Destination (see page 32).

2.1.1.5.10 TIBBatchMove.Mode Property

Specifies what the TIBBatchMove (see page 26) object does when the Execute (see page 28) method is called.

Pascal

```
property Mode: TBatchMode;
```

C++

```
__property TBatchMode Mode;
```

Description

Use Mode to indicate whether the TIBBatchMove (see page 26) object should add records, replace records, delete records, or copy the Source (see page 36). These are the possible values for Mode:

Value	Meaning
batAppend	Append the records in the source to the destination table. The destination table must already exist, and the two tables must not have records with duplicate keys. This is the default mode.
batUpdate	Replace records in the destination table with matching records from the source table. The destination table must exist and must have an index defined to match records.
batAppendUpdate	If a matching record exists in the destination table, replace it. Otherwise, append records to the destination table. The destination table must exist and must have an index defined to match records.
batCopy	Create (see page 27) the destination table based on the structure of the source table. If the destination already exists, the operation will delete it, and replace it with the new copy of the source.
batDelete	Delete records in the destination table that match records in the source table. The destination table must already exist and must have an index defined.

2.1.1.5.11 TIBBatchMove.MovedCount Property

Reports the number of records form the Source (see page 36) which were applied to the destination.

Pascal

```
property MovedCount: Longint;
```

C++

```
__property Longint MovedCount;
```

Description

Read MovedCount to learn the number of records from the Source (see page 36) that were read during the Execute (see page 28) method. The MovedCount value includes any records which caused key or integrity violations, or which were trimmed.

2.1.1.5.12 TIBBatchMove.ProblemCount Property

Indicates the number of records which could not be added to Destination (see page 32) without loss of data due to a field type mismatch.

Pascal

```
property ProblemCount: Longint;
```

C++

```
__property Longint ProblemCount;
```

Description

Read ProblemCount to learn the number of records from the Source (see page 36) that had field values that could not be mapped to destination fields without being 'trimmed'. If a ProblemTableName (see page 35) is specified, ProblemCount is the number of records in that table.

Trimming a field means converting its value to a value compatible with the destination field type. For example, if a field in the destination table holds a string of size 10 characters, and the corresponding field in the source table holds a string of size 15 characters, any values from the source table longer than 10 characters must be truncated. Values that cannot be converted will cause TIBBatchMove (see page 26) to raise an exception.

Trimming does not occur when the Mode (see page 34) property is set to batCopy. Trimming fields on a delete operation means that records in the destination table may be deleted that do not exactly match the values from the source table.

Note: If AbortOnProblem (see page 30) is true, then ProblemCount will be at most one, because the operation aborts when the problem occurs.

2.1.1.5.13 TIBBatchMove.ProblemTableName Property

Specifies the name of a Interbase table that will be created to contain all records from the Source (see page 36) that contain fields which were trimmed to match the corresponding field type in the Destination (see page 32) table.

Pascal

```
property ProblemTableName: TFileName;
```

C++

```
__property TFileName ProblemTableName;
```

Description

Set ProblemTableName to create a table that holds records from the Source (see page 36) that contain fields that had to be trimmed to be applied to the Destination (see page 32). ProblemCount (see page 35) will have the number of records placed in the new table. If ProblemTableName is not specified, the data in the record is still trimmed when applied to the destination table, but there will be no easy way to tell which fields were trimmed.

Trimming a field means converting its value to a value compatible with the destination field type. For example, if a field in the destination table holds a string of size 10 characters, and the corresponding field in the source table holds a string of size 15 characters, any values from the source table longer than 10 characters must be truncated. Values that cannot be converted will cause TIBBatchMove (see page 26) to raise an exception.

Trimming does not occur when the Mode (see page 34) property is set to batCopy. Trimming fields on a delete operation means that records in the destination table may be deleted that do not exactly match the values from the source table.

Note: If AbortOnProblem (see page 30) is true, then there will be at most one record in this table because the operation aborts with the first record that has a problem.

2.1.1.5.14 TIBBatchMove.RecordCount Property

Specifies the maximum number of records that are applied to the Destination (see page 32) when Execute (see page 28) is called.

Pascal

```
property RecordCount: Longint;
```

C++

```
__property Longint RecordCount;
```

Description

Use RecordCount to limit the number of Source (see page 36) records that are applied to the Destination (see page 32). If zero, all records are added, subtracted, or copied, beginning with the first record in Source (see page 36). If RecordCount is greater than zero, up to RecordCount records are applied to the Destination (see page 32), starting with the current record in the dataset. If RecordCount exceeds the number of records remaining in Source (see page 36), no wraparound occurs; the operation is terminated.

2.1.1.5.15 TIBBatchMove.Source Property

Specifies the dataset that is the source of the batch operation.

Pascal

```
property Source: TIBCustomDataSet;
```

C++

```
__property TIBCustomDataSet Source;
```

Description

Use Source to indicate the dataset that contains the records that will be added to, subtracted from, or copied to the Destination (see page 32). If Source is a TIBQuery component, the query is executed before the move is executed. If a filter is currently in effect on Source, the filter conditions are respected when the batch move executes. The Mode (see page 34) property indicates how the Source records are applied to the Destination (see page 32):

Mode (see page 34)	Effect on Destination (see page 32)
batAppend	batAppend Records are added to the destination table.
batUpdate	Records in the destination table with key fields matching the corresponding fields in the source are changed to match the source records.
batAppendUpdate	Records in the destination table with key fields matching the corresponding fields in the source are changed to match the source. Source records that do not match key fields are added to the destination table.

batDelete	Records in the destination table that match the records in the source are deleted.
batCopy	Destination (see page 32) table is created to match the records in the source.

2.1.1.5.16 TIBBatchMove.Transliterate Property

Specifies whether the data in the Source (see page 36) records should be converted form the locale of the Source (see page 36) to the locale of the Destination (see page 32) when the Execute (see page 28) method is called.

Pascal

```
property Transliterate: Boolean;
```

C++

```
__property Boolean Transliterate;
```

Description

Set Transliterate to true when the Source (see page 36) dataset and the Destination (see page 32) table use different language drivers and the data may contain extended ASCII characters. Set Transliterate to false to avoid the overhead of the character set conversion when both the Source (see page 36) and the Destination (see page 32) use the same language driver or the data does not contain extended ASCII characters.

2.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TBatchMode (see page 38)	This is record IBBatchMove.TBatchMode.

2.2.1 IBBatchMove.TBatchMode Enumeration

Pascal

```
TBatchMode = (
  batAppend,
  batUpdate,
  batAppendUpdate,
  batDelete,
  batCopy
);
```

C++

```
enum TBatchMode {
  batAppend,
  batUpdate,
  batAppendUpdate,
  batDelete,
  batCopy
};
```

File

IBBatchMove

Description

This is record IBBatchMove.TBatchMode.

3 IBBlob Namespace

This is namespace IBBlob.

Topics

Name	Description
Classes (see page 40)	The following table lists classes in this documentation.
Functions (see page 54)	The following table lists functions in this documentation.
Constants (see page 56)	The following table lists constants in this documentation.

Classes

	Name	Description
	TIBBlobStream (see page 40)	TIBBlobStream is a stream object that lets applications read from or write to field objects that represent Blob fields.

Constants

Name	Description
DefaultBlobSegmentSize (see page 56)	This is constant IBBlob.DefaultBlobSegmentSize.

Functions

	Name	Description
	GetBlobInfo (see page 54)	This is function IBBlob.GetBlobInfo.
	ReadBlob (see page 54)	This is function IBBlob.ReadBlob.
	WriteBlob (see page 55)	This is function IBBlob.WriteBlob.

3.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TIBBlobStream (see page 40)	TIBBlobStream is a stream object that lets applications read from or write to field objects that represent Blob fields.

3.1.1 TIBBlobStream Class

TIBBlobStream is a stream object that lets applications read from or write to field objects that represent Blob fields.

Class Hierarchy

Pascal

```
TIBBlobStream = class(TStream);
```

C++

```
class TIBBlobStream : public TStream;
```

File

IBBlob

Description

Use TIBBlobStream to access or modify the value of a Blob field object. Blob field objects are TBlobField objects and descendants of TBlobField such as TGraphicField and TMemoField. Blob fields use Blob streams to implement many of their data access properties and methods.

TIBBlobStream allows objects that have no specialized knowledge of how data is stored in a Blob field to read or write such data by employing the uniform stream interface.

To use a Blob stream, create an instance of TIBBlobStream, use the methods of the stream to read or write the data, and then free the Blob stream. Do not use the same instance of TBlobStream to access data from more than one record. Instead, create a new TIBBlobStream object every time you need to read or write Blob data on a new record.

3.1.1.1 TIBBlobStream Members

The following tables list the members exposed by TIBBlobStream.

Protected Methods

	Name	Description
	CloseBlob (see page 44)	This is CloseBlob, a member of class TIBBlobStream.
	CreateBlob (see page 44)	This is CreateBlob, a member of class TIBBlobStream.
	EnsureBlobInitialized (see page 44)	This is EnsureBlobInitialized, a member of class TIBBlobStream.
	GetBlobInfo (see page 45)	This is GetBlobInfo, a member of class TIBBlobStream.

	GetDatabase (see page 45)	This is GetDatabase, a member of class TIBBlobStream.
	GetDBHandle (see page 45)	This is GetDBHandle, a member of class TIBBlobStream.
	GetTransaction (see page 45)	This is GetTransaction, a member of class TIBBlobStream.
	GetTRHandle (see page 46)	This is GetTRHandle, a member of class TIBBlobStream.
	OpenBlob (see page 46)	This is OpenBlob, a member of class TIBBlobStream.
	SetBlobID (see page 48)	This is SetBlobID, a member of class TIBBlobStream.
	SetDatabase (see page 48)	This is SetDatabase, a member of class TIBBlobStream.
	SetMode (see page 49)	This is SetMode, a member of class TIBBlobStream.
	SetTransaction (see page 49)	This is SetTransaction, a member of class TIBBlobStream.

Public Methods

	Name	Description
	Call (see page 43)	Returns an error message based on the error code.
	Cancel (see page 43)	Cancels all changes to the BLOB field, reverting to its state when the Blob stream was created.
	CheckReadable (see page 43)	Indicates whether or not a Blob is readable.
	CheckWritable (see page 44)	Indicates whether or not a Blob is write-able.
	Create (see page 41)	Creates an instance of TIBBlobStream (see page 40).
V	Destroy (see page 42)	Destroys an instance of TIBBlobStream (see page 40).
	Finalize (see page 45)	Creates a Blob on the InterBase server and writes the data from the BlobStream to it.
	LoadFromFile (see page 46)	Loads a Blob from a file to the field.
	LoadFromStream (see page 46)	Loads a Blob from a stream into the field.
V	Read (see page 47)	Reads up to Count bytes from the current position in the field's data into Buffer.
	SaveToFile (see page 47)	Saves the contents of the Blob field to a file.
	SaveToStream (see page 47)	Saves the contents of the BLOB field to a stream.
V	Seek (see page 48)	Resets the current position of the TIBBlobStream (see page 40) object.
V	SetSize (see page 49)	Set the new total size of the Blob.
	Truncate (see page 49)	Discards all data in the Blob field from the current position on.
V	Write (see page 50)	Writes Count bytes from Buffer to the current position in the field and updates the current position by Count bytes.

Public Properties

	Name	Description
	BlobID (see page 50)	Sets or returns the Blob ID.
R	BlobMaxSegmentSize (see page 51)	Returns the maximum segment size.
R	BlobNumSegments (see page 51)	Returns the total number of segments in the Blob.
R	BlobSize (see page 51)	Returns the total size of the Blob.
R	BlobType (see page 51)	Returns the Blob type.
	Database (see page 52)	Sets or returns the associated database.
R	DBHandle (see page 52)	Indicates the database handle.
R	Handle (see page 52)	Indicates the Blob handle.
	Mode (see page 52)	Sets or returns the Blob stream mode type.
R	Modified (see page 53)	Indicates whether the Blob field has been modified.
	Transaction (see page 53)	Gets or sets the associated transaction.
R	TRHandle (see page 53)	Indicates the transaction handle.

3.1.1.2 TIBBlobStream.Create Constructor

Creates an instance of TIBBlobStream (see page 40).

Pascal

```
constructor Create;
```

C++

```
__fastcall TIBBlobStream();
```

Description

Call (see page 43) Create to obtain an instance of TIBBlobStream (see page 40) for reading from or writing to a specific TBlobField object.

3.1.1.3 TIBBlobStream.Destroy Destructor

Destroys an instance of TIBBlobStream (see page 40).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBBlobStream();
```

Description

Do not call Destroy directly in an application. Instead call Free. Free verifies that the TIBBlobStream (see page 40) object is not already freed and only then calls Destroy.

Destroy the TIBBlobStream (see page 40) object by calling Free when it is no longer needed for reading from or writing to the BLOB field.

Destroy triggers an OnDataChange event if the Blob stream was used to overwrite or modify the data in the field. Destroy then frees any buffers that were allocated to handle the data.

3.1.1.4 TIBBlobStream Methods

The methods of the TIBBlobStream class are listed here.

Protected Methods

	Name	Description
	CloseBlob (see page 44)	This is CloseBlob, a member of class TIBBlobStream.
	CreateBlob (see page 44)	This is CreateBlob, a member of class TIBBlobStream.
	EnsureBlobInitialized (see page 44)	This is EnsureBlobInitialized, a member of class TIBBlobStream.
	GetBlobInfo (see page 45)	This is GetBlobInfo, a member of class TIBBlobStream.
	GetDatabase (see page 45)	This is GetDatabase, a member of class TIBBlobStream.
	GetDBHandle (see page 45)	This is GetDBHandle, a member of class TIBBlobStream.
	GetTransaction (see page 45)	This is GetTransaction, a member of class TIBBlobStream.
	GetTRHandle (see page 46)	This is GetTRHandle, a member of class TIBBlobStream.
	OpenBlob (see page 46)	This is OpenBlob, a member of class TIBBlobStream.
	SetBlobID (see page 48)	This is SetBlobID, a member of class TIBBlobStream.
	SetDatabase (see page 48)	This is SetDatabase, a member of class TIBBlobStream.
	SetMode (see page 49)	This is SetMode, a member of class TIBBlobStream.
	SetTransaction (see page 49)	This is SetTransaction, a member of class TIBBlobStream.

Public Methods

	Name	Description
	Call (see page 43)	Returns an error message based on the error code.
	Cancel (see page 43)	Cancels all changes to the BLOB field, reverting to its state when the Blob stream was created.

	CheckReadable (see page 43)	Indicates whether or not a Blob is readable.
	CheckWritable (see page 44)	Indicates whether or not a Blob is write-able.
	Finalize (see page 45)	Creates a Blob on the InterBase server and writes the data from the BlobStream to it.
	LoadFromFile (see page 46)	Loads a Blob from a file to the field.
	LoadFromStream (see page 46)	Loads a Blob from a stream into the field.
V	Read (see page 47)	Reads up to Count bytes from the current position in the field's data into Buffer.
	SaveToFile (see page 47)	Saves the contents of the Blob field to a file.
	SaveToStream (see page 47)	Saves the contents of the BLOB field to a stream.
V	Seek (see page 48)	Resets the current position of the TIBBlobStream (see page 40) object.
V	SetSize (see page 49)	Set the new total size of the Blob.
	Truncate (see page 49)	Discards all data in the Blob field from the current position on.
V	Write (see page 50)	Writes Count bytes from Buffer to the current position in the field and updates the current position by Count bytes.

3.1.1.4.1 TIBBlobStream.Call Method

Returns an error message based on the error code.

Pascal

```
function Call(ErrCode: ISC_STATUS; RaiseError: Boolean): ISC_STATUS;
```

C++

```
__fastcall ISC_STATUS Call(ISC_STATUS ErrCode, Boolean RaiseError);
```

Description

Call is an internal method used to make calls to the InterBase API, and gives you the option of raising an exception or returning an error based on the value of RaiseError.

3.1.1.4.2 TIBBlobStream.Cancel Method

Cancels all changes to the BLOB field, reverting to its state when the Blob stream was created.

Pascal

```
procedure Cancel;
```

C++

```
__fastcall Cancel();
```

Description

Call (see page 43) Cancel to back out all changes to the Blob field using this Blob stream. After a call to Cancel, the Modified (see page 53) property is reset to false.

3.1.1.4.3 TIBBlobStream.CheckReadable Method

Indicates whether or not a Blob is readable.

Pascal

```
procedure CheckReadable;
```

C++

```
__fastcall CheckReadable();
```

Description

Call (see page 43) CheckReadable to determine whether or not a Blob is readable. This method raises an exception if the Blob is not readable.

3.1.1.4.4 TIBBlobStream.CheckWritable Method

Indicates whether or not a Blob is write-able.

Pascal

```
procedure CheckWritable;
```

C++

```
__fastcall CheckWritable();
```

Description

Call (see page 43) CheckWritable to determine whether or not a Blob is writeable. This method raises an exception if the Blob is not writeable.

3.1.1.4.5 TIBBlobStream.CloseBlob Method

Pascal

```
procedure CloseBlob;
```

C++

```
__fastcall CloseBlob();
```

Description

This is CloseBlob, a member of class TIBBlobStream.

3.1.1.4.6 TIBBlobStream.CreateBlob Method

Pascal

```
procedure CreateBlob;
```

C++

```
__fastcall CreateBlob();
```

Description

This is CreateBlob, a member of class TIBBlobStream.

3.1.1.4.7 TIBBlobStream.EnsureBlobInitialized Method

Pascal

```
procedure EnsureBlobInitialized;
```

C++

```
__fastcall EnsureBlobInitialized();
```

Description

This is EnsureBlobInitialized, a member of class TIBBlobStream.

3.1.1.4.8 TIBBlobStream.Finalize Method

Creates a Blob on the InterBase server and writes the data from the BlobStream to it.

Pascal

```
procedure Finalize;
```

C++

```
__fastcall Finalize();
```

Description

Finalize creates a Blob on the InterBase server and writes the data from the BlobStream to the Blob and then closes the Blob.

3.1.1.4.9 TIBBlobStream.GetBlobInfo Method

Pascal

```
procedure GetBlobInfo;
```

C++

```
__fastcall GetBlobInfo();
```

Description

This is GetBlobInfo, a member of class TIBBlobStream.

3.1.1.4.10 TIBBlobStream.GetDatabase Method

Pascal

```
function GetDatabase: TIBDatabase;
```

C++

```
__fastcall TIBDatabase GetDatabase();
```

Description

This is GetDatabase, a member of class TIBBlobStream.

3.1.1.4.11 TIBBlobStream.GetDBHandle Method

Pascal

```
function GetDBHandle: PISC_DB_HANDLE;
```

C++

```
__fastcall PISC_DB_HANDLE GetDBHandle();
```

Description

This is GetDBHandle, a member of class TIBBlobStream.

3.1.1.4.12 TIBBlobStream.GetTransaction Method

Pascal

```
function GetTransaction: TIBTransaction;
```

C++

```
__fastcall TIBTransaction GetTransaction();
```

Description

This is GetTransaction, a member of class TIBBlobStream.

3.1.1.4.13 TIBBlobStream.GetTRHandle Method

Pascal

```
function GetTRHandle: PISC_TR_HANDLE;
```

C++

```
__fastcall PISC_TR_HANDLE GetTRHandle();
```

Description

This is GetTRHandle, a member of class TIBBlobStream.

3.1.1.4.14 TIBBlobStream.LoadFromFile Method

Loads a Blob from a file to the field.

Pascal

```
procedure LoadFromFile(Filename: string);
```

C++

```
__fastcall LoadFromFile(UnicodeString Filename);
```

Description

Use LoadFromFile to load the contents of a file into a Blob field. Specify the name of the file to load into the field as the value of the FileName parameter.

3.1.1.4.15 TIBBlobStream.LoadFromStream Method

Loads a Blob from a stream into the field.

Pascal

```
procedure LoadFromStream(Stream: TStream);
```

C++

```
__fastcall LoadFromStream(TStream Stream);
```

Description

Use LoadFromStream to copy the contents of a stream into the Blob field. Specify the stream from which the field's value is copied as the value of the Stream parameter.

3.1.1.4.16 TIBBlobStream.OpenBlob Method

Pascal

```
procedure OpenBlob;
```

C++

```
__fastcall OpenBlob();
```

Description

This is OpenBlob, a member of class TIBBlobStream.

3.1.1.4.17 TIBBlobStream.Read Method

Reads up to Count bytes from the current position in the field's data into Buffer.

Pascal

```
function Read(var Buffer; Count: Longint): Longint; override;
```

C++

```
virtual __fastcall Longint Read( Buffer, Longint Count);
```

Description

Call (see page 43) Read to read data from the Blob field when the number of bytes in the field's data is not known. Buffer must have at least Count bytes allocated to hold the data that was read from the field.

Read transfers up to Count bytes from the Blob data into Buffer, starting in the current position, and then advances the current position by the number of bytes actually transferred. Read returns the number of bytes actually transferred (which may be less than the number requested in Count.)

Read checks the Transliterate property of the field, and converts the data into ANSI from the character set specified by the dataset if Transliterate is true.

All the other data-reading methods of a Blob stream (ReadBuffer, ReadComponent) call Read to do their actual reading.

Do not call Read when the TIBBlobStream (see page 40) was created in bmWrite mode.

3.1.1.4.18 TIBBlobStream.SaveToFile Method

Saves the contents of the Blob field to a file.

Pascal

```
procedure SaveToFile(Filename: string);
```

C++

```
__fastcall SaveToFile(UnicodeString Filename);
```

Description

Use SaveToFile to save the contents of the Blob field to a file. Specify the name of the file as the value of the FileName parameter.

3.1.1.4.19 TIBBlobStream.SaveToStream Method

Saves the contents of the BLOB field to a stream.

Pascal

```
procedure SaveToStream(Stream: TStream);
```

C++

```
__fastcall SaveToStream(TStream Stream);
```

Description

Use SaveToStream to copy the contents of a Blob field to a stream. Specify the name of the stream to which the field's value is

saved as the value of the Stream parameter.

3.1.1.4.20 TIBBlobStream.Seek Method

Resets the current position of the TIBBlobStream (see page 40) object.

Pascal

```
function Seek(Offset: Longint; Origin: Word): Longint; override;
```

C++

```
virtual __fastcall Longint Seek(Longint Offset, Word Origin);
```

Description

Use Seek to move the current position within the Blob data by the indicated offset. Seek allows an application to read from or write to a particular location within the Blob data.

The Origin parameter indicates how to interpret the Offset parameter. Origin should be one of the following values:

Value	Meaning
soFromBeginning	Offset is from the beginning of the Blob data Seek moves to the position Offset Offset must be >= 0
soFromCurrent	Offset is from the current position in the Blob data Seek moves to Position + Offset
soFromEnd	Offset is from the end of the Blob data Offset must be <= 0 to indicate a number of bytes before the end of the Blob

Seek returns the new value of the Position property, the new current position in the Blob data.

3.1.1.4.21 TIBBlobStream.SetBlobID Method

Pascal

```
procedure SetBlobID(Value: TISC_QUAD);
```

C++

```
__fastcall SetBlobID(TISC_QUAD Value);
```

Description

This is SetBlobID, a member of class TIBBlobStream.

3.1.1.4.22 TIBBlobStream.SetDatabase Method

Pascal

```
procedure SetDatabase(Value: TIBDatabase);
```

C++

```
__fastcall SetDatabase(TIBDatabase Value);
```

Description

This is SetDatabase, a member of class TIBBlobStream.

3.1.1.4.23 TIBBlobStream.SetMode Method

Pascal

```
procedure SetMode(Value: TBlobStreamMode);
```

C++

```
__fastcall SetMode(TBlobStreamMode Value);
```

Description

This is SetMode, a member of class TIBBlobStream.

3.1.1.4.24 TIBBlobStream.SetSize Method

Set the new total size of the Blob.

Pascal

```
procedure SetSize(NewSize: Long); override;
```

C++

```
virtual __fastcall SetSize(Long NewSize);
```

Description

Call (see page 43) SetSize to set the new total size of the Blob.

3.1.1.4.25 TIBBlobStream.SetTransaction Method

Pascal

```
procedure SetTransaction(Value: TIBTransaction);
```

C++

```
__fastcall SetTransaction(TIBTransaction Value);
```

Description

This is SetTransaction, a member of class TIBBlobStream.

3.1.1.4.26 TIBBlobStream.Truncate Method

Discards all data in the Blob field from the current position on.

Pascal

```
procedure Truncate;
```

C++

```
__fastcall Truncate();
```

Description

Use Truncate to limit the size of the Blob data. Calling Truncate when the current position is 0 will clear the contents of the Blob field.

Do not call Truncate when the TIBBlobStream (see page 40) was created in bmRead mode.

3.1.1.4.27 TIBBlobStream.Write Method

Writes Count bytes from Buffer to the current position in the field and updates the current position by Count bytes.

Pascal

```
function Write(const Buffer; Count: Longint): Longint; override;
```

C++

```
virtual __fastcall Longint Write(const  Buffer, Longint Count);
```

Description

Use Write to write Count bytes to the Blob field, starting at the current position. The Write method for TIBBlobStream (see page 40) always writes the entire Count bytes, as Blob data does not necessarily include a termination character. Thus, Write is equivalent to the WriteBuffer method.

Write checks the Transliterate property of the field, and converts the data from ANSI into the character set of the dataset if Transliterate is true.

All the other data-writing methods of a Blob stream (WriteBuffer, WriteComponent) call Write to do their actual writing.

Do not call Write when the TIBBlobStream (see page 40) was created in bmRead mode.

3.1.1.5 TIBBlobStream Properties

The properties of the TIBBlobStream class are listed here.

Public Properties

	Name	Description
	BlobID (see page 50)	Sets or returns the Blob ID.
R	BlobMaxSegmentSize (see page 51)	Returns the maximum segment size.
R	BlobNumSegments (see page 51)	Returns the total number of segments in the Blob.
R	BlobSize (see page 51)	Returns the total size of the Blob.
R	BlobType (see page 51)	Returns the Blob type.
	Database (see page 52)	Sets or returns the associated database.
R	DBHandle (see page 52)	Indicates the database handle.
R	Handle (see page 52)	Indicates the Blob handle.
	Mode (see page 52)	Sets or returns the Blob stream mode type.
R	Modified (see page 53)	Indicates whether the Blob field has been modified.
	Transaction (see page 53)	Gets or sets the associated transaction.
R	TRHandle (see page 53)	Indicates the transaction handle.

3.1.1.5.1 TIBBlobStream.BlobID Property

Sets or returns the Blob ID.

Pascal

```
property BlobID: TISC_QUAD;
```

C++

```
__property TISC_QUAD BlobID;
```

Description

Use BlobID to set or return the 64-bit system-defined Blob ID, which is stored in a field in the table and points to the first segment of the Blob or to a page of pointers to Blob fragments

3.1.1.5.2 TIBBlobStream.BlobMaxSegmentSize Property

Returns the maximum segment size.

Pascal

```
property BlobMaxSegmentSize: Long;
```

C++

```
__property Long BlobMaxSegmentSize;
```

Description

Use BlobMaxSegmentSize to return the length of the longest Blob segment.

3.1.1.5.3 TIBBlobStream.BlobNumSegments Property

Returns the total number of segments in the Blob.

Pascal

```
property BlobNumSegments: Long;
```

C++

```
__property Long BlobNumSegments;
```

Description

Use BlobNumSegments to return the total number of segments in the Blob.

3.1.1.5.4 TIBBlobStream.BlobSize Property

Returns the total size of the Blob.

Pascal

```
property BlobSize: Long;
```

C++

```
__property Long BlobSize;
```

Description

Use BlobSize to return the total size of the Blob in bytes.

3.1.1.5.5 TIBBlobStream.BlobType Property

Returns the Blob type.

Pascal

```
property BlobType: Short;
```

C++

```
__property Short BlobType;
```

Description

Use BlobType to return the Blob type; either 0 for segmented, or 1 for stream.

3.1.1.5.6 TIBBlobStream.Database Property

Sets or returns the associated database.

Pascal

```
property Database: TIBDatabase;
```

C++

```
__property TIBDatabase Database;
```

Description

Use Database to set or return the associated database.

3.1.1.5.7 TIBBlobStream.DBHandle Property

Indicates the database handle.

Pascal

```
property DBHandle: PISC_DB_HANDLE;
```

C++

```
__property PISC_DB_HANDLE DBHandle;
```

Description

Use DBHandle to return the database handle.

3.1.1.5.8 TIBBlobStream.Handle Property

Indicates the Blob handle.

Pascal

```
property Handle: TISC_BLOB_HANDLE;
```

C++

```
__property TISC_BLOB_HANDLE Handle;
```

Description

Use Handle to return the Blob handle.

3.1.1.5.9 TIBBlobStream.Mode Property

Sets or returns the Blob stream mode type.

Pascal

```
property Mode: TBlobStreamMode;
```

C++

```
__property TBlobStreamMode Mode;
```

Description

Use Mode to set or read the Blob stream mode type. The Mode specifies whether the stream is used for reading BLOB values, writing BLOB values, or both.

3.1.1.5.10 TIBBlobStream.Modified Property

Indicates whether the Blob field has been modified.

Pascal

```
property Modified: Boolean;
```

C++

```
__property Boolean Modified;
```

Description

Modified is true when the value to a Blob field has changed. If the value of the Blob field is set using the properties of TBlobField, or using a TIBBlobStream (see page 40) object, Modified is automatically set to true.

3.1.1.5.11 TIBBlobStream.Transaction Property

Gets or sets the associated transaction.

Pascal

```
property Transaction: TIBTransaction;
```

C++

```
__property TIBTransaction Transaction;
```

Description

Use Transaction to set or read the associated transaction.

3.1.1.5.12 TIBBlobStream.TRHandle Property

Indicates the transaction handle.

Pascal

```
property TRHandle: PISC_TR_HANDLE;
```

C++

```
__property PISC_TR_HANDLE TRHandle;
```

Description

Use TRHandle to obtain the transaction handle.

3.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GetBlobInfo (see page 54)	This is function IBBlob.GetBlobInfo.
	ReadBlob (see page 54)	This is function IBBlob.ReadBlob.
	WriteBlob (see page 55)	This is function IBBlob.WriteBlob.

3.2.1 IBBlob.GetBlobInfo Function

Pascal

```
procedure GetBlobInfo(hBlobHandle: PISC_BLOB_HANDLE; var NumSegments: Long; var
MaxSegmentSize: Long; var TotalSize: Long; var BlobType: Short);
```

C++

```
GetBlobInfo(PISC_BLOB_HANDLE hBlobHandle, Long NumSegments, Long MaxSegmentSize, Long
TotalSize, Short BlobType);
```

File

IBBlob

Description

This is function IBBlob.GetBlobInfo.

3.2.2 IBBlob.ReadBlob Function

Pascal

```
procedure ReadBlob(hBlobHandle: PISC_BLOB_HANDLE; Buffer: PChar; BlobSize: Long);
```

C++

```
ReadBlob(PISC_BLOB_HANDLE hBlobHandle, const char * Buffer, Long BlobSize);
```

File

IBBlob

Description

This is function IBBlob.ReadBlob.

3.2.3 IBBlob.WriteBlob Function

Pascal

```
procedure WriteBlob(hBlobHandle: PISC_BLOB_HANDLE; Buffer: PChar; BlobSize: Long);
```

C++

```
WriteBlob(PISC_BLOB_HANDLE hBlobHandle, const char * Buffer, Long BlobSize);
```

File

IBBlob

Description

This is function IBBlob.WriteBlob.

3.3 Constants

The following table lists constants in this documentation.

Constants

Name	Description
DefaultBlobSegmentSize (see page 56)	This is constant IBBlob.DefaultBlobSegmentSize.

3.3.1 IBBlob.DefaultBlobSegmentSize Constant

Pascal

```
DefaultBlobSegmentSize = 16 * 1024;
```

C++

```
DefaultBlobSegmentSize = 16 * 1024;
```

File

IBBlob

Description

This is constant IBBlob.DefaultBlobSegmentSize.

4 IBCustomDataSet Namespace

This is namespace IBCustomDataSet.

Topics

Name	Description
Classes (see page 59)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 149)	The following table lists structs, records, enums in this documentation.
Types (see page 154)	The following table lists types in this documentation.
Variables (see page 159)	The following table lists variables in this documentation.
Constants (see page 160)	The following table lists constants in this documentation.

Classes

	Name	Description
	TIBBCDField (see page 59)	TIBBCDField represents a numeric field as a Currency type..
	TIBCustomDataSet (see page 62)	TIBCustomDataSet is the base class for all datasets that represent data fetched using InterBase Express.
	TIBDataLink (see page 111)	TIBDataLink is a helper class used by data-aware objects to coordinate the actions of TIBDataSet (see page 114) and to respond to data events.
	TIBDataSet (see page 114)	TIBDataSet executes InterBase SQL statements.
	TIBDataSetUpdateObject (see page 134)	TIBDataSetUpdateObject is the abstract base class for update objects used to update otherwise ununpdateable queries when cached updates are enabled.
	TIBDSBlobStream (see page 138)	TIBDSBlobStream reads from and writes to BLOB fields on behalf of an IB (see page 1) Dataset.
	TIBGeneratorField (see page 142)	TIBGeneratorField calls the server to generate values for a field in an IB (see page 1) dataset.
	TIBStringField (see page 146)	TIBStringField allows for strings in excess of 8196 bytes of data.

Constants

Name	Description
BufferCacheSize (see page 160)	This is constant IBCustomDataSet.BufferCacheSize.
DefaultFieldClasses (see page 160)	This is constant IBCustomDataSet.DefaultFieldClasses.
UniCache (see page 161)	This is constant IBCustomDataSet.UniCache.

Structs, Records, Enums

	Name	Description
	TCachedUpdateStatus (see page 149)	TCachedUpdateStatus indicates the status of a record in a dataset that has cached updates.
	TFieldData (see page 150)	This is record IBCustomDataSet.TFieldData.

	TIBDBKey (see page 150)	TIBDBKey stores the key for a row in an InterBase table.
	TIBGeneratorApplyEvent (see page 151)	TIBGeneratorApplyEvent indicates when a generator should create field values.
	TIBUpdateAction (see page 151)	TIBUpdateAction indicates the action that a dataset should take after an event handler has responded to an update error.
	TLiveMode (see page 152)	This is record IBCustomDataSet.TLiveMode.
	TRecordData (see page 153)	This is record IBCustomDataSet.TRecordData.

Types

Name	Description
PBlobDataArray (see page 154)	This is type IBCustomDataSet.PBlobDataArray.
PDateTime (see page 154)	This is type IBCustomDataSet.PDateTime.
PFieldData (see page 155)	This is type IBCustomDataSet.PFieldData.
PIBDBKey (see page 155)	This is type IBCustomDataSet.PIBDBKey.
PRecordData (see page 155)	This is type IBCustomDataSet.PRecordData.
TBlobDataArray (see page 156)	This is type IBCustomDataSet.TBlobDataArray.
TIBUpdateErrorEvent (see page 156)	TIBUpdateErrorEvent is the type of event handlers that respond when an IBX dataset encounters an error applying a cached update.
TIBUpdateRecordEvent (see page 157)	TIBUpdateRecordEvent is the type of event handlers that respond when an IBX dataset applies a cached update.
TIBUpdateRecordTypes (see page 157)	TIBUpdateRecordTypes is a subset of all possible record types in a dataset that caches updates.
TLiveModes (see page 157)	TLiveModes and TLiveModes indicate what operations an application can perform on an IBX dataset.

Variables

Name	Description
CreateProviderProc (see page 159)	This is variable IBCustomDataSet.CreateProviderProc.

4.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TIBBCDField (see page 59)	TIBBCDField represents a numeric field as a Currency type..
	TIBCustomDataSet (see page 62)	TIBCustomDataSet is the base class for all datasets that represent data fetched using InterBase Express.
	TIBDataLink (see page 111)	TIBDataLink is a helper class used by data-aware objects to coordinate the actions of TIBDataSet (see page 114) and to respond to data events.
	TIBDataSet (see page 114)	TIBDataSet executes InterBase SQL statements.
	TIBDataSetUpdateObject (see page 134)	TIBDataSetUpdateObject is the abstract base class for update objects used to update otherwise unupdateable queries when cached updates are enabled.
	TIBDSBlobStream (see page 138)	TIBDSBlobStream reads from and writes to BLOB fields on behalf of an IB (see page 1) Dataset.
	TIBGeneratorField (see page 142)	TIBGeneratorField calls the server to generate values for a field in an IB (see page 1) dataset.
	TIBStringField (see page 146)	TIBStringField allows for strings in excess of 8196 bytes of data.

4.1.1 TIBBCDField Class

TIBBCDField represents a numeric field as a Currency type..

Class Hierarchy

Pascal

```
TIBBCDField = class(TBCDField);
```

C++

```
class TIBBCDField : public TBCDField;
```

File

IBCustomDataSet

Description

TIBBCDField encapsulates the Currency type. Despite the name, TIBBCDField does not represent a BCD value. Rather, TIBBCDFields represent InterBase Numeric(x, y) fields, where x < 18 and y <= 4.

4.1.1.1 TIBBCDField Members

The following tables list the members exposed by TIBBCDField.

Protected Methods

	Name	Description
	CheckTypeSize (see page 60)	This is CheckTypeSize, a member of class TIBBCDField.
	GetAsCurrency (see page 61)	This is GetAsCurrency, a member of class TIBBCDField.

	GetAsString (see page 61)	This is GetAsString, a member of class TIBBCDField.
	GetAsVariant (see page 61)	This is GetAsVariant, a member of class TIBBCDField.
	GetDataSize (see page 61)	This is GetDataSize, a member of class TIBBCDField.

Public Methods

	Name	Description
	Create (see page 60)	Creates an instance of a TIBBCDField (see page 59) object.

Published Properties

	Name	Description
	Size (see page 62)	This is Size, a member of class TIBBCDField.

4.1.1.2 TIBBCDField.Create Constructor

Creates an instance of a TIBBCDField (see page 59) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBBCDField(TComponent * AOwner);
```

Description

Create sets the datatype to ftBCD and the size to 8.

4.1.1.3 TIBBCDField Methods

The methods of the TIBBCDField class are listed here.

Protected Methods

	Name	Description
	CheckTypeSize (see page 60)	This is CheckTypeSize, a member of class TIBBCDField.
	GetAsCurrency (see page 61)	This is GetAsCurrency, a member of class TIBBCDField.
	GetAsString (see page 61)	This is GetAsString, a member of class TIBBCDField.
	GetAsVariant (see page 61)	This is GetAsVariant, a member of class TIBBCDField.
	GetDataSize (see page 61)	This is GetDataSize, a member of class TIBBCDField.

4.1.1.3.1 TIBBCDField.CheckTypeSize Method

Pascal

```
class procedure CheckTypeSize(Value: Integer); override;
```

C++

```
virtual __fastcall CheckTypeSize(int Value);
```

Description

This is CheckTypeSize, a member of class TIBBCDField.

4.1.1.3.2 TIBBCDField.GetAsCurrency Method

Pascal

```
function GetAsCurrency: Currency; override;
```

C++

```
virtual __fastcall Currency GetAsCurrency();
```

Description

This is GetAsCurrency, a member of class TIBBCDField.

4.1.1.3.3 TIBBCDField.GetAsString Method

Pascal

```
function GetAsString: string; override;
```

C++

```
virtual __fastcall UnicodeString GetAsString();
```

Description

This is GetAsString, a member of class TIBBCDField.

4.1.1.3.4 TIBBCDField.GetAsVariant Method

Pascal

```
function GetAsVariant: Variant; override;
```

C++

```
virtual __fastcall Variant GetAsVariant();
```

Description

This is GetAsVariant, a member of class TIBBCDField.

4.1.1.3.5 TIBBCDField.GetDataSize Method

Pascal

```
function GetDataSize: Integer; override;
```

C++

```
virtual __fastcall int GetDataSize();
```

Description

This is GetDataSize, a member of class TIBBCDField.

4.1.1.4 TIBBCDField Properties

The properties of the TIBBCDField class are listed here.

Published Properties

	Name	Description
	Size (see page 62)	This is Size, a member of class TIBBCDField.

4.1.1.4.1 TIBBCDField.Size Property

Pascal

```
property Size;
```

C++

```
__property Size;
```

Description

This is Size, a member of class TIBBCDField.

4.1.2 TIBCustomDataSet Class

TIBCustomDataSet is the base class for all datasets that represent data fetched using InterBase Express.

Class Hierarchy

Pascal

```
TIBCustomDataSet = class(TDataset);
```

C++

```
class TIBCustomDataSet : public TDataset;
```

File

IBCustomDataSet

Description

TIBCustomDataSet is a dataset object that defines InterBase Express (IBX) functionality for a dataset. Applications never use TIBCustomDataSet objects directly. Instead they use the descendants of TIBCustomDataSet, such as TIBDataSet (see page 114), TIBQuery, TIBStoredProc, and TIBTable, which inherit its dataset-related properties and methods.

Getting Started with InterBase Express

4.1.2.1 TIBCustomDataSet Members

The following tables list the members exposed by TIBCustomDataSet.

Protected Events

	Name	Description
	AfterDatabaseDisconnect (see page 109)	Occurs immediately after the connection to the associated database is closed.
	AfterTransactionEnd (see page 109)	Occurs immediately after a transaction that includes this dataset's query ends.
	BeforeDatabaseDisconnect (see page 109)	Occurs immediately before the connection to the associated database is closed.
	BeforeTransactionEnd (see page 109)	Occurs immediately before a transaction that includes this dataset's query ends.

	DatabaseFree (see page 110)	Occurs when the database associated with this dataset is freed.
	TransactionFree (see page 111)	Occurs when the transaction that includes this dataset's query is freed.

Protected Methods

	Name	Description
	ActivateConnection (see page 69)	This is ActivateConnection, a member of class TIBCustomDataSet.
	ActivateTransaction (see page 69)	This is ActivateTransaction, a member of class TIBCustomDataSet.
V	AllocRecordBuffer (see page 69)	This is AllocRecordBuffer, a member of class TIBCustomDataSet.
	CheckDatasetClosed (see page 71)	This is CheckDatasetClosed, a member of class TIBCustomDataSet.
	CheckDatasetOpen (see page 71)	This is CheckDatasetOpen, a member of class TIBCustomDataSet.
	CheckNotUniDirectional (see page 71)	This is CheckNotUniDirectional, a member of class TIBCustomDataSet.
V	ClearCalcFields (see page 71)	This is ClearCalcFields, a member of class TIBCustomDataSet.
	ConstraintsStored (see page 72)	This is ConstraintsStored, a member of class TIBCustomDataSet.
V	CreateFields (see page 72)	This is CreateFields, a member of class TIBCustomDataSet.
	DeactivateTransaction (see page 73)	This is DeactivateTransaction, a member of class TIBCustomDataSet.
V	Disconnect (see page 73)	This is Disconnect, a member of class TIBCustomDataSet.
V	DoBeforeDelete (see page 73)	This is DoBeforeDelete, a member of class TIBCustomDataSet.
V	DoBeforeEdit (see page 73)	This is DoBeforeEdit, a member of class TIBCustomDataSet.
V	DoBeforeInsert (see page 74)	This is DoBeforeInsert, a member of class TIBCustomDataSet.
V	DoOnNewRecord (see page 74)	This is DoOnNewRecord, a member of class TIBCustomDataSet.
V	FreeRecordBuffer (see page 75)	This is FreeRecordBuffer, a member of class TIBCustomDataSet.
	GetActiveBuf (see page 75)	This is GetActiveBuf, a member of class TIBCustomDataSet.
V	GetBookmarkData (see page 75)	This is GetBookmarkData, a member of class TIBCustomDataSet.
V	GetBookmarkFlag (see page 75)	This is GetBookmarkFlag, a member of class TIBCustomDataSet.
V	GetCanModify (see page 75)	This is GetCanModify, a member of class TIBCustomDataSet.
V	GetDataSource (see page 76)	This is GetDataSource, a member of class TIBCustomDataSet.
V	GetFieldClass (see page 76)	This is GetFieldClass, a member of class TIBCustomDataSet.
V	GetRecNo (see page 77)	This is GetRecNo, a member of class TIBCustomDataSet.
V	GetRecord (see page 77)	This is GetRecord, a member of class TIBCustomDataSet.
V	GetRecordCount (see page 78)	This is GetRecordCount, a member of class TIBCustomDataSet.
V	GetRecordSize (see page 78)	This is GetRecordSize, a member of class TIBCustomDataSet.
V	InitRecord (see page 78)	This is InitRecord, a member of class TIBCustomDataSet.
V	InternalAddRecord (see page 78)	This is InternalAddRecord, a member of class TIBCustomDataSet.
V	InternalBatchInput (see page 79)	This is InternalBatchInput, a member of class TIBCustomDataSet.
V	InternalBatchOutput (see page 79)	This is InternalBatchOutput, a member of class TIBCustomDataSet.
V	InternalCancel (see page 79)	This is InternalCancel, a member of class TIBCustomDataSet.
V	InternalClose (see page 79)	This is InternalClose, a member of class TIBCustomDataSet.
V	InternalDelete (see page 79)	This is InternalDelete, a member of class TIBCustomDataSet.
V	InternalExecQuery (see page 80)	This is InternalExecQuery, a member of class TIBCustomDataSet.
V	InternalFirst (see page 80)	This is InternalFirst, a member of class TIBCustomDataSet.
V	InternalGotoBookmark (see page 80)	This is InternalGotoBookmark, a member of class TIBCustomDataSet.
V	InternalHandleException (see page 80)	This is InternalHandleException, a member of class TIBCustomDataSet.
V	InternalInitFieldDefs (see page 81)	This is InternalInitFieldDefs, a member of class TIBCustomDataSet.
V	InternalInitRecord (see page 81)	This is InternalInitRecord, a member of class TIBCustomDataSet.
V	InternalInsert (see page 81)	This is InternalInsert, a member of class TIBCustomDataSet.
V	InternalLast (see page 81)	This is InternalLast, a member of class TIBCustomDataSet.
V	InternalOpen (see page 81)	This is InternalOpen, a member of class TIBCustomDataSet.
V	InternalPost (see page 82)	This is InternalPost, a member of class TIBCustomDataSet.
V	InternalPrepare (see page 82)	This is InternalPrepare, a member of class TIBCustomDataSet.
V	InternalRefresh (see page 82)	This is InternalRefresh, a member of class TIBCustomDataSet.
V	InternalRefreshRow (see page 82)	This is InternalRefreshRow, a member of class TIBCustomDataSet.
V	InternalSetParamsFromCursor (see page 83)	This is InternalSetParamsFromCursor, a member of class TIBCustomDataSet.
V	InternalSetToRecord (see page 83)	This is InternalSetToRecord, a member of class TIBCustomDataSet.
V	InternalUnPrepare (see page 83)	This is InternalUnPrepare, a member of class TIBCustomDataSet.

	IsCursorOpen (see page 83)	This is IsCursorOpen, a member of class TIBCustomDataSet.
	Loaded (see page 84)	This is Loaded, a member of class TIBCustomDataSet.
	PSEndTransaction (see page 86)	This is PSEndTransaction, a member of class TIBCustomDataSet.
	PSExecuteStatement (see page 86)	This is PSExecuteStatement, a member of class TIBCustomDataSet.
	PSGetQuoteChar (see page 87)	This is PSGetQuoteChar, a member of class TIBCustomDataSet.
	PSGetTableName (see page 87)	This is PSGetTableName, a member of class TIBCustomDataSet.
	PSGetUpdateException (see page 87)	This is PSGetUpdateException, a member of class TIBCustomDataSet.
	PSInTransaction (see page 87)	This is PSInTransaction, a member of class TIBCustomDataSet.
	PSIsSQLBased (see page 88)	This is PSIsSQLBased, a member of class TIBCustomDataSet.
	PSIsSQLSupported (see page 88)	This is PSIsSQLSupported, a member of class TIBCustomDataSet.
	PSReset (see page 88)	This is PSReset, a member of class TIBCustomDataSet.
	PSStartTransaction (see page 88)	This is PSStartTransaction, a member of class TIBCustomDataSet.
	PSUpdateRecord (see page 88)	This is PSUpdateRecord, a member of class TIBCustomDataSet.
	ReQuery (see page 89)	This is ReQuery, a member of class TIBCustomDataSet.
	SetActive (see page 89)	This is SetActive, a member of class TIBCustomDataSet.
	SetBookmarkData (see page 90)	This is SetBookmarkData, a member of class TIBCustomDataSet.
	SetBookmarkFlag (see page 90)	This is SetBookmarkFlag, a member of class TIBCustomDataSet.
	SetCachedUpdates (see page 90)	This is SetCachedUpdates, a member of class TIBCustomDataSet.
	SetDataSource (see page 90)	This is SetDataSource, a member of class TIBCustomDataSet.
	SetFieldData (see page 90)	This is the overview for the SetFieldData method overload.
	SetRecNo (see page 91)	This is SetRecNo, a member of class TIBCustomDataSet.

Protected Properties

	Name	Description
	BufferChunks (see page 98)	Specifies the dataset buffer chunk size.
	CachedUpdates (see page 98)	Specifies whether cached updates are enabled for a dataset.
	DeleteSQL (see page 99)	Holds the SQL statement used to delete rows from the dataset.
	GeneratorField (see page 100)	Specifies whether the dataset should refresh its data every time it posts a record.
	InsertSQL (see page 100)	Holds the SQL statement used to insert rows into the dataset.
R	InternalPrepared (see page 100)	Indicates whether the dataset has prepared its queries for execution.
R	LiveMode (see page 101)	Indicates what types of edits, if any, can be made to the data in the dataset.
	ModifySQL (see page 101)	Provides the ability to access the SQL object encapsulating the ModifySQL statement.
	ParamCheck (see page 102)	Specifies whether the parameter list for a query is regenerated if the SQL property changes at runtime.
R	Params (see page 103)	Specifies the parameters to use for any parameterized queries.
R	QDelete (see page 103)	Provides the ability to directly access the SQL object encapsulating the DeleteSQL (see page 99) statement.
R	QInsert (see page 104)	Provides the ability to directly access the SQL object encapsulating the InsertSQL (see page 100) statement.
R	QModify (see page 104)	Provides the ability to directly access the SQL object encapsulating the ModifySQL (see page 101) statement.
R	QRefresh (see page 104)	Provides the ability to directly access the SQL object encapsulating the RefreshSQL (see page 105) statement.
R	QSelect (see page 104)	Provides the ability to directly access the SQL object encapsulating the SelectSQL (see page 105) statement.
	RefreshSQL (see page 105)	Provides the ability to directly access the SQL object encapsulating the RefreshSQL statement.
	SelectSQL (see page 105)	Provides the ability to directly access the SQL object encapsulating the SelectSQL statement.
R	SelectStmtHandle (see page 105)	Gets the handle for the SELECT statement.
R	SQLParams (see page 106)	Specifies the parameters to use for any parameterized queries.
R	StatementType (see page 106)	Returns the statement type of the QSelect (see page 104) query.
	UniDirectional (see page 107)	Determines whether bidirectional cursors are enabled for the dataset.
	UpdateMode (see page 107)	Indicates how records are located when updating records.

Public Methods

	Name	Description
	ApplyUpdates (see page 69)	Writes a dataset's pending cached updates to the database.
V	BookmarkValid (see page 70)	Indicates the validity of a specified bookmark.
	CachedUpdateStatus (see page 70)	Returns the status of the cached updates.
	CancelUpdates (see page 70)	Clears all pending cached updates from the cache.
V	CompareBookmarks (see page 71)	Compares two bookmarks.
V	Create (see page 66)	Creates an instance of a TDataSet component.
V	CreateBlobStream (see page 72)	Returns a TIBDSBlobStream (see page 138) object for reading or writing the data in a specified blob field.
	Current (see page 73)	Returns the descriptor area that holds information about the current query.
V	Destroy (see page 66)	Destroys the instance of a dataset component.
	FetchAll (see page 74)	Retrieves all records from the current cursor position to the end of the file and stores them locally.
V	GetCurrentRecord (see page 76)	Retrieves the current record into a buffer.
V	GetFieldData (see page 76)	This is the overview for the GetFieldData method overload.
V	IsSequenced (see page 83)	IsSequenced indicates whether sequence numbers are available for database records.
V	Locate (see page 84)	Searches the dataset for a specified record and makes that record the current record.
	LocateNext (see page 85)	Searches the dataset for the record after a specified record and makes that record the current record.
V	Lookup (see page 85)	Retrieves field values from a record that matches specified search values.
V	Post (see page 86)	Writes a modified record to the database server.
	RecordModified (see page 89)	Sets the record to modified or unmodified.
	RevertRecord (see page 89)	Restores the current record in the dataset to an unmodified state when cached updates are enabled.
	SQLType (see page 91)	Returns the type of query to be executed.
	Undelete (see page 92)	Restores a record deleted from the dataset.
V	UpdateStatus (see page 92)	Reports the update status for the current record.

Public Properties

	Name	Description
R	DBHandle (see page 99)	Specifies the database handle for the dataset.
R	Plan (see page 103)	Indicates the PLAN portion of the dataset's SELECT query.
R	RowsAffected (see page 105)	Indicates the number of rows operated on by the latest query execution.
R	TRHandle (see page 106)	Specifies the transaction handle for the dataset.
	UpdateObject (see page 107)	Specifies the update object component used to update a read-only result set.
	UpdateRecordTypes (see page 108)	Specifies the type of records visible in a dataset when cached updates are enabled.
R	UpdatesPending (see page 108)	Indicates whether the cached updates buffer contains records that are not yet applied.

Published Events

	Name	Description
	OnUpdateError (see page 110)	Occurs if an exception is generated when cached updates are applied to a database.
	OnUpdateRecord (see page 111)	Occurs when cached updates are applied to a record.

Published Properties

	Name	Description
	AfterCancel (see page 94)	This is AfterCancel, a member of class TIBCustomDataSet.
	AfterClose (see page 94)	This is AfterClose, a member of class TIBCustomDataSet.
	AfterDelete (see page 94)	This is AfterDelete, a member of class TIBCustomDataSet.
	AfterEdit (see page 94)	This is AfterEdit, a member of class TIBCustomDataSet.
	AfterInsert (see page 95)	This is AfterInsert, a member of class TIBCustomDataSet.
	AfterOpen (see page 95)	This is AfterOpen, a member of class TIBCustomDataSet.

	AfterPost (see page 95)	This is AfterPost, a member of class TIBCustomDataSet.
	AfterRefresh (see page 95)	This is AfterRefresh, a member of class TIBCustomDataSet.
	AfterScroll (see page 95)	This is AfterScroll, a member of class TIBCustomDataSet.
	AutoCalcFields (see page 96)	This is AutoCalcFields, a member of class TIBCustomDataSet.
	BeforeCancel (see page 96)	This is BeforeCancel, a member of class TIBCustomDataSet.
	BeforeClose (see page 96)	This is BeforeClose, a member of class TIBCustomDataSet.
	BeforeDelete (see page 96)	This is BeforeDelete, a member of class TIBCustomDataSet.
	BeforeEdit (see page 97)	This is BeforeEdit, a member of class TIBCustomDataSet.
	BeforeInsert (see page 97)	This is BeforeInsert, a member of class TIBCustomDataSet.
	BeforeOpen (see page 97)	This is BeforeOpen, a member of class TIBCustomDataSet.
	BeforePost (see page 97)	This is BeforePost, a member of class TIBCustomDataSet.
	BeforeRefresh (see page 97)	This is BeforeRefresh, a member of class TIBCustomDataSet.
	BeforeScroll (see page 98)	This is BeforeScroll, a member of class TIBCustomDataSet.
	Database (see page 99)	Identifies the database component for which this dataset represents one or more tables.
	ForcedRefresh (see page 99)	Specifies whether the dataset should refresh its data every time it posts a record.
	ObjectView (see page 101)	This is ObjectView, a member of class TIBCustomDataSet.
	OnCalcFields (see page 101)	This is OnCalcFields, a member of class TIBCustomDataSet.
	OnDeleteError (see page 102)	This is OnDeleteError, a member of class TIBCustomDataSet.
	OnEditError (see page 102)	This is OnEditError, a member of class TIBCustomDataSet.
	OnNewRecord (see page 102)	This is OnNewRecord, a member of class TIBCustomDataSet.
	OnPostError (see page 102)	This is OnPostError, a member of class TIBCustomDataSet.
	Transaction (see page 106)	Identifies the transaction under which the query executes.

4.1.2.2 TIBCustomDataSet.Create Constructor

Creates an instance of a TDataSet component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBCustomDataSet(TComponent * AOwner);
```

Description

Call Create to instantiate a dataset component at runtime. Ordinarily applications instantiate dataset descendants, such as TIBTable, TIBQuery, TIBDataSet (see page 114), or TIBStoredProc, rather than TIBCustomDataSet (see page 62). These instantiated objects are handled automatically.

On the other hand, applications that create specialized dataset components, such as custom components, may need to instantiate a TIBCustomDataSet (see page 62) component by calling Create. Create:

- Calls the inherited Create for TDataSet.
- Creates the five query objects.
- Creates the base object to hold the reference to the database and transaction.
- Associates database and transaction related events to the base object component.

4.1.2.3 TIBCustomDataSet.Destroy Destructor

Destroys the instance of a dataset component.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBCustomDataSet();
```

Description

Do not call Destroy directly in an application. Usually destruction of datasets is handled automatically by Delphi. If an application creates its own instances of a dataset, however, the application should call Free, which verifies that the dataset component is not already freed before calling Destroy.

Destroy performs the following tasks:

- Frees the associated query objects.
- Frees the base object.
- Frees the associated internal resources.

4.1.2.4 TIBCustomDataSet Methods

The methods of the TIBCustomDataSet class are listed here.

Protected Methods

	Name	Description
	ActivateConnection (see page 69)	This is ActivateConnection, a member of class TIBCustomDataSet.
	ActivateTransaction (see page 69)	This is ActivateTransaction, a member of class TIBCustomDataSet.
V	AllocRecordBuffer (see page 69)	This is AllocRecordBuffer, a member of class TIBCustomDataSet.
	CheckDatasetClosed (see page 71)	This is CheckDatasetClosed, a member of class TIBCustomDataSet.
	CheckDatasetOpen (see page 71)	This is CheckDatasetOpen, a member of class TIBCustomDataSet.
	CheckNotUniDirectional (see page 71)	This is CheckNotUniDirectional, a member of class TIBCustomDataSet.
V	ClearCalcFields (see page 71)	This is ClearCalcFields, a member of class TIBCustomDataSet.
	ConstraintsStored (see page 72)	This is ConstraintsStored, a member of class TIBCustomDataSet.
V	CreateFields (see page 72)	This is CreateFields, a member of class TIBCustomDataSet.
	DeactivateTransaction (see page 73)	This is DeactivateTransaction, a member of class TIBCustomDataSet.
V	Disconnect (see page 73)	This is Disconnect, a member of class TIBCustomDataSet.
V	DoBeforeDelete (see page 73)	This is DoBeforeDelete, a member of class TIBCustomDataSet.
V	DoBeforeEdit (see page 73)	This is DoBeforeEdit, a member of class TIBCustomDataSet.
V	DoBeforeInsert (see page 74)	This is DoBeforeInsert, a member of class TIBCustomDataSet.
V	DoOnNewRecord (see page 74)	This is DoOnNewRecord, a member of class TIBCustomDataSet.
V	FreeRecordBuffer (see page 75)	This is FreeRecordBuffer, a member of class TIBCustomDataSet.
	GetActiveBuf (see page 75)	This is GetActiveBuf, a member of class TIBCustomDataSet.
V	GetBookmarkData (see page 75)	This is GetBookmarkData, a member of class TIBCustomDataSet.
V	GetBookmarkFlag (see page 75)	This is GetBookmarkFlag, a member of class TIBCustomDataSet.
V	GetCanModify (see page 75)	This is GetCanModify, a member of class TIBCustomDataSet.
V	GetDataSource (see page 76)	This is GetDataSource, a member of class TIBCustomDataSet.
V	GetFieldClass (see page 76)	This is GetFieldClass, a member of class TIBCustomDataSet.
V	GetRecNo (see page 77)	This is GetRecNo, a member of class TIBCustomDataSet.
V	GetRecord (see page 77)	This is GetRecord, a member of class TIBCustomDataSet.
V	GetRecordCount (see page 78)	This is GetRecordCount, a member of class TIBCustomDataSet.
V	GetRecordSize (see page 78)	This is GetRecordSize, a member of class TIBCustomDataSet.
V	InitRecord (see page 78)	This is InitRecord, a member of class TIBCustomDataSet.
V	InternalAddRecord (see page 78)	This is InternalAddRecord, a member of class TIBCustomDataSet.
V	InternalBatchInput (see page 79)	This is InternalBatchInput, a member of class TIBCustomDataSet.
V	InternalBatchOutput (see page 79)	This is InternalBatchOutput, a member of class TIBCustomDataSet.

	InternalCancel (see page 79)	This is InternalCancel, a member of class TIBCustomDataSet.
	InternalClose (see page 79)	This is InternalClose, a member of class TIBCustomDataSet.
	InternalDelete (see page 79)	This is InternalDelete, a member of class TIBCustomDataSet.
	InternalExecQuery (see page 80)	This is InternalExecQuery, a member of class TIBCustomDataSet.
	InternalFirst (see page 80)	This is InternalFirst, a member of class TIBCustomDataSet.
	InternalGotoBookmark (see page 80)	This is InternalGotoBookmark, a member of class TIBCustomDataSet.
	InternalHandleException (see page 80)	This is InternalHandleException, a member of class TIBCustomDataSet.
	InternalInitFieldDefs (see page 81)	This is InternalInitFieldDefs, a member of class TIBCustomDataSet.
	InternalInitRecord (see page 81)	This is InternalInitRecord, a member of class TIBCustomDataSet.
	InternalInsert (see page 81)	This is InternalInsert, a member of class TIBCustomDataSet.
	InternalLast (see page 81)	This is InternalLast, a member of class TIBCustomDataSet.
	InternalOpen (see page 81)	This is InternalOpen, a member of class TIBCustomDataSet.
	InternalPost (see page 82)	This is InternalPost, a member of class TIBCustomDataSet.
	InternalPrepare (see page 82)	This is InternalPrepare, a member of class TIBCustomDataSet.
	InternalRefresh (see page 82)	This is InternalRefresh, a member of class TIBCustomDataSet.
	InternalRefreshRow (see page 82)	This is InternalRefreshRow, a member of class TIBCustomDataSet.
	InternalSetParamsFromCursor (see page 83)	This is InternalSetParamsFromCursor, a member of class TIBCustomDataSet.
	InternalSetToRecord (see page 83)	This is InternalSetToRecord, a member of class TIBCustomDataSet.
	InternalUnPrepare (see page 83)	This is InternalUnPrepare, a member of class TIBCustomDataSet.
	IsCursorOpen (see page 83)	This is IsCursorOpen, a member of class TIBCustomDataSet.
	Loaded (see page 84)	This is Loaded, a member of class TIBCustomDataSet.
	PSEndTransaction (see page 86)	This is PSEndTransaction, a member of class TIBCustomDataSet.
	PSExecuteStatement (see page 86)	This is PSExecuteStatement, a member of class TIBCustomDataSet.
	PSGetQuoteChar (see page 87)	This is PSGetQuoteChar, a member of class TIBCustomDataSet.
	PSGetTableName (see page 87)	This is PSGetTableName, a member of class TIBCustomDataSet.
	PSGetUpdateException (see page 87)	This is PSGetUpdateException, a member of class TIBCustomDataSet.
	PSInTransaction (see page 87)	This is PSInTransaction, a member of class TIBCustomDataSet.
	PSIsSQLBased (see page 88)	This is PSIsSQLBased, a member of class TIBCustomDataSet.
	PSIsSQLSupported (see page 88)	This is PSIsSQLSupported, a member of class TIBCustomDataSet.
	PSReset (see page 88)	This is PSReset, a member of class TIBCustomDataSet.
	PSStartTransaction (see page 88)	This is PSStartTransaction, a member of class TIBCustomDataSet.
	PSUpdateRecord (see page 88)	This is PSUpdateRecord, a member of class TIBCustomDataSet.
	ReQuery (see page 89)	This is ReQuery, a member of class TIBCustomDataSet.
	SetActive (see page 89)	This is SetActive, a member of class TIBCustomDataSet.
	SetBookmarkData (see page 90)	This is SetBookmarkData, a member of class TIBCustomDataSet.
	SetBookmarkFlag (see page 90)	This is SetBookmarkFlag, a member of class TIBCustomDataSet.
	SetCachedUpdates (see page 90)	This is SetCachedUpdates, a member of class TIBCustomDataSet.
	SetDataSource (see page 90)	This is SetDataSource, a member of class TIBCustomDataSet.
	SetFieldData (see page 90)	This is the overview for the SetFieldData method overload.
	SetRecNo (see page 91)	This is SetRecNo, a member of class TIBCustomDataSet.

Public Methods

	Name	Description
	ApplyUpdates (see page 69)	Writes a dataset's pending cached updates to the database.
	BookmarkValid (see page 70)	Indicates the validity of a specified bookmark.
	CachedUpdateStatus (see page 70)	Returns the status of the cached updates.
	CancelUpdates (see page 70)	Clears all pending cached updates from the cache.
	CompareBookmarks (see page 71)	Compares two bookmarks.
	CreateBlobStream (see page 72)	Returns a TIBDSBlobStream (see page 138) object for reading or writing the data in a specified blob field.
	Current (see page 73)	Returns the descriptor area that holds information about the current query.
	FetchAll (see page 74)	Retrieves all records from the current cursor position to the end of the file and stores them locally.
	GetCurrentRecord (see page 76)	Retrieves the current record into a buffer.
	GetFieldData (see page 76)	This is the overview for the GetFieldData method overload.

	IsSequenced (see page 83)	IsSequenced indicates whether sequence numbers are available for database records.
	Locate (see page 84)	Searches the dataset for a specified record and makes that record the current record.
	LocateNext (see page 85)	Searches the dataset for the record after a specified record and makes that record the current record.
	Lookup (see page 85)	Retrieves field values from a record that matches specified search values.
	Post (see page 86)	Writes a modified record to the database server.
	RecordModified (see page 89)	Sets the record to modified or unmodified.
	RevertRecord (see page 89)	Restores the current record in the dataset to an unmodified state when cached updates are enabled.
	SQLType (see page 91)	Returns the type of query to be executed.
	Undelete (see page 92)	Restores a record deleted from the dataset.
	UpdateStatus (see page 92)	Reports the update status for the current record.

4.1.2.4.1 TIBCustomDataSet.ActivateConnection Method

Pascal

```
procedure ActivateConnection;
```

C++

```
__fastcall ActivateConnection();
```

Description

This is ActivateConnection, a member of class TIBCustomDataSet.

4.1.2.4.2 TIBCustomDataSet.ActivateTransaction Method

Pascal

```
function ActivateTransaction: Boolean;
```

C++

```
__fastcall Boolean ActivateTransaction();
```

Description

This is ActivateTransaction, a member of class TIBCustomDataSet.

4.1.2.4.3 TIBCustomDataSet.AllocRecordBuffer Method

Pascal

```
function AllocRecordBuffer: PChar; override;
```

C++

```
virtual __fastcall const char * AllocRecordBuffer();
```

Description

This is AllocRecordBuffer, a member of class TIBCustomDataSet.

4.1.2.4.4 TIBCustomDataSet.ApplyUpdates Method

Writes a dataset's pending cached updates to the database.

Pascal

```
procedure ApplyUpdates;
```

C++

```
__fastcall ApplyUpdates();
```

Description

Call ApplyUpdates to write a dataset's pending cached updates to a database. This method passes cached data to the database for storage, but the changes are not committed to the database. An application must explicitly call the TIBTransaction (see page 206) component's Commit method to commit the changes to the database if the write is successful, or call the TIBTransaction (see page 206) component's Rollback method to undo the changes if there is an error.

Note: The preferred method for updating datasets is to call a database component's ApplyUpdates method rather than to call each individual dataset's ApplyUpdates method. The application is responsible for committing or rolling back the transaction.

4.1.2.4.5 TIBCustomDataSet.BookmarkValid Method

Indicates the validity of a specified bookmark.

Pascal

```
function BookmarkValid(Bookmark: TBookmark): Boolean; override;
```

C++

```
virtual __fastcall Boolean BookmarkValid(TBookmark Bookmark);
```

Description

This function returns true if the specified bookmark can be used to identify a record in the dataset, false otherwise.

4.1.2.4.6 TIBCustomDataSet.CachedUpdateStatus Method

Returns the status of the cached updates.

Pascal

```
function CachedUpdateStatus: TCachedUpdateStatus;
```

C++

```
__fastcall TCachedUpdateStatus CachedUpdateStatus();
```

Description

Call CachedUpdateStatus to return the cached update status of the current record in the dataset.

4.1.2.4.7 TIBCustomDataSet.CancelUpdates Method

Clears all pending cached updates from the cache.

Pascal

```
procedure CancelUpdates;
```

C++

```
__fastcall CancelUpdates();
```

Description

Call CancelUpdates to clear all pending cached updates from the cache.

When a dataset is closed, or the CachedUpdates (see page 98) property is set to false, CancelUpdates is called automatically.

Note: To undo changes to a single record, call RevertRecord (see page 89).

4.1.2.4.8 TIBCustomDataSet.CheckDatasetClosed Method

Pascal

```
procedure CheckDatasetClosed;
```

C++

```
__fastcall CheckDatasetClosed();
```

Description

This is CheckDatasetClosed, a member of class TIBCustomDataSet.

4.1.2.4.9 TIBCustomDataSet.CheckDatasetOpen Method

Pascal

```
procedure CheckDatasetOpen;
```

C++

```
__fastcall CheckDatasetOpen();
```

Description

This is CheckDatasetOpen, a member of class TIBCustomDataSet.

4.1.2.4.10 TIBCustomDataSet.CheckNotUniDirectional Method

Pascal

```
procedure CheckNotUniDirectional;
```

C++

```
__fastcall CheckNotUniDirectional();
```

Description

This is CheckNotUniDirectional, a member of class TIBCustomDataSet.

4.1.2.4.11 TIBCustomDataSet.ClearCalcFields Method

Pascal

```
procedure ClearCalcFields(Buffer: PChar); override;
```

C++

```
virtual __fastcall ClearCalcFields(const char * Buffer);
```

Description

This is ClearCalcFields, a member of class TIBCustomDataSet.

4.1.2.4.12 TIBCustomDataSet.CompareBookmarks Method

Compares two bookmarks.

Pascal

```
function CompareBookmarks(Bookmark1: TBookmark; Bookmark2: TBookmark): Integer; override;
```

C++

```
virtual __fastcall int CompareBookmarks(TBookmark Bookmark1, TBookmark Bookmark2);
```

Description

Call CompareBookmarks to compare one bookmark to another. CompareBookmarks returns an integer value indicating the difference between the two bookmarks. CompareBookmarks returns a 0 (zero) if the two bookmarks are the same, a -1 (negative one) if bookmark one is less than bookmark two, or a 1 (positive one) if bookmark one is greater than bookmark two. CompareBookmarks also returns a zero if one of the two bookmarks is nil (Delphi) or NULL (C++).

Bookmark1 and Bookmark2 are the two TBookmark values to compare.

4.1.2.4.13 TIBCustomDataSet.ConstraintsStored Method

Pascal

```
function ConstraintsStored: Boolean;
```

C++

```
__fastcall Boolean ConstraintsStored();
```

Description

This is ConstraintsStored, a member of class TIBCustomDataSet.

4.1.2.4.14 TIBCustomDataSet.CreateBlobStream Method

Returns a TIBDSBlobStream (see page 138) object for reading or writing the data in a specified blob field.

Pascal

```
function CreateBlobStream(Field: TField; Mode: TBlobStreamMode): TStream; override;
```

C++

```
virtual __fastcall TStream CreateBlobStream(TField Field, TBlobStreamMode Mode);
```

Description

Call CreateBlobStream to obtain a stream for reading data from or writing data to a binary large object (BLOB) field. The Field parameter must specify a TBlobField component from the Fields property array. The Mode parameter specifies whether the stream will be used for reading, writing, or updating the contents of the field.

Note: The stream that this method returns belongs to the dataset. Do not free the stream: the dataset handles all allocation and freeing of streams that this method creates.

4.1.2.4.15 TIBCustomDataSet.CreateFields Method

Pascal

```
procedure CreateFields; override;
```

C++

```
virtual __fastcall CreateFields();
```

Description

This is CreateFields, a member of class TIBCustomDataSet.

4.1.2.4.16 TIBCustomDataSet.Current Method

Returns the descriptor area that holds information about the current query.

Pascal

```
function Current: TIBXSQLDA;
```

C++

```
__fastcall TIBXSQLDA Current();
```

Description

Most applications do not need to call the Current method. It returns the extended descriptor area for the dataset's SQL statement, which can be used to retrieve properties of the SQL statement.

4.1.2.4.17 TIBCustomDataSet.DeactivateTransaction Method

Pascal

```
procedure DeactivateTransaction;
```

C++

```
__fastcall DeactivateTransaction();
```

Description

This is DeactivateTransaction, a member of class TIBCustomDataSet.

4.1.2.4.18 TIBCustomDataSet.Disconnect Method

Pascal

```
procedure Disconnect; virtual;
```

C++

```
virtual __fastcall Disconnect();
```

Description

This is Disconnect, a member of class TIBCustomDataSet.

4.1.2.4.19 TIBCustomDataSet.DoBeforeDelete Method

Pascal

```
procedure DoBeforeDelete; override;
```

C++

```
virtual __fastcall DoBeforeDelete();
```

Description

This is DoBeforeDelete, a member of class TIBCustomDataSet.

4.1.2.4.20 TIBCustomDataSet.DoBeforeEdit Method

Pascal

```
procedure DoBeforeEdit; override;
```

C++

```
virtual __fastcall DoBeforeEdit();
```

Description

This is DoBeforeEdit, a member of class TIBCustomDataSet.

4.1.2.4.21 TIBCustomDataSet.DoBeforeInsert Method

Pascal

```
procedure DoBeforeInsert; override;
```

C++

```
virtual __fastcall DoBeforeInsert();
```

Description

This is DoBeforeInsert, a member of class TIBCustomDataSet.

4.1.2.4.22 TIBCustomDataSet.DoOnNewRecord Method

Pascal

```
procedure DoOnNewRecord; override;
```

C++

```
virtual __fastcall DoOnNewRecord();
```

Description

This is DoOnNewRecord, a member of class TIBCustomDataSet.

4.1.2.4.23 TIBCustomDataSet.FetchAll Method

Retrieves all records from the current cursor position to the end of the file and stores them locally.

Pascal

```
procedure FetchAll;
```

C++

```
__fastcall FetchAll();
```

Description

Call FetchAll to reduce network traffic when using cached updates. FetchAll calls CheckBrowseMode to post any pending changes, and then retrieves all records from the current cursor position to the end of the file, and stores them locally. Ordinarily when cached updates are enabled, a transaction retrieves only as much data as it needs for return purposes.

Note: Using FetchAll is not always appropriate. For example, when an application accesses a database used by many simultaneous clients and there is a high degree of contention for updating the same records, fetching all records at once may not be advantageous because some fetched records may be changed by other applications. Always weigh the advantages of reduced network traffic against the need for reduced record contention.

4.1.2.4.24 TIBCustomDataSet.FreeRecordBuffer Method

Pascal

```
procedure FreeRecordBuffer(var Buffer: PChar); override;
```

C++

```
virtual __fastcall FreeRecordBuffer(const char * Buffer);
```

Description

This is FreeRecordBuffer, a member of class TIBCustomDataSet.

4.1.2.4.25 TIBCustomDataSet.GetActiveBuf Method

Pascal

```
function GetActiveBuf: PChar;
```

C++

```
__fastcall const char * GetActiveBuf();
```

Description

This is GetActiveBuf, a member of class TIBCustomDataSet.

4.1.2.4.26 TIBCustomDataSet.GetBookmarkData Method

Pascal

```
procedure GetBookmarkData(Buffer: PChar; Data: Pointer); override;
```

C++

```
virtual __fastcall GetBookmarkData(const char * Buffer, void * Data);
```

Description

This is GetBookmarkData, a member of class TIBCustomDataSet.

4.1.2.4.27 TIBCustomDataSet.GetBookmarkFlag Method

Pascal

```
function GetBookmarkFlag(Buffer: PChar): TBookmarkFlag; override;
```

C++

```
virtual __fastcall TBookmarkFlag GetBookmarkFlag(const char * Buffer);
```

Description

This is GetBookmarkFlag, a member of class TIBCustomDataSet.

4.1.2.4.28 TIBCustomDataSet.GetCanModify Method

Pascal

```
function GetCanModify: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetCanModify();
```

Description

This is GetCanModify, a member of class TIBCustomDataSet.

4.1.2.4.29 TIBCustomDataSet.GetCurrentRecord Method

Retrieves the current record into a buffer.

Pascal

```
function GetCurrentRecord(Buffer: PChar): Boolean; override;
```

C++

```
virtual __fastcall Boolean GetCurrentRecord(const char * Buffer);
```

Description

Most applications should not need to call GetCurrentRecord. TDataSet automatically allocates a buffer for the active record.

Call GetCurrentRecord to copy the current record into a buffer allocated by the application. Buffer must be at least as big as the record size indicated by the RecordSize property.

4.1.2.4.30 TIBCustomDataSet.GetDataSource Method

Pascal

```
function GetDataSource: TDataSource; override;
```

C++

```
virtual __fastcall TDataSource GetDataSource();
```

Description

This is GetDataSource, a member of class TIBCustomDataSet.

4.1.2.4.31 TIBCustomDataSet.GetFieldClass Method

Pascal

```
function GetFieldClass(FieldType: TFieldType): TFieldClass; override;
```

C++

```
virtual __fastcall TFieldClass GetFieldClass(TFieldType FieldType);
```

Description

This is GetFieldClass, a member of class TIBCustomDataSet.

4.1.2.4.32 GetFieldData Method

This is the overview for the GetFieldData method overload.

Overload List

	Name	Description
	TIBCustomDataSet.GetFieldData (TField, Pointer) (see page 77)	Reads the field data into a buffer.
	TIBCustomDataSet.GetFieldData (TField, Pointer, Boolean) (see page 77)	Reads the field data into a buffer.

4.1.2.4.32.1 TIBCustomDataSet.GetFieldData Method (TField, Pointer)

Reads the field data into a buffer.

Pascal

```
function GetFieldData(Field: TField; Buffer: Pointer): Boolean; override; overload;
function GetFieldData(Field: TField; Buffer: Pointer; NativeFormat: Boolean): Boolean;
override; overload;
```

C++

```
virtual __fastcall Boolean GetFieldData(TField Field, void * Buffer);
virtual __fastcall Boolean GetFieldData(TField Field, void * Buffer, Boolean NativeFormat);
```

Description

Reads the field data into a buffer.

Delphi syntax:

```
        function GetFieldData(FieldNo: Integer; Buffer: Pointer): Boolean; overload;
    function GetFieldData(Field: TField; Buffer: Pointer): Boolean; overload; override;
    function GetFieldData(Field: TField; Buffer: Pointer; NativeFormat: Boolean): Boolean;
overload; override;
```

C++ syntax:

```
        virtual bool __fastcall GetFieldData(Db::TField* Field, void * Buffer);
    virtual bool __fastcall GetFieldData(Db::TField* Field, void * Buffer, bool NativeFormat);
    virtual bool __fastcall GetFieldData(int FieldNo, void * Buffer);
```

Description

Most applications do not need to call GetFieldData. TField objects call this method to implement their GetData method.

The Field or FieldNo parameter indicates the field whose data should be fetched. Field specifies the component itself, while FieldNo indicates its field number. The Buffer parameter is a memory buffer with sufficient space to accept the value of the field as it exists in the database (unformatted and untranslated). NativeFormat indicates whether the dataset fetches the field in Delphi's native format for the field type. When NativeFormat is false, the dataset must convert the field value to the native type. This allows the field to handle data from different types of datasets (IBX, BDE-based, and so on) in a uniform manner.

GetFieldData returns true if the data was successfully written to Buffer.

4.1.2.4.33 TIBCustomDataSet.GetRecNo Method

Pascal

```
function GetRecNo: Integer; override;
```

C++

```
virtual __fastcall int GetRecNo();
```

Description

This is GetRecNo, a member of class TIBCustomDataSet.

4.1.2.4.34 TIBCustomDataSet.GetRecord Method

Pascal

```
function GetRecord(Buffer: PChar; GetMode: TGetMode; DoCheck: Boolean): TGetResult; override;
```

C++

```
virtual __fastcall TGetResult GetRecord(const char * Buffer, TGetMode GetMode, Boolean
DoCheck);
```

Description

This is GetRecord, a member of class TIBCustomDataSet.

4.1.2.4.35 TIBCustomDataSet.GetRecordCount Method

Pascal

```
function GetRecordCount: Integer; override;
```

C++

```
virtual __fastcall int GetRecordCount();
```

Description

This is GetRecordCount, a member of class TIBCustomDataSet.

4.1.2.4.36 TIBCustomDataSet.GetRecordSize Method

Pascal

```
function GetRecordSize: Word; override;
```

C++

```
virtual __fastcall Word GetRecordSize();
```

Description

This is GetRecordSize, a member of class TIBCustomDataSet.

4.1.2.4.37 TIBCustomDataSet.InitRecord Method

Pascal

```
procedure InitRecord(Buffer: PChar); override;
```

C++

```
virtual __fastcall InitRecord(const char * Buffer);
```

Description

This is InitRecord, a member of class TIBCustomDataSet.

4.1.2.4.38 TIBCustomDataSet.InternalAddRecord Method

Pascal

```
procedure InternalAddRecord(Buffer: Pointer; Append: Boolean); override;
```

C++

```
virtual __fastcall InternalAddRecord(void * Buffer, Boolean Append);
```

Description

This is InternalAddRecord, a member of class TIBCustomDataSet.

4.1.2.4.39 TIBCustomDataSet.InternalBatchInput Method

Pascal

```
procedure InternalBatchInput(InputObject: TIBBatchInput); virtual;
```

C++

```
virtual __fastcall InternalBatchInput(TIBBatchInput InputObject);
```

Description

This is InternalBatchInput, a member of class TIBCustomDataSet.

4.1.2.4.40 TIBCustomDataSet.InternalBatchOutput Method

Pascal

```
procedure InternalBatchOutput(OutputObject: TIBBatchOutput); virtual;
```

C++

```
virtual __fastcall InternalBatchOutput(TIBBatchOutput OutputObject);
```

Description

This is InternalBatchOutput, a member of class TIBCustomDataSet.

4.1.2.4.41 TIBCustomDataSet.InternalCancel Method

Pascal

```
procedure InternalCancel; override;
```

C++

```
virtual __fastcall InternalCancel();
```

Description

This is InternalCancel, a member of class TIBCustomDataSet.

4.1.2.4.42 TIBCustomDataSet.InternalClose Method

Pascal

```
procedure InternalClose; override;
```

C++

```
virtual __fastcall InternalClose();
```

Description

This is InternalClose, a member of class TIBCustomDataSet.

4.1.2.4.43 TIBCustomDataSet.InternalDelete Method

Pascal

```
procedure InternalDelete; override;
```

C++

```
virtual __fastcall InternalDelete();
```

Description

This is InternalDelete, a member of class TIBCustomDataSet.

4.1.2.4.44 TIBCustomDataSet.InternalExecQuery Method

Pascal

```
procedure InternalExecQuery; virtual;
```

C++

```
virtual __fastcall InternalExecQuery();
```

Description

This is InternalExecQuery, a member of class TIBCustomDataSet.

4.1.2.4.45 TIBCustomDataSet.InternalFirst Method

Pascal

```
procedure InternalFirst; override;
```

C++

```
virtual __fastcall InternalFirst();
```

Description

This is InternalFirst, a member of class TIBCustomDataSet.

4.1.2.4.46 TIBCustomDataSet.InternalGotoBookmark Method

Pascal

```
procedure InternalGotoBookmark(Bookmark: Pointer); override;
```

C++

```
virtual __fastcall InternalGotoBookmark(void * Bookmark);
```

Description

This is InternalGotoBookmark, a member of class TIBCustomDataSet.

4.1.2.4.47 TIBCustomDataSet.InternalHandleException Method

Pascal

```
procedure InternalHandleException; override;
```

C++

```
virtual __fastcall InternalHandleException();
```

Description

This is InternalHandleException, a member of class TIBCustomDataSet.

4.1.2.4.48 TIBCustomDataSet.InternalInitFieldDefs Method

Pascal

```
procedure InternalInitFieldDefs; override;
```

C++

```
virtual __fastcall InternalInitFieldDefs();
```

Description

This is InternalInitFieldDefs, a member of class TIBCustomDataSet.

4.1.2.4.49 TIBCustomDataSet.InternalInitRecord Method

Pascal

```
procedure InternalInitRecord(Buffer: PChar); override;
```

C++

```
virtual __fastcall InternalInitRecord(const char * Buffer);
```

Description

This is InternalInitRecord, a member of class TIBCustomDataSet.

4.1.2.4.50 TIBCustomDataSet.InternalInsert Method

Pascal

```
procedure InternalInsert; override;
```

C++

```
virtual __fastcall InternalInsert();
```

Description

This is InternalInsert, a member of class TIBCustomDataSet.

4.1.2.4.51 TIBCustomDataSet.InternalLast Method

Pascal

```
procedure InternalLast; override;
```

C++

```
virtual __fastcall InternalLast();
```

Description

This is InternalLast, a member of class TIBCustomDataSet.

4.1.2.4.52 TIBCustomDataSet.InternalOpen Method

Pascal

```
procedure InternalOpen; override;
```

C++

```
virtual __fastcall InternalOpen();
```

Description

This is InternalOpen, a member of class TIBCustomDataSet.

4.1.2.4.53 TIBCustomDataSet.InternalPost Method

Pascal

```
procedure InternalPost; override;
```

C++

```
virtual __fastcall InternalPost();
```

Description

This is InternalPost, a member of class TIBCustomDataSet.

4.1.2.4.54 TIBCustomDataSet.InternalPrepare Method

Pascal

```
procedure InternalPrepare; virtual;
```

C++

```
virtual __fastcall InternalPrepare();
```

Description

This is InternalPrepare, a member of class TIBCustomDataSet.

4.1.2.4.55 TIBCustomDataSet.InternalRefresh Method

Pascal

```
procedure InternalRefresh; override;
```

C++

```
virtual __fastcall InternalRefresh();
```

Description

This is InternalRefresh, a member of class TIBCustomDataSet.

4.1.2.4.56 TIBCustomDataSet.InternalRefreshRow Method

Pascal

```
procedure InternalRefreshRow; virtual;
```

C++

```
virtual __fastcall InternalRefreshRow();
```

Description

This is InternalRefreshRow, a member of class TIBCustomDataSet.

4.1.2.4.57 TIBCustomDataSet.InternalSetParamsFromCursor Method

Pascal

```
procedure InternalSetParamsFromCursor; virtual;
```

C++

```
virtual __fastcall InternalSetParamsFromCursor();
```

Description

This is InternalSetParamsFromCursor, a member of class TIBCustomDataSet.

4.1.2.4.58 TIBCustomDataSet.InternalSetToRecord Method

Pascal

```
procedure InternalSetToRecord(Buffer: PChar); override;
```

C++

```
virtual __fastcall InternalSetToRecord(const char * Buffer);
```

Description

This is InternalSetToRecord, a member of class TIBCustomDataSet.

4.1.2.4.59 TIBCustomDataSet.InternalUnPrepare Method

Pascal

```
procedure InternalUnPrepare; virtual;
```

C++

```
virtual __fastcall InternalUnPrepare();
```

Description

This is InternalUnPrepare, a member of class TIBCustomDataSet.

4.1.2.4.60 TIBCustomDataSet.IsCursorOpen Method

Pascal

```
function IsCursorOpen: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsCursorOpen();
```

Description

This is IsCursorOpen, a member of class TIBCustomDataSet.

4.1.2.4.61 TIBCustomDataSet.IsSequenced Method

IsSequenced indicates whether sequence numbers are available for database records.

Pascal

```
function IsSequenced: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsSequenced();
```

Description

IsSequenced indicates whether sequence numbers are available for database records.

Delphi syntax:

```
function IsSequenced: Boolean; override;
```

C++ syntax:

```
virtual bool __fastcall IsSequenced(void);
```

Description

Call IsSequenced to determine whether database records can be located by sequence numbers. When IsSequenced is true, the dataset can navigate directly to a specific record by setting the RecNo property. If IsSequenced is false, the only way to navigate to a specific record is to start at the beginning and count records.

4.1.2.4.62 TIBCustomDataSet.Loaded Method

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

This is Loaded, a member of class TIBCustomDataSet.

4.1.2.4.63 TIBCustomDataSet.Locate Method

Searches the dataset for a specified record and makes that record the current record.

Pascal

```
function Locate(const KeyFields: string; const KeyValues: Variant; Options: TLocateOptions):
Boolean; override;
```

C++

```
virtual __fastcall Boolean Locate(const UnicodeString KeyFields, const Variant KeyValues,
TLocateOptions Options);
```

Description

Call Locate to search a dataset for a specific record and position the cursor on it.

KeyFields is a string containing a semicolon-delimited list of field names on which to search.

KeyValues is a variant that specifies the values to match in the key fields. If KeyFields lists a single field, KeyValues specifies the value for that field on the desired record. To specify multiple search values, pass a variant array as KeyValues, or construct a variant array on the fly using the VarArrayOf routine. For example:

```
        with CustTable do
    Locate('Company;Contact;Phone', VarArrayOf(['Sight Diver', 'P', '408-431-1000']),
[loPartialKey]);
       TLocateOptions Opts;
    Opts.Clear();
    Opts << loPartialKey;
```

```
Variant locvalues[3];
locvalues[0] = Variant("Sight Diver");
locvalues[1] = Variant("P");
locvalues[2] = Variant("408-431-1000");
CustTable->Locate("Company;Contact;Phone", VarArrayOf(locvalues, 2), Opts);
```

Options is a set that optionally specifies additional search latitude when searching on string fields. If Options contains the loCaseInsensitive setting, then Locate ignores case when matching fields. If Options contains the loPartialKey setting, then Locate allows partial-string matching on strings in KeyValues. If Options is an empty set, or if KeyFields does not include any string fields, Options is ignored.

Locate returns true if it finds a matching record, and makes that record the current one. Otherwise Locate returns false.

Locate uses the fastest possible method to locate matching records. If the search fields in KeyFields are indexed and the index is compatible with the specified search options, Locate uses the index. Otherwise Locate creates a filter for the search.

4.1.2.4.64 TIBCustomDataSet.LocateNext Method

Searches the dataset for the record after a specified record and makes that record the current record.

Pascal

```
function LocateNext(const KeyFields: string; const KeyValues: Variant; Options:
TLocateOptions): Boolean;
```

C++

```
__fastcall Boolean LocateNext(const UnicodeString KeyFields, const Variant KeyValues,
TLocateOptions Options);
```

Description

Call LocateNext to search a dataset for a record after the current cursor position

KeyFields is a string containing a semicolon-delimited list of field names on which to search.

KeyValues is a variant that specifies the values to match in the key fields. If KeyFields lists a single field, KeyValues specifies the value for that field on the desired record. To specify multiple search values, pass a variant array as KeyValues, or construct a variant array on the fly using the VarArrayOf routine.

The Options parameter is a set that optionally specifies additional search latitude when searching on string fields. If Options contains the loCaseInsensitive setting, then LocateNext ignores case when matching fields. If Options contains the loPartialKey setting, then LocateNext allows partial-string matching on strings in KeyValues. If Options is an empty set, or if KeyFields does not include any string fields, Options is ignored.

LocateNext returns true if it finds a matching record, and makes that record the current one. Otherwise LocateNext returns false.

LocateNext uses the fastest possible method to locate matching records. If the search fields in KeyFields are indexed and the index is compatible with the specified search options, LocateNext uses the index. Otherwise LocateNext creates a filter for the search.

4.1.2.4.65 TIBCustomDataSet.Lookup Method

Retrieves field values from a record that matches specified search values.

Pascal

```
function Lookup(const KeyFields: string; const KeyValues: Variant; const ResultFields:
string): Variant; override;
```

C++

```
virtual __fastcall Variant Lookup(const UnicodeString KeyFields, const Variant KeyValues,
```

```
const UnicodeString ResultFields);
```

Description

Call Lookup to retrieve values for specified fields from a record that matches search criteria. KeyFields is a string containing a semicolon-delimited list of field names on which to search.

KeyValues is a variant array containing the values to match in the key fields. To specify multiple search values, pass KeyValues as a variant array as an argument, or construct a variant array on the fly using the VarArrayOf routine.

ResultFields is a string containing a semicolon-delimited list of field names whose values should be returned from the matching record.

Lookup returns a variant array containing the values from the fields specified in ResultFields.

If the search fields in KeyFields are indexed, Lookup uses the index. Otherwise Lookup creates a filter for the search.

4.1.2.4.66 TIBCustomDataSet.Post Method

Writes a modified record to the database server.

Pascal

```
procedure Post; override;
```

C++

```
virtual __fastcall Post();
```

Description

Post writes any changes to the current record to the database server. Dataset methods that change the dataset state, such as Edit, Insert, or Append, or that move from one record to another, such as First, Last, Next, and Prior automatically call Post.

Before posting the current record, Post checks the GeneratorField (see page 100) property to determine whether it must generate any field values before posting the record. After changing the generated field, if necessary, Post triggers a BeforePost (see page 97) event, writes the modified record to the server, and then triggers an AfterPost (see page 95) event.

4.1.2.4.67 TIBCustomDataSet.PSEndTransaction Method

Pascal

```
procedure PSEndTransaction(Commit: Boolean); override;
```

C++

```
virtual __fastcall PSEndTransaction(Boolean Commit);
```

Description

This is PSEndTransaction, a member of class TIBCustomDataSet.

4.1.2.4.68 TIBCustomDataSet.PSExecuteStatement Method

Pascal

```
function PSExecuteStatement(const ASQL: string; AParams: TParams; ResultSet: Pointer = nil):
Integer; override;
```

C++

```
virtual __fastcall int PSExecuteStatement(const UnicodeString ASQL, TParams AParams, void *
ResultSet = nil);
```

Description

This is PSExecuteStatement, a member of class TIBCustomDataSet.

4.1.2.4.69 TIBCustomDataSet.PSGetQuoteChar Method

Pascal

```
function PSGetQuoteChar: string; override;
```

C++

```
virtual __fastcall UnicodeString PSGetQuoteChar();
```

Description

This is PSGetQuoteChar, a member of class TIBCustomDataSet.

4.1.2.4.70 TIBCustomDataSet.PSGetTableName Method

Pascal

```
function PSGetTableName: string; override;
```

C++

```
virtual __fastcall UnicodeString PSGetTableName();
```

Description

This is PSGetTableName, a member of class TIBCustomDataSet.

4.1.2.4.71 TIBCustomDataSet.PSGetUpdateException Method

Pascal

```
function PSGetUpdateException(E: Exception; Prev: EUpdateError): EUpdateError; override;
```

C++

```
virtual __fastcall EUpdateError PSGetUpdateException(Exception E, EUpdateError Prev);
```

Description

This is PSGetUpdateException, a member of class TIBCustomDataSet.

4.1.2.4.72 TIBCustomDataSet.PSInTransaction Method

Pascal

```
function PSInTransaction: Boolean; override;
```

C++

```
virtual __fastcall Boolean PSInTransaction();
```

Description

This is PSInTransaction, a member of class TIBCustomDataSet.

4.1.2.4.73 TIBCustomDataSet.PSIsSQLBased Method

Pascal

```
function PSIsSQLBased: Boolean; override;
```

C++

```
virtual __fastcall Boolean PSIsSQLBased();
```

Description

This is PSIsSQLBased, a member of class TIBCustomDataSet.

4.1.2.4.74 TIBCustomDataSet.PSIsSQLSupported Method

Pascal

```
function PSIsSQLSupported: Boolean; override;
```

C++

```
virtual __fastcall Boolean PSIsSQLSupported();
```

Description

This is PSIsSQLSupported, a member of class TIBCustomDataSet.

4.1.2.4.75 TIBCustomDataSet.PSReset Method

Pascal

```
procedure PSReset; override;
```

C++

```
virtual __fastcall PSReset();
```

Description

This is PSReset, a member of class TIBCustomDataSet.

4.1.2.4.76 TIBCustomDataSet.PSStartTransaction Method

Pascal

```
procedure PSStartTransaction; override;
```

C++

```
virtual __fastcall PSStartTransaction();
```

Description

This is PSStartTransaction, a member of class TIBCustomDataSet.

4.1.2.4.77 TIBCustomDataSet.PSUpdateRecord Method

Pascal

```
function PSUpdateRecord(UpdateKind: TUpdateKind; Delta: TDataSet): Boolean; override;
```

C++

```
virtual __fastcall Boolean PSUpdateRecord(TUpdateKind UpdateKind, TDataSet Delta);
```

Description

This is PSUpdateRecord, a member of class TIBCustomDataSet.

4.1.2.4.78 TIBCustomDataSet.RecordModified Method

Sets the record to modified or unmodified.

Pascal

```
procedure RecordModified(Value: Boolean);
```

C++

```
__fastcall RecordModified(Boolean Value);
```

Description

Call RecordModified to mark a record as modified or unmodified.

Note: This method is for internal use.

4.1.2.4.79 TIBCustomDataSet.ReQuery Method

Pascal

```
procedure ReQuery;
```

C++

```
__fastcall ReQuery();
```

Description

This is ReQuery, a member of class TIBCustomDataSet.

4.1.2.4.80 TIBCustomDataSet.RevertRecord Method

Restores the current record in the dataset to an unmodified state when cached updates are enabled.

Pascal

```
procedure RevertRecord;
```

C++

```
__fastcall RevertRecord();
```

Description

Call RevertRecord to undo changes made to the current record when cached updates are enabled.

Note: To undo all changes to all pending updates in the cache, call CancelUpdates (see page 70).

4.1.2.4.81 TIBCustomDataSet.SetActive Method

Pascal

```
procedure SetActive(Value: Boolean); override;
```

C++

```
virtual __fastcall SetActive(Boolean Value);
```

Description

This is SetActive, a member of class TIBCustomDataSet.

4.1.2.4.82 TIBCustomDataSet.SetBookmarkData Method

Pascal

```
procedure SetBookmarkData(Buffer: PChar; Data: Pointer); override;
```

C++

```
virtual __fastcall SetBookmarkData(const char * Buffer, void * Data);
```

Description

This is SetBookmarkData, a member of class TIBCustomDataSet.

4.1.2.4.83 TIBCustomDataSet.SetBookmarkFlag Method

Pascal

```
procedure SetBookmarkFlag(Buffer: PChar; Value: TBookmarkFlag); override;
```

C++

```
virtual __fastcall SetBookmarkFlag(const char * Buffer, TBookmarkFlag Value);
```

Description

This is SetBookmarkFlag, a member of class TIBCustomDataSet.

4.1.2.4.84 TIBCustomDataSet.SetCachedUpdates Method

Pascal

```
procedure SetCachedUpdates(Value: Boolean);
```

C++

```
__fastcall SetCachedUpdates(Boolean Value);
```

Description

This is SetCachedUpdates, a member of class TIBCustomDataSet.

4.1.2.4.85 TIBCustomDataSet.SetDataSource Method

Pascal

```
procedure SetDataSource(Value: TDataSource);
```

C++

```
__fastcall SetDataSource(TDataSource Value);
```

Description

This is SetDataSource, a member of class TIBCustomDataSet.

4.1.2.4.86 SetFieldData Method

This is the overview for the SetFieldData method overload.

Overload List

	Name	Description
	TIBCustomDataSet.SetFieldData (TField, Pointer) (see page 91)	This is SetFieldData, a member of class TIBCustomDataSet.
	TIBCustomDataSet.SetFieldData (TField, Pointer, Boolean) (see page 91)	This is SetFieldData, a member of class TIBCustomDataSet.

4.1.2.4.86.1 TIBCustomDataSet.SetFieldData Method (TField, Pointer)

Pascal

```
procedure SetFieldData(Field: TField; Buffer: Pointer); override;
```

C++

```
virtual __fastcall SetFieldData(TField Field, void * Buffer);
```

Description

This is SetFieldData, a member of class TIBCustomDataSet.

4.1.2.4.86.2 TIBCustomDataSet.SetFieldData Method (TField, Pointer, Boolean)

Pascal

```
procedure SetFieldData(Field: TField; Buffer: Pointer; NativeFormat: Boolean); override;
overload;
```

C++

```
virtual __fastcall SetFieldData(TField Field, void * Buffer, Boolean NativeFormat);
```

Description

This is SetFieldData, a member of class TIBCustomDataSet.

4.1.2.4.87 TIBCustomDataSet.SetRecNo Method

Pascal

```
procedure SetRecNo(Value: Integer); override;
```

C++

```
virtual __fastcall SetRecNo(int Value);
```

Description

This is SetRecNo, a member of class TIBCustomDataSet.

4.1.2.4.88 TIBCustomDataSet.SQLType Method

Returns the type of query to be executed.

Pascal

```
function SQLType: TIBSQLTypes;
```

C++

```
__fastcall TIBSQLTypes SQLType();
```

Description

Use the SQLType to determine the type of query to be executed. This is the same as the SQLType property of the query specified by QSelect (see page 104).

4.1.2.4.89 TIBCustomDataSet.Undelete Method

Restores a record deleted from the dataset.

Pascal

```
procedure Undelete;
```

C++

```
__fastcall Undelete();
```

Description

Call Undelete to restore a record deleted or uninserted from the dataset.

4.1.2.4.90 TIBCustomDataSet.UpdateStatus Method

Reports the update status for the current record.

Pascal

```
function UpdateStatus: TUpdateStatus; override;
```

C++

```
virtual __fastcall TUpdateStatus UpdateStatus();
```

Description

Call UpdateStatus to determine the update status for the current record when cached updates are enabled. Update status can change frequently as records are edited, inserted, or deleted. UpdateStatus offers a convenient method for applications to assess the current status before undertaking or completing operations that depend on the update status of records.

4.1.2.5 TIBCustomDataSet Properties

The properties of the TIBCustomDataSet class are listed here.

Protected Properties

	Name	Description
	BufferChunks (see page 98)	Specifies the dataset buffer chunk size.
	CachedUpdates (see page 98)	Specifies whether cached updates are enabled for a dataset.
	DeleteSQL (see page 99)	Holds the SQL statement used to delete rows from the dataset.
	GeneratorField (see page 100)	Specifies whether the dataset should refresh its data every time it posts a record.
	InsertSQL (see page 100)	Holds the SQL statement used to insert rows into the dataset.
R	InternalPrepared (see page 100)	Indicates whether the dataset has prepared its queries for execution.
R	LiveMode (see page 101)	Indicates what types of edits, if any, can be made to the data in the dataset.
	ModifySQL (see page 101)	Provides the ability to access the SQL object encapsulating the ModifySQL statement.
	ParamCheck (see page 102)	Specifies whether the parameter list for a query is regenerated if the SQL property changes at runtime.
R	Params (see page 103)	Specifies the parameters to use for any parameterized queries.
R	QDelete (see page 103)	Provides the ability to directly access the SQL object encapsulating the DeleteSQL (see page 99) statement.

	QInsert (see page 104)	Provides the ability to directly access the SQL object encapsulating the InsertSQL (see page 100) statement.
	QModify (see page 104)	Provides the ability to directly access the SQL object encapsulating the ModifySQL (see page 101) statement.
	QRefresh (see page 104)	Provides the ability to directly access the SQL object encapsulating the RefreshSQL (see page 105) statement.
	QSelect (see page 104)	Provides the ability to directly access the SQL object encapsulating the SelectSQL (see page 105) statement.
	RefreshSQL (see page 105)	Provides the ability to directly access the SQL object encapsulating the RefreshSQL statement.
	SelectSQL (see page 105)	Provides the ability to directly access the SQL object encapsulating the SelectSQL statement.
	SelectStmtHandle (see page 105)	Gets the handle for the SELECT statement.
	SQLParams (see page 106)	Specifies the parameters to use for any parameterized queries.
	StatementType (see page 106)	Returns the statement type of the QSelect (see page 104) query.
	UniDirectional (see page 107)	Determines whether bidirectional cursors are enabled for the dataset.
	UpdateMode (see page 107)	Indicates how records are located when updating records.

Public Properties

	Name	Description
	DBHandle (see page 99)	Specifies the database handle for the dataset.
	Plan (see page 103)	Indicates the PLAN portion of the dataset's SELECT query.
	RowsAffected (see page 105)	Indicates the number of rows operated on by the latest query execution.
	TRHandle (see page 106)	Specifies the transaction handle for the dataset.
	UpdateObject (see page 107)	Specifies the update object component used to update a read-only result set.
	UpdateRecordTypes (see page 108)	Specifies the type of records visible in a dataset when cached updates are enabled.
	UpdatesPending (see page 108)	Indicates whether the cached updates buffer contains records that are not yet applied.

Published Properties

	Name	Description
	AfterCancel (see page 94)	This is AfterCancel, a member of class TIBCustomDataSet.
	AfterClose (see page 94)	This is AfterClose, a member of class TIBCustomDataSet.
	AfterDelete (see page 94)	This is AfterDelete, a member of class TIBCustomDataSet.
	AfterEdit (see page 94)	This is AfterEdit, a member of class TIBCustomDataSet.
	AfterInsert (see page 95)	This is AfterInsert, a member of class TIBCustomDataSet.
	AfterOpen (see page 95)	This is AfterOpen, a member of class TIBCustomDataSet.
	AfterPost (see page 95)	This is AfterPost, a member of class TIBCustomDataSet.
	AfterRefresh (see page 95)	This is AfterRefresh, a member of class TIBCustomDataSet.
	AfterScroll (see page 95)	This is AfterScroll, a member of class TIBCustomDataSet.
	AutoCalcFields (see page 96)	This is AutoCalcFields, a member of class TIBCustomDataSet.
	BeforeCancel (see page 96)	This is BeforeCancel, a member of class TIBCustomDataSet.
	BeforeClose (see page 96)	This is BeforeClose, a member of class TIBCustomDataSet.
	BeforeDelete (see page 96)	This is BeforeDelete, a member of class TIBCustomDataSet.
	BeforeEdit (see page 97)	This is BeforeEdit, a member of class TIBCustomDataSet.
	BeforeInsert (see page 97)	This is BeforeInsert, a member of class TIBCustomDataSet.
	BeforeOpen (see page 97)	This is BeforeOpen, a member of class TIBCustomDataSet.
	BeforePost (see page 97)	This is BeforePost, a member of class TIBCustomDataSet.
	BeforeRefresh (see page 97)	This is BeforeRefresh, a member of class TIBCustomDataSet.
	BeforeScroll (see page 98)	This is BeforeScroll, a member of class TIBCustomDataSet.
	Database (see page 99)	Identifies the database component for which this dataset represents one or more tables.
	ForcedRefresh (see page 99)	Specifies whether the dataset should refresh its data every time it posts a record.
	ObjectView (see page 101)	This is ObjectView, a member of class TIBCustomDataSet.
	OnCalcFields (see page 101)	This is OnCalcFields, a member of class TIBCustomDataSet.
	OnDeleteError (see page 102)	This is OnDeleteError, a member of class TIBCustomDataSet.

	OnEditError (see page 102)	This is OnEditError, a member of class TIBCustomDataSet.
	OnNewRecord (see page 102)	This is OnNewRecord, a member of class TIBCustomDataSet.
	OnPostError (see page 102)	This is OnPostError, a member of class TIBCustomDataSet.
	Transaction (see page 106)	Identifies the transaction under which the query executes.

4.1.2.5.1 TIBCustomDataSet.AfterCancel Property

Pascal

```
property AfterCancel;
```

C++

```
__property AfterCancel;
```

Description

This is AfterCancel, a member of class TIBCustomDataSet.

4.1.2.5.2 TIBCustomDataSet.AfterClose Property

Pascal

```
property AfterClose;
```

C++

```
__property AfterClose;
```

Description

This is AfterClose, a member of class TIBCustomDataSet.

4.1.2.5.3 TIBCustomDataSet.AfterDelete Property

Pascal

```
property AfterDelete;
```

C++

```
__property AfterDelete;
```

Description

This is AfterDelete, a member of class TIBCustomDataSet.

4.1.2.5.4 TIBCustomDataSet.AfterEdit Property

Pascal

```
property AfterEdit;
```

C++

```
__property AfterEdit;
```

Description

This is AfterEdit, a member of class TIBCustomDataSet.

4.1.2.5.5 TIBCustomDataSet.AfterInsert Property

Pascal

```
property AfterInsert;
```

C++

```
__property AfterInsert;
```

Description

This is AfterInsert, a member of class TIBCustomDataSet.

4.1.2.5.6 TIBCustomDataSet.AfterOpen Property

Pascal

```
property AfterOpen;
```

C++

```
__property AfterOpen;
```

Description

This is AfterOpen, a member of class TIBCustomDataSet.

4.1.2.5.7 TIBCustomDataSet.AfterPost Property

Pascal

```
property AfterPost;
```

C++

```
__property AfterPost;
```

Description

This is AfterPost, a member of class TIBCustomDataSet.

4.1.2.5.8 TIBCustomDataSet.AfterRefresh Property

Pascal

```
property AfterRefresh;
```

C++

```
__property AfterRefresh;
```

Description

This is AfterRefresh, a member of class TIBCustomDataSet.

4.1.2.5.9 TIBCustomDataSet.AfterScroll Property

Pascal

```
property AfterScroll;
```

C++

```
__property AfterScroll;
```

Description

This is AfterScroll, a member of class TIBCustomDataSet.

4.1.2.5.10 TIBCustomDataSet.AutoCalcFields Property

Pascal

```
property AutoCalcFields;
```

C++

```
__property AutoCalcFields;
```

Description

This is AutoCalcFields, a member of class TIBCustomDataSet.

4.1.2.5.11 TIBCustomDataSet.BeforeCancel Property

Pascal

```
property BeforeCancel;
```

C++

```
__property BeforeCancel;
```

Description

This is BeforeCancel, a member of class TIBCustomDataSet.

4.1.2.5.12 TIBCustomDataSet.BeforeClose Property

Pascal

```
property BeforeClose;
```

C++

```
__property BeforeClose;
```

Description

This is BeforeClose, a member of class TIBCustomDataSet.

4.1.2.5.13 TIBCustomDataSet.BeforeDelete Property

Pascal

```
property BeforeDelete;
```

C++

```
__property BeforeDelete;
```

Description

This is BeforeDelete, a member of class TIBCustomDataSet.

4.1.2.5.14 TIBCustomDataSet.BeforeEdit Property

Pascal

```
property BeforeEdit;
```

C++

```
__property BeforeEdit;
```

Description

This is BeforeEdit, a member of class TIBCustomDataSet.

4.1.2.5.15 TIBCustomDataSet.BeforeInsert Property

Pascal

```
property BeforeInsert;
```

C++

```
__property BeforeInsert;
```

Description

This is BeforeInsert, a member of class TIBCustomDataSet.

4.1.2.5.16 TIBCustomDataSet.BeforeOpen Property

Pascal

```
property BeforeOpen;
```

C++

```
__property BeforeOpen;
```

Description

This is BeforeOpen, a member of class TIBCustomDataSet.

4.1.2.5.17 TIBCustomDataSet.BeforePost Property

Pascal

```
property BeforePost;
```

C++

```
__property BeforePost;
```

Description

This is BeforePost, a member of class TIBCustomDataSet.

4.1.2.5.18 TIBCustomDataSet.BeforeRefresh Property

Pascal

```
property BeforeRefresh;
```

C++

```
__property BeforeRefresh;
```

Description

This is BeforeRefresh, a member of class TIBCustomDataSet.

4.1.2.5.19 TIBCustomDataSet.BeforeScroll Property

Pascal

```
property BeforeScroll;
```

C++

```
__property BeforeScroll;
```

Description

This is BeforeScroll, a member of class TIBCustomDataSet.

4.1.2.5.20 TIBCustomDataSet.BufferChunks Property

Specifies the dataset buffer chunk size.

Pascal

```
property BufferChunks: Integer;
```

C++

```
__property int BufferChunks;
```

Description

Use BufferChunks to get or set the number of records for which the dataset allocates buffer space at any time. When the dataset's buffer is full, trying to fetch an additional record causes the dataset to reallocate the buffer so that it has enough memory to hold an additional BufferChunks records.

Note: When UniDirectional (see page 107) is true, BufferChunks has no meaning.

4.1.2.5.21 TIBCustomDataSet.CachedUpdates Property

Specifies whether cached updates are enabled for a dataset.

Pascal

```
property CachedUpdates: Boolean;
```

C++

```
__property Boolean CachedUpdates;
```

Description

CachedUpdates enables or disables the use of cached updates for a dataset. If CachedUpdates is true, cached updates are enabled. If CachedUpdates is false, cached updates are disabled.

When cached updates are enabled, updates to a dataset (such as posting changes, inserting new records, or deleting records), are stored in an internal cache on the client machine instead of being written directly to the dataset's underlying database tables. When changes are complete, an application writes all cached changes to the database in the context of a single transaction.

Note: **Note**: Instead of using cached updates, applications can obtain the same benefits with greater control by using a client dataset.

4.1.2.5.22 TIBCustomDataSet.Database Property

Identifies the database component for which this dataset represents one or more tables.

Pascal

```
property Database: TIBDatabase;
```

C++

```
__property TIBDatabase Database;
```

Description

Use Database to access the properties, events, and methods of the database component associated with this dataset.

Creating and Deleting Tables

Using Query-type Datasets

Using Stored Procedure-type Datasets

Using Table Type Datasets

Connecting Directly to a Database Server

4.1.2.5.23 TIBCustomDataSet.DBHandle Property

Specifies the database handle for the dataset.

Pascal

```
property DBHandle: PISC_DB_HANDLE;
```

C++

```
__property PISC_DB_HANDLE DBHandle;
```

Description

Check DBHandle to determine the database handle for the dataset.

4.1.2.5.24 TIBCustomDataSet.DeleteSQL Property

Holds the SQL statement used to delete rows from the dataset.

Pascal

```
property DeleteSQL: TStrings;
```

C++

```
__property TStrings DeleteSQL;
```

Description

Use DeleteSQL to delete rows in the dataset.

4.1.2.5.25 TIBCustomDataSet.ForcedRefresh Property

Specifies whether the dataset should refresh its data every time it posts a record.

Pascal

```
property ForcedRefresh: Boolean;
```

C++

```
__property Boolean ForcedRefresh;
```

Description

Set ForcedRefresh to true to force the dataset to refresh its data every time it posts a record. When ForcedRefresh is false (the default), the data is only refreshed when you call the Refresh method, or when the dataset needs to fetch the value of a default or internally calculated field.

4.1.2.5.26 TIBCustomDataSet.GeneratorField Property

Specifies whether the dataset should refresh its data every time it posts a record.

Pascal

```
property GeneratorField: TIBGeneratorField;
```

C++

```
__property TIBGeneratorField GeneratorField;
```

Description

Use GeneratorField to specify a generator that automatically provides the value for one of the fields in the dataset. Use the properties of the TIBGeneratorField (see page 142) object to indicate which field's value should be set and how that value should be calculated.

Warning: Do not set the value of GeneratorField. To change the value of this property, change the properties of the TIBGeneratorField (see page 142) object that is the value of this property.

4.1.2.5.27 TIBCustomDataSet.InsertSQL Property

Holds the SQL statement used to insert rows into the dataset.

Pascal

```
property InsertSQL: TStrings;
```

C++

```
__property TStrings InsertSQL;
```

Description

Use InsertSQL to insert rows into the dataset.

4.1.2.5.28 TIBCustomDataSet.InternalPrepared Property

Indicates whether the dataset has prepared its queries for execution.

Pascal

```
property InternalPrepared: Boolean;
```

C++

```
__property Boolean InternalPrepared;
```

Description

TIBCustomDataSet (see page 62) uses InternalPrepared internally to determine when it needs to prepare its set of queries for

execution. The dataset checks InternalPrepared before executing a query, and prepares the query if InternalPrepared is false.

4.1.2.5.29 TIBCustomDataSet.LiveMode Property

Indicates what types of edits, if any, can be made to the data in the dataset.

Pascal

```
property LiveMode: TLiveModes;
```

C++

```
__property TLiveModes LiveMode;
```

Description

Read LiveMode to determine what types of edits should be allowed. LiveMode is set automatically to restrict the capabilities of the dataset to reflect the user's rights.

Note: For read-only datasets, such as TIBQuery, LiveMode is always an empty set.

4.1.2.5.30 TIBCustomDataSet.ModifySQL Property

Provides the ability to access the SQL object encapsulating the ModifySQL statement.

Pascal

```
property ModifySQL: TStrings;
```

C++

```
__property TStrings ModifySQL;
```

Description

Use ModifySQL to access the SQL object that encapsulates the ModifySQL statement.

4.1.2.5.31 TIBCustomDataSet.ObjectView Property

Pascal

```
property ObjectView;
```

C++

```
__property ObjectView;
```

Description

This is ObjectView, a member of class TIBCustomDataSet.

4.1.2.5.32 TIBCustomDataSet.OnCalcFields Property

Pascal

```
property OnCalcFields;
```

C++

```
__property OnCalcFields;
```

Description

This is OnCalcFields, a member of class TIBCustomDataSet.

4.1.2.5.33 TIBCustomDataSet.OnDeleteError Property

Pascal

```
property OnDeleteError;
```

C++

```
__property OnDeleteError;
```

Description

This is OnDeleteError, a member of class TIBCustomDataSet.

4.1.2.5.34 TIBCustomDataSet.OnEditError Property

Pascal

```
property OnEditError;
```

C++

```
__property OnEditError;
```

Description

This is OnEditError, a member of class TIBCustomDataSet.

4.1.2.5.35 TIBCustomDataSet.OnNewRecord Property

Pascal

```
property OnNewRecord;
```

C++

```
__property OnNewRecord;
```

Description

This is OnNewRecord, a member of class TIBCustomDataSet.

4.1.2.5.36 TIBCustomDataSet.OnPostError Property

Pascal

```
property OnPostError;
```

C++

```
__property OnPostError;
```

Description

This is OnPostError, a member of class TIBCustomDataSet.

4.1.2.5.37 TIBCustomDataSet.ParamCheck Property

Specifies whether the parameter list for a query is regenerated if the SQL property changes at runtime.

Pascal

```
property ParamCheck: Boolean;
```

C++

```
__property Boolean ParamCheck;
```

Description

Set ParamCheck to specify whether the Params (see page 103) property is cleared and regenerated if an application modifies the SQL in this dataset's query. By default ParamCheck is true, meaning that the Params (see page 103) property is automatically regenerated at runtime. When ParamCheck is true, the proper number of parameters is guaranteed to be generated for the current SQL statement.

This property is useful for data definition language (DDL) statements that contain parameters as part of the DDL statement that are not parameters for the TIBCustomDataSet (see page 62). For example, the DDL statement to create a stored procedure may contain parameter statements that are part of the stored procedure. Set ParamCheck to false to prevent these parameters from being mistaken for parameters of the TIBCustomDataSet (see page 62) executing the DDL statement.

4.1.2.5.38 TIBCustomDataSet.Params Property

Specifies the parameters to use for any parameterized queries.

Pascal

```
property Params: TIBXSQLDA;
```

C++

```
__property TIBXSQLDA Params;
```

Description

Use Params to set up the parameters for the SQL object specified by the QSelect (see page 104) property. Params is the same as the SQLParams (see page 106) property.

4.1.2.5.39 TIBCustomDataSet.Plan Property

Indicates the PLAN portion of the dataset's SELECT query.

Pascal

```
property Plan: String;
```

C++

```
__property UnicodeString Plan;
```

Description

Read the Plan property to determine the PLAN clause in the query specified by QSelect (see page 104).

4.1.2.5.40 TIBCustomDataSet.QDelete Property

Provides the ability to directly access the SQL object encapsulating the DeleteSQL (see page 99) statement.

Pascal

```
property QDelete: TIBSQL;
```

C++

```
__property TIBSQL QDelete;
```

Description

Use QDelete to access the SQL object that encapsulates the Delete SQL statement.

4.1.2.5.41 TIBCustomDataSet.QInsert Property

Provides the ability to directly access the SQL object encapsulating the InsertSQL (see page 100) statement.

Pascal

```
property QInsert: TIBSQL;
```

C++

```
__property TIBSQL QInsert;
```

Description

Use QInsert to access the SQL object that encapsulates the InsertSQL (see page 100) statement.

4.1.2.5.42 TIBCustomDataSet.QModify Property

Provides the ability to directly access the SQL object encapsulating the ModifySQL (see page 101) statement.

Pascal

```
property QModify: TIBSQL;
```

C++

```
__property TIBSQL QModify;
```

Description

Use QModify to access the SQL object that encapsulates the ModifySQL (see page 101) statement.

4.1.2.5.43 TIBCustomDataSet.QRefresh Property

Provides the ability to directly access the SQL object encapsulating the RefreshSQL (see page 105) statement.

Pascal

```
property QRefresh: TIBSQL;
```

C++

```
__property TIBSQL QRefresh;
```

Description

Use QRefresh to access the SQL object that encapsulates the RefreshSQL (see page 105) statement.

4.1.2.5.44 TIBCustomDataSet.QSelect Property

Provides the ability to directly access the SQL object encapsulating the SelectSQL (see page 105) statement.

Pascal

```
property QSelect: TIBSQL;
```

C++

```
__property TIBSQL QSelect;
```

Description

Use QSelect to access the SQL object that encapsulates the SelectSQL (see page 105) statement.

4.1.2.5.45 TIBCustomDataSet.RefreshSQL Property

Provides the ability to directly access the SQL object encapsulating the RefreshSQL statement.

Pascal

```
property RefreshSQL: TStrings;
```

C++

```
__property TStrings RefreshSQL;
```

Description

Use RefreshSQL to access the SQL object that encapsulates the RefreshSQL statement.

4.1.2.5.46 TIBCustomDataSet.RowsAffected Property

Indicates the number of rows operated on by the latest query execution.

Pascal

```
property RowsAffected: Integer;
```

C++

```
__property int RowsAffected;
```

Description

When the dataset represents a query that does not return a result set, you can't use the RecordCount property to ascertain the number of records affected by the query. In such cases, read RowsAffected to determine how many rows were updated or deleted by the query when it executed. If no rows were updated or deleted, RowsAffected is zero. RowsAffected is -1 if the query could not be executed due to an error condition. (This latter situation typically follows the throwing of an exception.)

4.1.2.5.47 TIBCustomDataSet.SelectSQL Property

Provides the ability to directly access the SQL object encapsulating the SelectSQL statement.

Pascal

```
property SelectSQL: TStrings;
```

C++

```
__property TStrings SelectSQL;
```

Description

Use SelectSQL to access the SQL object that encapsulates the SelectSQL statement.

4.1.2.5.48 TIBCustomDataSet.SelectStmtHandle Property

Gets the handle for the SELECT statement.

Pascal

```
property SelectStmtHandle: TISC_STMT_HANDLE;
```

C++

```
__property TISC_STMT_HANDLE SelectStmtHandle;
```

Description

Use SelectStmtHandle to get the handle for the SELECT statement.

4.1.2.5.49 TIBCustomDataSet.SQLParams Property

Specifies the parameters to use for any parameterized queries.

Pascal

```
property SQLParams: TIBXSQLDA;
```

C++

```
__property TIBXSQLDA SQLParams;
```

Description

Use SQLParams to set up the parameters for the SQL object specified by the QSelect (see page 104) property. SQLParams is the same as the Params (see page 103) property.

4.1.2.5.50 TIBCustomDataSet.StatementType Property

Returns the statement type of the QSelect (see page 104) query.

Pascal

```
property StatementType: TIBSQLTypes;
```

C++

```
__property TIBSQLTypes StatementType;
```

Description

Use StatementType to determine the statement type of a QSelect (see page 104) query.

4.1.2.5.51 TIBCustomDataSet.Transaction Property

Identifies the transaction under which the query executes.

Pascal

```
property Transaction: TIBTransaction;
```

C++

```
__property TIBTransaction Transaction;
```

Description

Use Transaction to determine the transaction that contains any query this dataset executes. Set the properties of this transaction object to control how the transaction executes, or set the Transaction property to cause this dataset's queries to be included in an existing transaction.

4.1.2.5.52 TIBCustomDataSet.TRHandle Property

Specifies the transaction handle for the dataset.

Pascal

```
property TRHandle: PISC_TR_HANDLE;
```

C++

```
__property PISC_TR_HANDLE TRHandle;
```

Description

Check TRHandle to determine the transaction handle for the dataset.

4.1.2.5.53 TIBCustomDataSet.UniDirectional Property

Determines whether bidirectional cursors are enabled for the dataset.

Pascal

```
property UniDirectional: Boolean;
```

C++

```
__property Boolean UniDirectional;
```

Description

Use UniDirectional to determine whether bidirectional cursors are enabled for this dataset.

Note: Do not confuse the UniDirectional property with the IsUniDirectional property inherited from TDataSet. IsUniDirectional indicates whether the dataset is a dbExpress dataset, which, in addition to using a unidirectional cursor, does not buffer records. UniDirectional is only concerned with whether the cursor permits backward or random navigation.

4.1.2.5.54 TIBCustomDataSet.UpdateMode Property

Indicates how records are located when updating records.

Pascal

```
property UpdateMode: TUpdateMode;
```

C++

```
__property TUpdateMode UpdateMode;
```

Description

UpdateMode is not currently implemented in IB (see page 1) datasets. It is reserved for future use.

4.1.2.5.55 TIBCustomDataSet.UpdateObject Property

Specifies the update object component used to update a read-only result set.

Pascal

```
property UpdateObject: TIBDataSetUpdateObject;
```

C++

```
__property TIBDataSetUpdateObject UpdateObject;
```

Description

Use UpdateObject to specify the TIBDataSetUpdateObject (see page 134) component to use in an application that must be able to update a read-only result set.

In some cases, such as when using TIBQuery, the dataset does not automatically update records. In these cases, UpdateObject can be used to specify a TIBUpdateSQL component that performs updates as a separate transaction that is transparent to the application.

TIBDataSetUpdateObject (see page 134) is especially useful for complicated updates from an OnUpdateRecord (see page 111) event.

4.1.2.5.56 TIBCustomDataSet.UpdateRecordTypes Property

Specifies the type of records visible in a dataset when cached updates are enabled.

Pascal

```
property UpdateRecordTypes: TIBUpdateRecordTypes;
```

C++

```
__property TIBUpdateRecordTypes UpdateRecordTypes;
```

Description

Use UpdateRecordTypes to specify the records that are visible in a dataset when cached updates are enabled. UpdateRecordTypes is a set that can have the following values:

By default, a dataset is created with an UpdateRecordTypes set of cusModified, cusInserted, or cusUnmodified, meaning that all existing, edited, or inserted records are visible to the user.

An application that must cycle through a dataset to undelete records may change UpdateRecordTypes as part of an undelete method, so that deleted records are 'visible' long enough to restore them to their previously undeleted conditions.

Similarly, an application that must cycle through a dataset to uninsert records may change UpdateRecordTypes as part of an uninsert method, so that uninserted records are 'visible' long enough to restore them to their previously inserted conditions.

An application might also use UpdateRecordTypes like a filter to temporarily limit visible records to those added or inserted by the user during the current session.

4.1.2.5.57 TIBCustomDataSet.UpdatesPending Property

Indicates whether the cached updates buffer contains records that are not yet applied.

Pascal

```
property UpdatesPending: Boolean;
```

C++

```
__property Boolean UpdatesPending;
```

Description

Examine UpdatesPending to check the status of the cached updates buffer. If UpdatesPending is true, then there are edited, deleted, or inserted records to apply to the database. If UpdatesPending is false, there are no records in the cache.

4.1.2.6 TIBCustomDataSet Events

The events of the TIBCustomDataSet class are listed here.

Protected Events

	Name	Description
	AfterDatabaseDisconnect (see page 109)	Occurs immediately after the connection to the associated database is closed.
	AfterTransactionEnd (see page 109)	Occurs immediately after a transaction that includes this dataset's query ends.
	BeforeDatabaseDisconnect (see page 109)	Occurs immediately before the connection to the associated database is closed.
	BeforeTransactionEnd (see page 109)	Occurs immediately before a transaction that includes this dataset's query ends.
	DatabaseFree (see page 110)	Occurs when the database associated with this dataset is freed.

	TransactionFree (see page 111)	Occurs when the transaction that includes this dataset's query is freed.

Published Events

	Name	Description
	OnUpdateError (see page 110)	Occurs if an exception is generated when cached updates are applied to a database.
	OnUpdateRecord (see page 111)	Occurs when cached updates are applied to a record.

4.1.2.6.1 TIBCustomDataSet.AfterDatabaseDisconnect Event

Occurs immediately after the connection to the associated database is closed.

Pascal

```
property AfterDatabaseDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterDatabaseDisconnect;
```

Description

Write an AfterDatabaseDisconnect event handler to respond when the dataset closes its connection to the database specified by the Database (see page 99) property.

4.1.2.6.2 TIBCustomDataSet.AfterTransactionEnd Event

Occurs immediately after a transaction that includes this dataset's query ends.

Pascal

```
property AfterTransactionEnd: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterTransactionEnd;
```

Description

Write an AfterTransactionEnd event handler to respond when the transaction specified by the Transaction (see page 106) property ends.

4.1.2.6.3 TIBCustomDataSet.BeforeDatabaseDisconnect Event

Occurs immediately before the connection to the associated database is closed.

Pascal

```
property BeforeDatabaseDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeDatabaseDisconnect;
```

Description

Write a BeforeDatabaseDisconnect event handler to respond when the dataset is about to close its connection to the database specified by the Database (see page 99) property.

4.1.2.6.4 TIBCustomDataSet.BeforeTransactionEnd Event

Occurs immediately before a transaction that includes this dataset's query ends.

Pascal

```
property BeforeTransactionEnd: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeTransactionEnd;
```

Description

Write a BeforeTransactionEnd event handler to respond when the transaction specified by the Transaction (see page 106) property is about to end.

4.1.2.6.5 TIBCustomDataSet.DatabaseFree Event

Occurs when the database associated with this dataset is freed.

Pascal

```
property DatabaseFree: TNotifyEvent;
```

C++

```
__property TNotifyEvent DatabaseFree;
```

Description

Write a DatabaseFree event handler to respond when the database specified by the Database (see page 99) property is freed.

4.1.2.6.6 TIBCustomDataSet.OnUpdateError Event

Occurs if an exception is generated when cached updates are applied to a database.

Pascal

```
property OnUpdateError: TIBUpdateErrorEvent;
```

C++

```
__property TIBUpdateErrorEvent OnUpdateError;
```

Description

Write an OnUpdateError event handler to respond to exceptions generated when cached updates are applied to a database.

Because there is a delay between the time a record is first cached and the time cached updates are applied, there is a possibility that another application may change one or more of the same records in the database before the cached changes can be applied. DataSet is the name of the dataset to which updates are applied.

The error handler can use the OldValue and NewValue properties of TField to evaluate error conditions, and set NewValue to a new value to reapply. In this case, set UpdateAction to uaRetry before exiting.

Note: If a call to ApplyUpdates (see page 69) raises an exception and ApplyUpdates (see page 69) is not called within the context of a try..except (Delphi) or try..catch (C++) block, an error message is returned. If an OnUpdateError handler cannot correct the error condition and leaves UpdateAction set to uaFail, the error message is returned twice. To prevent re-return, set UpdateAction to uaAbort in the error handler.

Warning: **Important:** The code in an OnUpdateError handler must not call any methods that make a different record the current one.

4.1.2.6.7 TIBCustomDataSet.OnUpdateRecord Event

Occurs when cached updates are applied to a record.

Pascal

```
property OnUpdateRecord: TIBUpdateRecordEvent;
```

C++

```
__property TIBUpdateRecordEvent OnUpdateRecord;
```

Description

Write an OnUpdateRecord event handler to process updates that cannot be handled by a single update component, such as implementation of cascading updates, insertions, or deletions. This handler is also useful for applications that require additional control over parameter substitution in update components.

Note: The code in an OnUpdateRecord handler must not call any methods that make a different record the current one.

4.1.2.6.8 TIBCustomDataSet.TransactionFree Event

Occurs when the transaction that includes this dataset's query is freed.

Pascal

```
property TransactionFree: TNotifyEvent;
```

C++

```
__property TNotifyEvent TransactionFree;
```

Description

Write a TransactionFree event handler to respond when the transaction specified by the Transaction (see page 106) property is freed.

4.1.3 TIBDataLink Class

TIBDataLink is a helper class used by data-aware objects to coordinate the actions of TIBDataSet (see page 114) and to respond to data events.

Class Hierarchy

Pascal

```
TIBDataLink = class(TDetailDataLink);
```

C++

```
class TIBDataLink : public TDetailDataLink;
```

File

IBCustomDataSet

Description

Use TIBDataLink or one of its descendants in any data-aware object that implements a DataSource property to represent its link to a dataset or that needs to respond to data events.

The constructor of the data-aware object should call the constructor of TIBDataLink, and initialize any relevant properties. The data-aware object can then link to a TDataSource by using the DataSource property of the TIBDataLink.

Data-aware objects that link to a single field in a dataset should use a TFieldDataLink instead.

4.1.3.1 TIBDataLink Members

The following tables list the members exposed by TIBDataLink.

Protected Methods

	Name	Description
	ActiveChanged (see page 113)	This is ActiveChanged, a member of class TIBDataLink.
	CheckBrowseMode (see page 113)	This is CheckBrowseMode, a member of class TIBDataLink.
	GetDetailDataSet (see page 113)	This is GetDetailDataSet, a member of class TIBDataLink.
	RecordChanged (see page 114)	This is RecordChanged, a member of class TIBDataLink.

Public Methods

	Name	Description
	Create (see page 112)	Creates an instance of TIBDataLink (see page 111).
	Destroy (see page 112)	Destroys an instance of TIBDataLink (see page 111).

4.1.3.2 TIBDataLink.Create Constructor

Creates an instance of TIBDataLink (see page 111).

Pascal

```
constructor Create(ADataSet: TIBCustomDataSet);
```

C++

```
__fastcall TIBDataLink(TIBCustomDataSet ADataSet);
```

Description

Create is called from the constructor of any data-aware object that uses a TIBDataLink (see page 111) to implement its DataSource property.

After calling the inherited constructor, Create initializes the BufferCount property to 1. Data-aware objects that use a TIBDataLink (see page 111) object to manage their link to a DataSource should change the BufferCount property to the number or records they represent, after calling the inherited constructor.

4.1.3.3 TIBDataLink.Destroy Destructor

Destroys an instance of TIBDataLink (see page 111).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBDataLink();
```

Description

Do not call Destroy directly in an application. Instead, call the Free method. Free verifies that the TIBDataLink (see page 111) object is not already freed and only then calls Destroy.

Before calling the inherited destructor, Destroy removes any reference to the TIBDataLink (see page 111) from the data source object.

The TIBDataLink (see page 111) object should be destroyed in the destructor of its Owner, where that Owner calls Create (see page 112) from its constructor.

4.1.3.4 TIBDataLink Methods

The methods of the TIBDataLink class are listed here.

Protected Methods

	Name	Description
	ActiveChanged (see page 113)	This is ActiveChanged, a member of class TIBDataLink.
	CheckBrowseMode (see page 113)	This is CheckBrowseMode, a member of class TIBDataLink.
	GetDetailDataSet (see page 113)	This is GetDetailDataSet, a member of class TIBDataLink.
	RecordChanged (see page 114)	This is RecordChanged, a member of class TIBDataLink.

4.1.3.4.1 TIBDataLink.ActiveChanged Method

Pascal

```
procedure ActiveChanged; override;
```

C++

```
virtual __fastcall ActiveChanged();
```

Description

This is ActiveChanged, a member of class TIBDataLink.

4.1.3.4.2 TIBDataLink.CheckBrowseMode Method

Pascal

```
procedure CheckBrowseMode; override;
```

C++

```
virtual __fastcall CheckBrowseMode();
```

Description

This is CheckBrowseMode, a member of class TIBDataLink.

4.1.3.4.3 TIBDataLink.GetDetailDataSet Method

Pascal

```
function GetDetailDataSet: TDataSet; override;
```

C++

```
virtual __fastcall TDataSet GetDetailDataSet();
```

Description

This is GetDetailDataSet, a member of class TIBDataLink.

4.1.3.4.4 TIBDataLink.RecordChanged Method

Pascal

```
procedure RecordChanged(Field: TField); override;
```

C++

```
virtual __fastcall RecordChanged(TField Field);
```

Description

This is RecordChanged, a member of class TIBDataLink.

4.1.4 TIBDataSet Class

TIBDataSet executes InterBase SQL statements.

Class Hierarchy

Pascal

```
TIBDataSet = class(TIBCustomDataSet);
```

C++

```
class TIBDataSet : public TIBCustomDataSet;
```

File

IBCustomDataSet

Description

Use TIBDataSet to execute InterBase SQL statements. Each TIBDataSet component has properties for a statement to fetch data (typically an SQL SELECT statement), a statement to modify those records, one for inserting records, one for deleting records, and one to refresh the dataset.

TIBDataSet buffers the result set, making it completely scrollable. Since TIBDataSet is a descendant of TDataSet, it works well with all data-aware components.

Types of Datasets

Getting Started with InterBase Express

4.1.4.1 TIBDataSet Members

The following tables list the members exposed by TIBDataSet.

Protected Methods

	Name	Description
	ActivateConnection (see page 69)	This is ActivateConnection, a member of class TIBCustomDataSet.
	ActivateTransaction (see page 69)	This is ActivateTransaction, a member of class TIBCustomDataSet.
V	AllocRecordBuffer (see page 69)	This is AllocRecordBuffer, a member of class TIBCustomDataSet.
	CheckDatasetClosed (see page 71)	This is CheckDatasetClosed, a member of class TIBCustomDataSet.

	CheckDatasetOpen (see page 71)	This is CheckDatasetOpen, a member of class TIBCustomDataSet.
	CheckNotUniDirectional (see page 71)	This is CheckNotUniDirectional, a member of class TIBCustomDataSet.
V	ClearCalcFields (see page 71)	This is ClearCalcFields, a member of class TIBCustomDataSet.
	ConstraintsStored (see page 72)	This is ConstraintsStored, a member of class TIBCustomDataSet.
V	CreateFields (see page 72)	This is CreateFields, a member of class TIBCustomDataSet.
	DeactivateTransaction (see page 73)	This is DeactivateTransaction, a member of class TIBCustomDataSet.
V	Disconnect (see page 73)	This is Disconnect, a member of class TIBCustomDataSet.
V	DoBeforeDelete (see page 73)	This is DoBeforeDelete, a member of class TIBCustomDataSet.
V	DoBeforeEdit (see page 73)	This is DoBeforeEdit, a member of class TIBCustomDataSet.
V	DoBeforeInsert (see page 74)	This is DoBeforeInsert, a member of class TIBCustomDataSet.
V	DoOnNewRecord (see page 74)	This is DoOnNewRecord, a member of class TIBCustomDataSet.
V	FreeRecordBuffer (see page 75)	This is FreeRecordBuffer, a member of class TIBCustomDataSet.
	GetActiveBuf (see page 75)	This is GetActiveBuf, a member of class TIBCustomDataSet.
V	GetBookmarkData (see page 75)	This is GetBookmarkData, a member of class TIBCustomDataSet.
V	GetBookmarkFlag (see page 75)	This is GetBookmarkFlag, a member of class TIBCustomDataSet.
V	GetCanModify (see page 75)	This is GetCanModify, a member of class TIBCustomDataSet.
V	GetDataSource (see page 76)	This is GetDataSource, a member of class TIBCustomDataSet.
V	GetFieldClass (see page 76)	This is GetFieldClass, a member of class TIBCustomDataSet.
V	GetRecNo (see page 77)	This is GetRecNo, a member of class TIBCustomDataSet.
V	GetRecord (see page 77)	This is GetRecord, a member of class TIBCustomDataSet.
V	GetRecordCount (see page 78)	This is GetRecordCount, a member of class TIBCustomDataSet.
V	GetRecordSize (see page 78)	This is GetRecordSize, a member of class TIBCustomDataSet.
V	InitRecord (see page 78)	This is InitRecord, a member of class TIBCustomDataSet.
V	InternalAddRecord (see page 78)	This is InternalAddRecord, a member of class TIBCustomDataSet.
V	InternalBatchInput (see page 79)	This is InternalBatchInput, a member of class TIBCustomDataSet.
V	InternalBatchOutput (see page 79)	This is InternalBatchOutput, a member of class TIBCustomDataSet.
V	InternalCancel (see page 79)	This is InternalCancel, a member of class TIBCustomDataSet.
V	InternalClose (see page 79)	This is InternalClose, a member of class TIBCustomDataSet.
V	InternalDelete (see page 79)	This is InternalDelete, a member of class TIBCustomDataSet.
V	InternalExecQuery (see page 80)	This is InternalExecQuery, a member of class TIBCustomDataSet.
V	InternalFirst (see page 80)	This is InternalFirst, a member of class TIBCustomDataSet.
V	InternalGotoBookmark (see page 80)	This is InternalGotoBookmark, a member of class TIBCustomDataSet.
V	InternalHandleException (see page 80)	This is InternalHandleException, a member of class TIBCustomDataSet.
V	InternalInitFieldDefs (see page 81)	This is InternalInitFieldDefs, a member of class TIBCustomDataSet.
V	InternalInitRecord (see page 81)	This is InternalInitRecord, a member of class TIBCustomDataSet.
V	InternalInsert (see page 81)	This is InternalInsert, a member of class TIBCustomDataSet.
V	InternalLast (see page 81)	This is InternalLast, a member of class TIBCustomDataSet.
V	InternalOpen (see page 119)	This is InternalOpen, a member of class TIBDataSet.
V	InternalPost (see page 82)	This is InternalPost, a member of class TIBCustomDataSet.
V	InternalPrepare (see page 82)	This is InternalPrepare, a member of class TIBCustomDataSet.
V	InternalRefresh (see page 82)	This is InternalRefresh, a member of class TIBCustomDataSet.
V	InternalRefreshRow (see page 82)	This is InternalRefreshRow, a member of class TIBCustomDataSet.
V	InternalSetParamsFromCursor (see page 83)	This is InternalSetParamsFromCursor, a member of class TIBCustomDataSet.
V	InternalSetToRecord (see page 83)	This is InternalSetToRecord, a member of class TIBCustomDataSet.
V	InternalUnPrepare (see page 83)	This is InternalUnPrepare, a member of class TIBCustomDataSet.
V	IsCursorOpen (see page 83)	This is IsCursorOpen, a member of class TIBCustomDataSet.
V	Loaded (see page 84)	This is Loaded, a member of class TIBCustomDataSet.
V	PSEndTransaction (see page 86)	This is PSEndTransaction, a member of class TIBCustomDataSet.
V	PSExecuteStatement (see page 86)	This is PSExecuteStatement, a member of class TIBCustomDataSet.
V	PSGetQuoteChar (see page 87)	This is PSGetQuoteChar, a member of class TIBCustomDataSet.
V	PSGetTableName (see page 87)	This is PSGetTableName, a member of class TIBCustomDataSet.
V	PSGetUpdateException (see page 87)	This is PSGetUpdateException, a member of class TIBCustomDataSet.
V	PSInTransaction (see page 87)	This is PSInTransaction, a member of class TIBCustomDataSet.
V	PSIsSQLBased (see page 88)	This is PSIsSQLBased, a member of class TIBCustomDataSet.

	PSIsSQLSupported (see page 88)	This is PSIsSQLSupported, a member of class TIBCustomDataSet.
	PSReset (see page 88)	This is PSReset, a member of class TIBCustomDataSet.
	PSSetCommandText (see page 120)	This is PSSetCommandText, a member of class TIBDataSet.
	PSStartTransaction (see page 88)	This is PSStartTransaction, a member of class TIBCustomDataSet.
	PSUpdateRecord (see page 88)	This is PSUpdateRecord, a member of class TIBCustomDataSet.
	ReQuery (see page 89)	This is ReQuery, a member of class TIBCustomDataSet.
	SetActive (see page 89)	This is SetActive, a member of class TIBCustomDataSet.
	SetBookmarkData (see page 90)	This is SetBookmarkData, a member of class TIBCustomDataSet.
	SetBookmarkFlag (see page 90)	This is SetBookmarkFlag, a member of class TIBCustomDataSet.
	SetCachedUpdates (see page 90)	This is SetCachedUpdates, a member of class TIBCustomDataSet.
	SetDataSource (see page 90)	This is SetDataSource, a member of class TIBCustomDataSet.
	SetFieldData (see page 90)	This is the overview for the SetFieldData method overload.
	SetFiltered (see page 120)	This is SetFiltered, a member of class TIBDataSet.
	SetRecNo (see page 91)	This is SetRecNo, a member of class TIBCustomDataSet.

Protected Properties

	Name	Description
	InternalPrepared (see page 100)	Indicates whether the dataset has prepared its queries for execution.
	QDelete (see page 103)	Provides the ability to directly access the SQL object encapsulating the DeleteSQL (see page 99) statement.
	QInsert (see page 104)	Provides the ability to directly access the SQL object encapsulating the InsertSQL (see page 100) statement.
	QModify (see page 104)	Provides the ability to directly access the SQL object encapsulating the ModifySQL (see page 101) statement.
	QRefresh (see page 104)	Provides the ability to directly access the SQL object encapsulating the RefreshSQL (see page 105) statement.
	QSelect (see page 104)	Provides the ability to directly access the SQL object encapsulating the SelectSQL (see page 105) statement.
	SQLParams (see page 106)	Specifies the parameters to use for any parameterized queries.
	UpdateMode (see page 107)	Indicates how records are located when updating records.

Public Methods

	Name	Description
	ApplyUpdates (see page 69)	Writes a dataset's pending cached updates to the database.
	BatchInput (see page 119)	Executes the parameterized query in SQL for input in the referenced input object.
	BatchOutput (see page 119)	Outputs the selected query in SQL to the referenced OutputObject.
	BookmarkValid (see page 70)	Indicates the validity of a specified bookmark.
	CachedUpdateStatus (see page 70)	Returns the status of the cached updates.
	CancelUpdates (see page 70)	Clears all pending cached updates from the cache.
	CompareBookmarks (see page 71)	Compares two bookmarks.
	Create (see page 66)	Creates an instance of a TDataSet component.
	CreateBlobStream (see page 72)	Returns a TIBDSBlobStream (see page 138) object for reading or writing the data in a specified blob field.
	Current (see page 73)	Returns the descriptor area that holds information about the current query.
	Destroy (see page 66)	Destroys the instance of a dataset component.
	ExecSQL (see page 119)	Executes the SQL statement that the SelectSQL (see page 131) property specifies when it is not a SELECT statement.
	FetchAll (see page 74)	Retrieves all records from the current cursor position to the end of the file and stores them locally.
	GetCurrentRecord (see page 76)	Retrieves the current record into a buffer.
	GetFieldData (see page 76)	This is the overview for the GetFieldData method overload.
	IsSequenced (see page 83)	IsSequenced indicates whether sequence numbers are available for database records.
	Locate (see page 84)	Searches the dataset for a specified record and makes that record the current record.
	LocateNext (see page 85)	Searches the dataset for the record after a specified record and makes that record the current record.
	Lookup (see page 85)	Retrieves field values from a record that matches specified search values.

	ParamByName (see page 120)	Returns a specified parameter of the SELECT query that fetches this dataset's data.
V	Post (see page 86)	Writes a modified record to the database server.
	Prepare (see page 120)	Prepares all queries in the dataset to be executed.
	RecordModified (see page 89)	Sets the record to modified or unmodified.
	RevertRecord (see page 89)	Restores the current record in the dataset to an unmodified state when cached updates are enabled.
	SQLType (see page 91)	Returns the type of query to be executed.
	Undelete (see page 92)	Restores a record deleted from the dataset.
	UnPrepare (see page 121)	Resets the state of a dataset's internal queries.
V	UpdateStatus (see page 92)	Reports the update status for the current record.

Public Properties

	Name	Description
R	DBHandle (see page 99)	Specifies the database handle for the dataset.
	LiveMode (see page 128)	Indicates what types of edits, if any, can be made to the data in the dataset.
	Params (see page 130)	Provides the ability to specify values for a parameterized query.
R	Plan (see page 103)	Indicates the PLAN portion of the dataset's SELECT query.
R	Prepared (see page 131)	Determines whether or not a set of dataset queries is prepared for execution.
R	RowsAffected (see page 105)	Indicates the number of rows operated on by the latest query execution.
	SelectStmtHandle (see page 131)	Gets the handle for the SELECT statement.
	StatementType (see page 132)	Returns the statement type of the QSelect query.
R	TRHandle (see page 106)	Specifies the transaction handle for the dataset.
	UpdateRecordTypes (see page 108)	Specifies the type of records visible in a dataset when cached updates are enabled.
R	UpdatesPending (see page 108)	Indicates whether the cached updates buffer contains records that are not yet applied.

Published Events

	Name	Description
	AfterDatabaseDisconnect (see page 133)	Occurs immediately after the connection to the associated database is closed.
	AfterTransactionEnd (see page 133)	Occurs immediately after a transaction that includes this dataset's query ends.
	BeforeDatabaseDisconnect (see page 133)	Occurs immediately before the connection to the associated database is closed.
	BeforeTransactionEnd (see page 134)	Occurs immediately before a transaction that includes this dataset's query ends.
	DatabaseFree (see page 134)	Occurs when the database associated with this dataset is freed.
	OnUpdateError (see page 110)	Occurs if an exception is generated when cached updates are applied to a database.
	OnUpdateRecord (see page 111)	Occurs when cached updates are applied to a record.
	TransactionFree (see page 134)	Occurs when the transaction that includes this dataset's query is freed.

Published Properties

	Name	Description
	Active (see page 122)	This is Active, a member of class TIBDataSet.
	AfterCancel (see page 122)	This is AfterCancel, a member of class TIBDataSet.
	AfterClose (see page 122)	This is AfterClose, a member of class TIBDataSet.
	AfterDelete (see page 123)	This is AfterDelete, a member of class TIBDataSet.
	AfterEdit (see page 123)	This is AfterEdit, a member of class TIBDataSet.
	AfterInsert (see page 123)	This is AfterInsert, a member of class TIBDataSet.
	AfterOpen (see page 123)	This is AfterOpen, a member of class TIBDataSet.
	AfterPost (see page 123)	This is AfterPost, a member of class TIBDataSet.
	AfterRefresh (see page 95)	This is AfterRefresh, a member of class TIBCustomDataSet.
	AfterScroll (see page 124)	This is AfterScroll, a member of class TIBDataSet.
	AutoCalcFields (see page 124)	This is AutoCalcFields, a member of class TIBDataSet.
	BeforeCancel (see page 124)	This is BeforeCancel, a member of class TIBDataSet.
	BeforeClose (see page 124)	This is BeforeClose, a member of class TIBDataSet.
	BeforeDelete (see page 125)	This is BeforeDelete, a member of class TIBDataSet.

	BeforeEdit (see page 125)	This is BeforeEdit, a member of class TIBDataSet.
	BeforeInsert (see page 125)	This is BeforeInsert, a member of class TIBDataSet.
	BeforeOpen (see page 125)	This is BeforeOpen, a member of class TIBDataSet.
	BeforePost (see page 125)	This is BeforePost, a member of class TIBDataSet.
	BeforeRefresh (see page 97)	This is BeforeRefresh, a member of class TIBCustomDataSet.
	BeforeScroll (see page 126)	This is BeforeScroll, a member of class TIBDataSet.
	BufferChunks (see page 126)	Specifies the dataset buffer chunk size.
	CachedUpdates (see page 126)	Specifies whether cached updates are enabled for a dataset.
	Database (see page 99)	Identifies the database component for which this dataset represents one or more tables.
	DataSource (see page 127)	This is DataSource, a member of class TIBDataSet.
	DeleteSQL (see page 127)	Holds the SQL statement used to delete rows from the dataset.
	Filtered (see page 127)	Specifies whether or not filtering is active for the dataset.
	ForcedRefresh (see page 99)	Specifies whether the dataset should refresh its data every time it posts a record.
	GeneratorField (see page 127)	Specifies whether the dataset should refresh its data every time it posts a record.
	InsertSQL (see page 128)	Holds the SQL statement used to insert rows into the dataset.
	ModifySQL (see page 128)	Provides the ability to access the SQL object encapsulating the ModifySQL statement.
	ObjectView (see page 101)	This is ObjectView, a member of class TIBCustomDataSet.
	OnCalcFields (see page 129)	This is OnCalcFields, a member of class TIBDataSet.
	OnDeleteError (see page 129)	This is OnDeleteError, a member of class TIBDataSet.
	OnEditError (see page 129)	This is OnEditError, a member of class TIBDataSet.
	OnFilterRecord (see page 129)	This is OnFilterRecord, a member of class TIBDataSet.
	OnNewRecord (see page 129)	This is OnNewRecord, a member of class TIBDataSet.
	OnPostError (see page 130)	This is OnPostError, a member of class TIBDataSet.
	ParamCheck (see page 130)	Specifies whether the parameter list for a query is regenerated if the SQL property changes at runtime.
	RefreshSQL (see page 131)	Provides the ability to directly access the SQL object encapsulating the RefreshSQL statement.
	SelectSQL (see page 131)	Provides the ability to directly access the SQL object encapsulating the SelectSQL statement.
	Transaction (see page 106)	Identifies the transaction under which the query executes.
	UniDirectional (see page 132)	Determines whether bidirectional cursors are enabled for the dataset.
	UpdateObject (see page 132)	Specifies the update object component used to update a read-only result set.

4.1.4.2 TIBDataSet Methods

The methods of the TIBDataSet class are listed here.

Protected Methods

	Name	Description
	InternalOpen (see page 119)	This is InternalOpen, a member of class TIBDataSet.
	PSSetCommandText (see page 120)	This is PSSetCommandText, a member of class TIBDataSet.
	SetFiltered (see page 120)	This is SetFiltered, a member of class TIBDataSet.

Public Methods

	Name	Description
	BatchInput (see page 119)	Executes the parameterized query in SQL for input in the referenced input object.
	BatchOutput (see page 119)	Outputs the selected query in SQL to the referenced OutputObject.
	ExecSQL (see page 119)	Executes the SQL statement that the SelectSQL (see page 131) property specifies when it is not a SELECT statement.
	ParamByName (see page 120)	Returns a specified parameter of the SELECT query that fetches this dataset's data.
	Prepare (see page 120)	Prepares all queries in the dataset to be executed.
	UnPrepare (see page 121)	Resets the state of a dataset's internal queries.

4.1.4.2.1 TIBDataSet.BatchInput Method

Executes the parameterized query in SQL for input in the referenced input object.

Pascal

```
procedure BatchInput(InputObject: TIBBatchInput);
```

C++

```
__fastcall BatchInput(TIBBatchInput InputObject);
```

Description

Call BatchInput to execute the parameterized query in SQL for input in the referenced input object.

4.1.4.2.2 TIBDataSet.BatchOutput Method

Outputs the selected query in SQL to the referenced OutputObject.

Pascal

```
procedure BatchOutput(OutputObject: TIBBatchOutput);
```

C++

```
__fastcall BatchOutput(TIBBatchOutput OutputObject);
```

Description

Call BatchOutput to output the selected query in SQL to the referenced OutputObject.

4.1.4.2.3 TIBDataSet.ExecSQL Method

Executes the SQL statement that the SelectSQL (see page 131) property specifies when it is not a SELECT statement.

Pascal

```
procedure ExecSQL;
```

C++

```
__fastcall ExecSQL();
```

Description

Call ExecSQL to execute the main query for this dataset when it is not a SELECT statement. If the value of the SelectSQL (see page 131) property is not set, or if it is set to a SELECT statement, ExecSQL raises an EIBError (see page 3) exception.

4.1.4.2.4 TIBDataSet.InternalOpen Method

Pascal

```
procedure InternalOpen; override;
```

C++

```
virtual __fastcall InternalOpen();
```

Description

This is InternalOpen, a member of class TIBDataSet.

4.1.4.2.5 TIBDataSet.ParamByName Method

Returns a specified parameter of the SELECT query that fetches this dataset's data.

Pascal

```
function ParamByName(Idx: String): TIBXSQLVAR;
```

C++

```
__fastcall TIBXSQLVAR ParamByName(UnicodeString Idx);
```

Description

Call ParamByName to retrieve the object that represents a parameter of the query that fetches this dataset's data. Use the TIBXSQLVAR (see page 544) object this method returns to get or set the parameter value.

Idx is the name of the parameter.

4.1.4.2.6 TIBDataSet.Prepare Method

Prepares all queries in the dataset to be executed.

Pascal

```
procedure Prepare;
```

C++

```
__fastcall Prepare();
```

Description

Call Prepare to prepare all queries in the dataset to be executed.

4.1.4.2.7 TIBDataSet.PSSetCommandText Method

Pascal

```
procedure PSSetCommandText(const CommandText: string); override;
```

C++

```
virtual __fastcall PSSetCommandText(const UnicodeString CommandText);
```

Description

This is PSSetCommandText, a member of class TIBDataSet.

4.1.4.2.8 TIBDataSet.SetFiltered Method

Pascal

```
procedure SetFiltered(Value: Boolean); override;
```

C++

```
virtual __fastcall SetFiltered(Boolean Value);
```

Description

This is SetFiltered, a member of class TIBDataSet.

4.1.4.2.9 TIBDataSet.UnPrepare Method

Resets the state of a dataset's internal queries.

Pascal

```
procedure UnPrepare;
```

C++

```
__fastcall UnPrepare();
```

Description

Note: Call UnPrepare to reset the state of a dataset's internal queries.

4.1.4.3 TIBDataSet Properties

The properties of the TIBDataSet class are listed here.

Public Properties

	Name	Description
	LiveMode (see page 128)	Indicates what types of edits, if any, can be made to the data in the dataset.
	Params (see page 130)	Provides the ability to specify values for a parameterized query.
R	Prepared (see page 131)	Determines whether or not a set of dataset queries is prepared for execution.
	SelectStmtHandle (see page 131)	Gets the handle for the SELECT statement.
	StatementType (see page 132)	Returns the statement type of the QSelect query.

Published Properties

	Name	Description
	Active (see page 122)	This is Active, a member of class TIBDataSet.
	AfterCancel (see page 122)	This is AfterCancel, a member of class TIBDataSet.
	AfterClose (see page 122)	This is AfterClose, a member of class TIBDataSet.
	AfterDelete (see page 123)	This is AfterDelete, a member of class TIBDataSet.
	AfterEdit (see page 123)	This is AfterEdit, a member of class TIBDataSet.
	AfterInsert (see page 123)	This is AfterInsert, a member of class TIBDataSet.
	AfterOpen (see page 123)	This is AfterOpen, a member of class TIBDataSet.
	AfterPost (see page 123)	This is AfterPost, a member of class TIBDataSet.
	AfterScroll (see page 124)	This is AfterScroll, a member of class TIBDataSet.
	AutoCalcFields (see page 124)	This is AutoCalcFields, a member of class TIBDataSet.
	BeforeCancel (see page 124)	This is BeforeCancel, a member of class TIBDataSet.
	BeforeClose (see page 124)	This is BeforeClose, a member of class TIBDataSet.
	BeforeDelete (see page 125)	This is BeforeDelete, a member of class TIBDataSet.
	BeforeEdit (see page 125)	This is BeforeEdit, a member of class TIBDataSet.
	BeforeInsert (see page 125)	This is BeforeInsert, a member of class TIBDataSet.
	BeforeOpen (see page 125)	This is BeforeOpen, a member of class TIBDataSet.
	BeforePost (see page 125)	This is BeforePost, a member of class TIBDataSet.
	BeforeScroll (see page 126)	This is BeforeScroll, a member of class TIBDataSet.
	BufferChunks (see page 126)	Specifies the dataset buffer chunk size.
	CachedUpdates (see page 126)	Specifies whether cached updates are enabled for a dataset.
	DataSource (see page 127)	This is DataSource, a member of class TIBDataSet.
	DeleteSQL (see page 127)	Holds the SQL statement used to delete rows from the dataset.
	Filtered (see page 127)	Specifies whether or not filtering is active for the dataset.
	GeneratorField (see page 127)	Specifies whether the dataset should refresh its data every time it posts a record.
	InsertSQL (see page 128)	Holds the SQL statement used to insert rows into the dataset.

	ModifySQL (see page 128)	Provides the ability to access the SQL object encapsulating the ModifySQL statement.
	OnCalcFields (see page 129)	This is OnCalcFields, a member of class TIBDataSet.
	OnDeleteError (see page 129)	This is OnDeleteError, a member of class TIBDataSet.
	OnEditError (see page 129)	This is OnEditError, a member of class TIBDataSet.
	OnFilterRecord (see page 129)	This is OnFilterRecord, a member of class TIBDataSet.
	OnNewRecord (see page 129)	This is OnNewRecord, a member of class TIBDataSet.
	OnPostError (see page 130)	This is OnPostError, a member of class TIBDataSet.
	ParamCheck (see page 130)	Specifies whether the parameter list for a query is regenerated if the SQL property changes at runtime.
	RefreshSQL (see page 131)	Provides the ability to directly access the SQL object encapsulating the RefreshSQL statement.
	SelectSQL (see page 131)	Provides the ability to directly access the SQL object encapsulating the SelectSQL statement.
	UniDirectional (see page 132)	Determines whether bidirectional cursors are enabled for the dataset.
	UpdateObject (see page 132)	Specifies the update object component used to update a read-only result set.

4.1.4.3.1 TIBDataSet.Active Property

Pascal

```
property Active;
```

C++

```
__property Active;
```

Description

This is Active, a member of class TIBDataSet.

4.1.4.3.2 TIBDataSet.AfterCancel Property

Pascal

```
property AfterCancel;
```

C++

```
__property AfterCancel;
```

Description

This is AfterCancel, a member of class TIBDataSet.

4.1.4.3.3 TIBDataSet.AfterClose Property

Pascal

```
property AfterClose;
```

C++

```
__property AfterClose;
```

Description

This is AfterClose, a member of class TIBDataSet.

4.1.4.3.4 TIBDataSet.AfterDelete Property

Pascal

```
property AfterDelete;
```

C++

```
__property AfterDelete;
```

Description

This is AfterDelete, a member of class TIBDataSet.

4.1.4.3.5 TIBDataSet.AfterEdit Property

Pascal

```
property AfterEdit;
```

C++

```
__property AfterEdit;
```

Description

This is AfterEdit, a member of class TIBDataSet.

4.1.4.3.6 TIBDataSet.AfterInsert Property

Pascal

```
property AfterInsert;
```

C++

```
__property AfterInsert;
```

Description

This is AfterInsert, a member of class TIBDataSet.

4.1.4.3.7 TIBDataSet.AfterOpen Property

Pascal

```
property AfterOpen;
```

C++

```
__property AfterOpen;
```

Description

This is AfterOpen, a member of class TIBDataSet.

4.1.4.3.8 TIBDataSet.AfterPost Property

Pascal

```
property AfterPost;
```

C++

```
__property AfterPost;
```

Description

This is AfterPost, a member of class TIBDataSet.

4.1.4.3.9 TIBDataSet.AfterScroll Property

Pascal

```
property AfterScroll;
```

C++

```
__property AfterScroll;
```

Description

This is AfterScroll, a member of class TIBDataSet.

4.1.4.3.10 TIBDataSet.AutoCalcFields Property

Pascal

```
property AutoCalcFields;
```

C++

```
__property AutoCalcFields;
```

Description

This is AutoCalcFields, a member of class TIBDataSet.

4.1.4.3.11 TIBDataSet.BeforeCancel Property

Pascal

```
property BeforeCancel;
```

C++

```
__property BeforeCancel;
```

Description

This is BeforeCancel, a member of class TIBDataSet.

4.1.4.3.12 TIBDataSet.BeforeClose Property

Pascal

```
property BeforeClose;
```

C++

```
__property BeforeClose;
```

Description

This is BeforeClose, a member of class TIBDataSet.

4.1.4.3.13 TIBDataSet.BeforeDelete Property

Pascal

```
property BeforeDelete;
```

C++

```
__property BeforeDelete;
```

Description

This is BeforeDelete, a member of class TIBDataSet.

4.1.4.3.14 TIBDataSet.BeforeEdit Property

Pascal

```
property BeforeEdit;
```

C++

```
__property BeforeEdit;
```

Description

This is BeforeEdit, a member of class TIBDataSet.

4.1.4.3.15 TIBDataSet.BeforeInsert Property

Pascal

```
property BeforeInsert;
```

C++

```
__property BeforeInsert;
```

Description

This is BeforeInsert, a member of class TIBDataSet.

4.1.4.3.16 TIBDataSet.BeforeOpen Property

Pascal

```
property BeforeOpen;
```

C++

```
__property BeforeOpen;
```

Description

This is BeforeOpen, a member of class TIBDataSet.

4.1.4.3.17 TIBDataSet.BeforePost Property

Pascal

```
property BeforePost;
```

C++

```
__property BeforePost;
```

Description

This is BeforePost, a member of class TIBDataSet.

4.1.4.3.18 TIBDataSet.BeforeScroll Property

Pascal

```
property BeforeScroll;
```

C++

```
__property BeforeScroll;
```

Description

This is BeforeScroll, a member of class TIBDataSet.

4.1.4.3.19 TIBDataSet.BufferChunks Property

Specifies the dataset buffer chunk size.

Pascal

```
property BufferChunks: Integer;
```

C++

```
__property int BufferChunks;
```

Description

Use BufferChunks to get or set the number of records for which the dataset allocates buffer space at any time. When the dataset's buffer is full, trying to fetch an additional record causes the dataset to reallocate the buffer so that it has enough memory to hold an additional BufferChunks records.

Note: When UniDirectional is true, BufferChunks has no meaning.

4.1.4.3.20 TIBDataSet.CachedUpdates Property

Specifies whether cached updates are enabled for a dataset.

Pascal

```
property CachedUpdates: Boolean;
```

C++

```
__property Boolean CachedUpdates;
```

Description

CachedUpdates enables or disables the use of cached updates for a dataset. If CachedUpdates is true, cached updates are enabled. If CachedUpdates is false, cached updates are disabled.

When cached updates are enabled, updates to a dataset (such as posting changes, inserting new records, or deleting records), are stored in an internal cache on the client machine instead of being written directly to the dataset's underlying database tables. When changes are complete, an application writes all cached changes to the database in the context of a single transaction.

Note: **Note**: Instead of using cached updates, applications can obtain the same benefits with greater control by using a client dataset.

4.1.4.3.21 TIBDataSet.DataSource Property

Pascal

```
property DataSource;
```

C++

```
__property DataSource;
```

Description

This is DataSource, a member of class TIBDataSet.

4.1.4.3.22 TIBDataSet.DeleteSQL Property

Holds the SQL statement used to delete rows from the dataset.

Pascal

```
property DeleteSQL: TStrings;
```

C++

```
__property TStrings DeleteSQL;
```

Description

Use DeleteSQL to delete rows in the dataset.

4.1.4.3.23 TIBDataSet.Filtered Property

Specifies whether or not filtering is active for the dataset.

Pascal

```
property Filtered;
```

C++

```
__property Filtered;
```

Description

Check Filtered to determine whether or not dataset filtering is in effect. If Filtered is true, then filtering is active. Otherwise Filtered is false. To apply filter conditions specified in the Filter property or the OnFilterRecord (see page 129) event handler, set Filtered to true.

Note: When filtering is enabled, user edits to a record may mean that the record no longer meets a filter's test condition. The next time the record is retrieved from the dataset while the filter is in effect, the record may seem to disappear. If that happens, the next record that passes the filter condition becomes the current record.

4.1.4.3.24 TIBDataSet.GeneratorField Property

Specifies whether the dataset should refresh its data every time it posts a record.

Pascal

```
property GeneratorField: TIBGeneratorField;
```

C++

```
__property TIBGeneratorField GeneratorField;
```

Description

Use GeneratorField to specify a generator that automatically provides the value for one of the fields in the dataset. Use the properties of the TIBGeneratorField object to indicate which field's value should be set and how that value should be calculated.

Warning: Do not set the value of GeneratorField. To change the value of this property, change the properties of the TIBGeneratorField object that is the value of this property.

4.1.4.3.25 TIBDataSet.InsertSQL Property

Holds the SQL statement used to insert rows into the dataset.

Pascal

```
property InsertSQL: TStrings;
```

C++

```
__property TStrings InsertSQL;
```

Description

Use InsertSQL to insert rows into the dataset.

4.1.4.3.26 TIBDataSet.LiveMode Property

Indicates what types of edits, if any, can be made to the data in the dataset.

Pascal

```
property LiveMode: TLiveModes;
```

C++

```
__property TLiveModes LiveMode;
```

Description

Read LiveMode to determine what types of edits should be allowed. LiveMode is set automatically to restrict the capabilities of the dataset to reflect the user's rights.

Note: For read-only datasets, such as TIBQuery, LiveMode is always an empty set.

4.1.4.3.27 TIBDataSet.ModifySQL Property

Provides the ability to access the SQL object encapsulating the ModifySQL statement.

Pascal

```
property ModifySQL: TStrings;
```

C++

```
__property TStrings ModifySQL;
```

Description

Use ModifySQL to access the SQL object that encapsulates the ModifySQL statement.

4.1.4.3.28 TIBDataSet.OnCalcFields Property

Pascal

```
property OnCalcFields;
```

C++

```
__property OnCalcFields;
```

Description

This is OnCalcFields, a member of class TIBDataSet.

4.1.4.3.29 TIBDataSet.OnDeleteError Property

Pascal

```
property OnDeleteError;
```

C++

```
__property OnDeleteError;
```

Description

This is OnDeleteError, a member of class TIBDataSet.

4.1.4.3.30 TIBDataSet.OnEditError Property

Pascal

```
property OnEditError;
```

C++

```
__property OnEditError;
```

Description

This is OnEditError, a member of class TIBDataSet.

4.1.4.3.31 TIBDataSet.OnFilterRecord Property

Pascal

```
property OnFilterRecord;
```

C++

```
__property OnFilterRecord;
```

Description

This is OnFilterRecord, a member of class TIBDataSet.

4.1.4.3.32 TIBDataSet.OnNewRecord Property

Pascal

```
property OnNewRecord;
```

C++

```
__property OnNewRecord;
```

Description

This is OnNewRecord, a member of class TIBDataSet.

4.1.4.3.33 TIBDataSet.OnPostError Property

Pascal

```
property OnPostError;
```

C++

```
__property OnPostError;
```

Description

This is OnPostError, a member of class TIBDataSet.

4.1.4.3.34 TIBDataSet.ParamCheck Property

Specifies whether the parameter list for a query is regenerated if the SQL property changes at runtime.

Pascal

```
property ParamCheck: Boolean;
```

C++

```
__property Boolean ParamCheck;
```

Description

Set ParamCheck to specify whether the Params property is cleared and regenerated if an application modifies the SQL in this dataset's query. By default ParamCheck is true, meaning that the Params property is automatically regenerated at runtime. When ParamCheck is true, the proper number of parameters is guaranteed to be generated for the current SQL statement.

This property is useful for data definition language (DDL) statements that contain parameters as part of the DDL statement that are not parameters for the TIBCustomDataSet. For example, the DDL statement to create a stored procedure may contain parameter statements that are part of the stored procedure. Set ParamCheck to false to prevent these parameters from being mistaken for parameters of the TIBCustomDataSet executing the DDL statement.

4.1.4.3.35 TIBDataSet.Params Property

Provides the ability to specify values for a parameterized query.

Pascal

```
property Params: TIBXSQLDA;
```

C++

```
__property TIBXSQLDA Params;
```

Description

Use Params to specify values for a parameterized query.

For example:

```
DataSet1.Params[0].AsInteger := 24
 DataSet1.Params.ByName['Field2'].AsString := 'foo'
    DataSet1->Params->Items[0]->AsInteger = 24;
 DataSet1->Params->ByName["Field2"]->AsString = "foo";
```

4.1.4.3.36 TIBDataSet.Prepared Property

Determines whether or not a set of dataset queries is prepared for execution.

Pascal

```
property Prepared: Boolean;
```

C++

```
__property Boolean Prepared;
```

Description

Examine Prepared to determine if a set of queries is already prepared for execution. If Prepared is true, the set of queries is prepared, and if Prepared is false, the set of queries is not prepared. While a set of queries need not be prepared before execution, execution performance is enhanced if the set of queries is prepared beforehand, particularly if it is a parameterized set of queries that is executed more than once using the same parameter values.

4.1.4.3.37 TIBDataSet.RefreshSQL Property

Provides the ability to directly access the SQL object encapsulating the RefreshSQL statement.

Pascal

```
property RefreshSQL: TStrings;
```

C++

```
__property TStrings RefreshSQL;
```

Description

Use RefreshSQL to access the SQL object that encapsulates the RefreshSQL statement.

4.1.4.3.38 TIBDataSet.SelectSQL Property

Provides the ability to directly access the SQL object encapsulating the SelectSQL statement.

Pascal

```
property SelectSQL: TStrings;
```

C++

```
__property TStrings SelectSQL;
```

Description

Use SelectSQL to access the SQL object that encapsulates the SelectSQL statement.

4.1.4.3.39 TIBDataSet.SelectStmtHandle Property

Gets the handle for the SELECT statement.

Pascal

```
property SelectStmtHandle: TISC_STMT_HANDLE;
```

C++

```
__property TISC_STMT_HANDLE SelectStmtHandle;
```

Description

Use SelectStmtHandle to get the handle for the SELECT statement.

4.1.4.3.40 TIBDataSet.StatementType Property

Returns the statement type of the QSelect query.

Pascal

```
property StatementType: TIBSQLTypes;
```

C++

```
__property TIBSQLTypes StatementType;
```

Description

Use StatementType to determine the statement type of a QSelect query.

4.1.4.3.41 TIBDataSet.UniDirectional Property

Determines whether bidirectional cursors are enabled for the dataset.

Pascal

```
property UniDirectional: Boolean;
```

C++

```
__property Boolean UniDirectional;
```

Description

Use UniDirectional to determine whether bidirectional cursors are enabled for this dataset.

Note: Do not confuse the UniDirectional property with the IsUniDirectional property inherited from TDataSet. IsUniDirectional indicates whether the dataset is a dbExpress dataset, which, in addition to using a unidirectional cursor, does not buffer records. UniDirectional is only concerned with whether the cursor permits backward or random navigation.

4.1.4.3.42 TIBDataSet.UpdateObject Property

Specifies the update object component used to update a read-only result set.

Pascal

```
property UpdateObject: TIBDataSetUpdateObject;
```

C++

```
__property TIBDataSetUpdateObject UpdateObject;
```

Description

Use UpdateObject to specify the TIBDataSetUpdateObject component to use in an application that must be able to update a read-only result set.

In some cases, such as when using TIBQuery, the dataset does not automatically update records. In these cases, UpdateObject can be used to specify a TIBUpdateSQL component that performs updates as a separate transaction that is transparent to the application.

TIBDataSetUpdateObject is especially useful for complicated updates from an OnUpdateRecord event.

4.1.4.4 TIBDataSet Events

The events of the TIBDataSet class are listed here.

Published Events

	Name	Description
	AfterDatabaseDisconnect (see page 133)	Occurs immediately after the connection to the associated database is closed.
	AfterTransactionEnd (see page 133)	Occurs immediately after a transaction that includes this dataset's query ends.
	BeforeDatabaseDisconnect (see page 133)	Occurs immediately before the connection to the associated database is closed.
	BeforeTransactionEnd (see page 134)	Occurs immediately before a transaction that includes this dataset's query ends.
	DatabaseFree (see page 134)	Occurs when the database associated with this dataset is freed.
	TransactionFree (see page 134)	Occurs when the transaction that includes this dataset's query is freed.

4.1.4.4.1 TIBDataSet.AfterDatabaseDisconnect Event

Occurs immediately after the connection to the associated database is closed.

Pascal

```
property AfterDatabaseDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterDatabaseDisconnect;
```

Description

Write an AfterDatabaseDisconnect event handler to respond when the dataset closes its connection to the database specified by the Database property.

4.1.4.4.2 TIBDataSet.AfterTransactionEnd Event

Occurs immediately after a transaction that includes this dataset's query ends.

Pascal

```
property AfterTransactionEnd: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterTransactionEnd;
```

Description

Write an AfterTransactionEnd event handler to respond when the transaction specified by the Transaction property ends.

4.1.4.4.3 TIBDataSet.BeforeDatabaseDisconnect Event

Occurs immediately before the connection to the associated database is closed.

Pascal

```
property BeforeDatabaseDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeDatabaseDisconnect;
```

Description

Write a BeforeDatabaseDisconnect event handler to respond when the dataset is about to close its connection to the database

specified by the Database property.

4.1.4.4.4 TIBDataSet.BeforeTransactionEnd Event

Occurs immediately before a transaction that includes this dataset's query ends.

Pascal

```
property BeforeTransactionEnd: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeTransactionEnd;
```

Description

Write a BeforeTransactionEnd event handler to respond when the transaction specified by the Transaction property is about to end.

4.1.4.4.5 TIBDataSet.DatabaseFree Event

Occurs when the database associated with this dataset is freed.

Pascal

```
property DatabaseFree: TNotifyEvent;
```

C++

```
__property TNotifyEvent DatabaseFree;
```

Description

Write a DatabaseFree event handler to respond when the database specified by the Database property is freed.

4.1.4.4.6 TIBDataSet.TransactionFree Event

Occurs when the transaction that includes this dataset's query is freed.

Pascal

```
property TransactionFree: TNotifyEvent;
```

C++

```
__property TNotifyEvent TransactionFree;
```

Description

Write a TransactionFree event handler to respond when the transaction specified by the Transaction property is freed.

4.1.5 TIBDataSetUpdateObject Class

TIBDataSetUpdateObject is the abstract base class for update objects used to update otherwise unupdateable queries when cached updates are enabled.

Class Hierarchy

Pascal

```
TIBDataSetUpdateObject = class(TComponent);
```

C++

```
class TIBDataSetUpdateObject : public TComponent;
```

File

IBCustomDataSet

Description

Use TIBDataSetUpdateObject as a base class when creating customized update objects that can be used to update datasets. TIBDataSetUpdateObject declares a single property and some abstract methods, but provides no implementation details: these must be provided by descendant objects.

4.1.5.1 TIBDataSetUpdateObject Members

The following tables list the members exposed by TIBDataSetUpdateObject.

Protected Methods

	Name	Description
	Apply (see page 136)	This is Apply, a member of class TIBDataSetUpdateObject.
	GetDataSet (see page 136)	This is GetDataSet, a member of class TIBDataSetUpdateObject.
	GetSQL (see page 137)	This is GetSQL, a member of class TIBDataSetUpdateObject.
	SetDataSet (see page 137)	This is SetDataSet, a member of class TIBDataSetUpdateObject.

Protected Properties

	Name	Description
	DataSet (see page 137)	This is DataSet, a member of class TIBDataSetUpdateObject.

Public Methods

	Name	Description
	Create (see page 135)	Creates an instance of a TIBDataSetUpdateObject (see page 134) component.
	Destroy (see page 136)	Frees all resources associated with this instance.

Published Properties

	Name	Description
	RefreshSQL (see page 137)	Provides the ability to directly access the SQL object encapsulating the RefreshSQL statement.

4.1.5.2 TIBDataSetUpdateObject.Create Constructor

Creates an instance of a TIBDataSetUpdateObject (see page 134) component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBDataSetUpdateObject(TComponent * AOwner);
```

Description

Call Create to create an instance of a TIBDataSetUpdateObject (see page 134) component.

4.1.5.3 TIBDataSetUpdateObject.Destroy Destructor

Frees all resources associated with this instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBDataSetUpdateObject();
```

Description

Do not call Destroy directly in an application. Usually destruction of objects is handled automatically by Delphi. If an application creates its own instance of an update object, however, the application should call Free, which verifies that the update object is not already freed before calling Destroy.

4.1.5.4 TIBDataSetUpdateObject Methods

The methods of the TIBDataSetUpdateObject class are listed here.

Protected Methods

	Name	Description
	Apply (see page 136)	This is Apply, a member of class TIBDataSetUpdateObject.
	GetDataSet (see page 136)	This is GetDataSet, a member of class TIBDataSetUpdateObject.
	GetSQL (see page 137)	This is GetSQL, a member of class TIBDataSetUpdateObject.
	SetDataSet (see page 137)	This is SetDataSet, a member of class TIBDataSetUpdateObject.

4.1.5.4.1 TIBDataSetUpdateObject.Apply Method

Pascal

```
procedure Apply(UpdateKind: TUpdateKind); virtual; abstract;
```

C++

```
virtual __fastcall Apply(TUpdateKind UpdateKind) = 0;
```

Description

This is Apply, a member of class TIBDataSetUpdateObject.

4.1.5.4.2 TIBDataSetUpdateObject.GetDataSet Method

Pascal

```
function GetDataSet: TIBCustomDataSet; virtual; abstract;
```

C++

```
virtual __fastcall TIBCustomDataSet GetDataSet() = 0;
```

Description

This is GetDataSet, a member of class TIBDataSetUpdateObject.

4.1.5.4.3 TIBDataSetUpdateObject.GetSQL Method

Pascal

```
function GetSQL(UpdateKind: TUpdateKind): TStrings; virtual; abstract;
```

C++

```
virtual __fastcall TStrings GetSQL(TUpdateKind UpdateKind) = 0;
```

Description

This is GetSQL, a member of class TIBDataSetUpdateObject.

4.1.5.4.4 TIBDataSetUpdateObject.SetDataSet Method

Pascal

```
procedure SetDataSet(ADataSet: TIBCustomDataSet); virtual; abstract;
```

C++

```
virtual __fastcall SetDataSet(TIBCustomDataSet ADataSet) = 0;
```

Description

This is SetDataSet, a member of class TIBDataSetUpdateObject.

4.1.5.5 TIBDataSetUpdateObject Properties

The properties of the TIBDataSetUpdateObject class are listed here.

Protected Properties

	Name	Description
	DataSet (see page 137)	This is DataSet, a member of class TIBDataSetUpdateObject.

Published Properties

	Name	Description
	RefreshSQL (see page 137)	Provides the ability to directly access the SQL object encapsulating the RefreshSQL statement.

4.1.5.5.1 TIBDataSetUpdateObject.DataSet Property

Pascal

```
property DataSet: TIBCustomDataSet;
```

C++

```
__property TIBCustomDataSet DataSet;
```

Description

This is DataSet, a member of class TIBDataSetUpdateObject.

4.1.5.5.2 TIBDataSetUpdateObject.RefreshSQL Property

Provides the ability to directly access the SQL object encapsulating the RefreshSQL statement.

Pascal

```
property RefreshSQL: TStrings;
```

C++

```
__property TStrings RefreshSQL;
```

Description

Use RefreshSQL to access the SQL object that encapsulates the RefreshSQL statement.

4.1.6 TIBDSBlobStream Class

TIBDSBlobStream reads from and writes to BLOB fields on behalf of an IB (see page 1) Dataset.

Class Hierarchy

Pascal

```
TIBDSBlobStream = class(TStream);
```

C++

```
class TIBDSBlobStream : public TStream;
```

File

IBCustomDataSet

Description

TIBDSBlobStream is the type of stream returned when an application calls an IB (see page 1) dataset's CreateBlobStream method. Use this stream to access or modify the value of a Blob field in the dataset. TIBDSBlobStream allows objects that have no specialized knowledge of how data is stored in a Blob field to read or write such data by employing the uniform stream interface.

To use TIBDSBlobStream, call CreateBlobStream to obtain an instance of the stream and use the methods of the stream to read or write the data. The dataset retains ownership of the stream, so you should not free this Blob stream when you are done.

4.1.6.1 TIBDSBlobStream Members

The following tables list the members exposed by TIBDSBlobStream.

Protected Fields

	Name	Description
	FBlobStream (see page 139)	This is FBlobStream, a member of class TIBDSBlobStream.
	FField (see page 140)	This is FField, a member of class TIBDSBlobStream.
	FModified (see page 140)	This is FModified, a member of class TIBDSBlobStream.

Public Methods

	Name	Description
	Create (see page 139)	Resets the stream to the beginning of the Blob.
V	Destroy (see page 139)	Frees the instance of TIBDSBlobStream (see page 138).
V	Read (see page 140)	Reads the requested number of bytes from the Blob.
V	Seek (see page 141)	Resets the current position of the TIBDSBlobStream (see page 138) object.

	SetSize (see page 141)	Set the size of the Blob to the requested size.
	Write (see page 141)	Sets the field to be modified.

4.1.6.2 TIBDSBlobStream.Create Constructor

Resets the stream to the beginning of the Blob.

Pascal

```
constructor Create(AField: TField; ABlobStream: TIBBlobStream; Mode: TBlobStreamMode);
```

C++

```
__fastcall TIBDSBlobStream(TField AField, TIBBlobStream ABlobStream, TBlobStreamMode Mode);
```

Description

Call Create to reset the stream to the beginning of the Blob. Depending on the mode, it also truncates the Blob stream.

4.1.6.3 TIBDSBlobStream.Destroy Destructor

Frees the instance of TIBDSBlobStream (see page 138).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBDSBlobStream();
```

Description

Destroy frees the blob stream object and writes the BLOB value to the underlying TBlobField object.

Do not explicitly destroy the instance of TIBDSBlobStream (see page 138) that you obtain by calling a dataset's CreateBlobStream method. The Dataset retains ownership of this stream and is responsible for freeing it.

When working with a Blob stream that you explicitly create and destroy, use the TIBBlobStream (see page 40) class instead.

4.1.6.4 TIBDSBlobStream Fields

The fields of the TIBDSBlobStream class are listed here.

Protected Fields

	Name	Description
	FBlobStream (see page 139)	This is FBlobStream, a member of class TIBDSBlobStream.
	FField (see page 140)	This is FField, a member of class TIBDSBlobStream.
	FModified (see page 140)	This is FModified, a member of class TIBDSBlobStream.

4.1.6.4.1 TIBDSBlobStream.FBlobStream Field

Pascal

```
FBlobStream: TIBBlobStream;
```

C++

```
TIBBlobStream FBlobStream;
```

Description

This is FBlobStream, a member of class TIBDSBlobStream.

4.1.6.4.2 TIBDSBlobStream.FField Field

Pascal

```
FField: TField;
```

C++

```
TField FField;
```

Description

This is FField, a member of class TIBDSBlobStream.

4.1.6.4.3 TIBDSBlobStream.FModified Field

Pascal

```
FModified: Boolean;
```

C++

```
Boolean FModified;
```

Description

This is FModified, a member of class TIBDSBlobStream.

4.1.6.5 TIBDSBlobStream Methods

The methods of the TIBDSBlobStream class are listed here.

Public Methods

	Name	Description
	Read (see page 140)	Reads the requested number of bytes from the Blob.
	Seek (see page 141)	Resets the current position of the TIBDSBlobStream (see page 138) object.
	SetSize (see page 141)	Set the size of the Blob to the requested size.
	Write (see page 141)	Sets the field to be modified.

4.1.6.5.1 TIBDSBlobStream.Read Method

Reads the requested number of bytes from the Blob.

Pascal

```
function Read(var Buffer; Count: Longint): Longint; override;
```

C++

```
virtual __fastcall Longint Read( Buffer, Longint Count);
```

Description

Call Read to read data from the Blob field when the number of bytes in the field's data is not known. Buffer must have at least Count bytes allocated to hold the data that was read from the field.

Read transfers up to Count bytes from the Blob data into Buffer, starting in the current position, and then advances the current

position by the number of bytes actually transferred. Read returns the number of bytes actually transferred (which may be less than the number requested in Count.)

Read checks the Transliterate property of the field, and converts the data into ANSI from the character set specified by the dataset if Transliterate is true.

All the other data-reading methods of a Blob stream (ReadBuffer, ReadComponent) call Read to do their actual reading.

Do not call Read when the TIBDSBlobStream (see page 138) was created in bmWrite mode.

4.1.6.5.2 TIBDSBlobStream.Seek Method

Resets the current position of the TIBDSBlobStream (see page 138) object.

Pascal

```
function Seek(Offset: Longint; Origin: Word): Longint; override;
```

C++

```
virtual __fastcall Longint Seek(Longint Offset, Word Origin);
```

Description

Use Seek to move the current position within the Blob data by the indicated offset. Seek allows an application to read from or write to a particular location within the Blob data.

The Origin parameter indicates how to interpret the Offset parameter. Origin should be one of the following values:

Value	Meaning
soFromBeginning	Offset is from the beginning of the Blob data Seek moves to the position Offset Offset must be >= 0
soFromCurrent	Offset is from the current position in the Blob data Seek moves to Position + Offset
soFromEnd	Offset is from the end of the Blob data Offset must be <= 0 to indicate a number of bytes before the end of the Blob

Seek returns the new value of the Position property, the new current position in the Blob data.

4.1.6.5.3 TIBDSBlobStream.SetSize Method

Set the size of the Blob to the requested size.

Pascal

```
procedure SetSize(NewSize: Longint); override;
```

C++

```
virtual __fastcall SetSize(Longint NewSize);
```

Description

Call SetSize to set the size of the Blob to the requested size.

4.1.6.5.4 TIBDSBlobStream.Write Method

Sets the field to be modified.

Pascal

```
function Write(const Buffer; Count: Longint): Longint; override;
```

C++

```
virtual __fastcall Longint Write(const  Buffer, Longint Count);
```

Description

Use Write to set the field to be modified, write the requested number of bytes to the Blob stream.

4.1.7 TIBGeneratorField Class

TIBGeneratorField calls the server to generate values for a field in an IB (see page 1) dataset.

Class Hierarchy

Pascal

```
TIBGeneratorField = class(TPersistent);
```

C++

```
class TIBGeneratorField : public TPersistent;
```

File

IBCustomDataSet

Description

Assign (see page 144) an instance of TIBGeneratorField as the value of a dataset's GeneratorField property to indicate that the value of a specified field in the dataset can be generated by the server.

Use the Field (see page 145) property to specify the field whose value is generated by the TIBGeneratorField object. Use the Generator (see page 145) and IncrementBy (see page 146) properties to specify how the server should generate field values. Use the ApplyEvent (see page 145) property to indicate when the TIBGeneratorField should call the server to generate field values.

4.1.7.1 TIBGeneratorField Members

The following tables list the members exposed by TIBGeneratorField.

Public Methods

	Name	Description
	Apply (see page 143)	Calls the generator on the server to generate a field value and assigns it to the associated field.
	Assign (see page 144)	Copies the properties of another object.
	Create (see page 143)	Creates an instance of TIBGeneratorField (see page 142).
	ValueName (see page 144)	Returns a string that describes the value that the IB (see page 1) generate fetches.

Published Properties

	Name	Description
	ApplyEvent (see page 145)	Indicates when the TIBGeneratorField (see page 142) instance calls the server to generate a value for the associated field.

	Field (see page 145)	Specifies the field whose value the TIBGeneratorField (see page 142) object generates.
	Generator (see page 145)	Names the generator on the server that TIBGeneratorField (see page 142) calls to generate field values.
	IncrementBy (see page 146)	Names the amount by which a generator on the server increments the value of the associated field.

4.1.7.2 TIBGeneratorField.Create Constructor

Creates an instance of TIBGeneratorField (see page 142).

Pascal

```
constructor Create(ADataSet: TIBCustomDataSet);
```

C++

```
__fastcall TIBGeneratorField(TIBCustomDataSet ADataSet);
```

Description

Do not create instances of TIBGeneratorField (see page 142). This class is designed to work with an IB (see page 1) dataset and is automatically created by the dataset to implement its GeneratorField property.

ADataSet is the dataset that creates the TIBGeneratorField (see page 142) instance and which contains the field whose value the generator field assigns.

4.1.7.3 TIBGeneratorField Methods

The methods of the TIBGeneratorField class are listed here.

Public Methods

	Name	Description
	Apply (see page 143)	Calls the generator on the server to generate a field value and assigns it to the associated field.
	Assign (see page 144)	Copies the properties of another object.
	ValueName (see page 144)	Returns a string that describes the value that the IB (see page 1) generate fetches.

4.1.7.3.1 TIBGeneratorField.Apply Method

Calls the generator on the server to generate a field value and assigns it to the associated field.

Pascal

```
procedure Apply;
```

C++

```
__fastcall Apply();
```

Description

Call Apply to fetch the server-generated value for the field identified by the Field (see page 145) property and assign that value to the field.

If the ApplyEvent (see page 145) property is not gamOnServer, the associated dataset calls Apply automatically at the point indicated by ApplyEvent (see page 145).

4.1.7.3.2 TIBGeneratorField.Assign Method

Copies the properties of another object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy the properties of another object on to this TIBGeneratorField (see page 142) instance. TIBGeneratorField (see page 142) overrides the inherited method to copy the Field (see page 145), Generator (see page 145), IncrementBy (see page 146) and ApplyEvent (see page 145) properties of the object specified by Source if it is another TIBGeneratorField (see page 142) instance.

If Source is not another TIBGeneratorField (see page 142), Assign calls the inherited method, which allows any objects that know how to assign themselves to a TIBGeneratorField (see page 142) to copy their properties.

4.1.7.3.3 TIBGeneratorField.ValueName Method

Returns a string that describes the value that the IB (see page 1) generate fetches.

Pascal

```
function ValueName: string;
```

C++

```
__fastcall UnicodeString ValueName();
```

Description

ValueName returns a string of the form

```
Generator -> Field By IncrementBy
```

where Generator (see page 145) is the value of the Generator (see page 145) property, Field (see page 145) is the value of the Field (see page 145) property, and IncrementBy (see page 146) is the value of the IncrementBy (see page 146) property.

4.1.7.4 TIBGeneratorField Properties

The properties of the TIBGeneratorField class are listed here.

Published Properties

	Name	Description
	ApplyEvent (see page 145)	Indicates when the TIBGeneratorField (see page 142) instance calls the server to generate a value for the associated field.
	Field (see page 145)	Specifies the field whose value the TIBGeneratorField (see page 142) object generates.
	Generator (see page 145)	Names the generator on the server that TIBGeneratorField (see page 142) calls to generate field values.
	IncrementBy (see page 146)	Names the amount by which a generator on the server increments the value of the associated field.

4.1.7.4.1 TIBGeneratorField.ApplyEvent Property

Indicates when the TIBGeneratorField (see page 142) instance calls the server to generate a value for the associated field.

Pascal

```
property ApplyEvent: TIBGeneratorApplyEvent;
```

C++

```
__property TIBGeneratorApplyEvent ApplyEvent;
```

Description

Set TIBGeneratorApplyEvent (see page 151) to indicate when the server generates field values using this generator.

Note: Regardless of the value of ApplyEvent, applications can generate the field value at any time by calling the Apply (see page 143) method.

4.1.7.4.2 TIBGeneratorField.Field Property

Specifies the field whose value the TIBGeneratorField (see page 142) object generates.

Pascal

```
property Field: string;
```

C++

```
__property UnicodeString Field;
```

Description

Set Field to the name of the field whose value the generator sets. When the event specified by the ApplyEvent (see page 145) property occurs, or when an application calls the Apply (see page 143) method, the TIBGeneratorField (see page 142) object calls the server to generate a field value and assigns that value to the specified field.

Field must be the FieldName property of one of the fields in the associated dataset's Fields property list. The TIBGeneratorField (see page 142) object is associated with a dataset when it is the value of that dataset's GeneratorField property.

4.1.7.4.3 TIBGeneratorField.Generator Property

Names the generator on the server that TIBGeneratorField (see page 142) calls to generate field values.

Pascal

```
property Generator: string;
```

C++

```
__property UnicodeString Generator;
```

Description

TIBGeneratorField (see page 142) uses Generator, along with the IncrementBy (see page 146) property, to generate the SQL statement that fetches the generated field value. The generated SQL statement has the form

SELECT GEN_ID(Generator, IncrementBy (see page 146)) FROM RDB$DATABASE

Where 'Generator' is replaced by the value of Generator and 'IncrementBy (see page 146)' is replaced by the value of IncrementBy (see page 146).

4.1.7.4.4 TIBGeneratorField.IncrementBy Property

Names the amount by which a generator on the server increments the value of the associated field.

Pascal

```
property IncrementBy: Integer;
```

C++

```
__property int IncrementBy;
```

Description

TIBGeneratorField (see page 142) uses IncrementBy, along with the Generator (see page 145) property, to generate the SQL statement that fetches the generated field value. The generated SQL statement has the form

SELECT GEN_ID(Generator (see page 145), IncrementBy) FROM RDB$DATABASE

Where 'Generator (see page 145)' is replaced by the value of Generator (see page 145) and 'IncrementBy' is replaced by the value of IncrementBy.

4.1.8 TIBStringField Class

TIBStringField allows for strings in excess of 8196 bytes of data.

Class Hierarchy

Pascal

```
TIBStringField = class(TStringField);
```

C++

```
class TIBStringField : public TStringField;
```

File

IBCustomDataSet

Description

A value of a string field is physically stored as a sequence of characters. Common uses for string fields are to store text, such as names and addresses.

TIBStringField introduces properties to translate between string values and other data types, and to manage language driver conversions. As a descendent of TStringField, TIBStringField inherits many properties, methods, and events that are useful for managing the value and properties of a field in a database. TIBStringField allows for strings in excess of 8196 bytes of data.

4.1.8.1 TIBStringField Members

The following tables list the members exposed by TIBStringField.

Public Methods

	Name	Description
	CheckTypeSize (see page 147)	Indicates the type size of the string field.
	Create (see page 147)	Creates an instance of a TIBStringField (see page 146) object.

	GetAsString (see page 148)	Returns the value of a field as a string.
	GetAsVariant (see page 148)	Returns the value of a field as a variant.
	GetValue (see page 148)	Returns the value of a field.
	SetAsString (see page 148)	Sets the value of a field as a string type.

4.1.8.2 TIBStringField.Create Constructor

Creates an instance of a TIBStringField (see page 146) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBStringField(TComponent * AOwner);
```

Description

It is seldom necessary to call Create directly, because a string field component is instantiated automatically for all string fields in a dataset.

After calling the inherited constructor, Create sets

- DataType to ftString.
- Size to 20.
- Transliterate to True.
- BlanksToNull to True

4.1.8.3 TIBStringField Methods

The methods of the TIBStringField class are listed here.

Public Methods

	Name	Description
	CheckTypeSize (see page 147)	Indicates the type size of the string field.
	GetAsString (see page 148)	Returns the value of a field as a string.
	GetAsVariant (see page 148)	Returns the value of a field as a variant.
	GetValue (see page 148)	Returns the value of a field.
	SetAsString (see page 148)	Sets the value of a field as a string type.

4.1.8.3.1 TIBStringField.CheckTypeSize Method

Indicates the type size of the string field.

Pascal

```
class procedure CheckTypeSize(Value: Integer); override;
```

C++

```
virtual __fastcall CheckTypeSize(int Value);
```

Description

Call CheckTypeSize to determine the type size of the string field.

There is both a virtual method and a static method for the CheckTypeSize method.

All sizes are valid for a TIBString field.

4.1.8.3.2 TIBStringField.GetAsString Method

Returns the value of a field as a string.

Pascal

```
function GetAsString: string; override;
```

C++

```
virtual __fastcall UnicodeString GetAsString();
```

Description

Call GetAsString to return the value of a field as a string.

4.1.8.3.3 TIBStringField.GetAsVariant Method

Returns the value of a field as a variant.

Pascal

```
function GetAsVariant: Variant; override;
```

C++

```
virtual __fastcall Variant GetAsVariant();
```

Description

Call GetAsVariant return the value of a field as type Variant.

4.1.8.3.4 TIBStringField.GetValue Method

Returns the value of a field.

Pascal

```
function GetValue(var Value: string): Boolean;
```

C++

```
__fastcall Boolean GetValue(UnicodeString Value);
```

Description

Call GetValue to return the value of a field.

4.1.8.3.5 TIBStringField.SetAsString Method

Sets the value of a field as a string type.

Pascal

```
procedure SetAsString(const Value: string); override;
```

C++

```
virtual __fastcall SetAsString(const UnicodeString Value);
```

Description

Call SetAsString to set the value of a field as a string type.

4.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TCachedUpdateStatus (see page 149)	TCachedUpdateStatus indicates the status of a record in a dataset that has cached updates.
	TIBGeneratorApplyEvent (see page 151)	TIBGeneratorApplyEvent indicates when a generator should create field values.
	TIBUpdateAction (see page 151)	TIBUpdateAction indicates the action that a dataset should take after an event handler has responded to an update error.
	TLiveMode (see page 152)	This is record IBCustomDataSet.TLiveMode.

Records

	Name	Description
	TFieldData (see page 150)	This is record IBCustomDataSet.TFieldData.
	TIBDBKey (see page 150)	TIBDBKey stores the key for a row in an InterBase table.
	TRecordData (see page 153)	This is record IBCustomDataSet.TRecordData.

4.2.1 IBCustomDataSet.TCachedUpdateStatus Enumeration

TCachedUpdateStatus indicates the status of a record in a dataset that has cached updates.

Pascal

```
TCachedUpdateStatus = (
  cusUnmodified,
  cusModified,
  cusInserted,
  cusDeleted,
  cusUninserted
);
```

C++

```
enum TCachedUpdateStatus {
  cusUnmodified,
  cusModified,
  cusInserted,
  cusDeleted,
  cusUninserted
};
```

File

IBCustomDataSet

Description

TCachedUpdateStatus values are:

Value Meaning

cusModified Modified records.

cusInserted Inserted records.

cusDeleted Deleted records.

cusUnmodified Unmodified records.

cusUninserted Uninserted records.

4.2.2 IBCustomDataSet.TFieldData Record

Pascal

```
TFieldData = record
  fdDataType: Short;
  fdDataScale: Short;
  fdNullable: Boolean;
  fdIsNull: Boolean;
  fdDataSize: Short;
  fdDataLength: Short;
  fdDataOfs: Integer;
end;
```

C++

```
struct TFieldData {
  Short fdDataType;
  Short fdDataScale;
  Boolean fdNullable;
  Boolean fdIsNull;
  Short fdDataSize;
  Short fdDataLength;
  int fdDataOfs;
};
```

File

IBCustomDataSet

Description

This is record IBCustomDataSet.TFieldData.

4.2.3 IBCustomDataSet.TIBDBKey Record

TIBDBKey stores the key for a row in an InterBase table.

Pascal

```
TIBDBKey = record
  DBKey: array[0..7] of Byte;
end;
```

C++

```
struct TIBDBKey {
  array[0..7] of Byte DBKey;
};
```

File

IBCustomDataSet

Description

TIBDBKey stores the unique row identifier for the current row in the current transaction.

4.2.4 IBCustomDataSet.TIBGeneratorApplyEvent Enumeration

TIBGeneratorApplyEvent indicates when a generator should create field values.

Pascal

```
TIBGeneratorApplyEvent = (
  gamOnNewRecord,
  gamOnPost,
  gamOnServer
);
```

C++

```
enum TIBGeneratorApplyEvent {
  gamOnNewRecord,
  gamOnPost,
  gamOnServer
};
```

File

IBCustomDataSet

Description

TIBGeneratorApplyEvent values are:

Value Meaning

gamOnNewRecord The dataset calls the server to generate the field value immediately after it inserts or appends a new record (before the OnNewRecord event).

gamOnPost The dataset calls the server to generate the field value immediately before it posts a record to the server (before the BeforePost event).

gamOnServer The dataset does not need to call the server to generate field values: the server generates these values automatically. With gamOnServer, TIBGeneratorField (see page 142) serves primarily to ensure that the user is not required to enter a value in the field.

See Also

Procedural types

Creating events

4.2.5 IBCustomDataSet.TIBUpdateAction Enumeration

TIBUpdateAction indicates the action that a dataset should take after an event handler has responded to an update error.

Pascal

```
TIBUpdateAction = (
```

```
    uaFail,
    uaAbort,
    uaSkip,
    uaRetry,
    uaApply,
    uaApplied
  );
```

C++

```
  enum TIBUpdateAction {
    uaFail,
    uaAbort,
    uaSkip,
    uaRetry,
    uaApply,
    uaApplied
  };
```

File

IBCustomDataSet

Description

TIBUpdateAction values are:

Value Meaning

uaFail Abort the update operation and display an error message

uaAbort Abort the update operation without displaying an error message

uaSkip Skip updating the record that raised the error condition, and leave the unapplied changes in the cache

uaRetry Repeat the update operation that originally raised the error condition

uaApplied The event handler applied the update (not used in error handling event handlers). Free the current record update from the cache.

uaApply For internal use only

4.2.6 IBCustomDataSet.TLiveMode Enumeration

Pascal

```
  TLiveMode = (
    lmInsert,
    lmModify,
    lmDelete,
    lmRefresh
  );
```

C++

```
  enum TLiveMode {
    lmInsert,
    lmModify,
    lmDelete,
    lmRefresh
  };
```

File

IBCustomDataSet

Description

This is record IBCustomDataSet.TLiveMode.

4.2.7 IBCustomDataSet.TRecordData Record

Pascal

```
TRecordData = record
  rdBookmarkFlag: TBookmarkFlag;
  rdFieldCount: Short;
  rdRecordNumber: Long;
  rdCachedUpdateStatus: TCachedUpdateStatus;
  rdUpdateStatus: TUpdateStatus;
  rdSavedOffset: DWORD;
  rdDBKey: TIBDBKey;
  rdFields: array[1..1] of TFieldData;
end;
```

C++

```
struct TRecordData {
  TBookmarkFlag rdBookmarkFlag;
  Short rdFieldCount;
  Long rdRecordNumber;
  TCachedUpdateStatus rdCachedUpdateStatus;
  TUpdateStatus rdUpdateStatus;
  DWORD rdSavedOffset;
  TIBDBKey rdDBKey;
  array[1..1] of TFieldData rdFields;
};
```

File

IBCustomDataSet

Description

This is record IBCustomDataSet.TRecordData.

4.3 Types

The following table lists types in this documentation.

Types

Name	Description
PBlobDataArray (see page 154)	This is type IBCustomDataSet.PBlobDataArray.
PDateTime (see page 154)	This is type IBCustomDataSet.PDateTime.
PFieldData (see page 155)	This is type IBCustomDataSet.PFieldData.
PIBDBKey (see page 155)	This is type IBCustomDataSet.PIBDBKey.
PRecordData (see page 155)	This is type IBCustomDataSet.PRecordData.
TBlobDataArray (see page 156)	This is type IBCustomDataSet.TBlobDataArray.
TIBUpdateErrorEvent (see page 156)	TIBUpdateErrorEvent is the type of event handlers that respond when an IBX dataset encounters an error applying a cached update.
TIBUpdateRecordEvent (see page 157)	TIBUpdateRecordEvent is the type of event handlers that respond when an IBX dataset applies a cached update.
TIBUpdateRecordTypes (see page 157)	TIBUpdateRecordTypes is a subset of all possible record types in a dataset that caches updates.
TLiveModes (see page 157)	TLiveModes and TLiveModes indicate what operations an application can perform on an IBX dataset.

4.3.1 IBCustomDataSet.PBlobDataArray Type

Pascal

```
PBlobDataArray = ^TBlobDataArray;
```

C++

```
^TBlobDataArray PBlobDataArray;
```

File

IBCustomDataSet

Description

This is type IBCustomDataSet.PBlobDataArray.

4.3.2 IBCustomDataSet.PDateTime Type

Pascal

```
PDateTime = ^TDateTime;
```

C++

```
^TDateTime PDateTime;
```

File

IBCustomDataSet

Description

This is type IBCustomDataSet.PDateTime.

4.3.3 IBCustomDataSet.PFieldData Type

Pascal

```
PFieldData = ^TFieldData;
```

C++

```
^TFieldData PFieldData;
```

File

IBCustomDataSet

Description

This is type IBCustomDataSet.PFieldData.

4.3.4 IBCustomDataSet.PIBDBKey Type

Pascal

```
PIBDBKey = ^TIBDBKey;
```

C++

```
^TIBDBKey PIBDBKey;
```

File

IBCustomDataSet

Description

This is type IBCustomDataSet.PIBDBKey.

4.3.5 IBCustomDataSet.PRecordData Type

Pascal

```
PRecordData = ^TRecordData;
```

C++

```
^TRecordData PRecordData;
```

File

IBCustomDataSet

Description

This is type IBCustomDataSet.PRecordData.

4.3.6 IBCustomDataSet.TBlobDataArray Type

Pascal

```
TBlobDataArray = array[0..0] of TIBBlobStream;
```

C++

```
array[0..0] of TIBBlobStream TBlobDataArray;
```

File

IBCustomDataSet

Description

This is type IBCustomDataSet.TBlobDataArray.

4.3.7 IBCustomDataSet.TIBUpdateErrorEvent Type

TIBUpdateErrorEvent is the type of event handlers that respond when an IBX dataset encounters an error applying a cached update.

Pascal

```
TIBUpdateErrorEvent = procedure (DataSet: TDataSet; E: EDatabaseError; UpdateKind:
TUpdateKind; var UpdateAction: TIBUpdateAction) of object;
```

C++

```
(DataSet: TDataSet; E: EDatabaseError; UpdateKind: TUpdateKind; var UpdateAction:
TIBUpdateAction) ( TIBUpdateErrorEvent)();
```

File

IBCustomDataSet

Description

DataSet is the TIBCustomDataSet (see page 62) descendant that is attempting to apply cached updates.

E is an EDBEngineError object from which an application can extract an error message and the actual cause of the error condition. An OnUpdateError handler can use this information to determine how to respond to the error condition.

UpdateKind indicates whether the error occurred while inserting, deleting, or modifying a record.

UpdateAction indicates the action to take when the OnUpdateError handler exits. On entry into the handler, UpdateAction is always set to uaFail. If OnUpdateError can handle or correct the error, set UpdateAction to uaRetry before exiting the error handler.

See Also

Procedural types

Creating events

4.3.8 IBCustomDataSet.TIBUpdateRecordEvent Type

TIBUpdateRecordEvent is the type of event handlers that respond when an IBX dataset applies a cached update.

Pascal

```
TIBUpdateRecordEvent = procedure (DataSet: TDataSet; UpdateKind: TUpdateKind; var
UpdateAction: TIBUpdateAction) of object;
```

C++

```
(DataSet: TDataSet; UpdateKind: TUpdateKind; var UpdateAction: TIBUpdateAction) (
TIBUpdateRecordEvent)();
```

File

IBCustomDataSet

Description

DataSet is the dataset that is applying updates.

UpdateKind whether the current update is the insertion of a record, the deletion of a record, or the modification of a record.

UpdateAction indicates the action taken by the OnUpdateRecord handler before it exits. On entry into the handler, UpdateAction is always set to uaFail. If OnUpdateRecord is successful, it should set UpdateAction to uaApplied before exiting.

See Also

Procedural types

Creating events

4.3.9 IBCustomDataSet.TIBUpdateRecordTypes Type

TIBUpdateRecordTypes is a subset of all possible record types in a dataset that caches updates.

Pascal

```
TIBUpdateRecordTypes = set of TCachedUpdateStatus;
```

C++

```
TCachedUpdateStatus TIBUpdateRecordTypes;
```

File

IBCustomDataSet

Description

TIBUpdateRecordTypes is a set of TCachedUpdateStatus (see page 149) values. It describes the different types of status allowed for records in a dataset that caches updates if they are to be included in a specified set.

4.3.10 IBCustomDataSet.TLiveModes Type

TLiveModes and TLiveModes indicate what operations an application can perform on an IBX dataset.

Pascal

```
TLiveModes = set of TLiveMode;
```

C++

```
TLiveMode TLiveModes;
```

File

IBCustomDataSet

Description

TLiveModes is a set of TLiveMode (see page 152) values. The following table lists the possible values:

Value	Meaning
lmInsert	The application can insert records.
lmModify	The application can modify existing records.
lmDelete	The application can delete records.
lmRefresh	The application can refresh the records in the dataset.

4.4 Variables

The following table lists variables in this documentation.

Variables

Name	Description
CreateProviderProc (see page 159)	This is variable IBCustomDataSet.CreateProviderProc.

4.4.1 IBCustomDataSet.CreateProviderProc Variable

Pascal

```
CreateProviderProc: function(DataSet: TIBCustomDataSet): IProviderSupport = nil;
```

C++

```
function(DataSet: TIBCustomDataSet): IProviderSupport CreateProviderProc = nil;
```

File

IBCustomDataSet

Description

This is variable IBCustomDataSet.CreateProviderProc.

4.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
BufferCacheSize (see page 160)	This is constant IBCustomDataSet.BufferCacheSize.
DefaultFieldClasses (see page 160)	This is constant IBCustomDataSet.DefaultFieldClasses.
UniCache (see page 161)	This is constant IBCustomDataSet.UniCache.

4.5.1 IBCustomDataSet.BufferCacheSize Constant

Pascal

```
BufferCacheSize = 1000;
```

C++

```
BufferCacheSize = 1000;
```

File

IBCustomDataSet

Description

This is constant IBCustomDataSet.BufferCacheSize.

4.5.2 IBCustomDataSet.DefaultFieldClasses Constant

Pascal

```
DefaultFieldClasses: array[TFieldType] of TFieldClass = ( nil, TIBStringField, TSmallintField,
TIntegerField, TWordField, TBooleanField, TFloatField, TCurrencyField, TIBBCDField,
TDateField, TTimeField, TDateTimeField, TBytesField, TVarBytesField, TAutoIncField,
TBlobField, TMemoField, TGraphicField, TBlobField, TBlobField, TBlobField, TBlobField, nil,
TStringField, nil, TLargeIntField, TADTField, TArrayField, TReferenceField, TDataSetField,
TBlobField, TMemoField, TVariantField, TInterfaceField, TIDispatchField, TGuidField,
TSQLTimeStampField, TFMTBcdField, nil, nil, nil, nil);
```

C++

```
array[TFieldType] of TFieldClass DefaultFieldClasses = ( nil, TIBStringField, TSmallintField,
TIntegerField, TWordField, TBooleanField, TFloatField, TCurrencyField, TIBBCDField,
TDateField, TTimeField, TDateTimeField, TBytesField, TVarBytesField, TAutoIncField,
TBlobField, TMemoField, TGraphicField, TBlobField, TBlobField, TBlobField, TBlobField, nil,
TStringField, nil, TLargeIntField, TADTField, TArrayField, TReferenceField, TDataSetField,
TBlobField, TMemoField, TVariantField, TInterfaceField, TIDispatchField, TGuidField,
TSQLTimeStampField, TFMTBcdField, nil, nil, nil, nil);
```

File

IBCustomDataSet

Description

This is constant IBCustomDataSet.DefaultFieldClasses.

4.5.3 IBCustomDataSet.UniCache Constant

Pascal

```
UniCache = 2;
```

C++

```
UniCache = 2;
```

File

IBCustomDataSet

Description

This is constant IBCustomDataSet.UniCache.

5 IBDatabase Namespace

This is namespace IBDatabase.

Topics

Name	Description
Classes (see page 165)	The following table lists classes in this documentation.
Interfaces (see page 221)	The following table lists interfaces in this documentation.
Functions (see page 224)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 225)	The following table lists structs, records, enums in this documentation.
Types (see page 227)	The following table lists types in this documentation.
Constants (see page 229)	The following table lists constants in this documentation.

Classes

	Name	Description
	TIBBase (see page 165)	TIBBase is the ancestor object from which TIBTransaction (see page 206) descends.
	TIBDataBase (see page 176)	TIBDatabase encapsulates an InterBase database connection.
	TIBSchema (see page 201)	This is class IBDatabase.TIBSchema.
	TIBTimer (see page 202)	This is class IBDatabase.TIBTimer.
	TIBTransaction (see page 206)	TIBTransaction provides discrete transaction control over a one or more database connections in a database application.

Constants

Name	Description
DPBConstantNames (see page 229)	This is constant IBDatabase.DPBConstantNames.
DPBPrefix (see page 230)	This is constant IBDatabase.DPBPrefix.
TPBConstantNames (see page 230)	This is constant IBDatabase.TPBConstantNames.
TPBPrefix (see page 230)	This is constant IBDatabase.TPBPrefix.

Functions

	Name	Description
	GenerateDPB (see page 224)	This is function IBDatabase.GenerateDPB.
	GenerateTPB (see page 224)	This is function IBDatabase.GenerateTPB.

Interfaces

	Name	Description
	IIBEventNotifier (see page 221)	IIBEventNotifier allows a TIBDataBase (see page 176) component to automatically register interest in events on the InterBase server.

Structs, Records, Enums

	Name	Description
	TAutoStopAction (see page 225)	TAutoStopAction indicates the action to take on automatically ended transactions.
	TTransactionAction (see page 226)	This is record IBDatabase.TTransactionAction.

Types

Name	Description
TIBDatabaseLoginEvent (see page 227)	TIBDatabaseLoginEvent is the type of event handlers that respond when an IB (see page 1) database component forms a connection to an InterBase server.
TIBFileName (see page 227)	This is type IBDatabase.TIBFileName.

5.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TIBBase (see page 165)	TIBBase is the ancestor object from which TIBTransaction (see page 206) descends.
	TIBDataBase (see page 176)	TIBDatabase encapsulates an InterBase database connection.
	TIBSchema (see page 201)	This is class IBDatabase.TIBSchema.
	TIBTimer (see page 202)	This is class IBDatabase.TIBTimer.
	TIBTransaction (see page 206)	TIBTransaction provides discrete transaction control over a one or more database connections in a database application.

5.1.1 TIBBase Class

TIBBase is the ancestor object from which TIBTransaction (see page 206) descends.

Class Hierarchy

Pascal

```
TIBBase = class(TObject);
```

C++

```
class TIBBase : public TObject;
```

File

IBDatabase

Description

TIBBase is the ancestor object from which TIBTransaction (see page 206) descends.

5.1.1.1 TIBBase Members

The following tables list the members exposed by TIBBase.

Protected Fields

	Name	Description
	FAfterDatabaseDisconnect (see page 167)	This is FAfterDatabaseDisconnect, a member of class TIBBase.
	FAfterTransactionEnd (see page 167)	This is FAfterTransactionEnd, a member of class TIBBase.
	FBeforeDatabaseDisconnect (see page 168)	This is FBeforeDatabaseDisconnect, a member of class TIBBase.
	FBeforeTransactionEnd (see page 168)	This is FBeforeTransactionEnd, a member of class TIBBase.
	FDatabase (see page 168)	This is FDatabase, a member of class TIBBase.
	FIndexInDatabase (see page 168)	This is FIndexInDatabase, a member of class TIBBase.
	FIndexInTransaction (see page 169)	This is FIndexInTransaction, a member of class TIBBase.
	FOnDatabaseFree (see page 169)	This is FOnDatabaseFree, a member of class TIBBase.

	FOnTransactionFree (see page 169)	This is FOnTransactionFree, a member of class TIBBase.
	FOwner (see page 169)	This is FOwner, a member of class TIBBase.
	FTransaction (see page 169)	This is FTransaction, a member of class TIBBase.

Protected Methods

	Name	Description
	DoAfterDatabaseDisconnect (see page 171)	This is DoAfterDatabaseDisconnect, a member of class TIBBase.
	DoAfterTransactionEnd (see page 171)	This is DoAfterTransactionEnd, a member of class TIBBase.
	DoBeforeDatabaseDisconnect (see page 171)	This is DoBeforeDatabaseDisconnect, a member of class TIBBase.
	DoBeforeTransactionEnd (see page 171)	This is DoBeforeTransactionEnd, a member of class TIBBase.
	DoDatabaseFree (see page 171)	This is DoDatabaseFree, a member of class TIBBase.
	DoTransactionFree (see page 172)	This is DoTransactionFree, a member of class TIBBase.
	GetDBHandle (see page 172)	This is GetDBHandle, a member of class TIBBase.
	GetTRHandle (see page 172)	This is GetTRHandle, a member of class TIBBase.
	SetDatabase (see page 172)	This is SetDatabase, a member of class TIBBase.
	SetTransaction (see page 173)	This is SetTransaction, a member of class TIBBase.

Public Events

	Name	Description
	AfterDatabaseDisconnect (see page 175)	Occurs after a database is disconnected.
	AfterTransactionEnd (see page 175)	Occurs after a transaction has ended.
	BeforeDatabaseDisconnect (see page 175)	Occurs before a database disconnects.
	BeforeTransactionEnd (see page 175)	Occurs before a transaction ends.
	OnDatabaseFree (see page 176)	Occurs after a database is freed from memory.
	OnTransactionFree (see page 176)	Occurs after a transaction has been freed from memory.

Public Methods

	Name	Description
	CheckDatabase (see page 170)	Checks if the database is active.
	CheckTransaction (see page 170)	Checks if the transaction is active.
	Create (see page 166)	Creates an instance of an IBBase object.
	Destroy (see page 167)	Destroys an IBBase object.

Public Properties

	Name	Description
	Database (see page 173)	Sets or returns the associated database.
	DBHandle (see page 173)	Indicates the database handle.
	Owner (see page 174)	Indicates which component owns the component.
	Transaction (see page 174)	Sets or returns the associated transaction.
	TRHandle (see page 174)	Returns the transaction handle.

5.1.1.2 TIBBase.Create Constructor

Creates an instance of an IBBase object.

Pascal

```
constructor Create(AOwner: TObject);
```

C++

```
__fastcall TIBBase(TObject * AOwner);
```

Description

Call Create to create an instance of an IBBase object.

5.1.1.3 TIBBase.Destroy Destructor

Destroys an IBBase object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBBase();
```

Description

Call Destroy to destroy an IBBase object and to free up any resources associated with it.

5.1.1.4 TIBBase Fields

The fields of the TIBBase class are listed here.

Protected Fields

	Name	Description
	FAfterDatabaseDisconnect (see page 167)	This is FAfterDatabaseDisconnect, a member of class TIBBase.
	FAfterTransactionEnd (see page 167)	This is FAfterTransactionEnd, a member of class TIBBase.
	FBeforeDatabaseDisconnect (see page 168)	This is FBeforeDatabaseDisconnect, a member of class TIBBase.
	FBeforeTransactionEnd (see page 168)	This is FBeforeTransactionEnd, a member of class TIBBase.
	FDatabase (see page 168)	This is FDatabase, a member of class TIBBase.
	FIndexInDatabase (see page 168)	This is FIndexInDatabase, a member of class TIBBase.
	FIndexInTransaction (see page 169)	This is FIndexInTransaction, a member of class TIBBase.
	FOnDatabaseFree (see page 169)	This is FOnDatabaseFree, a member of class TIBBase.
	FOnTransactionFree (see page 169)	This is FOnTransactionFree, a member of class TIBBase.
	FOwner (see page 169)	This is FOwner, a member of class TIBBase.
	FTransaction (see page 169)	This is FTransaction, a member of class TIBBase.

5.1.1.4.1 TIBBase.FAfterDatabaseDisconnect Field

Pascal

```
FAfterDatabaseDisconnect: TNotifyEvent;
```

C++

```
TNotifyEvent FAfterDatabaseDisconnect;
```

Description

This is FAfterDatabaseDisconnect, a member of class TIBBase.

5.1.1.4.2 TIBBase.FAfterTransactionEnd Field

Pascal

```
FAfterTransactionEnd: TNotifyEvent;
```

C++

```
TNotifyEvent FAfterTransactionEnd;
```

Description

This is FAfterTransactionEnd, a member of class TIBBase.

5.1.1.4.3 TIBBase.FBeforeDatabaseDisconnect Field

Pascal

```
FBeforeDatabaseDisconnect: TNotifyEvent;
```

C++

```
TNotifyEvent FBeforeDatabaseDisconnect;
```

Description

This is FBeforeDatabaseDisconnect, a member of class TIBBase.

5.1.1.4.4 TIBBase.FBeforeTransactionEnd Field

Pascal

```
FBeforeTransactionEnd: TNotifyEvent;
```

C++

```
TNotifyEvent FBeforeTransactionEnd;
```

Description

This is FBeforeTransactionEnd, a member of class TIBBase.

5.1.1.4.5 TIBBase.FDatabase Field

Pascal

```
FDatabase: TIBDatabase;
```

C++

```
TIBDatabase FDatabase;
```

Description

This is FDatabase, a member of class TIBBase.

5.1.1.4.6 TIBBase.FIndexInDatabase Field

Pascal

```
FIndexInDatabase: Integer;
```

C++

```
int FIndexInDatabase;
```

Description

This is FIndexInDatabase, a member of class TIBBase.

5.1.1.4.7 TIBBase.FIndexInTransaction Field

Pascal

```
FIndexInTransaction: Integer;
```

C++

```
int FIndexInTransaction;
```

Description

This is FIndexInTransaction, a member of class TIBBase.

5.1.1.4.8 TIBBase.FOnDatabaseFree Field

Pascal

```
FOnDatabaseFree: TNotifyEvent;
```

C++

```
TNotifyEvent FOnDatabaseFree;
```

Description

This is FOnDatabaseFree, a member of class TIBBase.

5.1.1.4.9 TIBBase.FOnTransactionFree Field

Pascal

```
FOnTransactionFree: TNotifyEvent;
```

C++

```
TNotifyEvent FOnTransactionFree;
```

Description

This is FOnTransactionFree, a member of class TIBBase.

5.1.1.4.10 TIBBase.FOwner Field

Pascal

```
FOwner: TObject;
```

C++

```
TObject * FOwner;
```

Description

This is FOwner, a member of class TIBBase.

5.1.1.4.11 TIBBase.FTransaction Field

Pascal

```
FTransaction: TIBTransaction;
```

C++

```
TIBTransaction FTransaction;
```

Description

This is FTransaction, a member of class TIBBase.

5.1.1.5 TIBBase Methods

The methods of the TIBBase class are listed here.

Protected Methods

	Name	Description
	DoAfterDatabaseDisconnect (see page 171)	This is DoAfterDatabaseDisconnect, a member of class TIBBase.
	DoAfterTransactionEnd (see page 171)	This is DoAfterTransactionEnd, a member of class TIBBase.
	DoBeforeDatabaseDisconnect (see page 171)	This is DoBeforeDatabaseDisconnect, a member of class TIBBase.
	DoBeforeTransactionEnd (see page 171)	This is DoBeforeTransactionEnd, a member of class TIBBase.
	DoDatabaseFree (see page 171)	This is DoDatabaseFree, a member of class TIBBase.
	DoTransactionFree (see page 172)	This is DoTransactionFree, a member of class TIBBase.
	GetDBHandle (see page 172)	This is GetDBHandle, a member of class TIBBase.
	GetTRHandle (see page 172)	This is GetTRHandle, a member of class TIBBase.
	SetDatabase (see page 172)	This is SetDatabase, a member of class TIBBase.
	SetTransaction (see page 173)	This is SetTransaction, a member of class TIBBase.

Public Methods

	Name	Description
	CheckDatabase (see page 170)	Checks if the database is active.
	CheckTransaction (see page 170)	Checks if the transaction is active.

5.1.1.5.1 TIBBase.CheckDatabase Method

Checks if the database is active.

Pascal

```
procedure CheckDatabase; virtual;
```

C++

```
virtual __fastcall CheckDatabase();
```

Description

Call CheckDatabase to check if the database is assigned and active.

5.1.1.5.2 TIBBase.CheckTransaction Method

Checks if the transaction is active.

Pascal

```
procedure CheckTransaction; virtual;
```

C++

```
virtual __fastcall CheckTransaction();
```

Description

Call CheckTransaction to check if the transaction is assigned and active.

5.1.1.5.3 TIBBase.DoAfterDatabaseDisconnect Method

Pascal

```
procedure DoAfterDatabaseDisconnect; virtual;
```

C++

```
virtual __fastcall DoAfterDatabaseDisconnect();
```

Description

This is DoAfterDatabaseDisconnect, a member of class TIBBase.

5.1.1.5.4 TIBBase.DoAfterTransactionEnd Method

Pascal

```
procedure DoAfterTransactionEnd; virtual;
```

C++

```
virtual __fastcall DoAfterTransactionEnd();
```

Description

This is DoAfterTransactionEnd, a member of class TIBBase.

5.1.1.5.5 TIBBase.DoBeforeDatabaseDisconnect Method

Pascal

```
procedure DoBeforeDatabaseDisconnect; virtual;
```

C++

```
virtual __fastcall DoBeforeDatabaseDisconnect();
```

Description

This is DoBeforeDatabaseDisconnect, a member of class TIBBase.

5.1.1.5.6 TIBBase.DoBeforeTransactionEnd Method

Pascal

```
procedure DoBeforeTransactionEnd; virtual;
```

C++

```
virtual __fastcall DoBeforeTransactionEnd();
```

Description

This is DoBeforeTransactionEnd, a member of class TIBBase.

5.1.1.5.7 TIBBase.DoDatabaseFree Method

Pascal

```
procedure DoDatabaseFree; virtual;
```

C++

```
virtual __fastcall DoDatabaseFree();
```

Description

This is DoDatabaseFree, a member of class TIBBase.

5.1.1.5.8 TIBBase.DoTransactionFree Method

Pascal

```
procedure DoTransactionFree; virtual;
```

C++

```
virtual __fastcall DoTransactionFree();
```

Description

This is DoTransactionFree, a member of class TIBBase.

5.1.1.5.9 TIBBase.GetDBHandle Method

Pascal

```
function GetDBHandle: PISC_DB_HANDLE; virtual;
```

C++

```
virtual __fastcall PISC_DB_HANDLE GetDBHandle();
```

Description

This is GetDBHandle, a member of class TIBBase.

5.1.1.5.10 TIBBase.GetTRHandle Method

Pascal

```
function GetTRHandle: PISC_TR_HANDLE; virtual;
```

C++

```
virtual __fastcall PISC_TR_HANDLE GetTRHandle();
```

Description

This is GetTRHandle, a member of class TIBBase.

5.1.1.5.11 TIBBase.SetDatabase Method

Pascal

```
procedure SetDatabase(Value: TIBDatabase); virtual;
```

C++

```
virtual __fastcall SetDatabase(TIBDatabase Value);
```

Description

This is SetDatabase, a member of class TIBBase.

5.1.1.5.12 TIBBase.SetTransaction Method

Pascal

```
procedure SetTransaction(Value: TIBTransaction); virtual;
```

C++

```
virtual __fastcall SetTransaction(TIBTransaction Value);
```

Description

This is SetTransaction, a member of class TIBBase.

5.1.1.6 TIBBase Properties

The properties of the TIBBase class are listed here.

Public Properties

	Name	Description
	Database (see page 173)	Sets or returns the associated database.
R	DBHandle (see page 173)	Indicates the database handle.
R	Owner (see page 174)	Indicates which component owns the component.
	Transaction (see page 174)	Sets or returns the associated transaction.
R	TRHandle (see page 174)	Returns the transaction handle.

5.1.1.6.1 TIBBase.Database Property

Sets or returns the associated database.

Pascal

```
property Database: TIBDatabase;
```

C++

```
__property TIBDatabase Database;
```

Description

Use Database to set or return the associated database.

5.1.1.6.2 TIBBase.DBHandle Property

Indicates the database handle.

Pascal

```
property DBHandle: PISC_DB_HANDLE;
```

C++

```
__property PISC_DB_HANDLE DBHandle;
```

Description

Use DBHandle to return the database handle.

5.1.1.6.3 TIBBase.Owner Property

Indicates which component owns the component.

Pascal

```
property Owner: TObject;
```

C++

```
__property TObject * Owner;
```

Description

Owner refers to the SQL object (DataSet, TIBSQL, or Blob) that created the TIBBase (see page 165) component.

5.1.1.6.4 TIBBase.Transaction Property

Sets or returns the associated transaction.

Pascal

```
property Transaction: TIBTransaction;
```

C++

```
__property TIBTransaction Transaction;
```

Description

Use Transaction to set or return the associated transaction.

5.1.1.6.5 TIBBase.TRHandle Property

Returns the transaction handle.

Pascal

```
property TRHandle: PISC_TR_HANDLE;
```

C++

```
__property PISC_TR_HANDLE TRHandle;
```

Description

Use TRHandle to return the transaction handle.

5.1.1.7 TIBBase Events

The events of the TIBBase class are listed here.

Public Events

	Name	Description
	AfterDatabaseDisconnect (see page 175)	Occurs after a database is disconnected.
	AfterTransactionEnd (see page 175)	Occurs after a transaction has ended.
	BeforeDatabaseDisconnect (see page 175)	Occurs before a database disconnects.
	BeforeTransactionEnd (see page 175)	Occurs before a transaction ends.
	OnDatabaseFree (see page 176)	Occurs after a database is freed from memory.
	OnTransactionFree (see page 176)	Occurs after a transaction has been freed from memory.

5.1.1.7.1 TIBBase.AfterDatabaseDisconnect Event

Occurs after a database is disconnected.

Pascal

```
property AfterDatabaseDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterDatabaseDisconnect;
```

Description

Write an AfterDatabaseDisconnect event handler to take specific actions after a database is disconnected.

5.1.1.7.2 TIBBase.AfterTransactionEnd Event

Occurs after a transaction has ended.

Pascal

```
property AfterTransactionEnd: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterTransactionEnd;
```

Description

Write an AfterTransactionEnd event handler to take specific actions after a transaction has ended.

5.1.1.7.3 TIBBase.BeforeDatabaseDisconnect Event

Occurs before a database disconnects.

Pascal

```
property BeforeDatabaseDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeDatabaseDisconnect;
```

Description

Write a BeforeDatabaseDisconnect event handler to take specific actions before a database disconnects.

5.1.1.7.4 TIBBase.BeforeTransactionEnd Event

Occurs before a transaction ends.

Pascal

```
property BeforeTransactionEnd: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeTransactionEnd;
```

Description

Write a BeforeTransactionEnd event handler to take specific actions before a transaction ends.

5.1.1.7.5 TIBBase.OnDatabaseFree Event

Occurs after a database is freed from memory.

Pascal

```
property OnDatabaseFree: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDatabaseFree;
```

Description

Write an OnDatabaseFree event handler to take specific actions after a database is freed from memory.

5.1.1.7.6 TIBBase.OnTransactionFree Event

Occurs after a transaction has been freed from memory.

Pascal

```
property OnTransactionFree: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnTransactionFree;
```

Description

Write an OnTransactionFree event handler to take specific actions after a transaction has been freed from memory.

5.1.2 TIBDataBase Class

TIBDatabase encapsulates an InterBase database connection.

Class Hierarchy

Pascal

```
TIBDataBase = class(TCustomConnection);
```

C++

```
class TIBDataBase : public TCustomConnection;
```

File

IBDatabase

Description

Use TIBDataBase to encapsulate an InterBase database connection. All TIBCustomDataSet descendants and TIBSQL use the TIBDataBase component to gain access to databases.

See Also

Connecting to Databases: Overview

Connecting Directly to a Database Server

Getting Started with InterBase Express

5.1.2.1 TIBDataBase Members

The following tables list the members exposed by TIBDataBase.

Protected Methods

	Name	Description
	DoConnect (see page 182)	Provides the interface for a method that opens a connection.
	DoDisconnect (see page 183)	Provides the interface for a method that terminates the connection.
	GetConnected (see page 184)	Returns the value of the Connected property.
	Loaded (see page 186)	Initializes the connection component after all objects in the form or data module have been loaded.
	Notification (see page 187)	Forwards notification messages to all owned components.

Public Methods

	Name	Description
	AddEventNotifier (see page 180)	Adds an event notifier to the database's internal list so that the database can handle registering and unregistering interest in events.
	AddTransaction (see page 180)	Adds an association between the transaction component and the database component.
	ApplyUpdates (see page 180)	Posts pending cached updates for specified datasets to the database server.
	Call (see page 181)	Returns an error message based on the error code.
	CheckActive (see page 181)	Checks to see if the database connection is active.
	CheckDatabaseName (see page 181)	Checks to see if the DatabaseName (see page 190) property is not empty.
	CheckInactive (see page 181)	Checks to see if the database connection is inactive.
	CloseDataSets (see page 182)	Closes all datasets associated with the database component without disconnecting from the database server.
	Create (see page 178)	Creates an instance of a TIBDataBase (see page 176) component.
	CreateDatabase (see page 182)	Creates a database using Params (see page 196).
	Destroy (see page 178)	Destroys the instance of the database component.
	DropDatabase (see page 183)	Drops a database.
	FindDefaultTransaction (see page 183)	Returns the default transaction.
	FindTransaction (see page 184)	Finds the index of a transaction.
	FlushSchema (see page 184)	Clears the schema cache for the database.
	ForceClose (see page 184)	Forces the database connection to close.
	GetFieldNames (see page 185)	Populates a list with the names of the fields in the table.
	GetTableNames (see page 185)	Populates a string list with the names of tables in the database.
	Has_COMPUTED_BLR (see page 185)	Indicates whether a specified field in a specified relation includes a COMPUTED_BLR attribute.
	Has_DEFAULT_VALUE (see page 186)	Indicates whether a specified field in a specified relation includes a DEFAULT_VALUE attribute.
	IndexOfDBConst (see page 186)	Searches for the named parameter in the database parameters list.
	RemoveEventNotifier (see page 187)	Removes an event notifier from the database's internal list so that the database no longer handles registering and unregistering interest in events.
	RemoveTransaction (see page 187)	Disassociates a transaction from the database.
	RemoveTransactions (see page 188)	Disassociates all transactions from the database.
	SetHandle (see page 188)	Sets the handle for the database.
	TestConnected (see page 188)	Tests whether a database is connected.

Public Properties

	Name	Description
	DBParamByDPB (see page 190)	Specifies the name of the database to associate with this database component.
	Handle (see page 191)	Specifies the InterBase API database handle.
	HandleIsShared (see page 191)	Indicates whether or not a the handle is shared.
	InternalTransaction (see page 192)	Used internally by InterBase transactions.
	IsReadOnly (see page 192)	Indicates whether or not the database is set to read-only.

	SQLObjectCount (see page 197)	Returns the number of SQL objects.
	SQLObjects (see page 197)	Returns an SQL object.
	TransactionCount (see page 198)	Returns the number of transactions associated with the TIBDataBase (see page 176) component.
	Transactions (see page 198)	Specifies a transaction for the given index.

Published Events

	Name	Description
	AfterConnect (see page 198)	Occurs after a connection is established.
	AfterDisconnect (see page 199)	Occurs after the connection closes.
	BeforeConnect (see page 199)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 199)	Occurs immediately before the connection closes.
	OnDialectDowngradeWarning (see page 200)	Occurs after the SQL dialect of the client connection is downgraded.
	OnIdleTimer (see page 200)	Occurs after a database connection times out.
	OnLogin (see page 201)	Occurs when an application connects to a database.

Published Properties

	Name	Description
	AllowStreamedConnected (see page 189)	Indicates whether the Connected (see page 189) property can be set at design time.
	Connected (see page 189)	Indicates whether or not a database connection is active.
	DatabaseName (see page 190)	Specifies the name of the database to associate with this database component.
	DBSQLDialect (see page 190)	Returns the database SQL dialect.
	DefaultTransaction (see page 191)	Sets or returns the default database transaction.
	IdleTimer (see page 191)	Specifies how long the database should wait before disconnecting an idle connection.
	LoginPrompt (see page 192)	Specifies whether a login dialog appears immediately before opening a new connection.
	Params (see page 196)	Specifies the database parameters to pass to the InterBase server.
	SQLDialect (see page 196)	Sets or returns the SQL dialect used by the client.
	TraceFlags (see page 197)	Specifies the database operations to track with the SQL Monitor at runtime.

5.1.2.2 TIBDataBase.Create Constructor

Creates an instance of a TIBDataBase (see page 176) component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBDataBase(TComponent * AOwner);
```

Description

Call (see page 181) Create to instantiate a database component at runtime. An application can create a database component in order to control the component's existence and set its properties and events.

Create instantiates a database component and creates an empty list of dataset components for the DataSets property and an empty string list for the Params (see page 196) property.

5.1.2.3 TIBDataBase.Destroy Destructor

Destroys the instance of the database component.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBDataBase();
```

Description

Do not call Destroy directly in an application. Instead, call Free, which verifies that the database component is not already freed before calling Destroy.

Destroy disconnects from the database server, if necessary. It then frees the string resources allocated for the Params (see page 196) and DataSets properties before calling its inherited destructor.

5.1.2.4 TIBDataBase Methods

The methods of the TIBDataBase class are listed here.

Protected Methods

	Name	Description
	DoConnect (see page 182)	Provides the interface for a method that opens a connection.
	DoDisconnect (see page 183)	Provides the interface for a method that terminates the connection.
	GetConnected (see page 184)	Returns the value of the Connected property.
	Loaded (see page 186)	Initializes the connection component after all objects in the form or data module have been loaded.
	Notification (see page 187)	Forwards notification messages to all owned components.

Public Methods

	Name	Description
	AddEventNotifier (see page 180)	Adds an event notifier to the database's internal list so that the database can handle registering and unregistering interest in events.
	AddTransaction (see page 180)	Adds an association between the transaction component and the database component.
	ApplyUpdates (see page 180)	Posts pending cached updates for specified datasets to the database server.
	Call (see page 181)	Returns an error message based on the error code.
	CheckActive (see page 181)	Checks to see if the database connection is active.
	CheckDatabaseName (see page 181)	Checks to see if the DatabaseName (see page 190) property is not empty.
	CheckInactive (see page 181)	Checks to see if the database connection is inactive.
	CloseDataSets (see page 182)	Closes all datasets associated with the database component without disconnecting from the database server.
	CreateDatabase (see page 182)	Creates a database using Params (see page 196).
	DropDatabase (see page 183)	Drops a database.
	FindDefaultTransaction (see page 183)	Returns the default transaction.
	FindTransaction (see page 184)	Finds the index of a transaction.
	FlushSchema (see page 184)	Clears the schema cache for the database.
	ForceClose (see page 184)	Forces the database connection to close.
	GetFieldNames (see page 185)	Populates a list with the names of the fields in the table.
	GetTableNames (see page 185)	Populates a string list with the names of tables in the database.
	Has_COMPUTED_BLR (see page 185)	Indicates whether a specified field in a specified relation includes a COMPUTED_BLR attribute.
	Has_DEFAULT_VALUE (see page 186)	Indicates whether a specified field in a specified relation includes a DEFAULT_VALUE attribute.
	IndexOfDBConst (see page 186)	Searches for the named parameter in the database parameters list.
	RemoveEventNotifier (see page 187)	Removes an event notifier from the database's internal list so that the database no longer handles registering and unregistering interest in events.
	RemoveTransaction (see page 187)	Disassociates a transaction from the database.

	RemoveTransactions (see page 188)	Disassociates all transactions from the database.
	SetHandle (see page 188)	Sets the handle for the database.
	TestConnected (see page 188)	Tests whether a database is connected.

5.1.2.4.1 TIBDataBase.AddEventNotifier Method

Adds an event notifier to the database's internal list so that the database can handle registering and unregistering interest in events.

Pascal

```
procedure AddEventNotifier(Notifier: IIBEventNotifier);
```

C++

```
__fastcall AddEventNotifier(IIBEventNotifier Notifier);
```

Description

Call (see page 181) AddEventNotifier when you want the database to automatically register and unregister an interest in server events when it opens and closes a connection to the server.

Notifier is the interface to an object that has in interest in a set of events on the InterBase server. For example, Notifier can be the interface to a TIBEvents object.

AddEventNotifier adds Notifier to its internal list of event notifiers. When TIBDataBase (see page 176) opens a connection, it checks every notifier in its list, and if a notifier indicates that it wants to be auto-registered, AddEventNotifier calls its RegisterEvents method so that the notifier registers its interest with the InterBase Event manager. Before TIBDataBase (see page 176) closes a connection, it unregisters interest from every notifier in its list.

Note: If Notifier is a TIBEvents object, AddEventNotifier is automatically called when you set the Database property.

5.1.2.4.2 TIBDataBase.AddTransaction Method

Adds an association between the transaction component and the database component.

Pascal

```
function AddTransaction(TR: TIBTransaction): Integer;
```

C++

```
__fastcall int AddTransaction(TIBTransaction TR);
```

Description

Call (see page 181) AddTransaction to add an association between the transaction component and the database component.

5.1.2.4.3 TIBDataBase.ApplyUpdates Method

Posts pending cached updates for specified datasets to the database server.

Pascal

```
procedure ApplyUpdates(const DataSets: array of TDataSet);
```

C++

```
__fastcall ApplyUpdates(const array of TDataSet DataSets);
```

Description

Call (see page 181) ApplyUpdates to post pending cached updates for a specific set of open datasets to the database server. ApplyUpdates is only meaningful if the CachedUpdates property of a specified dataset is true.

DataSets is a list of dataset names specifying the datasets for which to post pending updates. DataSets need not list every currently open dataset. For each listed dataset ApplyUpdates calls the dataset's ApplyUpdates and CommitUpdates methods to post that dataset's pending cached updates.

5.1.2.4.4 TIBDataBase.Call Method

Returns an error message based on the error code.

Pascal

```
function Call(ErrCode: ISC_STATUS; RaiseError: Boolean): ISC_STATUS;
```

C++

```
__fastcall ISC_STATUS Call(ISC_STATUS ErrCode, Boolean RaiseError);
```

Description

Call is an internal method used to make calls to the InterBase API, and gives you the option of raising an exception or returning an error based on the value of RaiseError.

5.1.2.4.5 TIBDataBase.CheckActive Method

Checks to see if the database connection is active.

Pascal

```
procedure CheckActive;
```

C++

```
__fastcall CheckActive();
```

Description

Call (see page 181) CheckActive to determine if the connection to a database server is active. If the database connection is inactive, an ibxeDatabaseClosed exception is raised.

5.1.2.4.6 TIBDataBase.CheckDatabaseName Method

Checks to see if the DatabaseName (see page 190) property is not empty.

Pascal

```
procedure CheckDatabaseName;
```

C++

```
__fastcall CheckDatabaseName();
```

Description

Call (see page 181) CheckDatabaseName to determine whether the DatabaseName (see page 190) property is empty. If the DatabaseName (see page 190) is empty, an ibxeDatabaseNameMissing exception is raised.

5.1.2.4.7 TIBDataBase.CheckInactive Method

Checks to see if the database connection is inactive.

Pascal

```
procedure CheckInactive;
```

C++

```
__fastcall CheckInactive();
```

Description

Call (see page 181) CheckInactive to determine whether the connection to a database server is inactive. If the database connection is active, an ibxeDatabaseOpen exception is raised.

5.1.2.4.8 TIBDataBase.CloseDataSets Method

Closes all datasets associated with the database component without disconnecting from the database server.

Pascal

```
procedure CloseDataSets;
```

C++

```
__fastcall CloseDataSets();
```

Description

Call (see page 181) CloseDataSets to close all active datasets without disconnecting from the database server. Ordinarily, when an application calls Close, all datasets are closed, and the connection to the database server is dropped. Calling CloseDataSets instead of Close ensures that an application can close all active datasets without having to reconnect to the database server at a later time.

5.1.2.4.9 TIBDataBase.CreateDatabase Method

Creates a database using Params (see page 196).

Pascal

```
procedure CreateDatabase;
```

C++

```
__fastcall CreateDatabase();
```

Description

Call (see page 181) CreateDatabase to create a database using Params (see page 196) as the rest of the CREATE DATABASE command.

For example, if you wanted to create a local InterBase database, you could do the following:

1. Set the database name to the drive, path, and filename of the database file.
2. Set Params (see page 196) to the parameter for the CREATE DATABASE statement: `USER "SYSDBA" PASSWORD "masterkey" PAGE_SIZE 4096`
3. Set the SQLDialect (see page 196) value.
4. Call (see page 181) the CreateDatabase method.

5.1.2.4.10 TIBDataBase.DoConnect Method

Provides the interface for a method that opens a connection.

Pascal

```
procedure DoConnect; override;
```

C++

```
virtual __fastcall DoConnect();
```

Description

The Connected property uses DoConnect to establish a connection. Descendant classes override the DoConnect method to establish their connection as appropriate. As implemented in TCustomConnection, DoConnect does nothing.

See Also

Connected

DoDisconnect

5.1.2.4.11 TIBDataBase.DoDisconnect Method

Provides the interface for a method that terminates the connection.

Pascal

```
procedure DoDisconnect; override;
```

C++

```
virtual __fastcall DoDisconnect();
```

Description

The Connected property uses DoDisconnect to close a connection. Descendant classes override the DoDisconnect method to drop a connection. As implemented in TCustomConnection, DoDisconnect does nothing.

See Also

Connected

DoConnect

5.1.2.4.12 TIBDataBase.DropDatabase Method

Drops a database.

Pascal

```
procedure DropDatabase;
```

C++

```
__fastcall DropDatabase();
```

Description

Call (see page 181) DropDatabase to drop a database, which removes the database file from the server.

5.1.2.4.13 TIBDataBase.FindDefaultTransaction Method

Returns the default transaction.

Pascal

```
function FindDefaultTransaction: TIBTransaction;
```

C++

```
__fastcall TIBTransaction FindDefaultTransaction();
```

Description

Call (see page 181) FindDefaultTransaction to return the default transaction for the database.

5.1.2.4.14 TIBDataBase.FindTransaction Method

Finds the index of a transaction.

Pascal

```
function FindTransaction(TR: TIBTransaction): Integer;
```

C++

```
__fastcall int FindTransaction(TIBTransaction TR);
```

Description

Call (see page 181) FindTransaction to find the index of a specified transaction.

5.1.2.4.15 TIBDataBase.FlushSchema Method

Clears the schema cache for the database.

Pascal

```
procedure FlushSchema;
```

C++

```
__fastcall FlushSchema();
```

Description

Call (see page 181) FlushSchema to clear the schema cache.

5.1.2.4.16 TIBDataBase.ForceClose Method

Forces the database connection to close.

Pascal

```
procedure ForceClose;
```

C++

```
__fastcall ForceClose();
```

Description

Use ForceClose to force the database connection to close.

Note: Forcing a database to close attempts to close the connection to the server. Even if the call fails, the database handle is reset to nil (Delphi) or NULL (C++).

5.1.2.4.17 TIBDataBase.GetConnected Method

Returns the value of the Connected property.

Pascal

```
function GetConnected: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetConnected();
```

Description

GetConnected is the protected read implementation of the Connected property. Descendant classes override this method to return true if a connection is open and false otherwise. As defined in TCustomConnection, GetConnected always returns false.

See Also

Connected

SetConnected

5.1.2.4.18 TIBDataBase.GetFieldNames Method

Populates a list with the names of the fields in the table.

Pascal

```
procedure GetFieldNames(const TableName: Widestring; List: TWideStrings);
```

C++

```
__fastcall GetFieldNames(const BSTR TableName, TWideStrings List);
```

Description

Call (see page 181) GetFieldNames to retrieve a list of fields in the associated table.

5.1.2.4.19 TIBDataBase.GetTableNames Method

Populates a string list with the names of tables in the database.

Pascal

```
procedure GetTableNames(List: TWideStrings; SystemTables: Boolean = False);
```

C++

```
__fastcall GetTableNames(TWideStrings List, Boolean SystemTables = False);
```

Description

Call (see page 181) GetTableNames to retrieve a list of tables in the associated database.

List is the already-existing string list object into which the tables' names are put.

Set SystemTables to indicate whether the list of table names should include the database's system tables.

```
IBDatabase1.GetTableNames(ListBox2.Items, False);
    IBDatabase1->GetTableNames(ListBox2->Items, false);
```

Note: Any contents already in the target string list object are eliminated and overwritten by the data produced by GetTableNames.

5.1.2.4.20 TIBDataBase.Has_COMPUTED_BLR Method

Indicates whether a specified field in a specified relation includes a COMPUTED_BLR attribute.

Pascal

```
function Has_COMPUTED_BLR(Relation: String; Field: String): Boolean;
```

C++

```
__fastcall Boolean Has_COMPUTED_BLR(UnicodeString Relation, UnicodeString Field);
```

Description

Call (see page 181) Has_COMPUTED_BLR to determine whether the Field in Relation includes a COMPUTED_BLR attribute.

5.1.2.4.21 TIBDataBase.Has_DEFAULT_VALUE Method

Indicates whether a specified field in a specified relation includes a DEFAULT_VALUE attribute.

Pascal

```
function Has_DEFAULT_VALUE(Relation: String; Field: String): Boolean;
```

C++

```
__fastcall Boolean Has_DEFAULT_VALUE(UnicodeString Relation, UnicodeString Field);
```

Description

Call (see page 181) Has_DEFAULT_VALUE to determine whether Field has a default value when used in Relation.

5.1.2.4.22 TIBDataBase.IndexOfDBConst Method

Searches for the named parameter in the database parameters list.

Pascal

```
function IndexOfDBConst(st: String): Integer;
```

C++

```
__fastcall int IndexOfDBConst(UnicodeString st);
```

Description

Use IndexOfDBConst to locate a parameter in the database parameters list. If the parameter is not found, IndexOfDBConst returns -1.

5.1.2.4.23 TIBDataBase.Loaded Method

Initializes the connection component after all objects in the form or data module have been loaded.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call the protected Loaded method. It is called automatically after the form or data module that contains the connection component has loaded all its owned objects. TCustomConnection overrides the inherited method to establish a connection if the Connected property is true.

See Also

StreamedConnected

Loaded

5.1.2.4.24 TIBDataBase.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification

InsertComponent

RemoveComponent

Owner

5.1.2.4.25 TIBDataBase.RemoveEventNotifier Method

Removes an event notifier from the database's internal list so that the database no longer handles registering and unregistering interest in events.

Pascal

```
procedure RemoveEventNotifier(Notifier: IIBEventNotifier);
```

C++

```
__fastcall RemoveEventNotifier(IIBEventNotifier Notifier);
```

Description

Call (see page 181) RemoveEventNotifier when you no longer want the database to automatically register and unregister an interest in server events when it opens and closes a connection to the server. For example, TIBEvents automatically calls RemoveEventNotifier when you change its Database property.

Notifier is the event notifier previously added to the database's internal list by a call to AddEventNotifier (see page 180).

RemoveEventNotifier removes Notifier from its internal list of event notifiers.

Note: Removing an event notifier from the list does not first unregister an interest in any registered events.

5.1.2.4.26 TIBDataBase.RemoveTransaction Method

Disassociates a transaction from the database.

Pascal

```
procedure RemoveTransaction(Idx: Integer);
```

C++

```
__fastcall RemoveTransaction(int Idx);
```

Description

Call (see page 181) RemoveTransaction to disassociate a specified transaction from the database.

5.1.2.4.27 TIBDataBase.RemoveTransactions Method

Disassociates all transactions from the database.

Pascal

```
procedure RemoveTransactions;
```

C++

```
__fastcall RemoveTransactions();
```

Description

Call (see page 181) RemoveTransactions to disassociate all transactions from the database.

5.1.2.4.28 TIBDataBase.SetHandle Method

Sets the handle for the database.

Pascal

```
procedure SetHandle(Value: TISC_DB_HANDLE);
```

C++

```
__fastcall SetHandle(TISC_DB_HANDLE Value);
```

Description

Call (see page 181) SetHandle to set the handle for the database.

5.1.2.4.29 TIBDataBase.TestConnected Method

Tests whether a database is connected.

Pascal

```
function TestConnected: Boolean;
```

C++

```
__fastcall Boolean TestConnected();
```

Description

Use TestConnected to determine whether a database is connected to the server. TestConnected returns true if the connection is good, and false if it is not.

5.1.2.5 TIBDataBase Properties

The properties of the TIBDataBase class are listed here.

Public Properties

	Name	Description
	DBParamByDPB (see page 190)	Specifies the name of the database to associate with this database component.
R	Handle (see page 191)	Specifies the InterBase API database handle.
R	HandleIsShared (see page 191)	Indicates whether or not a the handle is shared.
R	InternalTransaction (see page 192)	Used internally by InterBase transactions.
R	IsReadOnly (see page 192)	Indicates whether or not the database is set to read-only.
R	SQLObjectCount (see page 197)	Returns the number of SQL objects.
R	SQLObjects (see page 197)	Returns an SQL object.
R	TransactionCount (see page 198)	Returns the number of transactions associated with the TIBDataBase (see page 176) component.
R	Transactions (see page 198)	Specifies a transaction for the given index.

Published Properties

	Name	Description
	AllowStreamedConnected (see page 189)	Indicates whether the Connected (see page 189) property can be set at design time.
	Connected (see page 189)	Indicates whether or not a database connection is active.
	DatabaseName (see page 190)	Specifies the name of the database to associate with this database component.
R	DBSQLDialect (see page 190)	Returns the database SQL dialect.
	DefaultTransaction (see page 191)	Sets or returns the default database transaction.
	IdleTimer (see page 191)	Specifies how long the database should wait before disconnecting an idle connection.
	LoginPrompt (see page 192)	Specifies whether a login dialog appears immediately before opening a new connection.
	Params (see page 196)	Specifies the database parameters to pass to the InterBase server.
	SQLDialect (see page 196)	Sets or returns the SQL dialect used by the client.
	TraceFlags (see page 197)	Specifies the database operations to track with the SQL Monitor at runtime.

5.1.2.5.1 TIBDataBase.AllowStreamedConnected Property

Indicates whether the Connected (see page 189) property can be set at design time.

Pascal

```
property AllowStreamedConnected: Boolean;
```

C++

```
__property Boolean AllowStreamedConnected;
```

Description

When AllowStreamedConnected is true (the default), then setting the Connected (see page 189) property to true at design time causes this component to automatically establish a database connection when the application starts up. When AllowStreamedConnected is false, the connection must be explicitly opened at runtime, either by setting the Connected (see page 189) property to true, or by calling the Open method.

Set AllowStreamedConnected to false when using a local test database at design time and a different database at runtime. This allows the application to set the appropriate runtime connection information before opening a runtime connection, without having to explicitly shut down the database connection that is used at design time.

5.1.2.5.2 TIBDataBase.Connected Property

Indicates whether or not a database connection is active.

Pascal

```
property Connected;
```

C++

```
__property Connected;
```

Description

Set Connected to true to establish a database connection without opening a dataset. Set Connected to false to close a database connection. An application can check Connected to determine the current status of a database connection. If Connected is true, the database connection is active; if false, then the connection is inactive.

5.1.2.5.3 TIBDataBase.DatabaseName Property

Specifies the name of the database to associate with this database component.

Pascal

```
property DatabaseName: TIBFileName;
```

C++

```
__property TIBFileName DatabaseName;
```

Description

Use DatabaseName to specify the name of the database to use with a database component. For local InterBase databases, this can be a filename.

To connect to an InterBase database on a remote server using TCP/IP the syntax is <server_name>:<filename>.

To connect to an InterBase database on a remote server using NetBEUI, the syntax is: \\<server_name>\<filename>.

To connect to an InterBase database on a remote server using SPX, the syntax is: <server_name>@<filename>.

5.1.2.5.4 TIBDataBase.DBParamByDPB Property

Specifies the name of the database to associate with this database component.

Pascal

```
property DBParamByDPB [const Idx: Integer]: String;
```

C++

```
__property UnicodeString DBParamByDPB[int const Idx];
```

Description

Use DBParamByDPB to inspect and set DPB parameters without looking at the Params (see page 196) string list.

For example,

```
DBParamByDPB[isc_dpb_user_name]
```

can be used to set and inspect the user name.

5.1.2.5.5 TIBDataBase.DBSQLDialect Property

Returns the database SQL dialect.

Pascal

```
property DBSQLDialect: Integer;
```

C++

```
__property int DBSQLDialect;
```

Description

Use DBSQLDialect to get the database SQL dialect.

5.1.2.5.6 TIBDataBase.DefaultTransaction Property

Sets or returns the default database transaction.

Pascal

```
property DefaultTransaction: TIBTransaction;
```

C++

```
__property TIBTransaction DefaultTransaction;
```

Description

Use DefaultTransaction to set or return the default database transaction.

A single database connection can manage one or more transactions. DefaultTransaction is a convenient way to specify a default transaction to a database connection.

5.1.2.5.7 TIBDataBase.Handle Property

Specifies the InterBase API database handle.

Pascal

```
property Handle: TISC_DB_HANDLE;
```

C++

```
__property TISC_DB_HANDLE Handle;
```

Description

Use Handle to make calls directly to the InterBase API. Many of the InterBase API functions require a database handle as one of their arguments. Handle is assigned an initial value when a database is opened.

5.1.2.5.8 TIBDataBase.HandleIsShared Property

Indicates whether or not a the handle is shared.

Pascal

```
property HandleIsShared: Boolean;
```

C++

```
__property Boolean HandleIsShared;
```

Description

Read HandleIsShared to determine if the handle to the database is shared.

5.1.2.5.9 TIBDataBase.IdleTimer Property

Specifies how long the database should wait before disconnecting an idle connection.

Pascal

```
property IdleTimer: Integer;
```

C++

```
__property int IdleTimer;
```

Description

Use IdleTimer to indicate how long the database should wait before automatically terminating the connection.

5.1.2.5.10 TIBDataBase.InternalTransaction Property

Used internally by InterBase transactions.

Pascal

```
property InternalTransaction: TIBTransaction;
```

C++

```
__property TIBTransaction InternalTransaction;
```

Description

Do not use InternalTransaction directly. It is for internal use only.

5.1.2.5.11 TIBDataBase.IsReadOnly Property

Indicates whether or not the database is set to read-only.

Pascal

```
property IsReadOnly: Boolean;
```

C++

```
__property Boolean IsReadOnly;
```

Description

Read IsReadOnly to determine if the database is read-only.

Read-only databases are an InterBase 6 feature.

5.1.2.5.12 TIBDataBase.LoginPrompt Property

Specifies whether a login dialog appears immediately before opening a new connection.

Pascal

```
property LoginPrompt;
```

C++

```
__property LoginPrompt;
```

Description

Set LoginPrompt to true to provide login support when establishing a connection. LoginPrompt controls two things: the occurrence of the OnLogin event, and the appearance of a default login dialog that prompts users for a name and password when you include DBLogDlg.hpp in your unit (C++) or add DBLogDlg to your uses clause (Delphi). When the OnLogin event occurs and when the default login dialog appears depend on the type of connection component:

For TDatabase, TIBDatabase, and TSQLConnection, the dialog appears after the BeforeConnect event and before the

AfterConnect event, unless you supply an OnLogin event handler. If there is an OnLogin event handler, that event occurs in place of the login dialog, and there is no need to include DBLogDlg.hpp in your unit (C++) or add DBLogDlg to your uses clause (Delphi). If correct values for the user name and password are not supplied in the dialog or by the OnLogin event handler, the connection fails. The OnLogin event does not fire unless LoginPrompt is set to true.

For TADOConnection components, the dialog appears after the OnWillConnect event and before the BeforeConnect event. If there is an OnLogin event handler, that event occurs after the login dialog. If you do not include DBLogDlg.hpp in your unit (C++) or add DBLogDlg to your uses clause (Delphi), the OnLogin event occurs but there is no default login dialog. If correct values for the user name and password are not supplied in the dialog or by the OnLogin event handler, the connection fails. The OnLogin event does not fire unless LoginPrompt is set to true.

For DataSnap SOAP connection components, the dialog appears after the OnGetUsername event and before the BeforeConnect, AfterConnect, and OnLogin events. If the user cancels from the login dialog, no attempt is made to open a connection.

When LoginPrompt is false, the application must supply user name and password values programmatically:

For TDatabase, the user name and password can be supplied as USER_NAME and PASSWORD parameters in the Params property.

For TADOConnection, the user name and password can be supplied as the ConnectionString property.

For TSQLConnection, the user name, password, and database can be supplied as UserName, Password, and Database parameters in the Params property, or provided as connection parameters associated with the connection name.

For DataSnap SOAP connection components, there is no built-in use for the user name and password supplied by the login dialog. (The UserName and Password properties of TWebConnection are unrelated).

Warning: Storing hard-coded user name and password entries as property values or in code for an OnLogin event handler can compromise server security.

C++ Examples:

```
//
//This example demostrates the use of ADO for database conectivity.
//Example assumes that a TDBGrid is placed on the form.
//
void __fastcall TForm2::FormCreate(TObject *Sender)
{
    /* Login details */
    String UserName = "db_user_name";
    String PassWord = "db_pass_word";
    String Server = "my.db.server";

    /* Connection String */
    String ConnString =
        "Provider=SQLOLEDB.1;Persist Security Info=False;";
    ConnString +=
        "User ID=%s;Password=%s;Data Source=%s;Use Procedure for Prepare=1;";
    ConnString +=
        "Auto Translate=True;Packet Size=4096;Use Encryption for Data=False;";
    ConnString +=
        "Tag with column collation when possible=False";

    /* SQL Query */
    String SQLStr = "SELECT * FROM customer WHERE customer_id = :AnId;";

    /* All ADO variables */
    TADOConnection* ADOConn;
    TADOQuery* ADOQuery;
    TDataSource* DataSrc;
```

```
    TParameter* Param;

    /* Create an ADO connection */
    ADOConn = new TADOConnection(this);

    /* Setup the connection string */
    ADOConn->ConnectionString = Format(ConnString,
        ARRAYOFCONST((UserName, PassWord, Server)));

    /* Disable login prompt */
    ADOConn->LoginPrompt = False;

    try
    {
        ADOConn->Connected = true;
    }
    catch (EADOError *e)
    {
        MessageDlg("Error while connecting", mtError,
                    TMsgDlgButtons() << mbOK, 0);
        return;
    }

    /* Create the query */
    ADOQuery = new TADOQuery(this);
    ADOQuery->Connection = ADOConn;
    ADOQuery->SQL->Add(SQLStr);

    /* Update the parameter that was parsed from the SQL query: AnId */
    Param = ADOQuery->Parameters->ParamByName("AnId");
    Param->DataType = ftInteger;
    Param->Value = 1;

    /* Set the query to Prepared - will improve performance */
    ADOQuery->Prepared = true;

    try
    {
        ADOQuery->Active = true;
    }
    catch (EADOError *e)
    {
        MessageDlg("Error while connecting", mtError,
                    TMsgDlgButtons() << mbOK, 0);
        return;
    }

    /* Create the data source */
    DataSrc = new TDataSource(this);
    DataSrc->DataSet = ADOQuery;
    DataSrc->Enabled = true;

    /* Finally initilalize the grid */
    DBGrid1->DataSource = DataSrc;
}
```

Delphi Examples:

```
{
This example demostrates the use of ADO for database conectivity.
Example assumes that a TDBGrid is placed on the form.
}
procedure TForm2.FormCreate(Sender: TObject);
const
  { Connection string }
  ConnString =
  'Provider=SQLOLEDB.1;Persist Security Info=False;' +
```

```
    'User ID=%s;Password=%s;Data Source=%s;Use Procedure for Prepare=1;' +
    'Auto Translate=True;Packet Size=4096;Use Encryption for Data=False;'+
    'Tag with column collation when possible=False';

    { SQL Query }
    SQLStr = 'SELECT * FROM customer WHERE customer_id = :AnId;';

    { User access }
    UserName = 'db_user_name';
    PassWord = 'db_pass_word';
    Server = 'my.db.server';

  var
    ADOConn  : TADOConnection;
    ADOQuery : TADOQuery;
    DataSrc  : TDataSource;
    Param    : TParameter;

  begin
    { Create an ADO connection }
    ADOConn := TADOConnection.Create(Self);
    { Setup the provider engine }

    { Setup the connection string }
    ADOConn.ConnectionString := Format(ConnString,
      [UserName, PassWord, Server]);

    { Disable login prompt }
    ADOConn.LoginPrompt := False;

    try
      ADOConn.Connected := True;
    except
      on e: EADOError do
      begin
        MessageDlg('Error while connecting', mtError,
                   [mbOK], 0);

        Exit;
      end;
    end;

    { Create the query }
    ADOQuery := TADOQuery.Create(Self);
    ADOQuery.Connection := ADOConn;
    ADOQuery.SQL.Add(SQLStr);

    { Update the parameter that was parsed from the SQL query: AnId }
    Param := ADOQuery.Parameters.ParamByName('AnId');
    Param.DataType := ftInteger;
    Param.Value := 1;

    { Set the query to Prepared - will improve performance }
    ADOQuery.Prepared := true;

    try
      ADOQuery.Active := True;
    except
      on e: EADOError do
      begin
        MessageDlg('Error while doing query', mtError,
                   [mbOK], 0);

        Exit;
      end;
    end;
```

```
    { Create the data source }
    DataSrc := TDataSource.Create(Self);
    DataSrc.DataSet := ADOQuery;
    DataSrc.Enabled := true;

    { Finally initilalize the grid }
    DBGrid1.DataSource := DataSrc;
  end;
```

Controlling Server Login

5.1.2.5.13 TIBDataBase.Params Property

Specifies the database parameters to pass to the InterBase server.

Pascal

```
property Params: TStrings;
```

C++

```
__property TStrings Params;
```

Description

Use Params to specify the database parameters to pass to the InterBase server.

Database parameters are passed to the server as text in order to establish the connection. For example:

```
user_name=sysdba
    password=masterkey
    sql_role_name=finance
    lc_ctype=WIN1252
```

For more information on character sets, refer to 'Character Sets and Collation Orders' in the InterBase Language Reference.

For other information, refer to the InterBase API Guide.

5.1.2.5.14 TIBDataBase.SQLDialect Property

Sets or returns the SQL dialect used by the client.

Pascal

```
property SQLDialect: Integer;
```

C++

```
__property int SQLDialect;
```

Description

Use the SQLDialect property to set or return the SQL dialect used by the client. If the connection is active, the SQLDialect

property cannot be set to a value greater than the database SQL dialect. If the connection is inactive, then on connect an OnDialectDowngradeWarning (see page 200) event may be fired if the SQLDialect is greater than the database SQL dialect. In such a case, the SQLDialect property will be downgraded to match the database SQL dialect.

5.1.2.5.15 TIBDataBase.SQLObjectCount Property

Returns the number of SQL objects.

Pascal

```
property SQLObjectCount: Integer;
```

C++

```
__property int SQLObjectCount;
```

Description

Use the SQLObjectCount property to return the number of SQL objects in the database.

SQL objects are usually defined as InterBase datasets, IBSQL (see page 493), and Blobs.

5.1.2.5.16 TIBDataBase.SQLObjects Property

Returns an SQL object.

Pascal

```
property SQLObjects [Index: Integer]: TIBBase;
```

C++

```
__property TIBBase SQLObjects[int Index];
```

Description

Use the SQLObjects property to return an SQL object based on its numeric index.

SQL objects are usually defined as InterBase datasets, IBSQL (see page 493), and Blobs.

5.1.2.5.17 TIBDataBase.TraceFlags Property

Specifies the database operations to track with the SQL Monitor at runtime.

Pascal

```
property TraceFlags: TTraceFlags;
```

C++

```
__property TTraceFlags TraceFlags;
```

Description

Use TraceFlags to specify which database operations the SQL Monitor should track in an application at runtime. TraceFlags is only meaningful for the SQL Monitor, which is provided to enable performance tuning and SQL debugging when working with remote SQL database servers.

Note: Normally trace options are set from the SQL Monitor rather than setting TraceFlags in application code.

The value of a session component's TraceFlags property determines the initial settings of the TraceFlags property for database components associated with the session.

Because TraceFlags is a set property, an application can specify different combinations of flags to monitor different combinations of statements. For example, the following statement limits monitoring to database connections and SQL statement preparation:

```
TraceFlags := [tfConnect, tfQPrepare];
    TraceFlags = [tfConnect, tfQPrepare];
```

5.1.2.5.18 TIBDataBase.TransactionCount Property

Returns the number of transactions associated with the TIBDataBase (see page 176) component.

Pascal

```
property TransactionCount: Integer;
```

C++

```
__property int TransactionCount;
```

Description

Use TransactionCount to return how many transactions are currently associated with the InterBase database component.

5.1.2.5.19 TIBDataBase.Transactions Property

Specifies a transaction for the given index.

Pascal

```
property Transactions [Index: Integer]: TIBTransaction;
```

C++

```
__property TIBTransaction Transactions[int Index];
```

Description

Given an integer index, Transactions returns the transaction at the given index. This is used internally for broadcasting important messages to attached components.

5.1.2.6 TIBDataBase Events

The events of the TIBDataBase class are listed here.

Published Events

	Name	Description
	AfterConnect (see page 198)	Occurs after a connection is established.
	AfterDisconnect (see page 199)	Occurs after the connection closes.
	BeforeConnect (see page 199)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 199)	Occurs immediately before the connection closes.
	OnDialectDowngradeWarning (see page 200)	Occurs after the SQL dialect of the client connection is downgraded.
	OnIdleTimer (see page 200)	Occurs after a database connection times out.
	OnLogin (see page 201)	Occurs when an application connects to a database.

5.1.2.6.1 TIBDataBase.AfterConnect Event

Occurs after a connection is established.

Pascal

```
property AfterConnect;
```

C++

```
__property AfterConnect;
```

Description

Write an AfterConnect event handler to take application-specific actions immediately after the connection component opens a connection to the remote source of database information.

See Also

BeforeConnect

Connected

Connecting to a Database Server

5.1.2.6.2 TIBDataBase.AfterDisconnect Event

Occurs after the connection closes.

Pascal

```
property AfterDisconnect;
```

C++

```
__property AfterDisconnect;
```

Description

Write an AfterDisconnect event handler to take application-specific actions after the connection component drops a connection.

See Also

BeforeDisconnect

Connected

Disconnecting from a Database Server

5.1.2.6.3 TIBDataBase.BeforeConnect Event

Occurs immediately before establishing a connection.

Pascal

```
property BeforeConnect;
```

C++

```
__property BeforeConnect;
```

Description

Write a BeforeConnect event handler to take application-specific actions before the connection component opens a connection to the remote source of database information.

See Also

AfterConnect

Connected

Connecting to a Database Server

5.1.2.6.4 TIBDataBase.BeforeDisconnect Event

Occurs immediately before the connection closes.

Pascal

```
property BeforeDisconnect;
```

C++

```
__property BeforeDisconnect;
```

Description

Write a BeforeDisconnect event handler to take application-specific actions before dropping a connection.

Delphi Examples:

```
{
This BeforeDisconnect event handler makes sure that the
client dataset has applied all its pending updates before
terminating the connection to the server.
}
procedure TForm1.RemoteServer1BeforeDisconnect(Sender: TObject);
begin
  if (ClientDataSet1.ChangeCount > 0) then
    ClientDataSet1.ApplyUpdates(-1);
end;
```

See Also

AfterDisconnect

Connected

Disconnecting from a Database Server

5.1.2.6.5 TIBDataBase.OnDialectDowngradeWarning Event

Occurs after the SQL dialect of the client connection is downgraded.

Pascal

```
property OnDialectDowngradeWarning: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDialectDowngradeWarning;
```

Description

Write an OnDialectDowngradeWarning event handler to take specific actions when the SQL dialect is downgraded.

For example, if the SQL dialect for your application is set to 3 and then a connection is made to a dialect 1 database, then the SQL dialect is downgraded to 1 and a OnDialectDowngradeWarning event is fired.

5.1.2.6.6 TIBDataBase.OnIdleTimer Event

Occurs after a database connection times out.

Pascal

```
property OnIdleTimer: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnIdleTimer;
```

Description

Write an OnIdleTimer event handler to take specific actions when the connection times out in the time specified by IdleTimer (see page 191).

5.1.2.6.7 TIBDataBase.OnLogin Event

Occurs when an application connects to a database.

Pascal

```
property OnLogin: TIBDatabaseLoginEvent;
```

C++

```
__property TIBDatabaseLoginEvent OnLogin;
```

Description

Write an OnLogin event handler to take specific actions when an application attempts to connect to a database. By default, a database login is required. The current USER_NAME is read from the Params (see page 196) property, and a standard Login dialog box opens. The dialog prompts for a user name and password combination, and then uses the values entered by the user to set the USER_NAME and PASSWORD values in the Params (see page 196) property. These values are then passed to the remote server.

Applications that provide alternative OnLogin event handlers must set the USER_NAME and PASSWORD values in LoginParams parameter of the event handler.

Note: OnLogin does not occur unless the LoginPrompt (see page 192) property is set to true.

5.1.3 TIBSchema Class

Class Hierarchy

Pascal

```
TIBSchema = class(TObject);
```

C++

```
class TIBSchema : public TObject;
```

File

IBDatabase

Description

This is class IBDatabase.TIBSchema.

5.1.3.1 TIBSchema Members

The following tables list the members exposed by TIBSchema.

Public Methods

	Name	Description
	FreeNodes (see page 202)	This is FreeNodes, a member of class TIBSchema.
	Has_COMPUTED_BLR (see page 202)	This is Has_COMPUTED_BLR, a member of class TIBSchema.
	Has_DEFAULT_VALUE (see page 202)	This is Has_DEFAULT_VALUE, a member of class TIBSchema.

5.1.3.2 TIBSchema Methods

The methods of the TIBSchema class are listed here.

Public Methods

	Name	Description
	FreeNodes (see page 202)	This is FreeNodes, a member of class TIBSchema.
	Has_COMPUTED_BLR (see page 202)	This is Has_COMPUTED_BLR, a member of class TIBSchema.
	Has_DEFAULT_VALUE (see page 202)	This is Has_DEFAULT_VALUE, a member of class TIBSchema.

5.1.3.2.1 TIBSchema.FreeNodes Method

Pascal

```
procedure FreeNodes; virtual; abstract;
```

C++

```
virtual __fastcall FreeNodes() = 0;
```

Description

This is FreeNodes, a member of class TIBSchema.

5.1.3.2.2 TIBSchema.Has_COMPUTED_BLR Method

Pascal

```
function Has_COMPUTED_BLR(Relation: String; Field: String): Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean Has_COMPUTED_BLR(UnicodeString Relation, UnicodeString Field) = 0;
```

Description

This is Has_COMPUTED_BLR, a member of class TIBSchema.

5.1.3.2.3 TIBSchema.Has_DEFAULT_VALUE Method

Pascal

```
function Has_DEFAULT_VALUE(Relation: String; Field: String): Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean Has_DEFAULT_VALUE(UnicodeString Relation, UnicodeString Field) = 0;
```

Description

This is Has_DEFAULT_VALUE, a member of class TIBSchema.

5.1.4 TIBTimer Class

Class Hierarchy

Pascal

```
TIBTimer = class(TComponent);
```

C++

```
class TIBTimer : public TComponent;
```

File

IBDatabase

Description

This is class IBDatabase.TIBTimer.

5.1.4.1 TIBTimer Members

The following tables list the members exposed by TIBTimer.

Protected Methods

	Name	Description
	Timer (see page 205)	This is Timer, a member of class TIBTimer.

Public Methods

	Name	Description
	Create (see page 203)	Allocates memory and constructs a safely initialized instance of a component.
	Destroy (see page 204)	Disposes of the component and its owned components.

Published Events

	Name	Description
	OnTimer (see page 206)	This is OnTimer, a member of class TIBTimer.

Published Properties

	Name	Description
	Enabled (see page 205)	This is Enabled, a member of class TIBTimer.
	Interval (see page 206)	This is Interval, a member of class TIBTimer.

5.1.4.2 TIBTimer.Create Constructor

Allocates memory and constructs a safely initialized instance of a component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBTimer(TComponent * AOwner);
```

Description

All objects have a Create method that constructs the object. TComponent redefines Create so that, for components, Create also:

establishes the relationship of a component and its Owner, as indicated by the AOwner parameter

sets the ComponentStyle property to csInheritable, meaning that the component can be inherited by a descendant form type

It is not necessary to explicitly create components added in the form designer. These components are created automatically when the application is run, and they are destroyed when the application is closed.

For components created programmatically, that is, not created in the form designer, call Create and pass in an owner component as the AOwner parameter. The owner disposes of the component when it is destroyed. If the component is not owned, then use Free when it needs to be destroyed.

Tip: When passing in Self as the Owner parameter, consider what Self references. If a component creates another component in one of its methods, then Self refers to the first component and not the component being created, which is then owned by the first component.

Note: The TComponent constructor is virtual in part to allow polymorphic instantiation of class references. This is critical to the streaming system and to the form designer. Do not forget to use the override directive when declaring a new component's Create constructor.

See Also

Components

ComponentStyle

System::TObject::Create

Destroy

System::TObject::Free

Owner

5.1.4.3 TIBTimer.Destroy Destructor

Disposes of the component and its owned components.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBTimer();
```

Description

Do not call Destroy directly. Call Free instead. Free verifies that the component is not nil, and only then calls Destroy.

Never explicitly free a component in one of its own event handlers, nor free a component from the event handler of a component that it owns or contains.

To destroy a form, call its Release method. Release waits for all the form's event handlers and the event handlers of the form's components to finish executing before destroying the form.

Note: A form owns all the controls and non-visual components that are placed on it in design mode. When it is freed, all of these components are automatically freed as well. By default, all forms are owned by the global Application object. When an application terminates, it frees the global Application object, which frees all forms. For objects that are not components, and for components created with a nil owner, be sure to call Free after finishing with the object; otherwise the memory allocated for the object will be lost until the application terminates.

5.1.4.4 TIBTimer Methods

The methods of the TIBTimer class are listed here.

Protected Methods

	Name	Description
	Timer (see page 205)	This is Timer, a member of class TIBTimer.

5.1.4.4.1 TIBTimer.Timer Method

Pascal

```
procedure Timer; dynamic;
```

C++

```
__fastcall Timer();
```

Description

This is Timer, a member of class TIBTimer.

5.1.4.5 TIBTimer Properties

The properties of the TIBTimer class are listed here.

Published Properties

	Name	Description
	Enabled (see page 205)	This is Enabled, a member of class TIBTimer.
	Interval (see page 206)	This is Interval, a member of class TIBTimer.

5.1.4.5.1 TIBTimer.Enabled Property

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

This is Enabled, a member of class TIBTimer.

5.1.4.5.2 TIBTimer.Interval Property

Pascal

```
property Interval: Cardinal;
```

C++

```
__property unsigned Interval;
```

Description

This is Interval, a member of class TIBTimer.

5.1.4.6 TIBTimer Events

The events of the TIBTimer class are listed here.

Published Events

	Name	Description
	OnTimer (see page 206)	This is OnTimer, a member of class TIBTimer.

5.1.4.6.1 TIBTimer.OnTimer Event

Pascal

```
property OnTimer: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnTimer;
```

Description

This is OnTimer, a member of class TIBTimer.

5.1.5 TIBTransaction Class

TIBTransaction provides discrete transaction control over a one or more database connections in a database application.

Class Hierarchy

Pascal

```
TIBTransaction = class(TComponent);
```

C++

```
class TIBTransaction : public TComponent;
```

File

IBDatabase

Description

All TIBCustomDataSet descendants and TIBSQL need to use a transaction along with a database component to gain access to data in a database.

Note: In applications that connect an InterBaseExpress dataset to a client dataset, every query must be in its own transaction. You must use one transaction component for each query component.

See Also

Getting Started with InterBase Express

5.1.5.1 TIBTransaction Members

The following tables list the members exposed by TIBTransaction.

Protected Methods

	Name	Description
	Loaded (see page 212)	Initializes the component after the form file has been read into memory.
	Notification (see page 212)	Forwards notification messages to all owned components.
	SetHandle (see page 214)	This is SetHandle, a member of class TIBTransaction.

Public Methods

	Name	Description
	AddDatabase (see page 209)	Associates a database to the transaction.
	Call (see page 209)	Returns an error message based on the error code.
	CheckAutoStop (see page 210)	Performs the action that the AutoStopAction (see page 215) property specifies.
	CheckDatabasesInList (see page 210)	Checks for databases in the list.
	CheckInTransaction (see page 210)	Checks whether the transaction is active and whether there are any databases in the transaction's database list.
	CheckNotInTransaction (see page 210)	Checks that the transaction is not active and that there are no databases in the transaction's database list.
	Commit (see page 211)	Permanently stores updates, insertions, and deletions of data associated with the current transaction, and ends the current transactions.
	CommitRetaining (see page 211)	Commits the active transaction and retains the transaction context after a commit.
	Create (see page 208)	Creates an instance of a transaction component.
	Destroy (see page 208)	Destroys the instance of the transaction component.
	FindDatabase (see page 211)	Finds the index of the associated database.
	FindDefaultDatabase (see page 212)	Finds the default database for the transaction.
	RemoveDatabase (see page 213)	Disassociates a database from the transaction.
	RemoveDatabases (see page 213)	Disassociates all databases from the transaction.
	Rollback (see page 213)	Cancels all updates, insertions, and deletions for the current transaction and ends the transaction.
	RollbackRetaining (see page 214)	Cancels all updates, insertions, and deletions for the current transaction and retains the transaction context.
	StartTransaction (see page 214)	Begins a new transaction against the database server.

Public Properties

	Name	Description
	DatabaseCount (see page 216)	Indicates the number of databases that are part of the transaction.
	Databases (see page 216)	Returns the database at the given integer index.
	Handle (see page 217)	Returns the transaction handle.
	HandleIsShared (see page 217)	Indicates whether or not the handle is shared.
	InTransaction (see page 218)	Indicates whether a database transaction is in progress or not.
	SQLObjectCount (see page 218)	Returns the number of active datasets associated with the database component.
	SQLObjects (see page 218)	Provides an indexed array of all active datasets for a database component.
	TPB (see page 219)	Provides a read-only view of the transaction parameter buffer.
	TPBLength (see page 219)	Returns the length of the transaction parameter buffer.

Published Events

	Name	Description
	OnIdleTimer (see page 219)	Occurs after a transaction has timed out.

Published Properties

	Name	Description
	Active (see page 215)	Specifies whether or not a transaction is active.
	AutoStopAction (see page 215)	Specifies what action to take when automatically ending transactions.
	DefaultAction (see page 216)	Specifies what action a transaction should take upon timing out.
	DefaultDatabase (see page 217)	Sets or returns the default database for the transaction.
	IdleTimer (see page 217)	Specifies how long the transaction should wait before automatically committing or rolling back.
	Params (see page 218)	Returns the transaction parameter buffer associated with the transaction component.

5.1.5.2 TIBTransaction.Create Constructor

Creates an instance of a transaction component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBTransaction(TComponent * AOwner);
```

Description

Call (see page 209) Create to instantiate a transaction component at runtime. An application creates a transaction component in order to control the component's existence and set its properties and events.

Create instantiates a transaction component and creates an empty string list for the Params (see page 218) property.

5.1.5.3 TIBTransaction.Destroy Destructor

Destroys the instance of the transaction component.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBTransaction();
```

Description

Do not call Destroy directly in an application. Instead, call Free, which verifies that the transaction component is not already freed before calling Destroy.

Destroy disconnects from the database server, if necessary. It then frees the string resources allocated for the Params (see page 218) and SQLObjects (see page 218) properties before calling its inherited destructor.

5.1.5.4 TIBTransaction Methods

The methods of the TIBTransaction class are listed here.

Protected Methods

	Name	Description
	Loaded (see page 212)	Initializes the component after the form file has been read into memory.
	Notification (see page 212)	Forwards notification messages to all owned components.
	SetHandle (see page 214)	This is SetHandle, a member of class TIBTransaction.

Public Methods

	Name	Description
	AddDatabase (see page 209)	Associates a database to the transaction.
	Call (see page 209)	Returns an error message based on the error code.
	CheckAutoStop (see page 210)	Performs the action that the AutoStopAction (see page 215) property specifies.
	CheckDatabasesInList (see page 210)	Checks for databases in the list.
	CheckInTransaction (see page 210)	Checks whether the transaction is active and whether there are any databases in the transaction's database list.
	CheckNotInTransaction (see page 210)	Checks that the transaction is not active and that there are no databases in the transaction's database list.
	Commit (see page 211)	Permanently stores updates, insertions, and deletions of data associated with the current transaction, and ends the current transactions.
	CommitRetaining (see page 211)	Commits the active transaction and retains the transaction context after a commit.
	FindDatabase (see page 211)	Finds the index of the associated database.
	FindDefaultDatabase (see page 212)	Finds the default database for the transaction.
	RemoveDatabase (see page 213)	Disassociates a database from the transaction.
	RemoveDatabases (see page 213)	Disassociates all databases from the transaction.
	Rollback (see page 213)	Cancels all updates, insertions, and deletions for the current transaction and ends the transaction.
	RollbackRetaining (see page 214)	Cancels all updates, insertions, and deletions for the current transaction and retains the transaction context.
	StartTransaction (see page 214)	Begins a new transaction against the database server.

5.1.5.4.1 TIBTransaction.AddDatabase Method

Associates a database to the transaction.

Pascal

```
function AddDatabase(db: TIBDatabase): Integer;
```

C++

```
__fastcall int AddDatabase(TIBDatabase db);
```

Description

Call (see page 209) AddDatabase to associate a database to the transaction.

5.1.5.4.2 TIBTransaction.Call Method

Returns an error message based on the error code.

Pascal

```
function Call(ErrCode: ISC_STATUS; RaiseError: Boolean): ISC_STATUS;
```

C++

```
__fastcall ISC_STATUS Call(ISC_STATUS ErrCode, Boolean RaiseError);
```

Description

Call is an internal method used to make calls to the InterBase API, and gives you the option of raising an exception or returning an error based on the value of RaiseError.

5.1.5.4.3 TIBTransaction.CheckAutoStop Method

Performs the action that the AutoStopAction (see page 215) property specifies.

Pascal

```
procedure CheckAutoStop;
```

C++

```
__fastcall CheckAutoStop();
```

Description

Datasets call CheckAutoStop at times when it is appropriate to implicitly end a transaction. CheckAutoStop then performs the action that the AutoStopAction (see page 215) property specifies.

5.1.5.4.4 TIBTransaction.CheckDatabasesInList Method

Checks for databases in the list.

Pascal

```
procedure CheckDatabasesInList;
```

C++

```
__fastcall CheckDatabasesInList();
```

Description

Call (see page 209) CheckDatabasesInList to check if there are any databases in the list. If there are no databases in the list, an exception is raised.

5.1.5.4.5 TIBTransaction.CheckInTransaction Method

Checks whether the transaction is active and whether there are any databases in the transaction's database list.

Pascal

```
procedure CheckInTransaction;
```

C++

```
__fastcall CheckInTransaction();
```

Description

Call (see page 209) CheckInTransaction to determine whether the transaction is active and whether there are any databases in the transaction's database list. If either condition is false, an exception is raised.

5.1.5.4.6 TIBTransaction.CheckNotInTransaction Method

Checks that the transaction is not active and that there are no databases in the transaction's database list.

Pascal

```
procedure CheckNotInTransaction;
```

C++

```
__fastcall CheckNotInTransaction();
```

Description

Call (see page 209) CheckInTransaction (see page 210) to determine that the transaction is not active and that there are no databases in the transaction's database list. If either condition is false, an exception is raised.

5.1.5.4.7 TIBTransaction.Commit Method

Permanently stores updates, insertions, and deletions of data associated with the current transaction, and ends the current transactions.

Pascal

```
procedure Commit;
```

C++

```
__fastcall Commit();
```

Description

Call (see page 209) Commit to permanently store to the database server all updates, insertions, and deletions of data associated with the current transaction and then end the transaction. The current transaction is the last transaction started by calling StartTransaction (see page 214).

Note: Before calling Commit, an application may check the status of the InTransaction (see page 218) property. If an application calls Commit and there is no current transaction, an exception is raised.

5.1.5.4.8 TIBTransaction.CommitRetaining Method

Commits the active transaction and retains the transaction context after a commit.

Pascal

```
procedure CommitRetaining;
```

C++

```
__fastcall CommitRetaining();
```

Description

Call (see page 209) CommitRetaining to permanently store to the database server all updates, insertions, and deletions of data associated with the current transaction and then retain the transaction context. The current transaction is the last transaction started by calling StartTransaction (see page 214).

Note: Before calling CommitRetaining, an application may check the status of the InTransaction (see page 218) property. If an application calls CommitRetaining and there is no current transaction, an exception is raised.

5.1.5.4.9 TIBTransaction.FindDatabase Method

Finds the index of the associated database.

Pascal

```
function FindDatabase(db: TIBDatabase): Integer;
```

C++

```
__fastcall int FindDatabase(TIBDatabase db);
```

Description

Call (see page 209) FindDatabase to find the index of the associated database.

5.1.5.4.10 TIBTransaction.FindDefaultDatabase Method

Finds the default database for the transaction.

Pascal

```
function FindDefaultDatabase: TIBDatabase;
```

C++

```
__fastcall TIBDatabase FindDefaultDatabase();
```

Description

Call (see page 209) FindDefaultDatabase to find the default database associated with the transaction.

5.1.5.4.11 TIBTransaction.Loaded Method

Initializes the component after the form file has been read into memory.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call the protected Loaded method. The streaming system calls this method after it loads the component's form from a stream.

When the streaming system loads a form or data module from its form file, it first constructs the form component by calling its constructor, then reads its property values from the form file. After reading all the property values for all the components, the streaming system calls the Loaded methods of each component in the order the components were created. This gives the components a chance to initialize any data that depends on the values of other components or other parts of itself.

Note: All references to sibling components are resolved by the time Loaded is called. Loaded is the first place that sibling pointers can be used after being streamed in.

As implemented in TComponent, Loaded clears the csLoading flag in the ComponentState property, indicating that the component is no longer loading.

Warning: Loaded may be called multiple times on inherited forms. It is called every time a level of inheritance is streamed in. Do not allocate memory in an overridden Loaded method without first checking that the memory has not been allocated in a previous call.

ComponentState

Create

TReader

5.1.5.4.12 TIBTransaction.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification

InsertComponent

RemoveComponent

Owner

5.1.5.4.13 TIBTransaction.RemoveDatabase Method

Disassociates a database from the transaction.

Pascal

```
procedure RemoveDatabase(Idx: Integer);
```

C++

```
__fastcall RemoveDatabase(int Idx);
```

Description

Call (see page 209) RemoveDatabase to disassociate a specified database from the transaction.

5.1.5.4.14 TIBTransaction.RemoveDatabases Method

Disassociates all databases from the transaction.

Pascal

```
procedure RemoveDatabases;
```

C++

```
__fastcall RemoveDatabases();
```

Description

Call (see page 209) RemoveDatabases to disassociate all databases from the transaction.

5.1.5.4.15 TIBTransaction.Rollback Method

Cancels all updates, insertions, and deletions for the current transaction and ends the transaction.

Pascal

```
procedure Rollback;
```

C++

```
__fastcall Rollback();
```

Description

Call (see page 209) Rollback to cancel all updates, insertions, and deletions for the current transaction and to end the transaction. The current transaction is the last transaction started by calling StartTransaction (see page 214).

Note: Before calling Rollback, an application may check the status of the InTransaction (see page 218) property. If an application calls Rollback and there is no current transaction, an exception is raised.

5.1.5.4.16 TIBTransaction.RollbackRetaining Method

Cancels all updates, insertions, and deletions for the current transaction and retains the transaction context.

Pascal

```
procedure RollbackRetaining;
```

C++

```
__fastcall RollbackRetaining();
```

Description

Call (see page 209) RollbackRetaining to roll back to the database server all updates, insertions, and deletions of data associated with the current transaction and then retain the transaction context. The current transaction is the last transaction started by calling StartTransaction (see page 214).

Note: Before calling RollbackRetaining, an application may check the status of the InTransaction (see page 218) property. If an application calls RollbackRetaining and there is no current transaction, an exception is raised.

Note: You must install InterBase 6 to use this feature.

5.1.5.4.17 TIBTransaction.SetHandle Method

Pascal

```
procedure SetHandle(Value: TISC_TR_HANDLE);
```

C++

```
__fastcall SetHandle(TISC_TR_HANDLE Value);
```

Description

This is SetHandle, a member of class TIBTransaction.

5.1.5.4.18 TIBTransaction.StartTransaction Method

Begins a new transaction against the database server.

Pascal

```
procedure StartTransaction;
```

C++

```
__fastcall StartTransaction();
```

Description

Call (see page 209) StartTransaction to begin a new transaction against the database server. Before calling StartTransaction, an application should check the status of the InTransaction (see page 218) property. If InTransaction (see page 218) is true, indicating that a transaction is already in progress, a subsequent call to StartTransaction without first calling Commit (see page 211) or Rollback (see page 213) to end the current transaction raises an exception.

Updates, insertions, and deletions that take place after a call to StartTransaction are held by the server until an application calls Commit (see page 211) to save the changes or Rollback (see page 213) is to cancel them.

5.1.5.5 TIBTransaction Properties

The properties of the TIBTransaction class are listed here.

Public Properties

	Name	Description
	DatabaseCount (see page 216)	Indicates the number of databases that are part of the transaction.
	Databases (see page 216)	Returns the database at the given integer index.
	Handle (see page 217)	Returns the transaction handle.
	HandleIsShared (see page 217)	Indicates whether or not the handle is shared.
	InTransaction (see page 218)	Indicates whether a database transaction is in progress or not.
	SQLObjectCount (see page 218)	Returns the number of active datasets associated with the database component.
	SQLObjects (see page 218)	Provides an indexed array of all active datasets for a database component.
	TPB (see page 219)	Provides a read-only view of the transaction parameter buffer.
	TPBLength (see page 219)	Returns the length of the transaction parameter buffer.

Published Properties

	Name	Description
	Active (see page 215)	Specifies whether or not a transaction is active.
	AutoStopAction (see page 215)	Specifies what action to take when automatically ending transactions.
	DefaultAction (see page 216)	Specifies what action a transaction should take upon timing out.
	DefaultDatabase (see page 217)	Sets or returns the default database for the transaction.
	IdleTimer (see page 217)	Specifies how long the transaction should wait before automatically committing or rolling back.
	Params (see page 218)	Returns the transaction parameter buffer associated with the transaction component.

5.1.5.5.1 TIBTransaction.Active Property

Specifies whether or not a transaction is active.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Use Active to determine or set a transaction's active state.

5.1.5.5.2 TIBTransaction.AutoStopAction Property

Specifies what action to take when automatically ending transactions.

Pascal

```
property AutoStopAction: TAutoStopAction;
```

C++

```
__property TAutoStopAction AutoStopAction;
```

Description

Use AutoStopAction to specify how the transaction should end when it is implicitly stopped. Transactions are implicitly stopped when AutoStopAction is not saNone and the last dataset associated with the transaction closes.

Note: This property only works with the closing of TDataSet descendants. If the transaction also includes TIBSQL components, AutoStopAction should be saNone, because the transaction can't tell whether there are any active TIBSQL components.

5.1.5.5.3 TIBTransaction.DatabaseCount Property

Indicates the number of databases that are part of the transaction.

Pascal

```
property DatabaseCount: Integer;
```

C++

```
__property int DatabaseCount;
```

Description

Use DatabaseCount to determine the number of databases involved in a transaction.

5.1.5.5.4 TIBTransaction.Databases Property

Returns the database at the given integer index.

Pascal

```
property Databases [Index: Integer]: TIBDatabase;
```

C++

```
__property TIBDatabase Databases[int Index];
```

Description

Use Databases to return the database at the given integer index.

5.1.5.5.5 TIBTransaction.DefaultAction Property

Specifies what action a transaction should take upon timing out.

Pascal

```
property DefaultAction: TTransactionAction;
```

C++

```
__property TTransactionAction DefaultAction;
```

Description

Use DefaultAction to what action the transaction should take when the IdleTimer (see page 217) limit is met.

5.1.5.5.6 TIBTransaction.DefaultDatabase Property

Sets or returns the default database for the transaction.

Pascal

```
property DefaultDatabase: TIBDatabase;
```

C++

```
__property TIBDatabase DefaultDatabase;
```

Description

Use DefaultDatabase to set or return the default database for the transaction.

5.1.5.5.7 TIBTransaction.Handle Property

Returns the transaction handle.

Pascal

```
property Handle: TISC_TR_HANDLE;
```

C++

```
__property TISC_TR_HANDLE Handle;
```

Description

Use Handle to retrieve a handle to the transaction. Handle is assigned an initial value when a transaction is started.

5.1.5.5.8 TIBTransaction.HandleIsShared Property

Indicates whether or not the handle is shared.

Pascal

```
property HandleIsShared: Boolean;
```

C++

```
__property Boolean HandleIsShared;
```

Description

HandleIsShared returns true when the transaction handle is shared by more than one transaction component.

5.1.5.5.9 TIBTransaction.IdleTimer Property

Specifies how long the transaction should wait before automatically committing or rolling back.

Pascal

```
property IdleTimer: Integer;
```

C++

```
__property int IdleTimer;
```

Description

Use IdleTimer to indicate how long a transaction should be allowed to remain idle before automatically committing or rolling back the data. Use DefaultAction (see page 216) to determine which action the transaction should take.

5.1.5.5.10 TIBTransaction.InTransaction Property

Indicates whether a database transaction is in progress or not.

Pascal

```
property InTransaction: Boolean;
```

C++

```
__property Boolean InTransaction;
```

Description

Examine InTransaction at run-time to determine if a database transaction is currently in progress. InTransaction is true if a transaction is in progress, false otherwise.

The value of InTransaction cannot be changed directly. Calling StartTransaction (see page 214) sets InTransaction to true. Calling Commit (see page 211) or Rollback (see page 213) sets InTransaction to false.

5.1.5.5.11 TIBTransaction.Params Property

Returns the transaction parameter buffer associated with the transaction component.

Pascal

```
property Params: TStrings;
```

C++

```
__property TStrings Params;
```

Description

Use Params to examine and set parameters in the transaction parameter buffer. Refer to the Interbase API Guide for the names of the parameters to provide.

5.1.5.5.12 TIBTransaction.SQLObjectCount Property

Returns the number of active datasets associated with the database component.

Pascal

```
property SQLObjectCount: Integer;
```

C++

```
__property int SQLObjectCount;
```

Description

Use the SQLObjectCount property to return the number currently active InterBase datasets, TIBSQL objects, and Blobs associated with the database component. As SQL objects are opened and closed, this value changes appropriately.

5.1.5.5.13 TIBTransaction.SQLObjects Property

Provides an indexed array of all active datasets for a database component.

Pascal

```
property SQLObjects [Index: Integer]: TIBBase;
```

C++

```
__property TIBBase SQLObjects[int Index];
```

Description

Use the SQLObjects to access active InterBase datasets, TIBSQL objects, and Blobs associated with the database component.

5.1.5.5.14 TIBTransaction.TPB Property

Provides a read-only view of the transaction parameter buffer.

Pascal

```
property TPB: PChar;
```

C++

```
__property const char * TPB;
```

Description

Use TPB view the transaction parameter buffer. To write to the transaction parameter buffer, use the Params (see page 218) property.

5.1.5.5.15 TIBTransaction.TPBLength Property

Returns the length of the transaction parameter buffer.

Pascal

```
property TPBLength: Short;
```

C++

```
__property Short TPBLength;
```

Description

Use TPBLength to retrieve the length of the transaction parameter buffer

5.1.5.6 TIBTransaction Events

The events of the TIBTransaction class are listed here.

Published Events

	Name	Description
	OnIdleTimer (see page 219)	Occurs after a transaction has timed out.

5.1.5.6.1 TIBTransaction.OnIdleTimer Event

Occurs after a transaction has timed out.

Pascal

```
property OnIdleTimer: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnIdleTimer;
```

Description

Write an OnIdleTimer event handler to take specific actions after a transaction is allowed to remain idle for the number of seconds specified by IdleTimer (see page 217).

5.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IIBEventNotifier (see page 221)	IIBEventNotifier allows a TIBDataBase (see page 176) component to automatically register interest in events on the InterBase server.

5.2.1 IIBEventNotifier Interface

IIBEventNotifier allows a TIBDataBase (see page 176) component to automatically register interest in events on the InterBase server.

Class Hierarchy

IBDatabase.IIBEventNotifier

Pascal

```
IIBEventNotifier = interface;
```

C++

```
__interface IIBEventNotifier;
```

File

IBDatabase

Description

TIBDatabase uses the IIBEventNotifier interface to communicate with objects such as TIBEvents that register an interest in events on the InterBase server.

Note: VCL Method declarations that use IIBEventNotifier use the _di_IIBEventNotifier type instead. This is a DelphiInterface wrapper around the IIBEventNotifier interface:

```
typedef System::DelphiInterface< IIBEventNotifier > _di_IIBEventNotifier;
```

5.2.1.1 IIBEventNotifier Members

The following tables list the members exposed by IIBEventNotifier.

Public Methods

	Name	Description
	GetAutoRegister (see page 222)	Indicates whether the database should automatically register events after it connects to the server.
	RegisterEvents (see page 222)	Registers interest in a set of events with the InterBase Event manager.
	UnRegisterEvents (see page 222)	Unregisters interest in the events previously registered by a call to RegisterEvents (see page 222).

5.2.1.2 IIBEventNotifier Methods

The methods of the IIBEventNotifier class are listed here.

Public Methods

	Name	Description
	GetAutoRegister (see page 222)	Indicates whether the database should automatically register events after it connects to the server.
	RegisterEvents (see page 222)	Registers interest in a set of events with the InterBase Event manager.
	UnRegisterEvents (see page 222)	Unregisters interest in the events previously registered by a call to RegisterEvents (see page 222).

5.2.1.2.1 IIBEventNotifier.GetAutoRegister Method

Indicates whether the database should automatically register events after it connects to the server.

Pascal

```
function GetAutoRegister: Boolean;
```

C++

```
__fastcall Boolean GetAutoRegister();
```

Description

When TIBDataBase (see page 176) connects to an InterBase server, it calls the GetAutoRegister method for every object in its list of event notifiers. For any event notifier that returns true, it calls the RegisterEvents (see page 222) method, so that the event notifier can register interest in its events with the InterBase Event Manager.

5.2.1.2.2 IIBEventNotifier.RegisterEvents Method

Registers interest in a set of events with the InterBase Event manager.

Pascal

```
procedure RegisterEvents;
```

C++

```
__fastcall RegisterEvents();
```

Description

RegisterEvents tells the event notifier to register its interest in a set of events with the InterBase Event manager.

5.2.1.2.3 IIBEventNotifier.UnRegisterEvents Method

Unregisters interest in the events previously registered by a call to RegisterEvents (see page 222).

Pascal

```
procedure UnRegisterEvents;
```

C++

```
__fastcall UnRegisterEvents();
```

Description

UnRegisterEvents cancels the interest in the events that was previously registered by a call to RegisterEvents (see page 222). TIBDataBase (see page 176) uses this interface to unregister all of its event notifiers when it disconnects from the InterBase

server.

5.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GenerateDPB (see page 224)	This is function IBDatabase.GenerateDPB.
	GenerateTPB (see page 224)	This is function IBDatabase.GenerateTPB.

5.3.1 IBDatabase.GenerateDPB Function

Pascal

```
procedure GenerateDPB(sl: TStrings; var DPB: string; var DPBLength: Short);
```

C++

```
GenerateDPB(TStrings sl, UnicodeString DPB, Short DPBLength);
```

File

IBDatabase

Description

This is function IBDatabase.GenerateDPB.

5.3.2 IBDatabase.GenerateTPB Function

Pascal

```
procedure GenerateTPB(sl: TStrings; var TPB: string; var TPBLength: Short);
```

C++

```
GenerateTPB(TStrings sl, UnicodeString TPB, Short TPBLength);
```

File

IBDatabase

Description

This is function IBDatabase.GenerateTPB.

5.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TAutoStopAction (see page 225)	TAutoStopAction indicates the action to take on automatically ended transactions.
	TTransactionAction (see page 226)	This is record IBDatabase.TTransactionAction.

5.4.1 IBDatabase.TAutoStopAction Enumeration

TAutoStopAction indicates the action to take on automatically ended transactions.

Pascal

```
TAutoStopAction = (
  saNone,
  saRollback,
  saCommit,
  saRollbackRetaining,
  saCommitRetaining
);
```

C++

```
enum TAutoStopAction {
  saNone,
  saRollback,
  saCommit,
  saRollbackRetaining,
  saCommitRetaining
};
```

File

IBDatabase

Description

TAutoStopAction values are:

Value Meaning

saNone Transactions are not implicitly stopped.

saRollback Transactions are rolled back and closed when stopped implicitly.

saCommit Transactions are committed and closed when stopped implicitly.

saRollbackRetaining Transactions are not stopped when the last dataset closes, but all updates, insertions, and deletions of data associated with the current transaction are backed out. This option is only supported in InterBase 6.0 and later.

saCommitRetaining Transactions are not stopped when the last dataset closes, but all updates, insertions, and deletions of data associated with the current transaction are committed.

5.4.2 IBDatabase.TTransactionAction Enumeration

Pascal

```
  TTransactionAction = (
    TARollback,
    TACommit,
    TARollbackRetaining,
    TACommitRetaining
  );
```

C++

```
  enum TTransactionAction {
    TARollback,
    TACommit,
    TARollbackRetaining,
    TACommitRetaining
  };
```

File

IBDatabase

Description

This is record IBDatabase.TTransactionAction.

5.5 Types

The following table lists types in this documentation.

Types

Name	Description
TIBDatabaseLoginEvent (see page 227)	TIBDatabaseLoginEvent is the type of event handlers that respond when an IB (see page 1) database component forms a connection to an InterBase server.
TIBFileName (see page 227)	This is type IBDatabase.TIBFileName.

5.5.1 IBDatabase.TIBDatabaseLoginEvent Type

TIBDatabaseLoginEvent is the type of event handlers that respond when an IB (see page 1) database component forms a connection to an InterBase server.

Pascal

```
TIBDatabaseLoginEvent = procedure (Database: TIBDatabase; LoginParams: TStrings) of object;
```

C++

```
(Database: TIBDatabase; LoginParams: TStrings) ( TIBDatabaseLoginEvent)();
```

File

IBDatabase

Description

Database is the connection component that establishes the connection to the InterBase server.

LoginParams is a temporary string list that contains the login parameters for forming the connection. The event handler can examine or change any of these value. Each parameter is of the form Name=Value. Of particular importance are the parameters with the names USER_NAME and PASSWORD. This string list does not persist: the IB (see page 1) database component frees it when it is no longer needed.

See Also

Procedural types

Creating events

5.5.2 IBDatabase.TIBFileName Type

Pascal

```
TIBFileName = type string;
```

C++

```
type string TIBFileName;
```

File

IBDatabase

Description

This is type IBDatabase.TIBFileName.

5.6 Constants

The following table lists constants in this documentation.

Constants

Name	Description
DPBConstantNames (see page 229)	This is constant IBDatabase.DPBConstantNames.
DPBPrefix (see page 230)	This is constant IBDatabase.DPBPrefix.
TPBConstantNames (see page 230)	This is constant IBDatabase.TPBConstantNames.
TPBPrefix (see page 230)	This is constant IBDatabase.TPBPrefix.

5.6.1 IBDatabase.DPBConstantNames Constant

Pascal

```
DPBConstantNames: array[1..isc_dpb_last_dpb_constant] of string = ( 'cdd_pathname',
'allocation', 'journal', 'page_size', 'num_buffers', 'buffer_length', 'debug',
'garbage_collect', 'verify', 'sweep', 'enable_journal', 'disable_journal', 'dbkey_scope',
'number_of_users', 'trace', 'no_garbage_collect', 'damaged', 'license', 'sys_user_name',
'encrypt_key', 'activate_shadow', 'sweep_interval', 'delete_shadow', 'force_write',
'begin_log', 'quit_log', 'no_reserve', 'user_name', 'password', 'password_enc',
'sys_user_name_enc', 'interp', 'online_dump', 'old_file_size', 'old_num_files', 'old_file',
'old_start_page', 'old_start_seqno', 'old_start_file', 'drop_walfile', 'old_dump_id',
'wal_backup_dir', 'wal_chkptlen', 'wal_numbufs', 'wal_bufsize', 'wal_grp_cmt_wait',
'lc_messages', 'lc_ctype', 'cache_manager', 'shutdown', 'online', 'shutdown_delay',
'reserved', 'overwrite', 'sec_attach', 'disable_wal', 'connect_timeout',
'dummy_packet_interval', 'gbak_attach', 'sql_role_name', 'set_page_buffers',
'working_directory', 'sql_dialect', 'set_db_readonly', 'set_db_sql_dialect', 'gfix_attach',
'gstat_attach' );
```

C++

```
array[1..isc_dpb_last_dpb_constant] of string DPBConstantNames = ( 'cdd_pathname',
'allocation', 'journal', 'page_size', 'num_buffers', 'buffer_length', 'debug',
'garbage_collect', 'verify', 'sweep', 'enable_journal', 'disable_journal', 'dbkey_scope',
'number_of_users', 'trace', 'no_garbage_collect', 'damaged', 'license', 'sys_user_name',
'encrypt_key', 'activate_shadow', 'sweep_interval', 'delete_shadow', 'force_write',
'begin_log', 'quit_log', 'no_reserve', 'user_name', 'password', 'password_enc',
'sys_user_name_enc', 'interp', 'online_dump', 'old_file_size', 'old_num_files', 'old_file',
'old_start_page', 'old_start_seqno', 'old_start_file', 'drop_walfile', 'old_dump_id',
'wal_backup_dir', 'wal_chkptlen', 'wal_numbufs', 'wal_bufsize', 'wal_grp_cmt_wait',
'lc_messages', 'lc_ctype', 'cache_manager', 'shutdown', 'online', 'shutdown_delay',
'reserved', 'overwrite', 'sec_attach', 'disable_wal', 'connect_timeout',
'dummy_packet_interval', 'gbak_attach', 'sql_role_name', 'set_page_buffers',
'working_directory', 'sql_dialect', 'set_db_readonly', 'set_db_sql_dialect', 'gfix_attach',
'gstat_attach' );
```

File

IBDatabase

Description

This is constant IBDatabase.DPBConstantNames.

5.6.2 IBDatabase.DPBPrefix Constant

Pascal

```
DPBPrefix = 'isc_dpb_';
```

C++

```
DPBPrefix = 'isc_dpb_';
```

File

IBDatabase

Description

This is constant IBDatabase.DPBPrefix.

5.6.3 IBDatabase.TPBConstantNames Constant

Pascal

```
TPBConstantNames: array[1..isc_tpb_last_tpb_constant] of string = ( 'consistency',
'concurrency', 'shared', 'protected', 'exclusive', 'wait', 'nowait', 'read', 'write',
'lock_read', 'lock_write', 'verb_time', 'commit_time', 'ignore_limbo', 'read_committed',
'autocommit', 'rec_version', 'no_rec_version', 'restart_requests', 'no_auto_undo' );
```

C++

```
array[1..isc_tpb_last_tpb_constant] of string TPBConstantNames = ( 'consistency',
'concurrency', 'shared', 'protected', 'exclusive', 'wait', 'nowait', 'read', 'write',
'lock_read', 'lock_write', 'verb_time', 'commit_time', 'ignore_limbo', 'read_committed',
'autocommit', 'rec_version', 'no_rec_version', 'restart_requests', 'no_auto_undo' );
```

File

IBDatabase

Description

This is constant IBDatabase.TPBConstantNames.

5.6.4 IBDatabase.TPBPrefix Constant

Pascal

```
TPBPrefix = 'isc_tpb_';
```

C++

```
TPBPrefix = 'isc_tpb_';
```

File

IBDatabase

Description

This is constant IBDatabase.TPBPrefix.

6 IBDatabaseInfo Namespace

This is namespace IBDatabaseInfo.

Topics

Name	Description
Classes (see page 232)	The following table lists classes in this documentation.

Classes

	Name	Description
	TIBDatabaseInfo (see page 232)	TIBDatabaseInfo returns information about the attached database.

6.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TIBDatabaseInfo (see page 232)	TIBDatabaseInfo returns information about the attached database.

6.1.1 TIBDatabaseInfo Class

TIBDatabaseInfo returns information about the attached database.

Class Hierarchy

Pascal

```
TIBDatabaseInfo = class(TComponent);
```

C++

```
class TIBDatabaseInfo : public TComponent;
```

File

IBDatabaseInfo

Description

Use TIBDatabaseInfo to fetch information about the attached database, such as the version of the online disk structure (ODS) used by the attachment, the number of database cache buffers allocated, the number of database pages read from or written to, or write-ahead log information.

Getting Started with InterBase Express

6.1.1.1 TIBDatabaseInfo Members

The following tables list the members exposed by TIBDatabaseInfo.

Protected Fields

	Name	Description
	FBackoutCount (see page 235)	This is FBackoutCount, a member of class TIBDatabaseInfo.
	FDatabase (see page 235)	This is FDatabase, a member of class TIBDatabaseInfo.
	FDeleteCount (see page 236)	This is FDeleteCount, a member of class TIBDatabaseInfo.
	FExpungeCount (see page 236)	This is FExpungeCount, a member of class TIBDatabaseInfo.
	FIBLoaded (see page 236)	This is FIBLoaded, a member of class TIBDatabaseInfo.
	FInsertCount (see page 236)	This is FInsertCount, a member of class TIBDatabaseInfo.
	FPurgeCount (see page 236)	This is FPurgeCount, a member of class TIBDatabaseInfo.
	FReadIdxCount (see page 237)	This is FReadIdxCount, a member of class TIBDatabaseInfo.

	FReadSeqCount (see page 237)	This is FReadSeqCount, a member of class TIBDatabaseInfo.
	FUpdateCount (see page 237)	This is FUpdateCount, a member of class TIBDatabaseInfo.
	FUserNames (see page 237)	This is FUserNames, a member of class TIBDatabaseInfo.

Protected Methods

	Name	Description
	GetAllocation (see page 239)	This is GetAllocation, a member of class TIBDatabaseInfo.
	GetBackoutCount (see page 239)	This is GetBackoutCount, a member of class TIBDatabaseInfo.
	GetBaseLevel (see page 239)	This is GetBaseLevel, a member of class TIBDatabaseInfo.
	GetCurrentMemory (see page 239)	This is GetCurrentMemory, a member of class TIBDatabaseInfo.
	GetDBFileName (see page 239)	This is GetDBFileName, a member of class TIBDatabaseInfo.
	GetDBImplementationClass (see page 240)	This is GetDBImplementationClass, a member of class TIBDatabaseInfo.
	GetDBImplementationNo (see page 240)	This is GetDBImplementationNo, a member of class TIBDatabaseInfo.
	GetDBSiteName (see page 240)	This is GetDBSiteName, a member of class TIBDatabaseInfo.
	GetDBSQLDialect (see page 240)	This is GetDBSQLDialect, a member of class TIBDatabaseInfo.
	GetDeleteCount (see page 241)	This is GetDeleteCount, a member of class TIBDatabaseInfo.
	GetExpungeCount (see page 241)	This is GetExpungeCount, a member of class TIBDatabaseInfo.
	GetFetches (see page 241)	This is GetFetches, a member of class TIBDatabaseInfo.
	GetForcedWrites (see page 241)	This is GetForcedWrites, a member of class TIBDatabaseInfo.
	GetInsertCount (see page 241)	This is GetInsertCount, a member of class TIBDatabaseInfo.
	GetMarks (see page 242)	This is GetMarks, a member of class TIBDatabaseInfo.
	GetMaxMemory (see page 242)	This is GetMaxMemory, a member of class TIBDatabaseInfo.
	GetNoReserve (see page 242)	This is GetNoReserve, a member of class TIBDatabaseInfo.
	GetNumBuffers (see page 243)	This is GetNumBuffers, a member of class TIBDatabaseInfo.
	GetODSMajorVersion (see page 243)	This is GetODSMajorVersion, a member of class TIBDatabaseInfo.
	GetODSMinorVersion (see page 243)	This is GetODSMinorVersion, a member of class TIBDatabaseInfo.
	GetOperationCounts (see page 243)	This is GetOperationCounts, a member of class TIBDatabaseInfo.
	GetPageSize (see page 244)	This is GetPageSize, a member of class TIBDatabaseInfo.
	GetPurgeCount (see page 244)	This is GetPurgeCount, a member of class TIBDatabaseInfo.
	GetReadIdxCount (see page 244)	This is GetReadIdxCount, a member of class TIBDatabaseInfo.
	GetReadOnly (see page 244)	This is GetReadOnly, a member of class TIBDatabaseInfo.
	GetReads (see page 244)	This is GetReads, a member of class TIBDatabaseInfo.
	GetReadSeqCount (see page 245)	This is GetReadSeqCount, a member of class TIBDatabaseInfo.
	GetStringDatabaseInfo (see page 245)	This is GetStringDatabaseInfo, a member of class TIBDatabaseInfo.
	GetSweepInterval (see page 245)	This is GetSweepInterval, a member of class TIBDatabaseInfo.
	GetUpdateCount (see page 245)	This is GetUpdateCount, a member of class TIBDatabaseInfo.
	GetUserNames (see page 246)	This is GetUserNames, a member of class TIBDatabaseInfo.
	GetVersion (see page 246)	This is GetVersion, a member of class TIBDatabaseInfo.
	GetWrites (see page 246)	This is GetWrites, a member of class TIBDatabaseInfo.

Public Methods

	Name	Description
	Call (see page 238)	Returns an error message based on the error code.
V	Create (see page 234)	Creates an instance of a DatabaseInfo component.
V	Destroy (see page 234)	Destroys an instance of a DatabaseInfo component.
	GetLongDatabaseInfo (see page 242)	Returns a specified long integer that describes some aspect of the associated database.

Public Properties

	Name	Description
R	Allocation (see page 247)	Returns the number of database pages allocated.
R	BackoutCount (see page 247)	Returns the number of removals of a version of a record.
R	BaseLevel (see page 248)	Returns the database version number.
R	CurrentMemory (see page 248)	Returns the amount of server memory currently in use.
R	DBFileName (see page 248)	Returns the database filename.

	DBImplementationClass (see page 249)	Returns the database implementation class number.
	DBImplementationNo (see page 249)	Returns the database implementation number.
	DBSiteName (see page 249)	Returns the database site name.
	DBSQLDialect (see page 249)	Returns the SQL dialect.
	DeleteCount (see page 250)	Returns the number of database deletes since the database was last attached.
	ExpungeCount (see page 250)	Returns the number of removals of a record and all of its ancestors.
	Fetches (see page 250)	Returns the number of reads from the memory buffer cache.
	ForcedWrites (see page 250)	Returns the mode in which database writes are performed.
	InsertCount (see page 251)	Returns number of inserts into the database since the database was last attached.
	Marks (see page 251)	Returns the number of writes to the memory buffer cache.
	MaxMemory (see page 251)	Returns the maximum amount of memory used at one time since the first process attached to the database.
	NoReserve (see page 251)	Returns whether or not space is reserved on each database page for holding backup versions of modified records.
	NumBuffers (see page 252)	Returns the number of memory buffers currently allocated.
	ODSMajorVersion (see page 252)	Returns the on disk structure (ODS) major version number.
	ODSMinorVersion (see page 252)	Returns the on disk structure (ODS) minor version number.
	PageSize (see page 252)	Returns the number of bytes per page of the attached database.
	PurgeCount (see page 253)	Returns the number of removals of fully mature records from the database.
	ReadIdxCount (see page 253)	Returns the number of reads done via an index since the database was last attached.
	ReadOnly (see page 253)	Indicates whether or not the database is read only.
	Reads (see page 253)	Returns the number of page reads from the database.
	ReadSeqCount (see page 254)	Returns the number of sequential database reads done on each table since the database was last attached.
	SweepInterval (see page 254)	Returns the number of transactions that are committed between 'sweeps.'
	UpdateCount (see page 254)	Returns the number of database updates since the database was last attached.
	UserNames (see page 255)	Returns the names of all users currently attached to the database.
	Version (see page 255)	Returns the version of the database implementation.
	Writes (see page 255)	Returns the number of page writes to the database.

Published Properties

	Name	Description
	Database (see page 248)	Sets or returns the database.

6.1.1.2 TIBDatabaseInfo.Create Constructor

Creates an instance of a DatabaseInfo component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBDatabaseInfo(TComponent * AOwner);
```

Description

Call (see page 238) Create to instantiate a DatabaseInfo component declared in an application.

6.1.1.3 TIBDatabaseInfo.Destroy Destructor

Destroys an instance of a DatabaseInfo component.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBDatabaseInfo();
```

Description

Do not call Destroy directly. Instead call Free to verify that the DatabaseInfo component is not already freed before calling Destroy. Destroy disconnects from the server, frees the parameter list, and calls its inherited Destroy destructor.

6.1.1.4 TIBDatabaseInfo Fields

The fields of the TIBDatabaseInfo class are listed here.

Protected Fields

	Name	Description
	FBackoutCount (see page 235)	This is FBackoutCount, a member of class TIBDatabaseInfo.
	FDatabase (see page 235)	This is FDatabase, a member of class TIBDatabaseInfo.
	FDeleteCount (see page 236)	This is FDeleteCount, a member of class TIBDatabaseInfo.
	FExpungeCount (see page 236)	This is FExpungeCount, a member of class TIBDatabaseInfo.
	FIBLoaded (see page 236)	This is FIBLoaded, a member of class TIBDatabaseInfo.
	FInsertCount (see page 236)	This is FInsertCount, a member of class TIBDatabaseInfo.
	FPurgeCount (see page 236)	This is FPurgeCount, a member of class TIBDatabaseInfo.
	FReadIdxCount (see page 237)	This is FReadIdxCount, a member of class TIBDatabaseInfo.
	FReadSeqCount (see page 237)	This is FReadSeqCount, a member of class TIBDatabaseInfo.
	FUpdateCount (see page 237)	This is FUpdateCount, a member of class TIBDatabaseInfo.
	FUserNames (see page 237)	This is FUserNames, a member of class TIBDatabaseInfo.

6.1.1.4.1 TIBDatabaseInfo.FBackoutCount Field

Pascal

```
FBackoutCount: TStringList;
```

C++

```
TStringList FBackoutCount;
```

Description

This is FBackoutCount, a member of class TIBDatabaseInfo.

6.1.1.4.2 TIBDatabaseInfo.FDatabase Field

Pascal

```
FDatabase: TIBDatabase;
```

C++

```
TIBDatabase FDatabase;
```

Description

This is FDatabase, a member of class TIBDatabaseInfo.

6.1.1.4.3 TIBDatabaseInfo.FDeleteCount Field

Pascal

```
FDeleteCount: TStringList;
```

C++

```
TStringList FDeleteCount;
```

Description

This is FDeleteCount, a member of class TIBDatabaseInfo.

6.1.1.4.4 TIBDatabaseInfo.FExpungeCount Field

Pascal

```
FExpungeCount: TStringList;
```

C++

```
TStringList FExpungeCount;
```

Description

This is FExpungeCount, a member of class TIBDatabaseInfo.

6.1.1.4.5 TIBDatabaseInfo.FIBLoaded Field

Pascal

```
FIBLoaded: Boolean;
```

C++

```
Boolean FIBLoaded;
```

Description

This is FIBLoaded, a member of class TIBDatabaseInfo.

6.1.1.4.6 TIBDatabaseInfo.FInsertCount Field

Pascal

```
FInsertCount: TStringList;
```

C++

```
TStringList FInsertCount;
```

Description

This is FInsertCount, a member of class TIBDatabaseInfo.

6.1.1.4.7 TIBDatabaseInfo.FPurgeCount Field

Pascal

```
FPurgeCount: TStringList;
```

C++

```
TStringList FPurgeCount;
```

Description

This is FPurgeCount, a member of class TIBDatabaseInfo.

6.1.1.4.8 TIBDatabaseInfo.FReadIdxCount Field

Pascal

```
FReadIdxCount: TStringList;
```

C++

```
TStringList FReadIdxCount;
```

Description

This is FReadIdxCount, a member of class TIBDatabaseInfo.

6.1.1.4.9 TIBDatabaseInfo.FReadSeqCount Field

Pascal

```
FReadSeqCount: TStringList;
```

C++

```
TStringList FReadSeqCount;
```

Description

This is FReadSeqCount, a member of class TIBDatabaseInfo.

6.1.1.4.10 TIBDatabaseInfo.FUpdateCount Field

Pascal

```
FUpdateCount: TStringList;
```

C++

```
TStringList FUpdateCount;
```

Description

This is FUpdateCount, a member of class TIBDatabaseInfo.

6.1.1.4.11 TIBDatabaseInfo.FUserNames Field

Pascal

```
FUserNames: TStringList;
```

C++

```
TStringList FUserNames;
```

Description

This is FUserNames, a member of class TIBDatabaseInfo.

6.1.1.5 TIBDatabaseInfo Methods

The methods of the TIBDatabaseInfo class are listed here.

Protected Methods

	Name	Description
	GetAllocation (see page 239)	This is GetAllocation, a member of class TIBDatabaseInfo.
	GetBackoutCount (see page 239)	This is GetBackoutCount, a member of class TIBDatabaseInfo.
	GetBaseLevel (see page 239)	This is GetBaseLevel, a member of class TIBDatabaseInfo.
	GetCurrentMemory (see page 239)	This is GetCurrentMemory, a member of class TIBDatabaseInfo.
	GetDBFileName (see page 239)	This is GetDBFileName, a member of class TIBDatabaseInfo.
	GetDBImplementationClass (see page 240)	This is GetDBImplementationClass, a member of class TIBDatabaseInfo.
	GetDBImplementationNo (see page 240)	This is GetDBImplementationNo, a member of class TIBDatabaseInfo.
	GetDBSiteName (see page 240)	This is GetDBSiteName, a member of class TIBDatabaseInfo.
	GetDBSQLDialect (see page 240)	This is GetDBSQLDialect, a member of class TIBDatabaseInfo.
	GetDeleteCount (see page 241)	This is GetDeleteCount, a member of class TIBDatabaseInfo.
	GetExpungeCount (see page 241)	This is GetExpungeCount, a member of class TIBDatabaseInfo.
	GetFetches (see page 241)	This is GetFetches, a member of class TIBDatabaseInfo.
	GetForcedWrites (see page 241)	This is GetForcedWrites, a member of class TIBDatabaseInfo.
	GetInsertCount (see page 241)	This is GetInsertCount, a member of class TIBDatabaseInfo.
	GetMarks (see page 242)	This is GetMarks, a member of class TIBDatabaseInfo.
	GetMaxMemory (see page 242)	This is GetMaxMemory, a member of class TIBDatabaseInfo.
	GetNoReserve (see page 242)	This is GetNoReserve, a member of class TIBDatabaseInfo.
	GetNumBuffers (see page 243)	This is GetNumBuffers, a member of class TIBDatabaseInfo.
	GetODSMajorVersion (see page 243)	This is GetODSMajorVersion, a member of class TIBDatabaseInfo.
	GetODSMinorVersion (see page 243)	This is GetODSMinorVersion, a member of class TIBDatabaseInfo.
	GetOperationCounts (see page 243)	This is GetOperationCounts, a member of class TIBDatabaseInfo.
	GetPageSize (see page 244)	This is GetPageSize, a member of class TIBDatabaseInfo.
	GetPurgeCount (see page 244)	This is GetPurgeCount, a member of class TIBDatabaseInfo.
	GetReadIdxCount (see page 244)	This is GetReadIdxCount, a member of class TIBDatabaseInfo.
	GetReadOnly (see page 244)	This is GetReadOnly, a member of class TIBDatabaseInfo.
	GetReads (see page 244)	This is GetReads, a member of class TIBDatabaseInfo.
	GetReadSeqCount (see page 245)	This is GetReadSeqCount, a member of class TIBDatabaseInfo.
	GetStringDatabaseInfo (see page 245)	This is GetStringDatabaseInfo, a member of class TIBDatabaseInfo.
	GetSweepInterval (see page 245)	This is GetSweepInterval, a member of class TIBDatabaseInfo.
	GetUpdateCount (see page 245)	This is GetUpdateCount, a member of class TIBDatabaseInfo.
	GetUserNames (see page 246)	This is GetUserNames, a member of class TIBDatabaseInfo.
	GetVersion (see page 246)	This is GetVersion, a member of class TIBDatabaseInfo.
	GetWrites (see page 246)	This is GetWrites, a member of class TIBDatabaseInfo.

Public Methods

	Name	Description
	Call (see page 238)	Returns an error message based on the error code.
	GetLongDatabaseInfo (see page 242)	Returns a specified long integer that describes some aspect of the associated database.

6.1.1.5.1 TIBDatabaseInfo.Call Method

Returns an error message based on the error code.

Pascal

```
function Call(ErrCode: ISC_STATUS; RaiseError: Boolean): ISC_STATUS;
```

C++

```
__fastcall ISC_STATUS Call(ISC_STATUS ErrCode, Boolean RaiseError);
```

Description

Call is an internal method used to make calls to the InterBase API, and gives you the option of raising an exception or returning

an error based on the value of RaiseError.

6.1.1.5.2 TIBDatabaseInfo.GetAllocation Method

Pascal

```
function GetAllocation: Long;
```

C++

```
__fastcall Long GetAllocation();
```

Description

This is GetAllocation, a member of class TIBDatabaseInfo.

6.1.1.5.3 TIBDatabaseInfo.GetBackoutCount Method

Pascal

```
function GetBackoutCount: TStringList;
```

C++

```
__fastcall TStringList GetBackoutCount();
```

Description

This is GetBackoutCount, a member of class TIBDatabaseInfo.

6.1.1.5.4 TIBDatabaseInfo.GetBaseLevel Method

Pascal

```
function GetBaseLevel: Long;
```

C++

```
__fastcall Long GetBaseLevel();
```

Description

This is GetBaseLevel, a member of class TIBDatabaseInfo.

6.1.1.5.5 TIBDatabaseInfo.GetCurrentMemory Method

Pascal

```
function GetCurrentMemory: Long;
```

C++

```
__fastcall Long GetCurrentMemory();
```

Description

This is GetCurrentMemory, a member of class TIBDatabaseInfo.

6.1.1.5.6 TIBDatabaseInfo.GetDBFileName Method

Pascal

```
function GetDBFileName: String;
```

C++

```
__fastcall UnicodeString GetDBFileName();
```

Description

This is GetDBFileName, a member of class TIBDatabaseInfo.

6.1.1.5.7 TIBDatabaseInfo.GetDBImplementationClass Method

Pascal

```
function GetDBImplementationClass: Long;
```

C++

```
__fastcall Long GetDBImplementationClass();
```

Description

This is GetDBImplementationClass, a member of class TIBDatabaseInfo.

6.1.1.5.8 TIBDatabaseInfo.GetDBImplementationNo Method

Pascal

```
function GetDBImplementationNo: Long;
```

C++

```
__fastcall Long GetDBImplementationNo();
```

Description

This is GetDBImplementationNo, a member of class TIBDatabaseInfo.

6.1.1.5.9 TIBDatabaseInfo.GetDBSiteName Method

Pascal

```
function GetDBSiteName: String;
```

C++

```
__fastcall UnicodeString GetDBSiteName();
```

Description

This is GetDBSiteName, a member of class TIBDatabaseInfo.

6.1.1.5.10 TIBDatabaseInfo.GetDBSQLDialect Method

Pascal

```
function GetDBSQLDialect: Long;
```

C++

```
__fastcall Long GetDBSQLDialect();
```

Description

This is GetDBSQLDialect, a member of class TIBDatabaseInfo.

6.1.1.5.11 TIBDatabaseInfo.GetDeleteCount Method

Pascal

```
function GetDeleteCount: TStringList;
```

C++

```
__fastcall TStringList GetDeleteCount();
```

Description

This is GetDeleteCount, a member of class TIBDatabaseInfo.

6.1.1.5.12 TIBDatabaseInfo.GetExpungeCount Method

Pascal

```
function GetExpungeCount: TStringList;
```

C++

```
__fastcall TStringList GetExpungeCount();
```

Description

This is GetExpungeCount, a member of class TIBDatabaseInfo.

6.1.1.5.13 TIBDatabaseInfo.GetFetches Method

Pascal

```
function GetFetches: Long;
```

C++

```
__fastcall Long GetFetches();
```

Description

This is GetFetches, a member of class TIBDatabaseInfo.

6.1.1.5.14 TIBDatabaseInfo.GetForcedWrites Method

Pascal

```
function GetForcedWrites: Long;
```

C++

```
__fastcall Long GetForcedWrites();
```

Description

This is GetForcedWrites, a member of class TIBDatabaseInfo.

6.1.1.5.15 TIBDatabaseInfo.GetInsertCount Method

Pascal

```
function GetInsertCount: TStringList;
```

C++

```
__fastcall TStringList GetInsertCount();
```

Description

This is GetInsertCount, a member of class TIBDatabaseInfo.

6.1.1.5.16 TIBDatabaseInfo.GetLongDatabaseInfo Method

Returns a specified long integer that describes some aspect of the associated database.

Pascal

```
function GetLongDatabaseInfo(DatabaseInfoCommand: Integer): Long;
```

C++

```
__fastcall Long GetLongDatabaseInfo(int DatabaseInfoCommand);
```

Description

TIBDatabaseInfo (see page 232) uses GetLongDatabaseInfo internally to fetch information that can be expressed as a long integer. For example, this method provides the underlying implementation for fetching the version number or page size. It is exposed as a public member so that as the underlying _DatabaseInfoCommand interface expands its capabilities, TIBDatabaseInfo (see page 232) can still be used to fetch information for which there is no specified property.

DatabaseInfoCommand is an index that identifies the information to fetch. It is one of the constants declared in the IBHeader unit.

Long returns desired information.

6.1.1.5.17 TIBDatabaseInfo.GetMarks Method

Pascal

```
function GetMarks: Long;
```

C++

```
__fastcall Long GetMarks();
```

Description

This is GetMarks, a member of class TIBDatabaseInfo.

6.1.1.5.18 TIBDatabaseInfo.GetMaxMemory Method

Pascal

```
function GetMaxMemory: Long;
```

C++

```
__fastcall Long GetMaxMemory();
```

Description

This is GetMaxMemory, a member of class TIBDatabaseInfo.

6.1.1.5.19 TIBDatabaseInfo.GetNoReserve Method

Pascal

```
function GetNoReserve: Long;
```

C++

```
__fastcall Long GetNoReserve();
```

Description

This is GetNoReserve, a member of class TIBDatabaseInfo.

6.1.1.5.20 TIBDatabaseInfo.GetNumBuffers Method

Pascal

```
function GetNumBuffers: Long;
```

C++

```
__fastcall Long GetNumBuffers();
```

Description

This is GetNumBuffers, a member of class TIBDatabaseInfo.

6.1.1.5.21 TIBDatabaseInfo.GetODSMajorVersion Method

Pascal

```
function GetODSMajorVersion: Long;
```

C++

```
__fastcall Long GetODSMajorVersion();
```

Description

This is GetODSMajorVersion, a member of class TIBDatabaseInfo.

6.1.1.5.22 TIBDatabaseInfo.GetODSMinorVersion Method

Pascal

```
function GetODSMinorVersion: Long;
```

C++

```
__fastcall Long GetODSMinorVersion();
```

Description

This is GetODSMinorVersion, a member of class TIBDatabaseInfo.

6.1.1.5.23 TIBDatabaseInfo.GetOperationCounts Method

Pascal

```
function GetOperationCounts(DBInfoCommand: Integer; FOperation: TStringList): TStringList;
```

C++

```
__fastcall TStringList GetOperationCounts(int DBInfoCommand, TStringList FOperation);
```

Description

This is GetOperationCounts, a member of class TIBDatabaseInfo.

6.1.1.5.24 TIBDatabaseInfo.GetPageSize Method

Pascal

```
function GetPageSize: Long;
```

C++

```
__fastcall Long GetPageSize();
```

Description

This is GetPageSize, a member of class TIBDatabaseInfo.

6.1.1.5.25 TIBDatabaseInfo.GetPurgeCount Method

Pascal

```
function GetPurgeCount: TStringList;
```

C++

```
__fastcall TStringList GetPurgeCount();
```

Description

This is GetPurgeCount, a member of class TIBDatabaseInfo.

6.1.1.5.26 TIBDatabaseInfo.GetReadIdxCount Method

Pascal

```
function GetReadIdxCount: TStringList;
```

C++

```
__fastcall TStringList GetReadIdxCount();
```

Description

This is GetReadIdxCount, a member of class TIBDatabaseInfo.

6.1.1.5.27 TIBDatabaseInfo.GetReadOnly Method

Pascal

```
function GetReadOnly: Long;
```

C++

```
__fastcall Long GetReadOnly();
```

Description

This is GetReadOnly, a member of class TIBDatabaseInfo.

6.1.1.5.28 TIBDatabaseInfo.GetReads Method

Pascal

```
function GetReads: Long;
```

C++

```
__fastcall Long GetReads();
```

Description

This is GetReads, a member of class TIBDatabaseInfo.

6.1.1.5.29 TIBDatabaseInfo.GetReadSeqCount Method

Pascal

```
function GetReadSeqCount: TStringList;
```

C++

```
__fastcall TStringList GetReadSeqCount();
```

Description

This is GetReadSeqCount, a member of class TIBDatabaseInfo.

6.1.1.5.30 TIBDatabaseInfo.GetStringDatabaseInfo Method

Pascal

```
function GetStringDatabaseInfo(DatabaseInfoCommand: Integer): String;
```

C++

```
__fastcall UnicodeString GetStringDatabaseInfo(int DatabaseInfoCommand);
```

Description

This is GetStringDatabaseInfo, a member of class TIBDatabaseInfo.

6.1.1.5.31 TIBDatabaseInfo.GetSweepInterval Method

Pascal

```
function GetSweepInterval: Long;
```

C++

```
__fastcall Long GetSweepInterval();
```

Description

This is GetSweepInterval, a member of class TIBDatabaseInfo.

6.1.1.5.32 TIBDatabaseInfo.GetUpdateCount Method

Pascal

```
function GetUpdateCount: TStringList;
```

C++

```
__fastcall TStringList GetUpdateCount();
```

Description

This is GetUpdateCount, a member of class TIBDatabaseInfo.

6.1.1.5.33 TIBDatabaseInfo.GetUserNames Method

Pascal

```
function GetUserNames: TStringList;
```

C++

```
__fastcall TStringList GetUserNames();
```

Description

This is GetUserNames, a member of class TIBDatabaseInfo.

6.1.1.5.34 TIBDatabaseInfo.GetVersion Method

Pascal

```
function GetVersion: String;
```

C++

```
__fastcall UnicodeString GetVersion();
```

Description

This is GetVersion, a member of class TIBDatabaseInfo.

6.1.1.5.35 TIBDatabaseInfo.GetWrites Method

Pascal

```
function GetWrites: Long;
```

C++

```
__fastcall Long GetWrites();
```

Description

This is GetWrites, a member of class TIBDatabaseInfo.

6.1.1.6 TIBDatabaseInfo Properties

The properties of the TIBDatabaseInfo class are listed here.

Public Properties

	Name	Description
	Allocation (see page 247)	Returns the number of database pages allocated.
	BackoutCount (see page 247)	Returns the number of removals of a version of a record.
	BaseLevel (see page 248)	Returns the database version number.
	CurrentMemory (see page 248)	Returns the amount of server memory currently in use.
	DBFileName (see page 248)	Returns the database filename.
	DBImplementationClass (see page 249)	Returns the database implementation class number.
	DBImplementationNo (see page 249)	Returns the database implementation number.
	DBSiteName (see page 249)	Returns the database site name.
	DBSQLDialect (see page 249)	Returns the SQL dialect.
	DeleteCount (see page 250)	Returns the number of database deletes since the database was last attached.
	ExpungeCount (see page 250)	Returns the number of removals of a record and all of its ancestors.
	Fetches (see page 250)	Returns the number of reads from the memory buffer cache.

	ForcedWrites (see page 250)	Returns the mode in which database writes are performed.
	InsertCount (see page 251)	Returns number of inserts into the database since the database was last attached.
	Marks (see page 251)	Returns the number of writes to the memory buffer cache.
	MaxMemory (see page 251)	Returns the maximum amount of memory used at one time since the first process attached to the database.
	NoReserve (see page 251)	Returns whether or not space is reserved on each database page for holding backup versions of modified records.
	NumBuffers (see page 252)	Returns the number of memory buffers currently allocated.
	ODSMajorVersion (see page 252)	Returns the on disk structure (ODS) major version number.
	ODSMinorVersion (see page 252)	Returns the on disk structure (ODS) minor version number.
	PageSize (see page 252)	Returns the number of bytes per page of the attached database.
	PurgeCount (see page 253)	Returns the number of removals of fully mature records from the database.
	ReadIdxCount (see page 253)	Returns the number of reads done via an index since the database was last attached.
	ReadOnly (see page 253)	Indicates whether or not the database is read only.
	Reads (see page 253)	Returns the number of page reads from the database.
	ReadSeqCount (see page 254)	Returns the number of sequential database reads done on each table since the database was last attached.
	SweepInterval (see page 254)	Returns the number of transactions that are committed between 'sweeps.'
	UpdateCount (see page 254)	Returns the number of database updates since the database was last attached.
	UserNames (see page 255)	Returns the names of all users currently attached to the database.
	Version (see page 255)	Returns the version of the database implementation.
	Writes (see page 255)	Returns the number of page writes to the database.

Published Properties

	Name	Description
	Database (see page 248)	Sets or returns the database.

6.1.1.6.1 TIBDatabaseInfo.Allocation Property

Returns the number of database pages allocated.

Pascal

```
property Allocation: Long;
```

C++

```
__property Long Allocation;
```

Description

Use Allocation to return the number of database pages allocated.

6.1.1.6.2 TIBDatabaseInfo.BackoutCount Property

Returns the number of removals of a version of a record.

Pascal

```
property BackoutCount: TStringList;
```

C++

```
__property TStringList BackoutCount;
```

Description

Use BackoutCount to determine the number of times a version of a database record has been removed.

6.1.1.6.3 TIBDatabaseInfo.BaseLevel Property

Returns the database version number.

Pascal

```
property BaseLevel: Long;
```

C++

```
__property Long BaseLevel;
```

Description

Use BaseLevel to return the database version number, which consists of 1 byte containing the number 1, and 1 byte containing the version number.

6.1.1.6.4 TIBDatabaseInfo.CurrentMemory Property

Returns the amount of server memory currently in use.

Pascal

```
property CurrentMemory: Long;
```

C++

```
__property Long CurrentMemory;
```

Description

Use CurrentMemory to return the amount of server memory (in bytes) currently in use.

6.1.1.6.5 TIBDatabaseInfo.Database Property

Sets or returns the database.

Pascal

```
property Database: TIBDatabase;
```

C++

```
__property TIBDatabase Database;
```

Description

Use Database to set or return the database on which information is being returned.

6.1.1.6.6 TIBDatabaseInfo.DBFileName Property

Returns the database filename.

Pascal

```
property DBFileName: String;
```

C++

```
__property UnicodeString DBFileName;
```

Description

Use DBFileName to return the database filename.

6.1.1.6.7 TIBDatabaseInfo.DBImplementationClass Property

Returns the database implementation class number.

Pascal

```
property DBImplementationClass: Long;
```

C++

```
__property Long DBImplementationClass;
```

Description

Use DBImplementationClass to return the database implementation class number, either 1 or 12.

6.1.1.6.8 TIBDatabaseInfo.DBImplementationNo Property

Returns the database implementation number.

Pascal

```
property DBImplementationNo: Long;
```

C++

```
__property Long DBImplementationNo;
```

Description

Use DBImplementationNo to return the database implementation number.

6.1.1.6.9 TIBDatabaseInfo.DBSiteName Property

Returns the database site name.

Pascal

```
property DBSiteName: String;
```

C++

```
__property UnicodeString DBSiteName;
```

Description

Use DBSiteName to return the database site name.

6.1.1.6.10 TIBDatabaseInfo.DBSQLDialect Property

Returns the SQL dialect.

Pascal

```
property DBSQLDialect: Long;
```

C++

```
__property Long DBSQLDialect;
```

Description

Use DBSQLDialect to return the SQL dialect.

6.1.1.6.11 TIBDatabaseInfo.DeleteCount Property

Returns the number of database deletes since the database was last attached.

Pascal

```
property DeleteCount: TStringList;
```

C++

```
__property TStringList DeleteCount;
```

Description

Use DeleteCount to return the number of database deletes since the database was last attached.

6.1.1.6.12 TIBDatabaseInfo.ExpungeCount Property

Returns the number of removals of a record and all of its ancestors.

Pascal

```
property ExpungeCount: TStringList;
```

C++

```
__property TStringList ExpungeCount;
```

Description

Use ExpungeCount to return the number of removals of a record and all of its ancestors for records whose deletions have been committed.

6.1.1.6.13 TIBDatabaseInfo.Fetches Property

Returns the number of reads from the memory buffer cache.

Pascal

```
property Fetches: Long;
```

C++

```
__property Long Fetches;
```

Description

Use Fetches to return the number of reads from the memory buffer cache.

6.1.1.6.14 TIBDatabaseInfo.ForcedWrites Property

Returns the mode in which database writes are performed.

Pascal

```
property ForcedWrites: Long;
```

C++

```
__property Long ForcedWrites;
```

Description

Use ForcedWrites to return the number specifying the mode in which database writes are performed. ForcedWrites returns 0 for asynchronous mode, or returns 1 for synchronous mode

6.1.1.6.15 TIBDatabaseInfo.InsertCount Property

Returns number of inserts into the database since the database was last attached.

Pascal

```
property InsertCount: TStringList;
```

C++

```
__property TStringList InsertCount;
```

Description

Use InsertCount to return the number of inserts into the database since the database was last attached.

6.1.1.6.16 TIBDatabaseInfo.Marks Property

Returns the number of writes to the memory buffer cache.

Pascal

```
property Marks: Long;
```

C++

```
__property Long Marks;
```

Description

Use Marks to return the number of writes to the memory buffer cache.

6.1.1.6.17 TIBDatabaseInfo.MaxMemory Property

Returns the maximum amount of memory used at one time since the first process attached to the database.

Pascal

```
property MaxMemory: Long;
```

C++

```
__property Long MaxMemory;
```

Description

Use MaxMemory to return in bytes the maximum amount of memory used at one time since the first process attached to the database.

6.1.1.6.18 TIBDatabaseInfo.NoReserve Property

Returns whether or not space is reserved on each database page for holding backup versions of modified records.

Pascal

```
property NoReserve: Long;
```

C++

```
__property Long NoReserve;
```

Description

Use NoReserve to return whether or not space is reserved on each database page for holding backup versions of modified records. NoReserve will return 0 to indicate that space is reserved (the default) or 1 to indicate that no space is reserved.

6.1.1.6.19 TIBDatabaseInfo.NumBuffers Property

Returns the number of memory buffers currently allocated.

Pascal

```
property NumBuffers: Long;
```

C++

```
__property Long NumBuffers;
```

Description

Use NumBuffers to return the number of memory buffers currently allocated.

6.1.1.6.20 TIBDatabaseInfo.ODSMajorVersion Property

Returns the on disk structure (ODS) major version number.

Pascal

```
property ODSMajorVersion: Long;
```

C++

```
__property Long ODSMajorVersion;
```

Description

Use ODSMajorVersion to return the ODS major version number for the database. Databases with different major version numbers have different physical layouts.

A database engine can access only databases with a particular ODS major version number. Attaching to a database with a different ODS number results in an error.

6.1.1.6.21 TIBDatabaseInfo.ODSMinorVersion Property

Returns the on disk structure (ODS) minor version number.

Pascal

```
property ODSMinorVersion: Long;
```

C++

```
__property Long ODSMinorVersion;
```

Description

Use ODSMinorVersion to return the (ODS) minor version number. An increase in a minor version number indicates a non-structural change, one that still allows the database to be accessed by databases with the same major version number but possibly different minor version numbers.

6.1.1.6.22 TIBDatabaseInfo.PageSize Property

Returns the number of bytes per page of the attached database.

Pascal

```
property PageSize: Long;
```

C++

```
__property Long PageSize;
```

Description

Use PageSize to return the number of bytes per page of the attached database. Use with Allocation (see page 247) to determine the size of the database.

6.1.1.6.23 TIBDatabaseInfo.PurgeCount Property

Returns the number of removals of fully mature records from the database.

Pascal

```
property PurgeCount: TStringList;
```

C++

```
__property TStringList PurgeCount;
```

Description

Use PurgeCount to return the number of removals of fully mature records (that is, records committed, resulting in older versions no longer being needed) from the database.

6.1.1.6.24 TIBDatabaseInfo.ReadIdxCount Property

Returns the number of reads done via an index since the database was last attached.

Pascal

```
property ReadIdxCount: TStringList;
```

C++

```
__property TStringList ReadIdxCount;
```

Description

Use ReadIdxCount to return the number of reads done via an index since the database was last attached.

6.1.1.6.25 TIBDatabaseInfo.ReadOnly Property

Indicates whether or not the database is read only.

Pascal

```
property ReadOnly: Long;
```

C++

```
__property Long ReadOnly;
```

Description

Use ReadOnly to determine whether the database is read only or not. ReadOnly returns 1 if the database is read-write and 0 if it is read only.

Read-only databases are an InterBase 6 feature.

6.1.1.6.26 TIBDatabaseInfo.Reads Property

Returns the number of page reads from the database.

Pascal

```
property Reads: Long;
```

C++

```
__property Long Reads;
```

Description

Use Reads to return the number of page reads from the database since the current database was first attached, that is, an aggregate of all reads done by all attached processes, rather than the number of reads done for the calling program since it attached to the database.

6.1.1.6.27 TIBDatabaseInfo.ReadSeqCount Property

Returns the number of sequential database reads done on each table since the database was last attached.

Pascal

```
property ReadSeqCount: TStringList;
```

C++

```
__property TStringList ReadSeqCount;
```

Description

Use ReadSeqCount to return the number of sequential database reads (that is, the number of sequential table scans) done on each table since the database was last attached

6.1.1.6.28 TIBDatabaseInfo.SweepInterval Property

Returns the number of transactions that are committed between 'sweeps.'

Pascal

```
property SweepInterval: Long;
```

C++

```
__property Long SweepInterval;
```

Description

Use SweepInterval to return the number of transactions that are committed between 'sweeps' to remove database record versions that are no longer needed.

6.1.1.6.29 TIBDatabaseInfo.UpdateCount Property

Returns the number of database updates since the database was last attached.

Pascal

```
property UpdateCount: TStringList;
```

C++

```
__property TStringList UpdateCount;
```

Description

Use UpdateCount to return the number of database updates since the database was last attached.

6.1.1.6.30 TIBDatabaseInfo.UserNames Property

Returns the names of all users currently attached to the database.

Pascal

```
property UserNames: TStringList;
```

C++

```
__property TStringList UserNames;
```

Description

Use UserNames to return the names of all users currently attached to the database.

6.1.1.6.31 TIBDatabaseInfo.Version Property

Returns the version of the database implementation.

Pascal

```
property Version: String;
```

C++

```
__property UnicodeString Version;
```

Description

Use Version to return the version identification string of the database implementation.

6.1.1.6.32 TIBDatabaseInfo.Writes Property

Returns the number of page writes to the database.

Pascal

```
property Writes: Long;
```

C++

```
__property Long Writes;
```

Description

Use Writes to return the number of page writes to the current database since it was first attached by any process; that is, an aggregate of all write done by all attached processes, rather than the number of writes done for the calling program since it attached to the database.

7 IBEvents Namespace

This is namespace IBEvents.

Topics

Name	Description
Classes (see page 258)	The following table lists classes in this documentation.
Types (see page 266)	The following table lists types in this documentation.

Classes

	Name	Description
	TIBEvents (see page 258)	TIBEvents enables applications to respond to posted events.

Types

Name	Description
TErrorEvent (see page 266)	TErrorEvent is the type of event handlers that respond to exceptions that occur when monitoring InterBase events.
TEventAlert (see page 266)	TEventAlert is the type of event handlers that respond to InterBase events.

7.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TIBEvents (see page 258)	TIBEvents enables applications to respond to posted events.

7.1.1 TIBEvents Class

TIBEvents enables applications to respond to posted events.

Class Hierarchy

Pascal

```
TIBEvents = class(TComponent, IIBEventNotifier);
```

C++

```
class TIBEvents : public TComponent, public IIBEventNotifier;
```

File

IBEvents

Description

Use a TIBEvents component to allow your application to register interest in, and asynchronously handle, events posted by an InterBase server. The InterBase event allows applications to respond to actions and database changes made by other, concurrently running applications, without having to resort to polling the database on a regular basis, or communicating directly with the other applications.

In essence, the TIBEvents component allows an application to say 'I want to be informed when events X, Y and Z occur.' When any of the requested events does occur, the InterBase server notifies the application and OnEventAlert (see page 265) is called.

To use TIBEvents, set the Database (see page 263) property to the component that connects to the InterBase server. Then, use the Events (see page 264) property to indicate the events to which you want to respond. You can set the AutoRegister (see page 263) property to true if you want TIBEvents to automatically register interest in its events when the database component opens a connection, or set the Registered (see page 264) property to true after the connection is open to explicitly register your interest. Finally, write an OnEventAlert (see page 265) event handler to respond when the InterBase event handler informs TIBEvents that an event occurred.

7.1.1.1 TIBEvents Members

The following tables list the members exposed by TIBEvents.

Protected Methods

	Name	Description
	EventChange (see page 260)	This is EventChange, a member of class TIBEvents.
	GetNativeHandle (see page 261)	This is GetNativeHandle, a member of class TIBEvents.
	Notification (see page 261)	Forwards notification messages to all owned components.
	ThreadEnded (see page 262)	This is ThreadEnded, a member of class TIBEvents.
	ValidateDatabase (see page 263)	This is ValidateDatabase, a member of class TIBEvents.

Public Methods

	Name	Description
	Create (see page 259)	Creates an instance of TIBEvents (see page 258).
	Destroy (see page 260)	Destroys an instance of TIBEvents (see page 258).
	GetAutoRegister (see page 260)	Returns the value of the AutoRegister (see page 263) property.
	RegisterEvents (see page 261)	Registers interest in the events listed by the Events (see page 264) property.
	SetAutoRegister (see page 262)	Sets the AutoRegister (see page 263) property.
	UnRegisterEvents (see page 262)	Unregisters interest in the events listed by the Events (see page 264) property.

Public Properties

	Name	Description
	NativeHandle (see page 264)	Supplies the InterBase handle for the database on which events occur.

Published Events

	Name	Description
	OnError (see page 265)	Occurs when an exception is caught while monitoring events.
	OnEventAlert (see page 265)	Occurs when an InterBase event is received.

Published Properties

	Name	Description
	AutoRegister (see page 263)	Specifies the AutoRegister on which to perform event alerter tasks.
	Database (see page 263)	Specifies the database on which to perform event alerter tasks.
	Events (see page 264)	Specifies the events to which TIBEvents (see page 258) responds.
	Registered (see page 264)	Indicates whether the events in the Events (see page 264) property are registered.

7.1.1.2 TIBEvents.Create Constructor

Creates an instance of TIBEvents (see page 258).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBEvents(TComponent * AOwner);
```

Description

Call Create to create an instance of TIBEvents (see page 258). TIBEvents (see page 258) objects placed on a form or data module at design time are created automatically.

AOwner specifies the object (typically a form or data module) that is responsible for freeing the TIBEvents (see page 258) instance.

7.1.1.3 TIBEvents.Destroy Destructor

Destroys an instance of TIBEvents (see page 258).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBEvents();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TIBEvents (see page 258) object is not nil and only then calls Destroy. Destroy unregisters the events and then frees them.

7.1.1.4 TIBEvents Methods

The methods of the TIBEvents class are listed here.

Protected Methods

	Name	Description
	EventChange (see page 260)	This is EventChange, a member of class TIBEvents.
	GetNativeHandle (see page 261)	This is GetNativeHandle, a member of class TIBEvents.
	Notification (see page 261)	Forwards notification messages to all owned components.
	ThreadEnded (see page 262)	This is ThreadEnded, a member of class TIBEvents.
	ValidateDatabase (see page 263)	This is ValidateDatabase, a member of class TIBEvents.

Public Methods

	Name	Description
	GetAutoRegister (see page 260)	Returns the value of the AutoRegister (see page 263) property.
	RegisterEvents (see page 261)	Registers interest in the events listed by the Events (see page 264) property.
	SetAutoRegister (see page 262)	Sets the AutoRegister (see page 263) property.
	UnRegisterEvents (see page 262)	Unregisters interest in the events listed by the Events (see page 264) property.

7.1.1.4.1 TIBEvents.EventChange Method

Pascal

```
procedure EventChange(Sender: TObject); virtual;
```

C++

```
virtual __fastcall EventChange(TObject * Sender);
```

Description

This is EventChange, a member of class TIBEvents.

7.1.1.4.2 TIBEvents.GetAutoRegister Method

Returns the value of the AutoRegister (see page 263) property.

Pascal

```
function GetAutoRegister: Boolean;
```

C++

```
__fastcall Boolean GetAutoRegister();
```

Description

GetAutoRegister is the read implementation of the AutoRegister (see page 263) property.

7.1.1.4.3 TIBEvents.GetNativeHandle Method

Pascal

```
function GetNativeHandle: TISC_DB_HANDLE; virtual;
```

C++

```
virtual __fastcall TISC_DB_HANDLE GetNativeHandle();
```

Description

This is GetNativeHandle, a member of class TIBEvents.

7.1.1.4.4 TIBEvents.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification

InsertComponent

RemoveComponent

Owner

7.1.1.4.5 TIBEvents.RegisterEvents Method

Registers interest in the events listed by the Events (see page 264) property.

Pascal

```
procedure RegisterEvents; virtual;
```

C++

```
virtual __fastcall RegisterEvents();
```

Description

Call RegisterEvents to register interest in the events listed in the Events (see page 264) property with the InterBase Event Manager. Once this interest is registered, the InterBase Event Manager generates an OnEventAlert (see page 265) event when any of the registered events occurs.

Note: RegisterEvents is called automatically when you set the Registered (see page 264) property to true or when the AutoRegister (see page 263) property is true and the database connection is open.

7.1.1.4.6 TIBEvents.SetAutoRegister Method

Sets the AutoRegister (see page 263) property.

Pascal

```
procedure SetAutoRegister(const Value: Boolean);
```

C++

```
__fastcall SetAutoRegister(const Boolean Value);
```

Description

SetAutoRegister is the write implementation method for the AutoRegister (see page 263) property.

Value is the new value for the AutoRegister (see page 263) property.

When SetAutoRegister changes the AutoRegister (see page 263) property to true, it checks whether the database connection is already open. If so, it calls RegisterEvents (see page 261) to register the events.

7.1.1.4.7 TIBEvents.ThreadEnded Method

Pascal

```
procedure ThreadEnded(Sender: TObject); virtual;
```

C++

```
virtual __fastcall ThreadEnded(TObject * Sender);
```

Description

This is ThreadEnded, a member of class TIBEvents.

7.1.1.4.8 TIBEvents.UnRegisterEvents Method

Unregisters interest in the events listed by the Events (see page 264) property.

Pascal

```
procedure UnRegisterEvents; virtual;
```

C++

```
virtual __fastcall UnRegisterEvents();
```

Description

Call UnRegisterEvents to unregister interest in the events in the Events (see page 264) list. When the database closes a connection, or when the IBEvents (see page 257) component is destroyed, UnRegisterEvents is called automatically.

7.1.1.4.9 TIBEvents.ValidateDatabase Method

Pascal

```
procedure ValidateDatabase(DataBase: TIBDatabase); virtual;
```

C++

```
virtual __fastcall ValidateDatabase(TIBDatabase DataBase);
```

Description

This is ValidateDatabase, a member of class TIBEvents.

7.1.1.5 TIBEvents Properties

The properties of the TIBEvents class are listed here.

Public Properties

	Name	Description
	NativeHandle (see page 264)	Supplies the InterBase handle for the database on which events occur.

Published Properties

	Name	Description
	AutoRegister (see page 263)	Specifies the AutoRegister on which to perform event alerter tasks.
	Database (see page 263)	Specifies the database on which to perform event alerter tasks.
	Events (see page 264)	Specifies the events to which TIBEvents (see page 258) responds.
	Registered (see page 264)	Indicates whether the events in the Events (see page 264) property are registered.

7.1.1.5.1 TIBEvents.AutoRegister Property

Specifies the AutoRegister on which to perform event alerter tasks.

Pascal

```
property AutoRegister: Boolean;
```

C++

```
__property Boolean AutoRegister;
```

Description

When AutoRegister is true, the database automatically registers this component's events whenever it opens a connection to the InterBase server. When AutoRegister is false, you must explicitly register the events by setting the Registered (see page 264) property to true (or calling RegisterEvents (see page 261)) after the database connection is opened.

Note: The database always unregisters the events when it closes a connection. By setting AutoRegister to true, you do not need to explicitly re-register interest in the events when the database reopens a connection.

7.1.1.5.2 TIBEvents.Database Property

Specifies the database on which to perform event alerter tasks.

Pascal

```
property Database: TIBDatabase;
```

C++

```
__property TIBDatabase Database;
```

Description

Use Database to specify the component that manages a connection to the InterBase server. This connection must be open for TIBEvents (see page 258) to register an interest in its events with the InterBase Event manager on that server.

When you set the Database property, TIBEvents (see page 258) automatically calls the database component's AddEventNotifier method so that it can register this component's events when it opens a connection (if AutoRegister (see page 263) is true), and so that it can unregister this component's events before closing the connection.

7.1.1.5.3 TIBEvents.Events Property

Specifies the events to which TIBEvents (see page 258) responds.

Pascal

```
property Events: TStrings;
```

C++

```
__property TStrings Events;
```

Description

Use the Events property to list events to which the IBEvents (see page 257) component responds.

To add an event use code similar to the following:

```
Delphi: IBEvents.Events.Add('EVENT_NAME')
    C++: IBEvents->Events->Add("EVENT_NAME")
```

Note: Event names are case-sensitive.

7.1.1.5.4 TIBEvents.NativeHandle Property

Supplies the InterBase handle for the database on which events occur.

Pascal

```
property NativeHandle: TISC_DB_HANDLE;
```

C++

```
__property TISC_DB_HANDLE NativeHandle;
```

Description

Read NativeHandle to get the InterBase handle for the server on which the events occur. This property can be used when working with the InterBase API.

7.1.1.5.5 TIBEvents.Registered Property

Indicates whether the events in the Events (see page 264) property are registered.

Pascal

```
property Registered: Boolean;
```

C++

```
__property Boolean Registered;
```

Description

Set Registered to true to call RegisterEvents (see page 261), which registers the events listed by the Events (see page 264) property. Read Registered to determine whether TIBEvents (see page 258) is currently registered (that is, if the InterBase Event manager is notifying this component when any of its events occur.)

7.1.1.6 TIBEvents Events

The events of the TIBEvents class are listed here.

Published Events

	Name	Description
	OnError (see page 265)	Occurs when an exception is caught while monitoring events.
	OnEventAlert (see page 265)	Occurs when an InterBase event is received.

7.1.1.6.1 TIBEvents.OnError Event

Occurs when an exception is caught while monitoring events.

Pascal

```
property OnError: TErrorEvent;
```

C++

```
__property TErrorEvent OnError;
```

Description

Write an OnError event handler to respond when TIBEvents (see page 258) encounters an exception in the process of monitoring events.

7.1.1.6.2 TIBEvents.OnEventAlert Event

Occurs when an InterBase event is received.

Pascal

```
property OnEventAlert: TEventAlert;
```

C++

```
__property TEventAlert OnEventAlert;
```

Description

Write an OnEventAlert event handler to take specific actions when an InterBase event is received.

In the event handler, set CancelAlerts to true to cancel interest in any further events. To start receiving events again, call the GetAutoRegister (see page 260) method. You cannot call RegisterEvents (see page 261), UnRegisterEvents (see page 262), GetAutoRegister (see page 260) or SetAutoRegister (see page 262) from within an OnEventAlert event handler.

OnEventAlert runs as a separate thread to allow for true asynchronous event processing, however, the IBEvents (see page 257) component provides synchronization code to ensure that only one OnEventAlert event handler executes at any one time.

7.2 Types

The following table lists types in this documentation.

Types

Name	Description
TErrorEvent (see page 266)	TErrorEvent is the type of event handlers that respond to exceptions that occur when monitoring InterBase events.
TEventAlert (see page 266)	TEventAlert is the type of event handlers that respond to InterBase events.

7.2.1 IBEvents.TErrorEvent Type

TErrorEvent is the type of event handlers that respond to exceptions that occur when monitoring InterBase events.

Pascal

```
TErrorEvent = procedure ( Sender: TObject; ErrorCode:integer) of object;
```

C++

```
( Sender: TObject; ErrorCode:integer) ( TErrorEvent)();
```

File

IBEvents

Description

Sender is the TIBEvents (see page 258) component that encounters the exception.

If the exception is an EIBError (see page 3) object, ErrorCode is the InterBase error code it represents. Otherwise, ErrorCode is 0.

See Also

Procedural types

Creating events

7.2.2 IBEvents.TEventAlert Type

TEventAlert is the type of event handlers that respond to InterBase events.

Pascal

```
TEventAlert = procedure ( Sender: TObject; EventName: string; EventCount: longint; var
CancelAlerts: Boolean) of object;
```

C++

```
( Sender: TObject; EventName: string; EventCount: longint; var CancelAlerts: Boolean) (
TEventAlert)();
```

File

IBEvents

Description

Sender is the TIBEvents (see page 258) object that is monitoring InterBase events.

EventName is the name of the most recently received event.

EventCount is the number of EventName events received since the last time the event handler was called.

CancelAlerts returns true if the TIBEvents (see page 258) object should stop monitoring events, false if the event monitoring should continue.

8 IBExtract Namespace

This is namespace IBExtract.

Topics

Name	Description
Classes (see page 271)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 283)	The following table lists structs, records, enums in this documentation.
Types (see page 287)	The following table lists types in this documentation.
Constants (see page 289)	The following table lists constants in this documentation.

Classes

	Name	Description
	TIBExtract (see page 271)	TIBExtract fetches metadata from an InterBase server.

Constants

Name	Description
ColumnTypes (see page 290)	This is constant IBExtract.ColumnTypes.
FILE_cache (see page 290)	This is constant IBExtract.FILE_cache.
FILE_conditional (see page 290)	This is constant IBExtract.FILE_conditional.
FILE_inactive (see page 291)	This is constant IBExtract.FILE_inactive.
FILE_manual (see page 291)	This is constant IBExtract.FILE_manual.
FILE_shadow (see page 291)	This is constant IBExtract.FILE_shadow.

ODS_VERSION10 (see page 299)	This is constant IBExtract.ODS_VERSION10.
ODS_VERSION6 (see page 299)	This is constant IBExtract.ODS_VERSION6.
ODS_VERSION7 (see page 299)	This is constant IBExtract.ODS_VERSION7.
ODS_VERSION8 (see page 300)	This is constant IBExtract.ODS_VERSION8.
ODS_VERSION9 (see page 300)	This is constant IBExtract.ODS_VERSION9.
priv_DELETE (see page 300)	This is constant IBExtract.priv_DELETE.
priv_EXECUTE (see page 301)	This is constant IBExtract.priv_EXECUTE.
priv_INSERT (see page 301)	This is constant IBExtract.priv_INSERT.
priv_REFERENCES (see page 301)	This is constant IBExtract.priv_REFERENCES.
priv_SELECT (see page 302)	This is constant IBExtract.priv_SELECT.
priv_UNKNOWN (see page 302)	This is constant IBExtract.priv_UNKNOWN.
priv_UPDATE (see page 302)	This is constant IBExtract.priv_UPDATE.
PrivTypes (see page 303)	This is constant IBExtract.PrivTypes.
SubTypes (see page 303)	This is constant IBExtract.SubTypes.
TriggerTypes (see page 303)	This is constant IBExtract.TriggerTypes.

Structs, Records, Enums

	Name	Description
	TExtractObjectTypes (see page 283)	TExtractObjectTypes indicates the type of metadata to fetch from an InterBase server.
	TExtractType (see page 284)	TExtractType is an enumeration indicating the scope of metadata to extract from an InterBase server.
	TPrivTypes (see page 285)	This is record IBExtract.TPrivTypes.
	TSQLType (see page 286)	This is record IBExtract.TSQLType.

Types

Name	Description
TExtractTypes (see page 287)	TExtractType (see page 284) and TExtractTypes indicate the scope of metadata to extract from an InterBase server.
TSQLTypes (see page 288)	This is type IBExtract.TSQLTypes.

8.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TIBExtract (see page 271)	TIBExtract fetches metadata from an InterBase server.

8.1.1 TIBExtract Class

TIBExtract fetches metadata from an InterBase server.

Class Hierarchy

Pascal

```
TIBExtract = class(TComponent);
```

C++

```
class TIBExtract : public TComponent;
```

File

IBExtract

Description

Use a TIBExtract component to fetch metadata information such as a list of tables, views, roles, indexes, and so on. To use TIBExtract,

1. et the Database (see page 281) and Transaction (see page 282) properties to specify the database from which to fetch information and to provide a transaction to use when fetching that information.
2. all the ExtractObject (see page 274) method, indicating the type of metadata you want to fetch.
3. ead the extracted information from the Items (see page 281) property.

8.1.1.1 TIBExtract Members

The following tables list the members exposed by TIBExtract.

Protected Methods

	Name	Description
	ExtractDDL (see page 274)	This is ExtractDDL, a member of class TIBExtract.
	ExtractListTable (see page 274)	This is ExtractListTable, a member of class TIBExtract.
	ExtractListView (see page 274)	This is ExtractListView, a member of class TIBExtract.
	ListAllTables (see page 276)	This is ListAllTables, a member of class TIBExtract.

	ListCheck (see page 277)	This is ListCheck, a member of class TIBExtract.
	ListCreateDb (see page 277)	This is ListCreateDb, a member of class TIBExtract.
	ListData (see page 277)	This is ListData, a member of class TIBExtract.
	ListDomains (see page 277)	This is ListDomains, a member of class TIBExtract.
	ListException (see page 278)	This is ListException, a member of class TIBExtract.
	ListFilters (see page 278)	This is ListFilters, a member of class TIBExtract.
	ListForeign (see page 278)	This is ListForeign, a member of class TIBExtract.
	ListFunctions (see page 278)	This is ListFunctions, a member of class TIBExtract.
	ListGenerators (see page 278)	This is ListGenerators, a member of class TIBExtract.
	ListGrants (see page 279)	This is ListGrants, a member of class TIBExtract.
	ListIndex (see page 279)	This is ListIndex, a member of class TIBExtract.
	ListProcs (see page 279)	This is ListProcs, a member of class TIBExtract.
	ListRoles (see page 279)	This is ListRoles, a member of class TIBExtract.
	ListTriggers (see page 280)	This is ListTriggers, a member of class TIBExtract.
	ListViews (see page 280)	This is ListViews, a member of class TIBExtract.
	PrintSet (see page 280)	This is PrintSet, a member of class TIBExtract.

Public Methods

	Name	Description
V	Create (see page 272)	Creates an instance of TIBExtract (see page 271).
V	Destroy (see page 273)	Destroys an instance of TIBExtract (see page 271).
	ExtractObject (see page 274)	Fetches specified metadata from the InterBase server and writes it to the Items (see page 281) property.
	GetArrayField (see page 276)	Returns the dimensions of an array field as a printable string.
	GetCharacterSets (see page 276)	Returns a specified character set and collation order as a printable string.
	GetFieldType (see page 276)	Returns the full description of a specified field type as a printable string.
V	Notification (see page 280)	Responds to notifications when components are created or freed.

Public Properties

	Name	Description
R	DatabaseInfo (see page 281)	Represents information about the associated database.
R	Items (see page 281)	Lists the information that the TIBExtract (see page 271) object has fetched from the database server.

Published Properties

	Name	Description
	Database (see page 281)	Specifies the database from which to fetch metadata.
	ShowSystem (see page 282)	Reserved for future use.
	Transaction (see page 282)	Specifies the transaction to use when fetching metadata from the server.

8.1.1.2 TIBExtract.Create Constructor

Creates an instance of TIBExtract (see page 271).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBExtract(TComponent * AOwner);
```

Description

Call Create to create an instance of TIBExtract (see page 271) at runtime. TIBExtract (see page 271) components added to forms or data modules at design time are created automatically.

AOwner specifies the component that is responsible for freeing the TIBExtract (see page 271) instance. If AOwner is a

TIBDatabase component, it is used to initialize the Database (see page 281) property.

8.1.1.3 TIBExtract.Destroy Destructor

Destroys an instance of TIBExtract (see page 271).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBExtract();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TIBExtract (see page 271) object is not already freed and only then calls Destroy.

There is no need to explicitly free a TIBExtract (see page 271) instance that is created with an Owner. The component's Owner handles the task of freeing it.

8.1.1.4 TIBExtract Methods

The methods of the TIBExtract class are listed here.

Protected Methods

	Name	Description
	ExtractDDL (see page 274)	This is ExtractDDL, a member of class TIBExtract.
	ExtractListTable (see page 274)	This is ExtractListTable, a member of class TIBExtract.
	ExtractListView (see page 274)	This is ExtractListView, a member of class TIBExtract.
	ListAllTables (see page 276)	This is ListAllTables, a member of class TIBExtract.
	ListCheck (see page 277)	This is ListCheck, a member of class TIBExtract.
	ListCreateDb (see page 277)	This is ListCreateDb, a member of class TIBExtract.
	ListData (see page 277)	This is ListData, a member of class TIBExtract.
	ListDomains (see page 277)	This is ListDomains, a member of class TIBExtract.
	ListException (see page 278)	This is ListException, a member of class TIBExtract.
	ListFilters (see page 278)	This is ListFilters, a member of class TIBExtract.
	ListForeign (see page 278)	This is ListForeign, a member of class TIBExtract.
	ListFunctions (see page 278)	This is ListFunctions, a member of class TIBExtract.
	ListGenerators (see page 278)	This is ListGenerators, a member of class TIBExtract.
	ListGrants (see page 279)	This is ListGrants, a member of class TIBExtract.
	ListIndex (see page 279)	This is ListIndex, a member of class TIBExtract.
	ListProcs (see page 279)	This is ListProcs, a member of class TIBExtract.
	ListRoles (see page 279)	This is ListRoles, a member of class TIBExtract.
	ListTriggers (see page 280)	This is ListTriggers, a member of class TIBExtract.
	ListViews (see page 280)	This is ListViews, a member of class TIBExtract.
	PrintSet (see page 280)	This is PrintSet, a member of class TIBExtract.

Public Methods

	Name	Description
	ExtractObject (see page 274)	Fetches specified metadata from the InterBase server and writes it to the Items (see page 281) property.
	GetArrayField (see page 276)	Returns the dimensions of an array field as a printable string.
	GetCharacterSets (see page 276)	Returns a specified character set and collation order as a printable string.
	GetFieldType (see page 276)	Returns the full description of a specified field type as a printable string.

	Notification (see page 280)	Responds to notifications when components are created or freed.

8.1.1.4.1 TIBExtract.ExtractDDL Method

Pascal

```
function ExtractDDL(Flag: Boolean; TableName: String): Boolean;
```

C++

```
__fastcall Boolean ExtractDDL(Boolean Flag, UnicodeString TableName);
```

Description

This is ExtractDDL, a member of class TIBExtract.

8.1.1.4.2 TIBExtract.ExtractListTable Method

Pascal

```
function ExtractListTable(RelationName: String; NewName: String; DomainFlag: Boolean): Boolean;
```

C++

```
__fastcall Boolean ExtractListTable(UnicodeString RelationName, UnicodeString NewName, Boolean
DomainFlag);
```

Description

This is ExtractListTable, a member of class TIBExtract.

8.1.1.4.3 TIBExtract.ExtractListView Method

Pascal

```
procedure ExtractListView(ViewName: String);
```

C++

```
__fastcall ExtractListView(UnicodeString ViewName);
```

Description

This is ExtractListView, a member of class TIBExtract.

8.1.1.4.4 TIBExtract.ExtractObject Method

Fetches specified metadata from the InterBase server and writes it to the Items (see page 281) property.

Pascal

```
procedure ExtractObject(ObjectType: TExtractObjectTypes; ObjectName: String = '';
ExtractTypes: TExtractTypes = []);
```

C++

```
__fastcall ExtractObject(TExtractObjectTypes ObjectType, UnicodeString ObjectName = '',
TExtractTypes ExtractTypes = []);
```

Description

Call ExtractObject to fetch metadata from the database specified by the Database (see page 281) property and write it to the Items (see page 281) property.

ObjectType indicates the desired type of metadata. Its meaning is modified by the ObjectName and ExtractTypes parameters, as

indicated in the following table:

Value Meaning

eoDatabase Lists all objects defined on the database. This is the list that would be fetched by calling ExtractObject for each of the other object types in turn (plus the create database command that is supported), with no limits placed by the ObjectName and ExtractTypes parameters.

eoDomain Lists all domains. If ExtractTypes includes etTable, this list includes only domains for the table specified by ObjectName.

eoTable If ObjectName is an empty string, lists all the tables defined on the server. If ObjectName is non-empty, lists all the columns and types of the table named by ObjectName, plus any information specified by ExtractTypes that pertains to that table. This can include domains (etDomain), indexes (etIndex), foreign key constrains (etForeign), check constrains (etCheck), triggers (etTrigger), user permissions (etGrant), and data (etData).

eoView If ObjectName is an empty string, lists the text of all views. Otherwise, lists the text of the view named by the ObjectName parameter.

eoProcedure If ObjectName is an empty string, lists all the stored procedures. Otherwise, lists the text of the stored procedure named by the ObjectName parameter. To handle the situation where procedures reference each other, ExtractObject creates dummy procedures of the correct name and then alters these to their correct form. If ExtractTypes includes etAlterProc, only the corrected form is fetched.

eoFunction Lists all external functions. If ObjectName is non-empty, the list is filtered to include only those functions that match the specified name.

eoGenerator Lists all non-system generators. If ObjectName is non-empty, the list is filtered to include only those generators that match the specified name.

eoException Lists all exceptions that the database defines. If ObjectName is non-empty, the list is filtered to include only those exceptions that match the specified name.

eoBLOBFilter Lists all blob filters. If ObjectName is non-empty, the list is filtered to include only those filters whose function name matches the specified name.

eoRole Lists all roles. If ObjectName is non-empty, the list is filtered to include only those roles whose name matches the specified string.

eoTrigger If ExtractTypes includes etTable, lists all triggers defined for the table specified by ObjectName. Otherwise, lists all triggers or, if ObjectName is nonempty, all triggers that match the string specified by ObjectName.

eoForeign If ExtractTypes includes etTable, lists all foreign key constraints that pertain to the table specified by ObjectName. Otherwise, list all foreign key constraints, or, if ObjectName is nonempty, all foreign key constraints that have a name that matches ObjectName.

eoIndexes If ExtractTypes includes etTable, lists all indexes defined on the table specified by ObjectName. Otherwise, lists all indexes, or, if ObjectName is nonempty, all indexes that have a name that matches ObjectName.

eoChecks If ExtractTypes includes etTable, lists all non-foreign check constraints on the table specified by ObjectName. Otherwise, lists all non-foreign check constraints, or, if ObjectName is nonempty, all check constraints that have a name that matches ObjectName.

eoData Lists all the data in the object named by the ObjectName parameter.

ObjectName specifies the name of an object (such as a table or stored procedure) about which you want information. The type of this object and the way it limits the fetched information depends on the values of ObjectType and ExtractTypes.

ExtractTypes modifies the interpretation of ObjectType, to filter the type of information fetched.

8.1.1.4.5 TIBExtract.GetArrayField Method

Returns the dimensions of an array field as a printable string.

Pascal

```
function GetArrayField(FieldName: String): String;
```

C++

```
__fastcall UnicodeString GetArrayField(UnicodeString FieldName);
```

Description

GetArrayField returns the dimensions of the array field with the name specified by the FieldName parameter. The resulting string has the form

```
[lower:upper, lower:upper,..]
```

8.1.1.4.6 TIBExtract.GetCharacterSets Method

Returns a specified character set and collation order as a printable string.

Pascal

```
function GetCharacterSets(CharSetId: Short; Collation: Short; CollateOnly: Boolean): String;
```

C++

```
__fastcall UnicodeString GetCharacterSets(Short CharSetId, Short Collation, Boolean
CollateOnly);
```

Description

GetCharacterSets looks up a specified character set and collation order, and returns their names.

CharSetId is the identifier of the desired character set.

Collation is the identifier of the desired collation order.

CollateOnly indicates that the return string should include the name of the collation order but not the name of the character set.

8.1.1.4.7 TIBExtract.GetFieldType Method

Returns the full description of a specified field type as a printable string.

Pascal

```
function GetFieldType(FieldType: Integer; FieldSubType: Integer; FieldScale: Integer;
FieldSize: Integer; FieldPrec: Integer; FieldLen: Integer): String;
```

C++

```
__fastcall UnicodeString GetFieldType(int FieldType, int FieldSubType, int FieldScale, int
FieldSize, int FieldPrec, int FieldLen);
```

Description

GetFieldType returns the string description with the specified field type, subtype, scale, size, precision, and length.

8.1.1.4.8 TIBExtract.ListAllTables Method

Pascal

```
procedure ListAllTables(flag: Boolean);
```

C++

```
__fastcall ListAllTables(Boolean flag);
```

Description

This is ListAllTables, a member of class TIBExtract.

8.1.1.4.9 TIBExtract.ListCheck Method

Pascal

```
procedure ListCheck(ObjectName: String = ''; ExtractType: TExtractType = etCheck);
```

C++

```
__fastcall ListCheck(UnicodeString ObjectName = '', TExtractType ExtractType = etCheck);
```

Description

This is ListCheck, a member of class TIBExtract.

8.1.1.4.10 TIBExtract.ListCreateDb Method

Pascal

```
procedure ListCreateDb(TargetDb: String = '');
```

C++

```
__fastcall ListCreateDb(UnicodeString TargetDb = '');
```

Description

This is ListCreateDb, a member of class TIBExtract.

8.1.1.4.11 TIBExtract.ListData Method

Pascal

```
procedure ListData(ObjectName: String);
```

C++

```
__fastcall ListData(UnicodeString ObjectName);
```

Description

This is ListData, a member of class TIBExtract.

8.1.1.4.12 TIBExtract.ListDomains Method

Pascal

```
procedure ListDomains(ObjectName: String = ''; ExtractType: TExtractType = etDomain);
```

C++

```
__fastcall ListDomains(UnicodeString ObjectName = '', TExtractType ExtractType = etDomain);
```

Description

This is ListDomains, a member of class TIBExtract.

8.1.1.4.13 TIBExtract.ListException Method

Pascal

```
procedure ListException(ExceptionName: String = '');
```

C++

```
__fastcall ListException(UnicodeString ExceptionName = '');
```

Description

This is ListException, a member of class TIBExtract.

8.1.1.4.14 TIBExtract.ListFilters Method

Pascal

```
procedure ListFilters(FilterName: String = '');
```

C++

```
__fastcall ListFilters(UnicodeString FilterName = '');
```

Description

This is ListFilters, a member of class TIBExtract.

8.1.1.4.15 TIBExtract.ListForeign Method

Pascal

```
procedure ListForeign(ObjectName: String = ''; ExtractType: TExtractType = etForeign);
```

C++

```
__fastcall ListForeign(UnicodeString ObjectName = '', TExtractType ExtractType = etForeign);
```

Description

This is ListForeign, a member of class TIBExtract.

8.1.1.4.16 TIBExtract.ListFunctions Method

Pascal

```
procedure ListFunctions(FunctionName: String = '');
```

C++

```
__fastcall ListFunctions(UnicodeString FunctionName = '');
```

Description

This is ListFunctions, a member of class TIBExtract.

8.1.1.4.17 TIBExtract.ListGenerators Method

Pascal

```
procedure ListGenerators(GeneratorName: String = '');
```

C++

```
__fastcall ListGenerators(UnicodeString GeneratorName = '');
```

Description

This is ListGenerators, a member of class TIBExtract.

8.1.1.4.18 TIBExtract.ListGrants Method

Pascal

```
procedure ListGrants;
```

C++

```
__fastcall ListGrants();
```

Description

This is ListGrants, a member of class TIBExtract.

8.1.1.4.19 TIBExtract.ListIndex Method

Pascal

```
procedure ListIndex(ObjectName: String = ''; ExtractType: TExtractType = etIndex);
```

C++

```
__fastcall ListIndex(UnicodeString ObjectName = '', TExtractType ExtractType = etIndex);
```

Description

This is ListIndex, a member of class TIBExtract.

8.1.1.4.20 TIBExtract.ListProcs Method

Pascal

```
procedure ListProcs(ProcedureName: String = ''; AlterOnly: Boolean = false);
```

C++

```
__fastcall ListProcs(UnicodeString ProcedureName = '', Boolean AlterOnly = false);
```

Description

This is ListProcs, a member of class TIBExtract.

8.1.1.4.21 TIBExtract.ListRoles Method

Pascal

```
procedure ListRoles(ObjectName: String = '');
```

C++

```
__fastcall ListRoles(UnicodeString ObjectName = '');
```

Description

This is ListRoles, a member of class TIBExtract.

8.1.1.4.22 TIBExtract.ListTriggers Method

Pascal

```
procedure ListTriggers(ObjectName: String = ''; ExtractType: TExtractType = etTrigger);
```

C++

```
__fastcall ListTriggers(UnicodeString ObjectName = '', TExtractType ExtractType = etTrigger);
```

Description

This is ListTriggers, a member of class TIBExtract.

8.1.1.4.23 TIBExtract.ListViews Method

Pascal

```
procedure ListViews(ViewName: String = '');
```

C++

```
__fastcall ListViews(UnicodeString ViewName = '');
```

Description

This is ListViews, a member of class TIBExtract.

8.1.1.4.24 TIBExtract.Notification Method

Responds to notifications when components are created or freed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called automatically when objects are created or freed so that TIBExtract (see page 271) can make any necessary adjustments.

AComponent is the component that was just created or that is about to be destroyed.

Operation indicates whether AComponent was just created (opInsert) or is about to be freed (opRemove).

In TIBExtract (see page 271), Notification checks whether the components that implement the Database (see page 281) and Transaction (see page 282) properties are about to be freed, and if so, sets the appropriate property to nil (Delphi) or NULL (C++).

8.1.1.4.25 TIBExtract.PrintSet Method

Pascal

```
function PrintSet(var Used: Boolean): String;
```

C++

```
__fastcall UnicodeString PrintSet(Boolean Used);
```

Description

This is PrintSet, a member of class TIBExtract.

8.1.1.5 TIBExtract Properties

The properties of the TIBExtract class are listed here.

Public Properties

	Name	Description
	DatabaseInfo (see page 281)	Represents information about the associated database.
	Items (see page 281)	Lists the information that the TIBExtract (see page 271) object has fetched from the database server.

Published Properties

	Name	Description
	Database (see page 281)	Specifies the database from which to fetch metadata.
	ShowSystem (see page 282)	Reserved for future use.
	Transaction (see page 282)	Specifies the transaction to use when fetching metadata from the server.

8.1.1.5.1 TIBExtract.Database Property

Specifies the database from which to fetch metadata.

Pascal

```
property Database: TIBDatabase;
```

C++

```
__property TIBDatabase Database;
```

Description

Use Database to specify the database from which to fetch metadata.

8.1.1.5.2 TIBExtract.DatabaseInfo Property

Represents information about the associated database.

Pascal

```
property DatabaseInfo: TIBDatabaseInfo;
```

C++

```
__property TIBDatabaseInfo DatabaseInfo;
```

Description

Read DatabaseInfo to obtain information about the database that is specified by the Database (see page 281) property. DatabaseInfo provides a variety of information about the database itself, such as the version of the online disk structure (ODS) used by the attachment, the number of database cache buffers allocated, the number of database pages read from or written to, and write-ahead log information.

8.1.1.5.3 TIBExtract.Items Property

Lists the information that the TIBExtract (see page 271) object has fetched from the database server.

Pascal

```
property Items: TStrings;
```

C++

```
__property TStrings Items;
```

Description

Use the Items property to read the metadata information that was fetched from the database server. The ExtractObject (see page 274) method writes information to the Items property every time you call it.

Tip: TIBExtract (see page 271) does not clear the Items property when you make a new call to ExtractObject (see page 274). You may want to clear this list of strings between calls to ExtractObject (see page 274) so that the list does not get too long.

8.1.1.5.4 TIBExtract.ShowSystem Property

Reserved for future use.

Pascal

```
property ShowSystem: Boolean;
```

C++

```
__property Boolean ShowSystem;
```

Description

Currently, ShowSystem is not implemented.

8.1.1.5.5 TIBExtract.Transaction Property

Specifies the transaction to use when fetching metadata from the server.

Pascal

```
property Transaction: TIBTransaction;
```

C++

```
__property TIBTransaction Transaction;
```

Description

Set Transaction to specify a transaction to use when fetching metadata from the server. The ExtractObject (see page 274) method executes all calls to the server within the context of this transaction.

8.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TExtractObjectTypes (see page 283)	TExtractObjectTypes indicates the type of metadata to fetch from an InterBase server.
	TExtractType (see page 284)	TExtractType is an enumeration indicating the scope of metadata to extract from an InterBase server.

Records

	Name	Description
	TPrivTypes (see page 285)	This is record IBExtract.TPrivTypes.
	TSQLType (see page 286)	This is record IBExtract.TSQLType.

8.2.1 IBExtract.TExtractObjectTypes Enumeration

TExtractObjectTypes indicates the type of metadata to fetch from an InterBase server.

Pascal

```
TExtractObjectTypes = (
  eoDatabase,
  eoDomain,
  eoTable,
  eoView,
  eoProcedure,
  eoFunction,
  eoGenerator,
  eoException,
  eoBLOBFilter,
  eoRole,
  eoTrigger,
  eoForeign,
  eoIndexes,
  eoChecks,
  eoData
);
```

C++

```
enum TExtractObjectTypes {
  eoDatabase,
  eoDomain,
  eoTable,
  eoView,
  eoProcedure,
  eoFunction,
  eoGenerator,
  eoException,
  eoBLOBFilter,
  eoRole,
  eoTrigger,
  eoForeign,
  eoIndexes,
```

```
    eoChecks,
    eoData
  };
```

File

IBExtract

Description

Value Meaning

eoDatabase Fetch metadata about all objects defined on the database.

eoDomain List all domains, either for the entire database or only those that pertain to a specified table.

eoTable List all tables or information about a specified table.

eoView List all views in the database or the text of a specified view.

eoProcedure List all stored procedures or the text of a specified stored procedure.

eoFunction List all external functions, or list those external functions that match a specified name.

eoGenerator List all non-system generators, or only those generators that match a specified name.

eoException List all exceptions that the database defines, or only those exceptions that match a specified name.

eoBLOBFilter List all blob filters or only those filters whose function name matches a specified name.

eoRole List all roles or only those roles whose name matches a specified string.

eoTrigger List all triggers. The scope can be the entire database, those triggers that match a specified string, or those triggers defined for a specified table.

eoForeign List all foreign key constraints. The scope can be the entire database, those foreign key constraints with a specified name, or those that pertain to a specified table.

eoIndexes List all indexes. The scope can be the entire database, those indexes with a specified name, or those that are defined for a specified table.

eoChecks List all non-foreign check constraints. The scope can be the entire database, those check constraints with a specified name, or those that pertain to a specified table.

eoData List all the data a specified object.

8.2.2 IBExtract.TExtractType Enumeration

TExtractType is an enumeration indicating the scope of metadata to extract from an InterBase server.

Pascal

```
  TExtractType = (
    etDomain,
    etTable,
    etRole,
    etTrigger,
    etForeign,
    etIndex,
    etData,
    etGrant,
    etCheck,
    etAlterProc
```

```
);
```

C++

```
enum TExtractType {
  etDomain,
  etTable,
  etRole,
  etTrigger,
  etForeign,
  etIndex,
  etData,
  etGrant,
  etCheck,
  etAlterProc
};
```

File

IBExtract

Description

The following table lists the TExtractType enum items and meanings:

Value	Meaning
etDomain	When fetching metadata about a database table, include information about all domains that pertain to the table.
etTable	Fetch metadata of the target type that pertains only to a specified named table.
etRole	When fetching metadata about a database table, include information about all roles that have access to the table.
etTrigger	When fetching metadata about a database table, include information about all triggers that pertain to the table.
etForeign	When fetching metadata about a database table, include information about foreign key constraints.
etIndex	When fetching metadata about a database table, include information about indexes defined for the table.
etData	When fetching metadata about a database table, include the data values.
etGrant	When fetching metadata about a database table, include information about user permissions.
etCheck	When fetching metadata about a database table, include information about check constraints.
etAlterProc	When fetching metadata about stored procedures, the extraction may involve the creation of dummy procedures to handle the situation where procedures reference each other. These dummy procedures, which stand in for a referenced stored procedure, are later altered to their correct form. This flag indicates that only the corrected form should be fetched.

8.2.3 IBExtract.TPrivTypes Record

Pascal

```
TPrivTypes = record
  PrivFlag: Integer;
  PrivString: String;
end;
```

C++

```
struct TPrivTypes {
  int PrivFlag;
  UnicodeString PrivString;
};
```

File

IBExtract

Description

This is record IBExtract.TPrivTypes.

8.2.4 IBExtract.TSQLType Record

Pascal

```
TSQLType = record
  SqlType: Integer;
  TypeName: String;
end;
```

C++

```
struct TSQLType {
  int SqlType;
  UnicodeString TypeName;
};
```

File

IBExtract

Description

This is record IBExtract.TSQLType.

8.3 Types

The following table lists types in this documentation.

Types

Name	Description
TExtractTypes (see page 287)	TExtractType (see page 284) and TExtractTypes indicate the scope of metadata to extract from an InterBase server.
TSQLTypes (see page 288)	This is type IBExtract.TSQLTypes.

8.3.1 IBExtract.TExtractTypes Type

TExtractType (see page 284) and TExtractTypes indicate the scope of metadata to extract from an InterBase server.

Pascal

```
TExtractTypes = set of TExtractType;
```

C++

```
TExtractType TExtractTypes;
```

File

IBExtract

Description

TExtractTypes is a set of TExtractType (see page 284) values. The following table lists the possible values:

Value	Meaning
etDomain	When fetching metadata about a database table, include information about all domains that pertain to the table.
etTable	Fetch metadata of the target type that pertains only to a specified named table.
etRole	When fetching metadata about a database table, include information about all roles that have access to the table.
etTrigger	When fetching metadata about a database table, include information about all triggers that pertain to the table.
etForeign	When fetching metadata about a database table, include information about foreign key constraints.
etIndex	When fetching metadata about a database table, include information about indexes defined for the table.
etData	When fetching metadata about a database table, include the data values.
etGrant	When fetching metadata about a database table, include information about user permissions.
etCheck	When fetching metadata about a database table, include information about check constraints.
etAlterProc	When fetching metadata about stored procedures, the extraction may involve the creation of dummy procedures to handle the situation where procedures reference each other. These dummy procedures, which stand in for a referenced stored procedure, are later altered to their correct form. This flag indicates that only the corrected form should be fetched.

8.3.2 IBExtract.TSQLTypes Type

Pascal

```
TSQLTypes = Array[0..13] of TSQLType;
```

C++

```
Array[0..13] of TSQLType TSQLTypes;
```

File

IBExtract

Description

This is type IBExtract.TSQLTypes.

8.4 Constants

The following table lists constants in this documentation.

Constants

Name	Description
ColumnTypes (see page 290)	This is constant IBExtract.ColumnTypes.
FILE_cache (see page 290)	This is constant IBExtract.FILE_cache.
FILE_conditional (see page 290)	This is constant IBExtract.FILE_conditional.
FILE_inactive (see page 291)	This is constant IBExtract.FILE_inactive.
FILE_manual (see page 291)	This is constant IBExtract.FILE_manual.
FILE_shadow (see page 291)	This is constant IBExtract.FILE_shadow.
IntegralSubtypes (see page 292)	This is constant IBExtract.IntegralSubtypes.
LOG_default (see page 292)	This is constant IBExtract.LOG_default.
LOG_overflow (see page 292)	This is constant IBExtract.LOG_overflow.
LOG_raw (see page 293)	This is constant IBExtract.LOG_raw.
LOG_serial (see page 293)	This is constant IBExtract.LOG_serial.
MAX_INTSUBTYPES (see page 293)	This is constant IBExtract.MAX_INTSUBTYPES.
MAXSUBTYPES (see page 294)	This is constant IBExtract.MAXSUBTYPES.
obj_computed (see page 294)	This is constant IBExtract.obj_computed.
obj_count (see page 294)	This is constant IBExtract.obj_count.
obj_exception (see page 295)	This is constant IBExtract.obj_exception.
obj_expression_index (see page 295)	This is constant IBExtract.obj_expression_index.
obj_field (see page 295)	This is constant IBExtract.obj_field.
obj_index (see page 296)	This is constant IBExtract.obj_index.
obj_procedure (see page 296)	This is constant IBExtract.obj_procedure.
obj_relation (see page 296)	This is constant IBExtract.obj_relation.
obj_sql_role (see page 297)	This is constant IBExtract.obj_sql_role.
obj_trigger (see page 297)	This is constant IBExtract.obj_trigger.
obj_user (see page 297)	This is constant IBExtract.obj_user.
obj_user_group (see page 298)	This is constant IBExtract.obj_user_group.
obj_validation (see page 298)	This is constant IBExtract.obj_validation.
obj_view (see page 298)	This is constant IBExtract.obj_view.
ODS_VERSION10 (see page 299)	This is constant IBExtract.ODS_VERSION10.
ODS_VERSION6 (see page 299)	This is constant IBExtract.ODS_VERSION6.
ODS_VERSION7 (see page 299)	This is constant IBExtract.ODS_VERSION7.
ODS_VERSION8 (see page 300)	This is constant IBExtract.ODS_VERSION8.
ODS_VERSION9 (see page 300)	This is constant IBExtract.ODS_VERSION9.
priv_DELETE (see page 300)	This is constant IBExtract.priv_DELETE.
priv_EXECUTE (see page 301)	This is constant IBExtract.priv_EXECUTE.
priv_INSERT (see page 301)	This is constant IBExtract.priv_INSERT.
priv_REFERENCES (see page 301)	This is constant IBExtract.priv_REFERENCES.
priv_SELECT (see page 302)	This is constant IBExtract.priv_SELECT.
priv_UNKNOWN (see page 302)	This is constant IBExtract.priv_UNKNOWN.
priv_UPDATE (see page 302)	This is constant IBExtract.priv_UPDATE.
PrivTypes (see page 303)	This is constant IBExtract.PrivTypes.
SubTypes (see page 303)	This is constant IBExtract.SubTypes.
TriggerTypes (see page 303)	This is constant IBExtract.TriggerTypes.

8.4.1 IBExtract.ColumnTypes Constant

Pascal

```
ColumnTypes: TSQLTypes = ( (SqlType : blr_short; TypeName : 'SMALLINT'), (SqlType : blr_long;
TypeName : 'INTEGER'), (SqlType : blr_quad; TypeName : 'QUAD'), (SqlType : blr_float; TypeName
: 'FLOAT'), (SqlType : blr_text; TypeName : 'CHAR'), (SqlType : blr_double; TypeName : 'DOUBLE
PRECISION'), (SqlType : blr_varying; TypeName : 'VARCHAR'), (SqlType : blr_cstring; TypeName :
'CSTRING'), (SqlType : blr_blob_id; TypeName : 'BLOB_ID'), (SqlType : blr_blob; TypeName :
'BLOB'), (SqlType : blr_sql_time; TypeName : 'TIME'), (SqlType : blr_sql_date; TypeName :
'DATE'), (SqlType : blr_timestamp; TypeName : 'TIMESTAMP'), (SqlType : blr_int64; TypeName :
'INT64'));
```

C++

```
TSQLTypes ColumnTypes = ( (SqlType : blr_short; TypeName : 'SMALLINT'), (SqlType : blr_long;
TypeName : 'INTEGER'), (SqlType : blr_quad; TypeName : 'QUAD'), (SqlType : blr_float; TypeName
: 'FLOAT'), (SqlType : blr_text; TypeName : 'CHAR'), (SqlType : blr_double; TypeName : 'DOUBLE
PRECISION'), (SqlType : blr_varying; TypeName : 'VARCHAR'), (SqlType : blr_cstring; TypeName :
'CSTRING'), (SqlType : blr_blob_id; TypeName : 'BLOB_ID'), (SqlType : blr_blob; TypeName :
'BLOB'), (SqlType : blr_sql_time; TypeName : 'TIME'), (SqlType : blr_sql_date; TypeName :
'DATE'), (SqlType : blr_timestamp; TypeName : 'TIMESTAMP'), (SqlType : blr_int64; TypeName :
'INT64'));
```

File

IBExtract

Description

This is constant IBExtract.ColumnTypes.

8.4.2 IBExtract.FILE_cache Constant

Pascal

```
FILE_cache = 8;
```

C++

```
FILE_cache = 8;
```

File

IBExtract

Description

This is constant IBExtract.FILE_cache.

8.4.3 IBExtract.FILE_conditional Constant

Pascal

```
FILE_conditional = 16;
```

C++

```
FILE_conditional = 16;
```

File

IBExtract

Description

This is constant IBExtract.FILE_conditional.

8.4.4 IBExtract.FILE_inactive Constant

Pascal

```
FILE_inactive = 2;
```

C++

```
FILE_inactive = 2;
```

File

IBExtract

Description

This is constant IBExtract.FILE_inactive.

8.4.5 IBExtract.FILE_manual Constant

Pascal

```
FILE_manual = 4;
```

C++

```
FILE_manual = 4;
```

File

IBExtract

Description

This is constant IBExtract.FILE_manual.

8.4.6 IBExtract.FILE_shadow Constant

Pascal

```
FILE_shadow = 1;
```

C++

```
FILE_shadow = 1;
```

File

IBExtract

Description

This is constant IBExtract.FILE_shadow.

8.4.7 IBExtract.IntegralSubtypes Constant

Pascal

```
IntegralSubtypes: Array[0..2] of String = ( 'UNKNOWN', 'NUMERIC', 'DECIMAL');
```

C++

```
Array[0..2] of String IntegralSubtypes = ( 'UNKNOWN', 'NUMERIC', 'DECIMAL');
```

File

IBExtract

Description

This is constant IBExtract.IntegralSubtypes.

8.4.8 IBExtract.LOG_default Constant

Pascal

```
LOG_default = 2;
```

C++

```
LOG_default = 2;
```

File

IBExtract

Description

This is constant IBExtract.LOG_default.

8.4.9 IBExtract.LOG_overflow Constant

Pascal

```
LOG_overflow = 8;
```

C++

```
LOG_overflow = 8;
```

File

IBExtract

Description

This is constant IBExtract.LOG_overflow.

8.4.10 IBExtract.LOG_raw Constant

Pascal

```
LOG_raw = 4;
```

C++

```
LOG_raw = 4;
```

File

IBExtract

Description

This is constant IBExtract.LOG_raw.

8.4.11 IBExtract.LOG_serial Constant

Pascal

```
LOG_serial = 1;
```

C++

```
LOG_serial = 1;
```

File

IBExtract

Description

This is constant IBExtract.LOG_serial.

8.4.12 IBExtract.MAX_INTSUBTYPES Constant

Pascal

```
MAX_INTSUBTYPES = 2;
```

C++

```
MAX_INTSUBTYPES = 2;
```

File

IBExtract

Description

This is constant IBExtract.MAX_INTSUBTYPES.

8.4.13 IBExtract.MAXSUBTYPES Constant

Pascal

```
MAXSUBTYPES = 8;
```

C++

```
MAXSUBTYPES = 8;
```

File

IBExtract

Description

This is constant IBExtract.MAXSUBTYPES.

8.4.14 IBExtract.obj_computed Constant

Pascal

```
obj_computed = 3;
```

C++

```
obj_computed = 3;
```

File

IBExtract

Description

This is constant IBExtract.obj_computed.

8.4.15 IBExtract.obj_count Constant

Pascal

```
obj_count = 11;
```

C++

```
obj_count = 11;
```

File

IBExtract

Description

This is constant IBExtract.obj_count.

8.4.16 IBExtract.obj_exception Constant

Pascal

```
obj_exception = 7;
```

C++

```
obj_exception = 7;
```

File

IBExtract

Description

This is constant IBExtract.obj_exception.

8.4.17 IBExtract.obj_expression_index Constant

Pascal

```
obj_expression_index = 6;
```

C++

```
obj_expression_index = 6;
```

File

IBExtract

Description

This is constant IBExtract.obj_expression_index.

8.4.18 IBExtract.obj_field Constant

Pascal

```
obj_field = 9;
```

C++

```
obj_field = 9;
```

File

IBExtract

Description

This is constant IBExtract.obj_field.

8.4.19 IBExtract.obj_index Constant

Pascal

```
obj_index = 10;
```

C++

```
obj_index = 10;
```

File

IBExtract

Description

This is constant IBExtract.obj_index.

8.4.20 IBExtract.obj_procedure Constant

Pascal

```
obj_procedure = 5;
```

C++

```
obj_procedure = 5;
```

File

IBExtract

Description

This is constant IBExtract.obj_procedure.

8.4.21 IBExtract.obj_relation Constant

Pascal

```
obj_relation = 0;
```

C++

```
obj_relation = 0;
```

File

IBExtract

Description

This is constant IBExtract.obj_relation.

8.4.22 IBExtract.obj_sql_role Constant

Pascal

```
obj_sql_role = 13;
```

C++

```
obj_sql_role = 13;
```

File

IBExtract

Description

This is constant IBExtract.obj_sql_role.

8.4.23 IBExtract.obj_trigger Constant

Pascal

```
obj_trigger = 2;
```

C++

```
obj_trigger = 2;
```

File

IBExtract

Description

This is constant IBExtract.obj_trigger.

8.4.24 IBExtract.obj_user Constant

Pascal

```
obj_user = 8;
```

C++

```
obj_user = 8;
```

File

IBExtract

Description

This is constant IBExtract.obj_user.

8.4.25 IBExtract.obj_user_group Constant

Pascal

```
obj_user_group = 12;
```

C++

```
obj_user_group = 12;
```

File

IBExtract

Description

This is constant IBExtract.obj_user_group.

8.4.26 IBExtract.obj_validation Constant

Pascal

```
obj_validation = 4;
```

C++

```
obj_validation = 4;
```

File

IBExtract

Description

This is constant IBExtract.obj_validation.

8.4.27 IBExtract.obj_view Constant

Pascal

```
obj_view = 1;
```

C++

```
obj_view = 1;
```

File

IBExtract

Description

This is constant IBExtract.obj_view.

8.4.28 IBExtract.ODS_VERSION10 Constant

Pascal

```
ODS_VERSION10 = 10;
```

C++

```
ODS_VERSION10 = 10;
```

File

IBExtract

Description

This is constant IBExtract.ODS_VERSION10.

8.4.29 IBExtract.ODS_VERSION6 Constant

Pascal

```
ODS_VERSION6 = 6;
```

C++

```
ODS_VERSION6 = 6;
```

File

IBExtract

Description

This is constant IBExtract.ODS_VERSION6.

8.4.30 IBExtract.ODS_VERSION7 Constant

Pascal

```
ODS_VERSION7 = 7;
```

C++

```
ODS_VERSION7 = 7;
```

File

IBExtract

Description

This is constant IBExtract.ODS_VERSION7.

8.4.31 IBExtract.ODS_VERSION8 Constant

Pascal

```
ODS_VERSION8 = 8;
```

C++

```
ODS_VERSION8 = 8;
```

File

IBExtract

Description

This is constant IBExtract.ODS_VERSION8.

8.4.32 IBExtract.ODS_VERSION9 Constant

Pascal

```
ODS_VERSION9 = 9;
```

C++

```
ODS_VERSION9 = 9;
```

File

IBExtract

Description

This is constant IBExtract.ODS_VERSION9.

8.4.33 IBExtract.priv_DELETE Constant

Pascal

```
priv_DELETE = 16;
```

C++

```
priv_DELETE = 16;
```

File

IBExtract

Description

This is constant IBExtract.priv_DELETE.

8.4.34 IBExtract.priv_EXECUTE Constant

Pascal

```
priv_EXECUTE = 32;
```

C++

```
priv_EXECUTE = 32;
```

File

IBExtract

Description

This is constant IBExtract.priv_EXECUTE.

8.4.35 IBExtract.priv_INSERT Constant

Pascal

```
priv_INSERT = 4;
```

C++

```
priv_INSERT = 4;
```

File

IBExtract

Description

This is constant IBExtract.priv_INSERT.

8.4.36 IBExtract.priv_REFERENCES Constant

Pascal

```
priv_REFERENCES = 64;
```

C++

```
priv_REFERENCES = 64;
```

File

IBExtract

Description

This is constant IBExtract.priv_REFERENCES.

8.4.37 IBExtract.priv_SELECT Constant

Pascal

```
priv_SELECT = 2;
```

C++

```
priv_SELECT = 2;
```

File

IBExtract

Description

This is constant IBExtract.priv_SELECT.

8.4.38 IBExtract.priv_UNKNOWN Constant

Pascal

```
priv_UNKNOWN = 1;
```

C++

```
priv_UNKNOWN = 1;
```

File

IBExtract

Description

This is constant IBExtract.priv_UNKNOWN.

8.4.39 IBExtract.priv_UPDATE Constant

Pascal

```
priv_UPDATE = 8;
```

C++

```
priv_UPDATE = 8;
```

File

IBExtract

Description

This is constant IBExtract.priv_UPDATE.

8.4.40 IBExtract.PrivTypes Constant

Pascal

```
PrivTypes: Array[0..5] of TPrivTypes = ( (PrivFlag : priv_DELETE; PrivString : 'DELETE' ),
(PrivFlag : priv_EXECUTE; PrivString : 'EXECUTE' ), (PrivFlag : priv_INSERT; PrivString :
'INSERT' ), (PrivFlag : priv_SELECT; PrivString : 'SELECT' ), (PrivFlag : priv_UPDATE;
PrivString : 'UPDATE' ), (PrivFlag : priv_REFERENCES; PrivString : 'REFERENCES'));
```

C++

```
Array[0..5] of TPrivTypes PrivTypes = ( (PrivFlag : priv_DELETE; PrivString : 'DELETE' ),
(PrivFlag : priv_EXECUTE; PrivString : 'EXECUTE' ), (PrivFlag : priv_INSERT; PrivString :
'INSERT' ), (PrivFlag : priv_SELECT; PrivString : 'SELECT' ), (PrivFlag : priv_UPDATE;
PrivString : 'UPDATE' ), (PrivFlag : priv_REFERENCES; PrivString : 'REFERENCES'));
```

File

IBExtract

Description

This is constant IBExtract.PrivTypes.

8.4.41 IBExtract.SubTypes Constant

Pascal

```
SubTypes: Array[0..8] of String = ( 'UNKNOWN', 'TEXT', 'BLR', 'ACL', 'RANGES', 'SUMMARY',
'FORMAT', 'TRANSACTION_DESCRIPTION', 'EXTERNAL_FILE_DESCRIPTION');
```

C++

```
Array[0..8] of String SubTypes = ( 'UNKNOWN', 'TEXT', 'BLR', 'ACL', 'RANGES', 'SUMMARY',
'FORMAT', 'TRANSACTION_DESCRIPTION', 'EXTERNAL_FILE_DESCRIPTION');
```

File

IBExtract

Description

This is constant IBExtract.SubTypes.

8.4.42 IBExtract.TriggerTypes Constant

Pascal

```
TriggerTypes: Array[0..6] of String = ( '', 'BEFORE INSERT', 'AFTER INSERT', 'BEFORE UPDATE',
'AFTER UPDATE', 'BEFORE DELETE', 'AFTER DELETE');
```

C++

```
Array[0..6] of String TriggerTypes = ( '', 'BEFORE INSERT', 'AFTER INSERT', 'BEFORE UPDATE',
'AFTER UPDATE', 'BEFORE DELETE', 'AFTER DELETE');
```

File

IBExtract

Description

This is constant IBExtract.TriggerTypes.

9 IBInstall Namespace

This is namespace IBInstall.

Topics

Name	Description
Classes (see page 307)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 328)	The following table lists structs, records, enums in this documentation.
Types (see page 333)	The following table lists types in this documentation.

Classes

	Name	Description
	EIBInstall (see page 307)	EIBInstall catches all of the installation exceptions.
	EIBInstallerError (see page 309)	This is class IBInstall.EIBInstallerError.
	EIBInstallError (see page 310)	This is class IBInstall.EIBInstallError.
	TIBInstall (see page 310)	Use TIBInstall to set up an InterBase installation component.
	TIBSetup (see page 317)	TIBSetup is the ancestor object from which TIBInstall (see page 310) and TIBUnInstall (see page 322) are derived.
	TIBUnInstall (see page 322)	Use TIBUnInstall to set up an uninstall component.
	TInstallOptions (see page 325)	TInstallOptions configures the options of a TIBInstall (see page 310) instance.

Structs, Records, Enums

	Name	Description
	TCmdOption (see page 328)	TCmdOption and TCmdOptions (see page 333) indicate which of the command-line tools are installed.
	TConnectivityOption (see page 329)	TConnectivityOption and TConnectivityOptions (see page 333) identify InterBase connectivity clients.
	TErrorResult (see page 329)	This is record IBInstall.TErrorResult.
	TExamplesOption (see page 330)	TExamplesOption and TExamplesOptions (see page 334) identify InterBase Examples clients.
	TIBInstallerError (see page 330)	This is record IBInstall.TIBInstallerError.
	TMainOption (see page 331)	TMainOption and TMainOptions (see page 336) identify the main InterBase components.
	TStatusResult (see page 332)	This is record IBInstall.TStatusResult.
	TWarningResult (see page 332)	This is record IBInstall.TWarningResult.

Types

Name	Description
TCmdOptions (see page 333)	This is type IBInstall.TCmdOptions.
TConnectivityOptions (see page 333)	This is type IBInstall.TConnectivityOptions.
TExamplesOptions (see page 334)	This is type IBInstall.TExamplesOptions.
TIBSetupOnError (see page 334)	TIBSetupOnError is the type of event handlers that respond to installation errors.
TIBSetupOnStatus (see page 334)	TIBSetupOnStatus is the type of event handlers that respond during the InterBase installation or de-installation process.
TIBSetupOnWarning (see page 335)	TIBSetupOnWarning is the type of event handlers that respond to installation warnings.
TIscError (see page 335)	This is type IBInstall.TIscError.
TMainOptions (see page 336)	This is type IBInstall.TMainOptions.

9.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EIBInstall (see page 307)	EIBInstall catches all of the installation exceptions.
	EIBInstallerError (see page 309)	This is class IBInstall.EIBInstallerError.
	EIBInstallError (see page 310)	This is class IBInstall.EIBInstallError.
	TIBInstall (see page 310)	Use TIBInstall to set up an InterBase installation component.
	TIBSetup (see page 317)	TIBSetup is the ancestor object from which TIBInstall (see page 310) and TIBUnInstall (see page 322) are derived.
	TIBUnInstall (see page 322)	Use TIBUnInstall to set up an uninstall component.
	TInstallOptions (see page 325)	TInstallOptions configures the options of a TIBInstall (see page 310) instance.

9.1.1 EIBInstall Class

EIBInstall catches all of the installation exceptions.

Class Hierarchy

Pascal

```
EIBInstall = class(Exception);
```

C++

```
class EIBInstall : public Exception;
```

File

IBInstall

Description

Use EIBInstall to catch installation exceptions from InterBase and InterBase Express (IBX).

Note: You must install InterBase 6 to use this feature.

9.1.1.1 EIBInstall Members

The following tables list the members exposed by EIBInstall.

Public Methods

	Name	Description
	Create (see page 308)	This is the overview for the Create constructor overload.

Public Properties

	Name	Description
	InstallerError (see page 308)	Returns IBX error messages.

	InstallError (see page 309)	Returns InterBase installation error messages.

9.1.1.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	EIBInstall.Create (MSG_NO, string) (see page 308)	Creates an instance of an EIBInstall (see page 307) object.
	EIBInstall.Create (TIBInstallerError, string) (see page 308)	Creates an instance of an EIBInstall (see page 307) object.

9.1.1.2.1 EIBInstall.Create Constructor (MSG_NO, string)

Creates an instance of an EIBInstall (see page 307) object.

Pascal

```
constructor Create(IscCode: MSG_NO; IscMessage: string); virtual; overload;
constructor Create(ECode: TIBInstallerError; EMessage: string); virtual; overload;
```

C++

```
virtual __fastcall EIBInstall(MSG_NO IscCode, UnicodeString IscMessage);
virtual __fastcall EIBInstall(TIBInstallerError ECode, UnicodeString EMessage);
```

Description

Call Create to create an instance of an EIBInstall (see page 307) exception object.

Note: You must install InterBase 6 to use this feature.

9.1.1.3 EIBInstall Properties

The properties of the EIBInstall class are listed here.

Public Properties

	Name	Description
	InstallerError (see page 308)	Returns IBX error messages.
	InstallError (see page 309)	Returns InterBase installation error messages.

9.1.1.3.1 EIBInstall.InstallerError Property

Returns IBX error messages.

Pascal

```
property InstallerError: TIBInstallerError;
```

C++

```
__property TIBInstallerError InstallerError;
```

Description

Use InstallerError to return error messages generated by the IBX install components. InstallerError can be one of:

ieSuccess	Installation is successful
ieDelphiException	Installation fails due to a Delphi exception
ieNoOptionsSet	Installation fails because no installation options are set
ieNoDestinationDirectory	Installation fails because no destination directory is set
ieNoSourceDirectory	Installation fails because no source directory is set
ieNoUninstallFile	Installation fails because no uninstall file is named
ieOptionNeedsClient	Installation fails because the installation needs the InterBase Client component to succeed
ieOptionNeedsServer	Installation fails because the installation needs the InterBase Server component to succeed
ieInvalidOption	Option is invalid
ieInvalidOnErrorResult	The OnError event result is invalid
ieInvalidOnStatusResult	The OnStatus event result is invalid

Note: You must install InterBase 6 to use this feature.

9.1.1.3.2 EIBInstall.InstallError Property

Returns InterBase installation error messages.

Pascal

```
property InstallError: MSG_NO;
```

C++

```
__property MSG_NO InstallError;
```

Description

Use InstallError to return error messages generated by the InterBase API.

Note: You must install InterBase 6 to use this feature.

9.1.2 EIBInstallerError Class

Class Hierarchy

Pascal

```
EIBInstallerError = class(EIBInstall);
```

C++

```
class EIBInstallerError : public EIBInstall;
```

File

IBInstall

Description

This is class IBInstall.EIBInstallerError.

9.1.3 EIBInstallError Class

Class Hierarchy

Pascal

```
EIBInstallError = class(EIBInstall);
```

C++

```
class EIBInstallError : public EIBInstall;
```

File

IBInstall

Description

This is class IBInstall.EIBInstallError.

9.1.4 TIBInstall Class

Use TIBInstall to set up an InterBase installation component.

Class Hierarchy

Pascal

```
TIBInstall = class(TIBSetup);
```

C++

```
class TIBInstall : public TIBSetup;
```

File

IBInstall

Description

Use TIBInstall to set up an InterBase installation component.

Note: To use this component, you must install InterBase 6 and you must place ibinstall.dll in the path.

See Also

Getting Started with InterBase Express

9.1.4.1 TIBInstall Members

The following tables list the members exposed by TIBInstall.

Protected Methods

	Name	Description
	Call (see page 318)	This is Call, a member of class TIBSetup.
	ErrorInternal (see page 318)	This is ErrorInternal, a member of class TIBSetup.
	GetInstallMessage (see page 319)	This is GetInstallMessage, a member of class TIBSetup.
	IBInstallError (see page 319)	This is IBInstallError, a member of class TIBSetup.
	StatusInternal (see page 319)	This is StatusInternal, a member of class TIBSetup.

Public Methods

	Name	Description
V	Create (see page 311)	Creates an installation component.
V	Destroy (see page 312)	Destroys the instance of TIBInstall (see page 310).
	GetOptionDescription (see page 312)	This is the overview for the GetOptionDescription method overload.
	GetOptionName (see page 313)	This is the overview for the GetOptionName method overload.
	GetOptionSpaceRequired (see page 313)	This is the overview for the GetOptionSpaceRequired method overload.
	InstallCheck (see page 314)	Checks if the installation is ready to be performed.
	InstallExecute (see page 314)	Executes the installation.

Public Properties

	Name	Description
	ErrorContext (see page 319)	Sets or returns the error context.
	MsgFilePath (see page 320)	Sets or returns the installation message file path.
R	Progress (see page 320)	Returns the installation progress.
R	RebootToComplete (see page 320)	Sets whether it is necessary to reboot to complete the installation.
	StatusContext (see page 321)	Sets or returns the status context.
R	SuggestedDestination (see page 316)	Returns the suggested installation target destination.
R	UnInstallFile (see page 316)	Returns the name and path of the uninstall file.

Published Events

	Name	Description
	OnError (see page 321)	Occurs when an installation error occurs.
	OnStatusChange (see page 322)	Occurs when a change in installation status occurs.
	OnWarning (see page 322)	Occurs when an installation warning occurs.

Published Properties

	Name	Description
	DestinationDirectory (see page 315)	Sets or returns the installation target path.
	InstallOptions (see page 315)	Sets or displays the installation options.
	SourceDirectory (see page 316)	Sets or returns the path of the InterBase installation source files.

9.1.4.2 TIBInstall.Create Constructor

Creates an installation component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBInstall(TComponent * AOwner);
```

Description

Call (see page 318) Create to create an installation component.

Note: You must install InterBase 6 to use this feature.

9.1.4.3 TIBInstall.Destroy Destructor

Destroys the instance of TIBInstall (see page 310).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBInstall();
```

Description

Do not call Destroy directly in an application. Instead, an application should call Free. Free verifies that the install object has not already been freed before it calls Destroy.

Note: You must install InterBase 6 to use this feature.

9.1.4.4 TIBInstall Methods

The methods of the TIBInstall class are listed here.

Public Methods

	Name	Description
	GetOptionDescription (see page 312)	This is the overview for the GetOptionDescription method overload.
	GetOptionName (see page 313)	This is the overview for the GetOptionName method overload.
	GetOptionSpaceRequired (see page 313)	This is the overview for the GetOptionSpaceRequired method overload.
	InstallCheck (see page 314)	Checks if the installation is ready to be performed.
	InstallExecute (see page 314)	Executes the installation.

9.1.4.4.1 GetOptionDescription Method

This is the overview for the GetOptionDescription method overload.

Overload List

	Name	Description
	TIBInstall.GetOptionDescription (TCmdOption) (see page 312)	Returns a description of a specified option.
	TIBInstall.GetOptionDescription (TConnectivityOption) (see page 312)	Returns a description of a specified option.
	TIBInstall.GetOptionDescription (TExamplesOption) (see page 312)	Returns a description of a specified option.
	TIBInstall.GetOptionDescription (TMainOption) (see page 312)	Returns a description of a specified option.

9.1.4.4.1.1 TIBInstall.GetOptionDescription Method (TCmdOption)

Returns a description of a specified option.

Pascal

```
function GetOptionDescription(Option: TExamplesOption): string; overload;
function GetOptionDescription(Option: TMainOption): string; overload;
```

```
function GetOptionDescription(Option: TConnectivityOption): string; overload;
function GetOptionDescription(Option: TCmdOption): string; overload;
```

C++

```
__fastcall UnicodeString GetOptionDescription(TExamplesOption Option);
__fastcall UnicodeString GetOptionDescription(TMainOption Option);
__fastcall UnicodeString GetOptionDescription(TConnectivityOption Option);
__fastcall UnicodeString GetOptionDescription(TCmdOption Option);
```

Description

Call (see page 318) GetOptionDescription to return a description of the indicated option. If the specified option is not valid, an error is returned.

Note: You must install InterBase 6 to use this feature.

9.1.4.4.2 GetOptionName Method

This is the overview for the GetOptionName method overload.

Overload List

	Name	Description
	TIBInstall.GetOptionName (TCmdOption) (see page 313)	Returns the option name.
	TIBInstall.GetOptionName (TConnectivityOption) (see page 313)	Returns the option name.
	TIBInstall.GetOptionName (TExamplesOption) (see page 313)	Returns the option name.
	TIBInstall.GetOptionName (TMainOption) (see page 313)	Returns the option name.

9.1.4.4.2.1 TIBInstall.GetOptionName Method (TCmdOption)

Returns the option name.

Pascal

```
function GetOptionName(Option: TExamplesOption): string; overload;
function GetOptionName(Option: TMainOption): string; overload;
function GetOptionName(Option: TConnectivityOption): string; overload;
function GetOptionName(Option: TCmdOption): string; overload;
```

C++

```
__fastcall UnicodeString GetOptionName(TExamplesOption Option);
__fastcall UnicodeString GetOptionName(TMainOption Option);
__fastcall UnicodeString GetOptionName(TConnectivityOption Option);
__fastcall UnicodeString GetOptionName(TCmdOption Option);
```

Description

Call (see page 318) GetOptionName to return the name of the indicated option.

Note: You must install InterBase 6 to use this feature.

9.1.4.4.3 GetOptionSpaceRequired Method

This is the overview for the GetOptionSpaceRequired method overload.

Overload List

	Name	Description
	TIBInstall.GetOptionSpaceRequired (TCmdOption) (see page 314)	Returns the space required to install the indicated option.
	TIBInstall.GetOptionSpaceRequired (TConnectivityOption) (see page 314)	Returns the space required to install the indicated option.
	TIBInstall.GetOptionSpaceRequired (TExamplesOption) (see page 314)	Returns the space required to install the indicated option.
	TIBInstall.GetOptionSpaceRequired (TMainOption) (see page 314)	Returns the space required to install the indicated option.

9.1.4.4.3.1 TIBInstall.GetOptionSpaceRequired Method (TCmdOption)

Returns the space required to install the indicated option.

Pascal

```
function GetOptionSpaceRequired(Option: TExamplesOption): longword; overload;
function GetOptionSpaceRequired(Option: TMainOption): longword; overload;
function GetOptionSpaceRequired(Option: TConnectivityOption): longword; overload;
function GetOptionSpaceRequired(Option: TCmdOption): longword; overload;
```

C++

```
__fastcall longword GetOptionSpaceRequired(TExamplesOption Option);
__fastcall longword GetOptionSpaceRequired(TMainOption Option);
__fastcall longword GetOptionSpaceRequired(TConnectivityOption Option);
__fastcall longword GetOptionSpaceRequired(TCmdOption Option);
```

Description

Call (see page 318) GetOptionSpaceRequired to return the space required in kilobytes for the indicated option.

Note: You must install InterBase 6 to use this feature.

9.1.4.4.4 TIBInstall.InstallCheck Method

Checks if the installation is ready to be performed.

Pascal

```
procedure InstallCheck;
```

C++

```
__fastcall InstallCheck();
```

Description

Call (see page 318) InstallCheck to check if everything is ready for the installation to be performed.

Note: You must install InterBase 6 to use this feature.

9.1.4.4.5 TIBInstall.InstallExecute Method

Executes the installation.

Pascal

```
procedure InstallExecute;
```

C++

```
__fastcall InstallExecute();
```

Description

Call (see page 318) InstallExecute to execute the installation.

Note: You must install InterBase 6 to use this feature.

9.1.4.5 TIBInstall Properties

The properties of the TIBInstall class are listed here.

Public Properties

	Name	Description
	SuggestedDestination (see page 316)	Returns the suggested installation target destination.
	UnInstallFile (see page 316)	Returns the name and path of the uninstall file.

Published Properties

	Name	Description
	DestinationDirectory (see page 315)	Sets or returns the installation target path.
	InstallOptions (see page 315)	Sets or displays the installation options.
	SourceDirectory (see page 316)	Sets or returns the path of the InterBase installation source files.

9.1.4.5.1 TIBInstall.DestinationDirectory Property

Sets or returns the installation target path.

Pascal

```
property DestinationDirectory: string;
```

C++

```
__property UnicodeString DestinationDirectory;
```

Description

Use DestinationDirectory to set or returns the installation target path. Initially, this will be the same as the SuggestedDestination (see page 316).

Note: You must install InterBase 6 to use this feature.

9.1.4.5.2 TIBInstall.InstallOptions Property

Sets or displays the installation options.

Pascal

```
property InstallOptions: TInstallOptions;
```

C++

```
__property TInstallOptions InstallOptions;
```

Description

Use InstallOptions to set or display the installation options (TInstallOptions (see page 325)). TInstallOptions (see page 325) are:

Option	Installs:
CmdLineTools	The InterBase command line tools
ConnectivityClients	The InterBase connectivity clients
Examples	The InterBase examples
MainComponents	The main InterBase components

Note: You must install InterBase 6 to use this feature.

9.1.4.5.3 TIBInstall.SourceDirectory Property

Sets or returns the path of the InterBase installation source files.

Pascal

```
property SourceDirectory: string;
```

C++

```
__property UnicodeString SourceDirectory;
```

Description

Use SourceDirectory to set or return the path of the installation source files. In most cases, this will be a path on the InterBase CDROM.

Note: You must install InterBase 6 to use this feature.

9.1.4.5.4 TIBInstall.SuggestedDestination Property

Returns the suggested installation target destination.

Pascal

```
property SuggestedDestination: string;
```

C++

```
__property UnicodeString SuggestedDestination;
```

Description

Use SuggestedDestination to return suggested installation target destination.

Note: You must install InterBase 6 to use this feature.

9.1.4.5.5 TIBInstall.UnInstallFile Property

Returns the name and path of the uninstall file.

Pascal

```
property UnInstallFile: string;
```

C++

```
__property UnicodeString UnInstallFile;
```

Description

Use UnInstallFile to return the binary log file name and path of the uninstall file. The uninstall file contains information on which options were installed. This information lets the TIBUnInstall (see page 322) component know what needs to be removed.

Note: You must install InterBase 6 to use this feature.

9.1.5 TIBSetup Class

TIBSetup is the ancestor object from which TIBInstall (see page 310) and TIBUnInstall (see page 322) are derived.

Class Hierarchy

Pascal

```
TIBSetup = class(TComponent);
```

C++

```
class TIBSetup : public TComponent;
```

File

IBInstall

Description

TIBSetup is the ancestor object from which TIBInstall (see page 310) and TIBUnInstall (see page 322) are derived.

Note: You must install InterBase 6 to use this feature.

9.1.5.1 TIBSetup Members

The following tables list the members exposed by TIBSetup.

Protected Methods

	Name	Description
	Call (see page 318)	This is Call, a member of class TIBSetup.
	ErrorInternal (see page 318)	This is ErrorInternal, a member of class TIBSetup.
	GetInstallMessage (see page 319)	This is GetInstallMessage, a member of class TIBSetup.
	IBInstallError (see page 319)	This is IBInstallError, a member of class TIBSetup.
	StatusInternal (see page 319)	This is StatusInternal, a member of class TIBSetup.

Public Methods

	Name	Description
V	Create (see page 318)	Creates an installation component.

Public Properties

	Name	Description
	ErrorContext (see page 319)	Sets or returns the error context.
	MsgFilePath (see page 320)	Sets or returns the installation message file path.
R	Progress (see page 320)	Returns the installation progress.
R	RebootToComplete (see page 320)	Sets whether it is necessary to reboot to complete the installation.
	StatusContext (see page 321)	Sets or returns the status context.

Published Events

	Name	Description
	OnError (see page 321)	Occurs when an installation error occurs.
	OnStatusChange (see page 322)	Occurs when a change in installation status occurs.

	OnWarning (see page 322)	Occurs when an installation warning occurs.

9.1.5.2 TIBSetup.Create Constructor

Creates an installation component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBSetup(TComponent * AOwner);
```

Description

Call (see page 318) Create to create an installation component.

Note: You must install InterBase 6 to use this feature.

9.1.5.3 TIBSetup Methods

The methods of the TIBSetup class are listed here.

Protected Methods

	Name	Description
	Call (see page 318)	This is Call, a member of class TIBSetup.
	ErrorInternal (see page 318)	This is ErrorInternal, a member of class TIBSetup.
	GetInstallMessage (see page 319)	This is GetInstallMessage, a member of class TIBSetup.
	IBInstallError (see page 319)	This is IBInstallError, a member of class TIBSetup.
	StatusInternal (see page 319)	This is StatusInternal, a member of class TIBSetup.

9.1.5.3.1 TIBSetup.Call Method

Pascal

```
procedure Call(IscCode: MSG_NO);
```

C++

```
__fastcall Call(MSG_NO IscCode);
```

Description

This is Call, a member of class TIBSetup.

9.1.5.3.2 TIBSetup.ErrorInternal Method

Pascal

```
function ErrorInternal(IscCode: MSG_NO; const ActionDescription: TEXT): Integer;
```

C++

```
__fastcall int ErrorInternal(MSG_NO IscCode, const TEXT ActionDescription);
```

Description

This is ErrorInternal, a member of class TIBSetup.

9.1.5.3.3 TIBSetup.GetInstallMessage Method

Pascal

```
function GetInstallMessage(IscCode: MSG_NO): string;
```

C++

```
__fastcall UnicodeString GetInstallMessage(MSG_NO IscCode);
```

Description

This is GetInstallMessage, a member of class TIBSetup.

9.1.5.3.4 TIBSetup.IBInstallError Method

Pascal

```
procedure IBInstallError(IscCode: MSG_NO);
```

C++

```
__fastcall IBInstallError(MSG_NO IscCode);
```

Description

This is IBInstallError, a member of class TIBSetup.

9.1.5.3.5 TIBSetup.StatusInternal Method

Pascal

```
function StatusInternal(Status: Integer; const ActionDescription: TEXT): Integer;
```

C++

```
__fastcall int StatusInternal(int Status, const TEXT ActionDescription);
```

Description

This is StatusInternal, a member of class TIBSetup.

9.1.5.4 TIBSetup Properties

The properties of the TIBSetup class are listed here.

Public Properties

	Name	Description
	ErrorContext (see page 319)	Sets or returns the error context.
	MsgFilePath (see page 320)	Sets or returns the installation message file path.
R	Progress (see page 320)	Returns the installation progress.
R	RebootToComplete (see page 320)	Sets whether it is necessary to reboot to complete the installation.
	StatusContext (see page 321)	Sets or returns the status context.

9.1.5.4.1 TIBSetup.ErrorContext Property

Sets or returns the error context.

Pascal

```
property ErrorContext: Pointer;
```

C++

```
__property void * ErrorContext;
```

Description

Use ErrorContext to set or return the user-defined data for the error function.

Note: You must install InterBase 6 to use this feature.

9.1.5.4.2 TIBSetup.MsgFilePath Property

Sets or returns the installation message file path.

Pascal

```
property MsgFilePath: string;
```

C++

```
__property UnicodeString MsgFilePath;
```

Description

Use MsgFilePath to set or return the full directory path to the filename.msg file. Most of the time this is the same as the source and path where the InterBase product is installed.

This property allows you to supply your own installation messages. It is also possible to write the setup program in such a way that you could switch languages on demand, by providing several filename.msg files at different locations.

The filename.msg file normally contains:

- Error messages
- Option names and descriptions
- Actions descriptions and status messages that are logged to the ibinstall.log file

Note: You must install InterBase 6 to use this feature.

9.1.5.4.3 TIBSetup.Progress Property

Returns the installation progress.

Pascal

```
property Progress: Integer;
```

C++

```
__property int Progress;
```

Description

Use Progress to return the installation progress as an integer between 0 and 100. Progress is updated by the OnStatusChange (see page 322) event.

Note: You must install InterBase 6 to use this feature.

9.1.5.4.4 TIBSetup.RebootToComplete Property

Sets whether it is necessary to reboot to complete the installation.

Pascal

```
property RebootToComplete: Boolean;
```

C++

```
__property Boolean RebootToComplete;
```

Description

Use RebootToComplete to set whether it is necessary to reboot the system to complete the installation or uninstallation. By default, this is not necessary (False).

Note: You must install InterBase 6 to use this feature.

9.1.5.4.5 TIBSetup.StatusContext Property

Sets or returns the status context.

Pascal

```
property StatusContext: Pointer;
```

C++

```
__property void * StatusContext;
```

Description

Use StatusContext to set or return the user-defined data for the status function.

Note: You must install InterBase 6 to use this feature.

9.1.5.5 TIBSetup Events

The events of the TIBSetup class are listed here.

Published Events

	Name	Description
	OnError (see page 321)	Occurs when an installation error occurs.
	OnStatusChange (see page 322)	Occurs when a change in installation status occurs.
	OnWarning (see page 322)	Occurs when an installation warning occurs.

9.1.5.5.1 TIBSetup.OnError Event

Occurs when an installation error occurs.

Pascal

```
property OnError: TIBSetupOnError;
```

C++

```
__property TIBSetupOnError OnError;
```

Description

Write an OnError event handler to take specific actions when an error occurs during installation.

Note: You must install InterBase 6 to use this feature.

9.1.5.5.2 TIBSetup.OnStatusChange Event

Occurs when a change in installation status occurs.

Pascal

```
property OnStatusChange: TIBSetupOnStatus;
```

C++

```
__property TIBSetupOnStatus OnStatusChange;
```

Description

Write an OnStatusChange event handler to take specific actions when a status change occurs during installation.

Status events are generated from time to time when InstallExecute is called. The event informs the user of the installation progress. The event handler might want to use the StatusContext (see page 321) property to display information about the current installation status. The progress is returned by the Progress (see page 320) property as an integer from 1-100.

Note: You must install InterBase 6 to use this feature.

9.1.5.5.3 TIBSetup.OnWarning Event

Occurs when an installation warning occurs.

Pascal

```
property OnWarning: TIBSetupOnWarning;
```

C++

```
__property TIBSetupOnWarning OnWarning;
```

Description

Write an OnWarning event handler to take specific actions when a warning occurs.

An OnWarning event is generated whenever warning is reported, and must return either isc_fp_install_continue or isc_install_abort.

Note: You must install InterBase 6 to use this feature.

9.1.6 TIBUnInstall Class

Use TIBUnInstall to set up an uninstall component.

Class Hierarchy

Pascal

```
TIBUnInstall = class(TIBSetup);
```

C++

```
class TIBUnInstall : public TIBSetup;
```

File

IBInstall

Description

Use TIBUnInstall to set up an uninstall component.

Note: You must install InterBase 6 to use this feature.

See Also

Getting Started with InterBase Express

9.1.6.1 TIBUnInstall Members

The following tables list the members exposed by TIBUnInstall.

Protected Methods

	Name	Description
	Call (see page 318)	This is Call, a member of class TIBSetup.
	ErrorInternal (see page 318)	This is ErrorInternal, a member of class TIBSetup.
	GetInstallMessage (see page 319)	This is GetInstallMessage, a member of class TIBSetup.
	IBInstallError (see page 319)	This is IBInstallError, a member of class TIBSetup.
	StatusInternal (see page 319)	This is StatusInternal, a member of class TIBSetup.

Public Methods

	Name	Description
V	Create (see page 318)	Creates an installation component.
	UnInstallCheck (see page 324)	Checks to see if uninstallation is possible.
	UnInstallExecute (see page 324)	Executes the uninstallation.

Public Properties

	Name	Description
	ErrorContext (see page 319)	Sets or returns the error context.
	MsgFilePath (see page 320)	Sets or returns the installation message file path.
R	Progress (see page 320)	Returns the installation progress.
R	RebootToComplete (see page 320)	Sets whether it is necessary to reboot to complete the installation.
	StatusContext (see page 321)	Sets or returns the status context.
	UnInstallFile (see page 324)	Returns the name and path of the InterBase uninstall file.

Published Events

	Name	Description
	OnError (see page 321)	Occurs when an installation error occurs.
	OnStatusChange (see page 322)	Occurs when a change in installation status occurs.
	OnWarning (see page 322)	Occurs when an installation warning occurs.

9.1.6.2 TIBUnInstall Methods

The methods of the TIBUnInstall class are listed here.

Public Methods

	Name	Description
	UnInstallCheck (see page 324)	Checks to see if uninstallation is possible.
	UnInstallExecute (see page 324)	Executes the uninstallation.

9.1.6.2.1 TIBUnInstall.UnInstallCheck Method

Checks to see if uninstallation is possible.

Pascal

```
procedure UnInstallCheck;
```

C++

```
__fastcall UnInstallCheck();
```

Description

Call (see page 318) UnInstallCheck to check if uninstallation is possible.

Note: You must install InterBase 6 to use this feature.

9.1.6.2.2 TIBUnInstall.UnInstallExecute Method

Executes the uninstallation.

Pascal

```
procedure UnInstallExecute;
```

C++

```
__fastcall UnInstallExecute();
```

Description

Call (see page 318) UnInstallExecute to execute the uninstallation.

Note: You must install InterBase 6 to use this feature.

9.1.6.3 TIBUnInstall Properties

The properties of the TIBUnInstall class are listed here.

Public Properties

	Name	Description
	UnInstallFile (see page 324)	Returns the name and path of the InterBase uninstall file.

9.1.6.3.1 TIBUnInstall.UnInstallFile Property

Returns the name and path of the InterBase uninstall file.

Pascal

```
property UnInstallFile: string;
```

C++

```
__property UnicodeString UnInstallFile;
```

Description

Use UnInstallFile to return the name and path of the InterBase uninstall file.

Note: You must install InterBase 6 to use this feature.

9.1.7 TInstallOptions Class

TInstallOptions configures the options of a TIBInstall (see page 310) instance.

Class Hierarchy

Pascal

```
TInstallOptions = class(TPersistent);
```

C++

```
class TInstallOptions : public TPersistent;
```

File

IBInstall

Description

Use TInstallOptions to indicate the options to use when installing InterBase. This is the type of the Options property on TIBInstall (see page 310).

Note: You must install InterBase 6 to use this feature.

9.1.7.1 TInstallOptions Members

The following tables list the members exposed by TInstallOptions.

Published Properties

	Name	Description
	CmdLineTools (see page 325)	Installs the command line tools for InterBase.
	ConnectivityClients (see page 326)	Installs the connectivity clients for InterBase.
	Examples (see page 326)	Installs all the InterBase examples.
	MainComponents (see page 326)	Installs the InterBase main components.

9.1.7.2 TInstallOptions Properties

The properties of the TInstallOptions class are listed here.

Published Properties

	Name	Description
	CmdLineTools (see page 325)	Installs the command line tools for InterBase.
	ConnectivityClients (see page 326)	Installs the connectivity clients for InterBase.
	Examples (see page 326)	Installs all the InterBase examples.
	MainComponents (see page 326)	Installs the InterBase main components.

9.1.7.2.1 TInstallOptions.CmdLineTools Property

Installs the command line tools for InterBase.

Pascal

```
property CmdLineTools: TCmdOptions;
```

C++

```
__property TCmdOptions CmdLineTools;
```

Description

Use CmdLineTools to indicate which of the command line tools for InterBase should be installed. The installer issues a warning for any of these if the MainComponents (see page 326) property does not include moClient.

Note: You must install InterBase 6 to use this feature.

9.1.7.2.2 TInstallOptions.ConnectivityClients Property

Installs the connectivity clients for InterBase.

Pascal

```
property ConnectivityClients: TConnectivityOptions;
```

C++

```
__property TConnectivityOptions ConnectivityClients;
```

Description

Use ConnectivityClients to install the InterBase connectivity clients.

Note: You must install InterBase 6 to use this feature.

9.1.7.2.3 TInstallOptions.Examples Property

Installs all the InterBase examples.

Pascal

```
property Examples: TExamplesOptions;
```

C++

```
__property TExamplesOptions Examples;
```

Description

Use Examples to indicates which of the InterBase examples should be installed.

When Examples includes exAPI, the MainComponents (see page 326) property must include moClient and moDevelopment. When Examples includes exDev, MainComponents (see page 326) must include moServer.

Note: You must install InterBase 6 to use this feature.

9.1.7.2.4 TInstallOptions.MainComponents Property

Installs the InterBase main components.

Pascal

```
property MainComponents: TMainOptions;
```

C++

```
__property TMainOptions MainComponents;
```

Description

Use MainComponents to indicate which of the InterBase main components to install. These can include the client, server, development tools, documentation, and ODBC driver and driver manager.

Note: You must install InterBase 6 to use this feature.

9.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TCmdOption (see page 328)	TCmdOption and TCmdOptions (see page 333) indicate which of the command-line tools are installed.
	TConnectivityOption (see page 329)	TConnectivityOption and TConnectivityOptions (see page 333) identify InterBase connectivity clients.
	TErrorResult (see page 329)	This is record IBInstall.TErrorResult.
	TExamplesOption (see page 330)	TExamplesOption and TExamplesOptions (see page 334) identify InterBase Examples clients.
	TIBInstallerError (see page 330)	This is record IBInstall.TIBInstallerError.
	TMainOption (see page 331)	TMainOption and TMainOptions (see page 336) identify the main InterBase components.
	TStatusResult (see page 332)	This is record IBInstall.TStatusResult.
	TWarningResult (see page 332)	This is record IBInstall.TWarningResult.

9.2.1 IBInstall.TCmdOption Enumeration

TCmdOption and TCmdOptions (see page 333) indicate which of the command-line tools are installed.

Pascal

```
TCmdOption = (
  cmDBMgmt,
  cmDBQuery,
  cmUsrMgmt
);
```

C++

```
enum TCmdOption {
  cmDBMgmt,
  cmDBQuery,
  cmUsrMgmt
};
```

File

IBInstall

Description

TCmdOption indicates a particular command-line tool for InterBase. TCmdOptions (see page 333) is a set of TCmdOption values that indicates the tools that are installed. The following table lists the TCmdOption values:

Value Meaning

cmDBMgmt gbak and gfix database management tools.

cmDBQuery isql, gdef, and qli database query tools.

cmUsrMgmt gsec user management tool.

9.2.2 IBInstall.TConnectivityOption Enumeration

TConnectivityOption and TConnectivityOptions (see page 333) identify InterBase connectivity clients.

Pascal

```
TConnectivityOption = (
  cnODBC,
  cnOLEDB,
  cnJDBC
);
```

C++

```
enum TConnectivityOption {
  cnODBC,
  cnOLEDB,
  cnJDBC
};
```

File

IBInstall

Description

TConnectivityOption indicates a particular connectivity client. TConnectivityOptions (see page 333) is a set of TConnectivityOption values that indicates the clients that are installed. The following table lists the TConnectivityOption values:

Value Meaning

cnODBC The Open Database Connectivity client.

cnOLEDB The OLE DB connectivity client.

cnJDBC The InterClient Java (see page 987) connectivity client.

9.2.3 IBInstall.TErrorResult Enumeration

Pascal

```
TErrorResult = (
  erAbort,
  erContinue,
  erRetry
);
```

C++

```
enum TErrorResult {
  erAbort,
  erContinue,
  erRetry
};
```

File

IBInstall

Description

This is record IBInstall.TErrorResult.

9.2.4 IBInstall.TExamplesOption Enumeration

TExamplesOption and TExamplesOptions (see page 334) identify InterBase Examples clients.

Pascal

```
TExamplesOption = (
  exDB,
  exAPI
);
```

C++

```
enum TExamplesOption {
  exDB,
  exAPI
};
```

File

IBInstall

Description

TExamplesOption indicates a particular example that ships with InterBase. TExamplesOptions (see page 334) is a set of TExamplesOption values that indicates the examples that are installed. The following table lists the TExamplesOption values:

Value Meaning

exAPI API, SQL, DSQL, and ESQL example files.

exDB Database examples.

9.2.5 IBInstall.TIBInstallerError Enumeration

Pascal

```
TIBInstallerError = (
  ieSuccess,
  ieDelphiException,
  ieNoOptionsSet,
  ieNoDestinationDirectory,
  ieNosourceDirectory,
  ieNoUninstallFile,
  ieOptionNeedsClient,
  ieOptionNeedsServer,
  ieInvalidOption,
  ieInvalidOnErrorResult,
  ieInvalidOnStatusResult
);
```

C++

```
enum TIBInstallerError {
  ieSuccess,
  ieDelphiException,
```

```
    ieNoOptionsSet,
    ieNoDestinationDirectory,
    ieNosourceDirectory,
    ieNoUninstallFile,
    ieOptionNeedsClient,
    ieOptionNeedsServer,
    ieInvalidOption,
    ieInvalidOnErrorResult,
    ieInvalidOnStatusResult
  };
```

File

IBInstall

Description

This is record IBInstall.TIBInstallerError.

9.2.6 IBInstall.TMainOption Enumeration

TMainOption and TMainOptions (see page 336) identify the main InterBase components.

Pascal

```
  TMainOption = (
    moServer,
    moClient,
    moConServer,
    moGuiTools,
    moDocumentation,
    moDevelopment
  );
```

C++

```
  enum TMainOption {
    moServer,
    moClient,
    moConServer,
    moGuiTools,
    moDocumentation,
    moDevelopment
  };
```

File

IBInstall

Description

TMainOption indicates one of the main InterBase components. TMainOptions (see page 336) is a set of TMainOption values that indicates the components that are installed. The following table lists the TMainOption values:

Value Meaning

moServer Server component, including: the server, license file (if present), message file, the Guardian, server configuration tool, the database information tools, UDF library, International character set library, and help files (Windows only).

moClient Client component, including the client library, license file, and message file.

moConServer Connectivity server, for future implementation.

moGuiTools Graphical interface tools, including IBConsole.

moDocumentation Documentation, including PDF files and indexes.

moDevelopment Development tools, including gpre, the import libraries, and the header files.

9.2.7 IBInstall.TStatusResult Enumeration

Pascal

```
TStatusResult = (
  srAbort,
  srContinue
);
```

C++

```
enum TStatusResult {
  srAbort,
  srContinue
};
```

File

IBInstall

Description

This is record IBInstall.TStatusResult.

9.2.8 IBInstall.TWarningResult Enumeration

Pascal

```
TWarningResult = (
  wrAbort,
  wrContinue
);
```

C++

```
enum TWarningResult {
  wrAbort,
  wrContinue
};
```

File

IBInstall

Description

This is record IBInstall.TWarningResult.

9.3 Types

The following table lists types in this documentation.

Types

Name	Description
TCmdOptions (see page 333)	This is type IBInstall.TCmdOptions.
TConnectivityOptions (see page 333)	This is type IBInstall.TConnectivityOptions.
TExamplesOptions (see page 334)	This is type IBInstall.TExamplesOptions.
TIBSetupOnError (see page 334)	TIBSetupOnError is the type of event handlers that respond to installation errors.
TIBSetupOnStatus (see page 334)	TIBSetupOnStatus is the type of event handlers that respond during the InterBase installation or de-installation process.
TIBSetupOnWarning (see page 335)	TIBSetupOnWarning is the type of event handlers that respond to installation warnings.
TIscError (see page 335)	This is type IBInstall.TIscError.
TMainOptions (see page 336)	This is type IBInstall.TMainOptions.

9.3.1 IBInstall.TCmdOptions Type

Pascal

```
TCmdOptions = set of TCmdOption;
```

C++

```
TCmdOption TCmdOptions;
```

File

IBInstall

Description

This is type IBInstall.TCmdOptions.

9.3.2 IBInstall.TConnectivityOptions Type

Pascal

```
TConnectivityOptions = set of TConnectivityOption;
```

C++

```
TConnectivityOption TConnectivityOptions;
```

File

IBInstall

Description

This is type IBInstall.TConnectivityOptions.

9.3.3 IBInstall.TExamplesOptions Type

Pascal

```
TExamplesOptions = set of TExamplesOption;
```

C++

```
TExamplesOption TExamplesOptions;
```

File

IBInstall

Description

This is type IBInstall.TExamplesOptions.

9.3.4 IBInstall.TIBSetupOnError Type

TIBSetupOnError is the type of event handlers that respond to installation errors.

Pascal

```
TIBSetupOnError = function (Sender : TObject; IscCode : TIscError; ErrorMessage, ErrorComment
: string): TErrorResult of object;
```

C++

```
(Sender : TObject; IscCode : TIscError; ErrorMessage, ErrorComment : string): TErrorResult (
TIBSetupOnError)();
```

File

IBInstall

Description

Sender is the TIBSetup (see page 317) component that encounters the exception.

IscCode is the error code for the problem that was encounted.

ErrorMessage is the error message fro the problem that occurred.

ErrorComment returns a string that will be displayed to the user.

The event handler is expected to return isc_fp_install_continue, isc_install_abort or isc_fp_install_retry.

9.3.5 IBInstall.TIBSetupOnStatus Type

TIBSetupOnStatus is the type of event handlers that respond during the InterBase installation or de-installation process.

Pascal

```
TIBSetupOnStatus = function (Sender : TObject; StatusComment : string): TStatusResult of
object;
```

C++

```
(Sender : TObject; StatusComment : string): TStatusResult ( TIBSetupOnStatus)();
```

File

IBInstall

Description

Sender is the TIBSetup (see page 317) component that is installing or uninstalling.

StatusComment is a short string that indicates what operation is currently occurring. This can be used to supply the user with feedback on the installation process.

The event handler can return isc_fp_install_continue if the installation should continue, or isc_install_abort if the user cancels the installation process.

9.3.6 IBInstall.TIBSetupOnWarning Type

TIBSetupOnWarning is the type of event handlers that respond to installation warnings.

Pascal

```
TIBSetupOnWarning = function (Sender :TObject; WarningCode: TIscError; WarningMessage :
string): TWarningResult of object;
```

C++

```
(Sender :TObject; WarningCode: TIscError; WarningMessage : string): TWarningResult (
TIBSetupOnWarning)();
```

File

IBInstall

Description

Sender is the TIBSetup (see page 317) component that encounters the warning.

WarningCode is the warning code for the situation that was encounted.

WarningMessage is the warning message for the situation that occurred.

The event handler must return either isc_fp_install_continue or isc_install_abort.

9.3.7 IBInstall.TIscError Type

Pascal

```
TIscError = MSG_NO;
```

C++

```
MSG_NO TIscError;
```

File

IBInstall

Description

This is type IBInstall.TIscError.

9.3.8 IBInstall.TMainOptions Type

Pascal

```
TMainOptions = set of TMainOption;
```

C++

```
TMainOption TMainOptions;
```

File

IBInstall

Description

This is type IBInstall.TMainOptions.

10 IBIntf Namespace

This is namespace IBIntf.

Topics

Name	Description
Functions (see page 340)	The following table lists functions in this documentation.
Variables (see page 351)	The following table lists variables in this documentation.

Functions

	Name	Description
	CheckIBInstallLoaded (see page 340)	Attempts to load IBInstall.DLL into memory if it is not already loaded.
	CheckIBLoaded (see page 341)	Attempts to load GDS32.DLL into memory if it is not already loaded.
	FreeIBInstallLibrary (see page 341)	Frees the IBInstall.DLL from memory.
	FreeIBLibrary (see page 341)	Frees the GDS32.DLL from memory.
	GetIBClientVersion (see page 342)	Returns the major version number of the InterBase client.
	isc_decode_sql_date_stub (see page 342)	This is function IBIntf.isc_decode_sql_date_stub.
	isc_decode_sql_time_stub (see page 342)	This is function IBIntf.isc_decode_sql_time_stub.
	isc_decode_timestamp_stub (see page 343)	This is function IBIntf.isc_decode_timestamp_stub.
	isc_encode_sql_date_stub (see page 343)	This is function IBIntf.isc_encode_sql_date_stub.
	isc_encode_sql_time_stub (see page 343)	This is function IBIntf.isc_encode_sql_time_stub.
	isc_encode_timestamp_stub (see page 344)	This is function IBIntf.isc_encode_timestamp_stub.
	isc_install_clear_options_stub (see page 344)	This is function IBIntf.isc_install_clear_options_stub.
	isc_install_execute_stub (see page 344)	This is function IBIntf.isc_install_execute_stub.
	isc_install_get_info_stub (see page 345)	This is function IBIntf.isc_install_get_info_stub.
	isc_install_get_message_stub (see page 345)	This is function IBIntf.isc_install_get_message_stub.
	isc_install_load_external_text_stub (see page 345)	This is function IBIntf.isc_install_load_external_text_stub.
	isc_install_precheck_stub (see page 346)	This is function IBIntf.isc_install_precheck_stub.
	isc_install_set_option_stub (see page 346)	This is function IBIntf.isc_install_set_option_stub.
	isc_install_unset_option_stub (see page 346)	This is function IBIntf.isc_install_unset_option_stub.
	isc_rollback_retaining_stub (see page 347)	This is function IBIntf.isc_rollback_retaining_stub.
	isc_service_attach_stub (see page 347)	This is function IBIntf.isc_service_attach_stub.
	isc_service_detach_stub (see page 347)	This is function IBIntf.isc_service_detach_stub.
	isc_service_query_stub (see page 348)	This is function IBIntf.isc_service_query_stub.
	isc_service_start_stub (see page 348)	This is function IBIntf.isc_service_start_stub.
	isc_uninstall_execute_stub (see page 348)	This is function IBIntf.isc_uninstall_execute_stub.
	isc_uninstall_precheck_stub (see page 349)	This is function IBIntf.isc_uninstall_precheck_stub.

	LoadIBInstallLibrary (see page 349)	Loads IBInstall.DLL into memory.
	LoadIBLibrary (see page 349)	Loads GDS32.DLL into memory.
	TryIBLoad (see page 350)	This is function IBIntf.TryIBLoad.

Variables

Name	Description
BLOB_get (see page 352)	This is variable IBIntf.BLOB_get.
BLOB_put (see page 352)	This is variable IBIntf.BLOB_put.
isc_add_user (see page 353)	This is variable IBIntf.isc_add_user.
isc_attach_database (see page 353)	This is variable IBIntf.isc_attach_database.
isc_blob_info (see page 353)	This is variable IBIntf.isc_blob_info.
isc_cancel_events (see page 354)	This is variable IBIntf.isc_cancel_events.
isc_close_blob (see page 354)	This is variable IBIntf.isc_close_blob.
isc_commit_retaining (see page 354)	This is variable IBIntf.isc_commit_retaining.
isc_commit_transaction (see page 355)	This is variable IBIntf.isc_commit_transaction.
isc_create_blob2 (see page 355)	This is variable IBIntf.isc_create_blob2.
isc_database_info (see page 355)	This is variable IBIntf.isc_database_info.
isc_decode_date (see page 356)	This is variable IBIntf.isc_decode_date.
isc_decode_sql_date (see page 356)	This is variable IBIntf.isc_decode_sql_date.
isc_decode_sql_time (see page 356)	This is variable IBIntf.isc_decode_sql_time.
isc_decode_timestamp (see page 357)	This is variable IBIntf.isc_decode_timestamp.
isc_delete_user (see page 357)	This is variable IBIntf.isc_delete_user.
isc_detach_database (see page 357)	This is variable IBIntf.isc_detach_database.
isc_drop_database (see page 358)	This is variable IBIntf.isc_drop_database.
isc_dsql_alloc_statement2 (see page 358)	This is variable IBIntf.isc_dsql_alloc_statement2.
isc_dsql_describe (see page 358)	This is variable IBIntf.isc_dsql_describe.
isc_dsql_describe_bind (see page 359)	This is variable IBIntf.isc_dsql_describe_bind.
isc_dsql_execute (see page 359)	This is variable IBIntf.isc_dsql_execute.
isc_dsql_execute_immediate (see page 359)	This is variable IBIntf.isc_dsql_execute_immediate.
isc_dsql_execute2 (see page 360)	This is variable IBIntf.isc_dsql_execute2.
isc_dsql_fetch (see page 360)	This is variable IBIntf.isc_dsql_fetch.
isc_dsql_free_statement (see page 360)	This is variable IBIntf.isc_dsql_free_statement.
isc_dsql_prepare (see page 361)	This is variable IBIntf.isc_dsql_prepare.
isc_dsql_set_cursor_name (see page 361)	This is variable IBIntf.isc_dsql_set_cursor_name.
isc_dsql_sql_info (see page 361)	This is variable IBIntf.isc_dsql_sql_info.
isc_encode_date (see page 362)	This is variable IBIntf.isc_encode_date.
isc_encode_sql_date (see page 362)	This is variable IBIntf.isc_encode_sql_date.
isc_encode_sql_time (see page 362)	This is variable IBIntf.isc_encode_sql_time.
isc_encode_timestamp (see page 363)	This is variable IBIntf.isc_encode_timestamp.
isc_event_block (see page 363)	This is variable IBIntf.isc_event_block.
isc_event_counts (see page 363)	This is variable IBIntf.isc_event_counts.
isc_free (see page 364)	This is variable IBIntf.isc_free.
isc_get_segment (see page 364)	This is variable IBIntf.isc_get_segment.
isc_install_clear_options (see page 364)	This is variable IBIntf.isc_install_clear_options.
isc_install_execute (see page 365)	This is variable IBIntf.isc_install_execute.
isc_install_get_info (see page 365)	This is variable IBIntf.isc_install_get_info.
isc_install_get_message (see page 365)	This is variable IBIntf.isc_install_get_message.
isc_install_load_external_text (see page 366)	This is variable IBIntf.isc_install_load_external_text.
isc_install_precheck (see page 366)	This is variable IBIntf.isc_install_precheck.
isc_install_set_option (see page 366)	This is variable IBIntf.isc_install_set_option.
isc_install_unset_option (see page 367)	This is variable IBIntf.isc_install_unset_option.
isc_interprete (see page 367)	This is variable IBIntf.isc_interprete.
isc_modify_user (see page 367)	This is variable IBIntf.isc_modify_user.
isc_open_blob2 (see page 368)	This is variable IBIntf.isc_open_blob2.

isc_prepare_transaction (see page 368)	This is variable IBIntf.isc_prepare_transaction.
isc_prepare_transaction2 (see page 368)	This is variable IBIntf.isc_prepare_transaction2.
isc_put_segment (see page 369)	This is variable IBIntf.isc_put_segment.
isc_que_events (see page 369)	This is variable IBIntf.isc_que_events.
isc_rollback_retaining (see page 369)	This is variable IBIntf.isc_rollback_retaining.
isc_rollback_transaction (see page 370)	This is variable IBIntf.isc_rollback_transaction.
isc_service_attach (see page 370)	This is variable IBIntf.isc_service_attach.
isc_service_detach (see page 370)	This is variable IBIntf.isc_service_detach.
isc_service_query (see page 371)	This is variable IBIntf.isc_service_query.
isc_service_start (see page 371)	This is variable IBIntf.isc_service_start.
isc_sql_interprete (see page 371)	This is variable IBIntf.isc_sql_interprete.
isc_sqlcode (see page 372)	This is variable IBIntf.isc_sqlcode.
isc_start_multiple (see page 372)	This is variable IBIntf.isc_start_multiple.
isc_uninstall_execute (see page 372)	This is variable IBIntf.isc_uninstall_execute.
isc_uninstall_precheck (see page 373)	This is variable IBIntf.isc_uninstall_precheck.
isc_vax_integer (see page 373)	This is variable IBIntf.isc_vax_integer.

10.1 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	CheckIBInstallLoaded (see page 340)	Attempts to load IBInstall.DLL into memory if it is not already loaded.
	CheckIBLoaded (see page 341)	Attempts to load GDS32.DLL into memory if it is not already loaded.
	FreeIBInstallLibrary (see page 341)	Frees the IBInstall.DLL from memory.
	FreeIBLibrary (see page 341)	Frees the GDS32.DLL from memory.
	GetIBClientVersion (see page 342)	Returns the major version number of the InterBase client.
	isc_decode_sql_date_stub (see page 342)	This is function IBIntf.isc_decode_sql_date_stub.
	isc_decode_sql_time_stub (see page 342)	This is function IBIntf.isc_decode_sql_time_stub.
	isc_decode_timestamp_stub (see page 343)	This is function IBIntf.isc_decode_timestamp_stub.
	isc_encode_sql_date_stub (see page 343)	This is function IBIntf.isc_encode_sql_date_stub.
	isc_encode_sql_time_stub (see page 343)	This is function IBIntf.isc_encode_sql_time_stub.
	isc_encode_timestamp_stub (see page 344)	This is function IBIntf.isc_encode_timestamp_stub.
	isc_install_clear_options_stub (see page 344)	This is function IBIntf.isc_install_clear_options_stub.
	isc_install_execute_stub (see page 344)	This is function IBIntf.isc_install_execute_stub.
	isc_install_get_info_stub (see page 345)	This is function IBIntf.isc_install_get_info_stub.
	isc_install_get_message_stub (see page 345)	This is function IBIntf.isc_install_get_message_stub.
	isc_install_load_external_text_stub (see page 345)	This is function IBIntf.isc_install_load_external_text_stub.
	isc_install_precheck_stub (see page 346)	This is function IBIntf.isc_install_precheck_stub.
	isc_install_set_option_stub (see page 346)	This is function IBIntf.isc_install_set_option_stub.
	isc_install_unset_option_stub (see page 346)	This is function IBIntf.isc_install_unset_option_stub.
	isc_rollback_retaining_stub (see page 347)	This is function IBIntf.isc_rollback_retaining_stub.
	isc_service_attach_stub (see page 347)	This is function IBIntf.isc_service_attach_stub.
	isc_service_detach_stub (see page 347)	This is function IBIntf.isc_service_detach_stub.
	isc_service_query_stub (see page 348)	This is function IBIntf.isc_service_query_stub.
	isc_service_start_stub (see page 348)	This is function IBIntf.isc_service_start_stub.
	isc_uninstall_execute_stub (see page 348)	This is function IBIntf.isc_uninstall_execute_stub.
	isc_uninstall_precheck_stub (see page 349)	This is function IBIntf.isc_uninstall_precheck_stub.
	LoadIBInstallLibrary (see page 349)	Loads IBInstall.DLL into memory.
	LoadIBLibrary (see page 349)	Loads GDS32.DLL into memory.
	TryIBLoad (see page 350)	This is function IBIntf.TryIBLoad.

10.1.1 IBIntf.CheckIBInstallLoaded Function

Attempts to load IBInstall.DLL into memory if it is not already loaded.

Pascal

```
procedure CheckIBInstallLoaded;
```

C++

```
CheckIBInstallLoaded();
```

File

IBIntf

Description

Use the CheckIBInstallLibrary procedure to load IBInstall.DLL into memory if it is not already loaded. If unsuccessful, this procedure raises an exception.

10.1.2 IBIntf.CheckIBLoaded Function

Attempts to load GDS32.DLL into memory if it is not already loaded.

Pascal

```
procedure CheckIBLoaded;
```

C++

```
CheckIBLoaded();
```

File

IBIntf

Description

Use the CheckIBInstallLibrary procedure to load GDS32.DLL into memory if it is not already loaded. If unsuccessful, this procedure raises an exception.

10.1.3 IBIntf.FreeIBInstallLibrary Function

Frees the IBInstall.DLL from memory.

Pascal

```
procedure FreeIBInstallLibrary;
```

C++

```
FreeIBInstallLibrary();
```

File

IBIntf

Description

Use the FreeIBInstallLibrary procedure to free the previously loaded the IBInstall.DLL from memory.

10.1.4 IBIntf.FreeIBLibrary Function

Frees the GDS32.DLL from memory.

Pascal

```
procedure FreeIBLibrary;
```

C++

```
FreeIBLibrary();
```

File

IBIntf

Description

Use the FreeIBInstallLibrary (see page 341) procedure to free the previously loaded the GDS32.DLL from memory.

10.1.5 IBIntf.GetIBClientVersion Function

Returns the major version number of the InterBase client.

Pascal

```
function GetIBClientVersion: Integer;
```

C++

```
int GetIBClientVersion();
```

File

IBIntf

Description

Use the GetIBClientVersion function to retrieve the major version number of the InterBase client.

10.1.6 IBIntf.isc_decode_sql_date_stub Function

Pascal

```
procedure isc_decode_sql_date_stub(ib_date: PISC_DATE; tm_date: PCTimeStructure); stdcall;
```

C++

```
__stdcall isc_decode_sql_date_stub(PISC_DATE ib_date, PCTimeStructure tm_date);
```

File

IBIntf

Description

This is function IBIntf.isc_decode_sql_date_stub.

10.1.7 IBIntf.isc_decode_sql_time_stub Function

Pascal

```
procedure isc_decode_sql_time_stub(ib_time: PISC_TIME; tm_date: PCTimeStructure); stdcall;
```

C++

```
__stdcall isc_decode_sql_time_stub(PISC_TIME ib_time, PCTimeStructure tm_date);
```

File

IBIntf

Description

This is function IBIntf.isc_decode_sql_time_stub.

10.1.8 IBIntf.isc_decode_timestamp_stub Function

Pascal

```
procedure isc_decode_timestamp_stub(ib_timestamp: PISC_TIMESTAMP; tm_date: PCTimeStructure);
stdcall;
```

C++

```
__stdcall isc_decode_timestamp_stub(PISC_TIMESTAMP ib_timestamp, PCTimeStructure tm_date);
```

File

IBIntf

Description

This is function IBIntf.isc_decode_timestamp_stub.

10.1.9 IBIntf.isc_encode_sql_date_stub Function

Pascal

```
procedure isc_encode_sql_date_stub(tm_date: PCTimeStructure; ib_date: PISC_DATE); stdcall;
```

C++

```
__stdcall isc_encode_sql_date_stub(PCTimeStructure tm_date, PISC_DATE ib_date);
```

File

IBIntf

Description

This is function IBIntf.isc_encode_sql_date_stub.

10.1.10 IBIntf.isc_encode_sql_time_stub Function

Pascal

```
procedure isc_encode_sql_time_stub(tm_date: PCTimeStructure; ib_time: PISC_TIME); stdcall;
```

C++

```
__stdcall isc_encode_sql_time_stub(PCTimeStructure tm_date, PISC_TIME ib_time);
```

File

IBIntf

Description

This is function IBIntf.isc_encode_sql_time_stub.

10.1.11 IBIntf.isc_encode_timestamp_stub Function

Pascal

```
procedure isc_encode_timestamp_stub(tm_date: PCTimeStructure; ib_timestamp: PISC_TIMESTAMP);
stdcall;
```

C++

```
__stdcall isc_encode_timestamp_stub(PCTimeStructure tm_date, PISC_TIMESTAMP ib_timestamp);
```

File

IBIntf

Description

This is function IBIntf.isc_encode_timestamp_stub.

10.1.12 IBIntf.isc_install_clear_options_stub Function

Pascal

```
function isc_install_clear_options_stub(hOption: POPTIONS_HANDLE): MSG_NO; stdcall;
```

C++

```
__stdcall MSG_NO isc_install_clear_options_stub(POPTIONS_HANDLE hOption);
```

File

IBIntf

Description

This is function IBIntf.isc_install_clear_options_stub.

10.1.13 IBIntf.isc_install_execute_stub Function

Pascal

```
function isc_install_execute_stub(hOption: OPTIONS_HANDLE; src_dir: TEXT; dest_dir: TEXT;
status_func: FP_STATUS; status_data: pointer; error_func: FP_ERROR; error_data: pointer;
uninstal_file_name: TEXT): MSG_NO; stdcall;
```

C++

```
__stdcall MSG_NO isc_install_execute_stub(OPTIONS_HANDLE hOption, TEXT src_dir, TEXT dest_dir,
FP_STATUS status_func, void * status_data, FP_ERROR error_func, void * error_data, TEXT
uninstal_file_name);
```

File

IBIntf

Description

This is function IBIntf.isc_install_execute_stub.

10.1.14 IBIntf.isc_install_get_info_stub Function

Pascal

```
function isc_install_get_info_stub(info_type: integer; option: OPT; info_buffer: Pointer;
buf_len: Cardinal): MSG_NO; stdcall;
```

C++

```
__stdcall MSG_NO isc_install_get_info_stub(int info_type, OPT option, void * info_buffer,
unsigned buf_len);
```

File

IBIntf

Description

This is function IBIntf.isc_install_get_info_stub.

10.1.15 IBIntf.isc_install_get_message_stub Function

Pascal

```
function isc_install_get_message_stub(hOption: OPTIONS_HANDLE; message_no: MSG_NO;
message_txt: Pointer; message_len: Cardinal): MSG_NO; stdcall;
```

C++

```
__stdcall MSG_NO isc_install_get_message_stub(OPTIONS_HANDLE hOption, MSG_NO message_no, void
* message_txt, unsigned message_len);
```

File

IBIntf

Description

This is function IBIntf.isc_install_get_message_stub.

10.1.16 IBIntf.isc_install_load_external_text_stub Function

Pascal

```
function isc_install_load_external_text_stub(msg_file_name: TEXT): MSG_NO; stdcall;
```

C++

```
__stdcall MSG_NO isc_install_load_external_text_stub(TEXT msg_file_name);
```

File

IBIntf

Description

This is function IBIntf.isc_install_load_external_text_stub.

10.1.17 IBIntf.isc_install_precheck_stub Function

Pascal

```
function isc_install_precheck_stub(hOption: OPTIONS_HANDLE; src_dir: TEXT; dest_dir: TEXT):
MSG_NO; stdcall;
```

C++

```
__stdcall MSG_NO isc_install_precheck_stub(OPTIONS_HANDLE hOption, TEXT src_dir, TEXT
dest_dir);
```

File

IBIntf

Description

This is function IBIntf.isc_install_precheck_stub.

10.1.18 IBIntf.isc_install_set_option_stub Function

Pascal

```
function isc_install_set_option_stub(hOption: POPTIONS_HANDLE; option: OPT): MSG_NO; stdcall;
```

C++

```
__stdcall MSG_NO isc_install_set_option_stub(POPTIONS_HANDLE hOption, OPT option);
```

File

IBIntf

Description

This is function IBIntf.isc_install_set_option_stub.

10.1.19 IBIntf.isc_install_unset_option_stub Function

Pascal

```
function isc_install_unset_option_stub(hOption: POPTIONS_HANDLE; option: OPT): MSG_NO; stdcall;
```

C++

```
__stdcall MSG_NO isc_install_unset_option_stub(POPTIONS_HANDLE hOption, OPT option);
```

File

IBIntf

Description

This is function IBIntf.isc_install_unset_option_stub.

10.1.20 IBIntf.isc_rollback_retaining_stub Function

Pascal

```
function isc_rollback_retaining_stub(status_vector: PISC_STATUS; tran_handle: PISC_TR_HANDLE):
ISC_STATUS; stdcall;
```

C++

```
__stdcall ISC_STATUS isc_rollback_retaining_stub(PISC_STATUS status_vector, PISC_TR_HANDLE
tran_handle);
```

File

IBIntf

Description

This is function IBIntf.isc_rollback_retaining_stub.

10.1.21 IBIntf.isc_service_attach_stub Function

Pascal

```
function isc_service_attach_stub(status_vector: PISC_STATUS; isc_arg2: UShort; isc_arg3:
PChar; service_handle: PISC_SVC_HANDLE; isc_arg5: UShort; isc_arg6: PChar): ISC_STATUS;
stdcall;
```

C++

```
__stdcall ISC_STATUS isc_service_attach_stub(PISC_STATUS status_vector, UShort isc_arg2, const
char * isc_arg3, PISC_SVC_HANDLE service_handle, UShort isc_arg5, const char * isc_arg6);
```

File

IBIntf

Description

This is function IBIntf.isc_service_attach_stub.

10.1.22 IBIntf.isc_service_detach_stub Function

Pascal

```
function isc_service_detach_stub(status_vector: PISC_STATUS; service_handle: PISC_SVC_HANDLE):
ISC_STATUS; stdcall;
```

C++

```
__stdcall ISC_STATUS isc_service_detach_stub(PISC_STATUS status_vector, PISC_SVC_HANDLE
service_handle);
```

File

IBIntf

Description

This is function IBIntf.isc_service_detach_stub.

10.1.23 IBIntf.isc_service_query_stub Function

Pascal

```
function isc_service_query_stub(status_vector: PISC_STATUS; service_handle: PISC_SVC_HANDLE;
recv_handle: PISC_SVC_HANDLE; isc_arg4: UShort; isc_arg5: PChar; isc_arg6: UShort; isc_arg7:
PChar; isc_arg8: UShort; isc_arg9: PChar): ISC_STATUS; stdcall;
```

C++

```
__stdcall ISC_STATUS isc_service_query_stub(PISC_STATUS status_vector, PISC_SVC_HANDLE
service_handle, PISC_SVC_HANDLE recv_handle, UShort isc_arg4, const char * isc_arg5, UShort
isc_arg6, const char * isc_arg7, UShort isc_arg8, const char * isc_arg9);
```

File

IBIntf

Description

This is function IBIntf.isc_service_query_stub.

10.1.24 IBIntf.isc_service_start_stub Function

Pascal

```
function isc_service_start_stub(status_vector: PISC_STATUS; service_handle: PISC_SVC_HANDLE;
recv_handle: PISC_SVC_HANDLE; isc_arg4: UShort; isc_arg5: PChar): ISC_STATUS; stdcall;
```

C++

```
__stdcall ISC_STATUS isc_service_start_stub(PISC_STATUS status_vector, PISC_SVC_HANDLE
service_handle, PISC_SVC_HANDLE recv_handle, UShort isc_arg4, const char * isc_arg5);
```

File

IBIntf

Description

This is function IBIntf.isc_service_start_stub.

10.1.25 IBIntf.isc_uninstall_execute_stub Function

Pascal

```
function isc_uninstall_execute_stub(uninstall_file_name: TEXT; status_func: FP_STATUS;
status_data: pointer; error_func: FP_ERROR; error_data: pointer): MSG_NO; stdcall;
```

C++

```
__stdcall MSG_NO isc_uninstall_execute_stub(TEXT uninstall_file_name, FP_STATUS status_func,
void * status_data, FP_ERROR error_func, void * error_data);
```

File

IBIntf

Description

This is function IBIntf.isc_uninstall_execute_stub.

10.1.26 IBIntf.isc_uninstall_precheck_stub Function

Pascal

```
function isc_uninstall_precheck_stub(uninstall_file_name: TEXT): MSG_NO; stdcall;
```

C++

```
__stdcall MSG_NO isc_uninstall_precheck_stub(TEXT uninstall_file_name);
```

File

IBIntf

Description

This is function IBIntf.isc_uninstall_precheck_stub.

10.1.27 IBIntf.LoadIBInstallLibrary Function

Loads IBInstall.DLL into memory.

Pascal

```
procedure LoadIBInstallLibrary;
```

C++

```
LoadIBInstallLibrary();
```

File

IBIntf

Description

Use the LoadIBInstallLibrary procedure to load the IBInstall.DLL into memory and resolve the respective entry points into to the respective procedure pointer in the unit.

10.1.28 IBIntf.LoadIBLibrary Function

Loads GDS32.DLL into memory.

Pascal

```
procedure LoadIBLibrary;
```

C++

```
LoadIBLibrary();
```

File

IBIntf

Description

Use the LoadIBLibrary procedure to load the GDS32.DLL into memory and resolve the respective entry points into to the respective procedure pointer in the unit. In addition, it loads the InterBase entry points, if they are available.

10.1.29 IBIntf.TryIBLoad Function

Pascal

```
function TryIBLoad: Boolean;
```

C++

```
Boolean TryIBLoad();
```

File

IBIntf

Description

This is function IBIntf.TryIBLoad.

10.2 Variables

The following table lists variables in this documentation.

Variables

Name	Description
BLOB_get (see page 352)	This is variable IBIntf.BLOB_get.
BLOB_put (see page 352)	This is variable IBIntf.BLOB_put.
isc_add_user (see page 353)	This is variable IBIntf.isc_add_user.
isc_attach_database (see page 353)	This is variable IBIntf.isc_attach_database.
isc_blob_info (see page 353)	This is variable IBIntf.isc_blob_info.
isc_cancel_events (see page 354)	This is variable IBIntf.isc_cancel_events.
isc_close_blob (see page 354)	This is variable IBIntf.isc_close_blob.
isc_commit_retaining (see page 354)	This is variable IBIntf.isc_commit_retaining.
isc_commit_transaction (see page 355)	This is variable IBIntf.isc_commit_transaction.
isc_create_blob2 (see page 355)	This is variable IBIntf.isc_create_blob2.
isc_database_info (see page 355)	This is variable IBIntf.isc_database_info.
isc_decode_date (see page 356)	This is variable IBIntf.isc_decode_date.
isc_decode_sql_date (see page 356)	This is variable IBIntf.isc_decode_sql_date.
isc_decode_sql_time (see page 356)	This is variable IBIntf.isc_decode_sql_time.
isc_decode_timestamp (see page 357)	This is variable IBIntf.isc_decode_timestamp.
isc_delete_user (see page 357)	This is variable IBIntf.isc_delete_user.
isc_detach_database (see page 357)	This is variable IBIntf.isc_detach_database.
isc_drop_database (see page 358)	This is variable IBIntf.isc_drop_database.
isc_dsql_alloc_statement2 (see page 358)	This is variable IBIntf.isc_dsql_alloc_statement2.
isc_dsql_describe (see page 358)	This is variable IBIntf.isc_dsql_describe.
isc_dsql_describe_bind (see page 359)	This is variable IBIntf.isc_dsql_describe_bind.
isc_dsql_execute (see page 359)	This is variable IBIntf.isc_dsql_execute.
isc_dsql_execute_immediate (see page 359)	This is variable IBIntf.isc_dsql_execute_immediate.
isc_dsql_execute2 (see page 360)	This is variable IBIntf.isc_dsql_execute2.
isc_dsql_fetch (see page 360)	This is variable IBIntf.isc_dsql_fetch.
isc_dsql_free_statement (see page 360)	This is variable IBIntf.isc_dsql_free_statement.
isc_dsql_prepare (see page 361)	This is variable IBIntf.isc_dsql_prepare.
isc_dsql_set_cursor_name (see page 361)	This is variable IBIntf.isc_dsql_set_cursor_name.
isc_dsql_sql_info (see page 361)	This is variable IBIntf.isc_dsql_sql_info.
isc_encode_date (see page 362)	This is variable IBIntf.isc_encode_date.
isc_encode_sql_date (see page 362)	This is variable IBIntf.isc_encode_sql_date.
isc_encode_sql_time (see page 362)	This is variable IBIntf.isc_encode_sql_time.
isc_encode_timestamp (see page 363)	This is variable IBIntf.isc_encode_timestamp.
isc_event_block (see page 363)	This is variable IBIntf.isc_event_block.
isc_event_counts (see page 363)	This is variable IBIntf.isc_event_counts.
isc_free (see page 364)	This is variable IBIntf.isc_free.
isc_get_segment (see page 364)	This is variable IBIntf.isc_get_segment.
isc_install_clear_options (see page 364)	This is variable IBIntf.isc_install_clear_options.
isc_install_execute (see page 365)	This is variable IBIntf.isc_install_execute.
isc_install_get_info (see page 365)	This is variable IBIntf.isc_install_get_info.
isc_install_get_message (see page 365)	This is variable IBIntf.isc_install_get_message.
isc_install_load_external_text (see page 366)	This is variable IBIntf.isc_install_load_external_text.
isc_install_precheck (see page 366)	This is variable IBIntf.isc_install_precheck.
isc_install_set_option (see page 366)	This is variable IBIntf.isc_install_set_option.

isc_install_unset_option (see page 367)	This is variable IBIntf.isc_install_unset_option.
isc_interprete (see page 367)	This is variable IBIntf.isc_interprete.
isc_modify_user (see page 367)	This is variable IBIntf.isc_modify_user.
isc_open_blob2 (see page 368)	This is variable IBIntf.isc_open_blob2.
isc_prepare_transaction (see page 368)	This is variable IBIntf.isc_prepare_transaction.
isc_prepare_transaction2 (see page 368)	This is variable IBIntf.isc_prepare_transaction2.
isc_put_segment (see page 369)	This is variable IBIntf.isc_put_segment.
isc_que_events (see page 369)	This is variable IBIntf.isc_que_events.
isc_rollback_retaining (see page 369)	This is variable IBIntf.isc_rollback_retaining.
isc_rollback_transaction (see page 370)	This is variable IBIntf.isc_rollback_transaction.
isc_service_attach (see page 370)	This is variable IBIntf.isc_service_attach.
isc_service_detach (see page 370)	This is variable IBIntf.isc_service_detach.
isc_service_query (see page 371)	This is variable IBIntf.isc_service_query.
isc_service_start (see page 371)	This is variable IBIntf.isc_service_start.
isc_sql_interprete (see page 371)	This is variable IBIntf.isc_sql_interprete.
isc_sqlcode (see page 372)	This is variable IBIntf.isc_sqlcode.
isc_start_multiple (see page 372)	This is variable IBIntf.isc_start_multiple.
isc_uninstall_execute (see page 372)	This is variable IBIntf.isc_uninstall_execute.
isc_uninstall_precheck (see page 373)	This is variable IBIntf.isc_uninstall_precheck.
isc_vax_integer (see page 373)	This is variable IBIntf.isc_vax_integer.

10.2.1 IBIntf.BLOB_get Variable

Pascal

```
BLOB_get: TBLOB_get;
```

C++

```
TBLOB_get BLOB_get;
```

File

IBIntf

Description

This is variable IBIntf.BLOB_get.

10.2.2 IBIntf.BLOB_put Variable

Pascal

```
BLOB_put: TBLOB_put;
```

C++

```
TBLOB_put BLOB_put;
```

File

IBIntf

Description

This is variable IBIntf.BLOB_put.

10.2.3 IBIntf.isc_add_user Variable

Pascal

```
isc_add_user: Tisc_add_user;
```

C++

```
Tisc_add_user isc_add_user;
```

File

IBIntf

Description

This is variable IBIntf.isc_add_user.

10.2.4 IBIntf.isc_attach_database Variable

Pascal

```
isc_attach_database: Tisc_attach_database;
```

C++

```
Tisc_attach_database isc_attach_database;
```

File

IBIntf

Description

This is variable IBIntf.isc_attach_database.

10.2.5 IBIntf.isc_blob_info Variable

Pascal

```
isc_blob_info: Tisc_blob_info;
```

C++

```
Tisc_blob_info isc_blob_info;
```

File

IBIntf

Description

This is variable IBIntf.isc_blob_info.

10.2.6 IBIntf.isc_cancel_events Variable

Pascal

```
isc_cancel_events: Tisc_cancel_events;
```

C++

```
Tisc_cancel_events isc_cancel_events;
```

File

IBIntf

Description

This is variable IBIntf.isc_cancel_events.

10.2.7 IBIntf.isc_close_blob Variable

Pascal

```
isc_close_blob: Tisc_close_blob;
```

C++

```
Tisc_close_blob isc_close_blob;
```

File

IBIntf

Description

This is variable IBIntf.isc_close_blob.

10.2.8 IBIntf.isc_commit_retaining Variable

Pascal

```
isc_commit_retaining: Tisc_commit_retaining;
```

C++

```
Tisc_commit_retaining isc_commit_retaining;
```

File

IBIntf

Description

This is variable IBIntf.isc_commit_retaining.

10.2.9 IBIntf.isc_commit_transaction Variable

Pascal

```
isc_commit_transaction: Tisc_commit_transaction;
```

C++

```
Tisc_commit_transaction isc_commit_transaction;
```

File

IBIntf

Description

This is variable IBIntf.isc_commit_transaction.

10.2.10 IBIntf.isc_create_blob2 Variable

Pascal

```
isc_create_blob2: Tisc_create_blob2;
```

C++

```
Tisc_create_blob2 isc_create_blob2;
```

File

IBIntf

Description

This is variable IBIntf.isc_create_blob2.

10.2.11 IBIntf.isc_database_info Variable

Pascal

```
isc_database_info: Tisc_database_info;
```

C++

```
Tisc_database_info isc_database_info;
```

File

IBIntf

Description

This is variable IBIntf.isc_database_info.

10.2.12 IBIntf.isc_decode_date Variable

Pascal

```
isc_decode_date: Tisc_decode_date;
```

C++

```
Tisc_decode_date isc_decode_date;
```

File

IBIntf

Description

This is variable IBIntf.isc_decode_date.

10.2.13 IBIntf.isc_decode_sql_date Variable

Pascal

```
isc_decode_sql_date: Tisc_decode_sql_date;
```

C++

```
Tisc_decode_sql_date isc_decode_sql_date;
```

File

IBIntf

Description

This is variable IBIntf.isc_decode_sql_date.

10.2.14 IBIntf.isc_decode_sql_time Variable

Pascal

```
isc_decode_sql_time: Tisc_decode_sql_time;
```

C++

```
Tisc_decode_sql_time isc_decode_sql_time;
```

File

IBIntf

Description

This is variable IBIntf.isc_decode_sql_time.

10.2.15 IBIntf.isc_decode_timestamp Variable

Pascal

```
isc_decode_timestamp: Tisc_decode_timestamp;
```

C++

```
Tisc_decode_timestamp isc_decode_timestamp;
```

File

IBIntf

Description

This is variable IBIntf.isc_decode_timestamp.

10.2.16 IBIntf.isc_delete_user Variable

Pascal

```
isc_delete_user: Tisc_delete_user;
```

C++

```
Tisc_delete_user isc_delete_user;
```

File

IBIntf

Description

This is variable IBIntf.isc_delete_user.

10.2.17 IBIntf.isc_detach_database Variable

Pascal

```
isc_detach_database: Tisc_detach_database;
```

C++

```
Tisc_detach_database isc_detach_database;
```

File

IBIntf

Description

This is variable IBIntf.isc_detach_database.

10.2.18 IBIntf.isc_drop_database Variable

Pascal

```
isc_drop_database: Tisc_drop_database;
```

C++

```
Tisc_drop_database isc_drop_database;
```

File

IBIntf

Description

This is variable IBIntf.isc_drop_database.

10.2.19 IBIntf.isc_dsql_alloc_statement2 Variable

Pascal

```
isc_dsql_alloc_statement2: Tisc_dsql_alloc_statement2;
```

C++

```
Tisc_dsql_alloc_statement2 isc_dsql_alloc_statement2;
```

File

IBIntf

Description

This is variable IBIntf.isc_dsql_alloc_statement2.

10.2.20 IBIntf.isc_dsql_describe Variable

Pascal

```
isc_dsql_describe: Tisc_dsql_describe;
```

C++

```
Tisc_dsql_describe isc_dsql_describe;
```

File

IBIntf

Description

This is variable IBIntf.isc_dsql_describe.

10.2.21 IBIntf.isc_dsql_describe_bind Variable

Pascal

```
isc_dsql_describe_bind: Tisc_dsql_describe_bind;
```

C++

```
Tisc_dsql_describe_bind isc_dsql_describe_bind;
```

File

IBIntf

Description

This is variable IBIntf.isc_dsql_describe_bind.

10.2.22 IBIntf.isc_dsql_execute Variable

Pascal

```
isc_dsql_execute: Tisc_dsql_execute;
```

C++

```
Tisc_dsql_execute isc_dsql_execute;
```

File

IBIntf

Description

This is variable IBIntf.isc_dsql_execute.

10.2.23 IBIntf.isc_dsql_execute_immediate Variable

Pascal

```
isc_dsql_execute_immediate: Tisc_dsql_execute_immediate;
```

C++

```
Tisc_dsql_execute_immediate isc_dsql_execute_immediate;
```

File

IBIntf

Description

This is variable IBIntf.isc_dsql_execute_immediate.

10.2.24 IBIntf.isc_dsql_execute2 Variable

Pascal

```
isc_dsql_execute2: Tisc_dsql_execute2;
```

C++

```
Tisc_dsql_execute2 isc_dsql_execute2;
```

File

IBIntf

Description

This is variable IBIntf.isc_dsql_execute2.

10.2.25 IBIntf.isc_dsql_fetch Variable

Pascal

```
isc_dsql_fetch: Tisc_dsql_fetch;
```

C++

```
Tisc_dsql_fetch isc_dsql_fetch;
```

File

IBIntf

Description

This is variable IBIntf.isc_dsql_fetch.

10.2.26 IBIntf.isc_dsql_free_statement Variable

Pascal

```
isc_dsql_free_statement: Tisc_dsql_free_statement;
```

C++

```
Tisc_dsql_free_statement isc_dsql_free_statement;
```

File

IBIntf

Description

This is variable IBIntf.isc_dsql_free_statement.

10.2.27 IBIntf.isc_dsql_prepare Variable

Pascal

```
isc_dsql_prepare: Tisc_dsql_prepare;
```

C++

```
Tisc_dsql_prepare isc_dsql_prepare;
```

File

IBIntf

Description

This is variable IBIntf.isc_dsql_prepare.

10.2.28 IBIntf.isc_dsql_set_cursor_name Variable

Pascal

```
isc_dsql_set_cursor_name: Tisc_dsql_set_cursor_name;
```

C++

```
Tisc_dsql_set_cursor_name isc_dsql_set_cursor_name;
```

File

IBIntf

Description

This is variable IBIntf.isc_dsql_set_cursor_name.

10.2.29 IBIntf.isc_dsql_sql_info Variable

Pascal

```
isc_dsql_sql_info: Tisc_dsql_sql_info;
```

C++

```
Tisc_dsql_sql_info isc_dsql_sql_info;
```

File

IBIntf

Description

This is variable IBIntf.isc_dsql_sql_info.

10.2.30 IBIntf.isc_encode_date Variable

Pascal

```
isc_encode_date: Tisc_encode_date;
```

C++

```
Tisc_encode_date isc_encode_date;
```

File

IBIntf

Description

This is variable IBIntf.isc_encode_date.

10.2.31 IBIntf.isc_encode_sql_date Variable

Pascal

```
isc_encode_sql_date: Tisc_encode_sql_date;
```

C++

```
Tisc_encode_sql_date isc_encode_sql_date;
```

File

IBIntf

Description

This is variable IBIntf.isc_encode_sql_date.

10.2.32 IBIntf.isc_encode_sql_time Variable

Pascal

```
isc_encode_sql_time: Tisc_encode_sql_time;
```

C++

```
Tisc_encode_sql_time isc_encode_sql_time;
```

File

IBIntf

Description

This is variable IBIntf.isc_encode_sql_time.

10.2.33 IBIntf.isc_encode_timestamp Variable

Pascal

```
isc_encode_timestamp: Tisc_encode_timestamp;
```

C++

```
Tisc_encode_timestamp isc_encode_timestamp;
```

File

IBIntf

Description

This is variable IBIntf.isc_encode_timestamp.

10.2.34 IBIntf.isc_event_block Variable

Pascal

```
isc_event_block: Tisc_event_block;
```

C++

```
Tisc_event_block isc_event_block;
```

File

IBIntf

Description

This is variable IBIntf.isc_event_block.

10.2.35 IBIntf.isc_event_counts Variable

Pascal

```
isc_event_counts: Tisc_event_counts;
```

C++

```
Tisc_event_counts isc_event_counts;
```

File

IBIntf

Description

This is variable IBIntf.isc_event_counts.

10.2.36 IBIntf.isc_free Variable

Pascal

```
isc_free: Tisc_free;
```

C++

```
Tisc_free isc_free;
```

File

IBIntf

Description

This is variable IBIntf.isc_free.

10.2.37 IBIntf.isc_get_segment Variable

Pascal

```
isc_get_segment: Tisc_get_segment;
```

C++

```
Tisc_get_segment isc_get_segment;
```

File

IBIntf

Description

This is variable IBIntf.isc_get_segment.

10.2.38 IBIntf.isc_install_clear_options Variable

Pascal

```
isc_install_clear_options: Tisc_install_clear_options;
```

C++

```
Tisc_install_clear_options isc_install_clear_options;
```

File

IBIntf

Description

This is variable IBIntf.isc_install_clear_options.

10.2.39 IBIntf.isc_install_execute Variable

Pascal

```
isc_install_execute: Tisc_install_execute;
```

C++

```
Tisc_install_execute isc_install_execute;
```

File

IBIntf

Description

This is variable IBIntf.isc_install_execute.

10.2.40 IBIntf.isc_install_get_info Variable

Pascal

```
isc_install_get_info: Tisc_install_get_info;
```

C++

```
Tisc_install_get_info isc_install_get_info;
```

File

IBIntf

Description

This is variable IBIntf.isc_install_get_info.

10.2.41 IBIntf.isc_install_get_message Variable

Pascal

```
isc_install_get_message: Tisc_install_get_message;
```

C++

```
Tisc_install_get_message isc_install_get_message;
```

File

IBIntf

Description

This is variable IBIntf.isc_install_get_message.

10.2.42 IBIntf.isc_install_load_external_text Variable

Pascal

```
isc_install_load_external_text: Tisc_install_load_external_text;
```

C++

```
Tisc_install_load_external_text isc_install_load_external_text;
```

File

IBIntf

Description

This is variable IBIntf.isc_install_load_external_text.

10.2.43 IBIntf.isc_install_precheck Variable

Pascal

```
isc_install_precheck: Tisc_install_precheck;
```

C++

```
Tisc_install_precheck isc_install_precheck;
```

File

IBIntf

Description

This is variable IBIntf.isc_install_precheck.

10.2.44 IBIntf.isc_install_set_option Variable

Pascal

```
isc_install_set_option: Tisc_install_set_option;
```

C++

```
Tisc_install_set_option isc_install_set_option;
```

File

IBIntf

Description

This is variable IBIntf.isc_install_set_option.

10.2.45 IBIntf.isc_install_unset_option Variable

Pascal

```
isc_install_unset_option: Tisc_install_unset_option;
```

C++

```
Tisc_install_unset_option isc_install_unset_option;
```

File

IBIntf

Description

This is variable IBIntf.isc_install_unset_option.

10.2.46 IBIntf.isc_interprete Variable

Pascal

```
isc_interprete: Tisc_interprete;
```

C++

```
Tisc_interprete isc_interprete;
```

File

IBIntf

Description

This is variable IBIntf.isc_interprete.

10.2.47 IBIntf.isc_modify_user Variable

Pascal

```
isc_modify_user: Tisc_modify_user;
```

C++

```
Tisc_modify_user isc_modify_user;
```

File

IBIntf

Description

This is variable IBIntf.isc_modify_user.

10.2.48 IBIntf.isc_open_blob2 Variable

Pascal

```
isc_open_blob2: Tisc_open_blob2;
```

C++

```
Tisc_open_blob2 isc_open_blob2;
```

File

IBIntf

Description

This is variable IBIntf.isc_open_blob2.

10.2.49 IBIntf.isc_prepare_transaction Variable

Pascal

```
isc_prepare_transaction: Tisc_prepare_transaction;
```

C++

```
Tisc_prepare_transaction isc_prepare_transaction;
```

File

IBIntf

Description

This is variable IBIntf.isc_prepare_transaction.

10.2.50 IBIntf.isc_prepare_transaction2 Variable

Pascal

```
isc_prepare_transaction2: Tisc_prepare_transaction2;
```

C++

```
Tisc_prepare_transaction2 isc_prepare_transaction2;
```

File

IBIntf

Description

This is variable IBIntf.isc_prepare_transaction2.

10.2.51 IBIntf.isc_put_segment Variable

Pascal

```
isc_put_segment: Tisc_put_segment;
```

C++

```
Tisc_put_segment isc_put_segment;
```

File

IBIntf

Description

This is variable IBIntf.isc_put_segment.

10.2.52 IBIntf.isc_que_events Variable

Pascal

```
isc_que_events: Tisc_que_events;
```

C++

```
Tisc_que_events isc_que_events;
```

File

IBIntf

Description

This is variable IBIntf.isc_que_events.

10.2.53 IBIntf.isc_rollback_retaining Variable

Pascal

```
isc_rollback_retaining: Tisc_rollback_retaining;
```

C++

```
Tisc_rollback_retaining isc_rollback_retaining;
```

File

IBIntf

Description

This is variable IBIntf.isc_rollback_retaining.

10.2.54 IBIntf.isc_rollback_transaction Variable

Pascal

```
isc_rollback_transaction: Tisc_rollback_transaction;
```

C++

```
Tisc_rollback_transaction isc_rollback_transaction;
```

File

IBIntf

Description

This is variable IBIntf.isc_rollback_transaction.

10.2.55 IBIntf.isc_service_attach Variable

Pascal

```
isc_service_attach: Tisc_service_attach;
```

C++

```
Tisc_service_attach isc_service_attach;
```

File

IBIntf

Description

This is variable IBIntf.isc_service_attach.

10.2.56 IBIntf.isc_service_detach Variable

Pascal

```
isc_service_detach: Tisc_service_detach;
```

C++

```
Tisc_service_detach isc_service_detach;
```

File

IBIntf

Description

This is variable IBIntf.isc_service_detach.

10.2.57 IBIntf.isc_service_query Variable

Pascal

```
isc_service_query: Tisc_service_query;
```

C++

```
Tisc_service_query isc_service_query;
```

File

IBIntf

Description

This is variable IBIntf.isc_service_query.

10.2.58 IBIntf.isc_service_start Variable

Pascal

```
isc_service_start: Tisc_service_start;
```

C++

```
Tisc_service_start isc_service_start;
```

File

IBIntf

Description

This is variable IBIntf.isc_service_start.

10.2.59 IBIntf.isc_sql_interprete Variable

Pascal

```
isc_sql_interprete: Tisc_sql_interprete;
```

C++

```
Tisc_sql_interprete isc_sql_interprete;
```

File

IBIntf

Description

This is variable IBIntf.isc_sql_interprete.

10.2.60 IBIntf.isc_sqlcode Variable

Pascal

```
isc_sqlcode: Tisc_sqlcode;
```

C++

```
Tisc_sqlcode isc_sqlcode;
```

File

IBIntf

Description

This is variable IBIntf.isc_sqlcode.

10.2.61 IBIntf.isc_start_multiple Variable

Pascal

```
isc_start_multiple: Tisc_start_multiple;
```

C++

```
Tisc_start_multiple isc_start_multiple;
```

File

IBIntf

Description

This is variable IBIntf.isc_start_multiple.

10.2.62 IBIntf.isc_uninstall_execute Variable

Pascal

```
isc_uninstall_execute: Tisc_uninstall_execute;
```

C++

```
Tisc_uninstall_execute isc_uninstall_execute;
```

File

IBIntf

Description

This is variable IBIntf.isc_uninstall_execute.

10.2.63 IBIntf.isc_uninstall_precheck Variable

Pascal

```
isc_uninstall_precheck: Tisc_uninstall_precheck;
```

C++

```
Tisc_uninstall_precheck isc_uninstall_precheck;
```

File

IBIntf

Description

This is variable IBIntf.isc_uninstall_precheck.

10.2.64 IBIntf.isc_vax_integer Variable

Pascal

```
isc_vax_integer: Tisc_vax_integer;
```

C++

```
Tisc_vax_integer isc_vax_integer;
```

File

IBIntf

Description

This is variable IBIntf.isc_vax_integer.

11 IBQuery Namespace

This is namespace IBQuery.

Topics

Name	Description
Classes (see page 376)	The following table lists classes in this documentation.

Classes

	Name	Description
	TIBQuery (see page 376)	TIBQuery executes an InterBase SQL (see page 392) statement.

11.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TIBQuery (see page 376)	TIBQuery executes an InterBase SQL (see page 392) statement.

11.1.1 TIBQuery Class

TIBQuery executes an InterBase SQL (see page 392) statement.

Class Hierarchy

Pascal

```
TIBQuery = class(TIBCustomDataSet);
```

C++

```
class TIBQuery : public TIBCustomDataSet;
```

File

IBQuery

Description

Use TIBQuery to access one or more tables in a database using SQL (see page 392) statements. The TIBQuery component provides a read-only dataset, and adapts well to the InterBase client/server environment. To update the result set that TIBQuery represents, use this component in conjunction with a TIBUpdateSQL component.

Query components are useful because they can

- Access more than one table at a time (called a 'join' in SQL (see page 392)).
- Automatically access a subset of rows and columns in its underlying table(s), rather than always returning all rows and columns.

Note: TIBQuery is of particular importance to the development of scalable database applications. If there is any chance that an application built to run against local databases will be scaled to a remote SQL (see page 392) database server in the future, use TIBQuery components from the start to ensure easier scaling later.

Getting Started with InterBase Express

11.1.1.1 TIBQuery Members

The following tables list the members exposed by TIBQuery.

Protected Methods

	Name	Description
	ActivateConnection (see page 69)	This is ActivateConnection, a member of class TIBCustomDataSet.
	ActivateTransaction (see page 69)	This is ActivateTransaction, a member of class TIBCustomDataSet.
V	AllocRecordBuffer (see page 69)	This is AllocRecordBuffer, a member of class TIBCustomDataSet.
	CheckDatasetClosed (see page 71)	This is CheckDatasetClosed, a member of class TIBCustomDataSet.
	CheckDatasetOpen (see page 71)	This is CheckDatasetOpen, a member of class TIBCustomDataSet.
	CheckNotUniDirectional (see page 71)	This is CheckNotUniDirectional, a member of class TIBCustomDataSet.
V	ClearCalcFields (see page 71)	This is ClearCalcFields, a member of class TIBCustomDataSet.
	ConstraintsStored (see page 72)	This is ConstraintsStored, a member of class TIBCustomDataSet.
V	CreateFields (see page 72)	This is CreateFields, a member of class TIBCustomDataSet.
	DeactivateTransaction (see page 73)	This is DeactivateTransaction, a member of class TIBCustomDataSet.
V	DefineProperties (see page 382)	This is DefineProperties, a member of class TIBQuery.
V	Disconnect (see page 383)	This is Disconnect, a member of class TIBQuery.
V	DoBeforeDelete (see page 73)	This is DoBeforeDelete, a member of class TIBCustomDataSet.
V	DoBeforeEdit (see page 73)	This is DoBeforeEdit, a member of class TIBCustomDataSet.
V	DoBeforeInsert (see page 74)	This is DoBeforeInsert, a member of class TIBCustomDataSet.
V	DoOnNewRecord (see page 74)	This is DoOnNewRecord, a member of class TIBCustomDataSet.
V	FreeRecordBuffer (see page 75)	This is FreeRecordBuffer, a member of class TIBCustomDataSet.
	GenerateQueryForLiveUpdate (see page 383)	This is GenerateQueryForLiveUpdate, a member of class TIBQuery.
	GetActiveBuf (see page 75)	This is GetActiveBuf, a member of class TIBCustomDataSet.
V	GetBookmarkData (see page 75)	This is GetBookmarkData, a member of class TIBCustomDataSet.
V	GetBookmarkFlag (see page 75)	This is GetBookmarkFlag, a member of class TIBCustomDataSet.
V	GetCanModify (see page 75)	This is GetCanModify, a member of class TIBCustomDataSet.
V	GetDataSource (see page 76)	This is GetDataSource, a member of class TIBCustomDataSet.
V	GetFieldClass (see page 76)	This is GetFieldClass, a member of class TIBCustomDataSet.
	GetParamsCount (see page 384)	This is GetParamsCount, a member of class TIBQuery.
V	GetRecNo (see page 77)	This is GetRecNo, a member of class TIBCustomDataSet.
V	GetRecord (see page 77)	This is GetRecord, a member of class TIBCustomDataSet.
V	GetRecordCount (see page 78)	This is GetRecordCount, a member of class TIBCustomDataSet.
V	GetRecordSize (see page 78)	This is GetRecordSize, a member of class TIBCustomDataSet.
V	InitFieldDefs (see page 384)	This is InitFieldDefs, a member of class TIBQuery.
V	InitRecord (see page 78)	This is InitRecord, a member of class TIBCustomDataSet.
V	InternalAddRecord (see page 78)	This is InternalAddRecord, a member of class TIBCustomDataSet.
V	InternalBatchInput (see page 79)	This is InternalBatchInput, a member of class TIBCustomDataSet.
V	InternalBatchOutput (see page 79)	This is InternalBatchOutput, a member of class TIBCustomDataSet.
V	InternalCancel (see page 79)	This is InternalCancel, a member of class TIBCustomDataSet.
V	InternalClose (see page 79)	This is InternalClose, a member of class TIBCustomDataSet.
V	InternalDelete (see page 79)	This is InternalDelete, a member of class TIBCustomDataSet.
V	InternalExecQuery (see page 80)	This is InternalExecQuery, a member of class TIBCustomDataSet.
V	InternalFirst (see page 80)	This is InternalFirst, a member of class TIBCustomDataSet.
V	InternalGotoBookmark (see page 80)	This is InternalGotoBookmark, a member of class TIBCustomDataSet.
V	InternalHandleException (see page 80)	This is InternalHandleException, a member of class TIBCustomDataSet.
V	InternalInitFieldDefs (see page 81)	This is InternalInitFieldDefs, a member of class TIBCustomDataSet.
V	InternalInitRecord (see page 81)	This is InternalInitRecord, a member of class TIBCustomDataSet.
V	InternalInsert (see page 81)	This is InternalInsert, a member of class TIBCustomDataSet.
V	InternalLast (see page 81)	This is InternalLast, a member of class TIBCustomDataSet.
V	InternalOpen (see page 384)	This is InternalOpen, a member of class TIBQuery.
V	InternalPost (see page 82)	This is InternalPost, a member of class TIBCustomDataSet.
V	InternalPrepare (see page 82)	This is InternalPrepare, a member of class TIBCustomDataSet.
V	InternalRefresh (see page 82)	This is InternalRefresh, a member of class TIBCustomDataSet.
V	InternalRefreshRow (see page 82)	This is InternalRefreshRow, a member of class TIBCustomDataSet.
V	InternalSetParamsFromCursor (see page 83)	This is InternalSetParamsFromCursor, a member of class TIBCustomDataSet.
V	InternalSetToRecord (see page 83)	This is InternalSetToRecord, a member of class TIBCustomDataSet.

	InternalUnPrepare (see page 83)	This is InternalUnPrepare, a member of class TIBCustomDataSet.
	IsCursorOpen (see page 83)	This is IsCursorOpen, a member of class TIBCustomDataSet.
	Loaded (see page 84)	This is Loaded, a member of class TIBCustomDataSet.
	PSEndTransaction (see page 86)	This is PSEndTransaction, a member of class TIBCustomDataSet.
	PSExecute (see page 385)	This is PSExecute, a member of class TIBQuery.
	PSExecuteStatement (see page 86)	This is PSExecuteStatement, a member of class TIBCustomDataSet.
	PSGetParams (see page 385)	This is PSGetParams, a member of class TIBQuery.
	PSGetQuoteChar (see page 87)	This is PSGetQuoteChar, a member of class TIBCustomDataSet.
	PSGetTableName (see page 385)	This is PSGetTableName, a member of class TIBQuery.
	PSGetUpdateException (see page 87)	This is PSGetUpdateException, a member of class TIBCustomDataSet.
	PSInTransaction (see page 87)	This is PSInTransaction, a member of class TIBCustomDataSet.
	PSIsSQLBased (see page 88)	This is PSIsSQLBased, a member of class TIBCustomDataSet.
	PSIsSQLSupported (see page 88)	This is PSIsSQLSupported, a member of class TIBCustomDataSet.
	PSReset (see page 88)	This is PSReset, a member of class TIBCustomDataSet.
	PSSetCommandText (see page 386)	This is PSSetCommandText, a member of class TIBQuery.
	PSSetParams (see page 386)	This is PSSetParams, a member of class TIBQuery.
	PSStartTransaction (see page 88)	This is PSStartTransaction, a member of class TIBCustomDataSet.
	PSUpdateRecord (see page 88)	This is PSUpdateRecord, a member of class TIBCustomDataSet.
	ReQuery (see page 89)	This is ReQuery, a member of class TIBCustomDataSet.
	SetActive (see page 89)	This is SetActive, a member of class TIBCustomDataSet.
	SetBookmarkData (see page 90)	This is SetBookmarkData, a member of class TIBCustomDataSet.
	SetBookmarkFlag (see page 90)	This is SetBookmarkFlag, a member of class TIBCustomDataSet.
	SetCachedUpdates (see page 90)	This is SetCachedUpdates, a member of class TIBCustomDataSet.
	SetDataSource (see page 90)	This is SetDataSource, a member of class TIBCustomDataSet.
	SetFieldData (see page 90)	This is the overview for the SetFieldData method overload.
	SetFiltered (see page 386)	This is SetFiltered, a member of class TIBQuery.
	SetRecNo (see page 91)	This is SetRecNo, a member of class TIBCustomDataSet.

Protected Properties

	Name	Description
	DeleteSQL (see page 99)	Holds the SQL statement used to delete rows from the dataset.
	InsertSQL (see page 100)	Holds the SQL statement used to insert rows into the dataset.
R	InternalPrepared (see page 100)	Indicates whether the dataset has prepared its queries for execution.
	ModifySQL (see page 101)	Provides the ability to access the SQL object encapsulating the ModifySQL statement.
R	QDelete (see page 103)	Provides the ability to directly access the SQL object encapsulating the DeleteSQL (see page 99) statement.
R	QInsert (see page 104)	Provides the ability to directly access the SQL object encapsulating the InsertSQL (see page 100) statement.
R	QModify (see page 104)	Provides the ability to directly access the SQL object encapsulating the ModifySQL (see page 101) statement.
R	QRefresh (see page 104)	Provides the ability to directly access the SQL object encapsulating the RefreshSQL (see page 105) statement.
R	QSelect (see page 104)	Provides the ability to directly access the SQL object encapsulating the SelectSQL (see page 105) statement.
	RefreshSQL (see page 105)	Provides the ability to directly access the SQL object encapsulating the RefreshSQL statement.
	SelectSQL (see page 105)	Provides the ability to directly access the SQL object encapsulating the SelectSQL statement.
R	SelectStmtHandle (see page 105)	Gets the handle for the SELECT statement.
R	SQLParams (see page 106)	Specifies the parameters to use for any parameterized queries.
	UpdateMode (see page 107)	Indicates how records are located when updating records.

Public Methods

	Name	Description
	ApplyUpdates (see page 69)	Writes a dataset's pending cached updates to the database.

	BatchInput (see page 382)	Executes the parameterized query in SQL (see page 392) for input in the referenced input object.
	BatchOutput (see page 382)	Outputs the selected query in SQL (see page 392) to the referenced OutputObject.
V	BookmarkValid (see page 70)	Indicates the validity of a specified bookmark.
	CachedUpdateStatus (see page 70)	Returns the status of the cached updates.
	CancelUpdates (see page 70)	Clears all pending cached updates from the cache.
V	CompareBookmarks (see page 71)	Compares two bookmarks.
V	Create (see page 381)	Creates an instance of a query component.
V	CreateBlobStream (see page 72)	Returns a TIBDSBlobStream (see page 138) object for reading or writing the data in a specified blob field.
	Current (see page 73)	Returns the descriptor area that holds information about the current query.
V	Destroy (see page 381)	Destroys the instance of a query.
	ExecSQL (see page 383)	Executes the SQL (see page 392) statement for the query.
	FetchAll (see page 74)	Retrieves all records from the current cursor position to the end of the file and stores them locally.
V	GetCurrentRecord (see page 76)	Retrieves the current record into a buffer.
V	GetDetailLinkFields (see page 383)	Fills lists with the master and detail fields of the link.
V	GetFieldData (see page 76)	This is the overview for the GetFieldData method overload.
V	IsSequenced (see page 83)	IsSequenced indicates whether sequence numbers are available for database records.
V	Locate (see page 84)	Searches the dataset for a specified record and makes that record the current record.
	LocateNext (see page 85)	Searches the dataset for the record after a specified record and makes that record the current record.
V	Lookup (see page 85)	Retrieves field values from a record that matches specified search values.
	ParamByName (see page 384)	Accesses parameter information based on a specified parameter name.
V	Post (see page 86)	Writes a modified record to the database server.
	Prepare (see page 385)	Sends a query to the server for optimization prior to execution.
	RecordModified (see page 89)	Sets the record to modified or unmodified.
	RevertRecord (see page 89)	Restores the current record in the dataset to an unmodified state when cached updates are enabled.
	SQLType (see page 91)	Returns the type of query to be executed.
	Undelete (see page 92)	Restores a record deleted from the dataset.
	UnPrepare (see page 386)	Frees the resources allocated for a previously prepared query.
V	UpdateStatus (see page 92)	Reports the update status for the current record.

Public Properties

	Name	Description
R	DBHandle (see page 99)	Specifies the database handle for the dataset.
	GenerateParamNames (see page 389)	Generates a list of parameter names for the query.
	LiveMode (see page 389)	Indicates what types of edits, if any, can be made to the data in the dataset.
R	ParamCount (see page 390)	Indicates the current number of parameters for the query.
R	Plan (see page 103)	Indicates the PLAN portion of the dataset's SELECT query.
	Prepared (see page 391)	Determines whether or not a query is prepared for execution.
R	RowsAffected (see page 391)	Returns the number of rows operated upon by the latest query execution.
	StatementType (see page 392)	Returns the statement type of the QSelect query.
R	StmtHandle (see page 392)	Identifies the statement handle for the query.
R	Text (see page 392)	Points to the actual text of the SQL (see page 392) query.
R	TRHandle (see page 106)	Specifies the transaction handle for the dataset.
	UpdateRecordTypes (see page 108)	Specifies the type of records visible in a dataset when cached updates are enabled.
R	UpdatesPending (see page 108)	Indicates whether the cached updates buffer contains records that are not yet applied.

Published Events

	Name	Description
	AfterDatabaseDisconnect (see page 394)	Occurs immediately after the connection to the associated database is closed.
	AfterTransactionEnd (see page 394)	Occurs immediately after a transaction that includes this dataset's query ends.
	BeforeDatabaseDisconnect (see page 394)	Occurs immediately before the connection to the associated database is closed.
	BeforeTransactionEnd (see page 395)	Occurs immediately before a transaction that includes this dataset's query ends.
	DatabaseFree (see page 395)	Occurs when the database associated with this dataset is freed.
	OnUpdateError (see page 110)	Occurs if an exception is generated when cached updates are applied to a database.
	OnUpdateRecord (see page 111)	Occurs when cached updates are applied to a record.
	TransactionFree (see page 395)	Occurs when the transaction that includes this dataset's query is freed.

Published Properties

	Name	Description
	Active (see page 387)	This is Active, a member of class TIBQuery.
	AfterCancel (see page 94)	This is AfterCancel, a member of class TIBCustomDataSet.
	AfterClose (see page 94)	This is AfterClose, a member of class TIBCustomDataSet.
	AfterDelete (see page 94)	This is AfterDelete, a member of class TIBCustomDataSet.
	AfterEdit (see page 94)	This is AfterEdit, a member of class TIBCustomDataSet.
	AfterInsert (see page 95)	This is AfterInsert, a member of class TIBCustomDataSet.
	AfterOpen (see page 95)	This is AfterOpen, a member of class TIBCustomDataSet.
	AfterPost (see page 95)	This is AfterPost, a member of class TIBCustomDataSet.
	AfterRefresh (see page 95)	This is AfterRefresh, a member of class TIBCustomDataSet.
	AfterScroll (see page 95)	This is AfterScroll, a member of class TIBCustomDataSet.
	AutoCalcFields (see page 96)	This is AutoCalcFields, a member of class TIBCustomDataSet.
	BeforeCancel (see page 96)	This is BeforeCancel, a member of class TIBCustomDataSet.
	BeforeClose (see page 96)	This is BeforeClose, a member of class TIBCustomDataSet.
	BeforeDelete (see page 96)	This is BeforeDelete, a member of class TIBCustomDataSet.
	BeforeEdit (see page 97)	This is BeforeEdit, a member of class TIBCustomDataSet.
	BeforeInsert (see page 97)	This is BeforeInsert, a member of class TIBCustomDataSet.
	BeforeOpen (see page 97)	This is BeforeOpen, a member of class TIBCustomDataSet.
	BeforePost (see page 97)	This is BeforePost, a member of class TIBCustomDataSet.
	BeforeRefresh (see page 97)	This is BeforeRefresh, a member of class TIBCustomDataSet.
	BeforeScroll (see page 98)	This is BeforeScroll, a member of class TIBCustomDataSet.
	BufferChunks (see page 387)	Specifies the dataset buffer chunk size.
	CachedUpdates (see page 388)	Specifies whether cached updates are enabled for a dataset.
	Constraints (see page 388)	This is Constraints, a member of class TIBQuery.
	Database (see page 99)	Identifies the database component for which this dataset represents one or more tables.
	DataSource (see page 388)	This is DataSource, a member of class TIBQuery.
	Filtered (see page 389)	Specifies whether filtering is active for a dataset.
	ForcedRefresh (see page 99)	Specifies whether the dataset should refresh its data every time it posts a record.
	GeneratorField (see page 389)	Specifies whether the dataset should refresh its data every time it posts a record.
	ObjectView (see page 101)	This is ObjectView, a member of class TIBCustomDataSet.
	OnCalcFields (see page 101)	This is OnCalcFields, a member of class TIBCustomDataSet.
	OnDeleteError (see page 102)	This is OnDeleteError, a member of class TIBCustomDataSet.
	OnEditError (see page 102)	This is OnEditError, a member of class TIBCustomDataSet.
	OnFilterRecord (see page 390)	This is OnFilterRecord, a member of class TIBQuery.
	OnNewRecord (see page 102)	This is OnNewRecord, a member of class TIBCustomDataSet.
	OnPostError (see page 102)	This is OnPostError, a member of class TIBCustomDataSet.
	ParamCheck (see page 390)	Specifies whether the parameter list for a query is regenerated if the SQL property changes at runtime.
	Params (see page 391)	Contains the parameters for a query's SQL (see page 392) statement.
	SQL (see page 392)	Contains the text of the SQL statement to execute for the query.
	Transaction (see page 106)	Identifies the transaction under which the query executes.

	UniDirectional (see page 393)	Determines whether bidirectional cursors are enabled for the dataset.
	UpdateObject (see page 393)	Specifies the update object component used to update a read-only result set.

11.1.1.2 TIBQuery.Create Constructor

Creates an instance of a query component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBQuery(TComponent * AOwner);
```

Description

Call Create to instantiate a query at runtime. Query components placed in forms or data modules at design time are created automatically.

Create calls its inherited Create constructor, creates an empty SQL (see page 392) statement list, creates an empty parameter list, sets the OnChange event handler for the SQL (see page 392) statement list, sets the ParamCheck (see page 390) property to True, and sets the RowsAffected (see page 391) property to -1.

11.1.1.3 TIBQuery.Destroy Destructor

Destroys the instance of a query.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBQuery();
```

Description

Do not call Destroy directly. Instead call Free to verify that the query is not already freed before calling Destroy. Destroy disconnects from the server, frees the SQL (see page 392) statement list and the parameter list, and then calls its inherited destructor.

11.1.1.4 TIBQuery Methods

The methods of the TIBQuery class are listed here.

Protected Methods

	Name	Description
	DefineProperties (see page 382)	This is DefineProperties, a member of class TIBQuery.
	Disconnect (see page 383)	This is Disconnect, a member of class TIBQuery.
	GenerateQueryForLiveUpdate (see page 383)	This is GenerateQueryForLiveUpdate, a member of class TIBQuery.
	GetParamsCount (see page 384)	This is GetParamsCount, a member of class TIBQuery.
	InitFieldDefs (see page 384)	This is InitFieldDefs, a member of class TIBQuery.
	InternalOpen (see page 384)	This is InternalOpen, a member of class TIBQuery.
	PSExecute (see page 385)	This is PSExecute, a member of class TIBQuery.
	PSGetParams (see page 385)	This is PSGetParams, a member of class TIBQuery.
	PSGetTableName (see page 385)	This is PSGetTableName, a member of class TIBQuery.

	PSSetCommandText (see page 386)	This is PSSetCommandText, a member of class TIBQuery.
	PSSetParams (see page 386)	This is PSSetParams, a member of class TIBQuery.
	SetFiltered (see page 386)	This is SetFiltered, a member of class TIBQuery.

Public Methods

	Name	Description
	BatchInput (see page 382)	Executes the parameterized query in SQL (see page 392) for input in the referenced input object.
	BatchOutput (see page 382)	Outputs the selected query in SQL (see page 392) to the referenced OutputObject.
	ExecSQL (see page 383)	Executes the SQL (see page 392) statement for the query.
	GetDetailLinkFields (see page 383)	Fills lists with the master and detail fields of the link.
	ParamByName (see page 384)	Accesses parameter information based on a specified parameter name.
	Prepare (see page 385)	Sends a query to the server for optimization prior to execution.
	UnPrepare (see page 386)	Frees the resources allocated for a previously prepared query.

11.1.1.4.1 TIBQuery.BatchInput Method

Executes the parameterized query in SQL (see page 392) for input in the referenced input object.

Pascal

```
procedure BatchInput(InputObject: TIBBatchInput);
```

C++

```
__fastcall BatchInput(TIBBatchInput InputObject);
```

Description

Call BatchInput to execute the parameterized query in SQL (see page 392) for input in the referenced input object.

11.1.1.4.2 TIBQuery.BatchOutput Method

Outputs the selected query in SQL (see page 392) to the referenced OutputObject.

Pascal

```
procedure BatchOutput(OutputObject: TIBBatchOutput);
```

C++

```
__fastcall BatchOutput(TIBBatchOutput OutputObject);
```

Description

Call BatchOutput to output the selected query in SQL (see page 392) to the referenced OutputObject.

11.1.1.4.3 TIBQuery.DefineProperties Method

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

This is DefineProperties, a member of class TIBQuery.

11.1.1.4.4 TIBQuery.Disconnect Method

Pascal

```
procedure Disconnect; override;
```

C++

```
virtual __fastcall Disconnect();
```

Description

This is Disconnect, a member of class TIBQuery.

11.1.1.4.5 TIBQuery.ExecSQL Method

Executes the SQL (see page 392) statement for the query.

Pascal

```
procedure ExecSQL;
```

C++

```
__fastcall ExecSQL();
```

Description

Call ExecSQL to execute the SQL (see page 392) statement currently assigned to the SQL (see page 392) property. Use ExecSQL to execute queries that do not return a cursor to data (such as INSERT, UPDATE, DELETE, and CREATE TABLE).

Note: For SELECT statements, call Open instead of ExecSQL.

ExecSQL prepares the statement in SQL (see page 392) property for execution if it has not already been prepared. To speed performance, an application should ordinarily call Prepare (see page 385) before calling ExecSQL for the first time.

11.1.1.4.6 TIBQuery.GenerateQueryForLiveUpdate Method

Pascal

```
function GenerateQueryForLiveUpdate: Boolean;
```

C++

```
__fastcall Boolean GenerateQueryForLiveUpdate();
```

Description

This is GenerateQueryForLiveUpdate, a member of class TIBQuery.

11.1.1.4.7 TIBQuery.GetDetailLinkFields Method

Fills lists with the master and detail fields of the link.

Pascal

```
procedure GetDetailLinkFields(MasterFields: TList; DetailFields: TList); override;
```

C++

```
virtual __fastcall GetDetailLinkFields(TList MasterFields, TList DetailFields);
```

Description

Creates two lists of TFields from the master-detail relationship between two tables; one containing the master fields, and the

other containing the detail fields.

11.1.1.4.8 TIBQuery.GetParamsCount Method

Pascal

```
function GetParamsCount: Word;
```

C++

```
__fastcall Word GetParamsCount();
```

Description

This is GetParamsCount, a member of class TIBQuery.

11.1.1.4.9 TIBQuery.InitFieldDefs Method

Pascal

```
procedure InitFieldDefs; override;
```

C++

```
virtual __fastcall InitFieldDefs();
```

Description

This is InitFieldDefs, a member of class TIBQuery.

11.1.1.4.10 TIBQuery.InternalOpen Method

Pascal

```
procedure InternalOpen; override;
```

C++

```
virtual __fastcall InternalOpen();
```

Description

This is InternalOpen, a member of class TIBQuery.

11.1.1.4.11 TIBQuery.ParamByName Method

Accesses parameter information based on a specified parameter name.

Pascal

```
function ParamByName(const Value: string): TParam;
```

C++

```
__fastcall TParam ParamByName(const UnicodeString Value);
```

Description

Call ParamByName to set or use parameter information for a specific parameter based on its name.

Value is the name of the parameter for which to retrieve information.

ParamByName is primarily used to set an parameter's value at runtime. For example, the following statement retrieves the current value of a parameter called 'Contact' into an edit box:

```
Edit1.Text := Query1.ParamByName('Contact').AsString;
```

```
Edit1->Text = Query1->ParamByName("Contact")->AsString;
```

11.1.1.4.12 TIBQuery.Prepare Method

Sends a query to the server for optimization prior to execution.

Pascal

```
procedure Prepare;
```

C++

```
__fastcall Prepare();
```

Description

Call Prepare to have the remote database server allocate resources for the query and to perform additional optimizations. Calling Prepare before executing a query improves application performance.

A query is automatically prepared before being executed. A query that was automatically prepared will then be automatically unprepared after it executes. When a query will be executed a number of times, an application should always explicitly prepare the query to avoid multiple and unnecessary prepares and unprepares.

Preparing a query consumes some database resources, so it is good practice for an application to unprepare a query once it is done using it. The UnPrepare (see page 386) method unprepares a query.

Note: When you change the text of a query at runtime, the query is automatically closed and unprepared.

11.1.1.4.13 TIBQuery.PSExecute Method

Pascal

```
procedure PSExecute; override;
```

C++

```
virtual __fastcall PSExecute();
```

Description

This is PSExecute, a member of class TIBQuery.

11.1.1.4.14 TIBQuery.PSGetParams Method

Pascal

```
function PSGetParams: TParams; override;
```

C++

```
virtual __fastcall TParams PSGetParams();
```

Description

This is PSGetParams, a member of class TIBQuery.

11.1.1.4.15 TIBQuery.PSGetTableName Method

Pascal

```
function PSGetTableName: string; override;
```

C++

```
virtual __fastcall UnicodeString PSGetTableName();
```

Description

This is PSGetTableName, a member of class TIBQuery.

11.1.1.4.16 TIBQuery.PSSetCommandText Method

Pascal

```
procedure PSSetCommandText(const CommandText: string); override;
```

C++

```
virtual __fastcall PSSetCommandText(const UnicodeString CommandText);
```

Description

This is PSSetCommandText, a member of class TIBQuery.

11.1.1.4.17 TIBQuery.PSSetParams Method

Pascal

```
procedure PSSetParams(AParams: TParams); override;
```

C++

```
virtual __fastcall PSSetParams(TParams AParams);
```

Description

This is PSSetParams, a member of class TIBQuery.

11.1.1.4.18 TIBQuery.SetFiltered Method

Pascal

```
procedure SetFiltered(Value: Boolean); override;
```

C++

```
virtual __fastcall SetFiltered(Boolean Value);
```

Description

This is SetFiltered, a member of class TIBQuery.

11.1.1.4.19 TIBQuery.UnPrepare Method

Frees the resources allocated for a previously prepared query.

Pascal

```
procedure UnPrepare;
```

C++

```
__fastcall UnPrepare();
```

Description

Call UnPrepare to free the resources allocated for a previously prepared query on the server and client sides.

Preparing a query consumes some database resources, so it is good practice for an application to unprepare a query once it is done using it. The UnPrepare method unprepares a query.

Note: When you change the text of a query at runtime, the query is automatically closed and unprepared.

11.1.1.5 TIBQuery Properties

The properties of the TIBQuery class are listed here.

Public Properties

	Name	Description
	GenerateParamNames (see page 389)	Generates a list of parameter names for the query.
	LiveMode (see page 389)	Indicates what types of edits, if any, can be made to the data in the dataset.
R	ParamCount (see page 390)	Indicates the current number of parameters for the query.
	Prepared (see page 391)	Determines whether or not a query is prepared for execution.
R	RowsAffected (see page 391)	Returns the number of rows operated upon by the latest query execution.
	StatementType (see page 392)	Returns the statement type of the QSelect query.
R	StmtHandle (see page 392)	Identifies the statement handle for the query.
R	Text (see page 392)	Points to the actual text of the SQL (see page 392) query.

Published Properties

	Name	Description
	Active (see page 387)	This is Active, a member of class TIBQuery.
	BufferChunks (see page 387)	Specifies the dataset buffer chunk size.
	CachedUpdates (see page 388)	Specifies whether cached updates are enabled for a dataset.
	Constraints (see page 388)	This is Constraints, a member of class TIBQuery.
	DataSource (see page 388)	This is DataSource, a member of class TIBQuery.
	Filtered (see page 389)	Specifies whether filtering is active for a dataset.
	GeneratorField (see page 389)	Specifies whether the dataset should refresh its data every time it posts a record.
	OnFilterRecord (see page 390)	This is OnFilterRecord, a member of class TIBQuery.
	ParamCheck (see page 390)	Specifies whether the parameter list for a query is regenerated if the SQL property changes at runtime.
	Params (see page 391)	Contains the parameters for a query's SQL (see page 392) statement.
	SQL (see page 392)	Contains the text of the SQL statement to execute for the query.
	UniDirectional (see page 393)	Determines whether bidirectional cursors are enabled for the dataset.
	UpdateObject (see page 393)	Specifies the update object component used to update a read-only result set.

11.1.1.5.1 TIBQuery.Active Property

Pascal

```
property Active;
```

C++

```
__property Active;
```

Description

This is Active, a member of class TIBQuery.

11.1.1.5.2 TIBQuery.BufferChunks Property

Specifies the dataset buffer chunk size.

Pascal

```
property BufferChunks: Integer;
```

C++

```
__property int BufferChunks;
```

Description

Use BufferChunks to get or set the number of records for which the dataset allocates buffer space at any time. When the dataset's buffer is full, trying to fetch an additional record causes the dataset to reallocate the buffer so that it has enough memory to hold an additional BufferChunks records.

Note: When UniDirectional is true, BufferChunks has no meaning.

11.1.1.5.3 TIBQuery.CachedUpdates Property

Specifies whether cached updates are enabled for a dataset.

Pascal

```
property CachedUpdates: Boolean;
```

C++

```
__property Boolean CachedUpdates;
```

Description

CachedUpdates enables or disables the use of cached updates for a dataset. If CachedUpdates is true, cached updates are enabled. If CachedUpdates is false, cached updates are disabled.

When cached updates are enabled, updates to a dataset (such as posting changes, inserting new records, or deleting records), are stored in an internal cache on the client machine instead of being written directly to the dataset's underlying database tables. When changes are complete, an application writes all cached changes to the database in the context of a single transaction.

Note: **Note**: Instead of using cached updates, applications can obtain the same benefits with greater control by using a client dataset.

11.1.1.5.4 TIBQuery.Constraints Property

Pascal

```
property Constraints;
```

C++

```
__property Constraints;
```

Description

This is Constraints, a member of class TIBQuery.

11.1.1.5.5 TIBQuery.DataSource Property

Pascal

```
property DataSource;
```

C++

```
__property DataSource;
```

Description

This is DataSource, a member of class TIBQuery.

11.1.1.5.6 TIBQuery.Filtered Property

Specifies whether filtering is active for a dataset.

Pascal

```
property Filtered;
```

C++

```
__property Filtered;
```

Description

Check Filtered to determine whether dataset filtering is in effect. If Filtered is true, then filtering is active. Otherwise Filtered is false. To apply filter conditions specified in the Filter property or the OnFilterRecord (see page 390) event handler, set Filtered to true. Filtered is set to false by default.

Note: When filtering is enabled, user edits to a record may mean that the record no longer meets a filter's test condition. The next time the record is retrieved from the dataset while the filter is in effect, the record may seem to disappear. If that happens, the next record that passes the filter condition becomes the current record.

11.1.1.5.7 TIBQuery.GenerateParamNames Property

Generates a list of parameter names for the query.

Pascal

```
property GenerateParamNames: Boolean;
```

C++

```
__property Boolean GenerateParamNames;
```

Description

Set GenerateParamNames to true to have the query generate a list of parameter names.

11.1.1.5.8 TIBQuery.GeneratorField Property

Specifies whether the dataset should refresh its data every time it posts a record.

Pascal

```
property GeneratorField: TIBGeneratorField;
```

C++

```
__property TIBGeneratorField GeneratorField;
```

Description

Use GeneratorField to specify a generator that automatically provides the value for one of the fields in the dataset. Use the properties of the TIBGeneratorField object to indicate which field's value should be set and how that value should be calculated.

Warning: Do not set the value of GeneratorField. To change the value of this property, change the properties of the TIBGeneratorField object that is the value of this property.

11.1.1.5.9 TIBQuery.LiveMode Property

Indicates what types of edits, if any, can be made to the data in the dataset.

Pascal

```
property LiveMode: TLiveModes;
```

C++

```
__property TLiveModes LiveMode;
```

Description

Read LiveMode to determine what types of edits should be allowed. LiveMode is set automatically to restrict the capabilities of the dataset to reflect the user's rights.

Note: For read-only datasets, such as TIBQuery, LiveMode is always an empty set.

11.1.1.5.10 TIBQuery.OnFilterRecord Property

Pascal

```
property OnFilterRecord;
```

C++

```
__property OnFilterRecord;
```

Description

This is OnFilterRecord, a member of class TIBQuery.

11.1.1.5.11 TIBQuery.ParamCheck Property

Specifies whether the parameter list for a query is regenerated if the SQL property changes at runtime.

Pascal

```
property ParamCheck: Boolean;
```

C++

```
__property Boolean ParamCheck;
```

Description

Set ParamCheck to specify whether the Params property is cleared and regenerated if an application modifies the SQL in this dataset's query. By default ParamCheck is true, meaning that the Params property is automatically regenerated at runtime. When ParamCheck is true, the proper number of parameters is guaranteed to be generated for the current SQL statement.

This property is useful for data definition language (DDL) statements that contain parameters as part of the DDL statement that are not parameters for the TIBCustomDataSet. For example, the DDL statement to create a stored procedure may contain parameter statements that are part of the stored procedure. Set ParamCheck to false to prevent these parameters from being mistaken for parameters of the TIBCustomDataSet executing the DDL statement.

11.1.1.5.12 TIBQuery.ParamCount Property

Indicates the current number of parameters for the query.

Pascal

```
property ParamCount: Word;
```

C++

```
__property Word ParamCount;
```

Description

Inspect ParamCount to determine how many parameters are in the Params (see page 391) property. If the ParamCheck (see page 390) property is true, ParamCount always corresponds to the number of actual parameters in the SQL (see page 392) statement for the query.

11.1.1.5.13 TIBQuery.Params Property

Contains the parameters for a query's SQL (see page 392) statement.

Pascal

```
property Params: TParams;
```

C++

```
__property TParams Params;
```

Description

Access Params at runtime to view and set parameter names, values, and data types dynamically (at design time use the collection editor for the Params property to set parameter information). Params is a zero-based array of TParams parameter records. Index specifies the array element to access.

Note: An easier way to set and retrieve parameter values when the name of each parameter is known is to call ParamByName (see page 384). ParamByName (see page 384) cannot, however, be used to change a parameter's data type or name.

11.1.1.5.14 TIBQuery.Prepared Property

Determines whether or not a query is prepared for execution.

Pascal

```
property Prepared: Boolean;
```

C++

```
__property Boolean Prepared;
```

Description

Examine Prepared to determine if a query is already prepared for execution. If Prepared is true, the query is prepared, and if Prepared is false, the query is not prepared. While a query need not be prepared before execution, execution performance is enhanced if the query is prepared beforehand, particularly if it is a parameterized query that is executed more than once using the same parameter values.

Note: An application can change the current setting of Prepared to prepare or unprepare a query. If Prepared is true, setting it to false calls the UnPrepare (see page 386) method to unprepare the query. If Prepared is false, setting it to true calls the Prepare (see page 385) method to prepare the query. Generally, however, it is better programming practice to call Prepare (see page 385) and UnPrepare (see page 386) directly. These methods automatically update the Prepared property.

11.1.1.5.15 TIBQuery.RowsAffected Property

Returns the number of rows operated upon by the latest query execution.

Pascal

```
property RowsAffected: Integer;
```

C++

```
__property int RowsAffected;
```

Description

Check RowsAffected to determine how many rows were updated or deleted by the last query operation. If RowsAffected is -1, the query did not update or delete any rows.

11.1.1.5.16 TIBQuery.SQL Property

Contains the text of the SQL statement to execute for the query.

Pascal

```
property SQL: TStrings;
```

C++

```
__property TStrings SQL;
```

Description

Use SQL to provide the SQL statement that a query component executes when its ExecSQL (see page 383) or Open method is called. At design time the SQL property can be edited by invoking the String List editor in the Object Inspector.

The SQL property may contain only one complete SQL statement at a time.

11.1.1.5.17 TIBQuery.StatementType Property

Returns the statement type of the QSelect query.

Pascal

```
property StatementType: TIBSQLTypes;
```

C++

```
__property TIBSQLTypes StatementType;
```

Description

Use StatementType to determine the statement type of a QSelect query.

11.1.1.5.18 TIBQuery.StmtHandle Property

Identifies the statement handle for the query.

Pascal

```
property StmtHandle: TISC_STMT_HANDLE;
```

C++

```
__property TISC_STMT_HANDLE StmtHandle;
```

Description

Retrieve StmtHandle if an application makes a direct call to the InterBase server, bypassing the methods of TIBQuery (see page 376). Some API calls require a statement handle as a parameter. Under all other circumstances an application does not need to access this property.

11.1.1.5.19 TIBQuery.Text Property

Points to the actual text of the SQL (see page 392) query.

Pascal

```
property Text: string;
```

C++

```
__property UnicodeString Text;
```

Description

Text is a read-only property that can be examined to determine the actual contents of SQL (see page 392) statement. For parameterized queries, Text contains the SQL (see page 392) statement with parameters replaced by the parameter substitution symbol (?) in place of actual parameter values.

In general there should be no need to examine the Text property. To access or change the SQL (see page 392) statement for the query, use the SQL (see page 392) property. To examine or modify parameters, use the Params (see page 391) property.

11.1.1.5.20 TIBQuery.UniDirectional Property

Determines whether bidirectional cursors are enabled for the dataset.

Pascal

```
property UniDirectional: Boolean;
```

C++

```
__property Boolean UniDirectional;
```

Description

Use UniDirectional to determine whether bidirectional cursors are enabled for this dataset.

Note: Do not confuse the UniDirectional property with the IsUniDirectional property inherited from TDataSet. IsUniDirectional indicates whether the dataset is a dbExpress dataset, which, in addition to using a unidirectional cursor, does not buffer records. UniDirectional is only concerned with whether the cursor permits backward or random navigation.

11.1.1.5.21 TIBQuery.UpdateObject Property

Specifies the update object component used to update a read-only result set.

Pascal

```
property UpdateObject: TIBDataSetUpdateObject;
```

C++

```
__property TIBDataSetUpdateObject UpdateObject;
```

Description

Use UpdateObject to specify the TIBDataSetUpdateObject component to use in an application that must be able to update a read-only result set.

In some cases, such as when using TIBQuery, the dataset does not automatically update records. In these cases, UpdateObject can be used to specify a TIBUpdateSQL component that performs updates as a separate transaction that is transparent to the application.

TIBDataSetUpdateObject is especially useful for complicated updates from an OnUpdateRecord event.

11.1.1.6 TIBQuery Events

The events of the TIBQuery class are listed here.

Published Events

	Name	Description
	AfterDatabaseDisconnect (see page 394)	Occurs immediately after the connection to the associated database is closed.
	AfterTransactionEnd (see page 394)	Occurs immediately after a transaction that includes this dataset's query ends.
	BeforeDatabaseDisconnect (see page 394)	Occurs immediately before the connection to the associated database is closed.
	BeforeTransactionEnd (see page 395)	Occurs immediately before a transaction that includes this dataset's query ends.
	DatabaseFree (see page 395)	Occurs when the database associated with this dataset is freed.
	TransactionFree (see page 395)	Occurs when the transaction that includes this dataset's query is freed.

11.1.1.6.1 TIBQuery.AfterDatabaseDisconnect Event

Occurs immediately after the connection to the associated database is closed.

Pascal

```
property AfterDatabaseDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterDatabaseDisconnect;
```

Description

Write an AfterDatabaseDisconnect event handler to respond when the dataset closes its connection to the database specified by the Database property.

11.1.1.6.2 TIBQuery.AfterTransactionEnd Event

Occurs immediately after a transaction that includes this dataset's query ends.

Pascal

```
property AfterTransactionEnd: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterTransactionEnd;
```

Description

Write an AfterTransactionEnd event handler to respond when the transaction specified by the Transaction property ends.

11.1.1.6.3 TIBQuery.BeforeDatabaseDisconnect Event

Occurs immediately before the connection to the associated database is closed.

Pascal

```
property BeforeDatabaseDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeDatabaseDisconnect;
```

Description

Write a BeforeDatabaseDisconnect event handler to respond when the dataset is about to close its connection to the database

specified by the Database property.

11.1.1.6.4 TIBQuery.BeforeTransactionEnd Event

Occurs immediately before a transaction that includes this dataset's query ends.

Pascal

```
property BeforeTransactionEnd: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeTransactionEnd;
```

Description

Write a BeforeTransactionEnd event handler to respond when the transaction specified by the Transaction property is about to end.

11.1.1.6.5 TIBQuery.DatabaseFree Event

Occurs when the database associated with this dataset is freed.

Pascal

```
property DatabaseFree: TNotifyEvent;
```

C++

```
__property TNotifyEvent DatabaseFree;
```

Description

Write a DatabaseFree event handler to respond when the database specified by the Database property is freed.

11.1.1.6.6 TIBQuery.TransactionFree Event

Occurs when the transaction that includes this dataset's query is freed.

Pascal

```
property TransactionFree: TNotifyEvent;
```

C++

```
__property TNotifyEvent TransactionFree;
```

Description

Write a TransactionFree event handler to respond when the transaction specified by the Transaction property is freed.

12 IBServices Namespace

This is namespace IBServices.

Topics

Name	Description
Classes (see page 399)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 477)	The following table lists structs, records, enums in this documentation.
Types (see page 486)	The following table lists types in this documentation.
Constants (see page 491)	The following table lists constants in this documentation.

Classes

	Name	Description
	TConfigFileData (see page 399)	This is class IBServices.TConfigFileData.
	TConfigParams (see page 401)	TConfigFileData (see page 399) and TConfigParams hold configuration information about an InterBase server
	TDatabaseInfo (see page 404)	TDatabaseInfo stores information about an InterBase database.
	TIBBackupRestoreService (see page 406)	TIBBackupRestoreService is the ancestor object from which TIBBackupService (see page 408) and TIBRestoreService (see page 439) are derived.
	TIBBackupService (see page 408)	TIBBackupService allows you to back up your database.
	TIBConfigService (see page 412)	TIBConfigService configures the database parameters
	TIBControlAndQueryService (see page 417)	TIBControlAndQueryService is the ancestor object from which the log, statistical, validation, security, and backup and restore IBService components descend.
	TIBControlService (see page 421)	TIBControlService is the ancestor object from which the structured and unstructured IBService components descend.
	TIBCustomService (see page 425)	TIBCustomService is the ancestor object from which all IBService components descend.
	TIBLicensingService (see page 433)	TIBLicensingService configures the licensing parameters
	TIBLogService (see page 437)	TIBLogService returns the contents of the interbase.log file from a server.
	TIBRestoreService (see page 439)	TIBRestoreService allows you to restore your database.
	TIBSecurityService (see page 443)	TIBSecurityService enables you to manage user access to the InterBase server.
	TIBServerProperties (see page 452)	TIBServerProperties returns database server information.
	TIBStatisticalService (see page 458)	TIBStatisticalService allows you to view database statistics.
	TIBValidationService (see page 461)	TIBValidationService enables you to validate your database and reconcile your database transactions.
	TLicenseInfo (see page 466)	TLicenseInfo stores information about licensed users.
	TLicenseMaskInfo (see page 468)	TLicenseMaskInfo indicates the software activation certificate options enabled on the server.
	TLimboTransactionInfo (see page 469)	TLimboTransactionInfo stores information about a limbo transaction.

	TUserInfo (see page 472)	TUserInfo stores information about an InterBase user for the security service.
	TVersionInfo (see page 475)	TVersionInfo represents version information about an InterBase server.

Constants

Name	Description
DefaultBufferSize (see page 491)	This is constant IBServices.DefaultBufferSize.
SPBConstantNames (see page 491)	This is constant IBServices.SPBConstantNames.
SPBConstantValues (see page 492)	This is constant IBServices.SPBConstantValues.
SPBPrefix (see page 492)	This is constant IBServices.SPBPrefix.

Structs, Records, Enums

	Name	Description
	TBackupOption (see page 477)	This is record IBServices.TBackupOption.
	TLicensingAction (see page 478)	TLicensingAction indicates whether to add or remove InterBase software activation certificates.
	TOutputBufferOption (see page 478)	This is record IBServices.TOutputBufferOption.
	TPropertyOption (see page 479)	This is record IBServices.TPropertyOption.
	TProtocol (see page 479)	TProtocol identifies a network protocol.
	TRestoreOption (see page 480)	This is record IBServices.TRestoreOption.
	TSecurityAction (see page 480)	TSecurityAction indicates what operation the InterBase security service should perform.
	TSecurityModifyParam (see page 481)	This is record IBServices.TSecurityModifyParam.
	TShutdownMode (see page 481)	TShutdownMode indicates what steps to take when shutting down the InterBase database.
	TStatOption (see page 482)	This is record IBServices.TStatOption.
	TTransactionAction (see page 482)	TTransactionAction indicates the action a transaction can take when it times out.
	TTransactionAdvise (see page 483)	This is record IBServices.TTransactionAdvise.
	TTransactionGlobalAction (see page 483)	TTransactionGlobalAction indicates the action to take on a set of transactions.
	TTransactionState (see page 484)	This is record IBServices.TTransactionState.
	TValidateOption (see page 485)	This is record IBServices.TValidateOption.

Types

Name	Description
TBackupOptions (see page 486)	TBackupOption (see page 477) and TBackupOptions indicate how TIBBackupService (see page 408) performs database backup.
TLoginEvent (see page 487)	This is type IBServices.TLoginEvent.
TPropertyOptions (see page 487)	TPropertyOption (see page 479) and TPropertyOptions indicate groups of InterBase server properties.
TRestoreOptions (see page 488)	TRestoreOption (see page 480) and TRestoreOptions indicate what operations take place when restoring an InterBase database.
TSecurityModifyParams (see page 489)	This is type IBServices.TSecurityModifyParams.
TStatOptions (see page 489)	TStatOption (see page 482) and TStatOptions indicate the different statistical information available about a database.
TValidateOptions (see page 490)	TValidateOption (see page 485) and TValidateOptions indicate what operations the validation service should perform when restoring a database.

12.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TConfigFileData (see page 399)	This is class IBServices.TConfigFileData.
	TConfigParams (see page 401)	TConfigFileData (see page 399) and TConfigParams hold configuration information about an InterBase server
	TDatabaseInfo (see page 404)	TDatabaseInfo stores information about an InterBase database.
	TIBBackupRestoreService (see page 406)	TIBBackupRestoreService is the ancestor object from which TIBBackupService (see page 408) and TIBRestoreService (see page 439) are derived.
	TIBBackupService (see page 408)	TIBBackupService allows you to back up your database.
	TIBConfigService (see page 412)	TIBConfigService configures the database parameters
	TIBControlAndQueryService (see page 417)	TIBControlAndQueryService is the ancestor object from which the log, statistical, validation, security, and backup and restore IBService components descend.
	TIBControlService (see page 421)	TIBControlService is the ancestor object from which the structured and unstructured IBService components descend.
	TIBCustomService (see page 425)	TIBCustomService is the ancestor object from which all IBService components descend.
	TIBLicensingService (see page 433)	TIBLicensingService configures the licensing parameters
	TIBLogService (see page 437)	TIBLogService returns the contents of the interbase.log file from a server.
	TIBRestoreService (see page 439)	TIBRestoreService allows you to restore your database.
	TIBSecurityService (see page 443)	TIBSecurityService enables you to manage user access to the InterBase server.
	TIBServerProperties (see page 452)	TIBServerProperties returns database server information.
	TIBStatisticalService (see page 458)	TIBStatisticalService allows you to view database statistics.
	TIBValidationService (see page 461)	TIBValidationService enables you to validate your database and reconcile your database transactions.
	TLicenseInfo (see page 466)	TLicenseInfo stores information about licensed users.
	TLicenseMaskInfo (see page 468)	TLicenseMaskInfo indicates the software activation certificate options enabled on the server.
	TLimboTransactionInfo (see page 469)	TLimboTransactionInfo stores information about a limbo transaction.
	TUserInfo (see page 472)	TUserInfo stores information about an InterBase user for the security service.
	TVersionInfo (see page 475)	TVersionInfo represents version information about an InterBase server.

12.1.1 TConfigFileData Class

Class Hierarchy

Pascal

```
TConfigFileData = class;
```

C++

```
class TConfigFileData;
```

File

IBServices

Description

This is class IBServices.TConfigFileData.

12.1.1.1 TConfigFileData Members

The following tables list the members exposed by TConfigFileData.

Public Fields

	Name	Description
	ConfigFileKey (see page 401)	This is ConfigFileKey, a member of class TConfigFileData.
	ConfigFileValue (see page 401)	This is ConfigFileValue, a member of class TConfigFileData.

Public Methods

	Name	Description
	Create (see page 400)	This is Create, a member of class TConfigFileData.
	Destroy (see page 400)	This is Destroy, a member of class TConfigFileData.

12.1.1.2 TConfigFileData.Create Constructor

Pascal

```
constructor Create;
```

C++

```
__fastcall TConfigFileData();
```

Description

This is Create, a member of class TConfigFileData.

12.1.1.3 TConfigFileData.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TConfigFileData();
```

Description

This is Destroy, a member of class TConfigFileData.

12.1.1.4 TConfigFileData Fields

The fields of the TConfigFileData class are listed here.

Public Fields

	Name	Description
	ConfigFileKey (see page 401)	This is ConfigFileKey, a member of class TConfigFileData.
	ConfigFileValue (see page 401)	This is ConfigFileValue, a member of class TConfigFileData.

12.1.1.4.1 TConfigFileData.ConfigFileKey Field

Pascal

```
ConfigFileKey: array of integer;
```

C++

```
array of integer ConfigFileKey;
```

Description

This is ConfigFileKey, a member of class TConfigFileData.

12.1.1.4.2 TConfigFileData.ConfigFileValue Field

Pascal

```
ConfigFileValue: array of integer;
```

C++

```
array of integer ConfigFileValue;
```

Description

This is ConfigFileValue, a member of class TConfigFileData.

12.1.2 TConfigParams Class

TConfigFileData (see page 399) and TConfigParams hold configuration information about an InterBase server

Class Hierarchy

Pascal

```
TConfigParams = class;
```

C++

```
class TConfigParams;
```

File

IBServices

Description

TConfigFileData (see page 399) stored information about an InterBase configuration file. It is one of the parameters of the TConfigParams type, which stores server configuration settings.

12.1.2.1 TConfigParams Members

The following tables list the members exposed by TConfigParams.

Public Fields

	Name	Description
	BaseLocation (see page 402)	This is BaseLocation, a member of class TConfigParams.

	ConfigFileData (see page 403)	This is ConfigFileData, a member of class TConfigParams.
	ConfigFileParams (see page 403)	This is ConfigFileParams, a member of class TConfigParams.
	LockFileLocation (see page 403)	This is LockFileLocation, a member of class TConfigParams.
	MessageFileLocation (see page 403)	This is MessageFileLocation, a member of class TConfigParams.
	SecurityDatabaseLocation (see page 404)	This is SecurityDatabaseLocation, a member of class TConfigParams.

Public Methods

	Name	Description
	Create (see page 402)	This is Create, a member of class TConfigParams.
V	Destroy (see page 402)	This is Destroy, a member of class TConfigParams.

12.1.2.2 TConfigParams.Create Constructor

Pascal

```
constructor Create;
```

C++

```
__fastcall TConfigParams();
```

Description

This is Create, a member of class TConfigParams.

12.1.2.3 TConfigParams.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TConfigParams();
```

Description

This is Destroy, a member of class TConfigParams.

12.1.2.4 TConfigParams Fields

The fields of the TConfigParams class are listed here.

Public Fields

	Name	Description
	BaseLocation (see page 402)	This is BaseLocation, a member of class TConfigParams.
	ConfigFileData (see page 403)	This is ConfigFileData, a member of class TConfigParams.
	ConfigFileParams (see page 403)	This is ConfigFileParams, a member of class TConfigParams.
	LockFileLocation (see page 403)	This is LockFileLocation, a member of class TConfigParams.
	MessageFileLocation (see page 403)	This is MessageFileLocation, a member of class TConfigParams.
	SecurityDatabaseLocation (see page 404)	This is SecurityDatabaseLocation, a member of class TConfigParams.

12.1.2.4.1 TConfigParams.BaseLocation Field

Pascal

```
BaseLocation: string;
```

C++

```
UnicodeString BaseLocation;
```

Description

This is BaseLocation, a member of class TConfigParams.

12.1.2.4.2 TConfigParams.ConfigFileData Field

Pascal

```
ConfigFileData: TConfigFileData;
```

C++

```
TConfigFileData ConfigFileData;
```

Description

This is ConfigFileData, a member of class TConfigParams.

12.1.2.4.3 TConfigParams.ConfigFileParams Field

Pascal

```
ConfigFileParams: array of string;
```

C++

```
array of string ConfigFileParams;
```

Description

This is ConfigFileParams, a member of class TConfigParams.

12.1.2.4.4 TConfigParams.LockFileLocation Field

Pascal

```
LockFileLocation: string;
```

C++

```
UnicodeString LockFileLocation;
```

Description

This is LockFileLocation, a member of class TConfigParams.

12.1.2.4.5 TConfigParams.MessageFileLocation Field

Pascal

```
MessageFileLocation: string;
```

C++

```
UnicodeString MessageFileLocation;
```

Description

This is MessageFileLocation, a member of class TConfigParams.

12.1.2.4.6 TConfigParams.SecurityDatabaseLocation Field

Pascal

```
SecurityDatabaseLocation: string;
```

C++

```
UnicodeString SecurityDatabaseLocation;
```

Description

This is SecurityDatabaseLocation, a member of class TConfigParams.

12.1.3 TDatabaseInfo Class

TDatabaseInfo stores information about an InterBase database.

Class Hierarchy

Pascal

```
TDatabaseInfo = class;
```

C++

```
class TDatabaseInfo;
```

File

IBServices

Description

TDatabaseInfo describes an InterBase database.

NoOfAttachments (see page 405) is the number attachments.

NoOfDatabases (see page 406) is the number of databases.

DbName (see page 405) is the name of the database.

12.1.3.1 TDatabaseInfo Members

The following tables list the members exposed by TDatabaseInfo.

Public Fields

	Name	Description
	DbName (see page 405)	This is DbName, a member of class TDatabaseInfo.
	NoOfAttachments (see page 405)	This is NoOfAttachments, a member of class TDatabaseInfo.
	NoOfDatabases (see page 406)	This is NoOfDatabases, a member of class TDatabaseInfo.

Public Methods

	Name	Description
	Create (see page 405)	This is Create, a member of class TDatabaseInfo.
	Destroy (see page 405)	This is Destroy, a member of class TDatabaseInfo.

12.1.3.2 TDatabaseInfo.Create Constructor

Pascal

```
constructor Create;
```

C++

```
__fastcall TDatabaseInfo();
```

Description

This is Create, a member of class TDatabaseInfo.

12.1.3.3 TDatabaseInfo.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDatabaseInfo();
```

Description

This is Destroy, a member of class TDatabaseInfo.

12.1.3.4 TDatabaseInfo Fields

The fields of the TDatabaseInfo class are listed here.

Public Fields

	Name	Description
	DbName (see page 405)	This is DbName, a member of class TDatabaseInfo.
	NoOfAttachments (see page 405)	This is NoOfAttachments, a member of class TDatabaseInfo.
	NoOfDatabases (see page 406)	This is NoOfDatabases, a member of class TDatabaseInfo.

12.1.3.4.1 TDatabaseInfo.DbName Field

Pascal

```
DbName: array of string;
```

C++

```
array of string DbName;
```

Description

This is DbName, a member of class TDatabaseInfo.

12.1.3.4.2 TDatabaseInfo.NoOfAttachments Field

Pascal

```
NoOfAttachments: Integer;
```

C++

```
int NoOfAttachments;
```

Description

This is NoOfAttachments, a member of class TDatabaseInfo.

12.1.3.4.3 TDatabaseInfo.NoOfDatabases Field

Pascal

```
NoOfDatabases: Integer;
```

C++

```
int NoOfDatabases;
```

Description

This is NoOfDatabases, a member of class TDatabaseInfo.

12.1.4 TIBBackupRestoreService Class

TIBBackupRestoreService is the ancestor object from which TIBBackupService (see page 408) and TIBRestoreService (see page 439) are derived.

Class Hierarchy

Pascal

```
TIBBackupRestoreService = class(TIBControlAndQueryService);
```

C++

```
class TIBBackupRestoreService : public TIBControlAndQueryService;
```

File

IBServices

Description

TIBBackupRestoreService is the ancestor object from which TIBBackupService (see page 408) and TIBRestoreService (see page 439) are derived.

Note: You must install InterBase 6 to use this feature.

12.1.4.1 TIBBackupRestoreService Members

The following tables list the members exposed by TIBBackupRestoreService.

Protected Methods

	Name	Description
	CheckActive (see page 427)	This is CheckActive, a member of class TIBCustomService.
	CheckInactive (see page 428)	This is CheckInactive, a member of class TIBCustomService.
	InternalServiceQuery (see page 428)	This is InternalServiceQuery, a member of class TIBCustomService.

	InternalServiceStart (see page 423)	This is InternalServiceStart, a member of class TIBControlService.
V	Loaded (see page 428)	Initializes the component after the form file has been read into memory.
	Login (see page 429)	This is Login, a member of class TIBCustomService.
	ServiceStartAddParam (see page 423)	This is the overview for the ServiceStartAddParam method overload.
V	SetServiceStartOptions (see page 424)	This is SetServiceStartOptions, a member of class TIBControlService.

Protected Properties

	Name	Description
	Action (see page 420)	This is Action, a member of class TIBControlAndQueryService.
	BufferSize (see page 430)	This is BufferSize, a member of class TIBCustomService.
R	OutputBuffer (see page 431)	This is OutputBuffer, a member of class TIBCustomService.
	OutputBufferOption (see page 431)	This is OutputBufferOption, a member of class TIBCustomService.
	ServiceQueryParams (see page 432)	This is ServiceQueryParams, a member of class TIBCustomService.
	ServiceStartParams (see page 425)	This is ServiceStartParams, a member of class TIBControlService.

Public Methods

	Name	Description
	Attach (see page 427)	Attaches to the database.
V	Create (see page 419)	Creates an instance of a TIBControlAndQueryService (see page 417).
V	Create (see page 422)	Creates an instance of TIBControlService (see page 421)
V	Create (see page 426)	Creates an instance of TIBCustomService (see page 425)
V	Destroy (see page 426)	Destroys the service.
	Detach (see page 428)	Detaches from the database.
	GetNextChunk (see page 419)	Gets the next chunk of data.
	GetNextLine (see page 420)	Starts the service.
V	ServiceStart (see page 423)	Starts the service.

Public Properties

	Name	Description
R	Eof (see page 421)	Indicates that the end of file has been reached.
R	Handle (see page 430)	Returns the database handle.
R	IsServiceRunning (see page 424)	Indicates whether the service is running.
	ServiceParamBySPB (see page 432)	Returns and sets SPB parameters.

Published Events

	Name	Description
	OnAttach (see page 433)	Occurs when the database is attached.
	OnLogin (see page 433)	Occurs during database login.

Published Properties

	Name	Description
	Active (see page 430)	Sets the active state of the service.
	BufferSize (see page 420)	Sets or returns the buffer size.
	LoginPrompt (see page 430)	Turns on and off login prompt display.
	Params (see page 431)	Sets or returns the database parameters
	Protocol (see page 431)	Sets or returns the network protocol.
	ServerName (see page 431)	Sets the name of the server on which the services are to be run.
	TraceFlags (see page 432)	This is TraceFlags, a member of class TIBCustomService.
	Verbose (see page 408)	Sets or returns the backup or restore in verbose mode.

12.1.4.2 TIBBackupRestoreService Properties

The properties of the TIBBackupRestoreService class are listed here.

Published Properties

	Name	Description
	Verbose (see page 408)	Sets or returns the backup or restore in verbose mode.

12.1.4.2.1 TIBBackupRestoreService.Verbose Property

Sets or returns the backup or restore in verbose mode.

Pascal

```
property Verbose: Boolean;
```

C++

```
__property Boolean Verbose;
```

Description

Use Verbose to set or return the backup or restore in verbose mode.

Note: You must install InterBase 6 to use this feature.

12.1.5 TIBBackupService Class

TIBBackupService allows you to back up your database.

Class Hierarchy

Pascal

```
TIBBackupService = class(TIBBackupRestoreService);
```

C++

```
class TIBBackupService : public TIBBackupRestoreService;
```

File

IBServices

Description

Use a TIBBackupService object to back up your database.

Getting Started with InterBase Express

12.1.5.1 TIBBackupService Members

The following tables list the members exposed by TIBBackupService.

Protected Methods

	Name	Description
	CheckActive (see page 427)	This is CheckActive, a member of class TIBCustomService.
	CheckInactive (see page 428)	This is CheckInactive, a member of class TIBCustomService.
	InternalServiceQuery (see page 428)	This is InternalServiceQuery, a member of class TIBCustomService.

	InternalServiceStart (see page 423)	This is InternalServiceStart, a member of class TIBControlService.
V	Loaded (see page 428)	Initializes the component after the form file has been read into memory.
	Login (see page 429)	This is Login, a member of class TIBCustomService.
	ServiceStartAddParam (see page 423)	This is the overview for the ServiceStartAddParam method overload.
V	SetServiceStartOptions (see page 410)	This is SetServiceStartOptions, a member of class TIBBackupService.

Protected Properties

	Name	Description
	Action (see page 420)	This is Action, a member of class TIBControlAndQueryService.
	BufferSize (see page 430)	This is BufferSize, a member of class TIBCustomService.
R	OutputBuffer (see page 431)	This is OutputBuffer, a member of class TIBCustomService.
	OutputBufferOption (see page 431)	This is OutputBufferOption, a member of class TIBCustomService.
	ServiceQueryParams (see page 432)	This is ServiceQueryParams, a member of class TIBCustomService.
	ServiceStartParams (see page 425)	This is ServiceStartParams, a member of class TIBControlService.

Public Methods

	Name	Description
	Attach (see page 427)	Attaches to the database.
V	Create (see page 410)	Creates an instance of TIBBackupService (see page 408)
V	Destroy (see page 410)	Destroys the service.
	Detach (see page 428)	Detaches from the database.
	GetNextChunk (see page 419)	Gets the next chunk of data.
	GetNextLine (see page 420)	Starts the service.
V	ServiceStart (see page 423)	Starts the service.

Public Properties

	Name	Description
R	Eof (see page 421)	Indicates that the end of file has been reached.
R	Handle (see page 430)	Returns the database handle.
R	IsServiceRunning (see page 424)	Indicates whether the service is running.
	ServiceParamBySPB (see page 432)	Returns and sets SPB parameters.

Published Events

	Name	Description
	OnAttach (see page 433)	Occurs when the database is attached.
	OnLogin (see page 433)	Occurs during database login.

Published Properties

	Name	Description
	Active (see page 430)	Sets the active state of the service.
	BackupFile (see page 411)	Sets or returns the backup file name.
	BlockingFactor (see page 411)	Sets or returns the blocking factor for the tape device.
	BufferSize (see page 420)	Sets or returns the buffer size.
	DatabaseName (see page 411)	Sets or returns the database name.
	LoginPrompt (see page 430)	Turns on and off login prompt display.
	Options (see page 411)	Sets the options for the database backup.
	Params (see page 431)	Sets or returns the database parameters
	Protocol (see page 431)	Sets or returns the network protocol.
	ServerName (see page 431)	Sets the name of the server on which the services are to be run.
	TraceFlags (see page 432)	This is TraceFlags, a member of class TIBCustomService.
	Verbose (see page 408)	Sets or returns the backup or restore in verbose mode.

12.1.5.2 TIBBackupService.Create Constructor

Creates an instance of TIBBackupService (see page 408)

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBBackupService(TComponent * AOwner);
```

Description

Call Create to create an instance of TIBBackupService (see page 408).

12.1.5.3 TIBBackupService.Destroy Destructor

Destroys the service.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBBackupService();
```

Description

Do not call Destroy directly in an application. Instead, an application should call Free. Free verifies that the service object has not already been freed before it calls Destroy.

12.1.5.4 TIBBackupService Methods

The methods of the TIBBackupService class are listed here.

Protected Methods

	Name	Description
	SetServiceStartOptions (see page 410)	This is SetServiceStartOptions, a member of class TIBBackupService.

12.1.5.4.1 TIBBackupService.SetServiceStartOptions Method

Pascal

```
procedure SetServiceStartOptions; override;
```

C++

```
virtual __fastcall SetServiceStartOptions();
```

Description

This is SetServiceStartOptions, a member of class TIBBackupService.

12.1.5.5 TIBBackupService Properties

The properties of the TIBBackupService class are listed here.

Published Properties

	Name	Description
	BackupFile (see page 411)	Sets or returns the backup file name.
	BlockingFactor (see page 411)	Sets or returns the blocking factor for the tape device.
	DatabaseName (see page 411)	Sets or returns the database name.
	Options (see page 411)	Sets the options for the database backup.

12.1.5.5.1 TIBBackupService.BackupFile Property

Sets or returns the backup file name.

Pascal

```
property BackupFile: TStrings;
```

C++

```
__property TStrings BackupFile;
```

Description

Use BackupFile to set or return the backup file name.

12.1.5.5.2 TIBBackupService.BlockingFactor Property

Sets or returns the blocking factor for the tape device.

Pascal

```
property BlockingFactor: Integer;
```

C++

```
__property int BlockingFactor;
```

Description

Use BlockingFactor to set the blocking factor for the tape device as an integer.

12.1.5.5.3 TIBBackupService.DatabaseName Property

Sets or returns the database name.

Pascal

```
property DatabaseName: string;
```

C++

```
__property UnicodeString DatabaseName;
```

Description

Use DatabaseName to set or return the database name.

12.1.5.5.4 TIBBackupService.Options Property

Sets the options for the database backup.

Pascal

```
property Options: TBackupOptions;
```

C++

```
__property TBackupOptions Options;
```

Description

Use Options to select the options for the database backup.

12.1.6 TIBConfigService Class

TIBConfigService configures the database parameters

Class Hierarchy

Pascal

```
TIBConfigService = class(TIBControlService);
```

C++

```
class TIBConfigService : public TIBControlService;
```

File

IBServices

Description

Use a TIBConfigService object to configure database parameters.

Note: You must install InterBase 6 to use this feature.

Getting Started with InterBase Express

12.1.6.1 TIBConfigService Members

The following tables list the members exposed by TIBConfigService.

Protected Methods

	Name	Description
	CheckActive (see page 427)	This is CheckActive, a member of class TIBCustomService.
	CheckInactive (see page 428)	This is CheckInactive, a member of class TIBCustomService.
	InternalServiceQuery (see page 428)	This is InternalServiceQuery, a member of class TIBCustomService.
	InternalServiceStart (see page 423)	This is InternalServiceStart, a member of class TIBControlService.
V	Loaded (see page 428)	Initializes the component after the form file has been read into memory.
	Login (see page 429)	This is Login, a member of class TIBCustomService.
	ServiceStartAddParam (see page 423)	This is the overview for the ServiceStartAddParam method overload.
V	SetServiceStartOptions (see page 424)	This is SetServiceStartOptions, a member of class TIBControlService.

Protected Properties

	Name	Description
	BufferSize (see page 430)	This is BufferSize, a member of class TIBCustomService.
R	OutputBuffer (see page 431)	This is OutputBuffer, a member of class TIBCustomService.
	OutputBufferOption (see page 431)	This is OutputBufferOption, a member of class TIBCustomService.

	ServiceQueryParams (see page 432)	This is ServiceQueryParams, a member of class TIBCustomService.
	ServiceStartParams (see page 425)	This is ServiceStartParams, a member of class TIBControlService.

Public Methods

	Name	Description
	ActivateShadow (see page 414)	Activates the shadow file for database use.
	Attach (see page 427)	Attaches to the database.
	BringDatabaseOnline (see page 414)	Brings the database online.
V	Create (see page 422)	Creates an instance of TIBControlService (see page 421)
V	Create (see page 426)	Creates an instance of TIBCustomService (see page 425)
V	Destroy (see page 426)	Destroys the service.
	Detach (see page 428)	Detaches from the database.
V	ServiceStart (see page 414)	Starts the service.
	SetAsyncMode (see page 415)	Sets database writes to asynchronous mode.
	SetDBSqlDialect (see page 415)	Sets the SQL dialect for the database.
	SetPageBuffers (see page 415)	Sets the number of database page buffers.
	SetReadOnly (see page 416)	Sets the database to read only.
	SetReserveSpace (see page 416)	Sets reserve space on the data page for versioning.
	SetSweepInterval (see page 416)	Sets the sweep interval.
	ShutdownDatabase (see page 417)	Shuts down the database.

Public Properties

	Name	Description
R	Handle (see page 430)	Returns the database handle.
R	IsServiceRunning (see page 424)	Indicates whether the service is running.
	ServiceParamBySPB (see page 432)	Returns and sets SPB parameters.

Published Events

	Name	Description
	OnAttach (see page 433)	Occurs when the database is attached.
	OnLogin (see page 433)	Occurs during database login.

Published Properties

	Name	Description
	Active (see page 430)	Sets the active state of the service.
	DatabaseName (see page 417)	This is DatabaseName, a member of class TIBConfigService.
	LoginPrompt (see page 430)	Turns on and off login prompt display.
	Params (see page 431)	Sets or returns the database parameters
	Protocol (see page 431)	Sets or returns the network protocol.
	ServerName (see page 431)	Sets the name of the server on which the services are to be run.
	TraceFlags (see page 432)	This is TraceFlags, a member of class TIBCustomService.

12.1.6.2 TIBConfigService Methods

The methods of the TIBConfigService class are listed here.

Public Methods

	Name	Description
	ActivateShadow (see page 414)	Activates the shadow file for database use.
	BringDatabaseOnline (see page 414)	Brings the database online.
V	ServiceStart (see page 414)	Starts the service.
	SetAsyncMode (see page 415)	Sets database writes to asynchronous mode.
	SetDBSqlDialect (see page 415)	Sets the SQL dialect for the database.
	SetPageBuffers (see page 415)	Sets the number of database page buffers.

	SetReadOnly (see page 416)	Sets the database to read only.
	SetReserveSpace (see page 416)	Sets reserve space on the data page for versioning.
	SetSweepInterval (see page 416)	Sets the sweep interval.
	ShutdownDatabase (see page 417)	Shuts down the database.

12.1.6.2.1 TIBConfigService.ActivateShadow Method

Activates the shadow file for database use.

Pascal

```
procedure ActivateShadow;
```

C++

```
__fastcall ActivateShadow();
```

Description

Call ActivateShadow to activate the database shadow.

InterBase 6 lets you recover a database in case of disk failure, network failure, or accidental deletion of the database. This recovery method is known as disk shadowing, or simply shadowing. Before you can activate shadowing, you must first create a database shadow, as discussed in 'Shadowing' and 'Creating a shadow' in the InterBase 6 Operations Guide.

Note: You must install InterBase 6 to use this feature.

12.1.6.2.2 TIBConfigService.BringDatabaseOnline Method

Brings the database online.

Pascal

```
procedure BringDatabaseOnline;
```

C++

```
__fastcall BringDatabaseOnline();
```

Description

Call BringDatabaseOnline to bring a database online.

Note: You must install InterBase 6 to use this feature.

12.1.6.2.3 TIBConfigService.ServiceStart Method

Starts the service.

Pascal

```
procedure ServiceStart; override;
```

C++

```
virtual __fastcall ServiceStart();
```

Description

Call ServiceStart to start the service.

Note: You must install InterBase 6 to use this feature.

12.1.6.2.4 TIBConfigService.SetAsyncMode Method

Sets database writes to asynchronous mode.

Pascal

```
procedure SetAsyncMode(Value: Boolean);
```

C++

```
__fastcall SetAsyncMode(Boolean Value);
```

Description

Set SetAsyncMode to true to change the database write mode to asynchronous (buffered writes).

InterBase 6 allows you to write to databases in both synchronous and asynchronous modes. In synchronous mode, the database writes are forced. In asynchronous mode, the database writes are buffered.

For more information, refer to 'Forced writes vs. buffered writes' in the InterBase 6 Operations Guide.

Note: You must install InterBase 6 to use this feature.

12.1.6.2.5 TIBConfigService.SetDBSqlDialect Method

Sets the SQL dialect for the database.

Pascal

```
procedure SetDBSqlDialect(Value: Integer);
```

C++

```
__fastcall SetDBSqlDialect(int Value);
```

Description

Call SetDBSqlDialect to set the SQL dialect for the database. Valid integer values are 1, 2, and 3.

Note: You must install InterBase 6 to use this feature.

12.1.6.2.6 TIBConfigService.SetPageBuffers Method

Sets the number of database page buffers.

Pascal

```
procedure SetPageBuffers(Value: Integer);
```

C++

```
__fastcall SetPageBuffers(int Value);
```

Description

Call SetPageBuffers to set the number of database page buffers.

When a program establishes a connection to a database, InterBase allocates system memory to use as a private buffer. The buffers are used to store accessed database pages to speed performance. The number of buffers assigned determines how many simultaneous database pages it can have access to in the memory pool. Buffers remain assigned until a program finishes with a database.

For more information on page buffers, refer to 'Setting database cache buffers' in the InterBase 6 Programmer's Guide.

Note: You must install InterBase 6 to use this feature.

12.1.6.2.7 TIBConfigService.SetReadOnly Method

Sets the database to read only.

Pascal

```
procedure SetReadOnly(Value: Boolean);
```

C++

```
__fastcall SetReadOnly(Boolean Value);
```

Description

Call SetReadOnly to set the database to read only.

Access mode specifies the type of access a transaction has for the table it uses. There are two possible modes: read-only and read-write.

- Read-only specifies that a transaction can read data from a table, but cannot insert, update, or delete table data.
- Read-write specifies that a transaction can select, insert, update, and delete table data. This is the default setting if none is specified.

Tip: You should specify the transaction's access mode even if is read-write. It makes the application's source code easier to read and debug, because the program's intentions are clearly spelled out.

Note: You must install InterBase 6 to use this feature.

12.1.6.2.8 TIBConfigService.SetReserveSpace Method

Sets reserve space on the data page for versioning.

Pascal

```
procedure SetReserveSpace(Value: Boolean);
```

C++

```
__fastcall SetReserveSpace(Boolean Value);
```

Description

Set SetReserveSpace to true to reserve space on the data page for versioning.

Note: You must install InterBase 6 to use this feature.

12.1.6.2.9 TIBConfigService.SetSweepInterval Method

Sets the sweep interval.

Pascal

```
procedure SetSweepInterval(Value: Integer);
```

C++

```
__fastcall SetSweepInterval(int Value);
```

Description

Call SetSweepInterval set the sweep interval for the database. The sweep interval refers to the number of transactions between database sweeps.

To turn off database sweeps, set the sweep interval to 0.

Sweeping a database is a systematic way of removing outdated records from the database. Periodic sweeping keeps the database from getting too large. However, sweeping can also slow performance. For more information, refer to 'Setting the sweep interval' in the InterBase 6 Operations Guide.

Note: You must install InterBase 6 to use this feature.

12.1.6.2.10 TIBConfigService.ShutdownDatabase Method

Shuts down the database.

Pascal

```
procedure ShutdownDatabase(Options: TShutdownMode; Wait: Integer);
```

C++

```
__fastcall ShutdownDatabase(TShutdownMode Options, int Wait);
```

Description

Call ShutdownDatabase to shut down the database after a specified number of seconds.

Note: You must install InterBase 6 to use this feature.

12.1.6.3 TIBConfigService Properties

The properties of the TIBConfigService class are listed here.

Published Properties

	Name	Description
	DatabaseName (see page 417)	This is DatabaseName, a member of class TIBConfigService.

12.1.6.3.1 TIBConfigService.DatabaseName Property

Pascal

```
property DatabaseName: string;
```

C++

```
__property UnicodeString DatabaseName;
```

Description

This is DatabaseName, a member of class TIBConfigService.

12.1.7 TIBControlAndQueryService Class

TIBControlAndQueryService is the ancestor object from which the log, statistical, validation, security, and backup and restore IBService components descend.

Class Hierarchy

Pascal

```
TIBControlAndQueryService = class(TIBControlService);
```

C++

```
class TIBControlAndQueryService : public TIBControlService;
```

File

IBServices

Description

TIBControlAndQueryService is the ancestor object from which the log, statistical, validation, security, and backup and restore IBService components descend. The service is unstructured because the output is in an unformatted text file.

Note: You must install InterBase 6 to use this feature.

12.1.7.1 TIBControlAndQueryService Members

The following tables list the members exposed by TIBControlAndQueryService.

Protected Methods

	Name	Description
	CheckActive (see page 427)	This is CheckActive, a member of class TIBCustomService.
	CheckInactive (see page 428)	This is CheckInactive, a member of class TIBCustomService.
	InternalServiceQuery (see page 428)	This is InternalServiceQuery, a member of class TIBCustomService.
	InternalServiceStart (see page 423)	This is InternalServiceStart, a member of class TIBControlService.
V	Loaded (see page 428)	Initializes the component after the form file has been read into memory.
	Login (see page 429)	This is Login, a member of class TIBCustomService.
	ServiceStartAddParam (see page 423)	This is the overview for the ServiceStartAddParam method overload.
V	SetServiceStartOptions (see page 424)	This is SetServiceStartOptions, a member of class TIBControlService.

Protected Properties

	Name	Description
	Action (see page 420)	This is Action, a member of class TIBControlAndQueryService.
R	OutputBuffer (see page 431)	This is OutputBuffer, a member of class TIBCustomService.
	OutputBufferOption (see page 431)	This is OutputBufferOption, a member of class TIBCustomService.
	ServiceQueryParams (see page 432)	This is ServiceQueryParams, a member of class TIBCustomService.
	ServiceStartParams (see page 425)	This is ServiceStartParams, a member of class TIBControlService.

Public Methods

	Name	Description
	Attach (see page 427)	Attaches to the database.
V	Create (see page 419)	Creates an instance of a TIBControlAndQueryService (see page 417).
V	Destroy (see page 426)	Destroys the service.
	Detach (see page 428)	Detaches from the database.
	GetNextChunk (see page 419)	Gets the next chunk of data.
	GetNextLine (see page 420)	Starts the service.
V	ServiceStart (see page 423)	Starts the service.

Public Properties

	Name	Description
R	Eof (see page 421)	Indicates that the end of file has been reached.
R	Handle (see page 430)	Returns the database handle.
R	IsServiceRunning (see page 424)	Indicates whether the service is running.

	ServiceParamBySPB (see page 432)	Returns and sets SPB parameters.

Published Events

	Name	Description
	OnAttach (see page 433)	Occurs when the database is attached.
	OnLogin (see page 433)	Occurs during database login.

Published Properties

	Name	Description
	Active (see page 430)	Sets the active state of the service.
	BufferSize (see page 420)	Sets or returns the buffer size.
	LoginPrompt (see page 430)	Turns on and off login prompt display.
	Params (see page 431)	Sets or returns the database parameters
	Protocol (see page 431)	Sets or returns the network protocol.
	ServerName (see page 431)	Sets the name of the server on which the services are to be run.
	TraceFlags (see page 432)	This is TraceFlags, a member of class TIBCustomService.

12.1.7.2 TIBControlAndQueryService.Create Constructor

Creates an instance of a TIBControlAndQueryService (see page 417).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBControlAndQueryService(TComponent * AOwner);
```

Description

Call Create to create an instance of a TIBControlAndQueryService (see page 417) component.

Note: You must install InterBase 6 to use this feature.

12.1.7.3 TIBControlAndQueryService Methods

The methods of the TIBControlAndQueryService class are listed here.

Public Methods

	Name	Description
	GetNextChunk (see page 419)	Gets the next chunk of data.
	GetNextLine (see page 420)	Starts the service.

12.1.7.3.1 TIBControlAndQueryService.GetNextChunk Method

Gets the next chunk of data.

Pascal

```
function GetNextChunk: String;
```

C++

```
__fastcall UnicodeString GetNextChunk();
```

Description

Call GetNextChunk to get the next chunk of data.

Note: You must install InterBase 6 to use this feature.

12.1.7.3.2 TIBControlAndQueryService.GetNextLine Method

Starts the service.

Pascal

```
function GetNextLine: String;
```

C++

```
__fastcall UnicodeString GetNextLine();
```

Description

Call GetNextLine to get the next line of data.

Note: You must install InterBase 6 to use this feature.

12.1.7.4 TIBControlAndQueryService Properties

The properties of the TIBControlAndQueryService class are listed here.

Protected Properties

	Name	Description
	Action (see page 420)	This is Action, a member of class TIBControlAndQueryService.

Public Properties

	Name	Description
R	Eof (see page 421)	Indicates that the end of file has been reached.

Published Properties

	Name	Description
	BufferSize (see page 420)	Sets or returns the buffer size.

12.1.7.4.1 TIBControlAndQueryService.Action Property

Pascal

```
property Action: Integer;
```

C++

```
__property int Action;
```

Description

This is Action, a member of class TIBControlAndQueryService.

12.1.7.4.2 TIBControlAndQueryService.BufferSize Property

Sets or returns the buffer size.

Pascal

```
property BufferSize: Integer;
```

C++

```
__property int BufferSize;
```

Description

Use the BufferSize property to set or return the buffer size.

Note: You must install InterBase 6 to use this feature.

12.1.7.4.3 TIBControlAndQueryService.Eof Property

Indicates that the end of file has been reached.

Pascal

```
property Eof: boolean;
```

C++

```
__property boolean Eof;
```

Description

Use the Eof property to determine whether the end of the file has been reached.

Note: You must install InterBase 6 to use this feature.

12.1.8 TIBControlService Class

TIBControlService is the ancestor object from which the structured and unstructured IBService components descend.

Class Hierarchy

Pascal

```
TIBControlService = class(TIBCustomService);
```

C++

```
class TIBControlService : public TIBCustomService;
```

File

IBServices

Description

TIBControlService is the ancestor object from which the structured and unstructured IBService components descend.

Note: You must install InterBase 6 to use this feature.

12.1.8.1 TIBControlService Members

The following tables list the members exposed by TIBControlService.

Protected Methods

	Name	Description
	CheckActive (see page 427)	This is CheckActive, a member of class TIBCustomService.
	CheckInactive (see page 428)	This is CheckInactive, a member of class TIBCustomService.
	InternalServiceQuery (see page 428)	This is InternalServiceQuery, a member of class TIBCustomService.

	InternalServiceStart (see page 423)	This is InternalServiceStart, a member of class TIBControlService.
V	Loaded (see page 428)	Initializes the component after the form file has been read into memory.
	Login (see page 429)	This is Login, a member of class TIBCustomService.
	ServiceStartAddParam (see page 423)	This is the overview for the ServiceStartAddParam method overload.
V	SetServiceStartOptions (see page 424)	This is SetServiceStartOptions, a member of class TIBControlService.

Protected Properties

	Name	Description
	BufferSize (see page 430)	This is BufferSize, a member of class TIBCustomService.
R	OutputBuffer (see page 431)	This is OutputBuffer, a member of class TIBCustomService.
	OutputBufferOption (see page 431)	This is OutputBufferOption, a member of class TIBCustomService.
	ServiceQueryParams (see page 432)	This is ServiceQueryParams, a member of class TIBCustomService.
	ServiceStartParams (see page 425)	This is ServiceStartParams, a member of class TIBControlService.

Public Methods

	Name	Description
	Attach (see page 427)	Attaches to the database.
V	Create (see page 422)	Creates an instance of TIBControlService (see page 421)
V	Destroy (see page 426)	Destroys the service.
	Detach (see page 428)	Detaches from the database.
V	ServiceStart (see page 423)	Starts the service.

Public Properties

	Name	Description
R	Handle (see page 430)	Returns the database handle.
R	IsServiceRunning (see page 424)	Indicates whether the service is running.
	ServiceParamBySPB (see page 432)	Returns and sets SPB parameters.

Published Events

	Name	Description
	OnAttach (see page 433)	Occurs when the database is attached.
	OnLogin (see page 433)	Occurs during database login.

Published Properties

	Name	Description
	Active (see page 430)	Sets the active state of the service.
	LoginPrompt (see page 430)	Turns on and off login prompt display.
	Params (see page 431)	Sets or returns the database parameters
	Protocol (see page 431)	Sets or returns the network protocol.
	ServerName (see page 431)	Sets the name of the server on which the services are to be run.
	TraceFlags (see page 432)	This is TraceFlags, a member of class TIBCustomService.

12.1.8.2 TIBControlService.Create Constructor

Creates an instance of TIBControlService (see page 421)

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBControlService(TComponent * AOwner);
```

Description

Call Create to create an instance of TIBControlService (see page 421).

Note: You must install InterBase 6 to use this feature.

12.1.8.3 TIBControlService Methods

The methods of the TIBControlService class are listed here.

Protected Methods

	Name	Description
	InternalServiceStart (see page 423)	This is InternalServiceStart, a member of class TIBControlService.
	ServiceStartAddParam (see page 423)	This is the overview for the ServiceStartAddParam method overload.
V	SetServiceStartOptions (see page 424)	This is SetServiceStartOptions, a member of class TIBControlService.

Public Methods

	Name	Description
V	ServiceStart (see page 423)	Starts the service.

12.1.8.3.1 TIBControlService.InternalServiceStart Method

Pascal

```
procedure InternalServiceStart;
```

C++

```
__fastcall InternalServiceStart();
```

Description

This is InternalServiceStart, a member of class TIBControlService.

12.1.8.3.2 TIBControlService.ServiceStart Method

Starts the service.

Pascal

```
procedure ServiceStart; virtual;
```

C++

```
virtual __fastcall ServiceStart();
```

Description

Call ServiceStart to start the service.

Note: You must install InterBase 6 to use this feature.

12.1.8.3.3 ServiceStartAddParam Method

This is the overview for the ServiceStartAddParam method overload.

Overload List

	Name	Description
	TIBControlService.ServiceStartAddParam (Integer, Integer) (see page 424)	This is ServiceStartAddParam, a member of class TIBControlService.

	TIBControlService.ServiceStartAddParam (string, Integer) (see page 424)	This is ServiceStartAddParam, a member of class TIBControlService.

12.1.8.3.3.1 TIBControlService.ServiceStartAddParam Method (Integer, Integer)

Pascal

```
procedure ServiceStartAddParam(Value: Integer; param: Integer); overload;
```

C++

```
__fastcall ServiceStartAddParam(int Value, int param);
```

Description

This is ServiceStartAddParam, a member of class TIBControlService.

12.1.8.3.3.2 TIBControlService.ServiceStartAddParam Method (string, Integer)

Pascal

```
procedure ServiceStartAddParam(Value: string; param: Integer); overload;
```

C++

```
__fastcall ServiceStartAddParam(UnicodeString Value, int param);
```

Description

This is ServiceStartAddParam, a member of class TIBControlService.

12.1.8.3.4 TIBControlService.SetServiceStartOptions Method

Pascal

```
procedure SetServiceStartOptions; virtual;
```

C++

```
virtual __fastcall SetServiceStartOptions();
```

Description

This is SetServiceStartOptions, a member of class TIBControlService.

12.1.8.4 TIBControlService Properties

The properties of the TIBControlService class are listed here.

Protected Properties

	Name	Description
	ServiceStartParams (see page 425)	This is ServiceStartParams, a member of class TIBControlService.

Public Properties

	Name	Description
R	IsServiceRunning (see page 424)	Indicates whether the service is running.

12.1.8.4.1 TIBControlService.IsServiceRunning Property

Indicates whether the service is running.

Pascal

```
property IsServiceRunning: Boolean;
```

C++

```
__property Boolean IsServiceRunning;
```

Description

Use the IsServiceRunning property to check whether the service is running.

Note: You must install InterBase 6 to use this feature.

12.1.8.4.2 TIBControlService.ServiceStartParams Property

Pascal

```
property ServiceStartParams: String;
```

C++

```
__property UnicodeString ServiceStartParams;
```

Description

This is ServiceStartParams, a member of class TIBControlService.

12.1.9 TIBCustomService Class

TIBCustomService is the ancestor object from which all IBService components descend.

Class Hierarchy

Pascal

```
TIBCustomService = class(TComponent);
```

C++

```
class TIBCustomService : public TComponent;
```

File

IBServices

Description

TIBCustomService is the ancestor object from which all IBService components descend.

12.1.9.1 TIBCustomService Members

The following tables list the members exposed by TIBCustomService.

Protected Methods

	Name	Description
	CheckActive (see page 427)	This is CheckActive, a member of class TIBCustomService.
	CheckInactive (see page 428)	This is CheckInactive, a member of class TIBCustomService.
	InternalServiceQuery (see page 428)	This is InternalServiceQuery, a member of class TIBCustomService.

	Loaded (see page 428)	Initializes the component after the form file has been read into memory.
	Login (see page 429)	This is Login, a member of class TIBCustomService.

Protected Properties

	Name	Description
	BufferSize (see page 430)	This is BufferSize, a member of class TIBCustomService.
	OutputBuffer (see page 431)	This is OutputBuffer, a member of class TIBCustomService.
	OutputBufferOption (see page 431)	This is OutputBufferOption, a member of class TIBCustomService.
	ServiceQueryParams (see page 432)	This is ServiceQueryParams, a member of class TIBCustomService.

Public Methods

	Name	Description
	Attach (see page 427)	Attaches to the database.
	Create (see page 426)	Creates an instance of TIBCustomService (see page 425)
	Destroy (see page 426)	Destroys the service.
	Detach (see page 428)	Detaches from the database.

Public Properties

	Name	Description
	Handle (see page 430)	Returns the database handle.
	ServiceParamBySPB (see page 432)	Returns and sets SPB parameters.

Published Events

	Name	Description
	OnAttach (see page 433)	Occurs when the database is attached.
	OnLogin (see page 433)	Occurs during database login.

Published Properties

	Name	Description
	Active (see page 430)	Sets the active state of the service.
	LoginPrompt (see page 430)	Turns on and off login prompt display.
	Params (see page 431)	Sets or returns the database parameters
	Protocol (see page 431)	Sets or returns the network protocol.
	ServerName (see page 431)	Sets the name of the server on which the services are to be run.
	TraceFlags (see page 432)	This is TraceFlags, a member of class TIBCustomService.

12.1.9.2 TIBCustomService.Create Constructor

Creates an instance of TIBCustomService (see page 425)

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBCustomService(TComponent * AOwner);
```

Description

Call Create to create an instance of TIBCustomService (see page 425).

12.1.9.3 TIBCustomService.Destroy Destructor

Destroys the service.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBCustomService();
```

Description

Do not call Destroy directly in an application. Instead, an application should call Free. Free verifies that the service object has not already been freed before it calls Destroy.

12.1.9.4 TIBCustomService Methods

The methods of the TIBCustomService class are listed here.

Protected Methods

	Name	Description
	CheckActive (see page 427)	This is CheckActive, a member of class TIBCustomService.
	CheckInactive (see page 428)	This is CheckInactive, a member of class TIBCustomService.
	InternalServiceQuery (see page 428)	This is InternalServiceQuery, a member of class TIBCustomService.
	Loaded (see page 428)	Initializes the component after the form file has been read into memory.
	Login (see page 429)	This is Login, a member of class TIBCustomService.

Public Methods

	Name	Description
	Attach (see page 427)	Attaches to the database.
	Detach (see page 428)	Detaches from the database.

12.1.9.4.1 TIBCustomService.Attach Method

Attaches to the database.

Pascal

```
procedure Attach;
```

C++

```
__fastcall Attach();
```

Description

Call Attach to attach to the database.

12.1.9.4.2 TIBCustomService.CheckActive Method

Pascal

```
procedure CheckActive;
```

C++

```
__fastcall CheckActive();
```

Description

This is CheckActive, a member of class TIBCustomService.

12.1.9.4.3 TIBCustomService.CheckInactive Method

Pascal

```
procedure CheckInactive;
```

C++

```
__fastcall CheckInactive();
```

Description

This is CheckInactive, a member of class TIBCustomService.

12.1.9.4.4 TIBCustomService.Detach Method

Detaches from the database.

Pascal

```
procedure Detach;
```

C++

```
__fastcall Detach();
```

Description

Call Detach to detach from the database.

12.1.9.4.5 TIBCustomService.InternalServiceQuery Method

Pascal

```
procedure InternalServiceQuery;
```

C++

```
__fastcall InternalServiceQuery();
```

Description

This is InternalServiceQuery, a member of class TIBCustomService.

12.1.9.4.6 TIBCustomService.Loaded Method

Initializes the component after the form file has been read into memory.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call the protected Loaded method. The streaming system calls this method after it loads the component's form from a stream.

When the streaming system loads a form or data module from its form file, it first constructs the form component by calling its constructor, then reads its property values from the form file. After reading all the property values for all the components, the streaming system calls the Loaded methods of each component in the order the components were created. This gives the components a chance to initialize any data that depends on the values of other components or other parts of itself.

Note: All references to sibling components are resolved by the time Loaded is called. Loaded is the first place that sibling pointers can be used after being streamed in.

As implemented in TComponent, Loaded clears the csLoading flag in the ComponentState property, indicating that the component is no longer loading.

Warning: Loaded may be called multiple times on inherited forms. It is called every time a level of inheritance is streamed in. Do not allocate memory in an overridden Loaded method without first checking that the memory has not been allocated in a previous call.

ComponentState

Create

TReader

12.1.9.4.7 TIBCustomService.Login Method

Pascal

```
function Login: Boolean;
```

C++

```
__fastcall Boolean Login();
```

Description

This is Login, a member of class TIBCustomService.

12.1.9.5 TIBCustomService Properties

The properties of the TIBCustomService class are listed here.

Protected Properties

	Name	Description
	BufferSize (see page 430)	This is BufferSize, a member of class TIBCustomService.
R	OutputBuffer (see page 431)	This is OutputBuffer, a member of class TIBCustomService.
	OutputBufferOption (see page 431)	This is OutputBufferOption, a member of class TIBCustomService.
	ServiceQueryParams (see page 432)	This is ServiceQueryParams, a member of class TIBCustomService.

Public Properties

	Name	Description
R	Handle (see page 430)	Returns the database handle.
	ServiceParamBySPB (see page 432)	Returns and sets SPB parameters.

Published Properties

	Name	Description
	Active (see page 430)	Sets the active state of the service.
	LoginPrompt (see page 430)	Turns on and off login prompt display.
	Params (see page 431)	Sets or returns the database parameters
	Protocol (see page 431)	Sets or returns the network protocol.
	ServerName (see page 431)	Sets the name of the server on which the services are to be run.
	TraceFlags (see page 432)	This is TraceFlags, a member of class TIBCustomService.

12.1.9.5.1 TIBCustomService.Active Property

Sets the active state of the service.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Use the Active property to set the service to active (true) or the default, inactive (false).

12.1.9.5.2 TIBCustomService.BufferSize Property

Pascal

```
property BufferSize: Integer;
```

C++

```
__property int BufferSize;
```

Description

This is BufferSize, a member of class TIBCustomService.

12.1.9.5.3 TIBCustomService.Handle Property

Returns the database handle.

Pascal

```
property Handle: TISC_SVC_HANDLE;
```

C++

```
__property TISC_SVC_HANDLE Handle;
```

Description

Use the Handle property to return the database handle.

12.1.9.5.4 TIBCustomService.LoginPrompt Property

Turns on and off login prompt display.

Pascal

```
property LoginPrompt: Boolean;
```

C++

```
__property Boolean LoginPrompt;
```

Description

Use the LoginPrompt**property to display (or not display) a login prompt before attaching to a database.**

12.1.9.5.5 TIBCustomService.OutputBuffer Property

Pascal

```
property OutputBuffer: PChar;
```

C++

```
__property const char * OutputBuffer;
```

Description

This is OutputBuffer, a member of class TIBCustomService.

12.1.9.5.6 TIBCustomService.OutputBufferOption Property

Pascal

```
property OutputBufferOption: TOutputBufferOption;
```

C++

```
__property TOutputBufferOption OutputBufferOption;
```

Description

This is OutputBufferOption, a member of class TIBCustomService.

12.1.9.5.7 TIBCustomService.Params Property

Sets or returns the database parameters

Pascal

```
property Params: TStrings;
```

C++

```
__property TStrings Params;
```

Description

Use the Params property to set or return database parameters.

12.1.9.5.8 TIBCustomService.Protocol Property

Sets or returns the network protocol.

Pascal

```
property Protocol: TProtocol;
```

C++

```
__property TProtocol Protocol;
```

Description

Use Protocol to select the network protocol.

12.1.9.5.9 TIBCustomService.ServerName Property

Sets the name of the server on which the services are to be run.

Pascal

```
property ServerName: string;
```

C++

```
__property UnicodeString ServerName;
```

Description

Use ServerName to set the name of the server on which the services are to be run.

12.1.9.5.10 TIBCustomService.ServiceParamBySPB Property

Returns and sets SPB parameters.

Pascal

```
property ServiceParamBySPB [const Idx: Integer]: String;
```

C++

```
__property UnicodeString ServiceParamBySPB[int const Idx];
```

Description

Use ParamBySPB to inspect and set SPB parameters.

For example DBParamBySPB[isc_SPB_user_name] sets and inspects the user name.

12.1.9.5.11 TIBCustomService.ServiceQueryParams Property

Pascal

```
property ServiceQueryParams: String;
```

C++

```
__property UnicodeString ServiceQueryParams;
```

Description

This is ServiceQueryParams, a member of class TIBCustomService.

12.1.9.5.12 TIBCustomService.TraceFlags Property

Pascal

```
property TraceFlags: TTraceFlags;
```

C++

```
__property TTraceFlags TraceFlags;
```

Description

This is TraceFlags, a member of class TIBCustomService.

12.1.9.6 TIBCustomService Events

The events of the TIBCustomService class are listed here.

Published Events

	Name	Description
	OnAttach (see page 433)	Occurs when the database is attached.
	OnLogin (see page 433)	Occurs during database login.

12.1.9.6.1 TIBCustomService.OnAttach Event

Occurs when the database is attached.

Pascal

```
property OnAttach: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnAttach;
```

Description

Write an OnAttach event handler to take specific actions when a database is attached. If an exception is raised in this event, the database is not attached.

12.1.9.6.2 TIBCustomService.OnLogin Event

Occurs during database login.

Pascal

```
property OnLogin: TLoginEvent;
```

C++

```
__property TLoginEvent OnLogin;
```

Description

Write an OnLogin event handler to take specific actions on database login.

12.1.10 TIBLicensingService Class

TIBLicensingService configures the licensing parameters

Class Hierarchy

Pascal

```
TIBLicensingService = class(TIBControlService);
```

C++

```
class TIBLicensingService : public TIBControlService;
```

File

IBServices

Description

Use a TIBLicensingService component to add or remove InterBase software activation certificates.

Note: You must install InterBase 6 to use this feature.

Getting Started with InterBase Express

12.1.10.1 TIBLicensingService Members

The following tables list the members exposed by TIBLicensingService.

Protected Methods

	Name	Description
	CheckActive (see page 427)	This is CheckActive, a member of class TIBCustomService.
	CheckInactive (see page 428)	This is CheckInactive, a member of class TIBCustomService.
	InternalServiceQuery (see page 428)	This is InternalServiceQuery, a member of class TIBCustomService.
	InternalServiceStart (see page 423)	This is InternalServiceStart, a member of class TIBControlService.
V	Loaded (see page 428)	Initializes the component after the form file has been read into memory.
	Login (see page 429)	This is Login, a member of class TIBCustomService.
	ServiceStartAddParam (see page 423)	This is the overview for the ServiceStartAddParam method overload.
V	SetServiceStartOptions (see page 436)	This is SetServiceStartOptions, a member of class TIBLicensingService.

Protected Properties

	Name	Description
	BufferSize (see page 430)	This is BufferSize, a member of class TIBCustomService.
R	OutputBuffer (see page 431)	This is OutputBuffer, a member of class TIBCustomService.
	OutputBufferOption (see page 431)	This is OutputBufferOption, a member of class TIBCustomService.
	ServiceQueryParams (see page 432)	This is ServiceQueryParams, a member of class TIBCustomService.
	ServiceStartParams (see page 425)	This is ServiceStartParams, a member of class TIBControlService.

Public Methods

	Name	Description
	AddLicense (see page 435)	Adds an InterBase software activation certificate.
	Attach (see page 427)	Attaches to the database.
V	Create (see page 422)	Creates an instance of TIBControlService (see page 421)
V	Create (see page 426)	Creates an instance of TIBCustomService (see page 425)
V	Destroy (see page 426)	Destroys the service.
	Detach (see page 428)	Detaches from the database.
	RemoveLicense (see page 435)	Removes an InterBase software activation certificate.
V	ServiceStart (see page 423)	Starts the service.

Public Properties

	Name	Description
R	Handle (see page 430)	Returns the database handle.
R	IsServiceRunning (see page 424)	Indicates whether the service is running.
	ServiceParamBySPB (see page 432)	Returns and sets SPB parameters.

Published Events

	Name	Description
	OnAttach (see page 433)	Occurs when the database is attached.
	OnLogin (see page 433)	Occurs during database login.

Published Properties

	Name	Description
	Action (see page 436)	Indictes the licensing action.

	Active (see page 430)	Sets the active state of the service.
	ID (see page 436)	Sets or returns the license identification.
	Key (see page 437)	Sets or returns the license key.
	LoginPrompt (see page 430)	Turns on and off login prompt display.
	Params (see page 431)	Sets or returns the database parameters
	Protocol (see page 431)	Sets or returns the network protocol.
	ServerName (see page 431)	Sets the name of the server on which the services are to be run.
	TraceFlags (see page 432)	This is TraceFlags, a member of class TIBCustomService.

12.1.10.2 TIBLicensingService Methods

The methods of the TIBLicensingService class are listed here.

Protected Methods

	Name	Description
	SetServiceStartOptions (see page 436)	This is SetServiceStartOptions, a member of class TIBLicensingService.

Public Methods

	Name	Description
	AddLicense (see page 435)	Adds an InterBase software activation certificate.
	RemoveLicense (see page 435)	Removes an InterBase software activation certificate.

12.1.10.2.1 TIBLicensingService.AddLicense Method

Adds an InterBase software activation certificate.

Pascal

```
procedure AddLicense;
```

C++

```
__fastcall AddLicense();
```

Description

Call AddLicense along to add an InterBase software activation certificate. The Key (see page 437) and ID (see page 436) properties must be supplied.

Note: You must install InterBase 6 to use this feature.

12.1.10.2.2 TIBLicensingService.RemoveLicense Method

Removes an InterBase software activation certificate.

Pascal

```
procedure RemoveLicense;
```

C++

```
__fastcall RemoveLicense();
```

Description

Call RemoveLicense to remove an InterBase software activation certificate.

Note: You must install InterBase 6 to use this feature.

12.1.10.2.3 TIBLicensingService.SetServiceStartOptions Method

Pascal

```
procedure SetServiceStartOptions; override;
```

C++

```
virtual __fastcall SetServiceStartOptions();
```

Description

This is SetServiceStartOptions, a member of class TIBLicensingService.

12.1.10.3 TIBLicensingService Properties

The properties of the TIBLicensingService class are listed here.

Published Properties

	Name	Description
	Action (see page 436)	Indictes the licensing action.
	ID (see page 436)	Sets or returns the license identification.
	Key (see page 437)	Sets or returns the license key.

12.1.10.3.1 TIBLicensingService.Action Property

Indictes the licensing action.

Pascal

```
property Action: TLicensingAction;
```

C++

```
__property TLicensingAction Action;
```

Description

Use Action to indicate what action the licensing service should take. This causes the service to call the AddLicense (see page 435) or RemoveLicense (see page 435) method, depending on whether the software activation certificate is added or removed.

Note: You must install InterBase 6 to use this feature.

12.1.10.3.2 TIBLicensingService.ID Property

Sets or returns the license identification.

Pascal

```
property ID: String;
```

C++

```
__property UnicodeString ID;
```

Description

Use ID to set or return the license identification.

Note: You must install InterBase 6 to use this feature.

12.1.10.3.3 TIBLicensingService.Key Property

Sets or returns the license key.

Pascal

```
property Key: String;
```

C++

```
__property UnicodeString Key;
```

Description

Use Key to set or return the license key.

Note: You must install InterBase 6 to use this feature.

12.1.11 TIBLogService Class

TIBLogService returns the contents of the interbase.log file from a server.

Class Hierarchy

Pascal

```
TIBLogService = class(TIBControlAndQueryService);
```

C++

```
class TIBLogService : public TIBControlAndQueryService;
```

File

IBServices

Description

Use a TIBLogService object to return the contents of the interbase.log file from a server.

Note: You must install InterBase 6 to use this feature.

See Also

Getting Started with InterBase Express

12.1.11.1 TIBLogService Members

The following tables list the members exposed by TIBLogService.

Protected Methods

	Name	Description
	CheckActive (see page 427)	This is CheckActive, a member of class TIBCustomService.
	CheckInactive (see page 428)	This is CheckInactive, a member of class TIBCustomService.
	InternalServiceQuery (see page 428)	This is InternalServiceQuery, a member of class TIBCustomService.
	InternalServiceStart (see page 423)	This is InternalServiceStart, a member of class TIBControlService.
V	Loaded (see page 428)	Initializes the component after the form file has been read into memory.
	Login (see page 429)	This is Login, a member of class TIBCustomService.

	ServiceStartAddParam (see page 423)	This is the overview for the ServiceStartAddParam method overload.
V	SetServiceStartOptions (see page 439)	This is SetServiceStartOptions, a member of class TIBLogService.

Protected Properties

	Name	Description
	Action (see page 420)	This is Action, a member of class TIBControlAndQueryService.
	BufferSize (see page 430)	This is BufferSize, a member of class TIBCustomService.
R	OutputBuffer (see page 431)	This is OutputBuffer, a member of class TIBCustomService.
	OutputBufferOption (see page 431)	This is OutputBufferOption, a member of class TIBCustomService.
	ServiceQueryParams (see page 432)	This is ServiceQueryParams, a member of class TIBCustomService.
	ServiceStartParams (see page 425)	This is ServiceStartParams, a member of class TIBControlService.

Public Methods

	Name	Description
	Attach (see page 427)	Attaches to the database.
V	Create (see page 419)	Creates an instance of a TIBControlAndQueryService (see page 417).
V	Create (see page 422)	Creates an instance of TIBControlService (see page 421)
V	Create (see page 426)	Creates an instance of TIBCustomService (see page 425)
V	Destroy (see page 426)	Destroys the service.
	Detach (see page 428)	Detaches from the database.
	GetNextChunk (see page 419)	Gets the next chunk of data.
	GetNextLine (see page 420)	Starts the service.
V	ServiceStart (see page 423)	Starts the service.

Public Properties

	Name	Description
R	Eof (see page 421)	Indicates that the end of file has been reached.
R	Handle (see page 430)	Returns the database handle.
R	IsServiceRunning (see page 424)	Indicates whether the service is running.
	ServiceParamBySPB (see page 432)	Returns and sets SPB parameters.

Published Events

	Name	Description
	OnAttach (see page 433)	Occurs when the database is attached.
	OnLogin (see page 433)	Occurs during database login.

Published Properties

	Name	Description
	Active (see page 430)	Sets the active state of the service.
	BufferSize (see page 420)	Sets or returns the buffer size.
	LoginPrompt (see page 430)	Turns on and off login prompt display.
	Params (see page 431)	Sets or returns the database parameters
	Protocol (see page 431)	Sets or returns the network protocol.
	ServerName (see page 431)	Sets the name of the server on which the services are to be run.
	TraceFlags (see page 432)	This is TraceFlags, a member of class TIBCustomService.

12.1.11.2 TIBLogService Methods

The methods of the TIBLogService class are listed here.

Protected Methods

	Name	Description
V	SetServiceStartOptions (see page 439)	This is SetServiceStartOptions, a member of class TIBLogService.

12.1.11.2.1 TIBLogService.SetServiceStartOptions Method

Pascal

```
procedure SetServiceStartOptions; override;
```

C++

```
virtual __fastcall SetServiceStartOptions();
```

Description

This is SetServiceStartOptions, a member of class TIBLogService.

12.1.12 TIBRestoreService Class

TIBRestoreService allows you to restore your database.

Class Hierarchy

Pascal

```
TIBRestoreService = class(TIBBackupRestoreService);
```

C++

```
class TIBRestoreService : public TIBBackupRestoreService;
```

File

IBServices

Description

Use a TIBRestoreService object to restore your database.

Note: You must install InterBase 6 to use this feature.

See Also

Getting Started with InterBase Express

12.1.12.1 TIBRestoreService Members

The following tables list the members exposed by TIBRestoreService.

Protected Methods

	Name	Description
	CheckActive (see page 427)	This is CheckActive, a member of class TIBCustomService.
	CheckInactive (see page 428)	This is CheckInactive, a member of class TIBCustomService.
	InternalServiceQuery (see page 428)	This is InternalServiceQuery, a member of class TIBCustomService.
	InternalServiceStart (see page 423)	This is InternalServiceStart, a member of class TIBControlService.
V	Loaded (see page 428)	Initializes the component after the form file has been read into memory.
	Login (see page 429)	This is Login, a member of class TIBCustomService.
	ServiceStartAddParam (see page 423)	This is the overview for the ServiceStartAddParam method overload.
V	SetServiceStartOptions (see page 441)	This is SetServiceStartOptions, a member of class TIBRestoreService.

Protected Properties

	Name	Description
	Action (see page 420)	This is Action, a member of class TIBControlAndQueryService.
	BufferSize (see page 430)	This is BufferSize, a member of class TIBCustomService.
R	OutputBuffer (see page 431)	This is OutputBuffer, a member of class TIBCustomService.
	OutputBufferOption (see page 431)	This is OutputBufferOption, a member of class TIBCustomService.
	ServiceQueryParams (see page 432)	This is ServiceQueryParams, a member of class TIBCustomService.
	ServiceStartParams (see page 425)	This is ServiceStartParams, a member of class TIBControlService.

Public Methods

	Name	Description
	Attach (see page 427)	Attaches to the database.
V	Create (see page 440)	Creates an instance of TIBRestoreService (see page 439)
V	Destroy (see page 441)	Destroys the service.
	Detach (see page 428)	Detaches from the database.
	GetNextChunk (see page 419)	Gets the next chunk of data.
	GetNextLine (see page 420)	Starts the service.
V	ServiceStart (see page 423)	Starts the service.

Public Properties

	Name	Description
R	Eof (see page 421)	Indicates that the end of file has been reached.
R	Handle (see page 430)	Returns the database handle.
R	IsServiceRunning (see page 424)	Indicates whether the service is running.
	ServiceParamBySPB (see page 432)	Returns and sets SPB parameters.

Published Events

	Name	Description
	OnAttach (see page 433)	Occurs when the database is attached.
	OnLogin (see page 433)	Occurs during database login.

Published Properties

	Name	Description
	Active (see page 430)	Sets the active state of the service.
	BackupFile (see page 442)	Sets or returns the backup file name.
	BufferSize (see page 420)	Sets or returns the buffer size.
	DatabaseName (see page 442)	Sets or returns the database name.
	LoginPrompt (see page 430)	Turns on and off login prompt display.
	Options (see page 442)	Sets the options for the database restore.
	PageBuffers (see page 442)	Sets or returns page buffer size.
	PageSize (see page 443)	Sets or returns the page size.
	Params (see page 431)	Sets or returns the database parameters
	Protocol (see page 431)	Sets or returns the network protocol.
	ServerName (see page 431)	Sets the name of the server on which the services are to be run.
	TraceFlags (see page 432)	This is TraceFlags, a member of class TIBCustomService.
	Verbose (see page 408)	Sets or returns the backup or restore in verbose mode.

12.1.12.2 TIBRestoreService.Create Constructor

Creates an instance of TIBRestoreService (see page 439)

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBRestoreService(TComponent * AOwner);
```

Description

Call Create to create an instance of TIBRestoreService (see page 439).

Note: You must install InterBase 6 to use this feature.

12.1.12.3 TIBRestoreService.Destroy Destructor

Destroys the service.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBRestoreService();
```

Description

Do not call Destroy directly in an application. Instead, an application should call Free. Free verifies that the service object has not already been freed before it calls Destroy.

Note: You must install InterBase 6 to use this feature.

12.1.12.4 TIBRestoreService Methods

The methods of the TIBRestoreService class are listed here.

Protected Methods

	Name	Description
	SetServiceStartOptions (see page 441)	This is SetServiceStartOptions, a member of class TIBRestoreService.

12.1.12.4.1 TIBRestoreService.SetServiceStartOptions Method

Pascal

```
procedure SetServiceStartOptions; override;
```

C++

```
virtual __fastcall SetServiceStartOptions();
```

Description

This is SetServiceStartOptions, a member of class TIBRestoreService.

12.1.12.5 TIBRestoreService Properties

The properties of the TIBRestoreService class are listed here.

Published Properties

	Name	Description
	BackupFile (see page 442)	Sets or returns the backup file name.

	DatabaseName (see page 442)	Sets or returns the database name.
	Options (see page 442)	Sets the options for the database restore.
	PageBuffers (see page 442)	Sets or returns page buffer size.
	PageSize (see page 443)	Sets or returns the page size.

12.1.12.5.1 TIBRestoreService.BackupFile Property

Sets or returns the backup file name.

Pascal

```
property BackupFile: TStrings;
```

C++

```
__property TStrings BackupFile;
```

Description

Use BackupFile to set or return the backup file name.

Note: You must install InterBase 6 to use this feature.

12.1.12.5.2 TIBRestoreService.DatabaseName Property

Sets or returns the database name.

Pascal

```
property DatabaseName: TStrings;
```

C++

```
__property TStrings DatabaseName;
```

Description

Use DatabaseName to set or return the database name.

Note: You must install InterBase 6 to use this feature.

12.1.12.5.3 TIBRestoreService.Options Property

Sets the options for the database restore.

Pascal

```
property Options: TRestoreOptions;
```

C++

```
__property TRestoreOptions Options;
```

Description

Use Options to select the options for the database backup.

Note: You must install InterBase 6 to use this feature.

12.1.12.5.4 TIBRestoreService.PageBuffers Property

Sets or returns page buffer size.

Pascal

```
property PageBuffers: Integer;
```

C++

```
__property int PageBuffers;
```

Description

Use PageBuffers to set or return the page buffer size in kilobytes.

Note: You must install InterBase 6 to use this feature.

12.1.12.5.5 TIBRestoreService.PageSize Property

Sets or returns the page size.

Pascal

```
property PageSize: Integer;
```

C++

```
__property int PageSize;
```

Description

Use PageSize to set or return the page size in kilobytes.

Note: You must install InterBase 6 to use this feature.

12.1.13 TIBSecurityService Class

TIBSecurityService enables you to manage user access to the InterBase server.

Class Hierarchy

Pascal

```
TIBSecurityService = class(TIBControlAndQueryService);
```

C++

```
class TIBSecurityService : public TIBControlAndQueryService;
```

File

IBServices

Description

Use a TIBSecurityService object to manage user access to the InterBase server.

Note: You must install InterBase 6 to use this feature.

Getting Started with InterBase Express

12.1.13.1 TIBSecurityService Members

The following tables list the members exposed by TIBSecurityService.

Protected Methods

	Name	Description
	CheckActive (see page 427)	This is CheckActive, a member of class TIBCustomService.
	CheckInactive (see page 428)	This is CheckInactive, a member of class TIBCustomService.
	InternalServiceQuery (see page 428)	This is InternalServiceQuery, a member of class TIBCustomService.
	InternalServiceStart (see page 423)	This is InternalServiceStart, a member of class TIBControlService.
V	Loaded (see page 447)	Initializes the component after the form file has been read into memory.
	Login (see page 429)	This is Login, a member of class TIBCustomService.
	ServiceStartAddParam (see page 423)	This is the overview for the ServiceStartAddParam method overload.
V	SetServiceStartOptions (see page 448)	This is SetServiceStartOptions, a member of class TIBSecurityService.

Protected Properties

	Name	Description
	Action (see page 420)	This is Action, a member of class TIBControlAndQueryService.
	BufferSize (see page 430)	This is BufferSize, a member of class TIBCustomService.
R	OutputBuffer (see page 431)	This is OutputBuffer, a member of class TIBCustomService.
	OutputBufferOption (see page 431)	This is OutputBufferOption, a member of class TIBCustomService.
	ServiceQueryParams (see page 432)	This is ServiceQueryParams, a member of class TIBCustomService.
	ServiceStartParams (see page 425)	This is ServiceStartParams, a member of class TIBControlService.

Public Methods

	Name	Description
	AddUser (see page 446)	Adds a user to the user table.
	Attach (see page 427)	Attaches to the database.
V	Create (see page 445)	Creates an instance of TIBSecurityService (see page 443).
	DeleteUser (see page 446)	Deletes a user from the user table.
V	Destroy (see page 445)	Destroys the service.
	Detach (see page 428)	Detaches from the database.
	DisplayUser (see page 446)	Fetches user information.
	DisplayUsers (see page 447)	Fetches information for all users.
	GetNextChunk (see page 419)	Gets the next chunk of data.
	GetNextLine (see page 420)	Starts the service.
	ModifyUser (see page 448)	Modifies user information.
V	ServiceStart (see page 423)	Starts the service.

Public Properties

	Name	Description
R	Eof (see page 421)	Indicates that the end of file has been reached.
R	Handle (see page 430)	Returns the database handle.
R	IsServiceRunning (see page 424)	Indicates whether the service is running.
	ServiceParamBySPB (see page 432)	Returns and sets SPB parameters.
R	UserInfo (see page 451)	Provides information about a user.
R	UserInfoCount (see page 451)	Returns the number of elements in the TUserInfo (see page 472) array.

Published Events

	Name	Description
	OnAttach (see page 433)	Occurs when the database is attached.
	OnLogin (see page 433)	Occurs during database login.

Published Properties

	Name	Description
	Active (see page 430)	Sets the active state of the service.
	BufferSize (see page 420)	Sets or returns the buffer size.
	FirstName (see page 449)	Sets or returns the user's first name.
	GroupID (see page 449)	Sets or returns the user's group ID number.
	LastName (see page 449)	Sets or returns the user's last name.
	LoginPrompt (see page 430)	Turns on and off login prompt display.
	MiddleName (see page 449)	Sets or returns the user's middle name.
	Params (see page 431)	Sets or returns the database parameters
	Password (see page 450)	Sets the user's password.
	Protocol (see page 431)	Sets or returns the network protocol.
	SecurityAction (see page 450)	Specifies the security action.
	ServerName (see page 431)	Sets the name of the server on which the services are to be run.
	SQlRole (see page 450)	The role name used to connect to the isc4.gdb security database.
	TraceFlags (see page 432)	This is TraceFlags, a member of class TIBCustomService.
	UserID (see page 450)	Sets or returns the user's ID number.
	UserName (see page 451)	Sets or returns the user's login name.

12.1.13.2 TIBSecurityService.Create Constructor

Creates an instance of TIBSecurityService (see page 443).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBSecurityService(TComponent * AOwner);
```

Description

Call Create to create an instance of TIBSecurityService (see page 443).

Note: You must install InterBase 6 to use this feature.

12.1.13.3 TIBSecurityService.Destroy Destructor

Destroys the service.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBSecurityService();
```

Description

Do not call Destroy directly in an application. Instead, an application should call Free. Free verifies that the service object has not already been freed before it calls Destroy.

Note: You must install InterBase 6 to use this feature.

12.1.13.4 TIBSecurityService Methods

The methods of the TIBSecurityService class are listed here.

Protected Methods

	Name	Description
	Loaded (see page 447)	Initializes the component after the form file has been read into memory.
	SetServiceStartOptions (see page 448)	This is SetServiceStartOptions, a member of class TIBSecurityService.

Public Methods

	Name	Description
	AddUser (see page 446)	Adds a user to the user table.
	DeleteUser (see page 446)	Deletes a user from the user table.
	DisplayUser (see page 446)	Fetches user information.
	DisplayUsers (see page 447)	Fetches information for all users.
	ModifyUser (see page 448)	Modifies user information.

12.1.13.4.1 TIBSecurityService.AddUser Method

Adds a user to the user table.

Pascal

```
procedure AddUser;
```

C++

```
__fastcall AddUser();
```

Description

Call AddUser to add a user to the user table.

Note: You must install InterBase 6 to use this feature.

12.1.13.4.2 TIBSecurityService.DeleteUser Method

Deletes a user from the user table.

Pascal

```
procedure DeleteUser;
```

C++

```
__fastcall DeleteUser();
```

Description

Call DeleteUser to delete a user from the user table.

Note: You must install InterBase 6 to use this feature.

12.1.13.4.3 TIBSecurityService.DisplayUser Method

Fetches user information.

Pascal

```
procedure DisplayUser(UserName: string);
```

C++

```
__fastcall DisplayUser(UnicodeString UserName);
```

Description

Call DisplayUser to fetch user information and dump it into the TUserInfo (see page 472) record, which can then be returned by the UserInfo (see page 451) property.

Note: You must install InterBase 6 to use this feature.

12.1.13.4.4 TIBSecurityService.DisplayUsers Method

Fetches information for all users.

Pascal

```
procedure DisplayUsers;
```

C++

```
__fastcall DisplayUsers();
```

Description

Call DisplayUsers to fetch all valid user information, which can then be returned by the UserInfo (see page 451) property.

Note: You must install InterBase 6 to use this feature.

12.1.13.4.5 TIBSecurityService.Loaded Method

Initializes the component after the form file has been read into memory.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call the protected Loaded method. The streaming system calls this method after it loads the component's form from a stream.

When the streaming system loads a form or data module from its form file, it first constructs the form component by calling its constructor, then reads its property values from the form file. After reading all the property values for all the components, the streaming system calls the Loaded methods of each component in the order the components were created. This gives the components a chance to initialize any data that depends on the values of other components or other parts of itself.

Note: All references to sibling components are resolved by the time Loaded is called. Loaded is the first place that sibling pointers can be used after being streamed in.

As implemented in TComponent, Loaded clears the csLoading flag in the ComponentState property, indicating that the component is no longer loading.

Warning: Loaded may be called multiple times on inherited forms. It is called every time a level of inheritance is streamed in. Do not allocate memory in an overridden Loaded method without first checking that the memory has not been allocated in a previous call.

ComponentState

Create

TReader

12.1.13.4.6 TIBSecurityService.ModifyUser Method

Modifies user information.

Pascal

```
procedure ModifyUser;
```

C++

```
__fastcall ModifyUser();
```

Description

Call ModifyUser to modify a user's information.

Note: You must install InterBase 6 to use this feature.

12.1.13.4.7 TIBSecurityService.SetServiceStartOptions Method

Pascal

```
procedure SetServiceStartOptions; override;
```

C++

```
virtual __fastcall SetServiceStartOptions();
```

Description

This is SetServiceStartOptions, a member of class TIBSecurityService.

12.1.13.5 TIBSecurityService Properties

The properties of the TIBSecurityService class are listed here.

Public Properties

	Name	Description
R	UserInfo (see page 451)	Provides information about a user.
R	UserInfoCount (see page 451)	Returns the number of elements in the TUserInfo (see page 472) array.

Published Properties

	Name	Description
	FirstName (see page 449)	Sets or returns the user's first name.
	GroupID (see page 449)	Sets or returns the user's group ID number.
	LastName (see page 449)	Sets or returns the user's last name.
	MiddleName (see page 449)	Sets or returns the user's middle name.
	Password (see page 450)	Sets the user's password.
	SecurityAction (see page 450)	Specifies the security action.
	SQlRole (see page 450)	The role name used to connect to the isc4.gdb security database.
	UserID (see page 450)	Sets or returns the user's ID number.
	UserName (see page 451)	Sets or returns the user's login name.

12.1.13.5.1 TIBSecurityService.FirstName Property

Sets or returns the user's first name.

Pascal

```
property FirstName: string;
```

C++

```
__property UnicodeString FirstName;
```

Description

Use FirstName to set or return the user's first name.

Note: You must install InterBase 6 to use this feature.

12.1.13.5.2 TIBSecurityService.GroupID Property

Sets or returns the user's group ID number.

Pascal

```
property GroupID: Integer;
```

C++

```
__property int GroupID;
```

Description

Use GroupID to set or return the user's group identification number (GID).

Note: You must install InterBase 6 to use this feature.

12.1.13.5.3 TIBSecurityService.LastName Property

Sets or returns the user's last name.

Pascal

```
property LastName: string;
```

C++

```
__property UnicodeString LastName;
```

Description

Use LastName to set or return the user's last name.

Note: You must install InterBase 6 to use this feature.

12.1.13.5.4 TIBSecurityService.MiddleName Property

Sets or returns the user's middle name.

Pascal

```
property MiddleName: string;
```

C++

```
__property UnicodeString MiddleName;
```

Description

Use MiddleName to set or return user's middle name.

Note: You must install InterBase 6 to use this feature.

12.1.13.5.5 TIBSecurityService.Password Property

Sets the user's password.

Pascal

```
property Password: string;
```

C++

```
__property UnicodeString Password;
```

Description

Use Password to indicate the user's password when adding or modifying a user's information.

Note: You must install InterBase 6 to use this feature.

12.1.13.5.6 TIBSecurityService.SecurityAction Property

Specifies the security action.

Pascal

```
property SecurityAction: TSecurityAction;
```

C++

```
__property TSecurityAction SecurityAction;
```

Description

Use SecurityAction to indicate what operation the security server should perform.

Note: You must install InterBase 6 to use this feature.

12.1.13.5.7 TIBSecurityService.SQlRole Property

The role name used to connect to the isc4.gdb security database.

Pascal

```
property SQlRole: string;
```

C++

```
__property UnicodeString SQlRole;
```

Description

Use SQlRole to set or return role name used to connect to the isc4.gdb security database. For more information about using SQL roles with InterBase, refer to "ANSI SQL 3 roles" in the InterBase 6 Operations Guide

You must install InterBase 6 to use this feature.

12.1.13.5.8 TIBSecurityService.UserID Property

Sets or returns the user's ID number.

Pascal

```
property UserID: Integer;
```

C++

```
__property int UserID;
```

Description

Use UserID to set or return the user's identification number (UID).

Note: You must install InterBase 6 to use this feature.

12.1.13.5.9 TIBSecurityService.UserInfo Property

Provides information about a user.

Pascal

```
property UserInfo [Index: Integer]: TUserInfo;
```

C++

```
__property TUserInfo UserInfo[int Index];
```

Description

Use UserInfo to return the user's information as a TUserInfo (see page 472) record, which contains the user name, groupID, UserID (see page 450), and the user's first, middle, and last names.

Note: You must install InterBase 6 to use this feature.

12.1.13.5.10 TIBSecurityService.UserInfoCount Property

Returns the number of elements in the TUserInfo (see page 472) array.

Pascal

```
property UserInfoCount: Integer;
```

C++

```
__property int UserInfoCount;
```

Description

Use UserInfoCount to return the number of elements in the TUserInfo (see page 472) array.

Note: You must install InterBase 6 to use this feature.

12.1.13.5.11 TIBSecurityService.UserName Property

Sets or returns the user's login name.

Pascal

```
property UserName: string;
```

C++

```
__property UnicodeString UserName;
```

Description

Use UserName to set or return the user's login (user) name.

Note: You must install InterBase 6 to use this feature.

12.1.14 TIBServerProperties Class

TIBServerProperties returns database server information.

Class Hierarchy

Pascal

```
TIBServerProperties = class(TIBCustomService);
```

C++

```
class TIBServerProperties : public TIBCustomService;
```

File

IBServices

Description

TIBServerProperties returns database server information, including configuration parameters, and version and license information.

Note: You must install InterBase 6 to use this feature.

Getting Started with InterBase Express

12.1.14.1 TIBServerProperties Members

The following tables list the members exposed by TIBServerProperties.

Protected Methods

	Name	Description
	CheckActive (see page 427)	This is CheckActive, a member of class TIBCustomService.
	CheckInactive (see page 428)	This is CheckInactive, a member of class TIBCustomService.
	InternalServiceQuery (see page 428)	This is InternalServiceQuery, a member of class TIBCustomService.
V	Loaded (see page 428)	Initializes the component after the form file has been read into memory.
	Login (see page 429)	This is Login, a member of class TIBCustomService.

Protected Properties

	Name	Description
	BufferSize (see page 430)	This is BufferSize, a member of class TIBCustomService.
R	OutputBuffer (see page 431)	This is OutputBuffer, a member of class TIBCustomService.
	OutputBufferOption (see page 431)	This is OutputBufferOption, a member of class TIBCustomService.
	ServiceQueryParams (see page 432)	This is ServiceQueryParams, a member of class TIBCustomService.

Public Methods

	Name	Description
	Attach (see page 427)	Attaches to the database.
V	Create (see page 453)	Creates an instance of TIBServerProperties (see page 452)
V	Destroy (see page 453)	Destroys the instance of TIBServerProperties (see page 452).

	Detach (see page 428)	Detaches from the database.
	Fetch (see page 454)	Fetches information from the server.
	FetchConfigParams (see page 454)	Returns the database configuration parameters.
	FetchDatabaseInfo (see page 455)	Returns database information.
	FetchLicenseInfo (see page 455)	Returns license information.
	FetchLicenseMaskInfo (see page 455)	Returns license mask information.
	FetchVersionInfo (see page 455)	Returns the database version information.

Public Properties

	Name	Description
R	ConfigParams (see page 456)	Returns the server configuration parameters.
R	DatabaseInfo (see page 456)	Indicates database information.
R	Handle (see page 430)	Returns the database handle.
R	LicenseInfo (see page 457)	Indicates license information.
R	LicenseMaskInfo (see page 457)	Returns license mask information.
	ServiceParamBySPB (see page 432)	Returns and sets SPB parameters.
R	VersionInfo (see page 457)	Indicates version information.

Published Events

	Name	Description
	OnAttach (see page 433)	Occurs when the database is attached.
	OnLogin (see page 433)	Occurs during database login.

Published Properties

	Name	Description
	Active (see page 430)	Sets the active state of the service.
	LoginPrompt (see page 430)	Turns on and off login prompt display.
	Options (see page 457)	Indicates the server properties.
	Params (see page 431)	Sets or returns the database parameters
	Protocol (see page 431)	Sets or returns the network protocol.
	ServerName (see page 431)	Sets the name of the server on which the services are to be run.
	TraceFlags (see page 432)	This is TraceFlags, a member of class TIBCustomService.

12.1.14.2 TIBServerProperties.Create Constructor

Creates an instance of TIBServerProperties (see page 452)

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBServerProperties(TComponent * AOwner);
```

Description

Call Create to create an instance of TIBServerProperties (see page 452).

Note: You must install InterBase 6 to use this feature.

12.1.14.3 TIBServerProperties.Destroy Destructor

Destroys the instance of TIBServerProperties (see page 452).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBServerProperties();
```

Description

Do not call Destroy directly in an application. Instead, an application should call Free. Free verifies that the service object has not already been freed before it calls Destroy.

Note: You must install InterBase 6 to use this feature.

12.1.14.4 TIBServerProperties Methods

The methods of the TIBServerProperties class are listed here.

Public Methods

	Name	Description
	Fetch (see page 454)	Fetches information from the server.
	FetchConfigParams (see page 454)	Returns the database configuration parameters.
	FetchDatabaseInfo (see page 455)	Returns database information.
	FetchLicenseInfo (see page 455)	Returns license information.
	FetchLicenseMaskInfo (see page 455)	Returns license mask information.
	FetchVersionInfo (see page 455)	Returns the database version information.

12.1.14.4.1 TIBServerProperties.Fetch Method

Fetches information from the server.

Pascal

```
procedure Fetch;
```

C++

```
__fastcall Fetch();
```

Description

Call Fetch to get information from the server.

Note: You must install InterBase 6 to use this feature.

12.1.14.4.2 TIBServerProperties.FetchConfigParams Method

Returns the database configuration parameters.

Pascal

```
procedure FetchConfigParams;
```

C++

```
__fastcall FetchConfigParams();
```

Description

Call FetchConfigParams to return database configuration parameters.

Note: You must install InterBase 6 to use this feature.

12.1.14.4.3 TIBServerProperties.FetchDatabaseInfo Method

Returns database information.

Pascal

```
procedure FetchDatabaseInfo;
```

C++

```
__fastcall FetchDatabaseInfo();
```

Description

Call FetchDatabaseInfo to return database information.

Note: You must install InterBase 6 to use this feature.

12.1.14.4.4 TIBServerProperties.FetchLicenseInfo Method

Returns license information.

Pascal

```
procedure FetchLicenseInfo;
```

C++

```
__fastcall FetchLicenseInfo();
```

Description

Call FetchLicenseInfo to return database license information.

Note: You must install InterBase 6 to use this feature.

12.1.14.4.5 TIBServerProperties.FetchLicenseMaskInfo Method

Returns license mask information.

Pascal

```
procedure FetchLicenseMaskInfo;
```

C++

```
__fastcall FetchLicenseMaskInfo();
```

Description

Call FetchLicenseMaskInfo to return database license mask information.

Note: You must install InterBase 6 to use this feature.

12.1.14.4.6 TIBServerProperties.FetchVersionInfo Method

Returns the database version information.

Pascal

```
procedure FetchVersionInfo;
```

C++

```
__fastcall FetchVersionInfo();
```

Description

Call FetchVersionInfo to return the database version information.

Note: You must install InterBase 6 to use this feature.

12.1.14.5 TIBServerProperties Properties

The properties of the TIBServerProperties class are listed here.

Public Properties

	Name	Description
	ConfigParams (see page 456)	Returns the server configuration parameters.
	DatabaseInfo (see page 456)	Indicates database information.
	LicenseInfo (see page 457)	Indicates license information.
	LicenseMaskInfo (see page 457)	Returns license mask information.
	VersionInfo (see page 457)	Indicates version information.

Published Properties

	Name	Description
	Options (see page 457)	Indicates the server properties.

12.1.14.5.1 TIBServerProperties.ConfigParams Property

Returns the server configuration parameters.

Pascal

```
property ConfigParams: TConfigParams;
```

C++

```
__property TConfigParams ConfigParams;
```

Description

Use the ConfigParams property to return the server configuration parameters as a TConfigParams (see page 401) record, which includes the configuration file data, base location, lock file location, message file location, and the security database location.

Note: You must install InterBase 6 to use this feature.

12.1.14.5.2 TIBServerProperties.DatabaseInfo Property

Indicates database information.

Pascal

```
property DatabaseInfo: TDatabaseInfo;
```

C++

```
__property TDatabaseInfo DatabaseInfo;
```

Description

Use the DatabaseInfo property to obtain database information, which includes the database name, number of attachments, and number of databases.

Note: You must install InterBase 6 to use this feature.

12.1.14.5.3 TIBServerProperties.LicenseInfo Property

Indicates license information.

Pascal

```
property LicenseInfo: TLicenseInfo;
```

C++

```
__property TLicenseInfo LicenseInfo;
```

Description

Use the LicenseInfo property to return licensing information as a TLicenseInfo (see page 466) record, which includes the key, ID, and number of licensed users.

Note: You must install InterBase 6 to use this feature.

12.1.14.5.4 TIBServerProperties.LicenseMaskInfo Property

Returns license mask information.

Pascal

```
property LicenseMaskInfo: TLicenseMaskInfo;
```

C++

```
__property TLicenseMaskInfo LicenseMaskInfo;
```

Description

Use the LicenseMaskInfo property to return licensing information as a TLicenseMaskInfo (see page 468) record, which includes the license mask and capability mask. A license mask is a bitmask representing the software activation certificate options currently enabled on the server. A capability mask is a bitmask representing the capabilities currently enabled on the server.

Note: You must install InterBase 6 to use this feature.

12.1.14.5.5 TIBServerProperties.Options Property

Indicates the server properties.

Pascal

```
property Options: TPropertyOptions;
```

C++

```
__property TPropertyOptions Options;
```

Description

Use the Options property to set and return server properties.

Note: You must install InterBase 6 to use this feature.

12.1.14.5.6 TIBServerProperties.VersionInfo Property

Indicates version information.

Pascal

```
property VersionInfo: TVersionInfo;
```

C++

```
__property TVersionInfo VersionInfo;
```

Description

Use the VersionInfo property to obtain the server configuration parameters as a TVersionInfo (see page 475) type, which includes the service version, and server version and implementation.

Note: You must install InterBase 6 to use this feature.

12.1.15 TIBStatisticalService Class

TIBStatisticalService allows you to view database statistics.

Class Hierarchy

Pascal

```
TIBStatisticalService = class(TIBControlAndQueryService);
```

C++

```
class TIBStatisticalService : public TIBControlAndQueryService;
```

File

IBServices

Description

Use a TIBStatisticalService object to view database statistics.

Note: You must install InterBase 6 to use this feature.

12.1.15.1 TIBStatisticalService Members

The following tables list the members exposed by TIBStatisticalService.

Protected Methods

	Name	Description
	CheckActive (see page 427)	This is CheckActive, a member of class TIBCustomService.
	CheckInactive (see page 428)	This is CheckInactive, a member of class TIBCustomService.
	InternalServiceQuery (see page 428)	This is InternalServiceQuery, a member of class TIBCustomService.
	InternalServiceStart (see page 423)	This is InternalServiceStart, a member of class TIBControlService.
V	Loaded (see page 428)	Initializes the component after the form file has been read into memory.
	Login (see page 429)	This is Login, a member of class TIBCustomService.
	ServiceStartAddParam (see page 423)	This is the overview for the ServiceStartAddParam method overload.
V	SetServiceStartOptions (see page 460)	This is SetServiceStartOptions, a member of class TIBStatisticalService.

Protected Properties

	Name	Description
	Action (see page 420)	This is Action, a member of class TIBControlAndQueryService.
	BufferSize (see page 430)	This is BufferSize, a member of class TIBCustomService.
R	OutputBuffer (see page 431)	This is OutputBuffer, a member of class TIBCustomService.
	OutputBufferOption (see page 431)	This is OutputBufferOption, a member of class TIBCustomService.
	ServiceQueryParams (see page 432)	This is ServiceQueryParams, a member of class TIBCustomService.
	ServiceStartParams (see page 425)	This is ServiceStartParams, a member of class TIBControlService.

Public Methods

	Name	Description
	Attach (see page 427)	Attaches to the database.
V	Create (see page 419)	Creates an instance of a TIBControlAndQueryService (see page 417).
V	Create (see page 422)	Creates an instance of TIBControlService (see page 421)
V	Create (see page 426)	Creates an instance of TIBCustomService (see page 425)
V	Destroy (see page 426)	Destroys the service.
	Detach (see page 428)	Detaches from the database.
	GetNextChunk (see page 419)	Gets the next chunk of data.
	GetNextLine (see page 420)	Starts the service.
V	ServiceStart (see page 423)	Starts the service.

Public Properties

	Name	Description
R	Eof (see page 421)	Indicates that the end of file has been reached.
R	Handle (see page 430)	Returns the database handle.
R	IsServiceRunning (see page 424)	Indicates whether the service is running.
	ServiceParamBySPB (see page 432)	Returns and sets SPB parameters.

Published Events

	Name	Description
	OnAttach (see page 433)	Occurs when the database is attached.
	OnLogin (see page 433)	Occurs during database login.

Published Properties

	Name	Description
	Active (see page 430)	Sets the active state of the service.
	BufferSize (see page 420)	Sets or returns the buffer size.
	DatabaseName (see page 460)	Sets or returns the database name.
	LoginPrompt (see page 430)	Turns on and off login prompt display.
	Options (see page 460)	Indicates the desired statistical information.
	Params (see page 431)	Sets or returns the database parameters
	Protocol (see page 431)	Sets or returns the network protocol.
	ServerName (see page 431)	Sets the name of the server on which the services are to be run.
	TraceFlags (see page 432)	This is TraceFlags, a member of class TIBCustomService.

12.1.15.2 TIBStatisticalService Methods

The methods of the TIBStatisticalService class are listed here.

Protected Methods

	Name	Description
V	SetServiceStartOptions (see page 460)	This is SetServiceStartOptions, a member of class TIBStatisticalService.

12.1.15.2.1 TIBStatisticalService.SetServiceStartOptions Method

Pascal

```
procedure SetServiceStartOptions; override;
```

C++

```
virtual __fastcall SetServiceStartOptions();
```

Description

This is SetServiceStartOptions, a member of class TIBStatisticalService.

12.1.15.3 TIBStatisticalService Properties

The properties of the TIBStatisticalService class are listed here.

Published Properties

	Name	Description
	DatabaseName (see page 460)	Sets or returns the database name.
	Options (see page 460)	Indicates the desired statistical information.

12.1.15.3.1 TIBStatisticalService.DatabaseName Property

Sets or returns the database name.

Pascal

```
property DatabaseName: string;
```

C++

```
__property UnicodeString DatabaseName;
```

Description

Use DatabaseName to set or return the database name.

Note: You must install InterBase 6 to use this feature.

12.1.15.3.2 TIBStatisticalService.Options Property

Indicates the desired statistical information.

Pascal

```
property Options: TStatOptions;
```

C++

```
__property TStatOptions Options;
```

Description

Use the Options property to request database statistics. These options are incremental; that is, including DbLog also returns HeaderPages statistics, including IndexPages also returns DbLog and HeaderPages statistics, and so forth.

Note: You must install InterBase 6 to use this feature.

12.1.16 TIBValidationService Class

TIBValidationService enables you to validate your database and reconcile your database transactions.

Class Hierarchy

Pascal

```
TIBValidationService = class(TIBControlAndQueryService);
```

C++

```
class TIBValidationService : public TIBControlAndQueryService;
```

File

IBServices

Description

Use a TIBValidationService object to validate your database and reconcile your database transactions.

Note: You must install InterBase 6 to use this feature.

Getting Started with InterBase Express

12.1.16.1 TIBValidationService Members

The following tables list the members exposed by TIBValidationService.

Protected Methods

	Name	Description
	CheckActive (see page 427)	This is CheckActive, a member of class TIBCustomService.
	CheckInactive (see page 428)	This is CheckInactive, a member of class TIBCustomService.
	InternalServiceQuery (see page 428)	This is InternalServiceQuery, a member of class TIBCustomService.
	InternalServiceStart (see page 423)	This is InternalServiceStart, a member of class TIBControlService.
V	Loaded (see page 428)	Initializes the component after the form file has been read into memory.
	Login (see page 429)	This is Login, a member of class TIBCustomService.
	ServiceStartAddParam (see page 423)	This is the overview for the ServiceStartAddParam method overload.
V	SetServiceStartOptions (see page 464)	This is SetServiceStartOptions, a member of class TIBValidationService.

Protected Properties

	Name	Description
	Action (see page 420)	This is Action, a member of class TIBControlAndQueryService.
	BufferSize (see page 430)	This is BufferSize, a member of class TIBCustomService.
R	OutputBuffer (see page 431)	This is OutputBuffer, a member of class TIBCustomService.
	OutputBufferOption (see page 431)	This is OutputBufferOption, a member of class TIBCustomService.
	ServiceQueryParams (see page 432)	This is ServiceQueryParams, a member of class TIBCustomService.
	ServiceStartParams (see page 425)	This is ServiceStartParams, a member of class TIBControlService.

Public Methods

	Name	Description
	Attach (see page 427)	Attaches to the database.

	Create (see page 462)	Creates an instance of TIBValidationService (see page 461)
	Destroy (see page 463)	Destroys the service.
	Detach (see page 428)	Detaches from the database.
	FetchLimboTransactionInfo (see page 463)	Gets limbo transaction information.
	FixLimboTransactionErrors (see page 463)	Fixes limbo transaction errors.
	GetNextChunk (see page 419)	Gets the next chunk of data.
	GetNextLine (see page 420)	Starts the service.
	ServiceStart (see page 423)	Starts the service.

Public Properties

	Name	Description
	Eof (see page 421)	Indicates that the end of file has been reached.
	Handle (see page 430)	Returns the database handle.
	IsServiceRunning (see page 424)	Indicates whether the service is running.
	LimboTransactionInfo (see page 465)	Returns the limbo transaction information.
	LimboTransactionInfoCount (see page 465)	Returns the number of elements in the TLimboTransactionInfo (see page 469) array.
	ServiceParamBySPB (see page 432)	Returns and sets SPB parameters.

Published Events

	Name	Description
	OnAttach (see page 433)	Occurs when the database is attached.
	OnLogin (see page 433)	Occurs during database login.

Published Properties

	Name	Description
	Active (see page 430)	Sets the active state of the service.
	BufferSize (see page 420)	Sets or returns the buffer size.
	DatabaseName (see page 464)	Sets or returns the database name.
	GlobalAction (see page 465)	Indicates the global transaction action.
	LoginPrompt (see page 430)	Turns on and off login prompt display.
	Options (see page 465)	Indicates the options for the database restore.
	Params (see page 431)	Sets or returns the database parameters
	Protocol (see page 431)	Sets or returns the network protocol.
	ServerName (see page 431)	Sets the name of the server on which the services are to be run.
	TraceFlags (see page 432)	This is TraceFlags, a member of class TIBCustomService.

12.1.16.2 TIBValidationService.Create Constructor

Creates an instance of TIBValidationService (see page 461)

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBValidationService(TComponent * AOwner);
```

Description

Call Create to create an instance of TIBValidationService (see page 461).

Note: You must install InterBase 6 to use this feature.

12.1.16.3 TIBValidationService.Destroy Destructor

Destroys the service.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBValidationService();
```

Description

Do not call Destroy directly in an application. Instead, an application should call Free. Free verifies that the service object has not already been freed before it calls Destroy.

Note: You must install InterBase 6 to use this feature.

12.1.16.4 TIBValidationService Methods

The methods of the TIBValidationService class are listed here.

Protected Methods

	Name	Description
	SetServiceStartOptions (see page 464)	This is SetServiceStartOptions, a member of class TIBValidationService.

Public Methods

	Name	Description
	FetchLimboTransactionInfo (see page 463)	Gets limbo transaction information.
	FixLimboTransactionErrors (see page 463)	Fixes limbo transaction errors.

12.1.16.4.1 TIBValidationService.FetchLimboTransactionInfo Method

Gets limbo transaction information.

Pascal

```
procedure FetchLimboTransactionInfo;
```

C++

```
__fastcall FetchLimboTransactionInfo();
```

Description

Call FetchLimboTransactionInfo to get limbo transaction information from the LimboTransactionInfo (see page 465) property.

Note: You must install InterBase 6 to use this feature.

12.1.16.4.2 TIBValidationService.FixLimboTransactionErrors Method

Fixes limbo transaction errors.

Pascal

```
procedure FixLimboTransactionErrors;
```

C++

```
__fastcall FixLimboTransactionErrors();
```

Description

Call FixLimboTransactionErrors to repair limbo transaction errors.

Note: You must install InterBase 6 to use this feature.

12.1.16.4.3 TIBValidationService.SetServiceStartOptions Method

Pascal

```
procedure SetServiceStartOptions; override;
```

C++

```
virtual __fastcall SetServiceStartOptions();
```

Description

This is SetServiceStartOptions, a member of class TIBValidationService.

12.1.16.5 TIBValidationService Properties

The properties of the TIBValidationService class are listed here.

Public Properties

	Name	Description
	LimboTransactionInfo (see page 465)	Returns the limbo transaction information.
	LimboTransactionInfoCount (see page 465)	Returns the number of elements in the TLimboTransactionInfo (see page 469) array.

Published Properties

	Name	Description
	DatabaseName (see page 464)	Sets or returns the database name.
	GlobalAction (see page 465)	Indicates the global transaction action.
	Options (see page 465)	Indicates the options for the database restore.

12.1.16.5.1 TIBValidationService.DatabaseName Property

Sets or returns the database name.

Pascal

```
property DatabaseName: string;
```

C++

```
__property UnicodeString DatabaseName;
```

Description

Use DatabaseName to set or return the name of the database to be repaired.

Note: You must install InterBase 6 to use this feature.

12.1.16.5.2 TIBValidationService.GlobalAction Property

Indicates the global transaction action.

Pascal

```
property GlobalAction: TTransactionGlobalAction;
```

C++

```
__property TTransactionGlobalAction GlobalAction;
```

Description

Use GlobalAction to set or return the global transaction action. This value indicates what action to take with the transactions that follow.

Note: You must install InterBase 6 to use this feature.

12.1.16.5.3 TIBValidationService.LimboTransactionInfo Property

Returns the limbo transaction information.

Pascal

```
property LimboTransactionInfo [Index: integer]: TLimboTransactionInfo;
```

C++

```
__property TLimboTransactionInfo LimboTransactionInfo[int Index];
```

Description

Use LimboTransactionInfo to return the limbo transaction information.

Note: You must install InterBase 6 to use this feature.

12.1.16.5.4 TIBValidationService.LimboTransactionInfoCount Property

Returns the number of elements in the TLimboTransactionInfo (see page 469) array.

Pascal

```
property LimboTransactionInfoCount: Integer;
```

C++

```
__property int LimboTransactionInfoCount;
```

Description

Use LimboTransactionInfoCount to set or return the number of elements in the TLimboTransactionInfo (see page 469) array.

Note: You must install InterBase 6 to use this feature.

12.1.16.5.5 TIBValidationService.Options Property

Indicates the options for the database restore.

Pascal

```
property Options: TValidateOptions;
```

C++

```
__property TValidateOptions Options;
```

Description

Use Options to select the options for the database restore.

Note: You must install InterBase 6 to use this feature.

12.1.17 TLicenseInfo Class

TLicenseInfo stores information about licensed users.

Class Hierarchy

Pascal

```
TLicenseInfo = class;
```

C++

```
class TLicenseInfo;
```

File

IBServices

Description

Key (see page 468) lists the license key for each licensed user.

Id (see page 467) lists the user Id (see page 467) for each licensed user.

Desc (see page 467) lists the description of each licensed user.

LicensedUsers (see page 468) indicates the number of users (the number of entries in the lists).

12.1.17.1 TLicenseInfo Members

The following tables list the members exposed by TLicenseInfo.

Public Fields

	Name	Description
	Desc (see page 467)	This is Desc, a member of class TLicenseInfo.
	Id (see page 467)	This is Id, a member of class TLicenseInfo.
	Key (see page 468)	This is Key, a member of class TLicenseInfo.
	LicensedUsers (see page 468)	This is LicensedUsers, a member of class TLicenseInfo.

Public Methods

	Name	Description
	Create (see page 467)	This is Create, a member of class TLicenseInfo.
	Destroy (see page 467)	This is Destroy, a member of class TLicenseInfo.

12.1.17.2 TLicenseInfo.Create Constructor

Pascal

```
constructor Create;
```

C++

```
__fastcall TLicenseInfo();
```

Description

This is Create, a member of class TLicenseInfo.

12.1.17.3 TLicenseInfo.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TLicenseInfo();
```

Description

This is Destroy, a member of class TLicenseInfo.

12.1.17.4 TLicenseInfo Fields

The fields of the TLicenseInfo class are listed here.

Public Fields

	Name	Description
	Desc (see page 467)	This is Desc, a member of class TLicenseInfo.
	Id (see page 467)	This is Id, a member of class TLicenseInfo.
	Key (see page 468)	This is Key, a member of class TLicenseInfo.
	LicensedUsers (see page 468)	This is LicensedUsers, a member of class TLicenseInfo.

12.1.17.4.1 TLicenseInfo.Desc Field

Pascal

```
Desc: array of string;
```

C++

```
array of string Desc;
```

Description

This is Desc, a member of class TLicenseInfo.

12.1.17.4.2 TLicenseInfo.Id Field

Pascal

```
Id: array of string;
```

C++

```
array of string Id;
```

Description

This is Id, a member of class TLicenseInfo.

12.1.17.4.3 TLicenseInfo.Key Field

Pascal

```
Key: array of string;
```

C++

```
array of string Key;
```

Description

This is Key, a member of class TLicenseInfo.

12.1.17.4.4 TLicenseInfo.LicensedUsers Field

Pascal

```
LicensedUsers: Integer;
```

C++

```
int LicensedUsers;
```

Description

This is LicensedUsers, a member of class TLicenseInfo.

12.1.18 TLicenseMaskInfo Class

TLicenseMaskInfo indicates the software activation certificate options enabled on the server.

Class Hierarchy

Pascal

```
TLicenseMaskInfo = class;
```

C++

```
class TLicenseMaskInfo;
```

File

IBServices

Description

LicenseMask (see page 469) is a bitmask representing the software activation certificate options currently enabled on the server.

CapabilityMask (see page 469) is a bitmask representing the capabilities currently enabled on the server.

12.1.18.1 TLicenseMaskInfo Members

The following tables list the members exposed by TLicenseMaskInfo.

Public Fields

	Name	Description
	CapabilityMask (see page 469)	This is CapabilityMask, a member of class TLicenseMaskInfo.
	LicenseMask (see page 469)	This is LicenseMask, a member of class TLicenseMaskInfo.

12.1.18.2 TLicenseMaskInfo Fields

The fields of the TLicenseMaskInfo class are listed here.

Public Fields

	Name	Description
	CapabilityMask (see page 469)	This is CapabilityMask, a member of class TLicenseMaskInfo.
	LicenseMask (see page 469)	This is LicenseMask, a member of class TLicenseMaskInfo.

12.1.18.2.1 TLicenseMaskInfo.CapabilityMask Field

Pascal

```
CapabilityMask: Integer;
```

C++

```
int CapabilityMask;
```

Description

This is CapabilityMask, a member of class TLicenseMaskInfo.

12.1.18.2.2 TLicenseMaskInfo.LicenseMask Field

Pascal

```
LicenseMask: Integer;
```

C++

```
int LicenseMask;
```

Description

This is LicenseMask, a member of class TLicenseMaskInfo.

12.1.19 TLimboTransactionInfo Class

TLimboTransactionInfo stores information about a limbo transaction.

Class Hierarchy

IBServices.TLimboTransactionInfo

Pascal

```
TLimboTransactionInfo = class;
```

C++

```
class TLimboTransactionInfo;
```

File

IBServices

Description

TLimboTransactionInfo describes limbo transaction. Limbo transactions are usually caused by the failure of a two-phased commit. They can also exist due to system failure or when a single-database transaction is prepared..

MultiDatabase (see page 472) indicates whether the limbo transaction involves multiple databases.

Transaction ID (see page 471) is the identifier for the limbo transaction.

Host site is the host name for the server where the transaction was started.

RemoteSite (see page 472) is the host name for a remote server involved in the transaction.

RemoteDatabasePath (see page 472) is the path to the remote server.

State (see page 472) is the current state of the limbo transaction.

Advise (see page 471) is the suggested action for ending the transaction.

Action (see page 471) is the action to take for ending the transaction.

12.1.19.1 TLimboTransactionInfo Members

The following tables list the members exposed by TLimboTransactionInfo.

Public Fields

	Name	Description
	Action (see page 471)	This is Action, a member of class TLimboTransactionInfo.
	Advise (see page 471)	This is Advise, a member of class TLimboTransactionInfo.
	HostSite (see page 471)	This is HostSite, a member of class TLimboTransactionInfo.
	ID (see page 471)	This is ID, a member of class TLimboTransactionInfo.
	MultiDatabase (see page 472)	This is MultiDatabase, a member of class TLimboTransactionInfo.
	RemoteDatabasePath (see page 472)	This is RemoteDatabasePath, a member of class TLimboTransactionInfo.
	RemoteSite (see page 472)	This is RemoteSite, a member of class TLimboTransactionInfo.
	State (see page 472)	This is State, a member of class TLimboTransactionInfo.

12.1.19.2 TLimboTransactionInfo Fields

The fields of the TLimboTransactionInfo class are listed here.

Public Fields

	Name	Description
	Action (see page 471)	This is Action, a member of class TLimboTransactionInfo.
	Advise (see page 471)	This is Advise, a member of class TLimboTransactionInfo.
	HostSite (see page 471)	This is HostSite, a member of class TLimboTransactionInfo.
	ID (see page 471)	This is ID, a member of class TLimboTransactionInfo.
	MultiDatabase (see page 472)	This is MultiDatabase, a member of class TLimboTransactionInfo.

	RemoteDatabasePath (see page 472)	This is RemoteDatabasePath, a member of class TLimboTransactionInfo.
	RemoteSite (see page 472)	This is RemoteSite, a member of class TLimboTransactionInfo.
	State (see page 472)	This is State, a member of class TLimboTransactionInfo.

12.1.19.2.1 TLimboTransactionInfo.Action Field

Pascal

```
Action: TTransactionAction;
```

C++

```
TTransactionAction Action;
```

Description

This is Action, a member of class TLimboTransactionInfo.

12.1.19.2.2 TLimboTransactionInfo.Advise Field

Pascal

```
Advise: TTransactionAdvise;
```

C++

```
TTransactionAdvise Advise;
```

Description

This is Advise, a member of class TLimboTransactionInfo.

12.1.19.2.3 TLimboTransactionInfo.HostSite Field

Pascal

```
HostSite: String;
```

C++

```
UnicodeString HostSite;
```

Description

This is HostSite, a member of class TLimboTransactionInfo.

12.1.19.2.4 TLimboTransactionInfo.ID Field

Pascal

```
ID: Integer;
```

C++

```
int ID;
```

Description

This is ID, a member of class TLimboTransactionInfo.

12.1.19.2.5 TLimboTransactionInfo.MultiDatabase Field

Pascal

```
MultiDatabase: Boolean;
```

C++

```
Boolean MultiDatabase;
```

Description

This is MultiDatabase, a member of class TLimboTransactionInfo.

12.1.19.2.6 TLimboTransactionInfo.RemoteDatabasePath Field

Pascal

```
RemoteDatabasePath: String;
```

C++

```
UnicodeString RemoteDatabasePath;
```

Description

This is RemoteDatabasePath, a member of class TLimboTransactionInfo.

12.1.19.2.7 TLimboTransactionInfo.RemoteSite Field

Pascal

```
RemoteSite: String;
```

C++

```
UnicodeString RemoteSite;
```

Description

This is RemoteSite, a member of class TLimboTransactionInfo.

12.1.19.2.8 TLimboTransactionInfo.State Field

Pascal

```
State: TTransactionState;
```

C++

```
TTransactionState State;
```

Description

This is State, a member of class TLimboTransactionInfo.

12.1.20 TUserInfo Class

TUserInfo stores information about an InterBase user for the security service.

Class Hierarchy

Pascal

```
TUserInfo = class;
```

C++

```
class TUserInfo;
```

File

IBServices

Description

TUserInfo is the user descriptor that the InterBase security service uses to describe a single user.

UserName (see page 475) is the user's login name.

FirstName (see page 474) is the user's first name.

MiddleName (see page 474) is the user's middle name.

LastName (see page 474) is the user's Last name.

GroupID (see page 474) is the user's group ID.

UserID (see page 474) is the user's individual ID.

12.1.20.1 TUserInfo Members

The following tables list the members exposed by TUserInfo.

Public Fields

	Name	Description
	FirstName (see page 474)	This is FirstName, a member of class TUserInfo.
	GroupID (see page 474)	This is GroupID, a member of class TUserInfo.
	LastName (see page 474)	This is LastName, a member of class TUserInfo.
	MiddleName (see page 474)	This is MiddleName, a member of class TUserInfo.
	UserID (see page 474)	This is UserID, a member of class TUserInfo.
	UserName (see page 475)	This is UserName, a member of class TUserInfo.

12.1.20.2 TUserInfo Fields

The fields of the TUserInfo class are listed here.

Public Fields

	Name	Description
	FirstName (see page 474)	This is FirstName, a member of class TUserInfo.
	GroupID (see page 474)	This is GroupID, a member of class TUserInfo.
	LastName (see page 474)	This is LastName, a member of class TUserInfo.
	MiddleName (see page 474)	This is MiddleName, a member of class TUserInfo.
	UserID (see page 474)	This is UserID, a member of class TUserInfo.
	UserName (see page 475)	This is UserName, a member of class TUserInfo.

12.1.20.2.1 TUserInfo.FirstName Field

Pascal

```
FirstName: string;
```

C++

```
UnicodeString FirstName;
```

Description

This is FirstName, a member of class TUserInfo.

12.1.20.2.2 TUserInfo.GroupID Field

Pascal

```
GroupID: Integer;
```

C++

```
int GroupID;
```

Description

This is GroupID, a member of class TUserInfo.

12.1.20.2.3 TUserInfo.LastName Field

Pascal

```
LastName: string;
```

C++

```
UnicodeString LastName;
```

Description

This is LastName, a member of class TUserInfo.

12.1.20.2.4 TUserInfo.MiddleName Field

Pascal

```
MiddleName: string;
```

C++

```
UnicodeString MiddleName;
```

Description

This is MiddleName, a member of class TUserInfo.

12.1.20.2.5 TUserInfo.UserID Field

Pascal

```
UserID: Integer;
```

C++

```
int UserID;
```

Description

This is UserID, a member of class TUserInfo.

12.1.20.2.6 TUserInfo.UserName Field

Pascal

```
UserName: string;
```

C++

```
UnicodeString UserName;
```

Description

This is UserName, a member of class TUserInfo.

12.1.21 TVersionInfo Class

TVersionInfo represents version information about an InterBase server.

Class Hierarchy

IBServices.TVersionInfo

Pascal

```
TVersionInfo = class;
```

C++

```
class TVersionInfo;
```

File

IBServices

Description

TVersionInfo supplies the following version information:

ServerVersion (see page 476) gives the version of the InterBase server.

ServerImplementation (see page 476) gives the implementation string.

ServiceVersion (see page 476) give the version number for the service that fetches the version information.

12.1.21.1 TVersionInfo Members

The following tables list the members exposed by TVersionInfo.

Public Fields

	Name	Description
	ServerImplementation (see page 476)	This is ServerImplementation, a member of class TVersionInfo.
	ServerVersion (see page 476)	This is ServerVersion, a member of class TVersionInfo.
	ServiceVersion (see page 476)	This is ServiceVersion, a member of class TVersionInfo.

12.1.21.2 TVersionInfo Fields

The fields of the TVersionInfo class are listed here.

Public Fields

	Name	Description
	ServerImplementation (see page 476)	This is ServerImplementation, a member of class TVersionInfo.
	ServerVersion (see page 476)	This is ServerVersion, a member of class TVersionInfo.
	ServiceVersion (see page 476)	This is ServiceVersion, a member of class TVersionInfo.

12.1.21.2.1 TVersionInfo.ServerImplementation Field

Pascal

```
ServerImplementation: string;
```

C++

```
UnicodeString ServerImplementation;
```

Description

This is ServerImplementation, a member of class TVersionInfo.

12.1.21.2.2 TVersionInfo.ServerVersion Field

Pascal

```
ServerVersion: String;
```

C++

```
UnicodeString ServerVersion;
```

Description

This is ServerVersion, a member of class TVersionInfo.

12.1.21.2.3 TVersionInfo.ServiceVersion Field

Pascal

```
ServiceVersion: Integer;
```

C++

```
int ServiceVersion;
```

Description

This is ServiceVersion, a member of class TVersionInfo.

12.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TBackupOption (see page 477)	This is record IBServices.TBackupOption.
	TLicensingAction (see page 478)	TLicensingAction indicates whether to add or remove InterBase software activation certificates.
	TOutputBufferOption (see page 478)	This is record IBServices.TOutputBufferOption.
	TPropertyOption (see page 479)	This is record IBServices.TPropertyOption.
	TProtocol (see page 479)	TProtocol identifies a network protocol.
	TRestoreOption (see page 480)	This is record IBServices.TRestoreOption.
	TSecurityAction (see page 480)	TSecurityAction indicates what operation the InterBase security service should perform.
	TSecurityModifyParam (see page 481)	This is record IBServices.TSecurityModifyParam.
	TShutdownMode (see page 481)	TShutdownMode indicates what steps to take when shutting down the InterBase database.
	TStatOption (see page 482)	This is record IBServices.TStatOption.
	TTransactionAction (see page 482)	TTransactionAction indicates the action a transaction can take when it times out.
	TTransactionAdvise (see page 483)	This is record IBServices.TTransactionAdvise.
	TTransactionGlobalAction (see page 483)	TTransactionGlobalAction indicates the action to take on a set of transactions.
	TTransactionState (see page 484)	This is record IBServices.TTransactionState.
	TValidateOption (see page 485)	This is record IBServices.TValidateOption.

12.2.1 IBServices.TBackupOption Enumeration

Pascal

```
TBackupOption = (
  IgnoreChecksums,
  IgnoreLimbo,
  MetadataOnly,
  NoGarbageCollection,
  OldMetadataDesc,
  NonTransportable,
  ConvertExtTables
);
```

C++

```
enum TBackupOption {
  IgnoreChecksums,
  IgnoreLimbo,
  MetadataOnly,
  NoGarbageCollection,
  OldMetadataDesc,
  NonTransportable,
  ConvertExtTables
};
```

File

IBServices

Description

This is record IBServices.TBackupOption.

12.2.2 IBServices.TLicensingAction Enumeration

TLicensingAction indicates whether to add or remove InterBase software activation certificates.

Pascal

```
TLicensingAction = (
  LicenseAdd,
  LicenseRemove
);
```

C++

```
enum TLicensingAction {
  LicenseAdd,
  LicenseRemove
};
```

File

IBServices

Description

TLicensingAction values are:

Value Meaning

LicenseAdd Add an InterBase software activation certificate.

LicenseRemove Remove an InterBase software activation certificate.

12.2.3 IBServices.TOutputBufferOption Enumeration

Pascal

```
TOutputBufferOption = (
  ByLine,
  ByChunk
);
```

C++

```
enum TOutputBufferOption {
  ByLine,
  ByChunk
};
```

File

IBServices

Description

This is record IBServices.TOutputBufferOption.

12.2.4 IBServices.TPropertyOption Enumeration

Pascal

```
TPropertyOption = (
  Database,
  License,
  LicenseMask,
  ConfigParameters,
  Version
);
```

C++

```
enum TPropertyOption {
  Database,
  License,
  LicenseMask,
  ConfigParameters,
  Version
};
```

File

IBServices

Description

This is record IBServices.TPropertyOption.

12.2.5 IBServices.TProtocol Enumeration

TProtocol identifies a network protocol.

Pascal

```
TProtocol = (
  TCP,
  SPX,
  NamedPipe,
  Local
);
```

C++

```
enum TProtocol {
  TCP,
  SPX,
  NamedPipe,
  Local
};
```

File

IBServices

Description

TProtocol values are:

Local	
NamedPipe	Named pipe (FIFO)
SPX	IPX/SPX
TCP	Transport control protocol

12.2.6 IBServices.TRestoreOption Enumeration

Pascal

```
TRestoreOption = (
  DeactivateIndexes,
  NoShadow,
  NoValidityCheck,
  OneRelationAtATime,
  Replace,
  CreateNewDB,
  UseAllSpace
);
```

C++

```
enum TRestoreOption {
  DeactivateIndexes,
  NoShadow,
  NoValidityCheck,
  OneRelationAtATime,
  Replace,
  CreateNewDB,
  UseAllSpace
};
```

File

IBServices

Description

This is record IBServices.TRestoreOption.

12.2.7 IBServices.TSecurityAction Enumeration

TSecurityAction indicates what operation the InterBase security service should perform.

Pascal

```
TSecurityAction = (
  ActionAddUser,
  ActionDeleteUser,
  ActionModifyUser,
  ActionDisplayUser
);
```

C++

```
enum TSecurityAction {
  ActionAddUser,
  ActionDeleteUser,
```

```
  ActionModifyUser,
  ActionDisplayUser
};
```

File

IBServices

Description

TSecurityAction values are:

ActionAddUser	Add the user
ActionDeleteUser	Delete the user
ActionDisplayUser	Display the user's information
ActionModifyUser	Modify the user account

12.2.8 IBServices.TSecurityModifyParam Enumeration

Pascal

```
TSecurityModifyParam = (
  ModifyFirstName,
  ModifyMiddleName,
  ModifyLastName,
  ModifyUserId,
  ModifyGroupId,
  ModifyPassword
);
```

C++

```
enum TSecurityModifyParam {
  ModifyFirstName,
  ModifyMiddleName,
  ModifyLastName,
  ModifyUserId,
  ModifyGroupId,
  ModifyPassword
};
```

File

IBServices

Description

This is record IBServices.TSecurityModifyParam.

12.2.9 IBServices.TShutdownMode Enumeration

TShutdownMode indicates what steps to take when shutting down the InterBase database.

Pascal

```
TShutdownMode = (
  Forced,
  DenyTransaction,
```

```
    DenyAttachment
  );
```

C++

```
  enum TShutdownMode {
    Forced,
    DenyTransaction,
    DenyAttachment
  };
```

File

IBServices

Description

TShutdownMode values are:

Forced	Shut down the database after the specified number of seconds. To shut down the database immediately, set the number of seconds to 0.
DenyTransaction	Deny new transactions for the specified number of seconds and then shut down. The shutdown will fail if there are still active transactions to the database.
DenyAttachment	Deny new attachments for the specified number of seconds and then shut down. The shutdown will fail if there are still active attachments to the database.

12.2.10 IBServices.TStatOption Enumeration

Pascal

```
  TStatOption = (
    DataPages,
    DbLog,
    HeaderPages,
    IndexPages,
    SystemRelations
  );
```

C++

```
  enum TStatOption {
    DataPages,
    DbLog,
    HeaderPages,
    IndexPages,
    SystemRelations
  };
```

File

IBServices

Description

This is record IBServices.TStatOption.

12.2.11 IBServices.TTransactionAction Enumeration

TTransactionAction indicates the action a transaction can take when it times out.

Pascal

```
TTransactionAction = (
  CommitAction,
  RollbackAction
);
```

C++

```
enum TTransactionAction {
  CommitAction,
  RollbackAction
};
```

File

IBServices

Description

TTransactionAction values are:

Value Meaning

TARollback Roll back the transaction.

TACommit Commit the transaction.

TARollbackRetaining Roll back the transaction, but retain the current transaction context. (Requires InterBase 6.0 or later)

TACommitRetaining Commit the transaction, but retain the current transaction context.

12.2.12 IBServices.TTransactionAdvise Enumeration

Pascal

```
TTransactionAdvise = (
  CommitAdvise,
  RollbackAdvise,
  UnknownAdvise
);
```

C++

```
enum TTransactionAdvise {
  CommitAdvise,
  RollbackAdvise,
  UnknownAdvise
};
```

File

IBServices

Description

This is record IBServices.TTransactionAdvise.

12.2.13 IBServices.TTransactionGlobalAction Enumeration

TTransactionGlobalAction indicates the action to take on a set of transactions.

Pascal

```
TTransactionGlobalAction = (
  CommitGlobal,
  RollbackGlobal,
  RecoverTwoPhaseGlobal,
  NoGlobalAction
);
```

C++

```
enum TTransactionGlobalAction {
  CommitGlobal,
  RollbackGlobal,
  RecoverTwoPhaseGlobal,
  NoGlobalAction
};
```

File

IBServices

Description

TTransactionGlobalAction values are:

Value Meaning

CommitGlobal Commit the transactions.

RollbackGlobal Roll back the transactions.

RecoverTwoPhaseGlobal Perform automated two-phase commit recovery on the transactions.

NoGlobalAction Take no action.

12.2.14 IBServices.TTransactionState Enumeration

Pascal

```
TTransactionState = (
  LimboState,
  CommitState,
  RollbackState,
  UnknownState
);
```

C++

```
enum TTransactionState {
  LimboState,
  CommitState,
  RollbackState,
  UnknownState
};
```

File

IBServices

Description

This is record IBServices.TTransactionState.

12.2.15 IBServices.TValidateOption Enumeration

Pascal

```
TValidateOption = (
  LimboTransactions,
  CheckDB,
  IgnoreChecksum,
  KillShadows,
  MendDB,
  SweepDB,
  ValidateDB,
  ValidateFull
);
```

C++

```
enum TValidateOption {
  LimboTransactions,
  CheckDB,
  IgnoreChecksum,
  KillShadows,
  MendDB,
  SweepDB,
  ValidateDB,
  ValidateFull
};
```

File

IBServices

Description

This is record IBServices.TValidateOption.

12.3 Types

The following table lists types in this documentation.

Types

Name	Description
TBackupOptions (see page 486)	TBackupOption (see page 477) and TBackupOptions indicate how TIBBackupService (see page 408) performs database backup.
TLoginEvent (see page 487)	This is type IBServices.TLoginEvent.
TPropertyOptions (see page 487)	TPropertyOption (see page 479) and TPropertyOptions indicate groups of InterBase server properties.
TRestoreOptions (see page 488)	TRestoreOption (see page 480) and TRestoreOptions indicate what operations take place when restoring an InterBase database.
TSecurityModifyParams (see page 489)	This is type IBServices.TSecurityModifyParams.
TStatOptions (see page 489)	TStatOption (see page 482) and TStatOptions indicate the different statistical information available about a database.
TValidateOptions (see page 490)	TValidateOption (see page 485) and TValidateOptions indicate what operations the validation service should perform when restoring a database.

12.3.1 IBServices.TBackupOptions Type

TBackupOption (see page 477) and TBackupOptions indicate how TIBBackupService (see page 408) performs database backup.

Pascal

```
TBackupOptions = set of TBackupOption;
```

C++

```
TBackupOption TBackupOptions;
```

File

IBServices

Description

TBackupOptions is a set of TBackupOption (see page 477) values. The following table lists the possible values:

IgnoreChecksums	A checksum is a page-by-page analysis of data to verify its integrity. A bad checksum means that a data page has been randomly overwritten, for example, due to a system crash. Checksum errors indicate data corruption, and InterBase normally prevents you from backing up a database if bad checksums are detected. Examine the data the next time you restore the database. To ignore checksums during backup, set IgnoreChecksums to true.
IgnoreLimbo	Limbo transactions are usually caused by the failure of a two-phased commit. They can also exist due to system failure or when a single-database transaction is prepared. To ignore limbo transactions during backup, set IgnoreLimbo to true. When your application ignores limbo transactions during backup, it ignores all records versions created by any limbo transaction, finds the most recently committed version of a record, and backs up that version.

MetadataOnly	When backing up a database, you can exclude its data, saving only the metadata. You might want to do this to: Retain a record of the metadata before it is modified. Create an empty copy of the database. The copy has the same metadata but can be populated with different data. Set MetaDataOnly to true to save only the metadata.
NoGarbageCollection	Garbage collections marks space used by old versions of data records as free for reuse. Generally, you want to perform garbage collection during backup. To disable garbage collection, set NoGarbageCollection to true.
OldMetadataDesc	Set OldMetadataDesc to true if you want to back up metadata in the old-style format.
NonTransportable	Set to NonTransportable to true if you do not want data to be moved to a machine with a different operating system than the one on which the backup was performed. If NonTransportable is set to false (the default), then data is saved in a generic format, enabling you to restore to any machine that supports InterBase.
ConvertExtTables	Set ConvertExtTables to true if you want to convert external files into internal tables during the backup

12.3.2 IBServices.TLoginEvent Type

Pascal

```
TLoginEvent = procedure (Database: TIBCustomService; LoginParams: TStrings) of object;
```

C++

```
(Database: TIBCustomService; LoginParams: TStrings) ( TLoginEvent)();
```

File

IBServices

Description

This is type IBServices.TLoginEvent.

12.3.3 IBServices.TPropertyOptions Type

TPropertyOption (see page 479) and TPropertyOptions indicate groups of InterBase server properties.

Pascal

```
TPropertyOptions = set of TPropertyOption;
```

C++

```
TPropertyOption TPropertyOptions;
```

File

IBServices

Description

TPropertyOptions is a set of TPropertyOption (see page 479) values. Each TPropertyOption (see page 479) value indicates a type of server property you wish to see. Each type of sever property has a corresponding data structure that holds the

information, as indicated in the following table:

Database	TDatabaseInfo (see page 404)
License	TLicenseInfo (see page 466)
ConfigParameters	TConfigParams (see page 401)
Version	TVersionInfo (see page 475)

12.3.4 IBServices.TRestoreOptions Type

TRestoreOption (see page 480) and TRestoreOptions indicate what operations take place when restoring an InterBase database.

Pascal

```
TRestoreOptions = set of TRestoreOption;
```

C++

```
TRestoreOption TRestoreOptions;
```

File

IBServices

Description

TRestoreOptions is a set of TRestoreOption (see page 480) values. The following table lists the possible values:

DeactivateIndexes	Normally, InterBase rebuilds indexes when it restores a database. If the database contained duplicate entries in a unique index when it was backed up, restoration fails. Duplicate values can be introduced into a database if indexes were temporarily made inactive (for example, to allow insertion of many records or to re-balance an index). To enable restoration to succeed in this case, set DeactivateIndexes to true. This makes indexes inactive and prevents them from rebuilding.
NoShadow	Normally, InterBase rebuilds previously defined database shadows when it restores a database. To make sure the shadows are not built, set the NoShadow option to true.
NoValidityCheck	If you redefine validity constraints in a database where data is already entered, your data might no longer satisfy the validity constraints. You might not discover this until you try to restore the database, at which time an error about invalid data appears. To restore a database that contains invalid data, set NoValidity to true. This deletes validity constraints from the metadata. After the database is restored, change the data to make it valid according to the new integrity constraints. Then add back the constraints that were deleted. **Important:** Always make a copy of metadata before redefining it; for example with the MetadataOnly option of the `Options` property of TIBBackupService (see page 408).
OneRelationAtATime	Set OneRelationATime to true to restore the metadata and data for each table together, one table at a time. This option is useful when you are having trouble restoring a backup file; for example, if the data is corrupt or invalid according to integrity constraints.
Replace	Your application cannot overwrite an existing database file unless you set Replace to true. If you attempt to restore to an existing database name and this option is not set, then the restore will not proceed. **Important:** Do not restore an existing database file when clients are operating on it. A safer approach is to rename the existing database file, restore the database, then drop or archive the old database as needed.

CreateNew	To restore a database to a new file, set the Create option to true.
UseAllSpace	When InterBase restores a database, it fills each data page to 80% of capacity by default. To set your application to restore a database with a 100% fill ratio on each data page, set the UseAllSpace option to true.

12.3.5 IBServices.TSecurityModifyParams Type

Pascal

```
TSecurityModifyParams = set of TSecurityModifyParam;
```

C++

```
TSecurityModifyParam TSecurityModifyParams;
```

File

IBServices

Description

This is type IBServices.TSecurityModifyParams.

12.3.6 IBServices.TStatOptions Type

TStatOption (see page 482) and TStatOptions indicate the different statistical information available about a database.

Pascal

```
TStatOptions = set of TStatOption;
```

C++

```
TStatOption TStatOptions;
```

File

IBServices

Description

TStatOptions is a set of TStatOption (see page 482) values. The following table lists the possible values:

Value Meaning

DataPages Request statistics for data tables in the database.

DbLog Stop reporting statistics after reporting information on the log pages.

HeaderPages Stop reporting statistics after reporting the information on the header page.

IndexPages Request statistics for the user indexes in the database.

SystemRelations Request statistics for system tables and indexes in addition to user tables and indexes.

12.3.7 IBServices.TValidateOptions Type

TValidateOption (see page 485) and TValidateOptions indicate what operations the validation service should perform when restoring a database.

Pascal

```
TValidateOptions = set of TValidateOption;
```

C++

```
TValidateOption TValidateOptions;
```

File

IBServices

Description

TValidateOptions is a set of TValidateOption (see page 485) values. The following table lists the possible values:

LimboTransactions	Return a list of limbo transactions
CheckDB	Validate the database, but don't repair it. Used in conjunction with ValidateDB.
IgnoreChecksum	Ignore all checksum errors
KillShadows	Kill all unavailable shadow files
MendDB	Prepare a corrupt database for backup
SweepDB	Perform a database sweep
ValidateDB	Validate the database structure
ValidateFull	Validate record fragments

12.4 Constants

The following table lists constants in this documentation.

Constants

Name	Description
DefaultBufferSize (see page 491)	This is constant IBServices.DefaultBufferSize.
SPBConstantNames (see page 491)	This is constant IBServices.SPBConstantNames.
SPBConstantValues (see page 492)	This is constant IBServices.SPBConstantValues.
SPBPrefix (see page 492)	This is constant IBServices.SPBPrefix.

12.4.1 IBServices.DefaultBufferSize Constant

Pascal

```
DefaultBufferSize = 32000;
```

C++

```
DefaultBufferSize = 32000;
```

File

IBServices

Description

This is constant IBServices.DefaultBufferSize.

12.4.2 IBServices.SPBConstantNames Constant

Pascal

```
SPBConstantNames: array[1..isc_spb_last_spb_constant] of String = ( 'user_name',
'sys_user_name', 'sys_user_name_enc', 'password', 'password_enc', 'command_line', 'db_name',
'verbose', 'options', 'connect_timeout', 'dummy_packet_interval', 'sql_role_name' );
```

C++

```
array[1..isc_spb_last_spb_constant] of String SPBConstantNames = ( 'user_name',
'sys_user_name', 'sys_user_name_enc', 'password', 'password_enc', 'command_line', 'db_name',
'verbose', 'options', 'connect_timeout', 'dummy_packet_interval', 'sql_role_name' );
```

File

IBServices

Description

This is constant IBServices.SPBConstantNames.

12.4.3 IBServices.SPBConstantValues Constant

Pascal

```
SPBConstantValues: array[1..isc_spb_last_spb_constant] of Integer = (
isc_spb_user_name_mapped_to_server, isc_spb_sys_user_name_mapped_to_server,
isc_spb_sys_user_name_enc_mapped_to_server, isc_spb_password_mapped_to_server,
isc_spb_password_enc_mapped_to_server, isc_spb_command_line_mapped_to_server,
isc_spb_dbname_mapped_to_server, isc_spb_verbose_mapped_to_server,
isc_spb_options_mapped_to_server, isc_spb_connect_timeout_mapped_to_server,
isc_spb_dummy_packet_interval_mapped_to_server, isc_spb_sql_role_name_mapped_to_server );
```

C++

```
array[1..isc_spb_last_spb_constant] of Integer SPBConstantValues = (
isc_spb_user_name_mapped_to_server, isc_spb_sys_user_name_mapped_to_server,
isc_spb_sys_user_name_enc_mapped_to_server, isc_spb_password_mapped_to_server,
isc_spb_password_enc_mapped_to_server, isc_spb_command_line_mapped_to_server,
isc_spb_dbname_mapped_to_server, isc_spb_verbose_mapped_to_server,
isc_spb_options_mapped_to_server, isc_spb_connect_timeout_mapped_to_server,
isc_spb_dummy_packet_interval_mapped_to_server, isc_spb_sql_role_name_mapped_to_server );
```

File

IBServices

Description

This is constant IBServices.SPBConstantValues.

12.4.4 IBServices.SPBPrefix Constant

Pascal

```
SPBPrefix = 'isc_spb_';
```

C++

```
SPBPrefix = 'isc_spb_';
```

File

IBServices

Description

This is constant IBServices.SPBPrefix.

13 IBSQL Namespace

This is namespace IBSQL.

Topics

Name	Description
Classes (see page 494)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 556)	The following table lists structs, records, enums in this documentation.
Types (see page 558)	The following table lists types in this documentation.

Classes

	Name	Description
	TIBBatch (see page 494)	TIBBatch is the abstract base class for the TIBBatchInput (see page 497) and TIBBatchOutput (see page 498) objects.
	TIBBatchInput (see page 497)	TIBBatchInput is the abstract class for performing all batch input.
	TIBBatchOutput (see page 498)	TIBBatchOutput is the abstract class for performing all batch output.
	TIBInputDelimitedFile (see page 500)	TIBInputDelimitedFile performs batch input of data from delimited files.
	TIBInputRawFile (see page 505)	TIBInputRawFile inputs data from a raw file.
	TIBOutputDelimitedFile (see page 507)	TIBOutputDelimitedFile performs batch output of data to delimited files.
	TIBOutputRawFile (see page 511)	TIBOutputRawFile outputs data to a raw file format.
	TIBSQL (see page 513)	TIBSQL provides an object for executing an InterBase SQL (see page 534) statement with minimal overhead.
	TIBXSQLDA (see page 536)	TIBXSQLDA provides properties and methods for use with the IBSQL component.
	TIBXSQLVAR (see page 544)	TIBXSQLVAR provides properties and methods for use with the IBSQL component.

Structs, Records, Enums

	Name	Description
	TIBSQLTypes (see page 556)	TIBSQLTypes indicates the type of an SQL query against an InterBase database.

Types

Name	Description
TIBXSQLVARArray (see page 558)	This is type IBSQL.TIBXSQLVARArray.

13.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TIBBatch (see page 494)	TIBBatch is the abstract base class for the TIBBatchInput (see page 497) and TIBBatchOutput (see page 498) objects.
	TIBBatchInput (see page 497)	TIBBatchInput is the abstract class for performing all batch input.
	TIBBatchOutput (see page 498)	TIBBatchOutput is the abstract class for performing all batch output.
	TIBInputDelimitedFile (see page 500)	TIBInputDelimitedFile performs batch input of data from delimited files.
	TIBInputRawFile (see page 505)	TIBInputRawFile inputs data from a raw file.
	TIBOutputDelimitedFile (see page 507)	TIBOutputDelimitedFile performs batch output of data to delimited files.
	TIBOutputRawFile (see page 511)	TIBOutputRawFile outputs data to a raw file format.
	TIBSQL (see page 513)	TIBSQL provides an object for executing an InterBase SQL (see page 534) statement with minimal overhead.
	TIBXSQLDA (see page 536)	TIBXSQLDA provides properties and methods for use with the IBSQL (see page 493) component.
	TIBXSQLVAR (see page 544)	TIBXSQLVAR provides properties and methods for use with the IBSQL (see page 493) component.

13.1.1 TIBBatch Class

TIBBatch is the abstract base class for the TIBBatchInput (see page 497) and TIBBatchOutput (see page 498) objects.

Class Hierarchy

Pascal

```
TIBBatch = class(TObject);
```

C++

```
class TIBBatch : public TObject;
```

File

IBSQL

Description

Use a TIBBatch object to provide properties and methods for use with the TIBBatchInput (see page 497) and TIBBatchOutput (see page 498) objects, which make it possible to input and output data in virtually any format.

Descendents of this class can specify a file name (for input or output), and a TIBXSQLDA (see page 536) object representing a record or parameters. The ReadyFile (see page 496) method is called right before performing the batch input or output.

13.1.1.1 TIBBatch Members

The following tables list the members exposed by TIBBatch.

Protected Fields

	Name	Description
	FColumns (see page 495)	This is FColumns, a member of class TIBBatch.
	FFilename (see page 495)	This is FFilename, a member of class TIBBatch.
	FParams (see page 496)	This is FParams, a member of class TIBBatch.

Public Methods

	Name	Description
	ReadyFile (see page 496)	Prepares the file.

Public Properties

	Name	Description
	Columns (see page 496)	Returns the XSQLDA columns.
	Filename (see page 497)	Sets or displays the name of the external file.
	Params (see page 497)	Returns the XSQLDA parameters.

13.1.1.2 TIBBatch Fields

The fields of the TIBBatch class are listed here.

Protected Fields

	Name	Description
	FColumns (see page 495)	This is FColumns, a member of class TIBBatch.
	FFilename (see page 495)	This is FFilename, a member of class TIBBatch.
	FParams (see page 496)	This is FParams, a member of class TIBBatch.

13.1.1.2.1 TIBBatch.FColumns Field

Pascal

```
FColumns: TIBXSQLDA;
```

C++

```
TIBXSQLDA FColumns;
```

Description

This is FColumns, a member of class TIBBatch.

13.1.1.2.2 TIBBatch.FFilename Field

Pascal

```
FFilename: String;
```

C++

```
UnicodeString FFilename;
```

Description

This is FFilename, a member of class TIBBatch.

13.1.1.2.3 TIBBatch.FParams Field

Pascal

```
FParams: TIBXSQLDA;
```

C++

```
TIBXSQLDA FParams;
```

Description

This is FParams, a member of class TIBBatch.

13.1.1.3 TIBBatch Methods

The methods of the TIBBatch class are listed here.

Public Methods

	Name	Description
	ReadyFile (see page 496)	Prepares the file.

13.1.1.3.1 TIBBatch.ReadyFile Method

Prepares the file.

Pascal

```
procedure ReadyFile; virtual; abstract;
```

C++

```
virtual __fastcall ReadyFile() = 0;
```

Description

Call ReadyFile to prepare the file for input or output.

13.1.1.4 TIBBatch Properties

The properties of the TIBBatch class are listed here.

Public Properties

	Name	Description
	Columns (see page 496)	Returns the XSQLDA columns.
	Filename (see page 497)	Sets or displays the name of the external file.
	Params (see page 497)	Returns the XSQLDA parameters.

13.1.1.4.1 TIBBatch.Columns Property

Returns the XSQLDA columns.

Pascal

```
property Columns: TIBXSQLDA;
```

C++

```
__property TIBXSQLDA Columns;
```

Description

Use the Columns property to retrieve or set the XSQLDA columns.

13.1.1.4.2 TIBBatch.Filename Property

Sets or displays the name of the external file.

Pascal

```
property Filename: String;
```

C++

```
__property UnicodeString Filename;
```

Description

Use the Filename property to set or display the external file name.

13.1.1.4.3 TIBBatch.Params Property

Returns the XSQLDA parameters.

Pascal

```
property Params: TIBXSQLDA;
```

C++

```
__property TIBXSQLDA Params;
```

Description

Use the Params property to retrieve or set the XSQLDA parameters.

13.1.2 TIBBatchInput Class

TIBBatchInput is the abstract class for performing all batch input.

Class Hierarchy

Pascal

```
TIBBatchInput = class(TIBBatch);
```

C++

```
class TIBBatchInput : public TIBBatch;
```

File

IBSQL

Description

Use a TIBBatchInput object to provide properties and methods for performing all batch input.

13.1.2.1 TIBBatchInput Members

The following tables list the members exposed by TIBBatchInput.

Protected Fields

	Name	Description
	FColumns (see page 495)	This is FColumns, a member of class TIBBatch.
	FFilename (see page 495)	This is FFilename, a member of class TIBBatch.
	FParams (see page 496)	This is FParams, a member of class TIBBatch.

Public Methods

	Name	Description
	ReadParameters (see page 498)	Reads the XSQLDA input parameters.
	ReadyFile (see page 496)	Prepares the file.

Public Properties

	Name	Description
	Columns (see page 496)	Returns the XSQLDA columns.
	Filename (see page 497)	Sets or displays the name of the external file.
	Params (see page 497)	Returns the XSQLDA parameters.

13.1.2.2 TIBBatchInput Methods

The methods of the TIBBatchInput class are listed here.

Public Methods

	Name	Description
	ReadParameters (see page 498)	Reads the XSQLDA input parameters.

13.1.2.2.1 TIBBatchInput.ReadParameters Method

Reads the XSQLDA input parameters.

Pascal

```
function ReadParameters: Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean ReadParameters() = 0;
```

Description

Call ReadParameters to read the input parameters of the extended SQL descriptor area (XSQLDA) from the specified file.

13.1.3 TIBBatchOutput Class

TIBBatchOutput is the abstract class for performing all batch output.

Class Hierarchy

Pascal

```
TIBBatchOutput = class(TIBBatch);
```

C++

```
class TIBBatchOutput : public TIBBatch;
```

File

IBSQL

Description

Use a TIBBatchOutput object to provide properties and methods for performing all batch output.

13.1.3.1 TIBBatchOutput Members

The following tables list the members exposed by TIBBatchOutput.

Protected Fields

	Name	Description
	FColumns (see page 495)	This is FColumns, a member of class TIBBatch.
	FFilename (see page 495)	This is FFilename, a member of class TIBBatch.
	FParams (see page 496)	This is FParams, a member of class TIBBatch.

Public Methods

	Name	Description
	ReadyFile (see page 496)	Prepares the file.
	WriteColumns (see page 499)	Outputs the data in columns in the XSQLDA to the specified file.

Public Properties

	Name	Description
	Columns (see page 496)	Returns the XSQLDA columns.
	Filename (see page 497)	Sets or displays the name of the external file.
	Params (see page 497)	Returns the XSQLDA parameters.

13.1.3.2 TIBBatchOutput Methods

The methods of the TIBBatchOutput class are listed here.

Public Methods

	Name	Description
	WriteColumns (see page 499)	Outputs the data in columns in the XSQLDA to the specified file.

13.1.3.2.1 TIBBatchOutput.WriteColumns Method

Outputs the data in columns in the XSQLDA to the specified file.

Pascal

```
function WriteColumns: Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean WriteColumns() = 0;
```

Description

Call WriteColumns to output data in columns in the extended SQL descriptor area (XSQLDA) to the specified file.

13.1.4 TIBInputDelimitedFile Class

TIBInputDelimitedFile performs batch input of data from delimited files.

Class Hierarchy

Pascal

```
TIBInputDelimitedFile = class(TIBBatchInput);
```

C++

```
class TIBInputDelimitedFile : public TIBBatchInput;
```

File

IBSQL

Description

Use a TIBInputDelimitedFile object to perform batch input of data from delimited files.

13.1.4.1 TIBInputDelimitedFile Members

The following tables list the members exposed by TIBInputDelimitedFile.

Protected Fields

	Name	Description
	FColDelimiter (see page 501)	This is FColDelimiter, a member of class TIBInputDelimitedFile.
	FColumns (see page 495)	This is FColumns, a member of class TIBBatch.
	FEOF (see page 501)	This is FEOF, a member of class TIBInputDelimitedFile.
	FFile (see page 502)	This is FFile, a member of class TIBInputDelimitedFile.
	FFilename (see page 495)	This is FFilename, a member of class TIBBatch.
	FLookAhead (see page 502)	This is FLookAhead, a member of class TIBInputDelimitedFile.
	FParams (see page 496)	This is FParams, a member of class TIBBatch.
	FReadBlanksAsNull (see page 502)	This is FReadBlanksAsNull, a member of class TIBInputDelimitedFile.
	FRowDelimiter (see page 502)	This is FRowDelimiter, a member of class TIBInputDelimitedFile.
	FSkipTitles (see page 503)	This is FSkipTitles, a member of class TIBInputDelimitedFile.

Public Methods

	Name	Description
	Destroy (see page 501)	Destroys the instance of TIBInputDelimitedFile (see page 500).
	GetColumn (see page 503)	Returns the contents of a column.
	ReadParameters (see page 503)	Reads the input parameters of the XSQLDA.
	ReadyFile (see page 503)	Prepares the output for the XSQLDA.

Public Properties

	Name	Description
	ColDelimiter (see page 504)	Sets the column delimiter for the input file.
	Columns (see page 496)	Returns the XSQLDA columns.

	Filename (see page 497)	Sets or displays the name of the external file.
	Params (see page 497)	Returns the XSQLDA parameters.
	ReadBlanksAsNull (see page 504)	Reads blank spaces in the input file as null characters.
	RowDelimiter (see page 504)	Sets the row delimiter for the input file.
	SkipTitles (see page 505)	Skips the first record of a delimited file.

13.1.4.2 TIBInputDelimitedFile.Destroy Destructor

Destroys the instance of TIBInputDelimitedFile (see page 500).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBInputDelimitedFile();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TIBInputDelimitedFile (see page 500) object is not already freed and only then calls Destroy.

13.1.4.3 TIBInputDelimitedFile Fields

The fields of the TIBInputDelimitedFile class are listed here.

Protected Fields

	Name	Description
	FColDelimiter (see page 501)	This is FColDelimiter, a member of class TIBInputDelimitedFile.
	FEOF (see page 501)	This is FEOF, a member of class TIBInputDelimitedFile.
	FFile (see page 502)	This is FFile, a member of class TIBInputDelimitedFile.
	FLookAhead (see page 502)	This is FLookAhead, a member of class TIBInputDelimitedFile.
	FReadBlanksAsNull (see page 502)	This is FReadBlanksAsNull, a member of class TIBInputDelimitedFile.
	FRowDelimiter (see page 502)	This is FRowDelimiter, a member of class TIBInputDelimitedFile.
	FSkipTitles (see page 503)	This is FSkipTitles, a member of class TIBInputDelimitedFile.

13.1.4.3.1 TIBInputDelimitedFile.FColDelimiter Field

Pascal

```
FColDelimiter: string;
```

C++

```
UnicodeString FColDelimiter;
```

Description

This is FColDelimiter, a member of class TIBInputDelimitedFile.

13.1.4.3.2 TIBInputDelimitedFile.FEOF Field

Pascal

```
FEOF: Boolean;
```

C++

```
Boolean FEOF;
```

Description

This is FEOF, a member of class TIBInputDelimitedFile.

13.1.4.3.3 TIBInputDelimitedFile.FFile Field

Pascal

```
FFile: TFileStream;
```

C++

```
TFileStream FFile;
```

Description

This is FFile, a member of class TIBInputDelimitedFile.

13.1.4.3.4 TIBInputDelimitedFile.FLookAhead Field

Pascal

```
FLookAhead: Char;
```

C++

```
Char FLookAhead;
```

Description

This is FLookAhead, a member of class TIBInputDelimitedFile.

13.1.4.3.5 TIBInputDelimitedFile.FReadBlanksAsNull Field

Pascal

```
FReadBlanksAsNull: Boolean;
```

C++

```
Boolean FReadBlanksAsNull;
```

Description

This is FReadBlanksAsNull, a member of class TIBInputDelimitedFile.

13.1.4.3.6 TIBInputDelimitedFile.FRowDelimiter Field

Pascal

```
FRowDelimiter: string;
```

C++

```
UnicodeString FRowDelimiter;
```

Description

This is FRowDelimiter, a member of class TIBInputDelimitedFile.

13.1.4.3.7 TIBInputDelimitedFile.FSkipTitles Field

Pascal

```
FSkipTitles: Boolean;
```

C++

```
Boolean FSkipTitles;
```

Description

This is FSkipTitles, a member of class TIBInputDelimitedFile.

13.1.4.4 TIBInputDelimitedFile Methods

The methods of the TIBInputDelimitedFile class are listed here.

Public Methods

	Name	Description
	GetColumn (see page 503)	Returns the contents of a column.
	ReadParameters (see page 503)	Reads the input parameters of the XSQLDA.
	ReadyFile (see page 503)	Prepares the output for the XSQLDA.

13.1.4.4.1 TIBInputDelimitedFile.GetColumn Method

Returns the contents of a column.

Pascal

```
function GetColumn(var Col: string): Integer;
```

C++

```
__fastcall int GetColumn(UnicodeString Col);
```

Description

Call GetColumn to return the contents of a column in the extended SQL descriptor area (XSQLDA).

13.1.4.4.2 TIBInputDelimitedFile.ReadParameters Method

Reads the input parameters of the XSQLDA.

Pascal

```
function ReadParameters: Boolean; override;
```

C++

```
virtual __fastcall Boolean ReadParameters();
```

Description

Call ReadParameters to read the input parameters of the extended SQL descriptor area (XSQLDA).

13.1.4.4.3 TIBInputDelimitedFile.ReadyFile Method

Prepares the output for the XSQLDA.

Pascal

```
procedure ReadyFile; override;
```

C++

```
virtual __fastcall ReadyFile();
```

Description

Call ReadyFile to prepare the output for the extended SQL descriptor area (XSQLDA).

13.1.4.5 TIBInputDelimitedFile Properties

The properties of the TIBInputDelimitedFile class are listed here.

Public Properties

	Name	Description
	ColDelimiter (see page 504)	Sets the column delimiter for the input file.
	ReadBlanksAsNull (see page 504)	Reads blank spaces in the input file as null characters.
	RowDelimiter (see page 504)	Sets the row delimiter for the input file.
	SkipTitles (see page 505)	Skips the first record of a delimited file.

13.1.4.5.1 TIBInputDelimitedFile.ColDelimiter Property

Sets the column delimiter for the input file.

Pascal

```
property ColDelimiter: string;
```

C++

```
__property UnicodeString ColDelimiter;
```

Description

Use ColDelimiter to set the column delimiter (either Tab-Ctrl-F or |~) for the input file.

13.1.4.5.2 TIBInputDelimitedFile.ReadBlanksAsNull Property

Reads blank spaces in the input file as null characters.

Pascal

```
property ReadBlanksAsNull: Boolean;
```

C++

```
__property Boolean ReadBlanksAsNull;
```

Description

Set ReadBlanksAsNull to true read blank spaces as null characters in the input file.

13.1.4.5.3 TIBInputDelimitedFile.RowDelimiter Property

Sets the row delimiter for the input file.

Pascal

```
property RowDelimiter: string;
```

C++

```
__property UnicodeString RowDelimiter;
```

Description

Use RowDelimiter to set the column delimiter (either Tab-Ctrl-F or |~) for the input file.

13.1.4.5.4 TIBInputDelimitedFile.SkipTitles Property

Skips the first record of a delimited file.

Pascal

```
property SkipTitles: Boolean;
```

C++

```
__property Boolean SkipTitles;
```

Description

Set SkipTitles to true to treat the first record of a delimited file as titles and skip it. Field titles are not useful in batch inputs, and this property allows you to skip them.

13.1.5 TIBInputRawFile Class

TIBInputRawFile inputs data from a raw file.

Class Hierarchy

Pascal

```
TIBInputRawFile = class(TIBBatchInput);
```

C++

```
class TIBInputRawFile : public TIBBatchInput;
```

File

IBSQL

Description

Use a TIBInputRawFile object input data from a raw file. A raw file is the equivalent to InterBase external file output. Raw files are not limited to a straight character format.

13.1.5.1 TIBInputRawFile Members

The following tables list the members exposed by TIBInputRawFile.

Protected Fields

	Name	Description
	FColumns (see page 495)	This is FColumns, a member of class TIBBatch.
	FFile (see page 506)	This is FFile, a member of class TIBInputRawFile.
	FFilename (see page 495)	This is FFilename, a member of class TIBBatch.

	FParams (see page 496)	This is FParams, a member of class TIBBatch.

Public Methods

	Name	Description
	Destroy (see page 506)	Destroys the instance of TIBInputRawFile (see page 505).
	ReadParameters (see page 507)	Reads the XSQLDA input parameters.
	ReadyFile (see page 507)	Prepares the output for the XSQLDA.

Public Properties

	Name	Description
	Columns (see page 496)	Returns the XSQLDA columns.
	Filename (see page 497)	Sets or displays the name of the external file.
	Params (see page 497)	Returns the XSQLDA parameters.

13.1.5.2 TIBInputRawFile.Destroy Destructor

Destroys the instance of TIBInputRawFile (see page 505).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBInputRawFile();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TIBInputRawFile (see page 505) object is not already freed and only then calls Destroy.

13.1.5.3 TIBInputRawFile Fields

The fields of the TIBInputRawFile class are listed here.

Protected Fields

	Name	Description
	FFile (see page 506)	This is FFile, a member of class TIBInputRawFile.

13.1.5.3.1 TIBInputRawFile.FFile Field

Pascal

```
FFile: TFileStream;
```

C++

```
TFileStream FFile;
```

Description

This is FFile, a member of class TIBInputRawFile.

13.1.5.4 TIBInputRawFile Methods

The methods of the TIBInputRawFile class are listed here.

Public Methods

	Name	Description
	ReadParameters (see page 507)	Reads the XSQLDA input parameters.
	ReadyFile (see page 507)	Prepares the output for the XSQLDA.

13.1.5.4.1 TIBInputRawFile.ReadParameters Method

Reads the XSQLDA input parameters.

Pascal

```
function ReadParameters: Boolean; override;
```

C++

```
virtual __fastcall Boolean ReadParameters();
```

Description

Call ReadParameters to read the input parameters of the extended SQL descriptor area (XSQLDA).

13.1.5.4.2 TIBInputRawFile.ReadyFile Method

Prepares the output for the XSQLDA.

Pascal

```
procedure ReadyFile; override;
```

C++

```
virtual __fastcall ReadyFile();
```

Description

Call ReadyFile to prepare the output for the extended SQL descriptor area (XSQLDA).

13.1.6 TIBOutputDelimitedFile Class

TIBOutputDelimitedFile performs batch output of data to delimited files.

Class Hierarchy

Pascal

```
TIBOutputDelimitedFile = class(TIBBatchOutput);
```

C++

```
class TIBOutputDelimitedFile : public TIBBatchOutput;
```

File

IBSQL

Description

Use a TIBOutputDelimitedFile object to perform batch output of data to delimited files.

13.1.6.1 TIBOutputDelimitedFile Members

The following tables list the members exposed by TIBOutputDelimitedFile.

Protected Fields

	Name	Description
	FColDelimiter (see page 509)	This is FColDelimiter, a member of class TIBOutputDelimitedFile.
	FColumns (see page 495)	This is FColumns, a member of class TIBBatch.
	FFile (see page 509)	This is FFile, a member of class TIBOutputDelimitedFile.
	FFilename (see page 495)	This is FFilename, a member of class TIBBatch.
	FOutputTitles (see page 509)	This is FOutputTitles, a member of class TIBOutputDelimitedFile.
	FParams (see page 496)	This is FParams, a member of class TIBBatch.
	FRowDelimiter (see page 509)	This is FRowDelimiter, a member of class TIBOutputDelimitedFile.

Public Methods

	Name	Description
	Destroy (see page 508)	Destroys the instance of TIBOutputDelimitedFile (see page 507).
	ReadyFile (see page 510)	Prepares the output for the XSQLDA.
	WriteColumns (see page 510)	Outputs the data in columns in the XSQLDA.

Public Properties

	Name	Description
	ColDelimiter (see page 510)	Sets the column delimiter for the output file.
	Columns (see page 496)	Returns the XSQLDA columns.
	Filename (see page 497)	Sets or displays the name of the external file.
	OutputTitles (see page 511)	Outputs the titles at the top of the file.
	Params (see page 497)	Returns the XSQLDA parameters.
	RowDelimiter (see page 511)	Sets the row delimiter for the output file.

13.1.6.2 TIBOutputDelimitedFile.Destroy Destructor

Destroys the instance of TIBOutputDelimitedFile (see page 507).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBOutputDelimitedFile();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TIBOutputDelimitedFile (see page 507) object is not already freed and only then calls Destroy.

13.1.6.3 TIBOutputDelimitedFile Fields

The fields of the TIBOutputDelimitedFile class are listed here.

Protected Fields

	Name	Description
	FColDelimiter (see page 509)	This is FColDelimiter, a member of class TIBOutputDelimitedFile.
	FFile (see page 509)	This is FFile, a member of class TIBOutputDelimitedFile.

	FOutputTitles (see page 509)	This is FOutputTitles, a member of class TIBOutputDelimitedFile.
	FRowDelimiter (see page 509)	This is FRowDelimiter, a member of class TIBOutputDelimitedFile.

13.1.6.3.1 TIBOutputDelimitedFile.FColDelimiter Field

Pascal

```
FColDelimiter: string;
```

C++

```
UnicodeString FColDelimiter;
```

Description

This is FColDelimiter, a member of class TIBOutputDelimitedFile.

13.1.6.3.2 TIBOutputDelimitedFile.FFile Field

Pascal

```
FFile: TFileStream;
```

C++

```
TFileStream FFile;
```

Description

This is FFile, a member of class TIBOutputDelimitedFile.

13.1.6.3.3 TIBOutputDelimitedFile.FOutputTitles Field

Pascal

```
FOutputTitles: Boolean;
```

C++

```
Boolean FOutputTitles;
```

Description

This is FOutputTitles, a member of class TIBOutputDelimitedFile.

13.1.6.3.4 TIBOutputDelimitedFile.FRowDelimiter Field

Pascal

```
FRowDelimiter: string;
```

C++

```
UnicodeString FRowDelimiter;
```

Description

This is FRowDelimiter, a member of class TIBOutputDelimitedFile.

13.1.6.4 TIBOutputDelimitedFile Methods

The methods of the TIBOutputDelimitedFile class are listed here.

Public Methods

	Name	Description
	ReadyFile (see page 510)	Prepares the output for the XSQLDA.
	WriteColumns (see page 510)	Outputs the data in columns in the XSQLDA.

13.1.6.4.1 TIBOutputDelimitedFile.ReadyFile Method

Prepares the output for the XSQLDA.

Pascal

```
procedure ReadyFile; override;
```

C++

```
virtual __fastcall ReadyFile();
```

Description

Call Ready file to prepare the output for the extended SQL descriptor area (XSQLDA).

13.1.6.4.2 TIBOutputDelimitedFile.WriteColumns Method

Outputs the data in columns in the XSQLDA.

Pascal

```
function WriteColumns: Boolean; override;
```

C++

```
virtual __fastcall Boolean WriteColumns();
```

Description

Set WriteColumns to true to output data in columns in the extended SQL descriptor area (XSQLDA).

13.1.6.5 TIBOutputDelimitedFile Properties

The properties of the TIBOutputDelimitedFile class are listed here.

Public Properties

	Name	Description
	ColDelimiter (see page 510)	Sets the column delimiter for the output file.
	OutputTitles (see page 511)	Outputs the titles at the top of the file.
	RowDelimiter (see page 511)	Sets the row delimiter for the output file.

13.1.6.5.1 TIBOutputDelimitedFile.ColDelimiter Property

Sets the column delimiter for the output file.

Pascal

```
property ColDelimiter: string;
```

C++

```
__property UnicodeString ColDelimiter;
```

Description

Use ColDelimiter to set the column delimiter (either Tab-Ctrl-F or |~) for the output file.

13.1.6.5.2 TIBOutputDelimitedFile.OutputTitles Property

Outputs the titles at the top of the file.

Pascal

```
property OutputTitles: Boolean;
```

C++

```
__property Boolean OutputTitles;
```

Description

Set OutputTitles to true to output the titles at the top of the file.

13.1.6.5.3 TIBOutputDelimitedFile.RowDelimiter Property

Sets the row delimiter for the output file.

Pascal

```
property RowDelimiter: string;
```

C++

```
__property UnicodeString RowDelimiter;
```

Description

Use RowDelimiter to set the column delimiter (either Tab-Ctrl-F or |~) for the output file.

13.1.7 TIBOutputRawFile Class

TIBOutputRawFile outputs data to a raw file format.

Class Hierarchy

Pascal

```
TIBOutputRawFile = class(TIBBatchOutput);
```

C++

```
class TIBOutputRawFile : public TIBBatchOutput;
```

File

IBSQL

Description

Use a TIBOutputRawFile object to output data from a raw file. A raw file is the equivalent to InterBase external file output. Raw files are not limited to a straight character format.

13.1.7.1 TIBOutputRawFile Members

The following tables list the members exposed by TIBOutputRawFile.

Protected Fields

	Name	Description
	FColumns (see page 495)	This is FColumns, a member of class TIBBatch.
	FFile (see page 512)	This is FFile, a member of class TIBOutputRawFile.
	FFilename (see page 495)	This is FFilename, a member of class TIBBatch.
	FParams (see page 496)	This is FParams, a member of class TIBBatch.

Public Methods

	Name	Description
	Destroy (see page 512)	Destroys the instance of TIBOutputRawFile (see page 511).
	ReadyFile (see page 513)	Prepares the output for the XSQLDA.
	WriteColumns (see page 513)	Outputs the data in columns in the XSQLDA.

Public Properties

	Name	Description
	Columns (see page 496)	Returns the XSQLDA columns.
	Filename (see page 497)	Sets or displays the name of the external file.
	Params (see page 497)	Returns the XSQLDA parameters.

13.1.7.2 TIBOutputRawFile.Destroy Destructor

Destroys the instance of TIBOutputRawFile (see page 511).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBOutputRawFile();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TIBOutputRawFile (see page 511) object is not already freed and only then calls Destroy.

13.1.7.3 TIBOutputRawFile Fields

The fields of the TIBOutputRawFile class are listed here.

Protected Fields

	Name	Description
	FFile (see page 512)	This is FFile, a member of class TIBOutputRawFile.

13.1.7.3.1 TIBOutputRawFile.FFile Field

Pascal

```
FFile: TFileStream;
```

C++

```
TFileStream FFile;
```

Description

This is FFile, a member of class TIBOutputRawFile.

13.1.7.4 TIBOutputRawFile Methods

The methods of the TIBOutputRawFile class are listed here.

Public Methods

	Name	Description
	ReadyFile (see page 513)	Prepares the output for the XSQLDA.
	WriteColumns (see page 513)	Outputs the data in columns in the XSQLDA.

13.1.7.4.1 TIBOutputRawFile.ReadyFile Method

Prepares the output for the XSQLDA.

Pascal

```
procedure ReadyFile; override;
```

C++

```
virtual __fastcall ReadyFile();
```

Description

Call Ready file to prepare the output for the extended SQL descriptor area (XSQLDA).

13.1.7.4.2 TIBOutputRawFile.WriteColumns Method

Outputs the data in columns in the XSQLDA.

Pascal

```
function WriteColumns: Boolean; override;
```

C++

```
virtual __fastcall Boolean WriteColumns();
```

Description

Call WriteColumns to output data in columns in the extended SQL descriptor area (XSQLDA).

13.1.8 TIBSQL Class

TIBSQL provides an object for executing an InterBase SQL (see page 534) statement with minimal overhead.

Class Hierarchy

Pascal

```
TIBSQL = class(TComponent);
```

C++

```
class TIBSQL : public TComponent;
```

File

IBSQL

Description

Use a TIBSQL object to execute an InterBase SQL (see page 534) statement with minimal overhead. TIBSQL has no standard interface to data-aware controls and is unidirectional.

Getting Started with InterBase Express

13.1.8.1 TIBSQL Members

The following tables list the members exposed by TIBSQL.

Protected Fields

	Name	Description
	FBase (see page 517)	This is FBase, a member of class TIBSQL.
	FBOF (see page 517)	This is FBOF, a member of class TIBSQL.
	FCursor (see page 517)	This is FCursor, a member of class TIBSQL.
	FEOF (see page 517)	This is FEOF, a member of class TIBSQL.
	FGenerateParamNames (see page 518)	This is FGenerateParamNames, a member of class TIBSQL.
	FGoToFirstRecordOnExecute (see page 518)	This is FGoToFirstRecordOnExecute, a member of class TIBSQL.
	FHandle (see page 518)	This is FHandle, a member of class TIBSQL.
	FOnSQLChanging (see page 518)	This is FOnSQLChanging, a member of class TIBSQL.
	FOpen (see page 519)	This is FOpen, a member of class TIBSQL.
	FParamCheck (see page 519)	This is FParamCheck, a member of class TIBSQL.
	FPrepared (see page 519)	This is FPrepared, a member of class TIBSQL.
	FProcessedSQL (see page 519)	This is FProcessedSQL, a member of class TIBSQL.
	FRecordCount (see page 519)	This is FRecordCount, a member of class TIBSQL.
	FSQL (see page 520)	This is FSQL, a member of class TIBSQL.
	FSQLParams (see page 520)	This is FSQLParams, a member of class TIBSQL.
	FSQLRecord (see page 520)	This is FSQLRecord, a member of class TIBSQL.
	FSQLType (see page 520)	This is FSQLType, a member of class TIBSQL.

Protected Methods

	Name	Description
	BeforeTransactionEnd (see page 522)	This is BeforeTransactionEnd, a member of class TIBSQL.
	DoBeforeDatabaseDisconnect (see page 524)	This is DoBeforeDatabaseDisconnect, a member of class TIBSQL.
	GetDatabase (see page 525)	This is GetDatabase, a member of class TIBSQL.
	GetDBHandle (see page 525)	This is GetDBHandle, a member of class TIBSQL.
	GetEOF (see page 525)	This is GetEOF, a member of class TIBSQL.
	GetFieldIndex (see page 525)	This is GetFieldIndex, a member of class TIBSQL.
	GetFields (see page 525)	This is GetFields, a member of class TIBSQL.
	GetPlan (see page 526)	This is GetPlan, a member of class TIBSQL.
	GetRecordCount (see page 526)	This is GetRecordCount, a member of class TIBSQL.
	GetRowsAffected (see page 526)	This is GetRowsAffected, a member of class TIBSQL.
	GetSQLParams (see page 526)	This is GetSQLParams, a member of class TIBSQL.

	GetTransaction (see page 527)	This is GetTransaction, a member of class TIBSQL.
	GetTRHandle (see page 527)	This is GetTRHandle, a member of class TIBSQL.
	PreprocessSQL (see page 528)	This is PreprocessSQL, a member of class TIBSQL.
	SetDatabase (see page 528)	This is SetDatabase, a member of class TIBSQL.
	SetSQL (see page 528)	This is SetSQL, a member of class TIBSQL.
	SetTransaction (see page 529)	This is SetTransaction, a member of class TIBSQL.
	SQLChanging (see page 529)	This is SQLChanging, a member of class TIBSQL.

Public Methods

	Name	Description
	BatchInput (see page 521)	Executes the parameterized query in SQL (see page 534) for input in the referenced input object.
	BatchOutput (see page 522)	Outputs the selected query in SQL (see page 534) to the referenced OutputObject.
	Call (see page 522)	Returns an error message based on the error code.
	CheckClosed (see page 522)	raises an exception if the query is not closed.
	CheckOpen (see page 523)	raises an exception if the query is not open.
	CheckValidStatement (see page 523)	raises an exception if the query does not have a valid statement.
	Close (see page 523)	Closes the query.
V	Create (see page 516)	Creates an instance of a TIBSQL (see page 513) component.
	Current (see page 523)	Returns an extended SQL (see page 534) descriptor for the current record.
V	Destroy (see page 516)	Frees all resources associated with this instance.
	ExecQuery (see page 524)	Executes an SQL (see page 534) query.
	FieldByName (see page 524)	Returns the XSQLVAR fields by name.
	FreeHandle (see page 524)	Frees InterBase resources associated with the query.
	GetUniqueRelationName (see page 527)	Gets the unique relation name.
	Next (see page 527)	Returns an extended SQL (see page 534) descriptor for the next record.
	ParamByName (see page 527)	Accesses parameter information based on a specified parameter name.
	Prepare (see page 528)	Prepares a query for execution.

Public Properties

	Name	Description
R	Bof (see page 530)	Indicates whether or not a query is at the beginning of the dataset.
R	DBHandle (see page 530)	Specifies the database handle for the query.
R	Eof (see page 530)	Indicates whether or not a query is at the end of the dataset.
R	FieldIndex (see page 531)	Returns the index of the named field.
R	Fields (see page 531)	Returns the XSQLVAR fields.
	GenerateParamNames (see page 531)	Generates a list of parameter names for the query.
R	Handle (see page 532)	Specifies the handle for the query.
R	Open (see page 532)	Determines if the dataset is open.
R	Params (see page 533)	Returns the XSQLDA parameters.
R	Plan (see page 533)	Returns the plan for the query.
R	Prepared (see page 533)	Indicates whether or not the query has been prepared.
R	RecordCount (see page 533)	Returns the current count of records from the query.
R	RowsAffected (see page 534)	Returns the number of rows affected.
R	SQLType (see page 534)	Returns the type of query to be executed.
R	TRHandle (see page 535)	Specifies the transaction handle for the query.
R	UniqueRelationName (see page 535)	Indicates the unique relation name.

Published Events

	Name	Description
	OnSQLChanging (see page 535)	Occurs when the SQL (see page 534) query is being modified.

Published Properties

	Name	Description
	Database (see page 530)	Sets or returns the database associated with the query.
	GoToFirstRecordOnExecute (see page 532)	Goes to the first record in the result set upon opening it.
	ParamCheck (see page 532)	Specifies whether the parameter list for an SQL (see page 534) query is regenerated if the SQL (see page 534) property changes at runtime.
	SQL (see page 534)	Sets the SQL query to be executed.
	Transaction (see page 535)	Sets or returns the transaction to be used by the query.

13.1.8.2 TIBSQL.Create Constructor

Creates an instance of a TIBSQL (see page 513) component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBSQL(TComponent * AOwner);
```

Description

Call (see page 522) Create to create an instance of a TIBSQL (see page 513) component.

13.1.8.3 TIBSQL.Destroy Destructor

Frees all resources associated with this instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBSQL();
```

Description

Do not call Destroy directly in an application. Usually destruction of objects is handled automatically by Delphi. If an application creates its own instance of an update object, however, the application should call Free, which verifies that the update object is not already freed before calling Destroy.

13.1.8.4 TIBSQL Fields

The fields of the TIBSQL class are listed here.

Protected Fields

	Name	Description
	FBase (see page 517)	This is FBase, a member of class TIBSQL.
	FBOF (see page 517)	This is FBOF, a member of class TIBSQL.
	FCursor (see page 517)	This is FCursor, a member of class TIBSQL.
	FEOF (see page 517)	This is FEOF, a member of class TIBSQL.
	FGenerateParamNames (see page 518)	This is FGenerateParamNames, a member of class TIBSQL.
	FGoToFirstRecordOnExecute (see page 518)	This is FGoToFirstRecordOnExecute, a member of class TIBSQL.
	FHandle (see page 518)	This is FHandle, a member of class TIBSQL.
	FOnSQLChanging (see page 518)	This is FOnSQLChanging, a member of class TIBSQL.

	FOpen (see page 519)	This is FOpen, a member of class TIBSQL.
	FParamCheck (see page 519)	This is FParamCheck, a member of class TIBSQL.
	FPrepared (see page 519)	This is FPrepared, a member of class TIBSQL.
	FProcessedSQL (see page 519)	This is FProcessedSQL, a member of class TIBSQL.
	FRecordCount (see page 519)	This is FRecordCount, a member of class TIBSQL.
	FSQL (see page 520)	This is FSQL, a member of class TIBSQL.
	FSQLParams (see page 520)	This is FSQLParams, a member of class TIBSQL.
	FSQLRecord (see page 520)	This is FSQLRecord, a member of class TIBSQL.
	FSQLType (see page 520)	This is FSQLType, a member of class TIBSQL.

13.1.8.4.1 TIBSQL.FBase Field

Pascal

```
FBase: TIBBase;
```

C++

```
TIBBase FBase;
```

Description

This is FBase, a member of class TIBSQL.

13.1.8.4.2 TIBSQL.FBOF Field

Pascal

```
FBOF: Boolean;
```

C++

```
Boolean FBOF;
```

Description

This is FBOF, a member of class TIBSQL.

13.1.8.4.3 TIBSQL.FCursor Field

Pascal

```
FCursor: String;
```

C++

```
UnicodeString FCursor;
```

Description

This is FCursor, a member of class TIBSQL.

13.1.8.4.4 TIBSQL.FEOF Field

Pascal

```
FEOF: Boolean;
```

C++

```
Boolean FEOF;
```

Description

This is FEOF, a member of class TIBSQL.

13.1.8.4.5 TIBSQL.FGenerateParamNames Field

Pascal

```
FGenerateParamNames: Boolean;
```

C++

```
Boolean FGenerateParamNames;
```

Description

This is FGenerateParamNames, a member of class TIBSQL.

13.1.8.4.6 TIBSQL.FGoToFirstRecordOnExecute Field

Pascal

```
FGoToFirstRecordOnExecute: Boolean;
```

C++

```
Boolean FGoToFirstRecordOnExecute;
```

Description

This is FGoToFirstRecordOnExecute, a member of class TIBSQL.

13.1.8.4.7 TIBSQL.FHandle Field

Pascal

```
FHandle: TISC_STMT_HANDLE;
```

C++

```
TISC_STMT_HANDLE FHandle;
```

Description

This is FHandle, a member of class TIBSQL.

13.1.8.4.8 TIBSQL.FOnSQLChanging Field

Pascal

```
FOnSQLChanging: TNotifyEvent;
```

C++

```
TNotifyEvent FOnSQLChanging;
```

Description

This is FOnSQLChanging, a member of class TIBSQL.

13.1.8.4.9 TIBSQL.FOpen Field

Pascal

```
FOpen: Boolean;
```

C++

```
Boolean FOpen;
```

Description

This is FOpen, a member of class TIBSQL.

13.1.8.4.10 TIBSQL.FParamCheck Field

Pascal

```
FParamCheck: Boolean;
```

C++

```
Boolean FParamCheck;
```

Description

This is FParamCheck, a member of class TIBSQL.

13.1.8.4.11 TIBSQL.FPrepared Field

Pascal

```
FPrepared: Boolean;
```

C++

```
Boolean FPrepared;
```

Description

This is FPrepared, a member of class TIBSQL.

13.1.8.4.12 TIBSQL.FProcessedSQL Field

Pascal

```
FProcessedSQL: TStrings;
```

C++

```
TStrings FProcessedSQL;
```

Description

This is FProcessedSQL, a member of class TIBSQL.

13.1.8.4.13 TIBSQL.FRecordCount Field

Pascal

```
FRecordCount: Integer;
```

C++

```
int FRecordCount;
```

Description

This is FRecordCount, a member of class TIBSQL.

13.1.8.4.14 TIBSQL.FSQL Field

Pascal

```
FSQL: TStrings;
```

C++

```
TStrings FSQL;
```

Description

This is FSQL, a member of class TIBSQL.

13.1.8.4.15 TIBSQL.FSQLParams Field

Pascal

```
FSQLParams: TIBXSQLDA;
```

C++

```
TIBXSQLDA FSQLParams;
```

Description

This is FSQLParams, a member of class TIBSQL.

13.1.8.4.16 TIBSQL.FSQLRecord Field

Pascal

```
FSQLRecord: TIBXSQLDA;
```

C++

```
TIBXSQLDA FSQLRecord;
```

Description

This is FSQLRecord, a member of class TIBSQL.

13.1.8.4.17 TIBSQL.FSQLType Field

Pascal

```
FSQLType: TIBSQLTypes;
```

C++

```
TIBSQLTypes FSQLType;
```

Description

This is FSQLType, a member of class TIBSQL.

13.1.8.5 TIBSQL Methods

The methods of the TIBSQL class are listed here.

Protected Methods

	Name	Description
	BeforeTransactionEnd (see page 522)	This is BeforeTransactionEnd, a member of class TIBSQL.
	DoBeforeDatabaseDisconnect (see page 524)	This is DoBeforeDatabaseDisconnect, a member of class TIBSQL.
	GetDatabase (see page 525)	This is GetDatabase, a member of class TIBSQL.
	GetDBHandle (see page 525)	This is GetDBHandle, a member of class TIBSQL.
	GetEOF (see page 525)	This is GetEOF, a member of class TIBSQL.
	GetFieldIndex (see page 525)	This is GetFieldIndex, a member of class TIBSQL.
	GetFields (see page 525)	This is GetFields, a member of class TIBSQL.
	GetPlan (see page 526)	This is GetPlan, a member of class TIBSQL.
	GetRecordCount (see page 526)	This is GetRecordCount, a member of class TIBSQL.
	GetRowsAffected (see page 526)	This is GetRowsAffected, a member of class TIBSQL.
	GetSQLParams (see page 526)	This is GetSQLParams, a member of class TIBSQL.
	GetTransaction (see page 527)	This is GetTransaction, a member of class TIBSQL.
	GetTRHandle (see page 527)	This is GetTRHandle, a member of class TIBSQL.
	PreprocessSQL (see page 528)	This is PreprocessSQL, a member of class TIBSQL.
	SetDatabase (see page 528)	This is SetDatabase, a member of class TIBSQL.
	SetSQL (see page 528)	This is SetSQL, a member of class TIBSQL.
	SetTransaction (see page 529)	This is SetTransaction, a member of class TIBSQL.
	SQLChanging (see page 529)	This is SQLChanging, a member of class TIBSQL.

Public Methods

	Name	Description
	BatchInput (see page 521)	Executes the parameterized query in SQL (see page 534) for input in the referenced input object.
	BatchOutput (see page 522)	Outputs the selected query in SQL (see page 534) to the referenced OutputObject.
	Call (see page 522)	Returns an error message based on the error code.
	CheckClosed (see page 522)	raises an exception if the query is not closed.
	CheckOpen (see page 523)	raises an exception if the query is not open.
	CheckValidStatement (see page 523)	raises an exception if the query does not have a valid statement.
	Close (see page 523)	Closes the query.
	Current (see page 523)	Returns an extended SQL (see page 534) descriptor for the current record.
	ExecQuery (see page 524)	Executes an SQL (see page 534) query.
	FieldByName (see page 524)	Returns the XSQLVAR fields by name.
	FreeHandle (see page 524)	Frees InterBase resources associated with the query.
	GetUniqueRelationName (see page 527)	Gets the unique relation name.
	Next (see page 527)	Returns an extended SQL (see page 534) descriptor for the next record.
	ParamByName (see page 527)	Accesses parameter information based on a specified parameter name.
	Prepare (see page 528)	Prepares a query for execution.

13.1.8.5.1 TIBSQL.BatchInput Method

Executes the parameterized query in SQL (see page 534) for input in the referenced input object.

Pascal

```
procedure BatchInput(InputObject: TIBBatchInput);
```

C++

```
__fastcall BatchInput(TIBBatchInput InputObject);
```

Description

Call (see page 522) BatchInput to execute the parameterized query in SQL (see page 534) for input in the referenced input object.

13.1.8.5.2 TIBSQL.BatchOutput Method

Outputs the selected query in SQL (see page 534) to the referenced OutputObject.

Pascal

```
procedure BatchOutput(OutputObject: TIBBatchOutput);
```

C++

```
__fastcall BatchOutput(TIBBatchOutput OutputObject);
```

Description

Call (see page 522) BatchOutput to output the selected query in SQL (see page 534) to the referenced OutputObject.

13.1.8.5.3 TIBSQL.BeforeTransactionEnd Method

Pascal

```
procedure BeforeTransactionEnd(Sender: TObject);
```

C++

```
__fastcall BeforeTransactionEnd(TObject * Sender);
```

Description

This is BeforeTransactionEnd, a member of class TIBSQL.

13.1.8.5.4 TIBSQL.Call Method

Returns an error message based on the error code.

Pascal

```
function Call(ErrCode: ISC_STATUS; RaiseError: Boolean): ISC_STATUS;
```

C++

```
__fastcall ISC_STATUS Call(ISC_STATUS ErrCode, Boolean RaiseError);
```

Description

Call is an internal method used to make calls to the InterBase API, and gives you the option of raising an exception or returning an error based on the value of RaiseError.

13.1.8.5.5 TIBSQL.CheckClosed Method

raises an exception if the query is not closed.

Pascal

```
procedure CheckClosed;
```

C++

```
__fastcall CheckClosed();
```

Description

Call (see page 522) CheckClosed to raise an exception if the query is not closed.

13.1.8.5.6 TIBSQL.CheckOpen Method

raises an exception if the query is not open.

Pascal

```
procedure CheckOpen;
```

C++

```
__fastcall CheckOpen();
```

Description

Call (see page 522) CheckOpen to raise an exception if the query is closed.

13.1.8.5.7 TIBSQL.CheckValidStatement Method

raises an exception if the query does not have a valid statement.

Pascal

```
procedure CheckValidStatement;
```

C++

```
__fastcall CheckValidStatement();
```

Description

Call (see page 522) CheckValidStatement to raise an exception if the query does not have a valid statement.

13.1.8.5.8 TIBSQL.Close Method

Closes the query.

Pascal

```
procedure Close;
```

C++

```
__fastcall Close();
```

Description

Call (see page 522) Close to close the query.

13.1.8.5.9 TIBSQL.Current Method

Returns an extended SQL (see page 534) descriptor for the current record.

Pascal

```
function Current: TIBXSQLDA;
```

C++

```
__fastcall TIBXSQLDA Current();
```

Description

Call (see page 522) Current to get an extended SQL (see page 534) descriptor for the current record.

13.1.8.5.10 TIBSQL.DoBeforeDatabaseDisconnect Method

Pascal

```
procedure DoBeforeDatabaseDisconnect(Sender: TObject);
```

C++

```
__fastcall DoBeforeDatabaseDisconnect(TObject * Sender);
```

Description

This is DoBeforeDatabaseDisconnect, a member of class TIBSQL.

13.1.8.5.11 TIBSQL.ExecQuery Method

Executes an SQL (see page 534) query.

Pascal

```
procedure ExecQuery;
```

C++

```
__fastcall ExecQuery();
```

Description

Note: Call (see page 522) ExecQuery to execute the SQL (see page 534) query.

13.1.8.5.12 TIBSQL.FieldByName Method

Returns the XSQLVAR fields by name.

Pascal

```
function FieldByName(FieldName: String): TIBXSQLVAR;
```

C++

```
__fastcall TIBXSQLVAR FieldByName(UnicodeString FieldName);
```

Description

Use the FieldByName method to return the XSQLVAR fields by name.

13.1.8.5.13 TIBSQL.FreeHandle Method

Frees InterBase resources associated with the query.

Pascal

```
procedure FreeHandle;
```

C++

```
__fastcall FreeHandle();
```

Description

Call (see page 522) FreeHandle to free the InterBase resources associated with the query.

13.1.8.5.14 TIBSQL.GetDatabase Method

Pascal

```
function GetDatabase: TIBDatabase;
```

C++

```
__fastcall TIBDatabase GetDatabase();
```

Description

This is GetDatabase, a member of class TIBSQL.

13.1.8.5.15 TIBSQL.GetDBHandle Method

Pascal

```
function GetDBHandle: PISC_DB_HANDLE;
```

C++

```
__fastcall PISC_DB_HANDLE GetDBHandle();
```

Description

This is GetDBHandle, a member of class TIBSQL.

13.1.8.5.16 TIBSQL.GetEOF Method

Pascal

```
function GetEOF: Boolean;
```

C++

```
__fastcall Boolean GetEOF();
```

Description

This is GetEOF, a member of class TIBSQL.

13.1.8.5.17 TIBSQL.GetFieldIndex Method

Pascal

```
function GetFieldIndex(FieldName: String): Integer;
```

C++

```
__fastcall int GetFieldIndex(UnicodeString FieldName);
```

Description

This is GetFieldIndex, a member of class TIBSQL.

13.1.8.5.18 TIBSQL.GetFields Method

Pascal

```
function GetFields(const Idx: Integer): TIBXSQLVAR;
```

C++

```
__fastcall TIBXSQLVAR GetFields(const int Idx);
```

Description

This is GetFields, a member of class TIBSQL.

13.1.8.5.19 TIBSQL.GetPlan Method

Pascal

```
function GetPlan: String;
```

C++

```
__fastcall UnicodeString GetPlan();
```

Description

This is GetPlan, a member of class TIBSQL.

13.1.8.5.20 TIBSQL.GetRecordCount Method

Pascal

```
function GetRecordCount: Integer;
```

C++

```
__fastcall int GetRecordCount();
```

Description

This is GetRecordCount, a member of class TIBSQL.

13.1.8.5.21 TIBSQL.GetRowsAffected Method

Pascal

```
function GetRowsAffected: Integer;
```

C++

```
__fastcall int GetRowsAffected();
```

Description

This is GetRowsAffected, a member of class TIBSQL.

13.1.8.5.22 TIBSQL.GetSQLParams Method

Pascal

```
function GetSQLParams: TIBXSQLDA;
```

C++

```
__fastcall TIBXSQLDA GetSQLParams();
```

Description

This is GetSQLParams, a member of class TIBSQL.

13.1.8.5.23 TIBSQL.GetTransaction Method

Pascal

```
function GetTransaction: TIBTransaction;
```

C++

```
__fastcall TIBTransaction GetTransaction();
```

Description

This is GetTransaction, a member of class TIBSQL.

13.1.8.5.24 TIBSQL.GetTRHandle Method

Pascal

```
function GetTRHandle: PISC_TR_HANDLE;
```

C++

```
__fastcall PISC_TR_HANDLE GetTRHandle();
```

Description

This is GetTRHandle, a member of class TIBSQL.

13.1.8.5.25 TIBSQL.GetUniqueRelationName Method

Gets the unique relation name.

Pascal

```
function GetUniqueRelationName: String;
```

C++

```
__fastcall UnicodeString GetUniqueRelationName();
```

Description

Note: Call (see page 522) GetUniqueRelationName to get the unique relation name of the query.

13.1.8.5.26 TIBSQL.Next Method

Returns an extended SQL (see page 534) descriptor for the next record.

Pascal

```
function Next: TIBXSQLDA;
```

C++

```
__fastcall TIBXSQLDA Next();
```

Description

Call (see page 522) Next to get an extended SQL (see page 534) descriptor for the next record.

13.1.8.5.27 TIBSQL.ParamByName Method

Accesses parameter information based on a specified parameter name.

Pascal

```
function ParamByName(Idx: String): TIBXSQLVAR;
```

C++

```
__fastcall TIBXSQLVAR ParamByName(UnicodeString Idx);
```

Description

Call (see page 522) ParamByName to set or use parameter information for a specific parameter based on its name.

Idx is the name of the parameter for which to retrieve information.

13.1.8.5.28 TIBSQL.Prepare Method

Prepares a query for execution.

Pascal

```
procedure Prepare;
```

C++

```
__fastcall Prepare();
```

Description

Call (see page 522) Prepare to prepare a query for execution.

13.1.8.5.29 TIBSQL.PreprocessSQL Method

Pascal

```
procedure PreprocessSQL;
```

C++

```
__fastcall PreprocessSQL();
```

Description

This is PreprocessSQL, a member of class TIBSQL.

13.1.8.5.30 TIBSQL.SetDatabase Method

Pascal

```
procedure SetDatabase(Value: TIBDatabase);
```

C++

```
__fastcall SetDatabase(TIBDatabase Value);
```

Description

This is SetDatabase, a member of class TIBSQL.

13.1.8.5.31 TIBSQL.SetSQL Method

Pascal

```
procedure SetSQL(Value: TStrings);
```

C++

```
__fastcall SetSQL(TStrings Value);
```

Description

This is SetSQL, a member of class TIBSQL.

13.1.8.5.32 TIBSQL.SetTransaction Method

Pascal

```
procedure SetTransaction(Value: TIBTransaction);
```

C++

```
__fastcall SetTransaction(TIBTransaction Value);
```

Description

This is SetTransaction, a member of class TIBSQL.

13.1.8.5.33 TIBSQL.SQLChanging Method

Pascal

```
procedure SQLChanging(Sender: TObject);
```

C++

```
__fastcall SQLChanging(TObject * Sender);
```

Description

This is SQLChanging, a member of class TIBSQL.

13.1.8.6 TIBSQL Properties

The properties of the TIBSQL class are listed here.

Public Properties

	Name	Description
R	Bof (see page 530)	Indicates whether or not a query is at the beginning of the dataset.
R	DBHandle (see page 530)	Specifies the database handle for the query.
R	Eof (see page 530)	Indicates whether or not a query is at the end of the dataset.
R	FieldIndex (see page 531)	Returns the index of the named field.
R	Fields (see page 531)	Returns the XSQLVAR fields.
	GenerateParamNames (see page 531)	Generates a list of parameter names for the query.
R	Handle (see page 532)	Specifies the handle for the query.
R	Open (see page 532)	Determines if the dataset is open.
R	Params (see page 533)	Returns the XSQLDA parameters.
R	Plan (see page 533)	Returns the plan for the query.
R	Prepared (see page 533)	Indicates whether or not the query has been prepared.
R	RecordCount (see page 533)	Returns the current count of records from the query.
R	RowsAffected (see page 534)	Returns the number of rows affected.
R	SQLType (see page 534)	Returns the type of query to be executed.
R	TRHandle (see page 535)	Specifies the transaction handle for the query.
R	UniqueRelationName (see page 535)	Indicates the unique relation name.

Published Properties

	Name	Description
	Database (see page 530)	Sets or returns the database associated with the query.
	GoToFirstRecordOnExecute (see page 532)	Goes to the first record in the result set upon opening it.
	ParamCheck (see page 532)	Specifies whether the parameter list for an SQL (see page 534) query is regenerated if the SQL (see page 534) property changes at runtime.
	SQL (see page 534)	Sets the SQL query to be executed.
	Transaction (see page 535)	Sets or returns the transaction to be used by the query.

13.1.8.6.1 TIBSQL.Bof Property

Indicates whether or not a query is at the beginning of the dataset.

Pascal

```
property Bof: Boolean;
```

C++

```
__property Boolean Bof;
```

Description

Use the BOF property to determine whether or not a query is at the beginning of the dataset.

13.1.8.6.2 TIBSQL.Database Property

Sets or returns the database associated with the query.

Pascal

```
property Database: TIBDatabase;
```

C++

```
__property TIBDatabase Database;
```

Description

Use the Database property to set or return the database associated with the query.

13.1.8.6.3 TIBSQL.DBHandle Property

Specifies the database handle for the query.

Pascal

```
property DBHandle: PISC_DB_HANDLE;
```

C++

```
__property PISC_DB_HANDLE DBHandle;
```

Description

Use the DBHandle property to return the database handle for the query.

13.1.8.6.4 TIBSQL.Eof Property

Indicates whether or not a query is at the end of the dataset.

Pascal

```
property Eof: Boolean;
```

C++

```
__property Boolean Eof;
```

Description

Use the EOF property to determine whether or not a query is at the end of the dataset and whether or not the query returned any result rows.

In addition, if this property is true immediately after the query is opened, then it means that the dataset is empty.

13.1.8.6.5 TIBSQL.FieldIndex Property

Returns the index of the named field.

Pascal

```
property FieldIndex [FieldName: String]: Integer;
```

C++

```
__property int FieldIndex[UnicodeString FieldName];
```

Description

Use the FieldIndex property to return the index of the name field.

13.1.8.6.6 TIBSQL.Fields Property

Returns the XSQLVAR fields.

Pascal

```
property Fields [const Idx: Integer]: TIBXSQLVAR;
```

C++

```
__property TIBXSQLVAR Fields[int const Idx];
```

Description

Use the Fields property to return the XSQLVAR fields.

13.1.8.6.7 TIBSQL.GenerateParamNames Property

Generates a list of parameter names for the query.

Pascal

```
property GenerateParamNames: Boolean;
```

C++

```
__property Boolean GenerateParamNames;
```

Description

Set GenerateParamNames to true to have the query generate a list of parameter names.

13.1.8.6.8 TIBSQL.GoToFirstRecordOnExecute Property

Goes to the first record in the result set upon opening it.

Pascal

```
property GoToFirstRecordOnExecute: Boolean;
```

C++

```
__property Boolean GoToFirstRecordOnExecute;
```

Description

Use the GoToFirstRecordOnExecute property to go to the first record in a result set upon opening it. By default, this property is set to true. GoToFirstRecordOnExecute exists primarily for use in TIBDataSet, which sets this value to false for its internal TIBSQLs.

13.1.8.6.9 TIBSQL.Handle Property

Specifies the handle for the query.

Pascal

```
property Handle: TISC_STMT_HANDLE;
```

C++

```
__property TISC_STMT_HANDLE Handle;
```

Description

Use the Handle property to get the query handle.

13.1.8.6.10 TIBSQL.Open Property

Determines if the dataset is open.

Pascal

```
property Open: Boolean;
```

C++

```
__property Boolean Open;
```

Description

Use the Open property to determine if the dataset is open.

13.1.8.6.11 TIBSQL.ParamCheck Property

Specifies whether the parameter list for an SQL (see page 534) query is regenerated if the SQL (see page 534) property changes at runtime.

Pascal

```
property ParamCheck: Boolean;
```

C++

```
__property Boolean ParamCheck;
```

Description

This property is useful for data definition language (DDL) statements that contain parameters as part of the DDL statement and that are not parameters for the TIBSQL (see page 513) query. For example, the DDL statement to create a stored procedure may contain parameter statements that are part of the stored procedure. Set ParamCheck to false to prevent these parameters from being mistaken for parameters of the TIBSQL (see page 513) query executing the DDL statement.

An application that does not use parameterized queries may choose to set ParamCheck to false, but otherwise ParamCheck should be true.

13.1.8.6.12 TIBSQL.Params Property

Returns the XSQLDA parameters.

Pascal

```
property Params: TIBXSQLDA;
```

C++

```
__property TIBXSQLDA Params;
```

Description

Use the Params property to return the XSQLDA parameters.

13.1.8.6.13 TIBSQL.Plan Property

Returns the plan for the query.

Pascal

```
property Plan: String;
```

C++

```
__property UnicodeString Plan;
```

Description

Use the Plan property to view the query plan once the query has been prepared.

13.1.8.6.14 TIBSQL.Prepared Property

Indicates whether or not the query has been prepared.

Pascal

```
property Prepared: Boolean;
```

C++

```
__property Boolean Prepared;
```

Description

Use the Prepared property to determine whether or not a query has yet been prepared.

13.1.8.6.15 TIBSQL.RecordCount Property

Returns the current count of records from the query.

Pascal

```
property RecordCount: Integer;
```

C++

```
__property int RecordCount;
```

Description

Use the RecordCount property to see how many records are returned by a query. If the result set is to return 100 rows, RecordCount will only be 100 after all the records have been visited. That is, after looking at the first record, RecordCount is 1, and so forth.

13.1.8.6.16 TIBSQL.RowsAffected Property

Returns the number of rows affected.

Pascal

```
property RowsAffected: Integer;
```

C++

```
__property int RowsAffected;
```

Description

Use the RowsAffected property to return the number of rows affected by the query. This property is useful for INSERT, DELETE, and UPDATE statements.

13.1.8.6.17 TIBSQL.SQL Property

Sets the SQL query to be executed.

Pascal

```
property SQL: TStrings;
```

C++

```
__property TStrings SQL;
```

Description

Use the SQL property to write or view the SQL query to be executed.

13.1.8.6.18 TIBSQL.SQLType Property

Returns the type of query to be executed.

Pascal

```
property SQLType: TIBSQLTypes;
```

C++

```
__property TIBSQLTypes SQLType;
```

Description

Use the SQLType to determine the type of query to be executed.

13.1.8.6.19 TIBSQL.Transaction Property

Sets or returns the transaction to be used by the query.

Pascal

```
property Transaction: TIBTransaction;
```

C++

```
__property TIBTransaction Transaction;
```

Description

Use the Transaction property to set or return the transaction to be used by the query.

13.1.8.6.20 TIBSQL.TRHandle Property

Specifies the transaction handle for the query.

Pascal

```
property TRHandle: PISC_TR_HANDLE;
```

C++

```
__property PISC_TR_HANDLE TRHandle;
```

Description

Use the TRHandle property to return the transaction handle for the query.

13.1.8.6.21 TIBSQL.UniqueRelationName Property

Indicates the unique relation name.

Pascal

```
property UniqueRelationName: String;
```

C++

```
__property UnicodeString UniqueRelationName;
```

Description

Use the UniqueRelationName property to indicate the unique relation name for a query that involves only one base table.

13.1.8.7 TIBSQL Events

The events of the TIBSQL class are listed here.

Published Events

	Name	Description
	OnSQLChanging (see page 535)	Occurs when the SQL (see page 534) query is being modified.

13.1.8.7.1 TIBSQL.OnSQLChanging Event

Occurs when the SQL (see page 534) query is being modified.

Pascal

```
property OnSQLChanging: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnSQLChanging;
```

Description

Write an OnSQLChanging event handler to take specific actions when a query is being modified. If an exception is raised in this event, the query is not changed.

13.1.9 TIBXSQLDA Class

TIBXSQLDA provides properties and methods for use with the IBSQL (see page 493) component.

Class Hierarchy

Pascal

```
TIBXSQLDA = class(TObject);
```

C++

```
class TIBXSQLDA : public TObject;
```

File

IBSQL

Description

Use a TIBXSQLDA object to provide properties and methods for use with the IBSQL (see page 493) component.

All Dynamic SQL (DSQL) applications must declare one or more extended descriptor areas (XSQLDAs). The XSQLDA is a host language data structure that DSQL uses to transport data to or from a database when processing an SQL statement string. There are two types of XSQLDAs: input descriptors and output descriptors. Both input and output descriptors are implemented using the XSQLDA structure.

13.1.9.1 TIBXSQLDA Members

The following tables list the members exposed by TIBXSQLDA.

Protected Fields

	Name	Description
	FCount (see page 538)	This is FCount, a member of class TIBXSQLDA.
	FNames (see page 538)	This is FNames, a member of class TIBXSQLDA.
	FSize (see page 538)	This is FSize, a member of class TIBXSQLDA.
	FSQL (see page 539)	This is FSQL, a member of class TIBXSQLDA.
	FUniqueRelationName (see page 539)	This is FUniqueRelationName, a member of class TIBXSQLDA.
	FXSQLDA (see page 539)	This is FXSQLDA, a member of class TIBXSQLDA.
	FXSQLVARs (see page 539)	This is FXSQLVARs, a member of class TIBXSQLDA.

Protected Methods

	Name	Description
	GetModified (see page 540)	This is GetModified, a member of class TIBXSQLDA.
	GetNames (see page 541)	This is GetNames, a member of class TIBXSQLDA.
	GetRecordSize (see page 541)	This is GetRecordSize, a member of class TIBXSQLDA.
	GetXSQLDA (see page 541)	This is GetXSQLDA, a member of class TIBXSQLDA.
	GetXSQLVAR (see page 541)	This is GetXSQLVAR, a member of class TIBXSQLDA.
	GetXSQLVARByName (see page 541)	This is GetXSQLVARByName, a member of class TIBXSQLDA.
	Initialize (see page 542)	This is Initialize, a member of class TIBXSQLDA.
	SetCount (see page 542)	This is SetCount, a member of class TIBXSQLDA.

Public Methods

	Name	Description
	AddName (see page 540)	Adds a name to the XSQLDA structure.
	ByName (see page 540)	Returns the XSQLVAR fields by name.
	Create (see page 537)	Creates an instance of an XSQLDA structure.
V	Destroy (see page 537)	Destroys the XSQLDA structure.

Public Properties

	Name	Description
R	AsXSQLDA (see page 542)	Represents the XSQLDA field's value as an XSQLDA value.
	Count (see page 543)	Returns the number of XSQLDA fields.
R	Modified (see page 543)	Indicates whether a field has been modified.
R	Names (see page 543)	Returns the XSQLDA field names.
R	RecordSize (see page 543)	Returns the size of the XSQLDA record.
R	UniqueRelationName (see page 544)	Returns the name of the unique relation.
R	Vars (see page 544)	Returns the XSQLVAR defined for the XSQLDA parameter.

13.1.9.2 TIBXSQLDA.Create Constructor

Creates an instance of an XSQLDA structure.

Pascal

```
constructor Create(Query: TIBSQL);
```

C++

```
__fastcall TIBXSQLDA(TIBSQL Query);
```

Description

Call Create to create an instance of an XSQLDA structure. Create queries the DynamicSQL component for the structure members.

13.1.9.3 TIBXSQLDA.Destroy Destructor

Destroys the XSQLDA structure.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBXSQLDA();
```

Description

Do not call Destroy directly. Call Free instead. Free checks to ensure that the object instance is not nil before calling Destroy.

13.1.9.4 TIBXSQLDA Fields

The fields of the TIBXSQLDA class are listed here.

Protected Fields

	Name	Description
	FCount (see page 538)	This is FCount, a member of class TIBXSQLDA.
	FNames (see page 538)	This is FNames, a member of class TIBXSQLDA.
	FSize (see page 538)	This is FSize, a member of class TIBXSQLDA.
	FSQL (see page 539)	This is FSQL, a member of class TIBXSQLDA.
	FUniqueRelationName (see page 539)	This is FUniqueRelationName, a member of class TIBXSQLDA.
	FXSQLDA (see page 539)	This is FXSQLDA, a member of class TIBXSQLDA.
	FXSQLVARs (see page 539)	This is FXSQLVARs, a member of class TIBXSQLDA.

13.1.9.4.1 TIBXSQLDA.FCount Field

Pascal

```
FCount: Integer;
```

C++

```
int FCount;
```

Description

This is FCount, a member of class TIBXSQLDA.

13.1.9.4.2 TIBXSQLDA.FNames Field

Pascal

```
FNames: TStrings;
```

C++

```
TStrings FNames;
```

Description

This is FNames, a member of class TIBXSQLDA.

13.1.9.4.3 TIBXSQLDA.FSize Field

Pascal

```
FSize: Integer;
```

C++

```
int FSize;
```

Description

This is FSize, a member of class TIBXSQLDA.

13.1.9.4.4 TIBXSQLDA.FSQL Field

Pascal

```
FSQL: TIBSQL;
```

C++

```
TIBSQL FSQL;
```

Description

This is FSQL, a member of class TIBXSQLDA.

13.1.9.4.5 TIBXSQLDA.FUniqueRelationName Field

Pascal

```
FUniqueRelationName: String;
```

C++

```
UnicodeString FUniqueRelationName;
```

Description

This is FUniqueRelationName, a member of class TIBXSQLDA.

13.1.9.4.6 TIBXSQLDA.FXSQLDA Field

Pascal

```
FXSQLDA: PXSQLDA;
```

C++

```
PXSQLDA FXSQLDA;
```

Description

This is FXSQLDA, a member of class TIBXSQLDA.

13.1.9.4.7 TIBXSQLDA.FXSQLVARs Field

Pascal

```
FXSQLVARs: TIBXSQLVARArray;
```

C++

```
TIBXSQLVARArray FXSQLVARs;
```

Description

This is FXSQLVARs, a member of class TIBXSQLDA.

13.1.9.5 TIBXSQLDA Methods

The methods of the TIBXSQLDA class are listed here.

Protected Methods

	Name	Description
	GetModified (see page 540)	This is GetModified, a member of class TIBXSQLDA.
	GetNames (see page 541)	This is GetNames, a member of class TIBXSQLDA.
	GetRecordSize (see page 541)	This is GetRecordSize, a member of class TIBXSQLDA.
	GetXSQLDA (see page 541)	This is GetXSQLDA, a member of class TIBXSQLDA.
	GetXSQLVAR (see page 541)	This is GetXSQLVAR, a member of class TIBXSQLDA.
	GetXSQLVARByName (see page 541)	This is GetXSQLVARByName, a member of class TIBXSQLDA.
	Initialize (see page 542)	This is Initialize, a member of class TIBXSQLDA.
	SetCount (see page 542)	This is SetCount, a member of class TIBXSQLDA.

Public Methods

	Name	Description
	AddName (see page 540)	Adds a name to the XSQLDA structure.
	ByName (see page 540)	Returns the XSQLVAR fields by name.

13.1.9.5.1 TIBXSQLDA.AddName Method

Adds a name to the XSQLDA structure.

Pascal

```
procedure AddName(FieldName: String; Idx: Integer);
```

C++

```
__fastcall AddName(UnicodeString FieldName, int Idx);
```

Description

Call AddName to add a name to the XSQLDA structure.

13.1.9.5.2 TIBXSQLDA.ByName Method

Returns the XSQLVAR fields by name.

Pascal

```
function ByName(Idx: String): TIBXSQLVAR;
```

C++

```
__fastcall TIBXSQLVAR ByName(UnicodeString Idx);
```

Description

Use the ByName method to return the XSQLVAR fields by name.

13.1.9.5.3 TIBXSQLDA.GetModified Method

Pascal

```
function GetModified: Boolean;
```

C++

```
__fastcall Boolean GetModified();
```

Description

This is GetModified, a member of class TIBXSQLDA.

13.1.9.5.4 TIBXSQLDA.GetNames Method

Pascal

```
function GetNames: String;
```

C++

```
__fastcall UnicodeString GetNames();
```

Description

This is GetNames, a member of class TIBXSQLDA.

13.1.9.5.5 TIBXSQLDA.GetRecordSize Method

Pascal

```
function GetRecordSize: Integer;
```

C++

```
__fastcall int GetRecordSize();
```

Description

This is GetRecordSize, a member of class TIBXSQLDA.

13.1.9.5.6 TIBXSQLDA.GetXSQLDA Method

Pascal

```
function GetXSQLDA: PXSQLDA;
```

C++

```
__fastcall PXSQLDA GetXSQLDA();
```

Description

This is GetXSQLDA, a member of class TIBXSQLDA.

13.1.9.5.7 TIBXSQLDA.GetXSQLVAR Method

Pascal

```
function GetXSQLVAR(Idx: Integer): TIBXSQLVAR;
```

C++

```
__fastcall TIBXSQLVAR GetXSQLVAR(int Idx);
```

Description

This is GetXSQLVAR, a member of class TIBXSQLDA.

13.1.9.5.8 TIBXSQLDA.GetXSQLVARByName Method

Pascal

```
function GetXSQLVARByName(Idx: String): TIBXSQLVAR;
```

C++

```
__fastcall TIBXSQLVAR GetXSQLVARByName(UnicodeString Idx);
```

Description

This is GetXSQLVARByName, a member of class TIBXSQLDA.

13.1.9.5.9 TIBXSQLDA.Initialize Method

Pascal

```
procedure Initialize;
```

C++

```
__fastcall Initialize();
```

Description

This is Initialize, a member of class TIBXSQLDA.

13.1.9.5.10 TIBXSQLDA.SetCount Method

Pascal

```
procedure SetCount(Value: Integer);
```

C++

```
__fastcall SetCount(int Value);
```

Description

This is SetCount, a member of class TIBXSQLDA.

13.1.9.6 TIBXSQLDA Properties

The properties of the TIBXSQLDA class are listed here.

Public Properties

	Name	Description
R	AsXSQLDA (see page 542)	Represents the XSQLDA field's value as an XSQLDA value.
	Count (see page 543)	Returns the number of XSQLDA fields.
R	Modified (see page 543)	Indicates whether a field has been modified.
R	Names (see page 543)	Returns the XSQLDA field names.
R	RecordSize (see page 543)	Returns the size of the XSQLDA record.
R	UniqueRelationName (see page 544)	Returns the name of the unique relation.
R	Vars (see page 544)	Returns the XSQLVAR defined for the XSQLDA parameter.

13.1.9.6.1 TIBXSQLDA.AsXSQLDA Property

Represents the XSQLDA field's value as an XSQLDA value.

Pascal

```
property AsXSQLDA: PXSQLDA;
```

C++

```
__property PXSQLDA AsXSQLDA;
```

Description

Use the AsXSQLDA property to read the value of the field's data into an object or variable of type XSQLDA, or to assign an

XSQLDA value to the contents of the field.

13.1.9.6.2 TIBXSQLDA.Count Property

Returns the number of XSQLDA fields.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Use the Count property to return the number of XSQLDA fields.

13.1.9.6.3 TIBXSQLDA.Modified Property

Indicates whether a field has been modified.

Pascal

```
property Modified: Boolean;
```

C++

```
__property Boolean Modified;
```

Description

Use the Modified property to determine whether a field has been modified.

13.1.9.6.4 TIBXSQLDA.Names Property

Returns the XSQLDA field names.

Pascal

```
property Names: String;
```

C++

```
__property UnicodeString Names;
```

Description

Use the Names property to return the XSQLDA field names.

13.1.9.6.5 TIBXSQLDA.RecordSize Property

Returns the size of the XSQLDA record.

Pascal

```
property RecordSize: Integer;
```

C++

```
__property int RecordSize;
```

Description

Use the RecordSize property to return the XSQLDA record size.

13.1.9.6.6 TIBXSQLDA.UniqueRelationName Property

Returns the name of the unique relation.

Pascal

```
property UniqueRelationName: String;
```

C++

```
__property UnicodeString UniqueRelationName;
```

Description

Use the UniqueRelationName property to return the name of the relation if only one relation is involved in the query. Otherwise, it returns nil (Delphi) or NULL (C++). This property is primarily used for internal purposes.

13.1.9.6.7 TIBXSQLDA.Vars Property

Returns the XSQLVAR defined for the XSQLDA parameter.

Pascal

```
property Vars [Idx: Integer]: TIBXSQLVAR;
```

C++

```
__property TIBXSQLVAR Vars[int Idx];
```

Description

Use Vars to return the XSQLVAR defined for the XSQLDA parameter.

Vars is the default property for TIBXSQLDSA, which means that the name of the Vars property can be omitted when the TIBXSQLDA (see page 536) object implements a property in another object.

13.1.10 TIBXSQLVAR Class

TIBXSQLVAR provides properties and methods for use with the IBSQL (see page 493) component.

Class Hierarchy

Pascal

```
TIBXSQLVAR = class(TObject);
```

C++

```
class TIBXSQLVAR : public TObject;
```

File

IBSQL

Description

Use a TIBXSQLVAR object to provide properties and methods for use with the IBSQL (see page 493) component.

The XSQLVAR structure is a field, sqlvar, in the XSQLDA. The sqlvar is especially important, because one XSQLVAR must be defined for each input parameter or column returned.

Applications do not declare instances of the XSQLVAR ahead of time, but must, instead, dynamically allocate storage for the proper number of XSQLVAR structures required for each DSQL statement before it is executed, then deallocate it, as appropriate, after statement execution.

13.1.10.1 TIBXSQLVAR Members

The following tables list the members exposed by TIBXSQLVAR.

Public Methods

	Name	Description
	Assign (see page 546)	Assigns another XSQLVAR to the XSQLVAR component.
	Clear (see page 546)	Clears the value of this TIBXSQLVAR (see page 544) object.
	Create (see page 545)	Creates an instance of an XSQLVAR structure.
	LoadFromFile (see page 547)	Loads the contents of a file to a Blob field.
	LoadFromStream (see page 547)	Loads a stream into a Blob field.
	SaveToFile (see page 547)	Saves the contents of a Blob field to a file.
	SaveToStream (see page 547)	Saves the contents of a Blob field to a stream.

Public Properties

	Name	Description
	AsCurrency (see page 548)	Represents the XSQLVAR field's value as a Currency value.
	AsDate (see page 548)	Represents the XSQLVAR field's value as a TDateTime value.
	AsDateTime (see page 549)	Represents the XSQLVAR field's value as a TDateTime value.
	AsDouble (see page 549)	Represents the XSQLVAR field's value as a Double value.
	AsFloat (see page 549)	Represents the XSQLVAR field's value as a Float value.
	AsInt64 (see page 550)	Represents the XSQLVAR field's value as a 64-bit integer.
	AsInteger (see page 550)	Represents the XSQLVAR field's value as a 32-bit integer value.
	AsLong (see page 550)	Represents the XSQLVAR field's value as a Long integer value.
	AsPointer (see page 550)	Represents the XSQLVAR field's value as a Pointer value.
	AsQuad (see page 551)	Represents the XSQLVAR field's value as a Quad value.
	AsShort (see page 551)	Represents the XSQLVAR field's value as a Short integer value.
	AsString (see page 551)	Represents the XSQLVAR field's value as a string.
	AsTime (see page 551)	Represents the XSQLVAR field's value as a TDateTime value.
	AsTrimString (see page 552)	Represents the XSQLVAR field's value as a string with any trailing spaces removed.
	AsVariant (see page 552)	Represents the XSQLVAR field's value as type Variant.
	AsXSQLVAR (see page 552)	Represents the XSQLVAR field's value as an XSQLVAR value.
	Data (see page 553)	Accesses the underlying InterBase XSQLVAR structure.
R	Index (see page 553)	Indicates the position of the XSQLVAR in the XSQLDA.
	IsNull (see page 553)	Indicates whether the field has a value assigned to it.
	IsNullable (see page 553)	Indicates whether the field can have a value assigned to it.
	Modified (see page 554)	Indicates whether a field has been modified.
R	Name (see page 554)	Returns the name of the XSQLVAR.
R	Size (see page 554)	Indicates the maximum size, in bytes, of data in the sqldata field of the XSQLVAR.
R	SQLType (see page 554)	Indicates the SQL datatype of parameters or select list items.
	Value (see page 555)	Returns the value of the XSQLVAR field component.

13.1.10.2 TIBXSQLVAR.Create Constructor

Creates an instance of an XSQLVAR structure.

Pascal

```
constructor Create(Parent: TIBXSQLDA; Query: TIBSQL);
```

C++

```
__fastcall TIBXSQLVAR(TIBXSQLDA Parent, TIBSQL Query);
```

Description

Call Create to create an instance of TIBXSQLVAR (see page 544).

Parent is an extended descriptor area that defines the namespace to use for processing the variable name.

Query identifies the query that includes this variable.

13.1.10.3 TIBXSQLVAR Methods

The methods of the TIBXSQLVAR class are listed here.

Public Methods

	Name	Description
	Assign (see page 546)	Assigns another XSQLVAR to the XSQLVAR component.
	Clear (see page 546)	Clears the value of this TIBXSQLVAR (see page 544) object.
	LoadFromFile (see page 547)	Loads the contents of a file to a Blob field.
	LoadFromStream (see page 547)	Loads a stream into a Blob field.
	SaveToFile (see page 547)	Saves the contents of a Blob field to a file.
	SaveToStream (see page 547)	Saves the contents of a Blob field to a stream.

13.1.10.3.1 TIBXSQLVAR.Assign Method

Assigns another XSQLVAR to the XSQLVAR component.

Pascal

```
procedure Assign(Source: TIBXSQLVAR);
```

C++

```
__fastcall Assign(TIBXSQLVAR Source);
```

Description

Use Assign to assign another XSQLVAR to the XSQLVAR component. The fields must have compatible data types.

13.1.10.3.2 TIBXSQLVAR.Clear Method

Clears the value of this TIBXSQLVAR (see page 544) object.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Call Clear to assign a Null value to this TIBXSQLVAR (see page 544) object.

13.1.10.3.3 TIBXSQLVAR.LoadFromFile Method

Loads the contents of a file to a Blob field.

Pascal

```
procedure LoadFromFile(const FileName: String);
```

C++

```
__fastcall LoadFromFile(const UnicodeString FileName);
```

Description

Call LoadFromFile to load the contents of a file to a Blob field.

13.1.10.3.4 TIBXSQLVAR.LoadFromStream Method

Loads a stream into a Blob field.

Pascal

```
procedure LoadFromStream(Stream: TStream);
```

C++

```
__fastcall LoadFromStream(TStream Stream);
```

Description

Call LoadFromStream to load a stream into a Blob field.

13.1.10.3.5 TIBXSQLVAR.SaveToFile Method

Saves the contents of a Blob field to a file.

Pascal

```
procedure SaveToFile(const FileName: String);
```

C++

```
__fastcall SaveToFile(const UnicodeString FileName);
```

Description

Call SaveToFile to save the contents of a Blob field to a file.

13.1.10.3.6 TIBXSQLVAR.SaveToStream Method

Saves the contents of a Blob field to a stream.

Pascal

```
procedure SaveToStream(Stream: TStream);
```

C++

```
__fastcall SaveToStream(TStream Stream);
```

Description

Call SaveToStream to save the contents of a Blob field to a stream.

13.1.10.4 TIBXSQLVAR Properties

The properties of the TIBXSQLVAR class are listed here.

Public Properties

	Name	Description
	AsCurrency (see page 548)	Represents the XSQLVAR field's value as a Currency value.
	AsDate (see page 548)	Represents the XSQLVAR field's value as a TDateTime value.
	AsDateTime (see page 549)	Represents the XSQLVAR field's value as a TDateTime value.
	AsDouble (see page 549)	Represents the XSQLVAR field's value as a Double value.
	AsFloat (see page 549)	Represents the XSQLVAR field's value as a Float value.
	AsInt64 (see page 550)	Represents the XSQLVAR field's value as a 64-bit integer.
	AsInteger (see page 550)	Represents the XSQLVAR field's value as a 32-bit integer value.
	AsLong (see page 550)	Represents the XSQLVAR field's value as a Long integer value.
	AsPointer (see page 550)	Represents the XSQLVAR field's value as a Pointer value.
	AsQuad (see page 551)	Represents the XSQLVAR field's value as a Quad value.
	AsShort (see page 551)	Represents the XSQLVAR field's value as a Short integer value.
	AsString (see page 551)	Represents the XSQLVAR field's value as a string.
	AsTime (see page 551)	Represents the XSQLVAR field's value as a TDateTime value.
	AsTrimString (see page 552)	Represents the XSQLVAR field's value as a string with any trailing spaces removed.
	AsVariant (see page 552)	Represents the XSQLVAR field's value as type Variant.
	AsXSQLVAR (see page 552)	Represents the XSQLVAR field's value as an XSQLVAR value.
	Data (see page 553)	Accesses the underlying InterBase XSQLVAR structure.
R	Index (see page 553)	Indicates the position of the XSQLVAR in the XSQLDA.
	IsNull (see page 553)	Indicates whether the field has a value assigned to it.
	IsNullable (see page 553)	Indicates whether the field can have a value assigned to it.
	Modified (see page 554)	Indicates whether a field has been modified.
R	Name (see page 554)	Returns the name of the XSQLVAR.
R	Size (see page 554)	Indicates the maximum size, in bytes, of data in the sqldata field of the XSQLVAR.
R	SQLType (see page 554)	Indicates the SQL datatype of parameters or select list items.
	Value (see page 555)	Returns the value of the XSQLVAR field component.

13.1.10.4.1 TIBXSQLVAR.AsCurrency Property

Represents the XSQLVAR field's value as a Currency value.

Pascal

```
property AsCurrency: Currency;
```

C++

```
__property Currency AsCurrency;
```

Description

Use the AsCurrency property to read the value of the XSQLVAR field's data into an object or variable of type Currency, or to assign a Currency value to the contents of the field.

13.1.10.4.2 TIBXSQLVAR.AsDate Property

Represents the XSQLVAR field's value as a TDateTime value.

Pascal

```
property AsDate: TDateTime;
```

C++

```
__property TDateTime AsDate;
```

Description

Use the AsDate property to read the value of the field's data into an object or variable of type TDateTime, or to assign a TDateTime value to the contents of the field. The Time portion of the TDateTime value is set to zero.

13.1.10.4.3 TIBXSQLVAR.AsDateTime Property

Represents the XSQLVAR field's value as a TDateTime value.

Pascal

```
property AsDateTime: TDateTime;
```

C++

```
__property TDateTime AsDateTime;
```

Description

Use the AsDateTime property to read the value of the field's data into an object or variable of type TDateTime, or to assign a TDateTime value to the contents of the field.

13.1.10.4.4 TIBXSQLVAR.AsDouble Property

Represents the XSQLVAR field's value as a Double value.

Pascal

```
property AsDouble: Double;
```

C++

```
__property Double AsDouble;
```

Description

Use the AsDouble property to read the value of the field's data into an object or variable of type Double, or to assign a Double value to the contents of the field.

13.1.10.4.5 TIBXSQLVAR.AsFloat Property

Represents the XSQLVAR field's value as a Float value.

Pascal

```
property AsFloat: Float;
```

C++

```
__property Float AsFloat;
```

Description

Use the AsDouble (see page 549) property to read the value of the field's data into an object or variable of type Float, or to assign a Float value to the contents of the field.

13.1.10.4.6 TIBXSQLVAR.AsInt64 Property

Represents the XSQLVAR field's value as a 64-bit integer.

Pascal

```
property AsInt64: Int64;
```

C++

```
__property Int64 AsInt64;
```

Description

Use the AsInt64 property to read the value of the field's data into a 64-bit integer, or to assign an 64-bit integer value to the contents of the field.

13.1.10.4.7 TIBXSQLVAR.AsInteger Property

Represents the XSQLVAR field's value as a 32-bit integer value.

Pascal

```
property AsInteger: Integer;
```

C++

```
__property int AsInteger;
```

Description

Use the AsInteger property to read the value of the field's data into an integer, or to assign an integer value to the contents of the field.

13.1.10.4.8 TIBXSQLVAR.AsLong Property

Represents the XSQLVAR field's value as a Long integer value.

Pascal

```
property AsLong: Long;
```

C++

```
__property Long AsLong;
```

Description

Use the AsLong property to read the value of the field's data into a Long integer, or to assign a Long integer value to the contents of the field.

13.1.10.4.9 TIBXSQLVAR.AsPointer Property

Represents the XSQLVAR field's value as a Pointer value.

Pascal

```
property AsPointer: Pointer;
```

C++

```
__property void * AsPointer;
```

Description

Use the AsPointer property to read the value of the field's data into an object or variable of type Pointer, or to assign a Pointer value to the contents of the field.

13.1.10.4.10 TIBXSQLVAR.AsQuad Property

Represents the XSQLVAR field's value as a Quad value.

Pascal

```
property AsQuad: TISC_QUAD;
```

C++

```
__property TISC_QUAD AsQuad;
```

Description

Use the AsQuad property to read the value of the field's data into an object or variable of type Quad, or to assign a Quad value to the contents of the field.

13.1.10.4.11 TIBXSQLVAR.AsShort Property

Represents the XSQLVAR field's value as a Short integer value.

Pascal

```
property AsShort: Short;
```

C++

```
__property Short AsShort;
```

Description

Use the AsShort property to to read the value of the field's data into a Short integer, or to assign a Short integer value to the contents of the field.

13.1.10.4.12 TIBXSQLVAR.AsString Property

Represents the XSQLVAR field's value as a string.

Pascal

```
property AsString: String;
```

C++

```
__property UnicodeString AsString;
```

Description

Use the AsString property to read the value of the field's data into a string, or to assign a String value to the contents of the field.

13.1.10.4.13 TIBXSQLVAR.AsTime Property

Represents the XSQLVAR field's value as a TDateTime value.

Pascal

```
property AsTime: TDateTime;
```

C++

```
__property TDateTime AsTime;
```

Description

Use the AsTime property to read the value of the field's data into an object or variable of type TDateTime, or to assign a TDateTime value to the contents of the field. The Date portion of the field is set to zero.

13.1.10.4.14 TIBXSQLVAR.AsTrimString Property

Represents the XSQLVAR field's value as a string with any trailing spaces removed.

Pascal

```
property AsTrimString: String;
```

C++

```
__property UnicodeString AsTrimString;
```

Description

Use the AsTrimString property to read the value of the field's data into a string, removing any trailing spaces from the value.

When assigning AsTrimString, any trailing spaces in the assigned string are removed before assigning the value. The spaces do not become part of the underlying value.

13.1.10.4.15 TIBXSQLVAR.AsVariant Property

Represents the XSQLVAR field's value as type Variant.

Pascal

```
property AsVariant: Variant;
```

C++

```
__property Variant AsVariant;
```

Description

Use the AsVariant property to read the value of the field's data into a Variant, or to assign a Variant value to the contents of the field.

13.1.10.4.16 TIBXSQLVAR.AsXSQLVAR Property

Represents the XSQLVAR field's value as an XSQLVAR value.

Pascal

```
property AsXSQLVAR: PXSQLVAR;
```

C++

```
__property PXSQLVAR AsXSQLVAR;
```

Description

Use the AsXSQLVAR property to read the value of the field's data into an object or variable of type XSQLVAR, or to assign an XSQLVAR value to the contents of the field.

13.1.10.4.17 TIBXSQLVAR.Data Property

Accesses the underlying InterBase XSQLVAR structure.

Pascal

```
property Data: PXSQLVAR;
```

C++

```
__property PXSQLVAR Data;
```

Description

Use the Data property to access the underlying InterBase XSQLVAR structure.

13.1.10.4.18 TIBXSQLVAR.Index Property

Indicates the position of the XSQLVAR in the XSQLDA.

Pascal

```
property Index: Integer;
```

C++

```
__property int Index;
```

Description

Use the Index property to obtain the position of the XSQLVAR in the XSQLDA.

13.1.10.4.19 TIBXSQLVAR.IsNull Property

Indicates whether the field has a value assigned to it.

Pascal

```
property IsNull: Boolean;
```

C++

```
__property Boolean IsNull;
```

Description

Use the IsNull property to determine if the field contains a value. If IsNull is true, the field is blank. If IsNull is false, the field has a value.

13.1.10.4.20 TIBXSQLVAR.IsNullable Property

Indicates whether the field can have a value assigned to it.

Pascal

```
property IsNullable: Boolean;
```

C++

```
__property Boolean IsNullable;
```

Description

Use the IsNullable property to determine if the field can contain a value. If IsNullable is true, the field can contain a value. If IsNullable is false, the field cannot contain a value.

13.1.10.4.21 TIBXSQLVAR.Modified Property

Indicates whether a field has been modified.

Pascal

```
property Modified: Boolean;
```

C++

```
__property Boolean Modified;
```

Description

Use the Modified property to determine whether a field has been modified.

13.1.10.4.22 TIBXSQLVAR.Name Property

Returns the name of the XSQLVAR.

Pascal

```
property Name: String;
```

C++

```
__property UnicodeString Name;
```

Description

Use the Name property to return the name of the XSQLVAR.

13.1.10.4.23 TIBXSQLVAR.Size Property

Indicates the maximum size, in bytes, of data in the sqldata field of the XSQLVAR.

Pascal

```
property Size: Integer;
```

C++

```
__property int Size;
```

Description

Use the Size property to return the maximum size, in bytes, of data in the sqldata field of the XSQLVAR.

13.1.10.4.24 TIBXSQLVAR.SQLType Property

Indicates the SQL datatype of parameters or select list items.

Pascal

```
property SQLType: Integer;
```

C++

```
__property int SQLType;
```

Description

Read the SQLType property to indicate the SQL datatype of parameters or select list items.

13.1.10.4.25 TIBXSQLVAR.Value Property

Returns the value of the XSQLVAR field component.

Pascal

```
property Value: Variant;
```

C++

```
__property Variant Value;
```

Description

Use Value to return the value of the XSQLVAR field component as a Variant.

13.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TIBSQLTypes (see page 556)	TIBSQLTypes indicates the type of an SQL query against an InterBase database.

13.2.1 IBSQL.TIBSQLTypes Enumeration

TIBSQLTypes indicates the type of an SQL query against an InterBase database.

Pascal

```
TIBSQLTypes = (
  SQLUnknown,
  SQLSelect,
  SQLInsert,
  SQLUpdate,
  SQLDelete,
  SQLDDL,
  SQLGetSegment,
  SQLPutSegment,
  SQLExecProcedure,
  SQLStartTransaction,
  SQLCommit,
  SQLRollback,
  SQLSelectForUpdate,
  SQLSetGenerator
);
```

C++

```
enum TIBSQLTypes {
  SQLUnknown,
  SQLSelect,
  SQLInsert,
  SQLUpdate,
  SQLDelete,
  SQLDDL,
  SQLGetSegment,
  SQLPutSegment,
  SQLExecProcedure,
  SQLStartTransaction,
  SQLCommit,
  SQLRollback,
  SQLSelectForUpdate,
  SQLSetGenerator
};
```

File

IBSQL

Description

TIBSQLTypes values are:

SQLCommit	Commits an active transaction
SQLDDL	Executes a DDL statement
SQLDelete	Removes rows in a table or in the active set of a cursor
SQLExecProcedure	Calls a stored procedure
SQLGetSegment	Reads a segment from an open Blob
SQLInsert	Adds one or more new rows to a specified table
SQLPutSegment	Writes a Blob segment
SQLRollback	Restores the database to its state prior to the start of the current transaction
SQLSetForUpdate	Stored procedure is set for updating
SQLSetGenerator	Sets a new value for an existing generator
SQLSelect	Retrieves data from one or more tables
SQLStartTransaction	Starts a new transaction against one or more databases
SQLUnknown	Unknown SQL type
SQLUpdate	Changes data in all or part of an existing row in a table, view, or active set of a cursor

13.3 Types

The following table lists types in this documentation.

Types

Name	Description
TIBXSQLVARArray (see page 558)	This is type IBSQL.TIBXSQLVARArray.

13.3.1 IBSQL.TIBXSQLVARArray Type

Pascal

```
TIBXSQLVARArray = Array of TIBXSQLVAR;
```

C++

```
Array of TIBXSQLVAR TIBXSQLVARArray;
```

File

IBSQL

Description

This is type IBSQL.TIBXSQLVARArray.

14 IBSQLMonitor Namespace

This is namespace IBSQLMonitor.

Topics

Name	Description
Classes (see page 561)	The following table lists classes in this documentation.
Interfaces (see page 567)	The following table lists interfaces in this documentation.
Functions (see page 575)	The following table lists functions in this documentation.
Types (see page 577)	The following table lists types in this documentation.
Constants (see page 578)	The following table lists constants in this documentation.

Classes

	Name	Description
	TIBCustomSQLMonitor (see page 561)	TIBCustomSQLMonitor is the ancestor for TIBSQLMonitor (see page 564).
	TIBSQLMonitor (see page 564)	TIBSQLMonitor monitors dynamic SQL passed to the InterBase server.

Constants

Name	Description
WM_IBSQL_SQL_EVENT (see page 578)	This is constant IBSQLMonitor.WM_IBSQL_SQL_EVENT.
WM_MAX_IBSQL_MONITOR (see page 578)	This is constant IBSQLMonitor.WM_MAX_IBSQL_MONITOR.
WM_MIN_IBSQL_MONITOR (see page 578)	This is constant IBSQLMonitor.WM_MIN_IBSQL_MONITOR.

Functions

	Name	Description
	DisableMonitoring (see page 575)	Disables SQL monitoring.
	EnableMonitoring (see page 575)	This is function IBSQLMonitor.EnableMonitoring.
	MonitorHook (see page 576)	This is function IBSQLMonitor.MonitorHook.
	MonitoringEnabled (see page 576)	This is function IBSQLMonitor.MonitoringEnabled.

Interfaces

	Name	Description
	IIBSQLMonitorHook (see page 567)	This is class IBSQLMonitor.IIBSQLMonitorHook.

Types

Name	Description
TSQLEvent (see page 577)	TSQLEvent is the type of event handlers that respond to activity on an InterBase server.

14.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TIBCustomSQLMonitor (see page 561)	TIBCustomSQLMonitor is the ancestor for TIBSQLMonitor (see page 564).
	TIBSQLMonitor (see page 564)	TIBSQLMonitor monitors dynamic SQL passed to the InterBase server.

14.1.1 TIBCustomSQLMonitor Class

TIBCustomSQLMonitor is the ancestor for TIBSQLMonitor (see page 564).

Class Hierarchy

Pascal

```
TIBCustomSQLMonitor = class(TComponent);
```

C++

```
class TIBCustomSQLMonitor : public TComponent;
```

File

IBSQLMonitor

Description

TIBCustomSQLMonitor is the ancestor object from which TIBSQLMonitor (see page 564) is derived.

14.1.1.1 TIBCustomSQLMonitor Members

The following tables list the members exposed by TIBCustomSQLMonitor.

Protected Events

	Name	Description
	OnSQL (see page 564)	Reports dynamic SQL activity on InterBase applications.

Protected Properties

	Name	Description
	Enabled (see page 563)	Indicates whether the IB (see page 1) SQL monitor is actively monitoring communication with the server.
	TraceFlags (see page 564)	Indicates which database operations are tracked.

Public Methods

	Name	Description
	Create (see page 562)	Creates an instance of TIBCustomSQLMonitor (see page 561).
	Destroy (see page 562)	Destroys the instance of TIBCustomSQLMonitor (see page 561).
	Release (see page 562)	Frees the helper objects that intercept database commands.

Public Properties

	Name	Description
	Handle (see page 563)	Specifies the window handle that the SQL monitor uses to receive asynchronous messages.

14.1.1.2 TIBCustomSQLMonitor.Create Constructor

Creates an instance of TIBCustomSQLMonitor (see page 561).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBCustomSQLMonitor(TComponent * AOwner);
```

Description

Call Create to create an instance of TIBCustomSQLMonitor (see page 561). Create also:

1. Creates the window
2. Registers the event
3. Fires the Monitor thread

14.1.1.3 TIBCustomSQLMonitor.Destroy Destructor

Destroys the instance of TIBCustomSQLMonitor (see page 561).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBCustomSQLMonitor();
```

Description

Do not call Destroy directly in an application. Instead, an application should call Free. Free verifies that the service object has not already been freed before it calls Destroy.

Destroy unregisters the event, destroys the window, and kills the Monitor thread.

14.1.1.4 TIBCustomSQLMonitor Methods

The methods of the TIBCustomSQLMonitor class are listed here.

Public Methods

	Name	Description
	Release (see page 562)	Frees the helper objects that intercept database commands.

14.1.1.4.1 TIBCustomSQLMonitor.Release Method

Frees the helper objects that intercept database commands.

Pascal

```
procedure Release;
```

C++

```
__fastcall Release();
```

Description

Call Release when the SQL monitor will not be monitoring any more messages. Release sends a message to the object that intercepts database commands, telling it to free itself.

To temporarily disable the monitor, use the Enabled (see page 563) property instead.

14.1.1.5 TIBCustomSQLMonitor Properties

The properties of the TIBCustomSQLMonitor class are listed here.

Protected Properties

	Name	Description
	Enabled (see page 563)	Indicates whether the IB (see page 1) SQL monitor is actively monitoring communication with the server.
	TraceFlags (see page 564)	Indicates which database operations are tracked.

Public Properties

	Name	Description
R	Handle (see page 563)	Specifies the window handle that the SQL monitor uses to receive asynchronous messages.

14.1.1.5.1 TIBCustomSQLMonitor.Enabled Property

Indicates whether the IB (see page 1) SQL monitor is actively monitoring communication with the server.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to turn the SQL monitor on and off. When Enabled is true, the SQL monitor receives an OnSQL (see page 564) event for every database operation specified by the TraceFlags (see page 564) property. When Enabled is false, the SQL monitor does not receive any events.

14.1.1.5.2 TIBCustomSQLMonitor.Handle Property

Specifies the window handle that the SQL monitor uses to receive asynchronous messages.

Pascal

```
property Handle: HWND;
```

C++

```
__property HWND Handle;
```

Description

A separate thread of execution monitors the database operations that trigger OnSQL (see page 564) events. When that thread

detects a relevant database operation, it sends a Windows message to the window identified by this Handle.

14.1.1.5.3 TIBCustomSQLMonitor.TraceFlags Property

Indicates which database operations are tracked.

Pascal

```
property TraceFlags: TTraceFlags;
```

C++

```
__property TTraceFlags TraceFlags;
```

Description

Use TraceFlags to specify which database operations the SQL Monitor should track in an application at runtime. TraceFlags enables performance tuning and SQL debugging when working with remote SQL database servers.

Note: Normally trace options are set from the SQL Monitor rather than setting TraceFlags in application code.

14.1.1.6 TIBCustomSQLMonitor Events

The events of the TIBCustomSQLMonitor class are listed here.

Protected Events

	Name	Description
	OnSQL (see page 564)	Reports dynamic SQL activity on InterBase applications.

14.1.1.6.1 TIBCustomSQLMonitor.OnSQL Event

Reports dynamic SQL activity on InterBase applications.

Pascal

```
property OnSQL: TSQLEvent;
```

C++

```
__property TSQLEvent OnSQL;
```

Description

Write an OnSQL event handler to report dynamic SQL activity on InterBase applications.

Note: You must enable the TraceFlags (see page 564) in each TIBDatabase component in order for the SQL monitor to receive status information from each database connection.

14.1.2 TIBSQLMonitor Class

TIBSQLMonitor monitors dynamic SQL passed to the InterBase server.

Class Hierarchy

Pascal

```
TIBSQLMonitor = class(TIBCustomSQLMonitor);
```

C++

```
class TIBSQLMonitor : public TIBCustomSQLMonitor;
```

File

IBSQLMonitor

Description

Use TIBSQLMonitor to monitor dynamic SQL taking place in InterBase applications. Enable TraceFlags (see page 566) in each TIBDatabase component in order for the SQL monitor to receive status information from each database connection.

Getting Started with InterBase Express

14.1.2.1 TIBSQLMonitor Members

The following tables list the members exposed by TIBSQLMonitor.

Public Methods

	Name	Description
	Create (see page 562)	Creates an instance of TIBCustomSQLMonitor (see page 561).
	Destroy (see page 562)	Destroys the instance of TIBCustomSQLMonitor (see page 561).
	Release (see page 562)	Frees the helper objects that intercept database commands.

Public Properties

	Name	Description
	Handle (see page 563)	Specifies the window handle that the SQL monitor uses to receive asynchronous messages.

Published Events

	Name	Description
	OnSQL (see page 566)	Reports dynamic SQL activity on InterBase applications.

Published Properties

	Name	Description
	Enabled (see page 565)	Indicates whether the IB SQL monitor is actively monitoring communication with the server.
	TraceFlags (see page 566)	Indicates which database operations are tracked.

14.1.2.2 TIBSQLMonitor Properties

The properties of the TIBSQLMonitor class are listed here.

Published Properties

	Name	Description
	Enabled (see page 565)	Indicates whether the IB SQL monitor is actively monitoring communication with the server.
	TraceFlags (see page 566)	Indicates which database operations are tracked.

14.1.2.2.1 TIBSQLMonitor.Enabled Property

Indicates whether the IB SQL monitor is actively monitoring communication with the server.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to turn the SQL monitor on and off. When Enabled is true, the SQL monitor receives an OnSQL event for every database operation specified by the TraceFlags property. When Enabled is false, the SQL monitor does not receive any events.

14.1.2.2.2 TIBSQLMonitor.TraceFlags Property

Indicates which database operations are tracked.

Pascal

```
property TraceFlags: TTraceFlags;
```

C++

```
__property TTraceFlags TraceFlags;
```

Description

Use TraceFlags to specify which database operations the SQL Monitor should track in an application at runtime. TraceFlags enables performance tuning and SQL debugging when working with remote SQL database servers.

Note: Normally trace options are set from the SQL Monitor rather than setting TraceFlags in application code.

14.1.2.3 TIBSQLMonitor Events

The events of the TIBSQLMonitor class are listed here.

Published Events

	Name	Description
	OnSQL (see page 566)	Reports dynamic SQL activity on InterBase applications.

14.1.2.3.1 TIBSQLMonitor.OnSQL Event

Reports dynamic SQL activity on InterBase applications.

Pascal

```
property OnSQL: TSQLEvent;
```

C++

```
__property TSQLEvent OnSQL;
```

Description

Write an OnSQL event handler to report dynamic SQL activity on InterBase applications.

Note: You must enable the TraceFlags in each TIBDatabase component in order for the SQL monitor to receive status information from each database connection.

14.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IIBSQLMonitorHook (see page 567)	This is class IBSQLMonitor.IIBSQLMonitorHook.

14.2.1 IIBSQLMonitorHook Interface

Class Hierarchy

IBSQLMonitor.IIBSQLMonitorHook

Pascal

```
IIBSQLMonitorHook = interface;
```

C++

```
__interface IIBSQLMonitorHook;
```

File

IBSQLMonitor

Description

This is class IBSQLMonitor.IIBSQLMonitorHook.

14.2.1.1 IIBSQLMonitorHook Members

The following tables list the members exposed by IIBSQLMonitorHook.

Public Methods

	Name	Description
	DBConnect (see page 568)	This is DBConnect, a member of class IIBSQLMonitorHook.
	DBDisconnect (see page 569)	This is DBDisconnect, a member of class IIBSQLMonitorHook.
	GetEnabled (see page 569)	This is GetEnabled, a member of class IIBSQLMonitorHook.
	GetMonitorCount (see page 569)	This is GetMonitorCount, a member of class IIBSQLMonitorHook.
	GetTraceFlags (see page 569)	This is GetTraceFlags, a member of class IIBSQLMonitorHook.
	RegisterMonitor (see page 570)	This is RegisterMonitor, a member of class IIBSQLMonitorHook.
	ReleaseMonitor (see page 570)	This is ReleaseMonitor, a member of class IIBSQLMonitorHook.
	SendMisc (see page 570)	This is SendMisc, a member of class IIBSQLMonitorHook.
	ServiceAttach (see page 570)	This is ServiceAttach, a member of class IIBSQLMonitorHook.
	ServiceDetach (see page 570)	This is ServiceDetach, a member of class IIBSQLMonitorHook.
	ServiceQuery (see page 571)	This is ServiceQuery, a member of class IIBSQLMonitorHook.
	ServiceStart (see page 571)	This is ServiceStart, a member of class IIBSQLMonitorHook.
	SetEnabled (see page 571)	This is SetEnabled, a member of class IIBSQLMonitorHook.
	SetTraceFlags (see page 571)	This is SetTraceFlags, a member of class IIBSQLMonitorHook.
	SQLExecute (see page 572)	This is SQLExecute, a member of class IIBSQLMonitorHook.

	SQLFetch (see page 572)	This is SQLFetch, a member of class IIBSQLMonitorHook.
	SQLPrepare (see page 572)	This is SQLPrepare, a member of class IIBSQLMonitorHook.
	TRCommit (see page 572)	This is TRCommit, a member of class IIBSQLMonitorHook.
	TRCommitRetaining (see page 572)	This is TRCommitRetaining, a member of class IIBSQLMonitorHook.
	TRRollback (see page 573)	This is TRRollback, a member of class IIBSQLMonitorHook.
	TRRollbackRetaining (see page 573)	This is TRRollbackRetaining, a member of class IIBSQLMonitorHook.
	TRStart (see page 573)	This is TRStart, a member of class IIBSQLMonitorHook.
	UnregisterMonitor (see page 573)	This is UnregisterMonitor, a member of class IIBSQLMonitorHook.

Public Properties

	Name	Description
	Enabled (see page 574)	This is Enabled, a member of class IIBSQLMonitorHook.
	TraceFlags (see page 574)	This is TraceFlags, a member of class IIBSQLMonitorHook.

14.2.1.2 IIBSQLMonitorHook Methods

The methods of the IIBSQLMonitorHook class are listed here.

Public Methods

	Name	Description
	DBConnect (see page 568)	This is DBConnect, a member of class IIBSQLMonitorHook.
	DBDisconnect (see page 569)	This is DBDisconnect, a member of class IIBSQLMonitorHook.
	GetEnabled (see page 569)	This is GetEnabled, a member of class IIBSQLMonitorHook.
	GetMonitorCount (see page 569)	This is GetMonitorCount, a member of class IIBSQLMonitorHook.
	GetTraceFlags (see page 569)	This is GetTraceFlags, a member of class IIBSQLMonitorHook.
	RegisterMonitor (see page 570)	This is RegisterMonitor, a member of class IIBSQLMonitorHook.
	ReleaseMonitor (see page 570)	This is ReleaseMonitor, a member of class IIBSQLMonitorHook.
	SendMisc (see page 570)	This is SendMisc, a member of class IIBSQLMonitorHook.
	ServiceAttach (see page 570)	This is ServiceAttach, a member of class IIBSQLMonitorHook.
	ServiceDetach (see page 570)	This is ServiceDetach, a member of class IIBSQLMonitorHook.
	ServiceQuery (see page 571)	This is ServiceQuery, a member of class IIBSQLMonitorHook.
	ServiceStart (see page 571)	This is ServiceStart, a member of class IIBSQLMonitorHook.
	SetEnabled (see page 571)	This is SetEnabled, a member of class IIBSQLMonitorHook.
	SetTraceFlags (see page 571)	This is SetTraceFlags, a member of class IIBSQLMonitorHook.
	SQLExecute (see page 572)	This is SQLExecute, a member of class IIBSQLMonitorHook.
	SQLFetch (see page 572)	This is SQLFetch, a member of class IIBSQLMonitorHook.
	SQLPrepare (see page 572)	This is SQLPrepare, a member of class IIBSQLMonitorHook.
	TRCommit (see page 572)	This is TRCommit, a member of class IIBSQLMonitorHook.
	TRCommitRetaining (see page 572)	This is TRCommitRetaining, a member of class IIBSQLMonitorHook.
	TRRollback (see page 573)	This is TRRollback, a member of class IIBSQLMonitorHook.
	TRRollbackRetaining (see page 573)	This is TRRollbackRetaining, a member of class IIBSQLMonitorHook.
	TRStart (see page 573)	This is TRStart, a member of class IIBSQLMonitorHook.
	UnregisterMonitor (see page 573)	This is UnregisterMonitor, a member of class IIBSQLMonitorHook.

14.2.1.2.1 IIBSQLMonitorHook.DBConnect Method

Pascal

```
procedure DBConnect(db: TIBDatabase);
```

C++

```
__fastcall DBConnect(TIBDatabase db);
```

Description

This is DBConnect, a member of class IIBSQLMonitorHook.

14.2.1.2.2 IIBSQLMonitorHook.DBDisconnect Method

Pascal

```
procedure DBDisconnect(db: TIBDatabase);
```

C++

```
__fastcall DBDisconnect(TIBDatabase db);
```

Description

This is DBDisconnect, a member of class IIBSQLMonitorHook.

14.2.1.2.3 IIBSQLMonitorHook.GetEnabled Method

Pascal

```
function GetEnabled: boolean;
```

C++

```
__fastcall boolean GetEnabled();
```

Description

This is GetEnabled, a member of class IIBSQLMonitorHook.

14.2.1.2.4 IIBSQLMonitorHook.GetMonitorCount Method

Pascal

```
function GetMonitorCount: Integer;
```

C++

```
__fastcall int GetMonitorCount();
```

Description

This is GetMonitorCount, a member of class IIBSQLMonitorHook.

14.2.1.2.5 IIBSQLMonitorHook.GetTraceFlags Method

Pascal

```
function GetTraceFlags: TTraceFlags;
```

C++

```
__fastcall TTraceFlags GetTraceFlags();
```

Description

This is GetTraceFlags, a member of class IIBSQLMonitorHook.

14.2.1.2.6 IIBSQLMonitorHook.RegisterMonitor Method

Pascal

```
procedure RegisterMonitor(SQLMonitor: TIBCustomSQLMonitor);
```

C++

```
__fastcall RegisterMonitor(TIBCustomSQLMonitor SQLMonitor);
```

Description

This is RegisterMonitor, a member of class IIBSQLMonitorHook.

14.2.1.2.7 IIBSQLMonitorHook.ReleaseMonitor Method

Pascal

```
procedure ReleaseMonitor(Arg: TIBCustomSQLMonitor);
```

C++

```
__fastcall ReleaseMonitor(TIBCustomSQLMonitor Arg);
```

Description

This is ReleaseMonitor, a member of class IIBSQLMonitorHook.

14.2.1.2.8 IIBSQLMonitorHook.SendMisc Method

Pascal

```
procedure SendMisc(Msg: String);
```

C++

```
__fastcall SendMisc(UnicodeString Msg);
```

Description

This is SendMisc, a member of class IIBSQLMonitorHook.

14.2.1.2.9 IIBSQLMonitorHook.ServiceAttach Method

Pascal

```
procedure ServiceAttach(service: TIBCustomService);
```

C++

```
__fastcall ServiceAttach(TIBCustomService service);
```

Description

This is ServiceAttach, a member of class IIBSQLMonitorHook.

14.2.1.2.10 IIBSQLMonitorHook.ServiceDetach Method

Pascal

```
procedure ServiceDetach(service: TIBCustomService);
```

C++

```
__fastcall ServiceDetach(TIBCustomService service);
```

Description

This is ServiceDetach, a member of class IIBSQLMonitorHook.

14.2.1.2.11 IIBSQLMonitorHook.ServiceQuery Method

Pascal

```
procedure ServiceQuery(service: TIBCustomService);
```

C++

```
__fastcall ServiceQuery(TIBCustomService service);
```

Description

This is ServiceQuery, a member of class IIBSQLMonitorHook.

14.2.1.2.12 IIBSQLMonitorHook.ServiceStart Method

Pascal

```
procedure ServiceStart(service: TIBCustomService);
```

C++

```
__fastcall ServiceStart(TIBCustomService service);
```

Description

This is ServiceStart, a member of class IIBSQLMonitorHook.

14.2.1.2.13 IIBSQLMonitorHook.SetEnabled Method

Pascal

```
procedure SetEnabled(const Value: Boolean);
```

C++

```
__fastcall SetEnabled(const Boolean Value);
```

Description

This is SetEnabled, a member of class IIBSQLMonitorHook.

14.2.1.2.14 IIBSQLMonitorHook.SetTraceFlags Method

Pascal

```
procedure SetTraceFlags(const Value: TTraceFlags);
```

C++

```
__fastcall SetTraceFlags(const TTraceFlags Value);
```

Description

This is SetTraceFlags, a member of class IIBSQLMonitorHook.

14.2.1.2.15 IIBSQLMonitorHook.SQLExecute Method

Pascal

```
procedure SQLExecute(qry: TIBSQL);
```

C++

```
__fastcall SQLExecute(TIBSQL qry);
```

Description

This is SQLExecute, a member of class IIBSQLMonitorHook.

14.2.1.2.16 IIBSQLMonitorHook.SQLFetch Method

Pascal

```
procedure SQLFetch(qry: TIBSQL);
```

C++

```
__fastcall SQLFetch(TIBSQL qry);
```

Description

This is SQLFetch, a member of class IIBSQLMonitorHook.

14.2.1.2.17 IIBSQLMonitorHook.SQLPrepare Method

Pascal

```
procedure SQLPrepare(qry: TIBSQL);
```

C++

```
__fastcall SQLPrepare(TIBSQL qry);
```

Description

This is SQLPrepare, a member of class IIBSQLMonitorHook.

14.2.1.2.18 IIBSQLMonitorHook.TRCommit Method

Pascal

```
procedure TRCommit(tr: TIBTransaction);
```

C++

```
__fastcall TRCommit(TIBTransaction tr);
```

Description

This is TRCommit, a member of class IIBSQLMonitorHook.

14.2.1.2.19 IIBSQLMonitorHook.TRCommitRetaining Method

Pascal

```
procedure TRCommitRetaining(tr: TIBTransaction);
```

C++

```
__fastcall TRCommitRetaining(TIBTransaction tr);
```

Description

This is TRCommitRetaining, a member of class IIBSQLMonitorHook.

14.2.1.2.20 IIBSQLMonitorHook.TRRollback Method

Pascal

```
procedure TRRollback(tr: TIBTransaction);
```

C++

```
__fastcall TRRollback(TIBTransaction tr);
```

Description

This is TRRollback, a member of class IIBSQLMonitorHook.

14.2.1.2.21 IIBSQLMonitorHook.TRRollbackRetaining Method

Pascal

```
procedure TRRollbackRetaining(tr: TIBTransaction);
```

C++

```
__fastcall TRRollbackRetaining(TIBTransaction tr);
```

Description

This is TRRollbackRetaining, a member of class IIBSQLMonitorHook.

14.2.1.2.22 IIBSQLMonitorHook.TRStart Method

Pascal

```
procedure TRStart(tr: TIBTransaction);
```

C++

```
__fastcall TRStart(TIBTransaction tr);
```

Description

This is TRStart, a member of class IIBSQLMonitorHook.

14.2.1.2.23 IIBSQLMonitorHook.UnregisterMonitor Method

Pascal

```
procedure UnregisterMonitor(SQLMonitor: TIBCustomSQLMonitor);
```

C++

```
__fastcall UnregisterMonitor(TIBCustomSQLMonitor SQLMonitor);
```

Description

This is UnregisterMonitor, a member of class IIBSQLMonitorHook.

14.2.1.3 IIBSQLMonitorHook Properties

The properties of the IIBSQLMonitorHook class are listed here.

Public Properties

	Name	Description
	Enabled (see page 574)	This is Enabled, a member of class IIBSQLMonitorHook.
	TraceFlags (see page 574)	This is TraceFlags, a member of class IIBSQLMonitorHook.

14.2.1.3.1 IIBSQLMonitorHook.Enabled Property

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

This is Enabled, a member of class IIBSQLMonitorHook.

14.2.1.3.2 IIBSQLMonitorHook.TraceFlags Property

Pascal

```
property TraceFlags: TTraceFlags;
```

C++

```
__property TTraceFlags TraceFlags;
```

Description

This is TraceFlags, a member of class IIBSQLMonitorHook.

14.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	DisableMonitoring (see page 575)	Disables SQL monitoring.
	EnableMonitoring (see page 575)	This is function IBSQLMonitor.EnableMonitoring.
	MonitorHook (see page 576)	This is function IBSQLMonitor.MonitorHook.
	MonitoringEnabled (see page 576)	This is function IBSQLMonitor.MonitoringEnabled.

14.3.1 IBSQLMonitor.DisableMonitoring Function

Disables SQL monitoring.

Pascal

```
procedure DisableMonitoring;
```

C++

```
DisableMonitoring();
```

File

IBSQLMonitor

Description

Use the DisableMonitoring procedure to disable SQL monitoring.

14.3.2 IBSQLMonitor.EnableMonitoring Function

Pascal

```
procedure EnableMonitoring;
```

C++

```
EnableMonitoring();
```

File

IBSQLMonitor

Description

This is function IBSQLMonitor.EnableMonitoring.

14.3.3 IBSQLMonitor.MonitorHook Function

Pascal

```
function MonitorHook: IIBSQLMonitorHook;
```

C++

```
IIBSQLMonitorHook MonitorHook();
```

File

IBSQLMonitor

Description

This is function IBSQLMonitor.MonitorHook.

14.3.4 IBSQLMonitor.MonitoringEnabled Function

Pascal

```
function MonitoringEnabled: Boolean;
```

C++

```
Boolean MonitoringEnabled();
```

File

IBSQLMonitor

Description

This is function IBSQLMonitor.MonitoringEnabled.

14.4 Types

The following table lists types in this documentation.

Types

Name	Description
TSQLEvent (see page 577)	TSQLEvent is the type of event handlers that respond to activity on an InterBase server.

14.4.1 IBSQLMonitor.TSQLEvent Type

TSQLEvent is the type of event handlers that respond to activity on an InterBase server.

Pascal

```
TSQLEvent = procedure (EventText: String; EventTime : TDateTime) of object;
```

C++

```
(EventText: String; EventTime : TDateTime) ( TSQLEvent)();
```

File

IBSQLMonitor

Description

EventText is the text of the SQL command that triggered the event.

EventTime indicates the time when the command passed to or from the InterBase server.

See Also

Procedural types

Creating events

14.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
WM_IBSQL_SQL_EVENT (see page 578)	This is constant IBSQLMonitor.WM_IBSQL_SQL_EVENT.
WM_MAX_IBSQL_MONITOR (see page 578)	This is constant IBSQLMonitor.WM_MAX_IBSQL_MONITOR.
WM_MIN_IBSQL_MONITOR (see page 578)	This is constant IBSQLMonitor.WM_MIN_IBSQL_MONITOR.

14.5.1 IBSQLMonitor.WM_IBSQL_SQL_EVENT Constant

Pascal

```
WM_IBSQL_SQL_EVENT = WM_MIN_IBSQL_MONITOR + 1;
```

C++

```
WM_IBSQL_SQL_EVENT = WM_MIN_IBSQL_MONITOR + 1;
```

File

IBSQLMonitor

Description

This is constant IBSQLMonitor.WM_IBSQL_SQL_EVENT.

14.5.2 IBSQLMonitor.WM_MAX_IBSQL_MONITOR Constant

Pascal

```
WM_MAX_IBSQL_MONITOR = WM_USER + 512;
```

C++

```
WM_MAX_IBSQL_MONITOR = WM_USER + 512;
```

File

IBSQLMonitor

Description

This is constant IBSQLMonitor.WM_MAX_IBSQL_MONITOR.

14.5.3 IBSQLMonitor.WM_MIN_IBSQL_MONITOR Constant

Pascal

```
WM_MIN_IBSQL_MONITOR = WM_USER;
```

C++

```
WM_MIN_IBSQL_MONITOR = WM_USER;
```

File

IBSQLMonitor

Description

This is constant IBSQLMonitor.WM_MIN_IBSQL_MONITOR.

15 IBStoredProc Namespace

This is namespace IBStoredProc.

Topics

Name	Description
Classes (see page 582)	The following table lists classes in this documentation.

Classes

	Name	Description
	TIBStoredProc (see page 582)	TIBStoredProc encapsulates a stored procedure on a database server.

15.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TIBStoredProc (see page 582)	TIBStoredProc encapsulates a stored procedure on a database server.

15.1.1 TIBStoredProc Class

TIBStoredProc encapsulates a stored procedure on a database server.

Class Hierarchy

Pascal

```
TIBStoredProc = class(TIBCustomDataSet);
```

C++

```
class TIBStoredProc : public TIBCustomDataSet;
```

File

IBStoredProc

Description

Use a TIBStoredProc object when a client application must use a stored procedure on a database server. A stored procedure is a grouped set of statements, stored as part of a database server's metadata (just like tables, indexes, and domains), that performs a frequently repeated, database-related task on the server and passes results to the client.

Many stored procedures require a series of input arguments, or parameters, that are used during processing. TIBStoredProc provides a Params (see page 593) property that enables an application to set these parameters before executing the stored procedure.

TIBStoredProc reuses the Params (see page 593) property to hold the results returned by a stored procedure. Params (see page 593) is an array of values. A stored procedure will return a single set of values, or none at all.

Note: TIBStoredProc components should be used with InterBase Execute stored procedures only. To use InterBase Select procedures, use TIBQuery or TIBDataSet (see page 114). Since Execute stored procedures do not return result sets, never use Open or Active on the TIBStoredProc component. Use ExecProc (see page 588) instead.

Types of Datasets

Getting Started with InterBase Express

15.1.1.1 TIBStoredProc Members

The following tables list the members exposed by TIBStoredProc.

Protected Methods

	Name	Description
	ActivateConnection (see page 69)	This is ActivateConnection, a member of class TIBCustomDataSet.
	ActivateTransaction (see page 69)	This is ActivateTransaction, a member of class TIBCustomDataSet.
V	AllocRecordBuffer (see page 69)	This is AllocRecordBuffer, a member of class TIBCustomDataSet.
	CheckDatasetClosed (see page 71)	This is CheckDatasetClosed, a member of class TIBCustomDataSet.
	CheckDatasetOpen (see page 71)	This is CheckDatasetOpen, a member of class TIBCustomDataSet.
	CheckNotUniDirectional (see page 71)	This is CheckNotUniDirectional, a member of class TIBCustomDataSet.
V	ClearCalcFields (see page 71)	This is ClearCalcFields, a member of class TIBCustomDataSet.
	ConstraintsStored (see page 72)	This is ConstraintsStored, a member of class TIBCustomDataSet.
V	CreateFields (see page 72)	This is CreateFields, a member of class TIBCustomDataSet.
	DeactivateTransaction (see page 73)	This is DeactivateTransaction, a member of class TIBCustomDataSet.
V	DefineProperties (see page 588)	This is DefineProperties, a member of class TIBStoredProc.
V	Disconnect (see page 588)	This is Disconnect, a member of class TIBStoredProc.
V	DoBeforeDelete (see page 73)	This is DoBeforeDelete, a member of class TIBCustomDataSet.
V	DoBeforeEdit (see page 73)	This is DoBeforeEdit, a member of class TIBCustomDataSet.
V	DoBeforeInsert (see page 74)	This is DoBeforeInsert, a member of class TIBCustomDataSet.
V	DoOnNewRecord (see page 74)	This is DoOnNewRecord, a member of class TIBCustomDataSet.
V	FreeRecordBuffer (see page 75)	This is FreeRecordBuffer, a member of class TIBCustomDataSet.
	GetActiveBuf (see page 75)	This is GetActiveBuf, a member of class TIBCustomDataSet.
V	GetBookmarkData (see page 75)	This is GetBookmarkData, a member of class TIBCustomDataSet.
V	GetBookmarkFlag (see page 75)	This is GetBookmarkFlag, a member of class TIBCustomDataSet.
V	GetCanModify (see page 75)	This is GetCanModify, a member of class TIBCustomDataSet.
V	GetDataSource (see page 76)	This is GetDataSource, a member of class TIBCustomDataSet.
V	GetFieldClass (see page 76)	This is GetFieldClass, a member of class TIBCustomDataSet.
	GetParamsCount (see page 589)	This is GetParamsCount, a member of class TIBStoredProc.
V	GetRecNo (see page 77)	This is GetRecNo, a member of class TIBCustomDataSet.
V	GetRecord (see page 77)	This is GetRecord, a member of class TIBCustomDataSet.
V	GetRecordCount (see page 78)	This is GetRecordCount, a member of class TIBCustomDataSet.
V	GetRecordSize (see page 78)	This is GetRecordSize, a member of class TIBCustomDataSet.
V	InitRecord (see page 78)	This is InitRecord, a member of class TIBCustomDataSet.
V	InternalAddRecord (see page 78)	This is InternalAddRecord, a member of class TIBCustomDataSet.
V	InternalBatchInput (see page 79)	This is InternalBatchInput, a member of class TIBCustomDataSet.
V	InternalBatchOutput (see page 79)	This is InternalBatchOutput, a member of class TIBCustomDataSet.
V	InternalCancel (see page 79)	This is InternalCancel, a member of class TIBCustomDataSet.
V	InternalClose (see page 79)	This is InternalClose, a member of class TIBCustomDataSet.
V	InternalDelete (see page 79)	This is InternalDelete, a member of class TIBCustomDataSet.
V	InternalExecQuery (see page 80)	This is InternalExecQuery, a member of class TIBCustomDataSet.
V	InternalFirst (see page 80)	This is InternalFirst, a member of class TIBCustomDataSet.
V	InternalGotoBookmark (see page 80)	This is InternalGotoBookmark, a member of class TIBCustomDataSet.
V	InternalHandleException (see page 80)	This is InternalHandleException, a member of class TIBCustomDataSet.
V	InternalInitFieldDefs (see page 81)	This is InternalInitFieldDefs, a member of class TIBCustomDataSet.
V	InternalInitRecord (see page 81)	This is InternalInitRecord, a member of class TIBCustomDataSet.
V	InternalInsert (see page 81)	This is InternalInsert, a member of class TIBCustomDataSet.
V	InternalLast (see page 81)	This is InternalLast, a member of class TIBCustomDataSet.
V	InternalOpen (see page 589)	This is InternalOpen, a member of class TIBStoredProc.
V	InternalPost (see page 82)	This is InternalPost, a member of class TIBCustomDataSet.
V	InternalPrepare (see page 82)	This is InternalPrepare, a member of class TIBCustomDataSet.
V	InternalRefresh (see page 82)	This is InternalRefresh, a member of class TIBCustomDataSet.
V	InternalRefreshRow (see page 82)	This is InternalRefreshRow, a member of class TIBCustomDataSet.
V	InternalSetParamsFromCursor (see page 83)	This is InternalSetParamsFromCursor, a member of class TIBCustomDataSet.
V	InternalSetToRecord (see page 83)	This is InternalSetToRecord, a member of class TIBCustomDataSet.
V	InternalUnPrepare (see page 83)	This is InternalUnPrepare, a member of class TIBCustomDataSet.
V	IsCursorOpen (see page 83)	This is IsCursorOpen, a member of class TIBCustomDataSet.

V	Loaded (see page 84)	This is Loaded, a member of class TIBCustomDataSet.
V	PSEndTransaction (see page 86)	This is PSEndTransaction, a member of class TIBCustomDataSet.
V	PSExecute (see page 590)	This is PSExecute, a member of class TIBStoredProc.
V	PSExecuteStatement (see page 86)	This is PSExecuteStatement, a member of class TIBCustomDataSet.
V	PSGetParams (see page 590)	This is PSGetParams, a member of class TIBStoredProc.
V	PSGetQuoteChar (see page 87)	This is PSGetQuoteChar, a member of class TIBCustomDataSet.
V	PSGetTableName (see page 590)	This is PSGetTableName, a member of class TIBStoredProc.
V	PSGetUpdateException (see page 87)	This is PSGetUpdateException, a member of class TIBCustomDataSet.
V	PSInTransaction (see page 87)	This is PSInTransaction, a member of class TIBCustomDataSet.
V	PSIsSQLBased (see page 88)	This is PSIsSQLBased, a member of class TIBCustomDataSet.
V	PSIsSQLSupported (see page 88)	This is PSIsSQLSupported, a member of class TIBCustomDataSet.
V	PSReset (see page 88)	This is PSReset, a member of class TIBCustomDataSet.
V	PSSetCommandText (see page 591)	This is PSSetCommandText, a member of class TIBStoredProc.
V	PSSetParams (see page 591)	This is PSSetParams, a member of class TIBStoredProc.
V	PSStartTransaction (see page 88)	This is PSStartTransaction, a member of class TIBCustomDataSet.
V	PSUpdateRecord (see page 88)	This is PSUpdateRecord, a member of class TIBCustomDataSet.
	ReQuery (see page 89)	This is ReQuery, a member of class TIBCustomDataSet.
V	SetActive (see page 89)	This is SetActive, a member of class TIBCustomDataSet.
V	SetBookmarkData (see page 90)	This is SetBookmarkData, a member of class TIBCustomDataSet.
V	SetBookmarkFlag (see page 90)	This is SetBookmarkFlag, a member of class TIBCustomDataSet.
	SetCachedUpdates (see page 90)	This is SetCachedUpdates, a member of class TIBCustomDataSet.
	SetDataSource (see page 90)	This is SetDataSource, a member of class TIBCustomDataSet.
V	SetFieldData (see page 90)	This is the overview for the SetFieldData method overload.
V	SetFiltered (see page 591)	This is SetFiltered, a member of class TIBStoredProc.
	SetPrepare (see page 591)	This is SetPrepare, a member of class TIBStoredProc.
	SetPrepared (see page 591)	This is SetPrepared, a member of class TIBStoredProc.
	SetProcName (see page 592)	This is SetProcName, a member of class TIBStoredProc.
V	SetRecNo (see page 91)	This is SetRecNo, a member of class TIBCustomDataSet.

Protected Properties

	Name	Description
	BufferChunks (see page 98)	Specifies the dataset buffer chunk size.
	CachedUpdates (see page 98)	Specifies whether cached updates are enabled for a dataset.
	DeleteSQL (see page 99)	Holds the SQL statement used to delete rows from the dataset.
	GeneratorField (see page 100)	Specifies whether the dataset should refresh its data every time it posts a record.
	InsertSQL (see page 100)	Holds the SQL statement used to insert rows into the dataset.
R	InternalPrepared (see page 100)	Indicates whether the dataset has prepared its queries for execution.
R	LiveMode (see page 101)	Indicates what types of edits, if any, can be made to the data in the dataset.
	ModifySQL (see page 101)	Provides the ability to access the SQL object encapsulating the ModifySQL statement.
	ParamCheck (see page 102)	Specifies whether the parameter list for a query is regenerated if the SQL property changes at runtime.
R	QDelete (see page 103)	Provides the ability to directly access the SQL object encapsulating the DeleteSQL (see page 99) statement.
R	QInsert (see page 104)	Provides the ability to directly access the SQL object encapsulating the InsertSQL (see page 100) statement.
R	QModify (see page 104)	Provides the ability to directly access the SQL object encapsulating the ModifySQL (see page 101) statement.
R	QRefresh (see page 104)	Provides the ability to directly access the SQL object encapsulating the RefreshSQL (see page 105) statement.
R	QSelect (see page 104)	Provides the ability to directly access the SQL object encapsulating the SelectSQL (see page 105) statement.
	RefreshSQL (see page 105)	Provides the ability to directly access the SQL object encapsulating the RefreshSQL statement.
	SelectSQL (see page 105)	Provides the ability to directly access the SQL object encapsulating the SelectSQL statement.
R	SelectStmtHandle (see page 105)	Gets the handle for the SELECT statement.

	SQLParams (see page 106)	Specifies the parameters to use for any parameterized queries.
	StatementType (see page 106)	Returns the statement type of the QSelect (see page 104) query.
	UniDirectional (see page 107)	Determines whether bidirectional cursors are enabled for the dataset.
	UpdateMode (see page 107)	Indicates how records are located when updating records.

Public Methods

	Name	Description
	ApplyUpdates (see page 69)	Writes a dataset's pending cached updates to the database.
	BookmarkValid (see page 70)	Indicates the validity of a specified bookmark.
	CachedUpdateStatus (see page 70)	Returns the status of the cached updates.
	CancelUpdates (see page 70)	Clears all pending cached updates from the cache.
	CompareBookmarks (see page 71)	Compares two bookmarks.
	CopyParams (see page 588)	Copies a stored procedure's parameters into another parameter list.
	Create (see page 586)	Creates an instance of a stored procedure component.
	CreateBlobStream (see page 72)	Returns a TIBDSBlobStream (see page 138) object for reading or writing the data in a specified blob field.
	Current (see page 73)	Returns the descriptor area that holds information about the current query.
	Destroy (see page 587)	Destroys the instance of a stored procedure.
	ExecProc (see page 588)	Executes the stored procedure on the server.
	FetchAll (see page 74)	Retrieves all records from the current cursor position to the end of the file and stores them locally.
	GetCurrentRecord (see page 76)	Retrieves the current record into a buffer.
	GetFieldData (see page 76)	This is the overview for the GetFieldData method overload.
	IsSequenced (see page 83)	IsSequenced indicates whether sequence numbers are available for database records.
	Locate (see page 84)	Searches the dataset for a specified record and makes that record the current record.
	LocateNext (see page 85)	Searches the dataset for the record after a specified record and makes that record the current record.
	Lookup (see page 85)	Retrieves field values from a record that matches specified search values.
	ParamByName (see page 589)	Accesses parameter information based on a specified parameter name.
	Post (see page 86)	Writes a modified record to the database server.
	Prepare (see page 590)	Prepares a stored procedure for execution.
	RecordModified (see page 89)	Sets the record to modified or unmodified.
	RevertRecord (see page 89)	Restores the current record in the dataset to an unmodified state when cached updates are enabled.
	SQLType (see page 91)	Returns the type of query to be executed.
	Undelete (see page 92)	Restores a record deleted from the dataset.
	UnPrepare (see page 592)	Frees the resources allocated for a previously prepared stored procedure.
	UpdateStatus (see page 92)	Reports the update status for the current record.

Public Properties

	Name	Description
	DBHandle (see page 99)	Specifies the database handle for the dataset.
	ParamCount (see page 593)	Indicates the number of parameters for the stored procedure component.
	Plan (see page 103)	Indicates the PLAN portion of the dataset's SELECT query.
	Prepared (see page 594)	Determines whether or not a stored procedure is prepared for execution.
	RowsAffected (see page 105)	Indicates the number of rows operated on by the latest query execution.
	StmtHandle (see page 594)	Identifies the statement handle for the stored procedure.
	StoredProcedureNames (see page 594)	Returns a list of stored procedures in the database.
	TRHandle (see page 106)	Specifies the transaction handle for the dataset.
	UpdateObject (see page 107)	Specifies the update object component used to update a read-only result set.
	UpdateRecordTypes (see page 108)	Specifies the type of records visible in a dataset when cached updates are enabled.
	UpdatesPending (see page 108)	Indicates whether the cached updates buffer contains records that are not yet applied.

Published Events

	Name	Description
	AfterDatabaseDisconnect (see page 595)	Occurs immediately after the connection to the associated database is closed.
	AfterTransactionEnd (see page 595)	Occurs immediately after a transaction that includes this dataset's query ends.
	BeforeDatabaseDisconnect (see page 596)	Occurs immediately before the connection to the associated database is closed.
	BeforeTransactionEnd (see page 596)	Occurs immediately before a transaction that includes this dataset's query ends.
	DatabaseFree (see page 596)	Occurs when the database associated with this dataset is freed.
	OnUpdateError (see page 110)	Occurs if an exception is generated when cached updates are applied to a database.
	OnUpdateRecord (see page 111)	Occurs when cached updates are applied to a record.
	TransactionFree (see page 596)	Occurs when the transaction that includes this dataset's query is freed.

Published Properties

	Name	Description
	AfterCancel (see page 94)	This is AfterCancel, a member of class TIBCustomDataSet.
	AfterClose (see page 94)	This is AfterClose, a member of class TIBCustomDataSet.
	AfterDelete (see page 94)	This is AfterDelete, a member of class TIBCustomDataSet.
	AfterEdit (see page 94)	This is AfterEdit, a member of class TIBCustomDataSet.
	AfterInsert (see page 95)	This is AfterInsert, a member of class TIBCustomDataSet.
	AfterOpen (see page 95)	This is AfterOpen, a member of class TIBCustomDataSet.
	AfterPost (see page 95)	This is AfterPost, a member of class TIBCustomDataSet.
	AfterRefresh (see page 95)	This is AfterRefresh, a member of class TIBCustomDataSet.
	AfterScroll (see page 95)	This is AfterScroll, a member of class TIBCustomDataSet.
	AutoCalcFields (see page 96)	This is AutoCalcFields, a member of class TIBCustomDataSet.
	BeforeCancel (see page 96)	This is BeforeCancel, a member of class TIBCustomDataSet.
	BeforeClose (see page 96)	This is BeforeClose, a member of class TIBCustomDataSet.
	BeforeDelete (see page 96)	This is BeforeDelete, a member of class TIBCustomDataSet.
	BeforeEdit (see page 97)	This is BeforeEdit, a member of class TIBCustomDataSet.
	BeforeInsert (see page 97)	This is BeforeInsert, a member of class TIBCustomDataSet.
	BeforeOpen (see page 97)	This is BeforeOpen, a member of class TIBCustomDataSet.
	BeforePost (see page 97)	This is BeforePost, a member of class TIBCustomDataSet.
	BeforeRefresh (see page 97)	This is BeforeRefresh, a member of class TIBCustomDataSet.
	BeforeScroll (see page 98)	This is BeforeScroll, a member of class TIBCustomDataSet.
	Database (see page 99)	Identifies the database component for which this dataset represents one or more tables.
	Filtered (see page 592)	Specifies whether filtering is active for a dataset.
	ForcedRefresh (see page 99)	Specifies whether the dataset should refresh its data every time it posts a record.
	ObjectView (see page 101)	This is ObjectView, a member of class TIBCustomDataSet.
	OnCalcFields (see page 101)	This is OnCalcFields, a member of class TIBCustomDataSet.
	OnDeleteError (see page 102)	This is OnDeleteError, a member of class TIBCustomDataSet.
	OnEditError (see page 102)	This is OnEditError, a member of class TIBCustomDataSet.
	OnFilterRecord (see page 593)	This is OnFilterRecord, a member of class TIBStoredProc.
	OnNewRecord (see page 102)	This is OnNewRecord, a member of class TIBCustomDataSet.
	OnPostError (see page 102)	This is OnPostError, a member of class TIBCustomDataSet.
	Params (see page 593)	Stores the input and output parameters for a stored procedure.
	StoredProcName (see page 595)	Identifies the name of the stored procedure on the server for which this object is an encapsulation.
	Transaction (see page 106)	Identifies the transaction under which the query executes.

15.1.1.2 TIBStoredProc.Create Constructor

Creates an instance of a stored procedure component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBStoredProc(TComponent * AOwner);
```

Description

Call Create to instantiate a stored procedure declared in an application. Create calls its inherited Create constructor, creates an empty parameter list for the newly instantiated stored procedure, and initializes its parameter, server, and record buffers to nil.

15.1.1.3 TIBStoredProc.Destroy Destructor

Destroys the instance of a stored procedure.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBStoredProc();
```

Description

Do not call Destroy directly. Instead call Free to verify that the stored procedure is not already freed before calling Destroy. Destroy disconnects from the server, frees the parameter list, and calls its inherited Destroy destructor.

15.1.1.4 TIBStoredProc Methods

The methods of the TIBStoredProc class are listed here.

Protected Methods

	Name	Description
	DefineProperties (see page 588)	This is DefineProperties, a member of class TIBStoredProc.
	Disconnect (see page 588)	This is Disconnect, a member of class TIBStoredProc.
	GetParamsCount (see page 589)	This is GetParamsCount, a member of class TIBStoredProc.
	InternalOpen (see page 589)	This is InternalOpen, a member of class TIBStoredProc.
	PSExecute (see page 590)	This is PSExecute, a member of class TIBStoredProc.
	PSGetParams (see page 590)	This is PSGetParams, a member of class TIBStoredProc.
	PSGetTableName (see page 590)	This is PSGetTableName, a member of class TIBStoredProc.
	PSSetCommandText (see page 591)	This is PSSetCommandText, a member of class TIBStoredProc.
	PSSetParams (see page 591)	This is PSSetParams, a member of class TIBStoredProc.
	SetFiltered (see page 591)	This is SetFiltered, a member of class TIBStoredProc.
	SetPrepare (see page 591)	This is SetPrepare, a member of class TIBStoredProc.
	SetPrepared (see page 591)	This is SetPrepared, a member of class TIBStoredProc.
	SetProcName (see page 592)	This is SetProcName, a member of class TIBStoredProc.

Public Methods

	Name	Description
	CopyParams (see page 588)	Copies a stored procedure's parameters into another parameter list.
	ExecProc (see page 588)	Executes the stored procedure on the server.
	ParamByName (see page 589)	Accesses parameter information based on a specified parameter name.
	Prepare (see page 590)	Prepares a stored procedure for execution.
	UnPrepare (see page 592)	Frees the resources allocated for a previously prepared stored procedure.

15.1.1.4.1 TIBStoredProc.CopyParams Method

Copies a stored procedure's parameters into another parameter list.

Pascal

```
procedure CopyParams(Value: TParams);
```

C++

```
__fastcall CopyParams(TParams Value);
```

Description

Call CopyParams to copy this stored procedure's parameters into a separate parameter list object. Value is the parameter list into which to assign this stored procedure's parameters. Value can be the parameter list of another stored procedure. For example:

```
TIBStoredProc1.CopyParams(TIBStoredProc2.Params);
    TIBStoredProc1->CopyParams(TIBStoredProc2->Params);
```

If the stored procedure is not prepared when an application calls CopyParams, CopyParams calls Prepare (see page 590) before assigning the parameters to the target parameters list, and then calls UnPrepare (see page 592) to return the stored procedure to its previous state.

15.1.1.4.2 TIBStoredProc.DefineProperties Method

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

This is DefineProperties, a member of class TIBStoredProc.

15.1.1.4.3 TIBStoredProc.Disconnect Method

Pascal

```
procedure Disconnect; override;
```

C++

```
virtual __fastcall Disconnect();
```

Description

This is Disconnect, a member of class TIBStoredProc.

15.1.1.4.4 TIBStoredProc.ExecProc Method

Executes the stored procedure on the server.

Pascal

```
procedure ExecProc;
```

C++

```
__fastcall ExecProc();
```

Description

Call ExecProc to execute a stored procedure on the server. Before calling ExecProc:

1. **1** Provide any input parameters in the Params (see page 593) property. At design time, a developer can provide parameters using the Parameters editor. At runtime an application must access Params (see page 593) directly.
2. **2** Call Prepare (see page 590) to bind the parameters.

If a stored procedure returns output parameters, they are stored in the Params (see page 593) property when ExecProc returns control to the application. An application can access the output parameters by indexing into the Params (see page 593) list, or by using the ParamByName (see page 589) method.

15.1.1.4.5 TIBStoredProc.GetParamsCount Method

Pascal

```
function GetParamsCount: Word;
```

C++

```
__fastcall Word GetParamsCount();
```

Description

This is GetParamsCount, a member of class TIBStoredProc.

15.1.1.4.6 TIBStoredProc.InternalOpen Method

Pascal

```
procedure InternalOpen; override;
```

C++

```
virtual __fastcall InternalOpen();
```

Description

This is InternalOpen, a member of class TIBStoredProc.

15.1.1.4.7 TIBStoredProc.ParamByName Method

Accesses parameter information based on a specified parameter name.

Pascal

```
function ParamByName(const Value: string): TParam;
```

C++

```
__fastcall TParam ParamByName(const UnicodeString Value);
```

Description

Call ParamByName to return parameter information for a specific parameter based on its name. Value is the name of the parameter for which to retrieve information. Typically ParamByName is used to set an input parameter's value at runtime, or to retrieve the value of an output parameter. The following command line assigns the value "Jane Smith" as the value for the parameter named Contact:

```
StoredProc1.ParamByName('Contact').AsString := 'Jane Smith';
    StoredProc1->ParamByName("Contact")->AsString = "Jane Smith";
```

15.1.1.4.8 TIBStoredProc.Prepare Method

Prepares a stored procedure for execution.

Pascal

```
procedure Prepare;
```

C++

```
__fastcall Prepare();
```

Description

Call Prepare to bind a stored procedure's parameters before calling ExecProc (see page 588) to execute the procedure. Prepare readies a stored procedure's parameters and informs the server of the stored procedure's readiness. These steps allocate system resources and optimize the query for server performance.

Note: A stored procedure is automatically prepared if it is unprepared when the application calls ExecProc (see page 588). After execution, the stored procedure is then automatically unprepared. If a stored procedure will be executed more than once, it is more efficient for an application to call Prepare explicitly once to avoid repeated and unnecessary preparing and unpreparing of the stored procedure, and then call UnPrepare (see page 592) when the stored procedure is no longer needed.

15.1.1.4.9 TIBStoredProc.PSExecute Method

Pascal

```
procedure PSExecute; override;
```

C++

```
virtual __fastcall PSExecute();
```

Description

This is PSExecute, a member of class TIBStoredProc.

15.1.1.4.10 TIBStoredProc.PSGetParams Method

Pascal

```
function PSGetParams: TParams; override;
```

C++

```
virtual __fastcall TParams PSGetParams();
```

Description

This is PSGetParams, a member of class TIBStoredProc.

15.1.1.4.11 TIBStoredProc.PSGetTableName Method

Pascal

```
function PSGetTableName: string; override;
```

C++

```
virtual __fastcall UnicodeString PSGetTableName();
```

Description

This is PSGetTableName, a member of class TIBStoredProc.

15.1.1.4.12 TIBStoredProc.PSSetCommandText Method

Pascal

```
procedure PSSetCommandText(const CommandText: string); override;
```

C++

```
virtual __fastcall PSSetCommandText(const UnicodeString CommandText);
```

Description

This is PSSetCommandText, a member of class TIBStoredProc.

15.1.1.4.13 TIBStoredProc.PSSetParams Method

Pascal

```
procedure PSSetParams(AParams: TParams); override;
```

C++

```
virtual __fastcall PSSetParams(TParams AParams);
```

Description

This is PSSetParams, a member of class TIBStoredProc.

15.1.1.4.14 TIBStoredProc.SetFiltered Method

Pascal

```
procedure SetFiltered(Value: Boolean); override;
```

C++

```
virtual __fastcall SetFiltered(Boolean Value);
```

Description

This is SetFiltered, a member of class TIBStoredProc.

15.1.1.4.15 TIBStoredProc.SetPrepare Method

Pascal

```
procedure SetPrepare(Value: Boolean);
```

C++

```
__fastcall SetPrepare(Boolean Value);
```

Description

This is SetPrepare, a member of class TIBStoredProc.

15.1.1.4.16 TIBStoredProc.SetPrepared Method

Pascal

```
procedure SetPrepared(Value: Boolean);
```

C++

```
__fastcall SetPrepared(Boolean Value);
```

Description

This is SetPrepared, a member of class TIBStoredProc.

15.1.1.4.17 TIBStoredProc.SetProcName Method

Pascal

```
procedure SetProcName(Value: string);
```

C++

```
__fastcall SetProcName(UnicodeString Value);
```

Description

This is SetProcName, a member of class TIBStoredProc.

15.1.1.4.18 TIBStoredProc.UnPrepare Method

Frees the resources allocated for a previously prepared stored procedure.

Pascal

```
procedure UnPrepare;
```

C++

```
__fastcall UnPrepare();
```

Description

Call UnPrepare to free the resources allocated for a previously prepared stored procedure on the server and client sides.

15.1.1.5 TIBStoredProc Properties

The properties of the TIBStoredProc class are listed here.

Public Properties

	Name	Description
R	ParamCount (see page 593)	Indicates the number of parameters for the stored procedure component.
	Prepared (see page 594)	Determines whether or not a stored procedure is prepared for execution.
R	StmtHandle (see page 594)	Identifies the statement handle for the stored procedure.
R	StoredProcedureNames (see page 594)	Returns a list of stored procedures in the database.

Published Properties

	Name	Description
	Filtered (see page 592)	Specifies whether filtering is active for a dataset.
	OnFilterRecord (see page 593)	This is OnFilterRecord, a member of class TIBStoredProc.
	Params (see page 593)	Stores the input and output parameters for a stored procedure.
	StoredProcName (see page 595)	Identifies the name of the stored procedure on the server for which this object is an encapsulation.

15.1.1.5.1 TIBStoredProc.Filtered Property

Specifies whether filtering is active for a dataset.

Pascal

```
property Filtered;
```

C++

```
__property Filtered;
```

Description

Check Filtered to determine whether dataset filtering is in effect. If Filtered is true, then filtering is active. Otherwise Filtered is false. To apply filter conditions specified in the Filter property or the OnFilterRecord (see page 593) event handler, set Filtered to true. Filtered is set to false by default.

Note: When filtering is enabled, user edits to a record may mean that the record no longer meets a filter's test condition. The next time the record is retrieved from the dataset while the filter is in effect, the record may seem to disappear. If that happens, the next record that passes the filter condition becomes the current record.

15.1.1.5.2 TIBStoredProc.OnFilterRecord Property

Pascal

```
property OnFilterRecord;
```

C++

```
__property OnFilterRecord;
```

Description

This is OnFilterRecord, a member of class TIBStoredProc.

15.1.1.5.3 TIBStoredProc.ParamCount Property

Indicates the number of parameters for the stored procedure component.

Pascal

```
property ParamCount: Word;
```

C++

```
__property Word ParamCount;
```

Description

Examine ParamCount to determine the number of parameters currently stored in the Params (see page 593) property.

15.1.1.5.4 TIBStoredProc.Params Property

Stores the input and output parameters for a stored procedure.

Pascal

```
property Params: TParams;
```

C++

```
__property TParams Params;
```

Description

Access Params at runtime to set input parameter names, values, and data types dynamically (at design time use the Parameters editor to set parameter information). Params is an array of parameter values.

An application can also access Params after executing a stored procedure to retrieve the output parameters returned to the

procedure by the server.

15.1.1.5.5 TIBStoredProc.Prepared Property

Determines whether or not a stored procedure is prepared for execution.

Pascal

```
property Prepared: Boolean;
```

C++

```
__property Boolean Prepared;
```

Description

Examine Prepared to determine if a stored procedure is already prepared for execution. If Prepared is true, the stored procedure is prepared, and if Prepared is false, the procedure is not prepared. A stored procedure must be prepared before it can be executed.

Note: A stored procedure is automatically prepared if it is unprepared when the application calls ExecProc (see page 588). After execution, the stored procedure is then automatically unprepared. If a procedure will be executed a number of times, it is more efficient for the application to prepare the stored procedure once, and unprepare it when it is no longer needed.

An application can change the current setting of Prepared to prepare or unprepare a stored procedure. If Prepared is true, setting it to false calls the UnPrepare (see page 592) method to unprepare the stored procedure. If Prepared is false, setting it to true calls the Prepare (see page 590) method to prepare the procedure. Generally, however, it is better programming practice to call Prepare (see page 590) and UnPrepare (see page 592) directly. These methods automatically update the Prepared property.

15.1.1.5.6 TIBStoredProc.StmtHandle Property

Identifies the statement handle for the stored procedure.

Pascal

```
property StmtHandle: TISC_STMT_HANDLE;
```

C++

```
__property TISC_STMT_HANDLE StmtHandle;
```

Description

Retrieve StmtHandle if an application makes a direct call to the InterBase server, bypassing the methods of TIBStoredProc (see page 582). Some API calls require a statement handle as a parameter. Under all other circumstances an application does not need to access this property.

15.1.1.5.7 TIBStoredProc.StoredProcedureNames Property

Returns a list of stored procedures in the database.

Pascal

```
property StoredProcedureNames: TStrings;
```

C++

```
__property TStrings StoredProcedureNames;
```

Description

StoredProcedureNames is an internal property used to list the stored procedures available in the database.

15.1.1.5.8 TIBStoredProc.StoredProcName Property

Identifies the name of the stored procedure on the server for which this object is an encapsulation.

Pascal

```
property StoredProcName: string;
```

C++

```
__property UnicodeString StoredProcName;
```

Description

Set StoredProcName to specify the name of the stored procedure to call on the server. If StoredProcName does not match the name of an existing stored procedure on the server, then when the application attempts to prepare the procedure prior to execution, an exception is raised.

15.1.1.6 TIBStoredProc Events

The events of the TIBStoredProc class are listed here.

Published Events

	Name	Description
	AfterDatabaseDisconnect (see page 595)	Occurs immediately after the connection to the associated database is closed.
	AfterTransactionEnd (see page 595)	Occurs immediately after a transaction that includes this dataset's query ends.
	BeforeDatabaseDisconnect (see page 596)	Occurs immediately before the connection to the associated database is closed.
	BeforeTransactionEnd (see page 596)	Occurs immediately before a transaction that includes this dataset's query ends.
	DatabaseFree (see page 596)	Occurs when the database associated with this dataset is freed.
	TransactionFree (see page 596)	Occurs when the transaction that includes this dataset's query is freed.

15.1.1.6.1 TIBStoredProc.AfterDatabaseDisconnect Event

Occurs immediately after the connection to the associated database is closed.

Pascal

```
property AfterDatabaseDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterDatabaseDisconnect;
```

Description

Write an AfterDatabaseDisconnect event handler to respond when the dataset closes its connection to the database specified by the Database property.

15.1.1.6.2 TIBStoredProc.AfterTransactionEnd Event

Occurs immediately after a transaction that includes this dataset's query ends.

Pascal

```
property AfterTransactionEnd: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterTransactionEnd;
```

Description

Write an AfterTransactionEnd event handler to respond when the transaction specified by the Transaction property ends.

15.1.1.6.3 TIBStoredProc.BeforeDatabaseDisconnect Event

Occurs immediately before the connection to the associated database is closed.

Pascal

```
property BeforeDatabaseDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeDatabaseDisconnect;
```

Description

Write a BeforeDatabaseDisconnect event handler to respond when the dataset is about to close its connection to the database specified by the Database property.

15.1.1.6.4 TIBStoredProc.BeforeTransactionEnd Event

Occurs immediately before a transaction that includes this dataset's query ends.

Pascal

```
property BeforeTransactionEnd: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeTransactionEnd;
```

Description

Write a BeforeTransactionEnd event handler to respond when the transaction specified by the Transaction property is about to end.

15.1.1.6.5 TIBStoredProc.DatabaseFree Event

Occurs when the database associated with this dataset is freed.

Pascal

```
property DatabaseFree: TNotifyEvent;
```

C++

```
__property TNotifyEvent DatabaseFree;
```

Description

Write a DatabaseFree event handler to respond when the database specified by the Database property is freed.

15.1.1.6.6 TIBStoredProc.TransactionFree Event

Occurs when the transaction that includes this dataset's query is freed.

Pascal

```
property TransactionFree: TNotifyEvent;
```

C++

```
__property TNotifyEvent TransactionFree;
```

Description

Write a TransactionFree event handler to respond when the transaction specified by the Transaction property is freed.

16 IBTable Namespace

This is namespace IBTable.

Topics

Name	Description
Classes (see page 600)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 626)	The following table lists structs, records, enums in this documentation.
Types (see page 627)	The following table lists types in this documentation.

Classes

	Name	Description
	TIBTable (see page 600)	TIBTable is a dataset component that encapsulates a database table.

Structs, Records, Enums

	Name	Description
	TIBTableType (see page 626)	This is record IBTable.TIBTableType.

Types

Name	Description
TIBTableTypes (see page 627)	TIBTableTypes and TIBTableTypes indicate the types of InterBase tables and views other than user tables.
TIndexName (see page 627)	This is type IBTable.TIndexName.

16.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TIBTable (see page 600)	TIBTable is a dataset component that encapsulates a database table.

16.1.1 TIBTable Class

TIBTable is a dataset component that encapsulates a database table.

Class Hierarchy

Pascal

```
TIBTable = class(TIBCustomDataSet);
```

C++

```
class TIBTable : public TIBCustomDataSet;
```

File

IBTable

Description

Use TIBTable to access data in a single table or view. TIBTable provides direct access to every record and field in an underlying InterBase database table. A table component can also work with a subset of records within a database table using filters.

16.1.1.1 TIBTable Members

The following tables list the members exposed by TIBTable.

Protected Methods

	Name	Description
	ActivateConnection (see page 69)	This is ActivateConnection, a member of class TIBCustomDataSet.
	ActivateTransaction (see page 69)	This is ActivateTransaction, a member of class TIBCustomDataSet.
	AllocRecordBuffer (see page 69)	This is AllocRecordBuffer, a member of class TIBCustomDataSet.
	CheckDatasetClosed (see page 71)	This is CheckDatasetClosed, a member of class TIBCustomDataSet.
	CheckDatasetOpen (see page 71)	This is CheckDatasetOpen, a member of class TIBCustomDataSet.
	CheckNotUniDirectional (see page 71)	This is CheckNotUniDirectional, a member of class TIBCustomDataSet.
	ClearCalcFields (see page 71)	This is ClearCalcFields, a member of class TIBCustomDataSet.
	ConstraintsStored (see page 72)	This is ConstraintsStored, a member of class TIBCustomDataSet.

	CreateFields (see page 72)	This is CreateFields, a member of class TIBCustomDataSet.
	DataEvent (see page 607)	This is DataEvent, a member of class TIBTable.
	DeactivateTransaction (see page 73)	This is DeactivateTransaction, a member of class TIBCustomDataSet.
	DefChanged (see page 607)	This is DefChanged, a member of class TIBTable.
	Disconnect (see page 73)	This is Disconnect, a member of class TIBCustomDataSet.
	DoBeforeDelete (see page 73)	This is DoBeforeDelete, a member of class TIBCustomDataSet.
	DoBeforeEdit (see page 73)	This is DoBeforeEdit, a member of class TIBCustomDataSet.
	DoBeforeInsert (see page 74)	This is DoBeforeInsert, a member of class TIBCustomDataSet.
	DoOnNewRecord (see page 608)	This is DoOnNewRecord, a member of class TIBTable.
	FreeRecordBuffer (see page 75)	This is FreeRecordBuffer, a member of class TIBCustomDataSet.
	GetActiveBuf (see page 75)	This is GetActiveBuf, a member of class TIBCustomDataSet.
	GetBookmarkData (see page 75)	This is GetBookmarkData, a member of class TIBCustomDataSet.
	GetBookmarkFlag (see page 75)	This is GetBookmarkFlag, a member of class TIBCustomDataSet.
	GetCanModify (see page 608)	This is GetCanModify, a member of class TIBTable.
	GetDataSource (see page 609)	This is GetDataSource, a member of class TIBTable.
	GetFieldClass (see page 76)	This is GetFieldClass, a member of class TIBCustomDataSet.
	GetIndexParams (see page 609)	This is GetIndexParams, a member of class TIBTable.
	GetRecNo (see page 77)	This is GetRecNo, a member of class TIBCustomDataSet.
	GetRecord (see page 77)	This is GetRecord, a member of class TIBCustomDataSet.
	GetRecordCount (see page 78)	This is GetRecordCount, a member of class TIBCustomDataSet.
	GetRecordSize (see page 78)	This is GetRecordSize, a member of class TIBCustomDataSet.
	InitFieldDefs (see page 610)	This is InitFieldDefs, a member of class TIBTable.
	InitRecord (see page 78)	This is InitRecord, a member of class TIBCustomDataSet.
	InternalAddRecord (see page 78)	This is InternalAddRecord, a member of class TIBCustomDataSet.
	InternalBatchInput (see page 79)	This is InternalBatchInput, a member of class TIBCustomDataSet.
	InternalBatchOutput (see page 79)	This is InternalBatchOutput, a member of class TIBCustomDataSet.
	InternalCancel (see page 79)	This is InternalCancel, a member of class TIBCustomDataSet.
	InternalClose (see page 610)	This is InternalClose, a member of class TIBTable.
	InternalDelete (see page 79)	This is InternalDelete, a member of class TIBCustomDataSet.
	InternalExecQuery (see page 80)	This is InternalExecQuery, a member of class TIBCustomDataSet.
	InternalFirst (see page 80)	This is InternalFirst, a member of class TIBCustomDataSet.
	InternalGotoBookmark (see page 80)	This is InternalGotoBookmark, a member of class TIBCustomDataSet.
	InternalHandleException (see page 80)	This is InternalHandleException, a member of class TIBCustomDataSet.
	InternalInitFieldDefs (see page 81)	This is InternalInitFieldDefs, a member of class TIBCustomDataSet.
	InternalInitRecord (see page 81)	This is InternalInitRecord, a member of class TIBCustomDataSet.
	InternalInsert (see page 81)	This is InternalInsert, a member of class TIBCustomDataSet.
	InternalLast (see page 81)	This is InternalLast, a member of class TIBCustomDataSet.
	InternalOpen (see page 610)	This is InternalOpen, a member of class TIBTable.
	InternalPost (see page 82)	This is InternalPost, a member of class TIBCustomDataSet.
	InternalPrepare (see page 82)	This is InternalPrepare, a member of class TIBCustomDataSet.
	InternalRefresh (see page 611)	This is InternalRefresh, a member of class TIBTable.
	InternalRefreshRow (see page 611)	This is InternalRefreshRow, a member of class TIBTable.
	InternalSetParamsFromCursor (see page 83)	This is InternalSetParamsFromCursor, a member of class TIBCustomDataSet.
	InternalSetToRecord (see page 83)	This is InternalSetToRecord, a member of class TIBCustomDataSet.
	InternalUnPrepare (see page 83)	This is InternalUnPrepare, a member of class TIBCustomDataSet.
	IsCursorOpen (see page 83)	This is IsCursorOpen, a member of class TIBCustomDataSet.
	Loaded (see page 84)	This is Loaded, a member of class TIBCustomDataSet.
	PSEndTransaction (see page 86)	This is PSEndTransaction, a member of class TIBCustomDataSet.
	PSExecuteStatement (see page 86)	This is PSExecuteStatement, a member of class TIBCustomDataSet.
	PSGetDefaultOrder (see page 612)	This is PSGetDefaultOrder, a member of class TIBTable.
	PSGetIndexDefs (see page 612)	This is PSGetIndexDefs, a member of class TIBTable.
	PSGetKeyFields (see page 612)	This is PSGetKeyFields, a member of class TIBTable.
	PSGetQuoteChar (see page 87)	This is PSGetQuoteChar, a member of class TIBCustomDataSet.
	PSGetTableName (see page 612)	This is PSGetTableName, a member of class TIBTable.

	PSGetUpdateException (see page 87)	This is PSGetUpdateException, a member of class TIBCustomDataSet.
	PSInTransaction (see page 87)	This is PSInTransaction, a member of class TIBCustomDataSet.
	PSIsSQLBased (see page 88)	This is PSIsSQLBased, a member of class TIBCustomDataSet.
	PSIsSQLSupported (see page 88)	This is PSIsSQLSupported, a member of class TIBCustomDataSet.
	PSReset (see page 88)	This is PSReset, a member of class TIBCustomDataSet.
	PSSetCommandText (see page 613)	This is PSSetCommandText, a member of class TIBTable.
	PSSetParams (see page 613)	This is PSSetParams, a member of class TIBTable.
	PSStartTransaction (see page 88)	This is PSStartTransaction, a member of class TIBCustomDataSet.
	PSUpdateRecord (see page 88)	This is PSUpdateRecord, a member of class TIBCustomDataSet.
	ReQuery (see page 89)	This is ReQuery, a member of class TIBCustomDataSet.
	SetActive (see page 89)	This is SetActive, a member of class TIBCustomDataSet.
	SetBookmarkData (see page 90)	This is SetBookmarkData, a member of class TIBCustomDataSet.
	SetBookmarkFlag (see page 90)	This is SetBookmarkFlag, a member of class TIBCustomDataSet.
	SetCachedUpdates (see page 90)	This is SetCachedUpdates, a member of class TIBCustomDataSet.
	SetDataSource (see page 90)	This is SetDataSource, a member of class TIBCustomDataSet.
	SetFieldData (see page 90)	This is the overview for the SetFieldData method overload.
	SetFiltered (see page 613)	This is SetFiltered, a member of class TIBTable.
	SetFilterOptions (see page 613)	This is SetFilterOptions, a member of class TIBTable.
	SetFilterText (see page 614)	This is SetFilterText, a member of class TIBTable.
	SetRecNo (see page 91)	This is SetRecNo, a member of class TIBCustomDataSet.
	UpdateIndexDefs (see page 614)	This is UpdateIndexDefs, a member of class TIBTable.

Protected Properties

	Name	Description
	DeleteSQL (see page 99)	Holds the SQL statement used to delete rows from the dataset.
	GeneratorField (see page 100)	Specifies whether the dataset should refresh its data every time it posts a record.
	InsertSQL (see page 100)	Holds the SQL statement used to insert rows into the dataset.
	InternalPrepared (see page 100)	Indicates whether the dataset has prepared its queries for execution.
	ModifySQL (see page 101)	Provides the ability to access the SQL object encapsulating the ModifySQL statement.
	ParamCheck (see page 102)	Specifies whether the parameter list for a query is regenerated if the SQL property changes at runtime.
	Params (see page 103)	Specifies the parameters to use for any parameterized queries.
	QDelete (see page 103)	Provides the ability to directly access the SQL object encapsulating the DeleteSQL (see page 99) statement.
	QInsert (see page 104)	Provides the ability to directly access the SQL object encapsulating the InsertSQL (see page 100) statement.
	QModify (see page 104)	Provides the ability to directly access the SQL object encapsulating the ModifySQL (see page 101) statement.
	QRefresh (see page 104)	Provides the ability to directly access the SQL object encapsulating the RefreshSQL (see page 105) statement.
	QSelect (see page 104)	Provides the ability to directly access the SQL object encapsulating the SelectSQL (see page 105) statement.
	RefreshSQL (see page 105)	Provides the ability to directly access the SQL object encapsulating the RefreshSQL statement.
	SelectSQL (see page 105)	Provides the ability to directly access the SQL object encapsulating the SelectSQL statement.
	SelectStmtHandle (see page 105)	Gets the handle for the SELECT statement.
	SQLParams (see page 106)	Specifies the parameters to use for any parameterized queries.
	StatementType (see page 106)	Returns the statement type of the QSelect (see page 104) query.
	UpdateMode (see page 107)	Indicates how records are located when updating records.

Public Methods

	Name	Description
	AddIndex (see page 606)	Creates a new index for the table.
	ApplyUpdates (see page 69)	Writes a dataset's pending cached updates to the database.
	BookmarkValid (see page 70)	Indicates the validity of a specified bookmark.

	CachedUpdateStatus (see page 70)	Returns the status of the cached updates.
	CancelUpdates (see page 70)	Clears all pending cached updates from the cache.
V	CompareBookmarks (see page 71)	Compares two bookmarks.
V	Create (see page 605)	Creates an instance of a table component.
V	CreateBlobStream (see page 72)	Returns a TIBDSBlobStream (see page 138) object for reading or writing the data in a specified blob field.
	CreateTable (see page 606)	Builds a new table using new structure information.
	Current (see page 73)	Returns the descriptor area that holds information about the current query.
	DeleteIndex (see page 607)	Deletes an index for the table.
	DeleteTable (see page 608)	Deletes an existing database table.
V	Destroy (see page 605)	Destroys the instance of a table.
	EmptyTable (see page 608)	Deletes all records from the table.
	FetchAll (see page 74)	Retrieves all records from the current cursor position to the end of the file and stores them locally.
V	GetCurrentRecord (see page 76)	Retrieves the current record into a buffer.
V	GetDetailLinkFields (see page 609)	Lists the field components that link this dataset as a detail of a master dataset.
V	GetFieldData (see page 76)	This is the overview for the GetFieldData method overload.
	GetIndexNames (see page 609)	Retrieves a list of available indexes for a table.
	GotoCurrent (see page 610)	Synchronizes the current record for this table with the current record of a specified table component.
V	IsSequenced (see page 83)	IsSequenced indicates whether sequence numbers are available for database records.
V	Locate (see page 611)	Searches the table for a specified record and makes that record the current record.
	LocateNext (see page 85)	Searches the dataset for the record after a specified record and makes that record the current record.
V	Lookup (see page 85)	Retrieves field values from a record that matches specified search values.
V	Post (see page 86)	Writes a modified record to the database server.
	RecordModified (see page 89)	Sets the record to modified or unmodified.
	RevertRecord (see page 89)	Restores the current record in the dataset to an unmodified state when cached updates are enabled.
	SQLType (see page 91)	Returns the type of query to be executed.
	Undelete (see page 92)	Restores a record deleted from the dataset.
V	UpdateStatus (see page 92)	Reports the update status for the current record.

Public Properties

	Name	Description
R	CurrentDBKey (see page 616)	Returns the DBKey for the current row in the table.
R	DBHandle (see page 99)	Specifies the database handle for the dataset.
R	Exists (see page 616)	Indicates whether the underlying database table exists.
R	IndexFieldCount (see page 618)	Indicates the number of fields that comprise the current key.
	IndexFields (see page 619)	Retrieves or sets a field for an index.
	LiveMode (see page 619)	Indicates what types of edits, if any, can be made to the data in the dataset.
R	Plan (see page 103)	Indicates the PLAN portion of the dataset's SELECT query.
R	RowsAffected (see page 105)	Indicates the number of rows operated on by the latest query execution.
R	TableNames (see page 622)	Returns a list of table names.
R	TRHandle (see page 106)	Specifies the transaction handle for the dataset.
	UpdateRecordTypes (see page 108)	Specifies the type of records visible in a dataset when cached updates are enabled.
R	UpdatesPending (see page 108)	Indicates whether the cached updates buffer contains records that are not yet applied.

Published Events

	Name	Description
	AfterDatabaseDisconnect (see page 623)	Occurs immediately after the connection to the associated database is closed.
	AfterTransactionEnd (see page 623)	Occurs immediately after a transaction that includes this dataset's query ends.
	BeforeDatabaseDisconnect (see page 624)	Occurs immediately before the connection to the associated database is closed.

	BeforeTransactionEnd (see page 624)	Occurs immediately before a transaction that includes this dataset's query ends.
	DatabaseFree (see page 624)	Occurs when the database associated with this dataset is freed.
	OnUpdateError (see page 110)	Occurs if an exception is generated when cached updates are applied to a database.
	OnUpdateRecord (see page 111)	Occurs when cached updates are applied to a record.
	TransactionFree (see page 624)	Occurs when the transaction that includes this dataset's query is freed.

Published Properties

	Name	Description
	Active (see page 615)	This is Active, a member of class TIBTable.
	AfterCancel (see page 94)	This is AfterCancel, a member of class TIBCustomDataSet.
	AfterClose (see page 94)	This is AfterClose, a member of class TIBCustomDataSet.
	AfterDelete (see page 94)	This is AfterDelete, a member of class TIBCustomDataSet.
	AfterEdit (see page 94)	This is AfterEdit, a member of class TIBCustomDataSet.
	AfterInsert (see page 95)	This is AfterInsert, a member of class TIBCustomDataSet.
	AfterOpen (see page 95)	This is AfterOpen, a member of class TIBCustomDataSet.
	AfterPost (see page 95)	This is AfterPost, a member of class TIBCustomDataSet.
	AfterRefresh (see page 95)	This is AfterRefresh, a member of class TIBCustomDataSet.
	AfterScroll (see page 95)	This is AfterScroll, a member of class TIBCustomDataSet.
	AutoCalcFields (see page 96)	This is AutoCalcFields, a member of class TIBCustomDataSet.
	BeforeCancel (see page 96)	This is BeforeCancel, a member of class TIBCustomDataSet.
	BeforeClose (see page 96)	This is BeforeClose, a member of class TIBCustomDataSet.
	BeforeDelete (see page 96)	This is BeforeDelete, a member of class TIBCustomDataSet.
	BeforeEdit (see page 97)	This is BeforeEdit, a member of class TIBCustomDataSet.
	BeforeInsert (see page 97)	This is BeforeInsert, a member of class TIBCustomDataSet.
	BeforeOpen (see page 97)	This is BeforeOpen, a member of class TIBCustomDataSet.
	BeforePost (see page 97)	This is BeforePost, a member of class TIBCustomDataSet.
	BeforeRefresh (see page 97)	This is BeforeRefresh, a member of class TIBCustomDataSet.
	BeforeScroll (see page 98)	This is BeforeScroll, a member of class TIBCustomDataSet.
	BufferChunks (see page 615)	Specifies the dataset buffer chunk size.
	CachedUpdates (see page 615)	Specifies whether cached updates are enabled for a dataset.
	Constraints (see page 616)	This is Constraints, a member of class TIBTable.
	Database (see page 99)	Identifies the database component for which this dataset represents one or more tables.
	DefaultIndex (see page 616)	Specifies if the data in the table should be ordered on a default index when opened.
	FieldDefs (see page 617)	This is FieldDefs, a member of class TIBTable.
	Filter (see page 617)	Specifies rows in a dataset that meet the filter conditions.
	Filtered (see page 617)	Specifies whether or not filtering is active for a table.
	ForcedRefresh (see page 99)	Specifies whether the dataset should refresh its data every time it posts a record.
	IndexDefs (see page 618)	Contains information about the indexes for a table.
	IndexFieldNames (see page 618)	Lists the columns to use as an index for a table.
	IndexName (see page 619)	Identifies an index for the table.
	MasterFields (see page 620)	Specifies one or more fields in a master table to link with corresponding fields in this table in order to establish a master-detail relationship between the tables.
	MasterSource (see page 620)	Specifies the name of the data source for a dataset to use as a master table in establishing a detail-master relationship between this table and another one.
	ObjectView (see page 101)	This is ObjectView, a member of class TIBCustomDataSet.
	OnCalcFields (see page 101)	This is OnCalcFields, a member of class TIBCustomDataSet.
	OnDeleteError (see page 102)	This is OnDeleteError, a member of class TIBCustomDataSet.
	OnEditError (see page 102)	This is OnEditError, a member of class TIBCustomDataSet.
	OnFilterRecord (see page 620)	This is OnFilterRecord, a member of class TIBTable.
	OnNewRecord (see page 102)	This is OnNewRecord, a member of class TIBCustomDataSet.
	OnPostError (see page 102)	This is OnPostError, a member of class TIBCustomDataSet.
	ReadOnly (see page 621)	Specifies whether a table is read-only for this application.

	StoreDefs (see page 621)	Indicates whether the table's field and index definitions persist with the data module or form.
	TableName (see page 621)	Indicates the name of the database table or view that this component encapsulates.
	TableTypes (see page 622)	Sets the types of relations displayed in the TableName (see page 621) drop-down list.
	Transaction (see page 106)	Identifies the transaction under which the query executes.
	UniDirectional (see page 622)	Determines whether bidirectional cursors are enabled for the dataset.
	UpdateObject (see page 623)	Specifies the update object component used to update a read-only result set.

16.1.1.2 TIBTable.Create Constructor

Creates an instance of a table component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBTable(TComponent * AOwner);
```

Description

Call Create to instantiate a table declared in an application if it was not placed on a form at design time. Create calls its inherited Create constructor, creates an empty index definitions list, creates an empty data link, and creates an empty list of index files.

16.1.1.3 TIBTable.Destroy Destructor

Destroys the instance of a table.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBTable();
```

Description

Do not call Destroy directly. Instead call Free to verify that the table is not already freed before calling Destroy. Destroy frees the index files list for the table, frees its data link, frees its index definitions, and then calls its inherited Destroy destructor.

16.1.1.4 TIBTable Methods

The methods of the TIBTable class are listed here.

Protected Methods

	Name	Description
	DataEvent (see page 607)	This is DataEvent, a member of class TIBTable.
	DefChanged (see page 607)	This is DefChanged, a member of class TIBTable.
	DoOnNewRecord (see page 608)	This is DoOnNewRecord, a member of class TIBTable.
	GetCanModify (see page 608)	This is GetCanModify, a member of class TIBTable.
	GetDataSource (see page 609)	This is GetDataSource, a member of class TIBTable.
	GetIndexParams (see page 609)	This is GetIndexParams, a member of class TIBTable.
	InitFieldDefs (see page 610)	This is InitFieldDefs, a member of class TIBTable.
	InternalClose (see page 610)	This is InternalClose, a member of class TIBTable.

	InternalOpen (see page 610)	This is InternalOpen, a member of class TIBTable.
	InternalRefresh (see page 611)	This is InternalRefresh, a member of class TIBTable.
	InternalRefreshRow (see page 611)	This is InternalRefreshRow, a member of class TIBTable.
	PSGetDefaultOrder (see page 612)	This is PSGetDefaultOrder, a member of class TIBTable.
	PSGetIndexDefs (see page 612)	This is PSGetIndexDefs, a member of class TIBTable.
	PSGetKeyFields (see page 612)	This is PSGetKeyFields, a member of class TIBTable.
	PSGetTableName (see page 612)	This is PSGetTableName, a member of class TIBTable.
	PSSetCommandText (see page 613)	This is PSSetCommandText, a member of class TIBTable.
	PSSetParams (see page 613)	This is PSSetParams, a member of class TIBTable.
	SetFiltered (see page 613)	This is SetFiltered, a member of class TIBTable.
	SetFilterOptions (see page 613)	This is SetFilterOptions, a member of class TIBTable.
	SetFilterText (see page 614)	This is SetFilterText, a member of class TIBTable.
	UpdateIndexDefs (see page 614)	This is UpdateIndexDefs, a member of class TIBTable.

Public Methods

	Name	Description
	AddIndex (see page 606)	Creates a new index for the table.
	CreateTable (see page 606)	Builds a new table using new structure information.
	DeleteIndex (see page 607)	Deletes an index for the table.
	DeleteTable (see page 608)	Deletes an existing database table.
	EmptyTable (see page 608)	Deletes all records from the table.
	GetDetailLinkFields (see page 609)	Lists the field components that link this dataset as a detail of a master dataset.
	GetIndexNames (see page 609)	Retrieves a list of available indexes for a table.
	GotoCurrent (see page 610)	Synchronizes the current record for this table with the current record of a specified table component.
	Locate (see page 611)	Searches the table for a specified record and makes that record the current record.

16.1.1.4.1 TIBTable.AddIndex Method

Creates a new index for the table.

Pascal

```
procedure AddIndex(const Name: string; const Fields: string; Options: TIndexOptions; const
DescFields: string = '');
```

C++

```
__fastcall AddIndex(const UnicodeString Name, const UnicodeString Fields, TIndexOptions
Options, const UnicodeString DescFields = '');
```

Description

Call AddIndex to create a new index for the table associated with a dataset. The index created with this procedure is added to the database table underlying the dataset. Name is the name of the new index. Fields is a semicolon-delimited list of the fields to include in the index. Options is a potentially restricted set attributes for the index. It can specify that an index

- Represents the primary index for a dataset. (ixPrimary)
- Contains no duplicate values (ixUnique).
- Sorts records in descending order (isDescending).

Warning: Attempting to create an index using options that are not applicable to the table raises an exception.

16.1.1.4.2 TIBTable.CreateTable Method

Builds a new table using new structure information.

Pascal

```
procedure CreateTable;
```

C++

```
__fastcall CreateTable();
```

Description

Call CreateTable at runtime to create a table using this dataset's current definition. CreateTable overwrites an existing table's structure and data; to avoid overwriting an existing table, check Exists (see page 616) before calling CreateTable.

If the FieldDefs (see page 617) property contains values, these values are used to create field definitions. Otherwise the Fields property is used. One or both of these properties must contain values in order to recreate a dataset.

If the IndexDefs (see page 618) property contain values, these values are used to create index definitions for the dataset.

16.1.1.4.3 TIBTable.DataEvent Method

Pascal

```
procedure DataEvent(Event: TDataEvent; Info: Longint); override;
```

C++

```
virtual __fastcall DataEvent(TDataEvent Event, Longint Info);
```

Description

This is DataEvent, a member of class TIBTable.

16.1.1.4.4 TIBTable.DefChanged Method

Pascal

```
procedure DefChanged(Sender: TObject); override;
```

C++

```
virtual __fastcall DefChanged(TObject * Sender);
```

Description

This is DefChanged, a member of class TIBTable.

16.1.1.4.5 TIBTable.DeleteIndex Method

Deletes an index for the table.

Pascal

```
procedure DeleteIndex(const Name: string);
```

C++

```
__fastcall DeleteIndex(const UnicodeString Name);
```

Description

Call DeleteIndex to remove an index for a table. Name is the name of the index to delete. DeleteIndex cannot remove an index used by a constraint.

16.1.1.4.6 TIBTable.DeleteTable Method

Deletes an existing database table.

Pascal

```
procedure DeleteTable;
```

C++

```
__fastcall DeleteTable();
```

Description

Call DeleteTable to delete an existing database table associated with the table component through its Database and TableName (see page 621) properties. A table must be closed before it can be deleted.

Warning: Deleting a table erases any data the table contains and destroys the table's structure information.

16.1.1.4.7 TIBTable.DoOnNewRecord Method

Pascal

```
procedure DoOnNewRecord; override;
```

C++

```
virtual __fastcall DoOnNewRecord();
```

Description

This is DoOnNewRecord, a member of class TIBTable.

16.1.1.4.8 TIBTable.EmptyTable Method

Deletes all records from the table.

Pascal

```
procedure EmptyTable;
```

C++

```
__fastcall EmptyTable();
```

Description

The EmptyTable method deletes all records from the database table specified by the Database and TableName (see page 621) properties.

Note: Deletion of records can fail if the user lacks sufficient privileges to perform the delete operation.

16.1.1.4.9 TIBTable.GetCanModify Method

Pascal

```
function GetCanModify: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetCanModify();
```

Description

This is GetCanModify, a member of class TIBTable.

16.1.1.4.10 TIBTable.GetDataSource Method

Pascal

```
function GetDataSource: TDataSource; override;
```

C++

```
virtual __fastcall TDataSource GetDataSource();
```

Description

This is GetDataSource, a member of class TIBTable.

16.1.1.4.11 TIBTable.GetDetailLinkFields Method

Lists the field components that link this dataset as a detail of a master dataset.

Pascal

```
procedure GetDetailLinkFields(MasterFields: TList; DetailFields: TList); override;
```

C++

```
virtual __fastcall GetDetailLinkFields(TList MasterFields, TList DetailFields);
```

Description

GetDetailLinkFields fills two lists of TFields that define a master-detail relationship between this table and another (master) dataset. The MasterFields (see page 620) list is filled with fields from the master table whose values must equal the values of the fields in the DetailFields list. The DetailFields list is filled with fields from the calling dataset.

16.1.1.4.12 TIBTable.GetIndexNames Method

Retrieves a list of available indexes for a table.

Pascal

```
procedure GetIndexNames(List: TStrings);
```

C++

```
__fastcall GetIndexNames(TStrings List);
```

Description

Call GetIndexNames to retrieve a list of all available indexes for a table. List is a string list object, created and maintained by the application, into which to retrieve the index names.

See Also

Obtaining Information About Indexes

16.1.1.4.13 TIBTable.GetIndexParams Method

Pascal

```
procedure GetIndexParams(const IndexName: string; FieldsIndex: Boolean; var IndexedName:
string);
```

C++

```
__fastcall GetIndexParams(const UnicodeString IndexName, Boolean FieldsIndex, UnicodeString
IndexedName);
```

Description

This is GetIndexParams, a member of class TIBTable.

16.1.1.4.14 TIBTable.GotoCurrent Method

Synchronizes the current record for this table with the current record of a specified table component.

Pascal

```
procedure GotoCurrent(Table: TIBTable);
```

C++

```
__fastcall GotoCurrent(TIBTable Table);
```

Description

Call GotoCurrent to synchronize the cursor position for this table based on the cursor position in another dataset that uses a different data source component, but which is connected to the same underlying database table. Table is the name of the table component whose cursor position to use for synchronizing.

Note: This procedure works only for table components that have the same Database and TableName (see page 621) properties. Otherwise an exception is raised.

GotoCurrent is mainly for use in applications that have two table components that are linked to the same underlying database table through different data source components. It enables an application to ensure that separate views of the data appear to be linked.

16.1.1.4.15 TIBTable.InitFieldDefs Method

Pascal

```
procedure InitFieldDefs; override;
```

C++

```
virtual __fastcall InitFieldDefs();
```

Description

This is InitFieldDefs, a member of class TIBTable.

16.1.1.4.16 TIBTable.InternalClose Method

Pascal

```
procedure InternalClose; override;
```

C++

```
virtual __fastcall InternalClose();
```

Description

This is InternalClose, a member of class TIBTable.

16.1.1.4.17 TIBTable.InternalOpen Method

Pascal

```
procedure InternalOpen; override;
```

C++

```
virtual __fastcall InternalOpen();
```

Description

This is InternalOpen, a member of class TIBTable.

16.1.1.4.18 TIBTable.InternalRefresh Method

Pascal

```
procedure InternalRefresh; override;
```

C++

```
virtual __fastcall InternalRefresh();
```

Description

This is InternalRefresh, a member of class TIBTable.

16.1.1.4.19 TIBTable.InternalRefreshRow Method

Pascal

```
procedure InternalRefreshRow; override;
```

C++

```
virtual __fastcall InternalRefreshRow();
```

Description

This is InternalRefreshRow, a member of class TIBTable.

16.1.1.4.20 TIBTable.Locate Method

Searches the table for a specified record and makes that record the current record.

Pascal

```
function Locate(const KeyFields: string; const KeyValues: Variant; Options: TLocateOptions):
Boolean; override;
```

C++

```
virtual __fastcall Boolean Locate(const UnicodeString KeyFields, const Variant KeyValues,
TLocateOptions Options);
```

Description

Call Locate to search a dataset for a specific record and position the cursor on it.

KeyFields is a string containing a semicolon-delimited list of field names on which to search.

KeyValues is a variant that specifies the values to match in the key fields. If KeyFields lists a single field, KeyValues specifies the value for that field on the desired record. To specify multiple search values, pass a variant array as KeyValues, or construct a variant array on the fly using the VarArrayOf routine. For example:

```
        with CustTable do
    Locate('Company;Contact;Phone', VarArrayOf(['Sight Diver', 'P', '408-431-1000']),
[loPartialKey]);
       TLocateOptions Opts;
    Opts.Clear();
    Opts << loPartialKey;
```

```
Variant locvalues[3];
locvalues[0] = Variant("Sight Diver");
locvalues[1] = Variant("P");
locvalues[2] = Variant("408-431-1000");
CustTable->Locate("Company;Contact;Phone", VarArrayOf(locvalues, 2), Opts);
```

Options is a set that optionally specifies additional search latitude when searching on string fields. If Options contains the loCaseInsensitive setting, then Locate ignores case when matching fields. If Options contains the loPartialKey setting, then Locate allows partial-string matching on strings in KeyValues. If Options is an empty set, or if KeyFields does not include any string fields, Options is ignored.

Locate returns true if it finds a matching record, and makes that record the current one. Otherwise Locate returns false.

Locate uses the fastest possible method to locate matching records. If the search fields in KeyFields are indexed and the index is compatible with the specified search options, Locate uses the index. Otherwise Locate creates a filter for the search.

16.1.1.4.21 TIBTable.PSGetDefaultOrder Method

Pascal

```
function PSGetDefaultOrder: TIndexDef; override;
```

C++

```
virtual __fastcall TIndexDef PSGetDefaultOrder();
```

Description

This is PSGetDefaultOrder, a member of class TIBTable.

16.1.1.4.22 TIBTable.PSGetIndexDefs Method

Pascal

```
function PSGetIndexDefs(IndexTypes: TIndexOptions): TIndexDefs; override;
```

C++

```
virtual __fastcall TIndexDefs PSGetIndexDefs(TIndexOptions IndexTypes);
```

Description

This is PSGetIndexDefs, a member of class TIBTable.

16.1.1.4.23 TIBTable.PSGetKeyFields Method

Pascal

```
function PSGetKeyFields: string; override;
```

C++

```
virtual __fastcall UnicodeString PSGetKeyFields();
```

Description

This is PSGetKeyFields, a member of class TIBTable.

16.1.1.4.24 TIBTable.PSGetTableName Method

Pascal

```
function PSGetTableName: string; override;
```

C++

```
virtual __fastcall UnicodeString PSGetTableName();
```

Description

This is PSGetTableName, a member of class TIBTable.

16.1.1.4.25 TIBTable.PSSetCommandText Method

Pascal

```
procedure PSSetCommandText(const CommandText: string); override;
```

C++

```
virtual __fastcall PSSetCommandText(const UnicodeString CommandText);
```

Description

This is PSSetCommandText, a member of class TIBTable.

16.1.1.4.26 TIBTable.PSSetParams Method

Pascal

```
procedure PSSetParams(AParams: TParams); override;
```

C++

```
virtual __fastcall PSSetParams(TParams AParams);
```

Description

This is PSSetParams, a member of class TIBTable.

16.1.1.4.27 TIBTable.SetFiltered Method

Pascal

```
procedure SetFiltered(Value: Boolean); override;
```

C++

```
virtual __fastcall SetFiltered(Boolean Value);
```

Description

This is SetFiltered, a member of class TIBTable.

16.1.1.4.28 TIBTable.SetFilterOptions Method

Pascal

```
procedure SetFilterOptions(Value: TFilterOptions); override;
```

C++

```
virtual __fastcall SetFilterOptions(TFilterOptions Value);
```

Description

This is SetFilterOptions, a member of class TIBTable.

16.1.1.4.29 TIBTable.SetFilterText Method

Pascal

```
procedure SetFilterText(const Value: string); override;
```

C++

```
virtual __fastcall SetFilterText(const UnicodeString Value);
```

Description

This is SetFilterText, a member of class TIBTable.

16.1.1.4.30 TIBTable.UpdateIndexDefs Method

Pascal

```
procedure UpdateIndexDefs; override;
```

C++

```
virtual __fastcall UpdateIndexDefs();
```

Description

This is UpdateIndexDefs, a member of class TIBTable.

16.1.1.5 TIBTable Properties

The properties of the TIBTable class are listed here.

Public Properties

	Name	Description
R	CurrentDBKey (see page 616)	Returns the DBKey for the current row in the table.
R	Exists (see page 616)	Indicates whether the underlying database table exists.
R	IndexFieldCount (see page 618)	Indicates the number of fields that comprise the current key.
	IndexFields (see page 619)	Retrieves or sets a field for an index.
	LiveMode (see page 619)	Indicates what types of edits, if any, can be made to the data in the dataset.
R	TableNames (see page 622)	Returns a list of table names.

Published Properties

	Name	Description
	Active (see page 615)	This is Active, a member of class TIBTable.
	BufferChunks (see page 615)	Specifies the dataset buffer chunk size.
	CachedUpdates (see page 615)	Specifies whether cached updates are enabled for a dataset.
	Constraints (see page 616)	This is Constraints, a member of class TIBTable.
	DefaultIndex (see page 616)	Specifies if the data in the table should be ordered on a default index when opened.
	FieldDefs (see page 617)	This is FieldDefs, a member of class TIBTable.
	Filter (see page 617)	Specifies rows in a dataset that meet the filter conditions.
	Filtered (see page 617)	Specifies whether or not filtering is active for a table.
	IndexDefs (see page 618)	Contains information about the indexes for a table.
	IndexFieldNames (see page 618)	Lists the columns to use as an index for a table.
	IndexName (see page 619)	Identifies an index for the table.
	MasterFields (see page 620)	Specifies one or more fields in a master table to link with corresponding fields in this table in order to establish a master-detail relationship between the tables.

	MasterSource (see page 620)	Specifies the name of the data source for a dataset to use as a master table in establishing a detail-master relationship between this table and another one.
	OnFilterRecord (see page 620)	This is OnFilterRecord, a member of class TIBTable.
	ReadOnly (see page 621)	Specifies whether a table is read-only for this application.
	StoreDefs (see page 621)	Indicates whether the table's field and index definitions persist with the data module or form.
	TableName (see page 621)	Indicates the name of the database table or view that this component encapsulates.
	TableTypes (see page 622)	Sets the types of relations displayed in the TableName (see page 621) drop-down list.
	UniDirectional (see page 622)	Determines whether bidirectional cursors are enabled for the dataset.
	UpdateObject (see page 623)	Specifies the update object component used to update a read-only result set.

16.1.1.5.1 TIBTable.Active Property

Pascal

```
property Active;
```

C++

```
__property Active;
```

Description

This is Active, a member of class TIBTable.

16.1.1.5.2 TIBTable.BufferChunks Property

Specifies the dataset buffer chunk size.

Pascal

```
property BufferChunks: Integer;
```

C++

```
__property int BufferChunks;
```

Description

Use BufferChunks to get or set the number of records for which the dataset allocates buffer space at any time. When the dataset's buffer is full, trying to fetch an additional record causes the dataset to reallocate the buffer so that it has enough memory to hold an additional BufferChunks records.

Note: When UniDirectional is true, BufferChunks has no meaning.

16.1.1.5.3 TIBTable.CachedUpdates Property

Specifies whether cached updates are enabled for a dataset.

Pascal

```
property CachedUpdates: Boolean;
```

C++

```
__property Boolean CachedUpdates;
```

Description

CachedUpdates enables or disables the use of cached updates for a dataset. If CachedUpdates is true, cached updates are enabled. If CachedUpdates is false, cached updates are disabled.

When cached updates are enabled, updates to a dataset (such as posting changes, inserting new records, or deleting records), are stored in an internal cache on the client machine instead of being written directly to the dataset's underlying database tables. When changes are complete, an application writes all cached changes to the database in the context of a single transaction.

Note: **Note**: Instead of using cached updates, applications can obtain the same benefits with greater control by using a client dataset.

16.1.1.5.4 TIBTable.Constraints Property

Pascal

```
property Constraints;
```

C++

```
__property Constraints;
```

Description

This is Constraints, a member of class TIBTable.

16.1.1.5.5 TIBTable.CurrentDBKey Property

Returns the DBKey for the current row in the table.

Pascal

```
property CurrentDBKey: TIBDBKey;
```

C++

```
__property TIBDBKey CurrentDBKey;
```

Description

Use CurrentDBKey to return the DBKey for the current row in the table. A DBKey is a unique row identifier for the duration of the current transaction. This property is primarily for internal use.

16.1.1.5.6 TIBTable.DefaultIndex Property

Specifies if the data in the table should be ordered on a default index when opened.

Pascal

```
property DefaultIndex: Boolean;
```

C++

```
__property Boolean DefaultIndex;
```

Description

When this property is set to false, an ORDER BY clause is not used when opening a table on the server. When DefaultIndex is true, the data is ordered based on the primary key or a unique index when opening the table. DefaultIndex defaults to true.

16.1.1.5.7 TIBTable.Exists Property

Indicates whether the underlying database table exists.

Pascal

```
property Exists: Boolean;
```

C++

```
__property Boolean Exists;
```

Description

Read Exists at runtime to determine whether a database table exists. If the table does not exist, you can create a table from the field definitions and index definitions using the CreateTable (see page 606) method. This property is read-only.

16.1.1.5.8 TIBTable.FieldDefs Property

Pascal

```
property FieldDefs;
```

C++

```
__property FieldDefs;
```

Description

This is FieldDefs, a member of class TIBTable.

16.1.1.5.9 TIBTable.Filter Property

Specifies rows in a dataset that meet the filter conditions.

Pascal

```
property Filter;
```

C++

```
__property Filter;
```

Description

Use the Filter property to restrict the rows in the dataset to those that meet the filter conditions. The syntax for Filter is the same as the search condition that appears after a WHERE clause in a Select statement. For example, to view only those records where the value in the Country field contains 'France' or 'Fiji':

Country = 'France' or Country = 'Fiji'

You can use standard SQL wildcards such as percent (%) and underscore (_) in the condition when you use the LIKE operator. The following filter condition retrieves all Countries beginning with 'F':

```
Country LIKE 'F%'
```

To view rows that have a NULL value in the Country column and Contact_Name is not NULL, use the IS operator:

```
Country is NULL and Contact_Name is not NULL
```

You can also use complex expressions in filter clauses. The following example retrieves rows containing Country values that use Francs as currency.

```
Country IN (SELECT Country from Country where Currency = '_Franc')
```

16.1.1.5.10 TIBTable.Filtered Property

Specifies whether or not filtering is active for a table.

Pascal

```
property Filtered;
```

C++

```
__property Filtered;
```

Description

Check Filtered to determine whether or not dataset filtering is in effect. If Filtered is true, then filtering is active. To apply filter conditions specified in the Filter (see page 617) property or the OnFilterRecord (see page 620) event handler, set Filtered to true.

16.1.1.5.11 TIBTable.IndexDefs Property

Contains information about the indexes for a table.

Pascal

```
property IndexDefs: TIndexDefs;
```

C++

```
__property TIndexDefs IndexDefs;
```

Description

IndexDefs is an array of index items, each of which describes an available index for the table. Ordinarily an application accesses or specifies indexes through the IndexFieldNames (see page 618) or IndexFields (see page 619) properties. If IndexDefs is updated or manually edited, the StoreDefs (see page 621) property becomes true.

Note: The index items in IndexDefs may not always reflect the current indexes available for a table. Before examining IndexDefs, call its Update method to refresh the item list.

16.1.1.5.12 TIBTable.IndexFieldCount Property

Indicates the number of fields that comprise the current key.

Pascal

```
property IndexFieldCount: Integer;
```

C++

```
__property int IndexFieldCount;
```

Description

Examine IndexFieldCount to determine the number of fields that comprise the current key. For indexes based on a single column, IndexFieldCount returns 1. For multi-column indexes, IndexFieldCount indicates the number of fields upon which the index is based.

16.1.1.5.13 TIBTable.IndexFieldNames Property

Lists the columns to use as an index for a table.

Pascal

```
property IndexFieldNames: string;
```

C++

```
__property UnicodeString IndexFieldNames;
```

Description

Use IndexFieldNames as an alternative method of specifying the index to use for a table. In IndexFieldNames specify the name

of each column to use as an index for a table. Ordering of column names is significant. Separate names with semicolon.

Note: The IndexFieldNames and IndexName (see page 619) properties are mutually exclusive. Setting one clears the other.

See Also

Creating an Index with IndexFieldNames

16.1.1.5.14 TIBTable.IndexFields Property

Retrieves or sets a field for an index.

Pascal

```
property IndexFields [Index: Integer]: TField;
```

C++

```
__property TField IndexFields[int Index];
```

Description

IndexFields provides a zero-based array of field objects, each of which corresponds to a field in the current index. Index is an ordinal value indicating the position of a field in the index. The first field in the index is IndexFields[0], the second is IndexFields[1], and so on.

Note: Do not set IndexFields directly. Instead use the IndexFieldNames (see page 618) property to order datasets on the fly at runtime.

16.1.1.5.15 TIBTable.IndexName Property

Identifies an index for the table.

Pascal

```
property IndexName: string;
```

C++

```
__property UnicodeString IndexName;
```

Description

Use IndexName to specify an index for a table. If IndexName is empty, a table's sort order is based on its primary index.

If IndexName contains a valid index name, then that index is used to determine the order of records.

Note: IndexFieldNames (see page 618) and IndexName are mutually exclusive. Setting one clears the other.

16.1.1.5.16 TIBTable.LiveMode Property

Indicates what types of edits, if any, can be made to the data in the dataset.

Pascal

```
property LiveMode: TLiveModes;
```

C++

```
__property TLiveModes LiveMode;
```

Description

Read LiveMode to determine what types of edits should be allowed. LiveMode is set automatically to restrict the capabilities of the dataset to reflect the user's rights.

Note: For read-only datasets, such as TIBQuery, LiveMode is always an empty set.

16.1.1.5.17 TIBTable.MasterFields Property

Specifies one or more fields in a master table to link with corresponding fields in this table in order to establish a master-detail relationship between the tables.

Pascal

```
property MasterFields: string;
```

C++

```
__property UnicodeString MasterFields;
```

Description

Use MasterFields after setting the MasterSource (see page 620) property to specify the names of one or more fields to use in establishing a detail-master relationship between this table and the one specified in MasterSource (see page 620).

MasterFields is a string containing one or more field names in the master table. Separate field names with semicolons.

Each time the current record in the master table changes, the new values in those fields are used to select corresponding records in this table for display.

See Also

Making the Table a Detail of Another Dataset

16.1.1.5.18 TIBTable.MasterSource Property

Specifies the name of the data source for a dataset to use as a master table in establishing a detail-master relationship between this table and another one.

Pascal

```
property MasterSource: TDataSource;
```

C++

```
__property TDataSource MasterSource;
```

Description

Use MasterSource to specify the name of the data source component whose DataSet property identifies a dataset to use as a master table in establishing a detail-master relationship between this table and another one.

After setting the MasterSource property, specify which fields to use in the master table by setting the MasterFields (see page 620) property. At runtime each time the current record in the master table changes, the new values in those fields are used to select corresponding records in this table for display.

See Also

Making the Table a Detail of Another Dataset

16.1.1.5.19 TIBTable.OnFilterRecord Property

Pascal

```
property OnFilterRecord;
```

C++

```
__property OnFilterRecord;
```

Description

This is OnFilterRecord, a member of class TIBTable.

16.1.1.5.20 TIBTable.ReadOnly Property

Specifies whether a table is read-only for this application.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use the ReadOnly property to prevent users from updating, inserting, or deleting data in the table. By default, ReadOnly is false, meaning users can potentially alter a table's data.

Note: Even if ReadOnly is false, users may not be able to modify or add data to a table. Other factors, such as insufficient SQL privileges for the application or its current user may prevent successful alterations.

To guarantee that users cannot modify or add data to a table,

1. **1** Set the Active (see page 615) property to false.
2. **2** Set ReadOnly to true.

16.1.1.5.21 TIBTable.StoreDefs Property

Indicates whether the table's field and index definitions persist with the data module or form.

Pascal

```
property StoreDefs: Boolean;
```

C++

```
__property Boolean StoreDefs;
```

Description

If StoreDefs is true, the table's index and field definitions are stored with the data module or form. Setting StoreDefs to true makes the CreateTable (see page 606) method into a one-step procedure that creates fields, indexes, and validity checks at runtime.

StoreDefs is false by default. It becomes true whenever FieldDefs (see page 617) or IndexDefs (see page 618) is updated or edited manually; to prevent edited (or imported) definitions from being stored, reset StoreDefs to false.

16.1.1.5.22 TIBTable.TableName Property

Indicates the name of the database table or view that this component encapsulates.

Pascal

```
property TableName: String;
```

C++

```
__property UnicodeString TableName;
```

Description

Use TableName to specify the name of the database relation this component encapsulates. To set TableName to a meaningful value, the Database property should already be set. If Database is set at design time, then select a valid table name from the TableName drop-down list in the Object Inspector.

Note: To set TableName, the Active (see page 615) property must be false.

Tip: Setting TableName clears the FieldDefs (see page 617) property. Therefore, if you are using TIBTable (see page 600) to create a new table, set the value of TableName before you assign any field definitions.

16.1.1.5.23 TIBTable.TableNames Property

Returns a list of table names.

Pascal

```
property TableNames: TStrings;
```

C++

```
__property TStrings TableNames;
```

Description

The TableNames property is an internal property used to display a list of the table and view names in the database.

16.1.1.5.24 TIBTable.TableTypes Property

Sets the types of relations displayed in the TableName (see page 621) drop-down list.

Pascal

```
property TableTypes: TIBTableTypes;
```

C++

```
__property TIBTableTypes TableTypes;
```

Description

Use TableTypes to change which types of relations are displayed in the TableName (see page 621) drop-down list, in addition to user tables.

16.1.1.5.25 TIBTable.UniDirectional Property

Determines whether bidirectional cursors are enabled for the dataset.

Pascal

```
property UniDirectional: Boolean;
```

C++

```
__property Boolean UniDirectional;
```

Description

Use UniDirectional to determine whether bidirectional cursors are enabled for this dataset.

Note: Do not confuse the UniDirectional property with the IsUniDirectional property inherited from TDataSet. IsUniDirectional indicates whether the dataset is a dbExpress dataset, which, in addition to using a unidirectional cursor, does not buffer records.

UniDirectional is only concerned with whether the cursor permits backward or random navigation.

16.1.1.5.26 TIBTable.UpdateObject Property

Specifies the update object component used to update a read-only result set.

Pascal

```
property UpdateObject: TIBDataSetUpdateObject;
```

C++

```
__property TIBDataSetUpdateObject UpdateObject;
```

Description

Use UpdateObject to specify the TIBDataSetUpdateObject component to use in an application that must be able to update a read-only result set.

In some cases, such as when using TIBQuery, the dataset does not automatically update records. In these cases, UpdateObject can be used to specify a TIBUpdateSQL component that performs updates as a separate transaction that is transparent to the application.

TIBDataSetUpdateObject is especially useful for complicated updates from an OnUpdateRecord event.

16.1.1.6 TIBTable Events

The events of the TIBTable class are listed here.

Published Events

	Name	Description
	AfterDatabaseDisconnect (see page 623)	Occurs immediately after the connection to the associated database is closed.
	AfterTransactionEnd (see page 623)	Occurs immediately after a transaction that includes this dataset's query ends.
	BeforeDatabaseDisconnect (see page 624)	Occurs immediately before the connection to the associated database is closed.
	BeforeTransactionEnd (see page 624)	Occurs immediately before a transaction that includes this dataset's query ends.
	DatabaseFree (see page 624)	Occurs when the database associated with this dataset is freed.
	TransactionFree (see page 624)	Occurs when the transaction that includes this dataset's query is freed.

16.1.1.6.1 TIBTable.AfterDatabaseDisconnect Event

Occurs immediately after the connection to the associated database is closed.

Pascal

```
property AfterDatabaseDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterDatabaseDisconnect;
```

Description

Write an AfterDatabaseDisconnect event handler to respond when the dataset closes its connection to the database specified by the Database property.

16.1.1.6.2 TIBTable.AfterTransactionEnd Event

Occurs immediately after a transaction that includes this dataset's query ends.

Pascal

```
property AfterTransactionEnd: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterTransactionEnd;
```

Description

Write an AfterTransactionEnd event handler to respond when the transaction specified by the Transaction property ends.

16.1.1.6.3 TIBTable.BeforeDatabaseDisconnect Event

Occurs immediately before the connection to the associated database is closed.

Pascal

```
property BeforeDatabaseDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeDatabaseDisconnect;
```

Description

Write a BeforeDatabaseDisconnect event handler to respond when the dataset is about to close its connection to the database specified by the Database property.

16.1.1.6.4 TIBTable.BeforeTransactionEnd Event

Occurs immediately before a transaction that includes this dataset's query ends.

Pascal

```
property BeforeTransactionEnd: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeTransactionEnd;
```

Description

Write a BeforeTransactionEnd event handler to respond when the transaction specified by the Transaction property is about to end.

16.1.1.6.5 TIBTable.DatabaseFree Event

Occurs when the database associated with this dataset is freed.

Pascal

```
property DatabaseFree: TNotifyEvent;
```

C++

```
__property TNotifyEvent DatabaseFree;
```

Description

Write a DatabaseFree event handler to respond when the database specified by the Database property is freed.

16.1.1.6.6 TIBTable.TransactionFree Event

Occurs when the transaction that includes this dataset's query is freed.

Pascal

```
property TransactionFree: TNotifyEvent;
```

C++

```
__property TNotifyEvent TransactionFree;
```

Description

Write a TransactionFree event handler to respond when the transaction specified by the Transaction property is freed.

16.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TIBTableType (see page 626)	This is record IBTable.TIBTableType.

16.2.1 IBTable.TIBTableType Enumeration

Pascal

```
TIBTableType = (
  ttSystem,
  ttView
);
```

C++

```
enum TIBTableType {
  ttSystem,
  ttView
};
```

File

IBTable

Description

This is record IBTable.TIBTableType.

16.3 Types

The following table lists types in this documentation.

Types

Name	Description
TIBTableTypes (see page 627)	TIBTableTypes and TIBTableTypes indicate the types of InterBase tables and views other than user tables.
TIndexName (see page 627)	This is type IBTable.TIndexName.

16.3.1 IBTable.TIBTableTypes Type

TIBTableTypes and TIBTableTypes indicate the types of InterBase tables and views other than user tables.

Pascal

```
TIBTableTypes = set of TIBTableType;
```

C++

```
TIBTableType TIBTableTypes;
```

File

IBTable

Description

TIBTableTypes is a set of TIBTableType (see page 626) values. The following table lists the possible values:

Value	Meaning
ttSystem	System tables and views.
ttView	User views.

16.3.2 IBTable.TIndexName Type

Pascal

```
TIndexName = String;
```

C++

```
UnicodeString TIndexName;
```

File

IBTable

Description

This is type IBTable.TIndexName.

17 IBUpdateSQL Namespace

This is namespace IBUpdateSQL.

Topics

Name	Description
Classes (see page 630)	The following table lists classes in this documentation.

Classes

	Name	Description
	TIBUpdateSQL (see page 630)	TIBUpdateSQL provides an object for updating read-only datasets when cached updates are enabled.

17.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TIBUpdateSQL (see page 630)	TIBUpdateSQL provides an object for updating read-only datasets when cached updates are enabled.

17.1.1 TIBUpdateSQL Class

TIBUpdateSQL provides an object for updating read-only datasets when cached updates are enabled.

Class Hierarchy

Pascal

```
TIBUpdateSQL = class(TIBDataSetUpdateObject);
```

C++

```
class TIBUpdateSQL : public TIBDataSetUpdateObject;
```

File

IBUpdateSQL

Description

Use a TIBUpdateSQL object to provide SQL (see page 637) statements used to update read-only datasets represented by TIBQuery (see page 376) components when cached updates are enabled. A dataset is read-only either by design or circumstance. If a dataset is read-only by design, the application itself does not provide a user interface for updating data, but may institute a programmatic scheme behind the scenes.

TIBUpdateSQL provides a mechanism for circumventing what some developers consider an SQL (see page 637)-92 limitation. It enables a developer to provide INSERT, UPDATE, DELETE, and REFRESH statements for performing separate update queries on otherwise read-only result sets in such a manner that the separate update queries are transparent to the end user.

In practical application, a TIBUpdateSQL object is placed on a data module or form, and linked to a TIBQuery (see page 376) component through that component's UpdateObject property. If the UpdateObject property points to a valid TIBUpdateSQL object, the SQL (see page 637) statements belonging to the update object are automatically applied when cached updates are applied.

See Also

Getting Started with InterBase Express

17.1.1.1 TIBUpdateSQL Members

The following tables list the members exposed by TIBUpdateSQL.

Protected Methods

	Name	Description
	GetDataSet (see page 633)	This is GetDataSet, a member of class TIBUpdateSQL.
	GetSQL (see page 633)	This is GetSQL, a member of class TIBUpdateSQL.
	SetDataSet (see page 634)	This is SetDataSet, a member of class TIBUpdateSQL.
	SQLChanged (see page 634)	This is SQLChanged, a member of class TIBUpdateSQL.

Public Methods

	Name	Description
	Apply (see page 632)	Sets the parameters for a specified SQL (see page 637) statement type, and executes the resulting statement.
	Create (see page 631)	Creates an instance of an update object.
	Destroy (see page 631)	Frees an instance of an update object.
	ExecSQL (see page 633)	Executes a specified type of SQL (see page 637) statement to perform an update for an otherwise read-only results set when cached updates is enabled.
	SetParams (see page 634)	Binds parameters in an SQL (see page 637) statement prior to statement execution.

Public Properties

	Name	Description
	DataSet (see page 635)	Identifies the dataset to which a TIBUpdateSQL (see page 630) component belongs.
	Query (see page 636)	Returns the query object used to perform a specified kind of update.
	SQL (see page 637)	Returns a specified SQL statement used when applying cached updates.

Published Properties

	Name	Description
	DeleteSQL (see page 635)	Specifies the SQL (see page 637) DELETE statement to use when applying a cached deletion of a record.
	InsertSQL (see page 636)	Specifies the SQL (see page 637) INSERT statement to use when applying a cached insertion of a record.
	ModifySQL (see page 636)	Specifies the SQL (see page 637) UPDATE statement to use when applying an update to a record and cached updates is enabled.
	RefreshSQL (see page 137)	Provides the ability to directly access the SQL object encapsulating the RefreshSQL statement.

17.1.1.2 TIBUpdateSQL.Create Constructor

Creates an instance of an update object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBUpdateSQL(TComponent * AOwner);
```

Description

Call Create to instantiate an update object at run time. You do not need to call Create for update objects placed in a data module or form at design time. Delphi automatically handles these objects.

17.1.1.3 TIBUpdateSQL.Destroy Destructor

Frees an instance of an update object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBUpdateSQL();
```

Description

Do not call Destroy directly in an application. Usually destruction of update objects is handled automatically by Delphi. If an application creates its own instance of an update object, however, the application should call Free, which verifies that the update object is not already freed before calling Destroy.

17.1.1.4 TIBUpdateSQL Methods

The methods of the TIBUpdateSQL class are listed here.

Protected Methods

	Name	Description
	GetDataSet (see page 633)	This is GetDataSet, a member of class TIBUpdateSQL.
	GetSQL (see page 633)	This is GetSQL, a member of class TIBUpdateSQL.
	SetDataSet (see page 634)	This is SetDataSet, a member of class TIBUpdateSQL.
	SQLChanged (see page 634)	This is SQLChanged, a member of class TIBUpdateSQL.

Public Methods

	Name	Description
	Apply (see page 632)	Sets the parameters for a specified SQL (see page 637) statement type, and executes the resulting statement.
	ExecSQL (see page 633)	Executes a specified type of SQL (see page 637) statement to perform an update for an otherwise read-only results set when cached updates is enabled.
	SetParams (see page 634)	Binds parameters in an SQL (see page 637) statement prior to statement execution.

17.1.1.4.1 TIBUpdateSQL.Apply Method

Sets the parameters for a specified SQL (see page 637) statement type, and executes the resulting statement.

Pascal

```
procedure Apply(UpdateKind: TUpdateKind); override;
```

C++

```
virtual __fastcall Apply(TUpdateKind UpdateKind);
```

Description

Call Apply to set parameters for an SQL (see page 637) statement and execute it to update a record. UpdateKind indicates which SQL (see page 637) statement to bind and execute, and can be one of the following values:

Value Meaning

ukModify Bind and execute the SQL (see page 637) statement in the ModifySQL (see page 636) property

ukInsert Bind and execute the SQL (see page 637) statement in the InsertSQL (see page 636) property

ukDelete Bind and execute the SQL (see page 637) statement in the DeleteSQL (see page 635) property

Apply is primarily intended for manually executing update statements from an OnUpdateRecord event handler.

Note: If an SQL (see page 637) statement does not contain parameters, it is more efficient to call ExecSQL (see page 633)

instead of Apply.

17.1.1.4.2 TIBUpdateSQL.ExecSQL Method

Executes a specified type of SQL (see page 637) statement to perform an update for an otherwise read-only results set when cached updates is enabled.

Pascal

```
procedure ExecSQL(UpdateKind: TUpdateKind);
```

C++

```
__fastcall ExecSQL(TUpdateKind UpdateKind);
```

Description

Call ExecSQL to execute the SQL (see page 637) statement necessary for updating the records belonging to a read-only result set when cached updates is enabled. UpdateKind specifies the statement to execute, and can be one of the following values:

Value Meaning

ukModify Execute the SQL (see page 637) statement used to update records in the dataset

ukInsert Execute the SQL (see page 637) statement used to insert new records into the dataset

ukDelete Execute the SQL (see page 637) statement used to delete records in the dataset.

If the statement to execute contains any parameters, an application must call SetParams (see page 634) to bind the parameters before calling ExecSQL. To determine if a statement contains parameters, examine the appropriate ModifySQL (see page 636), InsertSQL (see page 636), or DeleteSQL (see page 635) property, depending on the statement type intended for execution.

Note: To both bind parameters and execute a statement, call Apply (see page 632).

17.1.1.4.3 TIBUpdateSQL.GetDataSet Method

Pascal

```
function GetDataSet: TIBCustomDataSet; override;
```

C++

```
virtual __fastcall TIBCustomDataSet GetDataSet();
```

Description

This is GetDataSet, a member of class TIBUpdateSQL.

17.1.1.4.4 TIBUpdateSQL.GetSQL Method

Pascal

```
function GetSQL(UpdateKind: TUpdateKind): TStrings; override;
```

C++

```
virtual __fastcall TStrings GetSQL(TUpdateKind UpdateKind);
```

Description

This is GetSQL, a member of class TIBUpdateSQL.

17.1.1.4.5 TIBUpdateSQL.SetDataSet Method

Pascal

```
procedure SetDataSet(ADataSet: TIBCustomDataSet); override;
```

C++

```
virtual __fastcall SetDataSet(TIBCustomDataSet ADataSet);
```

Description

This is SetDataSet, a member of class TIBUpdateSQL.

17.1.1.4.6 TIBUpdateSQL.SetParams Method

Binds parameters in an SQL (see page 637) statement prior to statement execution.

Pascal

```
procedure SetParams(UpdateKind: TUpdateKind);
```

C++

```
__fastcall SetParams(TUpdateKind UpdateKind);
```

Description

Call SetParams to bind parameters in an SQL (see page 637) statement associated with the update object prior to executing the statement. UpdateKind indicates the type of statement for which to bind parameters, and can be one of the following values:

Value	Meaning
ukModify	Bind parameters for the SQL (see page 637) statement used to update records
ukInsert	Bind parameters for the SQL (see page 637) statement used to insert new records
ukDelete	Bind parameters for the SQL (see page 637) statement used to delete records

Parameters are indicated in an SQL (see page 637) statement by a colon. Except for the leading colon in the parameter name, the parameter name must exactly match the name of an existing field name for the dataset.

Note: Parameter names can be prefaced by the 'OLD_' indicator. If so, the old value of the field is used to perform the update instead of any updates in the cache.

17.1.1.4.7 TIBUpdateSQL.SQLChanged Method

Pascal

```
procedure SQLChanged(Sender: TObject);
```

C++

```
__fastcall SQLChanged(TObject * Sender);
```

Description

This is SQLChanged, a member of class TIBUpdateSQL.

17.1.1.5 TIBUpdateSQL Properties

The properties of the TIBUpdateSQL class are listed here.

Public Properties

	Name	Description
	DataSet (see page 635)	Identifies the dataset to which a TIBUpdateSQL (see page 630) component belongs.
R	Query (see page 636)	Returns the query object used to perform a specified kind of update.
	SQL (see page 637)	Returns a specified SQL statement used when applying cached updates.

Published Properties

	Name	Description
	DeleteSQL (see page 635)	Specifies the SQL (see page 637) DELETE statement to use when applying a cached deletion of a record.
	InsertSQL (see page 636)	Specifies the SQL (see page 637) INSERT statement to use when applying a cached insertion of a record.
	ModifySQL (see page 636)	Specifies the SQL (see page 637) UPDATE statement to use when applying an update to a record and cached updates is enabled.

17.1.1.5.1 TIBUpdateSQL.DataSet Property

Identifies the dataset to which a TIBUpdateSQL (see page 630) component belongs.

Pascal

```
property DataSet: TIBCustomDataSet;
```

C++

```
__property TIBCustomDataSet DataSet;
```

Description

At design time, setting the dataset object's UpdateObject property automatically sets the DataSet property of the specified TIBUpdateSQL (see page 630) object. An application should only need to set this property if it creates a new update component at run time.

17.1.1.5.2 TIBUpdateSQL.DeleteSQL Property

Specifies the SQL (see page 637) DELETE statement to use when applying a cached deletion of a record.

Pascal

```
property DeleteSQL: TStrings;
```

C++

```
__property TStrings DeleteSQL;
```

Description

Set DeleteSQL to the SQL (see page 637) DELETE statement to use when applying a deletion to a record. Statements can be parameterized queries. To create a DELETE statement at design time, use the UpdateSQL editor to create statements, such as:

```
delete from Employee
    where
    Emp_No = :OLD_Emp_No
```

At run time, an application can write a statement directly to this property to set or change the DELETE statement.

Note: As the example illustrates, DeleteSQL supports an extension to normal parameter binding. To retrieve the value of a field as it exists prior to application of cached updates, use the field name with the prefix 'OLD_'. This is especially useful when doing field comparisons in the WHERE clause of the statement.

17.1.1.5.3 TIBUpdateSQL.InsertSQL Property

Specifies the SQL (see page 637) INSERT statement to use when applying a cached insertion of a record.

Pascal

```
property InsertSQL: TStrings;
```

C++

```
__property TStrings InsertSQL;
```

Description

Set InsertSQL to the SQL (see page 637) INSERT statement to use when applying an insertion to a dataset. Statements can be parameterized queries. To create a INSERT statement at design time, use the UpdateSQL editor to create statements, such as:

```
insert into Country
    (Country, Currency)
    values (:Country, :Currency)
```

At run time, an application can write a statement directly to this property to set or change the INSERT statement.

17.1.1.5.4 TIBUpdateSQL.ModifySQL Property

Specifies the SQL (see page 637) UPDATE statement to use when applying an update to a record and cached updates is enabled.

Pascal

```
property ModifySQL: TStrings;
```

C++

```
__property TStrings ModifySQL;
```

Description

Set ModifySQL to the SQL (see page 637) UPDATE statement to use when applying an updated record to a dataset. Statements can be parameterized queries. To create a UPDATE statement at design time, use the UpdateSQL editor to create statements, such as:

```
update Employee
    set Last_Name = :Last_Name
    where Emp_No = :OLD_Emp_No
```

At run time, an application can write a statement directly to this property to set or change the UPDATE statement.

Note: As the example illustrates, ModifySQL supports an extension to normal parameter binding. To retrieve the value of a field as it exists prior to application of cached updates, the field name with 'OLD_'. This is especially useful when doing field comparisons in the WHERE clause of the statement.

17.1.1.5.5 TIBUpdateSQL.Query Property

Returns the query object used to perform a specified kind of update.

Pascal

```
property Query [UpdateKind: TUpdateKind]: TIBQuery;
```

C++

```
__property TIBQuery Query[TUpdateKind UpdateKind];
```

Description

Query returns the TIBQuery (see page 376) object used to perform a particular form of SQL (see page 637) update. UpdateKind specifies which query object to retrieve. UpdateKind can be one of the following:

Value Meaning

ukModify Return the query object used to execute UPDATE statements

ukInsert Return the query object used to execute INSERT statements

ukDelete Return the query object used to execute DELETE statements

Each query object executes a particular kind of SQL (see page 637) statement. The contents of the SQL (see page 637) statements executed by these objects can be accessed directly using the ModifySQL (see page 636), InsertSQL (see page 636), and DeleteSQL (see page 635) properties.

The main purpose of Query is to provide a way for an application to set the properties for an update query object or to call the query object's methods.

Note: If a particular kind of update statement is not provided, then its corresponding query object is nil (Delphi) or NULL (C++). For example, if an application does not provide an SQL (see page 637) statement for the DeleteSQL (see page 635) property, then Query[ukDelete] returns nil or NULL.

17.1.1.5.6 TIBUpdateSQL.SQL Property

Returns a specified SQL statement used when applying cached updates.

Pascal

```
property SQL [UpdateKind: TUpdateKind]: TStrings;
```

C++

```
__property TStrings SQL[TUpdateKind UpdateKind];
```

Description

Returns the SQL statement in the ModifySQL (see page 636), InsertSQL (see page 636), or DeleteSQL (see page 635) property, depending on the setting of UpdateKind. UpdateKind can be any of the following:

Value Meaning

ukModify Return the SQL statement used to update records in the dataset

ukInsert Return the SQL statement used to insert new records into the dataset

ukDelete Return the SQL statement used to delete records in the dataset

18 IBUtils Namespace

This is namespace IBUtils.

Topics

Name	Description
Functions (see page 640)	The following table lists functions in this documentation.
Constants (see page 644)	The following table lists constants in this documentation.

Constants

Name	Description
CR (see page 644)	This is constant IBUtils.CR.
CRLF (see page 644)	This is constant IBUtils.CRLF.
LF (see page 645)	This is constant IBUtils.LF.
NULL_TERMINATOR (see page 645)	This is constant IBUtils.NULL_TERMINATOR.
TAB (see page 645)	This is constant IBUtils.TAB.

Functions

	Name	Description
	AddIBParamSQLForDetail (see page 640)	This is function IBUtils.AddIBParamSQLForDetail.
	ExtractIdentifier (see page 640)	This is function IBUtils.ExtractIdentifier.
	FormatIdentifier (see page 641)	This is function IBUtils.FormatIdentifier.
	FormatIdentifierValue (see page 641)	This is function IBUtils.FormatIdentifierValue.
	Max (see page 641)	Returns the greater of two numeric values (Delphi only).
	Min (see page 642)	Returns the lesser of two numeric values (Delphi only).
	QuoteIdentifier (see page 642)	This is function IBUtils.QuoteIdentifier.
	RandomInteger (see page 642)	This is function IBUtils.RandomInteger.
	RandomString (see page 643)	This is function IBUtils.RandomString.
	StripString (see page 643)	This is function IBUtils.StripString.

18.1 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	AddIBParamSQLForDetail (see page 640)	This is function IBUtils.AddIBParamSQLForDetail.
	ExtractIdentifier (see page 640)	This is function IBUtils.ExtractIdentifier.
	FormatIdentifier (see page 641)	This is function IBUtils.FormatIdentifier.
	FormatIdentifierValue (see page 641)	This is function IBUtils.FormatIdentifierValue.
	Max (see page 641)	Returns the greater of two numeric values (Delphi only).
	Min (see page 642)	Returns the lesser of two numeric values (Delphi only).
	QuoteIdentifier (see page 642)	This is function IBUtils.QuoteIdentifier.
	RandomInteger (see page 642)	This is function IBUtils.RandomInteger.
	RandomString (see page 643)	This is function IBUtils.RandomString.
	StripString (see page 643)	This is function IBUtils.StripString.

18.1.1 IBUtils.AddIBParamSQLForDetail Function

Pascal

```
function AddIBParamSQLForDetail(Params: TParams; SQL: string; Native: Boolean; Dialect:
Integer): string;
```

C++

```
UnicodeString AddIBParamSQLForDetail(TParams Params, UnicodeString SQL, Boolean Native, int
Dialect);
```

File

IBUtils

Description

This is function IBUtils.AddIBParamSQLForDetail.

18.1.2 IBUtils.ExtractIdentifier Function

Pascal

```
function ExtractIdentifier(Dialect: Integer; Value: String): String;
```

C++

```
UnicodeString ExtractIdentifier(int Dialect, UnicodeString Value);
```

File

IBUtils

Description

This is function IBUtils.ExtractIdentifier.

18.1.3 IBUtils.FormatIdentifier Function

Pascal

```
function FormatIdentifier(Dialect: Integer; Value: String): String;
```

C++

```
UnicodeString FormatIdentifier(int Dialect, UnicodeString Value);
```

File

IBUtils

Description

This is function IBUtils.FormatIdentifier.

18.1.4 IBUtils.FormatIdentifierValue Function

Pascal

```
function FormatIdentifierValue(Dialect: Integer; Value: String): String;
```

C++

```
UnicodeString FormatIdentifierValue(int Dialect, UnicodeString Value);
```

File

IBUtils

Description

This is function IBUtils.FormatIdentifierValue.

18.1.5 IBUtils.Max Function

Returns the greater of two numeric values (Delphi only).

Pascal

```
function Max(n1: Integer; n2: Integer): Integer;
```

C++

```
int Max(int n1, int n2);
```

File

IBUtils

Description

In Delphi, call Max to compare two numeric values. Max returns the greater value of the two.

See Also

MaxValue (see page 1240)

Min (see page 1241)

MaxIntValue (see page 1239)

18.1.6 IBUtils.Min Function

Returns the lesser of two numeric values (Delphi only).

Pascal

```
function Min(n1: Integer; n2: Integer): Integer;
```

C++

```
int Min(int n1, int n2);
```

File

IBUtils

Description

Call Min to compare two numeric values in Delphi. Min returns the smaller value of the two.

See Also

MinValue (see page 1242)

Max (see page 1239)

MinIntValue (see page 1242)

18.1.7 IBUtils.QuoteIdentifier Function

Pascal

```
function QuoteIdentifier(Dialect: Integer; Value: String): String;
```

C++

```
UnicodeString QuoteIdentifier(int Dialect, UnicodeString Value);
```

File

IBUtils

Description

This is function IBUtils.QuoteIdentifier.

18.1.8 IBUtils.RandomInteger Function

Pascal

```
function RandomInteger(iLow: Integer; iHigh: Integer): Integer;
```

C++

```
int RandomInteger(int iLow, int iHigh);
```

File

IBUtils

Description

This is function IBUtils.RandomInteger.

18.1.9 IBUtils.RandomString Function

Pascal

```
function RandomString(iLength: Integer): String;
```

C++

```
UnicodeString RandomString(int iLength);
```

File

IBUtils

Description

This is function IBUtils.RandomString.

18.1.10 IBUtils.StripString Function

Pascal

```
function StripString(st: String; CharsToStrip: String): String;
```

C++

```
UnicodeString StripString(UnicodeString st, UnicodeString CharsToStrip);
```

File

IBUtils

Description

This is function IBUtils.StripString.

18.2 Constants

The following table lists constants in this documentation.

Constants

Name	Description
CR (see page 644)	This is constant IBUtils.CR.
CRLF (see page 644)	This is constant IBUtils.CRLF.
LF (see page 645)	This is constant IBUtils.LF.
NULL_TERMINATOR (see page 645)	This is constant IBUtils.NULL_TERMINATOR.
TAB (see page 645)	This is constant IBUtils.TAB.

18.2.1 IBUtils.CR Constant

Pascal

```
CR = #13;
```

C++

```
CR = #13;
```

File

IBUtils

Description

This is constant IBUtils.CR.

18.2.2 IBUtils.CRLF Constant

Pascal

```
CRLF = #13 + #10;
```

C++

```
CRLF = #13 + #10;
```

File

IBUtils

Description

This is constant IBUtils.CRLF.

18.2.3 IBUtils.LF Constant

Pascal

```
LF = #10;
```

C++

```
LF = #10;
```

File

IBUtils

Description

This is constant IBUtils.LF.

18.2.4 IBUtils.NULL_TERMINATOR Constant

Pascal

```
NULL_TERMINATOR = #0;
```

C++

```
NULL_TERMINATOR = #0;
```

File

IBUtils

Description

This is constant IBUtils.NULL_TERMINATOR.

18.2.5 IBUtils.TAB Constant

Pascal

```
TAB = #9;
```

C++

```
TAB = #9;
```

File

IBUtils

Description

This is constant IBUtils.TAB.

19 ImgList Namespace

This is namespace ImgList.

Topics

Name	Description
Classes (see page 648)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 685)	The following table lists structs, records, enums in this documentation.
Types (see page 689)	The following table lists types in this documentation.

Classes

	Name	Description
	TChangeLink (see page 648)	The TImageList component uses TChangeLink internally to notify other objects when changes are made to the image list.
	TCustomImageList (see page 651)	TCustomImageList is the base class for collections of same-sized images, each of which can be referred to by its index.

Structs, Records, Enums

	Name	Description
	TColorDepth (see page 685)	Color depth of list images.
	TDrawingStyle (see page 686)	TDrawingStyle indicates the style to use when rendering an image from an image list.
	TImageType (see page 687)	TImageType indicates whether to use a mask when rendering an image from an image list.
	TLoadResource (see page 687)	TLoadResource and TLoadResources (see page 689) determine how a resource is loaded into an image list.
	TResType (see page 688)	TResType identifies a type of graphical resource to an image list.

Types

Name	Description
TImageIndex (see page 689)	This is type ImgList.TImageIndex.
TImageListHandle (see page 689)	This is type ImgList.TImageListHandle.
TLoadResources (see page 689)	TLoadResource (see page 687) and TLoadResources determine how a resource is loaded into an image list.
TOverlay (see page 690)	TOverlay indicates the index of an overlay mask.

19.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TChangeLink (see page 648)	The TImageList component uses TChangeLink internally to notify other objects when changes are made to the image list.
	TCustomImageList (see page 651)	TCustomImageList is the base class for collections of same-sized images, each of which can be referred to by its index.

19.1.1 TChangeLink Class

The TImageList component uses TChangeLink internally to notify other objects when changes are made to the image list.

Class Hierarchy

Pascal

```
TChangeLink = class(TObject);
```

C++

```
class TChangeLink : public TObject;
```

File

ImgList

Description

A TImageList keeps a list of its TChangeLink objects. Each is associated with a particular component, such as a tree view or list view control. A component can register its change link with an image list by calling the image list's RegisterChanges method. Before destruction, the component should then call the UnRegisterChanges method.

Component writers can use the change link object to receive notification when changes are made to an image list that a control uses. Use the OnChange (see page 650) event of the change link to execute some code when the image list changes. For example, the tree view control uses a change link object to know when its image list has changed.

See Also

TImageList

TTreeView

TListView

TCustomImageList (see page 651)

19.1.1.1 TChangeLink Members

The following tables list the members exposed by TChangeLink.

Public Events

	Name	Description
	OnChange (see page 650)	Occurs when there's a change in any of the images stored in the associated image list.

Public Methods

	Name	Description
	Change (see page 649)	Generates an OnChange (see page 650) event.
	Destroy (see page 649)	Destroys the change link object and releases the memory allocated to it.

Public Properties

	Name	Description
	Sender (see page 650)	Specifies which image list component notifies the change link object of changes.

19.1.1.2 TChangeLink.Destroy Destructor

Destroys the change link object and releases the memory allocated to it.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TChangeLink();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the change link is not nil before calling Destroy.

Before freeing the memory for the change link, Destroy first calls the image list's UnRegisterChanges method to unregister itself from receiving notification when the image list changes.

See Also

System::TObject::Free

UnRegisterChanges (see page 674)

19.1.1.3 TChangeLink Methods

The methods of the TChangeLink class are listed here.

Public Methods

	Name	Description
	Change (see page 649)	Generates an OnChange (see page 650) event.

19.1.1.3.1 TChangeLink.Change Method

Generates an OnChange (see page 650) event.

Pascal

```
procedure Change; dynamic;
```

C++

```
__fastcall Change();
```

Description

Use the Change method to trigger the OnChange (see page 650) event handler of the change link object.

See Also

OnChange (see page 650)

19.1.1.4 TChangeLink Properties

The properties of the TChangeLink class are listed here.

Public Properties

	Name	Description
	Sender (see page 650)	Specifies which image list component notifies the change link object of changes.

19.1.1.4.1 TChangeLink.Sender Property

Specifies which image list component notifies the change link object of changes.

Pascal

```
property Sender: TCustomImageList;
```

C++

```
__property TCustomImageList Sender;
```

Description

Use Sender to access the image list that has changed. The TImageList automatically sets this property when a call to RegisterChanges is made.

See Also

RegisterChanges (see page 672)

19.1.1.5 TChangeLink Events

The events of the TChangeLink class are listed here.

Public Events

	Name	Description
	OnChange (see page 650)	Occurs when there's a change in any of the images stored in the associated image list.

19.1.1.5.1 TChangeLink.OnChange Event

Occurs when there's a change in any of the images stored in the associated image list.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Use the OnChange event to notify a control when the image list that it's using changes. Specify any special processing to occur at that time in the OnChange event handler.

See Also

Change (see page 649)

19.1.2 TCustomImageList Class

TCustomImageList is the base class for collections of same-sized images, each of which can be referred to by its index.

Class Hierarchy

Pascal

```
[RootDesignerSerializerAttribute('', '', False)]
TCustomImageList = class(TComponent);
```

C++

```
[RootDesignerSerializerAttribute('', '', False)]
class TCustomImageList : public TComponent;
```

File

ImgList

Description

Image lists manage large sets of icons or bitmaps. All images in an image list are contained in a single, wide bitmap in screen device format. An image list may also include a monochrome bitmap that contains masks that are combined with the images to produce a transparent effect such as is common in icons.

See Also

TPicture

TImage

19.1.2.1 TCustomImageList Members

The following tables list the members exposed by TCustomImageList.

Protected Methods

	Name	Description
	AssignTo (see page 658)	Copies the image list's properties to another image list.
	Change (see page 658)	Generates an OnChange (see page 684) event.
	DefineProperties (see page 659)	Allows bitmap data to be saved and loaded.
	DoDraw (see page 659)	Draws the specified image onto the provided Canvas in the indicated style.
	GetImages (see page 666)	Returns a specified image and its mask as bitmaps.
	HandleNeeded (see page 669)	Creates an image list handle for the image list if one doesn't already exist.
	Initialize (see page 669)	Initializes a newly allocated image list.
	ReadData (see page 672)	This is ReadData, a member of class TCustomImageList.
	WriteData (see page 675)	This is WriteData, a member of class TCustomImageList.

Public Events

	Name	Description
	OnChange (see page 684)	Occurs when the image list changes.

Public Methods

	Name	Description
	Add (see page 655)	Adds an Image and its Mask (see page 1079) to the image list object.
	AddIcon (see page 655)	Adds an icon to the image list object.
	AddImage (see page 656)	Adds single image from another image list.
	AddImages (see page 656)	Adds all images from another image list.
	AddMasked (see page 657)	Adds an image to the image list along with a color which is used to generate the transparent mask.
V	Assign (see page 657)	Copies the information from one image list to another.
	Clear (see page 658)	Clears all images from the image list.
V	Create (see page 653)	Creates an empty image list.
	CreateSize (see page 653)	Creates an empty image list of a specified size.
	Delete (see page 659)	Deletes a particular image from the image list.
V	Destroy (see page 654)	Destroys the image list and releases the memory allocated to it.
	Draw (see page 660)	This is the overview for the Draw method overload.
	DrawOverlay (see page 663)	This is the overview for the DrawOverlay method overload.
	FileLoad (see page 664)	Loads a resourced image into the image list.
	GetBitmap (see page 664)	Retrieves a specified image as a bitmap.
V	GetHotSpot (see page 665)	Returns the hot spot location associated with the current drag image.
	GetIcon (see page 665)	This is the overview for the GetIcon method overload.
	GetImageBitmap (see page 666)	Returns a handle to a bitmap containing all of the images in the image list.
	GetInstRes (see page 667)	This is the overview for the GetInstRes method overload.
	GetMaskBitmap (see page 668)	Returns a handle to a bitmap containing all masks for images in the image list.
	GetResource (see page 668)	Loads the specified bitmap, cursor, or icon resource into the image list.
	HandleAllocated (see page 669)	Indicates whether a window handle exists for the image list.
	Insert (see page 670)	Inserts a bitmap and its mask into the image list following a specified image.
	InsertIcon (see page 670)	Inserts an icon at a specified position in the image list.
	InsertMasked (see page 670)	Inserts a bitmap at a specified position, creating the mask from a specified transparent color.
	Move (see page 671)	Moves a specified image to another position.
	Overlay (see page 671)	Identifies an image in the list as an image that can be used as an overlay mask.
	RegisterChanges (see page 672)	Registers an object to be notified when changes occur in the image list.
	Replace (see page 672)	Replaces an image in the image list with a new image and mask.
	ReplaceIcon (see page 673)	Replaces an image in the image list with an icon.
	ReplaceMasked (see page 673)	Replaces an image in the image list with a new image and automatically-generated mask.
	ResInstLoad (see page 673)	Loads a resource into the image list.
	ResourceLoad (see page 674)	Loads a resource into the image list.
	SetSize (see page 674)	This is SetSize, a member of class TCustomImageList.
	UnRegisterChanges (see page 674)	Removes an object from the list of objects to be notified when the image list changes.

Public Properties

	Name	Description
	AllocBy (see page 675)	Sets the number of images by which the image list grows when it needs to make room for new images.
	BkColor (see page 676)	Determines which background color to use when drawing an image.
	BlendColor (see page 676)	Determines which foreground color to use when drawing an image.
R	Count (see page 677)	Indicates the number of images in the image list.
	DrawingStyle (see page 681)	Specifies the style to be used when the image list is drawing an image.
	Handle (see page 682)	Designates the handle for the image list.

	Height (see page 682)	Specifies the height of images within the image list.
	ImageType (see page 682)	Determines whether the image list uses the associated mask when drawing.
	Masked (see page 683)	Specifies whether the image list includes masks that can be combined with the images.
	ShareImages (see page 683)	Specifies whether the image list destroys its handle when the image list is destroyed.
	Width (see page 684)	Specifies the width of all images within the image list.

Published Properties

	Name	Description
	ColorDepth (see page 677)	Color depth of images in list.

19.1.2.2 TCustomImageList.Create Constructor

Creates an empty image list.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomImageList(TComponent * AOwner);
```

Description

Call Create to instantiate an image list at runtime. ImageLists placed on forms or data modules at design time are created automatically. Specify the owner of the new imagelist using the AOwner parameter.

The new image list contains no images and has a default size of 16 by 16 pixels.

See Also

CreateSize (see page 653)

19.1.2.3 TCustomImageList.CreateSize Constructor

Creates an empty image list of a specified size.

Pascal

```
constructor CreateSize(AWidth: Integer; AHeight: Integer);
```

C++

```
__fastcall TCustomImageList(int AWidth, int AHeight);
```

Description

Use CreateSize to create an image list object at runtime with an image size other than the default of 16 x 16 pixels. The initial size of the image list is determined by the AHeight and AWidth parameters. The height and width can be altered after the image list has been created using the Width (see page 684) and Height (see page 682) properties.

See Also

Create (see page 653)

Height (see page 682)

Width (see page 684)

19.1.2.4 TCustomImageList.Destroy Destructor

Destroys the image list and releases the memory allocated to it.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomImageList();
```

Description

Destroy first calls UnRegisterChanges (see page 674) to unregister any objects registered to receive notification when the image list changed, and frees all helper objects associated with the image list.

Destroy seldom needs to be called. However, when an image list is constructed without an owner by the Create (see page 653) or CreateSize (see page 653) method, call Free to release memory and dispose of the object. Free checks to see if the pointer is nil before calling Destroy.

See Also

System::TObject::Free

UnRegisterChanges (see page 674)

19.1.2.5 TCustomImageList Methods

The methods of the TCustomImageList class are listed here.

Protected Methods

	Name	Description
	AssignTo (see page 658)	Copies the image list's properties to another image list.
	Change (see page 658)	Generates an OnChange (see page 684) event.
	DefineProperties (see page 659)	Allows bitmap data to be saved and loaded.
	DoDraw (see page 659)	Draws the specified image onto the provided Canvas in the indicated style.
	GetImages (see page 666)	Returns a specified image and its mask as bitmaps.
	HandleNeeded (see page 669)	Creates an image list handle for the image list if one doesn't already exist.
	Initialize (see page 669)	Initializes a newly allocated image list.
	ReadData (see page 672)	This is ReadData, a member of class TCustomImageList.
	WriteData (see page 675)	This is WriteData, a member of class TCustomImageList.

Public Methods

	Name	Description
	Add (see page 655)	Adds an Image and its Mask (see page 1079) to the image list object.
	AddIcon (see page 655)	Adds an icon to the image list object.
	AddImage (see page 656)	Adds single image from another image list.
	AddImages (see page 656)	Adds all images from another image list.
	AddMasked (see page 657)	Adds an image to the image list along with a color which is used to generate the transparent mask.
	Assign (see page 657)	Copies the information from one image list to another.
	Clear (see page 658)	Clears all images from the image list.
	Delete (see page 659)	Deletes a particular image from the image list.
	Draw (see page 660)	This is the overview for the Draw method overload.
	DrawOverlay (see page 663)	This is the overview for the DrawOverlay method overload.
	FileLoad (see page 664)	Loads a resourced image into the image list.

	GetBitmap (see page 664)	Retrieves a specified image as a bitmap.
	GetHotSpot (see page 665)	Returns the hot spot location associated with the current drag image.
	GetIcon (see page 665)	This is the overview for the GetIcon method overload.
	GetImageBitmap (see page 666)	Returns a handle to a bitmap containing all of the images in the image list.
	GetInstRes (see page 667)	This is the overview for the GetInstRes method overload.
	GetMaskBitmap (see page 668)	Returns a handle to a bitmap containing all masks for images in the image list.
	GetResource (see page 668)	Loads the specified bitmap, cursor, or icon resource into the image list.
	HandleAllocated (see page 669)	Indicates whether a window handle exists for the image list.
	Insert (see page 670)	Inserts a bitmap and its mask into the image list following a specified image.
	InsertIcon (see page 670)	Inserts an icon at a specified position in the image list.
	InsertMasked (see page 670)	Inserts a bitmap at a specified position, creating the mask from a specified transparent color.
	Move (see page 671)	Moves a specified image to another position.
	Overlay (see page 671)	Identifies an image in the list as an image that can be used as an overlay mask.
	RegisterChanges (see page 672)	Registers an object to be notified when changes occur in the image list.
	Replace (see page 672)	Replaces an image in the image list with a new image and mask.
	ReplaceIcon (see page 673)	Replaces an image in the image list with an icon.
	ReplaceMasked (see page 673)	Replaces an image in the image list with a new image and automatically-generated mask.
	ResInstLoad (see page 673)	Loads a resource into the image list.
	ResourceLoad (see page 674)	Loads a resource into the image list.
	SetSize (see page 674)	This is SetSize, a member of class TCustomImageList.
	UnRegisterChanges (see page 674)	Removes an object from the list of objects to be notified when the image list changes.

19.1.2.5.1 TCustomImageList.Add Method

Adds an Image and its Mask (see page 1079) to the image list object.

Pascal

```
function Add(Image: TBitmap; Mask: TBitmap): Integer;
```

C++

```
__fastcall int Add(TBitmap Image, TBitmap Mask);
```

Description

Use the Add method to add images with their masks to an image list. It returns the index of the added image, or -1 if it fails. When the Masked (see page 683) property of the image list is false, the second bitmap is ignored; it can be set to nil (Delphi) or NULL (C++).

See Also

AddIcon (see page 655)

AddImages (see page 656)

AddMasked (see page 657)

Masked (see page 683)

19.1.2.5.2 TCustomImageList.AddIcon Method

Adds an icon to the image list object.

Pascal

```
function AddIcon(Image: TIcon): Integer;
```

C++

```
__fastcall int AddIcon(TIcon Image);
```

Description

Use the AddIcon method to add the icon specified by the Image parameter to an image list. AddIcon returns the index of the added image, or -1 if it fails.

See Also

Add (see page 655)

AddImages (see page 656)

AddMasked (see page 657)

19.1.2.5.3 TCustomImageList.AddImage Method

Adds single image from another image list.

Pascal

```
function AddImage(Value: TCustomImageList; Index: Integer): Integer;
```

C++

```
__fastcall int AddImage(TCustomImageList Value, int Index);
```

Description

Use AddImage to add a single image from another image list. Values specifies the source image list. Index indicates the specific image, where images are numbered from 0.

AddImage returns the new size of the image list.

See Also

Add (see page 655)

AddIcon (see page 655)

AddMasked (see page 657)

AddImages (see page 656)

19.1.2.5.4 TCustomImageList.AddImages Method

Adds all images from another image list.

Pascal

```
procedure AddImages(Value: TCustomImageList);
```

C++

```
__fastcall AddImages(TCustomImageList Value);
```

Description

Use AddImages to add all the images from another image list. Value specifies the source image list.

See Also

Add (see page 655)

AddIcon (see page 655)

AddMasked (see page 657)

AddImage (see page 656)

19.1.2.5.5 TCustomImageList.AddMasked Method

Adds an image to the image list along with a color which is used to generate the transparent mask.

Pascal

```
function AddMasked(Image: TBitmap; MaskColor: TColor): Integer;
```

C++

```
__fastcall int AddMasked(TBitmap Image, TColor MaskColor);
```

Description

AddMasked is similar to Add (see page 655) except that a mask bitmap is not specified. Instead, a color that can be used to automatically generate the masks is specified. Each pixel of the specified color in the image bitmap is changed to black, and the corresponding bit in the mask is set to one. As a result, any pixel in the image that matches the specified color is transparent when the image is drawn. AddMasked returns -1 if it fails, 0 if it's successful.

See Also

Add (see page 655)

AddIcon (see page 655)

AddImages (see page 656)

Masked (see page 683)

19.1.2.5.6 TCustomImageList.Assign Method

Copies the information from one image list to another.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Use this method to copy another object's information to the image list.

If Source is another image list (TCustomImageList (see page 651) descendant), Assign discards any current image information and replaces it with the information from Source.

If Source is nil (Delphi) or NULL (C++), Assign clears the image list.

If Source is any other type of object, Assign calls its inherited method, which can copy from any source object that implements a way to copy to an image list in its AssignTo (see page 658) method.

See Also

AddImages (see page 656)

Add (see page 655)

AssignTo

19.1.2.5.7 TCustomImageList.AssignTo Method

Copies the image list's properties to another image list.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Applications do not call the protected AssignTo method. Instead, call the public Assign (see page 657) method of the destination image list. AssignTo is called when the image list is passed as the Source parameter of another object's Assign (see page 657) method and that Assign (see page 657) method can't copy information to the image list. The object whose Assign (see page 657) method was called is passed as the Dest parameter. AssignTo gives the image list an opportunity to copy properties to objects that were not created with the image list in mind.

See Also

AddImages (see page 656)

Add (see page 655)

Assign (see page 657)

19.1.2.5.8 TCustomImageList.Change Method

Generates an OnChange (see page 684) event.

Pascal

```
procedure Change; dynamic;
```

C++

```
__fastcall Change();
```

Description

Change calls the OnChange (see page 684) event handler if it is assigned. Override Change to block this event or provide additional responses to changes in the image list.

See Also

RegisterChanges (see page 672)

OnChange (see page 684)

19.1.2.5.9 TCustomImageList.Clear Method

Clears all images from the image list.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Use the Clear method to remove all images from the image list. Use the Delete (see page 659) method to delete one image from the image list.

See Also

Delete (see page 659)

19.1.2.5.10 TCustomImageList.DefineProperties Method

Allows bitmap data to be saved and loaded.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

DefineProperties allows the image list to create pseudo properties that are loaded and saved with the image list. TCustomImageList (see page 651) overrides the inherited method to save or load the bitmap image in addition to the other published properties.

See Also

DefineBinaryProperty

DefineProperties

19.1.2.5.11 TCustomImageList.Delete Method

Deletes a particular image from the image list.

Pascal

```
procedure Delete(Index: Integer);
```

C++

```
__fastcall Delete(int Index);
```

Description

Use the Delete method to delete an image specified by Index in the image list. Use the Clear (see page 658) method to delete all images in the image list.

See Also

Clear (see page 658)

19.1.2.5.12 TCustomImageList.DoDraw Method

Draws the specified image onto the provided Canvas in the indicated style.

Pascal

```
procedure DoDraw(Index: Integer; Canvas: TCanvas; X: Integer; Y: Integer; Style: Cardinal;
Enabled: Boolean = True); virtual;
```

C++

```
virtual __fastcall DoDraw(int Index, TCanvas Canvas, int X, int Y, unsigned Style, Boolean
Enabled = True);
```

Description

Applications can't call the protected DoDraw method. It provides the underlying implementation of the public Draw (see page 660) method.

Index specifies an image to draw.

Canvas indicates the drawing surface on which the image is rendered.

X and Y specify the top-left corner of the image on Canvas.

Style encodes how the image blends color or uses a mask (the DrawingStyle (see page 681) and ImageType (see page 682)).

Enabled indicates whether the image appears as a gray-mapped image. If Enabled is false, DoDraw renders a gray-mapped version of the image.

See Also

Draw (see page 660)

DrawingStyle (see page 681)

ImageType (see page 682)

19.1.2.5.13 Draw Method

This is the overview for the Draw method overload.

Overload List

	Name	Description
	TCustomImageList.Draw (TCanvas, Integer, Integer, Integer, Boolean) (see page 660)	Draws the image specified by the Index parameter onto the provided Canvas.
	TCustomImageList.Draw (TCanvas, Integer, Integer, Integer, TDrawingStyle, TImageType, Boolean) (see page 660)	Draws the image specified by the Index parameter onto the provided Canvas.

19.1.2.5.13.1 TCustomImageList.Draw Method (TCanvas, Integer, Integer, Integer, Boolean)

Draws the image specified by the Index parameter onto the provided Canvas.

Pascal

```
procedure Draw(Canvas: TCanvas; X: Integer; Y: Integer; Index: Integer; Enabled: Boolean =
True); overload;
procedure Draw(Canvas: TCanvas; X: Integer; Y: Integer; Index: Integer; ADrawingStyle:
TDrawingStyle; AImageType: TImageType; Enabled: Boolean = True); overload;
```

C++

```
__fastcall Draw(TCanvas Canvas, int X, int Y, int Index, Boolean Enabled = True);
__fastcall Draw(TCanvas Canvas, int X, int Y, int Index, TDrawingStyle ADrawingStyle,
TImageType AImageType, Boolean Enabled = True);
```

Description

Use the Draw method to draw one of the images in the image list onto a specified canvas.

Canvas is the drawing surface on which to render the image.

X and Y specify the location where the top-left corner should appear on Canvas.

Index indicates which image to draw, where 0 specifies the first image, 1 specifies the second image, and so on.

ADrawingStyle indicates how the color of the image may be altered. If this parameter is not specified, Draw uses the value of the DrawingStyle (see page 681) property.

AImageType indicates whether to draw the image or its associated mask. If this parameter is not specified, Draw uses the value of the ImageType (see page 682) property.

Enabled indicates whether the image appears as a gray-mapped image. If Enabled is false, Draw renders a gray-mapped version of the image. Because Enabled has a default value of true, this parameter can be omitted if the image should not be grayed.

C++ Examples:

```
/*
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It draws a focus rectangle around the cell that has focus.
goDrawFocusSelect in the DrawGrid Options parameter must be
True to set focus on a cell.  The ImageList Draw method must
be called after DrawFocusRect. The OnSelectCell event handler
must implemented to return true.
*/
void __fastcall TForm1::DrawGrid1DrawCell(
  TObject *Sender, int ACol, int ARow, TRect &Rect, TGridDrawState State)
{
  long index = ARow * DrawGrid1->ColCount + ACol;
  DrawGrid1->Canvas->Brush->Color = clBackground;
  DrawGrid1->Canvas->FillRect(Rect);
  if (State.Contains(gdFocused))
  {
    DrawGrid1->Canvas->DrawFocusRect(Rect);
    Label1->Caption = "Cell " + IntToStr(int(index)) + " has the focus.";
  }
  ImageList1->Draw(
    DrawGrid1->Canvas, Rect.Left, Rect.Top, index, True);
}

void __fastcall TForm1::DrawGrid1SelectCell(TObject *Sender, int ACol, int ARow,
      bool &CanSelect)
{
  CanSelect= True;
}
/*
The following code is the OnDrawPanel event handler of a
status bar.  It draws each panel of the status bar, adding
text and icons stored in ImageList1. The image list contains
as many icons as there are header sections.  This example
requires a populated image list and a statusbar with several
panels added to the Panels property.  Select each panel and
set the Style property to psOwnerDraw.
*/
void __fastcall TForm1::StatusBar1DrawPanel(TStatusBar *StatusBar,
        TStatusPanel *Panel, const TRect &Rect)
{
  TCanvas *canvas = StatusBar->Canvas;
  canvas->Brush->Color = clRed;
  canvas->FillRect(Rect);
  canvas->Font->Color = clYellow;
  ImageList1->Draw(canvas,Rect.Left,Rect.Top, Panel->Index, true);
  canvas->TextOut(Rect.left + 30, Rect.top + 2, "Panel" + IntToStr(Panel->Index));
}
```

Delphi Examples:

```
{
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It draws a focus rectangle around the cell that has focus.
goDrawFocusSelect in the DrawGrid Options parameter must be
True to set focus on a cell.  The ImageList Draw method must
be called after DrawFocusRect. The OnSelectCell event handler
must implemented to return true.
}
procedure TForm1.DrawGrid1DrawCell(Sender: TObject; ACol, ARow: Integer;
  Rect: TRect; State: TGridDrawState);
var
  index: Integer;
begin
  index := ARow * DrawGrid1.ColCount + ACol;
  DrawGrid1.Canvas.Brush.Color := clWhite;
  DrawGrid1.Canvas.FillRect(Rect);
  if (gdFocused in State) then
  begin
    DrawGrid1.Canvas.DrawFocusRect(Rect);
    Label1.Caption:= 'Cell ' + InttoStr(index) + ' has the focus.';
  end;
  ImageList1.Draw(DrawGrid1.Canvas,Rect.Left,Rect.Top,index, True);
end;

procedure TForm1.DrawGrid1SelectCell(Sender: TObject; ACol, ARow: Integer;
  var CanSelect: Boolean);
begin
  CanSelect:= True;
end;
{
The following code is the OnDrawPanel event handler of a
status bar.  It draws each panel of the status bar, adding
text and icons stored in ImageList1. The image list contains
as many icons as there are header sections.  This example
requires a populated image list and a statusbar with several
panels added to the Panels property.  Select each panel and
set the Style property to psOwnerDraw.
}
procedure TForm1.StatusBar1DrawPanel(StatusBar: TStatusBar;
  Panel: TStatusPanel; const Rect: TRect);
begin
with StatusBar1.Canvas do
  begin
    Brush.Color := clRed;
    FillRect(Rect);
    Font.Color := clYellow;
    ImageList1.Draw(StatusBar1.Canvas,Rect.Left,Rect.Top,Panel.Index);
    TextOut(Rect.left + 30, Rect.top + 2, 'Panel' + IntToStr(Panel.Index));
  end;
end;
```

19.1.2.5.14 DrawOverlay Method

This is the overview for the DrawOverlay method overload.

Overload List

	Name	Description
	TCustomImageList.DrawOverlay (TCanvas, Integer, Integer, Integer, TOverlay, Boolean) (see page 663)	Draws an image and an overlay onto the provided Canvas.
	TCustomImageList.DrawOverlay (TCanvas, Integer, Integer, Integer, TOverlay, TDrawingStyle, TImageType, Boolean) (see page 663)	Draws an image and an overlay onto the provided Canvas.

19.1.2.5.14.1 TCustomImageList.DrawOverlay Method (TCanvas, Integer, Integer, Integer, TOverlay, Boolean)

Draws an image and an overlay onto the provided Canvas.

Pascal

```
procedure DrawOverlay(Canvas: TCanvas; X: Integer; Y: Integer; ImageIndex: Integer; Overlay:
TOverlay; Enabled: Boolean = True); overload;
procedure DrawOverlay(Canvas: TCanvas; X: Integer; Y: Integer; ImageIndex: Integer; Overlay:
TOverlay; ADrawingStyle: TDrawingStyle; AImageType: TImageType; Enabled: Boolean = True);
overload;
```

C++

```
__fastcall DrawOverlay(TCanvas Canvas, int X, int Y, int ImageIndex, TOverlay Overlay, Boolean
Enabled = True);
__fastcall DrawOverlay(TCanvas Canvas, int X, int Y, int ImageIndex, TOverlay Overlay,
TDrawingStyle ADrawingStyle, TImageType AImageType, Boolean Enabled = True);
```

Description

An overlay mask is an image drawn transparently over another image. Any image can be used as an overlay mask. To draw an overlay mask over an image use the DrawOverlay method with the index of the overlay mask.

Canvas is the drawing surface on which to draw the overlay.

X and Y specify the location where the top-left corner should appear on Canvas.

ImageIndex indicates which image to draw, where 0 specifies the first image, 1 specifies the second image, and so on.

Overlay (see page 671) specifies the index of the overlay mask to use. This index is assigned to the image that is used as an overlay mask by calling the Overlay (see page 671) method.

ADrawingStyle indicates how the color of the image may be altered. If this parameter is not specified, Draw (see page 660) uses the value of the DrawingStyle (see page 681) property.

AImageType indicates whether to draw the image or its associated mask. If this parameter is not specified, Draw (see page 660) uses the value of the ImageType (see page 682) property.

Enabled indicates whether the image appears as a gray-mapped image. If Enabled is false, DoDraw (see page 659) renders a gray-mapped version of the image. Because Enabled has a default value of true, this parameter can be omitted if the image should not be grayed.

See Also

Overlay (see page 671)

Draw (see page 660)

SetDragImage

19.1.2.5.15 TCustomImageList.FileLoad Method

Loads a resourced image into the image list.

Pascal

```
function FileLoad(ResType: TResType; const Name: string; MaskColor: TColor): Boolean;
```

C++

```
__fastcall Boolean FileLoad(TResType ResType, const UnicodeString Name, TColor MaskColor);
```

Description

Use the FileLoad method to load a bitmap, cursor, or icon from a resource file. Use ResType to specify the type of resource. Use Name to identify the resource by name. Use MaskColor to set the transparent color for the images. FileLoad returns true if successful.

Note: Within a package, FileLoad returns an error. GetInstRes (see page 667) must be used to load a resource from within a package.

See Also

GetResource (see page 668)

ResourceLoad (see page 674)

GetInstRes (see page 667)

19.1.2.5.16 TCustomImageList.GetBitmap Method

Retrieves a specified image as a bitmap.

Pascal

```
function GetBitmap(Index: Integer; Image: TBitmap): Boolean;
```

C++

```
__fastcall Boolean GetBitmap(int Index, TBitmap Image);
```

Description

Use the GetBitmap method to obtain a particular image in the image list as a bitmap object. Index denotes the index of the image. GetBitmap assigns the image to the TBitmap object passed in as the Image parameter.

C++ Examples:

```
/*
This example assigns a bitmap contained in an ImageList to
an Image component's Picture's Bitmap property and displays
the bitmap.  TImage Stretch will fit the bitmap to the image
size.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  ImageList1->GetBitmap(0, Image1->Picture->Bitmap);
  Image1->Stretch = True;
```

```
}
```

Delphi Examples:

```
{
This example assigns a bitmap contained in an ImageList to
an Image component's Picture's Bitmap property and displays
the bitmap.  TImage Stretch will fit the bitmap to the image
size.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   ImageList1.GetBitmap(2,Image1.Picture.Bitmap);
   Image1.Stretch := True;
end;
```

See Also

GetMaskBitmap (see page 668)

19.1.2.5.17 TCustomImageList.GetHotSpot Method

Returns the hot spot location associated with the current drag image.

Pascal

```
function GetHotSpot: TPoint; virtual;
```

C++

```
virtual __fastcall TPoint GetHotSpot();
```

Description

Use the GetHotSpot method to obtain the position of the hot spot of the current drag image.

See Also

DragMove

SetDragImage

19.1.2.5.18 GetIcon Method

This is the overview for the GetIcon method overload.

Overload List

	Name	Description
	TCustomImageList.GetIcon (Integer, TIcon) (see page 665)	Returns the image specified by Index as an icon into the Image parameter.
	TCustomImageList.GetIcon (Integer, TIcon, TDrawingStyle, TImageType) (see page 665)	Returns the image specified by Index as an icon into the Image parameter.

19.1.2.5.18.1 TCustomImageList.GetIcon Method (Integer, TIcon)

Returns the image specified by Index as an icon into the Image parameter.

Pascal

```
procedure GetIcon(Index: Integer; Image: TIcon); overload;
procedure GetIcon(Index: Integer; Image: TIcon; ADrawingStyle: TDrawingStyle; AImageType:
TImageType); overload;
```

C++

```
__fastcall GetIcon(int Index, TIcon Image);
__fastcall GetIcon(int Index, TIcon Image, TDrawingStyle ADrawingStyle, TImageType AImageType);
```

Description

Call GetIcon to obtain a particular image in the image list as an icon.

Index identifies the desired image, where 0 specifies the first image, 1 specifies the second image, and so on.

Image is a TIcon object that receives the new image.

ADrawingStyle specifies the amount of color that is blended with the image to achieve various affects. When GetIcon is called using the version that does not take an ADrawingStyle parameter, it uses the value of the DrawingStyle (see page 681) property.

AImageType specifies whether the image is rendered using a mask. When GetIcon is called using the version that does not take an AImageType parameter, it uses the value of the ImageType (see page 682) property.

See Also

GetImageBitmap (see page 666)

DrawingStyle (see page 681)

ImageType (see page 682)

19.1.2.5.19 TCustomImageList.GetImageBitmap Method

Returns a handle to a bitmap containing all of the images in the image list.

Pascal

```
function GetImageBitmap: HBITMAP;
```

C++

```
__fastcall HBITMAP GetImageBitmap();
```

Description

Use the GetImageBitmap method to obtain a Windows handle for the bitmap that contains all images in the image list. GetImageBitmap returns 0 if unsuccessful.

See Also

GetImages (see page 666)

GetBitmap (see page 664)

19.1.2.5.20 TCustomImageList.GetImages Method

Returns a specified image and its mask as bitmaps.

Pascal

```
procedure GetImages(Index: Integer; Image: TBitmap; Mask: TBitmap);
```

C++

```
__fastcall GetImages(int Index, TBitmap Image, TBitmap Mask);
```

Description

Use GetImages to obtain the image (and its mask) identified by the Index parameter.

Index specifies the image (and mask) to return, where 0 identifies the first image, 1 the second image, and so on.

Image is a TBitmap object that receives the image of the bitmap.

Mask (see page 1079) is a TBitmap object that receives the image of the mask.

See Also

GetImageBitmap (see page 666)

GetMaskBitmap (see page 668)

GetBitmap (see page 664)

19.1.2.5.21 GetInstRes Method

This is the overview for the GetInstRes method overload.

Overload List

	Name	Description
	TCustomImageList.GetInstRes (THandle, TResType, DWORD, Integer, TLoadResources, TColor) (see page 667)	Loads a specified bitmap, cursor, or icon resource into the image list.
	TCustomImageList.GetInstRes (THandle, TResType, string, Integer, TLoadResources, TColor) (see page 667)	Loads a specified bitmap, cursor, or icon resource into the image list.

19.1.2.5.21.1 TCustomImageList.GetInstRes Method (THandle, TResType, DWORD, Integer, TLoadResources, TColor)

Loads a specified bitmap, cursor, or icon resource into the image list.

Pascal

```
function GetInstRes(Instance: THandle; ResType: TResType; const Name: string; Width: Integer;
LoadFlags: TLoadResources; MaskColor: TColor): Boolean; overload;
function GetInstRes(Instance: THandle; ResType: TResType; ResID: DWORD; Width: Integer;
LoadFlags: TLoadResources; MaskColor: TColor): Boolean; overload;
```

C++

```
__fastcall Boolean GetInstRes(THandle Instance, TResType ResType, const UnicodeString Name,
int Width, TLoadResources LoadFlags, TColor MaskColor);
__fastcall Boolean GetInstRes(THandle Instance, TResType ResType, DWORD ResID, int Width,
TLoadResources LoadFlags, TColor MaskColor);
```

Description

Use the GetInstRes method to load bitmap, cursor, or icon resource into an image list.

Instance is the instance handle of the resource module.

ResType indicates the type of resource (rtBitmap, rtCursor or rtIcon).

Name or ResID identifies the resource by name or ID, respectively.

Width (see page 684) specifies the width, in pixels, of the image.

LoadFlags specifies how to load the image.

MaskColor sets the transparent color for the image.

Note: GetInstRes must be used to load a resource from within a package. Within a package, GetResource (see page 668) or FileLoad (see page 664) returns an error.

See Also

ResInstLoad (see page 673)

ResourceLoad (see page 674)

FileLoad (see page 664)

GetResource (see page 668)

19.1.2.5.22 TCustomImageList.GetMaskBitmap Method

Returns a handle to a bitmap containing all masks for images in the image list.

Pascal

```
function GetMaskBitmap: HBITMAP;
```

C++

```
__fastcall HBITMAP GetMaskBitmap();
```

Description

Use the GetMaskBitmap to obtain a bitmap that contains all masks in the image list. GetMaskBitmap returns 0 if unsuccessful.

See Also

GetImageBitmap (see page 666)

GetImages (see page 666)

19.1.2.5.23 TCustomImageList.GetResource Method

Loads the specified bitmap, cursor, or icon resource into the image list.

Pascal

```
function GetResource(ResType: TResType; const Name: string; Width: Integer; LoadFlags:
TLoadResources; MaskColor: TColor): Boolean;
```

C++

```
__fastcall Boolean GetResource(TResType ResType, const UnicodeString Name, int Width,
TLoadResources LoadFlags, TColor MaskColor);
```

Description

Use the GetResource method to load bitmap, cursor, or icon resource into an image list.

Note: Within a package, GetResource returns an error. GetInstRes (see page 667) must be used to load a resource from within a package.

ResType specifies the type of graphical resource that is to be loaded into the image list and can be rtBitmap, rtCursor or rtIcon.

Name identifies the resource by name.

Width (see page 684) specifies the width, in pixels, of the image.

LoadFlags specifies how to load the image.

MaskColor sets the transparent color for the images in the file.

See Also

ResourceLoad (see page 674)

FileLoad (see page 664)

GetInstRes (see page 667)

19.1.2.5.24 TCustomImageList.HandleAllocated Method

Indicates whether a window handle exists for the image list.

Pascal

```
function HandleAllocated: Boolean;
```

C++

```
__fastcall Boolean HandleAllocated();
```

Description

Use HandleAllocated to determine if a handle exists for the image list. HandleAllocated returns true if the Windows image list has been created and a handle is available, false otherwise. HandleAllocated doesn't create a handle if it doesn't already exist.

Note: Getting the Handle (see page 682) property of creates the Windows image list automatically if it didn't previously exist, and returns the resulting handle.

See Also

Handle (see page 682)

19.1.2.5.25 TCustomImageList.HandleNeeded Method

Creates an image list handle for the image list if one doesn't already exist.

Pascal

```
procedure HandleNeeded;
```

C++

```
__fastcall HandleNeeded();
```

Description

Use HandleNeeded to create a Windows image list for the image list component when one doesn't already exist. This method is called automatically when an image list's handle property is accessed.

See Also

HandleAllocated (see page 669)

Handle (see page 682)

19.1.2.5.26 TCustomImageList.Initialize Method

Initializes a newly allocated image list.

Pascal

```
procedure Initialize; virtual;
```

C++

```
virtual __fastcall Initialize();
```

Description

Initialize is called from the constructor of the image list. It sets numerous image list properties to their default values and creates instances of helper objects used internally.

See Also

Create (see page 653)

CreateSize (see page 653)

19.1.2.5.27 TCustomImageList.Insert Method

Inserts a bitmap and its mask into the image list following a specified image.

Pascal

```
procedure Insert(Index: Integer; Image: TBitmap; Mask: TBitmap);
```

C++

```
__fastcall Insert(int Index, TBitmap Image, TBitmap Mask);
```

Description

Use the Insert method to insert a bitmap and its mask into the image list. The image is inserted following the image specified by Index.

See Also

Add (see page 655)

AddMasked (see page 657)

19.1.2.5.28 TCustomImageList.InsertIcon Method

Inserts an icon at a specified position in the image list.

Pascal

```
procedure InsertIcon(Index: Integer; Image: TIcon);
```

C++

```
__fastcall InsertIcon(int Index, TIcon Image);
```

Description

Use the InsertIcon method to insert an icon into the image list. The icon is inserted following the image specified by Index.

See Also

AddIcon (see page 655)

19.1.2.5.29 TCustomImageList.InsertMasked Method

Inserts a bitmap at a specified position, creating the mask from a specified transparent color.

Pascal

```
procedure InsertMasked(Index: Integer; Image: TBitmap; MaskColor: TColor);
```

C++

```
__fastcall InsertMasked(int Index, TBitmap Image, TColor MaskColor);
```

Description

Use the InsertMasked method to insert a masked image into the image list. The new image is inserted following the image specified by Index. Use MaskColor to identify the color in the image used to generate the Mask (see page 1079).

See Also

AddMasked (see page 657)

Insert (see page 670)

19.1.2.5.30 TCustomImageList.Move Method

Moves a specified image to another position.

Pascal

```
procedure Move(CurIndex: Integer; NewIndex: Integer);
```

C++

```
__fastcall Move(int CurIndex, int NewIndex);
```

Description

Use the Move method to move an image to another position in the image list. Specify the current position using CurIndex, and the new position using NewIndex.

See Also

Insert (see page 670)

19.1.2.5.31 TCustomImageList.Overlay Method

Identifies an image in the list as an image that can be used as an overlay mask.

Pascal

```
function Overlay(ImageIndex: Integer; Overlay: TOverlay): Boolean;
```

C++

```
__fastcall Boolean Overlay(int ImageIndex, TOverlay Overlay);
```

Description

Use Overlay to assign an overlay index to one of the images in the list. Once an image has an overlay index, it can be used as an overlay mask. An overlay mask is an image drawn transparently over another image.

ImageIndex identifies the image that can act as an overlay mask.

Overlay is the overlay index to assign to that image. It must be a value between 0 and 3 (inclusive). Note that this means at most four images can be used as overlay masks.

If successful, Overlay returns true.

To draw an overlay mask over an image use the DrawOverlaymethodwith the index of the overlay mask.

See Also

DrawOverlay (see page 663)

19.1.2.5.32 TCustomImageList.ReadData Method

Pascal

```
procedure ReadData(Stream: TStream); virtual;
```

C++

```
virtual __fastcall ReadData(TStream Stream);
```

Description

This is ReadData, a member of class TCustomImageList.

19.1.2.5.33 TCustomImageList.RegisterChanges Method

Registers an object to be notified when changes occur in the image list.

Pascal

```
procedure RegisterChanges(Value: TChangeLink);
```

C++

```
__fastcall RegisterChanges(TChangeLink Value);
```

Description

Use the RegisterChanges method to have an object notified whenever changes occur in the image list. The TChangeLink (see page 648)'s OnChange (see page 684) event is called whenever a change in the image list occurs.

Create (see page 653) a change link object for each object that should be notified of changes. Register each object by calling RegisterChanges and passing its change link object as the Value parameter. The OnChange (see page 684) event of all registered change link objects is then triggered when a change occurs in the image list. Any code assigned to the OnChange (see page 684) event handlers will execute.

See Also

UnRegisterChanges (see page 674)

OnChange (see page 650)

19.1.2.5.34 TCustomImageList.Replace Method

Replaces an image in the image list with a new image and mask.

Pascal

```
procedure Replace(Index: Integer; Image: TBitmap; Mask: TBitmap);
```

C++

```
__fastcall Replace(int Index, TBitmap Image, TBitmap Mask);
```

Description

Use the Replace method to replace the image at the Index position in the image list with a new Image and overlay Mask (see page 1079).

See Also

Insert (see page 670)

ReplaceIcon (see page 673)

ReplaceMasked (see page 673)

19.1.2.5.35 TCustomImageList.ReplaceIcon Method

Replaces an image in the image list with an icon.

Pascal

```
procedure ReplaceIcon(Index: Integer; Image: TIcon);
```

C++

```
__fastcall ReplaceIcon(int Index, TIcon Image);
```

Description

Use the ReplaceIcon method to replace the Image at the Index position in the image list with a new icon.

See Also

Replace (see page 672)

InsertIcon (see page 670)

19.1.2.5.36 TCustomImageList.ReplaceMasked Method

Replaces an image in the image list with a new image and automatically-generated mask.

Pascal

```
procedure ReplaceMasked(Index: Integer; NewImage: TBitmap; MaskColor: TColor);
```

C++

```
__fastcall ReplaceMasked(int Index, TBitmap NewImage, TColor MaskColor);
```

Description

Use the ReplaceMasked method to replace the image at Index position within the image list specified by NewImage and the mask generated from NewImage by masking out all pixels of the color specified by MaskColor.

See Also

Replace (see page 672)

InsertMasked (see page 670)

19.1.2.5.37 TCustomImageList.ResInstLoad Method

Loads a resource into the image list.

Pascal

```
function ResInstLoad(Instance: THandle; ResType: TResType; const Name: string; MaskColor:
TColor): Boolean;
```

C++

```
__fastcall Boolean ResInstLoad(THandle Instance, TResType ResType, const UnicodeString Name,
TColor MaskColor);
```

Description

Use the ResoInstLoad method to load a resource of type TResType (see page 688) into the image list. Use Instance to specify the instance handle of the resource module, and Name to identify the resource within that module. MaskColor is used to create the mask for the resulting image. ResInstLoad should be used rather than ResourceLoad (see page 674) to load a resource

from within a package.

ResInstLoad returns true if it is successful, false otherwise.

See Also

GetInstRes (see page 667)

GetResource (see page 668)

19.1.2.5.38 TCustomImageList.ResourceLoad Method

Loads a resource into the image list.

Pascal

```
function ResourceLoad(ResType: TResType; const Name: string; MaskColor: TColor): Boolean;
```

C++

```
__fastcall Boolean ResourceLoad(TResType ResType, const UnicodeString Name, TColor MaskColor);
```

Description

Use the ResourceLoad method to load a resource of type TResType (see page 688) into the image list. Use Name to identify the resource. MaskColor is used to create the mask for the resulting image. ResourceLoad returns true if successful, false otherwise.

Note: Within a package, use ResInstLoad (see page 673) instead of ResourceLoad. ResourceLoad returns an error when called from within a package.

See Also

GetResource (see page 668)

ResInstLoad (see page 673)

19.1.2.5.39 TCustomImageList.SetSize Method

Pascal

```
procedure SetSize(AWidth: Integer; AHeight: Integer);
```

C++

```
__fastcall SetSize(int AWidth, int AHeight);
```

Description

This is SetSize, a member of class TCustomImageList.

19.1.2.5.40 TCustomImageList.UnRegisterChanges Method

Removes an object from the list of objects to be notified when the image list changes.

Pascal

```
procedure UnRegisterChanges(Value: TChangeLink);
```

C++

```
__fastcall UnRegisterChanges(TChangeLink Value);
```

Description

Use the UnRegisterChanges method to unregister a TChangeLink (see page 648) object. The object will no longer receive

notification when the image list changes.

See Also

RegisterChanges (see page 672)

19.1.2.5.41 TCustomImageList.WriteData Method

Pascal

```
procedure WriteData(Stream: TStream); virtual;
```

C++

```
virtual __fastcall WriteData(TStream Stream);
```

Description

This is WriteData, a member of class TCustomImageList.

19.1.2.6 TCustomImageList Properties

The properties of the TCustomImageList class are listed here.

Public Properties

	Name	Description
	AllocBy (see page 675)	Sets the number of images by which the image list grows when it needs to make room for new images.
	BkColor (see page 676)	Determines which background color to use when drawing an image.
	BlendColor (see page 676)	Determines which foreground color to use when drawing an image.
R	Count (see page 677)	Indicates the number of images in the image list.
	DrawingStyle (see page 681)	Specifies the style to be used when the image list is drawing an image.
	Handle (see page 682)	Designates the handle for the image list.
	Height (see page 682)	Specifies the height of images within the image list.
	ImageType (see page 682)	Determines whether the image list uses the associated mask when drawing.
	Masked (see page 683)	Specifies whether the image list includes masks that can be combined with the images.
	ShareImages (see page 683)	Specifies whether the image list destroys its handle when the image list is destroyed.
	Width (see page 684)	Specifies the width of all images within the image list.

Published Properties

	Name	Description
	ColorDepth (see page 677)	Color depth of images in list.

19.1.2.6.1 TCustomImageList.AllocBy Property

Sets the number of images by which the image list grows when it needs to make room for new images.

Pascal

```
property AllocBy: Integer;
```

C++

```
__property int AllocBy;
```

Description

Use the AllocBy method to specify the number of new images that can be added to the resized image list.

See Also

Count (see page 677)

Add (see page 655)

AddIcon (see page 655)

AddImages (see page 656)

AddMasked (see page 657)

19.1.2.6.2 TCustomImageList.BkColor Property

Determines which background color to use when drawing an image.

Pascal

```
property BkColor: TColor;
```

C++

```
__property TColor BkColor;
```

Description

Use BkColor to specify the color used for the masked regions of the images in the list. When BkColor is clNone, the image is drawn transparently using the mask to define the transparent areas. Otherwise, the value of BkColor appears in the masked out portions.

Note: BkColor has no effect when the Masked (see page 683) property is false.

See Also

BlendColor (see page 676)

Masked (see page 683)

ImageType (see page 682)

19.1.2.6.3 TCustomImageList.BlendColor Property

Determines which foreground color to use when drawing an image.

Pascal

```
property BlendColor: TColor;
```

C++

```
__property TColor BlendColor;
```

Description

Set BlendColor to cause the images in the list to be combined with the specified color when the DrawingStyle (see page 681) is dsFocus or dsSelected. More of BlendColor is combined with the images when DrawingStyle (see page 681) is dsSelected. clNone specifies no blend color while clDefault specifies the system highlight .

See Also

BkColor (see page 676)

DrawingStyle (see page 681)

19.1.2.6.4 TCustomImageList.ColorDepth Property

Color depth of images in list.

Pascal

```
property ColorDepth: TColorDepth;
```

C++

```
__property TColorDepth ColorDepth;
```

Description

ColorDepth is the color depth type TColorDepth (see page 685) of images in the list.

See Also

BkColor (see page 676)

BlendColor (see page 676)

Height (see page 682)

Width (see page 684)

TColorDepth (see page 685)

19.1.2.6.5 TCustomImageList.Count Property

Indicates the number of images in the image list.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Use Count when iterating through the images in the image list. Retrieve the individual images using the GetBitmap (see page 664) method. Draw (see page 660) individual images using the Draw (see page 660) method.

C++ Examples:

```
/*
This example requires a TListView, a TImageList and a
TComboBox. You will need to double click the image list and
add several images to the image list prior to running the
project. During the form's OnCreate event
handler, items for the List View control are created for
each image in the Image List and the ImageIndex is assigned
the number of the image within the ImageList. Two columns are
created so that when ViewStyle is vsReport, you will have
columns to view.  Also within the form's OnCreate event
handler assign the ComboBox each of the four TViewStyle
constants to the Items' Objects property. You could also
simply code this within a series of OnClick event handlers
as, for instance, ListView1.->ViewStyle := vsIcon.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TListItem *Item;
  TListColumn *Column;
  const char imagenames[3][20] = {"C++ Image", "Borland Image", "Delphi Image"};
```

```
  const char Col2Array[3][40] = {"Documentation for the C++ icon.", "Borland icon.", "Delphi
icon."};
  // Create a ListView item for each image in the ImageList
  ListView1->SmallImages = ImageList1;
  ListView1->LargeImages = ImageList1;
  for (int i = 0; i < ImageList1->Count; i++)
  {
    Item = ListView1->Items->Add();
    Item->Caption = imagenames[i];
    Item->ImageIndex = i;
    Item->SubItems->Add(Col2Array[i]);
  }
  // Create two columns to show during viewing as vsReport
  Column = ListView1->Columns->Add();
  Column->Caption = "Column 1";
  Column->Width = 200;
  Column = ListView1->Columns->Add();
  Column->Caption = "Column 2";
  Column->Width = 200;
  // Add View styles and constants to the Combo Box
  ComboBox1->Items->AddObject("vsIcon", reinterpret_cast<TObject *>(vsIcon));
  ComboBox1->Items->AddObject("vsList", reinterpret_cast<TObject *>(vsList));
  ComboBox1->Items->AddObject("vsReport", reinterpret_cast<TObject *>(vsReport));
  ComboBox1->Items->AddObject("vsSmallIcon", reinterpret_cast<TObject *>(vsSmallIcon));
  // Display first item in the Combo Box
  ComboBox1->ItemIndex = 0;
}

void __fastcall TForm1::ComboBox1Click(TObject *Sender)
{
  ListView1->ViewStyle = (TViewStyle) ComboBox1->Items->Objects[ComboBox1->ItemIndex];
}
/*
This example shows how to use the OnColumnClick and
OnCompare events of a list view to let users sort the
columns in a report-style list view by clicking on the
column headers. This requires a global variable to keep
track of the column that was clicked.  The OnColumnClick
event handler sets the global variable to indicate the
column to sort and calls AlphaSort:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TListItem *Item;
  TListColumn *Column;
  const char imagenames[3][20] = {
    "C++ Image", "Borland Image", "Delphi Image"};
  const char Col2Array[3][40] = {
    "Documentation for the C++ icon.",
    "Borland icon.", "Delphi icon."
    };
  // Create a ListView item for each image in the ImageList
  ListView1->SmallImages = ImageList1;
  ListView1->LargeImages = ImageList1;
  for (int i = 0; i < ImageList1->Count; i++)
  {
    Item = ListView1->Items->Add();
    Item->Caption = imagenames[i];
    Item->ImageIndex = i;
    Item->SubItems->Add(Col2Array[i]);
  }
  // Create two columns to show during viewing as vsReport
  Column = ListView1->Columns->Add();
  Column->Caption = "Column 1";
  Column->Width = 200;
  Column = ListView1->Columns->Add();
```

```
  Column->Caption = "Column 2";
  Column->Width = 200;
  ListView1->ViewStyle = vsReport;
}

int ColumnToSort = 0;

/*
The OnColumnClick event handler sets the global variable to
indicate the column to sort and calls AlphaSort:
*/

void __fastcall TForm1::ListView1ColumnClick(TObject *Sender,
      TListColumn *Column)
{
  ColumnToSort = Column->Index;
  dynamic_cast<TCustomListView *>(Sender)->AlphaSort();
}

/*
The OnCompare event handler causes the list view to sort on
the selected column:
*/

void __fastcall TForm1::ListView1Compare(TObject *Sender, TListItem *Item1,
      TListItem *Item2, int Data, int &Compare)
{
  if (ColumnToSort == 0)
    Compare = CompareText(Item1->Caption,Item2->Caption);
  else
  {
    int ix = ColumnToSort - 1;
    Compare =
      CompareText(Item1->SubItems->Strings[ix], Item2->SubItems->Strings[ix]);
  }
}
```

Delphi Examples:

```
{
This example requires a TListView, a TImageList and a
TComboBox. You will need to double click the image list and
add several images to the image list prior to running the
project. You can use *.bmp or *.ico files from the
\Images\Icons directory. During the form's OnCreate event
handler, items for the List View control are created for
each image in the Image List and the ImageIndex is assigned
the number of the image within the ImageList. Two columns are
created so that when ViewStyle is vsReport, you will have
columns to view.  Also within the form's OnCreate event
handler assign the ComboBox each of the four TViewStyle
constants to the Items' Objects property. You could also
simply code this within a series of OnClick event handlers
as, for instance, ListView1.->ViewStyle := vsIcon.
}

procedure TComboForm.FormCreate(Sender: TObject);
var
  I: Integer;
  ListItem: TListItem;
  NewColumn: TListColumn;
begin
  Col2Array[0]:= 'Documentation for Image0.';
  Col2Array[1]:= 'Documentation for Image1.';
  Col2Array[2]:= 'Documentation for Image2.';
  // Create a ListView item for each image in the ImageList
  with ListView1 do
```

```
    begin
      SmallImages := ImageList1;
      LargeImages := ImageList1;
      for I := 0 to ImageList1.Count - 1 do
      begin
        ListItem := Items.Add;
        Listitem.Caption := 'Image' + IntToStr(I);
        ListItem.ImageIndex := I;
        Listitem.SubItems.Add(Col2Array[I]);
      end;
      // Create two columns to show during viewing as vsReport
      NewColumn := Columns.Add;
      NewColumn.Caption := 'Column 1';
      NewColumn.Width := 200;
      NewColumn := Columns.Add;
      NewColumn.Caption := 'Column 2';
      NewColumn.Width := 200;
      // Add View styles and constants to the Combo Box
      ComboBox1.Items.AddObject('vsIcon', TObject(vsIcon));
      ComboBox1.Items.AddObject('vsList', TObject(vsList));
      ComboBox1.Items.AddObject('vsReport', TObject(vsReport));
      ComboBox1.Items.AddObject(
        'vsSmallIcon', TObject(vsSmallIcon));
      // Display first item in the Combo Box
      ComboBox1.ItemIndex := 0;
    end;
  end;

  procedure TComboForm.ComboBox1Click(Sender: TObject);
  begin
    with ComboBox1 do
      ListView1.ViewStyle := TViewStyle(Items.Objects[ItemIndex]);

  end;
  {
  This example shows how to use the OnColumnClick and
  OnCompare events of a list view to let users sort the
  columns in a report-style list view by clicking on the
  column headers. This requires a global variable to keep
  track of the column that was clicked.  The OnColumnClick
  event handler sets the global variable to indicate the
  column to sort and calls AlphaSort:
  }
  var ColumnToSort: Integer;

  procedure TForm1.FormCreate(Sender: TObject);
  var
    I: Integer;
    ListItem: TListItem;
    NewColumn: TListColumn;
  const
    imagenames: Array[0..2] of string = ('C++ Image', 'Borland Image', 'Delphi Image');
  begin
    Col2Array[0]:= 'Documentation for the C++ icon.';
    Col2Array[1]:= 'Borland icon.';
    Col2Array[2]:= 'Delphi icon.';
    // Create a ListView item for each image in the ImageList
    with ListView1 do
    begin
      SmallImages := ImageList1;
      LargeImages := ImageList1;
      for I := 0 to ImageList1.Count - 1 do
      begin
        ListItem := Items.Add;
        Listitem.Caption := imagenames[I];
        ListItem.ImageIndex := I;
```

```
        Listitem.SubItems.Add(Col2Array[I]);
      end;
      // Create two columns to show during viewing as vsReport
      NewColumn := Columns.Add;
      NewColumn.Caption := 'Column 1';
      NewColumn.Width := 200;
      NewColumn := Columns.Add;
      NewColumn.Caption := 'Column 2';
      NewColumn.Width := 200;
      ListView1.ViewStyle := vsReport;
    end;
  end;

  procedure TForm1.ListView1ColumnClick(Sender: TObject; Column: TListColumn);
  begin
    ColumnToSort := Column.Index;
    (Sender as TCustomListView).AlphaSort;
  end;

  {
  The OnCompare event handler causes the list view to sort on
  the selected column:
  }
  procedure TForm1.ListView1Compare(Sender: TObject; Item1, Item2: TListItem; Data: Integer; var
  Compare: Integer);
  var
    ix: Integer;
  begin
    if ColumnToSort = 0 then
      Compare := CompareText(Item1.Caption,Item2.Caption)
    else begin
     ix := ColumnToSort - 1;
     Compare := CompareText(Item1.SubItems[ix],Item2.SubItems[ix]);
    end;
  end;
  {
  Note:   This OnCompare event handler uses the global
  CompareText function. An application may want to use
  AnsiCompareText, CompareStr, or AnsiCompareStr instead,
  depending on whether the comparison should be case-sensitive
  and whether the locale should be considered.
  }
```

See Also

AllocBy (see page 675)

GetBitmap (see page 664)

Draw (see page 660)

19.1.2.6.6 TCustomImageList.DrawingStyle Property

Specifies the style to be used when the image list is drawing an image.

Pascal

```
property DrawingStyle: TDrawingStyle;
```

C++

```
__property TDrawingStyle DrawingStyle;
```

Description

Use the DrawingStyle property to control how the image is to appear. DrawingStyle controls how much of the blend color specified by BlendColor (see page 676) is combined with the foreground, or what background color to use.

See Also

Draw (see page 660)

DrawOverlay (see page 663)

ImageType (see page 682)

BlendColor (see page 676)

BkColor (see page 676)

19.1.2.6.7 TCustomImageList.Handle Property

Designates the handle for the image list.

Pascal

```
property Handle: HImageList;
```

C++

```
__property HImageList Handle;
```

Description

Handle is the Windows image list object handle. Use this handle when calling Windows API functions that require it.

See Also

HandleAllocated (see page 669)

19.1.2.6.8 TCustomImageList.Height Property

Specifies the height of images within the image list.

Pascal

```
property Height: Integer;
```

C++

```
__property int Height;
```

Description

Use the Height property to specify the height of images before any are added to the image list. The image list is cleared when this value changes.

See Also

Width (see page 684)

CreateSize (see page 653)

Create (see page 653)

19.1.2.6.9 TCustomImageList.ImageType Property

Determines whether the image list uses the associated mask when drawing.

Pascal

```
property ImageType: TImageType;
```

C++

```
__property TImageType ImageType;
```

Description

Use the ImageType property to control whether the images are drawn using the image mask (itMask), or without the mask (itImage).

See Also

DrawingStyle (see page 681)

Draw (see page 660)

Masked (see page 683)

DrawOverlay (see page 663)

19.1.2.6.10 TCustomImageList.Masked Property

Specifies whether the image list includes masks that can be combined with the images.

Pascal

```
property Masked: Boolean;
```

C++

```
__property Boolean Masked;
```

Description

Set the Masked property to true to combine the images with masks. The masked portion of the bitmap is drawn transparently, or replaced by the color specified by the BkColor (see page 676) property.

Masked indicates whether the image list stores masks to combine with the images. To use those masks, the ImageType (see page 682) property indicates whether to draw the image or the mask.

See Also

AddMasked (see page 657)

InsertMasked (see page 670)

BkColor (see page 676)

ImageType (see page 682)

19.1.2.6.11 TCustomImageList.ShareImages Property

Specifies whether the image list destroys its handle when the image list is destroyed.

Pascal

```
property ShareImages: Boolean;
```

C++

```
__property Boolean ShareImages;
```

Description

Set the ShareImages property to false to ensure that the handle to the image list is freed when the image list is destroyed.

See Also

Destroy (see page 654)

Handle (see page 682)

19.1.2.6.12 TCustomImageList.Width Property

Specifies the width of all images within the image list.

Pascal

```
property Width: Integer;
```

C++

```
__property int Width;
```

Description

Use the Width property to specify the width of images before any are added to the image list. The image list is cleared when this value changes.

See Also

Height (see page 682)

Create (see page 653)

CreateSize (see page 653)

19.1.2.7 TCustomImageList Events

The events of the TCustomImageList class are listed here.

Public Events

	Name	Description
	OnChange (see page 684)	Occurs when the image list changes.

19.1.2.7.1 TCustomImageList.OnChange Event

Occurs when the image list changes.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Write an OnChange event handler to execute code when the image list changes. Any objects registered with the RegisterChanges (see page 672) method will also be notified.

See Also

RegisterChanges (see page 672)

19.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TColorDepth (see page 685)	Color depth of list images.
	TDrawingStyle (see page 686)	TDrawingStyle indicates the style to use when rendering an image from an image list.
	TImageType (see page 687)	TImageType indicates whether to use a mask when rendering an image from an image list.
	TLoadResource (see page 687)	TLoadResource and TLoadResources (see page 689) determine how a resource is loaded into an image list.
	TResType (see page 688)	TResType identifies a type of graphical resource to an image list.

19.2.1 ImgList.TColorDepth Enumeration

Color depth of list images.

Pascal

```
TColorDepth = (
  cdDefault,
  cdDeviceDependent,
  cd4Bit,
  cd8Bit,
  cd16Bit,
  cd24Bit,
  cd32Bit
);
```

C++

```
enum TColorDepth {
  cdDefault,
  cdDeviceDependent,
  cd4Bit,
  cd8Bit,
  cd16Bit,
  cd24Bit,
  cd32Bit
};
```

File

ImgList

Description

TColorDepth is the color depth of images in the list. This is the number of bits to represent color for each pixel. The following table describes the possible values:

Value	Meaning
cdDefault	Default color depth.
cdDeviceDependent	Device dependent color depth.

cd4Bit	4 bit color depth.
cd8Bit	8 bit color depth.
cd16Bit	16 bit color depth.
cd24Bit	24 bit color depth.
cd32Bit	32 bit color depth.

See Also

ColorDepth (see page 677)

19.2.2 ImgList.TDrawingStyle Enumeration

TDrawingStyle indicates the style to use when rendering an image from an image list.

Pascal

```
TDrawingStyle = (
  dsFocus,
  dsSelected,
  dsNormal,
  dsTransparent
);
```

C++

```
enum TDrawingStyle {
  dsFocus,
  dsSelected,
  dsNormal,
  dsTransparent
};
```

File

ImgList

Description

TDrawingStyle describes how to render an image from an image list component. The following table describes the possible values:

Value	Meaning
dsFocus	Draws the image blending 25% with the color specified by the BlendColor property. This only affects image lists that contain masks.
dsSelected	Draws the image blending 50% with the color specified by the BlendColor property. This only affects image lists that contain masks.
dsNormal	Draws the image using the color specified in the BkColor property. If the BkColor is clNone, the image is drawn transparently using the mask.
dsTransparent	Draws using the mask regardless of the BkColor setting.

19.2.3 ImgList.TImageType Enumeration

TImageType indicates whether to use a mask when rendering an image from an image list.

Pascal

```
TImageType = (
  itImage,
  itMask
);
```

C++

```
enum TImageType {
  itImage,
  itMask
};
```

File

ImgList

Description

TImageType indicates whether to use a mask when rendering an image in an image list. It includes the following values:

Value	Meaning
itImage	Image does not include a mask.
itMask	Image uses a mask.

19.2.4 ImgList.TLoadResource Enumeration

TLoadResource and TLoadResources (see page 689) determine how a resource is loaded into an image list.

Pascal

```
TLoadResource = (
  lrDefaultColor,
  lrDefaultSize,
  lrFromFile,
  lrMap3DColors,
  lrTransparent,
  lrMonoChrome
);
```

C++

```
enum TLoadResource {
  lrDefaultColor,
  lrDefaultSize,
  lrFromFile,
  lrMap3DColors,
  lrTransparent,
  lrMonoChrome
};
```

File

ImgList

Description

TLoadResources (see page 689) is a set of flags (TLoadResource values) that govern the way an image list loads image resources. The following table lists the possible TLoadResource values.

Value	Meaning
lrDefaultColor	Use the color format of the display.
lrDefaultSize	Use system metrics for Height and Width if the Width parameter to GetResource is 0. If the Width parameter is 0 and this option is not specified for cursors and icons, the resources width and height will be used.
lrFromFile	Loads the resource from a specified file.
lrMap3DColors	Replaces the images' gray shades with the 3D windows colors.
lrTransparent	Replaces the color table entry for the first pixel of the resource with the default window color (COLOR_WINDOW). This applies only to images with color tables.
lrMonoChrome	Loads the resource as black and white.

See Also

SelectDirectory

19.2.5 ImgList.TResType Enumeration

TResType identifies a type of graphical resource to an image list.

Pascal

```
TResType = (
  rtBitmap,
  rtCursor,
  rtIcon
);
```

C++

```
enum TResType {
  rtBitmap,
  rtCursor,
  rtIcon
};
```

File

ImgList

Description

TResTypes is used by the image list methods ResourceLoad, GetResource and FileLoad to specify the type of graphical resource that is to be loaded or retrieved from an image list.

Value	Meaning
rtBitmap	Loads or retrieves a bitmap
rtCursor	Loads or retrieves a cursor
rtIcon	Loads or retrieves an icon

19.3 Types

The following table lists types in this documentation.

Types

Name	Description
TImageIndex (see page 689)	This is type ImgList.TImageIndex.
TImageListHandle (see page 689)	This is type ImgList.TImageListHandle.
TLoadResources (see page 689)	TLoadResource (see page 687) and TLoadResources determine how a resource is loaded into an image list.
TOverlay (see page 690)	TOverlay indicates the index of an overlay mask.

19.3.1 ImgList.TImageIndex Type

Pascal

```
TImageIndex = type Integer;
```

C++

```
type Integer TImageIndex;
```

File

ImgList

Description

This is type ImgList.TImageIndex.

19.3.2 ImgList.TImageListHandle Type

Pascal

```
TImageListHandle = HImageList;
```

C++

```
HImageList TImageListHandle;
```

File

ImgList

Description

This is type ImgList.TImageListHandle.

19.3.3 ImgList.TLoadResources Type

TLoadResource (see page 687) and TLoadResources determine how a resource is loaded into an image list.

Pascal

```
TLoadResources = set of TLoadResource;
```

C++

```
TLoadResource TLoadResources;
```

File

ImgList

Description

TLoadResources is a set of flags (TLoadResource (see page 687) values) that govern the way an image list loads image resources. The following table lists the possible TLoadResource (see page 687) values.

Value	Meaning
lrDefaultColor	Use the color format of the display.
lrDefaultSize	Use system metrics for Height and Width if the Width parameter to GetResource is 0. If the Width parameter is 0 and this option is not specified for cursors and icons, the resources width and height will be used.
lrFromFile	Loads the resource from a specified file.
lrMap3DColors	Replaces the images' gray shades with the 3D windows colors.
lrTransparent	Replaces the color table entry for the first pixel of the resource with the default window color (COLOR_WINDOW). This applies only to images with color tables.
lrMonoChrome	Loads the resource as black and white.

See Also

SelectDirectory

19.3.4 ImgList.TOverlay Type

TOverlay indicates the index of an overlay mask.

Pascal

```
TOverlay = 0..3;
```

C++

```
0..3 TOverlay;
```

File

ImgList

Description

TOverlay has a value between 0 and 3 (inclusive). It indicates the index of an image in an image list that acts as an overlay mask.

20 IMouse Namespace

This is namespace IMouse.

Topics

Name	Description
Classes (see page 693)	The following table lists classes in this documentation.
Functions (see page 706)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 707)	The following table lists structs, records, enums in this documentation.
Types (see page 709)	The following table lists types in this documentation.
Constants (see page 711)	The following table lists constants in this documentation.

Classes

	Name	Description
	TPanningWindow (see page 693)	This is a class of TCustomPanningWindow.

Constants

Name	Description
crPanAll (see page 711)	This is constant IMouse.crPanAll.
crPanDown (see page 711)	This is constant IMouse.crPanDown.
crPanDownLeft (see page 712)	This is constant IMouse.crPanDownLeft.
crPanDownRight (see page 712)	This is constant IMouse.crPanDownRight.
crPanLeft (see page 712)	This is constant IMouse.crPanLeft.
crPanLeftRight (see page 713)	This is constant IMouse.crPanLeftRight.
crPanRight (see page 713)	This is constant IMouse.crPanRight.
crPanUp (see page 713)	This is constant IMouse.crPanUp.
crPanUpDown (see page 714)	This is constant IMouse.crPanUpDown.
crPanUpLeft (see page 714)	This is constant IMouse.crPanUpLeft.
crPanUpRight (see page 714)	This is constant IMouse.crPanUpRight.

Functions

	Name	Description
	StartPan (see page 706)	This is function IMouse.StartPan.

Structs, Records, Enums

	Name	Description
	TPanDirection (see page 707)	The type describes the panning direction.

	TPanOption (see page 707)	This is record IMouse.TPanOption.

Types

Name	Description
TPanDirections (see page 709)	Set of TPanDirection (see page 707). .
TPanOptions (see page 709)	This is type IMouse.TPanOptions.
TUpdateEvent (see page 709)	Initiates the cursor update.

20.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TPanningWindow (see page 693)	This is a class of TCustomPanningWindow.

20.1.1 TPanningWindow Class

This is a class of TCustomPanningWindow.

Class Hierarchy

Pascal

```
TPanningWindow = class(TCustomPanningWindow);
```

C++

```
class TPanningWindow : public TCustomPanningWindow;
```

File

IMouse

Description

Use this type if you are creating a specialized version of TPanningWindowClass.

20.1.1.1 TPanningWindow Members

The following tables list the members exposed by TPanningWindow.

Protected Methods

	Name	Description
	CreateParams (see page 695)	Initializes a window-creation parameter data structure.
	DoUpdate (see page 696)	This is DoUpdate, a member of class TPanningWindow.
	GetPanOptions (see page 696)	This is GetPanOptions, a member of class TPanningWindow.
	MouseMove (see page 697)	Respond to mouse moving over control area..
	Paint (see page 697)	Renders the image of a custom control.
	SetPanCursor (see page 698)	This is SetPanCursor, a member of class TPanningWindow.
	UpdateScroll (see page 698)	This is UpdateScroll, a member of class TPanningWindow.
	WndProc (see page 699)	Provides specific message responses for the control.

Public Events

	Name	Description
	OnUpdate (see page 704)	Initiates the cursor update.

Public Methods

	Name	Description
	Create (see page 694)	Creates an instance of TCustomControl.
	Destroy (see page 694)	Destroys an instance of TCustomControl.
	GetIsPanning (see page 696)	Returns whether or not the mouse is actively panning.
	StartPanning (see page 698)	Tells the panning window to start the panning operation.
	StopPanning (see page 698)	Tells the panning window to stop the panning operation.

Public Properties

	Name	Description
	IsPanning (see page 703)	Returns GetIsPanning (see page 696).
	PanControl (see page 703)	The control that is being panned. .
	PanInterval (see page 704)	The interval that determines when to update the cursor, send events, etc.
	PanOptions (see page 704)	Vertical panning, Horizontal panning, both or neither (it is a set).

20.1.1.2 TPanningWindow.Create Constructor

Creates an instance of TCustomControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TPanningWindow(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomControl. However, you should never attempt to instantiate a TCustomControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants. Controls placed on forms at design time are created automatically.

After calling the inherited constructor, Create initializes the control, including the following property settings:

Initializes a TCanvas object for its Canvas property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

Create

Destroy

Canvas

Owner

20.1.1.3 TPanningWindow.Destroy Destructor

Destroys an instance of TCustomControl.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TPanningWindow();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the control is not nil, and only then calls Destroy.

Applications should only free controls explicitly when the constructor was called without assigning an owner to the control.

As the control is destroyed, it:

Destroys the TCanvas object in its Canvas property.

Override Destroy to free any memory or resources allocated in the Create method. When declaring a Destroy method in a descendant control type, always add the override directive to the declaration and call the inherited Destroy as the last statement in the redeclared method.

When a control is created, Delphi automatically provides exception handling around the constructor call. The destructor is called if an exception escapes from the constructor. This means that the destructor code must be prepared to clean up a partially constructed instance. Check all data fields for zero before disposing of their contents.

Create

20.1.1.4 TPanningWindow Methods

The methods of the TPanningWindow class are listed here.

Protected Methods

	Name	Description
	CreateParams (see page 695)	Initializes a window-creation parameter data structure.
	DoUpdate (see page 696)	This is DoUpdate, a member of class TPanningWindow.
	GetPanOptions (see page 696)	This is GetPanOptions, a member of class TPanningWindow.
	MouseMove (see page 697)	Respond to mouse moving over control area..
	Paint (see page 697)	Renders the image of a custom control.
	SetPanCursor (see page 698)	This is SetPanCursor, a member of class TPanningWindow.
	UpdateScroll (see page 698)	This is UpdateScroll, a member of class TPanningWindow.
	WndProc (see page 699)	Provides specific message responses for the control.

Public Methods

	Name	Description
	GetIsPanning (see page 696)	Returns whether or not the mouse is actively panning.
	StartPanning (see page 698)	Tells the panning window to start the panning operation.
	StopPanning (see page 698)	Tells the panning window to stop the panning operation.

20.1.1.4.1 TPanningWindow.CreateParams Method

Initializes a window-creation parameter data structure.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. Override CreateParams to customize the way a control creates its Windows representation. When overriding CreateParams, always call the inherited method first to set the default values, then make any desired adjustments.

CreateParams fills in the parameter that is passed as the value of the Params parameter. This data structure holds information needed when telling Windows to create a window handle. The fields of a TCreateParams record become the parameters to a call to the CreateWindowEx API function.

TWinControl implements CreateParams by setting all the fields of Params to generic base values. A number of the standard controls override CreateParams to change one or more of the default values in Params.

20.1.1.4.2 TPanningWindow.DoUpdate Method

Pascal

```
procedure DoUpdate(var Delta: TPoint; var CursorDirection: TPanDirections); dynamic;
```

C++

```
__fastcall DoUpdate(TPoint Delta, TPanDirections CursorDirection);
```

Description

This is DoUpdate, a member of class TPanningWindow.

20.1.1.4.3 TPanningWindow.GetIsPanning Method

Returns whether or not the mouse is actively panning.

Pascal

```
function GetIsPanning: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetIsPanning();
```

Description

This boolean value returns True if the mouse is actively panning; false if it is not.

20.1.1.4.4 TPanningWindow.GetPanOptions Method

Pascal

```
function GetPanOptions: TPanOptions; virtual;
```

C++

```
virtual __fastcall TPanOptions GetPanOptions();
```

Description

This is GetPanOptions, a member of class TPanningWindow.

20.1.1.4.5 TPanningWindow.MouseMove Method

Respond to mouse moving over control area..

Pascal

```
procedure MouseMove(Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseMove(TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseMove method to provide other responses in addition to calling the OnMouseMove event handler when the user moves the mouse.

A control calls MouseMove in response to any of the Windows mouse-move messages (WM_MOUSEMOVE), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively.

As the mouse cursor moves across a control, this method is called repeatedly. Each time it is called, it is with the new coordinates that reflect the continuous path of the mouse cursor across the screen real estate covered by the control's visual representation.

MouseDown

MouseUp

OnMouseMove

20.1.1.4.6 TPanningWindow.Paint Method

Renders the image of a custom control.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method for TCustomControl does nothing other than provide the interface for a method that responds to WM_PAINT messages. Paint is called by the PaintWindow method, after that method has supplied the Canvas with the handle to a device context. When creating a custom control, always override Paint to draw the image of the control.

Tip: To determine which portions of the control's canvas need to be repainted when Paint is called, use the ClipRect property of the canvas.

GetDeviceContext

ClipRect

20.1.1.4.7 TPanningWindow.SetPanCursor Method

Pascal

```
procedure SetPanCursor(ADirection: TPanDirections); virtual;
```

C++

```
virtual __fastcall SetPanCursor(TPanDirections ADirection);
```

Description

This is SetPanCursor, a member of class TPanningWindow.

20.1.1.4.8 TPanningWindow.StartPanning Method

Tells the panning window to start the panning operation.

Pascal

```
function StartPanning(AHandle: THandle; AControl: TControl): Boolean; override;
```

C++

```
virtual __fastcall Boolean StartPanning(THandle AHandle, TControl * AControl);
```

Description

Use this method to initiate panning.

20.1.1.4.9 TPanningWindow.StopPanning Method

Tells the panning window to stop the panning operation.

Pascal

```
procedure StopPanning; override;
```

C++

```
virtual __fastcall StopPanning();
```

Description

Use this method to cease panning.

20.1.1.4.10 TPanningWindow.UpdateScroll Method

Pascal

```
procedure UpdateScroll(Pt: TPoint); virtual;
```

C++

```
virtual __fastcall UpdateScroll(TPoint Pt);
```

Description

This is UpdateScroll, a member of class TPanningWindow.

20.1.1.4.11 TPanningWindow.WndProc Method

Provides specific message responses for the control.

Pascal

```
procedure WndProc(var Msg: TMessage); override;
```

C++

```
virtual __fastcall WndProc(TMessage Msg);
```

Description

Override WndProc to change the initial Windows message handler for the control. The WindowProc property is initialized to point to the WndProc method.

WndProc for TWinControl overrides the inherited method to define responses for focus, mouse, and keyboard messages. It sends all others to its inherited WndProc.

When overriding WndProc to provide specialized responses to messages, call the inherited WndProc at the end to dispatch any unhandled messages.

C++ Examples:

```
/*
This example shows how to use the WndProc method and the
WindowProc property to subclass a custom control's window
procedure.  This example subclasses the window procedure of
a TListBox descendant to respond to a user-defined message
called WM_STYLEMESSAGE. The subclassed window procedure can
be turned on or off by pressing a radio button.
*/

20.1.1.5 TPanningWindow Properties

The properties of the TPanningWindow class are listed here.

Public Properties

	Name	Description
R	IsPanning (see page 703)	Returns GetIsPanning (see page 696).
R	PanControl (see page 703)	The control that is being panned. .
	PanInterval (see page 704)	The interval that determines when to update the cursor, send events, etc.
R	PanOptions (see page 704)	Vertical panning, Horizontal panning, both or neither (it is a set).

20.1.1.5.1 TPanningWindow.IsPanning Property

Returns GetIsPanning (see page 696).

Pascal

```
property IsPanning: Boolean;
```

C++

```
__property Boolean IsPanning;
```

Description

This property runs the GetIsPanning (see page 696) method and stores the result.

20.1.1.5.2 TPanningWindow.PanControl Property

The control that is being panned. .

Pascal

```
property PanControl: TControl;
```

C++

```
__property TControl * PanControl;
```

Description

Use this property to store the control that is being panned.

20.1.1.5.3 TPanningWindow.PanInterval Property

The interval that determines when to update the cursor, send events, etc.

Pascal

```
property PanInterval: Integer;
```

C++

```
__property int PanInterval;
```

Description

Use this property to store the number of minutes between updates for the cursor, send events, etc..

20.1.1.5.4 TPanningWindow.PanOptions Property

Vertical panning, Horizontal panning, both or neither (it is a set).

Pascal

```
property PanOptions: TPanOptions;
```

C++

```
__property TPanOptions PanOptions;
```

Description

This property stores the option chosen for panning.

20.1.1.6 TPanningWindow Events

The events of the TPanningWindow class are listed here.

Public Events

	Name	Description
	OnUpdate (see page 704)	Initiates the cursor update.

20.1.1.6.1 TPanningWindow.OnUpdate Event

Initiates the cursor update.

Pascal

```
property OnUpdate: TUpdateEvent;
```

C++

```
__property TUpdateEvent OnUpdate;
```

Description

This event is called when the cursor is to be updated.

20.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	StartPan (see page 706)	This is function IMouse.StartPan.

20.2.1 IMouse.StartPan Function

Pascal

```
function StartPan(WndHandle: THandle; AControl: TControl): Boolean;
```

C++

```
Boolean StartPan(THandle WndHandle, TControl * AControl);
```

File

IMouse

Description

This is function IMouse.StartPan.

20.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TPanDirection (see page 707)	The type describes the panning direction.
	TPanOption (see page 707)	This is record IMouse.TPanOption.

20.3.1 IMouse.TPanDirection Enumeration

The type describes the panning direction.

Pascal

```
TPanDirection = (
  pdUp,
  pdDown,
  pdLeft,
  pdRight
);
```

C++

```
enum TPanDirection {
  pdUp,
  pdDown,
  pdLeft,
  pdRight
};
```

File

IMouse

Description

The possible panning values are: pdUp, pdDown, pdLeft, pdRight.

20.3.2 IMouse.TPanOption Enumeration

Pascal

```
TPanOption = (
  poVertical,
  poHorizontal
);
```

C++

```
enum TPanOption {
  poVertical,
  poHorizontal
};
```

File

IMouse

Description

This is record IMouse.TPanOption.

20.4 Types

The following table lists types in this documentation.

Types

Name	Description
TPanDirections (see page 709)	Set of TPanDirection (see page 707). .
TPanOptions (see page 709)	This is type IMouse.TPanOptions.
TUpdateEvent (see page 709)	Initiates the cursor update.

20.4.1 IMouse.TPanDirections Type

Set of TPanDirection (see page 707). .

Pascal

```
TPanDirections = set of TPanDirection;
```

C++

```
TPanDirection TPanDirections;
```

File

IMouse

Description

Set of TPanDirection (see page 707).

20.4.2 IMouse.TPanOptions Type

Pascal

```
TPanOptions = set of TPanOption;
```

C++

```
TPanOption TPanOptions;
```

File

IMouse

Description

This is type IMouse.TPanOptions.

20.4.3 IMouse.TUpdateEvent Type

Initiates the cursor update.

Pascal

```
TUpdateEvent = procedure (Sender: TObject; var Delta: TPoint; var CursorDirection:
TPanDirections) of object;
```

C++

```
(Sender: TObject; var Delta: TPoint; var CursorDirection: TPanDirections) ( TUpdateEvent)();
```

File

IMouse

Description

This event is called when the cursor is to be updated.

Procedural types

Creating events

20.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
crPanAll (see page 711)	This is constant IMouse.crPanAll.
crPanDown (see page 711)	This is constant IMouse.crPanDown.
crPanDownLeft (see page 712)	This is constant IMouse.crPanDownLeft.
crPanDownRight (see page 712)	This is constant IMouse.crPanDownRight.
crPanLeft (see page 712)	This is constant IMouse.crPanLeft.
crPanLeftRight (see page 713)	This is constant IMouse.crPanLeftRight.
crPanRight (see page 713)	This is constant IMouse.crPanRight.
crPanUp (see page 713)	This is constant IMouse.crPanUp.
crPanUpDown (see page 714)	This is constant IMouse.crPanUpDown.
crPanUpLeft (see page 714)	This is constant IMouse.crPanUpLeft.
crPanUpRight (see page 714)	This is constant IMouse.crPanUpRight.

20.5.1 IMouse.crPanAll Constant

Pascal

```
crPanAll = TCursor(-50);
```

C++

```
crPanAll = TCursor(-50);
```

File

IMouse

Description

This is constant IMouse.crPanAll.

20.5.2 IMouse.crPanDown Constant

Pascal

```
crPanDown = TCursor(-51);
```

C++

```
crPanDown = TCursor(-51);
```

File

IMouse

Description

This is constant IMouse.crPanDown.

20.5.3 IMouse.crPanDownLeft Constant

Pascal

```
crPanDownLeft = TCursor(-52);
```

C++

```
crPanDownLeft = TCursor(-52);
```

File

IMouse

Description

This is constant IMouse.crPanDownLeft.

20.5.4 IMouse.crPanDownRight Constant

Pascal

```
crPanDownRight = TCursor(-53);
```

C++

```
crPanDownRight = TCursor(-53);
```

File

IMouse

Description

This is constant IMouse.crPanDownRight.

20.5.5 IMouse.crPanLeft Constant

Pascal

```
crPanLeft = TCursor(-54);
```

C++

```
crPanLeft = TCursor(-54);
```

File

IMouse

Description

This is constant IMouse.crPanLeft.

20.5.6 IMouse.crPanLeftRight Constant

Pascal

```
crPanLeftRight = TCursor(-55);
```

C++

```
crPanLeftRight = TCursor(-55);
```

File

IMouse

Description

This is constant IMouse.crPanLeftRight.

20.5.7 IMouse.crPanRight Constant

Pascal

```
crPanRight = TCursor(-56);
```

C++

```
crPanRight = TCursor(-56);
```

File

IMouse

Description

This is constant IMouse.crPanRight.

20.5.8 IMouse.crPanUp Constant

Pascal

```
crPanUp = TCursor(-57);
```

C++

```
crPanUp = TCursor(-57);
```

File

IMouse

Description

This is constant IMouse.crPanUp.

20.5.9 IMouse.crPanUpDown Constant

Pascal

```
crPanUpDown = TCursor(-58);
```

C++

```
crPanUpDown = TCursor(-58);
```

File

IMouse

Description

This is constant IMouse.crPanUpDown.

20.5.10 IMouse.crPanUpLeft Constant

Pascal

```
crPanUpLeft = TCursor(-59);
```

C++

```
crPanUpLeft = TCursor(-59);
```

File

IMouse

Description

This is constant IMouse.crPanUpLeft.

20.5.11 IMouse.crPanUpRight Constant

Pascal

```
crPanUpRight = TCursor(-60);
```

C++

```
crPanUpRight = TCursor(-60);
```

File

IMouse

Description

This is constant IMouse.crPanUpRight.

21 IniFiles Namespace

This is namespace IniFiles.

Topics

Name	Description
Classes (see page 716)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 787)	The following table lists structs, records, enums in this documentation.
Types (see page 788)	The following table lists types in this documentation.

Classes

	Name	Description
	EIniFileException (see page 716)	EIniFileException is the exception class for errors that occur when working with INI files using TIniFile (see page 752).
	TCustomIniFile (see page 716)	TCustomIniFile is the base class for components that encapsulate access to .ini files and the Windows system registry.
	THashedStringList (see page 749)	THashedStringList maintains a list of strings using an internal hash table.
	TIniFile (see page 752)	TIniFile stores and retrieves application-specific information and settings from INI files.
	TMemIniFile (see page 765)	TMemIniFile enables buffered storage and retrieval of application-specific information and settings in an INI file.
	TStringHash (see page 783)	This is class IniFiles.TStringHash.

Structs, Records, Enums

	Name	Description
	THashItem (see page 787)	This is record IniFiles.THashItem.

Types

Name	Description
PHashItem (see page 788)	This is type IniFiles.PHashItem.
PPHashItem (see page 788)	This is type IniFiles.PPHashItem.

21.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EIniFileException (see page 716)	EIniFileException is the exception class for errors that occur when working with INI files using TIniFile (see page 752).
	TCustomIniFile (see page 716)	TCustomIniFile is the base class for components that encapsulate access to .ini files and the Windows system registry.
	THashedStringList (see page 749)	THashedStringList maintains a list of strings using an internal hash table.
	TIniFile (see page 752)	TIniFile stores and retrieves application-specific information and settings from INI files.
	TMemIniFile (see page 765)	TMemIniFile enables buffered storage and retrieval of application-specific information and settings in an INI file.
	TStringHash (see page 783)	This is class IniFiles.TStringHash.

21.1.1 EIniFileException Class

EIniFileException is the exception class for errors that occur when working with INI files using TIniFile (see page 752).

Class Hierarchy

Pascal

```
EIniFileException = class(Exception);
```

C++

```
class EIniFileException : public Exception;
```

File

IniFiles

Description

EIniFileException is raised when TIniFile (see page 752) fails in an attempt to modify its associated INI file.

See Also

TIniFile (see page 752)

21.1.2 TCustomIniFile Class

TCustomIniFile is the base class for components that encapsulate access to .ini files and the Windows system registry.

Class Hierarchy

Pascal

```
TCustomIniFile = class(TObject);
```

C++

```
class TCustomIniFile : public TObject;
```

File

IniFiles

Description

Note: Use TCustomIniFile as a base class when defining components that access ini files. Ini files are text files that are divided into sections with variable assignments in each section. TCustomIniFile introduces properties and methods to handle storage and retrieval of application-specific information and settings in a standard ini file.

Note: On Windows, TCustomIniFile is also the base class for TRegistryIniFile, which allows applications that use both ini files and the system registry to handle both media in a unified manner. This differs from the features of TRegistry, which corresponds more directly to Windows system registry native semantics.

Do not create instances of TCustomIniFile. Instead, use or create descendants of TCustomIniFile, such as TIniFile (see page 752), TRegistryIniFile, and TMemIniFile (see page 765).

C++ Examples:

```
/*
This example demonstrates the usage of Ini files in order to store
and load form configuration between sessions. Example assumes
a RadioGroup and two buttons are present on the main form.
*/
void __fastcall TForm2::btStoreClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    // Store current form properties to be used in later sessions.
    try
    {
        SettingsFile->WriteInteger (Name, "Top", Top);
        SettingsFile->WriteInteger (Name, "Left", Left);
        SettingsFile->WriteInteger (Name, "Width", Width);
        SettingsFile->WriteInteger (Name, "Height", Height);
        SettingsFile->WriteString  (Name, "Caption", Caption);
        SettingsFile->WriteBool    (Name, "InitMax", WindowState == wsMaximized );
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

void __fastcall TForm2::btLoadClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    try
    {
        /*
        Read all saved values from the last session. The section name
        is the name of the form. Also use form's properties as defaults
        */
        Top     = SettingsFile->ReadInteger(Name, "Top", Top );
```

```
        Left    = SettingsFile->ReadInteger(Name, "Left", Left );
        Width   = SettingsFile->ReadInteger(Name, "Width", Width );
        Height  = SettingsFile->ReadInteger(Name, "Height", Height );
        Caption = SettingsFile->ReadString (Name, "Caption", Caption);

        // Load last window state
        if (SettingsFile->ReadBool(Name, "InitMax", WindowState == wsMaximized))
            WindowState = wsMaximized;
        else
            WindowState = wsNormal;
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

TCustomIniFile* __fastcall TForm2::OpenIniFileInstance()
{
    /*
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    */

    switch (RadioGroup1->ItemIndex)
    {
        case 0:
            /* Registry mode selected: in HKEY_CURRENT_USER\Software\... */
            return new TRegistryIniFile(String("Software\\") + Application->Title);
        case 1:
            /* Ini file mode selected */
            return new TIniFile(ChangeFileExt(Application->ExeName, ".INI"));
        case 2:
            /* Memory based Ini file mode selected */
            return new TMemIniFile(ChangeFileExt(Application->ExeName, ".INI"));
      }
}
```

Delphi Examples:

```
{
This example demonstrates the use of Ini files in order to store
and load form configurations between sessions. This example requires
a RadioGroup and two buttons.
}
procedure TForm2.btLoadClick(Sender: TObject);
var
  SettingsFile : TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  try
    {
    Read all saved values from the last session. The section name
    is the name of the form. Also use form's properties as defaults
    }
    Top     := SettingsFile.ReadInteger(Name, 'Top', Top );
    Left    := SettingsFile.ReadInteger(Name, 'Left', Left );
    Width   := SettingsFile.ReadInteger(Name, 'Width', Width );
    Height  := SettingsFile.ReadInteger(Name, 'Height', Height );
    Caption := SettingsFile.ReadString (Name, 'Caption', Caption);

    { Load last window state }
    case SettingsFile.ReadBool(Name, 'InitMax', WindowState = wsMaximized) of
      true : WindowState := wsMaximized;
```

```
        false: WindowState := wsNormal;
      end;

    finally
      SettingsFile.Free;
    end;
  end;

  procedure TForm2.btStoreClick(Sender: TObject);
  var
    SettingsFile: TCustomIniFile;
  begin
    { Open an instance }
    SettingsFile := OpenIniFileInstance();

    {
    Store current form properties to be used in later sessions.
    }
    try
      SettingsFile.WriteInteger (Name, 'Top', Top);
      SettingsFile.WriteInteger (Name, 'Left', Left);
      SettingsFile.WriteInteger (Name, 'Width', Width);
      SettingsFile.WriteInteger (Name, 'Height', Height);
      SettingsFile.WriteString  (Name, 'Caption', Caption);
      SettingsFile.WriteBool    (Name, 'InitMax', WindowState = wsMaximized );
      SettingsFile.WriteDateTime(Name, 'LastRun', Now);
    finally
      SettingsFile.Free;
    end;

  end;

  function TForm2.OpenIniFileInstance: TCustomIniFile;
  begin
    {
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    }

    case RadioGroup1.ItemIndex of
      0:
        begin
          { Registry mode selected: in HKEY_CURRENT_USER\Software\... }
          Result := TRegistryIniFile.Create('Software\' + Application.Title);
        end;
      1:
        begin
          { Ini file mode selected }
          Result := TIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
        end;
      2:
        begin
          { Memory based Ini file mode selected }
          Result := TMemIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
        end;
    end;
  end;
```

21.1.2.1 TCustomIniFile Members

The following tables list the members exposed by TCustomIniFile.

Public Methods

	Name	Description
	Create (see page 720)	Creates a TCustomIniFile (see page 716) object for an application.
	DeleteKey (see page 721)	Erases the data value associated with an ini file entry.
	EraseSection (see page 722)	Erases an entire section of an ini file.
	ReadBinaryStream (see page 722)	Retrieves a binary value from the ini file.
	ReadBool (see page 723)	Retrieves a Boolean value from an ini file.
	ReadDate (see page 726)	Retrieves a date value from an ini file.
	ReadDateTime (see page 726)	Retrieves a date-time value from an ini file.
	ReadFloat (see page 727)	Retrieves a float value from an ini file.
	ReadInteger (see page 727)	Retrieves an integer value from an ini file.
	ReadSection (see page 730)	Reads all the key names from a specified section of an ini file into a string list.
	ReadSections (see page 731)	This is the overview for the ReadSections method overload.
	ReadSectionValues (see page 732)	Reads the values from all keys in a section of an ini file into a string list.
	ReadString (see page 732)	Retrieves a string value from an ini file.
	ReadTime (see page 735)	Retrieves a time value from an ini file.
	SectionExists (see page 736)	Indicates whether a section exists in the ini file.
	UpdateFile (see page 736)	Flushes buffered ini file data to disk.
	ValueExists (see page 736)	Indicates whether a key exists in the ini file.
	WriteBinaryStream (see page 737)	Writes a binary value to the ini file.
	WriteBool (see page 737)	Writes a Boolean value to an ini file.
	WriteDate (see page 741)	Writes a date value to an ini file.
	WriteDateTime (see page 741)	Writes a date-time value to an ini file.
	WriteFloat (see page 742)	Writes a float value to an ini file.
	WriteInteger (see page 742)	Writes an integer value to an ini file.
	WriteString (see page 745)	Writes a string value to an ini file.
	WriteTime (see page 748)	Writes a time value to an ini file.

Public Properties

	Name	Description
	FileName (see page 749)	Contains the name of the ini file from which to read and to which to write information.

21.1.2.2 TCustomIniFile.Create Constructor

Creates a TCustomIniFile (see page 716) object for an application.

Pascal

```
constructor Create(const FileName: string);
```

C++

```
__fastcall TCustomIniFile(const UnicodeString FileName);
```

Description

Create constructs a TCustomIniFile (see page 716) object for an application. Create assigns the FileName (see page 749) parameter to the FileName (see page 749) property, which is used to specify the name of the ini file to use.

See Also

FileName (see page 749)

System::TObject::Create

21.1.2.3 TCustomIniFile Methods

The methods of the TCustomIniFile class are listed here.

Public Methods

	Name	Description
	DeleteKey (see page 721)	Erases the data value associated with an ini file entry.
	EraseSection (see page 722)	Erases an entire section of an ini file.
	ReadBinaryStream (see page 722)	Retrieves a binary value from the ini file.
	ReadBool (see page 723)	Retrieves a Boolean value from an ini file.
	ReadDate (see page 726)	Retrieves a date value from an ini file.
	ReadDateTime (see page 726)	Retrieves a date-time value from an ini file.
	ReadFloat (see page 727)	Retrieves a float value from an ini file.
	ReadInteger (see page 727)	Retrieves an integer value from an ini file.
	ReadSection (see page 730)	Reads all the key names from a specified section of an ini file into a string list.
	ReadSections (see page 731)	This is the overview for the ReadSections method overload.
	ReadSectionValues (see page 732)	Reads the values from all keys in a section of an ini file into a string list.
	ReadString (see page 732)	Retrieves a string value from an ini file.
	ReadTime (see page 735)	Retrieves a time value from an ini file.
	SectionExists (see page 736)	Indicates whether a section exists in the ini file.
	UpdateFile (see page 736)	Flushes buffered ini file data to disk.
	ValueExists (see page 736)	Indicates whether a key exists in the ini file.
	WriteBinaryStream (see page 737)	Writes a binary value to the ini file.
	WriteBool (see page 737)	Writes a Boolean value to an ini file.
	WriteDate (see page 741)	Writes a date value to an ini file.
	WriteDateTime (see page 741)	Writes a date-time value to an ini file.
	WriteFloat (see page 742)	Writes a float value to an ini file.
	WriteInteger (see page 742)	Writes an integer value to an ini file.
	WriteString (see page 745)	Writes a string value to an ini file.
	WriteTime (see page 748)	Writes a time value to an ini file.

21.1.2.3.1 TCustomIniFile.DeleteKey Method

Erases the data value associated with an ini file entry.

Pascal

```
procedure DeleteKey(const Section: String; const Ident: String); virtual; abstract;
```

C++

```
virtual __fastcall DeleteKey(const UnicodeString Section, const UnicodeString Ident) = 0;
```

Description

Call DeleteKey to erase a data value associated with an ini file entry. Section is string containing the name of an ini file section, and Ident is a string containing the name of the key for which to set a nil (Delphi) or NULL (C++) value.

Note: Attempting to erase a data value in a nonexistent section or attempting to erase data from a nonexistent key are not errors. In these cases, DeleteKey creates the section and key and sets its initial value to an empty value.

See Also

EraseSection (see page 722)

21.1.2.3.2 TCustomIniFile.EraseSection Method

Erases an entire section of an ini file.

Pascal

```
procedure EraseSection(const Section: string); virtual; abstract;
```

C++

```
virtual __fastcall EraseSection(const UnicodeString Section) = 0;
```

Description

Call EraseSection to remove a section, all its keys, and their data values from an ini file. Section identifies the ini file section to remove. If a section cannot be removed, an exception is raised.

See Also

SectionExists (see page 736)

DeleteKey (see page 721)

21.1.2.3.3 TCustomIniFile.ReadBinaryStream Method

Retrieves a binary value from the ini file.

Pascal

```
function ReadBinaryStream(const Section: string; const Name: string; Value: TStream): Integer;
virtual;
```

C++

```
virtual __fastcall int ReadBinaryStream(const UnicodeString Section, const UnicodeString Name,
TStream Value);
```

Description

Call ReadBinaryStream to read a binary value into a specified stream. After reading the binary value, which it converts from a series of hexadecimal characters, from the ini file into the current position of the stream, ReadBinaryStream returns the number of bytes written to the stream. If the stream is a memory stream (TMemoryStream or one of its descendants), the stream is left positioned to the same byte as it was before the call to ReadBinaryStream (immediately before the new binary value).

Section is the section that contains the desired key.

Name is the key under which the binary data is stored.

Value is a stream to which the binary value is written.

Note: When used with a Windows .ini file, ReadBinaryStream is limited to 1023 characters,

See Also

ReadString (see page 732)

WriteBinaryStream (see page 737)

21.1.2.3.4 TCustomIniFile.ReadBool Method

Retrieves a Boolean value from an ini file.

Pascal

```
function ReadBool(const Section: string; const Ident: string; Default: Boolean): Boolean;
virtual;
```

C++

```
virtual __fastcall Boolean ReadBool(const UnicodeString Section, const UnicodeString Ident,
Boolean Default);
```

Description

Call ReadBool to read a Boolean value from an ini file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the Boolean value. Default is the Boolean value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

C++ Examples:

```
/*
This example demonstrates the usage of Ini files in order to store
and load form configuration between sessions. Example assumes
a RadioGroup and two buttons are present on the main form.
*/
void __fastcall TForm2::btStoreClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    // Store current form properties to be used in later sessions.
    try
    {
        SettingsFile->WriteInteger (Name, "Top", Top);
        SettingsFile->WriteInteger (Name, "Left", Left);
        SettingsFile->WriteInteger (Name, "Width", Width);
        SettingsFile->WriteInteger (Name, "Height", Height);
        SettingsFile->WriteString  (Name, "Caption", Caption);
        SettingsFile->WriteBool    (Name, "InitMax", WindowState == wsMaximized );
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

void __fastcall TForm2::btLoadClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    try
    {
        /*
        Read all saved values from the last session. The section name
        is the name of the form. Also use form's properties as defaults
        */
        Top     = SettingsFile->ReadInteger(Name, "Top", Top );
```

```
        Left    = SettingsFile->ReadInteger(Name, "Left", Left );
        Width   = SettingsFile->ReadInteger(Name, "Width", Width );
        Height  = SettingsFile->ReadInteger(Name, "Height", Height );
        Caption = SettingsFile->ReadString (Name, "Caption", Caption);

        // Load last window state
        if (SettingsFile->ReadBool(Name, "InitMax", WindowState == wsMaximized))
            WindowState = wsMaximized;
        else
            WindowState = wsNormal;
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

TCustomIniFile* __fastcall TForm2::OpenIniFileInstance()
{
    /*
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    */

    switch (RadioGroup1->ItemIndex)
    {
        case 0:
            /* Registry mode selected: in HKEY_CURRENT_USER\Software\... */
            return new TRegistryIniFile(String("Software\\") + Application->Title);
        case 1:
            /* Ini file mode selected */
            return new TIniFile(ChangeFileExt(Application->ExeName, ".INI"));
        case 2:
            /* Memory based Ini file mode selected */
            return new TMemIniFile(ChangeFileExt(Application->ExeName, ".INI"));
      }
}
```

Delphi Examples:

```
{
This example demonstrates the use of Ini files in order to store
and load form configurations between sessions. This example requires
a RadioGroup and two buttons.
}
procedure TForm2.btLoadClick(Sender: TObject);
var
  SettingsFile : TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  try
    {
    Read all saved values from the last session. The section name
    is the name of the form. Also use form's properties as defaults
    }
    Top     := SettingsFile.ReadInteger(Name, 'Top', Top );
    Left    := SettingsFile.ReadInteger(Name, 'Left', Left );
    Width   := SettingsFile.ReadInteger(Name, 'Width', Width );
    Height  := SettingsFile.ReadInteger(Name, 'Height', Height );
    Caption := SettingsFile.ReadString (Name, 'Caption', Caption);

    { Load last window state }
    case SettingsFile.ReadBool(Name, 'InitMax', WindowState = wsMaximized) of
      true : WindowState := wsMaximized;
```

```
        false: WindowState := wsNormal;
      end;

    finally
      SettingsFile.Free;
    end;
  end;

  procedure TForm2.btStoreClick(Sender: TObject);
  var
    SettingsFile: TCustomIniFile;
  begin
    { Open an instance }
    SettingsFile := OpenIniFileInstance();

    {
    Store current form properties to be used in later sessions.
    }
    try
      SettingsFile.WriteInteger (Name, 'Top', Top);
      SettingsFile.WriteInteger (Name, 'Left', Left);
      SettingsFile.WriteInteger (Name, 'Width', Width);
      SettingsFile.WriteInteger (Name, 'Height', Height);
      SettingsFile.WriteString  (Name, 'Caption', Caption);
      SettingsFile.WriteBool    (Name, 'InitMax', WindowState = wsMaximized );
      SettingsFile.WriteDateTime(Name, 'LastRun', Now);
    finally
      SettingsFile.Free;
    end;

  end;

  function TForm2.OpenIniFileInstance: TCustomIniFile;
  begin
    {
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    }

    case RadioGroup1.ItemIndex of
      0:
        begin
          { Registry mode selected: in HKEY_CURRENT_USER\Software\... }
          Result := TRegistryIniFile.Create('Software\' + Application.Title);
        end;
      1:
        begin
          { Ini file mode selected }
          Result := TIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
        end;
      2:
        begin
          { Memory based Ini file mode selected }
          Result := TMemIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
        end;
    end;
  end;
```

21.1.2.3.5 TCustomIniFile.ReadDate Method

Retrieves a date value from an ini file.

Pascal

```
function ReadDate(const Section: string; const Name: string; Default: TDateTime): TDateTime;
virtual;
```

C++

```
virtual __fastcall TDateTime ReadDate(const UnicodeString Section, const UnicodeString Name,
TDateTime Default);
```

Description

Call ReadDate to read a date value from an ini file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the date value. Default is the date value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

See Also

ReadBool (see page 723)

21.1.2.3.6 TCustomIniFile.ReadDateTime Method

Retrieves a date-time value from an ini file.

Pascal

```
function ReadDateTime(const Section: string; const Name: string; Default: TDateTime):
TDateTime; virtual;
```

C++

```
virtual __fastcall TDateTime ReadDateTime(const UnicodeString Section, const UnicodeString
Name, TDateTime Default);
```

Description

Call ReadDateTime to read a date-time value from an ini file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the date-time value. Default is the date-time value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

See Also

ReadBool (see page 723)

21.1.2.3.7 TCustomIniFile.ReadFloat Method

Retrieves a float value from an ini file.

Pascal

```
function ReadFloat(const Section: string; const Name: string; Default: Double): Double;
virtual;
```

C++

```
virtual __fastcall Double ReadFloat(const UnicodeString Section, const UnicodeString Name,
Double Default);
```

Description

Call ReadFloat to read a float value from an ini file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the float value. Default is the float value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

21.1.2.3.8 TCustomIniFile.ReadInteger Method

Retrieves an integer value from an ini file.

Pascal

```
function ReadInteger(const Section: string; const Ident: string; Default: Longint): Longint;
virtual;
```

C++

```
virtual __fastcall Longint ReadInteger(const UnicodeString Section, const UnicodeString Ident,
Longint Default);
```

Description

Call ReadInteger to read an integer value from an ini file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the value. Default is the integer value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

C++ Examples:

```
/*
This example demonstrates the usage of Ini files in order to store
and load form configuration between sessions. Example assumes
a RadioGroup and two buttons are present on the main form.
*/
void __fastcall TForm2::btStoreClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    // Store current form properties to be used in later sessions.
    try
    {
        SettingsFile->WriteInteger (Name, "Top", Top);
        SettingsFile->WriteInteger (Name, "Left", Left);
        SettingsFile->WriteInteger (Name, "Width", Width);
        SettingsFile->WriteInteger (Name, "Height", Height);
        SettingsFile->WriteString  (Name, "Caption", Caption);
        SettingsFile->WriteBool    (Name, "InitMax", WindowState == wsMaximized );
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

void __fastcall TForm2::btLoadClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    try
    {
        /*
        Read all saved values from the last session. The section name
        is the name of the form. Also use form's properties as defaults
        */
        Top     = SettingsFile->ReadInteger(Name, "Top", Top );
        Left    = SettingsFile->ReadInteger(Name, "Left", Left );
        Width   = SettingsFile->ReadInteger(Name, "Width", Width );
        Height  = SettingsFile->ReadInteger(Name, "Height", Height );
        Caption = SettingsFile->ReadString (Name, "Caption", Caption);

        // Load last window state
        if (SettingsFile->ReadBool(Name, "InitMax", WindowState == wsMaximized))
            WindowState = wsMaximized;
        else
            WindowState = wsNormal;
    }
    catch(Exception* e)
    {
    }
```

```
    delete SettingsFile;
}

TCustomIniFile* __fastcall TForm2::OpenIniFileInstance()
{
    /*
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    */

    switch (RadioGroup1->ItemIndex)
    {
        case 0:
            /* Registry mode selected: in HKEY_CURRENT_USER\Software\... */
            return new TRegistryIniFile(String("Software\\") + Application->Title);
        case 1:
            /* Ini file mode selected */
            return new TIniFile(ChangeFileExt(Application->ExeName, ".INI"));
        case 2:
            /* Memory based Ini file mode selected */
            return new TMemIniFile(ChangeFileExt(Application->ExeName, ".INI"));
      }
}
```

Delphi Examples:

```
{
This example demonstrates the use of Ini files in order to store
and load form configurations between sessions. This example requires
a RadioGroup and two buttons.
}
procedure TForm2.btLoadClick(Sender: TObject);
var
  SettingsFile : TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  try
    {
    Read all saved values from the last session. The section name
    is the name of the form. Also use form's properties as defaults
    }
    Top     := SettingsFile.ReadInteger(Name, 'Top', Top );
    Left    := SettingsFile.ReadInteger(Name, 'Left', Left );
    Width   := SettingsFile.ReadInteger(Name, 'Width', Width );
    Height  := SettingsFile.ReadInteger(Name, 'Height', Height );
    Caption := SettingsFile.ReadString (Name, 'Caption', Caption);

    { Load last window state }
    case SettingsFile.ReadBool(Name, 'InitMax', WindowState = wsMaximized) of
      true : WindowState := wsMaximized;
      false: WindowState := wsNormal;
    end;

  finally
    SettingsFile.Free;
  end;
end;

procedure TForm2.btStoreClick(Sender: TObject);
var
  SettingsFile: TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();
```

```
    {
    Store current form properties to be used in later sessions.
    }
    try
      SettingsFile.WriteInteger (Name, 'Top', Top);
      SettingsFile.WriteInteger (Name, 'Left', Left);
      SettingsFile.WriteInteger (Name, 'Width', Width);
      SettingsFile.WriteInteger (Name, 'Height', Height);
      SettingsFile.WriteString  (Name, 'Caption', Caption);
      SettingsFile.WriteBool    (Name, 'InitMax', WindowState = wsMaximized );
      SettingsFile.WriteDateTime(Name, 'LastRun', Now);
    finally
      SettingsFile.Free;
    end;

  end;

  function TForm2.OpenIniFileInstance: TCustomIniFile;
  begin
    {
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    }

    case RadioGroup1.ItemIndex of
      0:
        begin
          { Registry mode selected: in HKEY_CURRENT_USER\Software\... }
          Result := TRegistryIniFile.Create('Software\' + Application.Title);
        end;
      1:
        begin
          { Ini file mode selected }
          Result := TIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
        end;
      2:
        begin
          { Memory based Ini file mode selected }
          Result := TMemIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
        end;
    end;
  end;
```

21.1.2.3.9 TCustomIniFile.ReadSection Method

Reads all the key names from a specified section of an ini file into a string list.

Pascal

```
procedure ReadSection(const Section: string; Strings: TStrings); virtual; abstract;
```

C++

```
virtual __fastcall ReadSection(const UnicodeString Section, TStrings Strings) = 0;
```

Description

Call ReadSection to retrieve the names of all keys within a specified section of an ini file into a string list object.

Section identifies the section from which to retrieve a list of key names. Strings specifies the string object to hold the retrieved names. Strings can point to a TStrings descendant such as a string list, or to a component property, such as Items for a TListBox component.

21.1.2.3.10 ReadSections Method

This is the overview for the ReadSections method overload.

Overload List

	Name	Description
	TCustomIniFile.ReadSections (string, TStrings) (see page 731)	Reads the names of all sections in an ini file into a string list.
	TCustomIniFile.ReadSections (TStrings) (see page 731)	Reads the names of all sections in an ini file into a string list.

21.1.2.3.10.1 TCustomIniFile.ReadSections Method (TStrings)

Reads the names of all sections in an ini file into a string list.

Pascal

```
procedure ReadSections(Strings: TStrings); virtual; abstract; overload;
procedure ReadSections(const Section: string; Strings: TStrings); virtual; overload;
```

C++

```
virtual __fastcall ReadSections(TStrings Strings) = 0;
virtual __fastcall ReadSections(const UnicodeString Section, TStrings Strings);
```

Description

Call ReadSections to retrieve the names of all sections in an ini file into a string list.

`Strings` specifies the string object to hold the retrieved names. Strings can point to a TStrings descendant, or to a component property, such as Items for a TListBox component.

`Section` identifies the section from which to retrieve a list of key names.

See Also

ReadSection (see page 730)

ReadSectionValues (see page 732)

21.1.2.3.11 TCustomIniFile.ReadSectionValues Method

Reads the values from all keys in a section of an ini file into a string list.

Pascal

```
procedure ReadSectionValues(const Section: string; Strings: TStrings); virtual; abstract;
```

C++

```
virtual __fastcall ReadSectionValues(const UnicodeString Section, TStrings Strings) = 0;
```

Description

Call ReadSectionValues to read the values from all keys in a specified section of an ini file into a string list object. The values are added to the string list as strings of the form KeyName=ValueName.

Section identifies the section in the file from which to read key values.

Strings is the string list object into which to read the values. Strings can point to a TStrings object, or to a component property, such as Items for a TListBox component.

See Also

SectionExists (see page 736)

ReadSection (see page 730)

ReadSections (see page 731)

21.1.2.3.12 TCustomIniFile.ReadString Method

Retrieves a string value from an ini file.

Pascal

```
function ReadString(const Section: string; const Ident: string; const Default: string):
string; virtual; abstract;
```

C++

```
virtual __fastcall UnicodeString ReadString(const UnicodeString Section, const UnicodeString
Ident, const UnicodeString Default) = 0;
```

Description

Call ReadString to read a string value from a .ini file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the value. Default is the string value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

Note: On Windows, if the string in the .ini file is surrounded by quotation marks, the return value has those marks stripped away. On Linux, the quotation marks are preserved.

C++ Examples:

```
/*
This example demonstrates the usage of Ini files in order to store
and load form configuration between sessions. Example assumes
a RadioGroup and two buttons are present on the main form.
```

```
*/
void __fastcall TForm2::btStoreClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    // Store current form properties to be used in later sessions.
    try
    {
        SettingsFile->WriteInteger (Name, "Top", Top);
        SettingsFile->WriteInteger (Name, "Left", Left);
        SettingsFile->WriteInteger (Name, "Width", Width);
        SettingsFile->WriteInteger (Name, "Height", Height);
        SettingsFile->WriteString  (Name, "Caption", Caption);
        SettingsFile->WriteBool    (Name, "InitMax", WindowState == wsMaximized );
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

void __fastcall TForm2::btLoadClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    try
    {
        /*
        Read all saved values from the last session. The section name
        is the name of the form. Also use form's properties as defaults
        */
        Top     = SettingsFile->ReadInteger(Name, "Top", Top );
        Left    = SettingsFile->ReadInteger(Name, "Left", Left );
        Width   = SettingsFile->ReadInteger(Name, "Width", Width );
        Height  = SettingsFile->ReadInteger(Name, "Height", Height );
        Caption = SettingsFile->ReadString (Name, "Caption", Caption);

        // Load last window state
        if (SettingsFile->ReadBool(Name, "InitMax", WindowState == wsMaximized))
            WindowState = wsMaximized;
        else
            WindowState = wsNormal;
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

TCustomIniFile* __fastcall TForm2::OpenIniFileInstance()
{
    /*
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    */

    switch (RadioGroup1->ItemIndex)
    {
        case 0:
            /* Registry mode selected: in HKEY_CURRENT_USER\Software\... */
            return new TRegistryIniFile(String("Software\\") + Application->Title);
        case 1:
```

```
            /* Ini file mode selected */
            return new TIniFile(ChangeFileExt(Application->ExeName, ".INI"));
        case 2:
            /* Memory based Ini file mode selected */
            return new TMemIniFile(ChangeFileExt(Application->ExeName, ".INI"));
      }
}
```

Delphi Examples:

```
{
This example demonstrates the use of Ini files in order to store
and load form configurations between sessions. This example requires
a RadioGroup and two buttons.
}
procedure TForm2.btLoadClick(Sender: TObject);
var
  SettingsFile : TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  try
    {
    Read all saved values from the last session. The section name
    is the name of the form. Also use form's properties as defaults
    }
    Top     := SettingsFile.ReadInteger(Name, 'Top', Top );
    Left    := SettingsFile.ReadInteger(Name, 'Left', Left );
    Width   := SettingsFile.ReadInteger(Name, 'Width', Width );
    Height  := SettingsFile.ReadInteger(Name, 'Height', Height );
    Caption := SettingsFile.ReadString (Name, 'Caption', Caption);

    { Load last window state }
    case SettingsFile.ReadBool(Name, 'InitMax', WindowState = wsMaximized) of
      true : WindowState := wsMaximized;
      false: WindowState := wsNormal;
    end;

  finally
    SettingsFile.Free;
  end;
end;

procedure TForm2.btStoreClick(Sender: TObject);
var
  SettingsFile: TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  {
  Store current form properties to be used in later sessions.
  }
  try
    SettingsFile.WriteInteger (Name, 'Top', Top);
    SettingsFile.WriteInteger (Name, 'Left', Left);
    SettingsFile.WriteInteger (Name, 'Width', Width);
    SettingsFile.WriteInteger (Name, 'Height', Height);
    SettingsFile.WriteString  (Name, 'Caption', Caption);
    SettingsFile.WriteBool    (Name, 'InitMax', WindowState = wsMaximized );
    SettingsFile.WriteDateTime(Name, 'LastRun', Now);
  finally
    SettingsFile.Free;
  end;

end;
```

```
function TForm2.OpenIniFileInstance: TCustomIniFile;
begin
  {
  Open/create a new INI file that has the same name as our executable
  only with the INI extension.
  }

  case RadioGroup1.ItemIndex of
    0:
      begin
        { Registry mode selected: in HKEY_CURRENT_USER\Software\... }
        Result := TRegistryIniFile.Create('Software\' + Application.Title);
      end;
    1:
      begin
        { Ini file mode selected }
        Result := TIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
      end;
    2:
      begin
        { Memory based Ini file mode selected }
        Result := TMemIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
      end;
  end;
end;
```

ReadBinaryStream (see page 722)

21.1.2.3.13 TCustomIniFile.ReadTime Method

Retrieves a time value from an ini file.

Pascal

```
function ReadTime(const Section: string; const Name: string; Default: TDateTime): TDateTime;
virtual;
```

C++

```
virtual __fastcall TDateTime ReadTime(const UnicodeString Section, const UnicodeString Name,
TDateTime Default);
```

Description

Call ReadTime to read a time value from an ini file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the time value. Default is the time value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

See Also

ReadBool (see page 723)

ReadDate (see page 726)

ReadDateTime (see page 726)

ReadFloat (see page 727)

ReadInteger (see page 727)

ReadString (see page 732)

21.1.2.3.14 TCustomIniFile.SectionExists Method

Indicates whether a section exists in the ini file.

Pascal

```
function SectionExists(const Section: string): Boolean;
```

C++

```
__fastcall Boolean SectionExists(const UnicodeString Section);
```

Description

Use SectionExists to determine whether a section exists within the ini file specified in FileName (see page 749).

Section is the ini file section SectionExists determines the existence of.

SectionExists returns a Boolean value that indicates whether the section in question exists.

See Also

FileName (see page 749)

ValueExists (see page 736)

21.1.2.3.15 TCustomIniFile.UpdateFile Method

Flushes buffered ini file data to disk.

Pascal

```
procedure UpdateFile; virtual; abstract;
```

C++

```
virtual __fastcall UpdateFile() = 0;
```

Description

Call UpdateFile to flush buffered reads from and writes to the ini file to disk. [SK comment -- UpdateFile is useful under Windows95but has no effect under Windows NT as NT does not buffer ini file reads and writes. do not delete!]

See Also

FileName (see page 749)

21.1.2.3.16 TCustomIniFile.ValueExists Method

Indicates whether a key exists in the ini file.

Pascal

```
function ValueExists(const Section: string; const Ident: string): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ValueExists(const UnicodeString Section, const UnicodeString Ident);
```

Description

Use ValueExists to determine whether a key exists in the ini file specified in FileName (see page 749).

Section is the section in the ini file in which to search for the key.

Ident is the name of the key to search for.

ValueExists returns a boolean value that indicates whether the key exists in the specified section.

See Also

FileName (see page 749)

SectionExists (see page 736)

21.1.2.3.17 TCustomIniFile.WriteBinaryStream Method

Writes a binary value to the ini file.

Pascal

```
procedure WriteBinaryStream(const Section: string; const Name: string; Value: TStream);
virtual;
```

C++

```
virtual __fastcall WriteBinaryStream(const UnicodeString Section, const UnicodeString Name,
TStream Value);
```

Description

Call WriteBinaryStream to write a binary value from a specified stream to a specified section and key in the ini file. WriteBinaryStream writes from the current position in the stream to the end, converting the value into its hexadecimal representation.

Section is the section that contains the target key.

Name is the key under which the binary data is to be written.

Value is a stream to from which the binary value can be read.

Note: Attempting to write a value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteBinaryStream creates the section and key and sets its initial value to the hexadecimal representation of the stream's data.

See Also

WriteString (see page 745)

ReadBinaryStream (see page 722)

21.1.2.3.18 TCustomIniFile.WriteBool Method

Writes a Boolean value to an ini file.

Pascal

```
procedure WriteBool(const Section: string; const Ident: string; Value: Boolean); virtual;
```

C++

```
virtual __fastcall WriteBool(const UnicodeString Section, const UnicodeString Ident, Boolean
Value);
```

Description

Call WriteBool to write a Boolean value to an ini file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the Boolean value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteBool creates the section and key and sets its initial value to Value.

C++ Examples:

```
/*
This example demonstrates the usage of Ini files in order to store
and load form configuration between sessions. Example assumes
a RadioGroup and two buttons are present on the main form.
*/
void __fastcall TForm2::btStoreClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    // Store current form properties to be used in later sessions.
    try
    {
        SettingsFile->WriteInteger (Name, "Top", Top);
        SettingsFile->WriteInteger (Name, "Left", Left);
        SettingsFile->WriteInteger (Name, "Width", Width);

21.1.2.3.19 TCustomIniFile.WriteDate Method

Writes a date value to an ini file.

Pascal

```
procedure WriteDate(const Section: string; const Name: string; Value: TDateTime); virtual;
```

C++

```
virtual __fastcall WriteDate(const UnicodeString Section, const UnicodeString Name, TDateTime
Value);
```

Description

Call WriteDate to write a date value to an ini file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the date value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteDate creates the section and key and sets its initial value to Value.

21.1.2.3.20 TCustomIniFile.WriteDateTime Method

Writes a date-time value to an ini file.

Pascal

```
procedure WriteDateTime(const Section: string; const Name: string; Value: TDateTime); virtual;
```

C++

```
virtual __fastcall WriteDateTime(const UnicodeString Section, const UnicodeString Name,
TDateTime Value);
```

Description

Call WriteDateTime to write a date-time value to an ini file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the date-time value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteDateTime creates the section and key and sets its initial value to Value.

21.1.2.3.21 TCustomIniFile.WriteFloat Method

Writes a float value to an ini file.

Pascal

```
procedure WriteFloat(const Section: string; const Name: string; Value: Double); virtual;
```

C++

```
virtual __fastcall WriteFloat(const UnicodeString Section, const UnicodeString Name, Double
Value);
```

Description

Call WriteFloat to write a float value to an ini file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the float value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteFloat creates the section and key and sets its initial value to Value.

21.1.2.3.22 TCustomIniFile.WriteInteger Method

Writes an integer value to an ini file.

Pascal

```
procedure WriteInteger(const Section: string; const Ident: string; Value: Longint); virtual;
```

C++

```
virtual __fastcall WriteInteger(const UnicodeString Section, const UnicodeString Ident,
Longint Value);
```

Description

Call WriteInteger to write an integer value to an ini file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the integer value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteInteger creates the section and key and sets its initial value to Value.

C++ Examples:

```
/*
This example demonstrates the usage of Ini files in order to store
```

```
and load form configuration between sessions. Example assumes
a RadioGroup and two buttons are present on the main form.
*/
void __fastcall TForm2::btStoreClick(TObject *Sender)

21.1.2.3.23 TCustomIniFile.WriteString Method

Writes a string value to an ini file.

Pascal

```
procedure WriteString(const Section: String; const Ident: String; const Value: String);
virtual; abstract;
```

C++

```
virtual __fastcall WriteString(const UnicodeString Section, const UnicodeString Ident, const
UnicodeString Value) = 0;
```

Description

Call WriteString to write a string value to an ini file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the string value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteString creates the section and key and sets its initial value to Value.

C++ Examples:

```
/*
This example demonstrates the usage of Ini files in order to store
and load form configuration between sessions. Example assumes
a RadioGroup and two buttons are present on the main form.
*/
void __fastcall TForm2::btStoreClick(TObject *Sender)
{

WriteFloat (see page 742)

WriteInteger (see page 742)

WriteTime (see page 748)

21.1.2.3.24 TCustomIniFile.WriteTime Method

Writes a time value to an ini file.

Pascal

```
procedure WriteTime(const Section: string; const Name: string; Value: TDateTime); virtual;
```

C++

```
virtual __fastcall WriteTime(const UnicodeString Section, const UnicodeString Name, TDateTime
Value);
```

Description

Call WriteTime to write a time value to an ini file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the time value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteTime creates the section and key and sets its initial value to Value.

21.1.2.4 TCustomIniFile Properties

The properties of the TCustomIniFile class are listed here.

Public Properties

	Name	Description
	FileName (see page 749)	Contains the name of the ini file from which to read and to which to write information.

21.1.2.4.1 TCustomIniFile.FileName Property

Contains the name of the ini file from which to read and to which to write information.

Pascal

```
property FileName: string;
```

C++

```
__property UnicodeString FileName;
```

Description

Read FileName to retrieve the name of the ini file that this object can be used to access. The methods that read and write ini file information automatically handle opening and closing the file specified by FileName.

FileName is read-only. The name of the ini file the object uses is supplied as the parameter for the constructor.

Create (see page 720)

21.1.3 THashedStringList Class

THashedStringList maintains a list of strings using an internal hash table.

Class Hierarchy

Pascal

```
THashedStringList = class(TStringList);
```

C++

```
class THashedStringList : public TStringList;
```

File

IniFiles

Description

THashedStringList is a string list that uses a hash table internally to speed the process of locating strings. It is used internally by TMemIniFile (see page 765) to manage the strings from an INI file, but can be used in the same way as any other string list. By using THashedStringList instead of TStringList, you can improve performance when the list contains a large number of strings.

See Also

TStringList

TMemIniFile (see page 765)

Working with Lists

21.1.3.1 THashedStringList Members

The following tables list the members exposed by THashedStringList.

Protected Methods

	Name	Description
	Changed (see page 751)	This is Changed, a member of class THashedStringList.

Public Methods

	Name	Description
	Destroy (see page 750)	Destroys an instance of THashedStringList (see page 749).
	IndexOf (see page 751)	Returns the position of a string in the list.
	IndexOfName (see page 752)	Returns the position of the first string with the form Name=Value with the specified name part.

21.1.3.2 THashedStringList.Destroy Destructor

Destroys an instance of THashedStringList (see page 749).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~THashedStringList();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the THashedStringList (see page 749) reference is not nil and only then calls Destroy.

System::TObject::Free

21.1.3.3 THashedStringList Methods

The methods of the THashedStringList class are listed here.

Protected Methods

	Name	Description
	Changed (see page 751)	This is Changed, a member of class THashedStringList.

Public Methods

	Name	Description
	IndexOf (see page 751)	Returns the position of a string in the list.
	IndexOfName (see page 752)	Returns the position of the first string with the form Name=Value with the specified name part.

21.1.3.3.1 THashedStringList.Changed Method

Pascal

```
procedure Changed; override;
```

C++

```
virtual __fastcall Changed();
```

Description

This is Changed, a member of class THashedStringList.

21.1.3.3.2 THashedStringList.IndexOf Method

Returns the position of a string in the list.

Pascal

```
function IndexOf(const S: string): Integer; override;
```

C++

```
virtual __fastcall int IndexOf(const UnicodeString S);
```

Description

Call IndexOf to obtain the position of the first occurrence of a string that matches S. A string matches S if it is identical to S or differs only in case.

IndexOf returns the 0-based index of the string. Thus, if S matches the first string in the list, IndexOf returns 0, if S is the second string, IndexOf returns 1, and so on. If the string does not have a match in the string list, IndexOf returns -1.

IndexOfName (see page 752)

IndexOfObject

Strings

21.1.3.3.3 THashedStringList.IndexOfName Method

Returns the position of the first string with the form Name=Value with the specified name part.

Pascal

```
function IndexOfName(const Name: string): Integer; override;
```

C++

```
virtual __fastcall int IndexOfName(const UnicodeString Name);
```

Description

Call IndexOfName to locate the first occurrence of a string with the form Name=Value where the name part is equal to the Name parameter or differs only in case. IndexOfName returns the 0-based index of the string. If no string in the list has the indicated name, IndexOfName returns -1.

The Name that identifies the string is to the left of the equal sign (=), and the current Value of the Name identifier is on the right side. There should be no spaces present before or after the equal sign.

Note: If there is more than one string with a name portion matching the Name parameter, IndexOfName returns the position of the first such string.

21.1.4 TIniFile Class

TIniFile stores and retrieves application-specific information and settings from INI files.

Class Hierarchy

Pascal

```
TIniFile = class(TCustomIniFile);
```

C++

```
class TIniFile : public TCustomIniFile;
```

File

IniFiles

Description

TIniFile enables handling the storage and retrieval of application-specific information and settings in a standard INI file. An INI file stores information in logical groupings, called "sections." Within each section, actual data values are stored in named keys. Keys take the form:

```
<keyname>=<value>
```

A FileName (see page 749) is passed to the TIniFile constructor and identifies the INI file that the object accesses.

Note: On Windows, a related object, TMemIniFile (see page 765), works the same way as TIniFile, but buffers writes in memory to minimize disk access.

Note: On Linux, TIniFile is the same as TMemIniFile (see page 765).

C++ Examples:

```
/*
This example demonstrates the usage of Ini files in order to store
and load form configuration between sessions. Example assumes
a RadioGroup and two buttons are present on the main form.
*/
void __fastcall TForm2::btStoreClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    // Store current form properties to be used in later sessions.
    try
    {
        SettingsFile->WriteInteger (Name, "Top", Top);
        SettingsFile->WriteInteger (Name, "Left", Left);
        SettingsFile->WriteInteger (Name, "Width", Width);
        SettingsFile->WriteInteger (Name, "Height", Height);
        SettingsFile->WriteString  (Name, "Caption", Caption);
        SettingsFile->WriteBool    (Name, "InitMax", WindowState == wsMaximized );
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

void __fastcall TForm2::btLoadClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    try
    {
        /*
        Read all saved values from the last session. The section name
        is the name of the form. Also use form's properties as defaults
        */
        Top     = SettingsFile->ReadInteger(Name, "Top", Top );
        Left    = SettingsFile->ReadInteger(Name, "Left", Left );
        Width   = SettingsFile->ReadInteger(Name, "Width", Width );
        Height  = SettingsFile->ReadInteger(Name, "Height", Height );
        Caption = SettingsFile->ReadString (Name, "Caption", Caption);

        // Load last window state
        if (SettingsFile->ReadBool(Name, "InitMax", WindowState == wsMaximized))
            WindowState = wsMaximized;
        else
            WindowState = wsNormal;
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
```

```
}

TCustomIniFile* __fastcall TForm2::OpenIniFileInstance()
{
    /*
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    */

    switch (RadioGroup1->ItemIndex)
    {
        case 0:
            /* Registry mode selected: in HKEY_CURRENT_USER\Software\... */
            return new TRegistryIniFile(String("Software\\") + Application->Title);
        case 1:
            /* Ini file mode selected */
            return new TIniFile(ChangeFileExt(Application->ExeName, ".INI"));
        case 2:
            /* Memory based Ini file mode selected */
            return new TMemIniFile(ChangeFileExt(Application->ExeName, ".INI"));
      }
}
```

Delphi Examples:

```
{
This example demonstrates the use of Ini files in order to store
and load form configurations between sessions. This example requires
a RadioGroup and two buttons.
}
procedure TForm2.btLoadClick(Sender: TObject);
var
  SettingsFile : TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  try
    {
    Read all saved values from the last session. The section name
    is the name of the form. Also use form's properties as defaults
    }
    Top     := SettingsFile.ReadInteger(Name, 'Top', Top );
    Left    := SettingsFile.ReadInteger(Name, 'Left', Left );
    Width   := SettingsFile.ReadInteger(Name, 'Width', Width );
    Height  := SettingsFile.ReadInteger(Name, 'Height', Height );
    Caption := SettingsFile.ReadString (Name, 'Caption', Caption);

    { Load last window state }
    case SettingsFile.ReadBool(Name, 'InitMax', WindowState = wsMaximized) of
      true : WindowState := wsMaximized;
      false: WindowState := wsNormal;
    end;

  finally
    SettingsFile.Free;
  end;
end;

procedure TForm2.btStoreClick(Sender: TObject);
var
  SettingsFile: TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  {
```

```
    Store current form properties to be used in later sessions.
    }
    try
      SettingsFile.WriteInteger (Name, 'Top', Top);
      SettingsFile.WriteInteger (Name, 'Left', Left);
      SettingsFile.WriteInteger (Name, 'Width', Width);
      SettingsFile.WriteInteger (Name, 'Height', Height);
      SettingsFile.WriteString  (Name, 'Caption', Caption);
      SettingsFile.WriteBool    (Name, 'InitMax', WindowState = wsMaximized );
      SettingsFile.WriteDateTime(Name, 'LastRun', Now);
    finally
      SettingsFile.Free;
    end;

  end;

  function TForm2.OpenIniFileInstance: TCustomIniFile;
  begin
    {
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    }

    case RadioGroup1.ItemIndex of
      0:
        begin
          { Registry mode selected: in HKEY_CURRENT_USER\Software\... }
          Result := TRegistryIniFile.Create('Software\' + Application.Title);
        end;
      1:
        begin
          { Ini file mode selected }
          Result := TIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
        end;
      2:
        begin
          { Memory based Ini file mode selected }
          Result := TMemIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
        end;
    end;
  end;
```

21.1.4.1 TIniFile Members

The following tables list the members exposed by TIniFile.

Public Methods

	Name	Description
	Create (see page 720)	Creates a TCustomIniFile (see page 716) object for an application.
	DeleteKey (see page 757)	Removes an INI file entry for a specified key value.
	Destroy (see page 756)	Disposes of an object instance.
	EraseSection (see page 757)	Erases an entire section of an INI file.
	ReadBinaryStream (see page 722)	Retrieves a binary value from the ini file.
	ReadBool (see page 723)	Retrieves a Boolean value from an ini file.
	ReadDate (see page 726)	Retrieves a date value from an ini file.
	ReadDateTime (see page 726)	Retrieves a date-time value from an ini file.

	ReadFloat (see page 727)	Retrieves a float value from an ini file.
	ReadInteger (see page 727)	Retrieves an integer value from an ini file.
	ReadSection (see page 758)	Reads all the key names from a specified section of an INI file into a string list.
	ReadSections (see page 758)	Reads the names of all sections in an INI file into a string list.
	ReadSections (see page 731)	This is the overview for the ReadSections method overload.
	ReadSectionValues (see page 759)	Reads the values from all keys within a section of an INI file into a string list.
	ReadString (see page 759)	Retrieves a string value from an INI file.
	ReadTime (see page 735)	Retrieves a time value from an ini file.
	SectionExists (see page 736)	Indicates whether a section exists in the ini file.
	UpdateFile (see page 762)	Flushes buffered INI file data to disk.
	ValueExists (see page 736)	Indicates whether a key exists in the ini file.
	WriteBinaryStream (see page 737)	Writes a binary value to the ini file.
	WriteBool (see page 737)	Writes a Boolean value to an ini file.
	WriteDate (see page 741)	Writes a date value to an ini file.
	WriteDateTime (see page 741)	Writes a date-time value to an ini file.
	WriteFloat (see page 742)	Writes a float value to an ini file.
	WriteInteger (see page 742)	Writes an integer value to an ini file.
	WriteString (see page 762)	Writes a string value to an INI file.
	WriteTime (see page 748)	Writes a time value to an ini file.

Public Properties

	Name	Description
	FileName (see page 749)	Contains the name of the ini file from which to read and to which to write information.

21.1.4.2 TIniFile.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIniFile();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

System::TObject::Free

21.1.4.3 TIniFile Methods

The methods of the TIniFile class are listed here.

Public Methods

	Name	Description
	DeleteKey (see page 757)	Removes an INI file entry for a specified key value.
	EraseSection (see page 757)	Erases an entire section of an INI file.
	ReadSection (see page 758)	Reads all the key names from a specified section of an INI file into a string list.
	ReadSections (see page 758)	Reads the names of all sections in an INI file into a string list.
	ReadSectionValues (see page 759)	Reads the values from all keys within a section of an INI file into a string list.
	ReadString (see page 759)	Retrieves a string value from an INI file.
	UpdateFile (see page 762)	Flushes buffered INI file data to disk.
	WriteString (see page 762)	Writes a string value to an INI file.

21.1.4.3.1 TIniFile.DeleteKey Method

Removes an INI file entry for a specified key value.

Pascal

```
procedure DeleteKey(const Section: String; const Ident: String); override;
```

C++

```
virtual __fastcall DeleteKey(const UnicodeString Section, const UnicodeString Ident);
```

Description

Call DeleteKey to erase an INI file entry. Section is string containing the name of an INI file section, and Ident is a string containing the name of the key from for which to set a nil (Delphi) or NULL (C++) value.

This version of DeleteKey is only available if the application is compiled for Windows. On Linux, DeleteKey is inherited from TMemIniFile (see page 765).

Note: Attempting to delete a key in a nonexistent section or attempting to delete a nonexistent key are not errors. In these cases, DeleteKey does nothing.

See Also

EraseSection (see page 757)

21.1.4.3.2 TIniFile.EraseSection Method

Erases an entire section of an INI file.

Pascal

```
procedure EraseSection(const Section: string); override;
```

C++

```
virtual __fastcall EraseSection(const UnicodeString Section);
```

Description

Call EraseSection to remove a section, all its keys, and their data values from an INI file. Section identifies the INI file section to

remove. If a section cannot be removed, an exception is raised.

This version of EraseSection is only available if the application is compiled for Windows. On Linux, EraseSection is inherited from TMemIniFile (see page 765).

See Also

DeleteKey (see page 757)

21.1.4.3.3 TIniFile.ReadSection Method

Reads all the key names from a specified section of an INI file into a string list.

Pascal

```
procedure ReadSection(const Section: string; Strings: TStrings); override;
```

C++

```
virtual __fastcall ReadSection(const UnicodeString Section, TStrings Strings);
```

Description

Call ReadSection to retrieve the names of all keys within a specified section of an INI file into a string list object.

Section identifies the section from which to retrieve a list of key names. Strings specifies the TStrings descendant to hold the retrieved names. Strings can point to a TStrings descendant such as a string list (TStringList), or to a component property that is of type TStrings, such as the Items property of TListBox.

This version of ReadSection is only available if the application is compiled for Windows. On Linux, ReadSection is inherited from TMemIniFile (see page 765).

See Also

ReadSections (see page 758)

ReadSectionValues (see page 759)

21.1.4.3.4 TIniFile.ReadSections Method

Reads the names of all sections in an INI file into a string list.

Pascal

```
procedure ReadSections(Strings: TStrings); override;
```

C++

```
virtual __fastcall ReadSections(TStrings Strings);
```

Description

Call ReadSections to retrieve the names of all sections in an INI file into a string list object.

Strings specifies the string object to hold the retrieved names. Strings can point to a TStrings object, or to a component property, such as Items for a TListBox component.

This version of ReadSections is only available if the application is compiled for Windows. On Linux, ReadSections is inherited from TMemIniFile (see page 765).

See Also

ReadSection (see page 758)

ReadSectionValues (see page 759)

21.1.4.3.5 TIniFile.ReadSectionValues Method

Reads the values from all keys within a section of an INI file into a string list.

Pascal

```
procedure ReadSectionValues(const Section: string; Strings: TStrings); override;
```

C++

```
virtual __fastcall ReadSectionValues(const UnicodeString Section, TStrings Strings);
```

Description

Call ReadSectionValues to read the keys, and the values from all keys, within a specified section of an INI file into a string list object (TStrings descendant). The key names and values are added to the string list as strings of the form KeyName=ValueName.

Section identifies the section in the file from which to read key values.

Strings is the string list object into which to read the values. Strings can point to a TStrings object, or to a component property, such as Items for a TListBox component, that is a TStrings object itself.

This version of ReadSectionValues is only available if the application is compiled for Windows. On Linux, ReadSectionValues is inherited from TMemIniFile (see page 765).

See Also

ReadSection (see page 758)

ReadSections (see page 758)

21.1.4.3.6 TIniFile.ReadString Method

Retrieves a string value from an INI file.

Pascal

```
function ReadString(const Section: string; const Ident: string; const Default: string):
string; override;
```

C++

```
virtual __fastcall UnicodeString ReadString(const UnicodeString Section, const UnicodeString
Ident, const UnicodeString Default);
```

Description

Call ReadString to read a string value from an INI file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the value. Default is the string value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

This version of ReadString is only available if the application is compiled for Windows. On Linux, ReadString is inherited from TMemIniFile (see page 765).

C++ Examples:

```
/*
This example demonstrates the usage of Ini files in order to store
and load form configuration between sessions. Example assumes
```

```
a RadioGroup and two buttons are present on the main form.
*/
void __fastcall TForm2::btStoreClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    // Store current form properties to be used in later sessions.
    try
    {
        SettingsFile->WriteInteger (Name, "Top", Top);
        SettingsFile->WriteInteger (Name, "Left", Left);
        SettingsFile->WriteInteger (Name, "Width", Width);
        SettingsFile->WriteInteger (Name, "Height", Height);
        SettingsFile->WriteString  (Name, "Caption", Caption);
        SettingsFile->WriteBool    (Name, "InitMax", WindowState == wsMaximized );
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

void __fastcall TForm2::btLoadClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    try
    {
        /*
        Read all saved values from the last session. The section name
        is the name of the form. Also use form's properties as defaults
        */
        Top     = SettingsFile->ReadInteger(Name, "Top", Top );
        Left    = SettingsFile->ReadInteger(Name, "Left", Left );
        Width   = SettingsFile->ReadInteger(Name, "Width", Width );
        Height  = SettingsFile->ReadInteger(Name, "Height", Height );
        Caption = SettingsFile->ReadString (Name, "Caption", Caption);

        // Load last window state
        if (SettingsFile->ReadBool(Name, "InitMax", WindowState == wsMaximized))
            WindowState = wsMaximized;
        else
            WindowState = wsNormal;
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

TCustomIniFile* __fastcall TForm2::OpenIniFileInstance()
{
    /*
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    */

    switch (RadioGroup1->ItemIndex)
    {
        case 0:
            /* Registry mode selected: in HKEY_CURRENT_USER\Software\... */
            return new TRegistryIniFile(String("Software\\") + Application->Title);
```

```
        case 1:
            /* Ini file mode selected */
            return new TIniFile(ChangeFileExt(Application->ExeName, ".INI"));
        case 2:
            /* Memory based Ini file mode selected */
            return new TMemIniFile(ChangeFileExt(Application->ExeName, ".INI"));
      }
}
```

Delphi Examples:

```
{
This example demonstrates the use of Ini files in order to store
and load form configurations between sessions. This example requires
a RadioGroup and two buttons.
}
procedure TForm2.btLoadClick(Sender: TObject);
var
  SettingsFile : TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  try
    {
    Read all saved values from the last session. The section name
    is the name of the form. Also use form's properties as defaults
    }
    Top     := SettingsFile.ReadInteger(Name, 'Top', Top );
    Left    := SettingsFile.ReadInteger(Name, 'Left', Left );
    Width   := SettingsFile.ReadInteger(Name, 'Width', Width );
    Height  := SettingsFile.ReadInteger(Name, 'Height', Height );
    Caption := SettingsFile.ReadString (Name, 'Caption', Caption);

    { Load last window state }
    case SettingsFile.ReadBool(Name, 'InitMax', WindowState = wsMaximized) of
      true : WindowState := wsMaximized;
      false: WindowState := wsNormal;
    end;

  finally
    SettingsFile.Free;
  end;
end;

procedure TForm2.btStoreClick(Sender: TObject);
var
  SettingsFile: TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  {
  Store current form properties to be used in later sessions.
  }
  try
    SettingsFile.WriteInteger (Name, 'Top', Top);
    SettingsFile.WriteInteger (Name, 'Left', Left);
    SettingsFile.WriteInteger (Name, 'Width', Width);
    SettingsFile.WriteInteger (Name, 'Height', Height);
    SettingsFile.WriteString  (Name, 'Caption', Caption);
    SettingsFile.WriteBool    (Name, 'InitMax', WindowState = wsMaximized );
    SettingsFile.WriteDateTime(Name, 'LastRun', Now);
  finally
    SettingsFile.Free;
  end;
```

```
end;

function TForm2.OpenIniFileInstance: TCustomIniFile;
begin
  {
  Open/create a new INI file that has the same name as our executable
  only with the INI extension.
  }

  case RadioGroup1.ItemIndex of
    0:
      begin
        { Registry mode selected: in HKEY_CURRENT_USER\Software\... }
        Result := TRegistryIniFile.Create('Software\' + Application.Title);
      end;
    1:
      begin
        { Ini file mode selected }
        Result := TIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
      end;
    2:
      begin
        { Memory based Ini file mode selected }
        Result := TMemIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
      end;
  end;
end;
```

See Also

ReadBool (see page 723)

ReadInteger (see page 727)

21.1.4.3.7 TIniFile.UpdateFile Method

Flushes buffered INI file data to disk.

Pascal

```
procedure UpdateFile; override;
```

C++

```
virtual __fastcall UpdateFile();
```

Description

Call UpdateFile to flush buffered reads from and writes to the INI file to disk. UpdateFile is useful under Windows9x, but has no effect under Windows NT because NT does not buffer INI file reads and writes.

This version of UpdateFile is only available if the application is compiled for Windows. On Linux, Update is inherited from TMemIniFile (see page 765).

See Also

FileName (see page 749)

TMemIniFile (see page 765)

21.1.4.3.8 TIniFile.WriteString Method

Writes a string value to an INI file.

Pascal

```
procedure WriteString(const Section: String; const Ident: String; const Value: String);
override;
```

C++

```
virtual __fastcall WriteString(const UnicodeString Section, const UnicodeString Ident, const
UnicodeString Value);
```

Description

Call WriteString to write a string value to an INI file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the string value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteString creates the section and key and sets its initial value to Value.

This version of WriteString is only available if the application is compiled for Windows. On Linux, WriteString is inherited from TMemIniFile (see page 765).

C++ Examples:

```
/*
This example demonstrates the usage of Ini files in order to store
and load form configuration between sessions. Example assumes
a RadioGroup and two buttons are present on the main form.
*/
void __fastcall TForm2::btStoreClick(TObject *Sender)
{
    /* Open an instance */

            return new TMemIniFile(ChangeFileExt(Application->ExeName, ".INI"));
      }
}
```

Delphi Examples:

```
{
This example demonstrates the use of Ini files in order to store
and load form configurations between sessions. This example requires
a RadioGroup and two buttons.
}
procedure TForm2.btLoadClick(Sender: TObject);
var
  SettingsFile : TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  try
    {
    Read all saved values from the last session. The section name
    is the name of the form. Also use form's properties as defaults
    }
    Top     := SettingsFile.ReadInteger(Name, 'Top', Top );
    Left    := SettingsFile.ReadInteger(Name, 'Left', Left );
    Width   := SettingsFile.ReadInteger(Name, 'Width', Width );
    Height  := SettingsFile.ReadInteger(Name, 'Height', Height );
    Caption := SettingsFile.ReadString (Name, 'Caption', Caption);

    { Load last window state }
    case SettingsFile.ReadBool(Name, 'InitMax', WindowState = wsMaximized) of
      true : WindowState := wsMaximized;
      false: WindowState := wsNormal;
    end;

  finally
    SettingsFile.Free;
```

```
  end;
end;

procedure TForm2.btStoreClick(Sender: TObject);
var
  SettingsFile: TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  {
  Store current form properties to be used in later sessions.
  }
  try
    SettingsFile.WriteInteger (Name, 'Top', Top);
    SettingsFile.WriteInteger (Name, 'Left', Left);
    SettingsFile.WriteInteger (Name, 'Width', Width);
    SettingsFile.WriteInteger (Name, 'Height', Height);
    SettingsFile.WriteString  (Name, 'Caption', Caption);
    SettingsFile.WriteBool    (Name, 'InitMax', WindowState = wsMaximized );
    SettingsFile.WriteDateTime(Name, 'LastRun', Now);
  finally
    SettingsFile.Free;
  end;

end;

function TForm2.OpenIniFileInstance: TCustomIniFile;
begin
  {
  Open/create a new INI file that has the same name as our executable
  only with the INI extension.
  }

  case RadioGroup1.ItemIndex of
    0:
      begin
        { Registry mode selected: in HKEY_CURRENT_USER\Software\... }
        Result := TRegistryIniFile.Create('Software\' + Application.Title);
      end;
    1:
      begin
        { Ini file mode selected }
        Result := TIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
      end;
    2:
      begin
        { Memory based Ini file mode selected }
        Result := TMemIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
      end;
  end;
end;

21.1.5 TMemIniFile Class

TMemIniFile enables buffered storage and retrieval of application-specific information and settings in an INI file.

Class Hierarchy

Pascal

```
TMemIniFile = class(TCustomIniFile);
```

C++

```
class TMemIniFile : public TCustomIniFile;
```

File

IniFiles

Description

Use TMemIniFile to store and retrieve application-specific information and settings in a Windows INI file. An INI file stores information in logical groupings, called "sections." Within each section, actual data values are stored in named keys. Keys take the form:

```
<keyname>=<value>
```

TMemIniFile buffers all changes to the INI file. The INI file is read once, when the object is first created. Data from the INI file is stored in nested string lists. Each section in the INI file occupies one element in the top-most string list, and each element in this may itself contain a string list. Each element in each of the contained string list represents a key within the section. After the data is read, any changes to the data are stored in memory. To write the data from memory back to the associated INI file, call the UpdateFile (see page 778) method.

All TMemIniFile methods to read, write, and erase sections, keys, and values operate on the in-memory copy of the INI file.

C++ Examples:

```
/*
This example demonstrates the usage of Ini files in order to store
and load form configuration between sessions. Example assumes
a RadioGroup and two buttons are present on the main form.
*/
void __fastcall TForm2::btStoreClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    // Store current form properties to be used in later sessions.
    try
    {
        SettingsFile->WriteInteger (Name, "Top", Top);
        SettingsFile->WriteInteger (Name, "Left", Left);
        SettingsFile->WriteInteger (Name, "Width", Width);
        SettingsFile->WriteInteger (Name, "Height", Height);
        SettingsFile->WriteString  (Name, "Caption", Caption);
        SettingsFile->WriteBool    (Name, "InitMax", WindowState == wsMaximized );
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

void __fastcall TForm2::btLoadClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();
```

```
    try
    {
        /*
        Read all saved values from the last session. The section name
        is the name of the form. Also use form's properties as defaults
        */
        Top     = SettingsFile->ReadInteger(Name, "Top", Top );
        Left    = SettingsFile->ReadInteger(Name, "Left", Left );
        Width   = SettingsFile->ReadInteger(Name, "Width", Width );
        Height  = SettingsFile->ReadInteger(Name, "Height", Height );
        Caption = SettingsFile->ReadString (Name, "Caption", Caption);

        // Load last window state
        if (SettingsFile->ReadBool(Name, "InitMax", WindowState == wsMaximized))
            WindowState = wsMaximized;
        else
            WindowState = wsNormal;
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

TCustomIniFile* __fastcall TForm2::OpenIniFileInstance()
{
    /*
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    */

    switch (RadioGroup1->ItemIndex)
    {
        case 0:
            /* Registry mode selected: in HKEY_CURRENT_USER\Software\... */
            return new TRegistryIniFile(String("Software\\") + Application->Title);
        case 1:
            /* Ini file mode selected */
            return new TIniFile(ChangeFileExt(Application->ExeName, ".INI"));
        case 2:
            /* Memory based Ini file mode selected */
            return new TMemIniFile(ChangeFileExt(Application->ExeName, ".INI"));
      }
}
```

Delphi Examples:

```
{
This example demonstrates the use of Ini files in order to store
and load form configurations between sessions. This example requires
a RadioGroup and two buttons.
}
procedure TForm2.btLoadClick(Sender: TObject);
var
  SettingsFile : TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  try
    {
    Read all saved values from the last session. The section name
    is the name of the form. Also use form's properties as defaults
    }
    Top     := SettingsFile.ReadInteger(Name, 'Top', Top );
    Left    := SettingsFile.ReadInteger(Name, 'Left', Left );
```

```
    Width   := SettingsFile.ReadInteger(Name, 'Width', Width );
    Height  := SettingsFile.ReadInteger(Name, 'Height', Height );
    Caption := SettingsFile.ReadString (Name, 'Caption', Caption);

    { Load last window state }
    case SettingsFile.ReadBool(Name, 'InitMax', WindowState = wsMaximized) of
      true : WindowState := wsMaximized;
      false: WindowState := wsNormal;
    end;

  finally
    SettingsFile.Free;
  end;
end;

procedure TForm2.btStoreClick(Sender: TObject);
var
  SettingsFile: TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  {
  Store current form properties to be used in later sessions.
  }
  try
    SettingsFile.WriteInteger (Name, 'Top', Top);
    SettingsFile.WriteInteger (Name, 'Left', Left);
    SettingsFile.WriteInteger (Name, 'Width', Width);
    SettingsFile.WriteInteger (Name, 'Height', Height);
    SettingsFile.WriteString  (Name, 'Caption', Caption);
    SettingsFile.WriteBool    (Name, 'InitMax', WindowState = wsMaximized );
    SettingsFile.WriteDateTime(Name, 'LastRun', Now);
  finally
    SettingsFile.Free;
  end;

end;

function TForm2.OpenIniFileInstance: TCustomIniFile;
begin
  {
  Open/create a new INI file that has the same name as our executable
  only with the INI extension.
  }

  case RadioGroup1.ItemIndex of
    0:
      begin
        { Registry mode selected: in HKEY_CURRENT_USER\Software\... }
        Result := TRegistryIniFile.Create('Software\' + Application.Title);
      end;
    1:
      begin
        { Ini file mode selected }
        Result := TIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
      end;
    2:
      begin
        { Memory based Ini file mode selected }
        Result := TMemIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
      end;
  end;
end;
```

21.1.5.1 TMemIniFile Members

The following tables list the members exposed by TMemIniFile.

Public Methods

	Name	Description
	Clear (see page 771)	Erases all data from the INI file in memory.
	Create (see page 770)	This is the overview for the Create constructor overload.
V	DeleteKey (see page 771)	Deletes a specified entry from the .ini file.
V	Destroy (see page 770)	Frees the memory associated with the TMemIniFile (see page 765) object.
V	EraseSection (see page 772)	Erases an entire section of the INI file.
	GetStrings (see page 772)	Populates a string list with INI file data.
V	ReadBinaryStream (see page 722)	Retrieves a binary value from the ini file.
V	ReadBool (see page 723)	Retrieves a Boolean value from an ini file.
V	ReadDate (see page 726)	Retrieves a date value from an ini file.
V	ReadDateTime (see page 726)	Retrieves a date-time value from an ini file.
V	ReadFloat (see page 727)	Retrieves a float value from an ini file.
V	ReadInteger (see page 727)	Retrieves an integer value from an ini file.
V	ReadSection (see page 773)	Reads all the key names from a specified section of an INI file into a string list.
V	ReadSections (see page 773)	Reads the names of all sections in an INI file into a string list.
A	ReadSections (see page 731)	This is the overview for the ReadSections method overload.
V	ReadSectionValues (see page 774)	Reads the values from all keys within a section of an INI file into a string list.
V	ReadString (see page 774)	Retrieves a string value from the INI file.
V	ReadTime (see page 735)	Retrieves a time value from an ini file.
	Rename (see page 777)	Associates the TMemIniFile (see page 765) with a different INI file.
	SectionExists (see page 736)	Indicates whether a section exists in the ini file.
	SetStrings (see page 778)	Populates the memory buffer with contents of a string list.
V	UpdateFile (see page 778)	Flushes buffered INI file data to disk.
V	ValueExists (see page 736)	Indicates whether a key exists in the ini file.
V	WriteBinaryStream (see page 737)	Writes a binary value to the ini file.
V	WriteBool (see page 737)	Writes a Boolean value to an ini file.
V	WriteDate (see page 741)	Writes a date value to an ini file.
V	WriteDateTime (see page 741)	Writes a date-time value to an ini file.
V	WriteFloat (see page 742)	Writes a float value to an ini file.
V	WriteInteger (see page 742)	Writes an integer value to an ini file.
V	WriteString (see page 779)	Writes a string value to an INI file.
V	WriteTime (see page 748)	Writes a time value to an ini file.

Public Properties

	Name	Description
	CaseSensitive (see page 782)	Controls whether section and key names are handled in a case-sensitive manner.
	Encoding (see page 782)	This is Encoding, a member of class TMemIniFile.

	FileName (see page 749)	Contains the name of the ini file from which to read and to which to write information.

21.1.5.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	TMemIniFile.Create (string) (see page 770)	Creates a TMemIniFile (see page 765) object for an application.
	TMemIniFile.Create (string, TEncoding) (see page 770)	Creates a TMemIniFile (see page 765) object for an application.

21.1.5.2.1 TMemIniFile.Create Constructor (string)

Creates a TMemIniFile (see page 765) object for an application.

Pascal

```
constructor Create(const FileName: string); overload;
constructor Create(const FileName: string; Encoding: TEncoding); overload;
```

C++

```
__fastcall TMemIniFile(const UnicodeString FileName);
__fastcall TMemIniFile(const UnicodeString FileName, TEncoding Encoding);
```

Description

Call Create to instantiate a TMemIniFile (see page 765) object for an application. Create sets the FileName (see page 749) property, and loads a copy of the INI file into memory, in an internal string list.

FileName (see page 749) is the name of the INI file the TMemIniFile (see page 765) uses.

Note: On Windows, INI files are meant to be stored in the \WINDOWS directory or the application's directory. To work with an INI file in another location, specify the full path name of the file in FileName (see page 749).

See Also

FileName (see page 749)

System::TObject::Create

21.1.5.3 TMemIniFile.Destroy Destructor

Frees the memory associated with the TMemIniFile (see page 765) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TMemIniFile();
```

Description

Do not call Destroy directly; instead call Free.

Warning: The destructor does not write the current memory image to disk. Be sure to save changes made to TMemIniFile (see page 765) by calling UpdateFile (see page 778) before destroying a TMemIniFile (see page 765) instance.

System::TObject::Free

UpdateFile (see page 778)

Create (see page 770)

21.1.5.4 TMemIniFile Methods

The methods of the TMemIniFile class are listed here.

Public Methods

	Name	Description
	Clear (see page 771)	Erases all data from the INI file in memory.
	DeleteKey (see page 771)	Deletes a specified entry from the .ini file.
	EraseSection (see page 772)	Erases an entire section of the INI file.
	GetStrings (see page 772)	Populates a string list with INI file data.
	ReadSection (see page 773)	Reads all the key names from a specified section of an INI file into a string list.
	ReadSections (see page 773)	Reads the names of all sections in an INI file into a string list.
	ReadSectionValues (see page 774)	Reads the values from all keys within a section of an INI file into a string list.
	ReadString (see page 774)	Retrieves a string value from the INI file.
	Rename (see page 777)	Associates the TMemIniFile (see page 765) with a different INI file.
	SetStrings (see page 778)	Populates the memory buffer with contents of a string list.
	UpdateFile (see page 778)	Flushes buffered INI file data to disk.
	WriteString (see page 779)	Writes a string value to an INI file.

21.1.5.4.1 TMemIniFile.Clear Method

Erases all data from the INI file in memory.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Call Clear to erase all data from the INI file that is currently buffered in memory. All sections, keys, and values are erased.

Warning: No exception is generated when using Clear and the data has not been saved to the INI file with the UpdateFile (see page 778) method.

See Also

UpdateFile (see page 778)

SetStrings (see page 778)

21.1.5.4.2 TMemIniFile.DeleteKey Method

Deletes a specified entry from the .ini file.

Pascal

```
procedure DeleteKey(const Section: String; const Ident: String); override;
```

C++

```
virtual __fastcall DeleteKey(const UnicodeString Section, const UnicodeString Ident);
```

Description

Call DeleteKey to erase .ini file entry. Section is string containing the name of a .ini file section, and Ident is a string containing the name of the key to remove.

Note: Attempting to erase a key in a nonexistent section or attempting to erase a nonexistent key are not errors. In these cases, DeleteKey does nothing.

DeleteKey only affects the in-memory copy of the .ini file, not the copy on disk. The change is not written to disk until you call UpdateFile (see page 778).

See Also

SectionExists (see page 736)

ValueExists (see page 736)

EraseSection (see page 772)

UpdateFile (see page 736)

CaseSensitive (see page 782)

21.1.5.4.3 TMemIniFile.EraseSection Method

Erases an entire section of the INI file.

Pascal

```
procedure EraseSection(const Section: string); override;
```

C++

```
virtual __fastcall EraseSection(const UnicodeString Section);
```

Description

Call EraseSection to remove a section, all its keys, and their data values from an INI file. Section identifies the INI file section to remove. If a section cannot be removed, an exception is raised.

EraseSection only affects the in-memory copy of the INI file, not the copy on disk. The change is not written to disk until you call UpdateFile (see page 778).

See Also

SectionExists (see page 736)

DeleteKey (see page 771)

UpdateFile (see page 778)

CaseSensitive (see page 782)

21.1.5.4.4 TMemIniFile.GetStrings Method

Populates a string list with INI file data.

Pascal

```
procedure GetStrings(List: TStrings);
```

C++

```
__fastcall GetStrings(TStrings List);
```

Description

Call GetStrings to copy the INI file data currently stored in memory into a pre-existing string list.

List is a string list object, created and maintained by the application, into which the INI file data is copied.

See Also

SetStrings (see page 778)

21.1.5.4.5 TMemIniFile.ReadSection Method

Reads all the key names from a specified section of an INI file into a string list.

Pascal

```
procedure ReadSection(const Section: string; Strings: TStrings); override;
```

C++

```
virtual __fastcall ReadSection(const UnicodeString Section, TStrings Strings);
```

Description

Call ReadSection to retrieve the names of all keys within a specified section of an INI file into a string list.

Section identifies the section from which to retrieve a list of key names. Strings specifies the string to hold the retrieved names. Strings can point to a TStrings descendant such as a string list, or to a component property, such as Items for a TListBox component.

Data read by ReadSection comes from the in-memory copy of the INI file, not the copy on disk.

See Also

SectionExists (see page 736)

ReadSections (see page 773)

ReadSectionValues (see page 774)

CaseSensitive (see page 782)

21.1.5.4.6 TMemIniFile.ReadSections Method

Reads the names of all sections in an INI file into a string list.

Pascal

```
procedure ReadSections(Strings: TStrings); override;
```

C++

```
virtual __fastcall ReadSections(TStrings Strings);
```

Description

Call ReadSections to retrieve the names of all sections in an INI file into a string list.

Strings specifies the string object to hold the retrieved names. Strings can point to a TStrings descendant, or to a component property, such as Items for a TListBox component.

Data read by ReadSections comes from the in-memory copy of the INI file, not the copy on disk.

See Also

ReadSection (see page 773)

ReadSectionValues (see page 774)

21.1.5.4.7 TMemIniFile.ReadSectionValues Method

Reads the values from all keys within a section of an INI file into a string list.

Pascal

```
procedure ReadSectionValues(const Section: string; Strings: TStrings); override;
```

C++

```
virtual __fastcall ReadSectionValues(const UnicodeString Section, TStrings Strings);
```

Description

Call ReadSectionValues to read the values from all keys within a specified section of an INI file into a string list object. The values are added to the string list as strings of the form KeyName=ValueName.

Section identifies the section in the file from which to read key values.

Strings is the string list object into which to read the values. Strings can point to a TStrings descendant, or to a component property, such as Items for a TListBox component.

Data read by ReadSectionValues comes from the in-memory copy of the INI file, not the copy on disk.

See Also

SectionExists (see page 736)

ReadSection (see page 773)

ReadSections (see page 773)

CaseSensitive (see page 782)

21.1.5.4.8 TMemIniFile.ReadString Method

Retrieves a string value from the INI file.

Pascal

```
function ReadString(const Section: string; const Ident: string; const Default: string):
string; override;
```

C++

```
virtual __fastcall UnicodeString ReadString(const UnicodeString Section, const UnicodeString
Ident, const UnicodeString Default);
```

Description

Call ReadString to read a string value from an INI file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the value. Default is the string value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

The ReadString method inherited from TCustomIniFile (see page 716) is modified to operate on the in-memory copy of the INI file data. The read methods for all other data types use ReadString internally and then translate to the appropriate data type.

C++ Examples:

```
/*
This example demonstrates the usage of Ini files in order to store
and load form configuration between sessions. Example assumes
a RadioGroup and two buttons are present on the main form.
*/
void __fastcall TForm2::btStoreClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    // Store current form properties to be used in later sessions.
    try
    {
        SettingsFile->WriteInteger (Name, "Top", Top);
        SettingsFile->WriteInteger (Name, "Left", Left);
        SettingsFile->WriteInteger (Name, "Width", Width);
        SettingsFile->WriteInteger (Name, "Height", Height);
        SettingsFile->WriteString  (Name, "Caption", Caption);
        SettingsFile->WriteBool    (Name, "InitMax", WindowState == wsMaximized );
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

        }
}
```

Delphi Examples:

```
{
This example demonstrates the use of Ini files in order to store
and load form configurations between sessions. This example requires
a RadioGroup and two buttons.
}
procedure TForm2.btLoadClick(Sender: TObject);
var
  SettingsFile : TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  try
    {
    Read all saved values from the last session. The section name
    is the name of the form. Also use form's properties as defaults
    }
    Top     := SettingsFile.ReadInteger(Name, 'Top', Top );
    Left    := SettingsFile.ReadInteger(Name, 'Left', Left );
    Width   := SettingsFile.ReadInteger(Name, 'Width', Width );
    Height  := SettingsFile.ReadInteger(Name, 'Height', Height );
    Caption := SettingsFile.ReadString (Name, 'Caption', Caption);

    { Load last window state }
    case SettingsFile.ReadBool(Name, 'InitMax', WindowState = wsMaximized) of
      true : WindowState := wsMaximized;
      false: WindowState := wsNormal;
    end;

  finally
    SettingsFile.Free;
  end;
end;

procedure TForm2.btStoreClick(Sender: TObject);
var
  SettingsFile: TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  {
  Store current form properties to be used in later sessions.
  }
  try
    SettingsFile.WriteInteger (Name, 'Top', Top);
    SettingsFile.WriteInteger (Name, 'Left', Left);
    SettingsFile.WriteInteger (Name, 'Width', Width);
```

```
      SettingsFile.WriteInteger (Name, 'Height', Height);
      SettingsFile.WriteString  (Name, 'Caption', Caption);
      SettingsFile.WriteBool    (Name, 'InitMax', WindowState = wsMaximized );
      SettingsFile.WriteDateTime(Name, 'LastRun', Now);
    finally
      SettingsFile.Free;
    end;

  end;

  function TForm2.OpenIniFileInstance: TCustomIniFile;
  begin
    {
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    }

    case RadioGroup1.ItemIndex of
      0:
        begin
          { Registry mode selected: in HKEY_CURRENT_USER\Software\... }
          Result := TRegistryIniFile.Create('Software\' + Application.Title);
        end;
      1:
        begin
          { Ini file mode selected }
          Result := TIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
        end;
      2:
        begin
          { Memory based Ini file mode selected }
          Result := TMemIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
        end;
    end;
  end;
```

21.1.5.4.9 TMemIniFile.Rename Method

Associates the TMemIniFile (see page 765) with a different INI file.

Pascal

```
procedure Rename(const FileName: string; Reload: Boolean);
```

C++

```
__fastcall Rename(const UnicodeString FileName, Boolean Reload);
```

Description

Call Rename to change the INI file used by the TMemIniFile (see page 765) object to a file other than the one specified when

the object was created.

FileName (see page 749) is name of the new INI file to use.

Reload determines whether data is immediately loaded into memory from the INI file specified in FileName (see page 749). When Reload is true, the TMemIniFile (see page 765) object is repopulated with the data from the specified file. When Reload is false, the in-memory image is unchanged. This is useful, for example, when copying the data from one INI file to another file.

See Also

FileName (see page 749)

Create (see page 770)

21.1.5.4.10 TMemIniFile.SetStrings Method

Populates the memory buffer with contents of a string list.

Pascal

```
procedure SetStrings(List: TStrings);
```

C++

```
__fastcall SetStrings(TStrings List);
```

Description

Call SetStrings to populate the in-memory copy of the INI file data with the contents of a string list.

List is a string list object, created and maintained by the application, from which the INI file data is copied.

SetStrings uses the Clear (see page 771) method to erase any existing INI file data prior to copying the new data.

SetStrings can be used to reread data from the INI file from disk after it is erased with the Clear (see page 771) method. The LoadFromFile method of a string list can be used to retrieve the contents of the INI file and then SetStrings can copy the data into the memory buffer.

See Also

LoadFromFile

Clear (see page 771)

GetStrings (see page 772)

21.1.5.4.11 TMemIniFile.UpdateFile Method

Flushes buffered INI file data to disk.

Pascal

```
procedure UpdateFile; override;
```

C++

```
virtual __fastcall UpdateFile();
```

Description

Call UpdateFile to copy INI file data stored in memory to the copy of the INI file on disk UpdateFile overwrites all data in the disk copy of the INI file with the INI file data stored in memory.

If the Rename (see page 777) method is used to change the INI file the TMemIniFile (see page 765) uses, UpdateFile copies the INI file data in memory to a file of the new name. If the file does not already exist, it is created. If the new file already

exists, it is overwritten.

See Also

FileName (see page 749)

21.1.5.4.12 TMemIniFile.WriteString Method

Writes a string value to an INI file.

Pascal

```
procedure WriteString(const Section: String; const Ident: String; const Value: String);
override;
```

C++

```
virtual __fastcall WriteString(const UnicodeString Section, const UnicodeString Ident, const
UnicodeString Value);
```

Description

Call WriteString to write a string value to an INI file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the string value to write.

The WriteString method inherited from TCustomIniFile (see page 716) is modified to operate on the in-memory copy of the INI file data. The write methods for all other data types use WriteString internally after data values are translated from the original data type.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteString creates the section and key and sets its initial value to Value.

C++ Examples:

```
/*
This example demonstrates the usage of Ini files in order to store
and load form configuration between sessions. Example assumes
a RadioGroup and two buttons are present on the main form.
*/
void __fastcall TForm2::btStoreClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    // Store current form properties to be used in later sessions.
    try
    {
        SettingsFile->WriteInteger (Name, "Top", Top);
        SettingsFile->WriteInteger (Name, "Left", Left);
        SettingsFile->WriteInteger (Name, "Width", Width);
        SettingsFile->WriteInteger (Name, "Height", Height);
        SettingsFile->WriteString  (Name, "Caption", Caption);
        SettingsFile->WriteBool    (Name, "InitMax", WindowState == wsMaximized );
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

void __fastcall TForm2::btLoadClick(TObject *Sender)
{
    /* Open an instance */
```

```
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    try
    {
        /*
        Read all saved values from the last session. The section name
        is the name of the form. Also use form's properties as defaults
        */
        Top     = SettingsFile->ReadInteger(Name, "Top", Top );
        Left    = SettingsFile->ReadInteger(Name, "Left", Left );
        Width   = SettingsFile->ReadInteger(Name, "Width", Width );
        Height  = SettingsFile->ReadInteger(Name, "Height", Height );
        Caption = SettingsFile->ReadString (Name, "Caption", Caption);

        // Load last window state
        if (SettingsFile->ReadBool(Name, "InitMax", WindowState == wsMaximized))
            WindowState = wsMaximized;
        else
            WindowState = wsNormal;
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

TCustomIniFile* __fastcall TForm2::OpenIniFileInstance()
{
    /*
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    */

    switch (RadioGroup1->ItemIndex)
    {
        case 0:
            /* Registry mode selected: in HKEY_CURRENT_USER\Software\... */
            return new TRegistryIniFile(String("Software\\") + Application->Title);
        case 1:
            /* Ini file mode selected */
            return new TIniFile(ChangeFileExt(Application->ExeName, ".INI"));
        case 2:
            /* Memory based Ini file mode selected */
            return new TMemIniFile(ChangeFileExt(Application->ExeName, ".INI"));
      }
}
```

Delphi Examples:

```
{
This example demonstrates the use of Ini files in order to store
and load form configurations between sessions. This example requires
a RadioGroup and two buttons.
}
procedure TForm2.btLoadClick(Sender: TObject);
var
  SettingsFile : TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  try
    {
    Read all saved values from the last session. The section name
    is the name of the form. Also use form's properties as defaults
    }
```

```
    Top     := SettingsFile.ReadInteger(Name, 'Top', Top );
    Left    := SettingsFile.ReadInteger(Name, 'Left', Left );
    Width   := SettingsFile.ReadInteger(Name, 'Width', Width );
    Height  := SettingsFile.ReadInteger(Name, 'Height', Height );
    Caption := SettingsFile.ReadString (Name, 'Caption', Caption);

    { Load last window state }
    case SettingsFile.ReadBool(Name, 'InitMax', WindowState = wsMaximized) of
      true : WindowState := wsMaximized;
      false: WindowState := wsNormal;
    end;

  finally
    SettingsFile.Free;
  end;
end;

procedure TForm2.btStoreClick(Sender: TObject);
var
  SettingsFile: TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  {
  Store current form properties to be used in later sessions.
  }
  try
    SettingsFile.WriteInteger (Name, 'Top', Top);
    SettingsFile.WriteInteger (Name, 'Left', Left);
    SettingsFile.WriteInteger (Name, 'Width', Width);
    SettingsFile.WriteInteger (Name, 'Height', Height);
    SettingsFile.WriteString  (Name, 'Caption', Caption);
    SettingsFile.WriteBool    (Name, 'InitMax', WindowState = wsMaximized );
    SettingsFile.WriteDateTime(Name, 'LastRun', Now);
  finally
    SettingsFile.Free;
  end;

end;

function TForm2.OpenIniFileInstance: TCustomIniFile;
begin
  {
  Open/create a new INI file that has the same name as our executable
  only with the INI extension.
  }

  case RadioGroup1.ItemIndex of
    0:
      begin
        { Registry mode selected: in HKEY_CURRENT_USER\Software\... }
        Result := TRegistryIniFile.Create('Software\' + Application.Title);
      end;
    1:
      begin
        { Ini file mode selected }
        Result := TIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
      end;
    2:
      begin
        { Memory based Ini file mode selected }
        Result := TMemIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
      end;
  end;
end;
```

21.1.5.5 TMemIniFile Properties

The properties of the TMemIniFile class are listed here.

Public Properties

	Name	Description
	CaseSensitive (see page 782)	Controls whether section and key names are handled in a case-sensitive manner.
	Encoding (see page 782)	This is Encoding, a member of class TMemIniFile.

21.1.5.5.1 TMemIniFile.CaseSensitive Property

Controls whether section and key names are handled in a case-sensitive manner.

Pascal

```
property CaseSensitive: Boolean;
```

C++

```
__property Boolean CaseSensitive;
```

Description

Use CaseSensitive to indicate whether the names of sections and keys should be treated in a case-sensitive or case-insensitive manner. Set CaseSensitive to true to allow multiple sections or keys that differ only based on case. Set CaseSensitive to false to treat names that differ only by case as the same.

See Also

ReadSection (see page 773)

ReadString (see page 774)

SectionExists (see page 736)

ValueExists (see page 736)

21.1.5.5.2 TMemIniFile.Encoding Property

Pascal

```
property Encoding: TEncoding;
```

C++

```
__property TEncoding Encoding;
```

Description

This is Encoding, a member of class TMemIniFile.

21.1.6 TStringHash Class

Class Hierarchy

Pascal

```
TStringHash = class;
```

C++

```
class TStringHash;
```

File

IniFiles

Description

This is class IniFiles.TStringHash.

21.1.6.1 TStringHash Members

The following tables list the members exposed by TStringHash.

Protected Methods

	Name	Description
	Find (see page 785)	This is Find, a member of class TStringHash.
V	HashOf (see page 785)	This is HashOf, a member of class TStringHash.

Public Methods

	Name	Description
	Add (see page 784)	This is Add, a member of class TStringHash.
	Clear (see page 784)	This is Clear, a member of class TStringHash.
	Create (see page 783)	This is Create, a member of class TStringHash.
V	Destroy (see page 784)	This is Destroy, a member of class TStringHash.
	Modify (see page 785)	This is Modify, a member of class TStringHash.
	Remove (see page 785)	This is Remove, a member of class TStringHash.
	ValueOf (see page 786)	This is ValueOf, a member of class TStringHash.

21.1.6.2 TStringHash.Create Constructor

Pascal

```
constructor Create(Size: Cardinal = 256);
```

C++

```
__fastcall TStringHash(unsigned Size = 256);
```

Description

This is Create, a member of class TStringHash.

21.1.6.3 TStringHash.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TStringHash();
```

Description

This is Destroy, a member of class TStringHash.

21.1.6.4 TStringHash Methods

The methods of the TStringHash class are listed here.

Protected Methods

	Name	Description
	Find (see page 785)	This is Find, a member of class TStringHash.
	HashOf (see page 785)	This is HashOf, a member of class TStringHash.

Public Methods

	Name	Description
	Add (see page 784)	This is Add, a member of class TStringHash.
	Clear (see page 784)	This is Clear, a member of class TStringHash.
	Modify (see page 785)	This is Modify, a member of class TStringHash.
	Remove (see page 785)	This is Remove, a member of class TStringHash.
	ValueOf (see page 786)	This is ValueOf, a member of class TStringHash.

21.1.6.4.1 TStringHash.Add Method

Pascal

```
procedure Add(const Key: string; Value: Integer);
```

C++

```
__fastcall Add(const UnicodeString Key, int Value);
```

Description

This is Add, a member of class TStringHash.

21.1.6.4.2 TStringHash.Clear Method

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

This is Clear, a member of class TStringHash.

21.1.6.4.3 TStringHash.Find Method

Pascal

```
function Find(const Key: string): PPHashItem;
```

C++

```
__fastcall PPHashItem Find(const UnicodeString Key);
```

Description

This is Find, a member of class TStringHash.

21.1.6.4.4 TStringHash.HashOf Method

Pascal

```
function HashOf(const Key: string): Cardinal; virtual;
```

C++

```
virtual __fastcall unsigned HashOf(const UnicodeString Key);
```

Description

This is HashOf, a member of class TStringHash.

21.1.6.4.5 TStringHash.Modify Method

Pascal

```
function Modify(const Key: string; Value: Integer): Boolean;
```

C++

```
__fastcall Boolean Modify(const UnicodeString Key, int Value);
```

Description

This is Modify, a member of class TStringHash.

21.1.6.4.6 TStringHash.Remove Method

Pascal

```
procedure Remove(const Key: string);
```

C++

```
__fastcall Remove(const UnicodeString Key);
```

Description

This is Remove, a member of class TStringHash.

21.1.6.4.7 TStringHash.ValueOf Method

Pascal

```
function ValueOf(const Key: string): Integer;
```

C++

```
__fastcall int ValueOf(const UnicodeString Key);
```

Description

This is ValueOf, a member of class TStringHash.

21.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Records

	Name	Description
	THashItem (see page 787)	This is record IniFiles.THashItem.

21.2.1 IniFiles.THashItem Record

Pascal

```
THashItem = record
  Next: PHashItem;
  Key: string;
  Value: Integer;
end;
```

C++

```
struct THashItem {
  PHashItem Next;
  UnicodeString Key;
  int Value;
};
```

File

IniFiles

Description

This is record IniFiles.THashItem.

21.3 Types

The following table lists types in this documentation.

Types

Name	Description
PHashItem (see page 788)	This is type IniFiles.PHashItem.
PPHashItem (see page 788)	This is type IniFiles.PPHashItem.

21.3.1 IniFiles.PHashItem Type

Pascal

```
PHashItem = ^THashItem;
```

C++

```
^THashItem PHashItem;
```

File

IniFiles

Description

This is type IniFiles.PHashItem.

21.3.2 IniFiles.PPHashItem Type

Pascal

```
PPHashItem = ^PHashItem;
```

C++

```
^PHashItem PPHashItem;
```

File

IniFiles

Description

This is type IniFiles.PPHashItem.

22 IntfInfo Namespace

This is namespace IntfInfo.

Topics

Name	Description
Classes (see page 791)	The following table lists classes in this documentation.
Functions (see page 792)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 797)	The following table lists structs, records, enums in this documentation.
Types (see page 801)	The following table lists types in this documentation.
Constants (see page 804)	The following table lists constants in this documentation.

Classes

	Name	Description
	EInterfaceRTTIException (see page 791)	EInterfaceRTTIException is the exception raised when an interface does not have RTTI.

Constants

Name	Description
CallingConventionName (see page 804)	This is constant IntfInfo.CallingConventionName.
TypeInfoNames (see page 804)	This is constant IntfInfo.TypeInfoNames.

Functions

	Name	Description
	GetClsMemberTypeInfo (see page 792)	Returns the runtime type information (RTTI) for a published member of a class.
	GetDynArrayElTypeInfo (see page 792)	This is function IntfInfo.GetDynArrayElTypeInfo.
	GetDynArrayNextInfo (see page 793)	This is function IntfInfo.GetDynArrayNextInfo.
	GetDynArrayNextInfo2 (see page 793)	This is function IntfInfo.GetDynArrayNextInfo2.
	GetIntfMetaData (see page 793)	This is function IntfInfo.GetIntfMetaData.
	GetIntfMetaData (see page 794)	This is function IntfInfo.GetIntfMetaData.
	GetMethNum (see page 794)	This is function IntfInfo.GetMethNum.
	GetPropListFlat (see page 794)	This is function IntfInfo.GetPropListFlat.
	IsStoredPropConst (see page 795)	This is function IntfInfo.IsStoredPropConst.
	OtherTypeName (see page 795)	This is function IntfInfo.OtherTypeName.
	SameTypeInfo (see page 795)	This is function IntfInfo.SameTypeInfo.
	TypeNamesMatch (see page 796)	This is function IntfInfo.TypeNamesMatch.

Structs, Records, Enums

	Name	Description
	TCallConv (see page 797)	This is record IntfInfo.TCallConv.
	TFillMethodArrayOpt (see page 797)	This is record IntfInfo.TFillMethodArrayOpt.
	TIntfMetaData (see page 798)	TIntfMetaData represents the runtime type information (RTTI) from an invokable interface.
	TIntfMethEntry (see page 799)	TIntfMethEntry and TIntfMethEntryArray (see page 802) represent the table of interface methods in a TInfMetaData value.
	TIntfParamEntry (see page 800)	TIntfParamEntry and TIntfParamEntryArray (see page 802) represents the array of parameters in a TInfMethEntry value.

Types

Name	Description
PIntfMetaData (see page 801)	This is type IntfInfo.PIntfMetaData.
PIntfMethEntry (see page 801)	This is type IntfInfo.PIntfMethEntry.
PIntfParamEntry (see page 802)	This is type IntfInfo.PIntfParamEntry.
TIntfMethEntryArray (see page 802)	This is type IntfInfo.TIntfMethEntryArray.
TIntfParamEntryArray (see page 802)	This is type IntfInfo.TIntfParamEntryArray.
TPIntfMethEntryArray (see page 803)	This is type IntfInfo.TPIntfMethEntryArray.

22.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EInterfaceRTTIException (see page 791)	EInterfaceRTTIException is the exception raised when an interface does not have RTTI.

22.1.1 EInterfaceRTTIException Class

EInterfaceRTTIException is the exception raised when an interface does not have RTTI.

Class Hierarchy

Pascal

```
EInterfaceRTTIException = class(Exception);
```

C++

```
class EInterfaceRTTIException : public Exception;
```

File

IntfInfo

Description

EInterfaceRTTIException is thrown when an application expects an interface to be invokable but discovers that it does not include any runtime type information (RTTI). For example, the invocation registry raises an EInterfaceRTTIException exception when an application tries to register an interface that is not compiled with RTTI. Invoker components raise an EInterfaceRTTIException exception when an incoming request includes a call to an interface that does not include RTTI.

22.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GetClsMemberTypeInfo (see page 792)	Returns the runtime type information (RTTI) for a published member of a class.
	GetDynArrayElTypeInfo (see page 792)	This is function IntfInfo.GetDynArrayElTypeInfo.
	GetDynArrayNextInfo (see page 793)	This is function IntfInfo.GetDynArrayNextInfo.
	GetDynArrayNextInfo2 (see page 793)	This is function IntfInfo.GetDynArrayNextInfo2.
	GetIntfMetaData (see page 793)	This is function IntfInfo.GetIntfMetaData.
	GetIntfMetaData (see page 794)	This is function IntfInfo.GetIntfMetaData.
	GetMethNum (see page 794)	This is function IntfInfo.GetMethNum.
	GetPropListFlat (see page 794)	This is function IntfInfo.GetPropListFlat.
	IsStoredPropConst (see page 795)	This is function IntfInfo.IsStoredPropConst.
	OtherTypeName (see page 795)	This is function IntfInfo.OtherTypeName.
	SameTypeInfo (see page 795)	This is function IntfInfo.SameTypeInfo.
	TypeNamesMatch (see page 796)	This is function IntfInfo.TypeNamesMatch.

22.2.1 IntfInfo.GetClsMemberTypeInfo Function

Returns the runtime type information (RTTI) for a published member of a class.

Pascal

```
function GetClsMemberTypeInfo(const ObjectTypeInfo: PTypeInfo; const MemberName: string = ''):
PTypeInfo;
```

C++

```
PTypeInfo GetClsMemberTypeInfo(const PTypeInfo ObjectTypeInfo, const UnicodeString MemberName
= '');
```

File

IntfInfo

Description

ObjectTypeInfo is a pointer to the type information of the class that includes the published property. You can obtain this value for a class using the TypeInfo (Delphi) or __classid (C++) function.

MemberName is the name of a published property in the class identified by ObjectTypeInfo.

GetClsMemberTypeInfo returns a pointer to the type information for the specified property.

22.2.2 IntfInfo.GetDynArrayElTypeInfo Function

Pascal

```
procedure GetDynArrayElTypeInfo(typeInfo: PTypeInfo; var EltInfo: PTypeInfo; var Dims:
```

```
  Integer);
```

C++

```
  GetDynArrayElTypeInfo(PTypeInfo typeInfo, PTypeInfo EltInfo, int Dims);
```

File

IntfInfo

Description

This is function IntfInfo.GetDynArrayElTypeInfo.

22.2.3 IntfInfo.GetDynArrayNextInfo Function

Pascal

```
  function GetDynArrayNextInfo(typeInfo: PTypeInfo): PTypeInfo;
```

C++

```
  PTypeInfo GetDynArrayNextInfo(PTypeInfo typeInfo);
```

File

IntfInfo

Description

This is function IntfInfo.GetDynArrayNextInfo.

22.2.4 IntfInfo.GetDynArrayNextInfo2 Function

Pascal

```
  function GetDynArrayNextInfo2(typeInfo: PTypeInfo; var Name: string): PTypeInfo;
```

C++

```
  PTypeInfo GetDynArrayNextInfo2(PTypeInfo typeInfo, UnicodeString Name);
```

File

IntfInfo

Description

This is function IntfInfo.GetDynArrayNextInfo2.

22.2.5 IntfInfo.GetIntfMetaData Function

Pascal

```
  procedure GetIntfMetaData(Info: PTypeInfo; var IntfMD: TIntfMetaData; IncludeAllAncMethods:
  Boolean = False); overload;
```

C++

```
  GetIntfMetaData(PTypeInfo Info, TIntfMetaData IntfMD, Boolean IncludeAllAncMethods = False);
```

File

IntfInfo

Description

This is function IntfInfo.GetIntfMetaData.

22.2.6 IntfInfo.GetIntfMetaData Function

Pascal

```
procedure GetIntfMetaData(Info: PTypeInfo; var IntfMD: TIntfMetaData; MethodArrayOpt:
TFillMethodArrayOpt); overload;
```

C++

```
GetIntfMetaData(PTypeInfo Info, TIntfMetaData IntfMD, TFillMethodArrayOpt MethodArrayOpt);
```

File

IntfInfo

Description

This is function IntfInfo.GetIntfMetaData.

22.2.7 IntfInfo.GetMethNum Function

Pascal

```
function GetMethNum(const IntfMD: TIntfMetaData; const MethName: string; ParamCount: Integer =
-1): Integer;
```

C++

```
int GetMethNum(const TIntfMetaData IntfMD, const UnicodeString MethName, int ParamCount = -1);
```

File

IntfInfo

Description

This is function IntfInfo.GetMethNum.

22.2.8 IntfInfo.GetPropListFlat Function

Pascal

```
function GetPropListFlat(TypeInfo: PTypeInfo; out PropList: PPropList): Integer;
```

C++

```
int GetPropListFlat(PTypeInfo TypeInfo, PPropList PropList);
```

File

IntfInfo

Description

This is function IntfInfo.GetPropListFlat.

22.2.9 IntfInfo.IsStoredPropConst Function

Pascal

```
function IsStoredPropConst(Instance: TObject; PropInfo: PPropInfo): Boolean;
```

C++

```
Boolean IsStoredPropConst(TObject * Instance, PPropInfo PropInfo);
```

File

IntfInfo

Description

This is function IntfInfo.IsStoredPropConst.

22.2.10 IntfInfo.OtherTypeName Function

Pascal

```
function OtherTypeName(const TypeName: string): string;
```

C++

```
UnicodeString OtherTypeName(const UnicodeString TypeName);
```

File

IntfInfo

Description

This is function IntfInfo.OtherTypeName.

22.2.11 IntfInfo.SameTypeInfo Function

Pascal

```
function SameTypeInfo(const RegInfo: PTypeInfo; const OtherInfo: PTypeInfo): boolean;
```

C++

```
boolean SameTypeInfo(const PTypeInfo RegInfo, const PTypeInfo OtherInfo);
```

File

IntfInfo

Description

This is function IntfInfo.SameTypeInfo.

22.2.12 IntfInfo.TypeNamesMatch Function

Pascal

```
function TypeNamesMatch(const RegName: string; const OtherName: string): boolean;
```

C++

```
boolean TypeNamesMatch(const UnicodeString RegName, const UnicodeString OtherName);
```

File

IntfInfo

Description

This is function IntfInfo.TypeNamesMatch.

22.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TCallConv (see page 797)	This is record IntfInfo.TCallConv.
	TFillMethodArrayOpt (see page 797)	This is record IntfInfo.TFillMethodArrayOpt.

Records

	Name	Description
	TIntfMetaData (see page 798)	TIntfMetaData represents the runtime type information (RTTI) from an invokable interface.
	TIntfMethEntry (see page 799)	TIntfMethEntry and TIntfMethEntryArray (see page 802) represent the table of interface methods in a TInfMetaData value.
	TIntfParamEntry (see page 800)	TIntfParamEntry and TIntfParamEntryArray (see page 802) represents the array of parameters in a TInfMethEntry value.

22.3.1 IntfInfo.TCallConv Enumeration

Pascal

```
TCallConv = (
  ccReg,
  ccCdecl,
  ccPascal,
  ccStdCall,
  ccSafeCall
);
```

C++

```
enum TCallConv {
  ccReg,
  ccCdecl,
  ccPascal,
  ccStdCall,
  ccSafeCall
};
```

File

IntfInfo

Description

This is record IntfInfo.TCallConv.

22.3.2 IntfInfo.TFillMethodArrayOpt Enumeration

Pascal

```
TFillMethodArrayOpt = (
```

```
    fmoAllBaseMethods,
    fmoRTTIBaseMethods,
    fmoNoBaseMethods
  );
```

C++

```
  enum TFillMethodArrayOpt {
    fmoAllBaseMethods,
    fmoRTTIBaseMethods,
    fmoNoBaseMethods
  };
```

File

IntfInfo

Description

This is record IntfInfo.TFillMethodArrayOpt.

22.3.3 IntfInfo.TIntfMetaData Record

TIntfMetaData represents the runtime type information (RTTI) from an invokable interface.

Pascal

```
  TIntfMetaData = record
    Name: string;
    UnitName: string;
    MDA: TIntfMethEntryArray;
    IID: TGUID;
    Info: PTypeInfo;
    AncInfo: PTypeInfo;
    NumAnc: Integer;
  end;
```

C++

```
  struct TIntfMetaData {
    UnicodeString Name;
    UnicodeString UnitName;
    TIntfMethEntryArray MDA;
    TGUID IID;
    PTypeInfo Info;
    PTypeInfo AncInfo;
    int NumAnc;
  };
```

File

IntfInfo

Description

TIntfMetaData is used by classes that work with the runtime type information (RTTI) extracted from an invokable interface.

Name is the name of the invokable interface.

UnitName is the name of the unit in which the interface is declared.

MDA is an array of records, each of which describes a method on the interface, including its calling conventions and function signature.

IID is the globally unique identifier (GUID) of the interface.

Info is a pointer to the type description for the interface.

AncInfo is a pointer to the type description for the interface's ancestor type.

NumAnc indicates the number of methods that the interface inherits from its ancestor. It provides the offset in MDA of the first method that is introduced by the interface rather than inherited from an ancestor interface.

22.3.4 IntfInfo.TIntfMethEntry Record

TIntfMethEntry and TIntfMethEntryArray (see page 802) represent the table of interface methods in a TInfMetaData value.

Pascal

```
TIntfMethEntry = record
  Name: string;
  CC: TCallConv;
  Pos: Integer;
  ParamCount: Integer;
  ResultInfo: PTypeInfo;
  SelfInfo: PTypeInfo;
  Params: TIntfParamEntryArray;
  HasRTTI: Boolean;
end;
```

C++

```
struct TIntfMethEntry {
  UnicodeString Name;
  TCallConv CC;
  int Pos;
  int ParamCount;
  PTypeInfo ResultInfo;
  PTypeInfo SelfInfo;
  TIntfParamEntryArray Params;
  Boolean HasRTTI;
};
```

File

IntfInfo

Description

TIntfMethEntry describes a single method on an invokable interface.

Name is the name of the method.

CC is the calling convention for that method. It is one of the following values:

Value	Meaning
ccReg	register
ccCdecl	cdecl
ccPascal	pascal
ccStdCall	stdcall
ccSafeCall	safecall

Pos is the position of the method in the interface's method table.

ParamCount is the number of parameters that the method has.

ResultInfo is a pointer to the type description for the return type.

SelfInfo is a pointer to the type description for the method type.

Params is a dynamic array of records describing the method parameters.

HasRTTI indicates whether there is runtime type information (RTTI) for the method. If the method is inherited from an interface that was not compiled with RTTI, HasRTTI is false.

See Also

TIntfMetaData (see page 798)

22.3.5 IntfInfo.TIntfParamEntry Record

TIntfParamEntry and TIntfParamEntryArray (see page 802) represents the array of parameters in a TInfMethEntry value.

Pascal

```
TIntfParamEntry = record
  Flags: TParamFlags;
  Name: string;
  Info: PTypeInfo;
end;
```

C++

```
struct TIntfParamEntry {
  TParamFlags Flags;
  UnicodeString Name;
  PTypeInfo Info;
};
```

File

IntfInfo

Description

TIntfParamEntry describes a single parameter on a method. TIntfParamEntryArray (see page 802) describes all the parameters on a method.

Flags gives the attributes of the parameter.

Info is a pointer to the type description for the parameter type.

See Also

TIntfMethEntry (see page 799)

22.4 Types

The following table lists types in this documentation.

Types

Name	Description
PIntfMetaData (see page 801)	This is type IntfInfo.PIntfMetaData.
PIntfMethEntry (see page 801)	This is type IntfInfo.PIntfMethEntry.
PIntfParamEntry (see page 802)	This is type IntfInfo.PIntfParamEntry.
TIntfMethEntryArray (see page 802)	This is type IntfInfo.TIntfMethEntryArray.
TIntfParamEntryArray (see page 802)	This is type IntfInfo.TIntfParamEntryArray.
TPIntfMethEntryArray (see page 803)	This is type IntfInfo.TPIntfMethEntryArray.

22.4.1 IntfInfo.PIntfMetaData Type

Pascal

```
PIntfMetaData = ^TIntfMetaData;
```

C++

```
^TIntfMetaData PIntfMetaData;
```

File

IntfInfo

Description

This is type IntfInfo.PIntfMetaData.

22.4.2 IntfInfo.PIntfMethEntry Type

Pascal

```
PIntfMethEntry = ^TIntfMethEntry;
```

C++

```
^TIntfMethEntry PIntfMethEntry;
```

File

IntfInfo

Description

This is type IntfInfo.PIntfMethEntry.

22.4.3 IntfInfo.PIntfParamEntry Type

Pascal

```
PIntfParamEntry = ^TIntfParamEntry;
```

C++

```
^TIntfParamEntry PIntfParamEntry;
```

File

IntfInfo

Description

This is type IntfInfo.PIntfParamEntry.

22.4.4 IntfInfo.TIntfMethEntryArray Type

Pascal

```
TIntfMethEntryArray = array of TIntfMethEntry;
```

C++

```
array of TIntfMethEntry TIntfMethEntryArray;
```

File

IntfInfo

Description

This is type IntfInfo.TIntfMethEntryArray.

22.4.5 IntfInfo.TIntfParamEntryArray Type

Pascal

```
TIntfParamEntryArray = array of TIntfParamEntry;
```

C++

```
array of TIntfParamEntry TIntfParamEntryArray;
```

File

IntfInfo

Description

This is type IntfInfo.TIntfParamEntryArray.

22.4.6 IntfInfo.TPIntfMethEntryArray Type

Pascal

```
TPIntfMethEntryArray = array of PIntfMethEntry;
```

C++

```
array of PIntfMethEntry TPIntfMethEntryArray;
```

File

IntfInfo

Description

This is type IntfInfo.TPIntfMethEntryArray.

22.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
CallingConventionName (see page 804)	This is constant IntfInfo.CallingConventionName.
TypeInfoNames (see page 804)	This is constant IntfInfo.TypeInfoNames.

22.5.1 IntfInfo.CallingConventionName Constant

Pascal

```
CallingConventionName: array[ccReg..ccSafeCall] of string = ('REGISTER', 'CDECL', 'PASCAL',
'STDCALL', 'SAFECALL');
```

C++

```
array[ccReg..ccSafeCall] of string CallingConventionName = ('REGISTER', 'CDECL', 'PASCAL',
'STDCALL', 'SAFECALL');
```

File

IntfInfo

Description

This is constant IntfInfo.CallingConventionName.

22.5.2 IntfInfo.TypeInfoNames Constant

Pascal

```
TypeInfoNames: array[0..37] of string = ( 'Boolean', 'bool', 'AnsiChar', 'char', 'AnsiChar',
'signed char', 'Char', 'wchar_t', 'Byte', 'unsigned char', 'SmallInt', 'short', 'Word',
'unsigned short', 'Integer', 'int', 'Cardinal', 'unsigned int', 'Integer', 'long', 'Cardinal',
'unsigned long', 'Int64', '__int64', 'Int64', 'unsigned __int64', 'Single', 'float', 'Double',
'double', 'Extended', 'long double', 'string', 'UnicodeString', 'AnsiString', 'AnsiString',
'WideString', 'WideString');
```

C++

```
array[0..37] of string TypeInfoNames = ( 'Boolean', 'bool', 'AnsiChar', 'char', 'AnsiChar',
'signed char', 'Char', 'wchar_t', 'Byte', 'unsigned char', 'SmallInt', 'short', 'Word',
'unsigned short', 'Integer', 'int', 'Cardinal', 'unsigned int', 'Integer', 'long', 'Cardinal',
'unsigned long', 'Int64', '__int64', 'Int64', 'unsigned __int64', 'Single', 'float', 'Double',
'double', 'Extended', 'long double', 'string', 'UnicodeString', 'AnsiString', 'AnsiString',
'WideString', 'WideString');
```

File

IntfInfo

Description

This is constant IntfInfo.TypeInfoNames.

23 InvokeRegistry Namespace

This is namespace InvokeRegistry.

Topics

Name	Description
Classes (see page 810)	The following table lists classes in this documentation.
Interfaces (see page 919)	The following table lists interfaces in this documentation.
Functions (see page 929)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 934)	The following table lists structs, records, enums in this documentation.
Types (see page 946)	The following table lists types in this documentation.
Variables (see page 955)	The following table lists variables in this documentation.
Constants (see page 956)	The following table lists constants in this documentation.

Classes

	Name	Description
	ERemotableException (see page 810)	ERemotableException is the class for exceptions that can be communicated from a Web Service application to a client application.
	ETypeRegistryException (see page 813)	ETypeRegistryException is the exception raised when the invocation registry or the invokable type registry encounters an invalid type.
	TDataContext (see page 814)	TDataContext stores temporary information about a set of objects, Variants, and other related values.
	THeaderList (see page 823)	THeaderList maintains a list of SOAP headers.
	TInvContext (see page 829)	TInvContext stores information about a method call on an invokeable interface.
	TInvokableClass (see page 833)	TInvokableClass is the base class for the implementation classes of invokable interfaces.
	TInvokableClassRegistry (see page 840)	TInvokableClassRegistry is the type of the invocation registry.
	TRemotable (see page 868)	TRemotable is the base class for classes that can be passed as parameters or return values in a Web Service application.
	TRemotableTypeRegistry (see page 874)	TRemotableTypeRegistry is the type of the remotable type registry.
	TRemotableXS (see page 892)	TRemotableXS is the base class for classes that represent a non-native scalar type on an invokable interface in a Web Service application.
	TSOAPAttachment (see page 895)	TSOAPAttachment represents an attachment that is included with SOAP messages that represent method calls in a Web Service application.
	TSOAPHeader (see page 908)	TSOAPHeader represents a header on the SOAP envelope that contains an encoded message in a Web Service application.
	TSOAPHeaders (see page 912)	TSOAPHeaders is a helper object for implementing the ISOAPHeaders (see page 923) interface.
	TSOAPHeadersBase (see page 916)	TSOAPHeadersBase is the base class for classes that maintain lists of SOAP headers.

Constants

Name	Description
AS_ATTRIBUTE (see page 956)	Identifies a property of a remotable class as one that corresponds to an attribute in the SOAP encoding.
XMLBase64Types (see page 956)	This is constant InvokeRegistry.XMLBase64Types.
XMLSchemaInstNamepspaces (see page 957)	This is constant InvokeRegistry.XMLSchemaInstNamepspaces.
XMLSchemaNamepspaces (see page 957)	This is constant InvokeRegistry.XMLSchemaNamepspaces.

Functions

	Name	Description
	GetRemotableDataContext (see page 929)	Returns the TDataContext (see page 814) object that provides temporary storage during a call to an invokable interface.
	InvRegistry (see page 930)	Provides access to the invocation registry.
	RemClassRegistry (see page 930)	Provides access to the remotable class registry.
	RemTypeRegistry (see page 931)	Provides access to the remotable type registry.
	SetRemotableDataContext (see page 932)	Sets the data context that provides temporary storage during a call to an invokable interface.
	SubstituteStrings (see page 933)	This is function InvokeRegistry.SubstituteStrings.

Interfaces

	Name	Description
	IHeadersSetter (see page 919)	This is class InvokeRegistry.IHeadersSetter.
	IObjConverter (see page 920)	IObjConverter is the interface for converting between a remotable class and its SOAP representation.
	ISOAPHeaders (see page 923)	ISOAPHeaders is the interface for accessing the headers that accompany a message encoded using SOAP.

Structs, Records, Enums

	Name	Description
	eHeaderMethodType (see page 934)	eHeaderMethodType and THeaderMethodTypeArray (see page 949) indicate the types of messages that should include a given header type.
	ExtNameMapItem (see page 935)	This is record InvokeRegistry.ExtNameMapItem.
	IntfExceptionItem (see page 935)	IntfExceptionItem and TExceptionItemArray (see page 948) describe the association between a remotable exception and an interface that can raise it.
	IntfHeaderItem (see page 936)	IntfHeaderItem and THeaderItemArray (see page 948) describe the association between a header and the SOAP messages that include it.
	InvRegClassEntry (see page 937)	This is record InvokeRegistry.InvRegClassEntry.
	InvRegIntfEntry (see page 937)	InvRegIntfEntry stores information about an invokable interface.
	MethParamNameMapItem (see page 939)	This is record InvokeRegistry.MethParamNameMapItem.
	ObjectConvertOptions (see page 939)	ObjectConvertOptions and TObjectConvertOptions (see page 950) are flags that customize how to convert a remotable object to or from its SOAP representation.
	SerializationOptions (see page 940)	SerializationOptions and TSerializationOptions (see page 953) are flags that customize how to convert a remotable object to or from its SOAP representation.
	TDynToClear (see page 941)	This is record InvokeRegistry.TDynToClear.
	TIntfInvokeOption (see page 942)	TIntfInvokeOption and TIntfInvokeOptions (see page 949) represent flags that customize how to handle calls to an invokable interface.
	TObjMultiOptions (see page 943)	TObjMultiOptions indicates how multiple references to the same remotable class should be translated into a SOAP representation.
	TRemHeaderEntry (see page 944)	This is record InvokeRegistry.TRemHeaderEntry.
	TRemRegEntry (see page 944)	TRemRegEntry stores information for the remotable type registry.

Types

Name	Description
ERemotableExceptionClass (see page 946)	This is type InvokeRegistry.ERemotableExceptionClass.
InvString (see page 947)	InvString is the type for strings that are used to represent all or part of an encoded call on an invokable interface.
InvStringDynArray (see page 947)	This is type InvokeRegistry.InvStringDynArray.

PTRemotable (see page 947)	This is type InvokeRegistry.PTRemotable.
TCreateInstanceProc (see page 948)	TCreateInstanceProc is the type of the factory routine that returns an instance of an invokable class.
TExceptionItemArray (see page 948)	This is type InvokeRegistry.TExceptionItemArray.
THeaderItemArray (see page 948)	This is type InvokeRegistry.THeaderItemArray.
THeaderMethodTypeArray (see page 949)	This is type InvokeRegistry.THeaderMethodTypeArray.
TIntfInvokeOptions (see page 949)	This is type InvokeRegistry.TIntfInvokeOptions.
TInvokableClassClass (see page 949)	This is type InvokeRegistry.TInvokableClassClass.
TInvRegIntfEntryArray (see page 950)	This is type InvokeRegistry.TInvRegIntfEntryArray.
TObjectConvertOptions (see page 950)	This is type InvokeRegistry.TObjectConvertOptions.
TPascalRemotableClassRegistry (see page 950)	TPascalRemotableClassRegistry is the type of the remotable class registry.
TPascalRemotableTypeRegistry (see page 951)	TPascalRemotableTypeRegistry is the type of the remotable type registry.
TRemotableClass (see page 951)	This is type InvokeRegistry.TRemotableClass.
TRemotableClassRegistry (see page 951)	This is type InvokeRegistry.TRemotableClassRegistry.
TRemotableXSClass (see page 952)	This is type InvokeRegistry.TRemotableXSClass.
TRemRegEntryArray (see page 952)	This is type InvokeRegistry.TRemRegEntryArray.
TRequiredArray (see page 952)	TRequiredArray is a dynamic array of boolean values.
TSerializationOptions (see page 953)	This is type InvokeRegistry.TSerializationOptions.
TSOAPAttachmentClass (see page 953)	This is type InvokeRegistry.TSOAPAttachmentClass.
TSOAPHeaderClass (see page 953)	This is type InvokeRegistry.TSOAPHeaderClass.

Variables

Name	Description
AppNameSpacePrefix (see page 955)	Supplies a unique prefix to use for automatically generated namespaces given to invokable interfaces and remotable types.

23.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	ERemotableException (see page 810)	ERemotableException is the class for exceptions that can be communicated from a Web Service application to a client application.
	ETypeRegistryException (see page 813)	ETypeRegistryException is the exception raised when the invocation registry or the invokable type registry encounters an invalid type.
	TDataContext (see page 814)	TDataContext stores temporary information about a set of objects, Variants, and other related values.
	THeaderList (see page 823)	THeaderList maintains a list of SOAP headers.
	TInvContext (see page 829)	TInvContext stores information about a method call on an invokeable interface.
	TInvokableClass (see page 833)	TInvokableClass is the base class for the implementation classes of invokable interfaces.
	TInvokableClassRegistry (see page 840)	TInvokableClassRegistry is the type of the invocation registry.
	TRemotable (see page 868)	TRemotable is the base class for classes that can be passed as parameters or return values in a Web Service application.
	TRemotableTypeRegistry (see page 874)	TRemotableTypeRegistry is the type of the remotable type registry.
	TRemotableXS (see page 892)	TRemotableXS is the base class for classes that represent a non-native scalar type on an invokable interface in a Web Service application.
	TSOAPAttachment (see page 895)	TSOAPAttachment represents an attachment that is included with SOAP messages that represent method calls in a Web Service application.
	TSOAPHeader (see page 908)	TSOAPHeader represents a header on the SOAP envelope that contains an encoded message in a Web Service application.
	TSOAPHeaders (see page 912)	TSOAPHeaders is a helper object for implementing the ISOAPHeaders (see page 923) interface.
	TSOAPHeadersBase (see page 916)	TSOAPHeadersBase is the base class for classes that maintain lists of SOAP headers.

23.1.1 ERemotableException Class

ERemotableException is the class for exceptions that can be communicated from a Web Service application to a client application.

Class Hierarchy

Pascal

```
ERemotableException = class(Exception);
```

C++

```
class ERemotableException : public Exception;
```

File

InvokeRegistry

Description

ERemotableException is the exception class for exceptions that a client raises based on a SOAP fault packet that it receives from a Web Service application. The ERemotableException properties represent standard elements of the SOAP fault packet.

Create (see page 811) an ERemotableException descendant to define a custom exception class for problems encountered when executing the methods of an invokable interface in a Web Service application. When a Web Service application raises an ERemotableException descendant in the course of executing a request from a client application, it adds the values of any published properties to the fault packet, in addition to the value of the Message property. Note that these published properties must be remotable types: that is, the value must be a scalar type, or it must be a registered descendant of TRemotable (see page 868).

Before the properties of an ERemotableException descendant can be transmitted in a fault packet, it must be registered with the remotable type registry (RemTypeRegistry (see page 931)). Call the RegisterXSClass method of the remotable type registry, on both the client and the server application, to enable your exception class to be transmitted.

RemTypeRegistry (see page 931)

TRemotableTypeRegistry (see page 874)

Creating Custom Exception Classes for Web Services

23.1.1.1 ERemotableException Members

The following tables list the members exposed by ERemotableException.

Public Methods

	Name	Description
	Create (see page 811)	This is the overview for the Create constructor overload.

Public Properties

	Name	Description
	FaultActor (see page 812)	Indicates the agent that raised the fault.
	FaultCode (see page 812)	Indicates where the fault was encountered.
	FaultDetail (see page 813)	Provides application-specific details about the exception that occurred.

23.1.1.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	ERemotableException.Create () (see page 811)	Creates and initializes an instance of ERemotableException (see page 810).
	ERemotableException.Create (string, InvString, InvString) (see page 811)	Creates and initializes an instance of ERemotableException (see page 810).

23.1.1.2.1 ERemotableException.Create Constructor ()

Creates and initializes an instance of ERemotableException (see page 810).

Pascal

```
constructor Create; virtual; overload;
constructor Create(const Msg: string; const AFaultCode: InvString = ''; const AFaultActor:
InvString = ''); virtual; overload;
```

C++

```
virtual __fastcall ERemotableException();
virtual __fastcall ERemotableException(const UnicodeString Msg, const InvString AFaultCode =
'', const InvString AFaultActor = '');
```

Description

Create generates an ERemotableException (see page 810) object.

Msg is the error message associated with the exception. It becomes the value of the Message property.

AFaultCode indicates where the fault that gave rise to the exception was encountered. It becomes the value of the FaultCode (see page 812) property.

AFaultActor indicates the agent that gave rise to the fault. It becomes the value of the FaultActor (see page 812) property.

See Also

Message

FaultCode (see page 812)

FaultActor (see page 812)

23.1.1.3 ERemotableException Properties

The properties of the ERemotableException class are listed here.

Public Properties

	Name	Description
	FaultActor (see page 812)	Indicates the agent that raised the fault.
	FaultCode (see page 812)	Indicates where the fault was encountered.
	FaultDetail (see page 813)	Provides application-specific details about the exception that occurred.

23.1.1.3.1 ERemotableException.FaultActor Property

Indicates the agent that raised the fault.

Pascal

```
property FaultActor: InvString;
```

C++

```
__property InvString FaultActor;
```

Description

FaultActor is the URI of the agent that caused the fault. This is used when the SOAP request passes through multiple agents when processed. The FaultActor can be a proxy server, the Web Service application to which the request was addressed, or another agent that the target Web Service application calls on when processing the request.

This property is only set if the Web Service provider specifies a FaultActor in its SOAP fault packet.

See Also

FaultCode (see page 812)

23.1.1.3.2 ERemotableException.FaultCode Property

Indicates where the fault was encountered.

Pascal

```
property FaultCode: InvString;
```

C++

```
__property InvString FaultCode;
```

Description

FaultCode is one of the following strings:

Value	Meaning
Server	The Web Service application raised the exception before it was able to begin processing the content of the SOAP request packet. For example, if the server can't process a request because it is out of memory, it specifies a FaultCode of 'Server'.
Client	The Web Service application raised the exception because of an error in the SOAP request packet that the client provided. For example, if the SOAP request packet specified a nonexistent method or invalid parameter, the server specifies a FaultCode of 'Client'.
VersionMismatch	The Web Service application is a different version than the one that the SOAP request packet specifies.
MustUnderstand	The Web Service application did not understand one of the SOAP headers in the request packet and the request packet set its MustUnderstand header to indicate that the server must handle all of its SOAP headers.

See Also

FaultActor (see page 812)

23.1.1.3.3 ERemotableException.FaultDetail Property

Provides application-specific details about the exception that occurred.

Pascal

```
property FaultDetail: InvString;
```

C++

```
__property InvString FaultDetail;
```

Description

FaultDetail is a fragment of XML that the server generates to provide detailed information about the exception that occurred. FaultDetail provides context information in addition to the fault message that becomes the value of the Message property.

Each server defines the structure and meaning of FaultDetail in an application-specific way. When an ERemotableException (see page 810) descendant includes published properties, their values are added to FaultDetail.

Message

23.1.2 ETypeRegistryException Class

ETypeRegistryException is the exception raised when the invocation registry or the invokable type registry encounters an invalid type.

Class Hierarchy

Pascal

```
ETypeRegistryException = class(Exception);
```

C++

```
class ETypeRegistryException : public Exception;
```

File

InvokeRegistry

Description

ETypeRegistryException is thrown when

An application tries to register an implementation class with the invocation registry and that class does not implement any interfaces.

An application tries to look up a type in the remotable type registry that is not remotable.

See Also

TInvokableClassRegistry (see page 840)

TRemotableTypeRegistry (see page 874)

23.1.3 TDataContext Class

TDataContext stores temporary information about a set of objects, Variants, and other related values.

Class Hierarchy

Pascal

```
TDataContext = class;
```

C++

```
class TDataContext;
```

File

InvokeRegistry

Description

TDataContext is a repository for information that belongs together. It introduces a number of methods for storing different types of information, including objects, Variants, pointers, and raw data (untyped bytes). When the TDataContext object is freed, it performs all necessary cleanup of the information it stores, freeing the objects, clearing the Variants, and so on.

Do not use TDataContext directly. It is intended as a base class for classes that need a temporary repository that serves a specific purpose. TDataContext does not allocate the internal dynamic arrays that store pointers and raw data: This task is left to descendant classes, such as TInvContext (see page 829).

See Also

TInvContext (see page 829)

23.1.3.1 TDataContext Members

The following tables list the members exposed by TDataContext.

Protected Fields

	Name	Description
	Data (see page 816)	This is Data, a member of class TDataContext.
	DataOffset (see page 816)	This is DataOffset, a member of class TDataContext.
	DataP (see page 817)	This is DataP, a member of class TDataContext.
	DynArrayToClear (see page 817)	This is DynArrayToClear, a member of class TDataContext.
	FObjsToDestroy (see page 817)	This is FObjsToDestroy, a member of class TDataContext.
	StrToClear (see page 817)	This is StrToClear, a member of class TDataContext.
	UStrToClear (see page 817)	This is UStrToClear, a member of class TDataContext.
	VarToClear (see page 818)	This is VarToClear, a member of class TDataContext.
	WStrToClear (see page 818)	This is WStrToClear, a member of class TDataContext.

Public Methods

	Name	Description
	AddDynArrayToClear (see page 818)	Stores a dynamic array that can be cleared when the data context is finished.
	AddObjectToDestroy (see page 819)	Stores an object that can be freed when the data context is finished.
	AddStrToClear (see page 819)	Stores a string that can be cleared when the data context is finished.
	AddUStrToClear (see page 820)	This is AddUStrToClear, a member of class TDataContext.
	AddVariantToClear (see page 820)	Stores the value of a Variant that can be cleared when the data context is finished.
	AddWStrToClear (see page 821)	Stores a wide string that can be cleared when the data context is finished.
	AllocData (see page 821)	Returns a pointer to the data context's cache of raw memory.
	Create (see page 815)	Creates an instance of TDataContext (see page 814).
	Destroy (see page 815)	Destroys an instance of TDataContext (see page 814).
	GetDataPointer (see page 822)	Returns a pointer from the internal cache of pointers.
	RemoveObjectToDestroy (see page 822)	Remove an object from the list of objects to free when the data context is freed.
	SetDataPointer (see page 822)	Stores a pointer in the internal cache of pointers.

23.1.3.2 TDataContext.Create Constructor

Creates an instance of TDataContext (see page 814).

Pascal

```
constructor Create;
```

C++

```
__fastcall TDataContext();
```

Description

Call Create to instantiate a TDataContext (see page 814) object.

23.1.3.3 TDataContext.Destroy Destructor

Destroys an instance of TDataContext (see page 814).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDataContext();
```

Description

Destroy frees all the temporary data stored in the TDataContext (see page 814) instance.

See Also

delete

23.1.3.4 TDataContext Fields

The fields of the TDataContext class are listed here.

Protected Fields

	Name	Description
	Data (see page 816)	This is Data, a member of class TDataContext.
	DataOffset (see page 816)	This is DataOffset, a member of class TDataContext.
	DataP (see page 817)	This is DataP, a member of class TDataContext.
	DynArrayToClear (see page 817)	This is DynArrayToClear, a member of class TDataContext.
	FObjsToDestroy (see page 817)	This is FObjsToDestroy, a member of class TDataContext.
	StrToClear (see page 817)	This is StrToClear, a member of class TDataContext.
	UStrToClear (see page 817)	This is UStrToClear, a member of class TDataContext.
	VarToClear (see page 818)	This is VarToClear, a member of class TDataContext.
	WStrToClear (see page 818)	This is WStrToClear, a member of class TDataContext.

23.1.3.4.1 TDataContext.Data Field

Pascal

```
Data: array of Byte;
```

C++

```
array of Byte Data;
```

Description

This is Data, a member of class TDataContext.

23.1.3.4.2 TDataContext.DataOffset Field

Pascal

```
DataOffset: Integer;
```

C++

```
int DataOffset;
```

Description

This is DataOffset, a member of class TDataContext.

23.1.3.4.3 TDataContext.DataP Field

Pascal

```
DataP: array of Pointer;
```

C++

```
array of Pointer DataP;
```

Description

This is DataP, a member of class TDataContext.

23.1.3.4.4 TDataContext.DynArrayToClear Field

Pascal

```
DynArrayToClear: array of TDynToClear;
```

C++

```
array of TDynToClear DynArrayToClear;
```

Description

This is DynArrayToClear, a member of class TDataContext.

23.1.3.4.5 TDataContext.FObjsToDestroy Field

Pascal

```
FObjsToDestroy: array of TObject;
```

C++

```
array of TObject FObjsToDestroy;
```

Description

This is FObjsToDestroy, a member of class TDataContext.

23.1.3.4.6 TDataContext.StrToClear Field

Pascal

```
StrToClear: array of Pointer;
```

C++

```
array of Pointer StrToClear;
```

Description

This is StrToClear, a member of class TDataContext.

23.1.3.4.7 TDataContext.UStrToClear Field

Pascal

```
UStrToClear: array of Pointer;
```

C++

```
array of Pointer UStrToClear;
```

Description

This is UStrToClear, a member of class TDataContext.

23.1.3.4.8 TDataContext.VarToClear Field

Pascal

```
VarToClear: array of Pointer;
```

C++

```
array of Pointer VarToClear;
```

Description

This is VarToClear, a member of class TDataContext.

23.1.3.4.9 TDataContext.WStrToClear Field

Pascal

```
WStrToClear: array of Pointer;
```

C++

```
array of Pointer WStrToClear;
```

Description

This is WStrToClear, a member of class TDataContext.

23.1.3.5 TDataContext Methods

The methods of the TDataContext class are listed here.

Public Methods

	Name	Description
	AddDynArrayToClear (see page 818)	Stores a dynamic array that can be cleared when the data context is finished.
	AddObjectToDestroy (see page 819)	Stores an object that can be freed when the data context is finished.
	AddStrToClear (see page 819)	Stores a string that can be cleared when the data context is finished.
	AddUStrToClear (see page 820)	This is AddUStrToClear, a member of class TDataContext.
	AddVariantToClear (see page 820)	Stores the value of a Variant that can be cleared when the data context is finished.
	AddWStrToClear (see page 821)	Stores a wide string that can be cleared when the data context is finished.
	AllocData (see page 821)	Returns a pointer to the data context's cache of raw memory.
	GetDataPointer (see page 822)	Returns a pointer from the internal cache of pointers.
	RemoveObjectToDestroy (see page 822)	Remove an object from the list of objects to free when the data context is freed.
	SetDataPointer (see page 822)	Stores a pointer in the internal cache of pointers.

23.1.3.5.1 TDataContext.AddDynArrayToClear Method

Stores a dynamic array that can be cleared when the data context is finished.

Pascal

```
procedure AddDynArrayToClear(P: Pointer; Info: PTypeInfo);
```

C++

```
__fastcall AddDynArrayToClear(void * P, PTypeInfo Info);
```

Description

Call AddDynArrayToClear to add a dynamic array to the list of temporary dynamic arrays that TDataContext (see page 814) maintains. When the TDataContext (see page 814) instance is freed, it clears all dynamic arrays in this list of temporary arrays.

P is a pointer to the dynamic array.

Info is the TypeInfo pointer for the dynamic array.

Note: TDataContext (see page 814) does not provide access to this list. The caller must keep a reference to the dynamic arrays for use while the TDataContext (see page 814) instance exists.

See Also

Destroy (see page 815)

AddObjectToDestroy (see page 819)

AddVariantToClear (see page 820)

AddStrToClear (see page 819)

AddWStrToClear (see page 821)

23.1.3.5.2 TDataContext.AddObjectToDestroy Method

Stores an object that can be freed when the data context is finished.

Pascal

```
procedure AddObjectToDestroy(Obj: TObject);
```

C++

```
__fastcall AddObjectToDestroy(TObject * Obj);
```

Description

Call AddObjectToDestroy to add an object instance to the list of temporary objects that TDataContext (see page 814) maintains. When the TDataContext (see page 814) instance is freed, it frees all the objects in this list of temporary objects.

Note: TDataContext (see page 814) does not provide access to this list. The caller must keep a reference to the object for use while the TDataContext (see page 814) instance exists.

See Also

Destroy (see page 815)

AddDynArrayToClear (see page 818)

AddVariantToClear (see page 820)

RemoveObjectToDestroy (see page 822)

AddStrToClear (see page 819)

23.1.3.5.3 TDataContext.AddStrToClear Method

Stores a string that can be cleared when the data context is finished.

Pascal

```
procedure AddStrToClear(P: Pointer);
```

C++

```
__fastcall AddStrToClear(void * P);
```

Description

Call AddStrToClear to add a string to the list of temporary strings that TDataContext (see page 814) maintains. When the TDataContext (see page 814) instance is freed, it clears all strings in this list.

P is a pointer to the string.

Note: TDataContext (see page 814) does not provide access to this list. The caller must keep a reference to the string for use while the TDataContext (see page 814) instance exists.

See Also

Destroy (see page 815)

AddObjectToDestroy (see page 819)

AddVariantToClear (see page 820)

AddDynArrayToClear (see page 818)

AddWStrToClear (see page 821)

23.1.3.5.4 TDataContext.AddUStrToClear Method

Pascal

```
procedure AddUStrToClear(P: Pointer);
```

C++

```
__fastcall AddUStrToClear(void * P);
```

Description

This is AddUStrToClear, a member of class TDataContext.

23.1.3.5.5 TDataContext.AddVariantToClear Method

Stores the value of a Variant that can be cleared when the data context is finished.

Pascal

```
procedure AddVariantToClear(P: PVarData);
```

C++

```
__fastcall AddVariantToClear(PVarData P);
```

Description

Call AddVariantToClear to add a Variant to the list of temporary Variant values that TDataContext (see page 814) maintains. When the TDataContext (see page 814) instance is freed, it clears all the Variants in this list of temporary Variant values.

Note: TDataContext (see page 814) does not provide access to this list. The caller must keep a reference to the Variant for use while the TDataContext (see page 814) instance exists.

See Also

Destroy (see page 815)

AddStrToClear (see page 819)

AddWStrToClear (see page 821)

23.1.3.5.6 TDataContext.AddWStrToClear Method

Stores a wide string that can be cleared when the data context is finished.

Pascal

```
procedure AddWStrToClear(P: Pointer);
```

C++

```
__fastcall AddWStrToClear(void * P);
```

Description

Call AddWStrToClear to add a wide string to the list of temporary wide strings that TDataContext (see page 814) maintains. When the TDataContext (see page 814) instance is freed, it clears all strings in this list.

P is a pointer to the WideString.

Note: TDataContext (see page 814) does not provide access to this list. The caller must keep a reference to the string for use while the TDataContext (see page 814) instance exists.

See Also

Destroy (see page 815)

AddObjectToDestroy (see page 819)

AddVariantToClear (see page 820)

AddDynArrayToClear (see page 818)

AddStrToClear (see page 819)

23.1.3.5.7 TDataContext.AllocData Method

Returns a pointer to the data context's cache of raw memory.

Pascal

```
function AllocData(Size: Integer): Pointer;
```

C++

```
__fastcall void * AllocData(int Size);
```

Description

Use AllocData to obtain a pointer to a chunk of temporary memory.

Size is the number of bytes desired.

AllocData returns a pointer to Size bytes.

Note: TDataContext (see page 814) does not actually allocate the memory that AllocData returns. Descendant classes must initialize the internal cache that the returned pointer addresses.

See Also

GetDataPointer (see page 822)

23.1.3.5.8 TDataContext.GetDataPointer Method

Returns a pointer from the internal cache of pointers.

Pascal

```
function GetDataPointer(Index: Integer): Pointer;
```

C++

```
__fastcall void * GetDataPointer(int Index);
```

Description

GetDataPointer returns a pointer from the internal cache of pointers. This value is assigned by a call to the SetDataPointer (see page 822) method.

Index is the index of the desired pointer, where 0 is the first pointer, 1 is the second pointer, and so on.

Note: TDataContext (see page 814) does not actually allocate the memory to store these pointers. Descendant classes must initialize the internal dynamic array that TDataContext (see page 814) uses to store pointers.

See Also

SetDataPointer (see page 822)

23.1.3.5.9 TDataContext.RemoveObjectToDestroy Method

Remove an object from the list of objects to free when the data context is freed.

Pascal

```
procedure RemoveObjectToDestroy(Obj: TObject);
```

C++

```
__fastcall RemoveObjectToDestroy(TObject * Obj);
```

Description

Call RemoveObjectToDestroy to remove an object instance from the list of temporary objects that TDataContext (see page 814) maintains. This prevents TDataContext (see page 814) from freeing the object when it is itself freed.

For example, TRemotable (see page 868) descendants that are created by a Web Service application when it executes an invokable interface call are automatically added to a data context that persists for the length of the method call. When an application changes the remotable object's DataContext property, it automatically calls RemoveObjectToDestroy so that the object is not automatically freed when the method call is complete.

See Also

DataContext (see page 873)

AddObjectToDestroy (see page 819)

23.1.3.5.10 TDataContext.SetDataPointer Method

Stores a pointer in the internal cache of pointers.

Pascal

```
procedure SetDataPointer(Index: Integer; P: Pointer);
```

C++

```
__fastcall SetDataPointer(int Index, void * P);
```

Description

SetDataPointer stores a pointer that can later be retrieved by a call to GetDataPointer (see page 822). TDataContext (see page 814) owns only the pointer, not the data to which it points. When you free the TDataContext (see page 814) instance, it frees its list of pointers, but not the memory to which they point, unless they are first obtained by a call to the AllocData (see page 821) method.

Index is the index of the pointer in the internal cache of pointers, where 0 specifies the first pointer, 1 specifies the second pointer, and so on.

P is the pointer to store.

Note: TDataContext (see page 814) does not actually allocate the memory to store these pointers. Descendant classes must initialize the internal dynamic array that TDataContext (see page 814) uses to store pointers.

See Also

GetDataPointer (see page 822)

AllocData (see page 821)

23.1.4 THeaderList Class

THeaderList maintains a list of SOAP headers.

Class Hierarchy

InvokeRegistry.THeaderList

Pascal

```
THeaderList = class;
```

C++

```
class THeaderList;
```

File

InvokeRegistry

Description

Use THeaderList to store and maintain a list of SOAP headers (TSOAPHeader (see page 908) descendants).

See Also

TSOAPHeader (see page 908)

23.1.4.1 THeaderList Members

The following tables list the members exposed by THeaderList.

Protected Methods

	Name	Description
	GetCount (see page 826)	This is GetCount, a member of class THeaderList.
	GetHeader (see page 827)	This is GetHeader, a member of class THeaderList.
	GetOwnsObjects (see page 827)	This is GetOwnsObjects, a member of class THeaderList.
	SetOwnsObjects (see page 827)	This is SetOwnsObjects, a member of class THeaderList.

Public Methods

	Name	Description
	Add (see page 825)	This is the overview for the Add method overload.
	Clear (see page 826)	Empties the list and frees the TSOAPHeader (see page 908) objects.
	Create (see page 824)	Creates and initializes a THeaderList (see page 823) instance.
V	Destroy (see page 824)	Destroys an instance of THeaderList (see page 823).
	Extract (see page 826)	Removes a specified header from the list without freeing it.
	IndexOf (see page 827)	This is IndexOf, a member of class THeaderList.

Public Properties

	Name	Description
R	Count (see page 828)	Indicates the number of headers in the list.
R	Headers (see page 828)	Lists the headers.
	OwnsObjects (see page 829)	Allows THeaderList (see page 823) to free objects when they the list is cleared or destroyed.

23.1.4.2 THeaderList.Create Constructor

Creates and initializes a THeaderList (see page 823) instance.

Pascal

```
constructor Create;
```

C++

```
__fastcall THeaderList();
```

Description

Create creates a THeaderList (see page 823) instance.

23.1.4.3 THeaderList.Destroy Destructor

Destroys an instance of THeaderList (see page 823).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~THeaderList();
```

Description

Do not call Destroy directly. Instead, call Free. Free verifies that the THeaderList (see page 823) reference is not nil, and only then calls Destroy.

Destroy frees the THeaderList (see page 823) instance. If the OwnsObjects (see page 829) property is true, it also frees the header objects in the list.

See Also

System::TObject::Free

OwnsObjects (see page 829)

23.1.4.4 THeaderList Methods

The methods of the THeaderList class are listed here.

Protected Methods

	Name	Description
	GetCount (see page 826)	This is GetCount, a member of class THeaderList.
	GetHeader (see page 827)	This is GetHeader, a member of class THeaderList.
	GetOwnsObjects (see page 827)	This is GetOwnsObjects, a member of class THeaderList.
	SetOwnsObjects (see page 827)	This is SetOwnsObjects, a member of class THeaderList.

Public Methods

	Name	Description
	Add (see page 825)	This is the overview for the Add method overload.
	Clear (see page 826)	Empties the list and frees the TSOAPHeader (see page 908) objects.
	Extract (see page 826)	Removes a specified header from the list without freeing it.
	IndexOf (see page 827)	This is IndexOf, a member of class THeaderList.

23.1.4.4.1 Add Method

This is the overview for the Add method overload.

Overload List

	Name	Description
	THeaderList.Add (TObject) (see page 825)	Adds a new header to the end of the list.
	THeaderList.Add (TSOAPHeader) (see page 825)	Adds a new header to the end of the list.

23.1.4.4.1.1 THeaderList.Add Method (TObject)

Adds a new header to the end of the list.

Pascal

```
procedure Add(Header: TSOAPHeader); overload;
procedure Add(Header: TObject); overload;
```

C++

```
__fastcall Add(TSOAPHeader Header);
__fastcall Add(TObject * Header);
```

Description

Call Add to add a header to the end of the Headers (see page 828) property array. When you call Add, the new Header is added to the end of the array and the value of the Count (see page 828) property is incremented.

Header is the TSOAPHeader (see page 908) descendants that is added to the list.

See Also

Headers (see page 828)

Count (see page 828)

Clear (see page 826)

23.1.4.4.2 THeaderList.Clear Method

Empties the list and frees the TSOAPHeader (see page 908) objects.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Clear removes all of the headers from the list and, if the OwnsObjects (see page 829) property is true, frees each one . After a call to Clear, the value of the Count (see page 828) property is 0.

See Also

Headers (see page 828)

Count (see page 828)

OwnsObjects (see page 829)

23.1.4.4.3 THeaderList.Extract Method

Removes a specified header from the list without freeing it.

Pascal

```
function Extract(Obj: TObject): TObject;
```

C++

```
__fastcall TObject * Extract(TObject * Obj);
```

Description

Call Extract to remove a header from the list without freeing the header object. After a header is removed, all the headers that follow it are moved up in index position and Count (see page 828) is decremented.

See Also

Add (see page 825)

Count (see page 828)

Headers (see page 828)

OwnsObjects (see page 829)

23.1.4.4.4 THeaderList.GetCount Method

Pascal

```
function GetCount: Integer;
```

C++

```
__fastcall int GetCount();
```

Description

This is GetCount, a member of class THeaderList.

23.1.4.4.5 THeaderList.GetHeader Method

Pascal

```
function GetHeader(Index: Integer): TObject;
```

C++

```
__fastcall TObject * GetHeader(int Index);
```

Description

This is GetHeader, a member of class THeaderList.

23.1.4.4.6 THeaderList.GetOwnsObjects Method

Pascal

```
function GetOwnsObjects: Boolean;
```

C++

```
__fastcall Boolean GetOwnsObjects();
```

Description

This is GetOwnsObjects, a member of class THeaderList.

23.1.4.4.7 THeaderList.IndexOf Method

Pascal

```
function IndexOf(Obj: TObject): Integer;
```

C++

```
__fastcall int IndexOf(TObject * Obj);
```

Description

This is IndexOf, a member of class THeaderList.

23.1.4.4.8 THeaderList.SetOwnsObjects Method

Pascal

```
procedure SetOwnsObjects(Val: Boolean);
```

C++

```
__fastcall SetOwnsObjects(Boolean Val);
```

Description

This is SetOwnsObjects, a member of class THeaderList.

23.1.4.5 THeaderList Properties

The properties of the THeaderList class are listed here.

Public Properties

	Name	Description
	Count (see page 828)	Indicates the number of headers in the list.
	Headers (see page 828)	Lists the headers.
	OwnsObjects (see page 829)	Allows THeaderList (see page 823) to free objects when they the list is cleared or destroyed.

23.1.4.5.1 THeaderList.Count Property

Indicates the number of headers in the list.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Count indicates the number of headers that the Headers (see page 828) property lists. To change the value of Count, you can add headers using the Add (see page 825) method, remove them using the Extract (see page 826) method, or remove all headers using the Clear (see page 826) method.

See Also

Headers (see page 828)

Add (see page 825)

Clear (see page 826)

Extract (see page 826)

23.1.4.5.2 THeaderList.Headers Property

Lists the headers.

Pascal

```
property Headers [Index: Integer]: TObject;
```

C++

```
__property TObject * Headers[int Index];
```

Description

Use Headers to access headers in the list. Headers is a zero-based array of TSOAPHeader (see page 908) descendants: The first header is indexed as 0, the second header is indexed as 1, and so forth. You can read the value at a specific index, or use Headers with the Count (see page 828) property to iterate through the list.

Note: In Delphi, Headers is the default property of THeaderList (see page 823). This means you can omit the property name.

Note: In C++, you can use the subscript operator to achieve a similar effect.

See Also

OwnsObjects (see page 829)

Add (see page 825)

Extract (see page 826)

Count (see page 828)

Clear (see page 826)

23.1.4.5.3 THeaderList.OwnsObjects Property

Allows THeaderList (see page 823) to free objects when they the list is cleared or destroyed.

Pascal

```
property OwnsObjects: Boolean;
```

C++

```
__property Boolean OwnsObjects;
```

Description

OwnsObjects allows THeaderList (see page 823) to control the memory of its TSOAPHeader (see page 908) objects. If OwnsObjects is true,

calling Clear (see page 826) frees all the headers in the list in addition to emptying the list.

freeing the THeaderList (see page 823) object frees all the objects in the list in addition to destroying the THeaderList (see page 823) itself.

Note: Even if OwnsObjects is true, the Extract (see page 826) method removes objects from the list without freeing them.

See Also

Headers (see page 828)

Clear

Destroy (see page 824)

Extract (see page 826)

23.1.5 TInvContext Class

TInvContext stores information about a method call on an invokeable interface.

Class Hierarchy

Pascal

```
TInvContext = class(TDataContext);
```

C++

```
class TInvContext : public TDataContext;
```

File

InvokeRegistry

Description

TInvContext is a helper object created and used by TRIO and TSoapPascalInvoker for generating calls to the methods on an invokeable interface. It stores temporary data needed when making the method call. TInvContext introduces methods for

retrieving and setting information about the method being called, including its type signature, parameter values, and so on.

Component writers implementing their own classes to implement the IOPConvert interface must translate between the information stored in a TInvContext object and their class-specific encoding of a method call.

See Also

IOPConvert (see page 2730)

TRIO (see page 4056)

TSoapPascalInvoker

23.1.5.1 TInvContext Members

The following tables list the members exposed by TInvContext.

Protected Fields

	Name	Description
	Data (see page 816)	This is Data, a member of class TDataContext.
	DataOffset (see page 816)	This is DataOffset, a member of class TDataContext.
	DataP (see page 817)	This is DataP, a member of class TDataContext.
	DynArrayToClear (see page 817)	This is DynArrayToClear, a member of class TDataContext.
	FObjsToDestroy (see page 817)	This is FObjsToDestroy, a member of class TDataContext.
	StrToClear (see page 817)	This is StrToClear, a member of class TDataContext.
	UStrToClear (see page 817)	This is UStrToClear, a member of class TDataContext.
	VarToClear (see page 818)	This is VarToClear, a member of class TDataContext.
	WStrToClear (see page 818)	This is WStrToClear, a member of class TDataContext.

Public Methods

	Name	Description
	AddDynArrayToClear (see page 818)	Stores a dynamic array that can be cleared when the data context is finished.
	AddObjectToDestroy (see page 819)	Stores an object that can be freed when the data context is finished.
	AddStrToClear (see page 819)	Stores a string that can be cleared when the data context is finished.
	AddUStrToClear (see page 820)	This is AddUStrToClear, a member of class TDataContext.
	AddVariantToClear (see page 820)	Stores the value of a Variant that can be cleared when the data context is finished.
	AddWStrToClear (see page 821)	Stores a wide string that can be cleared when the data context is finished.
	AllocData (see page 821)	Returns a pointer to the data context's cache of raw memory.
	AllocServerData (see page 831)	Allocates memory for the parameters and result values of a specified method and sets up the parameter and result pointers.
	Create (see page 815)	Creates an instance of TDataContext (see page 814).
	Destroy (see page 815)	Destroys an instance of TDataContext (see page 814).
	GetDataPointer (see page 822)	Returns a pointer from the internal cache of pointers.
	GetParamPointer (see page 831)	Returns a pointer to the value of a parameter on the called method.
	GetResultPointer (see page 832)	Returns a pointer to the return value of the method call.
	RemoveObjectToDestroy (see page 822)	Remove an object from the list of objects to free when the data context is freed.
	SetDataPointer (see page 822)	Stores a pointer in the internal cache of pointers.
	SetMethodInfo (see page 832)	Initializes the TInvContext (see page 829) for a particular method on the invokeable interface.
	SetParamPointer (see page 833)	Sets the value of a specified parameter.
	SetResultPointer (see page 833)	Sets the value of the function's return value.

23.1.5.2 TInvContext Methods

The methods of the TInvContext class are listed here.

Public Methods

	Name	Description
	AllocServerData (see page 831)	Allocates memory for the parameters and result values of a specified method and sets up the parameter and result pointers.
	GetParamPointer (see page 831)	Returns a pointer to the value of a parameter on the called method.
	GetResultPointer (see page 832)	Returns a pointer to the return value of the method call.
	SetMethodInfo (see page 832)	Initializes the TInvContext (see page 829) for a particular method on the invokeable interface.
	SetParamPointer (see page 833)	Sets the value of a specified parameter.
	SetResultPointer (see page 833)	Sets the value of the function's return value.

23.1.5.2.1 TInvContext.AllocServerData Method

Allocates memory for the parameters and result values of a specified method and sets up the parameter and result pointers.

Pascal

```
procedure AllocServerData(const MD: TIntfMethEntry);
```

C++

```
__fastcall AllocServerData(const TIntfMethEntry MD);
```

Description

AllocServerData suballocates the memory that the SetMethodInfo (see page 832) method allocates so that it can represent the parameters and return value of a method. It looks up the types of each parameter and of the return type for the method, allocates memory for their values using the AllocData (see page 821) method, and stores the pointers to that memory by calling the SetParamPointer (see page 833) and SetResultPointer (see page 833) methods.

MD is a description of the method, including its type, calling convention, and parameter signature.

Note: AllocServerData must come after a call to SetMethodInfo (see page 832) so that the pool of memory is available. After calling AllocServerData, an application can call GetParamPointer (see page 831) and GetResultPointer (see page 832) to obtain pointers to the memory allocated for each parameter and for the return value of the method.

See Also

AllocData (see page 821)

SetParamPointer (see page 833)

SetResultPointer (see page 833)

SetMethodInfo (see page 832)

23.1.5.2.2 TInvContext.GetParamPointer Method

Returns a pointer to the value of a parameter on the called method.

Pascal

```
function GetParamPointer(Param: Integer): Pointer;
```

C++

```
__fastcall void * GetParamPointer(int Param);
```

Description

GetParamPointer returns a pointer to the value of a specified parameter.

Param is the index of the desired parameter, where 0 is the first parameter, 1 is the second parameter, and so on.

This value is assigned by a call to the SetParamPointer (see page 833) method.

See Also

SetParamPointer (see page 833)

23.1.5.2.3 TInvContext.GetResultPointer Method

Returns a pointer to the return value of the method call.

Pascal

```
function GetResultPointer: Pointer;
```

C++

```
__fastcall void * GetResultPointer();
```

Description

GetResultPointer returns a pointer to the return value of the method call. This value is assigned by a call to the SetResultPointer (see page 833) method.

See Also

SetResultPointer (see page 833)

23.1.5.2.4 TInvContext.SetMethodInfo Method

Initializes the TInvContext (see page 829) for a particular method on the invokeable interface.

Pascal

```
procedure SetMethodInfo(const MD: TIntfMethEntry);
```

C++

```
__fastcall SetMethodInfo(const TIntfMethEntry MD);
```

Description

SetMethodInfo initializes the invocation context so that it represents a particular method. Objects that implement the IOPConvert interface call this method to initialize an invocation context when implementing their MsgToInvContext method.

MD is a description of the method, including its type, calling convention, and parameter signature.

Note: SetMethodInfo allocates the memory used internally to store pointers and raw data. An application must call this method before any calls to the AllocData (see page 821), SetDataPointer (see page 822), or SetParamPointer (see page 833) methods.

See Also

IOPConvert (see page 2730)

MsgToInvContext (see page 2735)

AllocData (see page 821)

SetDataPointer (see page 822)

SetParamPointer (see page 833)

23.1.5.2.5 TInvContext.SetParamPointer Method

Sets the value of a specified parameter.

Pascal

```
procedure SetParamPointer(Param: Integer; P: Pointer);
```

C++

```
__fastcall SetParamPointer(int Param, void * P);
```

Description

SetParamPointer associates a pointer with a specified parameter.

Param identifies the parameter whose value is to be set, where 0 specifies the first parameter, 1 specifies the second parameter, and so on.

P is a pointer to the value of the parameter. Memory to contain the value of P can be allocated using the AllocData (see page 821) method.

See Also

GetParamPointer (see page 831)

AllocData (see page 821)

23.1.5.2.6 TInvContext.SetResultPointer Method

Sets the value of the function's return value.

Pascal

```
procedure SetResultPointer(P: Pointer);
```

C++

```
__fastcall SetResultPointer(void * P);
```

Description

SetResultPointer associates a pointer with the return value of the function.

P is a pointer to the return value. Memory to contain the value to which P points can be allocated using the AllocData (see page 821) method.

See Also

GetResultPointer (see page 832)

AllocData (see page 821)

23.1.6 TInvokableClass Class

TInvokableClass is the base class for the implementation classes of invokable interfaces.

Class Hierarchy

Pascal

```
TInvokableClass = class(TObject, IInterface);
```

C++

```
class TInvokableClass : public TObject, public IInterface;
```

File

InvokeRegistry

Description

Use TInvokableClass as a base class when writing the implementation class of an invokable interface. TInvokableClass has the following important attributes:

The invocation registry (InvRegistry (see page 930)) knows how to create instances of TInvokableClass and (because it has a virtual constructor) its descendants. This allows the registry to supply an invoker in a Web Service application with an instance of the invokable class that can handle an incoming request.

TInvokableClass is an interfaced object that frees itself when the reference count on its interface drops to zero. Invoker components do not know when to free the implementation classes of the interfaces they call. Because TInvokableClass knows when to free itself, you do not need to supply your own lifetime management for this object.

TInvokableClass supports the ISOAPHeaders (see page 923) interface so that your server can process the headers that accompany requests and add headers to outgoing responses.

To use a TInvokableClass descendant in a Web Service application, you must register it with the invocation registry. Use the RegisterInvokableClass method of the invocation registry to register your TInvokableClass descendant.

Note: If you do not use TInvokableClass as a base class when writing the implementation class for an invokable interface, you must supply the invocation registry with a method to retrieve instances of your class and you must handle the lifetime management of your class. If you are sending or receiving SOAP headers, you must use the global GetSOAPHeaders function to obtain an ISOAPHeaders (see page 923) interface instead of obtaining one from the implementation class.

Adding New Web Services

23.1.6.1 TInvokableClass Members

The following tables list the members exposed by TInvokableClass.

Protected Fields

	Name	Description
	FRefCount (see page 836)	This is FRefCount, a member of class TInvokableClass.
	FSOAPHeaders (see page 836)	This is FSOAPHeaders, a member of class TInvokableClass.

Protected Methods

	Name	Description
	_AddRef (see page 836)	Implements the IInterface _AddRef method.
	_Release (see page 837)	Implements the IInterface _Release method.
	QueryInterface (see page 839)	Implements the IInterface QueryInterface method.

Public Methods

	Name	Description
V	AfterConstruction (see page 837)	Responds after the last constructor executes.
V	BeforeDestruction (see page 838)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	Create (see page 835)	Creates and initializes a TInvokableClass (see page 833) object.
V	NewInstance (see page 838)	Allocates memory for each instance of an invokable object.

Public Properties

	Name	Description
R	RefCount (see page 839)	Indicates the number of interface pointers currently dependent upon the object.

23.1.6.2 TInvokableClass.Create Constructor

Creates and initializes a TInvokableClass (see page 833) object.

Pascal

```
constructor Create; virtual;
```

C++

```
virtual __fastcall TInvokableClass();
```

Description

The TInvokableClass (see page 833) constructor does nothing special. It exists primarily because

The TInvokableClass (see page 833) constructor exists primarily because

The invocation registry knows how to call it.

It is virtual, so that the invocation registry can also instantiate descendant classes.

In addition, the constructor initializes the invokable class so that it can support the ISOAPHeaders (see page 923) interface.

See Also

InvRegistry (see page 930)

ISOAPHeaders (see page 923)

23.1.6.3 TInvokableClass Fields

The fields of the TInvokableClass class are listed here.

Protected Fields

	Name	Description
	FRefCount (see page 836)	This is FRefCount, a member of class TInvokableClass.
	FSOAPHeaders (see page 836)	This is FSOAPHeaders, a member of class TInvokableClass.

23.1.6.3.1 TInvokableClass.FRefCount Field

Pascal

```
FRefCount: Integer;
```

C++

```
int FRefCount;
```

Description

This is FRefCount, a member of class TInvokableClass.

23.1.6.3.2 TInvokableClass.FSOAPHeaders Field

Pascal

```
FSOAPHeaders: TSOAPHeaders;
```

C++

```
TSOAPHeaders FSOAPHeaders;
```

Description

This is FSOAPHeaders, a member of class TInvokableClass.

23.1.6.4 TInvokableClass Methods

The methods of the TInvokableClass class are listed here.

Protected Methods

	Name	Description
	_AddRef (see page 836)	Implements the IInterface _AddRef method.
	_Release (see page 837)	Implements the IInterface _Release method.
	QueryInterface (see page 839)	Implements the IInterface QueryInterface method.

Public Methods

	Name	Description
	AfterConstruction (see page 837)	Responds after the last constructor executes.
	BeforeDestruction (see page 838)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	NewInstance (see page 838)	Allocates memory for each instance of an invokable object.

23.1.6.4.1 TInvokableClass._AddRef Method

Implements the IInterface _AddRef method.

Pascal

```
function _AddRef: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _AddRef();
```

Description

Do not call the protected __AddRef method directly. __AddRef is called through the interface to indicate that another object is using the invokable object's interface pointer. When the other object is through with the interface, it calls _Release (see page 837) through the same interface. This allows the invokable object to free itself when it is no longer used (when the reference count goes to zero).

__AddRef increments the RefCount (see page 839) property.

See Also

RefCount (see page 839)

_Release (see page 837)

23.1.6.4.2 TInvokableClass._Release Method

Implements the IInterface _Release method.

Pascal

```
function _Release: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _Release();
```

Description

Do not call the protected __Release method directly. __Release is called through the IInterface interface to indicate that another object is through with the interfaced object's interface pointer. This allows the interfaced object to free itself when it is no longer used (when the reference count goes to zero).

__Release decrements the RefCount (see page 839) property.

See Also

RefCount (see page 839)

_AddRef (see page 836)

BeforeDestruction (see page 838)

23.1.6.4.3 TInvokableClass.AfterConstruction Method

Responds after the last constructor executes.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

When an instance of TInvokableClass (see page 833) is allocated, RefCount (see page 839) is incremented to prevent its

destruction while processing the constructor. AfterConstruction decrements that RefCount (see page 839) to re-establish the correct reference count after all constructors have executed.

See Also

BeforeDestruction (see page 838)

NewInstance (see page 838)

RefCount (see page 839)

23.1.6.4.4 TInvokableClass.BeforeDestruction Method

Checks that the reference count is zero before allowing the interfaced object to be destroyed.

Pascal

```
procedure BeforeDestruction; override;
```

C++

```
virtual __fastcall BeforeDestruction();
```

Description

BeforeDestruction is called automatically immediately before the interfaced object's destructor. It checks that the reference count is zero, and, if it is not, raises an exception.

See Also

RefCount (see page 839)

System::TObject::Free

23.1.6.4.5 TInvokableClass.NewInstance Method

Allocates memory for each instance of an invokable object.

Pascal

```
class function NewInstance: TObject; override;
```

C++

```
virtual __fastcall TObject * NewInstance();
```

Description

Constructors call NewInstance automatically. NewInstance calls InstanceSize to determine how much memory to allocate from the heap to contain a particular instance. Do not call NewInstance directly.

TInvokableClass (see page 833) overrides NewInstance to increment the reference count when a new instance is created. This prevents any constructor from accidentally deleting the instance due to a RefCount (see page 839) of zero. The AfterConstruction (see page 837) method decrements the value of RefCount (see page 839) after all constructors have executed.

See Also

RefCount (see page 839)

System::TObject::NewInstance

System::TObject::InstanceSize

AfterConstruction (see page 837)

23.1.6.4.6 TInvokableClass.QueryInterface Method

Implements the IInterface QueryInterface method.

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

Do not call the protected QueryInterface method directly. QueryInterface is called through the IInterface interface to obtain an interface pointer for the interface identified by the IID parameter. If the object supports the requested interface, it is returned in the Obj parameter and QueryInterface returns S_OK. If the object does not support the interface, QueryInterface returns E_NOINTERFACE.

If QueryInterface successfully returns an interface pointer, it automatically increments the reference count.

See Also

_AddRef (see page 836)

23.1.6.5 TInvokableClass Properties

The properties of the TInvokableClass class are listed here.

Public Properties

	Name	Description
	RefCount (see page 839)	Indicates the number of interface pointers currently dependent upon the object.

23.1.6.5.1 TInvokableClass.RefCount Property

Indicates the number of interface pointers currently dependent upon the object.

Pascal

```
property RefCount: Integer;
```

C++

```
__property int RefCount;
```

Description

RefCount defines the lifetime of the object. When RefCount is zero, the object is destroyed.

RefCount is incremented by calls to the _AddRef (see page 836) method and decremented by the _Release (see page 837) method.

Note:

See Also

_AddRef (see page 836)

_Release (see page 837)

23.1.7 TInvokableClassRegistry Class

TInvokableClassRegistry is the type of the invocation registry.

Class Hierarchy

Pascal

```
TInvokableClassRegistry = class(TInterfacedObject);
```

C++

```
class TInvokableClassRegistry : public TInterfacedObject;
```

File

InvokeRegistry

Description

TInvokableClassRegistry manages information about invokable interfaces and the classes that implement them. Invokable interfaces are used in applications that work with Web Services.

Server applications that implement Web Services need to register both the invokable interfaces and the implementation classes. The invoker component (such as THTTPSoapPascalInvoker or THTTPSoapCppInvoker) can then use the invocation registry to locate invokable interfaces and execute calls made to them. In addition, server applications should register the headers that are used with calls to the methods of the invokable interface and the exceptions that such calls can raise.

Client applications that call on Web Services register the invokable interfaces that they call. The remote interfaced object component (THTTPRio) can then use the invocation registry to generate a dynamic vtable for calling the invokable interfaces.

Do not create instances of TInvokableClassRegistry. Instead, use the global InvRegistry (see page 930) function to access the invocation registry. Most applications need only call the RegisterInterface (see page 864) and (if a server) the RegisterInvokableClass (see page 865) methods. The other TInvokableClassRegistry methods are used by invoker components, remote interfaced object components, and the WSDL document importer. The allow these components to look up information about invokable interfaces and their implementation classes, access invokable interfaces, and so on.

THTTPSoapPascalInvoker

THTTPRIO

23.1.7.1 TInvokableClassRegistry Members

The following tables list the members exposed by TInvokableClassRegistry.

Public Methods

	Name	Description
	Create (see page 842)	Creates and initializes a TInvokableClassRegistry (see page 840) object.

	Destroy (see page 842)	Frees the memory associated with the TInvokableClassRegistry (see page 840) object.
	GetActionURIOfIID (see page 844)	Returns the SOAP Action header associated with the interface with a specified GUID.
	GetActionURIOfInfo (see page 844)	Returns the SOAP Action header associated with the type info of a registered interface.
	GetClassFromIntfInfo (see page 845)	Retrieves the implementation class that corresponds to the type info of an invokable interface.
	GetExceptionInfoForInterface (see page 845)	Retrieves an array of exceptions that are registered as associated with an invokable interface.
	GetHeaderClass (see page 846)	Returns the class reference for a header type, given its name and namespace.
	GetHeaderInfoForInterface (see page 846)	Retrieves an array of headers that are registered as associated with an invokable interface.
	GetHeaderName (see page 847)	Returns the name of a header that is identified by a specified class reference.
	GetHeaderNamespace (see page 847)	This is the overview for the GetHeaderNamespace method overload.
	GetInfoForURI (see page 848)	Retrieves information about a registered invokable interface that is identified by a SOAP action header or the path of an HTTP message.
	GetInterfaceCount (see page 849)	Returns the number of registered invokable interfaces.
	GetInterfaceExternalName (see page 849)	This is the overview for the GetInterfaceExternalName method overload.
	GetInterfaceInfoFromName (see page 850)	Returns information about a registered invokable interface given its name.
	GetInterfaceTypeInfo (see page 850)	Returns the runtime type information (RTTI) of an invokable interface.
	GetIntfInvokeOptions (see page 851)	This is the overview for the GetIntfInvokeOptions method overload.
	GetInvokableObjectFromClass (see page 852)	Returns an instance of the implementation class for a registered invokable interface.
	GetMethExternalName (see page 852)	Returns the name of the operation that corresponds to a method on an invokable interface.
	GetMethInternalName (see page 852)	Returns the name of the method that corresponds to an operation in a WSDL document.
	GetNamespaceByGUID (see page 853)	Returns a namespace that is uniquely associated with a registered interface.
	GetParamExternalName (see page 853)	Returns the name of the part that corresponds to a parameter on a method of an invokable interface.
	GetParamInternalName (see page 854)	Returns the name of the parameter that corresponds to a part on a message of an operation in a WSDL document.
	GetRegInterfaceEntry (see page 854)	Returns the internal data that TInvokableClassRegistry (see page 840) maintains for one of its registered interfaces.
	GetRequestHeaderInfoForInterface (see page 855)	Retrieves an array of headers that are registered as associated with requests to an invokable interface.
	GetResponseHeaderInfoForInterface (see page 855)	Retrieves an array of headers that are registered as associated with responses to invocations of an invokable interface.
	GetReturnParamNames (see page 856)	Returns the list of parameter names that map to return values of interface methods.
	GetUDDIInfo (see page 856)	This is the overview for the GetUDDIInfo method overload.
	GetWSDLEncoding (see page 857)	This is the overview for the GetWSDLEncoding method overload.
	HasRegInterfaceImpl (see page 858)	Indicates whether there is a registered implementation class for an invokable interface.
	RegisterAllSOAPActions (see page 859)	Supplies a set of SOAP Action headers to use for an already-registered interface.
	RegisterDefaultSOAPAction (see page 859)	Supplies a SOAP Action header to use for an already-registered interface.
	RegisterException (see page 860)	Registers the remotable exception classes that calls to an invokable interface can raise.
	RegisterExceptionMethod (see page 860)	Registers methods of an invokable interface that can raise a registered exception class.
	RegisterExternalMethName (see page 861)	Registers the correspondence between a method name on an invokable interface and the corresponding operation name in a WSDL document.
	RegisterExternalParamName (see page 861)	Registers the correspondence between a parameter name on an invokable interface and the corresponding part name in a WSDL document.
	RegisterHeaderClass (see page 862)	This is the overview for the RegisterHeaderClass method overload.
	RegisterHeaderMethod (see page 863)	Registers methods of an invokable interface that make use of a registered header.
	RegisterInterface (see page 864)	Registers an invokable interface.
	RegisterInvokableClass (see page 865)	This is the overview for the RegisterInvokableClass method overload.
	RegisterInvokeOptions (see page 866)	This is the overview for the RegisterInvokeOptions method overload.

	RegisterReturnParamNames (see page 867)	Registers a list of parameter names that map to return values of interface methods.
	RegisterUDDIInfo (see page 867)	Registers the location of the UDDI description that can be used to import the location of a Web Service.
	UnRegisterInterface (see page 867)	Unregisters an invokable interface.
	UnRegisterInvokableClass (see page 868)	Unregisters the implementation class for an invokable interface.

23.1.7.2 TInvokableClassRegistry.Create Constructor

Creates and initializes a TInvokableClassRegistry (see page 840) object.

Pascal

```
constructor Create;
```

C++

```
__fastcall TInvokableClassRegistry();
```

Description

Do not create your own instances of TInvokableClassRegistry (see page 840). Instead, use the global InvRegistry (see page 930) function, which provides access to a single global instance of TInvokableClassRegistry (see page 840).

See Also

InvRegistry (see page 930)

23.1.7.3 TInvokableClassRegistry.Destroy Destructor

Frees the memory associated with the TInvokableClassRegistry (see page 840) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TInvokableClassRegistry();
```

Description

Do not destroy the global TInvokableClassRegistry (see page 840) instance that is available through the InvRegistry (see page 930) function. This object is freed automatically when the application unloads the InvokeRegistry (see page 807) unit.

See Also

InvRegistry (see page 930)

23.1.7.4 TInvokableClassRegistry Methods

The methods of the TInvokableClassRegistry class are listed here.

Public Methods

	Name	Description
	GetActionURIOfIID (see page 844)	Returns the SOAP Action header associated with the interface with a specified GUID.
	GetActionURIOfInfo (see page 844)	Returns the SOAP Action header associated with the type info of a registered interface.
	GetClassFromIntfInfo (see page 845)	Retrieves the implementation class that corresponds to the type info of an invokable interface.

	GetExceptionInfoForInterface (see page 845)	Retrieves an array of exceptions that are registered as associated with an invokable interface.
	GetHeaderClass (see page 846)	Returns the class reference for a header type, given its name and namespace.
	GetHeaderInfoForInterface (see page 846)	Retrieves an array of headers that are registered as associated with an invokable interface.
	GetHeaderName (see page 847)	Returns the name of a header that is identified by a specified class reference.
	GetHeaderNamespace (see page 847)	This is the overview for the GetHeaderNamespace method overload.
	GetInfoForURI (see page 848)	Retrieves information about a registered invokable interface that is identified by a SOAP action header or the path of an HTTP message.
	GetInterfaceCount (see page 849)	Returns the number of registered invokable interfaces.
	GetInterfaceExternalName (see page 849)	This is the overview for the GetInterfaceExternalName method overload.
	GetInterfaceInfoFromName (see page 850)	Returns information about a registered invokable interface given its name.
	GetInterfaceTypeInfo (see page 850)	Returns the runtime type information (RTTI) of an invokable interface.
	GetIntfInvokeOptions (see page 851)	This is the overview for the GetIntfInvokeOptions method overload.
	GetInvokableObjectFromClass (see page 852)	Returns an instance of the implementation class for a registered invokable interface.
	GetMethExternalName (see page 852)	Returns the name of the operation that corresponds to a method on an invokable interface.
	GetMethInternalName (see page 852)	Returns the name of the method that corresponds to an operation in a WSDL document.
	GetNamespaceByGUID (see page 853)	Returns a namespace that is uniquely associated with a registered interface.
	GetParamExternalName (see page 853)	Returns the name of the part that corresponds to a parameter on a method of an invokable interface.
	GetParamInternalName (see page 854)	Returns the name of the parameter that corresponds to a part on a message of an operation in a WSDL document.
	GetRegInterfaceEntry (see page 854)	Returns the internal data that TInvokableClassRegistry (see page 840) maintains for one of its registered interfaces.
	GetRequestHeaderInfoForInterface (see page 855)	Retrieves an array of headers that are registered as associated with requests to an invokable interface.
	GetResponseHeaderInfoForInterface (see page 855)	Retrieves an array of headers that are registered as associated with responses to invocations of an invokable interface.
	GetReturnParamNames (see page 856)	Returns the list of parameter names that map to return values of interface methods.
	GetUDDIInfo (see page 856)	This is the overview for the GetUDDIInfo method overload.
	GetWSDLEncoding (see page 857)	This is the overview for the GetWSDLEncoding method overload.
	HasRegInterfaceImpl (see page 858)	Indicates whether there is a registered implementation class for an invokable interface.
	RegisterAllSOAPActions (see page 859)	Supplies a set of SOAP Action headers to use for an already-registered interface.
	RegisterDefaultSOAPAction (see page 859)	Supplies a SOAP Action header to use for an already-registered interface.
	RegisterException (see page 860)	Registers the remotable exception classes that calls to an invokable interface can raise.
	RegisterExceptionMethod (see page 860)	Registers methods of an invokable interface that can raise a registered exception class.
	RegisterExternalMethName (see page 861)	Registers the correspondence between a method name on an invokable interface and the corresponding operation name in a WSDL document.
	RegisterExternalParamName (see page 861)	Registers the correspondence between a parameter name on an invokable interface and the corresponding part name in a WSDL document.
	RegisterHeaderClass (see page 862)	This is the overview for the RegisterHeaderClass method overload.
	RegisterHeaderMethod (see page 863)	Registers methods of an invokable interface that make use of a registered header.
	RegisterInterface (see page 864)	Registers an invokable interface.
	RegisterInvokableClass (see page 865)	This is the overview for the RegisterInvokableClass method overload.
	RegisterInvokeOptions (see page 866)	This is the overview for the RegisterInvokeOptions method overload.
	RegisterReturnParamNames (see page 867)	Registers a list of parameter names that map to return values of interface methods.
	RegisterUDDIInfo (see page 867)	Registers the location of the UDDI description that can be used to import the location of a Web Service.
	UnRegisterInterface (see page 867)	Unregisters an invokable interface.
	UnRegisterInvokableClass (see page 868)	Unregisters the implementation class for an invokable interface.

23.1.7.4.1 TInvokableClassRegistry.GetActionURIOfIID Method

Returns the SOAP Action header associated with the interface with a specified GUID.

Pascal

```
function GetActionURIOfIID(const AGUID: TGUID): string;
```

C++

```
__fastcall UnicodeString GetActionURIOfIID(const TGUID AGUID);
```

Description

Typically, applications do not need to call GetActionURIOfIID. This method is called by remote interfaced objects (THTTPRIO) when generating the SOAP Action header of messages that call a method on a registered interface.

AGUID is the globally unique identifier (GUID) of the interface to call. The interface must be previously registered by a call to the RegisterInterface (see page 864) method.

GetActionURIOfIID returns the string that should appear as the SOAP Action header on request messages to that interface.

See Also

GetActionURIOfInfo (see page 844)

RegisterDefaultSOAPAction (see page 859)

RegisterInterface (see page 864)

THTTPRIO

23.1.7.4.2 TInvokableClassRegistry.GetActionURIOfInfo Method

Returns the SOAP Action header associated with the type info of a registered interface.

Pascal

```
function GetActionURIOfInfo(const IntfInfo: PTypeInfo; const MethodName: InvString;
MethodIndex: Integer): string;
```

C++

```
__fastcall UnicodeString GetActionURIOfInfo(const PTypeInfo IntfInfo, const InvString
MethodName, int MethodIndex);
```

Description

GetActionURIOfInfo looks up or generates the SOAP Action header that should be used with messages that call a specified method on an invokable interface.

IntfInfo (see page 789) is the runtime type information (RTTI) that is compiled for the invokable interface. The interface must have been previously registered by a call to the RegisterInterface (see page 864) method.

MethodName is the name of the method to call on the specified interface.

MethodIndex indicates which method to use when the interface includes an overload of the method that MethodName specifies. 0 indicates the overload that is declared first, 1 the overload that is declared second, and so on.

GetActionURIOfInfo returns the string that should appear as the SOAP Action header on request messages to the specified method of the specified interface.

See Also

GetActionURIOfIID (see page 844)

RegisterDefaultSOAPAction (see page 859)

RegisterInterface (see page 864)

THTTPRIO

23.1.7.4.3 TInvokableClassRegistry.GetClassFromIntfInfo Method

Retrieves the implementation class that corresponds to the type info of an invokable interface.

Pascal

```
procedure GetClassFromIntfInfo(Info: PTypeInfo; var AClass: TClass);
```

C++

```
__fastcall GetClassFromIntfInfo(PTypeInfo Info, TClass AClass);
```

Description

Typically, applications do not need to call GetClassFromIntfInfo. This method allows the invoker component (THTTPSoapPascalInvoker or THTTPSoapCppInvoker) to look up the implementation class for an interface it is invoking.

Info is the runtime type information (RTTI) from a registered invokable interface. The interface must have been previously registered by a call to the RegisterInterface (see page 864) method.

AClass returns a class reference for the class that implements the invokable interface identified by Info. It can be passed to the GetInvokableObjectFromClass (see page 852) method to obtain an instance of the implementation class.

See Also

GetInvokableObjectFromClass (see page 852)

RegisterInvokableClass (see page 865)

RegisterInterface (see page 864)

THTTPSoapPascalInvoker

THTTPSoapCppInvoker

23.1.7.4.4 TInvokableClassRegistry.GetExceptionInfoForInterface Method

Retrieves an array of exceptions that are registered as associated with an invokable interface.

Pascal

```
function GetExceptionInfoForInterface(Info: PTypeInfo): TExceptionItemArray;
```

C++

```
__fastcall TExceptionItemArray GetExceptionInfoForInterface(PTypeInfo Info);
```

Description

Typically, applications do not need to call GetExceptionInfoForInterface. This method is used internally by the WSDL publisher to generate the WSDL that describes the exceptions that an invokable interface can raise.

Info is the runtime type information (RTTI) from a registered invokable interface. The interface must have been previously registered by a call to the RegisterInterface (see page 864) method.

GetExceptionInfoForInterface returns an array of IntfExceptionItem (see page 935) values, each of which describes a remotable exception that was registered for the invokable interface by a call to the RegisterException (see page 860) method.

See Also

RegisterException (see page 860)

TWSDLHTMLPublish

RegisterInterface (see page 864)

23.1.7.4.5 TInvokableClassRegistry.GetHeaderClass Method

Returns the class reference for a header type, given its name and namespace.

Pascal

```
function GetHeaderClass(Name: InvString; Namespace: InvString): TClass;
```

C++

```
__fastcall TClass GetHeaderClass(InvString Name, InvString Namespace);
```

Description

Typically, applications do not need to call GetHeaderClass. This method is used internally to look up the class of a header that is identified by name.

Name is the name of the header node.

Namespace is the URI of the namespace in which Name is defined.

GetHeaderClass returns the class reference for the TSOAPHeader (see page 908) descendant that represents the identified header.

See Also

RegisterHeaderClass (see page 862)

TSOAPHeader (see page 908)

GetHeaderName (see page 847)

GetHeaderNamespace (see page 848)

23.1.7.4.6 TInvokableClassRegistry.GetHeaderInfoForInterface Method

Retrieves an array of headers that are registered as associated with an invokable interface.

Pascal

```
function GetHeaderInfoForInterface(Info: PTypeInfo; MethodType: eHeaderMethodType = hmtAll):
THeaderItemArray;
```

C++

```
__fastcall THeaderItemArray GetHeaderInfoForInterface(PTypeInfo Info, eHeaderMethodType
MethodType = hmtAll);
```

Description

Typically, applications do not need to call GetHeaderInfoForInterface. This method is used internally by the WSDL publisher to generate the WSDL that describes the headers that are used in messages about an invokable interface.

Info is the runtime type information (RTTI) from a registered invokable interface. The interface must have been previously registered by a call to the RegisterInterface (see page 864) method.

MethodType indicates whether to retrieve information about the headers to use on request messages, the headers to use on

response messages, or both.

GetHeaderInfoForInterface returns an array of IntfHeaderItem (see page 936) values, each of which describes a header that was registered for the invokable interface by a call to the RegisterHeaderClass (see page 862) method.

See Also

RegisterHeaderClass (see page 862)

TWSDLHTMLPublish

RegisterInterface (see page 864)

23.1.7.4.7 TInvokableClassRegistry.GetHeaderName Method

Returns the name of a header that is identified by a specified class reference.

Pascal

```
function GetHeaderName(Info: PTypeInfo; AClass: TClass): InvString;
```

C++

```
__fastcall InvString GetHeaderName(PTypeInfo Info, TClass AClass);
```

Description

GetHeaderName returns the name of a header given the class that represents it. This is the name supplied to a call to RegisterHeaderClass (see page 862) when the header was registered. If the header was registered without supplying a name, this is the same name as the type name supplied for the header when it is registered with the remotable type registry.

Info is the runtime type information for the interface associated with the header.

AClass is a class reference to the TSOAPHeader (see page 908) descendant that represents the header.

GetHeaderName returns the name of the header. This name is defined within the namespace that the GetHeaderNamespace (see page 848) method returns.

See Also

RegisterHeaderClass (see page 862)

TSOAPHeader (see page 908)

GetHeaderNamespace (see page 848)

GetHeaderClass (see page 846)

23.1.7.4.8 GetHeaderNamespace Method

This is the overview for the GetHeaderNamespace method overload.

Overload List

	Name	Description
	TInvokableClassRegistry.GetHeaderNamespace (PTypeInfo, TClass) (see page 848)	Returns the namespace URI for a header that is identified by a specified class reference.
	TInvokableClassRegistry.GetHeaderNamespace (TClass) (see page 848)	Returns the namespace URI for a header that is identified by a specified class reference.

23.1.7.4.8.1 TInvokableClassRegistry.GetHeaderNamespace Method (PTypeInfo, TClass)

Returns the namespace URI for a header that is identified by a specified class reference.

Pascal

```
function GetHeaderNamespace(Info: PTypeInfo; AClass: TClass): InvString; overload;
function GetHeaderNamespace(AClass: TClass): InvString; overload;
```

C++

```
__fastcall InvString GetHeaderNamespace(PTypeInfo Info, TClass AClass);
__fastcall InvString GetHeaderNamespace(TClass AClass);
```

Description

GetHeaderNamespace returns the namespace in which a header's name is defined. This is the namespace URI supplied to a call to RegisterHeaderClass (see page 862) when the header was registered. If the header was registered without supplying a namespace URI, this is the same namespace as the one associated with the interface that uses the header.

Info is the runtime type information for the interface associated with the header.

AClass is a class reference to the TSOAPHeader (see page 908) descendant that represents the header.

GetHeaderNamespace returns the namespace URI to use for resolving the name of the header.

See Also

RegisterHeaderClass (see page 862)

TSOAPHeader (see page 908)

GetHeaderName (see page 847)

GetHeaderClass (see page 846)

23.1.7.4.9 TInvokableClassRegistry.GetInfoForURI Method

Retrieves information about a registered invokable interface that is identified by a SOAP action header or the path of an HTTP message.

Pascal

```
function GetInfoForURI(const PathURI: string; const ActionURI: string; var ACLass: TClass; var
IntfInfo: PTypeInfo; var AMeth: string): Boolean;
```

C++

```
__fastcall Boolean GetInfoForURI(const UnicodeString PathURI, const UnicodeString ActionURI,
TClass ACLass, PTypeInfo IntfInfo, UnicodeString AMeth);
```

Description

Typically, applications do not need to call GetInfoForURI. This method is called by the invoker component (THTTPSoapPascalInvoker or THTTPSoapCppInvoker) to look up the target of a SOAP message that it is invoking.

PathURI is the path portion of the target URI on the SOAP message. When using a path to identify an invokable interface, the path portion must end in the name of the unit followed by the name of the interface. It is only used if ActionURI is an empty string.

ActionURI is the SOAP action header of the SOAP message. It identifies an interface based on the namespace in the SOAP action header. This namespace must match the namespace supplied to the RegisterInterface (see page 864) method (or generated by that method if the caller did not supply a namespace). If ActionURI is an empty string, GetInfoForURI uses PathURI instead to identify the target interface.

AClass returns a class reference for the class that implements the invokable interface identified by PathURI or ActionURI.

IntfInfo (see page 789) returns the runtime type information (RTTI) of the invokable interface identified by PathURI or ActionURI.

AMeth is not currently used.

See Also

DispatchSOAP

RegisterInterface (see page 864)

23.1.7.4.10 TInvokableClassRegistry.GetInterfaceCount Method

Returns the number of registered invokable interfaces.

Pascal

```
function GetInterfaceCount: Integer;
```

C++

```
__fastcall int GetInterfaceCount();
```

Description

GetInterfaceCount returns the number of invokable interfaces that have been registered. Each invokable interface is registered by a call to the RegisterInterface (see page 864) method.

See Also

RegisterInterface (see page 864)

23.1.7.4.11 GetInterfaceExternalName Method

This is the overview for the GetInterfaceExternalName method overload.

Overload List

	Name	Description
	TInvokableClassRegistry.GetInterfaceExternalName (PTypeInfo) (see page 849)	Returns the name of the port type that corresponds to an invokable interface.
	TInvokableClassRegistry.GetInterfaceExternalName (PTypeInfo, string) (see page 849)	Returns the name of the port type that corresponds to an invokable interface.
	TInvokableClassRegistry.GetInterfaceExternalName (PTypeInfo, string, string) (see page 849)	Returns the name of the port type that corresponds to an invokable interface.

23.1.7.4.11.1 TInvokableClassRegistry.GetInterfaceExternalName Method (PTypeInfo)

Returns the name of the port type that corresponds to an invokable interface.

Pascal

```
function GetInterfaceExternalName(Info: PTypeInfo; const Namespace: string; const
InternalIntfName: string): InvString; overload;
function GetInterfaceExternalName(Info: PTypeInfo; const Namespace: string): InvString;
overload;
function GetInterfaceExternalName(Info: PTypeInfo): InvString; overload;
```

C++

```
__fastcall InvString GetInterfaceExternalName(PTypeInfo Info, const UnicodeString Namespace,
const UnicodeString InternalIntfName);
```

```
__fastcall InvString GetInterfaceExternalName(PTypeInfo Info, const UnicodeString Namespace);
__fastcall InvString GetInterfaceExternalName(PTypeInfo Info);
```

Description

GetInterfaceExternalName returns the name of the port type that corresponds to a specified invokable interface. This is the name given to the corresponding port type in a WSDL document. The association between the external name and the interface name is established by the RegisterInterface (see page 864) method.

Info is the type information pointer for the invokable interface.

Namespace is the namespace assigned to the invokable interface when it was registered by a call to the RegisterInterface (see page 864) method. If the interface was registered using the automatically-generated namespace, this parameter can be omitted or you can supply an empty string.

InternalIntfName is the name of the invokable interface.

See Also

RegisterInterface (see page 864)

23.1.7.4.12 TInvokableClassRegistry.GetInterfaceInfoFromName Method

Returns information about a registered invokable interface given its name.

Pascal

```
procedure GetInterfaceInfoFromName(const UnitName: string; const IntfName: string; var Info:
PTypeInfo; var IID: TGUID);
```

C++

```
__fastcall GetInterfaceInfoFromName(const UnicodeString UnitName, const UnicodeString
IntfName, PTypeInfo Info, TGUID IID);
```

Description

GetInterfaceInfoFromName looks up a registered interface given its name and the name of the unit in which it is declared.

UnitName is the name of the unit that contains the interface definition.

IntfName is the name of the interface.

Info returns the type information that is compiled with the specified interface.

IID returns the globally unique identifier for the specified interface.

See Also

GetInterfaceTypeInfo (see page 850)

GetInfoForURI (see page 848)

23.1.7.4.13 TInvokableClassRegistry.GetInterfaceTypeInfo Method

Returns the runtime type information (RTTI) of an invokable interface.

Pascal

```
function GetInterfaceTypeInfo(const AGUID: TGUID): Pointer;
```

C++

```
__fastcall void * GetInterfaceTypeInfo(const TGUID AGUID);
```

Description

GetInterfaceTypeInfo returns a pointer to the RTTI that is compiled with an invokable interface.

AGUID is the globally unique identifier that specifies the desired interface.

See Also

GetInterfaceInfoFromName (see page 850)

GetInfoForURI (see page 848)

23.1.7.4.14 GetIntfInvokeOptions Method

This is the overview for the GetIntfInvokeOptions method overload.

Overload List

	Name	Description
	TInvokableClassRegistry.GetIntfInvokeOptions (PTypeInfo) (see page 851)	Retrieves any flags that customize the way calls to a registered interface are made.
	TInvokableClassRegistry.GetIntfInvokeOptions (TGUID) (see page 851)	Retrieves any flags that customize the way calls to a registered interface are made.

23.1.7.4.14.1 TInvokableClassRegistry.GetIntfInvokeOptions Method (PTypeInfo)

Retrieves any flags that customize the way calls to a registered interface are made.

Pascal

```
function GetIntfInvokeOptions(const IntfInfo: PTypeInfo): TIntfInvokeOptions; overload;
function GetIntfInvokeOptions(const AGUID: TGUID): TIntfInvokeOptions; overload;
```

C++

```
__fastcall TIntfInvokeOptions GetIntfInvokeOptions(const PTypeInfo IntfInfo);
__fastcall TIntfInvokeOptions GetIntfInvokeOptions(const TGUID AGUID);
```

Description

GetIntfInvokeOptions retrieves any invocation options that have been registered for an interface using the RegisterInvokeOptions (see page 866) method. Invocation options customize the way a registered interface is called, especially the way such calls are marshaled or unmarshaled. Remote interfaced objects (THTTPRIO) call this method to determine what options they need to set on the component that is the value of their Converter property.

AGUID identifies the registered interface using its GUID.

IntfInfo (see page 789) identifies the registered interface using its runtime type information (RTTI). You can obtain the type information from an invokable interface by calling the TypeInfo function (delphi) or the __delphirtti operator (C++).

GetIntfInvokeOptions returns a set of flags that indicate how to make calls to the specified interface.

See Also

RegisterInvokeOptions (see page 866)

Converter

Options (see page 2781)

RegisterInterface (see page 864)

23.1.7.4.15 TInvokableClassRegistry.GetInvokableObjectFromClass Method

Returns an instance of the implementation class for a registered invokable interface.

Pascal

```
function GetInvokableObjectFromClass(AClass: TClass): TObject;
```

C++

```
__fastcall TObject * GetInvokableObjectFromClass(TClass AClass);
```

Description

Typically, applications do not need to call GetInvokableObjectFromClass. This method is called by the invoker component (THTTPSoapPascalInvoker or THTTPSoapCppInvoker) to obtain an instance of the class that implements a registered invokable interface. When the invoker is finished with the object, it calls GetWSDLEncoding (see page 857) to free the instance.

AClass identifies the class whose instance is desired. It must be registered by a call to RegisterInvokableClass (see page 865). The invoker obtains this class reference by calling the GetInfoForURI (see page 848) method.

See Also

GetInfoForURI (see page 848)

RegisterInvokableClass (see page 865)

GetWSDLEncoding (see page 857)

23.1.7.4.16 TInvokableClassRegistry.GetMethExternalName Method

Returns the name of the operation that corresponds to a method on an invokable interface.

Pascal

```
function GetMethExternalName(Info: PTypeInfo; const MethodIntName: string): InvString;
```

C++

```
__fastcall InvString GetMethExternalName(PTypeInfo Info, const UnicodeString MethodIntName);
```

Description

GetMethExternalName returns the name of the operation that corresponds to a specified method. This is the name used to define the operation for that method in a WSDL document. The association between the external name and the method name is established by the RegisterExternalMethName (see page 861) method.

Info is the type information pointer for the invokable interface that includes the method.

MethodIntName is the name of the method on that invokable interface.

See Also

RegisterExternalMethName (see page 861)

GetMethInternalName (see page 852)

23.1.7.4.17 TInvokableClassRegistry.GetMethInternalName Method

Returns the name of the method that corresponds to an operation in a WSDL document.

Pascal

```
function GetMethInternalName(Info: PTypeInfo; const MethodExtName: InvString): string;
```

C++

```
__fastcall UnicodeString GetMethInternalName(PTypeInfo Info, const InvString MethodExtName);
```

Description

GetMethInternalName returns the name of a method on a registered invokable interface that corresponds to a specified operation. The operation name comes from a WSDL document that describes the invokable interface and its methods. The association between the operation name and the method name is established by the RegisterExternalMethName (see page 861) method.

Info is the type information pointer for the invokable interface that includes the method.

MethodExtName is the name of the operation for which you want the corresponding method name.

See Also

RegisterExternalMethName (see page 861)

GetMethExternalName (see page 852)

23.1.7.4.18 TInvokableClassRegistry.GetNamespaceByGUID Method

Returns a namespace that is uniquely associated with a registered interface.

Pascal

```
function GetNamespaceByGUID(const AGUID: TGUID): string;
```

C++

```
__fastcall UnicodeString GetNamespaceByGUID(const TGUID AGUID);
```

Description

GetNamespaceByGUID returns the namespace URI that identifies the specified interface. The namespace is originally associated with the interface when it is registered by a call to the RegisterInterface (see page 864) method. This namespace can be supplied when the interface is registered, or automatically generated by the RegisterInterface (see page 864) method.

AGUID is the globally unique identifier that identifies the interface whose namespace is desired..

GetInfoForURI (see page 848)

RegisterInterface (see page 864)

23.1.7.4.19 TInvokableClassRegistry.GetParamExternalName Method

Returns the name of the part that corresponds to a parameter on a method of an invokable interface.

Pascal

```
function GetParamExternalName(Info: PTypeInfo; const MethodName: string; const
InternalParamName: string): InvString;
```

C++

```
__fastcall InvString GetParamExternalName(PTypeInfo Info, const UnicodeString MethodName,
const UnicodeString InternalParamName);
```

Description

GetParamExternalName returns the name of the part that corresponds to a specified method parameter. This is the name used to define the part for that parameter in a WSDL document. The association between the external name and the parameter name

is established by the RegisterExternalParamName (see page 861) method.

Info is the type information pointer for the invokable interface that includes the method.

MethodName is the name of the method on that invokable interface.

InternalParamName is the name of the parameter on the method of the invokable interface.

See Also

RegisterExternalParamName (see page 861)

GetParamInternalName (see page 854)

23.1.7.4.20 TInvokableClassRegistry.GetParamInternalName Method

Returns the name of the parameter that corresponds to a part on a message of an operation in a WSDL document.

Pascal

```
function GetParamInternalName(Info: PTypeInfo; const MethodName: string; const
ExternalParamName: InvString): string;
```

C++

```
__fastcall UnicodeString GetParamInternalName(PTypeInfo Info, const UnicodeString MethodName,
const InvString ExternalParamName);
```

Description

GetParamInternalName returns the name of the method parameter that corresponds to a specified part. This is the parameter of a method on an invokable interface that is registered to correspond to a part that is defined in a WSDL document. The association between the parameter name and the part name is established by the RegisterExternalParamName (see page 861) method.

Info is the type information pointer for the invokable interface that includes the method.

MethodName is the name of the method on that invokable interface.

ExternalParamName is the name of a part on one of the messages in the operation that corresponds to MethodName. GetParamInternalName returns the corresponding parameter name.

See Also

RegisterExternalParamName (see page 861)

GetParamExternalName (see page 853)

23.1.7.4.21 TInvokableClassRegistry.GetRegInterfaceEntry Method

Returns the internal data that TInvokableClassRegistry (see page 840) maintains for one of its registered interfaces.

Pascal

```
function GetRegInterfaceEntry(Index: Integer): InvRegIntfEntry;
```

C++

```
__fastcall InvRegIntfEntry GetRegInterfaceEntry(int Index);
```

Description

TInvokableClassRegistry (see page 840) maintains an InvRegIntfEntry (see page 937) value for every registered invokable interface. GetRegInterfaceEntry provides indexed access to this information.

The InvRegIntfEntry (see page 937) value for a registered interface is intended for internal use by the invocation registry and

the components that use it.

See Also

GetInfoForURI (see page 848)

GetInterfaceCount (see page 849)

RegisterDefaultSOAPAction (see page 859)

23.1.7.4.22 TInvokableClassRegistry.GetRequestHeaderInfoForInterface Method

Retrieves an array of headers that are registered as associated with requests to an invokable interface.

Pascal

```
function GetRequestHeaderInfoForInterface(Info: PTypeInfo): THeaderItemArray;
```

C++

```
__fastcall THeaderItemArray GetRequestHeaderInfoForInterface(PTypeInfo Info);
```

Description

Typically, applications do not need to call GetRequestHeaderInfoForInterface. This method is used internally by the WSDL publisher to generate the WSDL that describes the headers that are used in messages that invoke a method on an invokable interface.

Info is the runtime type information (RTTI) from a registered invokable interface. The interface must have been previously registered by a call to the RegisterInterface (see page 864) method.

GetRequestHeaderInfoForInterface returns an array of IntfHeaderItem (see page 936) values, each of which describes a header that was registered for request messages on the invokable interface by a call to the RegisterHeaderClass (see page 862) method.

See Also

RegisterHeaderClass (see page 862)

TWSDLHTMLPublish

RegisterInterface (see page 864)

GetHeaderInfoForInterface (see page 846)

23.1.7.4.23 TInvokableClassRegistry.GetResponseHeaderInfoForInterface Method

Retrieves an array of headers that are registered as associated with responses to invocations of an invokable interface.

Pascal

```
function GetResponseHeaderInfoForInterface(Info: PTypeInfo): THeaderItemArray;
```

C++

```
__fastcall THeaderItemArray GetResponseHeaderInfoForInterface(PTypeInfo Info);
```

Description

Typically, applications do not need to call GetResponseHeaderInfoForInterface. This method is used internally by the WSDL publisher to generate the WSDL that describes the headers that are used in response messages that return the results of executing a method on an invokable interface.

Info is the runtime type information (RTTI) from a registered invokable interface. The interface must have been previously registered by a call to the RegisterInterface (see page 864) method.

GetResponseHeaderInfoForInterface returns an array of IntfHeaderItem (see page 936) values, each of which describes a header that was registered for response messages on the invokable interface by a call to the RegisterHeaderClass (see page 862) method.

See Also

RegisterHeaderClass (see page 862)

TWSDLHTMLPublish

RegisterInterface (see page 864)

GetHeaderInfoForInterface (see page 846)

23.1.7.4.24 TInvokableClassRegistry.GetReturnParamNames Method

Returns the list of parameter names that map to return values of interface methods.

Pascal

```
function GetReturnParamNames(const IntfInfo: PTypeInfo): string;
```

C++

```
__fastcall UnicodeString GetReturnParamNames(const PTypeInfo IntfInfo);
```

Description

GetReturnParamNames returns the list of parameter names that have been registered as mapping to return values of methods on a specified interface. Any out messages in a port type with these names are identified as the return value of a method on the corresponding interface. If the application does not explicitly register output parameter names by a call to RegisterReturnParamNames (see page 867), GetReturnParamNames returns the default list, 'Result;Return'.

IntfInfo (see page 789) is the type information pointer for the invokable interface for which you want the registered parameter names.

GetReturnParamNames returns the list of parameter names as a semicolon delimited list.

See Also

RegisterReturnParamNames (see page 867)

23.1.7.4.25 GetUDDIInfo Method

This is the overview for the GetUDDIInfo method overload.

Overload List

	Name	Description
	TInvokableClassRegistry.GetUDDIInfo (PTypeInfo, string, string) (see page 856)	Retrieves the description of the UDDI location that describes a registered interface.
	TInvokableClassRegistry.GetUDDIInfo (TGUID, string, string) (see page 856)	Retrieves the description of the UDDI location that describes a registered interface.

23.1.7.4.25.1 TInvokableClassRegistry.GetUDDIInfo Method (PTypeInfo, string, string)

Retrieves the description of the UDDI location that describes a registered interface.

Pascal

```
function GetUDDIInfo(const IntfInfo: PTypeInfo; var Operator: string; var BindingKey: string):
Boolean; overload;
function GetUDDIInfo(const AGUID: TGUID; var Operator: string; var BindingKey: string):
Boolean; overload;
```

C++

```
__fastcall Boolean GetUDDIInfo(const PTypeInfo IntfInfo, UnicodeString Operator, UnicodeString
BindingKey);
__fastcall Boolean GetUDDIInfo(const TGUID AGUID, UnicodeString Operator, UnicodeString
BindingKey);
```

Description

Typically, applications do not need to call GetUDDIInfo. This method is used internally to provide fail-over support when a registered interface was imported using the UDDI browser. It retrieves the information that identifies the UDDI entry for a Web Service, so that the application can re-fetch the target URL for a registered interface. The UDDI information is previously registered by a call to the RegisterUDDIInfo (see page 867) method.

IntfInfo (see page 789) is the runtime type information (RTTI) from a registered invokable interface. The interface must have been previously registered by a call to the RegisterInterface (see page 864) method.

AGUID is a GUID that identifies the registered interface. The interface must have been previously registered by a call to the RegisterInterface (see page 864) method.

Operator returns the URL of the UDDI registry that was used to import the interface definition.

BindingKey is the unique identifier for the TModel that describes the Web Service to which the interface belongs.

GetUDDIInfo returns true if it successfully locates and returns values for the Operator and BindingKey parameters. It returns false if there is no registered UDDI information for the specified interface.

See Also

RegisterUDDIInfo (see page 867)

RegisterInterface (see page 864)

23.1.7.4.26 GetWSDLEncoding Method

This is the overview for the GetWSDLEncoding method overload.

Overload List

	Name	Description
	TInvokableClassRegistry.GetWSDLEncoding (PTypeInfo) (see page 857)	Returns the encoding attribute of the xml header of a document that defines the port type to which the interface corresponds.
	TInvokableClassRegistry.GetWSDLEncoding (PTypeInfo, string) (see page 857)	Returns the encoding attribute of the xml header of a document that defines the port type to which the interface corresponds.
	TInvokableClassRegistry.GetWSDLEncoding (PTypeInfo, string, string) (see page 857)	Returns the encoding attribute of the xml header of a document that defines the port type to which the interface corresponds.

23.1.7.4.26.1 TInvokableClassRegistry.GetWSDLEncoding Method (PTypeInfo)

Returns the encoding attribute of the xml header of a document that defines the port type to which the interface corresponds.

Pascal

```
function GetWSDLEncoding(Info: PTypeInfo; const Namespace: string; const InternalIntfName:
string): InvString; overload;
function GetWSDLEncoding(Info: PTypeInfo; const Namespace: string): InvString; overload;
function GetWSDLEncoding(Info: PTypeInfo): InvString; overload;
```

C++

```
__fastcall InvString GetWSDLEncoding(PTypeInfo Info, const UnicodeString Namespace, const
UnicodeString InternalIntfName);
__fastcall InvString GetWSDLEncoding(PTypeInfo Info, const UnicodeString Namespace);
__fastcall InvString GetWSDLEncoding(PTypeInfo Info);
```

Description

GetWSDLEncoding returns the encoding attribute, if any, that is registered with the interface by a call to the RegisterInterface (see page 864) method. The encoding attribute is an attribute of the xml header of a WSDL document, and describes the character set that should be used with all the elements that the document defines.

Info points to the type information of the registered interface.

Namespace specifies the namespace that was registered for the interface by the RegisterInterface (see page 864) method. It can be an empty string.

InternalIntfName is the name of the interface (which may differ from the port type to which it corresponds).

See Also

RegisterInterface (see page 864)

23.1.7.4.27 TInvokableClassRegistry.HasRegInterfaceImpl Method

Indicates whether there is a registered implementation class for an invokable interface.

Pascal

```
function HasRegInterfaceImpl(Index: Integer): Boolean;
```

C++

```
__fastcall Boolean HasRegInterfaceImpl(int Index);
```

Description

Typically, applications do not need to call HasRegInterfaceImpl. This method is used internally to determine whether an implementation class has been registered for an invokable interface. The RegisterInvokableClass (see page 865) method registers these implementation classes.

Index identifies the invokable interface for which an implementation class is sought. This index is the same as the index used in the GetRegInterfaceEntry (see page 854) method, and reflects the order in which interfaces are registered.

HasRegInterfaceImpl returns true if there is a registered implementation class for the specified interface, false otherwise.

See Also

GetInterfaceCount (see page 849)

GetRegInterfaceEntry (see page 854)

RegisterInterface (see page 864)

RegisterInvokableClass (see page 865)

23.1.7.4.28 TInvokableClassRegistry.RegisterAllSOAPActions Method

Supplies a set of SOAP Action headers to use for an already-registered interface.

Pascal

```
procedure RegisterAllSOAPActions(Info: PTypeInfo; const AllSOAPActions: InvString);
```

C++

```
__fastcall RegisterAllSOAPActions(PTypeInfo Info, const InvString AllSOAPActions);
```

Description

RegisterDefaultSOAPAction (see page 859) associates a registered invokable interface with a set of SOAP Action headers. A default SOAP Action header is generated (based on the namespace) when you register the interface by a call to the RegisterInterface (see page 864) method. RegisterAllSOAPActions lets you supply or change the SOAP Action header to a set of headers after the interface is already registered.

Info is the runtime type information (RTTI) for the interface for which you are supplying a set of SOAP Action headers.

AllSOAPActions is a string that includes the SOAP headers to use for calls to the interface that Info identifies. The individual header strings are delimited by a character that is given by the first character in the string.

See Also

RegisterInterface (see page 864)

RegisterDefaultSOAPAction (see page 859)

23.1.7.4.29 TInvokableClassRegistry.RegisterDefaultSOAPAction Method

Supplies a SOAP Action header to use for an already-registered interface.

Pascal

```
procedure RegisterDefaultSOAPAction(Info: PTypeInfo; const DefSOAPAction: InvString);
```

C++

```
__fastcall RegisterDefaultSOAPAction(PTypeInfo Info, const InvString DefSOAPAction);
```

Description

RegisterDefaultSOAPAction associates a registered invokable interface with a SOAP Action header. A default SOAP Action header is generated (based on the namespace) when you register the interface by a call to the RegisterInterface (see page 864) method. RegisterDefaultSOAPAction lets you supply or change the SOAP Action header after the interface is already registered.

Info is the runtime type information (RTTI) for the interface for which you are supplying a default SOAP Action header.

DefSOAPAction is the SOAP Action header to use for calls to the interface that Info identifies. If this is an empty string, the server automatically generates a SOAP Action header based on the namespace in which the corresponding port type is defined.

See Also

RegisterInterface (see page 864)

THTTPRIO

RegisterAllSOAPActions (see page 859)

23.1.7.4.30 TInvokableClassRegistry.RegisterException Method

Registers the remotable exception classes that calls to an invokable interface can raise.

Pascal

```
procedure RegisterException(Info: PTypeInfo; AClass: TClass);
```

C++

```
__fastcall RegisterException(PTypeInfo Info, TClass AClass);
```

Description

Use RegisterException to register a remotable exception class. When an exception class is registered, its definition is exported to WSDL documents so that it can be used to communicate exception information between clients and servers.

Info points to the type information of the invokable interface that can raise the exception. If more than one interface can raise the exception, you must call this method once for each interface type.

AClass describes the exception class. This must be the class reference for an ERemotableException (see page 810) descendant.

Note: After a call to RegisterException, the exception class is registered so that it is associated with all methods of the specified interface. If only a subset of the interface's methods raise the exception, you can indicate this by calling the RegisterExceptionMethod (see page 860) method for each method that can raise the exception.

See Also

RegisterInterface (see page 864)

ERemotableException (see page 810)

RegisterExceptionMethod (see page 860)

Creating Custom Exception Classes for Web Services

23.1.7.4.31 TInvokableClassRegistry.RegisterExceptionMethod Method

Registers methods of an invokable interface that can raise a registered exception class.

Pascal

```
procedure RegisterExceptionMethod(Info: PTypeInfo; AClass: TClass; const MethodName: string);
```

C++

```
__fastcall RegisterExceptionMethod(PTypeInfo Info, TClass AClass, const UnicodeString
MethodName);
```

Description

Call RegisterExceptionMethod for each method of an invokable interface that can raise a registered exception class. The exception class must be previously registered by a call to the RegisterException (see page 860) method. If you do not call RegisterExceptionMethod, then the WSDL document for the interface treats the exception as associated with all methods of the interface. If you want to limit the use of the exception to a subset of the methods, call RegisterExceptionMethod for each method that can raise the exception. After the first method is registered this way, the exception becomes limited to that method alone (and to any method subsequently registered by another call to RegisterExceptionMethod).

Info points to the type information of the invokable interface that can raise the exception.

AClass describes the exception class. This must be the class reference used to register the exception previously by a call to the

RegisterException (see page 860) method.

MethodName is the name of a method that can raise the exception.

See Also

RegisterInterface (see page 864)

ERemotableException (see page 810)

RegisterException (see page 860)

23.1.7.4.32 TInvokableClassRegistry.RegisterExternalMethName Method

Registers the correspondence between a method name on an invokable interface and the corresponding operation name in a WSDL document.

Pascal

```
procedure RegisterExternalMethName(Info: PTypeInfo; const InternalName: string; const
ExternalName: InvString);
```

C++

```
__fastcall RegisterExternalMethName(PTypeInfo Info, const UnicodeString InternalName, const
InvString ExternalName);
```

Description

Use RegisterExternalMethName to create an association between the name of an operation in a WSDL document and the corresponding method of the invokable interface that corresponds to that operation's port type. This allows the invokable interface to represent a port type that includes operations with names that are not legal in Object Pascal (for example, keywords).

Info points to the type information of the invokable interface.

InternalName is the name used for the method of the invokable interface that corresponds to the operation.

ExternalName is the name of the operation that is defined in the WSDL document.

See Also

RegisterExternalParamName (see page 861)

RegisterInterface (see page 864)

23.1.7.4.33 TInvokableClassRegistry.RegisterExternalParamName Method

Registers the correspondence between a parameter name on an invokable interface and the corresponding part name in a WSDL document.

Pascal

```
procedure RegisterExternalParamName(Info: PTypeInfo; const MethodName: string; const
InternalName: string; const ExternalName: InvString);
```

C++

```
__fastcall RegisterExternalParamName(PTypeInfo Info, const UnicodeString MethodName, const
UnicodeString InternalName, const InvString ExternalName);
```

Description

Use RegisterExternalParamName to create an association between the name of a part in a WSDL document and the corresponding parameter on a method of an invokable interface. This allows the invokable interface to handle definitions that have names that are not legal in Object Pascal (for example, keywords).

Info points to the type information of the invokable interface.

MethodName is the name of the method on the invokable interface.

InternalName is the name used for the parameter of the specified method that corresponds to the part with the name specified by ExternalName.

ExternalName is the name of the part that is defined in the WSDL document.

See Also

RegisterExternalMethName (see page 861)

RegisterInterface (see page 864)

23.1.7.4.34 RegisterHeaderClass Method

This is the overview for the RegisterHeaderClass method overload.

Overload List

	Name	Description
	TInvokableClassRegistry.RegisterHeaderClass (PTypeInfo, TClass, eHeaderMethodType, Boolean) (see page 862)	Registers a class that represents a headers which accompanies calls to an invokable interface.
	TInvokableClassRegistry.RegisterHeaderClass (PTypeInfo, TClass, InvString, InvString, eHeaderMethodType, Boolean) (see page 862)	Registers a class that represents a headers which accompanies calls to an invokable interface.

23.1.7.4.34.1 TInvokableClassRegistry.RegisterHeaderClass Method (PTypeInfo, TClass, InvString, InvString, eHeaderMethodType, Boolean)

Registers a class that represents a headers which accompanies calls to an invokable interface.

Pascal

```
procedure RegisterHeaderClass(Info: PTypeInfo; AClass: TClass; const HeaderName: InvString;
const HeaderNamespace: InvString; DefaultMethodType: eHeaderMethodType = hmtAll; Required:
Boolean = False); overload;
procedure RegisterHeaderClass(Info: PTypeInfo; AClass: TClass; DefaultMethodType:
eHeaderMethodType = hmtAll; Required: Boolean = False); overload;
```

C++

```
__fastcall RegisterHeaderClass(PTypeInfo Info, TClass AClass, const InvString HeaderName,
const InvString HeaderNamespace, eHeaderMethodType DefaultMethodType = hmtAll, Boolean
Required = False);
__fastcall RegisterHeaderClass(PTypeInfo Info, TClass AClass, eHeaderMethodType
DefaultMethodType = hmtAll, Boolean Required = False);
```

Description

Use RegisterHeaderClass to register a TSOAPHeader (see page 908) descendant. Registering a TSOAPHeader (see page 908) descendant serves two purposes:

On servers, when a TSOAPHeader (see page 908) descendant is registered, its definition is exported to WSDL documents so that applications using that WSDL document can recognize and process the header.

On both servers and clients, registering associates the TSOAPHeader (see page 908) descendant with a header name and the namespace in which that name is defined.

Info points to the type information of the invokable interface that the header should accompany. If the header should be included

in messages invoking more than one interface or in the responses to more than one interface, you must call this method once for each interface type.

AClass describes the TSOAPHeader (see page 908) descendant that represents the header.

HeaderName is the name of the header, as defined within the header's namespace. If HeaderName is not supplied, the header's name is assumed to be the same as the type name under which it is registered in the remotable type registry.

HeaderNamespace is the URI for the namespace in which the header's name is defined. If HeaderName and HeaderNamespace are not supplied, the header is assumed to be defined in the same namespace as the interface with which it is associated.

DefaultMethodType indicates whether the header is to be used on request messages, response messages, or both. This default value is associated with the interface as a whole. It can be changed for individual methods of the interface by subsequent calls to the RegisterHeaderMethod (see page 863) method.

Required indicates whether the header must be included in messages about the interface. When Required is true, the header must be included and understood by the recipient of the message. When Required is false, the header is optional. Note that if the header is required by some but not all messages, you must set this Required parameter to false, and then add the requirement to individual methods by subsequent calls to the RegisterHeaderMethod (see page 863) method.

Note: After a call to RegisterHeaderClass, the header class is registered so that it is associated with all methods of the specified interface. If only a subset of the interface's methods use the header, or if the header should have a different method type for some of the methods on the interface, or if the header is required by a subset of the methods on the interface, you can indicate this by calling the RegisterHeaderMethod (see page 863) method for each method that the header accompanies.

See Also

RegisterInterface (see page 864)

TSOAPHeader (see page 908)

RegisterHeaderMethod (see page 863)

23.1.7.4.35 TInvokableClassRegistry.RegisterHeaderMethod Method

Registers methods of an invokable interface that make use of a registered header.

Pascal

```
procedure RegisterHeaderMethod(Info: PTypeInfo; AClass: TClass; const MethodName: string;
MethodType: eHeaderMethodType = hmtAll; Required: Boolean = False); overload;
```

C++

```
__fastcall RegisterHeaderMethod(PTypeInfo Info, TClass AClass, const UnicodeString MethodName,
eHeaderMethodType MethodType = hmtAll, Boolean Required = False);
```

Description

Call RegisterHeaderMethod for each method of an invokable interface that uses a registered header type. The header class must be previously registered by a call to the RegisterHeaderClass (see page 862) method. If you do not call RegisterHeaderMethod, then the WSDL document for the interface treats the header as associated with all methods of the interface. Use RegisterHeaderMethod if you want to

Limit the use of the header to a subset of the methods.

Specify whether the header is used for request messages, response messages, or both in a way that varies from method to method.

Indicate that the header is required for some methods but not others.

Call RegisterHeaderMethod for each method that uses the header. After the first method is registered this way, the header becomes limited to that method alone (and to any method subsequently registered by another call to RegisterHeaderMethod).

Info points to the type information of the invokable interface that the header should accompany.

AClass describes the TSOAPHeader (see page 908) descendant that represents the header. This class must be previously registered by a call to RegisterHeaderClass (see page 862).

MethodName is the name of a method that uses the header.

MethodType indicates whether the header is to be used on request messages, response messages, or both.

Required indicates whether the header must be included in messages about the specified method. When Required is true, the header must be included and understood by the recipient of the message. When Required is false, the header is optional.

See Also

RegisterInterface (see page 864)

TSOAPHeader (see page 908)

RegisterHeaderClass (see page 862)

23.1.7.4.36 TInvokableClassRegistry.RegisterInterface Method

Registers an invokable interface.

Pascal

```
procedure RegisterInterface(Info: PTypeInfo; const Namespace: InvString = ''; const
WSDLEncoding: InvString = ''; const Doc: string = ''; const ExtName: InvString = '');
```

C++

```
__fastcall RegisterInterface(PTypeInfo Info, const InvString Namespace = '', const InvString
WSDLEncoding = '', const UnicodeString Doc = '', const InvString ExtName = '');
```

Description

Call RegisterInterface to register an invokable interface with the invocation registry. Typically, the call to RegisterInterface is added by the WSDL importer or Web Service wizard. In Delphi, this call goes in the initialization section of the unit that defines the invokable interface. In C++, it is called within a RegTypes method that uses the pragma startup directive.

Once the invokable interface is registered, client applications can statically bind to it using THTTPRio. On the server side, you must also register the implementation class (using the RegisterInvokableClass (see page 865) method) before the server can respond to incoming SOAP requests.

PInfo is a pointer to the type information for the interface. You can obtain the type information from an invokable interface by calling the TypeInfo function (Delphi) or __delphirtti (C++).

Namespace specifies a namespace URI that uniquely identifies the interface. If Namespace is set to an empty string, RegisterInterface automatically generates a unique string to use as a namespace URI. Note that RegisterInterface generates a SOAP Action header to use based on the Namespace of the interface. You can change this SOAP Action header using the RegisterDefaultSOAPAction (see page 859) method.

WSDLEncoding specifies a encoding attribute that appears on the xml header of any WSDL document that includes the definition of this interface (or rather, the port type to which it corresponds). The encoding attribute describes the character set to use in the WSDL document.

Doc is a descriptive string that describes the purpose or use of the interface. It is used if the application publishes a WSDL document that defines this interface.

ExtName is the name of the port type that corresponds to this interface in a WSDL document. This can be an empty string if the

port type and interface have the same name. It is useful when a port type in a WSDL document has a name that is not a valid Object Pascal identifier (for example, a keyword).

DefSOAPAction is the SOAP Action header that should be used for messages that represent calls to the methods on this interface. If you do not supply a default SOAP Action header, your application uses an automatically-generated header that is based on the namespace of the interface.

UnRegisterInterface (see page 867)

RegisterDefaultSOAPAction (see page 859)

23.1.7.4.37 RegisterInvokableClass Method

This is the overview for the RegisterInvokableClass method overload.

Overload List

	Name	Description
	TInvokableClassRegistry.RegisterInvokableClass (TClass) (see page 865)	Registers the implementation class for an invokable interface.
	TInvokableClassRegistry.RegisterInvokableClass (TClass, TCreateInstanceProc) (see page 865)	Registers the implementation class for an invokable interface.

23.1.7.4.37.1 TInvokableClassRegistry.RegisterInvokableClass Method (TClass)

Registers the implementation class for an invokable interface.

Pascal

```
procedure RegisterInvokableClass(AClass: TClass; CreateProc: TCreateInstanceProc); overload;
procedure RegisterInvokableClass(AClass: TClass); overload;
```

C++

```
__fastcall RegisterInvokableClass(TClass AClass, TCreateInstanceProc CreateProc);
__fastcall RegisterInvokableClass(TClass AClass);
```

Description

RegisterInvokableClass registers the class that implements an already-registered invokable interface. It is only needed on server applications that implement Web Services. The interface itself is registered by the RegisterInterface (see page 864) method.

The invocation registry must be able to instantiate the implementation class. If the class has a virtual constructor that takes no arguments, you do not need to supply a method to create the class instance. If the constructor takes any arguments, of if it is not virtual, you must supply a method to instantiate the class as the value of the CreateProc argument.

AClass is a class reference to the class being registered. In Delphi code, you need only supply the class name. In C++, you can obtain a class reference for a class using the __classid operator.

CreateProc is a procedure that returns an instance of AClass. If CreateProc is nil (Delphi) or NULL (C++), then AClass must be a descendant of TInvokableClass (see page 833).

See Also

RegisterInterface (see page 864)

UnRegisterInvokableClass (see page 868)

TInvokableClass (see page 833)

23.1.7.4.38 RegisterInvokeOptions Method

This is the overview for the RegisterInvokeOptions method overload.

Overload List

	Name	Description
	TInvokableClassRegistry.RegisterInvokeOptions (PTypeInfo, TIntfInvokeOption) (see page 866)	Registers flags that customize the way calls to a registered interface are made.
	TInvokableClassRegistry.RegisterInvokeOptions (PTypeInfo, TIntfInvokeOptions) (see page 866)	Registers flags that customize the way calls to a registered interface are made.

23.1.7.4.38.1 TInvokableClassRegistry.RegisterInvokeOptions Method (PTypeInfo, TIntfInvokeOption)

Registers flags that customize the way calls to a registered interface are made.

Pascal

```
procedure RegisterInvokeOptions(Info: PTypeInfo; const InvokeOption: TIntfInvokeOption);
overload;
procedure RegisterInvokeOptions(Info: PTypeInfo; const InvokeOptions: TIntfInvokeOptions);
overload;
```

C++

```
__fastcall RegisterInvokeOptions(PTypeInfo Info, const TIntfInvokeOption InvokeOption);
__fastcall RegisterInvokeOptions(PTypeInfo Info, const TIntfInvokeOptions InvokeOptions);
```

Description

RegisterInvokeOptions associates the specified invocation flag or flags with a registered interface. The interface must be previously registered by a call to the RegisterInterface (see page 864) method. Invocation flags customize the way a registered interface is called, especially the way such calls are marshaled or unmarshaled.

Info identifies the registered interface using its runtime type information (RTTI). You can obtain the type information from an invokable interface by calling the TypeInfo function (delphi) or __delphirtti (C++).

InvokeOption specifies a single invocation option to associate with the interface.

InvokeOptions specifies a set of invocation options to associate with the interface.

Note: RegisterInvokeOptions adds the specified option or options to the set of invocation flags already registered for the interface. It does not remove any previously registered options.

GetIntfInvokeOptions (see page 851)

Converter

Options (see page 2781)

RegisterInterface (see page 864)

23.1.7.4.39 TInvokableClassRegistry.RegisterReturnParamNames Method

Registers a list of parameter names that map to return values of interface methods.

Pascal

```
procedure RegisterReturnParamNames(Info: PTypeInfo; const RetParamNames: string);
```

C++

```
__fastcall RegisterReturnParamNames(PTypeInfo Info, const UnicodeString RetParamNames);
```

Description

RegisterReturnParamNames registers a list of parameter names that correspond to the return value of methods on a specified interface. Typically, this method is called by the WSDL importer. It is important that these names correspond exactly to those that the WSDL importer uses if the interface was imported from a WSDL document.

Info is the type information pointer for the invokable interface whose method return values map to the names in the list.

RetParamNames is a semicolon delimited list of parameter names that map to return values of methods on the specified interface. If RetParamNames is an empty string, the methods of the interface never have a return value (only output parameters). If no return parameter names are registered for an interface, the default list, 'Result;Return', is used.

See Also

GetReturnParamNames (see page 856)

23.1.7.4.40 TInvokableClassRegistry.RegisterUDDIInfo Method

Registers the location of the UDDI description that can be used to import the location of a Web Service.

Pascal

```
procedure RegisterUDDIInfo(Info: PTypeInfo; const Operator: String; const BindingKey: string);
```

C++

```
__fastcall RegisterUDDIInfo(PTypeInfo Info, const UnicodeString Operator, const UnicodeString
BindingKey);
```

Description

Typically, applications do not need to call RegisterUDDIInfo. This method is called internally when a registered interface is imported using the UDDI browser. It associates the location of the imported UDDI entry with a registered interface so that the application can later provide fail-over support by re-fetching the location of the Web Service.

Info is the runtime type information (RTTI) from a registered invokable interface. The interface must have been previously registered by a call to the RegisterInterface (see page 864) method.

Operator is the URL of the UDDI registry that was used to import the interface definition.

BindingKey is the unique identifier for the TModel that describes the Web Service to which the interface belongs.

See Also

GetUDDIInfo (see page 856)

RegisterInterface (see page 864)

23.1.7.4.41 TInvokableClassRegistry.UnRegisterInterface Method

Unregisters an invokable interface.

Pascal

```
procedure UnRegisterInterface(Info: PTypeInfo);
```

C++

```
__fastcall UnRegisterInterface(PTypeInfo Info);
```

Description

Call UnRegisterInterface to unregister an invokable interface from the invocation registry. In Delphi, this call goes in the finalization section of the unit that defines the invokable interface. In C++, it is called from a method that uses the pragma exit directive.

Once an invokable interface is unregistered, client applications can no longer call it and server applications can't respond to calls directed at the interface methods.

Info is a pointer to the runtime type information for the interface. You can obtain the type information from an invokable interface by calling the TypeInfo function in Delphi or __delphirtti in C++.

See Also

UnRegisterInvokableClass (see page 868)

IInvokable

RegisterInterface (see page 864)

23.1.7.4.42 TInvokableClassRegistry.UnRegisterInvokableClass Method

Unregisters the implementation class for an invokable interface.

Pascal

```
procedure UnRegisterInvokableClass(AClass: TClass);
```

C++

```
__fastcall UnRegisterInvokableClass(TClass AClass);
```

Description

UnRegisterInvokableClass unregisters an implementation class that was previously registered by a call to RegisterInvokableClass (see page 865). Once a class is unregistered, the invocation registry can no longer create and use instances of the specified class to handle incoming method calls to its corresponding invokable interface.

AClass is a class reference to the class being unregistered.

See Also

UnRegisterInterface (see page 867)

RegisterInvokableClass (see page 865)

23.1.8 TRemotable Class

TRemotable is the base class for classes that can be passed as parameters or return values in a Web Service application.

Class Hierarchy

Pascal

```
TRemotable = class;
```

C++

```
class TRemotable;
```

File

InvokeRegistry

Description

Use TRemotable as a base class when defining a class that can be used for parameters or return values on an invokable interface. TRemotable descendants can represent non-scalar types, or scalar types that do not correspond to Object Pascal types. TRemotable is compiled with runtime type information (RTTI) and has a virtual constructor that the remotable class registry recognizes and uses to supply class instances.

Note: To create a class that represents scalar values that do not correspond directly to an Object Pascal type, use TRemotableXS (see page 892) as a base class instead. TRemotableXS (see page 892) is a descendant of the TRemotable class.

Note: When writing a TRemotable descendant, you can control whether a property is encoded as an element node or as an attribute node by using the stored directive. Properties declared with a stored directive set to AS_ATTRIBUTE (see page 956) are encoded as attribute nodes. Properties that are declared without a stored directive, or with a stored directive set to anything other than AS_ATTRIBUTE (see page 956) are encoded as element nodes.

Both the client application and server application must register a TRemotable descendant with the remotable class registry before they can use it. To register a remotable class, use the RegisterXSClass method of the object that the global RemTypeRegistry (see page 931) function returns.

On server applications, instances of TRemotable descendants that are input parameters on an invokable interface are automatically created when the method call is unmarshaled and automatically freed after any output parameters or return value are marshaled so that they can be sent to the client. When a TRemotable descendant is created in a method that was called remotely using an invokable interface, the instance is automatically freed after the value of the TRemotable descendant is marshaled for transport back to the client application.

The caller of an invokable interface (client) is responsible for creating any TRemotable instances that it passes as input parameters, and for freeing any TRemotable instances it creates or that are returned as output parameters or method results.

Using Remotable Objects

23.1.8.1 TRemotable Members

The following tables list the members exposed by TRemotable.

Protected Fields

	Name	Description
	FSerializationOptions (see page 871)	This is FSerializationOptions, a member of class TRemotable.

Public Methods

	Name	Description
	Create (see page 870)	Creates and initializes a TRemotable (see page 868) object.
	Destroy (see page 870)	Frees the memory associated with the TRemotable (see page 868) object.
	ObjectToSOAP (see page 871)	Converts this remotable object to its SOAP representation.
	SOAPToObject (see page 872)	Initializes this TRemotable (see page 868) instance to represent the value of its SOAP representation.

Public Properties

	Name	Description
	DataContext (see page 873)	Specifies the object that controls the lifetime of a TRemotable (see page 868) instance.
	SerializationOptions (see page 873)	Indicates how the value of the TRemotable (see page 868) descendant encodes its value.

23.1.8.2 TRemotable.Create Constructor

Creates and initializes a TRemotable (see page 868) object.

Pascal

```
constructor Create; virtual;
```

C++

```
virtual __fastcall TRemotable();
```

Description

The TRemotable (see page 868) constructor does nothing special. It exists primarily because

The remotable type registry knows how to call it.

It is virtual, so that the remotable type registry can also instantiate descendant classes.

See Also

RemTypeRegistry (see page 931)

23.1.8.3 TRemotable.Destroy Destructor

Frees the memory associated with the TRemotable (see page 868) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRemotable();
```

Description

Use the Free method to free a TRemotable (see page 868) instance. Free checks that the object is not nil before calling Destroy.

On server applications, there is typically no need to explicitly free a TRemotable (see page 868) instance (for example, one

created as a return value or output parameter). By default, when a TRemotable (see page 868) descendant is created in a method that was called remotely using an invokable interface, it is added to a data context (the value of the DataContext (see page 873) property). As long as the remotable object belongs to the data context, the data context handles freeing the object. Similarly, TRemotable (see page 868) instances that are passed in as a parameter belong to the data context.

On client applications, TRemotable (see page 868) instances created and passed to an invokable interface or returned as a parameter or result of an invokable interface must be freed by the calling application.

See Also

System::TObject::Free

DataContext (see page 873)

23.1.8.4 TRemotable Fields

The fields of the TRemotable class are listed here.

Protected Fields

	Name	Description
	FSerializationOptions (see page 871)	This is FSerializationOptions, a member of class TRemotable.

23.1.8.4.1 TRemotable.FSerializationOptions Field

Pascal

```
FSerializationOptions: TSerializationOptions;
```

C++

```
TSerializationOptions FSerializationOptions;
```

Description

This is FSerializationOptions, a member of class TRemotable.

23.1.8.5 TRemotable Methods

The methods of the TRemotable class are listed here.

Public Methods

	Name	Description
	ObjectToSOAP (see page 871)	Converts this remotable object to its SOAP representation.
	SOAPToObject (see page 872)	Initializes this TRemotable (see page 868) instance to represent the value of its SOAP representation.

23.1.8.5.1 TRemotable.ObjectToSOAP Method

Converts this remotable object to its SOAP representation.

Pascal

```
function ObjectToSOAP(RootNode: IXMLNode; ParentNode: IXMLNode; const ObjConverter:
IObjConverter; const Name: InvString; const URI: InvString; ObjConvOpts:
TObjectConvertOptions; out RefID: InvString): IXMLNode; virtual;
```

C++

```
virtual __fastcall IXMLNode ObjectToSOAP(IXMLNode RootNode, IXMLNode ParentNode, const
IObjConverter ObjConverter, const InvString Name, const InvString URI, TObjectConvertOptions
ObjConvOpts, InvString RefID);
```

Description

Override ObjectToSOAP to customize the way your application converts a TRemotable (see page 868) descendant to its SOAP representation. In TRemotable (see page 868), ObjectToSOAP simply calls the ObjInstanceToSOAP method of the converter that is supplied by the ObjConverter parameter.

RootNode is an ancestor of the generated node to which information about the generated node can be added as attributes.

ParentNode is the node in the SOAP representation that should act as a parent to the node that ObjectToSOAP generates.

ObjConverter is the interface of the default converter that translates between remotable objects and their SOAP representation. This is the interface to a TOPToSoapDomConvert instance.

Name is the name of the node that is generated.

URI is the URI for the namespace in which Name is defined.

ObjConvOpts are flags that customize the way the node is serialized.

RefID returns a reference ID for the node. This is used if the node is multi-referenced.

ObjectToSOAP returns the XML for the newly generated node.

See Also

ObjInstanceToSOAP (see page 922)

SOAPToObject (see page 872)

23.1.8.5.2 TRemotable.SOAPToObject Method

Initializes this TRemotable (see page 868) instance to represent the value of its SOAP representation.

Pascal

```
procedure SOAPToObject(const RootNode: IXMLNode; const Node: IXMLNode; const ObjConverter:
IObjConverter); virtual;
```

C++

```
virtual __fastcall SOAPToObject(const IXMLNode RootNode, const IXMLNode Node, const
IObjConverter ObjConverter);
```

Description

SOAPToObject initializes the published properties of this object instance so that they reflect the header's SOAP representation. Override this method to customize the way your application creates a specific remotable type from its XML representation.

RootNode is an ancestor node of the node for this object that can contain information about the remotable type's value.

Node is the node in the SOAP envelope that represents the remotable type's value.

ObjConverter is the interface of the default converter that translates between remotable objects and their SOAP representation. This is the interface to a TOPToSoapDomConvert instance.

In TRemotable (see page 868), SOAPToObject simply calls the InitObjectFromSOAP method of the converter supplied by the ObjConverter parameter.

See Also

ObjectToSOAP (see page 871)

InitObjectFromSOAP (see page 922)

23.1.8.6 TRemotable Properties

The properties of the TRemotable class are listed here.

Public Properties

	Name	Description
	DataContext (see page 873)	Specifies the object that controls the lifetime of a TRemotable (see page 868) instance.
R	SerializationOptions (see page 873)	Indicates how the value of the TRemotable (see page 868) descendant encodes its value.

23.1.8.6.1 TRemotable.DataContext Property

Specifies the object that controls the lifetime of a TRemotable (see page 868) instance.

Pascal

```
property DataContext: TDataContext;
```

C++

```
__property TDataContext DataContext;
```

Description

By default, when a Web Service application creates an instance of a remotable object, that object exists only for the time it takes to marshal the information it represents or to unmarshal that information into the TRemotable (see page 868) instance and then make a method call that uses the instance. The object specified by DataContext handles the freeing of the TRemotable (see page 868) instance.

There are times when a server may not want the TRemotable (see page 868) instance to be so transient. For example, if the object contains state information, it may be more efficient to have a single instance that is used for every message call. If you change DataContext, the TRemotable (see page 868) instance is removed from the data context, and is not freed when the data context goes away at the end of the method call.

Note: If DataContext is nil (Delphi) or NULL (C++), the application is responsible for freeing the TRemotable (see page 868) instance. For example, TRemotable (see page 868) objects created on client applications are created with a nil (Delphi) or NULL (C++) value for DataContext and must be freed by the client application.

See Also

Using Remotable Objects

23.1.8.6.2 TRemotable.SerializationOptions Property

Indicates how the value of the TRemotable (see page 868) descendant encodes its value.

Pascal

```
property SerializationOptions: TSerializationOptions;
```

C++

```
__property TSerializationOptions SerializationOptions;
```

Description

SerializationOptions is used internally when an instance of TRemotable (see page 868) is converted to or from its SOAP encoding. The value of this property is a set of flags that configure the mapping between the published properties of the TRemotable (see page 868) descendant and the corresponding SOAP encoding.

Typically, the value of this read-only property is set by the constructor of a TRemotable (see page 868) descendant or by the WSDL importer when it registers a remotable class.

See Also

SerializeOptions (see page 887)

RegisterSerializeOptions (see page 884)

23.1.9 TRemotableTypeRegistry Class

TRemotableTypeRegistry is the type of the remotable type registry.

Class Hierarchy

Pascal

```
TRemotableTypeRegistry = class;
```

C++

```
class TRemotableTypeRegistry;
```

File

InvokeRegistry

Description

TRemotableTypeRegistry manages information about remotable classes and types that can be communicated between client applications and a Web Service provider. Remotable classes can be used to represent non-scalar types for parameters and return values, or they can represent exceptions that occur when the Web Service application is trying to execute a request. All remotable classes are compiled with runtime type information (RTTI) and have a virtual constructor that the remotable type registry recognizes and uses to supply class instances. Remotable types include dynamic arrays, enumerated types, and boolean types, which can be used in an invokable interface without resorting to a remotable class representation, but which must be registered because their values require special marshaling.

Both the client application and server application must register remotable classes and types with the remotable type registry before they can use them. Use the RegisterXSClass (see page 885) method to register a remotable class. Use the RegiterXSInfo method to register a dynamic array type or enumerated type.

Do not create instances of TRemotableTypeRegistry. Instead, use the global RemTypeRegistry (see page 931) function to access the remotable type registry. Most applications need only call the RegisterXSClass (see page 885) or RegisterXSInfo (see page 886) methods. The other TRemotableTypeRegistry methods are used internally to create or look up information about remotable classes and types.

ERemotableException (see page 810)

TInvokableClassRegistry (see page 840)

23.1.9.1 TRemotableTypeRegistry Members

The following tables list the members exposed by TRemotableTypeRegistry.

Protected Methods

	Name	Description
	Lock (see page 883)	Prevents other threads from accessing the type registry.
	UnLock (see page 888)	Allows other threads to access the type registry after it was locked.

Public Methods

	Name	Description
	ClassOptions (see page 877)	Indicates how to handle multiple references to the same object when converting a specified remotable class to its SOAP representation.
	ClassToURI (see page 878)	This is the overview for the ClassToURI method overload.
	Create (see page 876)	Creates and initializes a TRemotableTypeRegistry (see page 874) object.
	Destroy (see page 876)	Frees the memory associated with the TRemotableTypeRegistry (see page 874) object.
	GetExternalPropName (see page 879)	Returns the name of the XML element that corresponds to a property of a registered remotable class.
	GetInternalPropName (see page 879)	Returns the name of the property on a remotable class that corresponds to a specified XML element.
	GetURICount (see page 879)	Returns the number of entries in the remotable type registry.
	GetURIMap (see page 880)	This is the overview for the GetURIMap method overload.
	GetVarTypeFromXSD (see page 881)	Returns the variant type that corresponds to a registered remotable type.
	GetXSDInfoForClass (see page 881)	Returns type name and namespace URI that correspond to a remotable class.
	InfoToURI (see page 882)	Returns the namespace URI and type name for a registered type.
	IsClassScalar (see page 882)	Indicates whether a registered class represents a scalar type.
	RegisterExternalPropName (see page 883)	Registers the correspondence between a property name on a remotable class and the corresponding element name in an XML schema.
	RegisterHolderClsMember (see page 883)	Registers a remotable type whose type information must be extracted from a holder class.
	RegisterSerializeOptions (see page 884)	This is the overview for the RegisterSerializeOptions method overload.
	RegisterXSClass (see page 885)	Registers a remotable class.
	RegisterXSInfo (see page 886)	Registers a remotable type.
	SerializeOptions (see page 887)	This is the overview for the SerializeOptions method overload.
	TypeInfoToXSD (see page 887)	Returns the type name and namespace URI registered with a remotable class or type.
	UnRegisterXSClass (see page 888)	Unregisters a remotable class.
	UnRegisterXSInfo (see page 889)	Unregisters a remotable type.
	URIToClass (see page 889)	This is the overview for the URIToClass method overload.
	URIToInfo (see page 890)	Returns the type information pointer for a registered remotable class or type.
	VariantToInfo (see page 890)	Returns the TypeInfo pointer for the type of a specified Variant's data.
	XSDToTypeInfo (see page 891)	Returns the type information pointer associated with a specified type name.

Public Properties

	Name	Description
	AutoRegisterNativeTypes (see page 891)	Specifies whether types that are used in an invokable interface or by a remotable class are automatically registered.

23.1.9.2 TRemotableTypeRegistry.Create Constructor

Creates and initializes a TRemotableTypeRegistry (see page 874) object.

Pascal

```
constructor Create;
```

C++

```
__fastcall TRemotableTypeRegistry();
```

Description

Do not create your own instances of TRemotableTypeRegistry (see page 874). Instead, use the global RemTypeRegistry (see page 931) function, which provides access to a single global instance of TRemotableTypeRegistry (see page 874).

See Also

RemTypeRegistry (see page 931)

23.1.9.3 TRemotableTypeRegistry.Destroy Destructor

Frees the memory associated with the TRemotableTypeRegistry (see page 874) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRemotableTypeRegistry();
```

Description

Do not destroy the global TRemotableTypeRegistry (see page 874) instance that is available through the RemClassRegistry (see page 930) function. This object is freed automatically when the application unloads the InvokeRegistry (see page 807) unit.

See Also

RemClassRegistry (see page 930)

23.1.9.4 TRemotableTypeRegistry Methods

The methods of the TRemotableTypeRegistry class are listed here.

Protected Methods

	Name	Description
	Lock (see page 883)	Prevents other threads from accessing the type registry.
	UnLock (see page 888)	Allows other threads to access the type registry after it was locked.

Public Methods

	Name	Description
	ClassOptions (see page 877)	Indicates how to handle multiple references to the same object when converting a specified remotable class to its SOAP representation.
	ClassToURI (see page 878)	This is the overview for the ClassToURI method overload.
	GetExternalPropName (see page 879)	Returns the name of the XML element that corresponds to a property of a registered remotable class.

	GetInternalPropName (see page 879)	Returns the name of the property on a remotable class that corresponds to a specified XML element.
	GetURICount (see page 879)	Returns the number of entries in the remotable type registry.
	GetURIMap (see page 880)	This is the overview for the GetURIMap method overload.
	GetVarTypeFromXSD (see page 881)	Returns the variant type that corresponds to a registered remotable type.
	GetXSDInfoForClass (see page 881)	Returns type name and namespace URI that correspond to a remotable class.
	InfoToURI (see page 882)	Returns the namespace URI and type name for a registered type.
	IsClassScalar (see page 882)	Indicates whether a registered class represents a scalar type.
	RegisterExternalPropName (see page 883)	Registers the correspondence between a property name on a remotable class and the corresponding element name in an XML schema.
	RegisterHolderClsMember (see page 883)	Registers a remotable type whose type information must be extracted from a holder class.
	RegisterSerializeOptions (see page 884)	This is the overview for the RegisterSerializeOptions method overload.
	RegisterXSClass (see page 885)	Registers a remotable class.
	RegisterXSInfo (see page 886)	Registers a remotable type.
	SerializeOptions (see page 887)	This is the overview for the SerializeOptions method overload.
	TypeInfoToXSD (see page 887)	Returns the type name and namespace URI registered with a remotable class or type.
	UnRegisterXSClass (see page 888)	Unregisters a remotable class.
	UnRegisterXSInfo (see page 889)	Unregisters a remotable type.
	URIToClass (see page 889)	This is the overview for the URIToClass method overload.
	URIToInfo (see page 890)	Returns the type information pointer for a registered remotable class or type.
	VariantToInfo (see page 890)	Returns the TypeInfo pointer for the type of a specified Variant's data.
	XSDToTypeInfo (see page 891)	Returns the type information pointer associated with a specified type name.

23.1.9.4.1 TRemotableTypeRegistry.ClassOptions Method

Indicates how to handle multiple references to the same object when converting a specified remotable class to its SOAP representation.

Pascal

```
function ClassOptions(AClass: TClass): TObjMultiOptions;
```

C++

```
__fastcall TObjMultiOptions ClassOptions(TClass AClass);
```

Description

When an application converts a remotable class to its SOAP representation, it can convert multiple references to the same object in one of two ways. It can treat the object as if its properties have meaning, but not the reference itself. (That is, two references to the same object are equivalent values, but not the same thing.) Alternately, if the object reference itself has meaning, it can encode the fact that these are multiple references to the same entity in the SOAP packet.

Individual remotable classes can specify how they want this conversion to be handled, overriding any defaults that would otherwise be used. For example, THTTPRIO, THTTPSoapPascalInvoker, and THTTPSoapCppInvoker use TOPToSoapDomConvert to convert between remotable classes and their SOAP representation. TOPToSoapDomConvert has an Options property that specifies, among other things, whether to encode multiple references to the same object by value or as references. Individual remotable classes can supply an override to this default strategy when they are registered using the RegisterXSClass (see page 885) method.

ClassOptions returns how to handle multiple references of a specified class.

AClass is a class reference for the registered class that you want to know how to convert.

See Also

RegisterXSClass (see page 885)

Options (see page 2781)

IOPConvert (see page 2730)

THTTPSoapCppInvoker

THTTPSoapPascalInvoker

THTTPRIO

TOPToSoapDomConvert (see page 2747)

23.1.9.4.2 ClassToURI Method

This is the overview for the ClassToURI method overload.

Overload List

	Name	Description
	TRemotableTypeRegistry.ClassToURI (TClass, InvString, InvString) (see page 878)	Returns the namespace URI associated with a specified remotable class.
	TRemotableTypeRegistry.ClassToURI (TClass, InvString, InvString, Boolean, Boolean) (see page 878)	Returns the namespace URI associated with a specified remotable class.

23.1.9.4.2.1 TRemotableTypeRegistry.ClassToURI Method (TClass, InvString, InvString)

Returns the namespace URI associated with a specified remotable class.

Pascal

```
function ClassToURI(AClass: TClass; var URI: InvString; var Name: InvString; var IsScalar:
Boolean; tryToRegister: Boolean = True): Boolean; overload;
function ClassToURI(AClass: TClass; var URI: InvString; var Name: InvString): Boolean;
overload;
```

C++

```
__fastcall Boolean ClassToURI(TClass AClass, InvString URI, InvString Name, Boolean IsScalar,
Boolean tryToRegister = True);
__fastcall Boolean ClassToURI(TClass AClass, InvString URI, InvString Name);
```

Description

ClassToURI looks up a registered remotable class and retrieves its namespace URI and typename. The association of the class and its namespace URI and typename is established when you call RegisterXSClass (see page 885) to register the remotable class.

AClass is a class reference for the remotable class you want to look up.

URI returns the namespace URI that is associated with the class.

Name returns the registered name of the type the class represents.

IsScalar indicates whether the class corresponds to a scalar type in a WSDL document.

tryToRegister indicates whether the remotable type registry should auto-register the class that AClass specifies if it is not already registered. This parameter is only used if the AutoRegisterNativeTypes (see page 891) property is true.

See Also

RegisterXSClass (see page 885)

URIToClass (see page 889)

AutoRegisterNativeTypes (see page 891)

23.1.9.4.3 TRemotableTypeRegistry.GetExternalPropName Method

Returns the name of the XML element that corresponds to a property of a registered remotable class.

Pascal

```
function GetExternalPropName(Info: PTypeInfo; InternalName: string): InvString;
```

C++

```
__fastcall InvString GetExternalPropName(PTypeInfo Info, UnicodeString InternalName);
```

Description

Use GetExternalPropName to obtain the name of the XML element that was registered as the XML schema analog of a property on a registered remotable class. The association between the element and the property must be previously registered by the RegisterExternalPropName (see page 883) method.

Info points to the type information of the remotable class that has the property.

InternalName is the name of the property from which you want to obtain the corresponding XML element name.

See Also

GetInternalPropName (see page 879)

RegisterExternalPropName (see page 883)

23.1.9.4.4 TRemotableTypeRegistry.GetInternalPropName Method

Returns the name of the property on a remotable class that corresponds to a specified XML element.

Pascal

```
function GetInternalPropName(Info: PTypeInfo; ExternalName: InvString): string;
```

C++

```
__fastcall UnicodeString GetInternalPropName(PTypeInfo Info, InvString ExternalName);
```

Description

Use GetInternalPropName to obtain the name of the property on a registered remotable class that corresponds to a specified XML element. The association between the element and the property must be previously registered by the RegisterExternalPropName (see page 883) method.

Info points to the type information of the remotable class that has the property.

ExternalName is the name of an XML element that is part of a complex type defined in an XML schema. The remotable class identified by Info must represent the complex type that includes ExternalName.

See Also

GetExternalPropName (see page 879)

RegisterExternalPropName (see page 883)

23.1.9.4.5 TRemotableTypeRegistry.GetURICount Method

Returns the number of entries in the remotable type registry.

Pascal

```
function GetURICount: Integer;
```

C++

```
__fastcall int GetURICount();
```

Description

GetURICount returns the number of entries in the remotable type registry. This value can be used as an upper bound for the index parameter of the GetURIMap (see page 880) method.

Each entry in the remotable type registry represents a registered class or a registered type. The RegisterXSClass (see page 885) method adds entries for classes, and the The RegisterXSInfo (see page 886) method adds entries for types. Each entry associates the class or type with a unique namespace URI.

See Also

GetURIMap (see page 880)

RegisterXSClass (see page 885)

RegisterXSInfo (see page 886)

23.1.9.4.6 GetURIMap Method

This is the overview for the GetURIMap method overload.

Overload List

	Name	Description
	TRemotableTypeRegistry.GetURIMap (Integer) (see page 880)	Returns an entry from the remotable type registry.
	TRemotableTypeRegistry.GetURIMap (Integer, TRemRegEntry) (see page 880)	Returns an entry from the remotable type registry.

23.1.9.4.6.1 TRemotableTypeRegistry.GetURIMap Method (Integer)

Returns an entry from the remotable type registry.

Pascal

```
function GetURIMap(Index: Integer): TRemRegEntry; overload;
function GetURIMap(Index: Integer; out RegEntry: TRemRegEntry): boolean; overload;
```

C++

```
__fastcall TRemRegEntry GetURIMap(int Index);
__fastcall boolean GetURIMap(int Index, TRemRegEntry RegEntry);
```

Description

GetURIMap returns an entry from the remotable type registry that is identified by its index. It is useful for operations that iterate over all the registered entries. Use the GetURICount (see page 879) method to obtain an upper bound for the index.

Index is the index of the entry you want to see.

Using the first syntax, GetURIMap returns a TRemRegEntry (see page 944) value that describes a registered class or type.

Using the second syntax, the RegEntry parameter returns the TRemRegEntry (see page 944) at the specified index. Using this syntax, GetURIMap returns true if Index is a valid index, false if Index is out of range.

The TRemRegEntry (see page 944) value that this method returns is used to represent both remotable classes, which are added using the RegisterXSClass (see page 885) method, and remotable types, which are added using the RegisterXSInfo (see page 886) method.

See Also

GetURICount (see page 879)

RegisterXSClass (see page 885)

23.1.9.4.7 TRemotableTypeRegistry.GetVarTypeFromXSD Method

Returns the variant type that corresponds to a registered remotable type.

Pascal

```
function GetVarTypeFromXSD(const URI: InvString; const TypeName: InvString): TVarType;
```

C++

```
__fastcall TVarType GetVarTypeFromXSD(const InvString URI, const InvString TypeName);
```

Description

GetVarTypeFromXSD returns the built-in Variant type that corresponds most naturally to a remotable type that was registered by a call to the RegisterXSInfo (see page 886) method.

URI is the namespace URI associated with the type when it was registered.

TypeName is the type name associated with the type when it was registered.

See Also

VariantToInfo (see page 890)

XSDToTypeInfo (see page 891)

URIToInfo (see page 890)

RegisterXSInfo (see page 886)

23.1.9.4.8 TRemotableTypeRegistry.GetXSDInfoForClass Method

Returns type name and namespace URI that correspond to a remotable class.

Pascal

```
procedure GetXSDInfoForClass(Info: PTypeInfo; var URI: InvString; var TypeName: InvString);
```

C++

```
__fastcall GetXSDInfoForClass(PTypeInfo Info, InvString URI, InvString TypeName);
```

Description

GetXSDInfoForClass returns the type name under which a remotable class is registered, along with the namespace URI in which that type name is defined. The class must be previously registered by a call to the RegisterXSClass (see page 885) method.

Info is the type info pointer for the registered remotable class.

URI returns the namespace URI that was associated with the class when it was registered.

TypeName returns the type name that was associated with the class when it was registered.

See Also

RegisterXSClass (see page 885)

XSDToTypeInfo (see page 891)

23.1.9.4.9 TRemotableTypeRegistry.InfoToURI Method

Returns the namespace URI and type name for a registered type.

Pascal

```
function InfoToURI(Info: PTypeInfo; var URI: InvString; var Name: InvString; var IsScalar:
Boolean; tryToRegister: Boolean = True): Boolean;
```

C++

```
__fastcall Boolean InfoToURI(PTypeInfo Info, InvString URI, InvString Name, Boolean IsScalar,
Boolean tryToRegister = True);
```

Description

InfoToURI returns the namespace URI and type name that is associated with the specified type description. This association is established when you register a type by calling the RegisterXSInfo (see page 886) method.

Info is a pointer to the runtime type information (RTTI) for the registered type.

URI returns the namespace URI that is associated with the type.

Name returns the registered name of the type.

IsScalar indicates whether the type corresponds to a scalar type in a WSDL document.

tryToRegister indicates whether the remotable type registry should auto-register the type that Info specifies if it is not already registered. This parameter is only used if the AutoRegisterNativeTypes (see page 891) property is true.

See Also

RegisterXSInfo (see page 886)

AutoRegisterNativeTypes (see page 891)

23.1.9.4.10 TRemotableTypeRegistry.IsClassScalar Method

Indicates whether a registered class represents a scalar type.

Pascal

```
function IsClassScalar(AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean IsClassScalar(TClass AClass);
```

Description

IsClassScalar returns true if the specified class represents a scalar type. Classes that represent scalar types descend from the TRemotableXS (see page 892) class, and can convert their value to or from a string.

AClass identifes the class to check. It must be previously registered by a call to RegisterXSClass (see page 885).

See Also

RegisterXSClass (see page 885)

TRemotableXS (see page 892)

23.1.9.4.11 TRemotableTypeRegistry.Lock Method

Prevents other threads from accessing the type registry.

Pascal

```
procedure Lock; virtual;
```

C++

```
virtual __fastcall Lock();
```

Description

Lock uses a critical section to prevent simultaneous use of the type registry by multiple threads in the same application. Once one thread has called Lock to obtain access to the type registry, no other thread can return from the Lock method until the first thread has called the UnLock (see page 888) method to release its lock.

Lock is called automatically by the methods of TRemotableTypeRegistry (see page 874).

See Also

UnLock (see page 888)

23.1.9.4.12 TRemotableTypeRegistry.RegisterExternalPropName Method

Registers the correspondence between a property name on a remotable class and the corresponding element name in an XML schema.

Pascal

```
procedure RegisterExternalPropName(Info: PTypeInfo; const InternalName: string; const
ExternalName: InvString);
```

C++

```
__fastcall RegisterExternalPropName(PTypeInfo Info, const UnicodeString InternalName, const
InvString ExternalName);
```

Description

Use RegisterExternalPropName to create an association between the name of an element in an XML schema complex type and the corresponding property of the remotable class that represents that type. This allows the remotable class to represent complex types that include elements with names that are not valid (for example, keywords).

Info points to the type information of the remotable class that corresponds to a complex type defined in an XML schema.

InternalName is the name used for the property of the remotable class that corresponds to the element.

ExternalName is the name of the element that is part of the complex type that the XML schema defines.

23.1.9.4.13 TRemotableTypeRegistry.RegisterHolderClsMember Method

Registers a remotable type whose type information must be extracted from a holder class.

Pascal

```
procedure RegisterHolderClsMember(ClsTypeInfo: PTypeInfo; const URI: InvString = ''; const
Name: InvString = ''; const ExtName: InvString = '');
```

C++

```
__fastcall RegisterHolderClsMember(PTypeInfo ClsTypeInfo, const InvString URI = '', const
InvString Name = '', const InvString ExtName = '');
```

Description

Use RegisterHolderClsMember to register a type that is used as the type of the only published property of a holder class. This method is used primarily for C++ applications, which can contain types that require a holder class so that the compiler can extract their runtime type information (RTTI). If the holder class contains more than one published property, use the RegisterXSInfo (see page 886) method after extracting the type information from the property using the global GetClsMemberTypeInfo (see page 792) function.

Info points to the type information of the holder class that has a single published member whose type you want to register.

URI is the namespace URI to associate with the type that is registered. This should uniquely identify the type. If you omit this parameter or supply an empty string, RegisterXSInfo (see page 886) generates a namespace URI for you, based on the name of the type, the name of the unit in which it is declared, and the value of the global AppNameSpacePrefix (see page 955) variable. Note that the namespace URI must be the same in both client and server applications. In Delphi, if you do not explicitly supply a namespace URI, the class must be declared in a unit with the same name, and the value of AppNameSpacePrefix (see page 955) must be the same in both applications. In C++, the client application must always explicitly supply a namespace.

Name is the name of the type as it appears in native code.

ExtName is the name of the type as it appears in encoded method calls and WSDL documents.

See Also

GetClsMemberTypeInfo (see page 792)

RegisterXSInfo (see page 886)

23.1.9.4.14 RegisterSerializeOptions Method

This is the overview for the RegisterSerializeOptions method overload.

Overload List

	Name	Description
	TRemotableTypeRegistry.RegisterSerializeOptions (PTypeInfo, TSerializationOptions) (see page 884)	Registers a set of serialization options that should be used with a registered remotable class or type.
	TRemotableTypeRegistry.RegisterSerializeOptions (TClass, TSerializationOptions) (see page 884)	Registers a set of serialization options that should be used with a registered remotable class or type.

23.1.9.4.14.1 TRemotableTypeRegistry.RegisterSerializeOptions Method (PTypeInfo, TSerializationOptions)

Registers a set of serialization options that should be used with a registered remotable class or type.

Pascal

```
procedure RegisterSerializeOptions(Info: PTypeInfo; SerialOpt: TSerializationOptions);
overload;
procedure RegisterSerializeOptions(AClass: TClass; SerialOpt: TSerializationOptions); overload;
```

C++

```
__fastcall RegisterSerializeOptions(PTypeInfo Info, TSerializationOptions SerialOpt);
__fastcall RegisterSerializeOptions(TClass AClass, TSerializationOptions SerialOpt);
```

Description

RegisterSerializeOptions associates a registered remotable class or type with a set of flags that indicate how to encode or decode its value. Typically, this method is called by the WSDL importer.

AClass identifes the class for which you are supplying serialization options. It must be previously registered by a call to RegisterXSClass (see page 885).

Info is the runtime type information for a type when you are supplying serialization options for a type rather than a class. It must be previously registered by a call to RegisterXSInfo (see page 886).

SerialOpt is the set of flags that customize how the class is encoded or decoded.

See Also

SerializationOptions (see page 873)

SerializeOptions (see page 887)

RegisterXSClass (see page 885)

RegisterXSInfo (see page 886)

Defining and Using SOAP Headers

23.1.9.4.15 TRemotableTypeRegistry.RegisterXSClass Method

Registers a remotable class.

Pascal

```
procedure RegisterXSClass(AClass: TClass; const URI: InvString = ''; const Name: InvString =
'''; const ExtName: InvString = ''; IsScalar: Boolean = False; MultiRefOpt: TObjMultiOptions =
ocDefault);
```

C++

```
__fastcall RegisterXSClass(TClass AClass, const InvString URI = '', const InvString Name = '',
const InvString ExtName = '', Boolean IsScalar = False, TObjMultiOptions MultiRefOpt =
ocDefault);
```

Description

Call RegisterXSClass to register a remotable class so that it can be communicated between client applications and a Web Service provider. All remotable classes are compiled with runtime type information (RTTI) and have a virtual constructor that the remotable type registry recognizes and uses to supply class instances.

When the remotable class is a TRemotable (see page 868) descendant, it can be used to represent non-scalar types for parameters and return values on an invokable interface. When it is an ERemotableException (see page 810) descendant, it allows the Web Service application to send clients a fault packet that includes all the published properties of the exception class.

AClass is the class reference for the remotable class. In Delphi, you specify this in code using the class name. In C++, you can obtain this class reference for a class using the __classid keyword.

URI is the namespace URI to associate with that class. This should uniquely identify the class. If you omit this parameter (or supply an empty string), RegisterXSClass generates a namespace URI for you, based on the name of the class, the name of the unit in which it is declared, and the value of the global AppNameSpacePrefix (see page 955) variable. Note that the namespace URI must be the same in both client and server applications. Thus, if you do not explicitly supply a namespace URI, the class must be declared in a unit with the same name, and the value of AppNameSpacePrefix (see page 955) must be the same in both applications.

Name is the name of a type that the class represents. This is used for the mapping between the class and its definition in a WSDL document.

ExtName is the same as Name.

IsScalar indicates whether the class represents a scalar type. Remotable classes that represent scalar types must implement the XSToNative and NativeToXS methods.

MultiRefOpt indicates how multiple references to the same instance of the class should be handled when converting them to their SOAP representation. For more information, see the ClassOptions (see page 877) method.

See Also

TRemotable (see page 868)

ClassOptions (see page 877)

Creating Custom Exception Classes for Web Services

Registering Nonscalar Types

23.1.9.4.16 TRemotableTypeRegistry.RegisterXSInfo Method

Registers a remotable type.

Pascal

```
procedure RegisterXSInfo(Info: PTypeInfo; const URI: InvString = ''; const Name: InvString =
'''; const ExtName: InvString = '');
```

C++

```
__fastcall RegisterXSInfo(PTypeInfo Info, const InvString URI = '', const InvString Name = '',
const InvString ExtName = '');
```

Description

Call RegisterXSInfo to register a type that requires special marshaling but does not need to be represented by a TRemotable (see page 868) descendant before it can be marshaled for transport to or from a Web Services provider. Such types include dynamic arrays such as the dynamic array types defined in the Types unit (Delphi) or sysdyn.h (C++), enumerated types, and boolean types (Delphi) or types defined using a typedef statement (C++).

Info is the TypeInfo pointer for the type. It can be obtained using the global TypeInfo function (Delphi) or the __delphirtti keyword (C++). In C++, it is sometimes obtained from a global function such as GetClsMemberTypeInfo (see page 792), which extracts the type information from a holder class.

URI is the namespace URI to associate with that type. This should uniquely identify the type. If you omit this parameter or supply an empty string, RegisterXSInfo generates a namespace URI for you, based on the name of the type, the name of the unit in which it is declared, and the value of the global AppNameSpacePrefix (see page 955) variable. Note that the namespace URI must be the same in both client and server applications. In Delphi, if you do not explicitly supply a namespace URI, the class must be declared in a unit with the same name, and the value of AppNameSpacePrefix (see page 955) must be the same in both applications. In C++, the client application must always explicitly supply a namespace.

Name is the name of the type as it appears in native code.

ExtName is the name of the type as it appears in encoded method calls and WSDL documents.

See Also

AppNameSpacePrefix (see page 955)

UnRegisterXSInfo (see page 889)

GetClsMemberTypeInfo (see page 792)

Registering Nonscalar Types

23.1.9.4.17 SerializeOptions Method

This is the overview for the SerializeOptions method overload.

Overload List

	Name	Description
	TRemotableTypeRegistry.SerializeOptions (PTypeInfo) (see page 887)	Returns the serialization options for a registered remotable class or type.
	TRemotableTypeRegistry.SerializeOptions (TClass) (see page 887)	Returns the serialization options for a registered remotable class or type.

23.1.9.4.17.1 TRemotableTypeRegistry.SerializeOptions Method (PTypeInfo)

Returns the serialization options for a registered remotable class or type.

Pascal

```
function SerializeOptions(Info: PTypeInfo): TSerializationOptions; overload;
function SerializeOptions(AClass: TClass): TSerializationOptions; overload;
```

C++

```
__fastcall TSerializationOptions SerializeOptions(PTypeInfo Info);
__fastcall TSerializationOptions SerializeOptions(TClass AClass);
```

Description

SerializeOptions is used internally to retrieve the flags that describe how a remotable class or type is encoded and decoded. These flags are associated with the remotable class or type by calling the RegisterSerializeOptions (see page 884) method.

AClass is the registered class for which you want to retrieve serialization options.

Info is the runtime type information for the registered type for which you want to retrieve serialization options.

SerializeOptions returns the value of SerializationOptions (see page 940) for the class that AClass specifies or the registered options for the type that Info specifies..

See Also

SerializationOptions (see page 873)

RegisterSerializeOptions (see page 884)

23.1.9.4.18 TRemotableTypeRegistry.TypeInfoToXSD Method

Returns the type name and namespace URI registered with a remotable class or type.

Pascal

```
function TypeInfoToXSD(Info: PTypeInfo; var URI: InvString; var TypeName: InvString): Boolean;
```

C++

```
__fastcall Boolean TypeInfoToXSD(PTypeInfo Info, InvString URI, InvString TypeName);
```

Description

TypInfoToXSD returns a type name and namespace URI from a type information pointer. The type information can describe either a remotable class that was previously registered by a call to RegisterXSClass (see page 885), or a remotable type that was previously registered by a call to RegisterXSInfo (see page 886).

Info is the type information pointer that describes the class or type.

URI returns the namespace URI that was associated with the class or type when it was registered.

TypeName returns the type name that was associated with the class or type when it was registered.

See Also

XSDToTypeInfo (see page 891)

RegisterXSInfo (see page 886)

RegisterXSClass (see page 885)

InfoToURI (see page 882)

23.1.9.4.19 TRemotableTypeRegistry.UnLock Method

Allows other threads to access the type registry after it was locked.

Pascal

```
procedure UnLock; virtual;
```

C++

```
virtual __fastcall UnLock();
```

Description

UnLock exits the critical section that the Lock (see page 883) method entered. It reenables other threads access to the type registry after a call to the Lock (see page 883) method.

Every call to the Lock (see page 883) method must be paired by a call to UnLock when the locking thread is finished with the type registry. The methods of TRemotableTypeRegistry (see page 874) that call the Lock (see page 883) method also call the UnLock method when they are finished.

See Also

Lock (see page 883)

23.1.9.4.20 TRemotableTypeRegistry.UnRegisterXSClass Method

Unregisters a remotable class.

Pascal

```
procedure UnRegisterXSClass(AClass: TClass);
```

C++

```
__fastcall UnRegisterXSClass(TClass AClass);
```

Description

Call UnRegisterXSClass to Unregister a remotable class that was previously registered by a call to the RegisterXSClass (see page 885) method. In Delphi, this call is made in the finalization section of the unit that implements the remotable class. In C++, it is made from a method that uses the pragma exit directive in the unit that implements the remotable class.

AClass is the class reference for the remotable class. In Delphi code, you specify this using the class name. In C++, you can obtain this class reference for a class using the __classid keyword.

See Also

TRemotable (see page 868)

ERemotableException (see page 810)

RegisterXSClass (see page 885)

23.1.9.4.21 TRemotableTypeRegistry.UnRegisterXSInfo Method

Unregisters a remotable type.

Pascal

```
procedure UnRegisterXSInfo(Info: PTypeInfo);
```

C++

```
__fastcall UnRegisterXSInfo(PTypeInfo Info);
```

Description

Call UnRegisterXSInfo to unregister a type that was previously registered (directly or indirectly) by a call to the RegisterXSInfo (see page 886) method.

Info is the TypeInfo pointer for the type. It is the same as the Info parameter of the RegisterXSInfo (see page 886) method.

See Also

RegisterXSInfo (see page 886)

23.1.9.4.22 URIToClass Method

This is the overview for the URIToClass method overload.

Overload List

	Name	Description
	TRemotableTypeRegistry.URIToClass (InvString, InvString) (see page 889)	Returns the class associated with a specified namespace URI.
	TRemotableTypeRegistry.URIToClass (InvString, InvString, Boolean) (see page 889)	Returns the class associated with a specified namespace URI.

23.1.9.4.22.1 TRemotableTypeRegistry.URIToClass Method (InvString, InvString)

Returns the class associated with a specified namespace URI.

Pascal

```
function URIToClass(const URI: InvString; const Name: InvString; var IsScalar: Boolean):
TClass; overload;
function URIToClass(const URI: InvString; const Name: InvString): TClass; overload;
```

C++

```
__fastcall TClass URIToClass(const InvString URI, const InvString Name, Boolean IsScalar);
__fastcall TClass URIToClass(const InvString URI, const InvString Name);
```

Description

URIToClass looks up a registered remotable class given its namespace URI and typename.

URI is the namespace URI associated with the class. This association is established by the RegisterXSClass (see page 885) method.

Name is the name of the type that the class represents. If the class does not have a corresponding type name, Name should be an empty string.

IsScalar returns true if the class represents a scalar type, false otherwise.

URIToClass returns the class reference for the class identified by URI (and Name).

See Also

RegisterXSClass (see page 885)

ClassToURI (see page 878)

23.1.9.4.23 TRemotableTypeRegistry.URIToInfo Method

Returns the type information pointer for a registered remotable class or type.

Pascal

```
function URIToInfo(const URI: InvString; const Name: InvString): PTypeInfo;
```

C++

```
__fastcall PTypeInfo URIToInfo(const InvString URI, const InvString Name);
```

Description

URIToInfo looks up a registered remotable class or type given its namespace URI and typename. It returns the type information pointer that describes the type or class.

URI is the namespace URI associated with the class or type. This association is established by the RegisterXSClass (see page 885) or RegisterXSInfo (see page 886) method.

Name is the type name that was associated with the class or type when it was registered.

Tip: To look up the type information for a namespace and type that may possibly represent a built-in XML schema type, use the XSDToTypeInfo (see page 891) method instead.

See Also

RegisterXSClass (see page 885)

InfoToURI (see page 882)

RegisterXSInfo (see page 886)

23.1.9.4.24 TRemotableTypeRegistry.VariantToInfo Method

Returns the TypeInfo pointer for the type of a specified Variant's data.

Pascal

```
function VariantToInfo(const V: Variant; TryAllSchema: Boolean): PTypeInfo;
```

C++

```
__fastcall PTypeInfo VariantToInfo(const Variant V, Boolean TryAllSchema);
```

Description

VariantToInfo returns the TypeInfo pointer of the scalar type that represents the value of a Variant. If the Variant's value is not a scalar type that can be marshaled without using a registered object or type, VariantToInfo raises an ETypeRegistryException (see page 813) exception.

V is the Variant for which you want the corresponding TypeInfo pointer.

TryAllSchema specifies whether VariantToInfo should check for corresponding scalar type definitions in the XML schema associated with this application, or whether it should check all the possible sets of XML schema types that are defined in the

xmlschema unit.

See Also

VarType

ETypeRegistryException (see page 813)

23.1.9.4.25 TRemotableTypeRegistry.XSDToTypeInfo Method

Returns the type information pointer associated with a specified type name.

Pascal

```
function XSDToTypeInfo(const URI: InvString; const TypeName: InvString): PTypeInfo;
```

C++

```
__fastcall PTypeInfo XSDToTypeInfo(const InvString URI, const InvString TypeName);
```

Description

XSDToTypeInfo looks up a namespace URI and typename, and returns the type information pointer that describes the corresponding Object Pascal type or class. Unlike the URIToInfo (see page 890) method, XSDToTypeInfo can look up built-in type correspondences that do not need to be registered.

URI is the namespace URI for the type.

TypeName is the type name to look up.

See Also

RegisterXSClass (see page 885)

URIToInfo (see page 890)

RegisterXSInfo (see page 886)

23.1.9.5 TRemotableTypeRegistry Properties

The properties of the TRemotableTypeRegistry class are listed here.

Public Properties

	Name	Description
	AutoRegisterNativeTypes (see page 891)	Specifies whether types that are used in an invokable interface or by a remotable class are automatically registered.

23.1.9.5.1 TRemotableTypeRegistry.AutoRegisterNativeTypes Property

Specifies whether types that are used in an invokable interface or by a remotable class are automatically registered.

Pascal

```
property AutoRegisterNativeTypes: Boolean;
```

C++

```
__property Boolean AutoRegisterNativeTypes;
```

Description

When AutoRegisterNativeTypes is true (the default), type definitions are automatically registered when the invokable interface or remotable class that uses them is registered. That is, when you register an invokable interface with the invocation registry or

when you register a remotable class with the remotable type registry, the registry checks whether it makes use of types that are not yet registered, and if so, registers them as well. Note that you can still provide your own registration (for example, to control the external name or namespace) by registering the type before the call that registers the interface or remotable class.

See Also

RegisterXSInfo (see page 886)

RegisterXSClass (see page 885)

23.1.10 TRemotableXS Class

TRemotableXS is the base class for classes that represent a non-native scalar type on an invokable interface in a Web Service application.

Class Hierarchy

Pascal

```
TRemotableXS = class(TRemotable);
```

C++

```
class TRemotableXS : public TRemotable;
```

File

InvokeRegistry

Description

Use TRemotableXS as a base class when defining a class to represent scalar values from a WSDL document that have no corresponding Object Pascal type. When creating a TRemotableXS descendant, override the XSToNative (see page 895) and NativeToXS (see page 893) methods to indicate how the value of the class can be converted to and from the string representation that is used to encode the value for transport.

Both the client application and server application must register a TRemotableXS descendant with the remotable class registry before they can use it. To register a remotable class, use the RegisterXSClass method of the object that the global RemTypeRegistry (see page 931) function returns.

On server applications, instances of TRemotableXS descendants that are input parameters on an invokable interface are automatically created when the method call is unmarshaled and automatically freed after any output parameters or return value are marshaled so that they can be sent to the client. When a TRemotableXS descendant is created in a method that was called remotely using an invokable interface, the instance is automatically freed after the value of the TRemotable (see page 868) descendant is marshaled for transport back to the client application.

The caller of an invokable interface (client) is responsible for creating any TRemotableXS instances that it passes as input parameters, and for freeing any TRemotableXS instances it creates or that are returned as output parameters or method results.

Using Remotable Objects

23.1.10.1 TRemotableXS Members

The following tables list the members exposed by TRemotableXS.

Protected Fields

	Name	Description
	FSerializationOptions (see page 871)	This is FSerializationOptions, a member of class TRemotable.

Public Methods

	Name	Description
	Create (see page 870)	Creates and initializes a TRemotable (see page 868) object.
	Destroy (see page 870)	Frees the memory associated with the TRemotable (see page 868) object.
	NativeToXS (see page 893)	Returns a string that represents the value of a TRemotableXS (see page 892) instance.
	ObjectToSOAP (see page 894)	Converts this remotable object to its SOAP representation.
	SOAPToObject (see page 894)	Initializes this TRemotableXS (see page 892) instance to represent the value of its SOAP representation.
	XSToNative (see page 895)	Assigns the value of a string to the TRemotableXS (see page 892) instance.

Public Properties

	Name	Description
	DataContext (see page 873)	Specifies the object that controls the lifetime of a TRemotable (see page 868) instance.
	SerializationOptions (see page 873)	Indicates how the value of the TRemotable (see page 868) descendant encodes its value.

23.1.10.2 TRemotableXS Methods

The methods of the TRemotableXS class are listed here.

Public Methods

	Name	Description
	NativeToXS (see page 893)	Returns a string that represents the value of a TRemotableXS (see page 892) instance.
	ObjectToSOAP (see page 894)	Converts this remotable object to its SOAP representation.
	SOAPToObject (see page 894)	Initializes this TRemotableXS (see page 892) instance to represent the value of its SOAP representation.
	XSToNative (see page 895)	Assigns the value of a string to the TRemotableXS (see page 892) instance.

23.1.10.2.1 TRemotableXS.NativeToXS Method

Returns a string that represents the value of a TRemotableXS (see page 892) instance.

Pascal

```
function NativeToXS: InvString; virtual; abstract;
```

C++

```
virtual __fastcall InvString NativeToXS() = 0;
```

Description

Override NativeToXS when implementing a TRemotableXS (see page 892) descendant that represents a non-native scalar type. NativeToXS returns a string that represents the value of the TRemotableXS (see page 892) instance. This string is used when marshaling the value of the TRemotableXS (see page 892) descendant.

Classes that implement NativeToXS must also override the XSToNative (see page 895) method so that it performs the converse transformation.

See Also

XSToNative (see page 895)

Using Remotable Objects

23.1.10.2.2 TRemotableXS.ObjectToSOAP Method

Converts this remotable object to its SOAP representation.

Pascal

```
function ObjectToSOAP(RootNode: IXMLNode; ParentNode: IXMLNode; const ObjConverter:
IObjConverter; const Name: InvString; const URI: InvString; ObjConvOpts:
TObjectConvertOptions; out RefID: InvString): IXMLNode; override;
```

C++

```
virtual __fastcall IXMLNode ObjectToSOAP(IXMLNode RootNode, IXMLNode ParentNode, const
IObjConverter ObjConverter, const InvString Name, const InvString URI, TObjectConvertOptions
ObjConvOpts, InvString RefID);
```

Description

Override ObjectToSOAP to customize the way your application converts a TRemotableXS (see page 892) descendant to its SOAP representation. In TRemotableXS (see page 892), ObjectToSOAP uses the default conversion, replacing the text of the node with the value that the NativeToXS (see page 893) method supplies.

RootNode is an ancestor of the generated node to which information about the generated node can be added as attributes.

ParentNode is the node in the SOAP representation that should act as a parent to the node that ObjectToSOAP generates.

ObjConverter is the interface of the default converter that translates between remotable objects and their SOAP representation. This is the interface to a TOPToSoapDomConvert instance.

Name is the name of the node that is generated.

URI is the URI for the namespace in which Name is defined.

ObjConvOpts are flags that customize the way the node is serialized.

RefID returns a reference ID for the node. This is used if the node is multi-referenced.

ObjectToSOAP returns the XML for the newly generated node.

See Also

SOAPToObject (see page 894)

NativeToXS (see page 893)

23.1.10.2.3 TRemotableXS.SOAPToObject Method

Initializes this TRemotableXS (see page 892) instance to represent the value of its SOAP representation.

Pascal

```
procedure SOAPToObject(const RootNode: IXMLNode; const Node: IXMLNode; const ObjConverter:
IObjConverter); override;
```

C++

```
virtual __fastcall SOAPToObject(const IXMLNode RootNode, const IXMLNode Node, const
```

```
IObjConverter ObjConverter);
```

Description

SOAPToObject initializes the published properties of this object instance so that they reflect the header's SOAP representation. Override this method to customize the way your application creates a scalar value from its XML representation.

RootNode is an ancestor node of the node for this object that can contain information about the remotable type's value.

Node is the node in the SOAP envelope that represents the remotable type's value.

ObjConverter is the interface of the default converter that translates between remotable objects and their SOAP representation. This is the interface to a TOPToSoapDomConvert instance.

In TRemotableXS (see page 892), SOAPToObject calls the XSToNative (see page 895) method, passing in the text of the specified node.

See Also

ObjectToSOAP (see page 894)

XSToNative (see page 895)

23.1.10.2.4 TRemotableXS.XSToNative Method

Assigns the value of a string to the TRemotableXS (see page 892) instance.

Pascal

```
procedure XSToNative(Data: InvString); virtual; abstract;
```

C++

```
virtual __fastcall XSToNative(InvString Data) = 0;
```

Description

Override XSToNative when implementing a TRemotableXS (see page 892) descendant that represents a non-native scalar type. NativeToXS (see page 893) interprets a string that represents the value of the TRemotableXS (see page 892) instance and uses it to make any necessary changes so that the TRemotableXS (see page 892) object reflects that value. It reverses the transformation that the NativeToXS (see page 893) method performs.

Data is a string that represents the value of the TRemotableXS (see page 892) instance.

See Also

NativeToXS (see page 893)

Using Remotable Objects

23.1.11 TSOAPAttachment Class

TSOAPAttachment represents an attachment that is included with SOAP messages that represent method calls in a Web Service application.

Class Hierarchy

Pascal

```
TSOAPAttachment = class(TRemotable);
```

C++

```
class TSOAPAttachment : public TRemotable;
```

File

InvokeRegistry

Description

Use TSOAPAttachment to receive or send an attachment as a parameter or return value of a method on an invokable interface. When a SOAP method call requires an attachment, it is marshaled as a MIME multipart form, where any attachments are included as additional parts.

Warning: Some Web Services (such as .Net) use DIME multipart forms rather than MIME multipart forms for attachments. TSOAPAttachment will not work with such services.

Note: Only use TSOAPAttachment and its descendants as the type for parameters or the return value of a method of an invokable interface. TSOAPAttachment can't be used as part of a more complex type, such as the type of a published property on a remotable object.

When sending an attachment, use the SourceString (see page 908) property or the SetSourceFile (see page 902) or SetSourceStream (see page 903) method to supply the attachment data. Use the ContentType (see page 905) property to indicate the type (encoding) of the attachment data.

When receiving an attachment, the attachment is automatically stored in a temporary file, whose name is given by the CacheFile (see page 904) property. You can copy the contents of this temporary file using the SaveToFile (see page 901) or SaveToStream (see page 901) method. To determine the format of the data, read the ContentType (see page 905) property. You can read any of the other headers for the part of the multipart form that contained the attachment using the Headers (see page 906) property. By default, when the TSOAPAttachment object is freed, it deletes the temporary file that contains the attachment data that was received. You can use the CacheFilePersist (see page 905) property to prevent this file from being deleted.

Note: If you use TSOAPAttachment as a base class for a customized attachment class, it is marshaled as a TSOAPAttachment value. That is, the application that receives the attachment sees it only as a TSOAPAttachment instance, not as an instance of the descendant class.

The application must register TSOAPAttachment with the remotable class registry before it can use this class. To register TSOAPAttachment or one of its descendants, use the RegisterXSClass method of the object that the global RemTypeRegistry (see page 931) function returns. When you import a WSDL document, the call to register TSOAPAttachment is automatically added if any of the interfaces use attachments.

The caller of an invokable interface (client) is responsible for creating any TSOAPAttachment instances that it passes as input parameters, and for freeing any TSOAPAttachment instances it creates or that are returned as output parameters or method results.

In Web Service applications (servers), any TSOAPAttachment instances that represent parameters or return values are added to the data context, which frees them as necessary.

TRemotableTypeRegistry (see page 874)

IInvokable

Using Remotable Objects

23.1.11.1 TSOAPAttachment Members

The following tables list the members exposed by TSOAPAttachment.

Protected Fields

	Name	Description
	FSerializationOptions (see page 871)	This is FSerializationOptions, a member of class TRemotable.

Protected Methods

	Name	Description
V	GetSourceStream (see page 899)	This is GetSourceStream, a member of class TSOAPAttachment.
V	InternalSetCacheFile (see page 900)	This is InternalSetCacheFile, a member of class TSOAPAttachment.
	InternalSetSourceStream (see page 900)	This is InternalSetSourceStream, a member of class TSOAPAttachment.
V	SetOwnership (see page 902)	This is SetOwnership, a member of class TSOAPAttachment.
V	SetSourceString (see page 903)	This is SetSourceString, a member of class TSOAPAttachment.

Public Methods

	Name	Description
V	Create (see page 897)	Creates and initializes a TSOAPAttachment (see page 895) object.
V	Destroy (see page 898)	Frees the memory associated with the TSOAPAttachment (see page 895) object.
	Init (see page 899)	Initializes the properties of a TSOAPAttachment (see page 895) instance.
V	ObjectToSOAP (see page 900)	Converts this attachment object to its SOAP representation.
	SaveToFile (see page 901)	Saves the contents of the attachment to a specified file.
	SaveToStream (see page 901)	Saves the contents of the attachment to a specified file.
V	SetSourceFile (see page 902)	Specifies a file from which TSOAPAttachment (see page 895) can read the content of the attachment.
V	SetSourceStream (see page 903)	Specifies a stream from which TSOAPAttachment (see page 895) can read the content of the attachment.
V	SOAPToObject (see page 903)	Initializes this TSOAPAttachment (see page 895) instance to represent the value of its SOAP representation.

Public Properties

	Name	Description
R	CacheFile (see page 904)	Identifies the temporary file where the attachment is saved.
	CacheFilePersist (see page 905)	Indicates whether the temporary file that contains the attachment data is deleted when TSOAPAttachment (see page 895) is freed.
	ContentType (see page 905)	Specifies the MIME type of the attachment data.
	DataContext (see page 873)	Specifies the object that controls the lifetime of a TRemotable (see page 868) instance.
	Encoding (see page 906)	Indicates the encoding (character set) of the body of the attachment.
R	Headers (see page 906)	Indicates the values of the headers received with the attachment.
	Ownership (see page 907)	Indicates whether the TSOAPAttachment (see page 895) object should free its source stream.
R	SerializationOptions (see page 873)	Indicates how the value of the TRemotable (see page 868) descendant encodes its value.
R	SourceStream (see page 907)	Indicates a stream from which to read the content of an attachment that the application sends.
	SourceString (see page 908)	Specifies a string that is sent as the value of the attachment.

23.1.11.2 TSOAPAttachment.Create Constructor

Creates and initializes a TSOAPAttachment (see page 895) object.

Pascal

```
constructor Create; override;
```

C++

```
virtual __fastcall TSOAPAttachment();
```

Description

Call Create to instantiate a TSOAPAttachment (see page 895) object for an attachment you wish to send. When an application receives a SOAP attachment, an instance of TSOAPAttachment (see page 895) is created automatically to represent that attachment.

23.1.11.3 TSOAPAttachment.Destroy Destructor

Frees the memory associated with the TSOAPAttachment (see page 895) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSOAPAttachment();
```

Description

Do not call Destroy to free a TSOAPAttachment (see page 895) object. Instead, use the Free method, which checks for a nil reference before calling Destroy.

On server applications, there is typically no need to explicitly free a TSOAPAttachment (see page 895) instance (for example, one created as a return value or output parameter). By default, when a TSOAPAttachment (see page 895) descendant is created in a method that was called remotely using an invokable interface, it is added to a data context (the value of the DataContext (see page 873) property). As long as the remotable object belongs to the data context, the data context handles freeing the object. Similarly, TSOAPAttachment (see page 895) instances that are passed in as a parameter belong to the data context.

On client applications, TSOAPAttachment (see page 895) instances created and passed to an invokable interface or returned as a parameter or result of an invokable interface must be freed by the calling application.

See Also

DataContext (see page 873)

System::TObject::Free

23.1.11.4 TSOAPAttachment Methods

The methods of the TSOAPAttachment class are listed here.

Protected Methods

	Name	Description
	GetSourceStream (see page 899)	This is GetSourceStream, a member of class TSOAPAttachment.
	InternalSetCacheFile (see page 900)	This is InternalSetCacheFile, a member of class TSOAPAttachment.
	InternalSetSourceStream (see page 900)	This is InternalSetSourceStream, a member of class TSOAPAttachment.
	SetOwnership (see page 902)	This is SetOwnership, a member of class TSOAPAttachment.
	SetSourceString (see page 903)	This is SetSourceString, a member of class TSOAPAttachment.

Public Methods

	Name	Description
	Init (see page 899)	Initializes the properties of a TSOAPAttachment (see page 895) instance.
V	ObjectToSOAP (see page 900)	Converts this attachment object to its SOAP representation.
	SaveToFile (see page 901)	Saves the contents of the attachment to a specified file.
	SaveToStream (see page 901)	Saves the contents of the attachment to a specified file.
V	SetSourceFile (see page 902)	Specifies a file from which TSOAPAttachment (see page 895) can read the content of the attachment.
V	SetSourceStream (see page 903)	Specifies a stream from which TSOAPAttachment (see page 895) can read the content of the attachment.
V	SOAPToObject (see page 903)	Initializes this TSOAPAttachment (see page 895) instance to represent the value of its SOAP representation.

23.1.11.4.1 TSOAPAttachment.GetSourceStream Method

Pascal

```
function GetSourceStream: TStream; virtual;
```

C++

```
virtual __fastcall TStream GetSourceStream();
```

Description

This is GetSourceStream, a member of class TSOAPAttachment.

23.1.11.4.2 TSOAPAttachment.Init Method

Initializes the properties of a TSOAPAttachment (see page 895) instance.

Pascal

```
procedure Init(ATempLocation: string; AHeaders: TStrings; AContentType: String; AEncoding:
InvString);
```

C++

```
__fastcall Init(UnicodeString ATempLocation, TStrings AHeaders, UnicodeString AContentType,
InvString AEncoding);
```

Description

Init sets the values of the CacheFile (see page 904), Headers (see page 906), ContentType (see page 905), and Encoding (see page 906) properties to the values supplied as parameters. It is used internally to initialize a TSOAPAttachment (see page 895) instance to describe an attachment that the application received.

ATempLocation is the name of the temporary file where the attachment has been stored. It becomes the value of the CacheFile (see page 904) property.

AHeaders lists the headers from the portion of the multipart form that represented this attachment. It becomes the value of the Headers (see page 906) property.

AContentType is the content-type of the attachment. It becomes the value of the ContentType (see page 905) property.

AEncoding is the character set encoding used for the attachment. It becomes the value of the Encoding (see page 906) property.

See Also

CacheFile (see page 904)

Headers (see page 906)

ContentType (see page 905)

Encoding (see page 906)

23.1.11.4.3 TSOAPAttachment.InternalSetCacheFile Method

Pascal

```
procedure InternalSetCacheFile(const Value: string); virtual;
```

C++

```
virtual __fastcall InternalSetCacheFile(const UnicodeString Value);
```

Description

This is InternalSetCacheFile, a member of class TSOAPAttachment.

23.1.11.4.4 TSOAPAttachment.InternalSetSourceStream Method

Pascal

```
procedure InternalSetSourceStream(const Value: TStream; const Ownership: TStreamOwnership =
soReference);
```

C++

```
__fastcall InternalSetSourceStream(const TStream Value, const TStreamOwnership Ownership =
soReference);
```

Description

This is InternalSetSourceStream, a member of class TSOAPAttachment.

23.1.11.4.5 TSOAPAttachment.ObjectToSOAP Method

Converts this attachment object to its SOAP representation.

Pascal

```
function ObjectToSOAP(RootNode: IXMLNode; ParentNode: IXMLNode; const ObjConverter:
IObjConverter; const Name: InvString; const URI: InvString; ObjConvOpts:
TObjectConvertOptions; out RefID: InvString): IXMLNode; override;
```

C++

```
virtual __fastcall IXMLNode ObjectToSOAP(IXMLNode RootNode, IXMLNode ParentNode, const
IObjConverter ObjConverter, const InvString Name, const InvString URI, TObjectConvertOptions
ObjConvOpts, InvString RefID);
```

Description

ObjectToSOAP customizes the way an application converts a TSOAPAttachment (see page 895) object to its SOAP representation. In TSOAPAttachment (see page 895), ObjectToSOAP calls the inherited method, adding ocoDontSerializeProps and ocoDontPutTypeAttr to the ObjConvOpts flags so that the converter ignores the published properties and does not add type information to the generated node. It then generates a unique identifier for the attachment and calls the converter's AddAttachment method to properly generate the SOAP representation of the attachment.

RootNode is an ancestor of the generated node to which information about the node can be added as attributes.

ParentNode is the node in the SOAP representation that should act as a parent to the node that ObjectToSOAP generates.

ObjConverter is the interface of the default converter that translates between remotable objects and their SOAP representation. This is the interface to a TOPToSoapDomConvert instance.

Name is the name of the node that is generated for the attachment.

URI is the URI for the namespace in which Name is defined.

ObjConvOpts are flags that customize the way the node is serialized.

RefID returns a reference ID for the node. This is used if the node is multi-referenced.

ObjectToSOAP returns the XML for the newly generated node.

See Also

ObjInstanceToSOAP (see page 922)

AddAttachment (see page 921)

SOAPToObject (see page 903)

23.1.11.4.6 TSOAPAttachment.SaveToFile Method

Saves the contents of the attachment to a specified file.

Pascal

```
procedure SaveToFile(AFileName: string);
```

C++

```
__fastcall SaveToFile(UnicodeString AFileName);
```

Description

Call SaveToFile to save the contents of the attachment to a specified file. This content can come from

The temporary file that the CacheFile (see page 904) property indicates.

The stream that the SourceStream (see page 907) property specifies.

The file that the SetSourceFile (see page 902) method supplies.

The string that the SourceString (see page 908) property specifies.

AFileName is the name of the file to which SaveToFile writes the content of the attachment.

See Also

CacheFile (see page 904)

SourceStream (see page 907)

SourceString (see page 908)

SaveToStream (see page 901)

23.1.11.4.7 TSOAPAttachment.SaveToStream Method

Saves the contents of the attachment to a specified file.

Pascal

```
procedure SaveToStream(AStream: TStream);
```

C++

```
__fastcall SaveToStream(TStream AStream);
```

Description

Call SaveToStream to write the contents of the attachment to a specified stream. This content can come from

The temporary file that the CacheFile (see page 904) property indicates.

The stream that the SourceStream (see page 907) property specifies.

The file that the SetSourceFile (see page 902) method supplies.

The string that the SourceString (see page 908) property specifies.

AStream is the stream to which SaveToStream writes the content of the attachment.

See Also

CacheFile (see page 904)

SourceStream (see page 907)

SourceString (see page 908)

SetSourceFile (see page 902)

23.1.11.4.8 TSOAPAttachment.SetOwnership Method

Pascal

```
procedure SetOwnership(const Value: TStreamOwnership); virtual;
```

C++

```
virtual __fastcall SetOwnership(const TStreamOwnership Value);
```

Description

This is SetOwnership, a member of class TSOAPAttachment.

23.1.11.4.9 TSOAPAttachment.SetSourceFile Method

Specifies a file from which TSOAPAttachment (see page 895) can read the content of the attachment.

Pascal

```
procedure SetSourceFile(const Value: string); virtual;
```

C++

```
virtual __fastcall SetSourceFile(const UnicodeString Value);
```

Description

Call SetSourceFile to supply the content of an attachment that the application sends from a file. SetSourceFile reads the content from the specified file, clears the SourceStream (see page 907) and SourceString (see page 908) properties, and sets the ContentType (see page 905) property to 'Application/binary'. If another MIME type string better describes the data, reset the ContentType (see page 905) property after calling SetSourceFile.

Value is the fully-qualified file name for the file whose content should be sent as an attachment.

See Also

ContentType (see page 905)

SetSourceStream (see page 903)

SourceString (see page 908)

23.1.11.4.10 TSOAPAttachment.SetSourceStream Method

Specifies a stream from which TSOAPAttachment (see page 895) can read the content of the attachment.

Pascal

```
procedure SetSourceStream(const Value: TStream; const Ownership: TStreamOwnership =
soReference); virtual;
```

C++

```
virtual __fastcall SetSourceStream(const TStream Value, const TStreamOwnership Ownership =
soReference);
```

Description

Call SetSourceStream to supply the content of an attachment that the application sends from a stream object. SetSourceStream assigns the specified stream as the value of the SourceStream (see page 907) property, clears the FileName and SourceString (see page 908) properties, and sets the ContentType (see page 905) property to 'Application/binary'. If another MIME type string better describes the data, reset the ContentType (see page 905) property after calling SetSourceStream.

Value is a stream from which TSOAPAttachment (see page 895) can read the content of the attachment.

Ownership (see page 907) indicates whether the TSOAPAttachment (see page 895) object should free the stream (Value) when it no longer needs it. It becomes the value of the Ownership (see page 907) property.

See Also

SourceStream (see page 907)

ContentType (see page 905)

Ownership (see page 907)

SourceString (see page 908)

SetSourceFile (see page 902)

23.1.11.4.11 TSOAPAttachment.SetSourceString Method

Pascal

```
procedure SetSourceString(const Value: string); virtual;
```

C++

```
virtual __fastcall SetSourceString(const UnicodeString Value);
```

Description

This is SetSourceString, a member of class TSOAPAttachment.

23.1.11.4.12 TSOAPAttachment.SOAPToObject Method

Initializes this TSOAPAttachment (see page 895) instance to represent the value of its SOAP representation.

Pascal

```
procedure SOAPToObject(const RootNode: IXMLNode; const Node: IXMLNode; const ObjConverter:
IObjConverter); override;
```

C++

```
virtual __fastcall SOAPToObject(const IXMLNode RootNode, const IXMLNode Node, const
IObjConverter ObjConverter);
```

Description

SOAPToObject initializes the published properties of this object instance so that they reflect the header's SOAP representation. In TSOAPAttachment (see page 895), this method calls the converter's FindAttachment method to locate information about the attachment, and then calls the Init (see page 899) method to initialize this object from the located information.

RootNode is an ancestor node of the attachment node that can contain information about the attachment node.

Node is the node in the SOAP envelope that represents a reference to the attachment.

ObjConverter is the interface of the default converter that translates between remotable objects and their SOAP representation. This is the interface to a TOPToSoapDomConvert instance.

In TSOAPAttachment (see page 895), SOAPToObject simply calls the InitObjectFromSOAP method of the converter supplied by the ObjConverter parameter.

See Also

ObjectToSOAP (see page 900)

FindAttachment (see page 922)

Init (see page 899)

23.1.11.5 TSOAPAttachment Properties

The properties of the TSOAPAttachment class are listed here.

Public Properties

	Name	Description
R	CacheFile (see page 904)	Identifies the temporary file where the attachment is saved.
	CacheFilePersist (see page 905)	Indicates whether the temporary file that contains the attachment data is deleted when TSOAPAttachment (see page 895) is freed.
	ContentType (see page 905)	Specifies the MIME type of the attachment data.
	Encoding (see page 906)	Indicates the encoding (character set) of the body of the attachment.
R	Headers (see page 906)	Indicates the values of the headers received with the attachment.
	Ownership (see page 907)	Indicates whether the TSOAPAttachment (see page 895) object should free its source stream.
R	SourceStream (see page 907)	Indicates a stream from which to read the content of an attachment that the application sends.
	SourceString (see page 908)	Specifies a string that is sent as the value of the attachment.

23.1.11.5.1 TSOAPAttachment.CacheFile Property

Identifies the temporary file where the attachment is saved.

Pascal

```
property CacheFile: string;
```

C++

```
__property UnicodeString CacheFile;
```

Description

CacheFile is set automatically when the application receives an attachment along with a SOAP message. This is the name of the temporary file where the application stores the contents of the attachment.

To save this temporary file to another file of your choosing, use the SaveToFile (see page 901) method. You can also save its contents to a stream, using the SaveToStream (see page 901) method.

The ContentType (see page 905) property indicates the format of the data in this temporary file.

By default, when the TSOAPAttachment (see page 895) object is freed, it deletes the temporary file that CacheFile indicates. Use the CacheFilePersist (see page 905) property to prevent this file from being deleted.

See Also

CacheFilePersist (see page 905)

ContentType (see page 905)

SaveToFile (see page 901)

SaveToStream (see page 901)

23.1.11.5.2 TSOAPAttachment.CacheFilePersist Property

Indicates whether the temporary file that contains the attachment data is deleted when TSOAPAttachment (see page 895) is freed.

Pascal

```
property CacheFilePersist: Boolean;
```

C++

```
__property Boolean CacheFilePersist;
```

Description

When CacheFilePersist is false (the default), the temporary file that the CacheFile (see page 904) property identifies is automatically deleted when the TSOAPAttachment (see page 895) instance is freed. You can save the information from the cache file using the SaveToFile (see page 901) or SaveToStream (see page 901) method before freeing the TSOAPAttachment (see page 895) instance.

When CacheFilePersist is true, the temporary file is not deleted when the TSOAPAttachment (see page 895) instance is freed.

See Also

CacheFile (see page 904)

SaveToFile (see page 901)

SaveToStream (see page 901)

23.1.11.5.3 TSOAPAttachment.ContentType Property

Specifies the MIME type of the attachment data.

Pascal

```
property ContentType: string;
```

C++

```
__property UnicodeString ContentType;
```

Description

Use ContentType to determine the MIME type (format) used for the data in the attachment.

When receiving an attachment, the ContentType property is automatically set to reflect the value of the content-type header of the part of the multipart form that holds the attachment. You can read this property to determine how to interpret the contents of the file that the CacheFile (see page 904) property indicates.

When sending an attachment, set ContentType to indicate the MIME type for the data you are sending. This property should not be set until after setting the SourceString (see page 908) property calling the SetSourceFile (see page 902) or SetSourceStream (see page 903) method. That is because calling SetSourceStream (see page 903) or SetSourceFile (see page 902) automatically sets ContentType to 'Application/binary', and setting SourceString (see page 908) automatically sets ContentType to 'Text/simple'. There is no need to reset ContentType if these values are correct.

See Also

CacheFile (see page 904)

SourceString (see page 908)

SetSourceFile (see page 902)

SetSourceStream (see page 903)

23.1.11.5.4 TSOAPAttachment.Encoding Property

Indicates the encoding (character set) of the body of the attachment.

Pascal

```
property Encoding: InvString;
```

C++

```
__property InvString Encoding;
```

Description

Use Encoding to look up or set the encoding type of the attachment's content. When sending an attachment, set this property to indicate the encoding that was used for the source you supply.

If you supply the attachment data as a string by setting the SourceString (see page 908) property, TSOAPAttachment (see page 895) assumes an encoding of UTF-8 if you do not set the Encoding property. If you supply the attachment data by calling SetSourceFile (see page 902) or SetSourceStream (see page 903), you must set the Encoding property, as TSOAPAttachment (see page 895) does not have a meaningful default encoding.

Note: Encoding indicates the encoding of the data that the SOAP attachment contains. The application does not automatically use this information to encode or decode that data.

See Also

ContentType (see page 905)

23.1.11.5.5 TSOAPAttachment.Headers Property

Indicates the values of the headers received with the attachment.

Pascal

```
property Headers: TStrings;
```

C++

```
__property TStrings Headers;
```

Description

Read Headers to determine the headers that appeared in the part of the multipart form that contained the attachment. Headers is only intended for attachments that the application receives. When sending attachments, the application automatically generates the headers that accompany the attachment.

Headers is a string list where each string has the form HeaderName=Value. HeaderName is the name of the header, such as

Content-Id, Content-Location, Content-Size, and so on. Value is the string that is the header value. Note that if you are only interested in the content type, you can use the ContentType (see page 905) property instead.

Note: Although the MIME specification states that the Content-Length header is optional, TSOAPAttachment (see page 895) requires this header and raises an exception if it is not present.

See Also

ContentType (see page 905)

CacheFile (see page 904)

23.1.11.5.6 TSOAPAttachment.Ownership Property

Indicates whether the TSOAPAttachment (see page 895) object should free its source stream.

Pascal

```
property Ownership: TStreamOwnership;
```

C++

```
__property TStreamOwnership Ownership;
```

Description

Ownership indicates whether TSOAPAttachment (see page 895) needs to free the stream that supplied the content of the attachment when the application supplied this data using the SetSourceStream (see page 903) method.

See Also

SourceStream (see page 907)

SetSourceStream (see page 903)

23.1.11.5.7 TSOAPAttachment.SourceStream Property

Indicates a stream from which to read the content of an attachment that the application sends.

Pascal

```
property SourceStream: TStream;
```

C++

```
__property TStream SourceStream;
```

Description

Read SourceStream to access the content of an attachment that the application is sending. When SourceStream is not nil (Delphi) or NULL (C++), the content of the attachment is read from this stream and the SourceString (see page 908) property is not set. Depending on the value of the Ownership (see page 907) property, SourceStream can be owned by the TSOAPAttachment (see page 895) object (in which case TSOAPAttachment (see page 895) frees the stream object when it is no longer needed) or can exist as an independent object that TSOAPAttachment (see page 895) does not free.

SourceStream is a read-only property. To specify a stream from which TSOAPAttachment (see page 895) reads its data, use the SetSourceStream (see page 903) method.

See Also

SourceString (see page 908)

SetSourceStream (see page 903)

Ownership (see page 907)

ContentType (see page 905)

23.1.11.5.8 TSOAPAttachment.SourceString Property

Specifies a string that is sent as the value of the attachment.

Pascal

```
property SourceString: string;
```

C++

```
__property UnicodeString SourceString;
```

Description

Use SourceString to supply the content of an attachment as a string.

Setting the SourceString property causes TSOAPAttachment (see page 895) to clear the SourceStream (see page 907) property and to set the ContentType (see page 905) property to 'Text/simple'. If another MIME type string better describes the data, reset the ContentType (see page 905) property after setting SourceString.

See Also

SourceStream (see page 907)

SetSourceStream (see page 903)

ContentType (see page 905)

SetSourceFile (see page 902)

23.1.12 TSOAPHeader Class

TSOAPHeader represents a header on the SOAP envelope that contains an encoded message in a Web Service application.

Class Hierarchy

Pascal

```
TSOAPHeader = class(TRemotable);
```

C++

```
class TSOAPHeader : public TRemotable;
```

File

InvokeRegistry

Description

TSOAPHeader is the base class for classes that represent SOAP headers. Each type of header has an associated TSOAPHeader descendant, which is registered with the remotable type registry. Register a TSOAPHeader descendant like any other remotable type, using the name of the header as the type name. If you import a WSDL document, the code to define and register the TSOAPHeader descendant is generated automtically.

You can also register the TSOAPHeader descendant with the invocation registry. The invocation registry's RegisterHeaderClass method associates the header class and the invokable interfaces with which it should be included. Registering the header with the invocation registry serves two purposes:

When a server publishes WSDL information about the Web Service, information about the header type is included in the resulting WSDL document.

On both servers and clients, the invocation registry associates the header class with a header name and a namespace in which that name is defined. This is important if the namespace for the header type is different than the namespace for the invokable interface that uses the header.

A SOAP header is a special remotable type that represents a node in the header section of a SOAP envelope. As with any other remotable type, the published properties of the TSOAPHeader descendant correspond to the child nodes and attributes of the corresponding header node. TSOAPHeader introduces two properties for common attributes of SOAP headers: MustUnderstand (see page 912) and Actor (see page 911). Typically, SOAP headers represent information that is associated with an entire invokable interface (port type) rather than just the method that is the focus of a single message.

When an application receives a SOAP message (that is, when a server receives a request to execute a method on an invokable interface or when a client receives a response after sending such a request), the headers on that message are automatically converted to the corresponding TSOAPHeader descendants that are registered with the remotable type registry. You can access these TSOAPHeader descendants using the ISOAPHeaders (see page 923) interface, which can be obtained from the implementation class of the invokable interface or from the invokable interface of a remote interfaced object.

When an application sends a SOAP message (either a client sending a request or a server sending a response), supply the headers that should appear on that outgoing message by creating TSOAPHeader descendants and calling the Send method of an ISOAPHeaders (see page 923) interface.

See Also

ISOAPHeaders (see page 923)

TRemotableTypeRegistry (see page 874)

TInvokableClassRegistry (see page 840)

23.1.12.1 TSOAPHeader Members

The following tables list the members exposed by TSOAPHeader.

Protected Fields

	Name	Description
	FSerializationOptions (see page 871)	This is FSerializationOptions, a member of class TRemotable.

Public Methods

	Name	Description
	Create (see page 870)	Creates and initializes a TRemotable (see page 868) object.
	Destroy (see page 870)	Frees the memory associated with the TRemotable (see page 868) object.
	ObjectToSOAP (see page 910)	Converts this TSOAPHeader (see page 908) object to its SOAP representation.
	SOAPToObject (see page 911)	Initializes this TSOAPHeader (see page 908) instance to represent the value of its SOAP representation.

Public Properties

	Name	Description
	Actor (see page 911)	Identifies the agent to which the header is directed.
	DataContext (see page 873)	Specifies the object that controls the lifetime of a TRemotable (see page 868) instance.
	MustUnderstand (see page 912)	Indicates whether an application is required to recognize and handle the header on received messages.
	SerializationOptions (see page 873)	Indicates how the value of the TRemotable (see page 868) descendant encodes its value.

23.1.12.2 TSOAPHeader Methods

The methods of the TSOAPHeader class are listed here.

Public Methods

	Name	Description
	ObjectToSOAP (see page 910)	Converts this TSOAPHeader (see page 908) object to its SOAP representation.
	SOAPToObject (see page 911)	Initializes this TSOAPHeader (see page 908) instance to represent the value of its SOAP representation.

23.1.12.2.1 TSOAPHeader.ObjectToSOAP Method

Converts this TSOAPHeader (see page 908) object to its SOAP representation.

Pascal

```
function ObjectToSOAP(RootNode: IXMLNode; ParentNode: IXMLNode; const ObjConverter:
IObjConverter; const Name: InvString; const URI: InvString; ObjConvOpts:
TObjectConvertOptions; out RefID: InvString): IXMLNode; override;
```

C++

```
virtual __fastcall IXMLNode ObjectToSOAP(IXMLNode RootNode, IXMLNode ParentNode, const
IObjConverter ObjConverter, const InvString Name, const InvString URI, TObjectConvertOptions
ObjConvOpts, InvString RefID);
```

Description

Override ObjectToSOAP to customize the way your application converts a TSOAPHeader (see page 908) descendant to its SOAP representation. In TSOAPHeader (see page 908), ObjectToSOAP uses the default conversion (supplied by the ObjConverter parameter), adding a MustUnderstand (see page 912) attribute whose value reflects the value of the MustUnderstand (see page 912) property.

RootNode is an ancestor of the generated node to which information about the generated node can be added as attributes.

ParentNode is the node in the SOAP representation that should act as a parent to the node that ObjectToSOAP generates.

ObjConverter is the interface of the default converter that translates between remotable objects and their SOAP representation. This is the interface to a TOPToSoapDomConvert instance.

Name is the name of the node that is generated.

URI is the URI for the namespace in which Name is defined.

ObjConvOpts are flags that customize the way the node is serialized.

RefID returns a reference ID for the node. This is used if the node is multi-referenced.

ObjectToSOAP returns the XML for the newly generated node.

See Also

MustUnderstand (see page 912)

ObjInstanceToSOAP (see page 922)

SOAPToObject (see page 911)

23.1.12.2.2 TSOAPHeader.SOAPToObject Method

Initializes this TSOAPHeader (see page 908) instance to represent the value of its SOAP representation.

Pascal

```
procedure SOAPToObject(const RootNode: IXMLNode; const Node: IXMLNode; const ObjConverter:
IObjConverter); override;
```

C++

```
virtual __fastcall SOAPToObject(const IXMLNode RootNode, const IXMLNode Node, const
IObjConverter ObjConverter);
```

Description

SOAPToObject initializes the published properties of this object instance so that they reflect the header's SOAP representation. Override this method to customize the way your application creates a specific type of header from its XML representation.

RootNode is an ancestor node of the header node that can contain information about the header node.

Node is the node in the SOAP envelope that represents the header.

ObjConverter is the interface of the default converter that translates between remotable objects and their SOAP representation. This is the interface to a TOPToSoapDomConvert instance.

See Also

ObjectToSOAP (see page 910)

InitObjectFromSOAP (see page 922)

MustUnderstand (see page 912)

23.1.12.3 TSOAPHeader Properties

The properties of the TSOAPHeader class are listed here.

Public Properties

	Name	Description
	Actor (see page 911)	Identifies the agent to which the header is directed.
	MustUnderstand (see page 912)	Indicates whether an application is required to recognize and handle the header on received messages.

23.1.12.3.1 TSOAPHeader.Actor Property

Identifies the agent to which the header is directed.

Pascal

```
property Actor: InvString;
```

C++

```
__property InvString Actor;
```

Description

Actor is the URI to which the header is directed. Set Actor to indicate the ultimate target of a header you are sending. Read Actor to determine whether a header the application receives is supposed to be handled by the application rather than merely passed on to the next processor.

Note: When the Actor property of a received header identifies this application and the application raises an exception concerning that header (such as a MustUnderstand (see page 912) fault for a header that it does not know how to handle), the value of Actor should become the value of the FaultActor property on the ERemotableException (see page 810) object.

See Also

MustUnderstand (see page 912)

FaultActor (see page 812)

23.1.12.3.2 TSOAPHeader.MustUnderstand Property

Indicates whether an application is required to recognize and handle the header on received messages.

Pascal

```
property MustUnderstand: Boolean;
```

C++

```
__property Boolean MustUnderstand;
```

Description

When MustUnderstand is false, applications can ignore this header if they do not recognize it and know how to handle it.

When MustUnderstand is true, applications that receive messages with this header but that do not recognize or handle it must throw a MustUnderstand fault.

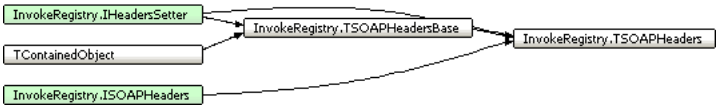
See Also

Actor (see page 911)

23.1.13 TSOAPHeaders Class

TSOAPHeaders is a helper object for implementing the ISOAPHeaders (see page 923) interface.

Class Hierarchy



Pascal

```
TSOAPHeaders = class(TSOAPHeadersBase, ISOAPHeaders, IHeadersSetter);
```

C++

```
class TSOAPHeaders : public TSOAPHeadersBase, public ISOAPHeaders, public IHeadersSetter;
```

File

InvokeRegistry

Description

TSOAPHeaders implements the ISOAPHeaders (see page 923) interface for a class that needs to provide access to the headers of SOAP messages that the application sends and receives Typically, an application does not work directly with instances of TSOAPHeaders. Rather, it uses the ISOAPHeaders (see page 923) interface that this object implements for another class, such as TRIO or TInvokableClass (see page 833).

See Also

ISOAPHeaders (see page 923)

TSOAPHeader (see page 908)

TRIO (see page 4056)

TInvokableClass (see page 833)

23.1.13.1 TSOAPHeaders Members

The following tables list the members exposed by TSOAPHeaders.

Protected Fields

	Name	Description
	FHeadersInbound (see page 917)	This is FHeadersInbound, a member of class TSOAPHeadersBase.
	FHeadersOutBound (see page 918)	This is FHeadersOutBound, a member of class TSOAPHeadersBase.

Protected Methods

	Name	Description
	SetHeadersInOut (see page 918)	Sets the lists of incoming and outgoing headers.

Public Methods

	Name	Description
	Get (see page 924)	This is the overview for the Get method overload.
	Get (see page 914)	This is the overview for the Get method overload.
	GetOwnsSentHeaders (see page 914)	Indicates whether the TSOAPHeaders (see page 912) object frees headers that are added using the Send (see page 915) method
	Send (see page 915)	Adds a header to an outgoing message.
	SendAt (see page 915)	Retrieves a header from an outgoing message, given its position.
	SendCount (see page 916)	Indicates the number of headers that have been added to an outgoing message.
	SetHeadersInOut (see page 920)	This is SetHeadersInOut, a member of class IHeadersSetter.
	SetOwnsSentHeaders (see page 916)	Sets a flag that indicates who should free outgoing header objects.

Public Properties

	Name	Description
	OwnsSentHeaders (see page 927)	Indicates who is responsible for freeing header objects that are included in outbound messages.

23.1.13.2 TSOAPHeaders Methods

The methods of the TSOAPHeaders class are listed here.

Public Methods

	Name	Description
	Get (see page 914)	This is the overview for the Get method overload.
	GetOwnsSentHeaders (see page 914)	Indicates whether the TSOAPHeaders (see page 912) object frees headers that are added using the Send (see page 915) method
	Send (see page 915)	Adds a header to an outgoing message.
	SendAt (see page 915)	Retrieves a header from an outgoing message, given its position.
	SendCount (see page 916)	Indicates the number of headers that have been added to an outgoing message.
	SetOwnsSentHeaders (see page 916)	Sets a flag that indicates who should free outgoing header objects.

23.1.13.2.1 Get Method

This is the overview for the Get method overload.

Overload List

	Name	Description
	TSOAPHeaders.Get (InvString, InvString) (see page 914)	Retrieves a header from an incoming message.
	TSOAPHeaders.Get (TClass) (see page 914)	Retrieves a header from an incoming message.
	TSOAPHeaders.Get (TClass, TSOAPHeader) (see page 914)	Retrieves a header from an incoming message.

23.1.13.2.1.1 TSOAPHeaders.Get Method (InvString, InvString)

Retrieves a header from an incoming message.

Pascal

```
procedure Get(Cls: TClass; out Hdr: TSOAPHeader); overload;
function Get(Cls: TClass): TSOAPHeader; overload;
function Get(const Name: InvString; const URI: InvString): TSOAPHeader; overload;
```

C++

```
__fastcall Get(TClass Cls, TSOAPHeader Hdr);
__fastcall TSOAPHeader Get(TClass Cls);
__fastcall TSOAPHeader Get(const InvString Name, const InvString URI);
```

Description

Call Get to access the header object that is automatically created to represent one of the headers on an incoming messages. On the server, this is a header on the request message. On the client, this is a header on the response message.

Cls is the class reference that indicates the type of header class you want to retrieve. Each header class corresponds to a type of header, where the type name under which the class is registered corresponds to the name of the header node.

Hdr returns a TSOAPHeader (see page 908) descendant that represents the header of the incoming message. If this syntax is not used, Get returns the header instance.

Name is the name of the header (the node name for the header node) that you want to retrieve.

URI is the URI for the namespace in which Name is defined.

See Also

Send (see page 915)

DataContext (see page 873)

23.1.13.2.2 TSOAPHeaders.GetOwnsSentHeaders Method

Indicates whether the TSOAPHeaders (see page 912) object frees headers that are added using the Send (see page 915) method

Pascal

```
function GetOwnsSentHeaders: Boolean;
```

C++

```
__fastcall Boolean GetOwnsSentHeaders();
```

Description

GetOwnsSentHeaders returns true if the TSOAPHeaders (see page 912) instance frees any header objects added using the Send (see page 915) method. It returns false if the caller is responsible for freeing these header objects.

See Also

Send (see page 915)

23.1.13.2.3 TSOAPHeaders.Send Method

Adds a header to an outgoing message.

Pascal

```
procedure Send(const Hdr: TSOAPHeader);
```

C++

```
__fastcall Send(const TSOAPHeader Hdr);
```

Description

Call Send to add a header to an outgoing message. On the client, call Send before executing a method on an invokable interface. On the server, call Send before returning from the method that the client invoked.

Hdr is the header object instance that represents the header you want to add to the outgoing message.

Note: The SetOwnsSentHeaders (see page 916) method controls whether you must free the object that is supplied as the Hdr parameter after sending the message.

See Also

SendAt (see page 915)

SendCount (see page 916)

SetOwnsSentHeaders (see page 916)

23.1.13.2.4 TSOAPHeaders.SendAt Method

Retrieves a header from an outgoing message, given its position.

Pascal

```
function SendAt(Index: Integer): TSOAPHeader;
```

C++

```
__fastcall TSOAPHeader SendAt(int Index);
```

Description

Call SendAt to retrieve the header object for a header you have already added to an outgoing message using the Send (see page 915) method.

Index is the position of the header you want to retrieve, where 0 specifies the first header, 1 specifies the second header, and so on. The SendCount (see page 916) property provides an upper bound for this index.

SendAt returns the header at the specified position.

See Also

Send (see page 915)

SendCount (see page 916)

23.1.13.2.5 TSOAPHeaders.SendCount Method

Indicates the number of headers that have been added to an outgoing message.

Pascal

```
function SendCount: Integer;
```

C++

```
__fastcall int SendCount();
```

Description

Call SendCount to determine the number of headers that have been added to an outgoing message. These headers are added by previous calls to the Send (see page 915) method.

See Also

Send (see page 915)

SendAt (see page 915)

23.1.13.2.6 TSOAPHeaders.SetOwnsSentHeaders Method

Sets a flag that indicates who should free outgoing header objects.

Pascal

```
procedure SetOwnsSentHeaders(Flag: Boolean);
```

C++

```
__fastcall SetOwnsSentHeaders(Boolean Flag);
```

Description

Call SetOwnsSentHeaders to specify who should free header objects that are added using the Send (see page 915) method.

Flag indicates whether this TSOAPHeaders (see page 912) frees the outgoing headers. If Flag is true, TSOAPHeaders (see page 912) frees the headers that are added by calling Send (see page 915). If Flag is false, the caller is responsible for freeing these header objects.

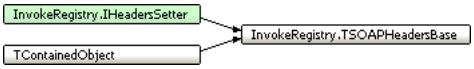
See Also

Send (see page 915)

23.1.14 TSOAPHeadersBase Class

TSOAPHeadersBase is the base class for classes that maintain lists of SOAP headers.

Class Hierarchy



Pascal

```
TSOAPHeadersBase = class(TContainedObject, IHeadersSetter);
```

C++

```
class TSOAPHeadersBase : public TContainedObject, public IHeadersSetter;
```

File

InvokeRegistry

Description

TSOAPHeadersBase provides support for maintaining two lists of TSOAPHeader (see page 908) descendants. One list is for the headers that an application sends and the other is for the headers that are it receives with an incoming message.

TSOAPHeadersBase is a descendant of TContainedObject. As such, it is designed to be used as a helper object in supporting an interface for working with SOAP headers. TSOAPHeadersBase is intended only as a base class. For working with SOAP headers, use a TSOAPHeadersBase descendant such as TSOAPHeaders (see page 912).

See Also

TSOAPHeaders (see page 912)

TSOAPHeader (see page 908)

23.1.14.1 TSOAPHeadersBase Members

The following tables list the members exposed by TSOAPHeadersBase.

Protected Fields

	Name	Description
	FHeadersInbound (see page 917)	This is FHeadersInbound, a member of class TSOAPHeadersBase.
	FHeadersOutBound (see page 918)	This is FHeadersOutBound, a member of class TSOAPHeadersBase.

Protected Methods

	Name	Description
	SetHeadersInOut (see page 918)	Sets the lists of incoming and outgoing headers.

23.1.14.2 TSOAPHeadersBase Fields

The fields of the TSOAPHeadersBase class are listed here.

Protected Fields

	Name	Description
	FHeadersInbound (see page 917)	This is FHeadersInbound, a member of class TSOAPHeadersBase.
	FHeadersOutBound (see page 918)	This is FHeadersOutBound, a member of class TSOAPHeadersBase.

23.1.14.2.1 TSOAPHeadersBase.FHeadersInbound Field

Pascal

```
FHeadersInbound: THeaderList;
```

C++

```
THeaderList FHeadersInbound;
```

Description

This is FHeadersInbound, a member of class TSOAPHeadersBase.

23.1.14.2.2 TSOAPHeadersBase.FHeadersOutBound Field

Pascal

```
FHeadersOutBound: THeaderList;
```

C++

```
THeaderList FHeadersOutBound;
```

Description

This is FHeadersOutBound, a member of class TSOAPHeadersBase.

23.1.14.3 TSOAPHeadersBase Methods

The methods of the TSOAPHeadersBase class are listed here.

Protected Methods

	Name	Description
	SetHeadersInOut (see page 918)	Sets the lists of incoming and outgoing headers.

23.1.14.3.1 TSOAPHeadersBase.SetHeadersInOut Method

Sets the lists of incoming and outgoing headers.

Pascal

```
procedure SetHeadersInOut(var InHdrs: THeaderList; var OutHdrs: THeaderList);
```

C++

```
__fastcall SetHeadersInOut(THeaderList InHdrs, THeaderList OutHdrs);
```

Description

Applications can't call the protected SetHeadersInOut method. It is used by descendant classes to initialize the lists of incoming and outgoing header objects.

InHdrs is a list of TSOAPHeader (see page 908) descendants that represent the headers received in a SOAP message.

OutHdrs is a list of TSOAPHeader (see page 908) descendants that represent the headers sent in a SOAP message.

See Also

TSOAPHeader (see page 908)

23.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IHeadersSetter (see page 919)	This is class InvokeRegistry.IHeadersSetter.
	IObjConverter (see page 920)	IObjConverter is the interface for converting between a remotable class and its SOAP representation.
	ISOAPHeaders (see page 923)	ISOAPHeaders is the interface for accessing the headers that accompany a message encoded using SOAP.

23.2.1 IHeadersSetter Interface

Class Hierarchy

Pascal

```
IHeadersSetter = interface;
```

C++

```
__interface IHeadersSetter;
```

File

InvokeRegistry

Description

This is class InvokeRegistry.IHeadersSetter.

23.2.1.1 IHeadersSetter Members

The following tables list the members exposed by IHeadersSetter.

Public Methods

	Name	Description
	SetHeadersInOut (see page 920)	This is SetHeadersInOut, a member of class IHeadersSetter.

23.2.1.2 IHeadersSetter Methods

The methods of the IHeadersSetter class are listed here.

Public Methods

	Name	Description
	SetHeadersInOut (see page 920)	This is SetHeadersInOut, a member of class IHeadersSetter.

23.2.1.2.1 IHeadersSetter.SetHeadersInOut Method

Pascal

```
procedure SetHeadersInOut(var InHdrs: THeaderList; var OutHdrs: THeaderList);
```

C++

```
__fastcall SetHeadersInOut(THeaderList InHdrs, THeaderList OutHdrs);
```

Description

This is SetHeadersInOut, a member of class IHeadersSetter.

23.2.2 IObjConverter Interface

IObjConverter is the interface for converting between a remotable class and its SOAP representation.

Class Hierarchy

Pascal

```
IObjConverter = interface;
```

C++

```
__interface IObjConverter;
```

File

InvokeRegistry

Description

IObjConverter defines methods that aid in the conversion between remotable classes (classes that descend from TRemotable (see page 868)) and their representation in the messages that pass between clients and Web Service providers. That is, this interface provides methods that are used when converting between a remotable class, whether it represents a complex type in an invokable interface, an attachment, or a SOAP header, and its SOAP representation. The TSOAPDomConv class implements this interface.

Note: C++ method declarations that use IObjConverter use the _di_IObjConverter type instead. This type is a DelphiInterface wrapper around the IObjConverter interface:

Note: typedef System::DelphiInterface< IObjConverter > _di_IObjConverter;

See Also

TSOAPDomConv (see page 2758)

TRemotable (see page 868)

TSOAPHeader (see page 908)

TSOAPAttachment (see page 895)

23.2.2.1 IObjConverter Members

The following tables list the members exposed by IObjConverter.

Public Methods

	Name	Description
	AddAttachment (see page 921)	Stores information about a SOAP attachment so that it is included in the final message that is created.
	FindAttachment (see page 922)	Returns a TSOAPAttachment (see page 895) instance that represent the attachment with a specified ID.
	InitObjectFromSOAP (see page 922)	Initializes an instance of a remotable object to reflect the values in its SOAP representation.
	ObjInstanceToSOAP (see page 922)	Returns the SOAP representation of a remotable object.

23.2.2.2 IObjConverter Methods

The methods of the IObjConverter class are listed here.

Public Methods

	Name	Description
	AddAttachment (see page 921)	Stores information about a SOAP attachment so that it is included in the final message that is created.
	FindAttachment (see page 922)	Returns a TSOAPAttachment (see page 895) instance that represent the attachment with a specified ID.
	InitObjectFromSOAP (see page 922)	Initializes an instance of a remotable object to reflect the values in its SOAP representation.
	ObjInstanceToSOAP (see page 922)	Returns the SOAP representation of a remotable object.

23.2.2.2.1 IObjConverter.AddAttachment Method

Stores information about a SOAP attachment so that it is included in the final message that is created.

Pascal

```
procedure AddAttachment(Attachment: TSOAPAttachment; const AContentId: string);
```

C++

```
__fastcall AddAttachment(TSOAPAttachment Attachment, const UnicodeString AContentId);
```

Description

AddAttachment stores a SOAP attachment so that it can be used to generate part of the multipart form that includes the SOAP envelope as another of its parts.

Attachment is the attachment that should be added to the multipart form.

AContentId is a string that uniquely identifies the attachment. It is added as a header to the part of the form that contains the attachment so that XML in the SOAP envelope can refer to the attachment. When interpreting the encoded SOAP envelope, this value is passed to the FindAttachment (see page 922) method so that the information in the attachment part can be used to recreate the TSOAPAttachment (see page 895) instance.

See Also

FindAttachment (see page 922)

23.2.2.2.2 IObjConverter.FindAttachment Method

Returns a TSOAPAttachment (see page 895) instance that represent the attachment with a specified ID.

Pascal

```
function FindAttachment(const AContentId: string): TSOAPAttachment;
```

C++

```
__fastcall TSOAPAttachment FindAttachment(const UnicodeString AContentId);
```

Description

FindAttachment locates the attachment that is identified by a specified content ID (HREF).

AContentId is the unique identifier for the attachment that was supplied to the AddAttachment (see page 921) method when the attachment was first added to the multipart form.

FindAttachment returns a TSOAPAttachment (see page 895) instance that represents the attachment.

See Also

AddAttachment (see page 921)

23.2.2.2.3 IObjConverter.InitObjectFromSOAP Method

Initializes an instance of a remotable object to reflect the values in its SOAP representation.

Pascal

```
procedure InitObjectFromSOAP(Instance: TObject; RootNode: IXMLNode; Node: IXMLNode);
```

C++

```
__fastcall InitObjectFromSOAP(TObject * Instance, IXMLNode RootNode, IXMLNode Node);
```

Description

InitObjectFromSOAP assigns values to the published properties of a remotable object that represents a node from the SOAP envelope.

Instance is the remotable object to initialize from its SOAP representation.

RootNode is an ancestor node of the node for the remotable object that can contain information needed for initializing the remotable object.

Node is the node in the SOAP envelope that represents the remotable object.

See Also

ObjInstanceToSOAP (see page 922)

23.2.2.2.4 IObjConverter.ObjInstanceToSOAP Method

Returns the SOAP representation of a remotable object.

Pascal

```
function ObjInstanceToSOAP(Instance: TObject; RootNode: IXMLNode; ParentNode: IXMLNode; const
NodeName: InvString; const NodeNamespace: InvString; ObjConvOpts: TObjectConvertOptions; out
RefID: InvString): IXMLNode;
```

C++

```
__fastcall IXMLNode ObjInstanceToSOAP(TObject * Instance, IXMLNode RootNode, IXMLNode
```

```
ParentNode, const InvString NodeName, const InvString NodeNamespace, TObjectConvertOptions
ObjConvOpts, InvString RefID);
```

Description

ObjInstanceToSOAP adds a node to represent the value of a remotable object.

Instance is the remotable object to encode as its SOAP representation.

RootNode is an ancestor of the node to which information about the node can be added as attributes.

ParentNode is the node in the SOAP representation that should act as a parent to the node that ObjInstanceToSOAP generates.

NodeName is the name of the node that is generated.

NodeNamespace is the URI for the namespace in which NodeName is defined.

ObjConvOpts are flags that customize the way the node is serialized.

RefID returns a reference ID for the node. This is used if the node is multi-referenced.

ObjInstanceToSOAP returns the XML for the newly generated node.

See Also

InitObjectFromSOAP (see page 922)

23.2.3 ISOAPHeaders Interface

ISOAPHeaders is the interface for accessing the headers that accompany a message encoded using SOAP.

Class Hierarchy

Pascal

```
ISOAPHeaders = interface;
```

C++

```
__interface ISOAPHeaders;
```

File

InvokeRegistry

Description

ISOAPHeaders is the interface for accessing the headers of a SOAP envelope. It defines methods for adding headers that are sent with an outgoing message and for retrieving the headers that were included in an incoming message.

On the server, the implementation class for in invokable interface supports this interface. You can obtain a reference to the ISOAPHeaders interface from the implementation class (a TInvokableClass (see page 833) descendant). You can then use this interface to retrieve the headers that were included in an incoming request or to add headers to an outgoing response message. If your implementation class does not descend from TInvokableClass (see page 833), you can obtain a reference to this interface using the global GetSOAPHeaders function.

For client-side header support, TRIO implements the ISOAPHeaders interface. However, you can't obtain an ISOAPHeaders interface directly from a remote interfaced object, because when you try to obtain an interface from TRIO or one of its descendants, it assumes that you are trying to obtain an invokable interface for a server object and generates an in-memory vtable. Instead, you must access the ISOAPHeaders interface from the invokable interface that the remote interface object supports.

Note: C++ method declarations that use ISOAPHeaders use the _di_ISOAPHeaders type instead. This type is a DelphiInterface wrapper around the ISOAPHeaders interface:

Note: typedef System::DelphiInterface< ISOAPHeaders > _di_ISOAPHeaders;

See Also

TRIO (see page 4056)

TInvokableClass (see page 833)

TSOAPHeaders (see page 912)

GetSOAPHeaders

Defining and Using SOAP Headers

Processing Headers in Client Applications

23.2.3.1 ISOAPHeaders Members

The following tables list the members exposed by ISOAPHeaders.

Public Methods

	Name	Description
	Get (see page 924)	This is the overview for the Get method overload.
	GetOwnsSentHeaders (see page 925)	Returns the value of the OwnsSentHeaders (see page 927) property.
	Send (see page 926)	Adds a header to an outgoing message.
	SendAt (see page 926)	Retrieves a header from an outgoing message, given its position.
	SendCount (see page 927)	Indicates the number of headers that have been added to an outgoing message.
	SetOwnsSentHeaders (see page 927)	Sets the value of the OwnsSentHeaders (see page 927) property.

Public Properties

	Name	Description
	OwnsSentHeaders (see page 927)	Indicates who is responsible for freeing header objects that are included in outbound messages.

23.2.3.2 ISOAPHeaders Methods

The methods of the ISOAPHeaders class are listed here.

Public Methods

	Name	Description
	Get (see page 924)	This is the overview for the Get method overload.
	GetOwnsSentHeaders (see page 925)	Returns the value of the OwnsSentHeaders (see page 927) property.
	Send (see page 926)	Adds a header to an outgoing message.
	SendAt (see page 926)	Retrieves a header from an outgoing message, given its position.
	SendCount (see page 927)	Indicates the number of headers that have been added to an outgoing message.
	SetOwnsSentHeaders (see page 927)	Sets the value of the OwnsSentHeaders (see page 927) property.

23.2.3.2.1 Get Method

This is the overview for the Get method overload.

Overload List

	Name	Description
	ISOAPHeaders.Get (InvString, InvString) (see page 925)	Retrieves a header from an incoming message.
	ISOAPHeaders.Get (TClass) (see page 925)	Retrieves a header from an incoming message.
	ISOAPHeaders.Get (TClass, TSOAPHeader) (see page 925)	Retrieves a header from an incoming message.

23.2.3.2.1.1 ISOAPHeaders.Get Method (InvString, InvString)

Retrieves a header from an incoming message.

Pascal

```
procedure Get(Cls: TClass; out Hdr: TSOAPHeader); overload;
function Get(Cls: TClass): TSOAPHeader; overload;
function Get(const Name: InvString; const URI: InvString): TSOAPHeader; overload;
```

C++

```
__fastcall Get(TClass Cls, TSOAPHeader Hdr);
__fastcall TSOAPHeader Get(TClass Cls);
__fastcall TSOAPHeader Get(const InvString Name, const InvString URI);
```

Description

Call Get to access the header object that is automatically created to represent one of the headers on an incoming messages. On the server, this is a header on the request message. On the client, this is a header on the response message.

Cls is the class reference that indicates the type of header class you want to retrieve. Each header class corresponds to a type of header, where the type name under which the class is registered corresponds to the name of the header node.

Hdr returns a TSOAPHeader (see page 908) descendant that represents the header of the incoming message. If this syntax is not used, Get returns the header instance.

Name is the name of the header (the node name for the header node) that you want to retrieve.

URI is the URI for the namespace in which Name is defined.

See Also

Send (see page 926)

DataContext (see page 873)

23.2.3.2.2 ISOAPHeaders.GetOwnsSentHeaders Method

Returns the value of the OwnsSentHeaders (see page 927) property.

Pascal

```
function GetOwnsSentHeaders: Boolean;
```

C++

```
__fastcall Boolean GetOwnsSentHeaders();
```

Description

GetOwnsSentHeaders is the read implementation for the OwnsSentHeaders (see page 927) property.

See Also

OwnsSentHeaders (see page 927)

23.2.3.2.3 ISOAPHeaders.Send Method

Adds a header to an outgoing message.

Pascal

```
procedure Send(const Hdr: TSOAPHeader);
```

C++

```
__fastcall Send(const TSOAPHeader Hdr);
```

Description

Call Send to add a header to an outgoing message. On the client, call Send before executing a method on an invokable interface. On the server, call Send before returning from the method that the client invoked.

Hdr is the header object instance that represents the header you want to add to the outgoing message.

Note: The OwnsSentHeaders (see page 927) property controls whether you must free the object that is supplied as the Hdr parameter after sending the message.

See Also

SendAt (see page 926)

SendCount (see page 927)

OwnsSentHeaders (see page 927)

23.2.3.2.4 ISOAPHeaders.SendAt Method

Retrieves a header from an outgoing message, given its position.

Pascal

```
function SendAt(Index: Integer): TSOAPHeader;
```

C++

```
__fastcall TSOAPHeader SendAt(int Index);
```

Description

Call SendAt to retrieve the header object for a header you have already added to an outgoing message using the Send (see page 926) method.

Index is the position of the header you want to retrieve, where 0 specifies the first header, 1 specifies the second header, and so on. The SendCount (see page 927) property provides an upper bound for this index.

SendAt returns the header at the specified position.

See Also

Send (see page 926)

SendCount (see page 927)

23.2.3.2.5 ISOAPHeaders.SendCount Method

Indicates the number of headers that have been added to an outgoing message.

Pascal

```
function SendCount: Integer;
```

C++

```
__fastcall int SendCount();
```

Description

Call SendCount to determine the number of headers that have been added to an outgoing message. These headers are added by previous calls to the Send (see page 926) method.

See Also

Send (see page 926)

SendAt (see page 926)

23.2.3.2.6 ISOAPHeaders.SetOwnsSentHeaders Method

Sets the value of the OwnsSentHeaders (see page 927) property.

Pascal

```
procedure SetOwnsSentHeaders(Flag: Boolean);
```

C++

```
__fastcall SetOwnsSentHeaders(Boolean Flag);
```

Description

SetOwnsSentHeaders is the write implementation for the OwnsSentHeaders (see page 927) property.

Flag is the new value of the OwnsSentHeaders (see page 927) property.

See Also

OwnsSentHeaders (see page 927)

23.2.3.3 ISOAPHeaders Properties

The properties of the ISOAPHeaders class are listed here.

Public Properties

	Name	Description
	OwnsSentHeaders (see page 927)	Indicates who is responsible for freeing header objects that are included in outbound messages.

23.2.3.3.1 ISOAPHeaders.OwnsSentHeaders Property

Indicates who is responsible for freeing header objects that are included in outbound messages.

Pascal

```
property OwnsSentHeaders: Boolean;
```

C++

```
__property Boolean OwnsSentHeaders;
```

Description

Use OwnsSentHeaders to indicate whether the header object instances you create and add to messages by calling the Send (see page 926) or SendAt (see page 926) method should be freed by the object that implements this interface. When OwnsSentHeaders is true, the object implementing ISOAPHeaders (see page 923) frees the header objects after sending them. When OwnsSentHeaders is false, the caller is responsible for freeing the header objects.

Note: For inbound headers (headers retrieved from incoming messages), the object that implements always frees them unless you call the Get (see page 925) method. After a call to Get (see page 925), the caller is responsible for freeing the header, except on the server, where the header object is freed by the header object's DataContext.

See Also

Send (see page 926)

SendAt (see page 926)

DataContext (see page 873)

23.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GetRemotableDataContext (see page 929)	Returns the TDataContext (see page 814) object that provides temporary storage during a call to an invokable interface.
	InvRegistry (see page 930)	Provides access to the invocation registry.
	RemClassRegistry (see page 930)	Provides access to the remotable class registry.
	RemTypeRegistry (see page 931)	Provides access to the remotable type registry.
	SetRemotableDataContext (see page 932)	Sets the data context that provides temporary storage during a call to an invokable interface.
	SubstituteStrings (see page 933)	This is function InvokeRegistry.SubstituteStrings.

23.3.1 InvokeRegistry.GetRemotableDataContext Function

Returns the TDataContext (see page 814) object that provides temporary storage during a call to an invokable interface.

Pascal

```
function GetRemotableDataContext: Pointer;
```

C++

```
void * GetRemotableDataContext();
```

File

InvokeRegistry

Description

GetRemotableDataContext returns a pointer to the data context object that stores all the temporary objects and values needed for implementing a call to an invokable interface. When a client application calls an invokable interface on a Web Service application, the Web Service application automatically creates a data context for the call. Any objects or variables that are needed for marshaling the interface call are automatically added to the data context for the duration of the call. In addition, any remotable objects (TRemotable (see page 868) descendants) that are created while there is a remotable data context available are automatically added to the data context. When the interface call is complete, the data context is freed, and it automatically frees the stored objects and variables.

See Also

SetRemotableDataContext (see page 932)

TRemotable (see page 868)

TDataContext (see page 814)

23.3.2 InvokeRegistry.InvRegistry Function

Provides access to the invocation registry.

Pascal

```
function InvRegistry: TInvokableClassRegistry;
```

C++

```
TInvokableClassRegistry InvRegistry();
```

File

InvokeRegistry

Description

Call InvRegistry to access the invocation registry. The returned object has two methods, RegisterInterface and RegisterInvokableClass, that you can use for registering invokable interfaces (interfaces compiled with RTTI) and the classes that implement them.

Server applications that implement Web Services need to register both the invokable interfaces and the implementation classes. The invoker component can then use the invocation registry to locate invokable interfaces and identify classes that implement them.

Client applications that call on Web Services register the invokable interfaces that they call. The remote interfaced object component can then use the invocation registry to generate a dynamic method table for calling the invokable interfaces.

Note: Both client and server applications must register invokable interfaces using the same namespace. You can either supply this namespace explicitly when you register an interface, or you can use the automatically generated namespace. If you use the automatically generated interface, the interface must be defined in the same unit on both client and server, and both client and server must have the same value set for the global AppNameSpacePrefix (see page 955) variable.

See Also

IInvokable

THTTPSoapPascalInvoker

THTTPRIO

AppNameSpacePrefix (see page 955)

RemTypeRegistry (see page 931)

23.3.3 InvokeRegistry.RemClassRegistry Function

Provides access to the remotable class registry.

Pascal

```
function RemClassRegistry: TRemotableClassRegistry;
```

C++

```
TRemotableClassRegistry RemClassRegistry();
```

File

InvokeRegistry

Description

RemClassRegistry returns the object that implements the remotable class registry. Use its RegisterXSClass method to register a remotable class in an application that publishes or uses Web Services.

Remotable classes are classes that can be transmitted between the client of a Web Services application and the server that implements the service. They can be used to represent non-scalar types for parameters and return values, or they can represent exceptions that occur when trying to execute a request to a Web Service application. All remotable classes are compiled with runtime type information (RTTI) and have a virtual constructor that the remotable class registry recognizes and uses to obtain class instances.

Both the client application and server application must register remotable classes before they can use them. They must register them to use the same namespace. You can either supply this namespace explicitly when you register the class, or you can use the automatically generated namespace. If you use the automatically generated interface, the class must be defined in the same unit on both client and server, and both client and server must have the same value set for the global AppNameSpacePrefix (see page 955) variable.

Note: The remotable class registry is the same thing as the remotable type registry. You can use RemClassRegistry interchangeably with the RemTypeRegistry (see page 931) function.

See Also

TRemotable (see page 868)

ERemotableException (see page 810)

AppNameSpacePrefix (see page 955)

InvRegistry (see page 930)

RemTypeRegistry (see page 931)

23.3.4 InvokeRegistry.RemTypeRegistry Function

Provides access to the remotable type registry.

Pascal

```
function RemTypeRegistry: TRemotableTypeRegistry;
```

C++

```
TRemotableTypeRegistry RemTypeRegistry();
```

File

InvokeRegistry

Description

Call RemTypeRegistry to access to the remotable type registry. Use the RegisterXSClass method of the returned object to register a remotable class in an application that publishes or uses Web Services. Use its RegisterXSInfo method to register a remotable type.

Remotable classes are classes that can be transmitted between the client of a Web Services application and the server that implements the service. They can be used to represent non-scalar types for parameters and return values, or they can represent exceptions that occur when trying to execute a request to a Web Service application. All remotable classes are compiled with

runtime type information (RTTI) and have a virtual constructor that the remotable class registry recognizes and uses to obtain class instances.

Remotable types include dynamic arrays, enumerated types, and boolean types, which can be used in an invokable interface without resorting to a remotable class representation, but which must be registered because their values require special marshaling.

Both the client application and server application must register remotable classes and types before they can use them. They must register them to use the same namespace. You can either supply this namespace explicitly when you register the class or type, or you can use the automatically generated namespace. If you use the automatically generated interface, the class must be defined in the same unit on both client and server, and both client and server must have the same value set for the global AppNameSpacePrefix (see page 955) variable.

Note: The remotable type registry is the same thing as the remotable class registry. You can use RemTypeRegistry interchangeably with the RemClassRegistry (see page 930) function.

See Also

TRemotable (see page 868)

ERemotableException (see page 810)

AppNameSpacePrefix (see page 955)

InvRegistry (see page 930)

23.3.5 InvokeRegistry.SetRemotableDataContext Function

Sets the data context that provides temporary storage during a call to an invokable interface.

Pascal

```
procedure SetRemotableDataContext(Value: Pointer);
```

C++

```
SetRemotableDataContext(void * Value);
```

File

InvokeRegistry

Description

SetRemotableDataContext assigns a data context for a remote call to an invokable interface. Once a data context is assigned, it is available to store the temporary objects and values needed for implementing a call to an invokable interface. If the application creates a TRemotable (see page 868) descendant while there is a remotable data context, that remotable object is automatically added to the data context and freed when the application frees the data context.

Note: The invoker component in a Web Services application automatically calls SetRemotableDataContext to set up a data context for incoming SOAP requests. Thus, there is typically no need to call this method in server applications.

Value is a pointer to a TDataContext (see page 814) descendant that temporarily stores information for remote interface calls.

See Also

GetRemotableDataContext (see page 929)

TRemotable (see page 868)

TDataContext (see page 814)

23.3.6 InvokeRegistry.SubstituteStrings Function

Pascal

```
function SubstituteStrings(const InputString: WideString; const SubString: WideString; const
Replacement: WideString): WideString;
```

C++

```
BSTR SubstituteStrings(const BSTR InputString, const BSTR SubString, const BSTR Replacement);
```

File

InvokeRegistry

Description

This is function InvokeRegistry.SubstituteStrings.

23.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	eHeaderMethodType (see page 934)	eHeaderMethodType and THeaderMethodTypeArray (see page 949) indicate the types of messages that should include a given header type.
	ObjectConvertOptions (see page 939)	ObjectConvertOptions and TObjectConvertOptions (see page 950) are flags that customize how to convert a remotable object to or from its SOAP representation.
	SerializationOptions (see page 940)	SerializationOptions and TSerializationOptions (see page 953) are flags that customize how to convert a remotable object to or from its SOAP representation.
	TIntfInvokeOption (see page 942)	TIntfInvokeOption and TIntfInvokeOptions (see page 949) represent flags that customize how to handle calls to an invokable interface.
	TObjMultiOptions (see page 943)	TObjMultiOptions indicates how multiple references to the same remotable class should be translated into a SOAP representation.

Records

	Name	Description
	ExtNameMapItem (see page 935)	This is record InvokeRegistry.ExtNameMapItem.
	IntfExceptionItem (see page 935)	IntfExceptionItem and TExceptionItemArray (see page 948) describe the association between a remotable exception and an interface that can raise it.
	IntfHeaderItem (see page 936)	IntfHeaderItem and THeaderItemArray (see page 948) describe the association between a header and the SOAP messages that include it.
	InvRegClassEntry (see page 937)	This is record InvokeRegistry.InvRegClassEntry.
	InvRegIntfEntry (see page 937)	InvRegIntfEntry stores information about an invokable interface.
	MethParamNameMapItem (see page 939)	This is record InvokeRegistry.MethParamNameMapItem.
	TDynToClear (see page 941)	This is record InvokeRegistry.TDynToClear.
	TRemHeaderEntry (see page 944)	This is record InvokeRegistry.TRemHeaderEntry.
	TRemRegEntry (see page 944)	TRemRegEntry stores information for the remotable type registry.

23.4.1 InvokeRegistry.eHeaderMethodType Enumeration

eHeaderMethodType and THeaderMethodTypeArray (see page 949) indicate the types of messages that should include a given header type.

Pascal

```
eHeaderMethodType = (
  hmtAll,
  hmtRequest,
  hmtResponse
);
```

C++

```
enum eHeaderMethodType {
  hmtAll,
  hmtRequest,
  hmtResponse
};
```

File

InvokeRegistry

Description

THeaderMethodTypeArray (see page 949) is a dynamic array of eHeaderMethodType values. The following table describes the possible eHeaderMethodType values:

Value	Meaning
hmtAll	The header should be included in all messages pertaining to the invokable interface.
hmtRequest	The header should be included in request messages in which the client attempts to invoke the invokable interface.
hmtResponse	The header should be included in response message that the server returns after executing a method on the invokable interface.

23.4.2 InvokeRegistry.ExtNameMapItem Record

Pascal

```
ExtNameMapItem = record
  Name: string;
  ExtName: InvString;
end;
```

C++

```
struct ExtNameMapItem {
  UnicodeString Name;
  InvString ExtName;
};
```

File

InvokeRegistry

Description

This is record InvokeRegistry.ExtNameMapItem.

23.4.3 InvokeRegistry.IntfExceptionItem Record

IntfExceptionItem and TExceptionItemArray (see page 948) describe the association between a remotable exception and an interface that can raise it.

Pascal

```
IntfExceptionItem = record
  ClassType: TClass;
  MethodNames: string;
end;
```

C++

```
struct IntfExceptionItem {
  TClass ClassType;
  UnicodeString MethodNames;
```

```
};
```

File

InvokeRegistry

Description

IntfExceptionItem describes a single remotable exception type. TExceptionItemArray (see page 948) is an array of IntfExceptionItem descriptors. Typically, this array describes the set of exceptions associated with an invokable interface.

ClassType is the class reference for the remotable exception class.

MethodNames is a comma-delimited list of method names. If MethodNames is an empty string, the exception is associated with all the methods on an interface. If MethodNames is nonempty, the exception is associated only with those methods of the interface that the MethodNames field lists.

23.4.4 InvokeRegistry.IntfHeaderItem Record

IntfHeaderItem and THeaderItemArray (see page 948) describe the association between a header and the SOAP messages that include it.

Pascal

```
IntfHeaderItem = record
  Info: PTypeInfo;
  ClassType: TClass;
  Namespace: InvString;
  Name: InvString;
  DefaultMethodType: eHeaderMethodType;
  DefaultRequired: Boolean;
  MethodNames: string;
  MethodTypes: THeaderMethodTypeArray;
  HeaderRequired: TRequiredArray;
end;
```

C++

```
struct IntfHeaderItem {
  PTypeInfo Info;
  TClass ClassType;
  InvString Namespace;
  InvString Name;
  eHeaderMethodType DefaultMethodType;
  Boolean DefaultRequired;
  UnicodeString MethodNames;
  THeaderMethodTypeArray MethodTypes;
  TRequiredArray HeaderRequired;
};
```

File

InvokeRegistry

Description

IntfHeaderItem describes a single header type. THeaderItemArray (see page 948) is an array of IntfHeaderItem descriptors. Typically, this array describes the set of headers associated with an invokable interface.

Info is a pointer to the type description for the interface that the header is associated with.

ClassType is the class reference for the header class (a TSOAPHeader (see page 908) descendant).

NameSpace is the namespace in which the header's name is defined.

Name is the name of the header node.

DefaultMethodType indicates whether the header is included in request messages, response messages, or both. This value is only used if the MethodNames field is an empty string. If MethodNames is nonempty, use the MethodTypes field instead.

DefaultRequired indicates whether the header must appear in messages about the interface that Info describes. If DefaultRequired is false, the header is optional. This value is only used if the MethodNames field is an empty string. If MethodNames is nonempty, use the HeaderRequired field instead.

MethodNames is a comma-delimited list of method names. If empty, the header is associated with all methods on the interface. If MethodNames includes one or more names, the header is only associated with those methods of the interface that are contained in the list.

MethodTypes is a dynamic array of values that indicate whether the header is included in request messages, response messages, or both. Each value is associated with a method listed in the MethodNames field in the same position. If MethodNames is an empty string, MethodTypes is not used.

HeaderRequired is a dynamic array of values that indicate whether the header is required or optional. Each value is associated with a method listed in the MethodNames field in the same position. If MethodNames is an empty string, HeaderRequired is not used.

23.4.5 InvokeRegistry.InvRegClassEntry Record

Pascal

```
InvRegClassEntry = record
  ClassType: TClass;
  Proc: TCreateInstanceProc;
  URI: string;
end;
```

C++

```
struct InvRegClassEntry {
  TClass ClassType;
  TCreateInstanceProc Proc;
  UnicodeString URI;
};
```

File

InvokeRegistry

Description

This is record InvokeRegistry.InvRegClassEntry.

23.4.6 InvokeRegistry.InvRegIntfEntry Record

InvRegIntfEntry stores information about an invokable interface.

Pascal

```
InvRegIntfEntry = record
  Name: string;
  ExtName: InvString;
  UnitName: string;
  GUID: TGUID;
```

```
    Info: PTypeInfo;
    DefImpl: TClass;
    Namespace: InvString;
    WSDLEncoding: InvString;
    Documentation: string;
    SOAPAction: string;
    ReturnParamNames: string;
    InvokeOptions: TIntfInvokeOptions;
    MethNameMap: array of ExtNameMapItem;
    MethParamNameMap: array of MethParamNameMapItem;
    IntfHeaders: array of IntfHeaderItem;
    IntfExceptions: array of IntfExceptionItem;
    UDDIOperator: String;
    UDDIBindingKey: String;
  end;
```

C++

```
  struct InvRegIntfEntry {
    UnicodeString Name;
    InvString ExtName;
    UnicodeString UnitName;
    TGUID GUID;
    PTypeInfo Info;
    TClass DefImpl;
    InvString Namespace;
    InvString WSDLEncoding;
    UnicodeString Documentation;
    UnicodeString SOAPAction;
    UnicodeString ReturnParamNames;
    TIntfInvokeOptions InvokeOptions;
    array of ExtNameMapItem MethNameMap;
    array of MethParamNameMapItem MethParamNameMap;
    array of IntfHeaderItem IntfHeaders;
    array of IntfExceptionItem IntfExceptions;
    UnicodeString UDDIOperator;
    UnicodeString UDDIBindingKey;
  };
```

File

InvokeRegistry

Description

InvRegIntfEntry is used by the invocation registry to store information about a registered invokable interface.

Name is the name of the registered invokable interface.

ExtName is the name of the corresponding port type that appears in the WSDL document describing this Web Service. ExtName can be an empty string if the interface and port type have the same name.

UnitName is the name of the unit in which the interface is defined.

GUID is the globally unique identifier for the interface.

Info points to the runtime type information (RTTI) compiled with the interface.

DefImpl is the default implementation class for the interface.

Namespace is the namespace that is uniquely associated with the interface.

WSDLEncoding is the encoding attribute, if any, of the xml header on a WSDL document that defines the port type to which the invokable interface corresponds.

Documentation is a brief description that documents the interface.

DefaultSOAPAction is the SOAP Action header (or set of SOAP Action headers) to use on messages directed to this interface. If

this is an empty string, the application generates a SOAP Action header that is based on the Namespace field. Assign SOAP Action headers using the RegisterDefaultSOAPAction or RegisterAllSOAPActions method. Note that if you have more than one interface with the same namespace URI, you must register them with different SOAP Action headers so that the server can distinguish them.

ReturnParamNames is a semicolon-delimited list of parameter names that map to the return value of a function.

InvokeOptions are the options for the interface that have been registered using the RegisterInvokeOptions method. These options customize the way the interface is called.

MethNameMap is an array of entries that describe the relationship between methods on the invokable interface and the operation names to which they correspond (if different).

MethParamNameMap is an array of entries that describe the relationship between parameters on a method of the invokable interface and the part names to which they correspond (if different).

IntfHeaders is an array of entries that describe the SOAP headers that should accompany requests directed at the invokable interface.

IntfExceptions is an array of entries that describe the exceptions that the interface can raise.

UDDIOperator is the URL of the UDDI registry, if any, that was used to import the interface definition.

UDDIBindingKey is the unique identifier for the TModel from UDDIOperator that describes the Web Service to which the interface belongs.

23.4.7 InvokeRegistry.MethParamNameMapItem Record

Pascal

```
MethParamNameMapItem = record
  MethName: string;
  ParamNameMap: array of ExtNameMapItem;
end;
```

C++

```
struct MethParamNameMapItem {
  UnicodeString MethName;
  array of ExtNameMapItem ParamNameMap;
};
```

File

InvokeRegistry

Description

This is record InvokeRegistry.MethParamNameMapItem.

23.4.8 InvokeRegistry.ObjectConvertOptions Enumeration

ObjectConvertOptions and TObjectConvertOptions (see page 950) are flags that customize how to convert a remotable object to or from its SOAP representation.

Pascal

```
ObjectConvertOptions = (
```

```
    ocoDontPrefixNode,
    ocoDontSerializeProps,
    ocoDontPutTypeAttr
  );
```

C++

```
  enum ObjectConvertOptions {
    ocoDontPrefixNode,
    ocoDontSerializeProps,
    ocoDontPutTypeAttr
  };
```

File

InvokeRegistry

Description

TObjectConvertOptions (see page 950) is a set of ObjectConvertOptions values. ObjectConvertOptions values are flags that can be supplied when customizing the conversion between an object and its SOAP representation.

Value	Meaning
ocoDontPrefixNode	When set, the SOAP representation does not include a namespace prefix on node names.
ocoDontSerializeProps	When set, the SOAP representation does not include any representation for the published properties of the remotable object.
ocoDontPutTypeAttr	When set, nodes do not include an xsi:type attribute that indicates their type.

23.4.9 InvokeRegistry.SerializationOptions Enumeration

SerializationOptions and TSerializationOptions (see page 953) are flags that customize how to convert a remotable object to or from its SOAP representation.

Pascal

```
  SerializationOptions = (
    xoHolderClass,
    xoAttributeOnLastMember,
    xoInlineArrays,
    xoLiteralParam,
    xoSimpleTypeWrapper,
    xoOption6,
    xoOption7,
    xoOption8,
    xoOption9,
    xoOptionA,
    xoOptionB,
    xoOptionC,
    xoOptionD,
    xoOptionE,
    xoOptionF,
    xoOptionG,
    xoOptionH,
    xoOptionI
  );
```

C++

```
  enum SerializationOptions {
    xoHolderClass,
    xoAttributeOnLastMember,
```

```
    xoInlineArrays,
    xoLiteralParam,
    xoSimpleTypeWrapper,
    xoOption6,
    xoOption7,
    xoOption8,
    xoOption9,
    xoOptionA,
    xoOptionB,
    xoOptionC,
    xoOptionD,
    xoOptionE,
    xoOptionF,
    xoOptionG,
    xoOptionH,
    xoOptionI
  };
```

File

InvokeRegistry

Description

TSerializationOptions (see page 953) is a set of SerializationOptions values. SerializationOptions values are flags that can be registered with an invokable interface to indicate how it should be called. The following table lists the possible values.

Value	Meaning
xoHolderClass	The remotable object corresponds to a "holder" class. That is, the SOAP representation does not include a node for the class itself, just for its members. This is used when a type that would otherwise not require a remotable class uses a feature only available on remotable classes (such as attributes).
xoAttributeOnLastMember	Attributes of the remotable class are stored on the last member of the class that maps to an element node rather than on the node that corresponds to the class itself. This is necessary if a holder class has attributes.
xoInlineArrays	If the remotable class contains class members that are array types, the encoding of those members omits the type name of the array types. This results in more efficient encoding of holder classes that represent array types.
xoLiteralParam	The remotable class represents one of the two top-level nodes (the input or output value) of a document-literal encoding. The class is treated as a holder class if it is used as the direct input or output parameter of a function.
xoSimpleTypeWrapper	The remotable class is a wrapper for a simple type such as a string or integer. The value that the class represents is represented as a single published property of the remotable class.
xoOption5 - xoOptionI	The remaining options are reserved for future use.

23.4.10 InvokeRegistry.TDynToClear Record

Pascal

```
  TDynToClear = record
    P: Pointer;
    Info: PTypeInfo;
  end;
```

C++

```
  struct TDynToClear {
    void * P;
```

```
  PTypeInfo Info;
};
```

File

InvokeRegistry

Description

This is record InvokeRegistry.TDynToClear.

23.4.11 InvokeRegistry.TIntfInvokeOption Enumeration

TIntfInvokeOption and TIntfInvokeOptions (see page 949) represent flags that customize how to handle calls to an invokable interface.

Pascal

```
TIntfInvokeOption = (
  ioDefault,
  ioDocument,
  ioLiteral,
  ioHasDefaultSOAPAction,
  ioHasReturnParamNames,
  ioHasNamespace,
  ioIsAppServerSOAP,
  ioHasUDDIInfo,
  ioHasAllSOAPActions
);
```

C++

```
enum TIntfInvokeOption {
  ioDefault,
  ioDocument,
  ioLiteral,
  ioHasDefaultSOAPAction,
  ioHasReturnParamNames,
  ioHasNamespace,
  ioIsAppServerSOAP,
  ioHasUDDIInfo,
  ioHasAllSOAPActions
};
```

File

InvokeRegistry

Description

TIntfInvokeOptions (see page 949) is a set of TIntfInvokeOption values. TIntfInvokeOption values are flags that can be registered with an invokable interface to indicate how it should be called. The following table lists the possible values.

Value	Meaning
ioDefault	Calls to the interface use the default options unless overridden by other options. (RPC-based SOAP encoding and HTTP as a transport protocol).
ioDocument	The Web Services server uses document-style encoding.
ioLiteral	The Web Services server uses document-literal style and the types for input and output values have not been unwound to create a method call.
ioHasDefaultSOAPAction	A default SOAP action header has been registered for use with the interface.

ioHasReturnParamNames	A set of parameter names have been registered for use with the interface that are reserved for the return value of function calls. If this option is not set, the strings 'Return' and 'Result' are used.
ioHasNamespace	A namespace was explicitly provided when the interface was registered, rather than using an automatically-generated namespace.
ioIsAppServerSOAP	The interface descends from IAppServerSOAP. Such interfaces are used in multi-tier database applications to interact with the application server.
ioHasUDDIInfo	UDDI information has been registered for the interface. This option is set when the Web Service description is imported using the UDDI browser.
ioHasAllSOAPActions	The SOAPAction headers could not be collapsed into a single string. When representing the SOAP action headers, a single string is created where the first character represents a delimiter that marks the boundary between the various SOAP action headers.

23.4.12 InvokeRegistry.TObjMultiOptions Enumeration

TObjMultiOptions indicates how multiple references to the same remotable class should be translated into a SOAP representation.

Pascal

```
TObjMultiOptions = (
  ocDefault,
  ocMultiRef,
  ocNoMultiRef
);
```

C++

```
enum TObjMultiOptions {
  ocDefault,
  ocMultiRef,
  ocNoMultiRef
};
```

File

InvokeRegistry

Description

TObjMultiOptions indicates a class-specific override to the default strategy for converting multiple references to the same object instance into the corresponding SOAP representation. It indicates whether a remotable object should be treated by value (like a structure) or by reference (where object identity is meaningful).

Value	Meaning
ocDefault	Use the default strategy for handling multiple references.
ocMultiRef	Always indicate in the SOAP packet when multiple references refer to the same instance of the specified class.
ocNoMultiRef	Never indicate in the SOAP packet when multiple references refer to the same instance of the specified class. That is, always treat it "by value".

23.4.13 InvokeRegistry.TRemHeaderEntry Record

Pascal

```
TRemHeaderEntry = record
  Name: InvString;
  ExtName: InvString;
  URI: InvString;
end;
```

C++

```
struct TRemHeaderEntry {
  InvString Name;
  InvString ExtName;
  InvString URI;
};
```

File

InvokeRegistry

Description

This is record InvokeRegistry.TRemHeaderEntry.

23.4.14 InvokeRegistry.TRemRegEntry Record

TRemRegEntry stores information for the remotable type registry.

Pascal

```
TRemRegEntry = record
  ClassType: TClass;
  Info: PTypeInfo;
  URI: InvString;
  Name: InvString;
  ExtName: InvString;
  IsScalar: Boolean;
  MultiRefOpt: TObjMultiOptions;
  SerializationOpt: TSerializationOptions;
  PropNameMap: array of ExtNameMapItem;
end;
```

C++

```
struct TRemRegEntry {
  TClass ClassType;
  PTypeInfo Info;
  InvString URI;
  InvString Name;
  InvString ExtName;
  Boolean IsScalar;
  TObjMultiOptions MultiRefOpt;
  TSerializationOptions SerializationOpt;
  array of ExtNameMapItem PropNameMap;
};
```

File

InvokeRegistry

Description

TRemRegEntry is the type that the remotable type registry uses to store information about a registered type. The TRemRegEntry type is used to represent both remotable classes and remotable types. It contains the following members:

ClassType is the class reference for the class. It is not used for entries that represent types that are not classes.

Info is the type info pointer for a registered class or type.

URI is the namespace URI that the registry associates with the class or type.

Name is the type name of the class or type, as it appears in encoded method calls or WSDL documents.

ExtName is the same as Name.

IsScalar indicates whether the entry describes a class or type that is marshaled as a scalar type.

MultiRefOpt indicates how to marshal multiple instances of a registered class. It is not used for entries that represent types.

SerializationOpt indicates how to convert between a registered class and its encoded representation.

PropNameMap is an array of entries that describe the relationship between properties on the invokable interface and the external names to which they correspond (if different).

23.5 Types

The following table lists types in this documentation.

Types

Name	Description
ERemotableExceptionClass (see page 946)	This is type InvokeRegistry.ERemotableExceptionClass.
InvString (see page 947)	InvString is the type for strings that are used to represent all or part of an encoded call on an invokable interface.
InvStringDynArray (see page 947)	This is type InvokeRegistry.InvStringDynArray.
PTRemotable (see page 947)	This is type InvokeRegistry.PTRemotable.
TCreateInstanceProc (see page 948)	TCreateInstanceProc is the type of the factory routine that returns an instance of an invokable class.
TExceptionItemArray (see page 948)	This is type InvokeRegistry.TExceptionItemArray.
THeaderItemArray (see page 948)	This is type InvokeRegistry.THeaderItemArray.
THeaderMethodTypeArray (see page 949)	This is type InvokeRegistry.THeaderMethodTypeArray.
TIntfInvokeOptions (see page 949)	This is type InvokeRegistry.TIntfInvokeOptions.
TInvokableClassClass (see page 949)	This is type InvokeRegistry.TInvokableClassClass.
TInvRegIntfEntryArray (see page 950)	This is type InvokeRegistry.TInvRegIntfEntryArray.
TObjectConvertOptions (see page 950)	This is type InvokeRegistry.TObjectConvertOptions.
TPascalRemotableClassRegistry (see page 950)	TPascalRemotableClassRegistry is the type of the remotable class registry.
TPascalRemotableTypeRegistry (see page 951)	TPascalRemotableTypeRegistry is the type of the remotable type registry.
TRemotableClass (see page 951)	This is type InvokeRegistry.TRemotableClass.
TRemotableClassRegistry (see page 951)	This is type InvokeRegistry.TRemotableClassRegistry.
TRemotableXSClass (see page 952)	This is type InvokeRegistry.TRemotableXSClass.
TRemRegEntryArray (see page 952)	This is type InvokeRegistry.TRemRegEntryArray.
TRequiredArray (see page 952)	TRequiredArray is a dynamic array of boolean values.
TSerializationOptions (see page 953)	This is type InvokeRegistry.TSerializationOptions.
TSOAPAttachmentClass (see page 953)	This is type InvokeRegistry.TSOAPAttachmentClass.
TSOAPHeaderClass (see page 953)	This is type InvokeRegistry.TSOAPHeaderClass.

23.5.1 InvokeRegistry.ERemotableExceptionClass Type

Pascal

```
ERemotableExceptionClass = class of ERemotableException;
```

C++

```
ERemotableException ERemotableExceptionClass;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.ERemotableExceptionClass.

23.5.2 InvokeRegistry.InvString Type

InvString is the type for strings that are used to represent all or part of an encoded call on an invokable interface.

Pascal

```
InvString = xmldom.DOMString;
```

C++

```
xmldom.DOMString InvString;
```

File

InvokeRegistry

Description

InvString is the type for encoded method calls in Web Service applications. It is used for the results of encoding an interface call or its results so that it can be transported between client and server applications.

23.5.3 InvokeRegistry.InvStringDynArray Type

Pascal

```
InvStringDynArray = array of InvString;
```

C++

```
array of InvString InvStringDynArray;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.InvStringDynArray.

23.5.4 InvokeRegistry.PTRemotable Type

Pascal

```
PTRemotable = ^TRemotable;
```

C++

```
^TRemotable PTRemotable;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.PTRemotable.

23.5.5 InvokeRegistry.TCreateInstanceProc Type

TCreateInstanceProc is the type of the factory routine that returns an instance of an invokable class.

Pascal

```
TCreateInstanceProc = procedure (out obj: TObject);
```

C++

```
(out obj: TObject) ( TCreateInstanceProc)();
```

File

InvokeRegistry

Description

TCreateInstanceProc is the type for procedures that return an instance of an invokable class on behalf of the invocation registry. When the class that implements an invokable interface is not a descendant of TInvokableClass (see page 833), or when you want to control the instantiation of the implementation class (for example to use a single shared instance for all incoming requests), supply a procedure of this type when registering the implementation class.

obj returns an instance of the invokable class, which can handle the current incoming request.

23.5.6 InvokeRegistry.TExceptionItemArray Type

Pascal

```
TExceptionItemArray = array of IntfExceptionItem;
```

C++

```
array of IntfExceptionItem TExceptionItemArray;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TExceptionItemArray.

23.5.7 InvokeRegistry.THeaderItemArray Type

Pascal

```
THeaderItemArray = array of IntfHeaderItem;
```

C++

```
array of IntfHeaderItem THeaderItemArray;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.THeaderItemArray.

23.5.8 InvokeRegistry.THeaderMethodTypeArray Type

Pascal

```
THeaderMethodTypeArray = array of eHeaderMethodType;
```

C++

```
array of eHeaderMethodType THeaderMethodTypeArray;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.THeaderMethodTypeArray.

23.5.9 InvokeRegistry.TIntfInvokeOptions Type

Pascal

```
TIntfInvokeOptions = set of TIntfInvokeOption;
```

C++

```
TIntfInvokeOption TIntfInvokeOptions;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TIntfInvokeOptions.

23.5.10 InvokeRegistry.TInvokableClassClass Type

Pascal

```
TInvokableClassClass = class of TInvokableClass;
```

C++

```
TInvokableClass TInvokableClassClass;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TInvokableClassClass.

23.5.11 InvokeRegistry.TInvRegIntfEntryArray Type

Pascal

```
TInvRegIntfEntryArray = array of InvRegIntfEntry;
```

C++

```
array of InvRegIntfEntry TInvRegIntfEntryArray;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TInvRegIntfEntryArray.

23.5.12 InvokeRegistry.TObjectConvertOptions Type

Pascal

```
TObjectConvertOptions = set of ObjectConvertOptions;
```

C++

```
ObjectConvertOptions TObjectConvertOptions;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TObjectConvertOptions.

23.5.13 InvokeRegistry.TPascalRemotableClassRegistry Type

TPascalRemotableClassRegistry is the type of the remotable class registry.

Pascal

```
TPascalRemotableClassRegistry = TRemotableTypeRegistry;
```

C++

```
TRemotableTypeRegistry TPascalRemotableClassRegistry;
```

File

InvokeRegistry

Description

TPascalRemotableClassRegistry is a synonym for TRemotableTypeRegistry (see page 874). It is defined for compatibility with Delphi 6.

See Also

RemClassRegistry (see page 930)

TRemotable (see page 868)

23.5.14 InvokeRegistry.TPascalRemotableTypeRegistry Type

TPascalRemotableTypeRegistry is the type of the remotable type registry.

Pascal

```
TPascalRemotableTypeRegistry = TRemotableTypeRegistry;
```

C++

```
TRemotableTypeRegistry TPascalRemotableTypeRegistry;
```

File

InvokeRegistry

Description

TPascalRemotableTypeRegistry is a synonym for TRemotableTypeRegistry (see page 874). It is defined for compatibility with Delphi 6.

See Also

RemTypeRegistry (see page 931)

TRemotable (see page 868)

23.5.15 InvokeRegistry.TRemotableClass Type

Pascal

```
TRemotableClass = class of TRemotable;
```

C++

```
TRemotable TRemotableClass;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TRemotableClass.

23.5.16 InvokeRegistry.TRemotableClassRegistry Type

Pascal

```
TRemotableClassRegistry = TRemotableTypeRegistry;
```

C++

```
TRemotableTypeRegistry TRemotableClassRegistry;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TRemotableClassRegistry.

23.5.17 InvokeRegistry.TRemotableXSClass Type

Pascal

```
TRemotableXSClass = class of TRemotableXS;
```

C++

```
TRemotableXS TRemotableXSClass;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TRemotableXSClass.

23.5.18 InvokeRegistry.TRemRegEntryArray Type

Pascal

```
TRemRegEntryArray = array of TRemRegEntry;
```

C++

```
array of TRemRegEntry TRemRegEntryArray;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TRemRegEntryArray.

23.5.19 InvokeRegistry.TRequiredArray Type

TRequiredArray is a dynamic array of boolean values.

Pascal

```
TRequiredArray = array of Boolean;
```

C++

```
array of Boolean TRequiredArray;
```

File

InvokeRegistry

Description

TRequiredArray is a dynamic array of boolean values. Each value indicates whether a corresponding item is required (true) or optional (false).

23.5.20 InvokeRegistry.TSerializationOptions Type

Pascal

```
TSerializationOptions = set of SerializationOptions;
```

C++

```
SerializationOptions TSerializationOptions;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TSerializationOptions.

23.5.21 InvokeRegistry.TSOAPAttachmentClass Type

Pascal

```
TSOAPAttachmentClass = class of TSOAPAttachment;
```

C++

```
TSOAPAttachment TSOAPAttachmentClass;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TSOAPAttachmentClass.

23.5.22 InvokeRegistry.TSOAPHeaderClass Type

Pascal

```
TSOAPHeaderClass = class of TSOAPHeader;
```

C++

```
TSOAPHeader TSOAPHeaderClass;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TSOAPHeaderClass.

23.6 Variables

The following table lists variables in this documentation.

Variables

Name	Description
AppNameSpacePrefix (see page 955)	Supplies a unique prefix to use for automatically generated namespaces given to invokable interfaces and remotable types.

23.6.1 InvokeRegistry.AppNameSpacePrefix Variable

Supplies a unique prefix to use for automatically generated namespaces given to invokable interfaces and remotable types.

Pascal

```
AppNameSpacePrefix: string;
```

C++

```
UnicodeString AppNameSpacePrefix;
```

File

InvokeRegistry

Description

Set AppNameSpacePrefix to a unique string that the invocation registry and remotable type registry use when generating namespaces. These generated namespaces must be unique strings that identify invokable interfaces and remotable classes in a Web Service application. They are generated by the RegisterInterface method of the invocation registry and the RegisterXSClass and RegisterXSInfo methods of the remotable class registry if the application does not explicitly supply a namespace.

The invocation registry and remotable type registry generate namespaces using the value of AppNameSpacePrefix, the name of the unit in which the interface or class is defined, and the name of the class, type, or interface. If your unit and interface or class names are at all generic, it is a good idea to supply a unique value to AppNameSpacePrefix to guard against the possibility of another interface, type, or class with the same name that is registered in another unit with the same name.

Both client and server applications must register invokable interfaces and remotable types and classes using the same namespace. If you rely on automatically-generated namespaces, be sure to use the same value of AppNameSpacePrefix in both the client and the server applications.

See Also

InvRegistry (see page 930)

TInvokableClassRegistry (see page 840)

TRemotableTypeRegistry (see page 874)

RemTypeRegistry (see page 931)

23.7 Constants

The following table lists constants in this documentation.

Constants

Name	Description
AS_ATTRIBUTE (see page 956)	Identifies a property of a remotable class as one that corresponds to an attribute in the SOAP encoding.
XMLBase64Types (see page 956)	This is constant InvokeRegistry.XMLBase64Types.
XMLSchemaInstNamepspaces (see page 957)	This is constant InvokeRegistry.XMLSchemaInstNamepspaces.
XMLSchemaNamepspaces (see page 957)	This is constant InvokeRegistry.XMLSchemaNamepspaces.

23.7.1 InvokeRegistry.AS_ATTRIBUTE Constant

Identifies a property of a remotable class as one that corresponds to an attribute in the SOAP encoding.

Pascal

```
AS_ATTRIBUTE = False;
```

C++

```
AS_ATTRIBUTE = False;
```

File

InvokeRegistry

Description

Assign AS_ATTRIBUTE as the value of the stored directive on a property declaration in a TRemotable (see page 868) descendant to indicate that the property is encoded as an attribute node rather than as an element node. If a property declaration does not include a stored directive with a value of AS_ATTRIBUTE, it is encoded as an element node instead.

Note: Note:AS_ATTRIBUTE must be used directly. If you set the stored directive to a function that returns AS_ATTRIBUTE (false), the property is still encoded as an element node.

TRemotable (see page 868)

TRemotableXS (see page 892)

23.7.2 InvokeRegistry.XMLBase64Types Constant

Pascal

```
XMLBase64Types: array[0..1] of InvString = ('base64Binary', 'bin.base64');
```

C++

```
array[0..1] of InvString XMLBase64Types = ('base64Binary', 'bin.base64');
```

File

InvokeRegistry

Description

This is constant InvokeRegistry.XMLBase64Types.

23.7.3 InvokeRegistry.XMLSchemaInstNamepspaces Constant

Pascal

```
XMLSchemaInstNamepspaces: array[0..2] of InvString = (SXMLSchemaInstURI_1999,
SXMLSchemaInstURI_2000_10, SXMLSchemaInstURI);
```

C++

```
array[0..2] of InvString XMLSchemaInstNamepspaces = (SXMLSchemaInstURI_1999,
SXMLSchemaInstURI_2000_10, SXMLSchemaInstURI);
```

File

InvokeRegistry

Description

This is constant InvokeRegistry.XMLSchemaInstNamepspaces.

23.7.4 InvokeRegistry.XMLSchemaNamepspaces Constant

Pascal

```
XMLSchemaNamepspaces: array[0..2] of InvString = (SXMLSchemaURI_1999, SXMLSchemaURI_2000_10,
SXMLSchemaURI_2001);
```

C++

```
array[0..2] of InvString XMLSchemaNamepspaces = (SXMLSchemaURI_1999, SXMLSchemaURI_2000_10,
SXMLSchemaURI_2001);
```

File

InvokeRegistry

Description

This is constant InvokeRegistry.XMLSchemaNamepspaces.

24 ISAPIApp Namespace

This is namespace ISAPIApp.

Topics

Name	Description
Classes (see page 960)	The following table lists classes in this documentation.
Functions (see page 965)	The following table lists functions in this documentation.
Variables (see page 967)	The following table lists variables in this documentation.

Classes

	Name	Description
	TISAPIApplication (see page 960)	TISAPIApplication encapsulates an ISAPI or NSAPI server application.
	TISAPIFactory (see page 963)	

Functions

	Name	Description
	GetExtensionVersion (see page 965)	Returns the name and version number of an ISAPI or NSAPI application.
	HttpExtensionProc (see page 965)	Receives an HTTP request message for an ISAPI or NSAPI application.
	TerminateExtension (see page 966)	Indicates whether an ISAPI or NSAPI application is ready to be shut down.

Variables

Name	Description
DispatchThread (see page 967)	This is variable ISAPIApp.DispatchThread.

24.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TISAPIApplication (see page 960)	TISAPIApplication encapsulates an ISAPI or NSAPI server application.
	TISAPIFactory (see page 963)	

24.1.1 TISAPIApplication Class

TISAPIApplication encapsulates an ISAPI or NSAPI server application.

Class Hierarchy

Pascal

```
TISAPIApplication = class(TWebApplication);
```

C++

```
class TISAPIApplication : public TWebApplication;
```

File

ISAPIApp

Description

TISAPIApplication provides the fundamental behavior of an ISAPI or NSAPI server application. The HTTP server calls the methods of TISAPIApplication when it receives an HTTP request message. TISAPIApplication creates a thread to manage the request message, and a creates a new instance of the Web module for that thread, or reuses an old instance that was deactivated after a previous response was sent.

TISAPIApplication creates TISAPIRequest (see page 970) and TISAPIResponse (see page 977) objects to represent the request message and any response that should be sent in return, passes these to the dispatcher so that the response can be filled in, and sends the response if it was not already sent by a TWebActionItem.

Each ISAPI server project automatically declares an Application variable of type TISAPIApplication as the instance of the application. This declaration overrides the Application variable declared in the Forms unit if the ISAPIApp (see page 959) unit is declared last in the uses list of the project file. Every ISAPI server application must include the ISAPIApp (see page 959) unit.

To work with an Apache server, use the TApacheApplication object. To work with a CGI server, use the TCGIApplication object instead.

See Also

TCGIApplication

TISAPIRequest (see page 970)

TISAPIResponse (see page 977)

TWebActionItem

TWebDispatcher

24.1.1.1 TISAPIApplication Members

The following tables list the members exposed by TISAPIApplication.

Public Methods

	Name	Description
	Create (see page 961)	Creates an instance of TWebApplication.
	Destroy (see page 961)	Destroys an instance of TWebApplication.
	GetExtensionVersion (see page 962)	Returns the application name and version number.
	HttpExtensionProc (see page 962)	Responds to an HTTP request message.
	TerminateExtension (see page 963)	Returns true.

24.1.1.2 TISAPIApplication.Create Constructor

Creates an instance of TWebApplication.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TISAPIApplication(TComponent * AOwner);
```

Description

Do not call Create. The single Web application object named Application is instantiated automatically when the CGIApp unit, the ISAPIApp unit, or the ApacheApp unit is included in the uses list of the project.

Create allocates the helper objects used by TWebApplication.

See Also

Create

24.1.1.3 TISAPIApplication.Destroy Destructor

Destroys an instance of TWebApplication.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TISAPIApplication();
```

Description

Never call the Destroy or Free method. The application is freed automatically when the application stops running.

Destroy frees the helper objects that were created at startup, as well as all Web modules created by the application.

See Also

System::TObject::Free

Run

24.1.1.4 TISAPIApplication Methods

The methods of the TISAPIApplication class are listed here.

Public Methods

	Name	Description
	GetExtensionVersion (see page 962)	Returns the application name and version number.
	HttpExtensionProc (see page 962)	Responds to an HTTP request message.
	TerminateExtension (see page 963)	Returns true.

24.1.1.4.1 TISAPIApplication.GetExtensionVersion Method

Returns the application name and version number.

Pascal

```
function GetExtensionVersion(var Ver: THSE_VERSION_INFO): BOOL;
```

C++

```
__fastcall BOOL GetExtensionVersion(THSE_VERSION_INFO Ver);
```

Description

The HTTP server calls GetExtensionVersion to obtain the application name and version number. GetExtensionVersion returns the version number for the HTTP functions in the runtime library, and the Title property of the ISAPI application object.

See Also

Title

24.1.1.4.2 TISAPIApplication.HttpExtensionProc Method

Responds to an HTTP request message.

Pascal

```
function HttpExtensionProc(var ECB: TEXTENSION_CONTROL_BLOCK): DWORD;
```

C++

```
__fastcall DWORD HttpExtensionProc(TEXTENSION_CONTROL_BLOCK ECB);
```

Description

The HTTP server calls HttpExtensionProc when it receives an HTTP request message. HttpExtensionProc creates the TISAPIRequest (see page 970) and TISAPIResponse (see page 977) objects for the HTTP request message, and calls the HandleRequest message so that the response can be filled out and sent. Finally, HttpExtensionProc frees the request and response objects.

If the response is filled out and sent, HttpExtensionProc returns HSE_STATUS_SUCCESS. Otherwise it returns HSE_STATUS_ERROR.

See Also

TISAPIRequest (see page 970)

TISAPIResponse (see page 977)

HandleRequest

TWebDispatcher

24.1.1.4.3 TISAPIApplication.TerminateExtension Method

Returns true.

Pascal

```
function TerminateExtension(dwFlags: DWORD): BOOL;
```

C++

```
__fastcall BOOL TerminateExtension(DWORD dwFlags);
```

Description

The HTTP server calls TerminateExtension when it wants to shut down the ISAPI application. TerminateExtension always returns true, allowing the server to shut down.

24.1.2 TISAPIFactory Class

Class Hierarchy

Pascal

```
TISAPIFactory = class(TObject);
```

C++

```
class TISAPIFactory : public TObject;
```

File

ISAPIApp

See Also

TCGIApplication

24.1.2.1 TISAPIFactory Members

The following tables list the members exposed by TISAPIFactory.

Protected Methods

	Name	Description
	NewRequest (see page 964)	This is NewRequest, a member of class TISAPIFactory.
	NewResponse (see page 964)	This is NewResponse, a member of class TISAPIFactory.

Public Methods

	Name	Description
	Create (see page 963)	Creates an instance of Create. {Placeholder—Update for BCB}

24.1.2.2 TISAPIFactory.Create Constructor

Creates an instance of Create. {Placeholder—Update for BCB}

Pascal

```
constructor Create;
```

C++

```
__fastcall TISAPIFactory();
```

Description

Do not create instances of Create. Instead, use the new keyword, passing any arguments for the Create's constructor.

See Also

System::TObject::Destroy

new

24.1.2.3 TISAPIFactory Methods

The methods of the TISAPIFactory class are listed here.

Protected Methods

	Name	Description
	NewRequest (see page 964)	This is NewRequest, a member of class TISAPIFactory.
	NewResponse (see page 964)	This is NewResponse, a member of class TISAPIFactory.

24.1.2.3.1 TISAPIFactory.NewRequest Method

Pascal

```
function NewRequest(var AECB: TEXTENSION_CONTROL_BLOCK): TISAPIRequest; virtual;
```

C++

```
virtual __fastcall TISAPIRequest NewRequest(TEXTENSION_CONTROL_BLOCK AECB);
```

Description

This is NewRequest, a member of class TISAPIFactory.

24.1.2.3.2 TISAPIFactory.NewResponse Method

Pascal

```
function NewResponse(ISAPIRequest: TISAPIRequest): TISAPIResponse; virtual;
```

C++

```
virtual __fastcall TISAPIResponse NewResponse(TISAPIRequest ISAPIRequest);
```

Description

This is NewResponse, a member of class TISAPIFactory.

24.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GetExtensionVersion (see page 965)	Returns the name and version number of an ISAPI or NSAPI application.
	HttpExtensionProc (see page 965)	Receives an HTTP request message for an ISAPI or NSAPI application.
	TerminateExtension (see page 966)	Indicates whether an ISAPI or NSAPI application is ready to be shut down.

24.2.1 ISAPIApp.GetExtensionVersion Function

Returns the name and version number of an ISAPI or NSAPI application.

Pascal

```
function GetExtensionVersion(var Ver: THSE_VERSION_INFO): BOOL; stdcall;
```

C++

```
__stdcall BOOL GetExtensionVersion(THSE_VERSION_INFO Ver);
```

File

ISAPIApp

Description

Do not call GetExtensionVersion. ISAPI and NSAPI DLLs export GetExtension to provide an entry point that is called by ISAPI or NSAPI Web servers. This allows the Web server to obtain version information about the web server application.

See Also

HttpExtensionProc (see page 965)

TerminateExtension (see page 966)

TISAPIApplication (see page 960)

24.2.2 ISAPIApp.HttpExtensionProc Function

Receives an HTTP request message for an ISAPI or NSAPI application.

Pascal

```
function HttpExtensionProc(var ECB: TEXTENSION_CONTROL_BLOCK): DWORD; stdcall;
```

C++

```
__stdcall DWORD HttpExtensionProc(TEXTENSION_CONTROL_BLOCK ECB);
```

File

ISAPIApp

Description

Do not call HttpExtensionProc. ISAPI and NSAPI DLLs export HttpExtensionProc to provide an entry point that is called by ISAPI or NSAPI Web servers when they receive HTTP request messages.

See Also

GetExtensionVersion (see page 965)

TerminateExtension (see page 966)

24.2.3 ISAPIApp.TerminateExtension Function

Indicates whether an ISAPI or NSAPI application is ready to be shut down.

Pascal

```
function TerminateExtension(dwFlags: DWORD): BOOL; stdcall;
```

C++

```
__stdcall BOOL TerminateExtension(DWORD dwFlags);
```

File

ISAPIApp

Description

Do not call TerminateExtension. TerminateExtension is exported by ISAPI and NSAPI DLLs. It provides an entry point that is called by ISAPI or NSAPI Web servers, when they are ready to shut down the ISAPI or NSAPI application, to check whether it would cause problems to do so.

See Also

HttpExtensionProc (see page 965)

24.3 Variables

The following table lists variables in this documentation.

Variables

Name	Description
DispatchThread (see page 967)	This is variable ISAPIApp.DispatchThread.

24.3.1 ISAPIApp.DispatchThread Variable

Pascal

```
DispatchThread: function (AECB: PEXTENSION_CONTROL_BLOCK): Boolean of object;
```

C++

```
function (AECB: PEXTENSION_CONTROL_BLOCK): Boolean of object DispatchThread;
```

File

ISAPIApp

Description

This is variable ISAPIApp.DispatchThread.

25 IsapiHTTP Namespace

This is namespace IsapiHTTP.

Topics

Name	Description
Classes (see page 970)	The following table lists classes in this documentation.

Classes

	Name	Description
	TISAPIRequest (see page 970)	TISAPIRequest represents client request information that is passed to a server application DLL.
	TISAPIResponse (see page 977)	TISAPIResponse represents HTTP messages sent by an ISAPI application in response to an HTTP request message.

25.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TISAPIRequest (see page 970)	TISAPIRequest represents client request information that is passed to a server application DLL.
	TISAPIResponse (see page 977)	TISAPIResponse represents HTTP messages sent by an ISAPI application in response to an HTTP request message.

25.1.1 TISAPIRequest Class

TISAPIRequest represents client request information that is passed to a server application DLL.

Class Hierarchy

Pascal

```
TISAPIRequest = class(TWebRequest);
```

C++

```
class TISAPIRequest : public TWebRequest;
```

File

IsapiHTTP

Description

Use TISAPIRequest to interpret a client request to a server application DLL.

ISAPI application objects create TISAPIRequest objects to capture client requests. The properties of the TISAPIRequest objects are obtained from the Web server. The ISAPI application uses TISAPIRequest objects to create corresponding TISAPIResponse (see page 977) objects. The TWebDispatcher for the application then invokes the TWebActionItem that is associated with the path portion of the URL of the TISAPIRequest object.

See Also

TISAPIApplication (see page 960)

TISAPIResponse (see page 977)

TWebActionItem

TWebDispatcher

Accessing Client Request Information

25.1.1.1 TISAPIRequest Members

The following tables list the members exposed by TISAPIRequest.

Protected Methods

	Name	Description
	GetDateVariable (see page 972)	Extracts a date value from the extension control block.
	GetIntegerVariable (see page 973)	Extracts an integer value from the extension control block.
	GetStringVariable (see page 973)	Extracts a string value from the extension control block.

Public Methods

	Name	Description
	Create (see page 971)	Creates an instance of TISAPIRequest (see page 970) to represent the request message information contained in the AECB parameter.
	GetFieldByName (see page 972)	Returns the value of the HTTP header variable specified by the Name parameter.
	ReadClient (see page 974)	Reads Count bytes from the HTTP request into Buffer.
	ReadString (see page 974)	Reads Count bytes from the HTTP request into a string.
	TranslateURI (see page 975)	Translates a Uniform Resource Identifier (URI) into the internal representation of a location on the server.
	WriteClient (see page 975)	Writes Count bytes from Buffer back to the HTTP client.
	WriteHeaders (see page 975)	Writes the header contents back to the HTTP client.
	WriteString (see page 976)	Writes the string AString back to the HTTP client.

Public Properties

	Name	Description
	ECB (see page 976)	Indicates the extension control block structure used by the server application DLL to communicate with the Web server.

25.1.1.2 TISAPIRequest.Create Constructor

Creates an instance of TISAPIRequest (see page 970) to represent the request message information contained in the AECB parameter.

Pascal

```
constructor Create(AECB: PEXTENSION_CONTROL_BLOCK);
```

C++

```
__fastcall TISAPIRequest(PEXTENSION_CONTROL_BLOCK AECB);
```

Description

Applications don't need to call Create to instantiate an ISAPI request object. TISAPIApplication creates a TISAPIRequest (see page 970) object whenever it receives a client request.

See Also

ECB (see page 976)

TISAPIApplication (see page 960)

25.1.1.3 TISAPIRequest Methods

The methods of the TISAPIRequest class are listed here.

Protected Methods

	Name	Description
	GetDateVariable (see page 972)	Extracts a date value from the extension control block.
	GetIntegerVariable (see page 973)	Extracts an integer value from the extension control block.
	GetStringVariable (see page 973)	Extracts a string value from the extension control block.

Public Methods

	Name	Description
	GetFieldByName (see page 972)	Returns the value of the HTTP header variable specified by the Name parameter.
	ReadClient (see page 974)	Reads Count bytes from the HTTP request into Buffer.
	ReadString (see page 974)	Reads Count bytes from the HTTP request into a string.
	TranslateURI (see page 975)	Translates a Uniform Resource Identifier (URI) into the internal representation of a location on the server.
	WriteClient (see page 975)	Writes Count bytes from Buffer back to the HTTP client.
	WriteHeaders (see page 975)	Writes the header contents back to the HTTP client.
	WriteString (see page 976)	Writes the string AString back to the HTTP client.

25.1.1.3.1 TISAPIRequest.GetDateVariable Method

Extracts a date value from the extension control block.

Pascal

```
function GetDateVariable(Index: Integer): TDateTime; override;
```

C++

```
virtual __fastcall TDateTime GetDateVariable(int Index);
```

Description

GetDateVariable reads date-time values from the extension control block specified by the ECB (see page 976) property. The ISAPI request object uses GetDateVariable to access the properties that represent dates from the HTTP request headers.

See Also

Date

ECB (see page 976)

Expires

IfModifiedSince

25.1.1.3.2 TISAPIRequest.GetFieldByName Method

Returns the value of the HTTP header variable specified by the Name parameter.

Pascal

```
function GetFieldByName(const Name: AnsiString): AnsiString; override;
```

C++

```
virtual __fastcall AnsiString GetFieldByName(const AnsiString Name);
```

Description

Use GetFieldByName to read the value of an HTTP header variable that is not surfaced as one of the properties of TISAPIRequest (see page 970). For information on possible HTTP request header variables, see the current Internet standards documents.

See Also

ECB (see page 976)

GetStringVariable (see page 973)

25.1.1.3.3 TISAPIRequest.GetIntegerVariable Method

Extracts an integer value from the extension control block.

Pascal

```
function GetIntegerVariable(Index: Integer): Integer; override;
```

C++

```
virtual __fastcall int GetIntegerVariable(int Index);
```

Description

GetIntegerVariable reads integer values from the extension control block specified by the ECB (see page 976) property. The ISAPI request object uses GetIntegerVariable to access the properties that represent integers from the HTTP request headers.

See Also

ContentLength

ECB (see page 976)

ServerPort

25.1.1.3.4 TISAPIRequest.GetStringVariable Method

Extracts a string value from the extension control block.

Pascal

```
function GetStringVariable(Index: Integer): AnsiString; override;
```

C++

```
virtual __fastcall AnsiString GetStringVariable(int Index);
```

Description

GetStringVariable reads string values from the extension control block specified by the ECB (see page 976) property. The ISAPI request object uses GetStringVariable to access the properties that represent strings from the HTTP request headers.

25.1.1.3.5 TISAPIRequest.ReadClient Method

Reads Count bytes from the HTTP request into Buffer.

Pascal

```
function ReadClient(var Buffer; Count: Integer): Integer; override;
```

C++

```
virtual __fastcall int ReadClient( Buffer, int Count);
```

Description

Use ReadClient to load a chunk of information from the contents of an HTTP request into a buffer. ReadClient allows the server application to get the next chunk of information when the content of the request message is too large for the Content property. ReadClient returns the number of bytes actually read. If no more content is available, ReadClient returns -1.

See Also

ReadString (see page 974)

WriteClient (see page 975)

25.1.1.3.6 TISAPIRequest.ReadString Method

Reads Count bytes from the HTTP request into a string.

Pascal

```
function ReadString(Count: Integer): AnsiString; override;
```

C++

```
virtual __fastcall AnsiString ReadString(int Count);
```

Description

Use ReadString to load the next chunk of content information form the HTTP request into a string. ReadString allows the server application to get the next chunk of information when the content of the request message is too large for the Content property.

See Also

GetStringVariable (see page 973)

ReadClient (see page 974)

WriteString (see page 976)

25.1.1.3.7 TISAPIRequest.TranslateURI Method

Translates a Uniform Resource Identifier (URI) into the internal representation of a location on the server.

Pascal

```
function TranslateURI(const URI: string): string; override;
```

C++

```
virtual __fastcall UnicodeString TranslateURI(const UnicodeString URI);
```

Description

Use TranslateURI is used to translate the URI specified in a client request into a format that can be used by the server application.

See Also

PathTranslated

URL

25.1.1.3.8 TISAPIRequest.WriteClient Method

Writes Count bytes from Buffer back to the HTTP client.

Pascal

```
function WriteClient(var Buffer; Count: Integer): Integer; override;
```

C++

```
virtual __fastcall int WriteClient( Buffer, int Count);
```

Description

Use WriteClient to write the contents of a response back to the Web client.

See Also

ReadClient (see page 974)

TISAPIResponse (see page 977)

WriteString (see page 976)

WriteHeaders (see page 975)

25.1.1.3.9 TISAPIRequest.WriteHeaders Method

Writes the header contents back to the HTTP client.

Pascal

```
function WriteHeaders(StatusCode: Integer; const StatusString: AnsiString; const Headers:
AnsiString): Boolean; override;
```

C++

```
virtual __fastcall Boolean WriteHeaders(int StatusCode, const AnsiString StatusString, const AnsiString Headers);
```

Description

WriteHeaders writes the HTTP headers of a response message before a call to the WriteClient (see page 975) method. These headers are used on the HTTP message that the WriteClient (see page 975) method sends in response to this request.

StatusCode is the status code of the response. This informs the client of the status of the request. For a list of status code values, see the StatusCode property of TWebResponse.

StatusString is a text string that describes the status that StatusCode indicates.

Headers is a formatted string that includes any other HTTP headers to add. It represents each header as a string of the form 'Headername: Value', where name/value pairs are separated by line breaks.

WriteHeaders returns true if it succeeds in writing the specified headers.

See Also

WriteClient (see page 975)

StatusCode

25.1.1.3.10 TISAPIRequest.WriteString Method

Writes the string AString back to the HTTP client.

Pascal

```
function WriteString(const AString: AnsiString): Boolean; override;
```

C++

```
virtual __fastcall Boolean WriteString(const AnsiString AString);
```

Description

Use WriteString to write the contents of a response back to the Web client.

See Also

ReadString (see page 974)

TISAPIResponse (see page 977)

WriteClient (see page 975)

25.1.1.4 TISAPIRequest Properties

The properties of the TISAPIRequest class are listed here.

Public Properties

	Name	Description
R	ECB (see page 976)	Indicates the extension control block structure used by the server application DLL to communicate with the Web server.

25.1.1.4.1 TISAPIRequest.ECB Property

Indicates the extension control block structure used by the server application DLL to communicate with the Web server.

Pascal

```
property ECB: PEXTENSION_CONTROL_BLOCK;
```

C++

```
__property PEXTENSION_CONTROL_BLOCK ECB;
```

Description

Read ECB to gain direct access to the extension control block that the server application DLL uses to represent the client request message. Most applications will not need to use the ECB property because the header fields values can be read using the GetFieldByName (see page 972) method.

See Also

GetFieldByName (see page 972)

25.1.2 TISAPIResponse Class

TISAPIResponse represents HTTP messages sent by an ISAPI application in response to an HTTP request message.

Class Hierarchy

Pascal

```
TISAPIResponse = class(TWebResponse);
```

C++

```
class TISAPIResponse : public TWebResponse;
```

File

IsapiHTTP

Description

Use TISAPIResponse to specify the response to an HTTP request message.

An ISAPI application creates a TISAPIResponse object based on the TISAPIRequest (see page 970) object for an incoming HTTP request message. TWebDispatcher then passes the TISAPIResponse object to the TWebActionItem associated with the TISAPIRequest (see page 970) object. The TWebActionItem sets the properties of the TISAPIResponse object.

See Also

TISAPIApplication (see page 960)

TISAPIRequest (see page 970)

TWebActionItem

TWebDispatcher

Creating HTTP Response Messages

25.1.2.1 TISAPIResponse Members

The following tables list the members exposed by TISAPIResponse.

Protected Methods

	Name	Description
	GetContent (see page 979)	Reads the value of the Content property.
	GetDateVariable (see page 979)	Extracts a date from the internal table of HTTP header variables.
	GetIntegerVariable (see page 980)	Extracts an integer value from the internal table of HTTP header variables.
	GetLogMessage (see page 980)	Reads the value of the LogMessage property.
	GetStatusCode (see page 980)	Reads the value of the StatusCode property.
	GetStringVariable (see page 981)	Extracts a string value from the internal table of HTTP header variables.
	InitResponse (see page 981)	This is InitResponse, a member of class TISAPIResponse.
	SetContent (see page 983)	Sets the Content property.
	SetDateVariable (see page 983)	Sets a date-time valued HTTP header property.
	SetIntegerVariable (see page 984)	Sets an integer valued HTTP header property.
	SetLogMessage (see page 984)	Sets the value of the LogMessage property.
	SetStatusCode (see page 984)	Sets the StatusCode property.
	SetStringVariable (see page 985)	Sets a string valued HTTP header property.

Public Methods

	Name	Description
	Create (see page 978)	Creates an instance of TISAPIResponse (see page 977) to represent the response to the HTTPRequest parameter.
	SendRedirect (see page 982)	Sends the response with a StatusCode of 301 (Moved Permanently) and with Location set to the URI parameter.
	SendResponse (see page 982)	Sends the ISAPI response message to the web client.
	SendStream (see page 982)	Sends the ISAPI response message with the contents set to the contents of AStream.
	Sent (see page 983)	Indicates whether the ISAPI response message has been sent.

25.1.2.2 TISAPIResponse.Create Constructor

Creates an instance of TISAPIResponse (see page 977) to represent the response to the HTTPRequest parameter.

Pascal

```
constructor Create(HTTPRequest: TWebRequest);
```

C++

```
__fastcall TISAPIResponse(TWebRequest HTTPRequest);
```

Description

Applications don't need to call Create to instantiate a ISAPI response object. TISAPIApplication creates a TISAPIResponse (see page 977) for each TISAPIRequest (see page 970) it creates.

See Also

TISAPIApplication (see page 960)

TISAPIRequest (see page 970)

25.1.2.3 TISAPIResponse Methods

The methods of the TISAPIResponse class are listed here.

Protected Methods

	Name	Description
	GetContent (see page 979)	Reads the value of the Content property.

	GetDateVariable (see page 979)	Extracts a date from the internal table of HTTP header variables.
	GetIntegerVariable (see page 980)	Extracts an integer value from the internal table of HTTP header variables.
	GetLogMessage (see page 980)	Reads the value of the LogMessage property.
	GetStatusCode (see page 980)	Reads the value of the StatusCode property.
	GetStringVariable (see page 981)	Extracts a string value from the internal table of HTTP header variables.
	InitResponse (see page 981)	This is InitResponse, a member of class TISAPIResponse.
	SetContent (see page 983)	Sets the Content property.
	SetDateVariable (see page 983)	Sets a date-time valued HTTP header property.
	SetIntegerVariable (see page 984)	Sets an integer valued HTTP header property.
	SetLogMessage (see page 984)	Sets the value of the LogMessage property.
	SetStatusCode (see page 984)	Sets the StatusCode property.
	SetStringVariable (see page 985)	Sets a string valued HTTP header property.

Public Methods

	Name	Description
	SendRedirect (see page 982)	Sends the response with a StatusCode of 301 (Moved Permanently) and with Location set to the URI parameter.
	SendResponse (see page 982)	Sends the ISAPI response message to the web client.
	SendStream (see page 982)	Sends the ISAPI response message with the contents set to the contents of AStream.
	Sent (see page 983)	Indicates whether the ISAPI response message has been sent.

25.1.2.3.1 TISAPIResponse.GetContent Method

Reads the value of the Content property.

Pascal

```
function GetContent: AnsiString; override;
```

C++

```
virtual __fastcall AnsiString GetContent();
```

Description

GetContent is the protected access function for the Content property.

See Also

Content

SetContent (see page 983)

25.1.2.3.2 TISAPIResponse.GetDateVariable Method

Extracts a date from the internal table of HTTP header variables.

Pascal

```
function GetDateVariable(Index: Integer): TDateTime; override;
```

C++

```
virtual __fastcall TDateTime GetDateVariable(int Index);
```

Description

The ISAPI response object uses GetDateVariable to access the properties that represent dates.

See Also

Date

Expires

LastModified

SetDateVariable (see page 983)

25.1.2.3.3 TISAPIResponse.GetIntegerVariable Method

Extracts an integer value from the internal table of HTTP header variables.

Pascal

```
function GetIntegerVariable(Index: Integer): Integer; override;
```

C++

```
virtual __fastcall int GetIntegerVariable(int Index);
```

Description

The ISAPI response object uses GetIntegerVariable to access the properties that represent integers.

See Also

ContentLength

SetIntegerVariable (see page 984)

25.1.2.3.4 TISAPIResponse.GetLogMessage Method

Reads the value of the LogMessage property.

Pascal

```
function GetLogMessage: string; override;
```

C++

```
virtual __fastcall UnicodeString GetLogMessage();
```

Description

GetLogMessage is the protected access function for LogMessage property.

See Also

LogMessage

SetLogMessage (see page 984)

25.1.2.3.5 TISAPIResponse.GetStatusCode Method

Reads the value of the StatusCode property.

Pascal

```
function GetStatusCode: Integer; override;
```

C++

```
virtual __fastcall int GetStatusCode();
```

Description

GetStatusCode is the protected access function for the StatusCode property.

See Also

StatusCode

SetStatusCode

25.1.2.3.6 TISAPIResponse.GetStringVariable Method

Extracts a string value from the internal table of HTTP header variables.

Pascal

```
function GetStringVariable(Index: Integer): AnsiString; override;
```

C++

```
virtual __fastcall AnsiString GetStringVariable(int Index);
```

Description

The ISAPI response object uses GetStringVariable to access the properties that represent strings.

WWWAuthenticate

25.1.2.3.7 TISAPIResponse.InitResponse Method

Pascal

```
procedure InitResponse; virtual;
```

C++

```
virtual __fastcall InitResponse();
```

Description

This is InitResponse, a member of class TISAPIResponse.

25.1.2.3.8 TISAPIResponse.SendRedirect Method

Sends the response with a StatusCode of 301 (Moved Permanently) and with Location set to the URI parameter.

Pascal

```
procedure SendRedirect(const URI: AnsiString); override;
```

C++

```
virtual __fastcall SendRedirect(const AnsiString URI);
```

Description

Call SendRedirect to redirect the web client request to another URI that is the proper target of the request. SendRedirect does the same thing as setting the StatusCode to 301, the Location to URI, and calling SendResponse (see page 982).

See Also

Location

SendResponse (see page 982)

StatusCode

25.1.2.3.9 TISAPIResponse.SendResponse Method

Sends the ISAPI response message to the web client.

Pascal

```
procedure SendResponse; override;
```

C++

```
virtual __fastcall SendResponse();
```

Description

Call SendResponse after setting the properties of the HTTP response object to specify the response that should be made to the web client. If the request should be redirected to another URI, it is more efficient to call SendRedirect (see page 982).

See Also

SendRedirect (see page 982)

25.1.2.3.10 TISAPIResponse.SendStream Method

Sends the ISAPI response message with the contents set to the contents of AStream.

Pascal

```
procedure SendStream(AStream: TStream); override;
```

C++

```
virtual __fastcall SendStream(TStream AStream);
```

Description

Only call SendStream after first calling SendResponse (see page 982). Unlike SendStream, SendResponse (see page 982) fills the header of the HTTP response message, based on the properties of the TISAPIResponse (see page 977) object. If SendResponse (see page 982) has not been called first to set the header of the HTTP response message, set the ContentStream property to AStream, and call SendResponse (see page 982).

See Also

ContentStream

SendResponse (see page 982)

Sent (see page 983)

25.1.2.3.11 TISAPIResponse.Sent Method

Indicates whether the ISAPI response message has been sent.

Pascal

```
function Sent: Boolean; override;
```

C++

```
virtual __fastcall Boolean Sent();
```

Description

Sent returns true if the SendRedirect (see page 982) or SendStream (see page 982) method has been called. TISAPIApplication objects read Sent to determine whether they should send a response to the web client.

See Also

SendRedirect (see page 982)

SendStream (see page 982)

25.1.2.3.12 TISAPIResponse.SetContent Method

Sets the Content property.

Pascal

```
procedure SetContent(const Value: AnsiString); override;
```

C++

```
virtual __fastcall SetContent(const AnsiString Value);
```

Description

SetContent is the protected method used by ISAPI response objects to set the Content property.

See Also

Content

GetContent (see page 979)

25.1.2.3.13 TISAPIResponse.SetDateVariable Method

Sets a date-time valued HTTP header property.

Pascal

```
procedure SetDateVariable(Index: Integer; const Value: TDateTime); override;
```

C++

```
virtual __fastcall SetDateVariable(int Index, const TDateTime Value);
```

Description

SetDateVariable writes date-time to the internal table used to store HTTP header variables. The ISAPI response object uses SetDateVariable to set the properties that represent dates.

See Also

Date

Expires

GetDateVariable (see page 979)

LastModified

25.1.2.3.14 TISAPIResponse.SetIntegerVariable Method

Sets an integer valued HTTP header property.

Pascal

```
procedure SetIntegerVariable(Index: Integer; Value: Integer); override;
```

C++

```
virtual __fastcall SetIntegerVariable(int Index, int Value);
```

Description

SetIntegerVariable writes integer values to the internal table used to store HTTP header variables. The ISAPI response object uses SetIntegerVariable to set the properties that represent integers.

See Also

ContentLength

GetIntegerVariable (see page 980)

25.1.2.3.15 TISAPIResponse.SetLogMessage Method

Sets the value of the LogMessage property.

Pascal

```
procedure SetLogMessage(const Value: string); override;
```

C++

```
virtual __fastcall SetLogMessage(const UnicodeString Value);
```

Description

SetLogMessage is the protected method used by ISAPI response objects to set the LogMessage property.

See Also

GetLogMessage (see page 980)

LogMessage

25.1.2.3.16 TISAPIResponse.SetStatusCode Method

Sets the StatusCode property.

Pascal

```
procedure SetStatusCode(Value: Integer); override;
```

C++

```
virtual __fastcall SetStatusCode(int Value);
```

Description

SetStatusCode is the protected method used by ISAPI response objects to set the StatusCode property.

See Also

StatusCode

GetStatusCode

25.1.2.3.17 TISAPIResponse.SetStringVariable Method

Sets a string valued HTTP header property.

Pascal

```
procedure SetStringVariable(Index: Integer; const Value: AnsiString); override;
```

C++

```
virtual __fastcall SetStringVariable(int Index, const AnsiString Value);
```

Description

SetStringVariable writes string values to the internal table used to store HTTP header variables. The ISAPI response object uses SetStringVariable to set the properties that represent strings.

	Name	Description
	SQLException (see page 988)	This is class Java.Sql.SQLException.

26.1.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	SQLException (see page 988)	This is class Java.Sql.SQLException.

26.1.1.1 SQLException Class

Class Hierarchy

Pascal

```
SQLException = class(System.Exception);
```

C++

```
class SQLException : public System.Exception;
```

File

SQLException.cs

Description

This is class Java.Sql.SQLException.

26.1.1.1.1 SQLException Members

The following tables list the members exposed by SQLException.

Public Methods

	Name	Description
	SQLException (see page 989)	This is the overview for the SQLException constructor overload.

Public Properties

	Name	Description
	ErrorCode (see page 989)	This is ErrorCode, a member of class SQLException.
	SQLState (see page 990)	This is SQLState, a member of class SQLException.

26.1.1.1.2 SQLException Constructor

This is the overview for the SQLException constructor overload.

Overload List

	Name	Description
	SQLException.SQLException (string) (see page 989)	This is SQLException, a member of class SQLException.
	SQLException.SQLException (string, string, int, Exception) (see page 989)	This is SQLException, a member of class SQLException.

26.1.1.1.2.1 SQLException.SQLException Constructor (string)

Pascal

```
constructor Create(reason: string);
```

C++

```
SQLException(string reason);
```

Description

This is SQLException, a member of class SQLException.

26.1.1.1.2.2 SQLException.SQLException Constructor (string, string, int, Exception)

Pascal

```
constructor Create(reason: string; SQLState: string; vendorCode: Integer; cause: Exception);
```

C++

```
SQLException(string reason, string SQLState, int vendorCode, Exception cause);
```

Description

This is SQLException, a member of class SQLException.

26.1.1.1.3 SQLException Properties

The properties of the SQLException class are listed here.

Public Properties

	Name	Description
	ErrorCode (see page 989)	This is ErrorCode, a member of class SQLException.
	SQLState (see page 990)	This is SQLState, a member of class SQLException.

26.1.1.1.3.1 SQLException.ErrorCode Property

Pascal

```
property ErrorCode: Integer;
```

C++

```
__property int ErrorCode;
```

Description

This is ErrorCode, a member of class SQLException.

26.1.1.1.3.2 SQLException.SQLState Property

Pascal

```
property SQLState: string;
```

C++

```
__property string SQLState;
```

Description

This is SQLState, a member of class SQLException.

27 jpeg Namespace

This is namespace jpeg.

Topics

Name	Description
Classes (see page 992)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 1011)	The following table lists structs, records, enums in this documentation.
Types (see page 1014)	The following table lists types in this documentation.
Variables (see page 1015)	The following table lists variables in this documentation.

Classes

	Name	Description
	TJPEGData (see page 992)	TJPEGData encapsulates the compressed file that contains the data source for the original compressed jpeg image used by a TJPEGImage (see page 994) object.
	TJPEGImage (see page 994)	TJPEGImage encapsulates a jpeg graphic.

Structs, Records, Enums

	Name	Description
	TJPEGDefaults (see page 1011)	This is record jpeg.TJPEGDefaults.
	TJPEGPerformance (see page 1012)	TJPEGPerformance represents the type of optimization to use when displaying a JPEG image.
	TJPEGPixelFormat (see page 1012)	TJPEGPixelFormat indicates the format used to display a JPEG image.
	TJPEGScale (see page 1013)	TJPEGScale represents the display size of a JPEG image.

Types

Name	Description
TJPEGQualityRange (see page 1014)	TJPEGQualityRange represents the trade-off ratio between image quality and file size in a JPEG image.

Variables

Name	Description
JPEGDefaults (see page 1015)	This is variable jpeg.JPEGDefaults.

27.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TJPEGData (see page 992)	TJPEGData encapsulates the compressed file that contains the data source for the original compressed jpeg (see page 991) image used by a TJPEGImage (see page 994) object.
	TJPEGImage (see page 994)	TJPEGImage encapsulates a jpeg (see page 991) graphic.

27.1.1 TJPEGData Class

TJPEGData encapsulates the compressed file that contains the data source for the original compressed jpeg (see page 991) image used by a TJPEGImage (see page 994) object.

Class Hierarchy

Pascal

```
TJPEGData = class(TSharedImage);
```

C++

```
class TJPEGData : public TSharedImage;
```

File

jpeg

Description

TJPEGData is used for the internal implementation of TJPEGImage (see page 994). TJPEGData is created automatically by the TJPEGImage (see page 994) object when that image object is created.

TJPEGData owns the file handle to the jpeg (see page 991) data source. Thus, TJPEGData implements how TJPEGImage (see page 994) does reference counting and handle sharing. When a jpeg (see page 991) image object is copied using the Assign method, those multiple instances of the image object refer to the same TJPEGData object.

The TJPEGData file itself is never modified. Each TJPEGImage (see page 994) instance that shares it has its own properties that determine how this data is decompressed into its own internal, local bitmap representation. However, if a TJPEGImage (see page 994) needs to modify the actual jpeg (see page 991) data, it breaks its link to that particular TJPEGData instance and creates a new one.

See Also

TJPEGImage (see page 994)

27.1.1.1 TJPEGData Members

The following tables list the members exposed by TJPEGData.

Protected Methods

	Name	Description
	FreeHandle (see page 993)	This is FreeHandle, a member of class TJPEGData.

Public Methods

	Name	Description
	Destroy (see page 993)	Destroys of an instance of a jpeg (see page 991) data object.

27.1.1.2 TJPEGData.Destroy Destructor

Destroys of an instance of a jpeg (see page 991) data object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TJPEGData();
```

Description

The jpeg (see page 991) data object is automatically destroyed by the jpeg (see page 991) image object that uses it. It is not necessary to call Destroy or to directly access the jpeg (see page 991) data object.

The Destroy method of a jpeg (see page 991) data object handles the freeing of the data.

See Also

System::TObject::Free

System::TObject::Destroy

27.1.1.3 TJPEGData Methods

The methods of the TJPEGData class are listed here.

Protected Methods

	Name	Description
	FreeHandle (see page 993)	This is FreeHandle, a member of class TJPEGData.

27.1.1.3.1 TJPEGData.FreeHandle Method

Pascal

```
procedure FreeHandle; override;
```

C++

```
virtual __fastcall FreeHandle();
```

Description

This is FreeHandle, a member of class TJPEGData.

27.1.2 TJPEGImage Class

TJPEGImage encapsulates a jpeg (see page 991) graphic.

Class Hierarchy

Pascal

```
TJPEGImage = class(TGraphic);
```

C++

```
class TJPEGImage : public TGraphic;
```

File

jpeg

Description

Use TJPEGImage to read and write jpeg (see page 991) compressed image data. TJPEGImage handles the digital compression and decompression of still images for use in computer systems. It uses the data from an instance of TJPEGData (see page 992), which contains the actual jpeg (see page 991) data source and is never modified. Each jpeg (see page 991) image object may share its TJPEGData (see page 992) object with other instances of a jpeg (see page 991) image by creating copies using the Assign (see page 998) method. The jpeg (see page 991) data source handles reference counting for the jpeg (see page 991) image objects that are linked to it.

TJPEGImage has an internal bitmap that represents the jpeg (see page 991) image. This internal image and the original source of the jpeg (see page 991) image are read only. TJPEGImage has properties that determine how each instance will handle color conversion, compression, decompression, performance, and so on.

The following are characteristics of this object. A TJPEGImage object:

Has no canvas (so it cannot draw onto a canvas). However, TJPEGImage implements the protected Draw (see page 1001) method introduced in TGraphic, so it can draw itself on the canvas of another object.

Provides no access to the internal bitmap image that it creates for the JPEG image.

Performs reference counting and handle sharing by means of the TJPEGData (see page 992) object. Multiple instances can refer to the same TJPEGData (see page 992) image. TJPEGData (see page 992) is the actual owner of the file handle to the jpeg (see page 991) data source.

See Also

TJPEGData (see page 992)

TBitmap

27.1.2.1 TJPEGImage Members

The following tables list the members exposed by TJPEGImage.

Protected Methods

	Name	Description
	AssignTo (see page 999)	Copies the properties of an object to a destination object.
	Changed (see page 1000)	Called when graphic has changed.

	Draw (see page 1001)	Render graphic onto canvas at rectangle.
	Equals (see page 1001)	Compare graphic to another TGraphic object and return true if objects contain same graphic.
	FreeBitmap (see page 1001)	This is FreeBitmap, a member of class TJPEGImage.
	GetEmpty (see page 1001)	Indicates whether graphics object contains graphic.
	GetHeight (see page 1002)	Get vertical size of graphic in pixels.
	GetPalette (see page 1002)	Get color palette of graphical image.
	GetWidth (see page 1002)	Get horizontal size of graphic in pixels.
	NewBitmap (see page 1004)	This is NewBitmap, a member of class TJPEGImage.
	NewImage (see page 1004)	This is NewImage, a member of class TJPEGImage.
	ReadData (see page 1004)	Read graphic data from TStream.
	ReadStream (see page 1005)	This is ReadStream, a member of class TJPEGImage.
	SetHeight (see page 1006)	Set vertical size of graphic in pixels.
	SetPalette (see page 1006)	This is SetPalette, a member of class TJPEGImage.
	SetWidth (see page 1006)	Set horizontal size of graphic in pixels.
	WriteData (see page 1007)	Write graphic data to TStream.

Protected Properties

	Name	Description
	Bitmap (see page 1008)	This is Bitmap, a member of class TJPEGImage.

Public Methods

	Name	Description
	Assign (see page 998)	Copies the jpeg (see page 991) image object and creates a new reference to the internal data source object.
	Compress (see page 1000)	Forces the action of compression.
	Create (see page 995)	Instantiates a jpeg (see page 991) image object.
	Destroy (see page 997)	Destroys an instance of a jpeg (see page 991) image object.
	DIBNeeded (see page 1000)	Decompress the jpeg (see page 991) image into a bitmap.
	JPEGNeeded (see page 1003)	Creates a new TJPEGData (see page 992) object if the jpeg (see page 991) image only has a bitmap and a jpeg (see page 991) is needed.
	LoadFromClipboardFormat (see page 1003)	Reads in a jpeg (see page 991) image from the Clipboard into the jpeg (see page 991) image object.
	LoadFromStream (see page 1004)	Loads the jpeg (see page 991) image from a stream.
	SaveToClipboardFormat (see page 1005)	Writes a jpeg (see page 991) image to a variable in Clipboard format.
	SaveToStream (see page 1005)	Writes the jpeg (see page 991) data to a stream.

Public Properties

	Name	Description
	CompressionQuality (see page 1008)	Indicates the trade-off ratio between the image quality and the file size.
	Grayscale (see page 1008)	Determines whether the image output of a JPEG image is black and white, or color.
	Performance (see page 1008)	Controls the trade-off between color quality and speed of decompression.
	PixelFormat (see page 1009)	Determines whether the JPEG image is displayed in 24 or 8-bit format.
	ProgressiveDisplay (see page 1009)	Controls how the image is displayed when decompressing files.
	ProgressiveEncoding (see page 1010)	Determines whether an image can be progressively displayed when it is decompressed.
	Scale (see page 1010)	Determines the size of the JPEG image when it is displayed.
	Smoothing (see page 1010)	Determines whether the jpeg (see page 991) image displays in blocks or with blurred edges.

27.1.2.2 TJPEGImage.Create Constructor

Instantiates a jpeg (see page 991) image object.

Pascal

```
constructor Create; override;
```

C++

```
virtual __fastcall TJPEGImage();
```

Description

Call Create to instantiate a jpeg (see page 991) image object at run time. Create allocates memory for a jpeg (see page 991) image object and then initializes its properties. After the jpeg (see page 991) is loaded from a file, an internal bitmap is created to hold the image.

C++ Examples:

```
/*
This example converts a bitmap image to a jpeg file by using
the Assign method.  This example requires a button and two
images.  One image must have it's Picture property loaded
with a bitmap at design time.
*/

#include <Jpeg.hpp>
#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  //Requires "jpeg.hpp" to be included in the source file
  std::auto_ptr<TJPEGImage> jp(new TJPEGImage());
  jp->Assign(Image1->Picture->Bitmap);
  jp->SaveToFile("..\\factory.jpg");
  Image2->Stretch = True;
  Image2->Picture->LoadFromFile("..\\factory.jpg");
}
```

Delphi Examples:

```
{
This example converts a bitmap image to a jpeg file by using
the Assign method.  This example requires a button and two
images.  One image must have it's Picture property loaded
with a bitmap at design time.
}
uses Jpeg;

procedure TForm1.Button1Click(Sender: TObject);
var
  jp: TJPEGImage;  //Requires the "jpeg" unit added to "uses" clause.
begin
  jp := TJPEGImage.Create;
  try
    with jp do
    begin
      Assign(Image1.Picture.Bitmap);
      SaveToFile('factory.jpg');
      Image2.Stretch := True;
      Image2.Picture.LoadFromFile('factory.jpg');
    end;
  finally
    jp.Free;
  end;
end;
```

See Also

System::TObject::Create

27.1.2.3 TJPEGImage.Destroy Destructor

Destroys an instance of a jpeg (see page 991) image object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TJPEGImage();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TJPEGImage (see page 994) reference is not nil before it calls Destroy.

Destroy handles the freeing of the internal bitmap image and decrements the reference count on the jpeg (see page 991) data source to which it was linked.

See Also

System::TObject::Free

TJPEGData (see page 992)

27.1.2.4 TJPEGImage Methods

The methods of the TJPEGImage class are listed here.

Protected Methods

	Name	Description
	AssignTo (see page 999)	Copies the properties of an object to a destination object.
	Changed (see page 1000)	Called when graphic has changed.
	Draw (see page 1001)	Render graphic onto canvas at rectangle.
	Equals (see page 1001)	Compare graphic to another TGraphic object and return true if objects contain same graphic.
	FreeBitmap (see page 1001)	This is FreeBitmap, a member of class TJPEGImage.
	GetEmpty (see page 1001)	Indicates whether graphics object contains graphic.
	GetHeight (see page 1002)	Get vertical size of graphic in pixels.
	GetPalette (see page 1002)	Get color palette of graphical image.
	GetWidth (see page 1002)	Get horizontal size of graphic in pixels.
	NewBitmap (see page 1004)	This is NewBitmap, a member of class TJPEGImage.
	NewImage (see page 1004)	This is NewImage, a member of class TJPEGImage.
	ReadData (see page 1004)	Read graphic data from TStream.
	ReadStream (see page 1005)	This is ReadStream, a member of class TJPEGImage.
	SetHeight (see page 1006)	Set vertical size of graphic in pixels.
	SetPalette (see page 1006)	This is SetPalette, a member of class TJPEGImage.
	SetWidth (see page 1006)	Set horizontal size of graphic in pixels.
	WriteData (see page 1007)	Write graphic data to TStream.

Public Methods

	Name	Description
	Assign (see page 998)	Copies the jpeg (see page 991) image object and creates a new reference to the internal data source object.
	Compress (see page 1000)	Forces the action of compression.
	DIBNeeded (see page 1000)	Decompress the jpeg (see page 991) image into a bitmap.

	JPEGNeeded (see page 1003)	Creates a new TJPEGData (see page 992) object if the jpeg (see page 991) image only has a bitmap and a jpeg (see page 991) is needed.
V	LoadFromClipboardFormat (see page 1003)	Reads in a jpeg (see page 991) image from the Clipboard into the jpeg (see page 991) image object.
V	LoadFromStream (see page 1004)	Loads the jpeg (see page 991) image from a stream.
V	SaveToClipboardFormat (see page 1005)	Writes a jpeg (see page 991) image to a variable in Clipboard format.
V	SaveToStream (see page 1005)	Writes the jpeg (see page 991) data to a stream.

27.1.2.4.1 TJPEGImage.Assign Method

Copies the jpeg (see page 991) image object and creates a new reference to the internal data source object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Assign copies the jpeg (see page 991) image contained in Source to the jpeg (see page 991) image object. Assign then calls the inherited Assign. Assign creates a new link to the internal jpeg (see page 991) data source by which the jpeg (see page 991) image objects do reference counting and handle sharing.

Tip: To draw on a jpeg (see page 991) image, Assign the jpeg (see page 991) image to a bitmap, and then draw on that.

Note: An object of one type can always be assigned to another object of the same type. Also, the Source can be of type TPicture if the Graphic property of the picture is a jpeg (see page 991) image or a bitmap.

C++ Examples:

```
/*
This example converts a bitmap image to a jpeg file by using
the Assign method.  This example requires a button and two
images.  One image must have it's Picture property loaded
with a bitmap at design time.
*/

#include <Jpeg.hpp>
#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  //Requires "jpeg.hpp" to be included in the source file
  std::auto_ptr<TJPEGImage> jp(new TJPEGImage());
  jp->Assign(Image1->Picture->Bitmap);
  jp->SaveToFile("..\\factory.jpg");
  Image2->Stretch = True;
  Image2->Picture->LoadFromFile("..\\factory.jpg");
}
```

Delphi Examples:

```
{
This example converts a bitmap image to a jpeg file by using
the Assign method.  This example requires a button and two
images.  One image must have it's Picture property loaded
with a bitmap at design time.
}
uses Jpeg;
```

```
procedure TForm1.Button1Click(Sender: TObject);
var
  jp: TJPEGImage;  //Requires the "jpeg" unit added to "uses" clause.
begin
  jp := TJPEGImage.Create;
  try
    with jp do
    begin
      Assign(Image1.Picture.Bitmap);
      SaveToFile('factory.jpg');
      Image2.Stretch := True;
      Image2.Picture.LoadFromFile('factory.jpg');
    end;
  finally
    jp.Free;
  end;
end;
```

See Also

TJPEGData (see page 992)

Assign

Graphic

27.1.2.4.2 TJPEGImage.AssignTo Method

Copies the properties of an object to a destination object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Override the AssignTo method to extend the functionality of the Assign method of destination objects so that they handle newly created object classes. When defining a new object class, override the Assign method for every existing object class that should be able to copy its properties to the new class. Override the AssignTo method for every existing class to which the new class can copy.

The Assign method of TPersistent calls AssignTo if the descendant object does not succeed in copying the properties of a source object. The AssignTo method defined by TPersistent raises an EConvertError exception.

For example, given the following code in which A and B are instance variables:

```
A.Assign(B); {Delphi}
A->Assign(B); // C++
```

if A knows how to handle B, then it does so and returns. If A doesn't know how to handle B's type, execution will trickle to the TPersistent version of Assign, which calls:

```
B.AssignTo(A); {Delphi}
B->AssignTo(A); // C++
```

If B knows how to copy to A, the assignment succeeds. Otherwise, TPersistent raises an exception.

See Also

Assign

EConvertError

27.1.2.4.3 TJPEGImage.Changed Method

Called when graphic has changed.

Pascal

```
procedure Changed(Sender: TObject); override;
```

C++

```
virtual __fastcall Changed(TObject * Sender);
```

Description

Changed is called automatically whenever the TGraphic object is modified. It sets the Modified property to True and triggers the OnChange event.

See Also

Modified

OnChange

27.1.2.4.4 TJPEGImage.Compress Method

Forces the action of compression.

Pascal

```
procedure Compress;
```

C++

```
__fastcall Compress();
```

Description

Call Compress to compress for optimization, such as before streaming out when assigning a bitmap to a jpeg (see page 991). Changing properties like CompressionQuality (see page 1008) does not force compression. To force compression, call Compress.

See Also

CompressionQuality (see page 1008)

27.1.2.4.5 TJPEGImage.DIBNeeded Method

Decompress the jpeg (see page 991) image into a bitmap.

Pascal

```
procedure DIBNeeded;
```

C++

```
__fastcall DIBNeeded();
```

Description

DIBNeeded is used when the jpeg (see page 991) image needs a bitmap representation of its image. Call DIBNeeded just before drawing rather than while drawing for optimization.

See Also

JPEGNeeded (see page 1003)

27.1.2.4.6 TJPEGImage.Draw Method

Render graphic onto canvas at rectangle.

Pascal

```
procedure Draw(ACanvas: TCanvas; const Rect: TRect); override;
```

C++

```
virtual __fastcall Draw(TCanvas ACanvas, const TRect Rect);
```

Description

TCanvas.Draw calls this function to render the graphic onto its canvas at the coordinates specified by the **Rect** parameter. Descendants of TGraphic should override this function with a specific rendering implementation.

See Also

TCanvas

Draw

DrawTransparent

27.1.2.4.7 TJPEGImage.Equals Method

Compare graphic to another TGraphic object and return true if objects contain same graphic.

Pascal

```
function Equals(Graphic: TGraphic): Boolean; override;
```

C++

```
virtual __fastcall Boolean Equals(TGraphic Graphic);
```

Description

Equals compares the contents of two TGraphic objects. Equals returns false if the TGraphic are different classes or if they contain different graphical data.

27.1.2.4.8 TJPEGImage.FreeBitmap Method

Pascal

```
procedure FreeBitmap;
```

C++

```
__fastcall FreeBitmap();
```

Description

This is FreeBitmap, a member of class TJPEGImage.

27.1.2.4.9 TJPEGImage.GetEmpty Method

Indicates whether graphics object contains graphic.

Pascal

```
function GetEmpty: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetEmpty();
```

Description

GetEmpty indicates whether the TGraphic object contains a graphic.

Each descendant of the TGraphic class should override the GetEmpty method to indicate whether a given TGraphic object is bound to an image.

See Also

Empty

27.1.2.4.10 TJPEGImage.GetHeight Method

Get vertical size of graphic in pixels.

Pascal

```
function GetHeight: Integer; override;
```

C++

```
virtual __fastcall int GetHeight();
```

Description

GetHeight gets the vertical size of the TGraphic object in pixels.

Each descendant of TGraphic defines its own GetHeight and SetHeight methods to access the Height property.

See Also

Height

SetHeight

27.1.2.4.11 TJPEGImage.GetPalette Method

Get color palette of graphical image.

Pascal

```
function GetPalette: HPALETTE; override;
```

C++

```
virtual __fastcall HPALETTE GetPalette();
```

Description

GetPalette gets the color palette of the graphical image. You can also use the Palette property to get the color palette of a graphical image. If the graphic does not need or use a palette, the Palette property is zero.

See Also

Palette

SetPalette

27.1.2.4.12 TJPEGImage.GetWidth Method

Get horizontal size of graphic in pixels.

Pascal

```
function GetWidth: Integer; override;
```

C++

```
virtual __fastcall int GetWidth();
```

Description

GetWidth gets the horizontal size of the graphic in pixels.

Each descendant of the TGraphic class defines its own GetWidth and SetWidth methods to access the Width property.

See Also

Width

SetWidth

27.1.2.4.13 TJPEGImage.JPEGNeeded Method

Creates a new TJPEGData (see page 992) object if the jpeg (see page 991) image only has a bitmap and a jpeg (see page 991) is needed.

Pascal

```
procedure JPEGNeeded;
```

C++

```
__fastcall JPEGNeeded();
```

Description

Call JPEGNeeded to create a new jpeg (see page 991) data source when the jpeg (see page 991) image has thrown away the jpeg (see page 991) data and only has an internal bitmap. JPEGNeeded creates a new jpeg (see page 991) data source. The SaveToStream (see page 1005) method uses JPEGNeeded.

See Also

SaveToStream

TJPEGData (see page 992)

27.1.2.4.14 TJPEGImage.LoadFromClipboardFormat Method

Reads in a jpeg (see page 991) image from the Clipboard into the jpeg (see page 991) image object.

Pascal

```
procedure LoadFromClipboardFormat(AFormat: Word; AData: THandle; APalette: HPALETTE); override;
```

C++

```
virtual __fastcall LoadFromClipboardFormat(Word AFormat, THandle AData, HPALETTE APalette);
```

Description

LoadFromClipboardFormat is called if the jpeg (see page 991) image is registered with the TPicture object using the RegisterClipboardFormat method. LoadFromClipboardFormat can also recognize, and supports, a bitmap format on the Clipboard.

LoadFromClipboardFormat replaces the current image with the data pointed to by the AData parameter. The palette for the jpeg (see page 991) image is specified by the APalette parameter.

See Also

TBitmap

TClipboard

TPicture

RegisterClipboardFormat

27.1.2.4.15 TJPEGImage.LoadFromStream Method

Loads the jpeg (see page 991) image from a stream.

Pascal

```
procedure LoadFromStream(Stream: TStream); override;
```

C++

```
virtual __fastcall LoadFromStream(TStream Stream);
```

Description

Use LoadFromStream by specifying the stream from which the jpeg (see page 991) image is loaded as the value of Stream. LoadFromStream reads a jpeg (see page 991) data source from a stream and replaces the current image with it.

See Also

SaveToStream

TJPEGData (see page 992)

27.1.2.4.16 TJPEGImage.NewBitmap Method

Pascal

```
procedure NewBitmap;
```

C++

```
__fastcall NewBitmap();
```

Description

This is NewBitmap, a member of class TJPEGImage.

27.1.2.4.17 TJPEGImage.NewImage Method

Pascal

```
procedure NewImage;
```

C++

```
__fastcall NewImage();
```

Description

This is NewImage, a member of class TJPEGImage.

27.1.2.4.18 TJPEGImage.ReadData Method

Read graphic data from TStream.

Pascal

```
procedure ReadData(Stream: TStream); override;
```

C++

```
virtual __fastcall ReadData(TStream Stream);
```

Description

ReadData is used to read the binary graphic from the virtual property **Data** (created by DefineProperties) when streaming in a TGraphic from the TStream **Stream**.

See Also

TStream

DefineProperties

WriteData

27.1.2.4.19 TJPEGImage.ReadStream Method

Pascal

```
procedure ReadStream(Size: Longint; Stream: TStream);
```

C++

```
__fastcall ReadStream(Longint Size, TStream Stream);
```

Description

This is ReadStream, a member of class TJPEGImage.

27.1.2.4.20 TJPEGImage.SaveToClipboardFormat Method

Writes a jpeg (see page 991) image to a variable in Clipboard format.

Pascal

```
procedure SaveToClipboardFormat(var AFormat: Word; var AData: THandle; var APalette:
HPALETTE); override;
```

C++

```
virtual __fastcall SaveToClipboardFormat(Word AFormat, THandle AData, HPALETTE APalette);
```

Description

Use SaveToClipboardFormat to save the jpeg (see page 991) image to a variable. The palette is returned as the APalette parameter, the format as the Aformat parameter, and the data as the AData parameter. Before the jpeg (see page 991) image can be saved, an application must have registered the format with the TJPEGImage (see page 994) object using the RegisterClipboardFormat method.

See Also

RegisterClipboardFormat

27.1.2.4.21 TJPEGImage.SaveToStream Method

Writes the jpeg (see page 991) data to a stream.

Pascal

```
procedure SaveToStream(Stream: TStream); override;
```

C++

```
virtual __fastcall SaveToStream(TStream Stream);
```

Description

Use SaveToStream to save the jpeg (see page 991) data to the stream specified by the Stream parameter. SaveToStream expects jpeg (see page 991) image data and may incur overhead of a compression cycle if the source is a bitmap.

See Also

LoadFromStream (see page 1004)

27.1.2.4.22 TJPEGImage.SetHeight Method

Set vertical size of graphic in pixels.

Pascal

```
procedure SetHeight(Value: Integer); override;
```

C++

```
virtual __fastcall SetHeight(int Value);
```

Description

SetHeight sets the vertical size of the graphic in pixels.

Each descendant of the TGraphic class defines its own GetHeight and SetHeight methods to access the Height property.

See Also

Height

GetHeight

27.1.2.4.23 TJPEGImage.SetPalette Method

Pascal

```
procedure SetPalette(Value: HPalette); override;
```

C++

```
virtual __fastcall SetPalette(HPalette Value);
```

Description

This is SetPalette, a member of class TJPEGImage.

27.1.2.4.24 TJPEGImage.SetWidth Method

Set horizontal size of graphic in pixels.

Pascal

```
procedure SetWidth(Value: Integer); override;
```

C++

```
virtual __fastcall SetWidth(int Value);
```

Description

SetWidth sets the horizontal size of the graphic in pixels.

Each descendant of the TGraphic class defines its own GetWidth and SetWidth methods to access the Width property.

See Also

Width

GetWidth

27.1.2.4.25 TJPEGImage.WriteData Method

Write graphic data to TStream.

Pascal

```
procedure WriteData(Stream: TStream); override;
```

C++

```
virtual __fastcall WriteData(TStream Stream);
```

Description

WriteData is used to write the binary graphic to the virtual property **Data** (created by DefineProperties) when streaming a TGraphic out to the TStream **Stream**.

See Also

TStream

DefineProperties

ReadData

27.1.2.5 TJPEGImage Properties

The properties of the TJPEGImage class are listed here.

Protected Properties

	Name	Description
	Bitmap (see page 1008)	This is Bitmap, a member of class TJPEGImage.

Public Properties

	Name	Description
	CompressionQuality (see page 1008)	Indicates the trade-off ratio between the image quality and the file size.
	Grayscale (see page 1008)	Determines whether the image output of a JPEG image is black and white, or color.
	Performance (see page 1008)	Controls the trade-off between color quality and speed of decompression.
	PixelFormat (see page 1009)	Determines whether the JPEG image is displayed in 24 or 8-bit format.
	ProgressiveDisplay (see page 1009)	Controls how the image is displayed when decompressing files.
	ProgressiveEncoding (see page 1010)	Determines whether an image can be progressively displayed when it is decompressed.
	Scale (see page 1010)	Determines the size of the JPEG image when it is displayed.
	Smoothing (see page 1010)	Determines whether the jpeg (see page 991) image displays in blocks or with blurred edges.

27.1.2.5.1 TJPEGImage.Bitmap Property

Pascal

```
property Bitmap: TBitmap;
```

C++

```
__property TBitmap Bitmap;
```

Description

This is Bitmap, a member of class TJPEGImage.

27.1.2.5.2 TJPEGImage.CompressionQuality Property

Indicates the trade-off ratio between the image quality and the file size.

Pascal

```
property CompressionQuality: TJPEGQualityRange;
```

C++

```
__property TJPEGQualityRange CompressionQuality;
```

Description

Use CompressionQuality to set the compression quality of the JPEG image when writing out a jpeg (see page 991) image. Higher compression results in a poorer picture quality, but a smaller file size. This property is not used for reading in files.

TJPEGQualityRange (see page 1014) is the type of the CompressionQuality property. The higher the TJPEGQualityRange (see page 1014) value (up to a maximum of 100), the better the image quality, but the larger the file size. The lower the TJPEGQualityRange (see page 1014) value (to a minimum of 1), the smaller the resulting file size, but at the expense of picture quality.

27.1.2.5.3 TJPEGImage.Grayscale Property

Determines whether the image output of a JPEG image is black and white, or color.

Pascal

```
property Grayscale: Boolean;
```

C++

```
__property Boolean Grayscale;
```

Description

Use Grayscale for reading in and writing out, that is, for decompressing and compressing, a jpeg (see page 991) image. This property affects how the image is displayed.

GrayScale is used for speed in output optimization. When Grayscale is set to true, the color is separated from luminosity. Color takes the most time to decompress, so for previewing the image, Grayscale can be set to true for speed. The output then contains 255 shades of gray.

27.1.2.5.4 TJPEGImage.Performance Property

Controls the trade-off between color quality and speed of decompression.

Pascal

```
property Performance: TJPEGPerformance;
```

C++

```
__property TJPEGPerformance Performance;
```

Description

Use Performance to set the performance of the jpeg (see page 991) image when reading, that is, for decompressing files. This property is not used for writing out files.

Performance affects the display of the internal bitmap image. This image is a 256-color bitmap. Setting Performance to jpBestSpeed may cause some dithering in the bitmap image.

27.1.2.5.5 TJPEGImage.PixelFormat Property

Determines whether the JPEG image is displayed in 24 or 8-bit format.

Pascal

```
property PixelFormat: TJPEGPixelFormat;
```

C++

```
__property TJPEGPixelFormat PixelFormat;
```

Description

Use PixelFormat to set the pixel format of the jpeg (see page 991) image to 8-bit for video drivers that cannot display 24-bit. The native format of a jpeg (see page 991) image is 24-bit. PixelFormat is used for decompression, that is, for reading in files. PixelFormat will also apply to a bitmap if the image is copied to it.

27.1.2.5.6 TJPEGImage.ProgressiveDisplay Property

Controls how the image is displayed when decompressing files.

Pascal

```
property ProgressiveDisplay: Boolean;
```

C++

```
__property Boolean ProgressiveDisplay;
```

Description

Use ProgressiveDisplay to turn on or off the incremental display of an image when reading in files. For example, if the jpeg (see page 991) data source file is on the hard drive, progressively displaying it slows down the display time: in this case setting ProgressiveDisplay to false speeds up the displaying of the image. If the file must be downloaded, set ProgressiveDisplay to true if the downloading process will take as long as the progressive displaying of the image.

ProgressiveDisplay is used only for decompression, but is affected by the manner in which the image was compressed. Images that were compressed with ProgressiveEncoding (see page 1010) set to false cannot take advantage of ProgressiveDisplay. Setting ProgressiveDisplay to true for these images has no effect.

See Also

ProgressiveEncoding (see page 1010)

Smoothing (see page 1010)

27.1.2.5.7 TJPEGImage.ProgressiveEncoding Property

Determines whether an image can be progressively displayed when it is decompressed.

Pascal

```
property ProgressiveEncoding: Boolean;
```

C++

```
__property Boolean ProgressiveEncoding;
```

Description

Use ProgressiveEncoding to compress an image when writing out files, so that it can be progressively displayed when it is decompressed. Setting the ProgressiveDisplay (see page 1009) property to true has no effect if ProgressiveEncoding was not set to true when the image was compressed.

See Also

ProgressiveDisplay (see page 1009)

27.1.2.5.8 TJPEGImage.Scale Property

Determines the size of the JPEG image when it is displayed.

Pascal

```
property Scale: TJPEGScale;
```

C++

```
__property TJPEGScale Scale;
```

Description

Use Scale to optimize performance for previewing an image. jsFullSize displays the image as maximum size, whereas jsEighth displays an eighth of the image size, but 8 times faster.

TJPEGScale (see page 1013) is the type of the Scale property.

Scale it used for reading in files, that is, for decompression.

27.1.2.5.9 TJPEGImage.Smoothing Property

Determines whether the jpeg (see page 991) image displays in blocks or with blurred edges.

Pascal

```
property Smoothing: Boolean;
```

C++

```
__property Boolean Smoothing;
```

Description

Smoothing is used if ProgressiveDisplay (see page 1009) is true, to determine whether the jpeg (see page 991) image is displayed in small blocks or with blurred edges. If Smoothing is true, the edges are blurred during progressive displaying of the image. If Smoothing is false, raw blocks of color are used to display the image.

See Also

ProgressiveDisplay (see page 1009)

27.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TJPEGPerformance (see page 1012)	TJPEGPerformance represents the type of optimization to use when displaying a JPEG image.
	TJPEGPixelFormat (see page 1012)	TJPEGPixelFormat indicates the format used to display a JPEG image.
	TJPEGScale (see page 1013)	TJPEGScale represents the display size of a JPEG image.

Records

	Name	Description
	TJPEGDefaults (see page 1011)	This is record jpeg.TJPEGDefaults.

27.2.1 jpeg.TJPEGDefaults Record

Pascal

```
TJPEGDefaults = record
  CompressionQuality: TJPEGQualityRange;
  Grayscale: Boolean;
  Performance: TJPEGPerformance;
  PixelFormat: TJPEGPixelFormat;
  ProgressiveDisplay: Boolean;
  ProgressiveEncoding: Boolean;
  Scale: TJPEGScale;
  Smoothing: Boolean;
end;
```

C++

```
struct TJPEGDefaults {
  TJPEGQualityRange CompressionQuality;
  Boolean Grayscale;
  TJPEGPerformance Performance;
  TJPEGPixelFormat PixelFormat;
  Boolean ProgressiveDisplay;
  Boolean ProgressiveEncoding;
  TJPEGScale Scale;
  Boolean Smoothing;
};
```

File

jpeg

Description

This is record jpeg.TJPEGDefaults.

27.2.2 jpeg.TJPEGPerformance Enumeration

TJPEGPerformance represents the type of optimization to use when displaying a JPEG image.

Pascal

```
TJPEGPerformance = (
  jpBestQuality,
  jpBestSpeed
);
```

C++

```
enum TJPEGPerformance {
  jpBestQuality,
  jpBestSpeed
};
```

File

jpeg

Description

The following table lists the possible values:

Value	Meaning
jpBestQuality	Optimize for image quality. This results in slower rendering of the image.
jpBestSpeed	Optimize for speed of display. This may result in some dithering in the image.

27.2.3 jpeg.TJPEGPixelFormat Enumeration

TJPEGPixelFormat indicates the format used to display a JPEG image.

Pascal

```
TJPEGPixelFormat = (
  jf24Bit,
  jf8Bit
);
```

C++

```
enum TJPEGPixelFormat {
  jf24Bit,
  jf8Bit
};
```

File

jpeg

Description

The following table lists the possible values:

Value	Meaning
jf24Bit	Use the native 24-bit jpeg (see page 991) image format.

jf8Bit	Use an 8-bit format (for video drivers that do not support the 24-bit format)

27.2.4 jpeg.TJPEGScale Enumeration

TJPEGScale represents the display size of a JPEG image.

Pascal

```
TJPEGScale = (
  jsFullSize,
  jsHalf,
  jsQuarter,
  jsEighth
);
```

C++

```
enum TJPEGScale {
  jsFullSize,
  jsHalf,
  jsQuarter,
  jsEighth
};
```

File

jpeg

Description

The following table lists the values of TJPEGScale:

Value	Meaning
jsFullSize	Displays a full-sized image.
jsHalf	Displays a half-size image in half the time it takes to display a full-sized image.
jsQuarter	Displays a quarter-size image in a quarter of the time it takes to display a full-sized image.
jsEighth	Displays an eighth-size image in an eighth of the time it takes to display a full-sized image.

27.3 Types

The following table lists types in this documentation.

Types

Name	Description
TJPEGQualityRange (see page 1014)	TJPEGQualityRange represents the trade-off ratio between image quality and file size in a JPEG image.

27.3.1 jpeg.TJPEGQualityRange Type

TJPEGQualityRange represents the trade-off ratio between image quality and file size in a JPEG image.

Pascal

```
TJPEGQualityRange = 1..100;
```

C++

```
1..100 TJPEGQualityRange;
```

File

jpeg

Description

TJPEGQualityRange represents a scale of 1 to 100, where higher values represent better image quality (but larger file size) and lower values represent smaller file sizes but with a loss of picture quality.

27.4 Variables

The following table lists variables in this documentation.

Variables

Name	Description
JPEGDefaults (see page 1015)	This is variable jpeg.JPEGDefaults.

27.4.1 jpeg.JPEGDefaults Variable

Pascal

```
JPEGDefaults: TJPEGDefaults = ( CompressionQuality: 90; Grayscale: False; Performance:
jpBestQuality; PixelFormat: jf24Bit; ProgressiveDisplay: False; ProgressiveEncoding: False;
Scale: jsFullSize; Smoothing: True; );
```

C++

```
TJPEGDefaults JPEGDefaults = ( CompressionQuality: 90; Grayscale: False; Performance:
jpBestQuality; PixelFormat: jf24Bit; ProgressiveDisplay: False; ProgressiveEncoding: False;
Scale: jsFullSize; Smoothing: True; );
```

File

jpeg

Description

This is variable jpeg.JPEGDefaults.

28 ListActns Namespace

This is namespace ListActns.

Topics

Name	Description
Classes (see page 1019)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 1074)	The following table lists structs, records, enums in this documentation.
Types (see page 1075)	The following table lists types in this documentation.

Classes

	Name	Description
	TCustomListAction (see page 1019)	TCustomListAction is the base class for action objects that provide items to client controls.
	TCustomStaticListAction (see page 1027)	This is class ListActns.TCustomStaticListAction.
	TCustomVirtualListAction (see page 1034)	This is class ListActns.TCustomVirtualListAction.
	TListActionLink (see page 1037)	This is class ListActns.TListActionLink.
	TListControlItem (see page 1041)	TListControlItem represents an item with a text value, an image, and a data pointer.
	TListControlItems (see page 1047)	TListControlItems manages a collection of TListControlItem (see page 1041) objects.
	TStaticListAction (see page 1054)	TStaticListAction provides items to client controls.
	TStaticListItems (see page 1063)	TStaticListItems represents the items that TStaticListAction (see page 1054) supplies to client controls.
	TVirtualListAction (see page 1066)	TVirtualListAction provides items to a client controls.

Structs, Records, Enums

	Name	Description
	TListItemsSortType (see page 1074)	This is record ListActns.TListItemsSortType.

Types

Name	Description
TGetItemCountEvent (see page 1075)	This is type ListActns.TGetItemCountEvent.
TGetItemEvent (see page 1075)	This is type ListActns.TGetItemEvent.
TGetVirtualItemEvent (see page 1076)	This is type ListActns.TGetVirtualItemEvent.
TItemSelectedEvent (see page 1076)	This is type ListActns.TItemSelectedEvent.
TListCompareEvent (see page 1076)	This is type ListActns.TListCompareEvent.
TListControlItemClass (see page 1077)	This is type ListActns.TListControlItemClass.

TListItemsCompare (see page 1077)	This is type ListActns.TListItemsCompare.

28.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TCustomListAction (see page 1019)	TCustomListAction is the base class for action objects that provide items to client controls.
	TCustomStaticListAction (see page 1027)	This is class ListActns.TCustomStaticListAction.
	TCustomVirtualListAction (see page 1034)	This is class ListActns.TCustomVirtualListAction.
	TListActionLink (see page 1037)	This is class ListActns.TListActionLink.
	TListControlItem (see page 1041)	TListControlItem represents an item with a text value, an image, and a data pointer.
	TListControlItems (see page 1047)	TListControlItems manages a collection of TListControlItem (see page 1041) objects.
	TStaticListAction (see page 1054)	TStaticListAction provides items to client controls.
	TStaticListItems (see page 1063)	TStaticListItems represents the items that TStaticListAction (see page 1054) supplies to client controls.
	TVirtualListAction (see page 1066)	TVirtualListAction provides items to a client controls.

28.1.1 TCustomListAction Class

TCustomListAction is the base class for action objects that provide items to client controls.

Class Hierarchy

Pascal

```
TCustomListAction = class(TCustomAction);
```

C++

```
class TCustomListAction : public TCustomAction;
```

File

ListActns

Description

TCustomListAction implements the common behavior for actions that supply the items to a list view, list box or combo box.

When an application sets the Active (see page 1024) property of a list action to true, the action fills all client list boxes and combo boxes with items. Each item may include information such as a text caption, an image, and a pointer to data.

When the user selects an item in one of the client controls, the client "executes" the list action, which causes it to generate an OnItemSelected (see page 1027) event.

When a TCustomListAction is added to an action manager, it uses the action to generate a drop-down list on a tool bar.

See Also

TStaticListAction (see page 1054)

TVirtualListAction (see page 1066)

28.1.1.1 TCustomListAction Members

The following tables list the members exposed by TCustomListAction.

Protected Events

	Name	Description
	OnGetItemCount (see page 1027)	Occurs when the list action needs to determine the number of items it supplies to client controls.
	OnItemSelected (see page 1027)	Occurs when a client control executes the action because a user selected one of the items.

Protected Methods

	Name	Description
V	GetCount (see page 1021)	Returns the value of the Count (see page 1024) property.
V	GetString (see page 1022)	Returns the value of the Strings (see page 1026) property.
V	Loaded (see page 1023)	Initializes the action after it is loaded into memory.
V	SetString (see page 1023)	Sets the value of the Strings (see page 1026) property.

Protected Properties

	Name	Description
	Images (see page 1025)	Lists the images that the list action supplies along with items.
R	Loading (see page 1026)	Indicates whether the action is currently adding items to client controls.

Public Methods

	Name	Description
V	Create (see page 1020)	Creates an instance of TCustomListAction (see page 1019).
V	ExecuteTarget (see page 1021)	Generates an OnItemSelected (see page 1027) event.
V	HandlesTarget (see page 1022)	Indicates whether the action can execute its function.

Public Properties

	Name	Description
	Active (see page 1024)	Indicates whether the list action has supplied items to its client controls.
R	Count (see page 1024)	Indicates the number of items this list action represents.
	ItemIndex (see page 1025)	Specifies the index of the selected item.
	Strings (see page 1026)	Lists the Strings that are the values of the items this action supplies.

28.1.1.2 TCustomListAction.Create Constructor

Creates an instance of TCustomListAction (see page 1019).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomListAction(TComponent * AOwner);
```

Description

Most applications do not need to call the TCustomListAction (see page 1019) constructor because actions are added at design time to an action list or action manager.

AOwner specifies the Owner for the action. This is the component that is responsible for freeing the TCustomListAction (see page 1019) instance.

See Also

Owner

28.1.1.3 TCustomListAction Methods

The methods of the TCustomListAction class are listed here.

Protected Methods

	Name	Description
	GetCount (see page 1021)	Returns the value of the Count (see page 1024) property.
	GetString (see page 1022)	Returns the value of the Strings (see page 1026) property.
	Loaded (see page 1023)	Initializes the action after it is loaded into memory.
	SetString (see page 1023)	Sets the value of the Strings (see page 1026) property.

Public Methods

	Name	Description
	ExecuteTarget (see page 1021)	Generates an OnItemSelected (see page 1027) event.
	HandlesTarget (see page 1022)	Indicates whether the action can execute its function.

28.1.1.3.1 TCustomListAction.ExecuteTarget Method

Generates an OnItemSelected (see page 1027) event.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

ExecuteTarget is called automatically when the user selects one of the items that the list action supplies to a client list box or combo box.

Target is the control whose item was selected.

ExecuteTarget updates the ItemIndex (see page 1025) property of all client controls that descend from TCustomListControl, and then generates an OnItemSelected (see page 1027) event, where your application can respond to the user's selection.

See Also

OnItemSelected (see page 1027)

ItemIndex (see page 1025)

28.1.1.3.2 TCustomListAction.GetCount Method

Returns the value of the Count (see page 1024) property.

Pascal

```
function GetCount: Integer; virtual;
```

C++

```
virtual __fastcall int GetCount();
```

Description

GetCount is the protected read implementation of the Count (see page 1024) property.

In TCustomListAction (see page 1019), GetCount generates an OnGetItemCount (see page 1027) event to determine the number of items that the list action supplies to clients. If there is no OnGetItemCount (see page 1027) event handler, GetCount returns –1.

Override GetCount to specify the number of items in some other way. For example, TStaticListAction (see page 1054) overrides GetCount to return the number of items in its internal list of items.

See Also

Count (see page 1024)

OnGetItemCount (see page 1027)

28.1.1.3.3 TCustomListAction.GetString Method

Returns the value of the Strings (see page 1026) property.

Pascal

```
function GetString(Index: Integer): String; virtual;
```

C++

```
virtual __fastcall UnicodeString GetString(int Index);
```

Description

GetString is the protected read implementation of the Strings (see page 1026) property.

In TCustomListAction (see page 1019), GetString always returns an empty string.

Override GetString to provide a more meaningful value to the Strings (see page 1026) property. For example, TStaticListAction (see page 1054) overrides GetString to return the caption of the specified item.

See Also

Strings (see page 1026)

28.1.1.3.4 TCustomListAction.HandlesTarget Method

Indicates whether the action can execute its function.

Pascal

```
function HandlesTarget(Target: TObject): Boolean; override;
```

C++

```
virtual __fastcall Boolean HandlesTarget(TObject * Target);
```

Description

Do not call the HandlesTarget method. This method is called automatically when the user invokes an object that is linked to this action. The HandlesTarget method provides the action object with an opportunity to indicate whether it is appropriate to execute at this time with the object specified by the Target parameter as a "target".

Target is the currently active object.

HandlesTarget always returns true because the list action's ability to perform its function is not dependant on any particular target.

See Also

ExecuteTarget (see page 1021)

UpdateTarget

28.1.1.3.5 TCustomListAction.Loaded Method

Initializes the action after it is loaded into memory.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Loaded is called automatically when the form or data module containing the action has been completely loaded into memory. TCustomListAction (see page 1019) overrides the inherited method to set Active (see page 1024) and Images (see page 1025) properties now that the other components involved (the client controls whose items are set when Active (see page 1024) becomes true and the image list component that is the value of Images (see page 1025)) are known to be loaded into memory.

See Also

Loaded

Images (see page 1025)

Active (see page 1024)

28.1.1.3.6 TCustomListAction.SetString Method

Sets the value of the Strings (see page 1026) property.

Pascal

```
procedure SetString(Index: Integer; const Value: String); virtual;
```

C++

```
virtual __fastcall SetString(int Index, const UnicodeString Value);
```

Description

SetString is the protected write implementation of the Strings (see page 1026) property.

In TCustomListAction (see page 1019), SetString does nothing.

Override SetString to provide a more meaningful value to the Strings (see page 1026) property. For example, TStaticListAction (see page 1054) overrides SetString to set the caption of the specified item.

See Also

Strings (see page 1026)

28.1.1.4 TCustomListAction Properties

The properties of the TCustomListAction class are listed here.

Protected Properties

	Name	Description
	Images (see page 1025)	Lists the images that the list action supplies along with items.
R	Loading (see page 1026)	Indicates whether the action is currently adding items to client controls.

Public Properties

	Name	Description
	Active (see page 1024)	Indicates whether the list action has supplied items to its client controls.
R	Count (see page 1024)	Indicates the number of items this list action represents.
	ItemIndex (see page 1025)	Specifies the index of the selected item.
	Strings (see page 1026)	Lists the Strings that are the values of the items this action supplies.

28.1.1.4.1 TCustomListAction.Active Property

Indicates whether the list action has supplied items to its client controls.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Set Active to true to cause the list action to fill all client controls with the items. These Items are supplied by calling the GetItem method, iterating over every index from 0 to Count (see page 1024).

See Also

GetItem (see page 1035)

Items

Items

Count (see page 1024)

Items

Strings (see page 1026)

28.1.1.4.2 TCustomListAction.Count Property

Indicates the number of items this list action represents.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Read Count to determine the number of items the list action supplies to client controls. This value provides an upper limit to the index that is supplied to the GetItem method or the Strings (see page 1026) property in order to fetch individual items.

In TCustomListAction (see page 1019), the value of Count is supplied by the OnGetItemCount (see page 1027) event handler. If there is no OnGetItemCount (see page 1027) event handler, the value of Count is –1. Thus, a Count of –1 indicates that Count is not defined, as opposed to 0, which indicates that there are no items.

Note: TCustomListAction (see page 1019) descendants can override the Count property access method to supply a value to Count that does not rely on an event handler. For example, TStaticListAction (see page 1054) stores all of its items in an internal list, and overrides GetCount (see page 1021) to indicate the number of items in that list.

See Also

GetItem (see page 1035)

OnGetItemCount (see page 1027)

Strings (see page 1026)

28.1.1.4.3 TCustomListAction.Images Property

Lists the images that the list action supplies along with items.

Pascal

```
property Images: TCustomImageList;
```

C++

```
__property TCustomImageList Images;
```

Description

For each item that the list action supplies to clients, it can supply an image index along with other information such as the text value. The supplied image index refers to an image in the Images property.

Note: List actions do not supply images to all clients. The Images property controls the SmallImages property of a list view or the Images property of a TComboBoxEx descendant.

See Also

SmallImages

Images

28.1.1.4.4 TCustomListAction.ItemIndex Property

Specifies the index of the selected item.

Pascal

```
property ItemIndex: Integer;
```

C++

```
__property int ItemIndex;
```

Description

ItemIndex represents the index of the selected item in all client controls that descend from TCustomListControl. Setting ItemIndex causes these clients to change their selection. When the user updates the selection using one of these clients, TCustomListAction (see page 1019) automatically updates the others so that they select the same item.

Note: List actions do not supply ItemIndex to all clients. The ItemIndex property controls only the ItemIndex property of clients that descend from TCustomListControl.

See Also

OnItemSelected (see page 1027)

ItemIndex

28.1.1.4.5 TCustomListAction.Loading Property

Indicates whether the action is currently adding items to client controls.

Pascal

```
property Loading: Boolean;
```

C++

```
__property Boolean Loading;
```

Description

Loading is used internally to detect when the list action is in the process of supplying client controls with items.

See Also

Active (see page 1024)

28.1.1.4.6 TCustomListAction.Strings Property

Lists the Strings that are the values of the items this action supplies.

Pascal

```
property Strings [Index: Integer]: String;
```

C++

```
__property UnicodeString Strings[int Index];
```

Description

Read Strings to get or set the text value for any of the items this action supplies to clients.

Index is the index of the item. It is a value from 0 to Count (see page 1024) – 1.

In TCustomListAction (see page 1019), Strings is not implemented. Reading Strings always returns an empty string, and setting Strings has no effect.

Descendant classes can override the protected GetString (see page 1022) and SetString (see page 1023) methods to provide an implementation for this property. However, there is no guarantee that Strings is implemented for any particular TCustomListAction (see page 1019) descendant.

See Also

Active (see page 1024)

Count (see page 1024)

28.1.1.5 TCustomListAction Events

The events of the TCustomListAction class are listed here.

Protected Events

	Name	Description
	OnGetItemCount (see page 1027)	Occurs when the list action needs to determine the number of items it supplies to client controls.
	OnItemSelected (see page 1027)	Occurs when a client control executes the action because a user selected one of the items.

28.1.1.5.1 TCustomListAction.OnGetItemCount Event

Occurs when the list action needs to determine the number of items it supplies to client controls.

Pascal

```
property OnGetItemCount: TGetItemCountEvent;
```

C++

```
__property TGetItemCountEvent OnGetItemCount;
```

Description

The GetCount (see page 1021) method generates an OnGetItemCount event to supply the value of the Count (see page 1024) property. Write an OnGetItemCount event handler to indicate the number of items for which you are supplying values in the OnGetItem event handler.

Sender is the list action that is supplying data to client controls.

Count (see page 1024) returns the number of items this list action supplies to client controls.

See Also

GetCount (see page 1021)

Count (see page 1024)

28.1.1.5.2 TCustomListAction.OnItemSelected Event

Occurs when a client control executes the action because a user selected one of the items.

Pascal

```
property OnItemSelected: TItemSelectedEvent;
```

C++

```
__property TItemSelectedEvent OnItemSelected;
```

Description

Write an OnItemSelected event handler to respond when the user selects one of the items supplied to client controls. Before this event is called, the list action first updates the ItemIndex (see page 1025) property of any client controls that descend from TCustomListControl.

Sender is the list action that supplies items to the control in which an item was selected.

Control is the control in which the user selected an item.

See Also

ExecuteTarget (see page 1021)

ItemIndex (see page 1025)

28.1.2 TCustomStaticListAction Class

Class Hierarchy

Pascal

```
TCustomStaticListAction = class(TCustomListAction);
```

C++

```
class TCustomStaticListAction : public TCustomListAction;
```

File

ListActns

Description

This is class ListActns.TCustomStaticListAction.

28.1.2.1 TCustomStaticListAction Members

The following tables list the members exposed by TCustomStaticListAction.

Protected Events

	Name	Description
	OnGetItemCount (see page 1027)	Occurs when the list action needs to determine the number of items it supplies to client controls.
	OnItemSelected (see page 1027)	Occurs when a client control executes the action because a user selected one of the items.

Protected Methods

	Name	Description
V	GetCount (see page 1030)	Returns the value of the Count property.
	GetItem (see page 1030)	Fills in a specified item to match the corresponding item in the Items (see page 1032) list.
V	GetItemClass (see page 1030)	Returns the class type for the items in the Items (see page 1032) property array.
V	GetString (see page 1031)	Returns the value of the Strings property.
V	Loaded (see page 1023)	Initializes the action after it is loaded into memory.
V	SetString (see page 1031)	Sets the value of the Strings property.

Protected Properties

	Name	Description
	Clients (see page 1032)	This is Clients, a member of class TCustomStaticListAction.
	Images (see page 1025)	Lists the images that the list action supplies along with items.
R	Loading (see page 1026)	Indicates whether the action is currently adding items to client controls.

Public Events

	Name	Description
	OnGetItem (see page 1033)	Occurs when the static list action supplies an item to its client controls.

Public Methods

	Name	Description
V	Create (see page 1029)	Creates an instance of TCustomStaticListAction (see page 1027).
V	Destroy (see page 1029)	Frees the memory associated with the TCustomStaticListAction (see page 1027) object.
V	ExecuteTarget (see page 1021)	Generates an OnItemSelected (see page 1027) event.
V	HandlesTarget (see page 1022)	Indicates whether the action can execute its function.

Public Properties

	Name	Description
	Active (see page 1024)	Indicates whether the list action has supplied items to its client controls.

	Count (see page 1032)	Indicates the number of items this list action represents.
	ItemIndex (see page 1025)	Specifies the index of the selected item.
	Items (see page 1032)	Lists the items that this list action supplies to clients.
	Strings (see page 1026)	Lists the Strings that are the values of the items this action supplies.

28.1.2.2 TCustomStaticListAction.Create Constructor

Creates an instance of TCustomStaticListAction (see page 1027).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomStaticListAction(TComponent * AOwner);
```

Description

Most applications do not need to call the TCustomStaticListAction (see page 1027) constructor, because actions are added at design time to an action list or action manager. `AOwner` specifies the owner for the action. This is the component that is responsible for freeing the TCustomStaticListAction (see page 1027) instance.

See Also

Count (see page 1032)

Strings (see page 1026)

28.1.2.3 TCustomStaticListAction.Destroy Destructor

Frees the memory associated with the TCustomStaticListAction (see page 1027) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomStaticListAction();
```

Description

Do not explicitly destroy actions. Action objects are created and destroyed by the action list or action manager that uses them.

See Also

Create (see page 1029)

28.1.2.4 TCustomStaticListAction Methods

The methods of the TCustomStaticListAction class are listed here.

Protected Methods

	Name	Description
	GetCount (see page 1030)	Returns the value of the Count property.
	GetItem (see page 1030)	Fills in a specified item to match the corresponding item in the Items (see page 1032) list.
	GetItemClass (see page 1030)	Returns the class type for the items in the Items (see page 1032) property array.

	GetString (see page 1031)	Returns the value of the Strings property.
	SetString (see page 1031)	Sets the value of the Strings property.

28.1.2.4.1 TCustomStaticListAction.GetCount Method

Returns the value of the Count property.

Pascal

```
function GetCount: Integer; override;
```

C++

```
virtual __fastcall int GetCount();
```

Description

GetCount is the protected read implementation of the Count property.

In TCustomListAction, GetCount generates an OnGetItemCount event to determine the number of items that the list action supplies to clients. If there is no OnGetItemCount event handler, GetCount returns –1.

Override GetCount to specify the number of items in some other way. For example, TStaticListAction overrides GetCount to return the number of items in its internal list of items.

See Also

Count (see page 1024)

OnGetItemCount (see page 1027)

28.1.2.4.2 TCustomStaticListAction.GetItem Method

Fills in a specified item to match the corresponding item in the Items (see page 1032) list.

Pascal

```
function GetItem(const Index: Integer; AnItem: TListControlItem): Boolean;
```

C++

```
__fastcall Boolean GetItem(const int Index, TListControlItem AnItem);
```

Description

When you set the Active (see page 1024) property to True, the static list action supplies items to client controls through a series of calls to GetItem, one for each item. `Index` indicates which item is desired, where 0 indicates the first item, 1 indicates the second item and so on up to the number of items specified by the Count (see page 1032) property. `AnItem` is the item supplied to clients. GetItem assigns the properties of the corresponding item in the Items (see page 1032) property to `AnItem`.

See Also

GetItemClass (see page 1030)

28.1.2.4.3 TCustomStaticListAction.GetItemClass Method

Returns the class type for the items in the Items (see page 1032) property array.

Pascal

```
function GetItemClass: TListControlItemClass; virtual;
```

C++

```
virtual __fastcall TListControlItemClass GetItemClass();
```

Description

GetItemClass returns the class type used for the items that TCustomStaticListAction (see page 1027) supplies to clients. This class type determines the item properties that can be assigned to the various client items. As implemented in TCustomStaticListAction (see page 1027), GetItemClass returns TListControlItem (see page 1041).

See Also

GetItem (see page 1030)

28.1.2.4.4 TCustomStaticListAction.GetString Method

Returns the value of the Strings property.

Pascal

```
function GetString(Index: Integer): String; override;
```

C++

```
virtual __fastcall UnicodeString GetString(int Index);
```

Description

GetString is the protected read implementation of the Strings property.

In TCustomListAction, GetString always returns an empty string.

Override GetString to provide a more meaningful value to the Strings property. For example, TStaticListAction overrides GetString to return the caption of the specified item.

See Also

Strings (see page 1026)

28.1.2.4.5 TCustomStaticListAction.SetString Method

Sets the value of the Strings property.

Pascal

```
procedure SetString(Index: Integer; const Value: String); override;
```

C++

```
virtual __fastcall SetString(int Index, const UnicodeString Value);
```

Description

SetString is the protected write implementation of the Strings property.

In TCustomListAction, SetString does nothing.

Override SetString to provide a more meaningful value to the Strings property. For example, TStaticListAction overrides SetString to set the caption of the specified item.

See Also

Strings (see page 1026)

28.1.2.5 TCustomStaticListAction Properties

The properties of the TCustomStaticListAction class are listed here.

Protected Properties

	Name	Description
	Clients (see page 1032)	This is Clients, a member of class TCustomStaticListAction.

Public Properties

	Name	Description
	Count (see page 1032)	Indicates the number of items this list action represents.
	Items (see page 1032)	Lists the items that this list action supplies to clients.

28.1.2.5.1 TCustomStaticListAction.Clients Property

Pascal

```
property Clients;
```

C++

```
__property Clients;
```

Description

This is Clients, a member of class TCustomStaticListAction.

28.1.2.5.2 TCustomStaticListAction.Count Property

Indicates the number of items this list action represents.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Read Count to determine the number of items the list action supplies to client controls. This value provides an upper limit to the index that is supplied to the GetItem method or the Strings property in order to fetch individual items.

In TCustomListAction, the value of Count is supplied by the OnGetItemCount event handler. If there is no OnGetItemCount event handler, the value of Count is –1. Thus, a Count of –1 indicates that Count is not defined, as opposed to 0, which indicates that there are no items.

Note: TCustomListAction descendants can override the Count property access method to supply a value to Count that does not rely on an event handler. For example, TStaticListAction stores all of its items in an internal list, and overrides GetCount to indicate the number of items in that list.

See Also

GetItem (see page 1035)

OnGetItemCount (see page 1027)

Strings (see page 1026)

28.1.2.5.3 TCustomStaticListAction.Items Property

Lists the items that this list action supplies to clients.

Pascal

```
property Items: TStaticListItems;
```

C++

```
__property TStaticListItems Items;
```

Description

Set Items to indicate the items that this action supplies to clients. At design time, you can use the collection editor to add items to the list and set their properties.

See Also

Count (see page 1032)

Strings (see page 1026)

28.1.2.6 TCustomStaticListAction Events

The events of the TCustomStaticListAction class are listed here.

Public Events

	Name	Description
	OnGetItem (see page 1033)	Occurs when the static list action supplies an item to its client controls.

28.1.2.6.1 TCustomStaticListAction.OnGetItem Event

Occurs when the static list action supplies an item to its client controls.

Pascal

```
property OnGetItem: TGetItemEvent;
```

C++

```
__property TGetItemEvent OnGetItem;
```

Description

Write an OnGetItem event handler to customize the properties of an item before it is supplied to client controls. The GetItem (see page 1030) method generates an OnGetItem event for every item it supplies to clients, passing in the current item from the Items (see page 1032) property. You can change that item's properties in the event handler before it is added to client controls.

Sender is the list action that is supplying data to client controls.

Index indicates which item is requested, where 0 is the first item, 1 is the second item and so on up to the index that is one less than the value of the Count (see page 1032) property.

Item is the item that the action is about to supply to the user. You can change any of its properties before it is passed on to the action's client.

28.1.3 TCustomVirtualListAction Class

Class Hierarchy

Pascal

```
TCustomVirtualListAction = class(TCustomListAction);
```

C++

```
class TCustomVirtualListAction : public TCustomListAction;
```

File

ListActns

Description

This is class ListActns.TCustomVirtualListAction.

28.1.3.1 TCustomVirtualListAction Members

The following tables list the members exposed by TCustomVirtualListAction.

Protected Events

	Name	Description
	OnGetItemCount (see page 1027)	Occurs when the list action needs to determine the number of items it supplies to client controls.
	OnItemSelected (see page 1027)	Occurs when a client control executes the action because a user selected one of the items.

Protected Methods

	Name	Description
V	GetCount (see page 1021)	Returns the value of the Count (see page 1024) property.
	GetItem (see page 1035)	Provides information about a specified item.
V	GetString (see page 1035)	Returns the value of the Strings property.
V	Loaded (see page 1023)	Initializes the action after it is loaded into memory.
V	SetString (see page 1023)	Sets the value of the Strings (see page 1026) property.

Protected Properties

	Name	Description
	Images (see page 1025)	Lists the images that the list action supplies along with items.
R	Loading (see page 1026)	Indicates whether the action is currently adding items to client controls.

Public Events

	Name	Description
	OnGetItem (see page 1037)	Occurs when the list action needs to supply an item to its client controls.

Public Methods

	Name	Description
V	Create (see page 1020)	Creates an instance of TCustomListAction (see page 1019).
V	ExecuteTarget (see page 1021)	Generates an OnItemSelected (see page 1027) event.
V	HandlesTarget (see page 1022)	Indicates whether the action can execute its function.

Public Properties

	Name	Description
	Active (see page 1024)	Indicates whether the list action has supplied items to its client controls.
	Count (see page 1036)	Indicates the number of items this list action represents.
	ItemIndex (see page 1025)	Specifies the index of the selected item.
	Strings (see page 1026)	Lists the Strings that are the values of the items this action supplies.

28.1.3.2 TCustomVirtualListAction Methods

The methods of the TCustomVirtualListAction class are listed here.

Protected Methods

	Name	Description
	GetItem (see page 1035)	Provides information about a specified item.
V	GetString (see page 1035)	Returns the value of the Strings property.

28.1.3.2.1 TCustomVirtualListAction.GetItem Method

Provides information about a specified item.

Pascal

```
function GetItem(const Index: Integer; var Value: String; var ImageIndex: Integer; var Data:
TCustomData): Boolean;
```

C++

```
__fastcall Boolean GetItem(const int Index, UnicodeString Value, int ImageIndex, TCustomData
Data);
```

Description

When you set the Active (see page 1024) property to True, the virtual list action supplies items to client controls through a series of calls to GetItem, one for each item. GetItem collects the information about each item by generating an OnGetItem (see page 1037) event. It returns True if there is an OnGetItem (see page 1037) event handler to provide information about the item, which is returned using the GetItem parameters. GetItem returns False if it cannot supply information about the item because there is no OnGetItem (see page 1037) event handler. `Index` indicates which item is desired, where 0 indicates the first item, 1 indicates the second item and so on up to the number of items specified by the Count (see page 1036) property. Value returns the string value of the item. This is the text that appears in the client combo box or list box. ImageIndex returns the index of an image associated with the item. If the item is not associated with an image, ImageIndex returns –1. Otherwise, it returns the index of an image in the Images (see page 1025) property. Data returns a pointer to application-defined data that is associated with the item. For client controls that store items in a TStrings object, Data supplies the value of the Objects property for the item.

See Also

Count (see page 1024)

OnGetItemCount (see page 1027)

28.1.3.2.2 TCustomVirtualListAction.GetString Method

Returns the value of the Strings property.

Pascal

```
function GetString(Index: Integer): String; override;
```

C++

```
virtual __fastcall UnicodeString GetString(int Index);
```

Description

GetString is the protected read implementation of the Strings property.

In TCustomListAction, GetString always returns an empty string.

Override GetString to provide a more meaningful value to the Strings property. For example, TStaticListAction overrides GetString to return the caption of the specified item.

See Also

Strings (see page 1026)

28.1.3.3 TCustomVirtualListAction Properties

The properties of the TCustomVirtualListAction class are listed here.

Public Properties

	Name	Description
	Count (see page 1036)	Indicates the number of items this list action represents.

28.1.3.3.1 TCustomVirtualListAction.Count Property

Indicates the number of items this list action represents.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Read Count to determine the number of items the list action supplies to client controls. This value provides an upper limit to the index that is supplied to the GetItem method or the Strings property in order to fetch individual items.

In TCustomListAction, the value of Count is supplied by the OnGetItemCount event handler. If there is no OnGetItemCount event handler, the value of Count is –1. Thus, a Count of –1 indicates that Count is not defined, as opposed to 0, which indicates that there are no items.

Note: TCustomListAction descendants can override the Count property access method to supply a value to Count that does not rely on an event handler. For example, TStaticListAction stores all of its items in an internal list, and overrides GetCount to indicate the number of items in that list.

See Also

GetItem (see page 1035)

OnGetItemCount (see page 1027)

Strings (see page 1026)

28.1.3.4 TCustomVirtualListAction Events

The events of the TCustomVirtualListAction class are listed here.

Public Events

	Name	Description
	OnGetItem (see page 1037)	Occurs when the list action needs to supply an item to its client controls.

28.1.3.4.1 TCustomVirtualListAction.OnGetItem Event

Occurs when the list action needs to supply an item to its client controls.

Pascal

```
property OnGetItem: TGetVirtualItemEvent;
```

C++

```
__property TGetVirtualItemEvent OnGetItem;
```

Description

Write an OnGetItem event handler to provide the items that the virtual list action supplies to clients. When you set the Active (see page 1024) property to True, the virtual list action generates an OnGetItem event for every index from 0 to Count (see page 1036) – 1. In the event handler, supply the string value, image, and data that corresponds to the index specified by Index.

Sender is the list action that is supplying data to client controls.

Index indicates which item is requested, where 0 is the first item, 1 is the second item and so on up to the index that is one less than the value of the Count (see page 1036) property.

Value returns the string value of the item. This is the text that appears in the client combo box or list box.

ImageIndex is the index of an image associated with the item. If the item is not associated with an image, ImageIndex should return –1. Otherwise, it should return the index of the desired image in the Images (see page 1025) property.

Data returns a pointer to application-defined data that is associated with the item. For client controls that store items in a TStrings object, Data is the value of the Objects property for the item.

See Also

Count (see page 1024)

28.1.4 TListActionLink Class

Class Hierarchy

Pascal

```
TListActionLink = class(TWinControlActionLink);
```

C++

```
class TListActionLink : public TWinControlActionLink;
```

File

ListActns

Description

This is class ListActns.TListActionLink.

28.1.4.1 TListActionLink Members

The following tables list the members exposed by TListActionLink.

Protected Methods

	Name	Description
	AddItem (see page 1038)	This is the overview for the AddItem method overload.
	IsActiveLinked (see page 1039)	This is IsActiveLinked, a member of class TListActionLink.
	IsImagesLinked (see page 1039)	This is IsImagesLinked, a member of class TListActionLink.
	RefreshControl (see page 1040)	This is RefreshControl, a member of class TListActionLink.
	SetAction (see page 1040)	SetAction associates an action to the link's clients.
	SetActive (see page 1040)	This is SetActive, a member of class TListActionLink.
	SetImages (see page 1040)	This is SetImages, a member of class TListActionLink.
	SetItemIndex (see page 1041)	This is SetItemIndex, a member of class TListActionLink.

28.1.4.2 TListActionLink Methods

The methods of the TListActionLink class are listed here.

Protected Methods

	Name	Description
	AddItem (see page 1038)	This is the overview for the AddItem method overload.
	IsActiveLinked (see page 1039)	This is IsActiveLinked, a member of class TListActionLink.
	IsImagesLinked (see page 1039)	This is IsImagesLinked, a member of class TListActionLink.
	RefreshControl (see page 1040)	This is RefreshControl, a member of class TListActionLink.
	SetAction (see page 1040)	SetAction associates an action to the link's clients.
	SetActive (see page 1040)	This is SetActive, a member of class TListActionLink.
	SetImages (see page 1040)	This is SetImages, a member of class TListActionLink.
	SetItemIndex (see page 1041)	This is SetItemIndex, a member of class TListActionLink.

28.1.4.2.1 AddItem Method

This is the overview for the AddItem method overload.

Overload List

	Name	Description
	TListActionLink.AddItem (String, Integer, TCustomData) (see page 1039)	This is AddItem, a member of class TListActionLink.

	TListActionLink.AddItem (TListControlItem) (see page 1039)	This is AddItem, a member of class TListActionLink.

28.1.4.2.1.1 TListActionLink.AddItem Method (String, Integer, TCustomData)

Pascal

```
procedure AddItem(ACaption: String; AImageIndex: Integer; DataPtr: TCustomData); virtual;
overload;
```

C++

```
virtual __fastcall AddItem(UnicodeString ACaption, int AImageIndex, TCustomData DataPtr);
```

Description

This is AddItem, a member of class TListActionLink.

28.1.4.2.1.2 TListActionLink.AddItem Method (TListControlItem)

Pascal

```
procedure AddItem(AnItem: TListControlItem); virtual; overload;
```

C++

```
virtual __fastcall AddItem(TListControlItem AnItem);
```

Description

This is AddItem, a member of class TListActionLink.

28.1.4.2.2 TListActionLink.IsActiveLinked Method

Pascal

```
function IsActiveLinked: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsActiveLinked();
```

Description

This is IsActiveLinked, a member of class TListActionLink.

28.1.4.2.3 TListActionLink.IsImagesLinked Method

Pascal

```
function IsImagesLinked: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsImagesLinked();
```

Description

This is IsImagesLinked, a member of class TListActionLink.

28.1.4.2.4 TListActionLink.RefreshControl Method

Pascal

```
procedure RefreshControl;
```

C++

```
__fastcall RefreshControl();
```

Description

This is RefreshControl, a member of class TListActionLink.

28.1.4.2.5 TListActionLink.SetAction Method

SetAction associates an action to the link's clients.

Pascal

```
procedure SetAction(Value: TBasicAction); override;
```

C++

```
virtual __fastcall SetAction(TBasicAction Value);
```

Description

SetAction is the setter method for the Action property. SetAction connects an action associated with a link to the link's clients.

See Also

SetAction

Action

28.1.4.2.6 TListActionLink.SetActive Method

Pascal

```
procedure SetActive(const Value: Boolean); virtual;
```

C++

```
virtual __fastcall SetActive(const Boolean Value);
```

Description

This is SetActive, a member of class TListActionLink.

28.1.4.2.7 TListActionLink.SetImages Method

Pascal

```
procedure SetImages(Value: TCustomImageList); virtual;
```

C++

```
virtual __fastcall SetImages(TCustomImageList Value);
```

Description

This is SetImages, a member of class TListActionLink.

28.1.4.2.8 TListActionLink.SetItemIndex Method

Pascal

```
procedure SetItemIndex(const Value: Integer); virtual;
```

C++

```
virtual __fastcall SetItemIndex(const int Value);
```

Description

This is SetItemIndex, a member of class TListActionLink.

28.1.5 TListControlItem Class

TListControlItem represents an item with a text value, an image, and a data pointer.

Class Hierarchy

Pascal

```
TListControlItem = class(TCollectionItem);
```

C++

```
class TListControlItem : public TCollectionItem;
```

File

ListActns

Description

TListControlItem represents a single item in a control that lists items. TListControlItem objects are used by TStaticListAction (see page 1054) to represent the items in a variety of client controls such as list views, list boxes, and combo boxes. In addition, TListControlItem is the base class for TComboExItem, which is specialized to work with the TComboBoxEx control.

Each TListControlItem has

A text value, which it stores as the Caption (see page 1046) property.

An associated image, which is identified by the ImageIndex (see page 1047) property.

A data pointer, which it stores as the Data (see page 1047) property.

See Also

TListControlItems (see page 1047)

TComboExItem

28.1.5.1 TListControlItem Members

The following tables list the members exposed by TListControlItem.

Protected Fields

	Name	Description
	FCaption (see page 1043)	This is FCaption, a member of class TListControlItem.
	FData (see page 1043)	This is FData, a member of class TListControlItem.
	FImageIndex (see page 1043)	This is FImageIndex, a member of class TListControlItem.

Protected Methods

	Name	Description
	Changed (see page 1044)	Responds when any of the item's properties changes.
	GetDisplayName (see page 1045)	Specifies the name of the item as it appears in the Object Inspector.
	SetCaption (see page 1045)	Sets the value of the Caption (see page 1046) property.
	SetData (see page 1045)	Sets the value of the Data (see page 1047) property.
	SetImageIndex (see page 1046)	Sets the value of the ImageIndex (see page 1047) property.

Public Methods

	Name	Description
	Assign (see page 1044)	Copies the contents of another, similar object.
	Create (see page 1042)	Creates and initializes a TListControlItem (see page 1041) instance.

Public Properties

	Name	Description
	Data (see page 1047)	Points to user-defined data associated with the control.

Published Properties

	Name	Description
	Caption (see page 1046)	Specifies the text value of the item.
	ImageIndex (see page 1047)	Identifies the image associated with this item.

28.1.5.2 TListControlItem.Create Constructor

Creates and initializes a TListControlItem (see page 1041) instance.

Pascal

```
constructor Create(Collection: TCollection); override;
```

C++

```
virtual __fastcall TListControlItem(TCollection Collection);
```

Description

Do not call the constructor to create a TListControlItem (see page 1041) instance. Instead, use the collection's Add method to create a new list control item.

Collection is the collection object that owns and manages this list control item.

See Also

Add

28.1.5.3 TListControlItem Fields

The fields of the TListControlItem class are listed here.

Protected Fields

	Name	Description
	FCaption (see page 1043)	This is FCaption, a member of class TListControlItem.
	FData (see page 1043)	This is FData, a member of class TListControlItem.
	FImageIndex (see page 1043)	This is FImageIndex, a member of class TListControlItem.

28.1.5.3.1 TListControlItem.FCaption Field

Pascal

```
FCaption: String;
```

C++

```
UnicodeString FCaption;
```

Description

This is FCaption, a member of class TListControlItem.

28.1.5.3.2 TListControlItem.FData Field

Pascal

```
FData: TCustomData;
```

C++

```
TCustomData FData;
```

Description

This is FData, a member of class TListControlItem.

28.1.5.3.3 TListControlItem.FImageIndex Field

Pascal

```
FImageIndex: TImageIndex;
```

C++

```
TImageIndex FImageIndex;
```

Description

This is FImageIndex, a member of class TListControlItem.

28.1.5.4 TListControlItem Methods

The methods of the TListControlItem class are listed here.

Protected Methods

	Name	Description
	Changed (see page 1044)	Responds when any of the item's properties changes.
V	GetDisplayName (see page 1045)	Specifies the name of the item as it appears in the Object Inspector.
V	SetCaption (see page 1045)	Sets the value of the Caption (see page 1046) property.
V	SetData (see page 1045)	Sets the value of the Data (see page 1047) property.
V	SetImageIndex (see page 1046)	Sets the value of the ImageIndex (see page 1047) property.

Public Methods

	Name	Description
	Assign (see page 1044)	Copies the contents of another, similar object.

28.1.5.4.1 TListControlItem.Assign Method

Copies the contents of another, similar object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy the properties or other attributes of one object from another. The standard form of a call to Assign is

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

which tells the Destination object to copy the contents of the Source object to itself.

Most objects override Assign to handle the assignment of properties from similar objects. When overriding Assign, call the inherited method if the destination object can't handle the assignment of properties from the class of the Source parameter.

If no overridden Assign method can handle the assignment of properties from Source, the method implemented in TPersistent calls the source object's AssignTo method. This allows the source object to handle the assignment. If the Source object is nil (Delphi) or NULL (C++), Assign raises an EConvertError exception.

In general, the statement

```
Destination := Source; {Delphi}
Destination = Source; // C++
```

is not the same as the statement

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

The assignment operator makes Destination reference the same object as Source, whereas the Assign method copies the contents of the object referenced by Source into the object referenced by Destination.

Note: The types of some properties are also objects. If these properties have write methods that use Assign to set the value of the property, then in these cases the assignment operator does the same thing as the Assign method.

See Also

AssignTo

EConvertError

28.1.5.4.2 TListControlItem.Changed Method

Responds when any of the item's properties changes.

Pascal

```
procedure Changed;
```

C++

```
__fastcall Changed();
```

Description

Changed is called automatically when the item's properties change. It calls the Update method of the corresponding TListControlItems (see page 1047) object, so that the collection can perform any necessary adjustments.

See Also

Update

28.1.5.4.3 TListControlItem.GetDisplayName Method

Specifies the name of the item as it appears in the Object Inspector.

Pascal

```
function GetDisplayName: String; override;
```

C++

```
virtual __fastcall UnicodeString GetDisplayName();
```

Description

GetDisplayName returns the string that represents the item in the Collection editor and the Object Inspector.

GetDisplayName returns the value of the Caption (see page 1046) if it is set. Otherwise, it returns the class name of the TListControlItem (see page 1041) descendant for which this is an instance, with a number added to ensure uniqueness.

See Also

Caption (see page 1046)

28.1.5.4.4 TListControlItem.SetCaption Method

Sets the value of the Caption (see page 1046) property.

Pascal

```
procedure SetCaption(const Value: String); virtual;
```

C++

```
virtual __fastcall SetCaption(const UnicodeString Value);
```

Description

SetCaption is the protected write implementation of the Caption (see page 1046) property. It sets the Caption (see page 1046) property to Value, and then calls the Changed (see page 1044) method so that the collection can update itself.

See Also

Caption (see page 1046)

Changed (see page 1044)

28.1.5.4.5 TListControlItem.SetData Method

Sets the value of the Data (see page 1047) property.

Pascal

```
procedure SetData(const Value: TCustomData); virtual;
```

C++

```
virtual __fastcall SetData(const TCustomData Value);
```

Description

SetData is the protected write implementation of the Data (see page 1047) property. It sets the Data (see page 1047) property to Value, and then calls the Changed (see page 1044) method so that the collection can update itself.

See Also

Data (see page 1047)

Changed (see page 1044)

28.1.5.4.6 TListControlItem.SetImageIndex Method

Sets the value of the ImageIndex (see page 1047) property.

Pascal

```
procedure SetImageIndex(const Value: TImageIndex); virtual;
```

C++

```
virtual __fastcall SetImageIndex(const TImageIndex Value);
```

Description

SetImageIndex is the protected write implementation of the ImageIndex (see page 1047) property. It sets the ImageIndex (see page 1047) property to Value, and then calls the Changed (see page 1044) method so that the collection can update itself.

See Also

ImageIndex (see page 1047)

Changed (see page 1044)

28.1.5.5 TListControlItem Properties

The properties of the TListControlItem class are listed here.

Public Properties

	Name	Description
	Data (see page 1047)	Points to user-defined data associated with the control.

Published Properties

	Name	Description
	Caption (see page 1046)	Specifies the text value of the item.
	ImageIndex (see page 1047)	Identifies the image associated with this item.

28.1.5.5.1 TListControlItem.Caption Property

Specifies the text value of the item.

Pascal

```
property Caption: String;
```

C++

```
__property UnicodeString Caption;
```

Description

Set Caption to provide the item with a text value. This is the value that appears in list boxes or combo boxes, or which labels items in list view controls.

See Also

ImageIndex (see page 1047)

Data (see page 1047)

28.1.5.5.2 TListControlItem.Data Property

Points to user-defined data associated with the control.

Pascal

```
property Data: TCustomData;
```

C++

```
__property TCustomData Data;
```

Description

Set Data to associate this item with application-specific data. Data has no predefined meaning, although it is used for sorting items when the managing collection's SortType property is stData.

See Also

SortType (see page 1053)

ImageIndex (see page 1047)

Caption (see page 1046)

28.1.5.5.3 TListControlItem.ImageIndex Property

Identifies the image associated with this item.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

Set ImageIndex to associate this item with an image. ImageIndex is an index into the Images property of the component that uses this TListControlItem (see page 1041) object to represent one of its items.

See Also

Images (see page 1025)

Images

28.1.6 TListControlItems Class

TListControlItems manages a collection of TListControlItem (see page 1041) objects.

Class Hierarchy

Pascal

```
TListControlItems = class(TOwnedCollection);
```

C++

```
class TListControlItems : public TOwnedCollection;
```

File

ListActns

Description

TListControlItems manages a collection of items that each include a text value, associated image, and a data pointer.

Use the properties and methods of TListControlItems to:

Access a specific item.

Add (see page 1049) or delete items from the collection.

Find out how many items are in the collection.

Sort (see page 1051) the items in the collection.

Although TListControlItems can be used on its own, it also acts as a base class to classes that manage the items for a specific component. TListControlItems descendants include TComboExItems, which manages the items of a TComboBoxEx control, and TStaticListItems (see page 1063), which manages items for a list action component.

See Also

TListControlItem (see page 1041)

TStaticListItems (see page 1063)

TComboExItems

28.1.6.1 TListControlItems Members

The following tables list the members exposed by TListControlItems.

Protected Methods

	Name	Description
	CompareItems (see page 1050)	Returns the relative order of two items in the collection.
	Update (see page 1051)	Updates the collection to reflect changes to its items.

Public Methods

	Name	Description
	Add (see page 1049)	Adds a new item to the collection.
	Create (see page 1049)	Creates and initializes a TOwnedCollection instance.
	CustomSort (see page 1050)	Sorts the items in the collection using a specified comparison function.
	Sort (see page 1051)	Sorts the items in the collection.

Public Properties

	Name	Description
	Items (see page 1052)	Lists the items in the collection.

Published Events

	Name	Description
	OnCompare (see page 1054)	Occurs to when two items need to be compared for sorting the collection.

Published Properties

	Name	Description
	CaseSensitive (see page 1052)	Controls whether items are sorted in a case-sensitive or case-insensitive manner.
	SortType (see page 1053)	Indicates how the items should be sorted.

28.1.6.2 TListControlItems.Create Constructor

Creates and initializes a TOwnedCollection instance.

Pascal

```
constructor Create(AOwner: TPersistent; ItemClass: TCollectionItemClass); virtual;
```

C++

```
virtual __fastcall TListControlItems(TPersistent * AOwner, TCollectionItemClass ItemClass);
```

Description

The Create method takes two parameters: the name of an instance object descended from TPersistent and the name of a TCollectionItem descendant class. The first parameter is the owner of the TOwnedCollection instance. The second parameter determines the class of the items created by the Add method.

See Also

Add

28.1.6.3 TListControlItems Methods

The methods of the TListControlItems class are listed here.

Protected Methods

	Name	Description
	CompareItems (see page 1050)	Returns the relative order of two items in the collection.
	Update (see page 1051)	Updates the collection to reflect changes to its items.

Public Methods

	Name	Description
	Add (see page 1049)	Adds a new item to the collection.
	CustomSort (see page 1050)	Sorts the items in the collection using a specified comparison function.
	Sort (see page 1051)	Sorts the items in the collection.

28.1.6.3.1 TListControlItems.Add Method

Adds a new item to the collection.

Pascal

```
function Add: TListControlItem;
```

C++

```
__fastcall TListControlItem Add();
```

Description

Call Add to add a new item to the collection. Add instantiates an object of the type that was specified when the TListControlItems (see page 1047) instance was created. It returns the newly created object.

See Also

Items (see page 1052)

Delete

28.1.6.3.2 TListControlItems.CompareItems Method

Returns the relative order of two items in the collection.

Pascal

```
function CompareItems(I1: TListControlItem; I2: TListControlItem): Integer; virtual;
```

C++

```
virtual __fastcall int CompareItems(TListControlItem I1, TListControlItem I2);
```

Description

CompareItems is used internally to provide the default sort order for items in the list. It is used when the SortType (see page 1053) property is not stNone. The Sort (see page 1051) method also uses this as a comparison function.

If I1 is greater than I2, CompareItems returns a value greater than 0. If I1 is the same as I2, CompareItems returns 0. If I1 is less than I2, CompareItems returns a value less than 0.

CompareItems always uses an OnCompare (see page 1054) event handler if it is assigned. Otherwise, it compares the captions of the items, taking into account the CaseSensitive (see page 1052) property. Descendant classes can override CompareItems to provide a different default sort order.

See Also

SortType (see page 1053)

CustomSort (see page 1050)

Sort (see page 1051)

CaseSensitive (see page 1052)

OnCompare (see page 1054)

28.1.6.3.3 TListControlItems.CustomSort Method

Sorts the items in the collection using a specified comparison function.

Pascal

```
procedure CustomSort(Compare: TListItemsCompare);
```

C++

```
__fastcall CustomSort(TListItemsCompare Compare);
```

Description

Call Sort (see page 1051) to sort the items in the collection based on the comparison function that is the value of the Compare parameter.

Compare is a function that compares two items in the list. Its List parameter is this TListControlItems (see page 1047) object.

The Index1 and Index2 parameters are the indexes of the items to compare in the Items (see page 1052) property array. This comparison function should return a value less than 0 if the first item is less than the second, a value greater than 0 if it is greater than the second, and 0 if the two items are equivalent.

Note: CustomSort sorts the items in the list, but does not maintain the sort order when new items are added. To provide a custom sort order that persists when new items are added, set the SortType (see page 1053) property to stData and supply an OnCompare (see page 1054) event handler.

See Also

SortType (see page 1053)

Sort (see page 1051)

OnCompare (see page 1054)

Items (see page 1052)

28.1.6.3.4 TListControlItems.Sort Method

Sorts the items in the collection.

Pascal

```
procedure Sort;
```

C++

```
__fastcall Sort();
```

Description

Call Sort to sort the items in the collection. Sort uses the comparison function specified by the protected CompareItems (see page 1050) method to determine the sort order.

Note: Sort sorts the items in the list, but does not maintain the sort order when new items are added. To impose a sort order that persists when new items are added, set the SortType (see page 1053) property to a value other than stNone and, if desired, supply an OnCompare (see page 1054) event handler.

See Also

SortType (see page 1053)

CustomSort (see page 1050)

OnCompare (see page 1054)

Items (see page 1052)

CompareItems (see page 1050)

28.1.6.3.5 TListControlItems.Update Method

Updates the collection to reflect changes to its items.

Pascal

```
procedure Update(Item: TCollectionItem); override;
```

C++

```
virtual __fastcall Update(TCollectionItem Item);
```

Description

Override Update in a descendant class to make any necessary changes when the items in the collection change. This method is called automatically when an update is complete.

Item identifies the item that changed. If the Item parameter is nil (Delphi) or NULL (C++), then the change affects more than one item in the collection.

As implemented in TCollection, Update does nothing. Descendant classes override this method to make any necessary adjustments.

Changed

Changed

28.1.6.4 TListControlItems Properties

The properties of the TListControlItems class are listed here.

Public Properties

	Name	Description
	Items (see page 1052)	Lists the items in the collection.

Published Properties

	Name	Description
	CaseSensitive (see page 1052)	Controls whether items are sorted in a case-sensitive or case-insensitive manner.
	SortType (see page 1053)	Indicates how the items should be sorted.

28.1.6.4.1 TListControlItems.CaseSensitive Property

Controls whether items are sorted in a case-sensitive or case-insensitive manner.

Pascal

```
property CaseSensitive: Boolean;
```

C++

```
__property Boolean CaseSensitive;
```

Description

Use CaseSensitive to indicate whether the case of item captions should be considered when sorting the items in the list.

See Also

Items (see page 1052)

SortType (see page 1053)

Caption (see page 1046)

28.1.6.4.2 TListControlItems.Items Property

Lists the items in the collection.

Pascal

```
property Items [const Index: Integer]: TListControlItem;
```

C++

```
__property TListControlItem Items[int const Index];
```

Description

Use Items to access the items in this collection.

Index indicates the item to access, where 0 is the index of the first item, 1 is the index of the second item, and so on. The Count property indicates the maximum number of items.

Note: In Delphi code, Items is the default property for TListControlItems (see page 1047). This means that the property name can be omitted when using the Items property. For example,

```
StaticListAction.Items.Items[0].Caption := Edit1.Text;
```

Note: can also be written

```
StaticListAction.Items[0].Caption := Edit1.Text;
```

Note: Items is a read-only property. To add or delete items from the collection, use the Add (see page 1049) and Delete methods.

See Also

Add (see page 1049)

Delete

Count

28.1.6.4.3 TListControlItems.SortType Property

Indicates how the items should be sorted.

Pascal

```
property SortType: TListItemsSortType;
```

C++

```
__property TListItemsSortType SortType;
```

Description

Use SortType to indicate how you want the items sorted, if at all. The following table lists the possible values:

Value	Meaning
stNone	Items (see page 1052) are not automatically sorted. You can still sort the items explicitly by calling the Sort (see page 1051) or CustomSort (see page 1050) method.
stData	Items (see page 1052) are sorted based on the value of their Data property. You must supply an OnCompare (see page 1054) event handler to specify the sort order.
stText	Items (see page 1052) are sorted base on the value of their Caption property. The CaseSensitive (see page 1052) property specifies whether comparisons are case-sensitive.
stBoth	Items (see page 1052) are sorted based on an OnCompare (see page 1054) event handler if one is assigned, otherwise based on the value of their Caption property.

See Also

Items (see page 1052)

OnCompare (see page 1054)

Data (see page 1047)

CaseSensitive (see page 1052)

CustomSort (see page 1050)

Sort (see page 1051)

28.1.6.5 TListControlItems Events

The events of the TListControlItems class are listed here.

Published Events

	Name	Description
	OnCompare (see page 1054)	Occurs to when two items need to be compared for sorting the collection.

28.1.6.5.1 TListControlItems.OnCompare Event

Occurs to when two items need to be compared for sorting the collection.

Pascal

```
property OnCompare: TListCompareEvent;
```

C++

```
__property TListCompareEvent OnCompare;
```

Description

Write an OnCompare event handler to indicate the sort order when the SortType (see page 1053) property is stData or stBoth.

The OnCompare event handler compares the items passed as the Item1 and Item2 parameters. If Item1 is the same as Item2 in the sort order, the event handler should return 0. If Item1 is less than Item2, the event handler should return a value less than 0. If Item1 is greater than Item2, the event handler should return value greater than 0.

See Also

SortType (see page 1053)

28.1.7 TStaticListAction Class

TStaticListAction provides items to client controls.

Class Hierarchy

Pascal

```
TStaticListAction = class(TCustomStaticListAction);
```

C++

```
class TStaticListAction : public TCustomStaticListAction;
```

File

ListActns

Description

TStaticListAction supplies items to client controls such as list views, list boxes, or combo boxes. TStaticListAction maintains a list of items in its Items (see page 1059) property. This lets you specify, at design time, the items it supplies to clients.

When an application sets the Active (see page 1056) property of a list action to true, the action fills all client controls with items. Each item may include text, an image, and a pointer to data. Each client control determines which of these features of the item it accepts.

When the user selects an item in one of the client controls, the client "executes" the list action, which causes it to generate an OnItemSelected (see page 1062) event.

When a TStaticListAction is added to an action manager, it uses the action to generate a drop-down list on a tool bar.

TCustomListBox

TCustomComboBox

28.1.7.1 TStaticListAction Members

The following tables list the members exposed by TStaticListAction.

Protected Events

	Name	Description
	OnGetItemCount (see page 1027)	Occurs when the list action needs to determine the number of items it supplies to client controls.

Protected Methods

	Name	Description
V	GetCount (see page 1021)	Returns the value of the Count (see page 1024) property.
V	GetCount (see page 1030)	Returns the value of the Count property.
	GetItem (see page 1030)	Fills in a specified item to match the corresponding item in the Items (see page 1032) list.
V	GetItemClass (see page 1030)	Returns the class type for the items in the Items (see page 1032) property array.
V	GetString (see page 1022)	Returns the value of the Strings (see page 1026) property.
V	GetString (see page 1031)	Returns the value of the Strings property.
V	Loaded (see page 1023)	Initializes the action after it is loaded into memory.
V	SetString (see page 1023)	Sets the value of the Strings (see page 1026) property.
V	SetString (see page 1031)	Sets the value of the Strings property.

Protected Properties

	Name	Description
	Clients (see page 1032)	This is Clients, a member of class TCustomStaticListAction.
R	Loading (see page 1026)	Indicates whether the action is currently adding items to client controls.

Public Methods

	Name	Description
V	Create (see page 1020)	Creates an instance of TCustomListAction (see page 1019).
V	Create (see page 1029)	Creates an instance of TCustomStaticListAction (see page 1027).

	Destroy (see page 1029)	Frees the memory associated with the TCustomStaticListAction (see page 1027) object.
	ExecuteTarget (see page 1021)	Generates an OnItemSelected (see page 1027) event.
	HandlesTarget (see page 1022)	Indicates whether the action can execute its function.

Public Properties

	Name	Description
	Count (see page 1024)	Indicates the number of items this list action represents.
	Count (see page 1032)	Indicates the number of items this list action represents.
	Strings (see page 1026)	Lists the Strings that are the values of the items this action supplies.

Published Events

	Name	Description
	OnGetItem (see page 1061)	Occurs when the static list action supplies an item to its client controls.
	OnHint (see page 1061)	Occurs when the mouse pauses over a client control or menu item.
	OnItemSelected (see page 1062)	Occurs when a client control executes the action because a user selected one of the items.
	OnUpdate (see page 1062)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	Active (see page 1056)	Indicates whether the list action has supplied items to its client controls.
	Caption (see page 1057)	Represents the caption of client controls and menu items.
	Enabled (see page 1057)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 1058)	Indicates the help context ID for client controls and menu items.
	Hint (see page 1058)	Indicates the Help hint for client controls and menu items.
	Images (see page 1058)	Lists the images that the list action supplies along with items.
	ItemIndex (see page 1059)	Specifies the index of the selected item.
	Items (see page 1059)	Lists the items that this list action supplies to clients.
	SecondaryShortCuts (see page 1060)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 1060)	Specifies the ShortCut property for client menu items.
	Visible (see page 1060)	Specifies the Visible property for client controls and menu items.

28.1.7.2 TStaticListAction Properties

The properties of the TStaticListAction class are listed here.

Published Properties

	Name	Description
	Active (see page 1056)	Indicates whether the list action has supplied items to its client controls.
	Caption (see page 1057)	Represents the caption of client controls and menu items.
	Enabled (see page 1057)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 1058)	Indicates the help context ID for client controls and menu items.
	Hint (see page 1058)	Indicates the Help hint for client controls and menu items.
	Images (see page 1058)	Lists the images that the list action supplies along with items.
	ItemIndex (see page 1059)	Specifies the index of the selected item.
	Items (see page 1059)	Lists the items that this list action supplies to clients.
	SecondaryShortCuts (see page 1060)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 1060)	Specifies the ShortCut property for client menu items.
	Visible (see page 1060)	Specifies the Visible property for client controls and menu items.

28.1.7.2.1 TStaticListAction.Active Property

Indicates whether the list action has supplied items to its client controls.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Set Active to true to cause the list action to fill all client controls with the items. These Items are supplied by calling the GetItem method, iterating over every index from 0 to Count.

See Also

GetItem (see page 1035)

Items

Items

Count (see page 1024)

Items

Strings (see page 1026)

28.1.7.2.2 TStaticListAction.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption;
```

C++

```
__property Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption

Caption (see page 1396)

28.1.7.2.3 TStaticListAction.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled;
```

C++

```
__property Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled

Enabled (see page 1406)

28.1.7.2.4 TStaticListAction.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext;
```

C++

```
__property HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType

HelpKeyword

28.1.7.2.5 TStaticListAction.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint;
```

C++

```
__property Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint

Hint (see page 1410)

28.1.7.2.6 TStaticListAction.Images Property

Lists the images that the list action supplies along with items.

Pascal

```
property Images: TCustomImageList;
```

C++

```
__property TCustomImageList Images;
```

Description

For each item that the list action supplies to clients, it can supply an image index along with other information such as the text value. The supplied image index refers to an image in the Images property.

Note: List actions do not supply images to all clients. The Images property controls the SmallImages property of a list view or the Images property of a TComboBoxEx descendant.

See Also

SmallImages

Images

28.1.7.2.7 TStaticListAction.ItemIndex Property

Specifies the index of the selected item.

Pascal

```
property ItemIndex: Integer;
```

C++

```
__property int ItemIndex;
```

Description

ItemIndex represents the index of the selected item in all client controls that descend from TCustomListControl. Setting ItemIndex causes these clients to change their selection. When the user updates the selection using one of these clients, TCustomListAction automatically updates the others so that they select the same item.

Note: List actions do not supply ItemIndex to all clients. The ItemIndex property controls only the ItemIndex property of clients that descend from TCustomListControl.

See Also

OnItemSelected (see page 1027)

ItemIndex

28.1.7.2.8 TStaticListAction.Items Property

Lists the items that this list action supplies to clients.

Pascal

```
property Items: TStaticListItems;
```

C++

```
__property TStaticListItems Items;
```

Description

Set Items to indicate the items that this action supplies to clients. At design time, you can use the collection editor to add items to the list and set their properties.

See Also

Count (see page 1032)

Strings (see page 1026)

28.1.7.2.9 TStaticListAction.SecondaryShortCuts Property

Specifies the short cuts (in addition to ShortCut) for triggering clients.

Pascal

```
property SecondaryShortCuts;
```

C++

```
__property SecondaryShortCuts;
```

Description

Actions can execute in response to multiple short cut key combinations. SecondaryShortCuts lists all the short cut key combinations (other than the one specified by the ShortCut property) that can trigger the action. This lets you specify shortcuts for clients that do not have a ShortCut property or provide additional, secondary shortcuts.

When the user types one of the key combinations listed in SecondaryShortCuts, the action's Execute method is called.

See Also

ShortCut

Execute

28.1.7.2.10 TStaticListAction.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut;
```

C++

```
__property ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 1415)

SecondaryShortCuts

28.1.7.2.11 TStaticListAction.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible;
```

C++

```
__property Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 1416)

Visible

28.1.7.3 TStaticListAction Events

The events of the TStaticListAction class are listed here.

Published Events

	Name	Description
	OnGetItem (see page 1061)	Occurs when the static list action supplies an item to its client controls.
	OnHint (see page 1061)	Occurs when the mouse pauses over a client control or menu item.
	OnItemSelected (see page 1062)	Occurs when a client control executes the action because a user selected one of the items.
	OnUpdate (see page 1062)	Occurs when the application is idle or when the action list updates.

28.1.7.3.1 TStaticListAction.OnGetItem Event

Occurs when the static list action supplies an item to its client controls.

Pascal

```
property OnGetItem: TGetItemEvent;
```

C++

```
__property TGetItemEvent OnGetItem;
```

Description

Write an OnGetItem event handler to customize the properties of an item before it is supplied to client controls. The GetItem method generates an OnGetItem event for every item it supplies to clients, passing in the current item from the Items property. You can change that item's properties in the event handler before it is added to client controls.

Sender is the list action that is supplying data to client controls.

Index indicates which item is requested, where 0 is the first item, 1 is the second item and so on up to the index that is one less than the value of the Count property.

Item is the item that the action is about to supply to the user. You can change any of its properties before it is passed on to the action's client.

See Also

Count (see page 1032)

Items (see page 1059)

Images (see page 1025)

Objects

28.1.7.3.2 TStaticListAction.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint;
```

C++

```
__property OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some application-specific way.

28.1.7.3.3 TStaticListAction.OnItemSelected Event

Occurs when a client control executes the action because a user selected one of the items.

Pascal

```
property OnItemSelected: TItemSelectedEvent;
```

C++

```
__property TItemSelectedEvent OnItemSelected;
```

Description

Write an OnItemSelected event handler to respond when the user selects one of the items supplied to client controls. Before this event is called, the list action first updates the ItemIndex property of any client controls that descend from TCustomListControl.

Sender is the list action that supplies items to the control in which an item was selected.

Control is the control in which the user selected an item.

See Also

ExecuteTarget (see page 1021)

ItemIndex (see page 1025)

28.1.7.3.4 TStaticListAction.OnUpdate Event

Occurs when the application is idle or when the action list updates.

Pascal

```
property OnUpdate;
```

C++

```
__property OnUpdate;
```

Description

Write an OnUpdate event handler to execute centralized code while an application is idle. For example, actions may want to update enabling and disabling, or checking and unchecking of client targets.

C++ Examples:

```
/*
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. Double click
```

```
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
*/
Boolean checked;

void __fastcall TForm1::Action1Update(TObject *Sender)
{
   // Indicate whether ToolBar1 is currently visible.
   TAction* pa = dynamic_cast<TAction*>(Sender);
   if (pa)
   {
     if (checked != ToolBar1->Visible)
     {
       lbOther->Items->Add("Event Action1Update: toolbar visibility changed");
     }
     checked = ToolBar1->Visible;
   }
//   pa->Checked = True;  // set this statically and don't change it!
}
```

Delphi Examples:

```
{
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
}
procedure TMainForm.Action1Update(Sender: TObject);
begin
  if ((Sender as TAction).Checked <> ToolBar1.Visible) then
    lbOther.Items.Add('Event Action1Update: toolbar visibility changed');
    { Indicate whether ToolBar1 is currently visible }
    (Sender as TAction).Checked := ToolBar1.Visible;
end;
```

28.1.8 TStaticListItems Class

TStaticListItems represents the items that TStaticListAction (see page 1054) supplies to client controls.

Class Hierarchy

Pascal

```
TStaticListItems = class(TListControlItems);
```

C++

```
class TStaticListItems : public TListControlItems;
```

File

ListActns

Description

TStaticListItems manages a collection of items for a TStaticListAction (see page 1054) component. Each item in the collection can include a text value, associated image, and a data pointer. If the associated TStaticListAction (see page 1054) is active, then when items are added to or deleted from TStaticListItems, the list action's clients are updated so that they reflect the current set of items.

See Also

TStaticListAction (see page 1054)

28.1.8.1 TStaticListItems Members

The following tables list the members exposed by TStaticListItems.

Protected Methods

	Name	Description
	CompareItems (see page 1050)	Returns the relative order of two items in the collection.
	Notify (see page 1065)	Responds when items are added to or removed from the collection.
	Update (see page 1065)	Updates the collection to reflect changes to its items.

Public Methods

	Name	Description
	Add (see page 1049)	Adds a new item to the collection.
	Create (see page 1049)	Creates and initializes a TOwnedCollection instance.
	CustomSort (see page 1050)	Sorts the items in the collection using a specified comparison function.
	Sort (see page 1051)	Sorts the items in the collection.

Public Properties

	Name	Description
	Items (see page 1052)	Lists the items in the collection.

Published Events

	Name	Description
	OnCompare (see page 1054)	Occurs to when two items need to be compared for sorting the collection.

Published Properties

	Name	Description
	CaseSensitive (see page 1052)	Controls whether items are sorted in a case-sensitive or case-insensitive manner.
	SortType (see page 1053)	Indicates how the items should be sorted.

28.1.8.2 TStaticListItems Methods

The methods of the TStaticListItems class are listed here.

Protected Methods

	Name	Description
	Notify (see page 1065)	Responds when items are added to or removed from the collection.
	Update (see page 1065)	Updates the collection to reflect changes to its items.

28.1.8.2.1 TStaticListItems.Notify Method

Responds when items are added to or removed from the collection.

Pascal

```
procedure Notify(Item: TCollectionItem; Action: TCollectionNotification); override;
```

C++

```
virtual __fastcall Notify(TCollectionItem Item, TCollectionNotification Action);
```

Description

Notify is called automatically when the items in the collection change.

Item is the item that was just added to or that is about to be removed from the collection.

Action indicates whether item was added, is about to be removed, or is about to be deleted:

As implemented in TCollection, Notify calls Added when `Action` is cnAdded and calls Deleting when `Action` is cnDeleting. TCollection ignores the cnExtracting action. Descendant classes can override Notify to modify this behavior.

See Also

Added

Deleting

28.1.8.2.2 TStaticListItems.Update Method

Updates the collection to reflect changes to its items.

Pascal

```
procedure Update(Item: TCollectionItem); override;
```

C++

```
virtual __fastcall Update(TCollectionItem Item);
```

Description

Override Update in a descendant class to make any necessary changes when the items in the collection change. This method is called automatically when an update is complete.

Item identifies the item that changed. If the Item parameter is nil (Delphi) or NULL (C++), then the change affects more than one item in the collection.

As implemented in TCollection, Update does nothing. Descendant classes override this method to make any necessary adjustments.

28.1.9 TVirtualListAction Class

TVirtualListAction provides items to a client controls.

Class Hierarchy

Pascal

```
TVirtualListAction = class(TCustomVirtualListAction);
```

C++

```
class TVirtualListAction : public TCustomVirtualListAction;
```

File

ListActns

Description

TVirtualListAction supplies items dynamically at runtime to client controls such as list views, list boxes, or combo boxes. These items are supplied by the code you supply to an OnGetItem (see page 1072) event handler.

When an application sets the Active (see page 1068) property of a list action to true, the action fills all client controls with items. Each item may include text, an image, and a pointer to data. Each client control determines which of these features of the item it accepts.

When the user selects an item in one of the client controls, the client "executes" the list action, which causes it to generate an OnItemSelected (see page 1073) event.

When a TVirtualListAction is added to an action manager, it uses the action to generate a drop-down list on a tool bar.

TCustomComboBox

28.1.9.1 TVirtualListAction Members

The following tables list the members exposed by TVirtualListAction.

Protected Methods

	Name	Description
	GetCount (see page 1021)	Returns the value of the Count (see page 1024) property.
	GetItem (see page 1035)	Provides information about a specified item.
	GetString (see page 1022)	Returns the value of the Strings (see page 1026) property.
	GetString (see page 1035)	Returns the value of the Strings property.
	Loaded (see page 1023)	Initializes the action after it is loaded into memory.
	SetString (see page 1023)	Sets the value of the Strings (see page 1026) property.

Protected Properties

	Name	Description
	Loading (see page 1026)	Indicates whether the action is currently adding items to client controls.

Public Methods

	Name	Description
	Create (see page 1020)	Creates an instance of TCustomListAction (see page 1019).
	ExecuteTarget (see page 1021)	Generates an OnItemSelected (see page 1027) event.
	HandlesTarget (see page 1022)	Indicates whether the action can execute its function.

Public Properties

	Name	Description
	Count (see page 1024)	Indicates the number of items this list action represents.
	Count (see page 1036)	Indicates the number of items this list action represents.
	Strings (see page 1026)	Lists the Strings that are the values of the items this action supplies.

Published Events

	Name	Description
	OnGetItem (see page 1072)	Occurs when the list action needs to supply an item to its client controls.
	OnGetItemCount (see page 1072)	Occurs when the list action needs to determine the number of items it supplies to client controls.
	OnHint (see page 1073)	Occurs when the mouse pauses over a client control or menu item.
	OnItemSelected (see page 1073)	Occurs when a client control executes the action because a user selected one of the items.

Published Properties

	Name	Description
	Active (see page 1068)	Indicates whether the list action has supplied items to its client controls.
	Caption (see page 1068)	Represents the caption of client controls and menu items.
	Enabled (see page 1068)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 1069)	Indicates the help context ID for client controls and menu items.
	Hint (see page 1069)	Indicates the Help hint for client controls and menu items.
	Images (see page 1070)	Lists the images that the list action supplies along with items.
	ItemIndex (see page 1070)	Specifies the index of the selected item.
	SecondaryShortCuts (see page 1070)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 1071)	Specifies the ShortCut property for client menu items.
	Visible (see page 1071)	Specifies the Visible property for client controls and menu items.

28.1.9.2 TVirtualListAction Properties

The properties of the TVirtualListAction class are listed here.

Published Properties

	Name	Description
	Active (see page 1068)	Indicates whether the list action has supplied items to its client controls.
	Caption (see page 1068)	Represents the caption of client controls and menu items.
	Enabled (see page 1068)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 1069)	Indicates the help context ID for client controls and menu items.
	Hint (see page 1069)	Indicates the Help hint for client controls and menu items.
	Images (see page 1070)	Lists the images that the list action supplies along with items.
	ItemIndex (see page 1070)	Specifies the index of the selected item.
	SecondaryShortCuts (see page 1070)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 1071)	Specifies the ShortCut property for client menu items.

	Visible (see page 1071)	Specifies the Visible property for client controls and menu items.

28.1.9.2.1 TVirtualListAction.Active Property

Indicates whether the list action has supplied items to its client controls.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Set Active to true to cause the list action to fill all client controls with the items. These Items are supplied by calling the GetItem method, iterating over every index from 0 to Count.

See Also

GetItem (see page 1035)

Items

Items

Count (see page 1024)

Items

Strings (see page 1026)

28.1.9.2.2 TVirtualListAction.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption;
```

C++

```
__property Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption

Caption (see page 1396)

28.1.9.2.3 TVirtualListAction.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled;
```

C++

```
__property Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled

Enabled (see page 1406)

28.1.9.2.4 TVirtualListAction.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext;
```

C++

```
__property HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType

HelpKeyword

28.1.9.2.5 TVirtualListAction.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint;
```

C++

```
__property Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint

Hint (see page 1410)

28.1.9.2.6 TVirtualListAction.Images Property

Lists the images that the list action supplies along with items.

Pascal

```
property Images: TCustomImageList;
```

C++

```
__property TCustomImageList Images;
```

Description

For each item that the list action supplies to clients, it can supply an image index along with other information such as the text value. The supplied image index refers to an image in the Images property.

Note: List actions do not supply images to all clients. The Images property controls the SmallImages property of a list view or the Images property of a TComboBoxEx descendant.

See Also

SmallImages

Images

28.1.9.2.7 TVirtualListAction.ItemIndex Property

Specifies the index of the selected item.

Pascal

```
property ItemIndex: Integer;
```

C++

```
__property int ItemIndex;
```

Description

ItemIndex represents the index of the selected item in all client controls that descend from TCustomListControl. Setting ItemIndex causes these clients to change their selection. When the user updates the selection using one of these clients, TCustomListAction automatically updates the others so that they select the same item.

Note: List actions do not supply ItemIndex to all clients. The ItemIndex property controls only the ItemIndex property of clients that descend from TCustomListControl.

See Also

OnItemSelected (see page 1027)

ItemIndex

28.1.9.2.8 TVirtualListAction.SecondaryShortCuts Property

Specifies the short cuts (in addition to ShortCut) for triggering clients.

Pascal

```
property SecondaryShortCuts;
```

C++

```
__property SecondaryShortCuts;
```

Description

Actions can execute in response to multiple short cut key combinations. SecondaryShortCuts lists all the short cut key combinations (other than the one specified by the ShortCut property) that can trigger the action. This lets you specify shortcuts for clients that do not have a ShortCut property or provide additional, secondary shortcuts.

When the user types one of the key combinations listed in SecondaryShortCuts, the action's Execute method is called.

See Also

ShortCut

Execute

28.1.9.2.9 TVirtualListAction.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut;
```

C++

```
__property ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 1415)

SecondaryShortCuts

28.1.9.2.10 TVirtualListAction.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible;
```

C++

```
__property Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 1416)

Visible

28.1.9.3 TVirtualListAction Events

The events of the TVirtualListAction class are listed here.

Published Events

	Name	Description
	OnGetItem (see page 1072)	Occurs when the list action needs to supply an item to its client controls.
	OnGetItemCount (see page 1072)	Occurs when the list action needs to determine the number of items it supplies to client controls.
	OnHint (see page 1073)	Occurs when the mouse pauses over a client control or menu item.
	OnItemSelected (see page 1073)	Occurs when a client control executes the action because a user selected one of the items.

28.1.9.3.1 TVirtualListAction.OnGetItem Event

Occurs when the list action needs to supply an item to its client controls.

Pascal

```
property OnGetItem: TGetVirtualItemEvent;
```

C++

```
__property TGetVirtualItemEvent OnGetItem;
```

Description

Write an OnGetItem event handler to provide the items that the virtual list action supplies to clients. When you set the Active property to True, the virtual list action generates an OnGetItem event for every index from 0 to Count – 1. In the event handler, supply the string value, image, and data that corresponds to the index specified by Index.

Sender is the list action that is supplying data to client controls.

Index indicates which item is requested, where 0 is the first item, 1 is the second item and so on up to the index that is one less than the value of the Count property.

Value returns the string value of the item. This is the text that appears in the client combo box or list box.

ImageIndex is the index of an image associated with the item. If the item is not associated with an image, ImageIndex should return –1. Otherwise, it should return the index of the desired image in the Images property.

Data returns a pointer to application-defined data that is associated with the item. For client controls that store items in a TStrings object, Data is the value of the Objects property for the item.

See Also

Count (see page 1024)

Images (see page 1025)

Objects

OnGetItemCount (see page 1027)

Active (see page 1024)

28.1.9.3.2 TVirtualListAction.OnGetItemCount Event

Occurs when the list action needs to determine the number of items it supplies to client controls.

Pascal

```
property OnGetItemCount: TGetItemCountEvent;
```

C++

```
__property TGetItemCountEvent OnGetItemCount;
```

Description

The GetCount method generates an OnGetItemCount event to supply the value of the Count property. Write an OnGetItemCount event handler to indicate the number of items for which you are supplying values in the OnGetItem event handler.

Sender is the list action that is supplying data to client controls.

Count returns the number of items this list action supplies to client controls.

See Also

GetCount (see page 1021)

Count (see page 1024)

28.1.9.3.3 TVirtualListAction.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint;
```

C++

```
__property OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some application-specific way.

28.1.9.3.4 TVirtualListAction.OnItemSelected Event

Occurs when a client control executes the action because a user selected one of the items.

Pascal

```
property OnItemSelected: TItemSelectedEvent;
```

C++

```
__property TItemSelectedEvent OnItemSelected;
```

Description

Write an OnItemSelected event handler to respond when the user selects one of the items supplied to client controls. Before this event is called, the list action first updates the ItemIndex property of any client controls that descend from TCustomListControl.

Sender is the list action that supplies items to the control in which an item was selected.

Control is the control in which the user selected an item.

See Also

ExecuteTarget (see page 1021)

ItemIndex (see page 1025)

28.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TListItemsSortType (see page 1074)	This is record ListActns.TListItemsSortType.

28.2.1 ListActns.TListItemsSortType Enumeration

Pascal

```
TListItemsSortType = (
  stNone,
  stData,
  stText,
  stBoth
);
```

C++

```
enum TListItemsSortType {
  stNone,
  stData,
  stText,
  stBoth
};
```

File

ListActns

Description

This is record ListActns.TListItemsSortType.

28.3 Types

The following table lists types in this documentation.

Types

Name	Description
TGetItemCountEvent (see page 1075)	This is type ListActns.TGetItemCountEvent.
TGetItemEvent (see page 1075)	This is type ListActns.TGetItemEvent.
TGetVirtualItemEvent (see page 1076)	This is type ListActns.TGetVirtualItemEvent.
TItemSelectedEvent (see page 1076)	This is type ListActns.TItemSelectedEvent.
TListCompareEvent (see page 1076)	This is type ListActns.TListCompareEvent.
TListControlItemClass (see page 1077)	This is type ListActns.TListControlItemClass.
TListItemsCompare (see page 1077)	This is type ListActns.TListItemsCompare.

28.3.1 ListActns.TGetItemCountEvent Type

Pascal

```
TGetItemCountEvent = procedure (Sender: TCustomListAction; var Count: Integer) of object;
```

C++

```
(Sender: TCustomListAction; var Count: Integer) ( TGetItemCountEvent)();
```

File

ListActns

Description

This is type ListActns.TGetItemCountEvent.

28.3.2 ListActns.TGetItemEvent Type

Pascal

```
TGetItemEvent = procedure (Sender: TCustomListAction; const Index: Integer; var Item:
TListControlItem) of object;
```

C++

```
(Sender: TCustomListAction; const Index: Integer; var Item: TListControlItem) (
TGetItemEvent)();
```

File

ListActns

Description

This is type ListActns.TGetItemEvent.

28.3.3 ListActns.TGetVirtualItemEvent Type

Pascal

```
TGetVirtualItemEvent = procedure (Sender: TCustomListAction; const Index: Integer; var Value:
String; var ImageIndex: Integer; var Data: TCustomData) of object;
```

C++

```
(Sender: TCustomListAction; const Index: Integer; var Value: String; var ImageIndex: Integer;
var Data: TCustomData) ( TGetVirtualItemEvent)();
```

File

ListActns

Description

This is type ListActns.TGetVirtualItemEvent.

28.3.4 ListActns.TItemSelectedEvent Type

Pascal

```
TItemSelectedEvent = procedure (Sender: TCustomListAction; Control: TControl) of object;
```

C++

```
(Sender: TCustomListAction; Control: TControl) ( TItemSelectedEvent)();
```

File

ListActns

Description

This is type ListActns.TItemSelectedEvent.

28.3.5 ListActns.TListCompareEvent Type

Pascal

```
TListCompareEvent = function (List: TListControlItems; Item1, Item2: TListControlItem):
Integer of object;
```

C++

```
(List: TListControlItems; Item1, Item2: TListControlItem): Integer ( TListCompareEvent)();
```

File

ListActns

Description

This is type ListActns.TListCompareEvent.

28.3.6 ListActns.TListControlItemClass Type

Pascal

```
TListControlItemClass = class of TListControlItem;
```

C++

```
TListControlItem TListControlItemClass;
```

File

ListActns

Description

This is type ListActns.TListControlItemClass.

28.3.7 ListActns.TListItemsCompare Type

Pascal

```
TListItemsCompare = function (List: TListControlItems; Index1, Index2: Integer): Integer;
```

C++

```
(List: TListControlItems; Index1, Index2: Integer): Integer ( TListItemsCompare)();
```

File

ListActns

Description

This is type ListActns.TListItemsCompare.

29 Mask Namespace

This is namespace Mask.

Topics

Name	Description
Classes (see page 1080)	The following table lists classes in this documentation.
Types (see page 1175)	The following table lists types in this documentation.

Classes

	Name	Description
	EDBEditError (see page 1080)	EDBEditError is the exception class for data that are incompatible with a specified mask.
	TCustomMaskEdit (see page 1080)	TCustomMaskEdit is the base type for edit controls that provide a mask for checking the validity of text typed into the control.
	TMaskEdit (see page 1100)	TMaskEdit implements a generic masked edit control.

Types

Name	Description
TMaskedState (see page 1175)	TMaskedState is a set of flags that describe the current state of a masked edit control.

29.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EDBEditError (see page 1080)	EDBEditError is the exception class for data that are incompatible with a specified mask.
	TCustomMaskEdit (see page 1080)	TCustomMaskEdit is the base type for edit controls that provide a mask for checking the validity of text typed into the control.
	TMaskEdit (see page 1100)	TMaskEdit implements a generic masked edit control.

29.1.1 EDBEditError Class

EDBEditError is the exception class for data that are incompatible with a specified mask.

Class Hierarchy

Pascal

```
EDBEditError = class(Exception);
```

C++

```
class EDBEditError : public Exception;
```

File

Mask

Description

EDBEditError is raised when an application attempts to use data that are incompatible with the mask specified for a field.

A mask restricts the data that can be put into an edit box or data field. Use the EditMask property to specify a mask.

See Also

TCustomMaskEdit (see page 1080)

TEditMask (see page 1193)

29.1.2 TCustomMaskEdit Class

TCustomMaskEdit is the base type for edit controls that provide a mask for checking the validity of text typed into the control.

Class Hierarchy

Pascal

```
TCustomMaskEdit = class(TCustomEdit);
```

C++

```
class TCustomMaskEdit : public TCustomEdit;
```

File

Mask

Description

TCustomMaskEdit introduces new properties and methods to expand the capabilities of TCustomEdit for validity checking using an edit mask. To create an edit control that takes advantage of the masking capabilities of TCustomMaskEdit, use a TMaskEdit (see page 1100) object. To create an edit control that does not validate the input, use the TEdit object instead.

Do not create instances of TCustomMaskEdit. Use TCustomMaskEdit as a base class when declaring control objects that implement a masked edit control. Properties and methods of TCustomMaskEdit provide basic behavior that descendant classes inherit as well as behavior that components can override to customize their behavior.

TEdit

TMaskEdit (see page 1100)

29.1.2.1 TCustomMaskEdit Members

The following tables list the members exposed by TCustomMaskEdit.

Protected Methods

	Name	Description
	CheckCursor (see page 1083)	Moves the cursor to the closest editable character and selects it if nothing is currently selected.
V	EditCanModify (see page 1084)	Permits the user to edit control contents.
	GetFirstEditChar (see page 1084)	Returns the index in the EditMask (see page 1092) of the first nonliteral character.
	GetLastEditChar (see page 1085)	Returns the index in the EditMask (see page 1092) of the last nonliteral character.
	GetMaxChars (see page 1085)	Returns the length of the EditText (see page 1095).
	GetNextEditChar (see page 1086)	Returns the first index of a nonliteral character equal to or greater than an offset.
	GetPriorEditChar (see page 1086)	Returns the first index of a nonliteral character equal to or less than an offset.
	GetSel (see page 1087)	Returns the endpoints of the current selection in the EditText (see page 1095).
V	KeyDown (see page 1087)	Supplements the inherited KeyDown to process navigation keys and the Delete key.
V	KeyPress (see page 1088)	Supplements the inherited method to process the Esc and Enter keys.
V	KeyUp (see page 1088)	Key up event dispatcher.
	ReformatText (see page 1089)	Applies the mask NewMask to the underlying text, and updates the internal representation of the mask.
V	Reset (see page 1089)	Returns the EditText (see page 1095) to its value at the time when the edit control last lost focus.
	SetCursor (see page 1090)	Moves the cursor to the first editable character at or before Pos, and selects that character.
	SetSel (see page 1090)	Selects character range.
V	Validate (see page 1091)	Validates a specified string against the current mask.

	ValidateError (see page 1091)	Beeps and raises an EDBEditError (see page 1080) exception.

Protected Properties

	Name	Description
	EditMask (see page 1092)	Specifies the mask that represents what text is valid for the masked edit control.
	MaskState (see page 1096)	Indicates state information about how the mask is being applied.
	MaxLength (see page 1096)	Specifies the maximum number of characters that can appear in the edit control.

Public Methods

	Name	Description
	Clear (see page 1083)	Sets the Text (see page 1097) property to an empty string.
	Create (see page 1082)	Creates an instance of TCustomMaskEdit (see page 1080).
	GetTextLen (see page 1087)	Returns the length of the underlying text.
	ValidateEdit (see page 1091)	Validates the EditText (see page 1095) against the current mask.

Public Properties

	Name	Description
	EditText (see page 1095)	Specifies the text that appears in the window of the masked edit control.
	IsMasked (see page 1096)	Indicates whether a mask exists for the edit control.
	Text (see page 1097)	Denotes the underlying text for the masked edit control before the mask has been applied.

29.1.2.2 TCustomMaskEdit.Create Constructor

Creates an instance of TCustomMaskEdit (see page 1080).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomMaskEdit(TComponent * AOwner);
```

Description

Call Create to instantiate a masked edit control at runtime. AOwner is the component that is responsible for freeing the masked edit control (typically the form). It becomes the value of the Owner property.

See Also

Owner

29.1.2.3 TCustomMaskEdit Methods

The methods of the TCustomMaskEdit class are listed here.

Protected Methods

	Name	Description
	CheckCursor (see page 1083)	Moves the cursor to the closest editable character and selects it if nothing is currently selected.
	EditCanModify (see page 1084)	Permits the user to edit control contents.
	GetFirstEditChar (see page 1084)	Returns the index in the EditMask (see page 1092) of the first nonliteral character.
	GetLastEditChar (see page 1085)	Returns the index in the EditMask (see page 1092) of the last nonliteral character.
	GetMaxChars (see page 1085)	Returns the length of the EditText (see page 1095).
	GetNextEditChar (see page 1086)	Returns the first index of a nonliteral character equal to or greater than an offset.

	GetPriorEditChar (see page 1086)	Returns the first index of a nonliteral character equal to or less than an offset.
	GetSel (see page 1087)	Returns the endpoints of the current selection in the EditText (see page 1095).
V	KeyDown (see page 1087)	Supplements the inherited KeyDown to process navigation keys and the Delete key.
V	KeyPress (see page 1088)	Supplements the inherited method to process the Esc and Enter keys.
V	KeyUp (see page 1088)	Key up event dispatcher.
	ReformatText (see page 1089)	Applies the mask NewMask to the underlying text, and updates the internal representation of the mask.
V	Reset (see page 1089)	Returns the EditText (see page 1095) to its value at the time when the edit control last lost focus.
	SetCursor (see page 1090)	Moves the cursor to the first editable character at or before Pos, and selects that character.
	SetSel (see page 1090)	Selects character range.
V	Validate (see page 1091)	Validates a specified string against the current mask.
V	ValidateError (see page 1091)	Beeps and raises an EDBEditError (see page 1080) exception.

Public Methods

	Name	Description
V	Clear (see page 1083)	Sets the Text (see page 1097) property to an empty string.
	GetTextLen (see page 1087)	Returns the length of the underlying text.
V	ValidateEdit (see page 1091)	Validates the EditText (see page 1095) against the current mask.

29.1.2.3.1 TCustomMaskEdit.CheckCursor Method

Moves the cursor to the closest editable character and selects it if nothing is currently selected.

Pascal

```
procedure CheckCursor;
```

C++

```
__fastcall CheckCursor();
```

Description

CheckCursor is called whenever the position of the cursor may have changed. It ensures that at least one character is always selected. Because editing a masked edit control consists of replacing the blank characters in the mask, there must always be a selection to replace. The selection corresponds to one or more nonliteral characters in the mask, which are either blank or contain characters for the user to reenter.

See Also

GetSel (see page 1087)

SetCursor (see page 1090)

SetSel (see page 1090)

29.1.2.3.2 TCustomMaskEdit.Clear Method

Sets the Text (see page 1097) property to an empty string.

Pascal

```
procedure Clear; override;
```

C++

```
virtual __fastcall Clear();
```

Description

Use Clear to remove all text that was entered into the masked edit control. Clear sets the value of Text (see page 1097) to an empty string. It does not clear the EditMask (see page 1092). If the edit control has a mask, EditText (see page 1095) is not empty, but has all non-literal characters replaced by blanks.

See Also

EditMask (see page 1092)

EditText (see page 1095)

IsMasked (see page 1096)

Reset (see page 1089)

Text (see page 1097)

29.1.2.3.3 TCustomMaskEdit.EditCanModify Method

Permits the user to edit control contents.

Pascal

```
function EditCanModify: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean EditCanModify();
```

Description

The EditCanModify method defined by TCustomMaskEdit (see page 1080) always returns true, allowing the Text (see page 1097) to be edited. EditCanModify exists primarily to provide an interface for a method that can conditionally disallow changes to the Text (see page 1097) by returning false.

See Also

Text (see page 1097)

29.1.2.3.4 TCustomMaskEdit.GetFirstEditChar Method

Returns the index in the EditMask (see page 1092) of the first nonliteral character.

Pascal

```
function GetFirstEditChar: Integer;
```

C++

```
__fastcall int GetFirstEditChar();
```

Description

Use GetFirstEditChar to find the first position of the EditMask (see page 1092) where the user can modify the EditText (see page 1095). 0 specifies the first character, 1 the second character, and so on. If there is no mask, GetFirstEditChar returns zero.

Use GetFirstEditChar as a starting point for programmatically processing all the nonliteral characters in the EditText (see page 1095). Use GetNextEditChar (see page 1086) to continue to loop through the editable characters in the EditText (see page 1095), and GetLastEditChar (see page 1085) to determine when all nonliteral characters have been processed.

See Also

EditMask (see page 1092)

EditText (see page 1095)

GetLastEditChar (see page 1085)

GetNextEditChar (see page 1086)

GetPriorEditChar (see page 1086)

29.1.2.3.5 TCustomMaskEdit.GetLastEditChar Method

Returns the index in the EditMask (see page 1092) of the last nonliteral character.

Pascal

```
function GetLastEditChar: Integer;
```

C++

```
__fastcall int GetLastEditChar();
```

Description

Use GetLastEditChar to find the last position of the EditMask (see page 1092) where the user can modify the EditText (see page 1095). 0 specifies the first character, 1 the second character, and so on. If there is no mask, GetLastEditChar returns the length of the text.

See Also

EditMask (see page 1092)

EditText (see page 1095)

GetFirstEditChar (see page 1084)

GetMaxChars (see page 1085)

GetNextEditChar (see page 1086)

GetPriorEditChar (see page 1086)

29.1.2.3.6 TCustomMaskEdit.GetMaxChars Method

Returns the length of the EditText (see page 1095).

Pascal

```
function GetMaxChars: Integer;
```

C++

```
__fastcall int GetMaxChars();
```

Description

If there is a mask, GetMaxChars returns the length of the EditText (see page 1095), including all blanks. This is the same as MaxLength (see page 1096), because editing in a masked edit control consists of replacing nonliteral characters. If there is no mask, GetMaxChars returns the length of the text in the window. In this case, the value returned by GetMaxChars may be less than MaxLength (see page 1096), which is the maximum number of characters that can be entered into the edit control.

See Also

EditText (see page 1095)

GetLastEditChar (see page 1085)

MaxLength (see page 1096)

Text (see page 1097)

29.1.2.3.7 TCustomMaskEdit.GetNextEditChar Method

Returns the first index of a nonliteral character equal to or greater than an offset.

Pascal

```
function GetNextEditChar(Offset: Integer): Integer;
```

C++

```
__fastcall int GetNextEditChar(int Offset);
```

Description

Call GetNextEditChar to find the first position of the EditMask (see page 1092) at or following Offset where the user can modify the EditText (see page 1095). 0 specifies the first character, 1 the second character, and so on. If there is no nonliteral character at or following Offset, GetNextEditChar returns MaxLength (see page 1096).

Use GetNextEditChar to loop through the editable characters in the EditText (see page 1095), starting with the value returned by GetFirstEditChar (see page 1084) and using GetLastEditChar (see page 1085) to determine when all nonliteral characters have been processed.

See Also

EditMask (see page 1092)

EditText (see page 1095)

GetFirstEditChar (see page 1084)

GetLastEditChar (see page 1085)

GetPriorEditChar (see page 1086)

29.1.2.3.8 TCustomMaskEdit.GetPriorEditChar Method

Returns the first index of a nonliteral character equal to or less than an offset.

Pascal

```
function GetPriorEditChar(Offset: Integer): Integer;
```

C++

```
__fastcall int GetPriorEditChar(int Offset);
```

Description

Call GetPriorEditChar to find the first position of the EditMask (see page 1092) at or preceding Offset, where the user can modify the EditText (see page 1095). 0 specifies the first character, 1 the second character, and so on. If there is no nonliteral character at or preceding Offset, GetPriorEditChar returns the index of the first editable character following Offset.

See Also

EditMask (see page 1092)

EditText (see page 1095)

GetFirstEditChar (see page 1084)

GetLastEditChar (see page 1085)

GetNextEditChar (see page 1086)

29.1.2.3.9 TCustomMaskEdit.GetSel Method

Returns the endpoints of the current selection in the EditText (see page 1095).

Pascal

```
procedure GetSel(var SelStart: Integer; var SelStop: Integer);
```

C++

```
__fastcall GetSel(int SelStart, int SelStop);
```

Description

Use GetSel to obtain the indexes of the first and last selected characters of the EditText (see page 1095), where 0 is the index of the first character. Not all the characters in the selection will necessarily be editable, if the mask contains literal characters. Do not use the resulting indexes on the Text (see page 1097) property if there is a mask, because the EditText (see page 1095) may contain blanks or nonliteral characters not found in the Text (see page 1097).

To programmatically change the selected text, use GetNextEditChar (see page 1086) to cycle through the editable characters of the selection from SelStart to SelStop.

See Also

EditText (see page 1095)

GetNextEditChar (see page 1086)

SelText

SetSel (see page 1090)

Text (see page 1097)

29.1.2.3.10 TCustomMaskEdit.GetTextLen Method

Returns the length of the underlying text.

Pascal

```
function GetTextLen: Integer; reintroduce;
```

C++

```
__fastcall int GetTextLen();
```

Description

Use GetTextLen to determine the length of the underlying text for the masked edit control. The underlying text has not been formatted for display by the mask, and may differ from the EditText (see page 1095) that appears in the window of the control.

See Also

EditText (see page 1095)

GetTextBuf

MaxLength (see page 1096)

Text (see page 1097)

29.1.2.3.11 TCustomMaskEdit.KeyDown Method

Supplements the inherited KeyDown to process navigation keys and the Delete key.

Pascal

```
procedure KeyDown(var Key: Word; Shift: TShiftState); override;
```

C++

```
virtual __fastcall KeyDown(Word Key, TShiftState Shift);
```

Description

After calling the inherited KeyDown, KeyDown ensures that moving the cursor within the masked edit control places the cursor on an editable character, and that deleting the current selection replaces nonliteral characters with blanks. Derived objects can override this method to further supplement the processing that takes place when the user presses a key down.

See Also

CheckCursor (see page 1083)

KeyPress (see page 1088)

KeyUp (see page 1088)

SetSel (see page 1090)

29.1.2.3.12 TCustomMaskEdit.KeyPress Method

Supplements the inherited method to process the Esc and Enter keys.

Pascal

```
procedure KeyPress(var Key: Char); override;
```

C++

```
virtual __fastcall KeyPress(Char Key);
```

Description

After calling the inherited method, KeyPress calls the Reset (see page 1089) method in response to the Esc key, or calls the ValidateEdit (see page 1091) method in response to the Enter key. Derived classes can override this method to further supplement the processing of specific keystrokes.

See Also

KeyDown (see page 1087)

Reset (see page 1089)

ValidateEdit (see page 1091)

29.1.2.3.13 TCustomMaskEdit.KeyUp Method

Key up event dispatcher.

Pascal

```
procedure KeyUp(var Key: Word; Shift: TShiftState); override;
```

C++

```
virtual __fastcall KeyUp(Word Key, TShiftState Shift);
```

Description

After calling the inherited method, KeyUp makes sure that selection using the Ctrl+Left and Ctrl+Right key combinations ends with an editable selection in the edit window. Derived classes can override this method to further supplement the processing that

takes place when the user releases a key.

See Also

CheckCursor (see page 1083)

KeyDown (see page 1087)

KeyPress (see page 1088)

SetSel (see page 1090)

29.1.2.3.14 TCustomMaskEdit.ReformatText Method

Applies the mask NewMask to the underlying text, and updates the internal representation of the mask.

Pascal

```
procedure ReformatText(const NewMask: string);
```

C++

```
__fastcall ReformatText(const UnicodeString NewMask);
```

Description

ReformatText does the bulk of the work of setting the EditMask (see page 1092) property at runtime. ReformatText should not be used in place of the EditMask (see page 1092) property, however, as it does not deal with the MaskState (see page 1096) property or the positioning of the cursor.

See Also

CheckCursor (see page 1083)

EditMask (see page 1092)

EditText (see page 1095)

MaskState (see page 1096)

Text (see page 1097)

29.1.2.3.15 TCustomMaskEdit.Reset Method

Returns the EditText (see page 1095) to its value at the time when the edit control last lost focus.

Pascal

```
procedure Reset; virtual;
```

C++

```
virtual __fastcall Reset();
```

Description

Reset cancels the most recent edits to the masked edit control. The EditText (see page 1095) returns to the value at the time the control last lost focus, not the time when it first regained focus. Thus, any changes to the EditText (see page 1095) that occurred programmatically while the edit control did not have focus are also discarded.

See Also

Clear (see page 1083)

EditText (see page 1095)

KeyPress (see page 1088)

29.1.2.3.16 TCustomMaskEdit.SetCursor Method

Moves the cursor to the first editable character at or before Pos, and selects that character.

Pascal

```
procedure SetCursor(Pos: Integer);
```

C++

```
__fastcall SetCursor(int Pos);
```

Description

SetCursor handles positioning of the cursor within the EditText (see page 1095) so that it is always on an editable character. It also ensures that at least one character is always selected. Because editing a masked edit control consists of replacing the blank characters in the mask, there must always be a selection to replace. The selection corresponds to one or more nonliteral characters in the mask, which are either blank or contain characters for the user to reenter.

See Also

CheckCursor (see page 1083)

GetPriorEditChar (see page 1086)

SetSel (see page 1090)

29.1.2.3.17 TCustomMaskEdit.SetSel Method

Selects character range.

Pascal

```
procedure SetSel(SelStart: Integer; SelStop: Integer);
```

C++

```
__fastcall SetSel(int SelStart, int SelStop);
```

Description

SetSel selects the indicated range of characters in the EditText (see page 1095), regardless of whether any of them are editable. If SelStart is the same as SelStop, SetSel positions the cursor at the SelStart character. When using SetSel, leave the cursor in an editable position if the intent is to create a selection for the user to replace.

SetSel can be used to select non-editable characters that can then be captured by using the SelText property or by copying to the Clipboard. Once the selection has been captured, return the cursor to an editable position by calling CheckCursor (see page 1083).

See Also

CheckCursor (see page 1083)

EditText (see page 1095)

GetSel (see page 1087)

SelText

SetCursor (see page 1090)

29.1.2.3.18 TCustomMaskEdit.Validate Method

Validates a specified string against the current mask.

Pascal

```
function Validate(const Value: string; var Pos: Integer): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean Validate(const UnicodeString Value, int Pos);
```

Description

The ValidateEdit (see page 1091) method calls Validate to perform the actual validation of the current text against the edit mask. It returns true if the string specified by Value is consistent with the edit mask, false if it detects an invalid character. If ValidateEdit (see page 1091) returns false, it returns the position of the invalid character as the Pos parameter.

See Also

EditMask (see page 1092)

ValidateEdit (see page 1091)

29.1.2.3.19 TCustomMaskEdit.ValidateEdit Method

Validates the EditText (see page 1095) against the current mask.

Pascal

```
procedure ValidateEdit; virtual;
```

C++

```
virtual __fastcall ValidateEdit();
```

Description

ValidateEdit attempts to validate the EditText (see page 1095) after each keystroke, and when the user attempts to leave the masked edit field. If the EditText (see page 1095) does not match the specifications of the EditMask (see page 1092), ValidateEdit calls ValidateError (see page 1091) to raise an exception, and returns the cursor to the first position where the EditText (see page 1095) did not comply with the EditMask (see page 1092).

See Also

EditMask (see page 1092)

EditText (see page 1095)

KeyPress (see page 1088)

ValidateError (see page 1091)

29.1.2.3.20 TCustomMaskEdit.ValidateError Method

Beeps and raises an EDBEditError (see page 1080) exception.

Pascal

```
procedure ValidateError; virtual;
```

C++

```
virtual __fastcall ValidateError();
```

Description

ValidateEdit (see page 1091) calls ValidateError when the EditText (see page 1095) fails to comply with the EditMask (see page 1092).

See Also

EditMask (see page 1092)

EditText (see page 1095)

ValidateEdit (see page 1091)

29.1.2.4 TCustomMaskEdit Properties

The properties of the TCustomMaskEdit class are listed here.

Protected Properties

	Name	Description
	EditMask (see page 1092)	Specifies the mask that represents what text is valid for the masked edit control.
	MaskState (see page 1096)	Indicates state information about how the mask is being applied.
	MaxLength (see page 1096)	Specifies the maximum number of characters that can appear in the edit control.

Public Properties

	Name	Description
	EditText (see page 1095)	Specifies the text that appears in the window of the masked edit control.
R	IsMasked (see page 1096)	Indicates whether a mask exists for the edit control.
	Text (see page 1097)	Denotes the underlying text for the masked edit control before the mask has been applied.

29.1.2.4.1 TCustomMaskEdit.EditMask Property

Specifies the mask that represents what text is valid for the masked edit control.

Pascal

```
property EditMask: TEditMask;
```

C++

```
__property TEditMask EditMask;
```

Description

Use EditMask to restrict the characters a user can enter into the masked edit control to valid characters and formats. If the user attempts to enter an invalid character, the edit control does not accept the character. Validation is performed on a character-by-character basis by the ValidateEdit (see page 1091) method.

Setting EditMask to an empty string removes the mask.

C++ Examples:

```
/*
This example uses three mask edit components on a form,
where the third mask edit box is set to be read only.
When the application runs, it initializes the mask edit boxes
to contain the empty string, to use the Courier font and to
use a particular mask, corresponding to IP address coding convetions.
The mask edit boxes display the IP address, the subnet mask
and the subnet address correspondingly. When the user exits the
subnet mask edit box, the subnet address is automatically calculated
```

```
  using bit-wise AND operations and displayed in the third mask edit box.
  An additional test is made to assure that the values in the IP address
  and in the subnet mask are in the interval from 0 to 255 ,
  as this validation test cannot be accomplished
  using the edit mask property alone.
  */
  void __fastcall TForm1::FormCreate(TObject *Sender)
  {
    // initialize the maskedit boxes to contain the empty string
    MaskEdit1->Text = "";
    MaskEdit2->Text = "";
    MaskEdit3->Text = "";

    // use the Courier font in the maskedit boxes
    MaskEdit1->Font->Name = "Courier";
    MaskEdit2->Font->Name = "Courier";
    MaskEdit3->Font->Name = "Courier";

    // initialize the mask of each maskedit box
    // according to IP address coding conventions
    MaskEdit1->EditMask = "!099.099.099.099;1; ";
    MaskEdit2->EditMask = "!099.099.099.099;1; ";
    MaskEdit3->EditMask = "!099.099.099.099;1; ";

    MaskEdit2->OnExit = MaskEdit2Exit;
  }

  void __fastcall TForm1::MaskEdit2Exit(TObject *Sender)
  {
    // extract the net and host address from the IP
    String IP = MaskEdit1->Text;
    int net1 = IP.SubString(0, 3).TrimRight().ToInt();
    int net2 = IP.SubString(5, 3).TrimRight().ToInt();
    int host1 = IP.SubString(9, 3).TrimRight().ToInt();
    int host2 = IP.SubString(13, 3).TrimRight().ToInt();

    // a range test that you cannot validate through edit masks
    if (net1 < 0 || net1 > 255 ||
        net2 < 0 || net2 > 255 ||
        host1 < 0 || host1 > 255 ||
        host2 < 0 || host2 > 255)
      throw(Exception("Not a valid IP address."));

    // extract the net and host mask from the subnet mask
    String mask = MaskEdit2->Text;
    int netmask1 = mask.SubString(0, 3).TrimRight().ToInt();
    int netmask2 = mask.SubString(5, 3).TrimRight().ToInt();
    int hostmask1 = mask.SubString(9, 3).TrimRight().ToInt();
    int hostmask2 = mask.SubString(13, 3).TrimRight().ToInt();

    // a range test that you cannot validate through edit masks
    if (netmask1 < 0 || netmask1 > 255 ||
        netmask2 < 0 || netmask2 > 255 ||
        hostmask1 < 0 || hostmask1 > 255 ||
        hostmask2 < 0 || hostmask2 > 255)
      throw(Exception("Not a valid subnet mask."));

    // compute the subnet address using bit-wise AND
    int sub_net1 = net1 & netmask1;
    int sub_net2 = net2 & netmask2;
    int sub_host1 = host1 & hostmask1;
    int sub_host2 = host2 & hostmask2;

    // display the subnet address
    MaskEdit3->Text =
      String(sub_net1) + "." + String(sub_net2) + "." +
```

```
    String(sub_host1) + "." + String(sub_host2);
}
```

Delphi Examples:

```
{
This example uses three mask edit components on a form,
where the third mask edit box is set to be read only.
When the application runs, it initializes the mask edit boxes
to contain the empty string, to use the Courier font and to
use a particular mask, corresponding to IP address coding convetions.
The mask edit boxes display the IP address, the subnet mask
and the subnet address correspondingly. When the user exits the
subnet mask edit box, the subnet address is automatically calculated
using bit-wise AND operations and displayed in the third mask edit box.
An additional test is made to assure that the values in the IP address
and in the subnet mask are in the interval from 0 to 255,
as this validation test cannot be accomplished
using the edit mask property alone.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  { initialize the maskedit boxes to contain the empty string }
  MaskEdit1.Text := '';
  MaskEdit2.Text := '';
  MaskEdit3.Text := '';

  { use the Courier font in the maskedit boxes }
  MaskEdit1.Font.Name := 'Courier';
  MaskEdit2.Font.Name := 'Courier';
  MaskEdit3.Font.Name := 'Courier';

  {
  initialize the mask of each maskedit box
  according to IP address coding conventions
  }
  MaskEdit1.EditMask := '!099.099.099.099;1; ';
  MaskEdit2.EditMask := '!099.099.099.099;1; ';
  MaskEdit3.EditMask := '!099.099.099.099;1; ';

  MaskEdit2.OnExit := MaskEdit2Exit;
end;

procedure TForm1.MaskEdit2Exit(Sender: TObject);
var
  net1, net2, host1, host2,
  netmask1, netmask2, hostmask1, hostmask2,
  sub_net1, sub_net2, sub_host1, sub_host2: Integer;

  IP, mask: String;

begin
  // extract the net and host address from the IP
  IP := MaskEdit1.Text;
  net1 := StrToInt(TrimRight(Copy(IP, 0, 3)));
  net2 := StrToInt(TrimRight(Copy(IP, 5, 3)));
  host1 := StrToInt(TrimRight(Copy(IP, 9, 3)));
  host2 := StrToInt(TrimRight(Copy(IP, 13, 3)));

  // a range test that you cannot validate through edit masks
  if ((net1 < 0) Or (net1 > 255) Or
      (net2 < 0) Or (net2 > 255) Or
      (host1 < 0) Or (host1 > 255) Or
      (host2 < 0) Or (host2 > 255)) then
    raise EArgumentException.Create('Not a valid IP address.');

  // extract the net and host mask from the subnet mask
```

```
    mask := MaskEdit2.Text;
    netmask1 := StrToInt(TrimRight(Copy(mask, 0, 3)));
    netmask2 := StrToInt(TrimRight(Copy(mask, 5, 3)));
    hostmask1 := StrToInt(TrimRight(Copy(mask, 9, 3)));
    hostmask2 := StrToInt(TrimRight(Copy(mask, 13, 3)));

    // a range test that you cannot validate through edit masks
    if ((netmask1 < 0) Or (netmask1 > 255) Or
        (netmask2 < 0) Or (netmask2 > 255) Or
        (hostmask1 < 0) Or (hostmask1 > 255) Or
        (hostmask2 < 0) Or (hostmask2 > 255)) then
      raise EArgumentException.Create('Not a valid subnet mask.');

    // compute the subnet address using bit-wise AND
    sub_net1 := net1 And netmask1;
    sub_net2 := net2 And netmask2;
    sub_host1 := host1 And hostmask1;
    sub_host2 := host2 And hostmask2;

    // display the subnet address
    MaskEdit3.Text :=
      IntToStr(sub_net1) + '.' + IntToStr(sub_net2) + '.' +
      IntToStr(sub_host1) + '.' + IntToStr(sub_host2);
  end;
```

29.1.2.4.2 TCustomMaskEdit.EditText Property

Specifies the text that appears in the window of the masked edit control.

Pascal

```
property EditText: string;
```

C++

```
__property UnicodeString EditText;
```

Description

EditText is the value of the text for the edit control after it is formatted using the EditMask (see page 1092). Before the text is fully entered into a masked edit control, the EditText includes a blank character for each unentered character. As characters are entered, the blank characters in the EditText are replaced by the values that the user types.

If literal mask characters are included in the text, and no character is substituted for blanks, the values of EditText and Text (see page 1097) are the same.

Note: EditText only applies at runtime.

See Also

EditMask (see page 1092)

Text (see page 1097)

29.1.2.4.3 TCustomMaskEdit.IsMasked Property

Indicates whether a mask exists for the edit control.

Pascal

```
property IsMasked: Boolean;
```

C++

```
__property Boolean IsMasked;
```

Description

Read IsMasked to determine whether the EditMask (see page 1092) property has been set. If IsMasked is true, the control has a mask, and input is validated at runtime. If IsMasked is false, the control does not restrict editing at runtime.

See Also

EditMask (see page 1092)

29.1.2.4.4 TCustomMaskEdit.MaskState Property

Indicates state information about how the mask is being applied.

Pascal

```
property MaskState: TMaskedState;
```

C++

```
__property TMaskedState MaskState;
```

Description

MaskState is used internally to determine appropriate actions based on how the mask is currently being applied. MaskState is a set drawn from among the following values:

Value	Meaning
msMasked	A mask has been assigned. MaskState includes msMasked when IsMasked (see page 1096) is true.
msReEnter	An invalid character has been rejected and the next edit should be a valid replacement character.
msDBSetText	The text comes from a database field and should not be validated.

MaskState is exposed as a protected property so that derived classes can maintain and use this state information in the implementation of properties and methods.

IsMasked (see page 1096)

ValidateEdit (see page 1091)

29.1.2.4.5 TCustomMaskEdit.MaxLength Property

Specifies the maximum number of characters that can appear in the edit control.

Pascal

```
property MaxLength: Integer;
```

C++

```
__property int MaxLength;
```

Description

MaxLength is the length of the EditText (see page 1095). Set MaxLength to limit the number of characters that can appear in the edit control when there is no EditMask (see page 1092). If there is an EditMask (see page 1092), MaxLength is implied by the mask itself, and cannot be changed. The EditText (see page 1095) contains blank characters for each character that has not been entered, padding the end or beginning of every optional section, so it remains constant in length.

EditMask (see page 1092)

EditText (see page 1095)

IsMasked (see page 1096)

Text (see page 1097)

29.1.2.4.6 TCustomMaskEdit.Text Property

Denotes the underlying text for the masked edit control before the mask has been applied.

Pascal

```
property Text: TMaskedText;
```

C++

```
__property TMaskedText Text;
```

Description

Use Text to determine the underlying value of the text before it has been formatted by the mask. Text may differ from the EditText (see page 1095) visible in the masked edit control if the mask specifies that literal characters should be removed, if the mask includes spaces, or if the mask includes characters that have not yet been filled in by the user. Text will not contain the blank characters, spaces will not be replaced by _, and literal characters in the mask will be removed if the mask indicates they should be.

When setting Text, the value of the text is formatted using the mask, and the resulting EditText (see page 1095) is used to update the window.

If there is no mask, Text is the text that appears in the edit control.

C++ Examples:

```
/*
This example uses three mask edit components on a form,
where the third mask edit box is set to be read only.
When the application runs, it initializes the mask edit boxes
to contain the empty string, to use the Courier font and to
use a particular mask, corresponding to IP address coding convetions.
The mask edit boxes display the IP address, the subnet mask
and the subnet address correspondingly. When the user exits the
subnet mask edit box, the subnet address is automatically calculated
using bit-wise AND operations and displayed in the third mask edit box.
An additional test is made to assure that the values in the IP address
and in the subnet mask are in the interval from 0 to 255 ,
as this validation test cannot be accomplished
using the edit mask property alone.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
```

```
  // initialize the maskedit boxes to contain the empty string
  MaskEdit1->Text = "";
  MaskEdit2->Text = "";
  MaskEdit3->Text = "";

  // use the Courier font in the maskedit boxes
  MaskEdit1->Font->Name = "Courier";
  MaskEdit2->Font->Name = "Courier";
  MaskEdit3->Font->Name = "Courier";

  // initialize the mask of each maskedit box
  // according to IP address coding conventions
  MaskEdit1->EditMask = "!099.099.099.099;1; ";
  MaskEdit2->EditMask = "!099.099.099.099;1; ";
  MaskEdit3->EditMask = "!099.099.099.099;1; ";

  MaskEdit2->OnExit = MaskEdit2Exit;
}

void __fastcall TForm1::MaskEdit2Exit(TObject *Sender)
{
  // extract the net and host address from the IP
  String IP = MaskEdit1->Text;
  int net1 = IP.SubString(0, 3).TrimRight().ToInt();
  int net2 = IP.SubString(5, 3).TrimRight().ToInt();
  int host1 = IP.SubString(9, 3).TrimRight().ToInt();
  int host2 = IP.SubString(13, 3).TrimRight().ToInt();

  // a range test that you cannot validate through edit masks
  if (net1 < 0 || net1 > 255 ||
      net2 < 0 || net2 > 255 ||
      host1 < 0 || host1 > 255 ||
      host2 < 0 || host2 > 255)
    throw(Exception("Not a valid IP address."));

  // extract the net and host mask from the subnet mask
  String mask = MaskEdit2->Text;
  int netmask1 = mask.SubString(0, 3).TrimRight().ToInt();
  int netmask2 = mask.SubString(5, 3).TrimRight().ToInt();
  int hostmask1 = mask.SubString(9, 3).TrimRight().ToInt();
  int hostmask2 = mask.SubString(13, 3).TrimRight().ToInt();

  // a range test that you cannot validate through edit masks
  if (netmask1 < 0 || netmask1 > 255 ||
      netmask2 < 0 || netmask2 > 255 ||

29.1.3 TMaskEdit Class

TMaskEdit implements a generic masked edit control.

Class Hierarchy

Pascal

```
TMaskEdit = class(TCustomMaskEdit);
```

C++

```
class TMaskEdit : public TCustomMaskEdit;
```

File

Mask

Description

Use a TMaskEdit object to put a masked edit control on your form. Masked edit controls validate the text the user enters against a mask that encodes the valid forms the text can take. The mask can also format text that is displayed to the user.

TMaskEdit implements the generic behavior introduced in TCustomMaskEdit (see page 1080). TMaskEdit publishes many of the properties and methods inherited from TCustomMaskEdit (see page 1080), but does not introduce any new behavior.

Edit Controls

29.1.3.1 TMaskEdit Members

The following tables list the members exposed by TMaskEdit.

Protected Methods

	Name	Description
	CheckCursor (see page 1083)	Moves the cursor to the closest editable character and selects it if nothing is currently selected.
V	EditCanModify (see page 1084)	Permits the user to edit control contents.
	GetFirstEditChar (see page 1084)	Returns the index in the EditMask (see page 1092) of the first nonliteral character.
	GetLastEditChar (see page 1085)	Returns the index in the EditMask (see page 1092) of the last nonliteral character.
	GetMaxChars (see page 1085)	Returns the length of the EditText (see page 1095).
	GetNextEditChar (see page 1086)	Returns the first index of a nonliteral character equal to or greater than an offset.
	GetPriorEditChar (see page 1086)	Returns the first index of a nonliteral character equal to or less than an offset.
	GetSel (see page 1087)	Returns the endpoints of the current selection in the EditText (see page 1095).
V	KeyDown (see page 1087)	Supplements the inherited KeyDown to process navigation keys and the Delete key.
V	KeyPress (see page 1088)	Supplements the inherited method to process the Esc and Enter keys.
V	KeyUp (see page 1088)	Key up event dispatcher.
	ReformatText (see page 1089)	Applies the mask NewMask to the underlying text, and updates the internal representation of the mask.
V	Reset (see page 1089)	Returns the EditText (see page 1095) to its value at the time when the edit control last lost focus.
	SetCursor (see page 1090)	Moves the cursor to the first editable character at or before Pos, and selects that character.
	SetSel (see page 1090)	Selects character range.
V	Validate (see page 1091)	Validates a specified string against the current mask.
V	ValidateError (see page 1091)	Beeps and raises an EDBEditError (see page 1080) exception.

Protected Properties

	Name	Description
	MaskState (see page 1096)	Indicates state information about how the mask is being applied.

Public Methods

	Name	Description
V	Clear (see page 1083)	Sets the Text (see page 1097) property to an empty string.
V	Create (see page 1082)	Creates an instance of TCustomMaskEdit (see page 1080).
	GetTextLen (see page 1087)	Returns the length of the underlying text.
V	ValidateEdit (see page 1091)	Validates the EditText (see page 1095) against the current mask.

Public Properties

	Name	Description
	EditText (see page 1095)	Specifies the text that appears in the window of the masked edit control.
R	IsMasked (see page 1096)	Indicates whether a mask exists for the edit control.

Published Events

	Name	Description
	OnChange (see page 1142)	Occurs when the text for the edit control may have changed.
	OnClick (see page 1142)	Occurs when the user clicks the control.
	OnDblClick (see page 1144)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 1144)	Occurs when the user drops an object being dragged.

	OnDragOver (see page 1147)	Occurs when the user drags an object over a control.
	OnEndDock (see page 1150)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 1151)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 1152)	Occurs when a control receives the input focus.
	OnExit (see page 1154)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 1158)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 1162)	Occurs when a key is pressed.
	OnKeyUp (see page 1163)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 1165)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 1166)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 1168)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 1168)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 1168)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 1171)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 1173)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 1173)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Published Properties

	Name	Description
	Align (see page 1104)	Determines how the control aligns within its container (parent control).
	Alignment (see page 1107)	Determines how the text is aligned within the text edit control.
	Anchors (see page 1108)	Specifies how the control is anchored to its parent.
	AutoSelect (see page 1108)	Determines whether all the text in the edit control is automatically selected when the control gets focus.
	AutoSize (see page 1109)	Determines whether the height of the edit control automatically resizes to accommodate the text.
	BevelEdges (see page 1110)	Specifies which edges of the control are beveled.
	BevelInner (see page 1110)	Specifies the cut of the inner bevel.
	BevelKind (see page 1111)	Specifies the control's bevel style.
	BevelOuter (see page 1111)	Specifies the cut of the outer bevel.
	BevelWidth (see page 1112)	Specifies the width of the inner and outer bevels.
	BiDiMode (see page 1112)	Specifies the bi-directional mode for the control.
	BorderStyle (see page 1112)	Determines whether the edit control has a single line border around the client area.
	CharCase (see page 1113)	Determines the case of the text within the edit control.
	Color (see page 1113)	Specifies the background color of the control.
	Constraints (see page 1114)	Specifies the size constraints for the control.
	Ctl3D (see page 1115)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DoubleBuffered (see page 1115)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	DragCursor (see page 1117)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 1117)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 1118)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	EditMask (see page 1119)	Specifies the mask that represents what text is valid for the masked edit control.
	Enabled (see page 1122)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 1123)	Controls the attributes of text written on or in the control.
	ImeMode (see page 1124)	Determines the behavior of the input method editor (IME).
	ImeName (see page 1124)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	MaxLength (see page 1125)	Specifies the maximum number of characters that can appear in the edit control.

	ParentBiDiMode (see page 1125)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 1126)	Determines where a control looks for its color information.
	ParentCtl3D (see page 1126)	Determines where a component looks to determine if it should appear three dimensional.
	ParentDoubleBuffered (see page 1127)	ParentDoubleBuffered defers the DoubleBuffered property of this component to the value of the parent's DoubleBuffered property.
	ParentFont (see page 1127)	Determines where a control looks for its font information.
	ParentShowHint (see page 1127)	Determines where a control looks to find out if its Help Hint should be shown.
	PasswordChar (see page 1128)	Indicates the character, if any, to display in place of the actual characters typed in the control.
	PopupMenu (see page 1128)	Identifies the pop-up menu associated with the control.
	ReadOnly (see page 1133)	Determines whether the user can change the text of the edit control.
	ShowHint (see page 1134)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 1135)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 1136)	Determines if the user can tab to a control.
	Text (see page 1136)	Denotes the underlying text for the masked edit control before the mask has been applied.
	TextHint (see page 1139)	A hint or message to be displayed when the Text property is empty.
	Visible (see page 1139)	Determines whether the component appears onscreen.

29.1.3.2 TMaskEdit Properties

The properties of the TMaskEdit class are listed here.

Published Properties

	Name	Description
	Align (see page 1104)	Determines how the control aligns within its container (parent control).
	Alignment (see page 1107)	Determines how the text is aligned within the text edit control.
	Anchors (see page 1108)	Specifies how the control is anchored to its parent.
	AutoSelect (see page 1108)	Determines whether all the text in the edit control is automatically selected when the control gets focus.
	AutoSize (see page 1109)	Determines whether the height of the edit control automatically resizes to accommodate the text.
	BevelEdges (see page 1110)	Specifies which edges of the control are beveled.
	BevelInner (see page 1110)	Specifies the cut of the inner bevel.
	BevelKind (see page 1111)	Specifies the control's bevel style.
	BevelOuter (see page 1111)	Specifies the cut of the outer bevel.
	BevelWidth (see page 1112)	Specifies the width of the inner and outer bevels.
	BiDiMode (see page 1112)	Specifies the bi-directional mode for the control.
	BorderStyle (see page 1112)	Determines whether the edit control has a single line border around the client area.
	CharCase (see page 1113)	Determines the case of the text within the edit control.
	Color (see page 1113)	Specifies the background color of the control.
	Constraints (see page 1114)	Specifies the size constraints for the control.
	Ctl3D (see page 1115)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DoubleBuffered (see page 1115)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	DragCursor (see page 1117)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 1117)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 1118)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	EditMask (see page 1119)	Specifies the mask that represents what text is valid for the masked edit control.
	Enabled (see page 1122)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 1123)	Controls the attributes of text written on or in the control.
	ImeMode (see page 1124)	Determines the behavior of the input method editor (IME).

	ImeName (see page 1124)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	MaxLength (see page 1125)	Specifies the maximum number of characters that can appear in the edit control.
	ParentBiDiMode (see page 1125)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 1126)	Determines where a control looks for its color information.
	ParentCtl3D (see page 1126)	Determines where a component looks to determine if it should appear three dimensional.
	ParentDoubleBuffered (see page 1127)	ParentDoubleBuffered defers the DoubleBuffered property of this component to the value of the parent's DoubleBuffered property.
	ParentFont (see page 1127)	Determines where a control looks for its font information.
	ParentShowHint (see page 1127)	Determines where a control looks to find out if its Help Hint should be shown.
	PasswordChar (see page 1128)	Indicates the character, if any, to display in place of the actual characters typed in the control.
	PopupMenu (see page 1128)	Identifies the pop-up menu associated with the control.
	ReadOnly (see page 1133)	Determines whether the user can change the text of the edit control.
	ShowHint (see page 1134)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 1135)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 1136)	Determines if the user can tab to a control.
	Text (see page 1136)	Denotes the underlying text for the masked edit control before the mask has been applied.
	TextHint (see page 1139)	A hint or message to be displayed when the Text property is empty.
	Visible (see page 1139)	Determines whether the component appears onscreen.

29.1.3.2.1 TMaskEdit.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align;
```

C++

```
__property Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1); // These objects will all be cleaned up by the owner
(Form1).
  TFileListBox* pflb = new TFileListBox(Form1); // The parent (Form1) will clean up these
objects.
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);  // The owner will clean this up.
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);  // The owner will clean this up.
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};
```

```
void __fastcall TForm1::FormCreate(TObject *Sender)
{
    ppc = new TPageControl(this); // The owner (this) will clean this up.
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this); // The owner (this) will clean this up.
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var

29.1.3.2.2 TMaskEdit.Alignment Property

Determines how the text is aligned within the text edit control.

Pascal

```
property Alignment;
```

C++

```
__property Alignment;
```

Description

Use Alignment to change the way the text is formatted in the text edit control. Alignment can take one of the following values:

Value	Meaning
taLeftJustify	Align text to the left side of the control
taCenter	Center text horizontally in the control.
taRightJustify	Align text to the right side of the control.

SetAlignment

Text

Displaying and Editing Fields in an Edit Box

29.1.3.2.3 TMaskEdit.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors;
```

C++

```
__property Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

Align

29.1.3.2.4 TMaskEdit.AutoSelect Property

Determines whether all the text in the edit control is automatically selected when the control gets focus.

Pascal

```
property AutoSelect;
```

C++

```
__property AutoSelect;
```

Description

Set AutoSelect to select all the text when the edit control gets focus. AutoSelect only applies to single-line edit controls.

Use AutoSelect when the user is more likely to replace the text in the edit control than to append to it.

29.1.3.2.5 TMaskEdit.AutoSize Property

Determines whether the height of the edit control automatically resizes to accommodate the text.

Pascal

```
property AutoSize;
```

C++

```
__property AutoSize;
```

Description

Use AutoSize to make the edit control adjust its size automatically so the client area accommodates the height of the text. When AutoSize is false, the edit control has a fixed height. When AutoSize is true, the size of the control is readjusted whenever a change occurs that could affect the height of the control, such as a change to the font or border style.

Note: AutoSize only adjusts the height of the edit control. Even with AutoSize set to true, text in the edit control may appear truncated if it extends beyond the width of the control.

C++ Examples:

```
/*
This example uses an edit box and a button on a form. When
the user clicks the button, the font in the edit box
enlarges, and the edit box enlarges also to accommodate the
larger font size.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Edit1->AutoSize = true;
  Edit1->Font->Size = 20;
  Edit1->Text = "The edit box is taller now";
}
```

Delphi Examples:

```
{
{
This example uses an edit box and a button on a form. When
the user clicks the button, the font in the edit box
enlarges, and the edit box enlarges also to accommodate the
```

```
  larger font size.
  }
  procedure TForm1.Button1Click(Sender: TObject);
  begin
    Edit1.AutoSize := True;
    Edit1.Font.Size := 20;
    Edit1.Text := 'The edit box is taller now';
  end;
```

29.1.3.2.6 TMaskEdit.BevelEdges Property

Specifies which edges of the control are beveled.

Pascal

```
property BevelEdges;
```

C++

```
__property BevelEdges;
```

Description

Use BevelEdges to get or set which edges of the control are beveled. The BevelInner, BevelOuter, and BevelKind properties determine the appearance of the specified edges.

See Also

BevelInner

BevelOuter

BevelKind

29.1.3.2.7 TMaskEdit.BevelInner Property

Specifies the cut of the inner bevel.

Pascal

```
property BevelInner;
```

C++

```
__property BevelInner;
```

Description

Use BevelInner to specify whether the inner bevel has a raised, lowered, or flat look.

The inner bevel appears immediately inside the outer bevel. If there is no outer bevel (BevelOuter is bvNone), the inner bevel appears immediately inside the border.

See Also

BevelEdges

BevelOuter

BevelKind

BevelWidth

BorderWidth

29.1.3.2.8 TMaskEdit.BevelKind Property

Specifies the control's bevel style.

Pascal

```
property BevelKind;
```

C++

```
__property BevelKind;
```

Description

Use BevelKind to modify the appearance of a bevel. BevelKind influences how sharply the bevel stands out.

BevelKind, in combination with BevelWidth and the cut of the bevel specified by BevelInner or BevelOuter, can create a variety of effects. Experiment with various combinations to get the look you want.

29.1.3.2.9 TMaskEdit.BevelOuter Property

Specifies the cut of the outer bevel.

Pascal

```
property BevelOuter;
```

C++

```
__property BevelOuter;
```

Description

Use BevelOuter to specify whether the outer bevel has a raised, lowered, or flat look.

The outer bevel appears immediately inside the border and outside the inner bevel.

See Also

BevelEdges

BevelInner

BevelKind

BevelWidth

29.1.3.2.10 TMaskEdit.BevelWidth Property

Specifies the width of the inner and outer bevels.

Pascal

```
property BevelWidth;
```

C++

```
__property BevelWidth;
```

Description

Use BevelWidth to specify the width, in pixels, of the inner and outer bevels.

See Also

BevelEdges

BevelInner

BevelKind

BevelOuter

29.1.3.2.11 TMaskEdit.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode;
```

C++

```
__property BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

29.1.3.2.12 TMaskEdit.BorderStyle Property

Determines whether the edit control has a single line border around the client area.

Pascal

```
property BorderStyle;
```

C++

```
__property BorderStyle;
```

Description

Use BorderStyle to affect the sharpness with which the client area of the edit control stands out. BorderStyle can have a value of either bsSingle or bsNone. If BorderStyle is bsSingle, the edit control has a single-line border around the client area. If BorderStyle is bsNone, there will be no border.

29.1.3.2.13 TMaskEdit.CharCase Property

Determines the case of the text within the edit control.

Pascal

```
property CharCase;
```

C++

```
__property CharCase;
```

Description

Use CharCase to force the contents of the edit control to assume a particular case.

When CharCase is set to ecLowerCase or ecUpperCase, the case of characters is converted as the user types them into the edit control. Changing the CharCase property to ecLowerCase or ecUpperCase changes the actual contents of the text, not just the appearance. Any case information is lost and can't be recaptured by changing CharCase to ecNormal.

Text

29.1.3.2.14 TMaskEdit.Color Property

Specifies the background color of the control.

Pascal

```
property Color;
```

C++

```
__property Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
```

```
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

ParentColor

29.1.3.2.15 TMaskEdit.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints;
```

C++

```
__property Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

OnCanResize

29.1.3.2.16 TMaskEdit.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D;
```

C++

```
__property Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

BorderWidth

29.1.3.2.17 TMaskEdit.DoubleBuffered Property

Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.

Pascal

```
property DoubleBuffered;
```

C++

```
__property DoubleBuffered;
```

Description

When DoubleBuffered is false, the windowed control paints itself directly to the window. When DoubleBuffered is true, the windowed control paints itself to an in-memory bitmap that is then used to paint the window. Double buffering reduces the amount of flicker when the control repaints, but is more memory intensive.

When a windowed control is a dock site and has an associated dock manager, it must be double-buffered.

Note: Some controls, such as TRichEdit, can't paint themselves into a bitmap. For such controls, DoubleBuffered must be set to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/
```

```
// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = dynamic_cast<TListBox *>(Sender);
    DestList->Font = (dynamic_cast<TLabel *>(Source))->Font;
    DestList->Color = (dynamic_cast<TLabel *>(Source))->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code requires a list box and three labels, each with a
different font and color.  The DragMode property for each of
the labels is dmAutomatic.  The user can select a label and
drag it to a list box and drop it. When the label is dropped,
the items in the list box assume the color and font of the
dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
```

```
      with Sender as TListBox do
      begin
        Font := (Source as TLabel).Font;
        Color := (Source as TLabel).Color;
        DoubleBuffered := true;
        Color := clWindow;
      end;
    end;
  end;
```

29.1.3.2.18 TMaskEdit.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor;
```

C++

```
__property DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

DragKind

DragMode

29.1.3.2.19 TMaskEdit.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind;
```

C++

```
__property DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor

DragMode

29.1.3.2.20 TMaskEdit.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode;
```

C++

```
__property DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != dynamic_cast<TObject *>(TreeView1) || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == dynamic_cast<TObject *>(TreeView1));
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property must be set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
```

```
    HT: THitTests;
  begin
    if TreeView1.Selected = nil then Exit;
    HT := TreeView1.GetHitTestInfoAt(X, Y);
    AnItem := TreeView1.GetNodeAt(X, Y);
    if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
    begin
      if (htOnItem in HT) or (htOnIcon in HT) then
        AttachMode := naAddChild

29.1.3.2.21 TMaskEdit.EditMask Property

Specifies the mask that represents what text is valid for the masked edit control.

Pascal

```
property EditMask: TEditMask;
```

C++

```
__property TEditMask EditMask;
```

Description

Use EditMask to restrict the characters a user can enter into the masked edit control to valid characters and formats. If the user attempts to enter an invalid character, the edit control does not accept the character. Validation is performed on a character-by-character basis by the ValidateEdit method.

Setting EditMask to an empty string removes the mask.

C++ Examples:

```
/*
This example uses three mask edit components on a form,
where the third mask edit box is set to be read only.
When the application runs, it initializes the mask edit boxes
```

```
  to contain the empty string, to use the Courier font and to
  use a particular mask, corresponding to IP address coding convetions.
  The mask edit boxes display the IP address, the subnet mask
  and the subnet address correspondingly. When the user exits the
  subnet mask edit box, the subnet address is automatically calculated
  using bit-wise AND operations and displayed in the third mask edit box.
  An additional test is made to assure that the values in the IP address
  and in the subnet mask are in the interval from 0 to 255 ,
  as this validation test cannot be accomplished
  using the edit mask property alone.
  */
  void __fastcall TForm1::FormCreate(TObject *Sender)
  {
    // initialize the maskedit boxes to contain the empty string
    MaskEdit1->Text = "";
    MaskEdit2->Text = "";
    MaskEdit3->Text = "";

    // use the Courier font in the maskedit boxes
    MaskEdit1->Font->Name = "Courier";
    MaskEdit2->Font->Name = "Courier";
    MaskEdit3->Font->Name = "Courier";

    // initialize the mask of each maskedit box
    // according to IP address coding conventions
    MaskEdit1->EditMask = "!099.099.099.099;1; ";
    MaskEdit2->EditMask = "!099.099.099.099;1; ";
    MaskEdit3->EditMask = "!099.099.099.099;1; ";

    MaskEdit2->OnExit = MaskEdit2Exit;
  }

  void __fastcall TForm1::MaskEdit2Exit(TObject *Sender)
  {
    // extract the net and host address from the IP
    String IP = MaskEdit1->Text;
    int net1 = IP.SubString(0, 3).TrimRight().ToInt();
    int net2 = IP.SubString(5, 3).TrimRight().ToInt();
    int host1 = IP.SubString(9, 3).TrimRight().ToInt();
    int host2 = IP.SubString(13, 3).TrimRight().ToInt();

    // a range test that you cannot validate through edit masks
    if (net1 < 0 || net1 > 255 ||
        net2 < 0 || net2 > 255 ||

        host2 < 0 || host2 > 255)
      throw(Exception("Not a valid IP address."));

    // extract the net and host mask from the subnet mask
    String mask = MaskEdit2->Text;
    int netmask1 = mask.SubString(0, 3).TrimRight().ToInt();
    int netmask2 = mask.SubString(5, 3).TrimRight().ToInt();
    int hostmask1 = mask.SubString(9, 3).TrimRight().ToInt();
    int hostmask2 = mask.SubString(13, 3).TrimRight().ToInt();

    // a range test that you cannot validate through edit masks
    if (netmask1 < 0 || netmask1 > 255 ||
        netmask2 < 0 || netmask2 > 255 ||
        hostmask1 < 0 || hostmask1 > 255 ||
        hostmask2 < 0 || hostmask2 > 255)
      throw(Exception("Not a valid subnet mask."));

    // compute the subnet address using bit-wise AND
    int sub_net1 = net1 & netmask1;
    int sub_net2 = net2 & netmask2;
    int sub_host1 = host1 & hostmask1;
```

```
  int sub_host2 = host2 & hostmask2;

  // display the subnet address
  MaskEdit3->Text =
    String(sub_net1) + "." + String(sub_net2) + "." +
    String(sub_host1) + "." + String(sub_host2);
}
```

Delphi Examples:

```
{
This example uses three mask edit components on a form,
where the third mask edit box is set to be read only.
When the application runs, it initializes the mask edit boxes
to contain the empty string, to use the Courier font and to
use a particular mask, corresponding to IP address coding convetions.
The mask edit boxes display the IP address, the subnet mask
and the subnet address correspondingly. When the user exits the
subnet mask edit box, the subnet address is automatically calculated
using bit-wise AND operations and displayed in the third mask edit box.
An additional test is made to assure that the values in the IP address
and in the subnet mask are in the interval from 0 to 255,
as this validation test cannot be accomplished
using the edit mask property alone.
}

29.1.3.2.22 TMaskEdit.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled;
```

C++

```
__property Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to False. Some disabled controls appear dimmed (for example: buttons, check boxes, labels), while others (container controls) simply lose their functionality without changing their appearance. If Enabled is set to False, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to True.

Note: This property applies to all TControl descendants.

29.1.3.2.23 TMaskEdit.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font;
```

C++

```
__property Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;
```

```
procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

29.1.3.2.24 TMaskEdit.ImeMode Property

Determines the behavior of the input method editor (IME).

Pascal

```
property ImeMode;
```

C++

```
__property ImeMode;
```

Description

Set ImeMode to configure the way an IME processes user keystrokes. An IME is a front-end input processor for Asian language characters. The IME hooks all keyboard input, converts it to Asian characters in a conversion window, and sends the converted characters or strings on to the application.

ImeMode allows a control to influence the type of conversion performed by the IME so that it is appropriate for the input expected by the control. For example, a control that only accepts numeric input might specify an ImeMode of imClose, as no conversion is necessary for numeric input.

Note: The value of ImeMode only takes effect when the control receives focus. To change the value of ImeMode when the control already has input focus, call the SetIme method.

SetIme

SetImeCompositionWindow

29.1.3.2.25 TMaskEdit.ImeName Property

Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.

Pascal

```
property ImeName;
```

C++

```
__property ImeName;
```

Description

Set ImeName to specify which IME to use for converting keystrokes. An IME is a front-end input processor for Asian language

characters. The IME hooks all keyboard input, converts it to Asian characters in a conversion window, and sends the converted characters or strings on to the application.

ImeName must specify one of the IMEs that has been installed through the Windows control panel. The property inspector provides a drop-down list of all currently installed IMEs on the system. At runtime, applications can obtain a list of currently installed IMEs from the global Screen variable.

If ImeName specifies an unavailable IME, the IME that was active when the application started is used instead. No exception is generated.

Note: The value of ImeName only takes effect when the control receives focus. To change the value of ImeName after the control has input focus, call the SetIme method.

29.1.3.2.26 TMaskEdit.MaxLength Property

Specifies the maximum number of characters that can appear in the edit control.

Pascal

```
property MaxLength: Integer;
```

C++

```
__property int MaxLength;
```

Description

MaxLength is the length of the EditText. Set MaxLength to limit the number of characters that can appear in the edit control when there is no EditMask. If there is an EditMask, MaxLength is implied by the mask itself, and cannot be changed. The EditText contains blank characters for each character that has not been entered, padding the end or beginning of every optional section, so it remains constant in length.

29.1.3.2.27 TMaskEdit.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode;
```

C++

```
__property ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

Parent

BiDiMode

29.1.3.2.28 TMaskEdit.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor;
```

C++

```
__property ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

29.1.3.2.29 TMaskEdit.ParentCtl3D Property

Determines where a component looks to determine if it should appear three dimensional.

Pascal

```
property ParentCtl3D;
```

C++

```
__property ParentCtl3D;
```

Description

ParentCtl3D is provided for backwards compatibility. It has no effect on 32-bit versions of Windows or NT 4.0 and later.

ParentCtl3D determines whether the control uses its parent's Ctl3D property.

See Also

Ctl3D

29.1.3.2.30 TMaskEdit.ParentDoubleBuffered Property

ParentDoubleBuffered defers the DoubleBuffered property of this component to the value of the parent's DoubleBuffered property.

Pascal

```
property ParentDoubleBuffered;
```

C++

```
__property ParentDoubleBuffered;
```

Description

ParentDoubleBuffered is a boolean indicating that the DoubleBuffered property of this component is overridden by the value of the parent's DoubleBuffered property.

29.1.3.2.31 TMaskEdit.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont;
```

C++

```
__property ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

ParentColor

ParentShowHint

29.1.3.2.32 TMaskEdit.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint;
```

C++

```
__property ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

29.1.3.2.33 TMaskEdit.PasswordChar Property

Indicates the character, if any, to display in place of the actual characters typed in the control.

Pascal

```
property PasswordChar;
```

C++

```
__property PasswordChar;
```

Description

Use the PasswordChar property to create an edit control that displays a special character in place of any entered text. If PasswordChar is set to the null character (ANSI character zero), the edit control displays its text normally. If PasswordChar is any other character, the edit control displays PasswordChar in place of each character typed. PasswordChar affects the appearance of the edit control only. The value of the Text property reflects the actual characters that are typed.

Text

29.1.3.2.34 TMaskEdit.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu;
```

C++

```
__property PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
```

```
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    // The owner (PopupMenu1) will cleanup this menu item.
    TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
    int index = PopupMenu1->Items->Count;
    PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
    NewItem->Caption = "Menu Item " + IntToStr(index);
    NewItem->Tag = index;
    NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
    TNotifyEvent();
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
```

```
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        // The owner (PopupMenu1) will cleanup this menu item.
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
```

```
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

OnContextPopup

29.1.3.2.35 TMaskEdit.ReadOnly Property

Determines whether the user can change the text of the edit control.

Pascal

```
property ReadOnly;
```

C++

```
__property ReadOnly;
```

Description

To restrict the edit control to display only, set the ReadOnly property to true. Set ReadOnly to false to allow the contents of the edit control to be edited.

Setting ReadOnly to true ensures that the text is not altered, while still allowing the user to select text. The selected text can then

be manipulated by the application, or copied to the Clipboard.

CopyToClipboard

GetSelTextBuf

29.1.3.2.36 TMaskEdit.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint;
```

C++

```
__property ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls

example.
}

29.1.3.2.37 TMaskEdit.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder;
```

C++

```
__property TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the

control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

FindNextControl

TabStop

29.1.3.2.38 TMaskEdit.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop;
```

C++

```
__property TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

TabOrder

29.1.3.2.39 TMaskEdit.Text Property

Denotes the underlying text for the masked edit control before the mask has been applied.

Pascal

```
property Text: TMaskedText;
```

C++

```
__property TMaskedText Text;
```

Description

Use Text to determine the underlying value of the text before it has been formatted by the mask. Text may differ from the EditText visible in the masked edit control if the mask specifies that literal characters should be removed, if the mask includes spaces, or if the mask includes characters that have not yet been filled in by the user. Text will not contain the blank characters, spaces will not be replaced by _, and literal characters in the mask will be removed if the mask indicates they should be.

When setting Text, the value of the text is formatted using the mask, and the resulting EditText is used to update the window.

If there is no mask, Text is the text that appears in the edit control.

C++ Examples:

```
/*
This example uses three mask edit components on a form,
where the third mask edit box is set to be read only.
When the application runs, it initializes the mask edit boxes
```

```
  to contain the empty string, to use the Courier font and to
  use a particular mask, corresponding to IP address coding convetions.
  The mask edit boxes display the IP address, the subnet mask
  and the subnet address correspondingly. When the user exits the
  subnet mask edit box, the subnet address is automatically calculated
  using bit-wise AND operations and displayed in the third mask edit box.
  An additional test is made to assure that the values in the IP address
  and in the subnet mask are in the interval from 0 to 255 ,
  as this validation test cannot be accomplished
  using the edit mask property alone.
  */
  void __fastcall TForm1::FormCreate(TObject *Sender)
  {
    // initialize the maskedit boxes to contain the empty string
    MaskEdit1->Text = "";
    MaskEdit2->Text = "";
    MaskEdit3->Text = "";

    // use the Courier font in the maskedit boxes
    MaskEdit1->Font->Name = "Courier";
    MaskEdit2->Font->Name = "Courier";
    MaskEdit3->Font->Name = "Courier";

    // initialize the mask of each maskedit box
    // according to IP address coding conventions
    MaskEdit1->EditMask = "!099.099.099.099;1; ";
    MaskEdit2->EditMask = "!099.099.099.099;1; ";
    MaskEdit3->EditMask = "!099.099.099.099;1; ";

    MaskEdit2->OnExit = MaskEdit2Exit;
  }

  void __fastcall TForm1::MaskEdit2Exit(TObject *Sender)
  {
    // extract the net and host address from the IP
    String IP = MaskEdit1->Text;
    int net1 = IP.SubString(0, 3).TrimRight().ToInt();
    int net2 = IP.SubString(5, 3).TrimRight().ToInt();
    int host1 = IP.SubString(9, 3).TrimRight().ToInt();
    int host2 = IP.SubString(13, 3).TrimRight().ToInt();

29.1.3.2.40 TMaskEdit.TextHint Property

A hint or message to be displayed when the Text property is empty.

Pascal

```
property TextHint;
```

C++

```
__property TextHint;
```

Description

Use TextHint to cue the user on what kind of entry is expected in the text field. Runtime themes must be enabled.
